interstitial lung disease); Patients with child-bearing potential; Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** CEREBROVASCULAR ACCIDENT (pancreatic cancer patients), fatigue. **CV:** MYOCARDIAL INFARCTION/ISCHEMIA (pancreatic cancer patients). **EENT:** conjunctivitis, corneal perforation, corneal ulceration. **Resp:** INTERSTITIAL LUNG DISEASE, dyspnea, cough. **GI:** HEPATOTOXICITY, GI PERFORATION, diarrhea, abdominal pain, anorexia, nausea, stomatitis, vomiting, ↑ liver enzymes. **Derm:** BULLOUS AND EXFOLIATIVE SKIN DISORDERS, rash, dry skin, pruritus. **GU:** RENAL FAILURE. **Hemat:** microangiopathic hemolytic anemia with thrombocytopenia (pancreatic cancer patients).

### Interactions

**Drug-Drug:** Strong inhibitors of CYP3A4, including **atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin,** or **voriconazole** ↑ levels and the risk of toxicity; consider dose reduction. Strong inducers of CYP3A4, including **rifampin** ↓ levels and may ↓ response; alternative therapy or ↑ dose should be considered. **Ciprofloxacin** may ↑ levels and the risk of toxicity. **Smoking** may ↓ levels and may ↓ response; may consider ↑ dose if smoking continues. May ↑ risk of bleeding with **warfarin**. ↓ levels with **proton pump inhibitors** and **$H_2$ blockers**; avoid concurrent use.

### Route/Dosage

**PO (Adults):** *Non-small cell lung cancer*—150 mg daily taken at least 1 hr before or 2 hr after food; *Pancreatic cancer*—100 mg daily taken at least 1 hr before or 2 hr after food.

### Availability

**Tablets:** 25 mg, 100 mg, 150 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess respiratory status prior to and periodically during therapy. If dyspnea, cough or fever occur, discontinue erlotinib, assess for interstitial lung disease, and institute treatment as needed.
- Assess for diarrhea. Usually responds to loperamide but may require dose reduction or discontinuation of therapy if patient becomes dehydrated.
- Assess skin throughout therapy. If bullous, blistering, and exfoliative skin conditions, including Stevens-Johnson syndrome/toxic epidermal necrolysis, occur, interrupt or discontinue treatment. Skin rash may require treatment with corticosteroids or anti-infectives with anti-inflammatory properties; acne treatments may aggravate dry skin and erythema.
- Assess eyes periodically during therapy. If acute or worsening eye disorders or pain occur, interrupt or discontinue therapy.
- Assess for GI pain. Patients receiving concomitant anti-angiogenic agents, corticosteroids, NSAIDs, and/or taxane-based chemotherapy, or who have prior history of peptic ulceration or diverticular disease, are at increased risk for GI perforation. Permanently discontinue erlotinib in patients who develop gastrointestinal perforation.
- ***Lab Test Considerations:*** Monitor liver function tests (AST, ALT, bilirubin, alkaline phosphatase) periodically during therapy. Dose reduction or discontinuation of therapy should be considered if severe changes in liver function (total bilirubin ≥3 times upper limit of normal and/or transaminases ≥ 5 times upper limit of normal) occur.
- Monitor renal function and electrolytes in patients at risk for dehydration. Withhold therapy if dehydration occurs.
- Monitor INR regularly in patients taking warfarin. May cause ↑ INR.

### Potential Nursing Diagnoses

Ineffective breathing pattern (Side Effects)

### Implementation

- **PO:** Administer at least 1 hr before or 2 hr after food.

### Patient/Family Teaching

- Instruct patient to take erlotinib as directed.
- Caution patient to use contraceptive during and for at least 2 wk after completion of therapy. Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Advise patient to notify health care professional if severe or persistent diarrhea, nausea, anorexia, vomiting, onset or worsening of skin rash, unexplained dyspnea or cough, or eye irritation occur.
- Advise patient to wear sunscreen and protective clothing to decrease skin reactions.

- Instruct patient to discontinue smoking during therapy; smoking decreases blood levels of erlotinib.

### Evaluation/Desired Outcomes

- Decrease in spread of non–small cell lung or pancreatic cancer with increased survival.

## ertapenem (er-ta-**pen**-em)

Invanz

***Classification***

Therapeutic: anti-infectives
Pharmacologic: carbapenems

**Pregnancy Category B**

### Indications

Moderate to severe: complicated intra-abdominal infections, complicated skin and skin structure infections, community acquired pneumonia, complicated urinary tract infections (including pyelonephritis), acute pelvic infections including postpartum endomyometritis, septic abortion, and post surgical gynecologic infections. Prophylaxis of surgical site infection following elective colorectal surgery.

### Action

**Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following aerobic gram-positive organisms *Staphylococcus aureus* (methicillin-susceptible strains only), *Staphylococcus epidermidis*, *Streptococcus agalactiae*, *S. pneumoniae* (penicillin-susceptible strains only), and *S. pyogenes*. Also active against the following gram-negative aerobic organisms *Escherichia coli*, *Haemophilus influenzae* (beta-lactamase negative strains), *Klebsiella pneumonia*, and *Moraxella catarrhalis*, *Providencia rettgeri*. Addition anaerobic spectrum includes *Bacteroides fragilis*, *B. distasonis*, *B. ovatus*, *B. thetaiotamicron*, *B. uniformis*, *B. vulgatis*, *Clostridium clostrioforme*, *Eubacterium lentum*, *Peptostreptococcus*, *Porphyromonas asaccharolytica*, and *Prevotella bivia*.

### Pharmacokinetics

**Absorption:** 90% after IM administration; IV administration results in complete bioavailability.
**Distribution:** Enters breast milk.
**Metabolism and Excretion:** Mostly excreted by the kidneys.
**Half-life:** 1.8 hr (increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | rapid | 2 hr | 24 hr |
| IV | rapid | end of infusion | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity may occur with penicillins, cephalosporins and other carbapenems; Hypersensitivity to lidocaine (may be used as a diluent for IM administration).
**Use Cautiously in:** History of multiple hypersensitivity reactions; Seizure disorders; Renal impairment; OB: Use in pregnancy only if clearly needed; Lactation: Not expected to cause adverse effects in breast-fed infants (NIH); Pedi: Safety not established in children <18 yr ; Geri: ↑ sensitivity due to age-related ↓ in renal function.

### Adverse Reactions/Side Effects

**CNS:** SEIZURES, headache. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **GU:** vaginitis. **Local:** phlebitis at IV site, pain at IM site. **Misc:** hypersensitivity reaction including ANAPHYLAXIS.

### Interactions

**Drug-Drug: Probenecid** ↓ excretion and ↑ blood levels. May ↓ serum **valproate** levels (↑ risk of seizures).

### Route/Dosage

**IV, IM (Adults and Children 13 yrs or older):** 1 g once daily for up to 14 days (IV) or 7 days (IM).
**IV, IM (Children 3 months–12 yrs):** 15 mg/kg twice daily (not to exceed 1 g/day) for up to 14 days (IV) or 7 days (IM).

#### Renal Impairment

**IM, IV (Adults):** *CCr ≤30 mL/min/1.73m²*—500 mg once daily.

### Availability

**Powder for injection:** 1 g/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins, cephalosporins or carbapenems. Persons with a negative history of penicillin sensitivity may still have an allergic response.

- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician immediately if these occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause ↑ AST, ALT, serum alkaline phosphatase levels.
- May cause ↑ platelet and eosinophil counts.

## Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

## Implementation

- **IM:** Reconstitute 1-g vial with 3.2 mL of 1% lidocaine without epinephrine. Shake well to form solution. Immediately withdraw contents and inject deep into large muscle mass. Use reconstituted solution within 1 hr.

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute 1-g vial with 10 mL of sterile water for injection or 0.9% NaCl and shake well. Further dilute in 50 mL of 0.9% NaCl. Administer within 6 hr of reconstitution. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amphotericin B liposome, argatroban, azithromycin, aztreonam, bumetanide, calcium chloride, calcium gluconate, chloramphenicol , cimetidine, ciprofloxacin, cisatracurium, cyclosporine, daptomycin, dexamethasone sodium phosphate, digoxin, diltiazem, diphenhydramine, dolasetron, dopamine, doxycycline, enalaprilat, epinephrine, eptifibatide, erythromycin, esmolol, famotidine, fenoldopam, fluconazole, furosemide, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydromorphone, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metronidazole, milrinone, morphine, nesiritide, nitroglycerin, nitroprusside, norepinephrine, pancuronium, pantoprazole, phenylephrine, potassium chloride, potassium phosphate, procainamide, propranolol, ranitidine, sodium bicarbonate, tacrolimus, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amiodarone, anidulafungin, caspofungin, diazepam, dobutamine, droperidol, hydralazine, hydroxyzine, midazolam, nicardipine, ondansetron, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, verapamil.

## Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication. Consult health care professional before treating with antidiarrheals.

## Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

# ERYTHROMYCIN†

(eh-rith-roe-**mye**-sin)

**erythromycin base**
Apo-Erythro-EC, E-Mycin, Erybid, Eryc, Ery-Tab, Erythromid, Novo-rythro, PCE

**erythromycin ethylsuccinate**
Apo-Erythro-ES, E.E.S, EryPed

**erythromycin lactobionate**
Erythrocin

**erythromycin stearate**
Erythrocin, Novo-rythro

**erythromycin (topical)**
Akne-Mycin, Erygel, Sans-Acne

***Classification***
Therapeutic: anti-infectives
Pharmacologic: macrolides

**Pregnancy Category B**

†See Appendix C for ophthalmic use

## Indications

**IV, PO:** Infections caused by susceptible organisms including: Upper and lower respiratory tract infections, Otitis media (with sulfonamides), Skin and skin structure infections, Pertussis, Diphtheria, Erythrasma, Intestinal amebiasis, Pelvic inflammatory disease, Nongonococcal urethritis, Syphilis, Legionnaires' disease, Rheumatic fever. Useful when penicillin is the most appropriate drug but cannot be used because of hypersensitivity, including: Streptococcal infections, Treatment of syphilis or gonorrhea. **Topical:** Treatment of acne.

## Action

Suppresses protein synthesis at the level of the 50S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action against susceptible bacteria. **Spectrum:** Active against many gram-positive cocci, including: Streptococci, Staphylococci. Gram-positive bacilli, including: *Clostridium*, *Corynebacterium*. Several gram-negative pathogens, notably: *Neisseria*, *Legionella pneumophila*. *Mycoplasma* and *Chlamydia* are also usually susceptible.

## Pharmacokinetics

**Absorption:** Variable absorption from the duodenum after oral administration (dependent on salt form). Absorption of enteric-coated products is delayed. Minimal absorption may follow topical or ophthalmic use.
**Distribution:** Widely distributed. Minimal CNS penetration. Crosses placenta; enters breast milk.
**Protein Binding:** 70–80%.
**Metabolism and Excretion:** Partially metabolized by the liver, excreted mainly unchanged in the bile; small amounts excreted unchanged in the urine.
**Half-life:** Neonates: 2.1 hr; Adults: 1.4–2 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 hr | 1–4 hr | 6–12 hr |
| IV | rapid | end of infusion | 6–12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent pimozide; Known alcohol intolerance (most topicals); Tartrazine sensitivity (some products contain tartrazine—FDC yellow dye #5); Products containing benzyl alcohol should be avoided in neonates.
**Use Cautiously in:** Liver/renal disease; OB: May be used in pregnancy to treat chlamydial infections or syphilis; Geri: ↑ risk of ototoxicity if parenteral dose >4 g/day, ↑ risk of QTc prolongation.

## Adverse Reactions/Side Effects

**CNS:** seizures (rare). **EENT:** ototoxicity. **CV:** QTC PROLONGATION (may result in torsades de pointes), VENTRICULAR ARRHYTHMIAS. **GI:** nausea, vomiting, abdominal pain, cramping, diarrhea, drug-induced hepatitis, infantile hypertrophic pyloric stenosis, drug-induced pancreatitis (rare). **Derm:** rashes. **Local:** phlebitis at IV site. **Misc:** allergic reactions, superinfection.

## Interactions

**Drug-Drug:** Concurrent use with **pimozide** ↑ risk of serious arrhythmias (concurrent use contraindicated); similar effects may occur with **diltiazem**, **verapamil**, **ketoconazole**, **itraconazole**, **nefazodone**, and **protease inhibitors**; avoid concurrent use. Concurrent use with **verapamil** ↑ risk of hypotension, bradycardia, and lactic acidosis. ↑ blood levels and effects of **sildenafil**, **tadalafil** and **vardenafil**; use lower doses. Concurrent **rifabutin** or **rifampin** may ↓ effect of erythromycin and ↑ risk of adverse GI reactions. ↑ levels and risk of toxicity from **alfentanil**, **alprazolam**, **buspirone**, **clozapine**, **bromocriptine**, **theophylline**, **carbamazepine**, **cyclosporine**, **cilostazol** **diazepam** **disopyramide**, **ergot alkaloids**, **felodipine**, **warfarin**, **methylprednisolone**, **midazolam**, **quinidine**, **rifabutin**, **tacrolimus**, **triazolam**, or **vinblastine**. Concurrent **HMG-CoA reductase inhibitors** ↑ risk of myopathy/rhabdomyolysis. May ↑ serum **digoxin** levels in a few patients. **Theophylline** may ↓ blood levels. Beneficial effects may be ↓ by **clindamycin** or **lincomycin**.

## Route/Dosage

250 mg of erythromycin base or stearate = 400 mg of erythromycin ethylsuccinate.

## Most Infections

**PO (Adults):** *Base, stearate*—250 mg q 6 hr, *or* 333 mg q 8 hr, *or* 500 mg q 12 hr. *Ethylsuccinate*—400 mg q 6 hr *or* 800 mg q 12 hr.
**PO (Children >1 mo):** *Base and ethylsuccinate*—30–50 mg/kg/day divided q 6–8 hr (maximum 2 g/day as base or 3.2 g/day as ethylsuccinate). *Stearate*—30–50 mg/kg/day divided q 6 hr (maximum 2 g/day).
**PO (Neonates ):** *Ethylsuccinate*—20–50 mg/kg/day divided q 6–12 hr.
**IV (Adults):** 250–500 mg (up to 1 g) q 6 hr.
**IV (Children > 1 mo):** 15–50 mg/kg/day divided q 6 hr, maximum 4 g/day.

### Acne
**Topical (Adults and Children >12 yr):** 2% ointment, gel, or solution bid.

### Availability (generic available)

### Erythromycin Base
**Enteric-coated tablets:** 250 mg, 333 mg. **Tablets with polymer-coated particles:** 333 mg, 500 mg. **Film-coated tablets:** 500 mg. **Delayed-release capsules:** 250 mg.

### Erythromycin Ethylsuccinate
**Chewable tablets (fruit flavor):** 200 mg. **Tablets:** 400 mg. **Oral suspension (fruit flavor, cherry):** 200 mg/5 mL. **Oral suspension (orange, banana flavors):** 400 mg/5 mL. **Drops (fruit flavor):** 100 mg/2.5 mL.

### Erythromycin Lactobionate
**Powder for injection:** 500 mg, 1 g.

### Erythromycin Stearate
**Film-coated tablets:** 250 mg.

### Topical Preparations
**Ointment:** 2%. **Gel:** 2%. **Solution:** 2%. ***In combination with:*** sulfisoxazole (generic only) and benzoyl peroxide (Benzamycin). See Appendix B.

## NURSING IMPLICATIONS

### Assessment
- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- ***Lab Test Considerations:*** Monitor liver function tests periodically on patients receiving high-dose, long-term therapy.
- May cause ↑ serum bilirubin, AST, ALT, and alkaline phosphatase concentrations.
- May cause false ↑ of urinary catecholamines.

### Potential Nursing Diagnoses
Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation
- Do not confuse erythromycin with azithromycin.
- **PO:** Administer around the clock. *Erythromycin film-coated tablets (base and stearate)* are absorbed better on an empty stomach, at least 1 hr before or 2 hr after meals; may be taken with food if GI irritation occurs. *Enteric-coated erythromycin (base)* may be taken without regard to meals. *Erythromycin ethylsuccinate* is best absorbed when taken with meals. Take each dose with a full glass of water.
- Use calibrated measuring device for liquid preparations. Shake well before using.
- Chewable tablets should be crushed or chewed and not swallowed whole.
- Do not crush or chew delayed-release capsules or tablets; swallow whole. *Erythromycin base delayed-release capsules* may be opened and sprinkled on applesauce, jelly, or ice cream immediately before ingestion. Entire contents of the capsule should be taken.

**IV Administration**

- **IV:** Add 10 mL of sterile water for injection without preservatives to 250- or 500-mg vials and 20 mL to 1-g vial. Solution is stable for 7 days after reconstitution if refrigerated.
- **Intermittent Infusion:** ***Diluent:*** Dilute in 0.9% NaCl or D5W. ***Concentration:*** 1–5 mg/mL. ***Rate:*** Administer slowly over 20–60 min to avoid phlebitis. Assess for pain along vein; slow rate if pain occurs; apply ice and notify health care professional if unable to relieve pain.
- **Continuous Infusion:** May also be administered as an infusion in a dilution of 1 g/L of 0.9% NaCl, D5W, or LR over 4 hr.

### Erythromycin Lactobionate
- **Y-Site Compatibility:** acyclovir, alfentanil, amikacin, aminophylline, amiodarone, anidulafungin, atracurium, atropine, azathioprine, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefotaxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxapram, doxorubicin, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eftifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, hydromorphone, idarubicin, ifos-

famide, imipenem/cilastatin, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, lorazepam, mannitol, mechlorethamine, meperidine, methotrexate, methoxamine, methyldopa, methylprednisolone, metoclopramide, metronidazole, miconazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, papaverine, pentamidine, pentazocine, perphenazine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, ranitidine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B liposome, ascorbic acid, aztreonam, cefazolin, cefepime, cefotetan, cefoxitin, ceftizoxime, chloramphenicol, dantrolene, dexamethasone, diazepam, diazoxide, doxycycline, furosemide, ganciclovir, indomethacin, ketorolac, metaraminol, nitroprusside, penicillin G, pentobarbital, phenobarbital, phenytoin, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole.
- **Topical:** Cleanse area before application. Wear gloves during application.

### Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Take missed doses as soon as remembered, with remaining doses evenly spaced throughout day. Advise patient that sharing of this medication may be dangerous.
- May cause nausea, vomiting, diarrhea, or stomach cramps; notify health care professional if these effects persist or if severe abdominal pain, yellow discoloration of the skin or eyes, darkened urine, pale stools, or unusual tiredness develops. May cause infantile hypertrophic pyloric stenosis in infants; notify health care professional if vomiting and irritability occur.
- Advise patient to report signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools).
- Instruct patient to notify health care professional if symptoms do not improve.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Improvement of acne lesions.

## escitalopram

(ess-sit-**al**-o-pram)

Lexapro

***Classification***

Therapeutic: antidepressants

Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

**Pregnancy Category C**

### Indications

Major depressive disorder. Generalized anxiety disorder (GAD). **Unlabeled Use:** Panic disorder. Obsessive-compulsive disorder (OCD). Post-traumatic stress disorder (PTSD). Social anxiety disorder (social phobia). Premenstrual dysphoric disorder (PMDD).

### Action

Selectively inhibits the reuptake of serotonin in the CNS. **Therapeutic Effects:** Antidepressant action.

### Pharmacokinetics

**Absorption:** 80% absorbed following oral administration.

**Distribution:** Enters breast milk.

**Metabolism and Excretion:** Mostly metabolized by the liver (primarily CYP3A4 and CYP2C19 isoenzymes); 7% excreted unchanged by kidneys.

**Half-life:** ↑ in geriatric patients and patients with hepatic impairment.

TIME/ACTION PROFILE (antidepressant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 1–4 wk | Unknown | Unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent MAO inhibitor or pimozide therapy; Concurrent use of citalopram.

**Use Cautiously in:** History of mania (may activate mania/hypomania); History of seizures; Patients at risk for suicide; Hepatic impairment (dose ↓ recommended); Severe renal impairment; OB: Neonates exposed to SSRIs in the 3rd

trimester may develop drug discontinuation syndrome manifested by respiratory distress, feeding difficulty, and irritability; Lactation: May cause adverse effects in infant; consider risk/benefit; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; safety not established in children <12 yr; Geri: ↓ doses recommended due to ↓ drug clearance in older patients.

### Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, insomnia, dizziness, drowsiness, fatigue. **GI:** diarrhea, nausea, abdominal pain, constipation, dry mouth, indigestion. **GU:** anorgasmia, ↓ libido, ejaculatory delay, erectile dysfunction. **Derm:** sweating. **Endo:** syndrome on inappropriate secretion of antidiuretic hormone (SIADH). **F and E:** hyponatremia. **Metab:** SEROTONIN SYNDROME, ↑ appetite.

### Interactions

**Drug-Drug:** May cause serious, potentially fatal reactions when used with **MAO inhibitors**; allow at least 14 days between escitalopram and **MAO inhibitors**. Concurrent use with **pimozide** may result in prolongation of the QTc interval and is contraindicated. Use cautiously with other **centrally acting drugs** (including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**; concurrent use with **alcohol** is not recommended). Drugs that affect serotonergic neurotransmitter systems, including **linezolid**, **tramadol**, and **triptans** ↑ risk of serotonin syndrome. **Cimetidine** may ↑ levels. Serotonergic effects may be ↑ by **lithium** (concurrent use should be carefully monitored). **Carbamazepine** may ↓ levels. May ↑ levels of **metoprolol**. Use cautiously with **tricyclic antidepressants** due to unpredictable effects on serotonin and norepinephrine reuptake. ↑ risk of bleeding with **aspirin**, **NSAIDs**, **clopidogrel**, or **warfarin**.

**Drug-Natural Products:** ↑ risk of serotonin syndrome with **St. John's wort** and **SAMe**.

### Route/Dosage

**PO (Adults):** *Depression and GAD*—10 mg once daily, may be ↑ to 20 mg once daily after 1 wk.

#### Hepatic Impairment

**PO (Adults):** 10 mg once daily.
**PO (Geriatric Patients):** 10 mg once daily.
**PO (Children ≥12 yr):** *Depression*—10 mg once daily, may be ↑ to 20 mg once daily after 3 wk.

### Availability

**Tablets:** 5 mg, 10 mg, 20 mg. **Cost:** 5 mg $214.97/90, 10 mg $228.97/90, 20 mg $239.97/90. **Oral solution (peppermint):** 1 mg/mL. **Cost:** $131.64/240 mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor mood changes and level of anxiety during therapy.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- Assess for sexual dysfunction (erectile dysfunction; decreased libido).
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile blood pressure, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).

### Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)
Sexual dysfunction (Side Effects)

### Implementation

- Do not administer escitalopram and citalopram concomitantly. Taper to avoid potential withdrawal reactions. Reduce dose by 50% for 3 days, then again by 50% for 3 days, then discontinue.
- **PO:** Administer as a single dose in the morning or evening without regard to meals.

### Patient/Family Teaching

- Instruct patient to take escitalopram as directed. Take missed doses on the same day as soon as remembered and consult health care professional. Resume regular dosing schedule next day. Do not double doses. Do not stop abruptly, should be discontinued gradually.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to avoid alcohol and other CNS-depressant drugs during therapy and to consult health care professional before taking other Rx, OTC, or herbal products.
- Instruct female patients to notify health care professional if pregnancy is planned or suspected or if they plan to breastfeed. If used during pregnancy, should be tapered during 3rd trimester to avoid neontal serotinin syndrome.
- Caution patients that escitalopram should not be used for at least 14 days after discontinuing MAO inhibitors, and at least 14 days should be allowed after stopping escitalopram before starting an MAO inhibitor.
- Emphasize importance of follow-up exams to monitor progress.

### Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects. Full antidepressant effects occur in 4–6 wk.
- Decrease in anxiety.

HIGH ALERT

## esmolol (es-moe-lole)

Brevibloc

***Classification***

Therapeutic: antiarrhythmics (class II)
Pharmacologic: beta blockers

**Pregnancy Category C**

### Indications

Management of sinus tachycardia and supraventricular arrhythmias.

### Action

Blocks stimulation of $beta_1$ (myocardial)-adrenergic receptors. Does not usually affect $beta_2$ (pulmonary, vascular, or uterine)-receptor sites. **Therapeutic Effects:** Decreased heart rate. Decreased AV conduction.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Rapidly and widely distributed.
**Metabolism and Excretion:** Metabolized by enzymes in RBCs and liver.
**Half-life:** 9 min.

TIME/ACTION PROFILE (antiarrhythmic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | within minutes | unknown | 1–20 min |

### Contraindications/Precautions

**Contraindicated in:** Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block; Known alcohol intolerance.
**Use Cautiously in:** Geri: ↑ sensitivity to the effects of beta blockers; Thyrotoxicosis (may mask symptoms); Diabetes mellitus (may mask symptoms of hypoglycemia); Patients with a history of severe allergic reactions (intensity of reactions may be increased); OB, Lactation, Pedi: Safety not established; neonatal bradycardia, hypotension, hypoglycemia, and respiratory depression may occur rarely.

### Adverse Reactions/Side Effects

**CNS:** fatigue, agitation, confusion, dizziness, drowsiness, weakness. **CV:** hypotension, peripheral ischemia. **GI:** nausea, vomiting. **Derm:** sweating. **Local:** injection site reactions.

### Interactions

**Drug-Drug: General anesthesia**, IV **phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid hormone** administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ effectiveness of **theophylline**. May ↓ beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

### Route/Dosage

**IV (Adults):** *Antiarrhythmic*—500-mcg/kg loading dose over 1 min initially, followed by 50-mcg/kg/min infusion for 4 min; if no response

within 5 min, give 2nd loading dose of 500 mcg/kg over 1 min, then ↑ infusion to 100 mcg/kg/min for 4 min. If no response, repeat loading dose of 500 mcg/kg over 1 min and ↑ infusion rate by 50-mcg/kg/min increments (not to exceed 200 mcg/kg/min for 48 hr). As therapeutic end point is achieved, eliminate loading doses and decrease dose increments to 25 mg/kg/min. *Intraoperative antihypertensive/antiarrhythmic*—250–500-mcg/kg loading dose over 1 min initially, followed by 50-mcg/kg/min infusion for 4 min; if no response within 5 min, give 2nd loading dose of 250–500 mcg/kg over 1 min, then ↑ infusion to 100 mcg/kg/min for 4 min. If no response, repeat loading dose of 250–500 mcg/kg over 1 min and ↑ infusion rate by 50-mcg/kg/min increments (not to exceed 200 mcg/kg/min for 48 hr).

**IV (Children):** *Antiarrhythmic*—50 mcg/kg/min, may be ↑ q 10 min up to 300 mcg/kg/min.

### Availability

**Solution for injection (prediluted for use as loading dose):** 10 mg/mL, 20 mg/mL. **Premixed infusion:** 2000 mg/100 mL, 2500 mg/250 mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, ECG, and pulse frequently during dose adjustment period and periodically during therapy. The risk of hypotension is greatest within the first 30 min of initiating esmolol infusion.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Assess infusion site frequently throughout therapy. Concentrations >10 mg/mL may cause redness, swelling, skin discoloration, and burning at the injection site. Do not use butterfly needles for administration. If venous irritation occurs, stop the infusion and resume at another site.
- ***Toxicity and Overdose:*** Monitor patients receiving esmolol for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures).
- IV glucagon and symptomatic care are used in the treatment of esmolol overdose. Because of the short action of esmolol, discontinuation of therapy may relieve acute toxicity.

### Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

### Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous. Esmolol is available in different concentrations; fatalities have occurred when loading dose vial is confused with concentrated solution for injection, which contains 2500 mg in 10 mL (250 mg/mL) and must be diluted. Before administering, have second practitioner independently check original order, dose calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse Brevibloc (esmolol) with Brevital (methohexital). If both are available as floor stock, store in separate areas.
- To convert to other antiarrhythmics following esmolol administration, administer the 1st dose of the antiarrhythmic agent and decrease the esmolol dose by 50% after 30 min. If an adequate response is maintained for 1 hr following the 2nd dose of the antiarrhythmic agent, discontinue esmolol.

#### IV Administration

- **Direct IV:** ***Diluent:*** The 10 mg/mL and 20 mg/mL vials should be used for the loading dose. These vials are already diluted. No further dilution is needed. ***Concentration:*** Avoid concentrations >10 mg/mL. ***Rate:*** Administer over 1 min.
- **Continuous Infusion:** ***Diluent:*** Premixed infusions are already diluted and ready to use. Solution is clear, colorless to light yellow. ***Concentration:*** 10 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titration of dose is based on desired heart rate or undesired decrease in blood pressure. Esmolol infusions should not be abruptly discontinued; the infusion rate should be tapered.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, cisatracurium, cisplatin, clindamy-

cin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doriopenem, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, eftifibatide, ertapenem, erythromycin, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, mitoxantrone, morphine, multivitamins, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, voriconazole.

- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl, amphotericin B colloidal, azathioprine, cefotetan, dantrolene, dexamethasone, diazepam, diazoxide, furosemide, ganciclovir, inamrinone, indomethacin, ketorolac, milrinone, oxacillin, pantoprazole, phenobarbital, phentolamine, warfarin.

## Patient/Family Teaching

- May cause drowsiness. Caution patients receiving esmolol to call for assistance during ambulation or transfer.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block dizziness or sweating as signs of hypoglycemia.

## Evaluation/Desired Outcomes

- Control of arrhythmias without appearance of detrimental side effects.

# esomeprazole

(es-o-**mep**-ra-zole)

Nexium

***Classification***

Therapeutic: antiulcer agents

Pharmacologic: proton-pump inhibitors

**Pregnancy Category B**

## Indications

GERD/erosive esophagitis. Hypersecretory conditions, including Zollinger-Ellison syndrome. With amoxicillin and clarithromycin to eradicate *Helicobacter pylori* in duodenal ulcer disease or history of duodenal ulcer disease. Decrease risk of gastric ulcer during continuous NSAID therapy.

## Action

Binds to an enzyme on gastric parietal cells in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen with lessened gastroesophageal reflux. Healing of duodenal ulcers. Decreased incidence of gastric ulcer during continuous NSAID therapy.

## Pharmacokinetics

**Absorption:** 90% absorbed following oral administration; food ↓ absorption.
**Distribution:** Unknown.
**Protein Binding:** 97%.
**Metabolism and Excretion:** Extensively metabolized by the liver (cytochrome P450 [CYP450] system, primarily CYP2C19 isoenzyme, but also the CYP3A4 isoenzyme) (the CYP2C19 enzyme system exhibits genetic polymorphism; 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ esomeprazole concentrations and an ↑ risk of adverse effects); <1% excreted unchanged in urine.
**Half-life:** 1.0–1.5 hr.

TIME/ACTION PROFILE (blood levels*)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1.6 hr | 24 hr |
| IV | rapid | end of infusion | 24 hr |

*Resolution of symptoms takes 5–8 days

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Lactation: Not recommended; Concurrent use of **atazanavir** or **nelfinavir**.

**Use Cautiously in:** Severe hepatic impairment; Geri: ↑ risk of hip fractures in patients using high-doses for >1 year; OB: Use only if clearly needed; Pedi: Children <1 yr (safety not established).

### Adverse Reactions/Side Effects

**CNS:** headache. **GI:** abdominal pain, constipation, diarrhea, dry mouth, flatulence, nausea.

### Interactions

**Drug-Drug:** May ↓ levels of **atazanavir** and **nelfinavir** (avoid concurrent use with either of these antiretrovirals). May ↑ levels and risk of toxicity of **saquinavir** (may need to ↓ dose of saquinavir). May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **atazanavir**, **ampicillin**, and **iron salts**. May ↑ risk of bleeding with **warfarin** (monitor INR and PT). **Voriconazole** may ↑ levels. May ↓ the antiplatelet effects of **clopidogrel**.

### Route/Dosage

### Gastroesophageal Reflux Disease

**PO (Adults):** *Healing of erosive esophagitis*—20 mg or 40 mg once daily for 4–8 wk; *maintenance of healing of erosive esophagitis*—20 mg once daily; *symptomatic GERD*—20 mg once daily for 4 wk (additional 4 wk may be considered for nonresponders).

**PO (Children 12–17 yrs):** *Short-term treatment of GERD*—20–40 mg once daily up to 8 wk.

**PO (Children 1–11 yrs):** *Short-term treatment of GERD*—10 mg once daily up to 8 wk; *Healing of erosive esophagitis*—<20 kg: 10 mg once daily for 8 wk; ≥20 kg: 10–20 mg once daily for 8 wk.

**IV (Adults):** 20 or 40 mg once daily.

### *H. pylori* Eradication to Reduce the Risk of Duodenal Ulcer Recurrence (Triple Therapy)

**PO (Adults):** 40 mg once daily for 10 days with amoxicillin 1000 mg twice daily for 10 days and clarithromycin 500 mg twice daily for 10 days.

### Decrease Gastric Ulcer During Continuous NSAID Therapy

**PO (Adults):** 20 or 40 mg once daily for up to 6 mo.

### Pathological Hypersecretory Conditions Including Zollinger-Ellison Syndrome

**PO (Adults):** 40 mg twice daily.

### Hepatic Impairment

**PO, IV (Adults):** *Severe hepatic impairment*—Dose should not exceed 20 mg/day.

### Availability

**Delayed-release capsules:** 20 mg, 40 mg. **Cost:** 20 mg $430.97/90, 40 mg $425.97/90. **Delayed-release oral suspension packets:** 10 mg, 20 mg, 40 mg. **Powder for injection (requires reconstitution):** 20 mg/vial, 40 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess patient routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** May cause ↑ serum creatinine, uric acid, total bilirubin, alkaline phosphatase, AST, and ALT.
- May alter hemoglobin, WBC, platelets, serum sodium, potassium, and thyroxine levels.

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- Antacids may be used while taking esomeprazole.
- **PO:** Administer at least 1 hr before meals. Capsules should be swallowed whole.
- *Delayed-release capsules:* For patients with difficulty swallowing, place 1 tbsp of applesauce in an empty bowl. Open capsule and carefully empty the pellets inside onto applesauce. Mix pellets with applesauce and swallow immediately. Applesauce should not be hot and should be soft enough to swallow without chewing. Do not store applesauce mixture for future use. Tap water, orange juice, apple juice, and yogurt have also been used. Do not crush or chew pellets.
- *For patients with an NG tube,* delayed-release capsules can be opened and intact granules emptied into a 60-mL syringe and mixed with 50 mL of water. Replace plunger and shake syringe vigorously for 15 sec. Hold syringe with tip up and check for granules in tip. Attach syringe to NG tube and administer solution. After administering, flush syringe with additional water. Do not administer if granules have dis-

solved or disintegrated. Administer immediately after mixing.
- For *Delayed-release oral suspension:* Mix contents of packet with 1 tbsp (15 mL) of water, leave 2–3 min to thicken, stir and drink within 30 minutes.
- *For Delayed-Release Oral Suspension Nasogastric or Gastric Tube:* Add 15 mL of water to a syringe and then add contents of packet. Shake the syringe, leave 2–3 min to thicken. Shake the syringe and inject through the nasogastric or gastric tube within 30 min.

**IV Administration**
- **Direct IV:** Reconstitute each vial with 5 mL of 0.9% NaCl, LR, or D5W. Do not administer solutions that are discolored or contain a precipitate. Stable at room temperature for up to 12 hr. ***Rate:*** Administer over at least 3 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute reconstituted solution to a volume of 50 mL. Solutions diluted with 0.9% NaCl or LR are stable for 12 hr and those diluted with D5W are stable for 6 hr at room temperature. ***Rate:*** Administer over 10–30 min.
- **Y-Site Incompatibility:** Do not administer with other medications or solutions. Flush line with 0.9% NaCl, LR, or D5W before and after administration.

## Patient/Family Teaching
- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.

## Evaluation/Desired Outcomes
- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy.
- Decrease in symptoms of GERD and erosive esophagitis. Sustained resolution of symptoms usually occurs in 5–8 days. Therapy is continued for 4–8 wk after initial episode.
- Decreased incidence of gastric ulcer during continuous NSAID therapy.
- Eradication of H. Pylori in duodenal ulcer disease.
- Decrease in symptoms of hypersecretory conditions, including Zollinger-Ellison.

# ESTRADIOL (es-tra-**dye**-ole)
Estrace

**estradiol acetate**
Femtrace

**estradiol cypionate**
Depo-Estradiol

**estradiol valerate**
Delestrogen, Femogex

**estradiol topical emulsion**
Estrasorb

**estradiol topical gel**
Divigel, Elestrin, EstroGel

**estradiol transdermal spray**
EvaMist

**estradiol transdermal system**
Alora, Climara, Estraderm, Menostar, Vivelle-Dot

**estradiol vaginal tablet**
Vagifem

**estradiol vaginal ring**
Femring, Estring

***Classification***
Therapeutic: hormones
Pharmacologic: estrogens

**Pregnancy Category X**

## Indications
**PO, IM, Topical, Transdermal:** Replacement of estrogen (HRT) to diminish moderate to severe vasomotor symptoms of menopause and of various estrogen deficiency states including: Female hypogonadism, Ovariectomy, Primary ovarian failure. Treatment and prevention of postmenopausal osteoporosis (not vaginal dose forms). **PO:** Inoperable metastatic postmenopausal breast or prostate carcinoma. **Vag:** Management of atrophic vaginitis that may occur with menopause (low dose), bothersome systemic symptoms of menopause (higher dose). Concurrent use of progestin is recommended during cyclical therapy to decrease the risk of endometrial carcinoma in patients with an intact uterus.

## Action
Estrogens promote growth and development of female sex organs and the maintenance of secondary sex characteristics in women. Metabolic effects include reduced blood cholesterol, protein synthesis, and sodium and water retention.

**Therapeutic Effects:** Restoration of hormonal balance in various deficiency states, including menopause. Treatment of hormone-sensitive tumors.

## Pharmacokinetics

**Absorption:** Well absorbed after oral administration. Readily absorbed through skin and mucous membranes.
**Distribution:** Widely distributed. Crosses the placenta and enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver and other tissues. Enterohepatic recirculation occurs, and more absorption may occur from the GI tract.
**Half-life:** Gel: 36 hr.

TIME/ACTION PROFILE (estrogenic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | unknown |
| IM | unknown | unknown | unknown |
| TD | unknown | unknown | 3–4 days (Estraderm), 7 days (Climara) |
| Topical | unknown | unknown | uknown |
| Vaginal ring | unknown | unknown | 90 days |
| Vaginal tablet | unknown | unknown | 3–4 days |

## Contraindications/Precautions

**Contraindicated in:** Thromboembolic disease; Undiagnosed vaginal bleeding; OB: Positive evidence of fetal risk.
**Use Cautiously in:** Underlying cardiovascular disease; Severe hepatic or renal disease; May ↑ the risk of endometrial carcinoma; History of porphyria; Lactation: Usually compatible with breast feeding (AAP).

## Adverse Reactions/Side Effects

**CNS:** headache, dizziness, lethargy. **EENT:** intolerance to contact lenses, worsening of myopia or astigmatism. **CV:** MI, THROMBOEMBOLISM, edema, hypertension. **GI:** nausea, weight changes, anorexia, ↑ appetite, jaundice, vomiting. **GU:** *women*—amenorrhea, dysmenorrhea, breakthrough bleeding, cervical erosions, loss of libido, vaginal candidiasis;; *men*, erectile dysfunction, testicular atrophy. **Derm:** oily skin, acne, pigmentation, urticaria. **Endo:** gynecomastia (men), hyperglycemia. **F and E:** hypercalcemia, sodium and water retention. **MS:** leg cramps. **Misc:** breast tenderness.

## Interactions

**Drug-Drug:** May alter requirement for **warfarin**, **oral hypoglycemic agents**, or **insulins**. **Barbiturates** or **rifampin** may ↓ effectiveness. **Smoking** ↑ risk of adverse CV reactions.

## Route/Dosage

Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.

### Symptoms of Menopause, Atrophic Vaginitis, Female Hypogonadism, Ovarian Failure/Osteoporosis

**PO (Adults):** 0.45–2 mg daily or in a cycle.
**IM (Adults):** 1–5 mg monthly (estradiol cypionate) *or* 10–20 mg (estradiol valerate) monthly.
**Topical Emulsion** *(Estrasorb)* **(Adults):** Apply two 1.74 g pouches (4.35 mg estradiol) daily.
**Gel (Adults):** Apply contents of one packet *(Divigel)* or one actuation from pump *(EstroGel, Elestrin)* daily .
**Spray** *EvaMist* **(Adults):** 1 spray daily, may be increased to 2–3 sprays daily.
**Transdermal (Adults):** *Alora*—25–50mcg/24-hr transdermal patch applied twice weekly. *Estraderm*—50–mcg/24-hr transdermal patch applied twice weekly. *Climara*—25-mcg/24-hr patch applied weekly. *Vivelle-Dot*—25–50–mcg/24-hr transdermal patch applied twice weekly. *Menostar*—14-mcg/24-hr patch applied q 7 days. Progestin may be administered for 10–14 days of each month.
**Vag (Adults):** *Cream*—2–4 g (0.2–0.4 mg estradiol) daily for 1–2 wk, then decrease to 1–2 g/day for 1–2 wk; then maintenance dose of 1 g 1–3 times weekly for 3 wk, then off for 1 wk; then repeat cycle once vaginal mucosa has been restored; *Vaginal ring (Estring)*—2-mg (releases 7.5 mcg estradiol/24 hr)q 3 mo; *Vaginal ring (Femring)*—12.4 mg (releases 50 mcg estradiol/24 hr)q 3 mo or 24.8 mg (releases 100 mcg estradiol/24 hr)q 3 mo (*Femring* requires concurrent progesterone) *Vaginal tablet*—25-mcg once daily for 2 wk, then twice weekly.

### Postmenopausal Breast Carcinoma

**PO (Adults):** 10 mg 3 times daily.

### Prostate Carcinoma

**PO (Adults):** 1–2 mg 3 times daily.
**IM (Adults):** 30 mg q 1–2 wk (estradiol valerate).

## Availability (generic available)

**Tablets:** 0.45 mg, 0.5 mg, 0.9 mg, 1 mg, 1.8 mg, 2 mg. **Cost:** *Generic*—0.5 mg $22.17/100, 1 mg $15.52/100, 2 mg $33.30/100. **Injection (val-**

**erate in oil):** 10 mg/mL, 20 mg/mL, 40 mg/mL. **Injection (cypionate in oil):** 5 mg/mL. **Topical emulsion:** 4.35 mg/1.74 g pouch in boxes of 14 pouches in a 1-month supply carton of 56 pouches. **Topical gel packet:** 0.25 mg/packet, 0.5 mg/packet, 1 mg/packet. **Topical gel pump (0.06%):** 0.52 mg/actuation, 0.75 mg/actuation. **Transdermal Spray:** 1.53 mg/spray. **Transdermal system:** 14 mcg/24-hr release rate, 25 mcg/24-hr release rate, 37.5 mcg/24-hr release rate, 50 mcg/24-hr release rate, 60 mcg/24-hr release rate, 75 mcg/24-hr release rate, 100 mcg/24-hr release rate. **Cost:** *Generic*— 25 mcg/24-hr release rate $36.99/4 patches, 37.5 mcg/24-hr release rate $39.35/4 patches, 50 mcg/24-hr release rate $29.97/4 patches, 60 mcg/24-hr release rate $39.99/4 patches, 75 mcg/24-hr release rate $35.99/4 patches, 100 mcg/24-hr release rate $31.46/4 patches. **Vaginal cream:** 100 mcg/g. **Vaginal ring (Estring):** 2 mg (releases 7.5 mcg/day over 90 days). **Vaginal ring (Femring):** 12.4 mg (releases 50 mcg/day over 90 days), 24.8 mg (releases 100 mcg/day over 90 days). **Vaginal tablet:** 25 mcg. **Cost:** $75.81/18 tablets.

## NURSING IMPLICATIONS

### Assessment

- Assess blood pressure before and periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Menopause:** Assess frequency and severity of vasomotor symptoms.
- ***Lab Test Considerations:*** May cause ↑ HDL, phospholipids, and triglycerides and ↓ serum LDL and total cholesterol concentrations.
- May cause ↑ serum glucose, sodium, cortisol, prolactin, prothrombin, and factor VII, VIII, IX, and X levels. May ↓ serum folate, pyridoxine, antithrombin III, and urine pregnanediol concentrations.
- Monitor hepatic function before and periodically during therapy.
- May cause false interpretations of thyroid function tests, false ↑ in norepinephrine platelet-induced aggregability, and false ↓ in metyrapone tests.
- May cause hypercalcemia in patients with metastatic bone lesions.

### Potential Nursing Diagnoses

Sexual dysfunction (Indications)

### Implementation

- **PO:** Administer with or immediately after food to reduce nausea.
- **Vag:** Manufacturer provides applicator with cream. Dose is marked on the applicator. Wash applicator with mild soap and warm water after each use.
- **Transdermal:** When switching from PO form, begin transdermal therapy 1 wk after the last dose or when symptoms reappear.
- **Topical:** In a comfortable position, apply *Estrasorb* to clean, dry skin of thighs each morning. Open each foil pouch individually. Cut or tear the first pouch at the notches near the top of the pouch. Apply the contents of the pouch to the top of the left thigh; push entire contents from bottom through neck of pouch. Using one or both hands rub the emulsion into the thigh and calf for 3 min until completely absorbed. Rub any excess remaining on hands into buttocks. Repeat procedure with second pouch on right leg. Allow application sites to dry completely before covering with clothing to prevent transfer. Wash hands with soap and water to remove residual estradiol.
- Apply *Divigel* individual-use once-daily packets of quick drying gel to an area measuring 5 inches by 7 inches (size of 2 palm prints) on the thigh. Do not wash area for at least 1 hr after gel has dried.
- Spray *EvaMist* on inside of forearm at the same time each day. Do not massage or rub the spray into the skin. Allow to dry for 2 min before dressing and 30 min before washing. Never spray *EvaMist* around breast or vagina Do not use more than 56 doses, even if fluid remains in pump.
- **IM:** Injection has oil base. Roll syringe to ensure even dispersion. Administer deep IM. Avoid IV administration.

### Patient/Family Teaching

- Instruct patient on correct method of administration. Instruct patient to take medication as directed. Take missed doses as soon as remembered as long as it is not just before next dose. If a dose of *EvaMist* is missed, apply if more than 12 hr before next dose; if less than 12 hr, omit dose and return to regular schedule. Do not double doses.
- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding.
- If nausea becomes a problem, advise patient that eating solid food often provides relief.

- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, or hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools) to health care professional.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient that cigarette smoking during estrogen therapy may cause increased risk of serious side effects, especially for women over age 35.
- Caution patient to use sunscreen and protective clothing to prevent increased pigmentation.
- Advise patient treated for osteoporosis that exercise has been found to arrest and reverse bone loss. The patient should discuss any exercise limitations with health care professional before beginning program.
- Inform patient that estrogens should not be used to decrease risk of cardiovascular disease. Estrogens may increase risk of cardiovascular disease and breast cancer.
- Emphasize the importance of routine follow-up physical exams, including blood pressure; breast, abdomen, and pelvic examinations; Papanicolaou smears every 6–12 mo; and mammogram every 12 mo or as directed. Health care professional will evaluate possibility of discontinuing medication every 3–6 mo. If on continuous (not cyclical) therapy or without concurrent progestins, endometrial biopsy may be recommended, if uterus is intact.
- **Vag:** Instruct patient in the correct use of applicator. Patient should remain recumbent for at least 30 min after administration. May use sanitary napkin to protect clothing, but do not use tampon. If a dose is missed, do not use the missed dose, but return to regular dosing schedule.
- Instruct patient to use applicator provided with vaginal tablet. Insert as high up in the vagina as comfortable, without using force.
- **Vaginal Ring:** Instruct patient to press ring into an oval and insert into the upper third of the vaginal vault. Exact position is not critical. Once ring is inserted, patient should not feel anything. If discomfort is felt, ring is probably not in far enough; gently push farther into vagina. Leave in place continuously for 90 days. Ring does not interfere with sexual intercourse. If straining at defecation makes ring move to lower vagina, push up with finger. If expelled totally, rinse ring with lukewarm water and reinsert. To remove, hook a finger through the ring and pull it out.
- **Transdermal:** Instruct patient to wash and dry hands first. Apply disc to intact skin on hairless portion of abdomen (do not apply to breasts or waistline). Press disc for 10 sec to ensure contact with skin (especially around edges). Avoid areas where clothing may rub disc loose. Change site with each administration to prevent skin irritation. Do not reuse site for 1 wk; disc may be reapplied if it falls off.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

### Evaluation/Desired Outcomes

- Resolution of menopausal vasomotor symptoms.
- Decreased vaginal and vulvar itching, inflammation, or dryness associated with menopause.
- Normalization of estrogen levels in patients with ovariectomy or hypogonadism.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Prevention of osteoporosis.

## estrogens, conjugated (equine) (ess-troe-jenz)

C.E.S, Congest, Premarin

**estrogens, conjugated (synthetic, A)**
Cenestin

**estrogens, conjugated (synthetic, B)**
Enjuvia

***Classification***
Therapeutic: hormones
Pharmacologic: estrogens

**Pregnancy Category X**

## Indications

**PO:** Treatment of moderate to severe vasomotor symptoms of menopause. Estrogen deficiency states, including: Female hypogonadism, Ovariectomy, Primary ovarian failure. Prevention of postmenopausal osteoporosis. Advanced inoperable metastatic breast and prostatic carcinoma. **IM, IV:** Uterine bleeding resulting from hormonal imbalance. **Vag:** Atrophic vaginitis. Moderate to severe dyspareunia due to menopause. Concurrent use of progestin is recommended during cyclical therapy to decrease the risk of endometrial carcinoma in patients with an intact uterus.

## Action

Estrogens promote the growth and development of female sex organs and the maintenance of secondary sex characteristics in women. **Therapeutic Effects:** Restoration of hormonal balance in various deficiency states and treatment of hormone-sensitive tumors.

## Pharmacokinetics

**Absorption:** Well absorbed after oral administration. Readily absorbed through skin and mucous membranes.
**Distribution:** Widely distributed. Crosses placenta and enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by liver and other tissues. Enterohepatic recirculation occurs, with more absorption from GI tract.
**Half-life:** Unknown.

TIME/ACTION PROFILE (estrogenic effects†)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | unknown | 24 hr |
| IM | delayed | unknown | 6–12 hr |
| IV | rapid | unknown | 6–12 hr |

†Tumor response may take several weeks

## Contraindications/Precautions

**Contraindicated in:** Thromboembolic disease (e.g., DVT, PE, MI, stroke); Undiagnosed vaginal bleeding; History of breast cancer; History of estrogen-dependent cancer; Liver dysfunction; OB: May result in harm to the fetus; Lactation: Negatively affects quantity and quality of breast milk.
**Use Cautiously in:** Long-term use (more than 4–5 yr); may ↑ risk of myocardial infarction, stroke, invasive breast cancer, pulmonary emboli, deep vein thrombosis and dementia in postmenopausal women; Underlying cardiovascular disease; Hypertriglyceridemia; May ↑ risk of endometrial carcinoma.

## Adverse Reactions/Side Effects

(Systemic use) **CNS:** headache, dizziness, insomnia, lethargy, mental depression. **CV:** MI, THROMBOEMBOLISM, edema, hypertension. **GI:** nausea, weight changes, anorexia, increased appetite, jaundice, vomiting. **GU:** *women*—amenorrhea, breakthrough bleeding, dysmenorrhea, cervical erosion, loss of libido, vaginal candidiasis; *men*, erectile dysfunction, testicular atrophy. **Derm:** acne, oily skin, pigmentation, urticaria. **Endo:** gynecomastia (men), hyperglycemia. **F and E:** hypercalcemia, sodium and water retention. **MS:** leg cramps. **Misc:** breast tenderness.

## Interactions

**Drug-Drug:** May alter requirement for **warfarin**, **oral hypoglycemic agents**, or **insulins**. **Barbiturates**, **carbamazepine**, or **rifampin** may ↓ effectiveness. **Smoking** ↑ risk of adverse CV reactions. **Erythromycin**, **clarithromycin**, **itraconazole**, **ketoconazole**, and **ritonavir** may ↑ risk of adverse effects.
**Drug-Natural Products: Grapefruit juice** may ↑ risk of adverse effects.

## Route/Dosage

Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.

### Ovariectomy, Primary Ovarian Failure

**PO (Adults):** 1.25 mg daily administered cyclically (3 wk on, 1 wk off).

### Osteoporosis/Menopausal Symptoms

**PO (Adults):** 0.3–1.25 mg daily or in a cycle.

### Female Hypogonadism

**PO (Adults):** 0.3–0.625 mg daily administered cyclically (3 wk on, 1 wk off).

### Inoperable Breast Carcinoma—Men and Postmenopausal Women

**PO (Adults):** 10 mg 3 times daily.

### Inoperable Prostate Carcinoma

**PO (Adults):** 1.25–2.5 mg 3 times daily.

### Uterine Bleeding

**IM, IV (Adults):** 25 mg, may repeat in 6–12 hr if necessary.

### Atrophic Vaginitis

**PO (Adults):** 0.3–1.25 mg daily.
**Vag (Adults):** *Conjugated estrogens (equine)*–0.5–2 g cream (0.3125 mg–1.25 g conjugated estrogens) daily for 3 wk, off for 1 wk, then repeat; *Synthetic conjugated estrogens, A*-1 g cream (0.3125 mg synthetic conjugated estrogens, A) daily for 1 wk, then twice weekly.

### Moderate to Severe Dyspareunia

**Vag (Adults):** *Conjugated estrogens (equine)* – 0.5 g cream (0.3125 mg conjugated estrogens) twice weekly continuously or daily for 3 wk, off for 1 wk, then repeat; *Synthetic conjugated estrogens, A*-1 g cream (0.3125 mg synthetic conjugated estrogens, A) daily for 1 wk, then twice weekly.

### Availability (generic available)

**Tablets:** 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, 1.25 mg. **Cost:** *Premarin*—0.3 mg $166.63/100, 0.45 mg $139.97/100, 0.625 mg $136.95/100, 0.9 mg $139.97/100, 1.25 mg $126.46/100. **Powder for injection:** 25 mg/vial. **Vaginal cream:** 0.625 mg/g. **Cost:** $85.99/42.5-g tube. ***In combination with:*** medroxyprogesterone (Prempro and Premphase [compliance package]). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess blood pressure before and periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Menopause:** Assess frequency and severity of vasomotor symptoms.
- ***Lab Test Considerations:*** May cause ↑ HDL and triglycerides, and ↓ serum LDL and total cholesterol concentrations.
- May cause ↑ serum glucose, sodium, cortisol, prolactin, prothrombin, and factor VII, VIII, IX, and X levels. May ↓ serum folate, pyridoxine, antithrombin III, and urine pregnanediol concentrations.
- Monitor hepatic function before and periodically during therapy.
- May cause false interpretations of thyroid function tests.
- May cause hypercalcemia in patients with metastatic bone lesions.

### Potential Nursing Diagnoses

Sexual dysfunction (Indications)

### Implementation

- Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.
- **PO:** Administer with or immediately after food to reduce nausea.
- **Vag:** Manufacturer provides applicator with cream. Dose is marked on the applicator. Wash applicator with mild soap and warm water after each use.
- **IM:** To reconstitute, withdraw at least 5 mL of air from dry container and then slowly introduce the sterile diluent (bacteriostatic water for injection) against the container side. Gently agitate container to dissolve; do not shake vigorously. Solution is stable for 60 days if refrigerated. Do not use if precipitate is present or if solution is darkened.
- IV is preferred parenteral route because of rapid response.

#### IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute as for IM. Inject into distal port tubing of free-flowing IV of 0.9% NaCl, D5W, or lactated Ringer's solution. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer slowly (no faster than 5 mg/min) to prevent flushing.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

### Patient/Family Teaching

- Instruct patient to take oral medication as directed. Take missed doses as soon as remembered, but not just before next dose. Do not double doses.
- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding. Bleeding is anticipated during the week when conjugated estrogens are withheld.
- If nausea becomes a problem, advise patient that eating solid food often provides relief.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities; headache; chest pain; blurred vision), depression, hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools), or abnormal vaginal bleeding to health care professional.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.
- Caution patient that cigarette smoking during estrogen therapy may increase risk of serious side effects, especially for women over age 35.
- Caution patient to use sunscreen and protective clothing to prevent increased pigmentation.

- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient treated for osteoporosis that exercise has been found to arrest and reverse bone loss. The patient should discuss any exercise limitations with health care professional before beginning program.
- Emphasize the importance of routine follow-up physical exams, including blood pressure; breast, abdomen, and pelvic examinations; Papanicolaou smears every 6–12 mo; and mammogram every 12 mo or as directed. Health care professional will evaluate possibility of discontinuing medication every 3–6 mo. If on continuous (not cyclical) therapy or without concurrent progestins, endometrial biopsy may be recommended if uterus is intact.
- Inform patient that estrogens should not be used to decrease risk of cardiovascular disease. Estrogens may increase risk of cardiovascular disease and breast cancer.
- **Vag:** Instruct patient in the correct use of applicator. Patient should remain recumbent for at least 30 min after administration. May use sanitary napkin to protect clothing, but do not use tampon. If a dose is missed, do not use the missed dose, but return to regular dosing schedule.

## Evaluation/Desired Outcomes

- Resolution of menopausal vasomotor symptoms.
- Decreased vaginal and vulvar itching, inflammation, or dryness associated with menopause.
- Normalization of estrogen levels in patients with ovariectomy or hypogonadism.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Prevention of osteoporosis.
- Relief of moderate to severe dyspareunia due to menopause.

# eszopiclone (es-zop-i-klone)

Lunesta

***Classification***

Therapeutic: sedative/hypnotics
Pharmacologic: cyclopyrrolones

**Schedule IV**

**Pregnancy Category C**

## Indications

Insomnia.

## Action

Interacts with GABA-receptor complexes; not a benzodiazepine. **Therapeutic Effects:** Improved sleep with decreased latency and increased maintenance of sleep.

## Pharmacokinetics

**Absorption:** Rapidly absorbed after oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Extensively metabolized by the liver (CYP3A4 and CYP2E1 enzyme systems); metabolites are renally excreted, <10% excreted unchanged in urine.
**Half-life:** 6 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1 hr | 6 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Debilitated patients may have ↓ metabolism or increased sensitivity; use lower initial dose; Conditions that may alter metabolic or hemodynamic function; Severe hepatic impairment (use lower initial dose); OB, Pedi: Safety not established in pregnancy or in children < 18 yr ; Lactation: Occasional use while breastfeeding an older infant should pose little risk (NIH); Geri: May impair motor and/or cognitive performance; see dosing guidelines.

## Adverse Reactions/Side Effects

**CNS:** abnormal thinking, behavior changes, depression, hallucinations, headache, sleep-driving. **CV:** chest pain, peripheral edema. **GI:** dry mouth, unpleasant taste. **Derm:** rash.

## Interactions

**Drug-Drug:** ↑ risk of CNS depression with other **CNS depressants** including **antihistamines**, **antidepressants**, **opioids**, **sedative/hypnotics** and **antipsychotics**. ↑ levels and risk of CNS depression with **drugs that inhibit the CYP3A4 enzyme system**, including **ketoconazole**, **itraconazole**, **clarithromycin**, **nefazodone**, **ritonavir** and **nelfinavir**. Levels and effectiveness may be ↓ by **drugs that induce the CYP3A4 enzyme system**, including **rifampicin**.

## Route/Dosage

**PO (Adults):** 2 mg immediately before bedtime, may be raised to 3 mg if needed (3 mg dose is more effective for sleep maintenance); *geriatric patients*— 1 mg immediately before bedtime for

patients with difficulty falling asleep, 2 mg for patients who difficulty staying asleep.

### Hepatic Impairment

**PO (Adults):** *Severe hepatic impairment*—1 mg immediately before bedtime.
**PO (Adults receiving concurrent CYP3A4 inhibitors):** 1 mg immediately before bedtime, may be raised to 2 mg if needed.

### Availability

**Tablets:** 1 mg, 2 mg, 3 mg. **Cost:** 1 mg $136.69/30, 2 mg $139.97/30, 3 mg $139.98/30.

## NURSING IMPLICATIONS

### Assessment

- Assess sleep patterns prior to and during administration. Continued insomnia after 7–10 days of therapy may indicate primary psychiatric or mental illness.
- Assess mental status and potential for abuse prior to administration. Prolonged use of >7–10 days may lead to physical and psychological dependence. Limit amount of drug available to the patient.

### Potential Nursing Diagnoses

Insomnia (Indications)

### Implementation

- **PO:** Onset is rapid. Administer immediately before going to bed or after patient has gone to bed and has experienced difficulty falling asleep, only on nights when patient is able to get 8 or more hours of sleep before being active again.
- Swallow tablet whole; do not break, crush, or chew.
- Eszopiclone is more effective if not taken with or before a high-fat, heavy meal.

### Patient/Family Teaching

- Instruct patient to take eszopiclone immediately before going to bed, as directed. Taking prior to going to bed may result in short-term memory impairment, hallucinations, impaired coordination, and dizziness. Do not increase dose or discontinue without notifying health care professional. Dose may need to be decreased gradually to minimize withdrawal symptoms. Rebound insomnia may occur upon discontinuation and usually resolves within 1–2 nights.
- May cause daytime drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional before taking any Rx, OTC, or herbal products with eszopiclone.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to notify health care professional if pregnancy is planned or suspected.

### Evaluation/Desired Outcomes

- Decreased sleep latency and improved sleep maintenance.

## etanercept (e-tan-er-sept)

Enbrel

***Classification***

Therapeutic: antirheumatics (DMARDs)
Pharmacologic: anti-TNF agents

**Pregnancy Category B**

### Indications

To decrease progression, signs and symptoms of rheumatoid arthritis, juvenile arthritis, ankylosing spondylitis, psoriatic arthritis or plaque psoriasis when response has been inadequate to other disease-modifying agents. May be used with other agents.

### Action

Binds to tumor necrosis factor (TNF), making it inactive. TNF is a mediator of inflammatory response. **Therapeutic Effects:** Decreased inflammation and slowed progression of arthritis, spondylitis or psoriasis.

### Pharmacokinetics

**Absorption:** 60% absorbed after subcut administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** 115 hr (range 98–300 hr).

TIME/ACTION PROFILE (symptom reduction)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | 2–4 wk | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Sepsis; Lactation: Lactation; Untreated infections; Wegener's granulomatosis (receiving immunosuppressive agents); Concurrent cyclophosphamide or anakinra.
**Use Cautiously in:** Pre-existing or recent demyelinating disorders (multiple sclerosis, myelitis,

optic neuritis); History of tuberculosis (increased risk of reactivation); Underlying chronic diseases which may predispose to infections (advanced or poorly-controlled diabetes mellitus); Latex allergy (needle cover of diluent syringe contains latex); Geri: May have ↑ risk of infection; Pedi: Children with significant exposure to varicella virus (temporarily discontinue etanercept; consider varicella zoster immune globulin); ↑ risk of lymphoma, leukemia, and other malignancies; OB: Use only if needed.

### Adverse Reactions/Side Effects

**CNS:** headache, dizziness, weakness. **EENT:** rhinitis, pharyngitis. **Resp:** upper respiratory tract infection, cough, respiratory disorder. **GI:** abdominal pain, dyspepsia. **Derm:** psoriasis, rash. **Hemat:** LEUKEMIA, pancytopenia. **Local:** injection site reactions. **Misc:** INFECTIONS (including reactivation tuberculosis and invasive fungal infections), MALIGNANCY.

### Interactions

**Drug-Drug:** Concurrent use with **anakinra** ↑ risk of serious infections (not recommended). Concurrent use of **cyclophosphamide** may ↑ risk of malignancies. May ↓ antibody response to **live-virus vaccine** and ↑ risk of adverse reactions (do not administer concurrently).

### Route/Dosage

**Subcut (Adults):** *Adult rheumatoid arthritis, ankylosing spondylitis, psoriatic arthritis*—50 mg once weekly; *adult plaque psoriasis*—50 mg twice weekly for 3 mos, then 50 mg once weekly, may also be given as 25–50 mg once weekly as an initial dose.

**Subcut (Children 4–17 yr):** *>63 kg*—0.8 mg/kg/wk (up to 50 mg) as a single injection; *31–62 kg*—0.8 mg/kg/wk either as two injections on the same day or divided and given on two separate days 3–4 days apart; *<31 kg*—0.8 mg/kg/wk as a single injection.

### Availability

**Pre-filled syringes:** 50 mg/mL. **Powder for injection:** 25 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess range of motion, degree of swelling, and pain in affected joints before and periodically during therapy.
- Assess patient for injection site reaction (erythema, pain, itching, swelling). Reactions are usually mild to moderate and last 3–5 days after injection.
- Monitor patients who develop a new infection while taking etanercept closely. Discontinue therapy in patients who develop a serious infection or sepsis. Do not initiate therapy in patients with active infections.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dypsnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping etanercept until the infection has been diagnosed and adequately treated.
- ***Lab Test Considerations:*** Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue etanerceptif symptoms of blood dyscrasias (persistent fever) occur.

### Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)

### Implementation

- Administer a tuberculin skin test prior to administration of etanercept. Patients with active latent TB should be treated for TB prior to therapy.
- Needle cover of the pre-filled syringe contains latex and should not be handled by people with latex allergies.
- **Subcut:** Prepare injection with single dose pre-filled syringe or multi-dose vial for reconstitution.
- Solution in pre-filled syringe may be allowed to reach room temperature (15–30 min); do not remove needle cap during this time.
- For multi-dose vial, reconstitute with 1 mL of the bacteriostatic sterile water supplied by manufacturer for a concentration of 25 mg/mL. If the vial is used for multiple doses, use a 25–gauge needle for reconstituting and withdrawing solution and apply "Mixing Date" sticker with date of reconstitution entered. Inject diluent slowly into vial to avoid foaming. Some foaming will occur. Swirl gently for dissolution; do not shake or vigorously agitate to prevent excess foaming. Solution should be clear and colorless; do not administer solution that is discolored or contains particulate matter. Dissolution usually takes <10 min. Withdraw solution into syringe. Some foam may remain in

vial. Amount in syringe should approximate 1 mL. Do not filter reconstituted solution during preparation or administration. Attach a 27 gauge needle to inject. Administer as soon as possible after reconstitution; stable up to 6 hr if refrigerated. Solution and pre-filled syringes are stable if refrigerated and used within 14 days.
- May be injected into abdomen, thigh, or upper arm. Rotate sites. Do not administer within 1 inch of an old site or into area that is tender, red, hard, or bruised.
- **Syringe Incompatibility:** Do not mix with other solutions or dilute with other diluents.

## Patient/Family Teaching
- Instruct patient on self-administration technique, storage, and disposal of equipment. First injection should be administered under the supervision of health care professional. Provide patient with a puncture-proof container for used equipment.
- Advise patient not to receive live vaccines during therapy. Parents should be advised that children should complete immunizations to date before initiation of etanercept. Patients with significant exposure to varicella virus (chickenpox) should temporarily discontinue therapy and varicella immune globulin should be considered.
- Advise patient that methotrexate, analgesics, NSAIDs, corticosteroids, and salicylates may be continued during therapy.
- Instruct patient to notify health care professional if upper respiratory or other infections occur. Therapy may need to be discontinued if serious infection occurs.

## Evaluation/Desired Outcomes
- Reduction in symptoms of rheumatoid arthritis. Symptoms may return within 1 mo of discontinuation of therapy.

# ethambutol (e-tham-byoo-tole)
Etibi, Myambutol

***Classification***
Therapeutic: antituberculars

**Pregnancy Category C**

## Indications
Active tuberculosis or other mycobacterial diseases (with at least one other drug).

## Action
Inhibits the growth of mycobacteria. **Therapeutic Effects:** Tuberculostatic effect against susceptible organisms.

## Pharmacokinetics
**Absorption:** Rapidly and well absorbed (80%) from the GI tract.
**Distribution:** Widely distributed; crosses blood-brain barrier in small amounts; crosses placenta and enters breast milk.
**Metabolism and Excretion:** 50% metabolized by the liver, 50% eliminated unchanged by the kidneys.
**Half-life:** 3.3 hr (increased in renal or hepatic impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 2–4 hr | 24 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Optic neuritis.
**Use Cautiously in:** Renal and severe hepatic impairment (dosage reduction required); OB: Although safety not established, ethambutol has been used with isoniazid in pregnant women without fetal adverse effects; Lactation: Usually compatible with breastfeeding (AAP); Pedi: Safety not established in children <13 yr.

## Adverse Reactions/Side Effects
**CNS:** confusion, dizziness, hallucinations, headache, malaise. **EENT:** optic neuritis. **GI:** HEPATITIS, abdominal pain, anorexia, nausea, vomiting. **Metab:** hyperuricemia. **MS:** joint pain. **Neuro:** peripheral neuritis. **Misc:** anaphylactoid reactions, fever.

## Interactions
**Drug-Drug:** Neurotoxicity may be ↑ with other **neurotoxic agents**.

## Route/Dosage
**PO (Adults and Children >13 yr):** 15–25 mg/kg/day (maximum 2.5 g/day) *or* 50 mg/kg (up to 2.5 g) twice weekly *or* 25–30 mg/kg (up to 2.5 g) 3 times weekly.

## Availability (generic available)
**Tablets:** 100 mg, 400 mg.

## NURSING IMPLICATIONS

### Assessment

- Mycobacterial studies and susceptibility tests should be performed before and periodically during therapy to detect possible resistance.
- Assess lung sounds and character and amount of sputum periodically during therapy.
- Assessments of visual function should be made frequently during therapy. Advise patient to report blurring of vision, constriction of visual fields, or changes in color perception immediately. Visual impairment, if not identified early, may lead to permanent sight impairment.
- ***Lab Test Considerations:*** Monitor renal and hepatic functions, CBC, and uric acid levels routinely therapy. Frequently causes elevated uric acid concentrations, which may precipitate an attack of gout.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Disturbed sensory perception (Side Effects)

### Implementation

- Ethambutol is given as a single daily dose and should be taken at the same time each day. Some regimens require dosing 2–3 times/week. Usually administered concurrently with other antitubercular medications to prevent development of bacterial resistance.
- **PO:** Administer with food or milk to minimize GI irritation.

### Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; do not double up on missed doses. A full course of therapy may take months to yr. Do not discontinue without consulting health care professional, even though symptoms may disappear.
- Advise patient to notify health care professional if pregnancy is suspected.
- Instruct patient to notify health care professional if no improvement is seen in 2–3 wk. Health care professional should also be notified if unexpected weight gain or decreased urine output occurs.
- Emphasize the importance of routine exams to evaluate progress and ophthalmic examinations if signs of optic neuritis occur.

### Evaluation/Desired Outcomes

- Resolution of clinical symptoms of tuberculosis.
- Decrease in acid-fast bacteria in sputum samples.
- Improvement seen in chest x-rays. Therapy for tuberculosis is usually continued for at least 1–2 yr.

**ethinyl estradiol/desogestrel, See CONTRACEPTIVES, HORMONAL.**

**ethinyl estradiol/drospirenone, See CONTRACEPTIVES, HORMONAL.**

**ethinyl estradiol/ethynodiol, See CONTRACEPTIVES, HORMONAL.**

**ethinyl estradiol/etonogestrel, See CONTRACEPTIVES, HORMONAL.**

**ethinyl estradiol/norelgestromin, See CONTRACEPTIVES, HORMONAL.**

**ethinyl estradiol/norethindrone, See CONTRACEPTIVES, HORMONAL.**

**ethinyl estradiol/norgestimate, See CONTRACEPTIVES, HORMONAL.**

**ethinyl estradiol/norgestrel, See CONTRACEPTIVES, HORMONAL.**

## etidronate (eh-tih-**droe**-nate)

Didrocal, Didronel

***Classification***

Therapeutic: bone resorption inhibitors, hypocalcemics
Pharmacologic: biphosphonates

**Pregnancy Category B (oral)**

### Indications

Treatment of Paget's disease of bone. Treatment and prophylaxis of heterotopic calcification associated with total hip replacement or spinal cord injury.

## Action
Blocks the growth of calcium hydroxyapatite crystals by binding to calcium phosphate. **Therapeutic Effects:** Decreased bone resorption and turnover.

## Pharmacokinetics
**Absorption:** Absorption is generally poor (1–6%) after oral administration.
**Distribution:** Half of the absorbed dose is bound to hydroxyapatite crystals in areas of increased osteogenesis.
**Metabolism and Excretion:** Unabsorbed drug is eliminated in the feces; 50% of the absorbed dose is excreted unchanged by the kidneys.
**Half-life:** 5–7 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (Paget's disease) | 1 mo† | unknown | 1 yr |
| PO (heterotopic calcification) | unknown | unknown | several months |

†As measured by decreased urinary hydroxyproline

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Overt osteomalacia.
**Use Cautiously in:** Hypocalcemia; Hypovitaminosis D; Renal impairment (dosage reduction may be needed); Dental surgery (may ↑ risk of jaw osteonecrosis); OB, Lactation, Pedi: Safety not established.

## Adverse Reactions/Side Effects
**GI:** diarrhea, nausea, esophagitis, esophageal cancer, esophageal ulcer. **MS:** musculoskeletal pain, microfractures, osteonecrosis (primarily of jaw).

## Interactions
**Drug-Drug: Antacids**, **mineral supplements**, or **buffers** (as in **didanosine**) containing **calcium**, **aluminum**, **iron**, or **magnesium** may ↓ absorption of etidronate. Hypocalcemic effect may be additive with **calcitonin**.
**Drug-Food:** Foods containing large amounts of **calcium**, **aluminum**, **iron**, or **magnesium** may ↓ absorption of etidronate.

## Route/Dosage

### Paget's Disease
**PO (Adults):** 5–10 mg/kg/day single dose for up to 6 mo *or* 11–20 mg/kg/day for not more than 3 mo.

### Heterotopic Ossification (Hip Replacement)
**PO (Adults):** 20 mg/kg/day for 1 mo before and 3 mo after surgery.

### Heterotopic Ossification (Spinal Cord Injury)
**PO (Adults):** 20 mg/kg/day for 2 wk, then decreased to 10 mg/kg/day for 10 wk.

## Availability (generic available)
**Tablets:** 200 mg, 400 mg.

# NURSING IMPLICATIONS

## Assessment
- Assess patient for bone pain, weakness, or loss of function before and throughout therapy. Bone pain may persist or increase in patients with Paget's disease; usually subsides days to months after therapy is discontinued. Confer with health care professional regarding analgesic to control pain.
- **Heterotopic Ossification:** Monitor for inflammation and pain at the site and loss of function if ossification occurs near a joint.
- ***Lab Test Considerations:*** Etidronate interferes with bone uptake of technetium 99 in diagnostic scans.
- *Paget's disease:* ↓ urinary excretions of hydroxyproline and serum alkaline phosphatase are often the first clinical signs of effectiveness; monitor every 3 mo. Treatment is restarted when levels return to 75% of pretreatment values. Monitor serum phosphate levels before and 4 wk after beginning therapy. Dose may be reduced if serum phosphate is elevated without corresponding decrease in urinary excretion of hydroxyproline or serum alkaline phosphatase.

## Potential Nursing Diagnoses
Acute pain (Indications, Side Effects)
Risk for injury (Indications)

## Implementation
- Do not confuse etidronate with etomidate.
- **PO:** Administer on empty stomach, because food decreases absorption. Tablet should be swallowed whole; do not break, crush, or chew.

## Patient/Family Teaching
- Advise patient to take as directed. Take missed doses as soon as remembered unless almost time for next dose. Do not double up on doses. Dose should not be taken within 2 hr of eating

(especially products high in calcium) or taking vitamins or antacids, because absorption will be impaired.
- Instruct patient to notify health care professional if diarrhea occurs. Health care professional may divide the dose throughout the day to control diarrhea.
- Encourage patients to comply with diet recommendations. Diet should contain adequate amounts of calcium and vitamin D (see Appendix M).
- Inform patient that severe musculoskeletal pain may occur within days, months, or yr after starting etidronate. Symptoms my resolve completely after discontinuation or slow or incomplete resolution may occur. Notify health care professional if severe pain occurs.
- Emphasize need for keeping follow-up appointments to monitor progress, even after medication is discontinued, to detect relapse.
- Advise patient to inform health care professional of etidronate therapy prior to dental surgery.

### Evaluation/Desired Outcomes
- Decreased bone pain and fractures in Paget's disease.
- Prevention or treatment of heterotopic ossification. Normal serum calcium levels are usually attained in 2–8 days in hypercalcemia associated with bony metastasis. Therapy may be repeated once after 1 wk.

## **etodolac** (ee-**toe**-doe-lak)
Lodine, Lodine XL

***Classification***
Therapeutic: antirheumatics, nonopioid analgesics
Pharmacologic: pyranocarboxylic acid

**Pregnancy Category C**

### Indications
Osteoarthritis. Rheumatoid arthritis. Mild to moderate pain (not XL tablets).

### Action
Inhibits prostaglandin synthesis. Also has uricosuric action. **Therapeutic Effects:** Suppression of inflammation. Decreased severity of pain.

### Pharmacokinetics
**Absorption:** Well absorbed after oral administration.
**Distribution:** Widely distributed.
**Protein Binding:** >99%.
**Metabolism and Excretion:** Mostly metabolized by the liver; <1% excreted unchanged in urine.
**Half-life:** 6–7 hr (single dose); 7.3 hr (chronic dosing).

TIME/ACTION PROFILE (analgesic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (analgesic) | 0.5 hr | 1–2 hr | 4–12 hr |
| PO (anti-inflammatory) | days–wk | unknown | 6–12 hr† |

†Up to 24 hr as XL (extended-release) tablet

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Active GI bleeding or ulcer disease; Cross-sensitivity may exist with other NSAIDs, including aspirin; OB: Use during second half of pregnancy can result in premature closure of ductus arteriosis.
**Use Cautiously in:** Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use) Renal or hepatic disease; History of ulcer disease; Lactation: Limited information available; use other safer NSAID; Pedi: Safety not established; Geri: Increased risk of GI bleeding.

### Adverse Reactions/Side Effects
**CNS:** depression, dizziness, drowsiness, insomnia, malaise, nervousness, syncope, weakness. **EENT:** blurred vision, photophobia, tinnitus. **Resp:** asthma. **CV:** CHF, edema, hypertension, palpitations. **GI:** GI BLEEDING, dyspepsia, abdominal pain, constipation, diarrhea, drug-induced hepatitis, dry mouth, flatulence, gastritis, nausea, stomatitis, thirst, vomiting. **GU:** dysuria, renal failure, urinary frequency. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, ecchymoses, flushing, hyperpigmentation, pruritus, rashes, sweating. **Hemat:** anemia, prolonged bleeding time, thrombocytopenia. **Misc:** allergic reactions including ANAPHYLAXIS, ANGIOEDEMA, chills, fever.

### Interactions
**Drug-Drug:** Concurrent use with **aspirin** may ↓ effectiveness. ↑ adverse GI effects with **aspirin**, other **NSAIDs**, **potassium supplements**, **corticosteroids**, **antiplatelet agents**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretic** or **antihypertensive** therapy. May ↑ serum **lithium** levels and ↑ risk of toxicity. ↑ risk of toxicity from **methotrexate**. ↑

risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **thrombolytics**, **antiplatelet agents**, or **anticoagulants**. Increased risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. May increase the risk of nephrotoxicity from **cyclosporine**.
**Drug-Natural Products:** ↑ risk of bleeding with **arnica**, **chamomile**, **clove**, **dong quai**, **fever few**, **garlic**, **ginko**, and **Panax ginseng**.

### Route/Dosage

**PO (Adults):** *Analgesia*—200–400 mg q 6–8 hr (not to exceed 1200 mg/day). *Osteoarthritis/rheumatoid arthritis*—300 mg 2–3 times daily, 400 mg twice daily, or 500 mg twice daily; may also be given as 400–1200 mg once daily as XL tablets.

### Availability (generic available)

**Capsules:** 200 mg, 300 mg. **Tablets:** 400 mg, 500 mg. **Extended-release tablets (XL):** 400 mg, 600 mg.

## NURSING IMPLICATIONS

### Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- **Osteoarthritis/Rheumatoid Arthritis:** Assess pain and range of movement before and 1–2 hr after administration.
- **Pain:** Assess location, duration, and intensity of the pain before and 60 min after administration.
- ***Lab Test Considerations:*** May cause ↓ hemoglobin, hematocrit, leukocyte, and platelet counts.
- Monitor liver function tests within 8 wk of initiating etodolac therapy and periodically during therapy. May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- Monitor BUN, serum creatinine, and electrolytes periodically during therapy. May cause ↑ BUN, serum creatinine, and electrolyte concentrations and ↓ urine electrolyte concentrations.
- May cause ↓ serum and ↑ urine uric acid concentrations.

### Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

### Implementation

- Do not confuse Lodine (etodolac) with codeine or iodine.
- Administration in higher-than-recommended doses does not provide increased effectiveness but may cause increased side effects.
- Use lowest effective dose for shortest period of time.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids containing aluminum or magnesium to decrease GI irritation.
- Do not break, crush, or chew extended-release tablets.

### Patient/Family Teaching

- Advise patients to take etodolac with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as possible within 1–2 hr if taking twice/day, or unless almost time for next dose if taking more than twice/day. Do not double doses.
- Etodolac may occasionally cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, NSAIDs, or other OTC medications without consultation with health care professional.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

### Evaluation/Desired Outcomes

- Decreased severity of pain.
- Improved joint mobility. Patients who do not respond to one NSAID may respond to another. May require 2 wk or more for maximum anti-inflammatory effects.

**etonorgestrel, See CONTRACEPTIVES, HORMONAL.**

HIGH ALERT

# ETOPOSIDES (e-toe-poe-sides)

**etoposide**
VePesid, VP-16

**etoposide phosphate**
Etopophos

***Classification***
Therapeutic: antineoplastics
Pharmacologic: podophyllotoxin derivatives

**Pregnancy Category D**

## Indications
Refractory testicular neoplasms (used in combination with other chemotherapeutic agents in patients who have already received chemotherapy, surgery, or radiation) (IV only). Small cell lung carcinoma (first-line therapy, used in combination with other chemotherapeutic agents) (oral and IV). **Unlabeled Use:** Lymphomas and some leukemias. Uterine cancer. Brain tumors.

## Action
Damages DNA before mitosis (cycle-dependent and phase-specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

## Pharmacokinetics
**Absorption:** Variably absorbed after oral administration. After IV administration, etoposide phosphate is rapidly converted to etoposide.
**Distribution:** Rapidly distributed, poorly enters the CSF; probably crosses placenta; enters breast milk.
**Protein Binding:** 97%.
**Metabolism and Excretion:** Some metabolism by the liver with biliary excretion, 44% excreted in feces; 45% excreted unchanged by the kidneys.
**Half-life:** 4–11 hr.

TIME/ACTION PROFILE (noted as effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Etoposide PO | unknown | 7–14 days (granulocytes); 9–16 days (platelets) | 20 days |
| Etoposide IV | 7–14 days | 7–14 days granulocytes; 9–16 days (platelets) | 20 days |
| Etoposide phosphate IV | Unknown | 12–19 days (granulocytes); 10–15 days (platelets) | 21 days |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Known intolerance to benzyl alcohol, polysorbate 80, polyethylene glycol (IV etoposide only), or dextran (IV etoposide phosphate only); OB: Teratogenic jn animal studies; Lactation: Antineoplastic therapy can cause adverse effects in the breastfed infant.
**Use Cautiously in:** Patients with childbearing potential; Active infections; Decreased bone marrow reserve; Hypoalbuminemia; Renal/hepatic impairment (dosage modification may be necessary); Other chronic debilitating illnesses; OB: Women of childbearing age should use two forms of contraception; Pedi: Safety and effectiveness not established; Geri: ↑ risk for adverse effects.

## Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness, fatigue. **CV:** hypotension (IV). **GI:** anorexia, diarrhea, nausea, vomiting, abdominal pain, stomatitis, taste alteration. **Derm:** alopecia, pruritis, rashes, urticaria. **Endo:** sterility. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Neuro:** peripheral neuropathy. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

## Interactions
**Drug-Drug:** ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May alter immune response to **live-virus vaccines** and ↑ risk of adverse reactions.

## Route/Dosage
Other regimens are used. Dosages below are expressed as the desired etoposide dosage.

### Testicular Neoplasms
**IV (Adults):** Dosage ranges from 50–100 mg/m² daily for 5 days to 100 mg/m² on days 1, 3, and 5; repeat at 3–4 wk intervals.

### Small-Cell Carcinoma of the Lung
**PO (Adults):** Dosage ranges from 70 mg/m² (rounded to the nearest 50 mg) daily for 4 days to 100 mg/m² (rounded to the nearest 50 mg) daily for 5 days; repeat at 3–4 wk intervals.
**IV (Adults):** Dosages range from 35 mg/m² daily for 4 days to 50 mg/m² daily for 5 days; repeat at 3–4 wk intervals.

## Availability
### Etoposide (generic available)
**Capsules:** 50 mg. **Injection:** 20 mg/mL.

### Etoposide Phosphate

**Powder for injection:** 100 mg/vial (with dextran).

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure before and every 15 min during infusion. If hypotension occurs, stop infusion and notify physician or other health care professional. After stabilizing blood pressure with IV fluids and supportive measures, infusion may be resumed at slower rate.
- Monitor for hypersensitivity reaction (fever, chills, dyspnea, pruritus, urticaria, bronchospasm, tachycardia, hypotension). If these occur, stop infusion and notify physician. Keep epinephrine, an antihistamine, corticosteroids, volume expanders, and resuscitative equipment close by in the event of an anaphylactic reaction.
- Assess for signs of infection (fever, chills, cough, hoarseness, lower back or side pain, sore throat, difficult or painful urination). Notify physician if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae, guaiac test stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- Monitor intake and output, appetite, and nutritional intake. Etoposide causes mild-to-moderate nausea and vomiting. Prophylactic antiemetics may ↓ frequency and duration of nausea and vomiting.
- Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- ***Lab Test Considerations:*** Monitor CBC and differential before and periodically during therapy. The nadir of leukopenia occurs in 7–14 days (etoposide) or 12–19 days (etoposide phosphate). Notify physician if leukocyte count is $<1000/mm^3$. The nadir of thrombocytopenia occurs in 9–16 days. Notify physician if the platelet count is $<75{,}000/mm^3$. Recovery of leukopenia and thrombocytopenia occurs in 20 days.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) before and periodically during therapy to detect hepatotoxicity and nephrotoxicity.

### Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)

### Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations, and infusion pump settings. Do not confuse VePesid (etoposide) with Versed (midazolam). Do not confuse etoposide (VePesid) with etoposide phosphate (Etopophos).
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Avoid contact with skin. Use Luer-Lok tubing to prevent accidental leakage. If contact with skin occurs, immediately wash skin with soap and water.
- **PO:** Capsules should be refrigerated. Capsules are stable for 24 mo when refrigerated.

### Etoposide (VePesid)

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute 5-mL vial with D5W or 0.9% NaCl. ***Concentration:*** 200–400 mcg/mL. The 200-mcg/mL solution is stable for 96 hr. The 400-mcg/mL solution is stable for 48 hr. Concentrations >400 mcg/mL are not recommended, because crystallization is likely. Discard solution if crystals are present. ***Rate:*** Infuse slowly over 30–60 min. Temporary hypotension may occur with infusion rates shorter than 30 min.
- **Y-Site Compatibility:** allopurinol, amifostine, aztreonam, cladribine, doxorubicin liposome, fludarabine, gemcitabine, granisetron, melphalan, methotrexate, mitoxandrone, ondansetron, paclitaxel, piperacillin/tazobactam, sargramostim, sodium bicarbonate, teniposide, thiotepa, topotecan, vinorelbine.
- **Y-Site Incompatibility:** cefepime, filgrastim, idarubicin.
- **Additive Compatibility:** carboplatin, cisplatin, cytarabine, floxuridine, fluorouracil, ifosfamide, mitoxantrone, ondansetron.

## Etoposide phosphate (Etopophos)

**IV Administration**

- **Intermittent Infusion:** Reconstitute each vial with 5 or 10 mL of sterile water, D5W, or 0.9% NaCl for a concentration of 20 or 10 mg/mL, respectively.
- ***Diluent:*** May be administered undiluted or diluted with D5W or 0.9% NaCl. ***Concentration:*** Undiluted: 10–20 mg/mL; Diluted: as low as 0.1 mg/mL, Reconstituted solutions are stable for 24 hr at room temperature or if refrigerated. ***Rate:*** Administer over 5–210 min.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, ampcillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, diphenhydramine, dobutamine, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, leucovorin calcium, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, metoclopramide, metronidazole, mitoxantrone, morphine, nalbuphine, ofloxacin, ondansetron, oxaliplatin, paclitaxel, piperacillin, piperacillin/tazobactam, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, zidovudine.
- **Y-Site Incompatibility:** amphotericin B, cefepime, chlorpromazine, imipenem/cilastatin, lansoprazole, methylprednisolone, mitomycin, prochlorperazine.

### Patient/Family Teaching

- Instruct patient to take etoposide exactly as directed, even if nausea or vomiting occurs. If vomiting occurs shortly after dose is taken, consult physician. If a dose is missed, do not take at all.
- Advise patient to notify health care professional if fever; chills; sore throat or other signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to notify health care professional if rapid heartbeat, difficulty breathing, abdominal pain, yellow skin, weakness, paresthesia, or gait disturbances occur.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Viscous lidocaine swishes may be used if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient to use contraception.
- Instruct patient not to receive any vaccinations without advice of physician.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Decrease in size or spread of testicular or small cell lung cancer.

## etravirine (e-tra-veer-een)

Intelence

***Classification***

Therapeutic: antiretrovirals
Pharmacologic: non-nucleoside reverse transcriptase inhibitors

**Pregnancy Category B**

### Indications

HIV infection (with other antiretrovirals).

### Action

Binds to the enzyme reverse transcriptase, which results in disrupted viral DNA synthesis. **Therapeutic Effects:** Evidence of decreased viral replication and reduced viral load with slowed progression of HIV and its sequelae.

### Pharmacokinetics

**Absorption:** Well absorbed following oral administration. Food enhances absorption.
**Distribution:** Unknown.
**Protein Binding:** 99.9%.
**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A4, CYP2C9, and CYP2C19 enzyme systems); minimal renal excretion; mostly eliminated in feces as unchanged drug and metabolites.

**Half-life:** 41 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2.5–4 hr | 12 hr |

## Contraindications/Precautions

**Contraindicated in:** Concurrent use with other non-nucleoside reverse transcriptase inhibitors (NNRTIs), rifampin, rifapentine, St. John's wort. **Use Cautiously in:** Concurrent use of antiarrhythmics, anticonvulsants, antifungals, clarithromycin, rifabutin, diazepam, dexamethasone, HMG CoA reductase inhibitors (statins), immunosuppressants; Geri: Consider age-related ↓ in organ function and body mass, concurrent disease states and medications; Pedi, OB, Lactation: Safety not established, breast-feeding not recommended in HIV-infected women.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, anxiety, confusion, fatigue, headache, insomnia, sleep disorders. **EENT:** blurred vision, vertigo. **CV:** MYOCARDIAL INFARCTION, angina pectoris, atrial fibrillation, hypertension. **GI:** HEPATIC FAILURE, nausea, abdominal pain, anorexia, dry mouth, hepatitis, stomatitis, vomiting. **GU:** renal failure. **Endo:** gynecomastia, hyperglycemia, hyperlipidemia. **Hemat:** anemia, hemolytic anemia. **Derm:** ERYTHEMA MULTIFORME, STEVENS JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash. **Metab:** fat redistribution. **Neuro:** peripheral neuropathy. **MS:** hemarthrosis. **Misc:** allergic reactions including, IMMUNE RECONSTITUTION SYNDROME.

## Interactions

**Drug-Drug:** Etravirine is a substrate of the **CYP3A4**, **CYP2C9**, and **CYP2C19** enzyme systems; other medications that induce or inhibit these systems may be expected to alter the response to etravirine. Etravirine is an inducer of **CYP3A4** and an inhibitor of **CYP2C9** and **CYP2C19**. The effects of medications that are substrates of these enzyme systems may be altered by concurrent use. Concurrent use with other **NNRTIs** including **efavirenz**, **nevirapine**, and **delavirdine** may lead to ↓ effectiveness and should be avoided. Concurrent use with **protease inhibitors (PIs )** including **atazanavir**, **fosamprenavir**, **nelfinavir**, and **indinavir** may lead to altered plasma levels and should be untertaken with concurrent low dose **ritonavir**. Concurrent use with higher dose **ritonavir**, combination **tipranavir/ritonavir**, **fosamprenavir/ritonavir**, **atazanavir/ritonavir** alter levels and effectiveness of etravirine and should be avoided. Concurrent use of the combination **saquinavir/ritonavir** should be undertake cautiously. ↓ blood levels and effectiveness of **antiarrhythmics** including **amiodarone**, **bepridil**, **disopyramide**, **flecainide**, **lidocaine**, **mexiletine**, **quinidine**, **propafenone**, and **quinidine**; blood level monitoring recommended. Blood levels and effects may be ↓ by anticonvulsants including **carbamazepine**, **phenobarbital**, and **phenytoin**. Concurrent use with **voriconazole** may ↑ levels of both drugs; ↓ levels of **itraconazole** and **ketoconazole** (dose adjustments may be necessary). May alter levels and response to **clarithromycin**; other agents should be considered. **Rifampin** and **rifapentine** ↓ blood levels and effectiveness and should be avoided; **rifabutin** should only be used without a protease inhibitor/ritonavir combination. May ↑ blood levels and sedation from **diazepam**, monitor for effects. Levels and effectiveness may be ↓ by **dexamethasone** use cautiously and consider alternatives. May alter blood levels and effects of **fluvastatin**, **lovastatin**, and **simvastatin**(dose adjustments may be necessary. May alter blood levels and effects of **cyclosporine**, **sirolimus**, and **tacrolimus**; careful monitoring required.

**Drug-Natural Products: St. John's wort** may ↓ blood levels and effectiveness; avoid concurrent use.

## Route/Dosage

**PO (Adults):** 200 mg twice daily.

## Availability

**Tablets:** 100 mg.

# NURSING IMPLICATIONS

## Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess patient for rash (mild to moderate rash usually occurs in the 2nd wk of therapy and resolves within 1–2 wk of continued therapy). If rash is severe (extensive erythematous or maculopapular rash with moist desquamation or angioedema) or accompanied by systemic symptoms (serum sickness-like reaction, Stevens-Johnson syndrome, toxic epidermal necrolysis), therapy must be discontinued immediately.

- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- Monitor liver function tests periodically during therapy. May cause ↑ serum AST, ALT concentrations.
- May cause ↑ pancreatic amylase and lipase.
- May cause ↑ in total cholesterol, low density lipoprotein, serum triglyceride, and glucose levels.
- May cause ↑ serum creatinine.
- May cause ↓ neutrophils, ↓ platelet count, anemia and hemolytic anemia.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Administer 2 tablets twice daily following a meal; type of food does not matter. Swallow tablet whole, do not break, crush, or chew. If patient has difficulty swallowing, may disperse tablet in a glass of water. Once dispersed, patient should stir well and drink immediately; rinse glass with water and drink several times to ensure entire dose is consumed.

### Patient/Family Teaching

- Emphasize the importance of taking etravirine as directed, at the same time each day. It must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses following a meal if remembered within 6 hr of the time its usually taken, then return to regular schedule. If more than 6 hr from time dose is usually taken, omit dose and resume dosing schedule; do not double doses.
- Instruct patient that etravirine should not be shared with others.
- Inform patient that etravirine does not cure AIDS or prevent associated or opportunistic infections. Etravirine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of etravirine are unknown at this time.
- May cause dizziness, impaired concentration, or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional immediately if rash, signs of hypersensitivity (fever, generally ill feeling, extreme tiredness, muscle or joint aches, blisters, oral lesions, eye inflammation, facial swelling), signs and symptoms of liver problems (yellowing of skin or whites of eyes, dark or tea colored urine, pale colored stools/bowel movements, nausea, vomiting, loss of appetite, or pain, aching or sensitivity on right side below ribs), or signs of Immune Reconstitution Syndrome (signs and symptoms of an infection) occur.
- Advise patient to avoid taking other Rx, OTC, vitamins, or herbal products, especially St. John's wort, without consulting health care professional.
- Inform patient that changes in body fat (increased fat in upper back and neck, breast, and around back, chest, and stomach area, loss of fat from legs, arms, and face) may occur.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control during etravirine therapy and to notify health care professional if they become pregnant or plan to breastfeed while taking etravirine.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

## exenatide (ex-**en**-a-tide)

Byetta

***Classification***
Therapeutic: antidiabetics
Pharmacologic: incretrin mimetic agents

**Pregnancy Category C**

### Indications

Type 2 diabetes uncontrolled by metformin, a sulfonylurea, or a thiazolidinedione (or a combination of these agents).

### Action

Mimics the action of incretin which promotes endogenous insulin secretion and promotes other mechanisms of glucose-lowering. **Therapeutic Effects:** Improved control of blood glucose.

### Pharmacokinetics

**Absorption:** Well absorbed following subcutaneous administration.

**Distribution:** Unknown.
**Metabolism and Excretion:** Excreted mostly by glomerular filtration followed by degradation.
**Half-life:** 2.4 hr.

TIME/ACTION PROFILE (effects on postprandial blood glucose)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| subcut | within 30 min | 2.1 hr | 8 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Type 1 diabetes or diabetic ketoacidosis; End-stage renal disease (CCr <30 mL/min); Severe gastrointestinal disease; OB: Has caused fetal physical defects and neonatal death in animal studies; Lactation: Excretion into breast milk unknown.
**Use Cautiously in:** Pedi: Safety not established.

## Adverse Reactions/Side Effects

**CV:** dizziness, headache, jitteriness, weakness.
**GI:** PANCREATITIS, diarrhea, nausea, vomiting, dyspepsia, gastroinestinal reflux. **Derm:** hyperhydrosis. **Metab:** ↓ appetite, weight loss.

## Interactions

**Drug-Drug:** Concurrent use with **sulfonlyureas** may ↑ risk of hypoglycemia ( ↓ dose of **sulfonylurea** if hypoglycemia occurs). Due to slowed gastric emptying, may decrease absorption of **orally administered medications**, especially those requiring rapid GI absorption or require a specific level for efficacy (**anti-infectives**, **oral contraceptives**).

## Route/Dosage

**Subcut (Adults):** 5 mcg within 60 min before morning and evening meal; after 1 month, dose may be increased to 10 mcg depending on response.

## Availability

**Solution for subcutaneous injection:** 250 mcg/mL in prefilled pen-injector that delivers either 5 mcg/dose (1.2-mL pen) or 10 mcg/dose (2.4-mL pen) for 60 doses (30 days of twice daily dosing). **Cost:** $200.98/1.2-mL pen, $225.99/2.4-mL pen.

# NURSING IMPLICATIONS

## Assessment

- Observe for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, drowsiness, tremor, tachycardia, anxiety, confusion, irritability, jitteriness), especially when combined with oral sulfonylureas.
- ***Lab Test Considerations:*** Monitor serum glucose and glycolysated hemoglobin periodically during therapy to evaluate effectiveness of therapy.

## Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

## Implementation

- Some medications may need to be taken 1 hr before exenatide.
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **Subcut:** Follow directions for *New Pen Setup* in *Information for Patient* prior to use of each new pen. Administer exenatide in thigh, abdomen, or upper arm at any time within the 60–min period **before** the morning and evening meals. Do not administer after a meal. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. Refrigerate; discard pen 30 days after 1st use, even if some drug remains in pen. Do not freeze. Do not store pen with needle attached; medication may leak from pen or air bubbles may form in the cartridge.

## Patient/Family Teaching

- Instruct patient to take exenatide as directed within 60 min before a meal. Do not take after a meal. If a dose is missed, skip the dose and take the next dose at the prescribed time. Do not take an extra dose or increase the amount of the next dose to make up for missed dose.
- Instruct patient in proper technique for administration, timing of dose and concurrent oral medications, storage of medication and disposal of used needles. Patients should read the *Information for Patient* insert prior to initiation of therapy and with each Rx refill. Advise patient that *New Pen Setup* should be done only with each new pen, not with each dose.
- Inform patient that pen needles are not included with pen and must be purchased separately. Advise patient which needle length and gauge should be used. Caution patient not to share pen and needles.

- Explain to patient that exenatide helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional. Risk of hypoglycemia is increased if sulfonureas are taken concurrently with exenatide.
- Advise patient to notify health care professional immediately if symptoms of pancreatitis (unexplained, persistent, severe abdominal pain which may or may not be accompanied by vomiting) occur.
- Inform patient that therapy may result in reduction of appetite, food intake, and/or body weight. Dose modification is not necessary. Nausea is more common at initiation of therapy and usually decreases over time.
- Advise patient to notify health care professional before taking any Rx, OTC, and herbal products. Exenatide delays stomach emptying. Some medications (such as anti-infectives and oral contraceptives) may need to be taken 1 hr before exenatide injection.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to notify health care professional if pregnancy is suspected or planned.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose and glycosylated hemoglobin.

### Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

## ezetimibe (e-zet-i-mibe)

Ezetrol, Zetia

***Classification***

Therapeutic: lipid-lowering agents
Pharmacologic: cholesterol absorption inhibitors

**Pregnancy Category C**

### Indications

Alone or with other agents (HMG-CoA reductase inhibitors) in the management of dyslipidemias including primary hypercholesterolemia, homozygous familial hypercholesterolemia and homozygous sitosterolemia.

### Action

Inhibits absorption of cholesterol in the small intestine. **Therapeutic Effects:** Lowering of cholesterol, a known risk factor for atherosclerosis.

### Pharmacokinetics

**Absorption:** Following absorption, rapidly converted to ezetimibe-glucaronide, which is active. Bioavailability is variable.
**Distribution:** Unknown.
**Metabolism and Excretion:** Undergoes enterhepatic recycling, mostly eliminated in feces, minimal renal excretion.
**Half-life:** 22 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Acute liver disease or unexplained laboratory evidence of liver disease (when used with HMG-CoA reductase inhibitor); Moderate or severe hepatic insufficiency; Concurrent use of fibrates; OB: May cause fetal harm by interfering with cholesterol synthesis and, possibly, biologically active substances derived from cholesterol; Potential for adverse effects in nursing infant.
**Use Cautiously in:** Pedi: Safety not established in children <10 yr.

### Adverse Reactions/Side Effects

**GI:** cholecystitis, cholelithiasis, ↑ hepatic transaminases (with HMG-CoA reductase inhibitors), nausea, pancreatitis. **Derm:** rash. **Misc:** ANGIOEDEMA.

### Interactions

**Drug-Drug:** Effects may be ↓ by **cholestyramine** or other **bile acid sequestrants**. Concurrent use of **fibrates** may ↑ blood levels of ezetimibe and also ↑ the risk of cholelithiasis. **Cyclosporine** may ↑ ezetimibe levels. May ↑

risk of rhabdomyolysis when used with **HMG CoA-reductase inhibitors**.

### Route/Dosage

**PO (Adults):** 10 mg once daily.

### Availability

**Tablets:** 10 mg. **Cost:** $265.98/90. ***In combination with:*** simvastatin (Vytorin); see Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Obtain a diet history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Evaluate serum cholesterol and triglyceride levels before initiating, after 2–4 wk of therapy, and periodically thereafter.
- May cause ↑ liver transaminases when administered with HMG-CoA reductase inhibitors. Monitor liver enzymes prior to initiation and during therapy according to recommendations of HMG-CoA reductase inhibitor. Elevations are usually asymptomatic and return to baseline with continued therapy.

### Potential Nursing Diagnoses

Noncompliance, related to diet and medication regimen (Patient/Family Teaching)

### Implementation

- **PO:** Administer without regard to meals. May be taken at the same time as HMG-CoA reductase inhibitors.

### Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well. Take missed doses as soon as remembered, but do not take more than 1 dose/day. Medication helps control but does not cure elevated serum cholesterol levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking. Ezetimibe does not assist with weight loss.
- Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected or if breast feeding. If regimen includes HMG-CoA reductase inhibitors, they are contraindicated in pregnancy.
- Instruct patient to notify health care professional if unexplained muscle pain, tenderness, or weakness occur. Risk may increase when used with HMG CoA reductase inhibitors.
- Advise patient to avoid taking OTC medications or natural/herbal products without consulting health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

### Evaluation/Desired Outcomes

- Decrease in serum LDL and total cholesterol levels.
- Increase in HDL cholesterol levels.

## famciclovir (fam-sye-kloe-veer)

Famvir

***Classification***

Therapeutic: antivirals

**Pregnancy Category B**

### Indications

Acute herpes zoster infections (shingles). Treatment/suppression of recurrent herpes genitalis in immunocompetent patients. Treatment of recurrent herpes labialis (cold sores) in immunocompetent patients. Treatment of recurrent mucocutaneous herpes simplex virus (HSV) infection in HIV-infected patients.

### Action

Inhibits viral DNA synthesis in herpes-infected cells only. **Therapeutic Effects:** Decreased duration of herpes zoster infection with decreased duration of viral shedding. Decreased time to healing for cold sores. Decreased lesion formation and improved healing in recurrent HSV infection.

### Pharmacokinetics

**Absorption:** Following absorption, famciclovir is rapidly converted in the intestinal wall to penciclovir, the active compound.
**Distribution:** Unknown.
**Metabolism and Excretion:** Penciclovir is mostly excreted by the kidneys.
**Half-life:** *Penciclovir*—2.1–3 hr (↑ in renal impairment).

TIME/ACTION PROFILE (penciclovir blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 0.9 hr | 8–12 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Patients with impaired renal function (↑ dose interval/↓ dose recommended if CCr <40–60 mL/min); OB, Lactation: Limited information; use only if maternal benefit clearly outweighs potential risks to fetus or infant; Pedi: Safety not established in children <18 yr; Geri: Consider age-related ↓ in renal function when prescribing.

### Adverse Reactions/Side Effects

**CNS:** headache, dizziness, fatigue. **GI:** diarrhea, nausea, vomiting.

### Interactions

**Drug-Drug: Probenecid** ↑ plasma concentrations of penciclovir.

### Route/Dosage

#### Herpes Zoster

**PO (Adults):** 500 mg q 8 hr for 7 days.

#### Renal Impairment

**PO (Adults):** *CCr 40–59 mL/min*—500 mg q 12 hr; *CCr 20–39mL/min*—500 mg q 24 hr; *CCr <20 mL/min*—250 mg q 24 hr; *Hemodialysis*—250 mg after each dialysis.

#### Recurrent Genital Herpes Simplex Infections

**PO (Adults):** 1000 mg twice daily for one day.

#### Renal Impairment

**PO (Adults):** *CCr 40–59 mL/min*—500 mg twice daily for 1 day; *CCr 20–39 mL/min*—500 mg as a single dose; *CCr <20 mL/min*—250 mg as a single dose; *Hemodialysis*—250 mg as a single dose after dialysis.

#### Suppression of Recurrent Herpes Simplex Infections

**PO (Adults):** 250 mg q 12 hr for up to 1 yr.

#### Renal Impairment

**PO (Adults):** *CCr 20–39 mL/min*—125 mg q 12 hr for 5 days; *CCr <20 mL/min*—125 mg q 24 hr for 5 days; *Hemodialysis*—125 mg after each dialysis.

#### Recurrent Herpes Labialis Infections (cold sores)

**PO (Adults):** 1500 mg as a single dose.

#### Renal Impairment

**PO (Adults):** *CCr 40–59 mL/min*—750 mg as a single dose; *CCr 20–39 mL/min*—500 mg as a single dose; *CCr <20 mL/min*—250 mg as a single dose; *Hemodialysis*—250 mg as a single dose after dialysis.

#### Herpes Simplex in HIV-Infected Patients

**PO (Adults):** 500 mg q 12 hr for 7 days.

#### Renal Impairment

**PO (Adults):** *CCr 20–39 mL/min*—500 mg q 24 hr for 7 days; *CCr <20 mL/min*—250 mg q 24 hr for 7 days; *Hemodialysis*—250 mg after each dialysis.

### Availability (generic available)

**Tablets:** 125 mg, 250 mg, 500 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess lesions prior to and daily during therapy.
- Assess patient for postherpetic neuralgia periodically during and following therapy.

### Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)
Risk for infection (Indications, Patient/Family Teaching)

### Implementation

- Famciclovir therapy should be started as soon as herpes zoster is diagnosed, at least within 72 hr, preferably within 48 hr.
- **PO:** Famciclovir may be administered without regard to meals.

### Patient/Family Teaching

- Instruct patient to take famciclovir as directed for the full course of therapy. Take missed doses as soon as remembered, if not just before next dose.
- Inform patient that famciclovir does not prevent the spread of infection to others. Until all lesions have crusted, precautions should be taken around others who have not had chickenpox or varicella vaccine or people who are immunosuppressed.
- Advise patient that condoms should be used during sexual contact and that no sexual contact should be made while lesions are present.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct women with genital herpes to have yearly Papanicolaou smears because these women may be more likely to develop cervical cancer.

### Evaluation/Desired Outcomes

- Decrease in time to full crusting, loss of vesicles, loss of ulcers, and loss of crusts in patients with acute herpes zoster (shingles).
- Crusting over and healing of lesions in herpes labialis, genital herpes and in recurrent mucocutaneous HSV infection in HIV-infected patients.
- Prevention of recurrence of herpes genitalis.
- Decreased time to healing for cold sores.

**famotidine, See HISTAMINE $H_2$ ANTAGONISTS.**

## febuxostat (fe-bux-o-stat)

Uloric

***Classification***

Therapeutic: antigout agents
Pharmacologic: xanthine oxidase inhibitors

**Pregnancy Category C**

### Indications

Chronic management of hyperuricemia in patients with a history of gout.

### Action

Decreases production of uric acid by inhibiting xanthine oxidase. **Therapeutic Effects:** Lowering of serum uric acid levels with resultant decrease in gouty attacks.

### Pharmacokinetics

**Absorption:** Well absorbed (49%) following oral administration.
**Distribution:** Unknown.
**Protein Binding:** 99.2%.
**Metabolism and Excretion:** Extensively metabolized by the liver; minimal renal excretion of unchanged drug, 45% eliminated in feces as unchanged drug, remainder is eliminated in urine and feces as inactive metabolites.
**Half-life:** 5–8 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1–1.5 hr* | 24 hr |

*Maximum lowering of uric acid may take 2 wk

### Contraindications/Precautions

**Contraindicated in:** Concurrent azathioprine, mercaptopurine, or theophylline.
**Use Cautiously in:** Severe renal impairment (CCr <30 mL/min); Severe hepatic impairment; OB: Use in pregnancy only when potential maternal benefit outweighs potential fetal risk; Pedi: Safety in children <18 yr not established.

### Adverse Reactions/Side Effects

**GI:** liver function abnormalities, nausea. **Derm:** rash. **MS:** gout flare, arthralgia.

### Interactions

**Drug-Drug:** Significantly ↑ blood levels of, and risk of serious toxicity from, **azathioprine**, **mercaptopurine**, and **theophylline**; concurrent use is contraindicated.

### Route/Dosage

**PO (Adults):** 40 mg once daily initially; if serum uric acid does not drop to <6 mg/dL dose should be increased to 80 mg daily.

### Availability
**Tablets:** 40 mg, 80 mg.

## NURSING IMPLICATIONS

### Assessment
- Assess for joint pain and swelling, especially during early therapy. Changing serum uric acid levels from mobilization of urate from tissue deposits may cause gout flares. Use prophylactic NSAID or colchicine therapy for up to 6 months. If a gout flare occurs, continue febuxostat therapy and treat flare concurrently.
- Monitor for signs and symptoms of MI and stroke.
- ***Lab Test Considerations:*** Monitor serum uric acid levels prior to, 2 wk after intitiating, and periodically thereafter. If serum uric acid levels are ≥6 mg/dL after 2 wk of daily 40 mg therapy, increase dose to 80 mg daily.
- Monitor liver function at 2 and 4 months of therapy and periodically thereafter. May cause ↑ AST, ALT, CPK, LDH, alkaline phosphatase and creatine.
- May cause prolonged aPTT and PT, and ↓ hematocrit, hemoglobin, RBC, platelet count, and lymphocyte, neutrohpil counts. May cause ↑ or ↓ WBC.
- May cause ↓ serum bicarbonate and ↑ serum sodium, glucose, potassium, and TSH levels.
- May cause ↑ serum cholesterol, triglycerides, amylase, and LDL levels.
- May cause ↑ BUN and serum creatinine and proteinuria.

### Potential Nursing Diagnoses
Chronic pain (Indications)

### Implementation
- **PO:** May be taken with or without food and with antacids.

### Patient/Family Teaching
- Instruct patient to take febuxostat as directed. If a gout flare occurs, continue febuxostat and consult health care professional; medications to manage gout flare may be added.
- Advise patient to notify health care professional if rash, chest pain, shortness of breath, or stroke symptoms (weakness, headache, confusion, slurred speech) occur or if side effects are persistent or bothersome.
- Instruct patient to consult health care professional prior to taking any other Rx, OTC, or herbal products.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Emphasize the importance of follow-up lab tests to monitor therapy.

### Evaluation/Desired Outcomes
- Reduction in serum uric acid levels and resultant gout attacks.

F

## felodipine (fe-loe-di-peen)
Renedil

***Classification***
Therapeutic: antianginals, antihypertensives
Pharmacologic: calcium channel blockers

**Pregnancy Category C**

### Indications
Management of hypertension, angina pectoris, and vasospastic (Prinzmetal's) angina.

### Action
Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased blood pressure. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina.

### Pharmacokinetics
**Absorption:** Well absorbed after oral administration, but extensively metabolized, resulting in ↓ bioavailability.
**Distribution:** Unknown.
**Protein Binding:** >99%.
**Metabolism and Excretion:** Mostly metabolized; minimal amounts excreted unchanged by kidneys.
**Half-life:** 11–16 hr.

TIME/ACTION PROFILE (antihypertensive effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 hr | 2–4 hr | up to 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity (cross-sensitivity may occur); Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Systolic blood pressure <90 mm Hg.

**Use Cautiously in:** Severe hepatic impairment (dose ↓ recommended); Geri: Dose ↓ recommended; ↑ risk of hypotension; Severe renal impairment; History of serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** headache, abnormal dreams, anxiety, confusion, dizziness, drowsiness, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea. **CV:** ARRHYTHMIAS, CHF, peripheral edema, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, ↑ liver function tests, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** dermatitis, erythema multiforme, flushing, ↑ sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

### Interactions

**Drug-Drug:** Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. **Ketoconazole**, **itraconazole**, **propranolol** and **erythromycin** ↓ metabolism, ↑ blood levels and the risk of toxicity (dose ↓ may be necessary).

**Drug-Food: Grapefruit juice** ↑ serum levels and effect.

### Route/Dosage

**PO (Adults):** 5 mg/day (2.5 mg/day in geriatric patients); may ↑ q 2 wk (range 5–10 mg/day; not to exceed 10 mg/day).

### Availability (generic available)

**Extended-release tablets:** 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg $89.96/90, 5 mg $85.97/90, 10 mg $139.97/90.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse before therapy, during dosage titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- **Hypertension:** Check frequency of refills to monitor adherence.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ risk of arrhythmias and should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. May cause ↑ in hepatic enzymes after several days of therapy, which return to normal upon discontinuation of therapy.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Acute pain (Indications)

### Implementation

- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Swallow tablets whole; do not break, crush, or chew. Empty tablets that appear in stool are not significant.

### Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. If a dose is missed, take as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to avoid concurrent use of alcohol or other Rx, OTC, or herbal products, especially cold preparations, without consulting health care professional.

- Advise patient to notify health care professional if irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, rash, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and to use sunscreen to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve or worsens after therapy, occurs with diaphoresis or shortness of breath, or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes.

## Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

# fenofibrate (fen-o-fi-brate)

Antara, Fenoglide, Lipofen, Lipidil Micro, Lipidil Supra, Lofibra, Tricor, Triglide

***Classification***

Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

**Pregnancy Category C**

## Indications

With dietary therapy to decrease LDL cholesterol, total cholesterol, triglycerides, and apolipoprotein B in adult patients with hypercholesterolemia or mixed dyslipidemia. With dietary management in the treatment of hypertriglyceridemia (types IV and V hyperlipidemia) in patients who are at risk for pancreatitis and do not respond to nondrug therapy.

## Action

Fenofibric acid primarily inhibits triglyceride synthesis. **Therapeutic Effects:** Lowering of cholesterol and triglycerides with subsequent decreased risk of pancreatitis.

## Pharmacokinetics

**Absorption:** Well absorbed (60%) after oral administration; absorption ↑ by food.
**Distribution:** Unknown.
**Protein Binding:** 99%.
**Metabolism and Excretion:** Rapidly converted to fenofibric acid, which is the active metabolite; fenofibric acid is metabolized by the liver. Fenofibric acid and its metabolites are primarily excreted in urine (60%).
**Half-life:** 20 hr.

TIME/ACTION PROFILE (lowering of triglycerides)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2 wk | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hepatic impairment (including primary biliary cirrhosis); Pre-existing gallbladder disease; Severe renal impairment; Concurrent use of HMG-CoA reductase inhibitors; Lactation: Potential for tumorigenicity noted in animal studies; discontinue breastfeeding.
**Use Cautiously in:** Concurrent warfarin therapy; OB: Embryocidal and teratogenic in animal studies; use only if potential benefits outweigh risks to the fetus; Pedi: Safety not established in children <18 yr; Geri: Age-related decline in renal function may make older patients more susceptible to adverse reactions.

## Adverse Reactions/Side Effects

**CNS:** fatigue/weakness, headache. **CV:** PULMONARY EMBOLISM, arrhythmias, deep vein thrombosis. **GI:** cholelithiasis, pancreatitis. **Derm:** rash, urticaria. **MS:** rhabdomyolysis. **Misc:** hypersensitivity reactions.

### Interactions

**Drug-Drug:** ↑ anticoagulant effects of **warfarin**. Concurrent use with **HMG-CoA reductase inhibitors** ↑ risk of rhabdomyolysis (combined use should be avoided). Absorption is ↓ by **bile acid sequestrants** (fenofibrate should be given 1 hr before or 4–6 hr after). ↑ risk of nephrotoxicity with **cyclosporine**.

### Route/Dosage

### Primary hypercholesterolemia/mixed dyslipidemia

**PO (Adults):** *Antara*—130 mg/day initially; *Fenoglide*—120 mg/day; *Lofibra*—200 mg/day initially; *Tricor*—145 mg/day initially; *Triglide*—160 mg/day initially; *Lipofen*—50 mg daily; *Lipidil Supra*—160 mg daily.

### Hypertriglyceridemia

**PO (Adults):** *Antara*—43–130 mg/day ; *Fenoglide*—40–120 mg/day; *Lofibra*—67–200 mg/day initially; *Tricor*—48–145 mg/day initially; *Triglide*—50–160 mg/day initially; *Lipofen*—50 mg daily; *Lipidil Supra*—160 mg daily.

### Renal impairment/Geriatric patients

**PO (Adults):** *Antara*—43 mg/day; *Fenoglide*—start at 40 mg/day; *Lofibra*—67 mg/day; *Tricor*—48mg/day.

### Availability

**Tablets (Tricor):** 48 mg, 145 mg. **Cost:** 48 mg $109.97/90, 145 mg $299.96/90. **Tablets (Fenoglide):** 40 mg, 120 mg. **Tablets (Triglide):** 50 mg, 160 mg. **Micronized tablets (Lofibra):** 54 mg, 160 mg. **Cost:** 160 mg $189.97/90. **Microcoated tablets (Lipidil Supra):** 100 mg, 160 mg. **Micronized capsules (Antara):** 43 mg, 130 mg. **Cost:** 43 mg $116.96/90, 130 mg $318.93/90. **Capsules (Lipofen):** 50 mg, 100 mg, 150 mg. **Micronized capsules (Lofibra):** 67 mg, 134 mg, 200 mg. **Cost:** *Generic*—67 mg $76.39/90, 134 mg $147.00/90, 200 mg $226.87/90. **Micronized capsules (Lipidil Micro):** 67 mg, 200 mg.

## NURSING IMPLICATIONS

### Assessment

- Obtain a diet history, especially with regard to fat consumption. Every attempt should be made to obtain normal serum triglyceride levels with diet, exercise, and weight loss in obese patients before fenofibrate therapy is instituted.
- Assess patient for cholelithiasis. If symptoms occur, gallbladder studies are indicated. Therapy should be discontinued if gallstones are found.
- ***Lab Test Considerations:*** Monitor serum lipids before therapy to determine consistent elevations, then monitor periodically during therapy.
- Monitor serum AST and ALT periodically during therapy. May cause ↑ levels. Therapy should be discontinued if levels rise >3 times the normal limit.
- If patient develops muscle tenderness during therapy, CPK levels should be monitored. If CPK levels are markedly ↑ or myopathy occurs, therapy should be discontinued.
- May cause mild to moderate ↓ in hemoglobin, hematocrit, and WBCs. Monitor periodically during first 12 mo of therapy. Levels usually stabilize during long-term therapy.
- Patients taking anticoagulants concurrently should have prothrombin levels monitored frequently until levels stabilize.

### Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

### Implementation

- Patients should be placed on a triglyceride-lowering diet before therapy and remain on this diet throughout therapy.
- Dose may be increased after repeated serum triglyceride levels every 4–8 wk.
- Brands are not interchangeable.
- **PO:** Administer *Antara, Fenoglide, Lipofen, Lipidil Micro, Lipidil Supra, Lofibra,* and *Tricor* products with meals. *Triglide* formulation may be taken without regard to meals.

### Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Medication helps control but does not cure elevated serum triglyceride levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional if unexplained muscle pain, tenderness, or weakness occurs, especially if accompanied by fever or malaise.
- Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

## Evaluation/Desired Outcomes

- Decrease in serum triglycerides and cholesterol to normal levels. Therapy should be discontinued in patients who do not have an adequate response in 2 months of therapy.

# fenofibric acid

(feen-oh**fye**-brik **as**-id)
Tri-Lipix

***Classification***
Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

## Indications

With a statin to reduce triglycerides (TG) and increase high density lipoprotein-C (HDL-C) in patients with mixed dyslipidemias and CHD or a CHD risk equivalent who are on statin therapy to achieve their low-density lipoprotein-C (LDL-C) goal. As monotherapy to reduce TG in patients with severe hypertriglyceridemia. As monotherapy to reduce elevated LDL-C, total cholesterol (Total-C), TG and apolipoprotein B (Apo B), and increase HDL-C in patients with primary hyperlipidemia or mixed dyslipidemia. Part of a comprehensive program to decrease cardiovascular risk factors.

## Action

Activates the peroxisome proliferator activated receptor $\alpha$ (PPAR$\alpha$), resulting in increased lipolysis and elimination of triglycerides from plasma. Activation of PPAR$\alpha$ also increases production of HDL. **Therapeutic Effects:** Improvement in lipid profile with lowered triglycerides and LDL cholesterol, and increased HDL cholesterol.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration.
**Distribution:** Unknown.
**Protein Binding:** 99%.
**Metabolism and Excretion:** Fenofibric acid is the active metabolite of fenofibrate. Fenofibric acid is mostly metabolized by glucuronidation and the metabolites are mostly excreted by the kidneys.
**Half-life:** 20 hr.

TIME/ACTION PROFILE (effects on blood lipids)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 4–5 hr† | unknown |

†Blood levels

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to fenofibric acid, choline fenofibrate or fenofibrate; Severe renal impairment (CCr <30 mL/min); Active liver or gallbladder disease; Lactation: Avoid use during breastfeeding.
**Use Cautiously in:** Mild/moderate renal impairment (dose reduction required for CCr 30–80 mL/min); Concurrent use with statins in elderly patients, patients with diabetes, renal failure, or hypothyroidism ( ↑ risk of myopathy/rhabdomyolysis); Geri: Consider age-related decrease in renal function, concurrent illnesses and drug therapy; OB: Use during pregnancy only if the potential benefit justifies the potential risk to the fetus.; Pedi: Safe and effective use in children has not been established.

## Adverse Reactions/Side Effects

**CNS:** headache. **GI:** diarrhea, nausea, cholelithiasis, ↑ liver enzymes, pancreatitis. **GU:** ↑ creatinine. **MS:** MYOPATHY/RHABDOMYOLYSIS, myalgia, back pain.

## Interactions

**Drug-Drug:** ↑ effects and risk of bleeding with **coumadin**; monitor prothrombin time/INR. **Bile acid sequestrants** may ↓ absorption and effectiveness; administer at least 1 hr before or 4–6 hr after a bile acid sequestrant. Concurrent use with **nephrotoxic drugs** including **cyclosporine** may impair renal function and excretion, ↑ risk of adverse reactions.

## Route/Dosage

**PO (Adults):** *Mixed dyslipidemia*—135 mg once daily; *Hypertriglyceridemia*—45–135 mg once daily.

### Renal Impairment

**PO (Adults):** *CCr 30–80 mL/min*—45 mg once daily .

## Availability

**Delayed-release capsules (choline fenofibrate):** 45 mg, 135 mg.

# NURSING IMPLICATIONS

## Assessment

- Obtain a diet history, especially with regard to fat consumption. Every attempt should be made to obtain normal serum triglyceride levels with diet, exercise, and weight loss in obese patients before fenofibric acid therapy is instituted.
- Assess patient for cholelithiasis. If symptoms occur, gallbladder studies are indicated. Ther-

apy should be discontinued if gallstones are found.
- ***Lab Test Considerations:*** Monitor serum lipids before therapy to determine consistent elevations, then monitor periodically during therapy.
- Monitor serum AST and ALT periodically during therapy. May cause ↑ levels. Therapy should be discontinued if levels rise >3 times the normal limit.
- If patient develops muscle tenderness during therapy, CPK levels should be monitored. If CPK levels are markedly ↑ or myopathy occurs, therapy should be discontinued.
- May cause reversible ↑ in serum creatinine. Monitor renal function in patients at risk for renal insufficiency (elderly, diabetics).
- May cause mild to moderate ↓ in hemoglobin, hematocrit, and WBCs. Monitor periodically during first 12 mo of therapy. Levels usually stabilize during long-term therapy.
- Patients taking anticoagulants concurrently should have prothrombin time and INR monitored frequently until levels stabilize.

### Potential Nursing Diagnoses
Noncompliance (Patient/Family Teaching)

### Implementation
- Patients should be placed on a triglyceride-lowering diet before therapy and remain on this diet throughout therapy.
- **PO:** Administer without regard to meals. Swallow capsules whole; do not open, crush, or chew. May be administered at same time as statin dose.

### Patient/Family Teaching
- Instruct patient to take medication as directed. Take missed doses as soon as remembered; if time for next dose, skip dose and take next dose at regular time. Do not double doses. Medication helps control but does not cure elevated serum triglyceride levels. Advise patient to read *Medication Guide* before starting and with each Rx refill, new information may be available.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional if unexplained muscle pain, tenderness, weakness, tiredness, fever, nausea, vomiting, or abdominal pain occurs, especially if accompanied by fever or malaise.
- Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

### Evaluation/Desired Outcomes
- Decrease in serum triglycerides and LDL cholesterol to normal levels with an increase in HDL levels.

## **fenoldopam** (fen-**ole**-doe-pam)
Corlopam

***Classification***
Therapeutic: antihypertensives
Pharmacologic: vasodilators

**Pregnancy Category B**

### Indications
Short-term (<48 hr), in-hospital management of hypertensive emergencies, including malignant hypertension with end-organ deterioration.

### Action
Acts as an agonist at dopamine $d_1$-like receptors. Also binds to alpha-adrenergic receptors. Acts as a vasodilator. **Therapeutic Effects:** Rapid lowering of blood pressure.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver; 90% of metabolites are excreted in urine, 10% in feces.
**Half-life:** 5–10 min.

TIME/ACTION PROFILE (effect on blood pressure)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | 15 min | 1–4 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to fenoldopam or sulfites; Concurrent beta blocker therapy (will prevent reflex tachycardia).

**Use Cautiously in:** Glaucoma or intraocular hypertension; OB, Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** headache, nervousness/anxiety, dizziness. **CV:** hypotension, tachycardia, ECG changes, peripheral edema. **GI:** nausea, abdominal pain, constipation, diarrhea, vomiting. **Derm:** flushing, sweating. **F and E:** hypokalemia. **Local:** injection site reactions. **MS:** back pain.

### Interactions

**Drug-Drug:** Concurrent use with **beta blockers** may result in excessive hypotension (concurrent use should be avoided).

### Route/Dosage

**IV (Adults):** 0.01–1.6 mcg/kg/min.

### Availability

**Concentrate for injection:** 10 mg/mL in 1– and 2-mL single-use ampules (with sodium metabisulfite).

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, heart rate, and ECG frequently throughout therapy; continuous monitoring is preferred. Consult physician for parameters.
- ***Lab Test Considerations:*** Monitor serum potassium concentrations every 6 hr during therapy. May cause hypokalemia. Treat with oral or IV potassium supplementation.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

### Implementation

#### IV Administration

- Administer via continuous infusion; do not use bolus doses. Avoid hypotension and rapid decreases in blood pressure. Initial dose titration should occur no more frequently than every 15 min and less frequently as desired blood pressure is reached. Increments of 0.05 to 0.1 mcg/kg/min are recommended for titration. Lower initial doses (0.03 to 0.1 mcg/kg/min) titrated slowly have been associated with less reflex tachycardia than higher initial doses.
- Infusion can be abruptly discontinued or gradually tapered before discontinuation. Oral therapy with other antihypertensives can begin anytime after the blood pressure is stable. Do not administer beta blockers concurrently with fenoldopam.
- **Continuous Infusion:** ***Diluent:*** Dilute 4 mL (40 mg of drug) with 1000 mL, 2 mL (20 mg of drug) with 500 mL, or 1 mL (10 mg of drug) with 250 mL of 0.9% NaCl or D5W. Infusion is stable for 24 hr at room temperature. ***Concentration:*** 40 mcg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titrate to desired effect. Administer via infusion pump to ensure accurate dosage rate.
- **Y-Site Compatibility:** alfentanil, amikacin, aminocaproic acid, amiodarone, ampicillin/sulbactam, argatroban, atracurium, atropine, azithromycin, aztreonam, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol , cimetidine, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fentanyl, fluconazole, gentamicin, granisetron, haloperidol, heparin, hydralazine, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, inamrinone, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pancuronium, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sufentanil, tacrolimus, theophylline, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, voriconazole.
- **Y-Site Incompatibility:** acyclovir, aminophylline, amphotericin B, ampicillin, bumetanide, cefoxitin, dexamethasone sodium phosphate, diazepam, fosphenytoin, furosemide, ganciclovir, ketorolac, meropenem, methohexital, methylprednisolone sodium succinate, pantoprazole, pentobarbital, phenytoin, prochlorperazine, sodium bicarbonate, thiopental.

### Patient/Family Teaching

- Explain purpose of medication to patient.
- Advise patient to report headache or pain at the injection site.

### Evaluation/Desired Outcomes

- Decrease in blood pressure without the appearance of side effects.

## fentanyl buccal/transmucosal (fen-ta-nil)

Actiq, Fentora, Onsolis

***Classification***

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

**Schedule II**

**Pregnancy Category C**

### Indications

Management of breakthrough pain in cancer patients already receiving and tolerant to around-the-clock opioid therapy for persistent cancer pain (60 mg/day of oral morphine or equivalent).

### Action

Binds to opiate receptors in the CNS, altering the response to and perception of pain. **Therapeutic Effects:** Decrease in severity of breakthrough pain.

### Pharmacokinetics

**Absorption:** *Buccal tablets*—65% absorbed from buccal mucosa; 50% is absorbed transmucosally, remainder is swallowed and is absorbed slowly from the GI tract. Buccal absorption is enhanced by an effervescent reaction in the dose form. Bioavailability is greater than transmucosal fentanyl; *Buccal soluble film*—51% absorbed from buccal mucosa and remaining 49% is swallowed (20% of which becomes systemically available); bioavailability is greater than transmucosal fentanyl; *Transmucosal*—Initial rapid absorption (25%) from buccal mucosa is followed by more prolonged absorption (25%) from GI tract (combined bioavailability 50%).
**Distribution:** Readily crosses the placenta and enters breast milk.
**Protein Binding:** 80–85%.
**Metabolism and Excretion:** >90% metabolized by the liver and intestinal mucosa (CYP3A4 enzyme system); <7% excreted unchanged in urine.
**Half-life:** *100 mcg tablet*—2.6 hr; *200 mcg tablet*—4.4 hr; *100 mcg tablet*—2.6 hr; *400 mcg tablet*—11.0 hr; *800 mcg tablet*—11.7 hr; *Buccal soluble film*—14 hr; *Transmucosal*—7 hr.

TIME/ACTION PROFILE (decreased pain)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Buccal tablet | 15 min | 40–60 min | 60 min |
| Buccal soluble film | 15–30 min | 1 hr | 2–6 hr |
| Transmucosal | rapid | 15–30 min | several hr |

### Contraindications/Precautions

**Contraindicated in:** Known intolerance or hypersensitivity; Acute/postoperative pain; Opioid—naive (non-tolerant) patients; OB: Labor and delivery; Lactation: Lactation.
**Use Cautiously in:** Chronic obstructive pulmonary disease; Concurrent use of CNS active drugs; History of substance abuse; Severe renal/hepatic impairment (use lowest effective starting dose); Concurrent use of CYP3A4 inhibitors (use lowest effective dose); Bradyarrhythmias; OB, Lactation: Short-term use at lower doses may be acceptable (AAP); Geri: May be more sensitive to effects and may have an ↑ risk of adverse reactions; titrate dosage carefully; Pedi: Safety not established.
**Exercise Extreme Caution in:** Head injuries/↑ intracranial pressure.

### Adverse Reactions/Side Effects

Opioid side effects ↑ with increased dosage.
**CNS:** dizziness, drowsiness, headache, confusion, depression, fatigue, hallucinations, headache, insomnia, weakness. **Resp:** RESPIRATORY DEPRESSION, dyspnea. **CV:** hypotension. **GI:** constipation, nausea, vomiting, abdominal pain, anorexia, dry mouth. **Misc:** physical dependence, psychological dependence.

### Interactions

**Drug-Drug:** Should not be used within 14 days of **MAO inhibitors** because of possible severe and unpredictable reactions. **CNS depressants**, including other **opioids**, **sedative/hypnotics**, **general anesthetics**, **phenothiazines**, **skeletal muscle relaxants**, **sedating antihistamines**, and **alcohol** may ↑ CNS depression, hypoventilation and hypotension. Concurrent use with **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **clarithromycin**, **nelfinavir**, **nefazodone**, **diltiazem**, **erythromycin**, **aprepitant**, **fluconazole**, **fosamprenavir**, and **verapamil** may significantly ↑ blood levels and ↑ risk of respiratory and CNS depression; careful monitoring and dose adjustment is recommended. Concurrent use of **agents that induce CYP3A4 enzyme activity** may ↓ analgesia. Administration of **partial-antagonist**

**opioid analgesics** or **opioid antagonists** will precipitate withdrawal in physically dependent patients.

**Drug-Food: Grapefruit juice** is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

### Route/Dosage

**Buccal (Adults):** *Tablets*—100 mcg, then titrated to dose that provides adequate analgesia with tolerable side effects; *Soluble film*—200 mcg, then titrated to dose that provides adequate analgesia with tolerable side effects; doses >1200 mcg should not be used.

**Transmucosal** (Adults): *Dose titration*—One 200 mcg unit dissolved in mouth (see Implementation section) over 15 min; additional unit may be used 15 min after first unit is completed. If more than one unit is required per episode (as evaluated over several episodes), dose may be increased as required to control pain. Optimal usage/titration should result in using no more than 4 units/day.

### Availability

**Buccal tablets (Fentora):** 100 mcg, 200 mcg, 300 mcg, 400 mcg, 600 mcg, 800 mcg. **Buccal soluble film (Onsolis):** 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1200 mcg. **Transmucosal lozenge on a stick (Actiq) (berry flavor-sugar free):** 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1200 mcg, 1600 mcg.

## NURSING IMPLICATIONS

### Assessment

- Monitor type, location, and intensity of pain before and 15–30 min after administration of buccal fentanyl.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10 min, assess level of sedation. Physical stimulation may be sufficient to prevent hypoventilation. Subsequent doses may need to be decreased. Patients tolerant to opioid analgesics are usually tolerant to the respiratory depressant effects also.
- Monitor for application site reactions (paresthesia, ulceration, bleeding, pain, ulcer, irritation). Reactions are usually self-limited and rarely require discontinuation.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg every 2 min. Use extreme caution when titrating dose in patients physically dependent on opioid analgesics to avoid withdrawal, seizures, and severe pain. Duration of respiratory depression may be longer than duration of opioid antagonist, requiring repeated doses.

### Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Adverse Reactions)

### Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations.
- Patients considered opioid-tolerant are those who are taking ≥60 mg of oral morphine/day, at least 25 mcg transdermal fentanyl/hr, 30 mg of oxycodone/day, 8 mg of hydromorphone/day or an equianalgesic dose of another opioid for ≥1 wk.
- ***High Alert:*** Dose may be lethal to a child; keep out of reach of children.
- Do not substitute fentanyl buccal products *(Actiq, Fentora, or Onsolis)*; doses are not equivalent.
- **Actiq (Transmucosal):** Open the foil package immediately before use. Instruct patient to place unit in the mouth between the cheek and lower gum, moving it from one side to the other using the handle. Patient should suck, not chew, the lozenge. If it is chewed and swallowed, lower peak concentrations and lower bioavailability may occur. Instruct patient to consume lozenge over 15-min period; longer or shorter periods may be less efficacious. If signs of excessive opioid effects occur, remove from patient's mouth immediately and decrease future doses.
- Initial dose for breakthrough pain should be 200 mcg. Six 200-mcg units should be prescribed and should be used before increasing to a higher dose. If one unit is ineffective, a second unit may be started 15 min after the completion of the first unit. Do not use more than 2

F

units during a single episode of breakthrough pain during titration phase. With each new dose during titration, 6 units should be prescribed, allowing treatment of several episodes of breakthrough pain. Adequate dose is determined based on effective analgesia with acceptable side effects. Side effects during titration period are usually greater than after effective dose is determined.

- Once an effective dose is determined, instruct patient to limit dose to 4 units/day. If >4 units/day are required, consider increasing the dose of the long-acting opioid.
- Discontinue with a gradual decrease in dose to prevent signs and symptoms of abrupt withdrawal.
- To dispose of remaining unit, using wire-cutting pliers cut off the drug matrix end so that it falls into the toilet. Flush remaining drug matrix down toilet. Drug remaining on handle may be removed by placing under running warm water until dissolved. Dispose of drug-free handle according to institutional protocol. ***High Alert:*** Partially consumed units are no longer protected by child-resistant pouch; dose may still be fatal. A temporary child-resistant storage bottle is provided for partially consumed units that cannot be disposed of properly.
- **Buccal: Fentora**: Do not attempt to push tablet through blister, may cause damage to tablet. Open by tearing along perforations to separate from blister card. Then bend blister unit on line where indicated. Blister backing should then be peeled to expose tablets. Use immediately; do not store, may damage integrity of tablet. Tablets are not to be sucked, chewed or swallowed whole; this will reduce medication effectiveness. Place between cheek and gum above a molar and allow medication to dissolve, usually 14–25 min. May cause bubbling sensation between teeth and gum while tablet dissolves. Do not attempt to split tablet. After 30 min, if remnants of tablet remain, swallow with glass of water.
- For patients not previously using transmucosal fentanyl, initial dose should be 100 mcg. Titrate to provide adequate relief while minimizing side effects. For patients switching from oral transmucosal fentanyl to fentanyl buccal, if transmucosal dose is 200–400 mcg, switch to 100 mcg buccal; if transmucosal dose is 600–800 mcg, switch to 200 mcg buccal; if transmucosal dose is 1200–1600 mcg, switch to 400 mcg buccal fentanyl.
- Dose may be repeated once during a single episode of breakthrough pain if not adequately relieved. Re-dose may occur 30 min after start of administration of fentanyl buccal and the same dose should be used.
- If more than one dose is required per breakthrough pain episode for several consecutive episodes, dose of maintenance opioid and fentanyl buccal should be adjusted. To increase dose, use multiples of 100 mcg tablet, use two 100 mcg tablets (one on each side of mouth in buccal cavity). If unsuccessful in controlling breakthrough pain episode, two 100 mcg tablets may be placed on each side of mouth in buccal cavity (four 100 mcg tablets). Titrate above 400 mcg by 200 mcg increments. To reduce risk of overdose, patients should have only one strength available at any one time.
- Once a successful dose has been established, if more than 4 breakthrough pain episodes/day occur, re-evaluate opioid dose for persistent pain.
- Inform patient if medication is no longer needed they should contact Cephalon at 1-800-896-5855 or remove from blister pack and flush any remaining product down toilet.
- **Buccal: Onsolis**: Available only through FOCUS, a restricted distribution program. Only prescribers and pharmacies registered in the program and patients enrolled in the program have access. Program provides education, counseling, and facilitated distribution of the medication. To enroll in the FOCUS Program call 1–877–4ONSOLIS or visit www.OnsolisFocus.com.
- Use tongue to wet inside of cheek or rinse mouth with water to wet area for placement of film. Open package immediately prior to use. Place entire film near tip of dry finger with pink side facing up and hold in place. Place pink side of film against inside of cheek. Press and hold film in place for 5 seconds. Film should stay in place on its own after this period. May consume liquids after 5 min. Do not cut or tear film prior to use. Film should dissolve within 15–30 min after application. Do not manipulate with tongue or fingers; avoid eating food until film has dissolved.
- If film is chewed or swallowed, lower peak concentration and lower bioavailability may result.
- Dose must be started with one 200 mcg film; do not convert patients on a mcg/mcg basis. If adequate relief is not achieved with one 200 mcg film, titrate using multiples of the 200 mcg film to provide adequate relief while minimizing side effects. Do not use more than 4 of the 200 mcg films simultaneously. Do not place on

top of each other; use both sides of the mouth. If adequate pain relief is not achieved after 800 mcg (four 200 mcg films) and patient tolerated 800 mcg dose, treat next episode with one 1200 mcg film. Do not use doses above 1200 mcg.
- Single doses should be separated by at least 2 hr. Use fentanyl buccal film only once per breakthrough pain episode; do not redose. Other rescue medications may be used as directed.
- Once a successful dose has been established, if more than 4 breakthrough pain episodes/day occur, re-evaluate opioid dose for persistent pain.
- To dispose of unneeded films, open foil packets, drop films into toilet and flush.

### Patient/Family Teaching
- Instruct patient to take fentanyl buccal exactly as directed. Do not take more often than prescribed, keep out of reach of children, protect it from being stolen, and do not share with others, even if they have the same symptoms. Open only when ready to administer. Advise patient to review *Medication Guide* each time fentanyl buccal is dispensed; new information may be available. Advise patient to notify health care professional if breakthrough pain is not alleviated, worsens, if >4 units/day are required to control pain, or if excessive opioid effects occur.
- Advise patient to avoid grapefruit juice during therapy.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Medication causes dizziness and drowsiness. Advise patient to call for assistance during ambulation and transfer, and to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants, such as sleep aids.
- Advise patient to notify health care professional if sores on gums or inside cheek become a problem.
- Instruct patient to notify health care professional before taking Rx, OTC, or herbal products.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- **Actiq:** Inform patient that this drug may contain sugar and may cause dry mouth. Advise patient to maintain good oral hygiene regular dental exams.
- **Onsolis:** Explain FOCUS Program to patient and caregiver, including receipt of medication via a traceable courier and need of adult signature upon delivery.

### Evaluation/Desired Outcomes
- Decrease in severity of pain during episodes of breakthrough pain in patients receiving long-acting opioids.

HIGH ALERT

## fentanyl (parenteral)
(**fen**-ta-nil)
Sublimaze

***Classification***
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

**Schedule II**

**Pregnancy Category C**

### Indications
Analgesic supplement to general anesthesia; usually with other agents (ultra–short-acting barbiturates, neuromuscular blocking agents, and inhalation anesthetics) to produce balanced anesthesia. Induction/maintenance of anesthesia (with oxygen or oxygen/nitrous oxide and a neuromuscular blocking agents). Neuroleptanalgesia/neuroleptanesthesia (with or without nitrous oxide). Supplement to regional/local anesthesia. Preoperative and postoperative analgesia. **Unlabeled Use:** Continuous IV infusion as part of PCA.

### Action
Binds to opiate receptors in the CNS, altering the response to and perception of pain. Produces CNS depression. **Therapeutic Effects:** Supplement in anesthesia. Decreased pain.

### Pharmacokinetics
**Absorption:** Well absorbed after IM administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver, 10–25% excreted unchanged by the kidneys.
**Half-life:** Children: Bolus dose—2.4 hr, long-term continuous infusion—11–36 hr; Adults:

2–4 hr (increased after cardiopulmonary bypass and in geriatric patients).

TIME/ACTION PROFILE (analgesia*)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | 7–15 min | 20–30 min | 1–2 hr |
| IV | 1–2 min | 3–5 min | 0.5–1 hr |

*Respiratory depression may last longer than analgesia

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; cross-sensitivity among agents may occur; Known intolerance.

**Use Cautiously in:** Geri: Geriatric, debilitated, or critically ill patients ; Diabetes; Severe renal, pulmonary or hepatic disease; CNS tumors; ↑ intracranial pressure; Head trauma; Adrenal insufficiency; Undiagnosed abdominal pain; Hypothyroidism; Alcoholism; Cardiac disease (arrhythmias); OB, Lactation: Pregnancy and lactation.

### Adverse Reactions/Side Effects

**CNS:** confusion, paradoxical excitation/delirium, postoperative depression, postoperative drowsiness. **EENT:** blurred/double vision. **Resp:** APNEA, LARYNGOSPASM, allergic bronchospasm, respiratory depression. **CV:** arrhythmias, bradycardia, circulatory depression, hypotension. **GI:** biliary spasm, nausea/vomiting. **Derm:** facial itching. **MS:** skeletal and thoracic muscle rigidity (with rapid IV infusion).

### Interactions

**Drug-Drug:** Avoid use in patients who have received **MAO inhibitors** within the previous 14 days (may produce unpredictable, potentially fatal reactions). Concomitant use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **clarithromycin**, **nelfinavir**, **nefazodone**, **diltiazem**, **aprepitant**, **fluconazole**, **fosamprenavir**, **verapamil**, and **erythromycin** may result in ↑ plasma levels and ↑ risk of CNS and respiratory depression. Additive CNS and respiratory depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, other **sedative/hypnotics**, and other **opioid analgesics**. ↑ risk of hypotension with **benzodiazepines**. **Nalbuphine**, **buprenorphine**, or **pentazocine** may ↓ analgesia.

**Drug-Food: Grapefruit juice** is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

### Route/Dosage

#### Preoperative Use

**IM, IV (Adults and Children > 12 yr):** 50–100 mcg 30–60 min before surgery.

#### Adjunct to General Anesthesia

**IM, IV (Adults and Children > 12 yr):** *Low dose–minor surgery*—2 mcg /kg. *Moderate dose–major surgery*—2–20 mcg /kg. *High dose–major surgery*—20–50 mcg /kg.

#### Adjunct to Regional Anesthesia

**IM, IV (Adults and Children > 12 yr):** 50–100 mcg .

#### Postoperative Use (Recovery Room)

**IM, IV (Adults and Children > 12 yr):** 50–100 mcg; may repeat in 1–2 hr.

#### General Anesthesia

**IV (Adults and Children > 12 yr):** 50–100 mcg /kg (up to 150 mcg/kg).

**IV (Children 1–12 yr):** 2–3 mcg/kg.

#### Sedation/Analgesia

**IV (Adults and Children > 12 yr):** 0.5–1 mcg/kg/dose, may repeat after 30–60 min.

**IV (Children 1–12 yr):** *Bolus*—1–2 mcg/kg/dose, may repeat at 30–60 min intervals. *Continuous infusion*—1–5 mcg/kg/hr following bolus dose.

**IV (Neonates):** *Bolus*—0.5–3 mcg/kg/dose. *Continuous infusion*—0.5–2 mcg/kg/hr following bolus dose. *Continuous infusion during ECMO*—5–10 mcg/kg bolus followed by 1–5 mcg/kg/hr, may require up to 20 mcg/kg/hr after 5 days of therapy.

### Availability (generic available)

**Injection:** 0.05 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor respiratory rate and blood pressure frequently throughout therapy. Report significant changes immediately. The respiratory depressant effects of fentanyl may last longer than the analgesic effects. Initial doses of other opioids should be reduced by 25–33% of the usually recommended dose. Monitor closely.
- Geri: Opioids have been associated with increased risk of falls in geriatric patients. Assess risk and implement fall prevention strategies.
- **IV, IM:** Assess type, location, and intensity of pain before and 30 min after IM administration or 3–5 min after IV administration when fentanyl is used to treat pain.

- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase concentrations.
- ***Toxicity and Overdose:*** Symptoms of toxicity include respiratory depression, hypotension, arrhythmias, bradycardia, and asystole. Atropine may be used to treat bradycardia. If respiratory depression persists after surgery, prolonged mechanical ventilation may be required. If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. Pedi: For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Administration of naloxone in these circumstances, especially in cardiac patients, has resulted in hypertension and tachycardia, occasionally causing left ventricular failure and pulmonary edema.

## Potential Nursing Diagnoses

Acute pain (Indications)
Ineffective breathing pattern (Adverse Reactions)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, route of administration, and infusion pump programming. Do not confuse fentanyl with alfentanil or sufentanil.
- Benzodiazepines may be administered before or after administration of fentanyl to reduce the induction dose requirements, decrease the time to loss of consciousness, and produce amnesia. This combination may also increase the risk of hypotension.
- ***High Alert:*** Opioid antagonists, oxygen, and resuscitative equipment should be readily available during the administration of fentanyl. Fentanyl derivatives should be administered IV only in monitored anesthesia care settings (operating room, emergency department, ICU) with immediate access to life-support equipment and should be administered only by personnel trained in resuscitation and emergency airway management.

### IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 50 mcg/mL. ***Rate:*** Injections should be administered slowly over 1–3 min. Administer doses > 5 mcg/kg over 5–10 min. Slow IV administration may reduce the incidence and severity of muscle rigidity, bradycardia, or hypotension. Neuromuscular blocking agents may be administered concurrently to decrease chest wall muscle rigidity.
- **Intermittent Infusion:** ***Diluent:*** May be diluted in D5W or 0.9% NaCl. ***Concentration:*** Up to 50 mcg/mL. ***Rate:*** see Direct IV.
- **Y-Site Compatibility:** acyclovir, alfentanil, alprostadil, amikacin, aminophylline, amiodarone, amphotericin cholesteryl, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bumetanide, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftozoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxapram , doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methotrimeprazine, methoxamine, methyldopate, methylpresnisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, pemetrexed,

penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, pipercaillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, scopolamine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin., vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole.

- **Y-Site Incompatibility:** azithromycin, dantrolene, diazoxide, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole.
- **Additive Compatibility:** bupivacaine, caffeine citrate, ropivacaine.

## Patient/Family Teaching

- Discuss the use of anesthetic agents and the sensations to expect with the patient before surgery.
- Explain pain assessment scale to patient.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Geri: Geriatric patients may be a greater risk for orthostatic hypotension and, consequently, falls. Teach patient to take precautions until drug effects have completely resolved.
- Medication causes dizziness and drowsiness. Advise patient to call for assistance during ambulation and transfer and to avoid driving or other activities requiring alertness for 24 hr after administration during outpatient surgery.
- Instruct patient to avoid alcohol or other CNS depressants for 24 hr after administration for outpatient surgery.

## Evaluation/Desired Outcomes

- General quiescence.
- Reduced motor activity.
- Pronounced analgesia.

HIGH ALERT

# fentanyl (transdermal)

(**fen**-ta-nil)

Duragesic

***Classification***

Therapeutic: opioid analgesics, anesthetic adjuncts

Pharmacologic: opioid agonists

**Schedule II**

**Pregnancy Category C**

## Indications

Moderate to severe chronic pain requiring continuous opioid analgesic therapy for an extended time at a dose of 25 mcg/hr or more of the transdermal system. Transdermal fentanyl is not recommended for the control of postoperative, mild, or intermittent pain, nor should it be used for short-term pain relief.

## Action

Binds to opiate receptors in the CNS, altering the response to and perception of pain. **Therapeutic Effects:** Decrease in severity of chronic pain.

## Pharmacokinetics

**Absorption:** Well absorbed (92% of dose) through skin surface under transdermal patch, creating a depot in the upper skin layers. Release from transdermal system into systemic circulation ↑ gradually to a constant rate, providing continuous delivery for 72 hr.

**Distribution:** Crosses the placenta; enters breast milk.

**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A4 enzyme system); 10–25% excreted unchanged by the kidneys.

**Half-life:** 17 hr after removal of a single application patch, ↑ to 21 hr after removal of multiple patches (because of continued release from deposition of drug in skin layers).

TIME/ACTION PROFILE (decreased pain)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Transdermal | 6 hr† | 12–24 hr | 72 hr‡ |

†Achievement of blood levels associated with analgesia. Maximal response and dose titration may take up to 6 days

‡While patch is worn

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to fentanyl or adhesives; Known intolerance; Acute pain (onset not rapid enough); Postoperative pain; Mild or intermittent pain; Alcohol intolerance (small amounts of alcohol released into skin); OB: Not recommended during labor and delivery; Lactation: May cause adverse affects in infant.

**Use Cautiously in:** Diabetes; Patients with severe pulmonary or hepatic disease; CNS tumors; ↑ intracranial pressure; Head trauma; Adrenal

insufficiency; Undiagnosed abdominal pain; Hypothyroidism; Alcoholism; Cardiac disease (particularly bradyarrhythmias); Fever or situations that increase body temperature (↑ release of fentanyl from delivery system); Titration period (additional analgesics may be required); Cachectic or debilitated patients (dose reduction suggested because of altered drug disposition); Pedi: Safety not established for children <2 yr; pediatric patients initiating therapy at 25 mcg/hr should be opioid tolerant and receiving at least 60 mg oral morphine equivalents per day; Geri: Dose reduction suggested due to altered drug disposition.

## Adverse Reactions/Side Effects

**CNS:** confusion, sedation, weakness, dizziness, restlessness. **Resp:** APNEA, bronchoconstriction, laryngospasm, respiratory depression. **CV:** bradycardia. **GI:** anorexia, constipation, dry mouth, nausea, vomiting. **Derm:** sweating, erythema. **Local:** application site reactions. **MS:** skeletal and thoracic muscle rigidity. **Misc:** physical dependence, psychological dependence.

## Interactions

**Drug-Drug:** Avoid use in patients who have received **MAO inhibitors** within the previous 14 days (may produce unpredictable, potentially fatal reactions). Concomitant use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **clarithromycin**, **nelfinavir**, **nefazodone**, **diltiazem**, **aprepitant**, **fluconazole**, **fosamprenavir**, **verapamil**, and **erythromycin** may result in ↑ plasma levels and ↑ risk of CNS and respiratory depression. Levels and effectiveness may be ↓ by **drugs that induce the CYP3A4 enzyme**. ↑ CNS and respiratory depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **sedative/hypnotics**, and other **opioids**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.
**Drug-Food: Grapefruit juice** is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

## Route/Dosage

**Transdermal (Adults):** 25 mcg/hr is the initial dose; patients who have not been receiving opioids should receive not more that 25 mcg/hr. To calculate the dose of transdermal fentanyl required in patients who are already receiving opioid analgesics, assess the 24-hr requirement of currently used opioid. Using the equianalgesic table in Appendix K, convert this to an equivalent amount of morphine/24 hr. Conversion to fentanyl transdermal may be accomplished by using the fentanyl conversion table (Appendix K). During dose titration, additional short-acting opioids should be available for any breakthrough pain that may occur. Morphine 10 mg IM or 60 mg PO q 4 hr (60 mg/24 hr IM or 360 mg/24 hr PO) is considered to be approximately equivalent to transdermal fentanyl 100 mcg/hr. Transdermal patch lasts 72 hr in most patients. Some patients require a new patch every 48 hr.
**Transdermal (Adults >60 yr, Debilitated, or Cachectic Patients):** Initial dose should be 25 mcg/hr unless previous opioid use was >135 mg morphine PO/day (or other opioid equivalent).

## Availability (generic available)

**Transdermal systems:** 12 mcg/hr, 25 mcg/hr, 50 mcg/hr, 75 mcg/hr, 100 mcg/hr.

# NURSING IMPLICATIONS

## Assessment

- Assess type, location, and intensity of pain before and 24 hr after application and periodically during therapy. Monitor pain frequently during initiation of therapy and dose changes to assess need for supplementary analgesics for breakthrough pain.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioid analgesics for pain do not develop psychological dependence.
- Progressively higher doses may be required to relieve pain with long-term therapy. It may take up to 6 days after increasing doses to reach equilibrium, so patients should wear higher dose through 2 applications before increasing dose again.
- Assess bowel function routinely. Prevent constipation with increased intake of fluids and bulk, and laxatives to minimize constipating effects.

Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.

- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Monitor patient closely; dose may need to be repeated or may need to be administered as an infusion because of long duration of action despite removal of patch.

## Potential Nursing Diagnoses

Chronic pain (Indications)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, confirm patient is opioid tolerant and clarify ambiguous orders; have second practitioner independently check original order and dose calculations.
- Duragesic-12 delivers 12.5 mcg/hr of fentanyl. Use supplemental doses of short-acting opioid analgesics to manage pain until relief is obtained with the transdermal system. Patients may continue to require supplemental opioids for breakthrough pain. If >100 mcg/hr is required, use multiple transdermal systems.
- Titrate dose based on patient's report of pain until adequate analgesia (50% reduction in patient's pain rating on numerical or visual analogue scale or patient reports satisfactory relief) is attained. Determine dose by calculating the previous 24-hr analgesic requirement and converting to the equianalgesic morphine dose using Appendix K. The conversion ratio from morphine to transdermal fentanyl is conservative; 50% of patients may require a dose increase after initial application. Increase after 3 days based on required daily doses of supplemental analgesics. Increases should be based on ratio of 45 mg/24 hr of oral morphine to 12.5 mcg/hr increase in transdermal fentanyl dose.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- To convert to another opioid analgesic, remove transdermal fentanyl system and begin treatment with half the equianalgesic dose of the new analgesic in 12–18 hr.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **Transdermal:** Apply system to flat, nonirritated, and nonirradiated site such as chest, back, flank, or upper arm. If skin preparation is necessary, use clear water and clip, do not shave, hair. Allow skin to dry completely before application. Apply immediately after removing from package. Do not alter the system (i.e., cut) in any way before application. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure contact is complete. Remove used system and fold so that adhesive edges are together. Flush system down toilet immediately on removal. Apply new system to a different site.

## Patient/Family Teaching

- Instruct patient in how and when to ask for and take pain medication.
- Instruct patient in correct method for application and disposal of transdermal system. Fatalities have occurred from children having access to improperly discarded patches. May be worn while bathing, showering, or swimming.
- May cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize dizziness.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Advise patient that fever, electric blankets, heating pads, saunas, hot tubs, and heated water beds increase the release of fentanyl from the patch.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

### Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness, respiratory status, or blood pressure.

## ferrous fumarate, See IRON SUPPLEMENTS.

## ferrous gluconate, See IRON SUPPLEMENTS.

## ferrous sulfate, See IRON SUPPLEMENTS.

## **ferumoxytol** (fer-u-**mox**-y-tole)

Feraheme

***Classification***

Therapeutic: antianemics
Pharmacologic: iron supplements

**Pregnancy Category C**

### Indications

Treatment of iron deficiency anemia in adult patients with chronic kidney disease (CKD).

### Action

Consists of a superparamagnetic iron oxide coated with a carbohydrate shell; when the iron-carbohydrate complex enters the reticuloendothelial system (RES), iron is released from the iron-carbohydrate complex within macrophages. This iron can either enter the intracellular storage iron pool or be transferred to erythroid precursor cells for incorporation into hemoglobin. **Therapeutic Effects:** Improvement in anemia in patients with chronic kidney disease.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability of iron-carboydrate complex, however iron is not liberated until incorporation into RES.
**Distribution:** Taken up by RES.
**Metabolism and Excretion:** Iron can either become part of intracellular ferritin or be transferred to erythroid precursor cells.
**Half-life:** 15 hr.

TIME/ACTION PROFILE (effect on anemia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | unknown | up to 1 mo |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Evidence of iron overload; Anemia not due to iron deficiency; Lactation: Avoid use during breastfeeding.
**Use Cautiously in:** MRI; Geri: Consider age-related decrease in hepatic, renal, or cardiac function, and concurrent diseases or other drug therapy; dose cautiously; OB: Use during pregnancy only if potential benefit justifies potential risk to the fetus.; Pedi: Safe and effective use in patients <18 yr not established.

### Adverse Reactions/Side Effects

**CNS:** dizziness. **CV:** hypertension, hypotension, peripheral edema. **GI:** constipation, diarrhea, nausea. **Hemat:** iron overload. **Misc:** hypersensitivity reactions including ANAPHYLAXIS AND ANAPHYLACTOID REACTIONS.

### Interactions

**Drug-Drug:** May ↓ absorption of concurrently administered **oral iron preparations**.

### Route/Dosage

**IV (Adults ≥ 18yr):** 510 mg initially, followed by a second 510-mg IV injection 3 to 8 days later. Course may be repeated after 1 mo.

### Availability

**Aqueous colloid for intravenous injection:** 510-mg elemental iron/17 mL (30 mg/mL) vials.

## NURSING IMPLICATIONS

### Assessment

- Assess nutritional status and dietary history to determine need for patient teaching.
- Assess bowel function for constipation or diarrhea. Notify health care professional and use appropriate measures should these occur.
- Monitor blood pressure frequently following administration until stable. May cause hypotension. For patients receiving hemodialysis, administer ferumoxytol once the blood pressure is stable and at least 1 hr of hemodialysis has been completed.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, urticaria, laryngeal edema, wheezing) for at least 30 min following injection. Notify health care professional immediately if these occur. Keep epinephrine and re-

suscitation equipment close by in the event of an anaphylactic reaction.
- Conduct MRI studies prior to administration. Alteration of MRI studies may persist for up to 3 mo following a dose; if imaging is required within 3 mo after administration, use T1- or proton density-weighted MR pulse sequences to decrease effects; MRI using T2-weighted pulse sequences should not be performed earlier than 4 weeks after administration; maximum alteration of vascular MRI is evident for 1–2 days after dose. Ferumoxytol does not interfere with x-ray, computed tomography (CT), or positron emission tomography (PET), single photon emission computed tomography (SPECT), ultrasound, or nuclear imaging.
- ***Lab Test Considerations:*** Monitor hemoglobin, ferritin, iron and transferrin saturation prior to and at least 1 mo following second dose and regularly thereafter. Iron and transferrin bound iron may be overestimated within first 24 hr by measuring iron in the *Ferebeme* complex.

### Potential Nursing Diagnoses
Activity intolerance

### Implementation
- **Intermittent Infusion:** Administer undiluted. Do not administer solutions that are discolored or contain particulate matter. Solution may be stored at room temperature. ***Rate:*** Administer at a rate of 1 mL/sec (30 mg/sec).

### Patient/Family Teaching
- Explain purpose of iron therapy to patient.
- Advise patients to avoid MRI studies during and for 3 mo following ferumoxytol therapy.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to report signs and symptoms of hypersensitivity reactions (rash, itching, dizziness, swelling, and breathing problems) to health care professional immediately.

### Evaluation/Desired Outcomes
- Improvement in iron deficiency anemia.

## fesoterodine
(fee-soe-**ter**-o-deen)
Toviaz

***Classification***
Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

**Pregnancy Category C**

### Indications
Treatment of overactive bladder function that results in urinary frequency, urgency, or urge incontinence.

### Action
Acts as a competitive muscarinic receptor antagonist resulting in inhibition of cholinergically mediated bladder contraction. **Therapeutic Effects:** Decreased urinary frequency, urgency, and urge incontinence.

### Pharmacokinetics
**Absorption:** Rapidly absorbed following oral administration, but is rapidly converted to its active metabolite (bioavailability of metabolite 52%; further metabolism occurs in the liver via CYP2D6 and CYP3A4 enzyme systems. 16% of active metabolite is excreted in urine, most of the remainder of inactive metabolites are renally excreted. 7% excreted in feces.
**Distribution:** Unknown.
**Metabolism and Excretion:** Rapidly converted by esterases to active metabolite.
**Half-life:** 7 hr (following oral administration).

TIME/ACTION PROFILE (active metabolite)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 5 hr | 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Urinary retention; Gastric retention; Severe hepatic impairment; Uncontrolled narrow-angle glaucoma.
**Use Cautiously in:** Significant bladder outlet obstruction (↑ risk of retention); Severe renal insufficiency (dose adjustment required); Decreased GI motility including severe constipation; Treated narrow-angle glaucoma (use only if benefits outweigh risks); Myasthenia gravis; Severe renal impairment (dose should not exceed 4 mg/day); Geri: ↑ risk of anticholinergic side effects in patients >75 yr; OB, Lactation: Avoid using unless potential benefits outweighs potential risk to fetus/neonate; Pedi: Safety in children not established.

### Adverse Reactions/Side Effects
**CV:** tachycardia (dose related). **GI:** dry mouth, constipation, nausea, upper abdominal pain. **GU:** dysuria, urinary retention. **MS:** back pain.

### Interactions
**Drug-Drug:** Concurrent use of **potent CYP3A4 enzyme inhibitors** including **ketoconazole**, **itraconazole**, and **clarithromycin** ↑ blood levels and risk of toxicity; daily dose should not exceed 4 mg. Use **less potent inhibitors of**

**CYP3A4** (such as **erythromycin**) with caution; escalate dose carefully. Anticholinergic effects may alter the GI absorption of other drugs.

### Route/Dosage

**PO (Adults):** 4 mg once daily initially may be increased to 8 mg/daily; *concurrent potent CYP3A4 inhibitors or CCr <30 mL/min*—dose should not exceed 4 mg/day.

### Availability

**Extended-release tablets:** 4 mg, 8 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for urinary urgency, frequency, and urge incontinence periodically throughout therapy.
- ***Lab Test Considerations:*** May cause ↑ ALT and GGT.

### Potential Nursing Diagnoses

Impaired urinary elimination (Indications)
Urinary retention (Indications)

### Implementation

- **PO:** Administer without regard to food.
- Extended-release tablets should be swallowed whole; do not break, crush, or chew.

### Patient/Family Teaching

- Instruct patient to take fesoterodine as directed. If a dose is missed, omit and begin taking again the next day; do not take 2 doses the same day. Advise patient to read the *Patient Information* sheet prior to initiation of therapy and with each Rx refill.
- May cause drowsiness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol; may increase drowsiness.
- Advise patient to use caution in hot environments; may cause decreased sweating and severe heat illness.
- Instruct patient to consult health care professional before taking other Rx, OTC, or herbal products.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

### Evaluation/Desired Outcomes

- Decreased urinary frequency, urgency, and urge incontinence.

## fexofenadine

(fex-oh-**fen**-a-deen)
Allegra

***Classification***
Therapeutic: allergy, cold, and cough remedies, antihistamines

**Pregnancy Category C**

F

### Indications

Relief of symptoms of seasonal allergic rhinitis. Management of chronic idiopathic urticaria.

### Action

Antagonizes the effects of histamine at peripheral histamine–1 ($H_1$) receptors, including pruritus and urticaria. Also has a drying effect on the nasal mucosa. **Therapeutic Effects:** Decreased sneezing, rhinorrhea, itchy eyes, nose, and throat associated with seasonal allergies. Decreased urticaria.

### Pharmacokinetics

**Absorption:** Rapidly absorbed after oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** 80% excreted in urine, 11% excreted in feces.
**Half-life:** 14.4 hr (increased in renal impairment).

TIME/ACTION PROFILE (antihistaminic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 1 hr | 2–3 hr | 12–24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Impaired renal function (increased dosing interval recommended); OB: use only if maternal benefit outweighs potential risk to fetus; Lactation: Usually compatible with breastfeeding (AAP).

### Adverse Reactions/Side Effects

**CNS:** drowsiness, fatigue. **GI:** dyspepsia. **Endo:** dysmenorrhea.

### Interactions

**Drug-Drug: Magnesium and aluminum-containing antacids** ↓ absorption and may decrease effectiveness.
**Drug-Food: Apple**, **orange**, and **grapefruit juice** ↓ absorption and may decrease effectiveness.

### Route/Dosage

**PO (Adults and Children ≥12 yr):** 60 mg twice daily, or 180 mg once daily.
**PO (Children 2–11 yr):** 30 mg twice daily.
**PO (Children 6 mo–2 yr):** 15 mg twice daily.

### Renal Impairment

**PO (Adults):** 60 mg once daily as a starting dose.
**PO (Children 6–11 yr):** 30 mg once daily as a starting dose.

### Availability (generic available)

**Tablets:** 30 mg, 60 mg, 180 mg. **Cost:** *Generic*—30 mg $49.97/90, 60 mg $99.97/90, 180 mg $161.97/90. **Suspension (raspberry–cream):** 30 mg/5 mL in 30-mL and 300-mL bottles. **Cost:** $59.07/300 mL. ***In combination with:*** pseudoephedrine (Allegra-D). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** Will cause false-negative reactions on allergy skin tests; discontinue 3 days before testing.

### Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

### Implementation

- **PO:** Administer with food or milk to decrease GI irritation. Capsules and tablets should be taken with water or milk, not juice.

### Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose.
- Inform patient that drug may cause drowsiness, although it is less likely to occur than with other antihistamines. Avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to contact health care professional if symptoms persist.

### Evaluation/Desired Outcomes

- Decrease in allergic symptoms.
- Decrease in urticaria.

## filgrastim (fil-gra-stim)

Neupogen, G-CSF, granulocyte colony stimulating factor

***Classification***
Therapeutic: colony-stimulating factors

**Pregnancy Category C**

### Indications

Prevention of febrile neutropenia and associated infection in patients who have received bone marrow–depressing antineoplastics for the treatment of nonmyeloid malignancies. Reduction of time for neutrophil recovery and duration of fever in patients undergoing induction and consolidation chemotherapy for acute myelogenous leukemia. Reduction of time to neutrophil recovery and sequelae of neutropenia in patients with nonmyeloid malignancies undergoing myeloablative chemotherapy followed by bone marrow transplantation. Mobilization of hematopoietic progenitor cells into peripheral blood for collection by leukapheresis. Management of severe chronic neutropenia. **Unlabeled Use:** Neutropenia associated with HIV infection. Neonatal neutropenia.

### Action

A glycoprotein, filgrastim binds to and stimulates immature neutrophils to divide and differentiate. Also activates mature neutrophils. **Therapeutic Effects:** Decreased incidence of infection in patients who are neutropenic from chemotherapy or other causes. Improved harvest of progenitor cells for bone marrow transplantation.

### Pharmacokinetics

**Absorption:** Well absorbed after subcut administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** *Adults*–3.5 hr; *Neonates*-4.4 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV, subcut | unknown | unknown | 4 days† |

†Return of neutrophil count to baseline

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to filgrastim or *Escherichia coli*–derived proteins.
**Use Cautiously in:** Malignancy with myeloid characteristics; Pre-existing cardiac disease; OB: Use only potential benefit justifies potential risk to fetus; Lactation: Unlikely to adversely affect breastfed infant (NIH).

### Adverse Reactions/Side Effects
**Hemat:** excessive leukocytosis. **Local:** pain, redness at subcut site. **MS:** medullary bone pain.

### Interactions
**Drug-Drug:** Simultaneous use with **antineoplastics** may have adverse effects on rapidly proliferating neutrophils—avoid use for 24 hr before and 24 hr after chemotherapy. **Lithium** may potentiate the release of neutrophils; concurrent use should be undertaken cautiously.

### Route/Dosage

### After Myelosuppressive Chemotherapy
**IV, Subcut (Adults and Children):** 5 mcg/kg/day as a single injection daily for up to 2 wk. Dosage may be increased by 5 mcg/kg during each cycle of chemotherapy, depending on blood counts.

### After Bone Marrow Transplantation
**IV, Subcut (Adults):** 10 mcg/kg/day as a 4- or 24-hr IV infusion or as a continuous subcut infusion; initiate at least 24 hr after chemotherapy and at least 24 hr after bone marrow transplantation. Subsequent dosage is adjusted according to blood counts.

### Peripheral Blood Progenitor Cell Collection and Therapy
**Subcut (Adults):** 10 mcg/kg/day as a bolus or continuous infusion for at least 4 days before first leukapheresis and continued until last leukapheresis; dosage modification suggested if WBC >100,000 cells/mm$^3$.

### Severe Chronic Neutropenia
**Subcut (Adults):** *Congenital neutropenia*—6 mcg/kg twice daily. *Idiopathic/cyclical neutropenia*—5 mcg/kg daily (decrease if ANC remains >10,000/mm$^3$).

### Neonatal neutropenia
**IV, Subcut (Neonates):** 5–10 mcg/kg/day once daily for 3–5 days.

### Availability
**Injection:** 300 mcg/mL in 1- and 1.6-mL vials.

## NURSING IMPLICATIONS

### Assessment
- Monitor heart rate, blood pressure, and respiratory status before and periodically during therapy.
- Assess bone pain throughout therapy. Pain is usually mild to moderate and controllable with nonopioid analgesics, but may require treatment with opioid analgesics, especially in patients receiving high-dose IV therapy.
- ***Lab Test Considerations:*** *After chemotherapy,* obtain a CBC with differential, including examination for the presence of blast cells, and platelet count before chemotherapy and twice weekly during therapy to avoid leukocytosis. Monitor ANC. A transient rise is seen 1–2 days after initiation of therapy, but therapy should not be discontinued until ANC >10,000/mm$^3$.
- *After bone marrow transplant,* the daily dose is titrated by the neutrophil response. When the ANC is >1000/mm$^3$ for 3 consecutive days, the dose should be reduced by 5 mcg/kg/day. If the ANC remains >1000/mm$^3$ for 3 or more consecutive days, filgrastim is discontinued. If the ANC decreases to <1000/mm$^3$, filgrastim should be resumed at 5 mcg/kg/day.
- *For chronic severe neutropenia,* monitor CBC with differential and platelet count twice weekly during initial 4 wk of therapy and during 2 wk after any dose adjustment.
- May cause ↓ platelet count and transient increases in uric acid, LDH, and alkaline phosphatase concentrations.

### Potential Nursing Diagnoses
Risk for infection (Indications)
Acute pain (Side Effects)

### Implementation
- Administer no earlier than 24 hr after cytotoxic chemotherapy, at least 24 hr after bone marrow infusion, and not during the 24 hr before administration of chemotherapy.
- Refrigerate; do not freeze. Do not shake. May warm to room temperature for up to 6 hr before injection. Discard if left at room temperature for >6 hr. Vial is for 1-time use only.
- **Subcut:** If dose requires >1 mL of solution, may be divided into 2 injection sites.
- May also be administered as a continuous subcut infusion over 24 hr after bone marrow transplantation.

#### IV Administration
- **Continuous Infusion:** ***Diluent:*** Dilute in D5W. Refrigerate; do not freeze. Do not shake. May warm to room temperature for up to 6 hr before injection. Vial is for 1-time use only. ***Concentration:*** Dilute to a final concentration of at least 15 mcg/mL. If the final concen-

tration is <15 mcg/mL, human albumin in a concentration of 2 mg/mL must be added to D5W before filgrastim to prevent adsorption of the components of the drug delivery system.
***Rate:*** *After chemotherapy* dose is administered via infusion over 15–60 min.
- *After chemotherapy* dose may also be administered as a continuous infusion.
- *After bone marrow transplant,* dose should be administered as an infusion over 4 or 24 hr.
- **Y-Site Compatibility:** acyclovir, allopurinol, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotetan, ceftazidime, chlorpromazine, cimetidine, cisplatin, cyclophosphamide, cytarabine, dacarbazine, daunorubicin, dexamethasone, diphenhydramine, doxorubicin, doxycycline, droperidol, enalaprilat, famotidine, floxuridine, fluconazole, fludarabine, ganciclovir, granisetron, haloperidol, hydrocortisone, hydromorphone, idarubicin, ifosfamide, leucovorin calcium, lorazepam, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, mitoxantrone, morphine, nalbuphine, ondansetron, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** amphotericin B, cefepime., cefotaxime, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, clindamycin, dactinomycin, etoposide, fluorouracil, furosemide, heparin, mannitol, methylprednisolone sodium succinate, metronidazole, mitomycin, piperacillin, prochlorperazine, thiotepa.

## Patient/Family Teaching
- **Home Care Issues:** Instruct patient on correct technique and proper disposal for home administration. Caution patient not to reuse needle, vial, or syringe. Provide patient with a puncture-proof container for needle and syringe disposal.

## Evaluation/Desired Outcomes
- Decreased incidence of infection in patients who receive bone marrow–depressing antineoplastics.
- Reduction of duration and sequelae of neutropenia after bone marrow transplantation.
- Reduction of the incidence and duration of sequelae of neutropenia in patients with severe chronic neutropenia.
- Improved harvest of progenitor cells for bone marrow transplantation.

# finasteride (fi-nas-teer-ide)
Propecia, Proscar

***Classification***
Therapeutic: hair regrowth stimulants
Pharmacologic: androgen inhibitors

**Pregnancy Category X**

## Indications
Benign prostatic hyperplasia (BPH); can be used with doxazosin. Androgenetic alopecia (male pattern baldness) in men only.

## Action
Inhibits the enzyme 5-alpha-reductase, which is responsible for converting testosterone to its potent metabolite 5-alpha-dihydrotestosterone in prostate, liver, and skin; 5-alpha-dihydrotestosterone is partially responsible for prostatic hyperplasia and hair loss. **Therapeutic Effects:** Reduced prostate size with associated decrease in urinary symptoms. Decreases hair loss; promotes hair regrowth.

## Pharmacokinetics
**Absorption:** Well absorbed after oral administration (63%).
**Distribution:** Enters prostatic tissue and crosses the blood-brain barrier. Remainder of distribution not known.
**Protein Binding:** 90%.
**Metabolism and Excretion:** Mostly metabolized; 39% excreted in urine as metabolites; 57% excreted in feces.
**Half-life:** 6 hr (range 6–15 hr; slightly increased in patients >70 yr).

TIME/ACTION PROFILE (reduction in dihydrotestosterone levels†)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 8 hr | 2 wk |

†Clinical effects as noted by urinary tract symptoms and hair regrowth may not be evident for several months and remain for 4 mo after discontinuation

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Women.
**Use Cautiously in:** Patients with hepatic impairment or obstructive uropathy.

## Adverse Reactions/Side Effects
**GU:** decreased libido, decreased volume of ejaculate, erectile dysfunction.

### Interactions
**Drug-Drug:** None noted.

### Route/Dosage
**PO (Adults):** *BPH*—5 mg once daily (Proscar); *androgenetic alopecia*—1 mg/day (Propecia).

### Availability (generic available)
**Tablets:** 1 mg (Propecia), 5 mg (Proscar). **Cost:** *Propecia*—1 mg $177.97/90; *Generic*—5 mg $199.98/90.

## NURSING IMPLICATIONS

### Assessment
- Assess for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Digital rectal examinations should be performed before and periodically during therapy for BPH.
- ***Lab Test Considerations:*** Serum prostate-specific antigen (PSA) concentrations, which are used to screen for prostate cancer, may be evaluated before and periodically during therapy. Finasteride may cause a ↓ in serum PSA levels.

### Potential Nursing Diagnoses
Impaired urinary elimination (Indications)

### Implementation
- **PO:** Administer once daily with or without meals.

### Patient/Family Teaching
- Instruct patient to take finasteride as directed, even if symptoms improve or are unchanged. At least 6–12 mo of therapy may be necessary to determine whether or not an individual will respond to finasteride.
- Inform patient that the volume of ejaculate may be decreased during therapy but that this will not interfere with normal sexual function. Sexual dysfunction side effects will diminish over time.
- Caution patient that finasteride poses a potential risk to a male fetus. Women who are pregnant or may become pregnant should avoid exposure to semen of a partner taking finasteride and should not handle crushed finasteride because of the potential for absorption.
- Emphasize the importance of periodic follow-up exams to determine whether a clinical response has occurred.

### Evaluation/Desired Outcomes
- Decrease in urinary symptoms of benign prostatic hyperplasia.
- Hair regrowth in androgenetic alopecia. Evidence of hair growth usually requires 3 mo or longer. Continued use is recommended to sustain benefit. Withdrawal leads to reversal of effect within 12 mo.

F

## flecainide (flek-a-nide)
Tambocor

***Classification***
Therapeutic: antiarrhythmics (class IC)

**Pregnancy Category C**

### Indications
Life-threatening ventricular arrhythmias, including ventricular tachycardia. Supraventricular tachyarrhythmias including: Paroxysmal supraventricular tachycardia (PSVT), Paroxysmal atrial fibrillation/flutter (PAF). **Unlabeled Use:** Single dose treatment of atrial fibrillation.

### Action
Slows conduction in cardiac tissue by altering transport of ions across cell membranes. **Therapeutic Effects:** Suppression of arrhythmias.

### Pharmacokinetics
**Absorption:** Well absorbed from the GI tract following oral administration.
**Distribution:** Widely distributed.
**Metabolism and Excretion:** Mostly metabolized by liver; 30% excreted unchanged by kidneys.
**Half-life:** 11–14 hr.

TIME/ACTION PROFILE (antiarrhythmic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | days | days–weeks | 12 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Cardiogenic shock.
**Use Cautiously in:** CHF (dosage reduction may be required); Pre-existing sinus node dysfunction or 2nd- or 3rd-degree heart block (without a pacemaker); Renal impairment (dosage reduc-

tion required if CCr <35 mL/min); OB: Teratogenic in animal studies; use only if potential benefit justifies potential risk to fetus; Lactation: Usually compatible with breast feeding (AAP).

### Adverse Reactions/Side Effects

**CNS:** dizziness, anxiety, fatigue, headache, mental depression. **EENT:** blurred vision, visual disturbances. **CV:** ARRHYTHMIAS, CHEST PAIN, CHF. **GI:** anorexia, constipation, drug-induced hepatitis, nausea, stomach pain, vomiting. **Derm:** rashes. **Neuro:** tremor.

### Interactions

**Drug-Drug:** ↑ risk of arrhythmias with other **antiarrhythmics**, including **calcium channel blockers**. **Disopyramide**, **beta blockers**, or **verapamil** may have ↑ myocardial depressant effects; combination use should be undertaken cautiously. **Amiodarone** doubles serum flecainide levels (↓ flecainide dose by 50%). Increases serum **digoxin** levels by a small amount (15–25%). Concurrent **beta blocker** therapy may cause ↑ levels of beta blocker and flecainide. **Alkalinizing agents** promote reabsorption, ↑ blood levels, and may cause toxicity. **Acidifying agents** ↑ renal elimination and may ↓ effectiveness of flecainide (if urine pH <5).

**Drug-Food: Foods that ↑ urine pH** to >7 result in ↑ levels (strict **vegetarian diet**). **Foods or beverages that ↓ urine pH** to <5 ↑ renal elimination and may ↓ effectiveness of flecainide **(acidic juices)**.

### Route/Dosage

#### Ventricular Tachycardia

**PO (Adults):** 100 mg q 12 hr initially, increased by 50 mg bid until response is obtained or maximum total daily dose of 400 mg is reached. Some patients may require q 8 hr dosing.

#### Renal Impairment

**PO (Adults):** *CCr <35 mL/min*—100 mg once a day or 50 mg q 12 hr initially; further dosing on the basis of frequent blood level monitoring.

#### PSVT/PAF

**PO (Adults):** 50 mg q 12 hr initially, increased by 50 mg bid until response is obtained or maximum total daily dose of 300 mg is reached. Some patients may require q 8 hr dosing.

#### Atrial Fibrillation (unlabeled)

**PO (Adults):** 200 mg or 300 mg single dose.

### Availability (generic available)

**Tablets:** 50 mg, 100 mg, 150 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor ECG or Holter monitor prior to and periodically during therapy. May cause QRS widening, PR prolongation, and QT prolongation.
- Monitor blood pressure and pulse periodically during therapy.
- Monitor intake and output ratios and daily weight. Assess patient for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Evaluate renal, pulmonary, and hepatic functions and CBC periodically on patients receiving long-term therapy. Flecainide should be discontinued if bone marrow depression occurs.
- May cause ↑ in serum alkaline phosphatase during prolonged therapy.
- ***Toxicity and Overdose:*** Therapeutic blood levels range from 0.2 to 1.0 mcg/mL. Monitor plasma trough levels frequently during dose adjustment in patients with severe renal or hepatic disease or in patients with CHF and moderate renal impairment.

### Potential Nursing Diagnoses

Decreased cardiac output (Adverse Reactions)

### Implementation

- Previous antiarrhythmic therapy (except lidocaine) should be withdrawn 2–4 half-lives before starting flecainide.
- Therapy should be initiated in a hospital setting to monitor for increase in arrhythmias.
- Dose adjustments should be at least 4 days apart because of the long half-life of flecainide.
- **PO:** May be administered with meals if GI irritation becomes a problem.

### Patient/Family Teaching

- Instruct patient to take medication around the clock as directed at evenly spaced intervals, even if feeling better. Take missed doses as soon as remembered if within 6 hr; omit if remembered later. Gradual dosage reduction may be necessary.
- May cause dizziness or visual disturbances. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional if chest pain, shortness of breath, or diaphoresis occurs.

- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.

### Evaluation/Desired Outcomes

- Decrease in frequency of life-threatening ventricular arrhythmias.
- Decrease in supraventricular tachyarrhythmias.

## fluconazole (floo-kon-a-zole)

Diflucan

***Classification***

Therapeutic: antifungals (systemic)

**Pregnancy Category C**

### Indications

**PO, IV:** Fungal infections caused by susceptible organisms, including: Oropharyngeal or esophageal candidiasis , Serious systemic candidal infections, Urinary tract infections, Peritonitis, Cryptococcal meningitis. Prevention of candidiasis in patients who have undergone bone marrow transplantation. **PO:** Single-dose oral treatment of vaginal candidiasis. **Unlabeled Use:** Prevention of recurrent vaginal yeast infections.

### Action

Inhibits synthesis of fungal sterols, a necessary component of the cell membrane. **Therapeutic Effects:** Fungistatic action against susceptible organisms. May be fungicidal in higher concentrations. **Spectrum:** *Cryptococcus neoformans*. *Candida* spp.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration.
**Distribution:** Widely distributed, good penetration into CSF, saliva, sputum, vaginal fluid, skin, eye, and peritoneum. Excreted in breast milk.
**Metabolism and Excretion:** >80% excreted unchanged by the kidneys; <10% metabolized by the liver.
**Half-life:** Premature neonates: 46–74 hr; Children: 19–25 hr (PO) and 15–17 hr (IV); Adults: 30 hr (increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2–4 hr | 24 hr |
| IV | rapid | end of infusion | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to fluconazole or other azole antifungals; Concurrent use with pimozide.
**Use Cautiously in:** Renal impairment (dose reduction required if CCr <50 mL/min); Underlying liver disease; OB: Safety not established; Lactation: Usually compatible with breastfeeding (AAP); Geri: Increased risk of adverse reactions (rash, vomiting, diarrhea, seizures); consider age-related decrease in renal function in determining dose.

### Adverse Reactions/Side Effects

Incidence of adverse reactions is increased in HIV patients.
**CNS:** headache, dizziness, seizures. **GI:** HEPATOTOXICITY, abdominal discomfort, diarrhea, nausea, vomiting. **Derm:** exfoliative skin disorders including STEVENS-JOHNSON SYNDROME. **Endo:** hypokalemia, hypertriglyceridemia. **Misc:** allergic reactions,including ANAPHYLAXIS.

### Interactions

**Drug-Drug:** ↑ activity of **warfarin**. **Rifampin**, **rifabutin**, and **isoniazid** ↓ levels. Fluconazole at doses >200 mg/day may inhibit the CYP3A4 enzyme system and effect the activity of drugs metabolized by this system. ↑ hypoglycemic effects of **tolbutamide**, **glyburide**, or **glipizide**. ↑ levels and risk of toxicity from **cyclosporine**, **rifabutin**, **tacrolimus**, **theophylline**, **zidovudine**, **alfentanil**, and **phenytoin**. ↑ levels and effects of **benzodiazepines**, **zolpidem**, **bispirone**, **nisoldipine**, **tricyclic antidepressants**, and **losartan**. May ↑ risk of bleeding with **warfarin**. May antagonize effects of **amphotericin B**.

### Route/Dosage

### Oropharyngeal Candidiasis

**PO, IV (Adults):** 200 mg initially, then 100 mg daily for at least 2 wk.
**PO, IV (Children >14 days):** 6 mg/kg initially, then 3 mg/kg/day for at least 2 wk.
**PO, IV (Neonates < 14 days, 30–36 weeks gestation):** same dose as older children except frequency is q 48 hr; Premature neonates < 29 weeks gestation: 5–6 mg/kg/dose q 48–72 hr.

### Esophageal Candidiasis

**PO, IV (Adults):** 200 mg initially, then 100 mg once daily for at least 3 wk (up to 400 mg/day).
**PO, IV (Children >14 days):** 6 mg/kg initially, then 3–12 mg/kg/day for at least 3 wk.
**PO, IV (Neonates < 14 days, 30–36 weeks gestation):** same dose as older children except frequency is q 48 hr; Premature neonates < 29 weeks gestation: 5–6 mg/kg/dose q 48–72 hr.

### Vaginal Candidiasis

**PO (Adults):** 150-mg single dose; prevention of recurrence (unlabeled)—150 mg daily for 3 days then weekly for 6 mo.

### Systemic Candidiasis

**PO, IV (Adults):** 400 mg/day initially, then 200–800 mg/day for 28 days.
**PO, IV (Children > 14 days):** 6–12 mg/kg/day for 28 days.
**PO, IV (Neonates < 14 days, 30–36 weeks gestation):** same dose as older children except frequency is q 48 hr; Premature neonates <29 weeks gestation: 5–6 mg/kg/dose q 48–72 hr.

### Cryptococcal Meningitis

**PO, IV (Adults):** *Treatment*—400 mg once daily until favorable clinical response, then 200–800 mg once daily for at least 10–12 wk after clearing of CSF; change to oral therapy as soon as possible. *Suppressive therapy*—200 mg once daily.
**PO, IV (Children >14 days):** 12 mg/kg/day initially, then 6–12 mg/kg/day for at least 10–12 wk after clearing of CSF; change to oral therapy as soon as possible. *Suppressive therapy*—6 mg/kg/day.
**PO, IV (Neonates < 14 days, 30–36 weeks gestation):** same dose as older children except frequency is q 48 hr; Premature neonates <29 weeks gestation: 5–6 mg/kg/dose q 48–72 hr.

### Prevention of Candidiasis after Bone Marrow Transplant

**PO, IV (Adults):** 400 mg once daily; begin several days before procedure if severe neutropenia is expected, and continue for 7 days after ANC >1000 /mm$^3$.
**PO, IV (Children >14 days):** 10–12 mg/kg/day, not to exceed 600 mg/day.

### Renal Impairment

**PO, IV (Adults):** *CCr 11–50 mL/min*—50% of the usual dose.

### Availability (generic available)

**Tablets:** 50 mg, 100 mg, 150 mg, 200 mg. **Cost:** *Generic*—100 mg $109.99/30, 150 mg $167.19/12, 200 mg $247.57/30. **Oral suspension (orange flavor):** 10 mg/mL in 35-mL bottle, 40 mg/mL in 35-mL bottle. **Cost:** $25.99/35 mL. **Premixed infusion:** 2 mg/mL in 100- or 200-mL bottles/containers.

## NURSING IMPLICATIONS

### Assessment

- Assess infected area and monitor CSF cultures before and periodically during therapy.
- Specimens for culture should be taken before instituting therapy. Therapy may be started before results are obtained.
- ***Lab Test Considerations:*** Monitor BUN and serum creatinine before and periodically during therapy; patients with renal dysfunction will require dose adjustment.
- Monitor liver function tests before and periodically during therapy. May cause ↑ AST, ALT, serum alkaline phosphate, and bilirubin concentrations.

### Potential Nursing Diagnoses

Risk for infection (Indications)

### Implementation

- Do not confuse Diflucan (fluconazole) with Diprivan (propofol).
- **PO:** Shake oral suspension well before administration.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Premixed infusions are pre-diluted and ready to use. Do not unwrap until ready to use. Do not administer solution that is cloudy or has a precipitate. Check for leaks by squeezing inner bag. If leaks are found, discard container as unsterile. ***Concentration:*** 2 mg/mL. ***Rate:*** Infuse over 1–2 hr. Do not exceed a rate of 200 mg/hr. Pedi: For children receiving doses > 6 mg/kg/day, give over 2 hr.
- **Y-Site Compatibility:** acyclovir, aldesleukin, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, ampicillin/sulbactam, atropine, aztreonam, benztropine, bivalirudin, bumetanide, calcium chloride, caspofungin, cefazolin, cefepime, cefoxitin, ceftizoxime, cimetidine, cisatracurium, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, doxycycline, droperidol, drotrecogin, enalaprilat, epinephrine, ertapenem, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, foscarnet, ganciclovir, gemcitabine,

gentamicin, granisetron, heparin, hydrocortisone, hydromorphone, insulin, isoproterenol, immune globulin, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, melphanan, magnesium sulfate, meperidine, meropenem, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, morphine, nafcillin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, paclitaxel, palonosetron, pancuronium, pemetrexed, penicillin G potassium, phenytoin, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinapristin-dalfopristin, ranitidine, remifentanil, sargramostim, sodium bicarbonate, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B, amphotericin B cholesteryl sulfate, ampicillin, calcium gluconate, cefotaxime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, diazepam, digoxin, furosemide, haloperidol, hydroxyzine, imipenem/cilastatin, pantoprazole, pentamidine, trimethoprim/sulfamethoxazole.

## Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Doses should be taken at the same time each day. Take missed doses as soon as remembered, but not if almost time for next dose. Do not double doses.
- Instruct patient to notify health care professional if skin rash, abdominal pain, fever, or diarrhea becomes pronounced, if signs and symptoms of liver dysfunction (unusual fatigue, anorexia, nausea, vomiting, jaundice, dark urine, or pale stools) occur, if unusual bruising or bleeding occur, or if no improvement is seen within a few days of therapy.

## Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Full course of therapy may require weeks or months of treatment after resolution of symptoms.
- Prevention of candidiasis in patients who have undergone bone marrow transplantation.
- Decrease in skin irritation and vaginal discomfort in patients with vaginal candidiasis. Diagnosis should be reconfirmed with smears or cultures before a second course of therapy to rule out other pathogens associated with vulvovaginitis. Recurrent vaginal infections may be a sign of systemic illness.

HIGH ALERT

# fludarabine (floo-dar-a-been)

Fludara, Oforta

F

***Classification***

Therapeutic: antineoplastics
Pharmacologic: antimetabolites

**Pregnancy Category D**

## Indications

B-cell chronic lymphocytic leukemia unresponsive to standard therapy. **Unlabeled Use:** Non-Hodgkin's lymphoma.

## Action

Converted intracellularly to an active phosphorylated metabolite that inhibits DNA synthesis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

## Pharmacokinetics

**Absorption:** Bioavailability of active metabolite, 2–fluoro-ara-A, is 50–65%.
**Distribution:** Extensively distributed.
**Metabolism and Excretion:** Following administration, rapidly converted to an active metabolite (2–fluoro-ara-A), which, when phosphorylated intracellularly, exerts antineoplastic activity; 40% of initial active metabolite excreted unchanged by the kidneys.
**Half-life:** 20 hr (for initial active metabolite).

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 13–16 days | unknown |
| IV | 7 wk† | 13–16 days | unknown |

†Median time to response

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to fludarabine, mannitol, or sodium hydroxide; Patients taking pentostatin; OB, Lactation: Pregnancy or lactation; Severe renal impairment (CCr <30 mL/min) (for intravenous).
**Use Cautiously in:** Moderate renal impairment (↓ dose if CCr <70 mL/min); OB: Patients with childbearing potential; Bone marrow depression; Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** NEUROTOXICITY, fatigue, agitation, coma, confusion, headache, malaise, weakness. **EENT:** hearing loss, visual disturbances. **Resp:** PULMONARY HYPERSENSITIVITY, cough, pneumonia, dyspnea, sinusitis. **CV:** edema. **GI:** GI BLEEDING, diarrhea, nausea, anorexia, esophagitis, mucositis, stomatitis, vomiting. **GU:** dysuria, hematuria, urinary tract infection. **Derm:** rashes. **Endo:** gonadal suppression. **Hemat:** PANCYTOPENIA, anemia, leukopenia, thrombocytopenia, hemolytic anemia. **MS:** myalgia. **Neuro:** peripheral neuropathy. **Misc:** fever, tumor lysis syndrome.

### Interactions

**Drug-Drug:** ↑ bone marrow suppression with other **antineoplastics** or **radiation therapy**. Concomitant use with **pentostatin** ↑ risk of potentially fatal pulmonary toxicity (concurrent use not recommended).

### Route/Dosage

**PO (Adults):** 40 mg/m² daily for 5 days; repeat course every 28 days.
**IV (Adults):** 25 mg/m² daily for 5 days; repeat course every 28 days.

#### Renal Impairment

**PO, IV (Adults):** *CCr 30–70 mL/min*— ↓ dose by 20%.

#### Renal Impairment

**PO (Adults):** *CCr <30 mL/min*— ↓ dose by 50%.

### Availability

**Tablets:** 10 mg. **Powder for injection:** 50 mg/vial. **Solution for injection:** 25 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for visual changes, weakness, confusion, and changes in level of consciousness during and for 60 days following therapy, as neurologic effects resulting in blindness, coma, and death have been reported. Therapy may be delayed or discontinued if neurotoxicity occurs.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor respiratory status, intake and output ratios, and daily weights. Report significant changes or symptoms of pulmonary hypersensitivity (cough, fever, shortness of breath).
- Assess nutritional status. Administering an antiemetic prior to and periodically during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- May cause tumor lysis syndrome, resulting in hyperuricemia, hyperphosphatemia, hypocalcemia, metabolic acidosis, hyperkalemia, hematuria, urate crystalluria, and renal failure. Monitor for flank pain and hematuria. Uric acid nephropathy may be prevented by adequate oral hydration. Allopurinol and alkalization of the urine may also be used to treat elevated uric acid concentrations.
- ***Lab Test Considerations:*** Monitor CBC with differential prior to and frequently during therapy. The nadir for leukopenia occurs in 13 days (range 3–25 days) and for thrombocytopenia in 16 days (range 2–32 days) after administration.
- Monitor serum uric acid concentrations periodically during therapy; may be ↑ as part of tumor lysis in patients with large tumor burdens.
- May cause ↑ AST and serum alkaline phosphatase concentrations.

### Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Side Effects)

### Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations, and infusion pump settings.
- PO and IV doses are different.
- **PO:** Administer daily without regard to food for 5 days every 28 days. Swallow tablets whole; do not break, crush, or chew. Avoid handling tablets directly.

#### IV Administration

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers (see Appendix L). Unopened vials should be refrigerated. The 5-day course of therapy is continued every 28 days

until patient is in complete remission or until neurotoxicity develops.

- **IV:** Reconstitute with 2 mL of sterile water for injection; solid cake should dissolve in <15 sec. ***Concentration:*** 25 mg/mL. Reconstituted solution is stable for 8 hr.
- **Intermittent Infusion:** ***Diluent:*** Dilute further in 100–125 mL of 0.9% NaCl or D5W. ***Rate:*** Infuse over 15–30 min.
- **Y-Site Compatibility:** alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, amsacrine, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, floxuridine, fluconazole, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, minocycline, mitoxantrone, mivacurium, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pemetrexed, pentamidine, pentazocine, pentobarbital, pentostatin, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, promethazine, propranolol, ranitidine, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** acyclovir, amiodarone, amphotericin B colloidal, chlorpromazine, dantrolene, daunorubicin hydrochloride, diazepam, ganciclovir, hydroxyzine, pantoprazole, phenytoin, prochlorperazine, quinapristin/dalfopristin, trastuzumab.

## Patient/Family Teaching

- Instruct patient to take fludarabine as directed. Avoid handling tablets; wash hands with soap and water if touching tablet or powder from tablets. Notify health care professional if a dose is missed.
- Caution patient to avoid crowds and persons with known infections. Health care professional should be informed immediately if symptoms of infection (chills, cough, or burning pain on urination) occur.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions (use soft toothbrush and electric razor; avoid contact sports and other situations in which injury might occur). Do not drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Consult health care professional if pain interferes with eating. Stomatitis pain treatment may require opioid analgesics.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 6 mo after therapy is concluded.
- Emphasize the need for periodic lab tests to monitor for side effects.

## Evaluation/Desired Outcomes

- Improvement of hematopoietic values in leukemias.

# fludrocortisone
(floo-droe-**kor**-ti-sone)

***Classification***
Therapeutic: hormones
Pharmacologic: corticosteroids (mineralocorticoid)

**Pregnancy Category C**

## Indications
Sodium loss and hypotension associated with adrenocortical insufficiency (given with hydrocortisone or cortisone). Management of sodium loss due to congenital adrenogenital syndrome (congenital adrenal hyperplasia). **Unlabeled Use:** Idiopathic orthostatic hypotension (with increased sodium intake). Type IV renal tubular acidosis.

## Action
Causes sodium reabsorption, hydrogen and potassium excretion, and water retention by its effects on the distal renal tubule. **Therapeutic Effects:** Maintenance of sodium balance and blood pressure in patients with adrenocortical insufficiency.

## Pharmacokinetics
**Absorption:** Well absorbed following oral administration.
**Distribution:** Widely distributed; probably enters breast milk.
**Protein Binding:** High.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 3.5 hr.

TIME/ACTION PROFILE (mineralocorticoid activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | 1–2 days |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** CHF; Addison's disease (patients may have exaggerated response); OB, Lactation, Pedi: Safety not established.

## Adverse Reactions/Side Effects
**CNS:** dizziness, headache. **CV:** CHF, arrhythmias, edema, hypertension. **GI:** anorexia, nausea. **Endo:** adrenal suppression, weight gain. **F and E:** hypokalemia, hypokalemic alkalosis. **MS:** arthralgia, muscular weakness, tendon contractures. **Neuro:** ascending paralysis. **Misc:** hypersensitivity reactions.

## Interactions
**Drug-Drug:** Use with **thiazide or loop diuretics**, **piperacillin**, or **amphotericin B** may ↑ risk of hypokalemia. Hypokalemia may ↑ risk of **digoxin** toxicity. May produce prolonged neuromuscular blockade following the use of **nondepolarizing neuromuscular blocking agents**. **Phenobarbital** or **rifampin** may ↑ metabolism and ↓ effectiveness of fludrocortisone.
**Drug-Food:** Large amounts of **salt** or **sodium-containing foods** may cause excessive sodium retention and potassium loss.

## Route/Dosage
**PO (Adults):** *Adrenocortical insufficiency*—100 mcg/day (range 100 mcg 3 times weekly—200 mcg daily). Doses as small as 50 mcg daily may be required by some patients. Use with 10–37.5 mg cortisone daily or 10–30 mg hydrocortisone daily. *Adrenogenital syndrome*—100–200 mcg/day. *Idiopathic hypotension*—50–200 mcg/day (unlabeled).
**PO (Children):** 50–100 mcg/day.

## Availability (generic available)
**Tablets:** 100 mcg (0.1 mg).

# NURSING IMPLICATIONS

## Assessment
- Monitor blood pressure periodically during therapy. Report significant changes. Hypotension may indicate insufficient dose.
- Monitor for fluid retention (weigh daily, assess for edema, and auscultate lungs for rales/crackles).
- Monitor patients with Addison's disease closely and stop treatment if a significant increase in weight or blood pressure, edema, or cardiac enlargement occurs. Patients with Addison's disease are more sensitive to the action of fludrocortisone and may have an exaggerated response.
- ***Lab Test Considerations:*** Monitor serum electrolytes periodically during therapy. Fludrocortisone causes ↓ serum potassium levels.

## Potential Nursing Diagnoses
Deficient fluid volume (Indications)
Excess fluid volume (Side Effects)

## Implementation
- **PO:** Tablets are scored and may be broken if dose adjustment is necessary.

## Patient/Family Teaching
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but

not just before next dose is due. Explain that lifelong therapy may be necessary and that abrupt discontinuation may lead to addisonian crisis. Patient should keep an adequate supply available at all times.
- Advise patient to follow dietary modification prescribed by health care professional. Instruct patient to follow a diet high in potassium (see Appendix M). Amount of sodium allowed in diet varies with pathophysiology.
- Instruct patient to inform health care professional if weight gain or edema, muscle weakness, cramps, nausea, anorexia, or dizziness occurs.
- Advise patient to carry identification at all times describing disease process and medication regimen.

### Evaluation/Desired Outcomes
- Normalization of fluid and electrolyte balance without the development of hypokalemia or hypertension.

## **flumazenil** (flu-**maz**-e-nil)
Anexate, Romazicon

***Classification***
Therapeutic: antidotes
Pharmacologic: benzodiazepines

**Pregnancy Category C**

### Indications
Complete/partial reversal of effects of benzodiazepines used as general anesthetics, or during diagnostic or therapeutic procedures. Management of intentional or accidental overdose of benzodiazepines.

### Action
Flumazenil is a benzodiazepine derivative that antagonizes the CNS depressant effects of benzodiazepine compounds. It has no effect on CNS depression from other causes, including opioids, alcohol, barbiturates, or general anesthetics.
**Therapeutic Effects:** Reversal of benzodiazepine effects.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Protein Binding:** 50% primarily to albumin.
**Metabolism and Excretion:** Metabolism of flumazenil occurs primarily in the liver.
**Half-life:** Children: 20–75 min; Adults: 41–79 min.

TIME/ACTION PROFILE (reversal of benzodiazepine effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 1–2 min | 6–10 min | 1–2 hr† |

†Depends on dose/concentration of benzodiazepine and dose of flumazenil

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to flumazenil or benzodiazepines; Patients receiving benzodiazepines for life-threatening medical problems, including status epilepticus or increased intracranial pressure, should not be given flumazenil; Serious cyclic antidepressant overdosage.
**Use Cautiously in:** Mixed CNS depressant overdose (effects of other agents may emerge when benzodiazepine effect is removed); History of seizures (seizures are more likely to occur in patients who are experiencing sedative/hypnotic withdrawal, who have recently received repeated doses of benzodiazepines, or who have a previous history of seizure activity); Head injury (may increase intracranial pressure and risk of seizures); Severe hepatic impairment; OB, Lactation: Safety not established; Pedi: Safety not established in children <1 yr .

### Adverse Reactions/Side Effects
**CNS:** SEIZURES, dizziness, agitation, confusion, drowsiness, emotional lability, fatigue, headache, sleep disorders. **EENT:** abnormal hearing, abnormal vision, blurred vision. **CV:** arrhythmias, chest pain, hypertension. **GI:** nausea, vomiting, hiccups. **Derm:** flushing, sweating. **Local:** pain/injection-site reactions, phlebitis. **Neuro:** paresthesia. **Misc:** rigors, shivering.

### Interactions
**Drug-Drug:** None significant.

### Route/Dosage

### Reversal of Conscious Sedation or General Anesthesia
**IV (Adults):** 0.2 mg. Additional doses may be given at 1-min intervals until desired results are obtained, up to a total dose of 1 mg. If resedation occurs, regimen may be repeated at 20-min intervals, not to exceed 3 mg/hr.
**IV (Children):** 0.01 mg/kg (up to 0.2 mg); if the desired level of consciousness is not obtained after waiting an additional 45 sec, further injections

of 0.01 mg/kg (up to 0.2 mg) can be administered and repeated at 60-sec intervals when necessary (up to a maximum of 4 additional times) to a maximum total dose of 0.05 mg/kg or 1 mg, whichever is lower. The dose should be individualized based on the patient's response.

### Suspected Benzodiazepine Overdose

**IV (Adults):** 0.2 mg. Additional 0.3 mg may be given 30 sec later. Further doses of 0.5 mg may be given at 1-min intervals, if necessary, to a total dose of 3 mg. Usual dose required is 1–3 mg. If resedation occurs, additional doses of 0.5 mg/min for 2 min may be given at 20-min intervals (given no more than 1 mg at a time, not to exceed 3 mg per hr).
**IV (Children):** *Unlabeled*—0.01 mg/kg (maximum dose 0.2 mg) with repeat doses every minute up to a cumulative dose of 1 mg. As an alternative to repeat doses, continuous infusions of 0.005–0.01 mg/kg/hr have been used.

### Availability (generic available)

**Injection:** 0.1 mg/mL in 5- and 10-mL vials.

## NURSING IMPLICATIONS

### Assessment

- Assess level of consciousness and respiratory status before and during therapy. Observe patient for at least 2 hr after administration for the appearance of resedation. Hypoventilation may occur.
- **Overdose:** Attempt to determine time of ingestion and amount and type of benzodiazepine taken. Knowledge of agent ingested allows an estimate of duration of CNS depression.

### Potential Nursing Diagnoses

Risk for injury (Indications)
Risk for poisoning (Indications)

### Implementation

- Ensure that patient has a patent airway before administration of flumazenil.
- Observe IV site frequently for redness or irritation. Administer through a free-flowing IV infusion into a large vein to minimize pain at the injection site.
- Optimal emergence should be undertaken slowly to decrease undesirable effects including confusion, agitation, emotional lability, and perceptual distortion.
- Institute seizure precautions. Seizures are more likely to occur in patients who are experiencing sedative/hypnotic withdrawal, patients who have recently received repeated doses of benzodiazepines, or those who have a previous history of seizure activity. Seizures may be treated with benzodiazepines, barbiturates, or phenytoin. Larger than normal doses of benzodiazepines may be required.
- **Suspected Benzodiazepine Overdose:** If no effects are seen after administration of flumazenil, consider other causes of decreased level of consciousness (alcohol, barbiturates, opioid analgesics).

#### IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted or diluted in syringe with D5W, 0.9% NaCl, or LR. Diluted solution should be discarded after 24 hr. ***Concentration:*** Up to 0.1 mg/mL. ***Rate:*** Administer each dose over 15–30 sec into free-flowing IV in a large vein. Do not exceed 0.2 mg/min in children or 0.5 mg/min in adults.

### Patient/Family Teaching

- Flumazenil does not consistently reverse the amnestic effects of benzodiazepines. Provide patient and family with written instructions for postprocedure care. Inform family that patient may appear alert at the time of discharge but the sedative effects of the benzodiazepine may recur. Instruct patient to avoid driving or other activities requiring alertness for at least 24 hr after discharge.
- Instruct patient not to take any alcohol or nonprescription drugs for at least 18–24 hr after discharge.
- Resumption of usual activities should occur only when no residual effects of the benzodiazepine remain.

### Evaluation/Desired Outcomes

- Improved level of consciousness.
- Decrease in respiratory depression caused by benzodiazepines.

**flunisolide, See CORTICOSTEROIDS (INHALATION).**

**flunisolide, See CORTICOSTEROIDS (NASAL).**

**fluocinolone, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

**fluocinonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

# FLUOROQUINOLONES
(floor-oh-**kwin**-oh-lones)

**ciprofloxacin†**
(sip-roe-**flox**-a-sin)
Apo-Ciproflox, Cipro, Cipro XR, Proquin XR

**gemifloxacin** (gem-i-**flox**-a-sin)
Factive

**levofloxacin** (le-voe-**flox**-a-sin)
Levaquin, Novo-Levofloxacin

**moxifloxacin†** (mox-i-**flox**-a-sin)
Avelox

**norfloxacin†** (nor-**flox**-a-sin)
Apo-Norfloxacin, Co-Norfloxacin, Noroxin, Novo-Norfloxacin, PMS-Norfloxacin, Riva-Norfloxacin

**ofloxacin†** (oh-**flox**-a-sin)
Apo-Ofloxacin, Floxin

***Classification***
Therapeutic: anti-infectives
Pharmacologic: fluoroquinolones

**Pregnancy Category C**

†See Appendix C for ophthalmic use

## Indications
**PO, IV:** Treatment of the following bacterial infections: Urinary tract infections including cystitis and prostatitis (ciprofloxacin, levofloxacin, norfloxacin, ofloxacin), Gonorrhea (may not be considered first-line agents due to increasing resistance), Gynecologic infections (ciprofloxacin, norfloxacin, ofloxacin), Respiratory tract infections including acute sinusitis, acute exacerbations of chronic bronchitis, and pneumonia (not norfloxacin), Skin and skin structure infections (levofloxacin, moxifloxacin, ciprofloxacin, ofloxacin), Bone and joint infections (ciprofloxacin), Infectious diarrhea (ciprofloxacin), Intra-abdominal infections (ciprofloxacin, moxifloxacin). Febrile neutropenia (ciprofloxacin). Post-exposure treatment of inhalational anthrax (ciprofloxacin, levofloxacin).

## Action
Inhibit bacterial DNA synthesis by inhibiting DNA gyrase. **Therapeutic Effects:** Death of susceptible bacteria. **Spectrum:** Broad activity includes many gram-positive pathogens: Staphylococci including methicillin-resistant *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Staphylococcus saprophyticus*, *Streptococcus pneumoniae*, *Streptococcus pyogenes*, and *Bacillus anthracis*. Gram-negative spectrum notable for activity against: *Escherichia coli*, *Klebsiella*, *Enterobacter*, *Salmonella*, *Shigella*, *Proteus*, *Providencia*, *Morganella morganii*, *Pseudomonas aeruginosa*, *Serratia*, *Haemophilus*, *Acinetobacter*, *Neisseria gonorrhoeae*, *Moraxella catarrhalis*, *Campylobacter*. Additional spectrum includes: *Chlamydia pneumoniae*, *Legionella pneumoniae*, and *Mycoplasma pneumoniae*.

## Pharmacokinetics
**Absorption:** Well absorbed after oral administration (*ciprofloxacin*—70%; *moxifloxacin*—90%; *gemifloxacin*—71%; *levofloxacin*—99%; *norfloxacin*—30–40%; *ofloxacin*—98%.
**Distribution:** Widely distributed. High tissue and urinary levels are achieved. All agents appear to cross the placenta. *Ciprofloxacin* and *ofloxacin* enter breast milk.
**Metabolism and Excretion:** *Ciprofloxacin*—15% metabolized by the liver, 40–50% excreted unchanged by the kidneys; *gemifloxacin*—Minimal metabolism, 61% excreted unchanged in feces, 36% excreted unchanged in urine; *levofloxacin*—87% excreted unchanged in urine, small amounts metabolized; *moxifloxacin*—mostly metabolized by the liver, 20% excreted unchanged in urine, 25% excreted unchanged in feces; *norfloxacin*—10% metabolized by the liver, 30% excreted unchanged by the kidneys, 30% excreted unchanged in feces; *ofloxacin*—70–80% excreted unchanged by the kidneys.
**Half-life:** *Ciprofloxacin*—4 hr; *gemifloxacin*—7 hr; *levofloxacin*—8 hr; *moxifloxacin*—12 hr; *norfloxacin*—6.5 hr; *ofloxacin*—5–7 hr (all are ↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Ciprofloxacin—PO | rapid | 1–2 hr | 12 hr |
| Ciprofloxacin—PO-ER | rapid | 1–4 hr | 24 hr |
| Ciprofloxacin—IV | rapid | end of infusion | 12 hr |
| Gemifloxacin—PO | rapid | 0.5—2 hr | 24 hr |
| Levofloxacin—PO | rapid | 1–2 hr | 24 hr |
| Levofloxacin—IV | rapid | end of infusion | 24 hr |

| | | | |
|---|---|---|---|
| Moxifloxacin—PO | within 1 hr | 1–3 hr | 24 hr |
| Moxifloxacin—IV | rapid | end of infusion | 24 hr |
| Norfloxacin—PO | rapid | 2–3 hr | 12 hr |
| Ofloxacin—PO | rapid | 1–2 hr | 12 hr |
| Ofloxacin—IV | rapid | end of infusion | 12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity. Cross-sensitivity among agents within class may occur; **Gemifloxacin and moxifloxacin**: Concurrent use of Class IA antiarrhythmics (disopyramide, quinidine, procainamide) or Class III antiarrhythmics (amiodarone, sotalol) ( ↑ risk of QTc prolongation and torsades de pointes); Known QT prolongation or concurrent use of agents causing prolongation; OB: Do not use unless potential benefit outweighs potential fetal risk; Pedi: Use only for treatment of anthrax and complicated UTIs in children 1–17 yrs due to possible arthropathy.

**Use Cautiously in:** Known or suspected CNS disorder; Renal impairment (dosage reduction if CCr ≤50 mL/min for ciprofloxacin, levofloxacin, ofloxacin; ≤30 mL/min for norfloxacin; <40 mL/min for gemifloxacin); Cirrhosis (levofloxacin, moxifloxacin, ornorfloxacin); **Gemifloxacin and moxifloxacin**: Concurrent use of erythromycin, antipsychotics, and tricyclic antidepressants ( ↑ risk of QTc prolongation and torsades de pointes); **Gemifloxacin and moxifloxacin**: Bradycardia; **Gemifloxacin and moxifloxacin**: Acute myocardial ischemia; Concurrent use of corticosteroids ( ↑ risk of tendinitis/tendon rupture); Kidney, heart, or lung transplant patients ( ↑ risk of tendinitis/tendon rupture); Lactation: Safety not established except for treatment of anthrax; Geri: ↑ risk of adverse reactions.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, dizziness, headache, insomnia, acute psychoses, agitation, confusion, drowsiness. **CV:** *gemifloxacin, levofloxacin, moxifloxacin, norfloxacin*—ARRHYTHMIAS, QT prolongation, vasodilation. **GI:** HEPATOTOXICITY (NORFLOXACIN), PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, abdominal pain, increased liver function tests (ciprofloxacin, moxifloxacin), vomiting. **GU:** vaginitis. **Derm:** photosensitivity, rash. **Endo:** hyperglycemia, hypoglycemia. **Local:** phlebitis at IV site. **MS:** tendinitis, tendon rupture. **Misc:** hypersensitivity reactions including ANAPHYLAXIS, STEVENS-JOHNSON SYNDROME.

## Interactions

**Drug-Drug:** ↑ risk of QTc prolongation and life-threatening arrhythmias with concurrent use of gemifloxacin, moxifloxacin, and norfloxacin and **amiodarone**, **disopyramide**, **erythromycin**, **pentamidine**, **phenothiazines**, **procainamide**, **quinidine**, **sotalol**, and **tricyclic antidepressants** (concurrent use should be avoided). ↑ serum **theophylline** levels and may lead to toxicity. Administration with **magnesium and aluminum-containing antacids**, **iron salts**, **bismuth subsalicylate**, **sucralfate**, **didanosine**, and **zinc salts** ↓ absorption of fluoroquinolones. May ↑ the effects of **warfarin**. Ciprofloxacin may ↓ blood levels and effectiveness of **phenytoin**. Serum levels of fluoroquinolones may be ↓ by **antineoplastics**. **Cimetidine** may interfere with elimination of fluoroquinolones. Beneficial effects of ciprofloxacin may be antagonized by **nitrofurantoin**. **Probenecid** ↓ renal elimination of fluoroquinolones. May ↑ risk of nephrotoxicity from **cyclosporine**. Concurrent use of ciprofloxacin with **foscarnet** may ↑ risk of seizures. Concurrent therapy with **corticosteroids** may ↑ the risk of tendon rupture. May ↑ risk of hypoglycemia when used with **antidiabetic agents**.

**Drug-Natural Products: Fennel** ↓ the absorption of ciprofloxacin.

**Drug-Food:** Absorption is impaired by **concurrent tube feeding** (because of metal cations). Absorption is ↓ if taken with **dairy products** or calcium-fortified juices.

## Route/Dosage

### Ciprofloxacin

**PO (Adults):** *Most infections*—500–750 mg q 12 hr. *Complicated urinary tract infections*—500 mg q 12 hr for 7–14 days (immediate-release); *or* 1000 mg q 24 hr for 7–14 days (extended-release). *Uncomplicated urinary tract infections*—250 mg every 12 hr for 3 days (immediate-release) *or* 500 mg every 24 hr for 3 days (extended-release). *Gonorrhea*—250-mg single dose. *Inhalational anthrax (post exposure) or cutaneous anthrax*—500 mg every 12 hr for 60 days.

**PO (Children 1–17 yr):** *Complicated urinary tract infections*—10–15 mg/kg q 12 hr (not to exceed 750 mg/dose) for 10–21 days. *Inhalational anthrax (post-exposure) or cutaneous anthrax*—10–15 mg/kg q 12 hr (not to exceed 500 mg/dose) for 60 days.

**IV (Adults):** *Most infections*—400 mg q 12 hr. *Complicated urinary tract infections*—400 mg q 12 hr for 7–14 days. *Uncomplicated urinary tract infections*—200 mg q 12 hr for 7–14 days. *Inhalational anthrax (post exposure)*—400 mg q 12 hr for 60 days.
**IV (Children 1–17 yr):** *Inhalational anthrax (post exposure)*—10 mg/kg q 12 hr (not to exceed 400 mg/dose) for 60 days; *Complicated urinary tract infections*—6–10 mg/kg q 8 hr (not to exceed 400 mg/dose) for 10–21 days.

### Renal Impairment

**PO (Adults):** *CCr 30–50 mL/min*—250–500 mg q 12 hr; *CCr 5–29 mL/min*—250–500 mg q 18 hr (immediate-release) *or* 500 mg q 24 hr (extended-release).
**IV (Adults):** *CCr 5–29 mL/min*—200–400 mg q 18–24 hr.

## Gemifloxacin

**PO (Adults):** *Acute bacterial exacerbation of chronic bronchitis*—320 mg once daily for 5 days; *Community-acquired pneumonia (CAP) caused by Klebsiella pneumoniae, Moraxella catarrhalis, and multidrug resistant strains of S. pneumonia*—320 mg once daily for 7 days. *Community-acquired-pneumonia (CAP) caused by S. pneumonia, Haemophilus influenzae, Mycoplasma pneumoniae, or Chlamydia pneumonia, and multidrug resistant strains of S. pneumonia*—320 mg once daily for 5 days.

### Renal Impairment

**PO (Adults):** *CCr ≤40 mL/min*—160 mg once daily for 5 days.

## Levofloxacin

**PO, IV (Adults):** *Most infections*—250–750 mg q 24 hr; *inhalational anthrax (post-exposure)*—500 mg once daily for 60 days.

### Renal Impairment

**PO, IV (Adults):** *Normal renal function dosing of 750 mg/day: CCr 20–49 mL/min*—750 mg q 48 hr; *CCr 10–19 mL/min*—750 mg initially, then 500 mg q 48 hr; *Normal renal function dosing of 500 mg/day: CCr 20–49 mL/min*—500 mg initially then 250 mg q 24 hr; *CCr 10–19 mL/min*—500 mg initially then 250 mg q 48 hr. *Normal renal function dosing of 250 mg/day: CCr 10–19 mL/min*—250 mg q 48 hr.

## Moxifloxacin

**PO, IV (Adults):** *Bacterial sinusitis*—400 mg once daily for 10 days; *Community-acquired pneumonia*—400 mg once daily for 7–14 days. *Acute bacterial exacerbation of chronic bronchitis*—400 mg once daily for 5 days. *Complicated intra-abdominal infection*—400 mg once daily for 5–14 days. *Urethritis/cervicitis*—300 mg q 12 hr for 7 days. *Skin/skin structure infections*—400 mg/day for 7–21 days.

## Norfloxacin

**PO (Adults):** *Uncomplicated urinary tract infections*—400 mg q 12 hr for 3–14 days. *Complicated urinary tract infections*—400 mg q 12 hr for 10–21 days. *Gonorrhea*—800-mg single dose. *Prostatitis*—400 mg q 12 hr for 4–6 wk.

### Renal Impairment

**PO (Adults):** *CCr ≤30 mL/min*—400 mg once daily.

## Ofloxacin

**PO (Adults):** *Most infections*—400 mg q 12 hr. *Prostatitis*—300 mg q 12 hr for 6 wk. *Uncomplicated urinary tract infections*—200 mg q 12 hr for 3–7 days. *Complicated urinary tract infections*—200 mg q 12 hr for 10 days. *Gonorrhea*—400-mg single dose.
**Otic (Adults and Children ≥6 mo):** *Otitis Externa 6 months to 13 yr*—5 drops instilled into affected ear once daily for 7 days; *Otitis Externa ≥13 yr*—10 drops instilled into affected ear once daily for 7 days. *Acute Otitis Media in pediatric patients 1–12 yr old with tympanostomy tubes*—5 drops instilled into the affected ear twice daily for 10 days. *Chronic Suppurative Otitis Media with perforated tympanic membranes in patients ≥12 yr*—10 drops instilled into the affected ear twice daily for 14 days.

### Renal Impairment

**PO, IV (Adults):** *CCr 20–50 mL/min*—100% of the usual dose q 24 hr; *CCr <20 mL/min*—50% of the usual dose q 24 hr.

## Availability

### Ciprofloxacin (generic available)

**Tablets:** 100 mg, 250 mg, 500 mg, 750 mg. **Extended-release tablets:** 500 mg, 1000 mg. **Oral suspension (strawberry flavor):** 250 mg/5 mL, 500 mg/5 mL. **Solution for injection:** 10 mg/mL. **Premixed infusion:** 200 mg/100 mL D5W, 400 mg/200 mL D5W. ***In combination with:*** hydrocortisone (Cipro HC) (see Appendix B).

### Gemifloxacin

**Tablets:** 320 mg.

### Levofloxacin (generic available)

**Tablets:** 250 mg, 500 mg, 750 mg. **Cost:** 250 mg $199.98/20, 500 mg $231.98/20, 750 mg $429.99/20. **Oral solution:** 25 mg/mL. **Solution for injection:** 25 mg/mL. **Premixed infusion:** 250 mg/50 mL D5W, 500 mg/100 mL D5W, 750 mg/150 mL D5W.

### Moxifloxacin

**Tablets:** 400 mg. **Cost:** $160.21/14. **Premixed infusion:** 400 mg/250 mL 0.8% NaCl.

### Norfloxacin

**Tablets:** 400 mg.

### Ofloxacin (generic available)

**Tablets:** 200 mg, 300 mg, 400 mg. **Cost:** *Generic*—200 mg $77.13/20, 300 mg $91.42/20, 400 mg $83.33/20. **Otic solution:** 0.3% in 5– and 10–mL dropper bottles and 0.25 mL single-dispensing containers. **Cost:** *Generic*—$55.99/5 mL, $92.99/10 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC; urinalysis; frequency and urgency of urination; cloudy or foul-smelling urine) prior to and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify physician or other health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction. Patients taking gemifloxacin who are at greater risk for rash are those receiving gemifloxacin for >7 days, <40 yr of age, females, and postmenopausal females receiving hormone replacement therapy.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- ***Lab Test Considerations:*** May cause ↑ serum AST, ALT, LDH, bilirubin, and alkaline phosphatase.
- May also cause ↑ or ↓ serum glucose.
- Moxifloxacin may cause hyperglycemia, hyperlipidemia, and altered prothrombin time. It may also cause ↑ WBC; ↑ serum calcium, chloride, albumin, and globulin; and ↓ glucose, hemoglobin, RBCs, neutrophils, eosinophils, and basophils.
- Monitor prothrombin time closely in patients receiving fluoroquinolones and warfarin; may enhance the anticoagulant effects of warfarin.

### Potential Nursing Diagnoses

Risk for infection (Patient/Family Teaching)

### Implementation

- Do not confuse norfloxacin with Norflex (orphenadrine).
- **PO:** Administer *norfloxacin and ofloxacin* on an empty stomach 1 hr before or 2 hr after meals, with a full glass of water. *Moxifloxacin, levofloxacin,* and *gemifloxacin* may be administered without regard to meals. Should be taken at least 2 hr (3 hr for gemifloxacin, 4 hr for moxifloxacin) before or 2 hr (8 hr for moxifloxacin) after antacids or other products containing calcium, iron, zinc, magnesium, or aluminum.
- If gastric irritation occurs, ciprofloxacin may be administered with meals.
- Ciprofloxacin 5% and 10% oral suspension should not be administered through a feeding tube (may ↓ absorption). Shake solution for 15 seconds prior to administration.
- *Gemifloxacin* and *ciprofloxacin extended-release tablets* should be swallowed whole; do not break, crush, or chew.

### Ciprofloxacin

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute with 0.9% NaCl or D5W. Stable for 14 days at refrigerated or room temperature. ***Concentration:*** 1–2 mg/mL. ***Rate:*** Administer over 60 min into a large vein to minimize venous irritation.
- **Y-Site Compatibility:** amifostine, amiodarone, anakinra, anidulafungin, aztreonam, bivalirudin, calcium gluconate, carboplatin, caspofungin, ceftazidime, cisatracurium, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxarubicin, doxorubicin liposome, epirubicin, ertapenem, etoposide, etoposide phosphate, fenoldopam, fludarabine, gemcitabine, gentamicin, granisetron, hydromorphone, ifosfamide, lidocaine, linezolid, lorazepam, LR, mechlorethamine, meperidine, methotrexate, metoclopramide, metronidazole, midazolam, midodrine, milri-

none, mitoxantrone, nesiritide, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, potassium acetate, potassium chloride, promethazine, quinupristin-dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, 0.9% NaCL, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole.

- **Y-Site Incompatibility:** Manufacturer recommends temporarily discontinuing other solutions when administering ciprofloxacin, acyclovir, aminophylline, amphotericin B liposome, ampicillin/sulbactam, azithromycin, cefepime, dexamethasone, drotrecogin, fluorouracil, furosemide, heparin, hydrocortisone, magnesium sulfate, methylprednisolone, pantoprazole, pemetrexed, phenytoin, piperacillin/tazobactam, potassium phosphates, propofol, rituxumab, sodium phosphates, warfarin.

## Levofloxacin

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute with 0.9% NaCl, D5W, dextrose/saline combinations, 5% sodium bicarbonate, Plasmalyte 56, or sodium lactate. Also available in premixed bottles and flexible containers with D5W, which need no further dilution. ***Concentration:*** 5 mg/mL Discard unused solution. Diluted solution is stable for 72 hr at room temperature and 14 days if refrigerated. ***Rate:*** Administer by infusion over at least 60 min for 250 mg or 500 mg doses and over 90 min for 750 mg dose. Avoid rapid bolus injection to prevent hypotension.
- **Y-Site Compatibility:** alfentanil, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, anidulafungin, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, caffeine citrate, calcium gluconate, carboplatin, carmustine, caspofungin, cefepime, cefotetan, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactomycin , daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxacurium, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, floxuridine, fluconazole, fludarabine, fosphenytoin, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, isoproterenol, labetalol, leucovorin, levorphanol, lidocaine, linezolid, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methylprednisolone, metoclopramide, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, nalbuphine, naloxone, nesiritide, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pemetrexed, penicillin G sodium, pentamidine, phenylephrine, plicamycin, potassium chloride, promethazine, propranolol, quinapristin/dalfopristin, ranitidine, remifentanil, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** acyclovir, alprostadil, amiodarone, amphotericin B colloidal, amphotericin B liposome, cefazolin, cefoperazone, cefoxitin, daunorubicin hydrochloride, diazepam, drotrecogin, fluorouracil, furosemide, ganciclovir, heparin, inamrinone, indomethacin, ketorolac, labetalol, methotrexate, nitroglycerin, nitroprusside, pentobarbital, phenytoin, piperacillin/tazobactam, prochlorperazine, propofol, rituximab, streptozocin, thiopental, trastuzumab.

## Moxifloxacin

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Premixed bags are diluted in sodium chloride 0.8% and should not be further diluted. Use transfer set whose piercing pin does not require excessive force; insert with a gentle twisting motion until pin is firmly seated. ***Concentration:*** 1.6 mg/mL. ***Rate:*** Administer over 60 min. Avoid rapid or bolus infusion.
- **Y-Site Compatibility:** bivalirudin, caspofungin, daptomycin, doripenem, ertapenem, nesiritide, octreotide, oxytocin, palonosetron, pemetrexed, tigecycline, tirofiban, vasopressin.

- **Y-Site Incompatibility:** furosemide, voriconazole.
- **Solution Compatibility:** 0.9% NaCl, D5W, D10W, LR.

### Patient/Family Teaching

- Instruct patient to take medication as directed at evenly spaced times and to finish drug completely, even if feeling better. Take missed doses as soon as possible, unless almost time for next dose. Do not double doses. Advise patient that sharing of this medication may be dangerous.
- Advise patients to notify health care professional immediately if they are taking theophylline.
- Encourage patient to maintain a fluid intake of at least 1500–2000 mL/day to prevent crystalluria.
- Advise patient that antacids or medications containing iron or zinc will decrease absorption. *Ciprofloxacin, levofloxacin, norfloxacin,* and *ofloxacin* should be taken at least 2 hr before (3 hr for *gemifloxacin*, 4 hr for *moxifloxacin*) or 2 hr after (8 hr for *moxifloxacin*) these products.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to use sunscreen and protective clothing to prevent phototoxicity reactions during and for 5 days after therapy. Notify health care professional if a sunburn-like reaction or skin eruption occurs.
- Instruct patients being treated for gonorrhea that partners also must be treated.
- Instruct patient to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools).
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional immediately if rash, jaundice, signs of hypersensitivity, or tendon (shoulder, hand, Achilles, and other) pain, swelling, or inflammation occur. If tendon symptoms occur, avoid exercise and use of the affected area. Increased risk in >65 yrs old, kidney, heart and lung transplant recipients, and patients taking corticosteroids concurrently. Therapy should be discontinued.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Time for complete resolution depends on organism and site of infection.
- Post exposure treatment of inhalational anthrax or cutaneous anthrax (ciprofloxacin and levofloxacin).

HIGH ALERT

## fluorouracil

(flure-oh-**yoor**-a-sill)

Carac, Efudex, Fluoroplex, 5-FU

***Classification***

Therapeutic: antineoplastics

Pharmacologic: antimetabolites

**Pregnancy Category D**

### Indications

**IV:** Used alone and in combination with other modalities (surgery, radiation therapy, other antineoplastics) in the treatment of: Colon cancer, Breast cancer, Rectal cancer, Gastric cancer, Pancreatic carcinoma. **Topical:** Management of multiple actinic (solar) keratoses and superficial basal cell carcinomas.

### Action

Inhibits DNA and RNA synthesis by preventing thymidine production (cell-cycle S-phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** Minimal absorption (5–10%) after topical application.
**Distribution:** Widely distributed; concentrates and persists in tumors.
**Metabolism and Excretion:** Metabolized by dihydropyrimidine dehydrogenase to a less toxic compound; inactive metabolites are excreted primarily in urine.
**Half-life:** 20 hr.

TIME/ACTION PROFILE (IV = effects on blood counts, Top = dermatologic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 1–9 days | 9–21 days (nadir) | 30 days |
| Top | 2–3 days | 2–6 wk | 1–2 mo |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; ⋈ Dihydropyrimidine dehydrogenase deficiency (patients at ↑ risk of 5–FU toxicity); OB, Lactation: Pregnancy or lactation.

**Use Cautiously in:** Infections; Depressed bone marrow reserve; Other chronic debilitating illnesses; Obese patients, patients with edema or ascites (dose should be based on ideal body weight).

## Adverse Reactions/Side Effects

More likely to occur with systemic use than with topical use.

**CNS:** acute cerebellar dysfunction. **GI:** diarrhea, nausea, stomatitis, vomiting. **Derm:** alopecia, maculopapular rash, local inflammatory reactions (topical only), melanosis of nails, nail loss, palmar-plantar erythrodysesthesia, phototoxicity. **Endo:** sterility. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** thrombophlebitis. **Misc:** fever.

## Interactions

**Drug-Drug:** Combination chemotherapy with **irinotecan** may produce unacceptable toxicity (dehydration, neutropenia, sepsis). Additive bone marrow depression with other **bone marrow depressants**, including other **antineoplastics** and **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

## Route/Dosage

Doses may vary greatly, depending on tumor, patient condition, and protocol used.

## Advanced Colorectal Cancer

**IV (Adults):** 370 mg/m² preceded by leucovorin *or* 425 mg/m² preceded by leucovorin daily for 5 days. May be repeated q 4–5 wk.

## Other Tumors

**IV (Adults):** *Initial dose*—12 mg/kg/day for 4 days, then 1 day of rest, then 6 mg/kg every other day for 4–5 doses *or* 7–12 mg/kg/day for 4 days followed by 3-day rest, then 7–10 mg/kg q 3–4 days for 3 doses. *Maintenance*—7–12 mg/kg q 7–10 days *or* 300–500 mg/m²/day for 4–5 days, repeated monthly (no single daily dose should exceed 800 mg). **Poor-Risk Patients:** 3–6 mg/kg/day on days 1–3, 3 mg/kg/day on days 5, 7, 9 (not to exceed 400 mg/dose). Doses of 370–425 mg/m²/day for 5 days have been used in combination with leucovorin.

## Actinic (Solar) Keratoses

**Topical (Adults):** *Carac*—Apply 0.5% cream to lesions once daily for up to 4 wk; *Efudex*—Apply 2% or 5% solution or cream to lesions twice daily for 2–4 wk; *Fluoroplex*—Apply 1% cream to lesions twice daily for 2–6 wk.

## Superficial Basal Cell Carcinomas

**Topical (Adults):** *Efudex*—Apply 5% solution or cream to lesions twice daily for 3–6 wk (up to 12 wk).

## Availability (generic available)

**Injection:** 50 mg/mL. **Cream:** 0.5%, 1%, 5%. **Solution:** 2%, 5%.

# NURSING IMPLICATIONS

## Assessment

- Monitor vital signs before and frequently during therapy.
- Assess mucous membranes, number and consistency of stools, and frequency of vomiting. Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, pain in lower back or side, difficult or painful urination). Assess for bleeding (bleeding gums; bruising; petechiae; and guaiac test stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min. Notify health care professional if symptoms of toxicity (stomatitis or esophagopharyngitis, uncontrollable vomiting, diarrhea, GI bleeding, myocardial ischemia, leukocyte count <3500/mm³, platelet count <100,000/mm³, or hemorrhage from any site) occur; drug will need to be discontinued. May be reinitiated at a lower dose when side effects have subsided.
- Assess IV site frequently for inflammation or infiltration. Patient should notify nurse if pain or irritation at injection site occurs. May cause thrombophlebitis. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Report immediately. Standard treatment includes application of ice compresses.
- Assess skin for palmar-plantar erythrodysesthesia (tingling of hands and feet followed by

pain, erythema, and swelling) throughout therapy.
- Monitor intake and output, appetite, and nutritional intake. GI effects usually occur on 4th day of therapy. Adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- Monitor patient for cerebellar dysfunction (weakness, ataxia, dizziness). This may persist after discontinuation of therapy.
- **Topical:** Inspect involved skin before and throughout therapy.
- ***Lab Test Considerations:*** May cause ↓ in plasma albumin.
- Monitor hepatic (AST, ALT, LDH, and serum bilirubin), renal, and hematologic (hematocrit, hemoglobin, leukocyte, platelet count) functions before and periodically during therapy. Monitor CBC daily during IV therapy. Report WBC of $<3500/mm^3$ or platelets $<100,000/mm^3$ immediately; they are criteria for discontinuation. Nadir of leukopenia usually occurs in 9–14 days, with recovery by day 30. May also cause thrombocytopenia.
- May cause ↑ in urine excretion of 5-hydroxyindoleacetic acid (5-HIAA).

## Potential Nursing Diagnoses

Risk for infection (Side Effects)
Imbalanced nutrition: less than body requirements (Side Effects)

## Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations and infusion pump settings. The number 5 in 5-fluorouracil is part of the drug name and does not refer to the dose.
- Do not confuse Carac with Kuric (ketoconazole).
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

### IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. ***Concentration:*** 50 mg/mL. ***Rate:*** Rapid IV push administration (over 1–2 min) is most effective, but there is a more rapid onset of toxicity.
- **Intermittent Infusion:** ***Diluent:*** May be diluted with D5W or 0.9% NaCl.
- Use plastic IV tubing and IV bags to maintain greater stability of medication. Solution is stable for 24 hr at room temperature; do not refrigerate. Solution is colorless to faint yellow. Discard highly discolored or cloudy solution. If crystals form, dissolve by warming solution to 140°F, shaking vigorously, and cooling to body temperature. ***Concentration:*** Up to 50 mg/mL. ***Rate:*** Onset of toxicity is greatly delayed by administering an infusion over 2–8 hr.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, butorphanol, calcium gluconate, carboplatin, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, cimetidine, cisatracurium, cisplatin, clindamycin, codeine, cyclophosphamide, cyclosporine, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, docetaxel, dopamine, doripenem, doxorubicin liposome, enalaprilat, ephedrine, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin, levorphanol, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylprednisolone, metoprolol, metronidazole, milrinone, mitomycin, mitoxantrone, morphine, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, paclitaxel, palonsetron, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, propofol, propranolol, ranitidine, remifentanil, rituximab, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trastuzumab, vasopressin, vecuronium, vinblastine, vincristine, vitamin B complex with C, voriconazole, zidovudine.
- **Y-Site Incompatibility:** aldesleukin, amiodarone, amphotericin B cholesteryl, amphotericin B colloidal, buprenorphine, calcium chloride, caspofungin, chlorpromazine,

ciprofloxacin, diazepam, diltiazem, diphenhydramine, dobutamine, doxycycline, droperidol, epinephrine, epirubicin, filgrastim, haloperidol, hydroxyzine, idarubicin, levofloxacin, lorazepam, midazolam, nicardipine, ondansetron, pentamidine, phenytoin, prochlorperazine, promethazine, quinapristin/dalfopristin, topotecan, trimethobenzamide, vancomycin, verapamil, vinorelbine.

- **Topical:** Consult health care professional before administering topical preparations to determine which skin preparation regimen should be followed. Tight occlusive dressings are not advised because of irritation to surrounding healthy tissue. A loose gauze dressing for cosmetic purposes is usually preferred. Wear gloves when applying medication. Do not use metallic applicator.

### Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; yellowing of skin or eyes; abdominal pain; joint or flank pain; swelling of feet or legs; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Advise patient to rinse mouth with clear water after eating and drinking and to avoid flossing to minimize stomatitis. Viscous lidocaine may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Review with patient the need for contraception during therapy.
- Caution patient to use sunscreen and protective clothing to prevent phototoxicity reactions.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the importance of routine follow-up lab tests to monitor progress and to check for side effects.
- **Topical:** Instruct patient in correct application of solution or cream. Emphasize importance of avoiding the eyes; caution should also be used when applying medication near mouth and nose. If patient uses clean finger to self-administer, emphasize importance of washing hands thoroughly after application. Explain that erythema, scaling, and blistering with pruritus and burning sensation are expected. Advise patient to avoid sunlight or ultraviolet light (tanning booths) as much as possible; may increase side effects. Therapy is discontinued when erosion, ulceration, and necrosis occur in 2–6 wk (10–12 wk for basal cell carcinomas). Skin heals 4–8 wk later.

### Evaluation/Desired Outcomes

- Tumor regression.
- Removal of solar keratoses or superficial basal cell skin cancers.

## fluoxetine (floo-**ox**-uh-teen)

Prozac, Prozac Weekly, Sarafem

***Classification***

Therapeutic: antidepressants

Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

**Pregnancy Category B**

### Indications

Major depressive disorder. Obsessive compulsive disorder (OCD). Bulimia nervosa. Panic disorder. Depressive episodes associated with bipolar I disorder (when used with olanzapine). Treatment-resistant depression (when used with olanzapine). **Sarafem:** Premenstrual dysphoric disorder (PMDD). **Unlabeled Use:** Anorexia nervosa: ADHD, Diabetic neuropathy, Fibromyalgia, Obesity, Raynaud's phenomenon, Social anxiety disorder (social phobia), Post-traumatic stress disorder (PTSD).

### Action

Selectively inhibits the reuptake of serotonin in the CNS. **Therapeutic Effects:** Antidepressant action. Decreased behaviors associated with: panic disorder, bulimia. Decreased mood alterations associated with PMDD.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration.

**Distribution:** Crosses the blood-brain barrier.

**Protein Binding:** 94.5%.

**Metabolism and Excretion:** Converted by the liver to norfluoxetine (primarily by CYP2D6 isoenzyme), another antidepressant compound; the CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor

metabolizers and may have significantly ↑ fluoxetine concentrations and an ↑ risk of adverse effects). Fluoxetine and norfluoxetine are mostly metabolized by the liver; 12% excreted by kidneys as unchanged fluoxetine, 7% as unchanged norfluoxetine.
**Half-life:** 1–3 days (norfluoxetine 5–7 days).

TIME/ACTION PROFILE (antidepressant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–4 wk | unknown | 2 wk |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent use or use within 14 days of discontinuing MAO inhibitors (fluoxetine should be discontinued at least 5 wk before MAO therapy is initiated); Concurrent use of pimozide; Concurrent use of thioridazine (fluoxetine should be discontinued at least 5 wk before thioridazine therapy is initiated).
**Use Cautiously in:** Severe hepatic or renal impairment (lower/less frequent dose may be necessary); History of seizures; Debilitated patients (↑ risk of seizures); Diabetes mellitus; Patients with concurrent chronic illness or multiple drug therapy (dose adjustments may be necessary); Patients with impaired hepatic function (↓ doses/↑ dosing interval may be necessary); May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; OB: Use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support. May cause sedation in infant; Lactation: May cause sedation in infant; discontinue drug or bottle-feed; Pedi: Risk of suicide ideation or attempt may be greater in children or adolescents (safe use in children <8 yr not established); Geri: Appears on Beers list. Geriatric patients are at ↑ risk for excessive CNS stimulation, sleep disturbances, and agitation.

## Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, anxiety, drowsiness, headache, insomnia, nervousness, abnormal dreams, dizziness, fatigue, hypomania, mania, weakness. **EENT:** stuffy nose, visual disturbances. **Resp:** cough. **CV:** chest pain, palpitations. **GI:** diarrhea, abdominal pain, abnormal taste, anorexia, constipation, dry mouth, dyspepsia, nausea, vomiting, weight loss. **GU:** sexual dysfunction, urinary frequency. **Derm:** ↑ sweating, pruritus, erythema nodusum, flushing, rashes. **Endo:** dysmenorrhea. **F and E:** hyponatremia. **MS:** arthralgia, back pain, myalgia. **Neuro:** tremor. **Misc:** SEROTONIN SYNDROME, allergic reactions, fever, flu-like syndrome, hot flashes, sensitivity reaction.

## Interactions

**Drug-Drug:** Discontinue use of **MAO inhibitors** for 14 days before fluoxetine therapy; combined therapy may result in confusion, agitation, seizures, hypertension, and hyperpyrexia (serotonin syndrome). Fluoxetine should be discontinued for at least 5 wk before MAO inhibitor therapy is initiated. Concurrent use with **pimozide** may ↑ risk of QT interval prolongation. ↑ levels of **thioridazine** may ↑ risk of QT interval prolongation (concurrent use contraindicated; fluoxetine should be discontinued for at least 5 wk before thioridazine is initiated). Inhibits the activity of cytochrome P450 2D6 enzyme in the liver and ↑ effects of drugs metabolized by this enzyme system. **Medications that inhibit the P450 enzyme system** (including **ritonavir**, **saquinavir**, and **efavirenz**) may ↑ risk of developing the serotonin syndrome). For concurrent use with **ritonavir** ↓ fluoxetine dose by 70%; if initiating fluoxetine, start with 10 mg/day dose. ↓ metabolism and ↑ effects of **alprazolam** (decrease alprazolam dose by 50%). Drugs that affect serotonergic neurotransmitter systems, including **linezolid**, **tramadol**, and **triptans**, ↑ risk of serotonin syndrome. ↑ CNS depression with **alcohol**, **antihistamines**, other **antidepressants**, **opioid analgesics**, or **sedative/hypnotics**. ↑ risk of side effects and adverse reactions with other **antidepressants**, **risperidone**, or **phenothiazines**. May ↑ effectiveness/risk of toxicity from **carbamazepine**, **clozapine**, **digoxin**, **haloperidol**, **phenytoin**, **lithium**, or **warfarin**. May ↓ the effects of **buspirone**. **Cyproheptadine** may ↓ or reverse effects of fluoxetine. May ↑ sensitivity to **adrenergics** and increase the risk of serotonin syndrome. May alter the activity of other **drugs that are highly bound to plasma proteins**. ↑ risk of serotonin syndrome with **5HT$_1$ agonists**. ↑ risk of bleeding with **NSAIDS**, **aspirin**, **clopidogrel**, or **warfarin**.
**Drug-Natural Products:** ↑ risk of serotonin syndrome with **St. John's wort** and **SAMe**.

## Route/Dosage

**PO (Adults):** *Depression, OCD*— 20 mg/day in the morning. After several weeks, may ↑ by 20 mg/day at weekly intervals. Doses greater than 20 mg/day should be given in 2 divided doses, in the morning and at noon (not to exceed 80 mg/day). Patients who have been stabilized on the 20 mg/

day dose may be switched over to delayed-release capsules (Prozac Weekly) at dose of 90 mg weekly, initiated 7 days after the last 20–mg dose. *Panic disorder*—10 mg/day initially, may ↑ after 1 week to 20 mg/day (usual dose is 20 mg, but may be ↑ as needed/tolerated up to 60 mg/day). *Bulimia nervosa*—60 mg/day (may need to titrate up to dosage over several days). *PMDD*—20 mg/day (not to exceed 80 mg/day) *or* 20 mg/day starting 14 days prior to expected onset on menses, continued through first full day of menstruation, repeated with each cycle. *Depressive episodes associated with bipolar I disorder*-20 mg/day with olanzapine 5 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 12.5 mg/day; *Treatment-resistant depression*-20 mg/day with olanzapine 5 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 20 mg/day.

**PO (Geriatric Patients):** *Depression*—10 mg/day in the morning initially, may be ↑ (not to exceed 60 mg/day).

**PO (Children 7–17 yr):** *Adolescents and higher weight children*—10 mg/day may be ↑ after 2 wk to 20 mg/day; additional increases may be made after several more weeks (range 20–60 mg/day); *Lower-weight children*—10 mg/day initially, may be ↑ after several more weeks (range 20–30 mg/day).

### Availability (generic available)

**Tablets:** 10 mg, 20 mg. **Cost:** *Generic*—10 mg $47.98/90, 20 mg $62.97/90. **Capsules:** 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—10 mg $48.97/90, 20 mg $26.99/90, 40 mg $119.97/90. **Delayed-release capsules (Prozac Weekly):** 90 mg. **Cost:** $110.99/4. **Oral solution (mint flavor):** 20 mg/5 mL. **Cost:** *Generic*—$72.98/120 mL. ***In combination with:*** olanzapine (Symbyax; see Appendix B).

## NURSING IMPLICATIONS

### Assessment

- Monitor mood changes. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- Monitor appetite and nutritional intake. Weigh weekly. Notify health care professional of continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess patient for sensitivity reaction (urticaria, fever, arthralgia, edema, carpal tunnel syndrome, rash, hives, lymphadenopathy, respiratory distress) and notify health care professional if present; symptoms usually resolve by stopping fluoxetine but may require administration of antihistamines or corticosteroids.
- Assess for sexual side effects (erectile dysfunction; decreased libido).
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile blood pressure, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **OCD:** Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning.
- **Bulimia Nervosa:** Assess frequency of binge eating and vomiting during therapy.
- **PMDD:** Monitor patient's mood prior to and periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC and differential periodically during therapy. Notify health care professional if leukopenia, anemia, thrombocytopenia, or increased bleeding time occurs.
- Proteinuria and mild ↑ in AST may occur during sensitivity reactions.
- May cause ↑ in serum alkaline phosphatase, ALT, BUN, creatine phosphokinase; hypouricemia, hypocalcemia, hypoglycemia or hyperglycemia, and hyponatremia.

### Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)
Sexual dysfunction (Side Effects)

### Implementation

- Do not confuse Sarafem (fluoxetine) with Serophene (clomiphene).
- **PO:** Administer as a single dose in the morning. Some patients may require increased

amounts, in divided doses, with a 2nd dose at noon.
- May be administered with food to minimize GI irritation. Do not open or crush ER preparations.

### Patient/Family Teaching
- Instruct patient to take fluoxetine as directed. If a dose is missed, omit and return to regular schedule. Do not double doses or discontinue without consulting health care professional; discontinuation may cause anxiety, insomnia, nervousness.
- May cause drowsiness, dizziness, impaired judgment, and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient, family and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and to consult health care professional before taking other medications or natural/herbal products with fluoxetine.
- Caution patient to change positions slowly to minimize dizziness.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Inform patient that medication may cause decreased libido.
- Advise patient to notify health care professional if symptoms of sensitivity reaction occur or if headache, nausea, anorexia, anxiety, or insomnia persists.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy to improve coping skills.

### Evaluation/Desired Outcomes
- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.
- Decrease in obsessive-compulsive behaviors.
- Decrease in binge eating and vomiting in patients with bulimia nervosa.
- Decreased incidence frequency of panic attacks.
- Decreased mood alterations associated with PMDD.

## fluphenazine (floo-**fen**-a-zeen)
Apo-Fluphenazine,
Modecate Concentrate,
PMS-Fluphenazine, Prolixin, Prolixin Decanoate

***Classification***
Therapeutic: antipsychotics
Pharmacologic: phenothiazines

**Pregnancy Category C**

### Indications
Acute and chronic psychoses.

### Action
Alters the effects of dopamine in the CNS. Has anticholinergic and alpha-adrenergic blocking activity. **Therapeutic Effects:** Diminished signs and symptoms of psychoses.

### Pharmacokinetics
**Absorption:** Well absorbed after PO/IM administration. Decanoate salt in sesame oil has delayed onset and prolonged action because of delayed release from oil vehicle and subsequent delayed release from fatty tissues.
**Distribution:** Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk.
**Protein Binding:** ≥90%.
**Metabolism and Excretion:** Highly metabolized by the liver; undergo enterohepatic recirculation.
**Half-life:** *Fluphenazine hydrochloride*—33 hr; *fluphenazine decanoate*—6.8–9.6 days.

TIME/ACTION PROFILE (antipsychotic activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO hydrochloride | 1 hr | unknown | 6–8 hr |
| IM decanoate | 24–72 hr | 48–96 hr | ≥4 wk |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other phenothiazines may exist; Subcortical brain damage; Severe CNS depression; Coma; Bone marrow depression; Liver disease; Hypersensitivity to sesame oil (decanoate salt); Some products contain alcohol or tartrazine and should be avoided in patients with known intolerance; Concurrent use of drugs that prolong the QT interval; Pedi: Safety not established in children <6 mo.

**Use Cautiously in:** Cardiovascular disease; Parkinson's disease; Angle-closure glaucoma; Myasthenia gravis; Prostatic hypertrophy; Seizure disorders; OB: Use only if potential benefit justifies potential risk to fetus; Lactation: Enters breast milk, not recommended; Geri: Initial dose reduction may be necessary in geriatric or debilitated patients; ↑ risk of mortality in elderly patients treated for dementia-related psychosis.

## Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, extrapyramidal reactions, sedation, tardive dyskinesia. **EENT:** blurred vision, dry eyes. **CV:** hypertension, hypotension, tachycardia. **GI:** anorexia, constipation, drug-induced hepatitis, dry mouth, ileus, nausea, weight gain. **GU:** urinary retention. **Derm:** photosensitivity, pigment changes, rashes. **Endo:** galactorrhea. **Hemat:** AGRANULOCYTOSIS, leukopenia, thrombocytopenia. **Misc:** allergic reactions.

## Interactions

**Drug-Drug:** Concurrent use with drugs that prolong the QT interval, including **antiarrhythmics**, **pimozide**, **erythromycin**, **clarithromycin**, **fluoroquinolones**, **methadone**, and **tricyclic antidepressants** may ↑ the risk for arrhythmias; concurrent use should be avoided. Additive hypotension with **antihypertensives**. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioids**, **sedative/hypnotics**, or **general anesthetics**. **Phenobarbital** may increase metabolism and decrease effectiveness of fluphenazine. May ↑ the risk of **lithium** toxicity. **Aluminum-containing antacids** may decrease oral absorption of fluphenazine. May decrease anti-Parkinson activity of **levodopa** and **bromocriptine**. May decrease the vasopressor response to **epinephrine** and **norepinephrine**. **Beta blockers**, **chlorpromazine**, **chloroquine**, **delavirdine**, **fluoxetine**, **paroxetine**, **quinidine**, **quinine**, **ritonavir**, and **ropinirole** may ↑ the effects of fluphenazine. Increased risk of anticholinergic effects with other **agents having anticholinergic properties**, including **antihistamines**, **tricyclic antidepressants**, **disopyramide**, or **quinidine**. **Metoclopramide** may ↑ the risk of extrapyramidal reactions.

F

## Route/Dosage

### Fluphenazine Decanoate

**IM (Adults):** 12.5–25 mg initially; may be repeated q 3 wk. Dose may be slowly increased as needed (not to exceed 100 mg/dose).

### Fluphenazine Hydrochloride

**PO (Adults):** 0.5–10 mg/day in divided doses q 6–8 hr (maximum dose = 40 mg/day).
**PO (Geriatric Patients or Debilitated Patients):** 1–2.5 mg/day initially; increase dose every 4–7 days by 1–2.5 mg/day as needed (max dose = 20 mg/day).
**IM (Adults):** 1.25–2.5 mg q 6–8 hr.

## Availability (generic available)

**Fluphenazine decanoate injection:** 25 mg/mL, 100 mg/mL. **Fluphenazine hydrochloride tablets:** 1 mg, 2.5 mg, 5 mg, 10 mg. **Fluphenazine hydrochloride elixir (orange flavor):** 2.5 mg/5 mL. **Fluphenazine hydrochloride concentrate:** 5 mg/mL. **Fluphenazine hydrochloride injection:** 2.5 mg/mL.

# NURSING IMPLICATIONS

## Assessment

- Assess patient's mental status (orientation, mood, behavior) before and periodically during therapy.
- Monitor blood pressure (sitting, standing, lying), ECG, pulse, and respiratory rate before and frequently during the period of dose adjustment. May cause Q-wave and T-wave changes in ECG.
- Observe patient carefully when administering oral medication to ensure that medication is actually taken and not hoarded.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet help minimize constipation.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—diffi-

culty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Reduction in dose or discontinuation of medication may be necessary. Benztropine or diphenhydramine may be used to control these symptoms.

- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or wormlike movements of tongue). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, arrhythmias, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report immediately.
- ***Lab Test Considerations:*** Evaluate CBC, liver function tests, and ocular examinations periodically during therapy. May cause ↓ hematocrit, hemoglobin, leukocytes, granulocytes, and platelets. May cause ↑ bilirubin, AST, ALT, and alkaline phosphatase. Agranulocytosis may occur after 4–10 wk of therapy with recovery 1–2 wk after discontinuation. May recur if medication is restarted. Liver function abnormalities may require discontinuation of therapy.

## Potential Nursing Diagnoses

Disturbed thought process (Indications)
Noncompliance (Patient/Family Teaching)

## Implementation

- Slight yellow to amber color does not alter potency.
- To prevent contact dermatitis, avoid getting liquid preparations on hands and wash hands thoroughly if spillage occurs.
- Injectable forms must be drawn up with a dry syringe and dry 21-gauge needle to prevent clouding of the solution.
- **PO:** Dilute concentrate just before administration in 120–240 mL of water, milk, carbonated beverage, soup, or tomato or fruit juice. Do not mix with beverages containing caffeine (cola, coffee), tannics (tea), or pectinates (apple juice).
- **Subcut:** Fluphenazine decanoate is dissolved in sesame oil for long duration of action. It may be administered subcut or IM. 12.5 mg of fluphenazine decanoate given every 3 wk is approximately equivalent to 10 mg/day orally of fluphenazine hydrochloride.
- **IM:** IM dose of fluphenazine hydrochloride is usually 30–50% of oral dose. Because fluphenazine hydrochloride has a shorter duration of action, it is used initially to determine the patient's response to the drug and to treat the acutely agitated patient.
- Administer deep IM, using a dry syringe and 21-gauge needle, into dorsal gluteal site. Instruct patient to remain recumbent for 30 min to prevent hypotension.
- **Syringe Compatibility:** Fluphenazine hydrocholride is compatible in syringe with, benztropine, diphenhydramine, hydroxyzine.

## Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. If a dose is missed, take within 1 hr or skip dose and return to regular schedule if taking more than 1 dose/day; take as soon as possible unless almost time for next dose if taking 1 dose/day. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Caution patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun. Exposed surfaces may develop a blue-gray pigmentation, which may fade after discontinuation of the medication. Extremes of temperature should also be avoided because this drug impairs body temperature regulation.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may help relieve dry mouth. Health care professional should be notified if dry mouth persists beyond 2 wk.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools occur.

- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up exams, including ocular exams, with long-term therapy and continued participation in psychotherapy.

### Evaluation/Desired Outcomes

- Decrease in excitable, paranoic, or withdrawn behavior.

## flurandrenolide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

## flurazepam (flur-az-e-pam)

Apo-Flurazepam, Dalmane, Novoflupam, Somnol

***Classification***

Therapeutic: sedative/hypnotics
Pharmacologic: benzodiazepines

**Schedule IV**

**Pregnancy Category UK**

### Indications

Short-term management of insomnia (<4 wk).

### Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Relief of insomnia.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration.
**Distribution:** Widely distributed; crosses blood-brain barrier. Probably crosses the placenta and enters breast milk. Accumulation of drug occurs with chronic dosing.
**Protein Binding:** 97% (one of the active metabolites).
**Metabolism and Excretion:** Metabolized by the liver; some metabolites have hypnotic activity.
**Half-life:** 2.3 hr (half-life of active metabolite may be 30–200 hr).

TIME/ACTION PROFILE (hypnotic activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15–45 min | 0.5–1 hr | 7–8 hr |

### Contraindications/Precautions

**Contraindicated in:** Impaired repiratory function; Impaired repiratory function; Sleep apnea; Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Pre-existing CNS depression; Severe uncontrolled pain; Angle-closure glaucoma; OB: Chronic use during pregnancy may cause withdrawal effects in neonates; Lactation: Enters breast milk; discontinue or bottle-feed.
**Use Cautiously in:** Hepatic dysfunction (dosage reduction may be necessary); History of suicide attempt or drug dependence; Debilitated patients (initial dose reduction may be necessary); Pedi: Safety not established in children <15 yr; Geri: Appears on Beer's list and is associated with increased falls risk in geriatric patients.

### Adverse Reactions/Side Effects

**CNS:** abnormal thinking, behavior changes, confusion, daytime drowsiness, decreased concentration, dizziness, hallucinations, headache, lethargy, mental depression, paradoxical excitation, sleep—driving. **EENT:** blurred vision. **GI:** constipation, diarrhea, nausea, vomiting. **Derm:** rashes. **Neuro:** ataxia. **Misc:** physical dependence, psychological dependence, tolerance.

### Interactions

**Drug-Drug:** Concurrent use with **alcohol**, **antidepressants**, **antihistamines**, and **opioids** may result in additive CNS depression. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propoxyphene**, **propranolol**, or **valproic acid** may ↓ metabolism of flurazepam, enhancing its actions. May ↓ efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↑ metabolism and decrease ↓ effectiveness of flurazepam. Sedative effects may be ↓ by **theophylline**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

### Route/Dosage

**PO (Adults):** 15–30 mg at bedtime.
**PO (Geriatric Patients or Debilitated Patients):** 15 mg initially, may be increased.

### Availability (generic available)

**Capsules:** 15 mg, 30 mg. **Tablets:** 15 mg, 30 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess sleep patterns before and periodically throughout therapy.
- Assess mental status (orientation, mood, behavior) and potential for abuse prior to administering medication.
- Prolonged use may lead to psychological or physical dependence. Restrict amount of drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.
- Geri: Assess fall risk and institute prevention strategies.

### Potential Nursing Diagnoses

Insomnia (Indications)
Ineffective coping (Indications)
Sleep deprivation (Indications)
Risk for falls (Side Effects)
Acute confusion (Side Effects)
Risk for injury (Side Effects)

### Implementation

- Do not confuse flurazepam with temazepam.
- Supervise ambulation and transfer of patients after administration. Remove cigarettes. Two side rails should be raised and call bell within reach at all times.
- When discontinuing, taper to decrease chance of withdrawal effects (may take months in some patients).
- **PO:** Capsules may be opened and mixed with food or fluids for patients having difficulty swallowing.

### Patient/Family Teaching

- Advise patient to take medication exactly as directed.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoidance of nictotine and caffeine).
- Maximum hypnotic properties are apparent 2–3 nights after initiating therapy and may last 1–2 nights after therapy is discontinued.
- Medication may cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Refer for psychotherapy if ineffective coping is basis for sleep pattern disturbance.
- OB: Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.
- Geri: Caution patient or family to institute fall prevention strategies at home.
- Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.

### Evaluation/Desired Outcomes

- Improvement in sleep patterns (decreased number of night time awakenings, improved sleep onset, and increased total sleep time).

**fluticasone, See CORTICOSTEROIDS (INHALATION).**

**fluticasone, See CORTICOSTEROIDS (NASAL).**

**fluticasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

**fluvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).**

## fluvoxamine

(floo-**voks**-a-meen)
Luvox, Luvox CR

***Classification***
Therapeutic: antidepressants, antiobsessive agents
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

**Pregnancy Category C**

### Indications

Obsessive-compulsive disorder (OCD) (immediate and controlled-release). Social anxiety disorder (SAD) (controlled-release only). **Unlabeled Use:** Depression. Generalized anxiety disorder (GAD). Post-traumatic stress disorder (PSTD).

### Action

Inhibits the reuptake of serotonin in the CNS. **Therapeutic Effects:** Decrease in obsessive-compulsive behaviors. Decrease in symptoms of social anxiety disorder.

### Pharmacokinetics

**Absorption:** 53% absorbed after oral administration.
**Distribution:** Excreted in breast milk; enters the CNS. Remainder of distribution not known.
**Metabolism and Excretion:** Eliminated mostly by the kidneys.

**Half-life:** 13.6–15.6 hr.

TIME/ACTION PROFILE (improvement on obsessive-compulsive behaviors)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 2–3 wk | several mo | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to fluvoxamine or other SSRIs; Concurrent use or use within 14 days of discontinuing MAOIs, alosetron, pimozide, thioridazine, or tizanidine.

**Use Cautiously in:** Impaired hepatic function; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents; OB: Neonates exposed to SSRI in third trimester may develop drug discontinuation syndrome including respiratory distress, feeding difficulty, and irritability; Lactation: Discontinue drug or bottle-feed; Pedi: Safety not established in children <8 yr (for immediate-release); Geri: May have ↑ sensitivity; recommend lower initial dose and slower dosage titration.

## Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, sedation, dizziness, drowsiness, headache, insomnia, nervousness, weakness, agitation, anxiety, apathy, emotional lability, manic reactions, mental depression, psychotic reactions, syncope. **EENT:** sinusitis. **Resp:** cough, dyspnea. **CV:** edema, hypertension, palpitations, postural hypotension, tachycardia, vasodilation. **GI:** constipation, diarrhea, dry mouth, dyspepsia, nausea, anorexia, dysphagia, ↑ liver enzymes, flatulence, weight gain (unusual), vomiting. **GU:** ↓ libido/sexual dysfunction. **Derm:** ↑ sweating. **Metab:** weight gain, weight loss. **MS:** hypertonia, myoclonus/twitching. **Neuro:** hypokinesia/hyperkinesia, tremor. **Misc:** SEROTONIN SYNDROME, allergic reactions, chills, flu-like symptoms, tooth disorder/caries, yawning.

## Interactions

**Drug-Drug:** Serious, potentially fatal reactions (serotonin syndrome) may occur with **MAO inhibitors**. **Smoking** may ↓ effectiveness of fluvoxamine. Concurrent use with **tricyclic antidepressants** may ↑ plasma levels of fluvoxamine. Drugs that affect serotonergic neurotransmitter systems, including **linezolid**, **tramadol**, and **triptans**, ↑ risk of serotonin syndrome. ↓ metabolism and may ↑ effects of some **beta blockers** (**propranolol**), **alosetron** (avoid concurrent use), some **benzodiazepines** (avoid concurrent **diazepam**), **carbamazepine**, **methadone**, **lithium**, **theophylline** ( ↓ dose to 33% of usual dose), **ramelteon** (avoid concurrent use), **warfarin**, and **L-tryptophan**. ↑ risk of bleeding with **NSAIDS**, **aspirin**, **clopidogrel**, or **warfarin**. ↑ blood levels and risk of toxicity from **clozapine** (dosage adjustments may be necessary).

## Route/Dosage

**PO (Adults):** *Immediate release (OCD only)* – 50 mg daily at bedtime; ↑ by 50 mg q 4–7 days until desired effect is achieved. If daily dose >100 mg, give in two equally divided doses or give a larger dose at bedtime (not to exceed 300 mg/day); *Controlled release (OCD and SAD)* – 100 mg at bedtime; ↑ by 50 mg q 7 days until desired effect is achieved, not to exceed 300 mg/day.

**PO (Children 8–17 yr):** *Immediate release (OCD only)* – 25 mg at bedtime, may ↑ by 25 mg/day q 4–7 days (not to exceed 200 mg/day; daily doses >50 mg should be given in divided doses with a larger dose at bedtime).

### Hepatic Impairment

**PO (Adults):** 25 mg daily at bedtime initially, slower titration and longer dosing intervals should be used.

## Availability

**Tablets:** 25 mg, 50 mg, 100 mg. **Controlled-release capsules:** 100 mg, 150 mg.

# NURSING IMPLICATIONS

## Assessment

- Monitor mood changes. Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- Monitor appetite and nutritional intake. Weigh weekly. Report significant changes in weight.

Adjust diet as tolerated to support nutritional status.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile blood pressure, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- ***Toxicity and Overdose:*** Common symptoms of toxicity include drowsiness, vomiting, diarrhea, and dizziness. Coma, tachycardia, bradycardia, hypotension, ECG abnormalities, liver function abnormalities, and convulsions may also occur. Treatment is symptomatic and supportive.

### Potential Nursing Diagnoses
Ineffective coping (Indications)
Risk for injury (Side Effects)

### Implementation
- Taper to avoid withdrawal effects. Reduce dose by 50% for 3 days, then reduce by 50% for 3 days, then discontinue.
- **PO:** Initial therapy is administered as a single bedtime dose. May be increased every 4–7 days as tolerated.
- Fluvoxamine may be given without regard to meals. Do not open, break, crush, or chew controlled-release capsules.

### Patient/Family Teaching
- Instruct patient to take fluvoxamine as directed. Do not skip or double up on missed doses. Improvement in symptoms may be noticed in 2–3 wk, but medication should be continued as directed.
- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to avoid alcohol or other CNS depressants during therapy and to consult health care professional before taking other medications with fluvoxamine.
- Instruct female patients to notify health care professional if breastfeeding or if pregnancy is planned or suspected.
- Advise patient to notify health care professional if rash or hives occur or if headache, nausea, anorexia, anxiety, or insomnia persists.
- Advise patient to avoid use of caffeine (chocolate, tea, cola).
- Emphasize the importance of follow-up exams to monitor progress.

### Evaluation/Desired Outcomes
- Decrease in symptoms of obsessive-compulsive disorder.
- Decrease in symptoms of social anxiety disorder.

## folic acid (foe-lika -sid)
Apo-Folic, folate, Folvite,
Novofolacid, vitamin B

***Classification***
Therapeutic: antianemics, vitamins
Pharmacologic: water soluble vitamins

**Pregnancy Category A**

### Indications
Prevention and treatment of megaloblastic and macrocytic anemias. Given during pregnancy to promote normal fetal development.

### Action
Required for protein synthesis and red blood cell function. Stimulates the production of red blood cells, white blood cells, and platelets. Necessary for normal fetal development. **Therapeutic Effects:** Restoration and maintenance of normal hematopoiesis.

### Pharmacokinetics
**Absorption:** Well absorbed from the GI tract and IM and subcut sites.
**Distribution:** Half of all stores are in the liver. Enters breast milk. Crosses the placenta.
**Protein Binding:** Extensive.
**Metabolism and Excretion:** Converted by the liver to its active metabolite, dihydrofolate reductase. Excess amounts are excreted unchanged by the kidneys.
**Half-life:** Unknown.

TIME/ACTION PROFILE (↑ in reticulocyte count)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO, IM, subcut, IV | 30–60 min | 1 hr | unknown |

### Contraindications/Precautions

**Contraindicated in:** Uncorrected pernicious, aplastic, or normocytic anemias (neurologic damage will progress despite correction of hematologic abnormalities); Pedi: Preparations containing benzyl alcohol should not be used in newborns.

**Use Cautiously in:** Undiagnosed anemias.

### Adverse Reactions/Side Effects

**Derm:** rash. **CNS:** irritability, difficulty sleeping, malaise, confusion. **Misc:** fever.

### Interactions

**Drug-Drug: Pyrimethamine**, **methotrexate**, **trimethoprim**, and **triamterene** prevent the activation of folic acid (leucovorin should be used instead to treat overdoses of these drugs). Absorption of folic acid is ↓ by **sulfonamides** (including **sulfasalazine**), **antacids**, and **cholestyramine**. Folic acid requirements are ↑ by **estrogens**, **phenytoin**, **phenobarbital**, **primidone**, **carbamazepine**, or **corticosteroids**. May ↓ **phenytoin** levels.

### Route/Dosage

### Therapeutic Dose (Folic acid deficiency)

**PO, IM, IV, Subcut (Adults and Children >11 yr):** 1 mg/day initial dose then 0.5 mg/day maintenance dose.

**PO, IM, IV, Subcut (Children >1 yr):** 1 mg/day initial dose then 0.1–0.4 mg/day maintenance dose.

**PO, IM, IV, Subcut (Infants):** 15 mcg/kg/dose daily or 50 mcg/day.

### Recommended Daily Allowance

**PO (Adults and Children >15 yr):** 0.2 mg/day.
**PO (Adults):** *Females of childbearing potential*–0.4–0.8 mg/day.
**PO (Children 11–14 yr):** 0.15 mg/day.
**PO (Children 7–10 yr):** 0.1 mg/day.
**PO (Children 4–6 yr):** 0.075 mg/day.
**PO (Infants 6 mo–3 yr):** 0.05 mg/day.

### Availability (generic available)

**Tablets:** 0.4 mg, 0.8 mg, 1 mg, 🍁 5 mg. **Injection:** 5 mg/mL. ***In combination with:*** other vitamins and minerals as multiple vitamins[Rx, OTC].

## NURSING IMPLICATIONS

### Assessment

- Assess patient for signs of megaloblastic anemia (fatigue, weakness, dyspnea) before and periodically throughout therapy.
- ***Lab Test Considerations:*** Monitor plasma folic acid levels, hemoglobin, hematocrit, and reticulocyte count before and periodically during therapy.
- May cause ↓ serum concentrations of other B complex vitamins when given in high continuous doses.

### Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)
Activity intolerance (Indications)

### Implementation

- Do not confuse folic acid with folinic acid (leucovorin calcium).
- Because of infrequency of solitary vitamin deficiencies, combinations are commonly administered (see Appendix B).
- May be given subcut, deep IM, or IV when PO route is not feasible.
- **PO:** Antacids should be given at least 2 hr after folic acid; folic acid should be given 2 hr before or 4–6 hr after cholestyramine. A 50-mcg/mL oral solution may be extemporaneously prepared by pharmacy for use in neonates and infants.
- **IV:** Solution ranges from yellow to orange-yellow in color.

#### IV Administration

- **Direct IV:** ***Diluent:*** Dilute with dextrose or 0.9%NaCl. ***Concentration:*** 0.1 mg/mL. ***Rate:*** 5 mg/min.
- **Continuous Infusion:** May be added to hyperalimentation solution.
- **Y-Site Compatibility:** alfentanil, aminophylline, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bumetanide, calcium gluconate, cefazolin, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, diphenhyrdamine, dopamine, enelaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, esmolol, famotidine, fentanyl, fluconazole, furosemide, ganciclovir, glycopyrrolate, heparin, hydrocortisone, imipenem/cilastatin, indomethacin, insulin, ketorolac, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine, methylprednisolone, metoclopramide, metoprolol, midazolam, multivitamins, naloxone, nitroglycerin,

nitroprusside, ondansetron, oxacillin, penicillin G, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, propranolol, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, theophylline, ticarcillin/clavulanate, trimetaphan, urokinase, vancomycin, vasopressin.

- **Y-Site Incompatibility:** amikacin, calcium chloride, chlorpromazine, dantrolene, diazepam, diazoxide, dobutamine, doxycycline, gentamicin, haloperidol, hydralazine, inamrinone, metaraminol, methoxamine, methyldopate, morphine, nafcillin, nalbuphine, norepinephrine, pentamidine, pentazocine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxime, tacrolimus, thiamine, tobramycin, tolazoline, trimethoprim/sulfamethoxazole, verapamil.

## Patient/Family Teaching

- Encourage patient to comply with diet recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups. A diet low in vitamin B and folate will be used to diagnose folic acid deficiency without concealing pernicious anemia.
- Folic acid in early pregnancy is necessary to prevent neural tube defects.
- Foods high in folic acid include vegetables, fruits, and organ meats; heat destroys folic acid in foods.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. The effectiveness of megadoses for treatment of various medical conditions is unproven and may cause side effects.
- Explain that folic acid may make urine more intensely yellow.
- Instruct patient to notify health care professional if rash occurs, which may indicate hypersensitivity.
- Emphasize the importance of follow-up exams to evaluate progress.

## Evaluation/Desired Outcomes

- Reticulocytosis 2–5 days after beginning therapy.
- Resolution of symptoms of megaloblastic anemia.
- Prevention of neural tube defects.

HIGH ALERT

# fondaparinux

(fon-da-**par**-i-nux)

Arixtra

***Classification***

Therapeutic: anticoagulants

Pharmacologic: active factor X inhibitors

**Pregnancy Category B**

## Indications

Prevention and treatment of deep vein thrombosis and pulmonary embolism. **Unlabeled Use:** Systemic anticoagulation for other diagnoses.

## Action

Binds selectively to antithrombin III (AT III). This binding potentiates the neutralization (inactivation) of active factor X (Xa). **Therapeutic Effects:** Interruption of the coagulation cascade resulting in inhibition of thrombus formation. Prevention of thrombus formation decreases the risk of pulmonary emboli.

## Pharmacokinetics

**Absorption:** 100% absorbed following subcutaneous administration.

**Distribution:** Distributes mainly throughout the intravascular space.

**Metabolism and Excretion:** Eliminated mainly unchanged in urine.

**Half-life:** 17–21 hr.

TIME/ACTION PROFILE (anticoagulant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | rapid | 3 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe renal impairment (CCr <30 mL/min; ↑ risk of bleeding); Body weight <50 kg in patients undergoing hip replacement (markedly ↑ risk of bleeding); Active major bleeding; Bacterial endocarditis; Thrombocytopenia due to fonaparinux antibodies.

**Use Cautiously in:** Mild-to-moderate renal impairment; Retinopathy (hypertensive or diabetic); Untreated hypertension; Recent history of ulcer disease; History of congenital or acquired bleeding disorder; Geri: Patients >65 yr (↑ risk of bleeding); Malignancy; History of heparin-induced thrombocytopenia; OB, Lactation, Pedi: Safety not established; use during pregnancy only if clearly needed.

**Exercise Extreme Caution in:** Severe uncontrolled hypertension; Bleeding disorders; GI bleeding/ulceration/pathology; Hemorrhagic stroke; Recent CNS or ophthalmologic surgery; Active GI bleeding/ulceration; Spinal/epidural anesthesia or spinal puncture (↑ risk of spinal/epidural hematoma that may lead to long-term or permanent paralysis).

### Adverse Reactions/Side Effects

**CNS:** confusion, dizziness, headache, insomnia. **CV:** edema, hypotension. **GI:** constipation, diarrhea, dyspepsia, ↑ serum aminotransferases, nausea, vomiting. **GU:** urinary retention. **Derm:** bullous eruption, hematoma, purpura, rash. **Hemat:** bleeding, thrombocytopenia. **F and E:** hypokalemia. **Misc:** fever, ↑ wound drainage.

### Interactions

**Drug-Drug:** Risk of bleeding may be ↑ by concurrent use of **warfarin** or **drugs that affect platelet function**, including **aspirin**, **NSAIDs**, **dipyridamole**, some **cephalosporins**, **valproates**, **clopidogrel**, **ticlopidine**, **abciximab**, **eptifibatide**, **tirofiban**, and **dextran**. **Drug-Natural Products:** ↑ risk of bleeding with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **gingko**, **Panax ginseng**, and others.

### Route/Dosage

### Treatment of DVT/PE

**Subcut (Adults):** *<50 kg*— 5 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); warfarin may be started withing 72 hr of fondaparinux (has been used for up to 26 days); *50–100 kg*— 7.5 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); *>100 kg*— 10 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); warfarin may be started within 72 hr of fondaparinux.

### Prevention of DVT/PE

**Subcut (Adults):** 2.5 mg once daily, starting 6–8 hr after surgery, continuing for 5–9 days (up to 11 days) following abdominal surgery or knee/hip replacement or continuing for 24 days following hip fracture surgery (up to 32 days).

### Availability

**Solution for subcut injection:** 2.5 mg/0.5 mL in prefilled syringes, 5 mg/0.4 mL in prefilled syringes, 7.5 mg/0.6 mL in prefilled syringes, 10 mg/0.8 mL in prefilled syringes.

## NURSING IMPLICATIONS

### Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit; sudden drop in blood pressure; guaiac positive stools); bleeding from surgical site. Notify health care professional if these occur.
- Assess for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement. Monitor neurological status frequently for signs of impairment, especially in patients with indwelling epidural catheters for administration of analgesia or with concomitant use of drugs affecting hemostasis (NSAIDs, platelet inhibitors, other anticoagulants). Risk is increased by traumatic or repeated epidural or spinal puncture. May require urgent treatment.
- ***Lab Test Considerations:*** Monitor platelet count closely; may cause thrombocytopenia. If platelet count is <100,000/mm$^3$, discontinue fondaparinux.
- Fondaparinux is not accurately measured by prothrombin time (PT), activated thromboplastin time (aPTT), or international standards of heparin or low molecular weight heparins. If unexpected changes in coagulation parameters or major bleeding occurs, discontinue fondaparinux.
- Monitor CBC, serum creatinine levels, and stool occult blood tests routinely during therapy.
- May cause asymptomatic ↑ in AST and ALT. Elevations are fully reversible and not associated with ↑ in bilirubin.
- May cause ↑ aPTT temporally associated with bleeding with or without concomitant administration of other anticoagulants and thrombocytopenia with thrombosis similar to heparin-induced thrombocytopenia, with or without exposure to heparin or low-molecular-weight heparin.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Side Effects)

### Implementation

- Fondaparinux cannot be used interchangeably with heparin, low-molecular-weight heparins, or heparinoids as they differ in manufacturing process, anti-Xa and anti-IIa activity, units, and dosage. Each of these medications has its own instructions for use.
- Initial dose should be administered 6-8 hr after surgery. Administration before 6 hr after surgery has been associated with risk of major bleeding.

- **Subcut:** Administer subcut only into fatty tissue, alternating sites between right and left anterolateral or posterolateral abdominal wall. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter. Do not mix with other injections.
- Fondaparinux is provided in a single-dose prefilled syringe with an automatic needle protection system. Do not expel air bubble from prefilled syringe before injection to prevent loss of drug.

### Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to health care professional immediately.
- Instruct patient not to take aspirin or NSAIDs without consulting health care professional during therapy.

### Evaluation/Desired Outcomes

- Prevention and treatment of deep vein thrombosis and pulmonary embolism.

## **formoterol** (for-**mo**-te-role)

Foradil, Perforomist

***Classification***

Therapeutic: bronchodilators
Pharmacologic: adrenergics

**Pregnancy Category C**

### Indications

Long-term maintenance treatment of asthma. Prevention of bronchospasm in reversible obstructive airways disease, including. Long-term management of bronchoconstriction associated with COPD including chronic bronchitis and emphysema. Acute prevention of exercise-induced bronchospasm, when used on an occasional, as needed, basis.

### Action

Produces accumulation of cyclic adenosine monophosphate (cAMP) at beta-adrenergic receptors, resulting in relaxation of airway smooth muscle. Relatively specific for $beta_2$ (pulmonary) receptors. **Therapeutic Effects:** Bronchodilation.

### Pharmacokinetics

**Absorption:** Following inhalation, majority of inhaled drug is swallowed and absorbed.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver; 10–18% excreted unchanged in urine.
**Half-life:** 10 hr.

TIME/ACTION PROFILE (bronchodilation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| inhalation | 15 min | 1–3 hr | 12 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Acute attack of asthma (onset of action is delayed).
**Use Cautiously in:** Cardiovascular disease (including angina and hypertension); Diabetes; Glaucoma; Hyperthyroidism; Pheochromocytoma; Excessive use (may lead to tolerance and paradoxical bronchospasm); OB, Lactation, Pedi: Pregnancy, lactation, or children <5 yr (may inhibit contractions during labor; use only if potential benefits outweigh risks).

### Adverse Reactions/Side Effects

**CNS:** dizziness, fatigue, headache, insomnia, malaise, nervousness. **Resp:** PARADOXICAL BRONCHOSPASM. **CV:** angina, arrhythmias, hypertension, hypotension, palpitations, tachycardia. **GI:** dry mouth, nausea. **F and E:** hypokalemia. **Metab:** hyperglycemia, metabolic acidosis. **MS:** muscle cramps. **Neuro:** tremor. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug:** Concurrent use with **MAO inhibitors**, **tricyclic antidepressants**, or other **agents that may prolong the QTc interval** may result in serious arrhythmias and should be undertaken with extreme caution. ↑ risk of hypokalemia with **theophylline**, **corticosteroids**, **potassium-losing diuretics**. **Beta blockers** may ↓ therapeutic effects of formoterol. ↑ adrenergic effects may occur with concurrent use of **adrenergics**.

### Route/Dosage

#### Maintenance Treatment of Asthma

**Inhaln (Adults and Children ≥ 5 yr):** 1 capsule (12 mcg) every 12 hr using the Aerolizer Inhaler.

#### Prevention of Exercise-Induced Bronchospasm

**Inhaln (Adults and Children ≥12 yr):** 1 capsule (12 mcg) at least 15 min before exercise on an occasional as-needed basis.

### Maintenance Treatment of COPD (Emphysema and Chronic Bronchitis)

**Inhaln (Adults):** 20 mcg/2 mL-unit-dose vial twice daily via jet nebulizer.

### Availability

**Capsule for Aerolizer use:** 12 mcg. **Vials for nebulization:** 20 mcg/2 mL. ***In combination with:*** budesonide (Symbicort; see Appendix B).

## NURSING IMPLICATIONS

### Assessment

- Assess lung sounds, pulse, and blood pressure before administration and during peak of medication. Note amount, color, and character of sputum produced. Closely monitor patients on higher dose for adverse effects.
- Monitor pulmonary function tests before initiating and periodically therapy to determine effectiveness.
- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify health care provider immediately.
- Monitor ECG periodically during therapy. May cause prolonged QTc interval.
- Monitor patient for signs of anaphylaxis (dyspnea, rash, laryngeal edema) throughout therapy.
- ***Lab Test Considerations:*** May cause ↑ serum glucose and decreased serum potassium.

### Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

### Implementation

- **Inhaln:** *For use with inhaler:* Place capsule in the well of the *Aerolizer Inhaler* with dry hands; do not expose to moisture. The capsule is pierced by pressing and releasing the buttons on the side of the device. Medication is dispersed into the air stream when patient inhales rapidly and deeply through mouthpiece. Capsules are only to be used with *Aerolizer Inhaler* and should not be taken orally. Store capsules in the blister and only remove immediately before use. Store inhaler in a level, horizontal position. *Aerolizer Inhaler* should never be washed and should be kept dry.
- Do not use a spacer with formoterol.
- To use, pull off the *Aerolizer* cover. Hold the base of the inhaler firmly, and twist mouthpiece in the direction of the arrow to open. Push the buttons in to make sure four pins are visible in the capsule well on each side. Remove capsule from blister pack immediately before use. Separate one blistered capsule by tearing at perforations. With foil-side up, fold back along perforation and flatten. Starting at slit, tear off corner; separate and peel foil from paper backing and remove capsule. Place capsule in the capsule chamber in the base of the *Aerolizer Inhaler*. Never place a capsule directly into the mouthpiece. Twist the mouthpiece back to the closed position. With the mouthpiece upright, simultaneously press both buttons only once. A click should be heard as the capsule is being pierced. Release buttons; if buttons stick in depressed position grasp wings on buttons and retract before inhalation. With patient sitting or standing in a comfortable upright position, exhale fully. Do not exhale into the device. Tilt head back slightly and breathe in rapidly but steadily. A sweet taste will be experienced and a whirring noise heard. If no whirring is heard, the capsule may be stuck. Open inhaler and loosen capsule allowing it to spin freely. Do not repeatedly press buttons to loosen capsule. Hold breath for as long as comfortably possible after removing inhaler from mouth. Open inhaler to see if any powder is still in capsule. If powder is found, repeat inhalation steps. After use, open, remove and discard empty capsule.
- **Inhaln:** *For use with nebulizer:* Administer via standard jet nebulizer via mouthpiece or face mask. Remove vial from foil immediately prior to use and discard via after use. May be stored in refrigerator for up to 3 months.

### Patient/Family Teaching

- Instruct patient to take fomoterol as directed. Do not discontinue therapy without discussing with health care professional, even if feeling better. If on a scheduled dosing regimen, take a missed dose as soon as remembered, spacing remaining doses at regular intervals. Do not double doses. Use a rapid-acting bronchodilator if symptoms occur before next dose is due. Caution patient not to use more than 2 times a day or less than 12 hr apart; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication Instruct patient to review medication guide with each Rx refill.
- Advise patient to have a rapid-acting bronchodilator available for use at all times for symptomatic relief of acute asthma attacks.

- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or nausea, vomiting, shakiness, headache, fast or irregular heartbeat, or sleeplessness occur.
- Instruct patient to notify health care professional if there is no response to the usual dose of formoterol. Asthma and treatment regimen should be re-evaluated and corticosteroids should be considered. Need for increased use to treat symptoms indicates decrease in asthma control and need to reevaluate therapy.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products or alcohol concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if nursing.
- **Inhaler:** Instruct patient on correct technique for use of *Aerolizer Inhaler*. Advise patient always to use new *Aerolizer Inhaler* that comes with each refill. Take sticker with "use by" date written by pharmacist from the outside of the box and place it on the *Aerolizer Inhaler* cover. If the date is blank, count 4 months from the date of purchase and write date on sticker. Use new inhaler and blister pack following the "use by" date.
- Inform patient that in rare cases capsule might break into small pieces. These pieces should be retained by the screen in the inhaler, however in rare instances tiny pieces may reach mouth or throat after inhalation. Shattering of capsule is less likely to happen if storage conditions are strictly followed, capsules removed from blister immediately before use, and capsules are only pierced once.

### Evaluation/Desired Outcomes

- Prevention of bronchospasm.

## fosamprenavir

(fos-am-**pren**-a-veer)
Lexiva, Telzir

***Classification***
Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors

**Pregnancy Category C**

### Indications

With other antiretrovirals in the management of HIV infection.

### Action

Inhibits the action of HIV protease and prevents the cleavage of viral polyproteins. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV and its sequelae.

### Pharmacokinetics

**Absorption:** Fosamprenavir is a prodrug. Following oral administration, it is rapidly converted to amprenavir by the gut lining during absorption.
**Distribution:** Penetration into RBCs is concentration dependent.
**Metabolism and Excretion:** Mostly metabolized the liver (CYP3A4 enzyme system). Minimal renal excretion.
**Half-life:** 7.7 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1.5–4 hr | 12–24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity, sulfonamide/sulfa hypersensitivity; Severe hepatic impairment; Concurrent use of flecainide, propafenone, rifampin, ergot derivatives, St. John's wort, lovastatin, simvastatin, pimozide, delavirdine, midazolam or triazolam.
**Use Cautiously in:** Geri: Consider age-related ↓ in body mass, cardiac/hepatic/renal impairment, concurrent illness and medications; Hepatic impairment; Concurrent use of medications handled by or affecting the CYP3A4 enzyme system (may require serum level monitoring, dose or dosing interval alterations); OB, Lactation, Pedi: Pregnancy, lactation, children <2 yr (safety not established; breast feeding not recommended in HIV-infected patients).

### Adverse Reactions/Side Effects

Reflects use with other antiretrovirals.
**CNS:** headache, fatigue, mood disorders. **GI:** diarrhea, nausea, vomiting, abdominal pain, ↑ liver enzymes. **Derm:** rash. **Endo:** glucose intolerance. **GU:** nephrolithiasis. **Hemat:** neutropenia. **Metab:** ↑ cholesterol, fat redistribution, ↑ triglycerides. **Misc:** allergic reactions including STEVENS-JOHNSON SYNDROME, ANGIOEDEMA, inflammatory response to opportunistic infection.

### Interactions

**Drug-Drug:** Amprenavir, the active moiety of fosamprenavir is metabolized by **CYP3A4**; it also inhibits and induces this enzyme system. The action of any other medication that is also handled by or affects this system may be altered by concurrent

use. Concurrent use of **flecainide**, **propafenone**, **rifampin**, **ergot derivatives (dihydroergotamine**, **ergotamine**, **ergonovine**, **methylergonovine)**, **fluticasone**, **lovastatin**, **simvastatin**, **pimozide**, **delavirdine**, **midazolam**, or **triazolam** may result in serious, potentially life-threatening adverse reactions including arrhythmias, excessive sedation, myopathy or loss of virologic response and is contraindicated. Blood levels are ↓ by **efavirenz** (additional ritonavir may be required when used together), **nevirapine**, **lopinavir/ritonavir**, **saquinavir**, **carbamazepine**, **phenobarbital**, **phenytoin**, **dexamethasone**, **histamine $H_2$-receptor antagonists**, and **proton-pump inhibitors**; monitor for ↓ antiretroviral activity. Levels are ↑ by **indinavir** and **nelfinavir**. May ↓ **methadone** and **paroxetine** levels. ↑ levels and risk of toxicity from **amiodarone**, **lidocaine**, **quinidine** (monitor blood levels), **ketoconazole**, and **itraconazole** (dose of itraconazole or ketoconazole should not exceed 200 mg/day when fosamprenavir is used with ritonavir or 400 mg/day when used without), **rifabutin** (monitor for neutropenia, ↓ rifabutin dose by 50% when used with fosamprenavir or by 75% when used with fosamprenavir with ritonavir), **atorvastatin** and **rosuvastatin** (dose not to exceed 20 mg/day or consider other HMG-CoA reductase inhibitors), **cyclsosporine** or **tacrolimus** (monitor blood levels of immunosuppressants), **calcium channel blockers** (clinical monitoring recommended), some **benzodiazepines** (**alprazolam**, **clorazepate**, **diazepam**, **flurazepam**; dose reduction of benzodiazepine may be needed), **sildenafil**, **tadalafil**, and **vardenafil** (use cautiously; ↓ dose of sildenafil to 25 mg every 48 hr, for tadalafil single dose should not exceed 10 mg in any 72 hr period, dose of vardenafil should not exceed 2.5 mg every 24 hr if used without ritonavir or 2.5 mg every 72 hr with ritonavir with monitoring for toxicity) and **tricyclic antidepressants** (blood level monitoring recommended). May alter the effects of **warfarin** (monitor INR) or **hormonal contraceptives** (use alternative method of contraception).

**Drug-Natural Products:** Concurrent use of **St. John's wort** is contraindicated; ↓ blood levels and may lead to ↓ virologic response.

## Route/Dosage

**PO (Adults):** *Treatment-naive patients without ritonavir*—1400 mg twice daily; *Treatment-naive patients with ritonavir*—1400 mg once daily with ritonavir 100 or 200 mg once daily, or 700 mg twice daily with ritonavir 100 mg twice daily. *Protease inhibitor–experienced patients*—700 mg twice daily with ritonavir 100 mg twice daily. If efavirenz is added to a once daily regimen using both fosamprenavir and ritonavir, an additional 100 mg of ritonavir (total of 300 mg) should be given.

**PO (Children 2–5 yr):** *Treatment-naive*—30 mg/kg twice daily, not to exceed 1400 mg twice daily.

**PO (Children ≥6 yr):** *Treatment-naive*—30 mg/kg twice daily, not to exceed 1400 mg twice daily, or 18 mg/kg twice daily (not to exceed 700 mg twice daily) with ritonavir 3 mg/kg twice daily (not to exceed 100 mg twice daily); *Protease inhibitor-experienced*—18 mg/kg twice daily (not to exceed 700 mg twice daily) with ritonavir 3 mg/kg twice daily (not to exceed 100 mg twice daily). When used without ritonavir in children ≥47 kg, may use adult regimen of 1400 mg twice daily.

### Hepatic Impairment

**PO (Adults):** *Mild hepatic impairment*–700 mg twice daily without ritonavir (therapy-naive) or 700 mg twice daily with ritonavir 100 mg once daily (therapy-naive or protease inhibitor experienced); *Moderate hepatic impairment*-700 mg twice daily without ritonavir (therapy-naive) or 450 mg twice daily with ritonavir 100 mg once daily (therapy-naive or protease inhibitor experienced); *Severe hepatic impairment*—350 mg twice daily without ritonavir (therapy-naive) or 300 mg twice daily with ritonavir 100 mg once daily (therapy-naive or protease inhibitor experienced).

## Availability

**Tablets:** 700 mg. **Oral suspension:** 50 mg/mL.

# NURSING IMPLICATIONS

## Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess patient for allergy to sulfonamides. May exhibit cross-sensitivity.
- Assess patient for skin reactions throughout therapy. Reactions may be severe and life threatening. Discontinue therapy if severe reactions or moderate rashes with systemic symptoms occur.

- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- May cause ↑ serum glucose cholesterol, and triglyceride levels.
- May cause ↑ AST and ALT levels.
- May cause neutropenia.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Tablets may be administered with or without food. Oral suspension should be taken without food in adults and with food in children. If emesis occurs within 30 minutes after dosing, re-dose.

### Patient/Family Teaching

- Emphasize the importance of taking fosamprenavir as directed. Advise patient to read the *Patient Information* that comes with the prescription prior to initiation of therapy and with each prescription refill. Fosamprenavir must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered, then return to regular schedule. If a dose is skipped, do not double the next doses.
- Instruct patient that fosamprenavir should not be shared with others.
- Inform patient that fosamprenavir does not cure AIDS or prevent associated or opportunistic infections. Fosamprenavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of fosamprenavir are unknown at this time.
- Emphasize the importance of providing health care professional with accurate current drug history and notifying health care professional before taking any Rx, OTC, or herbal products because of potentially serious drug interactions.
- May decrease effectiveness of hormonal contraceptives; advise patient to use a nonhormonal form of contraception during therapy.
- Instruct patient to notify health care professional if nausea, vomiting, diarrhea, or rash occurs.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

## foscarnet (foss-**kar**-net)

***Classification***
Therapeutic: antivirals

**Pregnancy Category C**

### Indications

Treatment of cytomegalovirus (CMV) retinitis in HIV-infected patients (alone or with ganciclovir). Treatment of acyclovir-resistant mucocutaneous herpes simplex virus (HSV) infections in immunocompromised patients.

### Action

Prevents viral replication by inhibiting viral DNA-polymerase and reverse transcriptase. **Therapeutic Effects:** Virustatic action against susceptible viruses including CMV.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Variable penetration into CSF. May concentrate in and be slowly released from bone.
**Metabolism and Excretion:** 80–90% excreted unchanged in urine.
**Half-life:** 3 hr (in patients with normal renal function); longer half-life of 90 hr may reflect release of drug from bone.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | 8–24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Renal impairment (dose reduction required if CCr ≤1.4–1.6 mL/min/kg; see product information); History of seizures; OB, Lactation, Pedi: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, headache, anxiety, confusion, dizziness, fatigue, malaise, mental depression, weakness. **EENT:** conjunctivitis, eye pain, vision abnormalities. **Resp:** coughing, dyspnea. **CV:** chest pain, ECG abnormalities, edema, palpitations. **GI:** diarrhea, nausea, vomiting, abdominal pain, abnormal taste sensation, anorexia, constipation, dyspepsia. **GU:** renal failure, albuminuria, dysuria, nocturia, polyuria, urinary retention. **Derm:** increased sweating, pruritus, rash, skin ulceration. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hyperphosphatemia, hypophosphatemia. **Hemat:** anemia, granulocytopenia, leukopenia. **Local:** pain/inflammation at injection site. **MS:** arthralgia, myalgia, back pain, involuntary muscle contraction. **Neuro:** ataxia, hypoesthesia, neuropathy, paresthesia, tremor. **Misc:** fever, chills, flu-like syndrome, lymphoma, sarcoma.

## Interactions

**Drug-Drug:** Concurrent use with parenteral **pentamidine** may result in severe, life-threatening hypocalcemia. Risk of nephrotoxicity may be ↑ by concurrent use of other **nephrotoxic agents** (**amphotericin B**, **aminoglycosides**).

## Route/Dosage

**IV (Adults):** *CMV retinitis*—60 mg/kg q 8 hr or 90 mg/kg q 12 hr for 2–3 wk, then 90–120 mg/kg/day as a single dose. Dosage reduction required for any degree of renal impairment; *HSV*—40 mg/kg q 8–12 hr for 2–3 wk or until healing occurs.

## Availability (generic available)

**Injection:** 6000 mg/250 mL, 12,000 mg/500 mL.

# NURSING IMPLICATIONS

## Assessment

- **CMV Retinitis:** Diagnosis of CMV retinitis should be determined by ophthalmoscopy before treatment with foscarnet. Ophthalmologic examinations should also be performed at the conclusion of induction and every 4 wk during maintenance therapy.
- Culture for CMV (urine, blood, throat) may be taken before administration. However, a negative CMV culture does not rule out CMV retinitis.
- **HSV Infections:** Assess lesions before and daily during therapy.
- ***Lab Test Considerations:*** Monitor serum creatinine before and 2–3 times weekly during induction therapy and at least once every 1–2 wk during maintenance therapy. Monitor 24-hr CCr before and periodically throughout therapy. If CCr drops below 0.4 mL/min/kg, discontinue foscarnet.
- Monitor serum calcium, magnesium, potassium, and phosphorus before and 2–3 times weekly during induction therapy and at least weekly during maintenance therapy. May cause concentrations.
- May cause anemia, granulocytopenia, leukopenia, and thrombocytopenia. May cause ↑ AST and ALT levels and abnormal A-G ratios.

## Potential Nursing Diagnoses

Risk for infection (Indications)

## Implementation

- Adequately hydrate patient with 750–1000 mL of 0.9% NaCl or D5W before first infusion to establish diuresis, then administer 750–1000 mL with 120 mg/kg of foscarnet or 500 mL with 40–60 mg/kg of foscarnet with each dose to prevent renal toxicity.

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** May be administered via central line undiluted. If administered via peripheral line, *must* be diluted with D5W or 0.9% NaCl to prevent vein irritation. Do not administer solution that is discolored or contains particulate matter. Use diluted solution within 24 hr. ***Concentration:*** Undiluted: 24 mg/mL; Diluted: 12 mg/mL.
- Dose is based on patient weight; excess solution may be discarded from bottle before administration to prevent overdosage.
- Patients who experience progression of CMV retinitis during maintenance therapy may be retreated with induction therapy followed by maintenance therapy. ***Rate:*** Administer at a rate not to exceed 1 mg/kg/min.
- Infuse solution via infusion pump to ensure accurate infusion rate.
- **Y-Site Compatibility:** aldesleukin, amikacin, aminophylline, ampicillin, aztreonam, bivalirudin, carboplatin, cefazolin, cefoperazone, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, diltiazem, docetaxel, dopamine, doripenem, ertapenem, erythromycin lactobionate, etopo-

side, etoposide phosphate, fenoldopam, fluconazole, flucytosine, fludarabine, fluorouracil, furosemide, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenen-cilastatin, linezolid, mechlorethamine, methotrexate, metoclopramide, metronidazole, morphine, nafcillin, nesiritide, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, pemetrexed, penicillin G potassium, phenytoin, piperacillin/tazobactam, ranitidine, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, vincristine, voriconazole.

- **Y-Site Incompatibility:** Manufacturer recommends that foscarnet not be administered concurrently with other drugs or solutions in the same IV catheter except D5W or 0.9% NaCl, acyclovir, amphotericin B colloidal, caspofungin, diazepam, digoxin, diphenhydramine, dobutamine, doxorubicin, droperidol, epirubicin, ganciclovir, haloperidol, leucovorin, midazolam, mitoxantrone, pentamidine, prochlorperazine, promethazine, trimetrexate, vinorelbine.

### Patient/Family Teaching

- Inform patient that foscarnet is not a cure for CMV retinitis. Progression of retinitis may continue in immunocompromised patients during and after therapy. Advise patients to have regular ophthalmologic exams.
- Advise patient to notify health care professional immediately if perioral tingling or numbness in the extremities or paresthesia occurs during or after infusion. If these signs of electrolyte imbalance occur during administration, infusion should be stopped and lab samples for serum electrolyte concentrations obtained immediately.
- Emphasize the importance of frequent follow-up exams to monitor renal function and electrolytes.

### Evaluation/Desired Outcomes

- Management of the symptoms of CMV retinitis in patients with AIDS.
- Crusting over and healing of skin lesions in HSV infections.

**fosinopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.**

## fosphenytoin

(foss-**fen**-i-toyn)

Cerebyx

***Classification***

Therapeutic: anticonvulsants

**Pregnancy Category D**

### Indications

Short-term (<5 day) parenteral management of generalized, convulsive status epilepticus when use of phenytoin is not feasible. Treatment and prevention of seizures during neurosurgery when use of phenytoin is not feasible.

### Action

Limits seizure propagation by altering ion transport. May also decrease synaptic transmission. Fosphenytoin is rapidly converted to phenytoin, which is responsible for its pharmacologic effects.

**Therapeutic Effects:** Diminished seizure activity.

### Pharmacokinetics

**Absorption:** Rapidly converted to phenytoin after IV administration and completely absorbed after IM administration.

**Distribution:** Distributes into CSF and other body tissues and fluids. Enters breast milk; crosses the placenta, achieving similar maternal/fetal levels. Preferentially distributes into fatty tissue.

**Protein Binding:** *Fosphenytoin*—95–99%; *phenytoin*—90–95%.

**Metabolism and Excretion:** Mostly metabolized by the liver; minimal amounts excreted in the urine.

**Half-life:** *Fosphenytoin*—15 min; *phenytoin*—22 hr (range 7–42 hr).

TIME/ACTION PROFILE (anticonvulsant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | unknown | 30 min | up to 24 hr |
| IV | 15–45 min | 15–60 min | up to 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Sinus bradycardia, sinoatrial block, 2nd- or 3rd-degree AV heart block or Adams-Stokes syndrome.

**Use Cautiously in:** Hepatic or renal disease (↑ risk of adverse reactions; dose reduction recommended for hepatic impairment); OB: Safety not established; may result in fetal hydantoin syndrome if used chronically or hemorrhage in the newborn if used at term; Lactation: Safety not established.

**Exercise Extreme Caution in:** Patients positive for HLA-B*1502 allele (unless exceptional circumstances exist where benefits clearly outweigh the risks).

## Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, nystagmus, agitation, brain edema, headache, stupor, vertigo. **EENT:** amblyopia, deafness, diplopia, tinnitus. **CV:** hypotension (with rapid IV administration), tachycardia. **GI:** dry mouth, nausea, taste perversion, tongue disorder, vomiting. **Derm:** pruritus, rash, STEVENS-JOHNSON SYMDROME. **MS:** back pain. **Neuro:** ataxia, dysarthria, extrapyramidal syndrome, hypesthesia, incoordination, paresthesia, tremor. **Misc:** pelvic pain.

## Interactions

**Drug-Drug: Disulfiram**, acute ingestion of **alcohol**, **amiodarone**, **ethosuximide**, **isoniazid**, **chloramphenicol**, **sulfonamides**, **fluoxetine**, **gabapentin**, **H2 antagonists**, **benzodiazepines**, **omeprazole**, **ketoconazole**, **fluconazole**, **estrogens**, **succinamides**, **halothane**, **methylphenidate**, **phenothiazines**, **salicylates**, **ticlopidine**, **tolbutamide**, **topiramate**, **trazodone**, **felbamate**, and **cimetidine** may ↑ phenytoin blood levels. **Barbiturates**, **carbamazepine**, **reserpine**, and chronic ingestion of **alcohol** may ↓ phenytoin blood levels. Phenytoin may ↓ the effects of **amiodarone**, **benzodiazepines**, **carbamazepine**, **chloramphenicol**, **corticosteroids**, **disopyramide**, **warfarin**, **felbamate**, **doxycycline**, **lamotrigine**, **oral contraceptives**, **paroxetine**, **propafenone**, **rifampin**, **ritonavir**, **quinidine**, **tacrolimus**, **theophylline**, **topiramate**, **tricyclic antidepressants**, **zonisamide**, **methadone**, **cyclosporine**, and **estrogens**. IV phenytoin and **dopamine** may cause additive hypotension. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioids**, and **sedative/hypnotics**. **Antacids** may ↓ absorption of orally administered phenytoin. ↑ systemic clearance of antileukemic drugs **teniposide** and **methotrexate** which has been associated with a worse event-free survival, phenytoin use is not recommended in children undergoing chemotherapy for acute lymphocytic leukemia. **Calcium** and **sucralfate** ↓ phenytoin absorption.

## Route/Dosage

Note: Doses of fosphenytoin are expressed as phenytoin sodium equivalents [PE].

### Status Epilepticus

**IV (Adults):** 15–20 mg PE/kg.

### Nonemergent and Maintenance Dosing

**IV, IM (Adults and Children > 16 yr):** *Loading dose*—10–20 mg PE/kg. *Maintenance dose*—4–6 mg PE/kg/day.
**IV, IM (Children 10–16 yr):** 6–7 mg PE/kg/day.
**IV, IM (Children 7–9 yr):** 7–8 mg PE/kg/day.
**IV, IM (Children 4–6 yr):** 7.5–9 mg PE/kg/day.
**IV, IM (Children 0.5–3 yr):** 8–10 mg PE kg/day.
**IV, IM (Infants):** 5 mg PE kg/day.
**IV, IM (Neonates):** 5–8 mg PE/kg/day.

### Availability (generic available)

**Injection:** 50 mgPE/mL.

## NURSING IMPLICATIONS

### Assessment

- **Seizures:** Assess location, duration, frequency, and characteristics of seizure activity. EEG may be monitored periodically during therapy.
- Monitor blood pressure, ECG, and respiratory function continuously during administration of fosphenytoin and during period when peak serum phenytoin levels occur (15–30 min after administration).
- Observe patient for development of rash. Discontinue fosphenytoin at the first sign of skin reactions. Serious adverse reactions such as exfoliative, purpuric, or bullous rashes or the development of lupus erythematosus, Stevens-Johnson syndrome, or toxic epidermal necrolysis preclude further use of phenytoin or fosphenytoin. Stevens-Johnson syndrome and toxic epidermal necrolysis are significantly more common in patients with a particular human leukocyte antigen (HLA) allele, HLA-B*1502 (occurs almost exclusively in patients with Asian ancestry, including including Han Chinese, Filipinos, Malaysians, South Asian Indians, and Thais). Avoid using phenytoin or fosphenytoin as alternatives to carbamazepine for patients who test positive. If less serious skin eruptions (measles-like or scarlatiniform) occur, fosphenytoin may be resumed after

complete clearing of the rash. If rash reappears, further use of fosphenytoin or phenytoin should be avoided.
- ***Lab Test Considerations:*** Fosphenytoin contains 0.0037 mmol phosphate per mg PE. Monitor serum phosphate concentrations in patients with renal insufficiency; may cause ↑ phosphate concentrations.
- May cause ↑ serum alkaline phosphatase, GTT, and glucose levels.
- Fosphenytoin therapy may be monitored using phenytoin levels. Optimal total plasma phenytoin concentrations are typically 10–20 mcg/mL (unbound plasma phenytoin concentrations of 1–2 mcg/mL).
- ***Toxicity and Overdose:*** Serum phenytoin levels should not be monitored until complete conversion from fosphenytoin to phenytoin has occurred (2 hr after IV or 4 hr after IM administration).
- Initial signs and symptoms of phenytoin toxicity include nystagmus, ataxia, confusion, nausea, slurred speech, and dizziness.

## Potential Nursing Diagnoses

Risk for injury (Indications)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

## Implementation

- Do not confuse fosphenytoin (Cerebyx) with celocoxib (Celebrex) or citalopram (Celexa).
- Implement seizure precautions.
- When substituting *fosphenytoin* for oral *phenytoin* therapy, the same total daily dose may be given as a single dose. Unlike parenteral phenytoin, fosphenytoin may be given safely by the IM route.
- The anticonvulsant effect of fosphenytoin is not immediate. Additional measures (including parenteral benzodiazepines) are usually required in the immediate management of status epilepticus. Loading dosage of *fosphenytoin* should be followed with the institution of maintenance anticonvulsant therapy.

### IV Administration

- **Direct IV:** ***Diluent:*** D5W or 0.9% NaCl. ***Concentration:*** 1.5–25 mg PE/mL May be refrigerated for up to 48 hr. ***Rate:*** Administer at a rate of <150 mg PE/min in adults and <3 mg/kg/min in children to minimize risk of hypotension.
- **Y-Site Compatibility:** amphotericin B liposome, bivalirudin, carboplatin, caspofungin, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexmedetomidine, diltiazem, docetaxel, doxacurium, ertapenem, etoposide, etoposide phosphate, fludarabine, fluorouracil, gemcitabine, granisetron, ifosfamide, levofloxacin, linezolid, lorazepam, mechlorethamine, meperidine, methotrexate, metronidazole, nesiritide, octreotide, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, pemetrexed, phenobarbital, piperacillin/tazobactam, rocuronium, sodium acetate, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, vincristine, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** caspofungin, doxorubicin hydrochloride, epirubicin, fenoldopam, midazolam, mitoxantrone, quinapristin/dalfopristin.
- **Additive Incompatibility:** Information unavailable. Do not admix with other solutions or medications.

## Patient/Family Teaching

- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Advise patient to notify health care professional if skin rash, severe nausea or vomiting, drowsiness, slurred speech, unsteady gait, swollen glands, bleeding or tender gums, yellow skin or eyes, joint pain, fever, sore throat, unusual bleeding or bruising, or persistent headache occurs.
- Advise female patients to use an additional nonhormonal method of contraception during therapy and until next menstrual period. Instruct patient to notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of routine exams to monitor progress. Patient should have routine physical exams, especially monitoring skin and lymph nodes, and EEG testing.

## Evaluation/Desired Outcomes

- Decrease or cessation of seizures without excessive sedation.

**frovatriptan** (froe-va-**trip**-tan)
Frova

***Classification***
Therapeutic: vascular headache suppressants
Pharmacologic: 5-$HT_1$ agonists

**Pregnancy Category C**

## Indications
Acute treatment of migraine headache.

## Action
Acts as an agonist at specific 5-HT receptor sites in intracranial blood vessels and sensory trigeminal nerves. **Therapeutic Effects:** Cranial vessel vasoconstriction with associated decrease in release of neuropeptides and resultant decrease in migraine headache.

## Pharmacokinetics
**Absorption:** 20–30% following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver (P450 1A2 enzyme system); some metabolites eliminated in urine, <10% excreted unchanged.
**Half-life:** 26 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2–4 hr | unknown |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; History, symptoms or findings consistent with: ischemic heart disease, coronary artery vasospasm, other significant underlying cardiovascular disease; Cerebrovascular syndromes including: strokes of any type, transient ischemic attacks; Uncontrolled hypertension; Hemiplegic or basilar migraine; Peripheral vascular disease, including ischemic bowel disease; Should not be used within 24 hr of any other 5-HT agonist or ergot-type compounds (e.g. dihydroergotamine, ergotamine); Pedi: Children <18 yr.
**Use Cautiously in:** Concurrent use of SSRIs or SNRIs (↑ risk of serotonin syndrome); Geri: May be more susceptible to adverse cardiovascular effects; OB, Lactation: Safety not established.
**Exercise Extreme Caution in:** Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and first dose is administered under supervision.

## Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness, fatigue. **CV:** CORONARY ARTERY VASOSPASM, MI, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA, chest pain, myocardial ischemia. **GI:** dry mouth, dyspepsia, nausea. **Derm:** flushing. **MS:** skeletal pain. **Neuro:** paresthesia. **Misc:** pain.

## Interactions
**Drug-Drug: Hormonal contraceptives** or **propranolol** may ↑ levels. ↑ risk of serious vasospastic reactions with **dihydroergotamine** or **ergotamine** (concurrent use contraindicated). ↑ risk of serotonin syndrome when used with **fluoxetine**, **paroxetine**, **sertraline**, **fluvoxamine**, **citalopram**, **escitalopram**, **venlafaxine**, or **duloxetine**.

## Route/Dosage
**PO (Adults):** 2.5 mg; if there has been initial relief, a second tablet may be taken after at least 2 hr (daily dose should not exceed 3 tablets and should not be used to treat more than 4 attacks/30 day period).

## Availability
**Tablets:** 2.5 mg.

# NURSING IMPLICATIONS

## Assessment
- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.

## Potential Nursing Diagnoses
Acute pain (Indications)

## Implementation
- **PO:** Tablets may be administered at any time after the headache starts.

## Patient/Family Teaching
- Inform patient that frovatriptan should be used only during a migraine attack. It is meant to be used to relieve migraine attack but not to prevent or reduce the number of attacks.
- Instruct patient to administer frovatriptan as soon as symptoms appear, but it may be administered any time during an attack. If migraine symptoms return, a second dose may be used. Allow at least 2 hr between doses, and do not use more than 3 tablets in any 24-hr period.

- If dose does not relieve headache, additional frovatriptan doses are not likely to be effective; notify health care professional.
- Advise patient that lying down in a darkened room following frovatriptan administration may further help relieve headache.
- Caution patient not to use frovatriptan if she is pregnant, suspects she is pregnant, plans to become pregnant, or is breastfeeding. Adequate contraception should be used during therapy.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional prior to next dose of frovatriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately and do not take more frovatriptan without approval of health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- Advise patient to avoid alcohol, which aggravates headaches, during frovatriptan use.

### Evaluation/Desired Outcomes

- Relief of migraine attack.

## furosemide (fur-oh-se-mide)

Apo-Furosemide, Lasix, Lasix Special, Novosemide, Nu-Furosemide, PMS-Furosemide

***Classification***

Therapeutic: diuretics
Pharmacologic: loop diuretics

**Pregnancy Category C**

### Indications

Edema due to heart failure, hepatic impairment or renal disease. Hypertension.

### Action

Inhibits the reabsorption of sodium and chloride from the loop of Henle and distal renal tubule. Increases renal excretion of water, sodium, chloride, magnesium, potassium, and calcium. Effectiveness persists in impaired renal function.
**Therapeutic Effects:** Diuresis and subsequent mobilization of excess fluid (edema, pleural effusions). Decreased blood pressure.

### Pharmacokinetics

**Absorption:** 60–67% absorbed after oral administration ( ↓ in acute CHF and in renal failure); also absorbed from IM sites.
**Distribution:** Crosses placenta, enters breast milk.
**Protein Binding:** 91–99%.
**Metabolism and Excretion:** Minimally metabolized by liver, some nonhepatic metabolism, some renal excretion as unchanged drug.
**Half-life:** 30–60 min ( ↑ in renal impairment).

TIME/ACTION PROFILE (diuretic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–60 min | 1–2 hr | 6–8 hr |
| IM | 10–30 min | unknown | 4–8 hr |
| IV | 5 min | 30 min | 2 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with thiazides and sulfonamides may occur; Hepatic coma or anuria; Some liquid products may contain alcohol, avoid in patients with alcohol intolerance.
**Use Cautiously in:** Severe liver disease (may precipitate hepatic coma; concurrent use with potassium-sparing diuretics may be necessary); Electrolyte depletion; Diabetes mellitus; Increasing azotemia; OB, Lactation: Safety not established; Pedi: Increased risk for renal calculi and patent ductus arteriosis in premature neonates; Geri: Geriatric patients may have increased risk of side effects, especially hypotension and electrolyte imbalance, at usual doses.

### Adverse Reactions/Side Effects

**CNS:** blurred vision, dizziness, headache, vertigo. **EENT:** hearing loss, tinnitus. **CV:** hypotension. **GI:** anorexia, constipation, diarrhea, dry mouth, dyspepsia, nausea, pancreatitis, vomiting. **GU:** excessive urination. **Derm:** photosensitivity, pruritis, rash. **Endo:** hyperglycemia, hyperuricemia. **F and E:** dehydration, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, hypovolemia, metabolic alkalosis. **Hemat:** APLASTIC ANEMIA, AGRANULOCYTOSIS, hemolytic anemia, leukopenia, thrombocytopenia. **MS:** muscle cramps. **Neuro:** paresthesia. **Misc:** fever, increased BUN, nephrocalcinosis.

### Interactions

**Drug-Drug:** ↑ hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. ↑ risk of hypokalemia with other **diuretics**, **amphotericin B**, **stimulant laxatives**, and **corticosteroids**. Hypokalemia may ↑ risk of **digoxin** toxicity and ↑ risk of arrhythmia in

patients taking drugs that prolong the QT interval. ↓ **lithium** excretion, may cause **lithium** toxicity. ↑ risk of ototoxicity with **aminoglycosides**. **NSAIDS** ↓ effects of furosemide. ↓ effects of furosemide when given at same time as **sucralfate**, **cholestyramine**,or **colestipol**. ↑ risk of **salicylate** toxicity (with use of high-dose **salicylate** therapy).

## Route/Dosage

### Edema

**PO (Adults):** 20–80 mg/day as a single dose initially, may repeat in 6–8 hr; may increase dose by 20–40 mg q 6–8 hr until desired response. Maintenance doses may be given once or twice daily (doses up to 2.5 g/day have been used in patients with congestive heart failure or renal disease). *Hypertension*—40 twice daily initially (when added to regimen, decrease dose of other antihypertensives by 50%); adjust further dosing based on response; *Hypercalcemia*—120 mg/day in 1–3 doses.
**PO (Children > 1 month):** 2 mg/kg as a single dose; may be increased by 1–2 mg/kg q 6–8 hr (maximum dose = 6 mg/kg).
**PO (Neonates):** 1–4 mg/kg/dose 1–2 times/day.
**IM, IV (Adults):** 20–40 mg, may repeat in 1–2 hr and increase by 20 mg every 1–2 hr until response is obtained, maintenance dose may be given q 6–12 hr; *Continuous infusion*—Bolus 0.1 mg/kg followed by 0.1 mg/kg/hr, double q 2 hr to a maximum of 0.4 mg/kg/hr.
**IM, IV (Children):** 1–2 mg/kg/dose q 6–12 hr *Continuous infusion*—0.05 mg/kg/hr, titrate to clinical effect.
**IM, IV (Neonates):** 1–2 mg/kg/dose q 12–24 hr.

### Hypertension

**PO (Adults):** 40 twice daily initially (when added to regimen, decrease dose of other antihypertensives by 50%); adjust further dosing based on response.

## Availability (generic available)

**Tablets:** 20 mg, 40 mg, 80 mg, 🍁500 mg. **Cost:** *Generic*—20 mg $10.99/100, 40 mg $8.99/100, 80 mg $16.99/100. **Oral solution (10 mg/mL—orange flavor, 8 mg/mL—pineapple—peach flavor):** 8 mg/mL, 10 mg/mL. **Cost:** *Generic*—10 mg/mL $13.99/60 mL. **Solution for injection:** 10 mg/mL.

# NURSING IMPLICATIONS

## Assessment

- Assess fluid status. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes. Notify physician or other health care professional if thirst, dry mouth, lethargy, weakness, hypotension, or oliguria occurs.
- Monitor blood pressure and pulse before and during administration. Monitor frequency of prescription refills to determine compliance in patients treated for hypertension.
- Geri: Diuretic use is associated with increased risk for falls in older adults. Assess falls risk and implement fall prevention strategies.
- Assess patients receiving digoxin for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Patients taking digoxin are at increased risk of digoxin toxicity because of the potassium-depleting effect of the diuretic. Potassium supplements or potassium-sparing diuretics may be used concurrently to prevent hypokalemia.
- Assess patient for tinnitus and hearing loss. Audiometry is recommended for patients receiving prolonged high-dose IV therapy. Hearing loss is most common after rapid or high-dose IV administration in patients with decreased renal function or those taking other ototoxic drugs.
- Assess for allergy to sulfonamides.
- ***Lab Test Considerations:*** Monitor electrolytes, renal and hepatic function, serum glucose, and uric acid levels before and periodically throughout therapy. Commonly ↓ serum potassium. May cause ↓ serum sodium, calcium, and magnesium concentrations. May also cause ↑ BUN, serum glucose, creatinine, and uric acid levels.

## Potential Nursing Diagnoses

Excess fluid volume (Indications)
Deficient fluid volume (Side Effects)

## Implementation

- Do not confuse furosemide with torsemide.
- If administering twice daily, give last dose no later than 5 pm to minimize disruption of sleep cycle.
- IV route is preferred over IM route for parenteral administration.
- **PO:** May be taken with food or milk to minimize gastric irritation. Tablets may be crushed if patient has difficulty swallowing.

- Do not administer discolored solution or tablets.

**IV Administration**

- **Direct IV:** ***Diluent:*** Administer undiluted (larger doses may be diluted and administered as intermittent infusion [see below]). ***Concentration:*** 10 mg/mL. ***Rate:*** Administer at a rate of 20 mg/min. Pedi: Administer at a maximum rate of 0.5 mg/kg/min (for doses <120 mg) or 4 mg/min (for doses >120 mg).
- **Intermittent Infusion:** ***Diluent:*** Dilute larger doses in 50 mL of D5W or 0.9% NaCl. Infusion stable for 24 hr at room temperature. Do not refrigerate. Protect from light. ***Concentration:*** Final concentration should not exceed 10 mg/mL. ***Rate:*** Administer at a rate not to exceed 4 mg/min (for doses > 120 mg) in adults to prevent ototoxicity. Use an infusion pump to ensure accurate dosage.
- **Continuous Infusion:** ***Diluent:*** May dilute in D5W or 0.9% NaCl. May also administer as undiluted drug. Protect from light. ***Concentration:*** Final concentration should not exceed 10 mg/mL. ***Rate:*** See Route/Dosage section.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amphotericin B cholesteryl sulfate, anidulafungin, argatroban, atropine, aztreonam, bivalirudin, calcium chloride, calcium gluconate, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, cyclosporine, daptomycin, dexamethasone, digoxin, enalaprilat, epinephrine, ertapenem, fentanyl, ganciclovir, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem, insulin, ketorolac, lidocaine, linezolid, lorazepam, meropenem, methylprednisolone, metoprolol, metronidazole, micafungin, nafcillin, nitroglycerin, nitroprusside, palonosetron, pantoprazole, penicillin G potassium, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propofol, propranolol, ranitidine, sodium bicarbonate, tacrolimus, thiopental, ticarcillin/clavulanate, tirofiban, tobramycin, vitamin B complex with C, voriconazole.
- **Y-Site Incompatibility:** azithromycin, caspofungin, cimetidine, ciprofloxacin, diazepam, diltiazem, diphenhydramine, doxycycline, droperidol, eptifibatide, erythromycin, esmolol, fenoldopam, filgrastim, hydroxyzine, labetalol, lansoprazole, levofloxacin, midazolam, milrinone, nesiritide, nicardipine, ondansetron, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sulfamethoxazole/trimethoprim, vecuronium, vinblastine, vincristine, vinorelbine.

## Patient/Family Teaching

- Instruct patient to take furosemide as directed. Take missed doses as soon as possible; do not double doses.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Caution patient that the use of alcohol, exercise during hot weather, or standing for long periods during therapy may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding a diet high in potassium (see Appendix M).
- Advise patient to contact health care professional of weight gain more than 3 lbs in 1 day.
- Advise patient to consult health care professional before taking OTC medication or herbal products concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to contact health care professional immediately if muscle weakness, cramps, nausea, dizziness, numbness, or tingling of extremities occurs.
- Advise diabeticpatients to monitor blood glucose closely; may cause increased blood glucose levels.
- Emphasize the importance of routine follow-up examinations.
- Geri: Caution older patients or their caregivers about increased risk for falls. Suggest strategies for fall prevention.
- **Hypertension:** Advise patients on antihypertensive regimen to continue taking medication even if feeling better. Furosemide controls but does not cure hypertension.
- Reinforce the need to continue additional therapies for hypertension (weight loss, exercise, restricted sodium intake, stress reduction, regular exercise, moderation of alcohol consumption, cessation of smoking).

## Evaluation/Desired Outcomes

- Decrease in edema.
- Decrease in abdominal girth and weight.
- Increase in urinary output.
- Decrease in blood pressure.

## gabapentin (ga-ba-**pen**-tin)

Neurontin

***Classification***

Therapeutic: analgesic adjuncts, therapeutic, anticonvulsants, mood stabilizers

**Pregnancy Category C**

### Indications

Partial seizures (adjunct treatment). Post-herpetic neuralgia. **Unlabeled Use:** Neuropathic pain. Prevention of migraine headache. Bipolar disorder. Anxiety. Diabetic peripheral neuropathy.

### Action

Mechanism of action is not known. May affect transport of amino acids across and stabilize neuronal membranes. **Therapeutic Effects:** Decreased incidence of seizures. Decreased post-herpetic pain.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration by active transport. At larger doses, transport becomes saturated and absorption decreases (bioavailability ranges from 60% for a 300-mg dose to 35% for a 1600-mg dose).
**Distribution:** Crosses blood-brain barrier; enters breast milk.
**Metabolism and Excretion:** Eliminated mostly by renal excretion of unchanged drug.
**Half-life:** *Adults*—5–7 hr (normal renal function); up to 132 hr in anuria; *Children*—4.7 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 2–4 hr | 8 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** All patients (may ↑ risk of suicidal thoughts/behaviors); Renal insufficiency (↓ dose and/or ↑ dosing interval if CCr ≤60 mL/min); OB, Pedi: Safety not established for children <3 yr and pregnant women; Lactation: Discontinue drug or bottle-feed; Geri: May be more susceptible to toxicity due to age-related ↓ in renal function.

### Adverse Reactions/Side Effects

**CNS:** SUICIDAL THOUGHTS, confusion, , depression, drowsiness, sedation, anxiety, concentration difficulties (children), dizziness, emotional lability (children), hostility, hyperkinesia (children), malaise, vertigo, weakness. **EENT:** abnormal vision, nystagmus. **CV:** hypertension. **GI:** weight gain, anorexia, flatulence, gingivitis. **MS:** arthralgia. **Neuro:** ataxia, altered reflexes, hyperkinesia, paresthesia. **Misc:** facial edema.

### Interactions

**Drug-Drug: Antacids** may ↓ absorption of gabapentin. ↑ risk of CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioids**, and **sedative/hypnotics**. **Morphine** ↑ gabapentin levels and may ↑ risk of toxicity, dosage adjustments may be required. **Drug-Natural Products: Kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

### Route/Dosage

#### Epilepsy

**PO (Adults and Children >12 yr):** 300 mg 3 times daily initially. Titration may be continued until desired (range is 900–1800 mg/day in 3 divided doses; doses should not be more than 12 hr apart). Doses up to 2400–3600 mg/day have been well tolerated.
**PO (Children ≥5–12 yr):** 10–15 mg/kg/day in 3 divided doses initially titrated upward over 3 days to 25–35 mg/kg/day in 3 divided doses; dosage interval should not exceed 12 hr (doses up to 50 mg/kg/day have been used).
**PO (Children 3–4 yrs):** 10–15 mg/kg/day in 3 divided doses initially titrated upward over 3 days to 40 mg/kg/day in 3 divided doses; dosage interval should not exceed 12 hr (doses up to 50 mg/kg/day have been used).

#### Neuropathic Pain

**PO (Adults):** 100 mg 3 times daily initially. Titrate weekly by 300 mg/day up to 900–2400 mg/day (maximum: 3600 mg/day).
**PO (Children):** 5 mg/kg/dose at bedtime initially then increase to 5 mg/kg BID on day 2 and 5 mg/kg TID on day 3. Titrate to effect up to 8–35 mg/kg/day in 3 divided doses.

#### Renal Impairment

**PO (Adults and Children >12 yr):** *CCr 30–60 mL/min*—300 mg 2 times daily; *CCr 15–30 mL/min*—300 mg once daily; *CCr < 15 mL/min*—300 mg once every other day; further adjustments are based on clinical response.

#### Post-Herpetic Neuralgia

**PO (Adults):** 300 mg once daily on first day, 300 mg 2 times daily on second day, then 300 mg 3

times/day on day 3, may then be titrated upward as needed up to 600 mg 3 times/day.

### Availability (generic available)

**Capsules:** 100 mg, 300 mg, 400 mg. **Cost:** *Generic*— 100 mg $64.96/270, 300 mg $169.97/270, 400 mg $209.98/270. **Tablets:** 100 mg, 300 mg, 400 mg, 600 mg, 800 mg. **Cost:** *Generic*— 600 mg $229.96/270, 800 mg $199.96/270. **Oral solution (cool strawberry anise flavor):** 250 mg/5 mL. **Cost:** $130.10/470 mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Post-herpetic Neuralgia & Neuropathic Pain:** Assess location, characteristics, and intensity of pain periodically during therapy.
- **Migraine Prophylaxis:** Monitor frequecy and intensity of pain on pain scale.
- ***Lab Test Considerations:*** May cause false-positive readings when testing for urinary protein with *Ames N-Multistix SG* dipstick test; use sulfosalicylic acid precipitation procedure.
- May cause leukopenia.

### Potential Nursing Diagnoses

Risk for injury (Side Effects)
Chronic pain (Indications)
Ineffective coping (Indications)

### Implementation

- **PO:** May be administered without regard to meals.
- 600 mg and 800 mg tablets are scored and can be broken to administer a half-tablet. If half-tablet is used, administer other half at the next dose. Discard half-tablets not used within several days.
- Gabapentin should be discontinued gradually over at least 1 wk. Abrupt discontinuation may cause increase in seizure frequency.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Patients on tid dosing should not exceed 12 hr between doses. Take missed doses as soon as possible; if less than 2 hr until next dose, take dose immediately and take next dose 1–2 hr later, then resume regular dosing schedule. Do not double dose. Do not discontinue abruptly; may cause increase in frequency of seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- Advise patient not to take gabapentin within 2 hr of an antacid.
- Gabapentin may cause dizziness and drowsiness. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Seizure patients should not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.

### Evaluation/Desired Outcomes

- Decreased frequency of or cessation of seizures.
- Decreased post-herpetic neuralgia pain.
- Decreased intensity of neuropathic pain.
- Decreased frequency of migraine headaches.
- Increased mood stability.

## **galantamine** (ga-**lant**-a-meen)

Razadyne, Razadyne ER

***Classification***

Therapeutic: anti-Alzheimer's agents
Pharmacologic: cholinergics (cholinesterase inhibitors)

**Pregnancy Category B**

### Indications

Mild to moderate dementia of the Alzheimer's type.

### Action

Enhances cholinergic function by reversible inhibition of cholinesterase. **Therapeutic Effects:** Decreased dementia (temporary) associated with Alzheimer's disease. Cognitive enhancer.

## Pharmacokinetics

**Absorption:** Well absorbed (90%) following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver; 20% excreted unchanged in urine.
**Half-life:** 7 hr.

TIME/ACTION PROFILE (antihcholinesterase activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1 hr | 12 hr |
| PO-ER | unknown | 1 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe hepatic or renal impairment; Pedi, Lactation: Children or lactation.
**Use Cautiously in:** Patients with supraventricular cardiac conduction defects or concurrent use of drugs that may slow heart rate (↑ risk of bradycardia); History of ulcer disease/GI bleeding/concurrent NSAID use; Severe asthma or obstructive pulmonary disease; Mild to moderate renal impairment (avoid use if CCr <9 mL/min); Mild to moderate hepatic impairment (cautious dose titration recommended); May ↑ risk of cardiovascular mortality; OB: Use only if potential benefit outweighs potential risk to fetus.

## Adverse Reactions/Side Effects

**CNS:** fatigue, dizziness, headache, syncope. **CV:** bradycardia, chest pain. **GI:** anorexia, diarrhea, dyspepsia, flatulence, nausea, vomiting. **GU:** bladder outflow obstruction, incontinence. **Neuro:** tremor. **Misc:** weight loss.

## Interactions

**Drug-Drug:** Will ↑ neuromuscular blockade from **succinylcholine-type neuromuscular blocking agents**. May ↑ effects of other **cholinesterase inhibitors** or other **cholinergic agonists**, including **bethanechol**. May ↓ effectiveness of **anticholinergic medications**. Blood levels and effects may be ↑ by **ketoconazole**, **paroxetine**, **amitriptyline**, **fluvoxamine**, or **quinidine**.

## Route/Dosage

**PO (Adults):** *Immediate-release tablets* 4 mg twice daily initially, dose increments of 4 mg should be made at 4 wk intervals, up to 12 mg twice daily. Doses up to 16 mg twice daily have been used (range 16–32 mg/day; *Extended-release capsules*—8mg/day as a single dose in the morning, may be ↑ to 16 mg/day after 4 wk, then up to 24 mg/day after 4 wk, increments based on benefit/tolerability.

### Renal Impairment

**PO (Adults):** *Moderate renal impairment*—Daily dose should not exceed 16 mg.

### Hepatic Impairment

**PO (Adults):** *Moderate hepatic impairment*—Daily dose should not exceed 16 mg.

## Availability (generic available)

**Immediate-release tablets:** 4 mg, 8 mg, 12 mg. **Extended-release capsules:** 8 mg, 16 mg, 24 mg. **Oral solution:** 4 mg/mL.

# NURSING IMPLICATIONS

## Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- Monitor heart rate periodically during therapy. May cause bradycardia.

## Potential Nursing Diagnoses

Disturbed thought process (Indications)
Risk for injury (Indications)
Impaired environmental interpretation syndrome (Indications)

## Implementation

- Patient should be maintained on a stable dose for a minimum of 4 weeks prior to increasing dose.
- If dose has been interrupted for several days or longer, restart at the lowest dose and escalate to the current dose.
- **PO:** Administer twice daily, preferably with morning and evening meal. Administration with food, the use of antiemetic medications, and ensuring adequate fluid intake may decrease nausea and vomiting.
- Administer extended-release capsules in the morning, preferably with food. Swallow whole; do not open, crush, or chew.
- Use pipette provided with oral solution to administer accurate amount.

## Patient/Family Teaching

- Emphasize the importance of taking galantamine daily, as directed. Instruct patient and/or caregiver in correct use of pipette if using oral solution. Skip missed doses and return to regular schedule the following day; do not double

doses. Do not discontinue abruptly; although no increase in frequency of adverse events may occur, beneficial affects of galantamine are lost when the drug is discontinued.
- Caution patient and caregiver that galantamine may cause dizziness.
- Advise patient and caregiver to notify health care professional if nausea or vomiting persists beyond 7 days or if new symptoms occur or previously noted symptoms increase in severity.
- Advise patient and caregiver to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of follow-up exams to monitor progress.
- Teach patient and caregivers that improvements in cognitive functioning may take weeks to months to stabilize.
- Caution that disease is not cured and degenerative process is not reversed.

### Evaluation/Desired Outcomes
- Improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

## ganciclovir (gan-**sye**-kloe-vir)
Cytovene, Vitrasert

***Classification***
Therapeutic: antivirals

**Pregnancy Category C**

### Indications
**IV:** Treatment of cytomegalovirus (CMV) retinitis in immunocompromised patients, including HIV-infected patients (may be used with foscarnet). Prevention of CMV infection in transplant patients at risk. **PO:** Maintenance treatment of stable CMV retinitis in immunocompromised patients after initial IV treatment and prevention of CMV retinitis in patients with advanced HIV infection.

### Action
CMV converts ganciclovir to its active form (ganciclovir phosphate) inside the host cell, where it inhibits viral DNA polymerase. **Therapeutic Effects:** Antiviral effect directed preferentially against CMV-infected cells.

### Pharmacokinetics
**Absorption:** 5–9% absorbed after oral administration. IV administration results in complete bioavailability. Action of intravitreal implant is local. **Distribution:** Widely distributed; enters CSF. **Metabolism and Excretion:** 90% excreted unchanged by the kidneys. **Half-life:** 2.9 hr (↑ in renal impairment).

TIME/ACTION PROFILE (antiviral levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1.8–3 hr | 3–8 hr |
| IV | rapid | end of infusion | 12–24 hr |
| Intravitreal | rapid | unknown | 5–8 mo |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to ganciclovir or acyclovir.
**Use Cautiously in:** Renal impairment (dose ↓ required if CCr <80 mL/min); Geri: Dose ↓ recommended; Bone marrow depression or immunosuppression; OB, Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** SEIZURES, abnormal dreams, coma, confusion, dizziness, drowsiness, headache, malaise, nervousness. **EENT:** retinal detachment; *intravitreal only*, ↓ visual acuity, vitreous hemorrhage, hyphema, intraocular pressure spikes, lens opacities, macular abnormalities, optic nerve changes, uveitis. **Resp:** dyspnea. **CV:** arrhythmias, edema, hypertension, hypotension. **GI:** GI BLEEDING, abdominal pain, ↑ liver enzymes, nausea, vomiting. **GU:** gonadal suppression, hematuria, renal toxicity. **Derm:** alopecia, photosensitivity, pruritus, rash, urticaria. **Endo:** hypoglycemia. **Hemat:** neutropenia, thrombocytopenia, anemia, eosinophilia. **Local:** pain/phlebitis at IV site. **Neuro:** ataxia, tremor. **Misc:** fever.

### Interactions
**Drug-Drug:** ↑ risk of bone marrow depression with **antineoplastics**, **radiation therapy**, or **zidovudine**. Toxicity may be ↑ by **probenecid**. ↑ risk of seizures with **imipenem/cilastatin**. Concurrent use of other **nephrotoxic drugs**, **cyclosporine**, or **amphotericin B** ↑ risk of nephrotoxicity.

### Route/Dosage
**IV (Adults):** *Induction*—5 mg/kg q 12 hr for 14–21 days. *Maintenance regimen*—5 mg/kg/day or 6 mg/kg for 5 days of each week. If progression occurs, ↑ to q 12 hr regimen. *Prevention*—5 mg/kg q 12 hr for 7–14 days, then 5 mg/kg/day or 6 mg/kg for 5 days of each week.
**PO (Adults):** *Maintenance regimen*—1000 mg 3 times daily (with food) or 500 mg 6 times daily; *Prevention of CMV retinitis in advanced HIV infection*—1000 mg 3 times daily.
**Intravitreal (Adults):** 4.5 mg implant.

### Availability (generic available)

**Capsules:** 250 mg, 500 mg. **Powder for injection:** 500 mg/vial. **Intravitreal insert:** 4.5 mg.

## NURSING IMPLICATIONS

### Assessment

- Diagnosis of CMV retinitis should be determined by ophthalmoscopy before treatment with ganciclovir.
- Culture for CMV (urine, blood, throat) may be taken before administration. However, a negative CMV culture does not rule out CMV retinitis. If symptoms do not respond after several weeks, resistance to ganciclovir may have occurred. Ophthalmologic exams should be performed weekly during induction and every 2 wk during maintenance or more frequently if the macula or optic nerve is threatened. Progression of CMV retinitis may occur during or after ganciclovir treatment.
- Assess for signs of infection (fever, chills, cough, hoarseness, lower back or side pain, sore throat, difficult or painful urination). Notify health care professional if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- ***Lab Test Considerations:*** Monitor neutrophil and platelet count at least every 2 days during bid therapy and weekly thereafter. Granulocytopenia usually occurs during the first 2 wk of treatment but may occur anytime during therapy. Do not administer if neutrophil count $<500/mm^3$ or platelet count $<25{,}000/mm^3$. Recovery begins within 3–7 days of discontinuation of therapy.
- Monitor BUN and serum creatinine at least once every 2 wk throughout therapy.
- Monitor liver function tests (AST, ALT, serum bilirubin, alkaline phosphatase) periodically during therapy. May cause ↑ levels.
- May cause ↓ blood glucose.

### Potential Nursing Diagnoses

Risk for infection (Indications, Patient/Family Teaching)

### Implementation

- Do not confuse Cytovene (ganciclovir) with Cytosar (cytarabine).
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Do not administer subcut or IM; severe tissue irritation may result.
- **PO:** Administer capsules with food. Swallow capsules whole; do not open, crush, or chew.
- **IV:** Observe infusion site for phlebitis. Rotate infusion site to prevent phlebitis.
- Maintain adequate hydration throughout therapy.

#### IV Administration

- **Intermittent Infusion:** Reconstitute 500 mg with 10 mL of sterile water for injection for a concentration of 50 mg/mL. Do not reconstitute with bacteriostatic water with parabens; precipitation will occur. Shake well to dissolve completely. Discard vial if particulate matter or discoloration occurs. Reconstituted solution is stable for 12 hr at room temperature; do not refrigerate.
- ***Diluent:*** Dilute in 100 mL of D5W, 0.9% NaCl, Ringer's or LR. Once diluted for infusion, solution should be used within 24 hr. Refrigerate but do not freeze. ***Concentration:*** 10 mg/mL. ***Rate:*** Administer slowly, via infusion pump, over 1 hr using an in-line filter. Rapid administration may increase toxicity.
- **Y-Site Compatibility:** alfentanyl, allopurinol, amphotericin B cholesteryl, anidulafungin, atropine, bivalirudin, calcium gluconate, carboplatin, caspofungin, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, docetaxel, doxacurium, doxorubicin liposome, enalaprilat, epoetin alfa, eptifibatide, ertapenem, etoposide, etoposide phosphate, fentanyl, filgrastim, fluconazole, fluorouracil, folic acid, furosemide, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, ifosfamide, indomethacin, insulin, labetalol, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, methotrexate, metoprolol, milrinone, mitoxantrone, nafcillin, naloxone, nesiritide, nitroglycerin, nitroprusside, octreotide, oxytocin, paclitaxel, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phytonadione, potassium chloride, propofol, propranolol, protamine, ranitidine, remifentanil, rituximab, rocuronium, sodium acetate, sufentanil, teniposide, thi-

otepa, tigecycline, tirofiban, trastuzumab, trimetaphan, vasopressin, vincristine, voriconazole.

- **Y-Site Incompatibility:** aldesleukin, amifostine, amikacin, aminophylline, amphotericin B colloidal, ampicillin, ampicillin/sulbactam, amsacrine, ascorbic acid, atracurium, azathioprine, aztreonam, bumetanide, butorphanol, cefazolin, cefepime, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, clindamycin, cytarabine, dantrolene, diazepam, diazoxide, diltiazem, diphenhydramine, dobutamine, dopamine, doxorubicin, doxycycline, ephedrine, epinephrine, epirubicin, erythromycin, esmolol, famotidine, fenoldopam, fludarabine, foscarnet, gemcitabine, gentamicin, haloperidol, hydralazine, hydrocortisone, hydroxyzine, idarubicin, imipenem/cilastatin, inamrinone, isorpoterenol, isoproterenol, ketorolac, levofloxacin, lidocaine, meperidine, metaraminol, methoxamine, methyldoapte, methylprednisolone, metoclopramide, metronidazole, midazolam, morphine, multivitamins, nalbuphine, norepinephrine, ondansetron, palonosetron, penicillin G, pentazocine, phentolamine, phenylephrine, phenytoin, piperacillin/tazobactam, procainamide, prochlorperazine, promethazine, pyridoxime, quinupristin/dalfopristin, sargramostim, sodium bicarbonate, streptokinase, succinylcholine, tacrolimus, theophylline, thiamine, ticarcillin/clavulanate, tobramycin, tolazoline, trimethoprim/sulfamethoxazone, vancomycin, verapamil, vinorelbine.

### Patient/Family Teaching

- Instruct patient to take ganciclovir with food, as directed.
- Inform patient that ganciclovir is not a cure for CMV retinitis. Progression of retinitis may continue in immunocompromised patients during and after therapy. Advise patients to have regular ophthalmic exams at least every 6 wk. Duration of therapy for CMV prevention is based on the duration and degree of immunosuppression.
- Advise patient to notify health care professional if fever; chills; sore throat; other signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Advise patient that ganciclovir may have teratogenic effects. A nonhormonal method of contraception should be used during and for at least 90 days after therapy.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the importance of frequent follow-up exams to monitor blood counts.

### Evaluation/Desired Outcomes

- Management of the symptoms of CMV retinitis in immunocompromised patients.
- Prevention of CMV retinitis in transplant patients at risk.

## gefitinib (je-fit-in-ib)

Iressa

***Classification***

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

**Pregnancy Category D**

### Indications

Patients who are currently benefiting from or have benefited from gefitinib in the past for treatment of non-small cell lung cancer.

### Action

Inhibits activation of kinases found in transmembrane cell surface receptors, including epidermal growth factor receptor (EGFR-TK). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** 60% absorbed following oral administration.
**Distribution:** Extensively distributed.
**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A4 enzyme system); excreted in feces, <4% excreted in urine.
**Half-life:** 48 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB, Lactation, Pedi: Pregnancy, lactation, children.
**Use Cautiously in:** Idiopathic pulmonary fibrosis (↑ risk of pulmonary toxicity); Concurrent use of strong inhibitors of the CYP3A4 enzyme system (may ↑ risk of toxicity).

### Adverse Reactions/Side Effects

**CNS:** weakness. **EENT:** aberrant eyelash, conjunctivitis, corneal erosion/ulcer, eye pain, ↓ vision. **CV:** peripheral edema. **Resp:** PULMONARY TOXICITY, dyspnea. **GI:** diarrhea, nausea, vomiting, anorexia, hepatotoxicity, mouth ulceration. **Derm:** acne, dry skin, rash, pruritus. **Metab:** weight loss. **Misc:** allergic reactions including ANGIOEDEMA.

### Interactions

**Drug-Drug:** Strong inducers of the CYP3A4 enzyme system, including **rifampin** and **phenytoin** ↓ blood levels and effects (consider ↑ dose of gefitinib to 500 mg/day). Strong inhibitors of the CYP3A4 enzyme system, including **ketoconazole** and **itraconazole** ↑ blood levels and effects (use with caution). Absorption and efficacy may be ↓ by **drugs that ↑ gastric pH** including **cimetidine** and **ranitidine**. May ↑ the risk of bleeding with **warfarin**. Concurrent use with **vinorelbine** may ↑ risk/severity of neutropenia.

### Route/Dosage

**PO (Adults):** 250 mg once daily.

### Availability

**Tablets:** 250 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess for signs of pulmonary toxicity (dyspnea, cough, fever). If interstitial lung disease is confirmed, discontinue gefitinib and treat appropriately.
- Assess patient for eye symptoms such as pain during therapy. May require interruption of therapy and removal of aberrant eyelash. After symptoms and eye changes have resolved, may reinstate therapy.
- ***Lab Test Considerations:*** Monitor liver function tests periodically. May cause ↑ transaminases, bilirubin, and alkaline phosphatase. Discontinue gefitinib if elevations are severe.
- Monitor for changes in prothrombin time and INR in patients taking warfarin. May cause ↑ levels.

### Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)
Impaired skin integrity (Side Effects)
Ineffective breathing pattern (Adverse Reactions)

### Implementation

- Available only through the *Iressa Access Program*. Patients must be currently on the medication or in an approved study and must sign the Patient Consent Form. Physicians and prescribers must enroll in program.
- **PO:** Administer one tablet daily without regard to food. Tablets can also be dispersed in half a glass of drinking water (non-carbonated). No other liquids should be used. Drop the tablet in the water, without crushing it, stir until the tablet is dispersed (approximately 10 minutes) and drink the liquid immediately. Rinse the glass with half a glass of water and drink. The liquid can also be administered through a nasogastric tube.
- May interrupt therapy briefly (14 days) for patients with poorly tolerated diarrhea with dehydration or skin adverse reactions. Follow by restarting 250 mg dose.

### Patient/Family Teaching

- Instruct patient to take gefitinib as directed. Advise patient to read the *Instruction Sheet* with each Rx refill; new information may be available.
- Advise patient to notify health care professional promptly if severe persistent diarrhea, nausea, vomiting, or anorexia occur; if shortness of breath or cough occur or worsen; or if eye irritation or other new symptoms develop.
- Instruct patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

### Evaluation/Desired Outcomes

- Decrease in size and spread of tumors in non-small cell lung cancer.

HIGH ALERT

## gemcitabine (jem-**site**-a-been)

Gemzar

***Classification***

Therapeutic: antineoplastics
Pharmacologic: antimetabolites, nucleoside analogues

**Pregnancy Category D**

### Indications

Pancreatic cancer (locally advanced or metastatic). Inoperable locally advanced/metastatic non-small cell lung cancer (with cisplatin). Metastatic breast cancer (with paclitaxel). Advanced ovarian cancer that has relapsed 6 months after completion of platinum-based therapy (with carboplatin).

## Action

Interferes with DNA synthesis (cell-cycle phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Converted in cells to active diphosphate and triphosphate metabolites; these are excreted primarily by the kidneys.
**Half-life:** 32–94 min.

TIME/ACTION PROFILE (effect on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | unknown | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB: Can cause fetal malformation; Lactation: Can expose infant to serious adverse effects. Bottle feed if gemcitabine therapy is necessary.
**Use Cautiously in:** History of cardiovascular disease; Impaired hepatic or renal function (increased risk of toxicity); Other chronic debilitating illness; OB: Patients with childbearing potential.

## Adverse Reactions/Side Effects

**Resp:** PULMONARY TOXICITY, dyspnea, bronchospasm. **CV:** ARRHYTHMIAS, CEREBROVASCULAR ACCIDENT, MI, edema, hypertension. **GI:** HEPATOTOXICITY, diarrhea, nausea, stomatitis, transient elevation of hepatic transaminases, vomiting. **GU:** HEMOLYTIC UREMIC SYNDROME, hematuria, proteinuria. **Derm:** alopecia, rash. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** injection site reactions. **Neuro:** paresthesias. **Misc:** flu-like symptoms, fever, anaphylactoid reactions.

## Interactions

**Drug-Drug:** ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live virus vaccines** and ↑ risk of adverse reactions.

## Route/Dosage

Other regimens are used.

### Pancreatic Cancer

**IV (Adults):** 1000 mg/m² once weekly for 7 wk, followed by a week of rest. May be followed by cycles of once-weekly administration for 3 wk followed by a week of rest.

### Non-Small Cell Lung Cancer (with Cisplatin)

**IV (Adults):** 1000 mg/m² on days 1, 8, and 15 of each 28-day cycle (cisplatin is also given on day 1) *or* 1250 mg/m² on days 1 and 8 of each 21-day cycle (cisplatin is also given on day 1).

### Breast Cancer

**IV (Adults):** 1250 mg/m² on days 1 and 8 of each 21-day cycle (paclitaxel is also given on day 1).

### Ovarian Cancer

**IV (Adults):** 1000 mg/m² on days 1 and 8 of each 21-day cycle.

## Availability

**Powder for injection:** 200 mg in 10-mL vial, 1 g in 50-mL vial. **Cost:** 200 mg $117.95/10-mL vial, 1 g $589.90/50-mL vial.

# NURSING IMPLICATIONS

## Assessment

- Monitor vital signs before and frequently during therapy.
- Assess injection site during administration. Although gemcitabine is not considered a vesicant, local reactions may occur.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output, appetite, and nutritional intake. Mild to moderate nausea and vomiting occur frequently. Antiemetics may be used prophylactically.
- ***Lab Test Considerations:*** Monitor CBC, including differential and platelet count, before each dose. Dose guidelines are based on the CBC. *For single-agent use:* If the absolute granulocyte count is >1000 and platelet count is >100,000, the full dose may be administered. If the absolute granulocyte count is 500–999 or platelet count is 50,000–99,000, 75% of the dose may be given. If the absolute granulocyte count is <500 or the platelet count is <50,000, withhold further doses. *For gemcitabine with paclitaxel (breast cancer):* If the absolute granulocyte count is >1200 and platelet count is >75,000, the full dose may be administered. If the absolute granulocyte count is

1000–1199 or platelet count is 50,000–75,000, 75% of the dose may be given. If the absolute granulocyte count is 700–999 or platelet count is ≥50,000, 50% of the dose may be given. If the absolute granulocyte count is <700 or the platelet count is <50,000, withhold further doses.

- Monitor serum creatinine, potassium, calcium, and magnesium in patients taking cisplatin with gemcitabine. *For gemcitabine with carboplatin (ovarian cancer):* If the absolute granulocyte count is >1500 and platelet count is >100,000, the full dose may be administered. If the absolute granulocyte count is 1000–1499 or platelet count is 75,000–99,000, 75% of the dose may be given. If the absolute granulocyte count is <1000 or the platelet count is <75,000, withhold further doses.
- Monitor hepatic and renal function before and periodically during therapy. May cause transient ↑ in serum AST, ALT, alkaline phosphatase, and bilirubin concentrations.
- May also cause ↑ BUN and serum creatinine concentrations, proteinuria, and hematuria.

## Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

## Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

### IV Administration

- **Intermittent Infusion:** To reconstitute, add 5 mL of 0.9% NaCl without preservatives to 200-mg vial or 25 mL of 0.9% NaCl to the 1-g vial of gemcitabine for a concentration of 40 mg/mL. Incomplete dissolution may result in concentrations greater than 40 mg/mL. ***Diluent:*** May be further diluted with 0.9% NaCl. Solution is colorless to light straw color. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 24 hr at room temperature. Discard unused portions. Do not refrigerate; crystallization may occur. ***Concentration:*** 0.1–38 mg/mL. ***Rate:*** Administer dose over 30 min. Infusions longer than 60 min have a greater incidence of toxicity.
- **Y-Site Compatibility:** amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromizine, cimetidine, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, cytarabine, dactinomycin, daunorubicin, dexrazoxane, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, etoposide, etoposide phosphate, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, leucoverin, linezolid, lorazepam, mannitol, meperidine, mesna, metoclopramide, metronidazole, mitoxantrone, morphine, nalbuphine, ofloxacin, ondansetron, oxaliplatin, paclitaxel, potassium chloride, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** acyclovir, amphotericin B, cefotaxime, furosemide, ganciclovir, imipenem-cilastatin, irinotecan, lansoprazole, methotrexate, methoprednisolone, mitomycin, pemetrexed, piperacillin, piperacillin/tazobactam, prochlorperazine.

## Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis pain may require management with opioid analgesics.

- Instruct patient to notify health care professional if flu-like symptoms (fever, anorexia, headache, cough, chills, myalgia), swelling of the feet or legs, or shortness of breath occurs.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Palliative, symptomatic improvement in patients with pancreatic cancer.
- Decrease in size and spread of malignancy in lung, ovarian, and breast cancer.

## **gemfibrozil** (gem-**fye**-broe-zil)
Lopid

***Classification***
Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

**Pregnancy Category C**

### Indications

Management of type II-b hyperlipidemia (decreased HDLs, increased LDLs, increased triglycerides) in patients who do not yet have clinical coronary artery disease and have failed therapy with diet, exercise, weight loss, or other agents (niacin, bile acid sequestrants).

### Action

Inhibits peripheral lipolysis. Decreases triglyceride production by the liver. Decreases production of the triglyceride carrier protein. Increases HDL.
**Therapeutic Effects:** Decreased plasma triglycerides and increased HDL.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Some metabolism by the liver, 70% excreted by the kidneys (mostly unchanged), 6% excreted in feces.
**Half-life:** 1.3–1.5 hr.

TIME/ACTION PROFILE (triglyceride-VLDL–lowering effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 2–5 days | 4 wk | several mo |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Primary biliary cirrhosis; Concurrent use of HMG-CoA reductase inhibitors or repaglinide.
**Use Cautiously in:** Gallbladder disease; Liver disease; Severe renal impairment; OB, Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** dizziness, headache. **EENT:** blurred vision. **GI:** abdominal pain, diarrhea, epigastric pain, flatulence, gallstones, heartburn, nausea, vomiting. **Derm:** alopecia, rashes, urticaria. **Hemat:** anemia, leukopenia. **MS:** myositis.

### Interactions

**Drug-Drug:** May ↑ the effects of **warfarin** or **sulfonylurea oral hypoglycemic agents**. Concurrent use with **HMG-CoA reductase inhibitors** may ↑ the risk of rhabdomyolysis (avoid concurrent use). Concurrent use with **repaglinide** may ↑ the risk of severe hypoglycemia (avoid concurrent use). May ↓ the effect of **cyclosporine**.

### Route/Dosage

**PO (Adults):** 600 mg twice daily 30 min before breakfast and dinner.

### Availability (generic available)

**Tablets:** 600 mg. **Cost:** *Generic*— $45.97/180.
**Capsules:** 🍁 300 mg.

## NURSING IMPLICATIONS

### Assessment

- Obtain patient's diet history, especially regarding fat and alcohol consumption.
- ***Lab Test Considerations:*** Monitor serum triglyceride and cholesterol levels before and periodically during therapy. Assess LDL and VLDL levels before and periodically during therapy. Discontinue gemfibrozil if paradoxical ↑ in lipid levels occurs.
- Assess liver function tests before and periodically during therapy. May cause ↑ serum bilirubin, alkaline phosphatase, CK, LDH, AST, and ALT. If hepatic function tests rise significantly, therapy should be discontinued and not resumed.
- Evaluate CBC and electrolytes every 3–6 mo and then yearly during therapy. May cause mild ↓ in hemoglobin, hematocrit, and leukocyte counts. May cause ↓ serum potassium concentrations.
- May cause slight ↑ in serum glucose.

### Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

### Implementation
- Do not confuse Lopid (gemfibrozil) with Levbid (hyoscyamine).
- **PO:** Administer 30 min before breakfast or dinner.

### Patient/Family Teaching
- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for next dose.
- Advise patient that this medication should be used in conjunction with dietary restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional promptly if any of the following symptoms occur: severe stomach pains with nausea and vomiting, fever, chills, sore throat, rash, diarrhea, muscle cramping, general abdominal discomfort, or persistent flatulence.

### Evaluation/Desired Outcomes
- Decrease in serum triglyceride and cholesterol levels and improved HDL to total cholesterol ratios. If response is not seen within 3 mo, medication is usually discontinued.

HIGH ALERT

## gemtuzumab ozogamicin
(gem-**tu**-zoo-mab o-zo-ga-**my**-sin)
Mylotarg

***Classification***
Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies, antitumor antibiotics

**Pregnancy Category D**

### Indications
Treatment of patients with patients with CD33 positive acute myeloid leukemia in first relapse who are ≥60 yr old and who are not considered to be candidates for cytotoxic chemotherapy.

### Action
The antibody portion (gemtuzumab) attaches to the CD33 antigen on the surface of acute myeloid leukemic cells. Binding produces a complex that is internalized by the leukemic cells. Once internalized the antitumor antibiotic portion of the drug (ozogamicin, also know as calicheamicin) is released and binds to DNA resulting in breaks in double strand DNA and cell death. **Therapeutic Effects:** Death of acute myeloid leukemic cells.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Binds to CD33 receptor sites, is then internalized by leukemic cells, releasing ozogamicin.
**Metabolism and Excretion:** Ozogamicin is probably metabolized by the liver.
**Half-life:** *Total ozogamicin*—45 hr (↑ with second dose); *unconjugated ozogamicin*—100 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IN | rapid | following infusion | 2 wk |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; OB: Pregnancy; Lactation: Lactation.
**Use Cautiously in:** Patients with hepatic impairment; Pedi: Children (safety not established).

### Adverse Reactions/Side Effects
**CNS:** headache. **Resp:** dyspnea, hypoxia. **CV:** hypotension, hypertension. **GI:** mucositis, nausea, vomiting, hepatotoxicity. **Derm:** rash. **Endo:** hyperglycemia. **F and E:** hypokalemia. **Hemat:** NEUTROPENIA, anemia, bleeding, thrombocytopenia. **Misc:** chills, fever, postinfusion reaction, allergic reactions, infection, tumor lysis syndrome.

### Interactions
**Drug-Drug:** None reported to date.

### Route/Dosage
**IV (Adults ≥60 yr):** 9 mg/m² as a 2-hr infusion followed by a second dose 14 days later.

### Availability
**Powder for injection (requires reconstitution):** 5 mg/vial.

## NURSING IMPLICATIONS

### Assessment
- Prophylactically treat patient with diphenhydramine 50 mg PO, and acetaminophen 650–1000 mg PO 1 hr prior to administration, with 2 additional doses of acetaminophen 650–1000 mg PO every 4 hr as needed. Assess patient for postinfusion symptom complex (fever, chills, nausea, vomiting, headache, hypotension, hypertension, dyspnea, hyperglycemia), which may occur within the first 24 hr following administration and usually resolve after 2–

4 hr with supportive therapy. Fewer infusion-related events occur with second dose.
- Monitor vital signs during infusion and for 4 hr after infusion.
- Monitor for development of tumor lysis syndrome. May require hydration and allopurinol to prevent hyperuricemia.
- ***Lab Test Considerations:*** Monitor hematologic status (electrolytes, hepatic function, CBC, platelet counts) during therapy. Severe myelosuppression (anemia, thrombocytopenia) will occur in all patients given the recommended dose of gemtuzumab. Full recovery from hematologic toxicities is not required before second infusion.
- May cause ↑ AST and ALT levels which are transient and usually reversible.

### Potential Nursing Diagnoses
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation
- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations, and infusion pump settings. Gemtuzumab should be administered under the supervision of a physician experienced in the use of cancer chemotherapeutic agents. May be administered in a outpatient setting. Do not administer by intravenous push or bolus.
- Protect medication from direct and indirect light and unshielded fluorescent lights during preparation and administration. Must be prepared under a biologic safety hood with the fluorescent light off.

#### IV Administration
- **Intermittent Infusion:** Prior to reconstitution, allow drug to come to room temperature. Reconstitute each vial with 5 ml of sterile water for injection. Gently swirl each vial and inspect for particulate matter. Reconstituted drug may be stored refrigerated for up to 8 hr. ***Diluent:*** To dilute for administration, withdraw desired volume from each vial and inject into 100 mL IV bag of 0.9% NaCl and place into a UV protectant bag. Use diluted solution immediately. ***Concentration:*** Concentration in vial will be 1 mg/mL. ***Rate:*** Infuse over 2 hr via a separate IV line with a low protein-binding 1.2-micron terminal filter. May be administered through peripheral or central line.

### Patient/Family Teaching
- Explain purpose of gemtuzumab to patient.

### Evaluation/Desired Outcomes
- Remission in patients with leukemia.

## gentamicin, See AMINOGLYCOSIDES.

## glimepiride, See SULFONYLUREAS.

## glipiZIDE, See SULFONYLUREAS.

## glucagon (gloo-ka-gon)
GlucaGen

***Classification***
Therapeutic: hormones
Pharmacologic: pancreatics

**Pregnancy Category B**

### Indications
Acute management of severe hypoglycemia when administration of glucose is not feasible. Facilitation of radiographic examination of the GI tract. **Unlabeled Use:** Antidote to: Beta blockers, Calcium channel blockers.

### Action
Stimulates hepatic production of glucose from glycogen stores (glycogenolysis). Relaxes the musculature of the GI tract (stomach, duodenum, small bowel, and colon), temporarily inhibiting movement. Has positive inotropic and chronotropic effects. **Therapeutic Effects:** Increase in blood glucose. Relaxation of GI musculature, facilitating radiographic examination.

### Pharmacokinetics
**Absorption:** Well absorbed following IM and subcut administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Extensively metabolized by the liver, plasma, and kidneys.
**Half-life:** 8–18 min.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM (hyperglycemic action) | within 10 min | 30 min | 12–27 min |
| IV (hyperglycemic action) | 1 min | 5 min | 9–17min |
| Subcut (hyperglycemic action) | within 10 min | 30–45 min | 60–90 min |
| IV (effect on GI musculature) | 45 sec (for 0.25–2-mg dose) | unknown | 9–17 min (0.25–0.5-mg dose); 22–25 min (2-mg dose) |
| IM (effect on GI musculature) | 8–10 min (1-mg dose); 4–7 min (2-mg dose) | unknown | 9–27 min (1-mg dose); 21–32 min (2-mg dose) |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Pheochromocytoma; Some products contain glycerin and phenol—avoid use in patients with hypersensitivities to these ingredients.

**Use Cautiously in:** History suggestive of insulinoma or pheochromocytoma; Prolonged fasting, starvation, adrenal insufficiency or chronic hypoglycemia (low levels of releasable glucose); When used to inhibit GI motility, use cautiously in geriatric patient with cardiac disease or diabetics; OB: Should be used during pregnancy only if clearly needed; Lactation: Safety not established.

## Adverse Reactions/Side Effects

**CV:** hypotension. **GI:** nausea, vomiting. **Misc:** hypersensitivity reactions including ANAPHYLAXIS.

## Interactions

**Drug-Drug:** Large doses may enhance the effect of **warfarin**. Negates the response to **insulin** or **oral hypoglycemic agents**. **Phenytoin** inhibits the stimulant effect of glucagon on insulin release. Hyperglycemic effect is intensified and prolonged by **epinephrine**. Patients on concurrent **beta blocker** therapy may have a greater increase in heart rate and blood pressure.

## Route/Dosage

### Hypoglycemia

**IV, IM, Subcut (Adults and Children ≥20 kg):** 1 mg; may be repeated in 15 min if necessary.

**IV, IM, Subcut (Children <20 kg ):** 0.5 mg or 0.02–0.03 mg/kg; may be repeated in 15 min if necessary.

### Radiographic Examination of the GI Tract

**IM, IV (Adults):** 0.25–2 mg; depending on location and duration of examination (0.5 mg IV or 2 mg IM for relaxation of stomach, for examination of the colon 2 mg IM 10 min before procedure).

### Antidote (unlabeled)

**IV (Adults):** *To beta blockers*—50–150 mcg (0.05–0.15 mg)/kg, followed by 1–5 mg/hr infusion. *To calcium channel blockers*—2 mg; additional doses determined by response.

## Availability

**Powder for injection:** 1-mg (equivalent to 1 unit) vials as an emergency kit for low blood glucose and a diagnostic kit.

# NURSING IMPLICATIONS

## Assessment

- Assess for signs of hypoglycemia (sweating, hunger, weakness, headache, dizziness, tremor, irritability, tachycardia, anxiety) prior to and periodically during therapy.
- Assess neurologic status throughout therapy. Institute safety precautions to protect patient from injury caused by seizures, falling, or aspiration. For insulin shock therapy, 0.5–1 mg is administered after 1 hr of coma; patient usually awakens in 10–25 min. If no response occurs, repeat the dose. Feed patient supplemental carbohydrates orally to replenish liver glycogen and prevent secondary hypoglycemia as soon as possible after awakening, especially pediatric patients.
- Assess nutritional status. Patients who lack liver glycogen stores (starvation, chronic hypoglycemia, adrenal insufficiency) will require glucose instead of glucagon.
- Assess for nausea and vomiting after administration of dose. Protect patients with depressed level of consciousness from aspiration by positioning on side; ensure that a suction unit is available. Notify health care professional if vomiting occurs; patient will require parenteral glucose to prevent recurrent hypoglycemia.
- ***Lab Test Considerations:*** Monitor serum glucose levels throughout episode, during treatment, and for 3–4 hr after patient regains consciousness. Use of bedside fingerstick

blood glucose determination methods is recommended for rapid results. Follow-up lab results may be ordered to validate fingerstick values, but do not delay treatment while awaiting lab results, as this could result in neurologic injury or death.
- Large doses of glucagon may cause a ↓ in serum potassium concentrations.

### Potential Nursing Diagnoses
Risk for injury (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation
- May be given subcut, IM, or IV. Reconstitute with diluent supplied in kit by manufacturer. Inspect solution prior to use; use only clear, water-like solution. Solution is stable for 48 hr if refrigerated, 24 hr at room temperature. Unmixed medication should be stored at room temperature.
- Administer supplemental carbohydrates IV or orally to facilitate increase of serum glucose levels.

**IV Administration**
- **Direct IV:** ***Diluent:*** Reconstitute each vial with 1 mL of an appropriate diluent. For doses ≤2 mg, use diluent provided by manufacturer. For doses >2 mg, use sterile water for injection instead of diluent supplied by manufacturer to minimize risk of thrombophlebitis, CNS toxicity, and myocardial depression from phenol preservative in diluent supplied by manufacturer. Reconstituted vials should be used immediately. ***Concentration:*** Not exceed 1 mg/mL. ***Rate:*** Administer at a rate not exceeding 1 mg/min. May be administered through IV line containing D5W.
- **Continuous Infusion:** ***Diluent:*** Reconstitute vials as per directions above (use sterile water for injection). Further dilute 10 mg of glucagon in 100 mL of D5W. ***Concentration:*** 0.1 mg/mL. ***Rate:*** See Route/Dosage section.
- **Y-Site Compatibility:** No information available.

### Patient/Family Teaching
- Teach patient and family signs and symptoms of hypoglycemia. Instruct patient to take oral glucose as soon as symptoms of hypoglycemia occur—glucagon is reserved for episodes when patient is unable to swallow because of decreased level of consciousness.
- **Home Care Issues:** Instruct family on correct technique to prepare, draw up, and administer injection. Health care professional must be contacted immediately after each dose for orders regarding further therapy or adjustment of insulin dose or diet.
- Advise family that patient should receive oral glucose when alertness returns.
- Instruct family to position patient on side until fully alert. Explain that glucagon may cause nausea and vomiting. Aspiration may occur if patient vomits while lying on back.
- Instruct patient to check expiration date monthly and to replace outdated medication immediately.
- Review hypoglycemic medication regimen, diet, and exercise programs.
- Patients with diabetes mellitus should carry a source of sugar (such as a packet of sugar or candy) and identification describing disease process and treatment regimen at all times.

### Evaluation/Desired Outcomes
- Increase of serum glucose to normal levels with improved level of consciousness.
- Smooth muscle relaxation of the stomach, duodenum, and small and large intestine in patients undergoing radiologic examination of the GI tract.

**glyBURIDE, See SULFONYLUREAS.**

## glycopyrrolate
(glye-koe-**pye**-roe-late)
Robinul, Robinul-Forte

***Classification***
Therapeutic: antispasmodics
Pharmacologic: anticholinergics

**Pregnancy Category B**

### Indications
Inhibits salivation and excessive respiratory secretions when given preoperatively. Reverses some of the secretory and vagal actions of cholinesterase inhibitors used to treat nondepolarizing neuromuscular blockade (cholinergic adjunct). Adjunctive management of peptic ulcer disease.

### Action
Inhibits the action of acetylcholine at postganglionic sites located in smooth muscle, secretory glands, and the CNS (antimuscarinic activity). Low doses decrease sweating, salivation, and respiratory secretions. Intermediate doses result in increased heart rate. Larger doses decrease GI and GU tract motility. **Therapeutic Effects:** Decreased GI and respiratory secretions.

## Pharmacokinetics

**Absorption:** Incompletely absorbed (10%) after oral administration. Well absorbed after IM administration.
**Distribution:** Distribution not fully known. Does not significantly cross the blood-brain barrier or eye. Crosses the placenta.
**Metabolism and Excretion:** Eliminated primarily unchanged in the feces, via biliary excretion.
**Half-life:** 1.7 hr (0.6–4.6 hr).

TIME/ACTION PROFILE (anticholinergic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 hr | unknown | 8–12 hr |
| IM | 15–30 min | 30–45 min | 2–7 hr* |
| IV | 1–10 min | unknown | 2–7 hr* |

*Antisecretory effect lasts up to 7 hr; vagal blockade lasts 2–3 hr

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Angle-closure glaucoma; Acute hemorrhage; Tachycardia secondary to cardiac insufficiency or thyrotoxicosis; Pedi: Injection contains benzyl alcohol and should not be given to neonates; Myasthenia gravis; Obstructive uropathy; Paralytic ileus.
**Use Cautiously in:** Patients who may have intra-abdominal infections; Prostatic hyperplasia; Chronic renal, hepatic, pulmonary, or cardiac disease; Down syndrome and children with spastic paralysis or brain damage (may be hypersensitive to antimuscarinic effects); OB, Lactation: Safety not established; Pedi: ↑ sensitivity to anticholinergic effects and adverse reactions; Geri: ↑ sensitivity to anticholinergic effects and adverse reactions.

## Adverse Reactions/Side Effects

**CNS:** confusion, drowsiness. **EENT:** blurred vision, cycloplegia, dry eyes, mydriasis. **CV:** tachycardia, orthostatic hypotension, palpitations. **GI:** dry mouth, constipation. **GU:** urinary hesitancy, retention.

## Interactions

**Drug-Drug:** Additive anticholinergic effects with other **anticholinergics**, including **antihistamines**, **phenothiazines**, **meperidine**, **amantadine**, **tricyclic antidepressants**, **quinidine**, and **disopyramide**. May alter the absorption of other **orally administered drugs** by slowing motility of the GI tract. **Antacids** or **adsorbent antidiarrheal agents** ↓ absorption of anticholinergics. May ↑ GI mucosal lesions in patients taking oral **potassium chloride** tablets. ↑ risk of adverse cardiovascular reactions with **cyclopropane** anesthesia. Concurrent use may ↓ absorption of **ketoconazole** (administer 2 hr after ketoconazole).

## Route/Dosage

### Control of Secretions during Surgery

**IM (Adults):** 4.4 mcg/kg 30–60 min preop (not to exceed 0.1 mg).
**IM (Children > 2 yr):** 4.4 mcg/kg 30–60 min preop.
**IM (Children < 2 yr):** 4.4–8.8 mcg/kg 30–60 min preop.

### Control of Secretions (chronic)

**IM, IV (Children):** 4–10 mcg/kg/dose q 3–4 hr.
**PO (Children):** 40–100 mcg/kg/dose 3–4 times/day.

### Cholinergic Adjunct

**IV (Adults and Children):** 200 mcg for each 1 mg of neostigmine or 5 mg of pyridostigmine given at the same time.

### Antiarrhythmic

**IV (Adults):** 100 mcg, may be repeated q 2–3 min.
**IV (Children):** 4.4 mcg/kg (up to 100 mcg); may be repeated q 2–3 min.

### Peptic Ulcer

**PO (Adults):** 1–2 mg 2–3 times daily. An additional 2 mg may be given at bedtime; may be decreased to 1 mg twice daily (not to exceed 8 mg/day).
**IM, IV (Adults):** 100–200 mcg q 4 hr up to 4 times daily.

## Availability (generic available)

**Tablets:** 1 mg, 2 mg. **Injection:** 200 mcg (0.2 mg)/mL.

# NURSING IMPLICATIONS

## Assessment

- Assess heart rate, blood pressure, and respiratory rate before and periodically during parenteral therapy.
- Pedi: Assess for hyperexcitability, a paradoxical response that may occur in children.
- Monitor intake and output ratios in geriatric or surgical patients; glycopyrrolate may cause uri-

nary retention. Instruct patient to void before parenteral administration.
- Assess patient routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate the constipating effects of the drug.
- Periodic intraocular pressure determinations should be made for patients receiving long-term therapy.
- ***Lab Test Considerations:*** Antagonizes effects of pentagastrin and histamine during the gastric acid secretion test. Avoid administration for 24 hr preceding the test.
- May cause ↓ uric acid levels in patients with gout or hyperuricemia.
- ***Toxicity and Overdose:*** If overdosage occurs, neostigmine is the antidote.

### Potential Nursing Diagnoses
Impaired oral mucous membrane (Side Effects)
Constipation (Side Effects)

### Implementation
- Do not administer cloudy or discolored solution.
- **PO:** Administer 30–60 min before meals to maximize absorption.
- Do not administer within 1 hr of antacids or antidiarrheal medications.
- Oral dose is 10 times the parenteral dose.
- **IM:** May be administered undiluted (200 mcg/mL).

**IV Administration**
- **Direct IV:** ***Diluent:*** May be given undiluted through Y-site. ***Concentration:*** 200 mcg/mL. ***Rate:*** Administer at a maximum rate of 20 mcg over 1 min.
- **Syringe Compatibility:** chlorpromazine, cimetidine, codeine, diphenhydramine, droperidol, hydromorphone, hydroxyzine, levorphanol, lidocaine, meperidine, midazolam, morphine, nalbuphine, neostigmine, ondansetron, oxymorphone, prochlorperazine, promethazine, pyridostigmine, ranitidine, triflupromazine.
- **Syringe Incompatibility:** chloramphenicol, dexamethasone, diazepam, dimenhydrinate, methohexital, pentazocine, pentobarbital, secobarbital, sodium bicarbonate, thiopental.
- **Y-Site Compatibility:** propofol.
- **Solution Compatibility:** D5/0.45% NaCl, D5W, 0.9% NaCl, Ringer's solution. Administer immediately after admixing.
- **Additive Incompatibility:** methylprednisolone sodium succinate.

### Patient/Family Teaching
- Instruct patient to take glycopyrrolate exactly as directed and not to take more than the prescribed amount. Take missed doses as soon as remembered if not just before next dose.
- Medication may cause drowsiness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Inform patient that frequent oral rinses, sugarless gum or candy, and good oral hygiene may help relieve dry mouth. Consult health care professional regarding use of saliva substitute if dry mouth persists for more than 2 wk.
- Advise patient to change positions slowly to minimize the effects of drug-induced orthostatic hypotension.
- Caution patient to avoid extremes of temperature. This medication decreases the ability to sweat and may increase the risk of heat stroke.
- Advise patient to notify health care professional immediately if eye pain or increased sensitivity to light occurs. Emphasize the importance of routine eye exams throughout therapy.
- Advise patient to consult health care professional before taking any OTC medications concurrently with this therapy.
- Geri: Advise geriatric patients about increased susceptibility to side effects and to call health care professional immediately if they occur.

### Evaluation/Desired Outcomes
- Mouth dryness preoperatively.
- Reversal of cholinergic medications.
- Decrease in GI motility and pain in patients with peptic ulcer disease.

## **golimumab** (go-**li**-mu-mab)
Simponi

***Classification***
Therapeutic: antirheumatics
Pharmacologic: DMARDs, monoclonal antibodies, anti-TNF agents

**Pregnancy Category B**

### Indications
Treatment of moderately to severely active rheumatoid arthritis (with methotrexate). Treatment of active psoriatic arthritis (alone or with methotrexate). Treatment of active ankylosing spondylitis.

### Action
Inhibits binding of TNF$\alpha$ to receptors inhibiting activity and resulting in anti-iflammatory and antiproliferative activity. **Therapeutic Effects:** De-

creased pain and swelling with decreased joint destruction in patients with rheumatoid arthritis, psoriatic arthritis and ankylosing spondylitis.

### Pharmacokinetics

**Absorption:** Well absorbed following subcutaneous administration.
**Distribution:** Distributed primarily in the circulatory system with limited extravascular distribution.
**Metabolism and Excretion:** Unknown.
**Half-life:** 2 wk.

TIME/ACTION PROFILE (improvement)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | within 3 mo | 2–7 days† | unknown |

† Blood levels

### Contraindications/Precautions

**Contraindicated in:** Active infection; Concurrent use of abatacept or anakinra (↑ risk of infections); Lactation: Avoid during breastfeeding.
**Use Cautiously in:** Past history of latent or active tuberculosis when adequate treatment cannot be confirmed; antitubercular therapy should be considered; Negative test for latent tuberculosis with risk factors for tuberculosis infection; consider treatment with antituberculars; History of CHF (may worsen); History of central nervous system demyelinating disorders (may worsen); History of psoriasis (may exacerbate); Hepatitis B virus carriers (risk of reactivation); Geri: Use cautiously in elderly patients due to ↑ risk of infection; OB: Use during pregnancy only if clearly needed; Pedi: Safety not established; ↑ risk of lymphoma, leukemia, and other malignancies.

### Adverse Reactions/Side Effects

**CNS:** CENTRAL NERVOUS SYSTEM DEMYELINATING DISORDERS. **EENT:** nasopharyngitis. **Resp:** upper respiratory tract infection. **CV:** CONGESTIVE HEART FAILURE, hypertension. **GI:** ↑ liver enzymes. **Derm:** psoriasis. **Hemat:** aplastic anemia, leukopenia, neutropenia, pancytopenia, thrombocytopenia. **Local:** injection site reactions. **Neuro:** paresthesia. **Misc:** INFECTIONS (including reactivation tuberculosis, invasive fungal infections, and hepatitis B virus), ↑ RISK OF LYMPHOMA/MALIGNANCIES, fever.

### Interactions

**Drug-Drug: Abatacept**, **anakinra**, **corticosteroids** or **methotrexate** ↑ risk of serious infections; concurrent use with anakinra or abatacept is not recommended. ↓ antibody response and ↑ risk of adverse reactions with **live virus vaccines**. May normalize previously suppressed levels of CYP450 enzymes, following initiation or discontinuation of golimumab, effects of substrates of this system may be altered and should be monitored, including **warfarin**, **theophylline**, and **cyclosporine**.

### Route/Dosage

**Subcut (Adults):** 50 mg once monthly.

### Availability

**Solution for subcutaneous injection:** 50 mg/0.5 mL in single-dose prefilled syringes and Smartject autoinjectors.

## NURSING IMPLICATIONS

### Assessment

- Assess pain and range of motion before and periodically during therapy.
- Assess for signs and symptoms of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound) prior to, during, and after therapy. Discontinue therapy if serious or opportunistic infection or sepsis occurs. If new infection develops during therapy, assess patient and institute antimicrobial therapy. Patients who tested negative for latent tuberculosis (TB) prior to therapy may develop TB during therapy. Initiate treatment for latent TB prior to initiating therapy.
- Monitor carriers of HBV for signs of reactivation during and for several months after therapy. If reactivation occurs, discontinue golimumab and institute antiviral therapy.
- Monitor patients with CHF for new or worsening symptoms. Discontinue therapy if symptoms occur.
- Assess for exacerbations and new onset psoriasis. Discontinue therapy of these occur.
- Assess patient for latex allergy. Needle cover of syringe contains latex and should not be handled by persons sensitive to latex.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dypsnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist.

Consider stopping golimumab until the infection has been diagnosed and adequately treated.

- ***Lab Test Considerations:*** Monitor liver function tests periodically during therapy. May cause ↑ serum AST and ALT.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue golimumab if symptoms of blood dyscrasias (persistent fever) occur.

## Potential Nursing Diagnoses

Chronic pain (Indications)
Risk for infection (Adverse Reactions)

## Implementation

- Administer a tuberculin skin test prior to administration of golimumab.
- Initial injection should be supervised by health care professional.
- Refrigerate solution; do not freeze. Allow prefilled syringe or auto-injector to sit at room temperature for 30 min prior to injection; do not warm in any other way. Do not shake. Solution is clear to slightly opalescent and colorless to light yellow. Do not administer solutions that are discolored, cloudy, or contain particulate matter. Discard unused solution.
- **Subcut:** Remove the needle cover or autoinjector cap just prior to injection. Inject into front of middle thigh, lower part of abdomen 2 inches from navel, or caregiver may administer into outer area of upper arm. Do not inject in areas where skin is tender, bruised, red, scaly, or hard; avoid scars or stretch marks. Press a cotton ball or gauze over injection site for 10 seconds; do not rub.
- *Autoinjector:* Press open end of autoinjector against skin at 90° angle. Use free hand to pinch and hold skin at injection site. Press button with fingers or thumb; button will stay pressed and does not need to be held. Injection will begin following a loud click. Keep holding the auto injector against skin until a second loud click is heard (usually 3–6 seconds, but may take up to 15 seconds). Lift autoinjector from skin following second click. Yellow indicator in viewing window indicates autoinjector worked correctly. If yellow does not appear in viewing window call 1-800-457-6399 for help.
- *Prefilled syringe:* Hold body of syringe between thumb and index finger. Do not pull back on plunger at any time. Pinch skin. Using a dart-like motion, insert needle into pinched skin at 45° angle. Inject all medication by pushing plunger until plunger head is between needle guard wings. Take needle out of skin and let go of skin. Slowly take thumb off plunger to allow empty syringe to move up until entire needle is covered by needle guard.

## Patient/Family Teaching

- Instruct patient on correct technique for administration. Review patient information sheet, preparation of dose, administration sites and technique, and disposal of equipment into a puncture-resistant container. Advise patient of risks and benefits of golimumab therapy. Inject missed doses as soon as remembered, then return to regular schedule. Instruct patient to read *Medication Guide* before starting therapy and with each Rx refill; new information may be available.
- Caution patient not to share this medication with others, even with the same symptoms; may be harmful.
- Caution patient to notify health care professional if any signs of infection, including TB, invasive fungal infections (fever, malaise, weight loss, sweats, cough, dypsnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock), or reactivation of HBV, develop.
- Advise patient to notify health care professional before taking other Rx, OTC, or herbal products.
- Inform patient to avoid receiving live vaccinations; other vaccinations may be given.
- Advise patient to notify health care professional of pregnancy is planned or suspected or if breastfeeding.

## Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.
- Decreased signs and symptoms, slowed progression of joint destruction, and improved physical function in patients with psoriatic arthritis.
- Reduced signs and symptoms of ankylosing spondylitis.

# **goserelin** (**goe**-se-rel-lin)

Zoladex

***Classification***
Therapeutic: antineoplastics, hormones
Pharmacologic: gonadotropin-releasing hormones

**Pregnancy Category D (breast cancer), X (endometriosis)**

## Indications
Prostate cancer in patients who cannot tolerate orchiectomy or estrogen therapy (palliative). With flutamide and radiation therapy in the treatment of locally confined stage T2b–T4 (stage B2–C) prostate cancer. Advanced breast cancer in peri- and postmenopausal women (palliative). Endometriosis. Produces thinning of the endometrium before endometrial ablation for dysfunctional uterine bleeding.

## Action
Acts as a synthetic form of luteinizing hormone–releasing hormone (LHRH, GnRH). Inhibits the production of gonadotropins by the pituitary gland. Initially, levels of luteinizing hormone (LH), follicle-stimulating hormone (FSH), and testosterone increase. Continued administration leads to decreased production of testosterone and estradiol. **Therapeutic Effects:** Decreased spread of cancer of the prostate or breast. Regression of endometriosis with decreased pain. Thinning of the endometrium.

## Pharmacokinetics
**Absorption:** Well absorbed from subcut implant. Absorption is slower in first 8 days, then is faster and continuous for remainder of 28-day dosing cycle.
**Distribution:** Unknown.
**Metabolism and Excretion:** Some metabolism by the liver (<10%), some excretion by kidneys (>90%, only 20% as unchanged drug).
**Half-life:** 4.2 hr.

TIME/ACTION PROFILE (↓ in serum testosterone levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | unknown | 2–4 wk | length of therapy |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Undiagnosed vaginal bleeding; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Pedi: Safety not established.

## Adverse Reactions/Side Effects
**CNS:** headache, anxiety, depression, dizziness, fatigue, insomnia, weakness. **Resp:** dyspnea. **CV:** CEREBROVASCULAR ACCIDENT, MYOCARDIAL INFARCTION, vasodilation, chest pain, hypertension, palpitations. **GI:** anorexia, constipation, diarrhea, nausea, ulcer, vomiting. **GU:** renal insufficiency, urinary obstruction. **Derm:** sweating, rash. **Endo:** ↓ libido, erectile dysfunction, breast swelling, breast tenderness, infertility, ovarian cysts, ovarian hyperstimulation syndrome (with gonadotropins). **F and E:** peripheral edema. **Hemat:** anemia. **Metab:** gout, hyperglycemia, ↑ lipids. **MS:** ↑ bone pain, arthralgia, ↓ bone density. **Misc:** hot flashes, chills, fever, weight gain.

## Interactions
**Drug-Drug:** None significant.

## Route/Dosage
**Subcut (Adults):** 3.6 mg every 4 wk or 10.8 mg q 12 wk. *Endometrial thinning*—1 or 2 depots given 4 wk apart; if 1 depot used, surgery is performed at 4 wk; if 2 depots used, surgery is performed 2–4 wk after 2nd depot.

## Availability
**Implant:** 3.6 mg, 10.8 mg.

# NURSING IMPLICATIONS

## Assessment
- **Cancer:** Monitor patients with vertebral metastases for increased back pain and decreased sensory/motor function.
- Monitor intake and output ratios and assess for bladder distention in patients with urinary tract obstruction during initiation of therapy.
- **Endometriosis:** Assess patient for signs and symptoms of endometriosis before and periodically during therapy. Amenorrhea usually occurs within 8 wk of initial administration and menses usually resume 8 wk after completion.
- ***Lab Test Considerations:*** Initially ↑, then ↓ LH and FSH. This leads to castration levels of testosterone in men 2–4 wk after initial increase in concentrations.
- Monitor serum acid phosphatase and prostate-specific antigen concentrations periodically during therapy. May cause transient ↑ in serum acid phosphatase concentrations, which usually return to baseline by the 4th wk of therapy and may ↓ to below baseline or return to baseline if elevated before therapy.

- May cause hypercalcemia in patients with breast or prostate cancer with bony metastases.
- May cause an ↑ in serum HDL, LDL, and triglycerides.

### Potential Nursing Diagnoses
Sexual dysfunction (Side Effects)

### Implementation
- **Subcut:** Implant is inserted in upper subcut tissue of upper abdominal wall every 28 days. Local anesthesia may be used before injection.
- If the implant needs to be removed for any reason, it can be located by ultrasound.

### Patient/Family Teaching
- Advise patient that bone pain may increase at initiation of therapy. This will resolve with time. Patient should discuss use of analgesics to control pain with health care professional.
- Advise female patients to notify health care professional if regular menstruation persists.
- Inform diabetic patients of potential for hyperglycemia. Encourage close monitoring of serum glucose.
- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome. Hormone replacement therapy may be added to decrease vasomotor symptoms and vaginal dryness without compromising beneficial effect.
- Instruct patient to notify health care professional promptly if difficulty urinating occurs.
- Advise premenopausal women to notify health care professional if pregnancy is planned or suspected of if breastfeeding. Effective contraception should be used during and for 12 wk after treatment ends.
- Emphasize the importance of adhering to the schedule of monthly or every-3-month administration.

### Evaluation/Desired Outcomes
- Decrease in the spread of prostate cancer.
- Reduction of symptoms of advanced breast cancer in peri- and postmenopausal women.
- Decrease in the signs and symptoms of endometriosis. Symptoms are usually reduced within 4 wk of implantation.
- Thinning of the endometrium before endometrial ablation for dysfunctional uterine bleeding.

## granisetron (oral and IV)
(gra-**nees**-e-tron)
Kytril

## granisetron (transdermal)

Sancuso

***Classification***
Therapeutic: antiemetics
Pharmacologic: 5-$HT_3$ antagonists

**Pregnancy Category B**

### Indications
**PO:** Prevention of nausea and vomiting due to emetogenic chemotherapy or radiation therapy. Prevention and treatment of postoperative nausea and vomiting. **Transdermal:** Prevention of nausea and vomiting due to moderately/highly emetogenic chemotherapy.

### Action
Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following emetogenic chemotherapy, radiation therapy or surgery.

### Pharmacokinetics
**Absorption:** 50% absorbed following oral administration; transdermal enters systemic circulation via passive diffusion through intact skin.
**Distribution:** Distributes into erythrocytes; remainder of distribution is unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver; 12% excreted unchanged in urine.
**Half-life:** *Patients with cancer*—8–9 hr (range 0.9–31.1 hr); *healthy volunteers*—4.9 hr (range 0.9–15.2 hr); *geriatric patients*—7.7 hr (range 2.6–17.7 hr).

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 60 min | 24 hr |
| IV | rapid | 30 min | up to 24 hr |
| TD* | unknown | 48 hr | unknown |

* Blood levels

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Some products contain benzyl alcohol; avoid use in neonates.
**Use Cautiously in:** OB, Lactation: Safety not established; Pedi: Safe use of IV route not established in children <2 yr ; safe use of PO or transdermal route not established in children <18 yr.

### Adverse Reactions/Side Effects
**CNS:** headache, agitation, anxiety, CNS stimulation, drowsiness, weakness. **CV:** hypertension. **GI:** constipation, diarrhea, elevated liver enzymes,

taste disorder. **Derm:** *Topical*—application site reactions, photosensitivity. **Misc:** anaphylactoid reactions, fever.

### Interactions

**Drug-Drug:** ↑ risk of extrapyramidal reactions with other **agents causing extrapyramidal reactions**.

### Route/Dosage

### Prevention of Nausea and Vomiting Due to Emetogenic Chemotherapy

**PO (Adults):** 1 mg twice daily; 1st dose given at least 60 min prior to chemotherapy and 2nd dose 12 hr later only on days when chemotherapy is administered; may also be given as 2 mg once daily at least 60 min prior to chemotherapy.
**IV (Adults and Children 2–16 yr):** 10 mcg/kg within 30 min prior to chemotherapy.
**Transdermal (Adults):** One 34.3 mg patch (delivers 3.1 mg/24 hr) applied up to 48 hr prior to chemotherapy, leave in place for at least 24 hr following chemotherapy, may be left in place for a total of 7 days.

### Prevention of Nausea and Vomiting Associated with Radiation Therapy

**PO (Adults):** 2 mg taken once daily within 1 hr of radiation therapy.

### Prevention and Treatment of Postoperative Nausea and Vomiting

**IV (Adults):** *Prevention*—1 mg prior to induction of anesthesia or just prior to reversal of anesthesia; *Treatment*—1 mg .

### Availability (generic available)

**Tablets:** 1 mg. **Cost:** $131.99/2. **Oral solution (orange flavor):** 2 mg/10 mL in 30-mL bottles. **Solution for injection:** 1 mg/mL. **Transdermal patch:** Each patch contains 34.3 mg/52 $cm^2$ (delivers 3.1 mg/24 hr).

## NURSING IMPLICATIONS

### Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- Assess for extrapyramidal symptoms (involuntary movements, facial grimacing, rigidity, shuffling walk, trembling of hands) during therapy. This occurs rarely and is usually associated with concurrent use of other drugs known to cause this effect.
- **Transdermal:** Monitor application site. If allergic, erythematous, macular, or papular rash or pruritus occurs, remove patch.
- ***Lab Test Considerations:*** May cause ↑ AST and ALT levels.

### Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

### Implementation

- For chemotherapy or radiation, granisetron is administered only on the day(s) chemotherapy or radiation is given. Continued treatment when not on chemotherapy or radiation therapy has not been found to be useful.
- **PO:** Administer 1st dose up to 1 hr before chemotherapy or radiation therapy and 2nd dose 12 hr after the first.
- 2 tsp oral solution are equal to 2 mg granisetron.

#### IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted or diluted in 20–50 mL of 0.9% NaCl or D5W. Solution should be prepared at time of administration but is stable for 24 hr at room temperature. ***Concentration:*** Up to 1 mg/mL. ***Rate:*** Administer undiluted granisetron over 30 sec or as a diluted solution over 5 min.
- **Syringe Compatibility:** dexamethasone, methylprednisolone.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B liposome, ampicillin, ampicillin-sulbactam, amsacrine, atracurium, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertape-

nem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, paclitaxel, pancuronium, pantoprazole, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin-tazobactam, plicamycin, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B colloidal, dantrolene, diazepam, phenytoin.
- **Additive Incompatibility:** Granisetron should not be admixed with other medications.
- **Transdermal:** Apply system clear, dry, intact healthy skin on upper outer arm 24–48 hr before chemotherapy. Do not use creams, lotions, or oils that may keep patch from sticking. Do not apply to skin that is red, irritated, or damaged. Apply immediately after removing from package. Do not cut patch into pieces. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure contact is complete. Patch should be worn throughout chemotherapy. If patch does not stick, bandages or medical adhesive tape may be applied on edges of patch; do not cover patch with tape or bandages or wrap completely around arm. Patient may shower and wash normally while wearing patch; avoid swimming, strenuous exercise, sauna, or whirlpool during patch use. Remove patch gently at least 24 hr after completion of chemotherapy; may be worn for up to 7 days. Fold so that adhesive edges are together. Throw away in garbage out of reach of children and pets on removal. Do not re-use patch. Use soap and water to remove remaining adhesive; do not use alcohol or acetone.

## Patient/Family Teaching

- Instruct patient to take granisetron as directed.
- Advise patient to notify health care professional immediately if involuntary movement of eyes, face, or limbs occurs.
- May cause dizziness and drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional prior to taking any other Rx, OTC, or herbal products.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- **Transdermal:** Instruct patient on correct application, removal, and disposal of patch. Advise patient to read *Patient Information* sheet prior to using and with each Rx refill in case of new information. Inform patient that additional granisetron should not be taken during patch application unless directed by health care professional.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- Advise patient to cover patch application site with clothing to avoid exposure to sunlight, sunlamp, or tanning beds during and for 10 days following removal of patch.
- Instruct patient to notify health care professional if pain or swelling in the abdomen occurs or if redness at patch removal site remains for more than 3 days.

## Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy or radiation therapy.
- Prevention and treatment of postoperative nausea and vomiting.

# GROWTH HORMONES

**somatropin (recombinant)**
(soe-ma-**troe**-pin)
Genotropin, Humatrope, Nordiflex, Norditropin, Nutropin, Nutropin AQ, Omnitrope, Saizen, Serostim, Serostim LQ, Tev-Tropin, Zorbtive

***Classification***
Therapeutic: hormones
Pharmacologic: growth hormones

**Pregnancy Category B (Omnitrope, Serostim, and Zorbtive), C (all others)**

## Indications
Growth failure in children due to chronic renal insufficiency. Growth failure in children due to deficiency of growth hormone. Short stature associated with Turner's syndrome. Short stature associated with or Noonan's syndrome (Norditropin only). Children with short stature born small for gestational age with no catch-up growth by age 2–4 yr (Norditropin only). Growth hormone deficiency in adults (Humatrope, Nutropin, Norditropin, Omnitrope). Idiopathic short stature syndrome (Genotropin, Humatrope, Nutropin, Nutropin AQ). AIDS wasting or cachexia (Serostim only). Increases spinal bone density in childhood–onset growth hormone–deficient patients (somatropin). As part of a comprehensive treatment program for Short Bowel Syndrome (Zorbtive).

## Action
Produce growth (skeletal and cellular). Metabolic actions include: Increased protein synthesis, Increased carbohydrate metabolism, Lipid mobilization, Retention of sodium, phosphorus, and potassium. Somatropin has the same amino acid sequence as naturally occurring growth hormone; somatrem has 1 additional amino acid. Both are produced by recombinant DNA techniques. Growth hormone enhances GI tract mucosal transport of water, electrolytes, and nutrients.
**Therapeutic Effects:** Increased skeletal growth in children with growth hormone deficiency. Replacement of somatropin in deficient adults. Decreased wasting in patients with AIDS. Increased bone density in adult growth hormone–deficient patients. Enhanced GI absorption of water, electrolytes and nutrients in short bowel syndrome.

## Pharmacokinetics
**Absorption:** Well absorbed.
**Distribution:** Localize to highly perfused organs (liver, kidneys).
**Metabolism and Excretion:** Broken down in renal cells to amino acids that are recirculated; some liver metabolism.
**Half-life:** *Subcut*—3.8 hr; *IM*—4.9 hr.

TIME/ACTION PROFILE (growth)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM, subcut | within 3 mo | unknown | 12–48 hr |

## Contraindications/Precautions
**Contraindicated in:** Closure of epiphyses; Active neoplasia; Hypersensitivity to growth hormone, *m*-cresol or glycerin (somatropin) or benzyl alcohol (Zorbtive); Acute critical illness (therapy should not be initiated) or respiratory failure; Diabetic retinopathy; Prader-Willi syndrome with obesity and respiratory impairment (risk of fatal complications; can be used only if growth hormone deficiency is documented); OB: Use only if clearly needed.
**Use Cautiously in:** Growth hormone deficiency due to intracranial lesion; Coexisting adrenocorticotropic hormone (ACTH) deficiency; Diabetes (may cause insulin resistance); Thyroid dysfunction; Lactation: Safety not established; Geri: ↑ sensitivity, ↑ risk of adverse reactions; use lower starting dose and smaller dose increments.

## Adverse Reactions/Side Effects
**CV:** edema of the hands and feet. **Endo:** hyperglycemia, hypothyroidism, insulin resistance. **Local:** pain at injection site. **MS:** arthralgia; *Serostim only*, carpal tunnel syndrome, musculoskeletal pain.

## Interactions
**Drug-Drug:** Excessive **corticosteroid** use (equivalent to 10–15 mg/m²/day) may ↓ response to somatropin.

## Route/Dosage

### Somatrem (Protropin)
**IM, Subcut (Children):** Up to 0.3 mg (0.9 unit)/kg weekly; subcut route is preferred.

### Somatropin (Genotropin)
**Subcut (Children):** 0.16–0.48 mg/kg/wk divided in 6–7 daily doses.
**Subcut (Adults):** 0.04–0.8 mg/kg/wk divided in 6–7 daily doses.

### Somatropin (Humatrope)

**Subcut (Adults):** 0.018 unit/kg/day (up to 0.0375 unit/kg/day).
**IM, Subcut (Children):** 0.18 mg/kg (0.54 unit/kg)/wk given in divided doses on 3 alternating days or 6 times weekly (up to 0.3 mg/kg or 0.9 unit/kg/wk).

### Somatropin (Nutropin/Nutropin AQ)

**Subcut (Children):** *Growth hormone inadequacy*—0.3 mg/kg. *Chronic renal insufficiency*—0.35 mg/kg (1.05 units/kg)/wk given as daily injections. *Turner's syndrome*—≤0.375 mg/kg (1.125 units/kg)/wk in 3–7 divided doses.
**Subcut (Adults):** <0.006 mg/kg daily; may be ↑ to 0.025 mg/kg/day in patients <35 yrs or 0.0125 mg/kg in patients >35 yrs.

### Somatropin (Norditropin)

**Subcut (Adults):** 0.004 mg/kg/day, may be increased to 0.016 mg/kg/day after 6 wk or 0.2 mg/day starting dose (without consideration of body weight) then gradually increase by 0.1–0.2 mg/day q 1–2 months until clinical response achieved.
**Subcut (Children):** *Growth hormone inadequacy*—0.024–0.034 mg/kg 6–7 times weekly; *Short stature associated with Noonan's syndrome*—Up to 0.066 mg/kg/day; *Short stature associated with Turner's syndrome or short stature born small for gestational age*-Up to 0.067 mg/kg/day.

### Somatropin (Omnitrope)

**Subcut (Adults):** 0.04 mg/kg/wk given in 7 divided doses; may be ↑ at 4–8 wk intervals (up to 0.08 mg/kg/wk).
**Subcut (Children):** 0.16–0.24 mg/kg/wk given in 6–7 divided doses.

### Somatropin (Saizen)

**Subcut, IM (Children):** 0.06 mg (0.18 unit/kg) 3 times weekly.

### Somatropin (Serostim)

**Subcut (Adults):** *>55 kg*—6 mg once daily; *45–55 kg*—5 mg once daily; *35–45 kg*—4 mg once daily; *<35 kg*—0.1 mg/kg once daily.

### Somatropin (Tev-Tropin)

**Subcut (Children):** up to 0.1 mg/kg 3 times weekly.

### Somatropin (Zorbtive)

**Subcut (Adults):** 0.1 mg/kg/day for 4 wk (not to exceed 8 mg/dose), dose may be stopped for 5 days and resumed at half dose for fluid retention or arthalgias.

### Availability

#### Genotropin
**Powder for injection:** 1.5-mg intra-mix cartridge (delivers 1.3 mg), 5.8-mg intra-mix cartridge (delivers 5 mg), 5.8-mg intra-mix cartridge (delivers 5 mg) as Pen 5 system, 13.8-mg intra-mix cartridge (delivers 12 mg), 13.8-mg intra-mix cartridge (delivers 12 mg) as Pen 12 system, MiniQuick system 0.2 mg, MiniQuick system 0.4 mg, MiniQuick system 0.6 mg, MiniQuick system 0.8 mg, MiniQuick system 1 mg, MiniQuick system 1.4 mg, MiniQuick system 1.6 mg, MiniQuick system 1.8 mg, MiniQuick system 2 mg.

#### Humatrope
**Powder for injection:** 5-mg/vial.

#### Norditropin
**Cartridges for injection (using Nordipen):** 5 mg/1.5 mL (orange), 15 mg/1.5 mL (green).
**Prefilled pens for injection (Nordiflex):** 5 mg/1.5 mL (orange), 10 mg/1.5 mL (blue), 15 mg/1.5 mL (green).

#### Nutropin
**Powder for injection:** 5-mg (13 units)/vial, 10-mg (26 units)/vial.

#### Nutropin AQ
**Solution for injection (AQ):** 5 mg (15 units)/mL in 2-mL vial.

#### Omnitrope
**Powder for injection:** 1.5 mg/vial, 5.8 mg/vial.
**Cartridges for injection (using Omnitrope Pen 5 or 10):** 5 mg/1.5 mL, 10 mg/1.5 mL.

#### Saizen
**Powder for injection:** 5-mg (15 units)/vial, 8.8-mg (26.4 units)/vial.

#### Serostim
**Powder for injection:** 6-mg (15 units)/vial.
**Liquid for injection:** 6–mg/0.5 mL cartridge.

#### Tev-Tropin
**Powder for injection:** 5-mg (15 units)/vial.

#### Zorbtive
**Powder for injection:** 4-, 5- or 6-mg vials, 8.8-mg multidose vials.

## NURSING IMPLICATIONS

### Assessment

- Assess for fluid retention (edema, arthralgia, carpal tunnel syndrome) especially in adults. May occur frequently; reduce dose as necessary.

- **Growth Failure:** Monitor bone age annually and growth rate determinations, height, and weight every 3–6 mo during therapy.
- **AIDS Wasting/Cachexia:** Re-evaluate treatment in patients who continue to lose weight in first 2 wk of treatment.
- ***Lab Test Considerations:*** Monitoring serum insulin-like growth factor I (IGF-I) levels may be useful during dose titration.
- Monitor thyroid function prior to and during therapy. May ↓ $T^4$, radioactive iodine uptake, and thyroxine-binding capacity. Hypothyroidism necessitates concurrent thyroid replacement for growth hormone to be effective. Serum inorganic phosphorus, alkaline phosphatase, and parathyroid hormone may ↑ with somatropin therapy.
- Monitor blood glucose periodically during therapy. Diabetic patients may require ↑ insulin dose.
- Monitor for development of neutralizing antibodies if growth rate does not exceed 2.5 cm/6 mo.
- Monitor alkaline phosphatase closely in patients with adult growth hormone deficiency.

## Potential Nursing Diagnoses

Disturbed body image (Indications)

## Implementation

- Rotate injection sites with each injection.
- **Somatropin:** Reconstitute 5-mg vial with 1.5–5 mL of sterile water for injection provided by manufacturer (contains preservative *m*-cresol), aiming the liquid against glass vial wall. Do not shake; swirl gently to dissolve. Solution is clear; do not use solutions that are cloudy or contain a precipitate. Stable for 14 days when refrigerated; do not freeze.
- *Genotropin intra-mix:* Dissolve powder with solution provided with 2-chamber cartridge as directed. Gently tip cartridge upside down a few times until contents are completely dissolved. The 1.5-mg cartridge is stable following dilution for 24 hr if refrigerated. The 5.8-mg and 13.8-mg cartridges contain preservatives and are stable for 14 days if refrigerated.
- *Genotropin Pen:* Prepare and administer as directed in patient instruction insert. Store in the refrigerator.
- *Genotropin MiniQuick:* For single use only. Inject immediately after reconstitution; may be refrigerated for 24 hr after reconstitution. Follow directions on patient package insert for reconstitution and administration.
- *Humatrope:* Reconstitute each 5-mg vial with 1.5–5 mL of diluent provided. Stable for 14 days if refrigerated.
- *Norditropin:* Reconstitute each 4-mg or 8-mg vial with 2 mL of diluent. Use reconstituted vials within 14 days. If using cartridges for the *Nordipen*, each cartridge has a corresponding color-coded pen which is graduated to deliver the appropriate dose based on the concentration of norditropin in the cartridge. Color coding of cartridge and pen must match. *Nordiflex* prefilled pens contain multiple doses. After initial injection, use within 4 weeks if stored in refrigerator or within 3 weeks if stored at room temperature.
- *Nutropin/Nutropin AQ:* Reconstitute 5-mg vial with 1–5 mL and 10-mg vial with 1–10 mL of bacteriostatic water for injection. Reconstituted vials are stable for 14 days (Nutropin) or 28 days (Nutropin AQ) if refrigerated.
- *Omnitrope Pen:* Insert cartridge into corresponding *Omnitrope Pen 5 delivery system*. Follow instructions in booklet provided by manufacturer. Solution is light sensitive; store in carton in refrigerator for up to 21 days.
- *Omnitrope vials:* Reconstitute with provided Sterile Water for Injection diluent. Do not shake. Do not administer solutions that are cloudy or contain a precipitate. 1.5 mg vial may be stored in refrigerator for 24 hr after reconstitution. 5.8 mg vial may be stored in carton in refrigerator up to 3 wk.
- *Saizen:* Reconstitute each 5-mg vial with 1–3 mL of bacteriostatic water for injection. Reconstituted vials are stable for 14 days if refrigerated. To use cool.click needle-free injector, wind the device to energize the spring, and draw medication into the Crystal Check nozzle. Using firm pressure at the injection site, hold the injector at a 90° angle and press the blue actuator button.
- *Serostim:* Reconstitute each vial with 1 mL of sterile water for injection. Use within 24 hr of reconstitution.
- *Tev-tropin:* Reconstitute with 1–5 mL or 0.9% NaCl. May be cloudy if refrigerated. Allow to warm to room temperature. If remains solution cloudy or contains particulate matter, do not use.
- *Zorbtive:* Reconstitute each 4-, 5-, or 6-mg vial with 0.5–1 mL of sterile water for injection and

each 8.8-mg vial with 1 or 2 mL bacteriostatic water for injection. Solution should be clear upon reconstitution. Do not administer if cloudy upon reconstitution (4-, 5-, or 6-mg vials) or after refrigeration (8.8-mg vial). After refrigeration may contain small particles which should disappear when allowed to warm to room temperature. Solution reconstituted with bacteriostatic water is stable for 14 days if refrigerated.

- **Subcut:** Injection volume for *somatropin* should not exceed 1 mL.

### Patient/Family Teaching

- Instruct patient and parents on correct procedure for reconstituting medication, site selection, technique for IM or subcut injection, and disposal of needles and syringes. Review dose schedule. Parents should report persistent pain or edema at injection site.
- Explain rationale for prohibition of use for increasing athletic performance. Administration to persons without growth hormone deficiency or after epiphyseal closure may result in acromegaly (coarsening of facial features; enlarged hands, feet, and internal organs; increased blood glucose; hypertension).
- Emphasize need for regular follow-up with endocrinologist to ensure appropriate growth rate, to evaluate lab work, and to determine bone age by x-ray exam.
- Assure parents and child that these dose forms are synthetic and therefore not capable of transmitting Creutzfeldt-Jakob disease, as was the original somatropin, which was extracted from human cadavers.

### Evaluation/Desired Outcomes

- Child's attainment of adult height in growth failure secondary to pituitary growth hormone deficiency. Therapy is limited to period before closure of epiphyseal plates (approximately up to 14–15 yr in girls, 15–16 yr in boys). Failure to increase growth rate, particularly during the first year of therapy, indicates the need for close assessment of compliance and evaluation for other causes of growth failure (hypothyroidism, undernutrition, advanced bone age, antibodies to recombinant human GH ).
- Replacement of somatropin in deficient adults.
- Decreased wasting in patients with AIDS.
- Enhanced GI absorption of water, electrolytes and nutrients in short bowel syndrome.

## guaifenesin (gwye-**fen**-e-sin)

Alfen Jr, Altarussin, Benylin-E, Breonesin, Calmylin Expectorant, Diabetic Tussin, Ganidin NR, Guiatuss, Hytuss, Hytuss-2X, Mucinex, Naldecon Senior EX, Organidin NR, Resyl, Robitussin, Scot-tussin Expectorant, Siltussin SA, Siltussin DAS

***Classification***

Therapeutic: allergy, cold, and cough remedies, expectorant

**Pregnancy Category C**

### Indications

Coughs associated with viral upper respiratory tract infections.

### Action

Reduces viscosity of tenacious secretions by increasing respiratory tract fluid. **Therapeutic Effects:** Mobilization and subsequent expectoration of mucus.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Renally excreted as metabolites.
**Half-life:** Unknown.

TIME/ACTION PROFILE (expectorant action)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | unknown | 4–6 hr |
| PO-ER | unknown | unknown | 12 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Some products contain alcohol; avoid in patients with known intolerance; Some products contain aspartame and should be avoided in patients with phenylketonuria.
**Use Cautiously in:** Cough lasting >1 wk or accompanied by fever, rash, or headache; Patients receiving disulfiram (liquid products may contain alcohol); Diabetic patients (some products may contain sugar); OB: Although safety has not been established, guaifenesin has been used without adverse effects; Pedi: OTC cough and cold products containing this medication should be avoided in children <4 yr .

### Adverse Reactions/Side Effects

**CNS:** dizziness, headache. **GI:** nausea, diarrhea, stomach pain, vomiting. **Derm:** rashes, urticaria.

### Interactions

**Drug-Drug:** None significant.

### Route/Dosage

**PO (Adults):** 200–400 mg q 4 hr or 600–1200 mg q 12 hr as extended-release product (not to exceed 2400 mg/day).
**PO (Children 6–12 yr):** 100–200 mg q 4 hr or 600 mg q 12 hr as extended-release product (not to exceed 1200 mg/day).
**PO (Children 4–6 yr):** 50–100 mg q 4 hr (not to exceed 600 mg/day).

### Availability (generic available)

**Syrup:** 100 mg/5 mL[OTC]. **Oral solution:** 100 mg/5 mL[Rx, OTC], 200 mg/5 mL[OTC]. **Capsules:** 200 mg[OTC]. **Tablets:** 100 mg[OTC], 200 mg[Rx, OTC], 1200 mg. **Extended-release tablets (Mucinex):** 600 mg, 1200 mg. ***In combination with:*** analgesics/antipyretics, antihistamines, decongestants, and cough suppressants[Rx, OTC].

## NURSING IMPLICATIONS

### Assessment

- Assess lung sounds, frequency and type of cough, and character of bronchial secretions periodically during therapy. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.

### Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

### Implementation

- **PO:** Administer each dose of guaifenesin followed by a full glass of water to decrease viscosity of secretions.
- Extended-release tablets should be swallowed whole; do not open, break, crush, or chew.

### Patient/Family Teaching

- Instruct patient to cough effectively. Patient should sit upright and take several deep breaths before attempting to cough.
- Caution parents to avoid OTC cough and cold products while breastfeeding or to children <4 yrs.
- Inform patient that drug may occasionally cause dizziness. Avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to limit talking, stop smoking, maintain moisture in environmental air, and take some sugarless gum or hard candy to help alleviate the discomfort caused by a chronic nonproductive cough.
- Instruct patient to contact health care professional if cough persists longer than 1 wk or is accompanied by fever, rash, or persistent headache or sore throat.

### Evaluation/Desired Outcomes

- Easier mobilization and expectoration of mucus from cough associated with upper respiratory infection.

**halcinonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

**halobetasol, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

## haloperidol (ha-loe-**per**-i-dole)

Apo-Haloperidol, Haldol, Haldol Decanoate, Haldol LA, Novo-Peridol, Peridol, PMS Haloperidol

***Classification***

Therapeutic: antipsychotics
Pharmacologic: butyrophenones

**Pregnancy Category C**

### Indications

Acute and chronic psychotic disorders including: schizophrenia, manic states, drug-induced psychoses. Schizophrenic patients who require long-term parenteral (IM) antipsychotic therapy. Also useful in managing aggressive or agitated patients. Tourette's syndrome. Severe behavioral problems in children which may be accompanied by: unprovoked, combative, explosive hyperexcitability, hyperactivity accompanied by conduct disorders (short-term use when other modalities have failed). Considered second-line treatment after failure with atypical antipsychotic. **Unlabeled Use:** Nausea and vomiting from surgery or chemotherapy.

### Action

Alters the effects of dopamine in the CNS. Also has anticholinergic and alpha-adrenergic blocking activity. **Therapeutic Effects:** Diminished signs and symptoms of psychoses. Improved behavior in children with Tourette's syndrome or other behavioral problems.

### Pharmacokinetics

**Absorption:** Well absorbed following PO/IM administration. Decanoate salt is slowly absorbed and has a long duration of action.
**Distribution:** Concentrates in liver. Crosses placenta; enters breast milk.
**Protein Binding:** 90%.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 21–24 hr.

TIME/ACTION PROFILE (antipsychotic activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 2 hr | 2–6 hr | 8–12 hr |
| IM | 20–30 min | 30–45 min | 4–8 hr† |
| IM (decanoate) | 3–9 days | unknown | 1 mo |

†Effect may persist for several days

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Angle-closure glaucoma; Bone marrow depression; CNS depression; Severe liver or cardiovascular disease (QT interval prolonging conditions); Some products contain tartrazine, sesame oil, or benzyl alcohol and should be avoided in patients with known intolerance or hypersensitivity.
**Use Cautiously in:** Debilitated patients (dose ↓ required); Cardiac disease; Diabetes; Respiratory insufficiency; Prostatic hyperplasia; CNS tumors; Intestinal obstruction; Seizures; OB: Safety not established; Lactation: Discontinue drug or bottle-feed; Geri: Dose ↓ required due to ↑ sensitivity; ↑ risk of mortality in elderly patients treated for dementia-related psychosis.

### Adverse Reactions/Side Effects

**CNS:** SEIZURES, extrapyramidal reactions, confusion, drowsiness, restlessness, tardive dyskinesia. **EENT:** blurred vision, dry eyes. **Resp:** respiratory depression. **CV:** hypotension, tachycardia. **GI:** constipation, dry mouth, anorexia, drug-induced hepatitis, ileus, weight gain. **GU:** impotence, urinary retention. **Derm:** diaphoresis, photosensitivity, rashes. **Endo:** amenorrhea, galactorrhea, gynecomastia. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia, neutropenia. **Metab:** hyperpyrexia. **Misc:** NEUROLEPTIC MALIGNANT SYNDROME, hypersensitivity reactions.

### Interactions

**Drug-Drug:** ↑ hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. ↑ anticholinergic effects with **drugs having anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **phenothiazines**, **quinidine**, and **disopyramide**. ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Concurrent use with **epinephrine** may result in severe hypotension and tachycardia. May ↓ therapeutic effects of **levodopa**. Acute encephalopathic syndrome may occur when used with **lithium**. Dementia may occur with **methyldopa**.

**Drug-Natural Products: Kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

### Route/Dosage

#### Haloperidol

**PO (Adults):** 0.5–5 mg 2–3 times daily. Patients with severe symptoms may require up to 100 mg/day.
**PO (Geriatric Patients or Debilitated Patients):** 0.5–2 mg twice daily initially; may be gradually ↑ as needed.
**PO (Children 3–12 yr or 15–40 kg):** 50 mcg/kg/day in 2–3 divided doses; may ↑ by 500 mcg (0.5 mg)/day q 5–7 days as needed (up to 75 mcg/kg/day for nonpsychotic disorders or Tourette's syndrome or 150 mcg/kg/day for psychoses).
**IM (Adults):** 2–5 mg q 1–8 hr (not to exceed 100 mg/day).
**IV (Adults):** 0.5–5 mg, may be repeated q 30 min (unlabeled).

#### Haloperidol Decanoate

**IM (Adults):** 10–15 times the previous daily PO dose but not to exceed 100 mg initially, given monthly (not to exceed 300 mg/mo).

### Availability (generic available)

**Tablets:** 0.5 mg, 1 mg, 2 mg, 5 mg, 10 mg, 20 mg. **Oral concentrate:** 2 mg/mL. **Haloperidol injection:** 5 mg/mL. **Haloperidol decanoate injection:** 50 mg/mL, 100 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess positive (hallucination, delusions) and negative (social isolation) symptoms of schizophrenia.
- Monitor blood pressure (sitting, standing, lying) and pulse prior to and frequently during the period of dose adjustment. May cause QT interval changes on ECG.
- Observe patient carefully when administering medication, to ensure that medication is actually taken and not hoarded.
- Monitor intake and output ratios and daily weight. Assess patient for signs and symptoms of dehydration (decreased thirst, lethargy, hemoconcentration), especially in geriatric patients.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet help minimize constipating effects.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving), which may appear within 6 hr of 1st dose and may be difficult to distinguish from psychotic agitation. Benztropine may be used to differentiate agitation from akathisia. Observe closely for extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs). Trihexyphenidyl or Benzotropine may be used to control these symptoms. Benzodiazepines may alleviate akathisia.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or wormlike movements of tongue, excessive eye blinking). Report immediately; may be irreversible.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report symptoms immediately. May also cause leukocytosis, elevated liver function tests, elevated CPK.
- ***Lab Test Considerations:*** Monitor CBC with differential and liver function tests periodically during therapy.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

### Potential Nursing Diagnoses

Disturbed thought process (Indications)
Disturbed sensory perception (specify: visual, auditory, kinesthetic, gustatory, tactile, olfactory) (Indications)

### Implementation

- Avoid skin contact with oral solution; may cause contact dermatitis.
- **PO:** Administer with food or full glass of water or milk to minimize GI irritation.
- Use calibrated measuring device for accurate dosage. Do not dilute concentrate with coffee or tea; may cause precipitation. May be given undiluted or mixed with water or juice.
- **IM:** Inject slowly, using 2-in., 21-gauge needle into well-developed muscle via Z-track technique. Do not exceed 3 mL per injection site.

Slight yellow color does not indicate altered potency. Keep patient recumbent for at least 30 min following injection to minimize hypotensive effects.

### IV Administration

- **IV:** Haloperidol decanoate should not be administered IV.
- **Direct IV:** ***Diluent:*** May be administered undiluted for rapid control of acute psychosis or delirium. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer at a rate of 5 mg/min.
- **Intermittent Infusion:** ***Diluent:*** May be diluted in 30–50 mL of D5W. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** amifostine, amphotericin B liposome, amsacrine, bivalirudin, carboplatin, caspofungin, cisatracurium, cisplatin, cladribine, cyclophospamide, cytarabine, dactinomycin, daptomycin, dexmedetomidine, diltiazem, docetaxel, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, epirubicin, ertapenem, etoposide, etoposide phosphate, fenoldopam, filgrastim, fludarabine, gemcitabine, granisetron, hetastarch, hydromorphone, ifosfamide, levofloxacin, linezolid, lorazepam, mechlorethamine, melphalan, methadone, metronidazole, milrinone, mitoxantrone, nesiritide, octreotided, oxaliplatin, paclitaxel, palonosetron, pemetrexed, propofol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, trastuzumab, vecuronium, vincristine, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B cholesteryl, amphotericin B colloidal, ampicillin, ampicillin/sulbactam, azathioprine, bumetanide, calcium chloride, cefazolin, cefepime, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone sodium phosphate, diazepam, diazoxide, epoetin alfa, fluorouracil, folic acid, foscarnet, furosemide, ganciclovir, heparin, hydralazine, hydrocortisone, imipenem/cilastatin, indomethacin, ketorolac, magnesium sulfate, methylprednisolone sodium succinate, nafcillin, oxacillin, pantoprazole, penicillin G potassium, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium chloride, sargramostim, sodium bicarbonate, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole.

### Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered, with remaining doses evenly spaced throughout the day. May require several weeks to obtain desired effects. Do not increase dose or discontinue medication without consulting health care professional. Abrupt withdrawal may cause dizziness; nausea; vomiting; GI upset; trembling; or uncontrolled movements of mouth, tongue, or jaw.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Caution patient to report symptoms immediately.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes of temperature should also be avoided, because this drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional promptly if weakness, tremors, visual disturbances, dark-colored urine or clay-colored stools, sore throat, fever, menstrual abnormalities, galactorrhea or sexual dysfunction occur.
- Emphasize the importance of routine follow-up exams to monitor response to medication and detect side effects.

### Evaluation/Desired Outcomes

- Decrease in hallucinations, insomnia, agitation, hostility, and delusions.
- Decreased tics and vocalization in Tourette's syndrome.
- Improved behavior in children with severe behavioral problems. If no therapeutic effects are seen in 2–4 wk, dosage may be increased.

HIGH ALERT

## heparin (hep-a-rin)

Calcilean, Calciparine, Hepalean, Heparin Leo, Hep-Lock, Hep-Lock U/P

***Classification***

Therapeutic: anticoagulants
Pharmacologic: antithrombotics

**Pregnancy Category C**

### Indications

Prophylaxis and treatment of various thromboembolic disorders including: Venous thromboembolism, Pulmonary emboli, Atrial fibrillation with embolization, Acute and chronic consumptive coagulopathies, Peripheral arterial thromboembolism. Used in very low doses (10–100 units) to maintain patency of IV catheters (heparin flush).

### Action

Potentiates the inhibitory effect of antithrombin on factor Xa and thrombin. In low doses, prevents the conversion of prothrombin to thrombin by its effects on factor Xa. Higher doses neutralize thrombin, preventing the conversion of fibrinogen to fibrin. **Therapeutic Effects:** Prevention of thrombus formation. Prevention of extension of existing thrombi (full dose).

### Pharmacokinetics

**Absorption:** Erratically absorbed following subcut or IM administration.
**Distribution:** Does not cross the placenta or enter breast milk.
**Protein Binding:** Very high (to low-density lipoproteins, globulins, and fibrinogen).
**Metabolism and Excretion:** Probably removed by the reticuloendothelial system (lymph nodes, spleen).
**Half-life:** 1–2 hr (↑ with increasing dose); affected by obesity, renal and hepatic function, malignancy, presence of pulmonary embolism, and infections.

TIME/ACTION PROFILE (anticoagulant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Heparin subcut | 20–60 min | 2 hr | 8–12 hr |
| Heparin IV | immediate | 5–10 min | 2–6 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Uncontrolled bleeding; Severe thrombocytopenia; Open wounds (full dose); Avoid use of products containing benzyl alcohol in premature infants.

**Use Cautiously in:** Severe liver or kidney disease; Retinopathy (hypertensive or diabetic); Untreated hypertension; Ulcer disease; Spinal cord or brain injury; History of congenital or acquired bleeding disorder; Malignancy; OB: May be used during pregnancy, but use with caution during the last trimester and in the immediate postpartum period; Geri: Women >60 yr have ↑ risk of bleeding.
**Exercise Extreme Caution in:** Severe uncontrolled hypertension; Bacterial endocarditis, bleeding disorders; GI bleeding/ulceration/pathology; Hemorrhagic stroke; Recent CNS or ophthalmologic surgery; Active GI bleeding/ulceration; History of thrombocytopenia related to heparin.

### Adverse Reactions/Side Effects

**GI:** drug-induced hepatitis. **Derm:** alopecia (long-term use), rashes, urticaria. **Hemat:** BLEEDING, anemia, thrombocytopenia (can occur up to several weeks after discontinuation of therapy). **Local:** pain at injection site. **MS:** osteoporosis (long-term use). **Misc:** fever, hypersensitivity.

### Interactions

Heparin is frequently used concurrently or sequentially with other agents affecting coagulation. The risk of potentially serious interactions is greatest with full anticoagulation.

**Drug-Drug:** Risk of bleeding may be ↑ by concurrent use of **drugs that affect platelet function**, including **aspirin**, **NSAIDs**, **clopidogrel**, **dipyridamole**, some **penicillins**, **ticlopidine**, **abciximab**, **eptifibitide**, **tirofiban**, and **dextran**. Risk of bleeding may be ↑ by concurrent use of **drugs that cause hypoprothrombinemia**, including **quinidine**, **cefoperazone**, **cefotetan**, and **valproic acid**. Concurrent use of **thrombolytics** ↑ risk of bleeding. Heparins affect the prothrombin time used in assessing the response to **warfarin**. **Digoxin**, **tetracyclines**, **nicotine**, and **antihistamines** may ↓ anticoagulant effect of heparin. **Streptokinase** may be followed by relative resistance to heparin.
**Drug-Natural Products:** ↑ risk of bleeding with **arnica**, **anise**, **chamomile**, **clove**, **dong quai**, **fever few**, **garlic**, **ginger**, and **Panax ginseng**.

### Route/Dosage

#### Therapeutic Anticoagulation

**IV (Adults):** *Intermittent bolus*—10,000 units, followed by 5000–10,000 units q 4–6 hr. *Continuous infusion*—5000 units (35–70 units/

kg), followed by 20,000–40,000 units infused over 24 hr (approx. 1000 units/hr or 15–18 units/kg/hr).
**IV (Children > 1 yr):** *Intermittent bolus*—50–100 units/kg, followed by 50–100 units/kg q 4 hr. *Continuous infusion*—Loading dose 75 units/kg, followed by 20 units/kg/hr, adjust to maintain aPTT of 60–85 sec.
**IV (Neonates and Infants < 1 yr):** *Continuous infusion*—Loading dose 75 units/kg, followed by 28 units/kg/hr, adjust to maintain aPTT of 60–85 sec.
**Subcut (Adults):** 5000 units IV, followed by initial subcut dose of 10,000–20,000 units, then 8000–10,000 units q 8 hr or 15,000–20,000 units q 12 hr.

### Prophylaxis of Thromboembolism

**Subcut (Adults):** 5000 units q 8–12 hr (may be started 2 hr prior to surgery).

### Cardiovascular Surgery

**IV (Adults):** At least 150 units/kg (300 units/kg if procedure <60 min; 400 units/kg if >60 min).
**Intraarterial (Neonates, Infants, and Children):** 100–150 units/kg via an artery prior to cardiac catheterization.

### Line Flushing

**IV (Adults and Children):** 10–100 units/mL (10 units/mL for infants <10 kg, 100 units/mL for all others) solution to fill heparin lock set to needle hub; replace after each use.

### Total Parenteral Nutrition

**IV (Adults and Children):** 05–1 units/mL (final solution concentration) to maintain line patency.

### Arterial Line Patency

**Intraarterial (Neonates):** 0.5–2 units/mL.

### Availability (generic available)

### Heparin Sodium

**Solution for injection:** 10 units/mL, 100 units/mL, 1000 units/mL, 5000 units/mL, 7500 units/mL, 10,000 units/mL, 20,000 units/mL, 40,000 units/mL. **Premixed solution:** 1000 units/500 mL, 2000 units/1000 mL, 12,500 units/250 mL, 25,000 units in 250 and 500 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or blood pressure; guaiac-positive stools). Notify health care professional if these occur.
- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement.
- Monitor patient for hypersensitivity reactions (chills, fever, urticaria).
- **Subcut:** Observe injection sites for hematomas, ecchymosis, or inflammation.
- ***Lab Test Considerations:*** Monitor activated partial thromboplastin time (aPTT) and hematocrit prior to and periodically during therapy. When *intermittent IV* therapy is used, draw aPTT levels 30 min before each dose during initial therapy and then periodically. During *continuous* administration, monitor aPTT levels every 4 hr during early therapy. For *Subcut* therapy, draw blood 4–6 hr after injection.
- Monitor platelet count every 2–3 days throughout therapy. May cause mild thrombocytopenia, which appears on 4th day and resolves despite continued heparin therapy. Heparin-induced thrombocytopenia (HIT), a more severe form which necessitates discontinuing medication, may develop on 8th day of therapy; may reduce platelet count to as low as 5000/$mm^3$ and lead to increased resistance to heparin therapy. HIT may progress to development of venous and arterial thrombosis (HITT) and may occur up to several wk after discontinuation. Patients who have received a previous course of heparin may be at higher risk for severe thrombocytopenia for several months after the initial course.
- May cause hyperkalemia and ↑ AST and ALT levels.
- ***Toxicity and Overdose:*** Protamine sulfate is the antidote. Due to short half-life, overdose can often be treated by withdrawing the drug.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Side Effects)

### Implementation

- ***High Alert:*** Fatal hemorrhages have occurred in pediatric patients due to errors in which heparin sodium injection vials were confused with heparin flush vials. Carefully examine all heparin sodium injection vials to confirm the correct vial choice prior to administration. Have second practitioner independently check original order, dose calculation, and infusion

pump settings. Unintended concomitant use of two heparin products (unfractionated heparin and LMW heparins) has resulted in serious harm or death. Review patients' recent (emergency department, operating room) and current medication administration records before administering any heparin or LMW heparin product. Do not confuse heparin with Hespan (hetastarch in sodium chloride). Do not confuse vials of heparin with vials of insulin.

- Inform all personnel caring for patient of anticoagulant therapy. Venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation. Avoid IM injections of other medications; hematomas may develop.
- In patients requiring long-term anticoagulation, oral anticoagulant therapy should be instituted 4–5 days prior to discontinuing heparin therapy.
- Solution is colorless to slightly yellow.

### IV Administration

- **Subcut:** Administer deep into subcut tissue. Alternate injection sites between arm and the left and right abdominal wall above the iliac crest. Inject entire length of needle at a 45°- or 90°-angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter.
- **Direct IV:** ***Diluent:*** Administer loading dose undiluted. ***Concentration:*** Varies depending upon vial used. ***Rate:*** Administer over at least 1 min. Loading dose given before continuous infusion.
- **Continuous Infusion:** ***Diluent:*** Dilute 25,000 units of heparin in 250–500 mL of 0.9% NaCl or D5W. Premixed infusions are already diluted and ready to use. Admixed solutions stable for 24 hr at room temperature or if refrigerated. Premixed infusion stable for 30 days once overwrap removed. ***Concentration:*** 50–100 units/mL. ***Rate:*** See Route/Dosage section. Adjust to maintain therapeutic aPTT. Use an infusion pump to ensure accuracy.
- **Flush:** To prevent clot formation in intermittent infusion (heparin lock) sets, inject dilute heparin solution of 10–100 units/0.5–1 mL after each medication injection or every 8–12 hr. To prevent incompatibility of heparin with medication, flush lock set with sterile water or 0.9% NaCl for injection before and after medication is administered.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminophylline, amphotericin B liposome, anidulafungin, ascorbin acid, atenolol, atropine, azathioprine, aztreonam, benztropine, betamethasone, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefonicid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlordiazepoxide, cimetidine, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclosporine, cytarabine, daptomycin, dexamethasone, dexmedetomidine, digoxin, docetaxel, dopamine, doripenem, doxacurium, doxapram, doxorubicin liposome, edrophonium, enalaprilat, ephedrine, epinephrine, epoetin, eptifibatide, ertapenem, estrogens, conjugated, ethacrynate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, flumazenil, fluorouracil, folic acid, foscarnet, furosemide, gallium nitrate, ganciclovir, gemcitabine, glycopyrrolate, granisetron, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, kanamycin, ketorolac, lansoprazole, leucovorin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meropenem, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylergonovine, metoclopramide, metoprolol, metronidazole, mezlocillin, micafungin, miconazole, midazolam, milrinone, minocycline, mitomycin, morphine, multiple vitamins, nafcillin, nalbuphine, naloxone, neostigmine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propofol, propranolol, pyridostigmine, pyridoxime, ranitidine, remifentanil, ritodrine, rituximab, rocuronium, sargramostim, scopolamine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimethoprim, trimethobenazamide, urokinse, vasopressin, vecuronium, verapamil, vinblas-

tine, vincristine, voriconazole, warfarin, zidovudine.
- **Y-Site Incompatibility:** alteplase, amikacin, amiodarone, amphotericin B cholesteryl sulfate, amsacrine, caspofungin, ciprofloxacin, dantrolene, diazepam, diazoxide, doxycycline, epirubicin, filgrastim, gentamicin, haloperidol, hydroxyzine, idarubicin, inamrinone, levofloxacin, methotrimeprazine, mitoxandrone, netilmicin, palifermin, papaverine, pentamidine, phenytoin, protamine, quinupristin/dalfopristin, reteplase, trimethoprim/sulfamethoxazole, tobramycin, vancomycin.
- **Additive Compatibility:** It is recommended that heparin not be mixed in solution with other medications when given for anticoagulation, even those that are compatible, because changes in rate of heparin infusion may be required that would also affect admixtures.

### Patient/Family Teaching
- Advise patient to report any symptoms of unusual bleeding or bruising to health care professional immediately.
- Instruct patient not to take medications containing aspirin or NSAIDs while on heparin therapy.
- Caution patient to avoid IM injections and activities leading to injury and to use a soft toothbrush and electric razor during heparin therapy.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Patients on anticoagulant therapy should carry an identification card with this information at all times.

### Evaluation/Desired Outcomes
- Prolonged partial thromboplastin time (PTT) of 1.5–2.5 times the control, without signs of hemorrhage.
- Prevention of deep vein thrombosis and pulmonary emboli.
- Patency of IV catheters.

HIGH ALERT

## HEPARINS (LOW MOLECULAR WEIGHT)

**dalteparin** (dal-**te**-pa-rin)
Fragmin

**enoxaparin** (e-nox-a-**pa**-rin)
Lovenox

**tinzaparin** (tin-za-**pa**-rin)
Innohep

***Classification***
Therapeutic: anticoagulants
Pharmacologic: antithrombotics

**Pregnancy Category B**

### Indications
**Enoxaparin and dalteparin:** Prevention of venous thromboembolism (VTE) (deep vein thrombosis (DVT) and/or pulmonary embolism (PE)) in surgical or medical patients. **Dalteparin only:** Extended treatment of symptomatic DVT and/or PE in patients with cancer. **Enoxaparin and tinzaparin:** Treatment of DVT with or without PE (with warfarin). **Enoxaparin and dalteparin only:** Prevention of ischemic complications (with aspirin) from unstable angina and non-ST-segment-elevation MI. **Enoxaparin only:** Treatment of acute ST-segment-elevation MI (with thrombolytics or percutaneous coronary intervention).

### Action
Potentiate the inhibitory effect of antithrombin on factor Xa and thrombin. **Therapeutic Effects:** Prevention of thrombus formation.

### Pharmacokinetics
**Absorption:** Well absorbed after subcut administration (87% for dalteparin and tinzaparin, 92% for enoxaparin).
**Distribution:** Unknown.
**Metabolism and Excretion:** *Dalteparin*—unknown; *enoxaparin*—primarily eliminated renally; *tinzaparin*—partially metabolized, elimination is primarily renal.
**Half-life:** *Dalteparin*—2.1–2.3 hr; *enoxaparin*—3–6 hr; *tinzaparin*—3.9 hr (all are ↑ in renal insufficiency).

TIME/ACTION PROFILE (anticoagulant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Dalteparin subcut | rapid | 4 hr | up to 24 hr |
| Enoxaparin subcut | unknown | 3–5 hr | 12 hr |
| Tinzaparin subcut | rapid | 4–6 hr | 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to specific agents or pork products; cross-sensitivity may occur; Some products contain sulfites or benzyl alcohol and should be avoided in patients with

known hypersensitivity or intolerance; Active major bleeding; History of heparin-induced thrombocytopenia; *Dalteparin*—regional anesthesia during treatment for unstable angina/non–Q-wave MI.

**Use Cautiously in:** Severe liver or kidney disease (adjust dose of enoxaparin if CCr <30 mL/min); Women <45 kg or men <57 kg; Retinopathy (hypertensive or diabetic); Untreated hypertension; Geri: May have ↑ risk of bleeding due to age-related decrease in renal function; *Dalteparin*-Geri: ↑ mortality in patients > 70 yrs with renal insufficiency; Recent history of ulcer disease; History of congenital or acquired bleeding disorder; OB, Lactation, Pedi: Safety not established; should not be used in pregnant patients with prosthetic heart valves without careful monitoring.

**Exercise Extreme Caution in:** Spinal/epidural anesthesia (increased risk of spinal/epidural hematomas, especially with concurrent NSAIDs, repeated or traumatic epidural puncture, or indwelling epidural catheter); Severe uncontrolled hypertension; Bacterial endocarditis, bleeding disorders.

## Adverse Reactions/Side Effects

**CNS:** dizziness, headache, insomnia. **CV:** edema. **GI:** constipation, nausea, reversible ↑ in liver enzymes, vomiting. **GU:** urinary retention. **Derm:** ecchymoses, pruritus, rash, urticaria. **Hemat:** BLEEDING, anemia, thrombocytopenia. **Local:** erythema at injection site, hematoma, irritation, pain. **Misc:** fever.

## Interactions

**Drug-Drug:** Risk of bleeding may be ↑ by concurrent use of **drugs that affect platelet function and coagulation**, including **warfarin**, **aspirin**, **NSAIDs**, **dipyridamole**, **clopidogrel**, **ticlopidine**, **abciximab**, **eptifibatide**, **tirofiban**, and **thrombolytics**.

**Drug-Natural Products:** ↑ bleeding risk with, **arnica**, **chamomile**, **clove**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

## Route/Dosage

### Dalteparin

**Subcut (Adults):** *Prophylaxis of DVT following abdominal surgery*—2500 IU 1–2 hr before surgery, then once daily for 5–10 days; *Prophylaxis of VTE in high-risk patients undergoing abdominal surgery*—5000 IU evening before surgery, then once daily for 5–10 days *or* in patients with malignancy, 2500 IU 1–2 hr before surgery, another 2500 IU 12 hr later, then 5000 IU once daily for 5–10 days; *Prophylaxis of VTE in patients undergoing hip replacement surgery*—2500 IU within 2 hr before surgery, then 2500 IU 4–8 hr after surgery, then 5000 IU once daily (start at least 6 hr after postsurgical dose) for 5–10 days *or* 5000 IU evening before surgery (10–14 hr before surgery), then 5000 IU 4–8 hr after surgery, then 5000 IU once daily for 5–10 days *or* 2500 IU 4–8 hr after surgery, then 5000 IU once daily (start at least 6 hr after postsurgical dose); *Prophylaxis of VTE in medical patients with severely restricted mobility during acute illness:* 5000 IU once daily for 12 to 14 days. *Unstable angina/non–ST-segment-elevation MI*—120 IU/kg (not to exceed 10,000 IU) q 12 hr for 5–8 days with concurrent aspirin; *Extended treatment of symptomatic VTE in cancer patients*—200 IU/kg (not to exceed 18,000 IU) once daily for first 30 days, followed by 150 IU/kg (not to exceed 18,000 IU) once daily for months 2–6.

### Renal Impairment

**Subcut (Adults):** *Cancer patients receiving extended treatment of symptomatic VTE with CCr <30 mL/min*—Monitor anti-Xa levels (target 0.5–1.5 IU/mL).

### Enoxaparin

**Subcut (Adults):** *VTE prophylaxis in patients undergoing knee replacement surgery*—30 mg q 12 hr starting 12–24 hr postop for 7–10 days; *VTE prophylaxis in patients undergoing hip replacement surgery*—30 mg q 12 hr starting 12–24 hr postop *or* 40 mg once daily starting 12 hr before surgery (either dose may be continued for 7–14 days; continued prophylaxis with 40 mg once daily may be continued for up to 3 wk); *VTE prophylaxis following abdominal surgery*—40 mg once daily starting 2 hr before surgery and then continued for 7–12 days or until ambulatory (up to 14 days); *VTE prophylaxis in medical patients with acute illness*—40 mg once daily for 6–14 days; *Treatment of DVT/PE (outpatient)*—1 mg/kg q 12 hr. Warfarin should be started within 72 hr; enoxaparin may be continued for a minimum of 5 days and until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); *Treatment of DVT/PE (inpatient)*—1 mg/kg q 12 hr *or* 1.5 mg/kg once daily. Warfarin should be started within 72 hr; enoxaparin may be continued for a minimum of 5 days and until therapeutic anticoagulation with warfarin is achieved (INR >2 for two consecutive days); *Unstable angina/non–ST-segment-elevation MI*—1 mg/kg q 12 hr for 2–8 days (with aspirin).

**IV, Subcut (Adults <75 yr):** *Acute ST–segment-elevation MI*—Administer single IV bolus of 30 mg plus 1 mg/kg subcut dose (maximum of 100 mg for first 2 doses only), followed by 1 mg/kg subcut q 12 hr. The usual duration of treatment is 2–8 days. In patients undergoing percutaneous coronary intervention, if last subcut dose was <8 hr before balloon inflation, no additional dosing needed; if last subcut dose was ≥8 hr before balloon inflation, administer single IV bolus of 0.3 mg/kg.
**Subcut (Adults ≥75 yr):** *Acute ST-segment-elevation MI*—0.75 mg/kg every 12 hr (no IV bolus needed) (maximum of 75 mg for first 2 doses only; no initial bolus). The usual duration of treatment is 2–8 days.

### Renal Impairment

**Subcut (Adults CCr <30 mL/min):** *VTE prophylaxis for abdominal or knee/hip replacement surgery*—30 mg once daily. *Treatment of DVT/PE*—1 mg/kg once daily. *Unstable angina/non-ST-segment-elevation MI*—1 mg/kg once daily. *Acute ST-segment-elevation MI (patients <75 yr)*—Single IV bolus of 30 mg plus 1 mg/kg subcut dose, followed by 1 mg/kg subcut once daily. *Acute ST-segment-elevation MI (patients ≥75 yr)*—1 mg/kg once daily (no initial bolus).

### Tinzaparin

**Subcut (Adults):** *Treatment of deep vein thrombosis*—175 anti-Xa IU/kg once daily for at least 6 days and until adequate anticoagulation is achieved with warfarin (INR >2 for 2 consecutive days).

## Availability

### Dalteparin

**Solution for injection (prefilled syringes):** 2500 IU/0.2 mL, 5000 IU/0.2 mL, 7500 IU/0.3 mL, 10,000 IU/0.4 mL, 10,000 IU/1 mL, 12,500 IU/0.5 mL, 15,000 IU/0.6 mL, 18,000 IU/0.72 mL.
**Solution for injection (multidose vials):** 10,000 IU/mL in 9.5-mL vials, 25,000 IU/mL in 3.8-mL vials.

### Enoxaparin

**Solution for injection (prefilled syringes):** 30 mg/0.3 mL, 40 mg/0.4 mL, 60 mg/0.6 mL, 80 mg/0.8 mL, 100 mg/1 mL, 120 mg/0.8 mL, 150 mg/mL. **Solution for injection (multidose vials):** 300 mg/3 mL.

### Tinzaparin

**Solution for injection:** 20,000 anti-Xa units/mL in 2-mL vials.

## NURSING IMPLICATIONS

### Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or blood pressure; guaiac-positive stools); bleeding from surgical site. Notify health care professional if these occur.
- Assess for evidence of additional or increased thrombosis. Symptoms depend on area of involvement. Monitor neurological status frequently for signs of neurological impairment. May require urgent treatment.
- Monitor for hypersensitivity reactions (chills, fever, urticaria). Report signs to health care professional.
- Monitor patients with epidural catheters frequently for signs and symptoms of neurologic impairment.
- **Subcut:** Observe injection sites for hematomas, ecchymosis, or inflammation.
- ***Lab Test Considerations:*** Monitor CBC, platelet count, and stools for occult blood periodically during therapy. If thrombocytopenia occurs (platelet count <100,000/mm$^3$), discontinue therapy. If hematocrit ↓ unexpectedly, assess patient for potential bleeding sites. For *dalteparin* use for extended treatment of symptomatic VTE in cancer patients, if platelets ↓ to 50,000–100,000/mm$^3$, reduce dose to 2500 IU once daily until recovery to ≥100,000/mm$^3$; if platelets <50,000/mm$^3$, discontinue until count returns to ≥50,000/mm$^3$.
- Special monitoring of aPTT is not necessary. Monitoring of anti-Xa levels may be considered in patients who are obese or have renal dysfunction (for *enoxaparin*, obtain 4 hr after injection).
- May cause ↑ in AST and ALT levels.
- ***Toxicity and Overdose:*** For *enoxaparin* overdose, protamine sulfate 1 mg for each mg of *enoxaparin* should be administered by slow IV injection. For *dalteparin* overdose, protamine sulfate 1 mg for each 100 anti-factor Xa IU of *dalteparin* should be administered by slow IV injection. If the aPTT measured 2–4 hr after protamine administration remains prolonged, a 2nd infusion of protamine 0.5 mg/

H

100 anti-factor Xa IU of *dalteparin* may be administered.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Side Effects)

### Implementation

- ***High Alert:*** Unintended concomitant use of two heparin products (unfractionated heparin and LMW heparins) has resulted in serious harm and death. Review patients' recent and current medication administration records before administering any heparin or low-molecular-weight heparin product.
- Cannot be used interchangeably (unit for unit) with unfractionated heparin or other low-molecular-weight heparins.
- **Subcut:** Administer deep into subcut tissue. Alternate injection sites daily between the left and right anterolateral and left and right posterolateral abdominal wall, the upper thigh, or buttocks. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter.
- If excessive bruising occurs, ice cube massage of site before injection may lessen bruising.
- **Enoxaparin:** To avoid the loss of drug, do not expel the air bubble from the syringe before the injection.
- **Subcut:** Per manufacturer's recommendations, to enhance absorption, inject enoxaparin into left or right anterolateral or posterolateral abdominal wall only.
- To minimize risk of bleeding after vascular instrumentation for unstable angina, recommended intervals between doses should be followed closely. Leave vascular access sheath in place for 6–8 hr after enoxaparin dose. Give next enoxaparin dose ≥6–8 hr after sheath removal. Observe site for bleeding or hematoma formation.
- **Direct IV:** Use multidose vial for bolus injections. Administer through a pre-exsting IV line. Flush line with 0.9% NaCl or D5W before and after administration.
- **Tinzaparin:** Tinzaparin should be administered daily for at least 6 days and until patient is adequately anticoagulated with warfarin (INR at least 2.0 for 2 consecutive days). Warfarin therapy should be started within 1–3 days of tinzaparin initiation.

### Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to health care professional immediately.
- Instruct patient not to take aspirin or NSAIDs without consulting health care professional while on therapy.

### Evaluation/Desired Outcomes

- Prevention of DVT and pulmonary emboli (enoxaparin and dalteparin only).
- Resolution of DVT and pulmonary embolism (enoxaparin and tinzaparin only).
- Prevention of ischemic complications (with aspirin) in patients with unstable angina or non–ST—segment—elevation MI (enoxaparin and dalteparin only).
- Prevention of recurrent MI or death in patients with acute ST-segment-elevation MI (enoxparin only).

## HISTAMINE $H_2$ ANTAGONISTS

**cimetidine** (sye-**me**-ti-deen)
Apo-Cimetidine, Dom-Cimetidine, Gen-Cimetidine, Novo-Cimetine, Nu-Cimet, PMS-Cimetidine, Tagamet, Tagamet HB

**famotidine** (fa-**moe**-ti-deen)
Acid Control, Apo-Famotidine, Gen-Famotidine, Novo-Famotidine, Nu-Famotidine, Pepcid, Pepcid AC, Ulcidine

**nizatidine** (ni-**za**-ti-deen)
Apo-Nizatidine, Axid, Axid AR, Dom-Nizatidine, Gen-Nizatidine, Novo-Nizatidine, PHL-Nizatidine, PMS-Nizatidine

**ranitidine** (ra-**ni**-ti-deen)
Apo-Ranitidine, Dom-Ranitidine, Gen-Ranitidine, Novo-Ranitidine, Nu-Ranitidine, PHL-Ranitidine, PMS-Ranitidine, Ratio-Ranitidine, Riva-Ranitidine, Zantac, Zantac EF-FERdose, Zantac 75, Zantac 150

***Classification***
Therapeutic: antiulcer agents
Pharmacologic: histamine $H_2$ antagonists

**Pregnancy Category B**

## Indications

Short-term treatment of active duodenal ulcers and benign gastric ulcers. Maintenance therapy for duodenal and gastric ulcers after healing of active ulcers. Management of GERD. Treatment of heartburn, acid indigestion, and sour stomach (OTC use). **Cimetidine, famotidine, ranitidine:** Management of gastric hypersecretory states (Zollinger-Ellison syndrome). **Cimetidine, famotidine, ranitidine IV:** Prevention and treatment of stress-induced upper GI bleeding in critically ill patients. **Ranitidine:** Treatment of and maintenance therapy for erosive esophagitis. **Unlabeled Use:** Management of GI symptoms associated with the use of NSAIDs. Prevention of acid inactivation of supplemental pancreatic enzymes in patients with pancreatic insufficiency. Management of urticaria.

## Action

Inhibits the action of histamine at the $H_2$-receptor site located primarily in gastric parietal cells, resulting in inhibition of gastric acid secretion. **Therapeutic Effects:** Healing and prevention of ulcers. Decreased symptoms of gastroesophageal reflux. Decreased secretion of gastric acid.

## Pharmacokinetics

**Absorption:** *Cimetidine*—well absorbed after oral and IM administration. *Famotidine*—40–45% absorbed after oral administration. *Nizatidine*—70–95% absorbed after oral administration. *Ranitidine*—50% absorbed after PO and IM administration.
**Distribution:** All agents enter breast milk and cerebrospinal fluid.
**Metabolism and Excretion:** *Cimetidine*—30% metabolized by the liver; remainder is eliminated unchanged by the kidneys. *Famotidine*—up to 70% excreted unchanged by the kidneys, 30–35% metabolized by the liver. *Nizatidine*—60% excreted unchanged by the kidneys; some hepatic metabolism; at least 1 metabolite has histamine-blocking activity. *Ranitidine*—metabolized by the liver, mostly on first pass; 30% excreted unchanged by the kidneys after PO administration, 70% after parenteral administration.
**Half-life:** *Cimetidine*—2 hr; *famotidine*—2.5–3.5 hr; *nizatidine*—1.6 hr; *ranitidine*—2–2.5 hr (all are ↑ in renal impairment).

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Cimetidine PO | 30 min | 45–90 min | 4–5 hr |
| Cimetidine IM, IV | 10 min | 30 min | 4–5 hr |
| Famotidine PO | within 60 min | 1–4 hr | 6–12 hr |
| Famotidine IV | within 60 min | 0.5–3 hr | 8–15 hr |
| Nizatidine PO | unknown | unknown | 8–12 hr |
| Ranitidine PO | unknown | 1–3 hr | 8–12 hr |
| Ranitidine IM | unknown | 15 min | 8–12 hr |
| Ranitidine IV | unknown | 15 min | 8–12 hr |

H

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Some products contain alcohol and should be avoided in patients with known intolerance; Some products contain aspartame and should be avoided in patients with phenylketonuria.
**Use Cautiously in:** Renal impairment (more susceptible to adverse CNS reactions; ↑ dose interval recommended for *cimetidine* and *nizatidine* if CCr ≤ 50 mL/min, and for *famotidine* and *ranitidine* if CCr <50 mL/min; Hepatic impairment (for *ranitidine*); Acute porphyria (for *ranitidine*); Geri: More susceptible to adverse CNS reactions; dose ↓ recommended; OB, Lactation: Pregnancy or lactation.

## Adverse Reactions/Side Effects

**CNS:** confusion, dizziness, drowsiness, hallucinations, headache. **CV:** ARRHYTHMIAS. **GI:** constipation, diarrhea, drug-induced hepatitis (nizatidine, cimetidine), nausea. **GU:** ↓ sperm count, erectile dysfunction (cimetidine). **Endo:** gynecomastia. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site. **Misc:** hypersensivity reactions, vasculitis.

## Interactions

**Drug-Drug:** Cimetidine is a moderate inhibitor of the CYP1A2, CYP2C9, CYP2D6, and CYP3A4 isoenzymes in the liver; may lead to ↑ levels and toxicity with **benzodiazepines** (especially **chlordiazepoxide**, **diazepam**, and **midazolam**), some **beta blockers** (**labetalol**, **metoprolol**, **propranolol**), **caffeine**, **calcium channel blockers**, **carbamazepine**, **cyclosporine**, **dofetilide**, **lidocaine**, **metronidazole**, **mexiletine**, **nefazodone**, **pentoxifylline**, **phenytoin**, **procainamide**, **propafenone**, **quinidine**, **metformin**, **risperidone**, **ritonavir**, **ropinirole**, **selective serotonin reuptake inhibitors**, **sildenafil**, **sulfo-**

**nylureas**, **tacrolimus**, **theophylline**, **tricyclic antidepressants**, **venlafaxine**, and **warfarin**. Famotidine, nizatidine, and ranitidine have a much smaller and less significant effect on the metabolism of other drugs. Cimetidine may ↑ myelosuppressive effects of **carmustine** (avoid concurrent use). All may ↓ absorption of **ketoconazole**, **itraconazole**, **atazanavir**, **delavirdine**, and **geftinib**. Ranitidine may ↑ absorption of **triazolam**, **midazolam**, and **glipizide**. Ranitidine may ↑ **procainamide** levels. Ranitidine may ↑ the effects of **warfarin**.

## Route/Dosage

### Cimetidine

**PO (Adults):** *Short-term treatment of active ulcers*—300 mg 4 times daily *or* 800 mg at bedtime *or* 400–600 mg twice daily (not to exceed 2.4 g/day) for up to 8 wk. *Duodenal ulcer prophylaxis*—300 mg twice daily *or* 400 mg at bedtime. *GERD*—400 mg q 6 hr *or* 800 mg twice daily for 12 wk. *Gastric hypersecretory conditions*—300–600 mg q 6 hr (up to 2400 mg/day). *OTC use*—up to 200 mg may be taken twice daily (for not more than 2 wk).
**PO (Children):** *Short-term treatment of active ulcers*—5–10 mg/kg q 6 hr.
**IM, IV (Adults):** *Short-term treatment of active ulcers*—300 mg q 6 hr (not to exceed 2.4 g/day). *Continuous IV infusion*—900 mg infused over 24 hr (37.5 mg/hr); may be preceded by a 150-mg bolus dose. *Gastric hypersecretory conditions*—300–600 mg q 6 hr (not to exceed 2.4 g/day). *Prevention of upper GI bleeding in critically ill patients*—50 mg/hr.
**IM, IV (Children):** *Short-term treatment of active ulcers*—5–10 mg/kg q 6 hr.

#### Renal Impairment

**IV, PO (Adults):** *CCr 10–50 mL/min*—Administer 50% of normal dose; *CCr <10 mL/min*—Administer 25% of normal dose; *prevention of upper GI bleeding in critically ill patients if CCr <30 mL/min*—25 mg/hr.

#### Renal Impairment

**PO (Children):** 10–15 mg/kg/day.

### Famotidine

**PO (Adults):** *Short-term treatment of active duodenal ulcers*—40 mg/day at bedtime or 20 mg twice daily for up to 8 wk. *Treatment of benign gastric ulcers*—40 mg/day at bedtime. *Maintenance treatment of duodenal ulcers*—20 mg once daily at bedtime. *GERD*—20 mg twice daily for up to 6 wk; up to 40 mg twice daily for up to 12 wk for esophagitis with erosions, ulcerations, and continuing symptoms. *Gastric hypersecretory conditions*—20 mg q 6 hr initially, up to 160 mg q 6 hr. *OTC use*—10 mg for relief of symptoms; for prevention—10 mg 60 min before eating or take 10 mg as chewable tablet 15 minutes before heartburn-inducing foods or beverages (not to exceed 20 mg/24 hr for up to 2 wk).
**PO, IV (Children 1–16 yr):** *Peptic ulcer*—0.5 mg/kg/day as a single bedtime dose or in 2 divided doses (up to 40 mg daily); *GERD*—1 mg/kg/day in 2 divided doses(up to 80 mg twice daily).
**PO (Infants >3 mo–1 yr):** *GERD*—0.5 mg/kg/dose twice daily.
**PO (Infants and neonates <3 mo):** *GERD*—0.5 mg/kg/dose once daily.
**IV (Adults):** 20 mg q 12 hr.

#### Renal Impairment

**PO (Adults):** *CCr <50 mL/min*—administer normal dose q 36–48 hr *or* 50% of normal dose at normal dosing interval. *CCr <10 mL/min*—dosing interval may need to be ↑ to q 36–48 hr.

### Nizatidine

**PO (Adults):** *Short-term treatment of active duodenal or benign gastric ulcers*—300 mg once daily at bedtime. *Maintenance treatment of duodenal ulcers*—150 mg once daily at bedtime. *GERD*—150 mg twice daily. *OTC use*—75 mg twice daily given 30–60 min before foods or beverages expected to cause symptoms.

#### Renal Impairment

**PO (Adults):** *Short-term treatment of active ulcers—CCr 20–50 mL/min*—150 mg once daily; *CCr <20 mL/min*—150 mg every other day. *Maintenance treatment of duodenal ulcers—CCr 20–50 mL/min*—150 mg every other day; *CCr <20 mL/min*—150 mg every 3 days.

### Ranitidine

**PO (Adults):** *Short-term treatment of active duodenal of benign gastric ulcers*—150 mg twice daily *or* 300 mg once daily at bedtime. *Maintenance treatment of duodenal or gastric ulcers*—150 mg once daily at bedtime. *GERD*—150 mg twice daily. *Erosive esophagitis*—150 mg 4 times daily initially, then 150 mg twice daily as maintenance. *Gastric hypersecretory conditions*—150 mg twice daily initially; up to 6 g/day have been used. *OTC use*—75 mg 30–60 min before foods or beverages expected to cause symptoms (up to twice daily) (not to be used for more than 2 wk).

**PO (Children 1 mo-16 yr):** *Treatment of gastric/duodenal ulcers*—2–4 mg/kg/day in 2 divided doses (up to 300 mg/day); *Maintenance treatment of ulcers*—2–4 mg/kg once daily (up to 150 mg/day); *GERD/erosive esophagitis*—5–10 mg/kg/day in 2 divided doses (up to 300 mg/day for GERD or 600 mg/day for erosive esophagitis).
**PO (Neonates):** 2 mg/kg/day in 2 divided doses.
**IV, IM (Adults):** 50 mg q 6–8 hr. *Continuous IV infusion*—6.25 mg/hr. *Gastric hypersecretory conditions*—1 mg/kg/hr; may be ↑ by 0.5 mg/kg/hr (not to exceed 2.5 mg/kg/hr).
**IV, IM (Children 1 mo-16 yr):** *Treatment of gastric/duodenal ulcers*—2–4 mg/kg/day divided q 6–8 hr (up to 200 mg/day). *Continuous infusion*—1 mg/kg/dose followed by 0.08–0.17 mg/kg/hr.
**IV (Neonates):** 1.5 mg/kg/dose load, then in 12 hr start maintenance of 1.5–2 mg/kg/day divided q 12 hr. *Continuous IV infusion*—1.5 mg/kg/dose load followed by 0.04–0.08 mg/kg/hr infusion.

### Renal Impairment
**PO (Adults):** *CCr<50 mL/min*—150 mg q 24 hr.

### Renal Impairment
**IV (Adults):** *CCr<50 mL/min*—50 mg q 24 hr.

### Availability

#### Cimetidine (generic available)
**Tablets:** 200 mg[Rx, OTC], 300 mg, 400 mg, 600 mg, 800 mg. **Oral liquid (mint-peach flavor):** 200 mg/5 mL[OTC], 300 mg/5 mL. **Premixed infusion:** 300 mg/50 mL 0.9% NaCl. **Solution for injection:** 150 mg/mL.

#### Famotidine (generic available)
**Tablets:** 10 mg[OTC], 20 mg[Rx, OTC], 40 mg. **Gelcaps:** 10 mg[OTC]. **Oral suspension (cherry-banana-mint flavor):** 40 mg/5 mL. **Premixed infusion:** 20 mg/50 mL 0.9% NaCl. **Solution for injection:** 10 mg/mL. ***In combination with:*** calcium carbonate and magnesium hydroxide[OTC] (Pepcid Complete, see Appendix B).

#### Nizatidine (generic available)
**Tablets:** 75 mg[OTC]. **Capsules:** 150 mg, 300 mg. **Oral solution (bubble gum flavor):** 15 mg/mL.

#### Ranitidine (generic available)
**Tablets:** 75 mg[OTC], 150 mg, 300 mg. **Cost:** *Generic*—150 mg $23.99/180, 300 mg $24.84/90. **Capsules:** 150 mg, 300 mg. **Cost:** *Generic*—150 mg $89.95/180, 300 mg $79.99/90. **Effervescent tablets (EFFERdose):** 25 mg. **Syrup (peppermint flavor):** 15 mg/mL. **Cost:** $330.01/473 mL. **Premixed infusion:** 50 mg/50 mL 0.45% NaCl. **Solution for injection:** 25 mg/mL.

## NURSING IMPLICATIONS

### Assessment
- Assess for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- Geri: Assess geriatric and debilitated patients routinely for confusion. Report promptly.
- ***Lab Test Considerations:*** Monitor CBC with differential periodically during therapy.
- Antagonize effects of pentagastrin and histamine during gastric acid secretion testing. Avoid administration for 24 hr before the test.
- May cause false-negative results in skin tests using allergenic extracts. Histamine $H_2$ antagonists should be discontinued 24 hr before the test.
- May cause ↑ in serum transaminases and serum creatinine.
- Serum prolactin concentration may be ↑ after IV bolus of *cimetidine*. May also cause ↓ parathyroid concentrations.
- *Nizatidine* may cause ↑ alkaline phosphatase concentrations.
- *Ranitidine* and *famotidine* may cause false-positive results for urine protein; test with sulfosalicylic acid.

### Potential Nursing Diagnoses
Acute pain (Indications)

### Implementation
- **PO:** Administer with meals or immediately afterward and at bedtime to prolong effect.
- If antacids or sucralfate are used concurrently for relief of pain, avoid administration of antacids within 30 min-1 hr of the $H_2$ antagonist and take sucralfate 2 hr after $H_2$ antagonist; may ↓ absorption of $H_2$ antagonist.
- Doses administered once daily should be administered at bedtime to prolong effect.
- Shake oral suspension before administration. Discard unused suspension after 30 days.
- Remove foil from *ranitidine effervescent tablets* and dissolve in 6–8 oz water before drinking.

## Cimetidine

### IV Administration

- **Direct IV:** ***Diluent:*** Dilute each 300 mg in 20 mL of 0.9% NaCl for injection. ***Concentration:*** Final concentration will be 13.7 mg/mL. ***Rate:*** Administer over at least 5 min. Rapid administration may cause hypotension and arrhythmias.
- **Intermittent Infusion:** ***Diluent:*** Dilute each 300 mg in 50 mL of 0.9% NaCl, D5W, D10W, D5/LR, D5/0.9% NaCl, D5/0.45% NaCl, D5/0.25% NaCl, Ringer's or lactated Ringer's solution, or sodium bicarbonate. ***Concentration:*** Final concentration will be 5.8 mg/mL. Diluted solution is stable for 48 hr at room temperature. Refrigeration may cause cloudiness but will not affect potency. Do not use solution that is discolored or contains precipitate. ***Rate:*** Administer over 15–20 min.
- **Continuous Infusion:** Dilute cimetidine 900 mg in 100–1000 mL of compatible solution (see Direct IV).
- ***Rate:*** Usually infused at a rate of 37.5 mg/hr or greater but should be individualized.
- **Y-Site Compatibility:** acyclovir, alfentanil, amifostine, amikacin, aminophylline, amphotericin B liposome, anikinra, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefonocid, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, ddexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quniupristin/dalfopristin, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimetaphan, urokinase, vancomycin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl, amphotericin B colloidal, amsacrine, azathioprine, cefepime, cefoperazone, chloramphenicol, dantrolene, diazepam, diazoxide, furosemide, ganciclovir, indomethacin, pantoprazole, pentobarbital, phenobarbital, phenytoin, trimethoprim/sulfamethoxazole, warfarin.

## Famotidine

### IV Administration

- **Direct IV:** ***Diluent:*** 0.9% NaCl, D5W, D10W, or LR. ***Concentration:*** 4 mg/mL. ***Rate:*** Administer at a rate of 10 mg/min. Rapid administration may cause hypotension.
- **Intermittent Infusion:** ***Diluent:*** Dilute each 20 mg in 100 mL of 0.9% NaCl, D5W, D10W, or LR. Diluted solution is stable for 48 hr at room temperature. Do not use solution that is discolored or contains a precipitate. ***Concentration:*** 0.2 mg/mL. ***Rate:*** Administer over 15–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B liposome, amsacrine, anakinra, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefonocid, cefotaxime, cefotetan, cefoxitin, ceftazidime, cefuroxime, chlorpromazine, cimetidine, cisatracurium, cisplatin, cladribine,

clindamycin, codeine, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dextran 40, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eftifibitide, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, perphenazine, phenobarbital, phentolamine, phenylephrine, phenytoin, phytonadione, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, ranitidine, remifentanil, rituximab, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole.

- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B colloidal, azathioprine, azithromycin, cefepime, cefapirin, chloramphenicol, dantrolene, diazepam, diazoxide, ganciclovir, indomethacin, pantoprazole, piperacillin/tazobactam, trimethoprim/sulfamethoxazole.

## Ranitidine

### IV Administration

- **Direct IV:** ***Diluent:*** 0.9% NaCl or D5W for injection. ***Concentration:*** 2.5 mg/mL. ***Rate:*** Administer over at least 5 min not to exceed 10 mg/min. Rapid administration may cause hypotension and arrhythmias.
- **Intermittent Infusion:** ***Diluent:*** Dilute each 50 mg in 100 mL of 0.9% NaCl or D5W. Diluted solution is stable for 48 hr at room temperature. Do not use solution that is discolored or that contains precipitate. ***Concentration:*** 0.5 mg/mL. ***Rate:*** Administer over 15–30 min.
- **Continuous Infusion:** ***Diluent:*** D5W. ***Concentration:*** 150 mg/250 mL (no greater than 2.5 mg/mL for Zollinger-Ellison patients). ***Rate:*** Administer at a rate of 6.25 mg/hr. In patients with Zollinger-Ellison syndrome, start infusion at 1 mg/kg/hr. If gastric acid output is >10 mEq/hr or patient becomes symptomatic after 4 hr, adjust dose by 0.5 mg/kg/hr increments and remeasure gastric output.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B liposome, amsacrine, anikinra, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefepime, cefonicid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxapram, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouacil, folic acid, foscarnet, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, inamrinone, indomethacin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium

sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, strepotkinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethaphan, urokinase, vancomycin, vecuronium, vincristine, vinorelbine, warfarin, zidovudine.

- **Y-Site Incompatibility:** amphotericin B cholesteryl, caspofungin, diazepam, diazoxide, insulin, pantoprazole, phenytoin, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole.

### Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- Advise patients taking OTC preparations not to take the maximum dose continuously for more than 2 wk without consulting health care professional. Notify health care professional if difficulty swallowing occurs or abdominal pain persists.
- Inform patient that smoking interferes with the action of histamine antagonists. Encourage patient to quit smoking or at least not to smoke after last dose of the day.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Inform patient that increased fluid and fiber intake and exercise may minimize constipation.
- Advise patient to report onset of black, tarry stools; fever; sore throat; diarrhea; dizziness; rash; confusion; or hallucinations to health care professional promptly.

### Evaluation/Desired Outcomes

- Decrease in abdominal pain.
- Treatment and prevention of gastric or duodenal irritation and bleeding. Healing of duodenal ulcers can be seen by x-rays or endoscopy. Therapy is continued for at least 6 wk in treatment of ulcers but not usually longer than 8 wk.
- Decreased symptoms of esophageal reflux.
- Treatment of heartburn, acid indigestion, and sour stomach (OTC use).

## HMG-CoA REDUCTASE INHIBITORS (statins)

**atorvastatin** (a-**tore**-va-stat-in)
Lipitor

**fluvastatin** (**floo**-va-sta-tin)
Lescol, Lescol XL

**lovastatin** (**loe**-va-sta-tin)
Altoprev, Mevacor

**pitavastatin** (pi-**tav**a-sta-tin)
Livalo

**pravastatin** (**pra**-va-sta-tin)
Pravachol

**rosuvastatin** (roe-**soo**-va-sta-tin)
Crestor

**simvastatin** (**sim**-va-sta-tin)
Zocor

***Classification***
Therapeutic: lipid-lowering agents
Pharmacologic: HMG-CoA reductase inhibitors

**Pregnancy Category X**

### Indications

Adjunctive management of primary hypercholesterolemia and mixed dyslipidemias. **Atorvastatin:** Primary prevention of cardiovascular disease ( ↓ risk of MI or stroke) in patients with multiple risk factors for coronary heart disease CHD or type 2 diabetes mellitus (also ↓ risk of angina or revascscularization procedures in patients with multiple risk factors for CHD). **Atorvastatin and Pravastatin:** Secondary prevention of cardiovascular disease ( ↓ risk of MI, stroke, revascularization procedures, angina, and hospitalizations

for CHF) in patients with clinically evident CHD. **Fluvastatin:** Secondary prevention of coronary revascularizations procedures in patients with clinically evident CHD. **Fluvastatin, lovastatin, and rosuvastatin:** Slow progression of coronary atherosclerosis in patients with CHD. **Lovastatin:** Primary prevention of CHD ( ↓ risk of MI, unstable angina, and coronary revascularization) in patients without symptomatic cardiovascular disease with ↑ total and low-density lipoprotein (LDL) cholesterol and ↓ high-density lipoprotein (HDL) cholesterol. **Pravastatin:** Primary prevention of CHD ( ↓ risk of MI, coronary revascularization, and cardiovascular mortality) in patients without clinically evident CHD. **Simvastatin:** Secondary prevention of cardiovascular events ( ↓ risk of MI, coronary revascularization, stroke, and cardiovascular mortality) in patients with clinically evident CHD or those at high-risk for CHD (history of diabetes, peripheral arterial disease, or stroke).

## Action

Inhibit an enzyme, 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) reductase, which is responsible for catalyzing an early step in the synthesis of cholesterol. **Therapeutic Effects:** Lowers total and LDL cholesterol and triglycerides. Slightly increase HDL. Slows of the progression of coronary atherosclerosis with resultant decrease in CHD-related events (all agents except rosuvastatin have indication for ↓ events).

## Pharmacokinetics

**Absorption:** *Atorvastatin* — rapidly absorbed but undergoes extensive GI and hepatic metabolism, resulting in 14% bioavailability; *fluvastatin* — 98% absorbed after oral administration, but undergoes extensive first-pass metabolism resulting in 24% bioavailability; *lovastatin, pravastatin* — poorly and variably absorbed after oral administration; *pitavastatin*-well absorbed (51%) after oral administration; *rosuvastatin* — 20% absorbed following oral administration; *simvastatin* — 85% absorbed but rapidly metabolized.

**Distribution:** *Atorvastatin* — probably enters breast milk. *Fluvastatin* — enters breast milk. *Lovastatin* — crosses the blood-brain barrier and placenta. *Pravastatin* — small amounts enter breast milk. *Pitavastatin, rosuvastatin, and simvastatin* — unknown.

**Protein Binding:** *Atorvastatin, fluvastatin, pitavastatin, and simvastatin*->98%.

**Metabolism and Excretion:** All agents are extensively metabolized by the liver; amount excreted unchanged in urine: *atorvastatin* — <2%, *lovastatin* — 10%, *fluvastatin* — 5%, *pitavastatin*-15%, *pravastatin* — 20%, and *simvastatin* — 13%.

**Half-life:** *Atorvastatin* — 14 hr; *fluvastatin* — 1.2 hr; *lovastatin* — 3 hr; *pitavastatin* — 12 hr; *pravastatin* — 1.3–2.7 hr; *rosuvastatin* — 19 hr; *simvastatin* — unknown.

TIME/ACTION PROFILE (cholesterol-lowering effect)

| ROUTE | ONSET | PEAK | DURATION* |
|---|---|---|---|
| Atorvastatin | unknown | unknown | 20–30 hr |
| Fluvastatin | 1–2 wk | 4–6 wk | unknown |
| Lovastatin | 2 wk | 4–6 wk | 6 wk |
| Pitavastatin | within 4 wk | 4 wk | unknown |
| Pravastatin | several days | 2–4 wk | unknown |
| Rosuvastatin | unknown | 2–4 wk | unknown |
| Simvastatin | several days | 2–4 wk | unknown |

*After discontinuation

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Active liver disease or unexplained persistent ↑ in AST or ALT; Concurrent use of gemfibrozil or azole antifungals; Concurrent use of nelfinavir or ritonavir (with lovastatin or simvastatin); *Pitavastatin* — concurrent use of cyclosporine or lopinavir/ritonavir (with pitavastatin); *Pitavastatin* — severe renal impairment (CCr <30 mL/min); OB: Potential for fetal anomalies; Lactation: May disrupt infant lipid metabolism.

**Use Cautiously in:** History of liver disease; Alcoholism; 🧬 *Rosuvastatin* — patients with Asian ancestry (may have ↑ blood levels and ↑ risk of rhabdomyolysis); *Atorvastatin, lovastatin, rosuvastatin, and simvastatin* — concurrent use of gemfibrozil, azole antifungals, macrolides, protease inhibitors, niacin, cyclosporine, amiodarone or verapamil ( ↑ risk of myopathy/rhabdomyolysis); *Pitavastatin* — Hypothyroidism, concurrent use of fibrates or lipid-lowering doses of niacin ( ↑ risk of myopathy); Renal impairment; Geri: *Pitavastatin* — ↑ risk of myopathy (age >65 yr); OB: Women of childbearing age; Pedi: Safety not established in children <8 yr (; some products approved for use in older children only.

## Adverse Reactions/Side Effects

**CNS:** dizziness, headache, insomnia, weakness. **CV:** chest pain, peripheral edema. **EENT:** rhinitis; *lovastatin*, blurred vision. **Resp:** bronchitis. **GI:**

abdominal cramps, constipation, diarrhea, flatus, heartburn, altered taste, drug-induced hepatitis, dyspepsia, elevated liver enzymes, nausea, pancreatitis. **GU:** erectile dysfunction. **Derm:** rashes, pruritus. **MS:** RHABDOMYOLYSIS, arthralgia, arthritis, myalgia, myositis. **Misc:** hypersensitivity reactions.

## Interactions

Atorvastatin, lovastatin, simvastatin, and rosuvastatin are metabolized by the CYP3A4 metabolic pathway. Fluvastatin is metabolized by CYP 2C9. Pravastatin is not metabolized by the CYP P450 system.

**Drug-Drug:** Atorvastatin, lovastatin, and simvastatin may interact with **CYP3A4 inhibitors**. Bioavailability and effectiveness may be ↓ by **cholestyramine** and **colestipol**. Risk of myopathy with atorvastatin, lovastatin, and simvastatin is ↑ with **amiodarone**, **cyclosporine**, **gemfibrozil**, **clofibrate**, **diltiazem**, **verapamil**, **erythromycin**, **clarithromycin**, **telithromycin**, **nefazodone**, large doses of **niacin**, **azole antifungals**, **nelfinavir**, **saquinavir**, and **ritonavir**. Atorvastatin, fluvastatin, and simvastatin may slightly ↑ serum **digoxin** levels. Atorvastatin and rosuvastatin may ↑ levels of **hormonal contraceptives**. Atorvastatin, fluvastatin, lovastatin, rosuvastatin, and simvastatin may ↑ risk of bleeding with **warfarin**. **Isradipine** may ↓ the effectiveness of lovastatin. **Alcohol**, **cimetidine**, **ranitidine**, and **omeprazole** may ↑ fluvastatin levels. **Rifampin** may ↓ fluvastatin levels. **Antacids** ↓ absorption of rosuvastatin (administer 2 hr after rosuvastatin. **Lopinavir/ritonavir** may ↑ pitavastatin and rosuvastatin levels. **Cyclosporine** ↑ levels and risk of toxicity of pitavastatin and rosuvastatin (dosage adjustment of rosuvastatin required; avoid use with pitavastatin). Fluvastatin ↑ levels of **glyburide**; **glyburide** ↑ fluvastatin levels (monitoring of both agents recommended). Fluvastatin ↑ levels of **phenytoin**; **phenytoin** ↑ fluvastatin levels (monitoring of both agents recommended). **Erythromycin** and **rifampin** may ↑ blood levels of pitavastatin. **Drug-Natural Products: St. John's wort** may ↓ levels and effectiveness (lovastatin and simvastatin).

**Drug-Food:** Large quantities of **grapefruit juice** ↑ blood levels and ↑ risk of rhabdomyolysis. **Food** enhances blood levels of lovastatin.

## Route/Dosage

### Atorvastatin

**PO (Adults):** 10–20 mg once daily initially (may start with 40 mg/day if LDL should be lowered by > 45%); may be increased q 2–4 wk up to 80 mg/day.

**PO (Children 10–17 yr):** 10 mg/day initially, may be ↑ q 4 wk up to 20 mg/day.

### Fluvastatin

**PO (Adults):** 20 mg (capsule) once daily at bedtime (may start with 40 mg once daily at bedtime if LDL needs to be lowered by ≥25%). May be ↑ to 80 mg once daily (as extended-release tablet) or 40 mg twice daily (capsule).

### Lovastatin

**PO (Adults):** 20 mg once daily with evening meal. May be ↑ at 4-wk intervals to a maximum of 80 mg/day (immediate-release) or 60 mg/day (extended-release); initiate at 10 mg/day in patients receiving cyclosporine or other immunosuppressants and do not exceed 20 mg/day; should not exceed 40 mg/day (immediate-release) or 20 mg/day (extended-release) if receiving verapamil or amiodarone; should not exceed 20 mg/day if receiving danazol or niacin (>1 g/day).

#### Renal Impairment

**PO (Adults):** *CCr < 30 mL/min*—dosage should not exceed 20 mg/day unless carefully titrated.

**PO (Children /Adolescents 10-17 yr):** *Familial heterozygous hypercholesterolemia*—10-40 mg/day adjusted at 4-wk intervals.

### Pitavastatin

**PO (Adults):** 2 mg once daily initially, may be increased up to 4 mg depending on response; *Concurrent erythromycin therapy*—daily dose should not exceed 1 mg; *Concurrent rifampin therapy*—daily dose should not exceed 2 mg.

#### Renal Impairment

**PO (Adults):** *CCr 30–<60 mL/min*—1 mg once daily initially, may be ↑ up to 2 mg daily.

### Pravastatin

**PO (Adults):** 40 mg once daily at bedtime; may be ↑ at 4-wk intervals up to maximum of 80 mg/day. *Concurrent cyclosporine therapy*—initial dose is 10 mg/day and should not exceed 20 mg/day.

**PO (Children 14-18 yrs):** 40 mg once daily.

**PO (Children 8-13 yrs):** 20 mg once daily.

#### Hepatic/Renal Impairment

**PO (Adults):** 10–20 mg once daily at bedtime; ↑ at 4-wk intervals as needed (usual range = 10–20 mg/day).

### Rosuvastatin

**PO (Adults):** 10 mg once daily initially (range 5–20 mg initially); dose may be adjusted at 2–4 wk intervals, some patients may require up to 40 mg/day (associated with ↑ risk of rhabdomyolysis); *Patients with Asian ancestry*—initial dose should not exceed 5 mg/day; *Concurrent cyclosporine therapy*—dose should not exceed 5 mg/day; *Concurrent gemfibrozil or lopinavir/ritonavir therapy*—dose should not exceed 10 mg/day (avoid if possible).

#### Renal Impairment

**PO (Adults):** *CCr <30 mL/min*—5 mg once daily intially; dose may be ↑ but should not exceed 10 mg/day.

### Simvastatin

**PO (Adults):** 5–80 mg once daily in the evening. *Concurrent cyclosporine or danazol therapy*—Initiate at 5 mg once daily; dose should not exceed 10 mg/day. *Concurrent fibrate or niacin therapy*—Dose should not exceed 10 mg/day. *Concurrent amiodarone or verapamil therapy*—Dose should not exceed 20 mg/day.
**PO (Children and Adolescents 10–17 yr):** 10 mg once daily initially, may be ↑ at 4–wk intervals up to 40 mg/day (not to exceed 10 mg/day in patients receiving cyclosporine, danazol, fibrates, or niacin or 20 mg/day in patients receiving amiodarone or verapamil).

#### Renal Impairment

**PO (Adults):** *CCr <10 mL/min*—5 mg/day initially, titrate carefully.

### Availability

### Atorvastatin

**Tablets:** 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** 10 mg $237.99/90, 20 mg $321.97/90, 40 mg $325.97/90, 80 mg $329.97/90. ***In combination with:*** amlodipine (Caduet); see Appendix B.

### Fluvastatin

**Capsules:** 20 mg, 40 mg. **Cost:** 20 mg $205.97/90, 40 mg $205.97/90. **Extended-release tablets:** 80 mg. **Cost:** 80 mg $265.99/90.

### Lovastatin (generic available)

**Immediate-release tablets :** 10 mg, 20 mg, 40 mg. **Cost:** 10 mg $89.70/60, 20 mg $158.19/60, 40 mg $284.76/60. **Extended-release tablets:** 10 mg, 20 mg, 40 mg, 60 mg. ***In combination with:*** Niacin (Advicor). See Appendix B.

### Pitavastatin

**Tablets:** 1 mg, 2 mg, 4 mg.

### Pravastatin (generic available)

**Tablets:** 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** 10 mg $169.97/90, 20 mg $44.67/90, 40 mg $49.97/90, 80 mg $379.72/90.

### Rosuvastatin

**Tablets:** 5 mg, 10 mg, 20 mg, 40 mg. **Cost:** 5 mg $275.96/90, 10 mg $275.96/90, 20 mg $275.96/90, 40 mg $278.96/90.

### Simvastatin (generic available)

**Tablets:** 5 mg, 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** *Generic*—5 mg $45.97/90, 10 mg $49.97/90, 20 mg $73.97/90, 40 mg $75.97/90, 80 mg $89.97/90. ***In combination with:*** Ezetimibe (Vytorin). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Obtain a dietary history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Evaluate serum cholesterol and triglyceride levels before initiating, after 4–6 wk of therapy, and periodically thereafter.
- Monitor liver function tests, including AST, before, at 12 wk after initiation of therapy or after dose elevation, and then q 6 mo. If AST levels ↑ to 3 times normal, HMG-CoA reductase inhibitor therapy should be reduced or discontinued. May also cause ↑ alkaline phosphatase and bilirubin levels.
- If patient develops muscle tenderness during therapy, monitor CK levels. If CK levels are >10 times the upper limit of normal or myopathy occurs, therapy should be discontinued.

### Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

### Implementation

- Do not confuse Pravachol (pravastatin) with Prevacid (lansoprazole).
- **PO:** Administer *lovastatin* with food. Administration on an empty stomach decreases absorption by approximately 30%. Initial once-daily dose is administered with the evening meal.
- Administer extended-release tablets at bedtime. Extended-release tablets should be swallowed whole, do not break, crush, or chew.
- Administer *fluvastatin, pravastatin,* and *simvastatin* once daily in the evening. *Atorvasta-*

*tin, pitavastatin,* and *rosuvastatin* can be taken any time of day. May be administered without regard to food.
- Avoid large amounts of grapefruit juice during therapy; may ↑ risk of toxicity.
- If *fluvastatin* or *pravastatin* is administered in conjunction with bile acid sequestrants (cholestyramine, colestipol), administer at least 4 hr after bile acid sequestrant.
- If *rosuvastatin* is administered in conjunction with magnesium or aluminum-containing antacids, administer antacid at least 2 hr after *rosuvastatin*.

## Patient/Family Teaching
- Instruct patient to take medication as directed and not to skip doses or double up on missed doses. Advise patient to avoid drinking more that 200 mL/day of grapefruit juice during therapy. Medication helps control but does not cure elevated serum cholesterol levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional if unexplained muscle pain, tenderness, or weakness occurs, especially if accompanied by fever or malaise.
- Advise patient to avoid taking Rx, OTC, or herbal products without consulting with a health care professional.
- Instruct female patients to notify health care professional promptly if pregnancy is planned or suspected. Advise women of childbearing age to use effective contraception during therapy and discuss plans to discontinue pitavastatin if trying to conceive. Advise patients to avoid breastfeeding during therapy.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

## Evaluation/Desired Outcomes
- Decrease in LDL and total cholesterol levels.
- Increase in HDL cholesterol levels.
- Decrease in triglyceride levels.
- Slowing of the progression of coronary artery disease.

# human papillomavirus quadrivalent (types 6, 11, 16, and 18) vaccine, recombinant
(**hyoo**-man pa-pil-**lo**-ma)
Gardasil

***Classification***
Therapeutic: vaccines/immunizing agents

## Indications
Prevention of cervical, vulvar, and vaginal cancers and genital warts (in females) and genital warts (in males).

## Action
Vaccination results in antibodies to HPV viruses that are causative agents for cervical, vulvar, and vaginal cancers and genital warts. **Therapeutic Effects:** Prevention of cervical, vulvar, and vaginal cancers and genital warts.

## Pharmacokinetics
**Absorption:** Well absorbed following IM administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** Unknown.

TIME/ACTION PROFILE (antibody response)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | unknown | 1 mo* | unknown |

*After third vaccination

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Thrombocytopenia/bleeding disorder; OB: Limited data available; use only if potential benefit justifies potential risk to fetus.
**Use Cautiously in:** Current/recent febrile illness; Immunosuppression may ↓ antibody response; Lactation: Excretion into breast milk unknown; Pedi: Safety not established in children <9 yr.

## Adverse Reactions/Side Effects
**Neuro:** fainting. **Local:** injection site reactions. **Misc:** ANAPHYLAXIS (RARE).

## Interactions
**Drug-Drug: Immunosuppressants** or **antineoplastics** may ↓ antibody response.

## Route/Dosage
**IM (Adults and Children — males and females 9–26 yr):** Three 0.5 mL doses at 0, 2, and 6 mo.

### Availability

**Sterile preparation for intramuscular administration:** 20 mcg of HPV 6 L1 protein, 40 mcg of HPV 11 L1 protein, 40 mcg of HPV 16 L1 protein, and 20 mcg of HPV 18 L1 protein/0.5-mL dose.

## NURSING IMPLICATIONS

### Assessment

- Assess vital signs prior to administration. Do not administer to patient with a current or recent febrile illness; low grade fever (<100°F) and mild upper respiratory infection are usually not contraindicated.
- Monitor patient for 15 min following injection for fainting. Patient should remain lying down or seated to prevent falls or injury.

### Potential Nursing Diagnoses

Risk for infection (Indications)

### Implementation

- Vaccine is not intended for treatment of active genital warts or cervical cancer and will not protect from diseases not caused by HPV.
- **IM:** Prefilled syringe is for single use; do not use for more than one person. Administer as supplied; do not dilute; administer full dose. Shake well prior to administration to maintain suspension of vaccine. Solution is cloudy and white; do not administer solution that is discolored or contains particulate matter. If using single-dose vial, withdraw 0.5 mL dose and administer entire contents of syringe. Administer intramuscularly in the deltoid or in the high anterolateral area of the thigh.

### Patient/Family Teaching

- Provide information about vaccine and the importance of completing immunization series unless contraindicated to patient and guardian.
- Inform patient that vaccine does not replace routine cervical cancer screening or prevent other sexually transmitted diseases; such screening should be continued as usual.
- Advise patient to consult health care professional prior to taking Rx, OTC, or herbal products.
- Advise patient to notify health care professional if pregnancy is planned or suspected. Women exposed to vaccine during pregnancy are encouraged to call manufacturer pregnancy registry at 800-986-8999.
- Instruct patient to report any adverse reactions to health care professional.

### Evaluation/Desired Outcomes

- Prevention of cervical cancer, genital warts, cervical adenocarcinoma in situ, cervical, vulvar, and vaginal intraepithelial neoplasia caused by HPV.

## hydrALAZINE

(hye-**dral**-a-zeen)

Apresoline, Novo-Hylazin

***Classification***

Therapeutic: antihypertensives

Pharmacologic: vasodilators

**Pregnancy Category C**

H

### Indications

Moderate to severe hypertension (with a diuretic). **Unlabeled Use:** CHF unresponsive to conventional therapy with digoxin and diuretics.

### Action

Direct-acting peripheral arteriolar vasodilator. **Therapeutic Effects:** Lowering of blood pressure in hypertensive patients and decreased afterload in patients with CHF.

### Pharmacokinetics

**Absorption:** Rapidly absorbed following oral administration; well absorbed from IM sites.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk in minimal concentrations.
**Metabolism and Excretion:** Mostly metabolized by the GI mucosa and liver by N-acetyltransferase (rate of acetylation is genetically determined [slow acetylators have ↑ hydralazine levels and ↑ risk of toxicity; fast acetylators have ↓ hydralazine levels and ↓ response]).
**Half-life:** 2–8 hr.

TIME/ACTION PROFILE (antihypertensive effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 45 min | 2 hr | 2–4 hr |
| IM | 10–30 min | 1 hr | 3–8 hr |
| IV | 5–20 min | 15–30 min | 2–6 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Some products contain tartrazine and should be avoided in patients with known intolerance.
**Use Cautiously in:** Cardiovascular or cerebrovascular disease; Severe renal and hepatic disease

(dose modification may be necessary); OB, Lactation: Has been used safely during pregnancy.

### Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, headache. **CV:** tachycardia, angina, arrhythmias, edema, orthostatic hypotension. **GI:** diarrhea, nausea, vomiting. **Derm:** rashes. **F and E:** sodium retention. **MS:** arthralgias, arthritis. **Neuro:** peripheral neuropathy. **Misc:** drug-induced lupus syndrome.

### Interactions

**Drug-Drug:** ↑ hypotension with acute ingestion of **alcohol**, other **antihypertensives**, or **nitrates**. **MAO inhibitors** may exaggerate hypotension. May ↓ pressor response to **epinephrine**. **NSAIDs** may ↓ antihypertensive response. **Beta blockers** ↓ tachycardia from hydralazine (therapy may be combined for this reason). **Metoprolol** and **propranolol** ↑ hydralazine levels. ↑ blood levels of **metoprolol** and **propranolol**.

### Route/Dosage

**PO (Adults):** *Hypertension*—10 mg 4 times daily initially. After 2–4 days may ↑ to 25 mg 4 times daily for the rest of the 1st week; may then ↑ to 50 mg 4 times daily (up to 300 mg/day). Once maintenance dose is established, twice-daily dosing may be used. *CHF*—25–37.5 mg 4 times daily; may be ↑ up to 300 mg/day in 3–4 divided doses.

**PO (Children > 1 mo):** Initial—0.75–1 mg/kg/day in 2–4 divided doses, not to exceed 25 mg/dose; may ↑ gradually to 5 mg/kg/day in infants and 7.5 mg/kg/day in children (not to exceed 200 mg/day) in 2–4 divided doses.

**IM, IV (Adults):** *Hypertension*—5–40 mg repeated as needed. *Eclampsia*—5 mg q 15–20 min; if no response after a total of 20 mg, consider an alternative agent.

**IM, IV (Children > 1 mo):** Initial—0.1–0.2 mg/kg/dose (not to exceed 20 mg) q 4–6 hr as needed, up 1.7–3.5 mg/kg/day in 4–6 divided doses.

### Availability (generic available)

**Tablets:** 10 mg, 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—10 mg $23.30/100, 25 mg $22.90/100, 50 mg $23.30/100, 100 mg $66.65/100. **Injection:** 20 mg/mL. ***In combination with:*** isosorbide dinitrate (BiDil). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse frequently during initial dose adjustment and periodically during therapy. About 50–65% of Caucasians, Black, South Indians, and Mexicans are slow acetylators at risk for toxicity, while 80–90% of Eskimos, Japanese, and Chinese are rapid acetylators at risk for decreased levels and treatment failure.
- Monitor frequency of prescription refills to determine adherence.
- ***Lab Test Considerations:*** Monitor CBC, electrolytes, LE cell prep, and ANA titer prior to and periodically during prolonged therapy.
- May cause a positive direct Coombs' test result.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- Do not confuse hydralazine with hydroxyzine.
- IM or IV route should be used only when drug cannot be given orally.
- May be administered concurrently with diuretics or beta blockers to permit lower doses and minimize side effects.
- **PO:** Administer with meals consistently to enhance absorption.
- Pharmacist may prepare oral solution from hydralazine injection for patients with difficulty swallowing.

#### IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. Use solution as quickly as possible after drawing through needle into syringe. ***Concentration:*** 20 mg/mL. ***Rate:*** Administer over at least 1 min. Pedi: Administer at a rate of 0.2 mg/kg/min in children. Monitor blood pressure and pulse in all patients frequently after injection.
- **Y-Site Compatibility:** anidulafungin, bivalirudin, bleomycin, dactinomycin, daptomycin, diltiazem, docetaxel, etoposide, etoposide phosphate, fenoldopam, fludarabine, gemcitabine, granisetron, hetastarch, hydromorphone, idarubicin, linezolid, mechlorethamine, metronidazole, milrinone, mitoxantrone, octreotide, oxaliplatin, paclitaxel, palonosetron, pancuronium, potassium chloride, tacrolimus, teniposide, thiotepa, tirofiban, vecuronium, vinorelbine, vitamin B complex with C, voriconazole.
- **Y-Site Incompatibility:** acyclovir, aminophylline, amphotericin B colloidal, ampicillin/sulbactam, ascorbic acid, azathioprine, cefazolin, cefonocid, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, dantrolene, diazepam, diazoxide, ertapenem, folic acid, ganciclovir, haloperidol, inamrinone, in-

domethacin, lorazepam, methylprednisolone, multivitamins, nafcillin, nitroprusside, oxacillin, pantoprazole, pemetrexed, pentobarbital, phenytoin, piperacillin/tazobactam, procainamide, sodium acetate, tigecycline, trimethoprim/sulfamethoxazole, urokinase.

- **Solution Compatibility:** 0.45% NaCl , 0.9% NaCl, LR.
- **Solution Incompatibility:** D5W.

### Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day; last dose of the day should be taken at bedtime. Take missed doses as soon as remembered; do not double doses. If more than 2 doses in a row are missed, consult health care professional. Must be discontinued gradually to avoid sudden increase in blood pressure. Hydralazine controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol intake, regular exercise, and stress management). Instruct patient and family on proper technique for blood pressure monitoring. Advise them to check blood pressure at least weekly and report significant changes.
- Patients should weigh themselves twice weekly and assess feet and ankles for fluid retention.
- May occasionally cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid sudden changes in position to minimize orthostatic hypotension.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products, especially cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication prior to treatment or surgery.
- Advise patient to notify health care professional immediately if general tiredness; fever; muscle or joint aching; chest pain; skin rash; sore throat; or numbness, tingling, pain, or weakness of hands and feet occurs. Vitamin $B_6$ (pyridoxine) may be used to treat peripheral neuritis.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.

### Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of side effects.
- Decreased afterload in patients with CHF.

## hydralazine/isosorbide dinitrate

(hye-**dral**-a-zeen eye-so-**sor**-bide di-**ni**-trate)

BiDil

H

***Classification***

Therapeutic: vasodilators

Pharmacologic: vasodilators, nitrates

**Pregnancy Category C**

### Indications

Management of heart failure in black patients.

### Action

BiDil is a fixed-dose combination of **isosorbide dinitrate**, a vasodilator with effects on both arteries and veins, and **hydralazine**, a predominantly arterial vasodilator. **Therapeutic Effects:** Improved survival, increased time to hospitalization and decreased symptoms of heart failure in black patients.

### Pharmacokinetics

See pharmacokinetic sections in hydralazine and isosorbide dinitrate monographs of Davis's Drug Guide for Nurses for more information.

**Absorption:** *Hydralazine*—10–26% absorbed in CHF patients, absorption can be saturated leading to large increases in absorption with higher doses; *isosorbide dinitrate*—variable absorbed (10–90%) reflecting first-pass hepatic metabolism.

**Distribution:** *Hydralazine*—widely distributed, crosses the placenta, minimal amounts in breast milk; *isosorbide dinitrate*—accumulates in muscle and venous wall.

**Metabolism and Excretion:** *Hydralazine*—mostly metabolized by GI mucosa and liver; *isosorbide dinitrate*—undergoes extensive first-pass metabolism in the liver mostly metabolized by the liver, some metabolites are vasodilators.

**Half-life:** *Hydralazine*—4 hr; *isosorbide dinitrate*—2 hr.

TIME/ACTION PROFILE ( effect on blood pressure)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| hydralazine | 45 min | 2 hr | 2–4 hr |
| isosorbide | 15–40 min | unknown | 4 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to either component.

**Use Cautiously in:** Lactation, Pedi: Safety not established in children <18 yr or breastfed infants; **Hydralazine:** Cardiovascular or cerebrovascular disease; Severe renal/hepatic disease (dose modification may be necessary); OB: Has been used safely during pregnancy; Lactation: Usually compatible with breastfeeding (AAP); **isosorbide dinitrate:** Head trauma or cerebral hemorrhage; Geriatric patients (start with lower doses); OB: May compromise maternal/fetal circulation; Lactation: Safety not established.

### Adverse Reactions/Side Effects

#### Hydralazine

**CNS:** dizziness, drowsiness, headache. **CV:** tachycardia, angina, arrhythmias, edema, orthostatic hypotension. **GI:** diarrhea, nausea, vomiting. **Derm:** rashes. **F and E:** sodium retention. **MS:** arthralgias, arthritis. **Neuro:** peripheral neuropathy. **Misc:** drug-induced lupus syndrome.

#### Isosorbide Dinitrate

**CNS:** dizziness, headache, apprehension, weakness. **CV:** hypotension, tachycardia, paradoxic bradycardia, syncope. **GI:** abdominal pain, nausea, vomiting. **Misc:** cross-tolerance, flushing, tolerance.

### Interactions

**Drug-Drug:** ↑ risk of hypotension with **phosphodiesterase inhibitors** (**sildenafil**, **vardenafil**, or **tadalafil**) other **antihypertensives**, acute ingestion of **alcohol**, **beta blockers**, **calcium channel blockers**, and **phenothiazines**. **MAO inhibitors** may exaggerate hypotension. May reduce the pressor response to **epinephrine**. **Beta blockers** ↓ tachycardia from hydralazine (therapy may be combined for this reason). **Metoprolol** and **propranolol** increase hydralazine levels. Hydralazine ↑ blood levels of **metoprolol** and **propranolol**.

### Route/Dosage

**PO (Adults):** 1 tablet 3 times daily, may be increased to 2 tablets 3 times daily.

### Availability

**Tablets:** hydralazine 37.5 mg/isosorbide dinitrate 20 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse routinely during period of dosage adjustment. Symptomatic hypotension may occur even with small doses. Use caution with patients who are volume depleted or hypotensive.
- ***Lab Test Considerations:*** If symptoms of systemic lupus erythematosus (SLE) occur obtain a CBC and ANA titer. If positive for SLE, carefully weigh risks/benefits of continued therapy.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Activity intolerance (Indications)

### Implementation

- Dose may be titrated rapidly over 3–5 days, but may need to decrease if side effects occur. May decrease to one-half tablet 3 times daily if intolerable side effects occur. Titrate up as soon as side effects subside.

### Patient/Family Teaching

- Instruct patient to take medication as directed on a regular schedule.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol or medications for erectile dysfunction with this medication. Patient should also consult health care professional before taking Rx, OTC, or herbal products while taking this medication.
- Caution patient that inadequate fluid intake or excessive fluid loss from perspiration, diarrhea or vomiting may lead to a fall in blood pressure, dizziness or syncope. If syncope occurs, discontinue medication and notify health care professional promptly.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe. Do not alter dose to avoid headache.
- Advise patient to notify health care professional if symptoms of systemic lupus erythematosus occur (arthralgia, fever, chest pain, prolonged malaise or other unexplained symptoms).

### Evaluation/Desired Outcomes

- Improved survival, increased time to hospitalization and decreased symptoms of heart failure in black patients.

**hydrochlorothiazide, See DIURETICS (THIAZIDE).**

HIGH ALERT

## hydrocodone

(hye-droe-**koe**-done)

Hycodan, Tussigon (U.S. antitussive formulations contain homatropine)

## hydrocodone/acetaminophen

Anexsia, Co-Gesic, Lorcet-HD, Lortab, Norco, Vicodin, Zydone

## hydrocodone/ibuprofen

Ibudone, Reprexain, Vicoprofen

***Classification***

Therapeutic: allergy, cold, and cough remedies (antitussive), opioid analgesics
Pharmacologic: opioid agonists/nonopioid analgesic combinations

**Schedule III (in combination)**

**Pregnancy Category C**

For information on the acetaminophen and ibuprofen components of these formulations, see the acetaminophen and ibuprofen monographs

### Indications

Used mainly in combination with nonopioid analgesics (acetaminophen/ibuprofen) in the management of moderate to severe pain. Antitussive (usually in combination products with decongestants).

### Action

Bind to opiate receptors in the CNS. Alter the perception of and response to painful stimuli while producing generalized CNS depression: Suppress the cough reflex via a direct central action. **Therapeutic Effects:** Decrease in severity of moderate pain. Suppression of the cough reflex.

### Pharmacokinetics

**Absorption:** Well absorbed following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver; eliminated in the urine (50–60% as metabolites, 15% as unchanged drug).
**Half-life:** 2.2 hr.

TIME/ACTION PROFILE (analgesic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 10–30 min | 30–60 min | 4–6 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to hydrocodone (cross-sensitivity may exist to other opioids); Hypersensitivity to acetaminophen/ibuprofen (for combination products); Ibuprofen-containing products should be avoided in patients with bleeding disorders or thrombocytopenia; Acetaminophen-containing products should be avoided in patients with severe hepatic or renal disease; Ibuprofen-containing products should be avoided in patients undergoing coronary artery bypass graft surgery; OB, Lactation: Avoid chronic use; Products containing alcohol, aspartame, saccharin, sugar, or tartrazine (FDC yellow dye #5) should be avoided in patients who have hypersensitivity or intolerance to these compounds.
**Use Cautiously in:** Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Cardiovascular disease (ibuprofen-containing products only); History of peptic ulcer disease (ibuprofen-containing products only); Alcoholism; Geri: Geriatric or debilitated patients (initial dosage ↓ required; more prone to CNS depression, constipation); Patients with undiagnosed abdominal pain; Prostatic hyperplasia; Pedi: Children (safety not established).

### Adverse Reactions/Side Effects

Noted for hydrocodone only; see acetaminophen/ibuprofen monographs for specific information on individual components.
**CNS:** confusion, dizziness, sedation, euphoria, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia. **GI:** constipation, dyspepsia, nausea, vomiting. **GU:** urinary retention. **Derm:** sweating. **Misc:** physical dependence, psychological dependence, tolerance.

### Interactions

**Drug-Drug:** Use with extreme caution in patients receiving **MAO inhibitors** (may produce severe, unpredictable reactions—do not use within 14 days of each other). Additive CNS depression with

**alcohol**, **antihistamines**, and **sedative/hypnotics**. Administration of partial antagonist opioids (**buprenorphine**, **butorphanol**, **nalbuphine**, or **pentazocine**) may ↓ analgesia or precipitate opioid withdrawal in physically dependent patients.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

### Route/Dosage

**PO (Adults):** *Analgesic*—2.5–10 mg q 3–6 hr as needed; if using combination products, acetaminophen dosage should not exceed 4 g/day and should not exceed 5 tablets/day of ibuprofen-containing products; *Antitussive*—5 mg q 4–6 hr as needed.
**PO (Children):** *Analgesic (2–13 yr)*—0.14 mg/kg q 4–6 hr. *Antitussive (6–12 yr)*—2.5 mg q 4–6 hr.

### Availability

#### Hydrocodone

**Hydrocodone tablets:** 5 mg (Hycodan). **Hydrocodone syrup:** 5 mg/mL (Hycodan, Robidone).

#### Hydrocodone/Acetaminophen (generic available)

**Tablets:** 2.5 mg hydrocodone/500 mg acetaminophen, 5 mg hydrocodone/400 mg acetaminophen (Zydone), 5 mg hydrocodone/325 mg acetaminophen (Anexsia 5/325, Norco), 5 mg hydrocodone/500 mg acetaminophen (Anexsia 5/500, Co-Gesic, Lorcet, Lortab 5/500, Vicodin), 7.5 mg hydrocodone/325 mg acetaminophen (Anexsia 7.5/325, Norco), 7.5 mg hydrocodone/400 mg acetaminophen (Zydone), 7.5 mg hydrocodone/500 mg acetaminophen, 7.5 mg hydrocodone/650 mg acetaminophen (Anexsia 7.5/650), 7.5 mg hydrocodone/750 mg acetaminophen (Vicodin ES), 10 mg hydrocodone/325 mg acetaminophen (Norco), 10 mg hydrocodone/400 mg acetaminophen (Zydone), 10 mg hydrocodone/500 mg acetaminophen (Lortab 10/500), 10 mg hydrocodone/650 mg acetaminophen, 10 mg hydrocodone/660 mg acetaminophen (Vicodin HP), 10 mg hydrocodone/750 mg acetaminophen (Anexsia 10/750). **Capsules:** 5 mg hydrocodone/500 mg acetaminophen (Lorcet-HD). **Elixir/oral solution:** 2.5 mg hydrocodone plus 167 mg acetaminophen/5 mL.

#### Hydrocodone/Ibuprofen (generic available)

**Tablets:** 2.5 mg hydrocodone/200 mg ibuprofen (Reprexain), 5 mg hydrocodone/200 mg ibuprofen (Ibudone, Reprexain), 7.5 mg hydrocodone/200 mg ibuprofen (Reprexain, Vicoprofen), 10 mg hydrocodone/200 mg ibuprofen (Ibudone, Reprexain).

## NURSING IMPLICATIONS

### Assessment

- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Pain:** Assess type, location, and intensity of pain prior to and 1 hr (peak) following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioids for pain do not develop psychological dependence. If progressively higher doses are required, consider conversion to a stronger opioid.
- **Cough:** Assess cough and lung sounds during antitussive use.
- ***Lab Test Considerations:*** May cause ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

### Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

### Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations. Do not confuse hydrocodone with hydrocortisone.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Combination with nonopioid analgesics may have additive analgesic effects and permit lower doses. Maximum doses of nonopioid agents limit the titration of hydrocodone doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** May be administered with food or milk to minimize GI irritation.

### Patient/Family Teaching

- Advise patient to take medication as directed and not to take more than the recommended amount. Severe and permanent liver damage may result from prolonged use or high doses of acetaminophen. Renal damage may occur with prolonged use of acetaminophen or ibuprofen. Doses of nonopioid agents should not exceed the maximum recommended daily dose.
- Instruct patient on how and when to ask for and take pain medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.

### Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of nonproductive cough.

**hydrocortisone, See CORTICOSTEROIDS (SYSTEMIC).**

**hydrocortisone, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

HIGH ALERT

## hydromorphone

(hye-droe-**mor**-fone)
Dilaudid, Dilaudid-HP, Hydrostat IR, PMS Hydromorphone

***Classification***
Therapeutic: allergy, cold, and cough remedies (antitussives), opioid analgesics
Pharmacologic: opioid agonists

**Schedule II**

**Pregnancy Category C**

### Indications

Moderate to severe pain (alone and in combination with nonopioid analgesics); extended release product for opioid-tolerant patients requiring around-the-clock management of persistent pain. Antitussive (lower doses).

### Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Suppresses the cough reflex via a direct central action. **Therapeutic Effects:** Decrease in moderate to severe pain. Suppression of cough.

### Pharmacokinetics

**Absorption:** Well absorbed following oral, rectal, subcut, and IM administration. Extended-release product results in an initial release of drug, followed by a second sustained phase of absorption.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk.

**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** *Oral, immediate release, or injection*—2–4 hr.

TIME/ACTION PROFILE (analgesic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | 30–90 min | 4–5 hr |
| Subcut | 15 min | 30–90 min | 4–5 hr |
| IM | 15 min | 30–60 min | 4–5 hr |
| IV | 10–15 min | 15–30 min | 2–3 hr |
| Rect | 15–30 min | 30–90 min | 4–5 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Some products contain bisulfites and should be avoided in patients with known hypersensitivity; OB, Lactation: Avoid chronic use during pregnancy or lactation.
**Use Cautiously in:** Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hypertrophy; Geri: Geriatric and debilitated patients may be more susceptible side effects; dose reduction recommended.

## Adverse Reactions/Side Effects

**CNS:** confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia. **GI:** constipation, dry mouth, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

## Interactions

**Drug-Drug:** Exercise extreme caution with **MAO inhibitors** (may produce severe, unpredictable reactions—reduce initial dose of hydromorphone to 25% of usual dose, discontinue MAO inhibitors 2 wk prior to hydromorphone). ↑ risk of CNS depression with **alcohol**, **antidepressants**, **antihistamines**, and **sedative/hypnotics** including **benzodazepines** and **phenothiazines**. Administration of partial antagonists (**buprenorphine**, **butorphanol**, **nalbuphine**, or **pentazocine**) may precipitate opioid withdrawal in physically dependent patients. **Nalbuphine** or **pentazocine** may ↓ analgesia.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

## Route/Dosage

Doses depend on level of pain and tolerance.

### Analgesic

**PO (Adults ≥50 kg):** 4–8 mg q 3–4 hr initially (some patients may respond to doses as small as 2 mg initially).
**PO (Adults and Children <50 kg):** 0.06 mg/kg q 3–4 hr initially, younger children may require smaller initial doses of 0.03 mg/kg. Maximum dose 5 mg.
**IV, IM, Subcut (Adults ≥50 kg):** 1.5 mg q 3–4 hr as needed initially; may be increased.
**IV, IM, Subcut (Adults and Children <50 kg):** 0.015 mg/kg mg q 3–4 hr as needed initially; may be increased.
**IV (Adults):** *Continuous infusion (unlabeled)*—0.2–30 mg/hr depending on previous opioid use. An initial bolus of twice the hourly rate in mg may be given with subsequent breakthrough boluses of 50–100% of the hourly rate in mg.
**Rect (Adults):** 3 mg q 6–8 hr initially as needed.

### Antitussive

**PO (Adults and Children > 12 yr):** 1 mg q 3–4 hr.
**PO (Children 6–12 yr):** 0.5 mg q 3–4 hr.

## Availability (generic available)

**Tablets:** 2 mg, 3 mg, 4 mg, 8 mg. **Oral solution:** 5 mg/5 mL. **Injection:** 1 mg/mL, 2 mg/mL, 4 mg/mL, 10 mg/mL. **Suppositories:** 3 mg. ***In combination with:*** guaifenesin and alcohol (Dilaudid Cough Syrup). See Appendix B.

# NURSING IMPLICATIONS

## Assessment

- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Geri: Pedi: Assess geriatric and pediatric patients frequently; more sensitive to the effects of opioid analgesics and may experience side effects and respiratory complications more frequently.
- Assess bowel function routinely. Institute prevention of constipation with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.
- **Pain:** Assess type, location, and intensity of pain prior to and 1 hr following IM and 5 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a

50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. When titrating doses of short-acting hydromorphone, a repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.

- Patients on a continuous infusion should have additional bolus doses provided every 15–30 min, as needed, for breakthrough pain. The bolus dose is usually set to the amount of drug infused each hour by continuous infusion.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive hydromorphone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- **Cough:** Assess cough and lung sounds during antitussive use.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

## Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings. Do not confuse with meperidine or morphine; fatalities have occurred. Do not confuse high-potency (HP) dose forms with regular dose forms. Pedi: Medication errors with opioid analgesics are common in pediatric patients; do not misinterpret or miscalculate doses. Use appropriate measuring devices.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** May be administered with food or milk to minimize GI irritation.

### IV Administration

- **Direct IV:** ***Diluent:*** Dilute with at least 5 mL of sterile water or 0.9% NaCl for injection. Inspect solution for particulate matter. Slight yellow color does not alter potency. Store at room temperature. ***Rate:*** Administer slowly, at a rate not to exceed 2 mg over 3–5 min. ***High Alert:*** Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Syringe Compatibility:** atropine, bupivacaine, ceftazidime, chlorpromazine, cimetidine, diphenhydramine, fentanyl, glycopyrrolate, hydroxyzine, lorazepam, metoclopramide, midazolam, pentobarbital, potassium chloride, prochlorperazine, promethazine, ranitidine, scopolamine, thiethylperazine.
- **Syringe Incompatibility:** ampicillin, diazepam, heparin, hyaluronidase, pantoprazole, phenobarbital, phenytoin.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, amikacin, amsacrine, atropine, aztreonam, bivalirudin, cefepime, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chloramphenicol, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dexamethasone, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, epinephrine, erythromycin lactobionate, etoposide, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, foscarnet, furosemide, gemcita-

bine, gentamicin, granisetron, haloperidol, heparin, kanamycin, ketorolac, labetalol, linezolid, lorazepam, magnesium sulfate, melphalan, methotrexate, methotrimeprizine, metoclopramide, metronidazole, midazolam, milrinone, morphine, nafcillin, nitroglycerin, norepinephrine, ondansetron, oxaliplatin, paclitaxel, pemetrexed, penicillin G potassium, piperacillin/tazobactam, propofol, ranitidine, remifentanil, scopolamine, tacrolimus, teniposide, thiotepa, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, vinorelbine.

- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, lansoprazole, phenytoin, sargramostim, thiopental.
- **Additive Compatibility:** bupivicaine, clonidine, heparin, midazolam, ondansetron, potassium chloride.
- **Additive Incompatibility:** sodium bicarbonate, thiopental.
- **Solution Compatibility:** D5W, D5/0.45% NaCl, D5/0.9% NaCl, D5/LR, D5/Ringer's solution, 0.45% NaCl, 0.9% NaCl, Ringer's and LR.

### Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- **Home Care Issues:** Explain to patient and family how and when to administer hydromorphone and how to care for infusion equipment properly. Pedi: Teach parents or caregivers how to accurately measure liquid medication and to use only the measuring device dispensed with the medication.
- Emphasize the importance of aggressive prevention of constipation with the use of hydromorphone.

### Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of cough.

**hydroxocobalamin, See VITAMIN $B_{12}$ PREPARATIONS.**

## hydroxychloroquine

(hye-drox-ee-**klor**-oh-kwin)

Plaquenil

***Classification***

Therapeutic: antimalarials, antirheumatics (DMARDs)

**Pregnancy Category C**

### Indications

Suppression/chemoprophylaxis of malaria. Treatment of severe rheumatoid arthritis/systemic lupus erythematosus.

### Action

Inhibits protein synthesis in susceptible organisms by inhibiting DNA and RNA polymerase.
**Therapeutic Effects:** Death of plasmodia responsible for causing malaria. Also has anti-inflammatory properties.

### Pharmacokinetics

**Absorption:** Highly variable (31–100%) following oral administation.
**Distribution:** Widely distributed; high concentrations in RBCs; crosses the placenta; excreted into breast milk.
**Metabolism and Excretion:** Partially metabolized by the liver to active metabolites; partially excreted unchanged by the kidneys.
**Half-life:** 72–120 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid† | 1–2 hr | days–weeks |

†Onset of antirheumatic action may take 6 wk

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to hydroxychloroquine or chloroquine; Previous visual damage from hydroxychloroquine or chloroquine.
**Use Cautiously in:** Concurrent use of hepatotoxic drugs; History of liver disease or alcoholism or renal impairment; Severe neurological disorders; Severe blood disorders; Retinal or visual field changes; G6PD deficiency; Psoriasis; Bone marrow depression; Obesity (determine dose by ideal body weight); OB, Lactation: Avoid use unless treating/preventing malaria or treating amebic abscess; Pedi: Long-term use may increase sensitivity to effects.

### Adverse Reactions/Side Effects

**CNS:** SEIZURES, aggressiveness, anxiety, apathy, confusion, fatigue, headache, irritability, personality changes, psychoses. **EENT:** keratopathy, ototoxicity, retinopathy, tinnitus, visual disturbances. **CV:** ECG changes, hypotension. **GI:** abdominal cramps, anorexia, diarrhea, epigastric discomfort, nausea, vomiting, hepatic failure. **Derm:** bleaching of hair, alopecia, hyperpigmentation, photosensitivity, Stevens-Johnson syndrome. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, thrombocytopenia. **Neuro:** neuromyopathy, peripheral neuritis.

### Interactions

**Drug-Drug:** May ↑ the risk of hepatotoxicity when administered with **hepatotoxic drugs**. May ↑ the risk of hematologic toxicity when administered with **penicillamine**. May ↑ risk of dermatitis when administered with other **agents having dermatologic toxicity**. May decrease serum titers of rabies antibody when given concurrently with **human diploid cell rabies vaccine**. **Urinary acidifiers** may ↑ renal excretion. May ↑ serum levels of **digoxin**.

### Route/Dosage

Antimalarial doses expressed as mg of base; antirheumatic and lupus doses expressed as mg of hydroxychloroquine sulfate (200 mg hydroxychloroquine sulfate = 155 mg of hydroxychloroquine base).

### Malaria

**PO (Adults):** *Suppression or chemoprophylaxis*—310 mg once weekly; start 1–2 wk prior to entering malarious area; continue for 4 wk after leaving area. *Treatment*—620 mg, then 310 mg at 6 hr, 24 hr, and 48 hr after initial dose.
**PO (Children):** *Suppression or chemoprophylaxis*—5 mg/kg once weekly; start 1–2 wk prior to entering malarious area; continue for 4 wk after leaving area. *Treatment*—10 mg/kg initially, then 5 mg/kg at 6–8 hr, 24 hr, and 48 hr after initial dose.

### Rheumatoid Arthritis

**PO (Adults):** 400–600 mg once daily initially, maintenance 200–400 mg/day divided 1–2 times/day.
**PO (Children):** 3–5 mg/kg/day divided 1–2 times/day to a maximum of 400 mg/day; not to exceed 7 mg/kg/day.

### Systemic Lupus Erythematosus

**PO (Adults):** 400 mg once or twice daily, maintenance 200–400 mg/day.
**PO (Children):** 3–5 mg/kg/day divided 1–2 times/day to a maximum of 400 mg/day; not to exceed 7 mg/kg/day.

### Availability

**Tablets:** 200 mg (155-mg base).

## NURSING IMPLICATIONS

H

### Assessment

- Assess deep tendon reflexes periodically to determine muscle weakness. Therapy may be discontinued should this occur.
- Patients on prolonged high-dose therapy should have eye exams prior to and every 3–6 mo during therapy to detect retinal damage.
- **Malaria or Lupus Erythematosus:** Assess patient for improvement in signs and symptoms of condition daily throughout course of therapy.
- **Rheumatoid Arthritis:** Assess patient monthly for pain, swelling, and range of motion.
- ***Lab Test Considerations:*** Monitor CBC and platelet count periodically throughout therapy. May cause decreased RBC, WBC, and platelet counts. If severe decreases occur that are not related to the disease process, hydroxychloroquine should be discontinued.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Chronic pain (Indications)

### Implementation

- **PO:** Administer with milk or meals to minimize GI distress.
- Tablets may be crushed and placed inside empty capsules for patients with difficulty swallowing. Contents of capsules may also be mixed with a teaspoonful of jam, jelly, or Jell-O prior to administration.
- **Malaria Prophylaxis:** Hydroxychloroquine therapy should be started 2 wk prior to potential exposure and continued for 4–6 wk after leaving the malarious area.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed and continue full course of therapy even if feeling better. Missed doses should be taken as soon as remembered unless it is almost time for next dose. Do not double doses.

- Advise patients to avoid use of alcohol while taking hydroxychloroquine.
- Caution patient to keep hydroxychloroquine out of reach of children; fatalities have occurred with ingestion of 3 or 4 tablets.
- Explain need for periodic ophthalmic exams for patients on prolonged high-dose therapy. Advise patient that the risk of ocular damage may be decreased by the use of dark glasses in bright light. Protective clothing and sunscreen should also be used to reduce risk of dermatoses.
- Advise patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, blurred vision, visual changes, ringing in the ears, difficulty hearing, or muscle weakness occurs.
- **Malaria Prophylaxis:** Review methods of minimizing exposure to mosquitoes with patients receiving hydroxychloroquine prophylactically (use repellent, wear long-sleeved shirt and long trousers, use screen or netting).
- Advise patient to notify health care professional if fever develops while traveling or within 2 mo of leaving an endemic area.
- **Rheumatoid Arthritis:** Instruct patient to contact health care professional if no improvement is noticed within a few days. Treatment for rheumatoid arthritis may require up to 6 mo for full benefit.

### Evaluation/Desired Outcomes

- Prevention or resolution of malaria.
- Improvement in signs and symptoms of rheumatoid arthritis.
- Improvement in symptoms of lupus erythematosus.

## hydrOXYzine (hye-drox-i-zeen)

Apo-Hydroxyzine, Atarax, Hyzine-50, Multipax, Novohydroxyzin, Vistaril

***Classification***

Therapeutic: antianxiety agents, antihistamines, sedative/hypnotics

**Pregnancy Category C**

### Indications

Treatment of anxiety. Preoperative sedation. Antiemetic. Antipruritic. May be combined with opioid analgesics.

### Action

Acts as a CNS depressant at the subcortical level of the CNS. Has anticholinergic, antihistaminic, and antiemetic properties. Blocks histamine 1 receptors. **Therapeutic Effects:** Sedation. Relief of anxiety. Decreased nausea and vomiting. Decreased allergic symptoms associated with release of histamine, including pruritus.

### Pharmacokinetics

**Absorption:** Well absorbed following PO/IM administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Completely metabolized by the liver; eliminated in the feces via biliary excretion.
**Half-life:** 3 hr.

TIME/ACTION PROFILE (sedative, antiemetic, antipruritic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15–30 min | 2–4 hr | 4–6 hr |
| IM | 15–30 min | 2–4 hr | 4–6 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB: Potential for congenital defects (oral clefts and hypoplasia of cerebral hemisphere; Lactation: Safety not established.
**Use Cautiously in:** Severe hepatic dysfunction; OB: Has been used safely during labor; Pedi: Injection contains benzyl alcohol, which can cause potentially fatal gasping syndrome in neonates; Geri: Appears on *Beers list*. Geriatric patients are more susceptible to adverse reactions due to anticholinergic effects; dosage reduction recommended.

### Adverse Reactions/Side Effects

**CNS:** drowsiness, agitation, ataxia, dizziness, headache, weakness. **Resp:** wheezing. **GI:** dry mouth, bitter taste, constipation, nausea. **GU:** urinary retention. **Derm:** flushing. **Local:** pain at IM site, abscesses at IM sites. **Misc:** chest tightness.

### Interactions

**Drug-Drug:** Additive CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**. Can antagonize the vasopressor effects of **epinephrine**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can increase CNS depression. Increased anticholinergic effects with **angel's trumpet**, **jimson weed**, and **scopolia**.

### Route/Dosage

**PO (Adults):** *Antianxiety*—25–100 mg 4 times/day, not to exceed 600 mg/day. *Preoperative sedation*—50–100 mg single dose. *Antipruritic*—25 mg 3–4 times daily.
**PO (Children):** —2 mg/kg/day divided q 6–8 hr.
**IM (Adults):** *Preoperative sedation*—25–100 mg single dose. *Antiemetic, adjunct to opioid analgesics*—25–100 mg q 4–6 hr as needed.
**IM (Children):** —0.5–1 mg/kg/dose q 4–6 hr as needed.

### Availability (generic available)

**Tablets:** 10 mg, 25 mg, 50 mg, 100 mg. **Capsules:** 10 mg, 25 mg, 50 mg, 100 mg. **Syrup:** 10 mg/5 mL. **Oral suspension:** 25 mg/5 mL. **Injection:** 25 mg/mL, 50 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for profound sedation and provide safety precautions as indicated (side rails up, bed in low position, call bell within reach, supervision of ambulation and transfer). Geri: Older adults are more sensitive to CNS and anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia). Monitor for drowsiness, agitation, over sedation, and other systemic side effects. Assess falls risk and implement prevention strategies.
- **Anxiety:** Assess mental status (orientation, mood, and behavior).
- **Nausea and Vomiting:** Assess degree of nausea and frequency and amount of emesis.
- **Pruritus:** Assess degree of itching and character of involved skin.
- ***Lab Test Considerations:*** May cause false-negative skin test results using allergen extracts. Discontinue hydroxyzine at least 72 hr before test.

### Potential Nursing Diagnoses

Anxiety (Indications)
Impaired skin integrity (Indications)
Risk for injury (Side Effects)
Ineffective coping (Side Effects)

### Implementation

- Do not confuse hydroxyzine with hydralazine or Atarax (hydroxyzine) with Ativan (lorazepam).
- **PO:** Tablets may be crushed and capsules opened and administered with food or fluids for patients having difficulty swallowing.
- Shake suspension well before administration.
- **IM:** Administer *only* IM deep into well-developed muscle, preferably with Z-track technique. Injection is extremely painful. Do not use deltoid site. If must be administered to children, midlateral muscles of the thigh are preferred. Significant tissue damage, necrosis, and sloughing may result from subcut or intra-arterial injections. Hemolysis may result from IV injections. Rotate injection sites frequently.
- **Syringe Compatibility:** atropine, butorphanol, chlorpromazine, cimetidine, codeine, diphenhydramine, doxapram, droperidol, fentanyl, fluphenazine, glycopyrrolate, hydromorphone, lidocaine, meperidine, metoclopramide, midazolam, morphine, nalbuphine, oxymorphone, pentazocine, perphenazine, procaine, prochlorperazine, promethazine, scopolamine, sufentanil.
- **Syringe Incompatibility:** dimenhydrinate, haloperidol, heparin, ketorolac, pentobarbital, ranitidine.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Missed doses should be taken as soon as remembered unless it is almost time for next dose; do not double doses.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Geri: Warn patients or caregivers that older adults are at increased risk for CNS effects and falls.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may help decrease dry mouth. If dry mouth persists for more than 2 wk, consult dentist about saliva substitute.
- If used for anxiety, advise patient that psychotherapy is beneficial in addressing sources of anxiety and improving coping skills.
- Teach other methods to decrease anxiety, such as increased exercise, support groups, and relaxation techniques.

## Evaluation/Desired Outcomes

- Decrease in anxiety.
- Relief of nausea and vomiting.
- Relief of pruritus.
- Sedation when used as a sedative/hypnotic.

## hyoscyamine (hi-oh-**si**-a-meen)

Anaspaz, A-Spas S/L, Cystospaz, Cystospaz-M, Donnamar, ED-SPAZ, Gastrosed, Levsinex, Levsin, Levbid, L-hyoscyamine, NuLev

***Classification***

Therapeutic: antispasmodics
Pharmacologic: anticholinergics

**Pregnancy Category C**

## Indications

Control of gastric secretion, visceral spasm, hypermotility in spastic colitis, spastic bladder, pylorospasm, and related abdominal cramps. Decreases symptoms of various functional intestinal disorders including mild dysenteries, diverticulitis, infant colic, biliary and renal colic. Adjunctive therapy in peptic ulcer disease, irritable bowel syndrome, neurogenic bowel disturbances. Decreases pain and hypersecretion associated with pancreatitis. Relief of symptoms of acute rhinitis. Decreases rigidity and tremors associated with parkinsonism and controls related sialorrhea and hyperhidrosis. May also be used to manage anticholinesterase poisoning. Management of cystitis or renal colic. Management of some forms of heart block due to vagal activity. **IM, IV, Subcut:** Facilitation of diagnostic hypotonic duodenography; may also increase radiologic visibility of the kidneys. Preoperative administration decreases secretions and blocks bradycardia associated with some forms of anesthesia and related surgical agents.

## Action

Inhibits the muscarinic effect of acetylcholine in smooth muscle, secretory glands and the CNS. Small doses decrease salivary and bronchial secretions and decrease sweating; intermediate doses dilate the pupil, inhibit accommodation, increase heart rate (vagolytic action); large doses decrease GI and GU motility, further increase in dose decreases gastric acid secretion. **Therapeutic Effects:** Decreased secretions with decreased GI and GU symptomatology. Increased heart rate.

## Pharmacokinetics

**Absorption:** Well absorbed; food does not affect absorption.
**Distribution:** Crosses the placenta and blood-brain barrier; enters breast milk.
**Metabolism and Excretion:** Excreted mostly unchanged by the kidneys.
**Half-life:** 3.5 hr.

TIME/ACTION PROFILE (GI effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 20–30 min | unknown | 4–6 hr |
| IM, IV, subcut | 2–3 min | unknown | 4–6 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Angle-closure glaucoma; Tachycardia or unstable cardiovascular status; GI obstructive disease, paralytic ileus, intestinal atony, severe ulcerative colitis; Obstructive uropathy; Myasthenia gravis; Lactation: Lactation; Pedi: Products containing benzyl alcohol should not be used in newborn or immature infants; Some products contain alcohol, sulfites, or tartrazine and should be avoided in patients with known intolerance/hypersensitivity; Phenylketonuria (NuLev contains aspartame).
**Use Cautiously in:** History of cardiovascular disease including CHF, arrhythmias, hypertension, tachycardia, or coronary artery disease; Renal or hepatic impairment; Prostatic hyperplasia; Early ileus or reflux esophagitis; Automonic neuropathy; Hyperthyroidism; Geri: Appears on Beers list; ↑ sensitivity to anticholinergics; Pedi: Infants, small children, Down's syndrome, brain damage, or spastic paralysis (↑ sensitivity); OB: May cause fetal tachycardia; safety not established.

## Adverse Reactions/Side Effects

**CNS:** confusion/excitement (especially in geriatric patients), dizziness, flushing, headache, insomnia, lightheadedness (IM, IV, subcut), nervousness. **EENT:** blurred vision, cycloplegia, ↑ intraocular pressure, mydriasis, photophobia. **CV:** palpitations, tachycardia. **GI:** dry mouth, altered taste perception, bloated feeling, constipation, nausea, paralytic ileus, vomiting. **GU:** erectile dysfunction, urinary hesitancy/retention. **Derm:** ↓ sweating, urticaria. **Local:** local irritation (IM, IV, subcut). **Misc:** allergic reactions including ANAPHYLAXIS, fever (especially in children), suppression of lactation.

## Interactions

**Drug-Drug:** Concurrent administration with **amantadine** ↑ anticholinergic side effects (may require dose ↓). ↑ effects of **atenolol**. Concurrent use with **phenothiazines** may result in ↓ effect of phenothiazine and ↑ anticholinergic side effects (dose reduction may be necessary).

↑ anticholinergic side effects with **tricyclic antidepressants**.

### Route/Dosage

**PO, SL (Adults):** 0.125–0.25 mg 3–4 times daily or 0.375–0.75 mg as sustained release form every 12 hr.
**PO (Children 2–<12 yr):** *orally disintegrating tablets (NuLev)* —0.0625–0.125 mg (1/2–1 tablet) every 4 hr, up to 6 times/day.
**PO (Children 34–36 kg):** 125–187 mcg every 4 hr as needed.
**PO (Children 22.7–33 kg):** 94–125 mcg every 4 hr as needed.
**PO (Children 13.6–22.6 kg):** 63 mcg every 4 hr as needed.
**PO (Children 9.1–13.5 kg):** 31.3 mcg every 4 hr as needed.
**PO (Children 6.8–9 kg):** 25 mcg every 4 hr as needed.
**PO (Children 4.5–6.7 kg):** 18.8 mcg every 4 hr as needed.
**PO (Children 3.4–4.4 kg):** 15.6 mcg every 4 hr as needed.
**PO (Children 2.3–3.3 kg):** 12.5 mcg every 4 hr as needed.
**IM, IV, Subcut (Adults):** *Gastrointestinal anticholinergic*—0.25–0.5 mg 3–4 times daily as needed; *preoperative prophylaxis of secretions*—0.5 mg or 0.005 mg/kg 30–60 min before anesthesia; *antiarrhythmic*—0.125 mg IV repeated as needed; *cholinergic adjunct (curariform block)*—0.2 mg for each 1 mg of neostigmine.
**IM, IV, Subcut (Children ≥2 yr):** *preoperative prophylaxis of secretions*—0.005 mg/kg 30–60 min before anesthesia.

### Availability (generic available)

**Tablets:** 0.125 mg. **Sublingual tablets:** 0.125 mg. **Orally-disintegrating tablets (contains aspartame) (mint):** 0.125 mg. **Extended-release tablets:** 0.375 mg. **Timed-release capsules:** 0.375 mg. **Solution (drops) (orange):** 0.125 mg/mL. **Elixir (orange):** 0.125 mg/5 mL. **Injection:** 0.5 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess vital signs and ECG tracings frequently during IV drug therapy. Report any significant changes in heart rate or blood pressure, or increased ventricular ectopy or angina promptly.
- Monitor intake and output ratios in elderly or surgical patients because hyoscyamine may cause urinary retention.
- Assess patients routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate constipation.
- ***Toxicity and Overdose:*** If overdose occurs, physostigmine is the antidote.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Impaired oral mucous membrane (Side Effects)
Constipation (Side Effects)

### Implementation

- Do not confuse Levbid (hyoscyamine) with Lithobid (lithium) or Lopid (gemfibrozil).
- **PO:** Oral doses are usually given 30 min before meals. Swallow extended-release and time-release products whole; do not open, break, crush, or chew.

#### IV Administration

- **Direct IV:** ***Diluent:*** May give IV undiluted or dilute in 10 mL of sterile water. ***Rate:*** No rate information available, administer slowly.

### Patient/Family Teaching

- Instruct patient to take exactly as directed. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- May cause drowsiness. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient that oral rinses, sugarless gum or candy, and frequent oral hygiene may help relieve dry mouth.
- Caution patients that hyoscyamine impairs heat regulation. Strenuous activity in a hot environment may cause heat stroke.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products concurrently with hyoscyamine.
- Inform male patients with benign prostatic hyperplasia that hyoscyamine may cause urinary hesitancy and retention. Changes in urinary stream should be reported to health care professional.

### Evaluation/Desired Outcomes

- Increase in heart rate.
- Dryness of mouth.
- Reversal of muscarinic effects.

## ibandronate (i-ban-dro-nate)
Boniva

***Classification***
Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates

**Pregnancy Category C**

### Indications
Treatment/prevention of postmenopausal osteoporosis.

### Action
Inhibits resorption of bone by inhibiting ostoclast activity. **Therapeutic Effects:** Reversal/prevention of progression of osteoporosis with decreased fractures.

### Pharmacokinetics
**Absorption:** 0.6% absorbed following oral administration (significantly decreased by food).
**Distribution:** Rapidly binds to bone.
**Protein Binding:** 90.9–99.5%.
**Metabolism and Excretion:** 50–60% excreted in urine; unabsorbed drug is eliminated in feces.
**Half-life:** *PO*—10–60 hr; *IV*—4.6–25.5 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 0.5–2 hr | up to 1 mo |
| IV | unknown | 3 hr | up to 3 mo |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Uncorrected hypocalcemia; Inability to stand/sit upright for at least 60 min; CCr <30 mL/min.
**Use Cautiously in:** Concurrent use of NSAIDs or aspirin; Concurrent dental surgery (may ↑ risk of jaw osteonecrosis); OB: Use only if potential benefit outweighs risks to mother and fetus; Lactation: Lactation; Pedi: Children <18 yr (safety not established); Geri: Consider age related ↓ in body mass, renal and hepatic function, concurrent disease states and drug therapy.

### Adverse Reactions/Side Effects
**GI:** diarrhea, dyspepsia, dysphagia, esophageal cancer, esophagitis, esophageal/gastric ulcer.
**MS:** musculoskeletal pain, pain in arms/legs, osteonecrosis (primarily of jaw). **Misc:** injection site reactions.

### Interactions
**Drug-Drug: Calcium-, aluminum-, magnesium-**, and **iron-**containing products, including **antacids** ↓ absorption (ibandronate should be taken 60 min before). Concurrent use of **NSAIDs** including **aspirin**, may ↑ risk of gastric irritation.
**Drug-Food:** Milk and other foods ↓ absorption.

### Route/Dosage
**PO (Adults):** 2.5 mg once daily or 150 mg once monthly.
**IV (Adults):** 3 mg every 3 months.

### Availability
**Tablets:** 2.5 mg, 150 mg. **Cost:** 150 mg $254.00/3. **Injection:** 3 mg/3 mL in prefilled single-use syringe.

## NURSING IMPLICATIONS

### Assessment
- **Osteoporosis:** Assess patients for low bone mass before and periodically during therapy.
- ***Lab Test Considerations:*** Assess serum calcium before and periodically during therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating ibandronate therapy.
- May cause ↓ total alkaline phosphatase levels.
- May cause hypercholesterolemia.

### Potential Nursing Diagnoses
Risk for injury (Indications)

### Implementation
- **PO:** Administer first thing in the morning with 6–8 oz plain water 30 min before other medications, beverages, or food. Tablet should be swallowed whole; do not break, crush, or chew.
- *Once-monthly tablet* should be administered on the same date each month.

**IV Administration**
- **IV:** Administer using prefilled syringe. Do not administer solution that is discolored or contain particulate matter. Administer IV only; other routes may cause tissue damage.
- ***Rate:*** Administer as a 15–30 second bolus.
- **Y-Site Incompatibility:** Do not administer with calcium-containing solutions or other IV drugs.

### Patient/Family Teaching
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D. Wait at

least 60 min after administration before taking supplemental calcium and vitamin D.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Inform patient that severe musculoskeletal pain may occur within days, months, or yr after starting ibandronate. Symptoms my resolve completely after discontinuation or slow or incomplete resolution may occur. Notify health care professional if sever pain occurs.
- Advise patient to inform health care professional of ibandronate therapy prior to dental surgery.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if she is breastfeeding.
- **PO:** Instruct patient on the importance of taking as directed, first thing in the morning, 60 min before other medications, beverages, or food. Ibandronate should be taken with 6–8 oz plain water (mineral water, orange juice, coffee, and other beverages decrease absorption). Do not chew or suck on tablet. If a dose is missed, skip dose and resume the next morning; do not double doses or take later in the day. If a once-monthly dose is missed and the next scheduled dose is >7 days away, take in the morning following the date it is remembered. Resume original schedule the following month. If the next dose is <7 days away, omit dose and take next scheduled dose. Do not discontinue without consulting health care professional.
- Caution patient to remain upright for 60 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation.
- **IV:** Advice patient that IV doses should not be administered sooner that every 3 months. If a dose is missed, have health care professional administer as soon as possible; next injection should be scheduled 3 months from last injection.

### Evaluation/Desired Outcomes
- Prevention of or decrease in the progression of osteoporosis in postmenopausal women.

## ibuprofen (oral)
(eye-byoo-**proe**-fen)
Actiprofen, Advil, Advil Migraine Liqui-Gels, Apo-Ibuprofen, Children's Advil, Children's Motrin, Excedrin IB, Genpril, Haltran, Junior Strength Advil, Menadol, Medipren, Midol Maximum Strength Cramp Formula, Motrin, Motrin Drops, Motrin IB, Motrin Junior Strength, Motrin Migraine Pain, Novo-Profen, Nu-Ibuprofen, Nuprin, PediaCare Children's Fever

## ibuprofen (injection)
Caldolor

***Classification***
Therapeutic: antipyretics, antirheumatics, nonopioid analgesics, nonsteroidal anti-inflammatory agents
Pharmacologic: nonopioid analgesics

**Pregnancy Category C (up to 30 wk gestation), D (starting at 30 wk gestation)**

### Indications
**PO, IV:** Treatment of: Mild to moderate pain, Fever. **PO:** Treatment of: Inflammatory disorders including rheumatoid arthritis (including juvenile) and osteoarthritis, Dysmenorrhea. **IV:** Moderate to severe pain with opioid analgesics.

### Action
Inhibits prostaglandin synthesis. **Therapeutic Effects:** Decreased pain and inflammation. Reduction of fever.

### Pharmacokinetics
**Absorption:** Oral formulation is well absorbed (80%) from the GI tract; IV administration results in complete bioavailability.
**Distribution:** Does not enter breast milk in significant amounts.
**Protein Binding:** 99%.
**Metabolism and Excretion:** Mostly metabolized by the liver; small amounts (1%) excreted unchanged by the kidneys.
**Half-life:** Children: 1–2 hr; Adults: 2–4 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (antipyretic) | 0.5–2.5 hr | 2–4 hr | 6–8 hr |
| PO (analgesic) | 30 min | 1–2 hr | 4–6 hr |
| PO (anti-inflammatory) | 7 days | 1–2 wk | unknown |
| IV (analgesic) | unknown | unknown | 6 hr |
| IV (antipyretic) | within 2 hr | 10–12 hr† | 4–6 hr |

† With repeated dosing

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity (cross-sensitivity may exist with other NSAIDs, including

aspirin); Active GI bleeding or ulcer disease; Chewable tablets contain aspartame and should not be used in patients with phenylketonuria; Peri-operative pain from coronary artery bypass graft (CABG) surgery; OB: Avoid after 30 wk gestation (may cause premature closure of fetal ductus arteriosus).

**Use Cautiously in:** Cardiovascular disease (may ↑ risk of cardiovascular events); Renal or hepatic disease, dehydration, or patients on nephrotoxic drugs (may ↑ risk of renal toxicity); Aspirin triad patients (asthma, nasal polyps, and aspirin intolerance); can cause fatal anaphylactoid reactions; Geri: ↑ risk of adverse reactions secondary to age-related ↓ in renal and hepatic function, concurrent illnesses, and medications; Chronic alcohol use/abuse; Coagulation disorders; OB: Use cautiously up to 30 wk gestation; avoid after that; Lactation: Use cautiously; Pedi: Safety not established for infants <6 mo (oral) and children <17 yr (IV).

**Exercise Extreme Caution in:** History of GI bleeding or GI ulcer disease.

## Adverse Reactions/Side Effects

**CNS:** headache, dizziness, drowsiness, psychic disturbances. **EENT:** amblyopia, blurred vision, tinnitus. **CV:** arrhythmias, edema, hypertension. **GI:** GI BLEEDING, HEPATITIS, constipation, dyspepsia, nausea, vomiting, abdominal discomfort. **GU:** cystitis, hematuria, renal failure. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rashes. **Hemat:** anemia, blood dyscrasias, prolonged bleeding time. **Misc:** allergic reactions including ANAPHYLAXIS.

## Interactions

**Drug-Drug:** May limit the cardioprotective effects of low-dose **aspirin**. Concurrent use with **aspirin** may ↓ effectiveness of ibuprofen. Additive adverse GI side effects with **aspirin**, **oral potassium**, other **NSAIDs**, **corticosteroids**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics**, **ACE inhibitors**, or other **antihypertensives**. May ↑ hypoglycemic effects of **insulin** or **oral hypoglycemic agents**. May ↑ serum **lithium** levels and risk of toxicity. ↑ risk of toxicity from **methotrexate**. **Probenecid** ↑ risk of toxicity from ibuprofen. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **corticosteroids**, **valproic acid**, **thrombolytics**, **warfarin**, and **drugs affecting platelet function** including **clopidogrel**, **ticlopidine**, **abciximab**, **eptifibatide**, or **tirofiban**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. ↑ risk of nephrotoxicity with **cyclosporine**.

**Drug-Natural Products:** ↑ bleeding risk with, **arnica**, **chamomile**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

## Route/Dosage

### Analgesia

**PO (Adults):** *Anti-inflammatory*—400–800 mg 3–4 times daily (not to exceed 3200 mg/day). *Analgesic/antidysmenorrheal/antipyretic*—200–400 mg q 4–6 hr (not to exceed 1200 mg/day).

**PO (Children 6 mo–12 yr):** *Anti-inflammatory*—30–50 mg/kg/day in 3–4 divided doses (maximum dose: 2.4 g/day). *Antipyretic*—5 mg/kg for temperature <102.5°F (39.17°C) or 10 mg/kg for higher temperatures (not to exceed 40 mg/kg/day); may be repeated q 4–6 hr. *Cystic fibrosis (unlabeled)*—20–30 mg/kg/day divided twice daily.

**PO (Infants and Children):** *Analgesic*—4–10 mg/kg/dose q 6–8 hr.

**IV (Adults):** *Analgesic*—400–800 mg q 6 hr as needed (not to exceed 3200 mg/day); *Antipyretic*—400 mg initially, then 400 mg q 4–6 hr or 100–200 mg q 4 hr as needed (not to exceed 3200 mg/day).

### Pediatric OTC Dosing

**PO (Children 11 yr/72–95 lb):** 300 mg q 6–8 hr.

**PO (Children 9–10 yr/60–71 lb):** 250 mg q 6–8 hr.

**PO (Children 6–8 yr/48–59 lb):** 200 mg q 6–8 hr.

**PO (Children 4–5 yr/36–47 lb):** 150 mg q 6–8 hr.

**PO (Children 2–3 yr/24–35 lb):** 100 mg q 6–8 hr.

**PO (Children 12–23 mo/18–23 lb):** 75 mg q 6–8 hr.

**PO (Infants 6–11 mo/12–17 lb):** 50 mg q 6–8 hr.

## Availability (generic available)

**Tablets:** 100 mg[OTC], 200 mg[OTC], 300 mg, 400 mg, 600 mg, 800 mg. **Capsules (liqui-gels):** 200 mg[OTC]. **Chewable tablets (fruit, grape, orange, and citrus flavor ):** 50 mg[OTC], 100 mg[OTC]. **Liquid (berry flavor):** 100 mg/5 mL[OTC]. **Oral**

**suspension (fruit, berry, grape flavor):** 100 mg/5 mL[OTC], 100 mg/2.5 mL[OTC]. **Pediatric drops (berry flavor):** 50 mg/1.25 mL[OTC]. **Solution for injection:** 100 mg/mL. ***In combination with:*** decongestants, [OTC], hydrocodone (Vicoprofen), oxycodone (Combunox). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- Assess for signs and symptoms of GI bleeding (tarry stools, lightheadedness, hypotension), renal dysfunction (elevated BUN and creatinine levels, decreased urine output), and hepatic impairment (elevated liver enzymes, jaundice). Geri: Higher risk for poor outcomes or death from GI bleeding. Age-related renal impairment increases risk of hepatic and renal toxicity.
- Assess patient for skin rash frequently during therapy. Discontinue ibuprofen at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- **Arthritis:** Assess pain and range of motion prior to and 1–2 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- ***Lab Test Considerations:*** BUN, serum creatinine, CBC, and liver function tests should be evaluated periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT may show ↑ levels. Blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- May cause prolonged bleeding time; may persist for <1 day following discontinuation.

### Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)
Ineffective thermoregulation (Indications)

### Implementation

- Administration of higher than recommended doses does not provide increased pain relief but may increase incidence of side effects.
- Patient should be well hydrated before administration to prevent renal adverse reactions.
- Use lowest effective dose for shortest period of time, especially in the elderly.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids to decrease GI irritation. Tablets may be crushed and mixed with fluids or food; 800-mg tablet can be dissolved in water.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** 0.9% NaCl, D5W, or LR. ***Concentration:*** Dilute the 800 mg dose in at least 200 mL and the 400 mg dose in at least 100 mL for a concentration of 4 mg/mL. Do not administer solutions that are discolored or contain particulate matter. Stable for up to 24 hr at room temperature. ***Rate:*** Infuse over at least 30 min.

### Patient/Family Teaching

- Advise patients to take ibuprofen with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses. Pedi: Teach parents and caregivers to calculate and measure doses accurately and to use measuring device supplied with product.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, and other OTC or herbal products without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patients not to take OTC ibuprofen preparations for more than 10 days for pain or more than 3 days for fever, and to consult health care professional if symptoms persist or worsen. Many OTC products contain ibuprofen; avoid duplication.
- Caution patient that use of ibuprofen with 3 or more glasses of alcohol per day may increase the risk of GI bleeding.

- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, epigastric pain, dyspepsia, black stools, hematemesis, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.
- Pedi: Advise parents or caregivers not to administer ibuprofen to children who may be dehydrated (can occur with vomiting, diarrhea, or poor fluid intake); dehydration increases risk of renal dysfuntion.
- Advise female patients to notify health care professional if pregnancy is planned or suspected.

### Evaluation/Desired Outcomes

- Decrease in severity of pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 7 days, but maximum effectiveness may require 1–2 wk of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Reduction in fever.

## ibutilide (eye-**byoo**-ti-lide)

Corvert

***Classification***

Therapeutic: antiarrhythmics (class III)

**Pregnancy Category C**

### Indications

Rapid conversion of recent-onset atrial flutter or fibrillation to normal sinus rhythm, including management of atrial flutter or fibrillation occurring within 1 wk of coronary artery bypass or cardiac valve surgery.

### Action

Activates slow inward current of sodium in cardiac tissue, resulting in delayed repolarization, prolonged action potential duration, and increased refractoriness. Mildly slows sinus rate and AV conduction. **Therapeutic Effects:** Conversion to normal sinus rhythm.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Highly metabolized by the liver, 1 metabolite is active; metabolites excreted by kidneys.
**Half-life:** 6 hr (2–12 hr).

TIME/ACTION PROFILE (antiarrhythmic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | within 30–90 min | unknown | up to 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** CHF or left ventricular dysfunction (↑ risk of more serious arrhythmias during infusion); OB, Lactation, Pedi: Pregnancy, lactation, or children <18 yr (safety not established).

### Adverse Reactions/Side Effects

**CNS:** headache. **CV:** arrhythmias. **GI:** nausea.

### Interactions

**Drug-Drug: Amiodarone**, **disopyramide**, **procainamide**, **quinidine**, and **sotalol** should not be given concurrently or within 4 hr because of additive effects on refractoriness. Proarrhythmic effects may be ↑ by **phenothiazines**, **tricyclic** and **tetracyclic antidepressants**, some **antihistamines**, and **histamine $H_2$-receptor blocking agents**; concurrent use should be avoided.

### Route/Dosage

#### Atrial Fibrillation/Flutter

**IV (Adults ≥60 kg):** 1 mg infusion; may be repeated 10 min after end of first infusion.
**IV (Adults <60 kg):** 0.01 mg/kg infusion; may be repeated 10 min after end of first infusion.

#### Atrial Fibrillation/Flutter After Cardiac Surgery

**IV (Adults ≥60 kg):** 0.5 mg infusion, may be repeated once.
**IV (Adults <60 kg):** 0.005 mg/kg infusion, may be repeated once.

### Availability

**Solution for injection:** 0.1 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor ECG continuously throughout and for 4 hr after infusion or until QT interval normalizes. Discontinue if arrhythmia terminates or if sustained ventricular tachycardia, prolonged QT, or QT develops. Ibutilide may have proarrhythmic effects. These arrhythmias may be serious and potentially life threatening. Clinicians trained to treat ventricular arrhythmias, medications, and equipment (defibrillator/cardio-

verter) should be available during therapy and monitoring of patient.

### Potential Nursing Diagnoses
Decreased cardiac output (Indications)

### Implementation
- Oral antiarrhythmic therapy may be instituted 4 hr after ibutilide infusion.

**IV Administration**
- **Intermittent Infusion:** ***Diluent:*** May be administered undiluted or diluted in 50 mL of 0.9% NaCl or D5W. Diluted solution is stable for 24 hr at room temperature or 48 hr if refrigerated. ***Concentration:*** Undiluted: 0.1 mg/mL; Diluted: 0.017 mg/mL. ***Rate:*** Administer over 10 min.
- **Additive Incompatibility:** Information unavailable; do not admix with other solutions or medications.

### Patient/Family Teaching
- Inform patient of the purpose of ibutilide.

### Evaluation/Desired Outcomes
- Conversion of recent-onset atrial flutter or fibrillation to normal sinus rhythm.

## idarubicin (eye-da-roo-bi-sin)
Idamycin

***Classification***
Therapeutic: antineoplastics
Pharmacologic: anthracyclines

**Pregnancy Category D**

### Indications
Acute myelogenous leukemia in adults (with other agents).

### Action
Inhibits nucleic acid synthesis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Rapidly distributed with extensive tissue binding. High degree of cellular uptake.
**Metabolism and Excretion:** Extensive hepatic and extrahepatic metabolism. One metabolite is active (idarubicinol). Primarily eliminated via biliary excretion.
**Half-life:** 22 hr (range 4–46 hr).

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | Unknown | 10–14 days | 21 days |

### Contraindications/Precautions
**Contraindicated in:** OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Patients with childbearing potential; Active infection; ↓ bone marrow reserve; Other chronic debilitating illnesses; Hepatic impairment (dose ↓ may be required; avoid if bilirubin ≥5 mg/dL); Renal impairment; Pre-existing cardiac disease; Previous daunorubicin or doxorubicin therapy; Pedi: Safety not established; Geri: ↑ incidence of side effects and adverse reactions.

### Adverse Reactions/Side Effects
**CNS:** headache, mental status changes. **Resp:** pulmonary toxicity, pulmonary allergic reactions. **CV:** ARRHYTHMIAS, CARDIOTOXICITY, CHF. **GI:** abdominal cramps, diarrhea, mucositis, nausea, vomiting. **Derm:** alopecia, photosensitivity, rashes. **Endo:** gonadal suppression. **Hemat:** BLEEDING, anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Neuro:** peripheral neuropathy. **Misc:** fever.

### Interactions
**Drug-Drug:** ↑ myelosuppression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to and increase risk of adverse reactions from **live-virus vaccines**.

### Route/Dosage
**IV (Adults):** 12 mg/m² daily for 3 days in combination with cytarabine.

### Availability (generic available)
**Powder for injection:** 5 mg/vial, 10 mg/vial.

## NURSING IMPLICATIONS

### Assessment
- Monitor blood pressure, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.

- Monitor intake and output ratios. Report significant discrepancies. Encourage fluid intake of 2000–3000 mL/day. Allopurinol and alkalinization of the urine may be used to decrease serum uric acid levels and to help prevent urate stone formation.
- Severe and protracted nausea and vomiting may occur as early as 1 hr after therapy and may last 24 hr. Parenteral antiemetics should be administered 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis; report emesis exceeding guidelines to prevent dehydration.
- Monitor for development of signs of myocardial toxicity manifested by life-threatening arrhythmias, cardiomyopathy, and CHF (peripheral edema, dyspnea, rales/crackles, weight gain). Chest x-ray, ECG, echocardiography, and radionuclide angiography determinations of ejection fraction should be monitored prior to and periodically during therapy.
- Assess injection site frequently for redness, irritation, or inflammation. May infiltrate painlessly. If extravasation occurs, infusion must be stopped and restarted elsewhere to avoid damage to subcut tissue. Treatment of extravasation includes rest and elevation of the extremity and application of intermittent ice packs (apply for 30 min immediately and 30 min qid for 3 days). If pain, erythema, or vesication persists longer than 48 hr, immediate plastic surgery may be warranted.
- ***Lab Test Considerations:*** Monitor CBC, differential, and platelet count prior to and frequently during therapy. Nadirs of leukopenia and thrombocytopenia are 10–14 days, with recovery occurring 21 days after a dose.
- Monitor renal and hepatic function prior to and periodically during therapy. Idarubicin may cause hyperuricemia. May also cause transient ↑ in AST, ALT, LDH, serum alkaline phosphatase, and bilirubin.

## Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Imbalanced nutrition: less than body requirements (Adverse Reactions)

## Implementation

- Do not confuse Adriamycin (doxorubicin hydrochloride) with Idamycin (idarubicin).
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- See cytarabine monograph for specific information on administration of cytarabine with idarubicin.
- Do not administer subcut or IM and avoid extravasation; may cause severe tissue necrosis.

### IV Administration

- **Direct IV:** ***Diluent:*** 0.9% NaCl (nonbacteriostatic) for injection. Reconstitute 5-mg and 10-mg vials with 5 mL and 10 mL, respectively. ***Concentration:*** 1 mg/mL. Vial contents are under pressure; use care when inserting needle.
- Reconstituted medication is stable for 72 hr at room temperature and 7 days if refrigerated. ***Rate:*** Administer each dose slowly over 10–30 min through Y-site of a free-flowing infusion of 0.9% NaCl or D5W. Tubing may be attached to a butterfly needle and injected into a large vein.
- **Y-Site Compatibility:** amifostine, amikacin, aztreonam, cimetidine, cladribine, cyclophosphamide, cytarabine, diphenhydramine, droperidol, erythromycin lactobionate, etoposide phosphate, filgrastim, gemcitabine, granisetron, imipenem/cilastatin, magnesium sulfate, mannitol, melphalan, metoclopramide, potassium chloride, ranitidine, sargramostim, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** acyclovir, allopurinol, ampicillin/sulbactam, cefazolin, cefepime, ceftazidime, clindamycin, dexamethasone, etoposide, furosemide, gentamicin, heparin, hydrocortisone sodium succinate, lorazepam, meperidine, methotrexate, piperacillin/tazobactam, sodium bicarbonate, teniposide, vancomycin, vincristine.

## Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, as these may precipitate gastric bleeding.

- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Further courses of idarubicin should be withheld until recovery from mucositis, and subsequent doses should be decreased by 25%. Stomatitis pain may require treatment with opioid analgesics.
- Advise patient that this medication may have teratogenic effects. Contraception should be practiced during and for at least 4 mo after therapy is concluded.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, or swelling of lower extremities occurs.
- Advise patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that urine may turn a reddish color.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Improvement of hematologic status in leukemias.

## **ifosfamide** (**eye**-foss-fam-ide)

Ifex

***Classification***

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

**Pregnancy Category D**

### Indications

Germ cell testicular carcinoma (with other agents). Used with mesna, which prevents ifosfamide-induced hemorrhagic cystitis.

### Action

Following conversion to active compounds, interferes with DNA replication and RNA transcription, ultimately disrupting protein synthesis (cell-cycle phase—nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** Administered IV only; inactive prior to conversion to metabolites.
**Distribution:** Excreted in breast milk.
**Metabolism and Excretion:** Metabolized by the liver to active antineoplastic compounds.
**Half-life:** 15 hr.

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | 7–14 days | 21 days |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Patients with childbearing potential; Active infections; Decreased bone marrow reserve; Geri: Geriatric patients; Other chronic debilitating illness; Impaired renal function; Pedi: Children.

### Adverse Reactions/Side Effects

**CNS:** CNS toxicity (somnolence, confusion, hallucinations, coma), cranial nerve dysfunction, disorientation, dizziness. **CV:** cardiotoxicity. **GI:** nausea, vomiting, anorexia, constipation, diarrhea, hepatotoxicity. **GU:** hemorrhagic cystitis, dysuria, sterility, renal toxicity. **Derm:** alopecia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis. **Misc:** allergic reactions.

### Interactions

**Drug-Drug:** ↑ myelosuppression with other **antineoplastics** or **radiation therapy**. Toxicity may be ↑ by **allopurinol** or **phenobarbital**. May ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.

### Route/Dosage

### Other Regimens are Used

**IV (Adults):** 1.2 g/m²/day for 5 days; coadminister with mesna. May repeat cycle q 3 wk.

### Availability (generic available)

**Injection:** 1 g/vial, 3 g/vial. ***In combination with:*** In a kit with mesna.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor urinary output frequently during therapy. Notify health care professional if hematuria occurs. To reduce the risk of hemorrhagic cystitis, fluid intake should be at least 3000 mL/

day for adults and 1000–2000 mL/day for children. Mesna is given concurrently to prevent hemorrhagic cystitis.
- Monitor neurologic status. Ifosfamide should be discontinued if severe CNS symptoms (agitation, confusion, hallucinations, unusual tiredness) occur. Symptoms usually abate within 3 days of discontinuation of ifosfamide but may persist for longer; fatalities have been reported.
- Assess nausea, vomiting, and appetite. Weigh weekly. Premedication with an antiemetic may be used to minimize GI effects. Adjust diet as tolerated.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- ***Lab Test Considerations:*** Monitor CBC, differential, and platelet count prior to and periodically during therapy. Withhold dose if WBC $<2000/mm^3$ or platelet count is $<50,000/mm^3$. Nadir of leukopenia and thrombocytopenia occurs within 7–14 days and usually recovers within 21 days of therapy.
- Urinalysis should be evaluated before each dose. Withhold dose until recovery if urinalysis shows >10 RBCs per high-power field.
- May cause ↑ in liver enzymes and serum bilirubin.
- Monitor AST, ALT, serum alkaline phosphatase, bilirubin, and LDH prior to and periodically during therapy. Ifosfamide may cause ↑ in liver enzymes and serum bilirubin.
- Monitor BUN, serum creatinine, phosphate, and potassium periodically during therapy. May cause hypokalemia.

## Potential Nursing Diagnoses

Risk for infection (Side Effects)
Disturbed body image (Side Effects)

## Implementation

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

### IV Administration

- **IV:** Prepare solution by diluting each 1-g vial with 20 mL of sterile water or bacteriostatic water for injection containing parabens. Use solution prepared without bacteriostatic water within 6 hr. Solution prepared with bacteriostatic water is stable for 1 wk at 30°C or 6 wk at 5°C.
- **Intermittent Infusion:** ***Diluent:*** May be further diluted in D5W, 0.9% NaCl, LR, or sterile water for injection. ***Concentration:*** 0.6 to 20 mg/mL (maximum 40 mg/mL). Dilute solution is stable for 7 days at room temperature or 6 wk if refrigerated. ***Rate:*** Administer over at least 30 min.
- **Continuous Infusion:** Has also been administered as a continuous infusion over 72 hr.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, codeine, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dipehnhydramine, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxacurium, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythroycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonose-

tron, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** cefepime, diazepam, methotrexate, pantoprazole, phenytoin, potassium phosphates.
- **Additive Compatibility:** carboplatin, cisplatin, epirubicin, etoposide, fluorouracil, mesna.

## Patient/Family Teaching

- Emphasize need for adequate fluid intake throughout therapy. Patient should void frequently to decrease bladder irritation from metabolites excreted by the kidneys. Notify health care professional immediately if hematuria is noted.
- Instruct patient to drink at least 8 glasses of water/day during and for 3 days after completion of therapy.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; or confusion occurs.
- Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patients should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs, as these may precipitate GI hemorrhage.
- Review with patient the need for contraception during therapy.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products.
- Instruct patient not to receive any vaccinations without advice of health care professional; ifosfamide may decrease antibody response to and increase risk of adverse reactions from live-virus vaccines.

## Evaluation/Desired Outcomes

- Decrease in size or spread of malignant germ cell testicular carcinoma.

# **iloperidone** (eye-loe-**per**-i-done)
Fanapt

***Classification***
Therapeutic: antipsychotics
Pharmacologic: benzisoxazoles

**Pregnancy Category C**

## Indications

Acute management of schizophrenia.

## Action

May act by antagonizing dopamine and serotonin in the CNS. **Therapeutic Effects:** Decreased symptoms of schizophrenia.

## Pharmacokinetics

**Absorption:** Well absorbed (96%) following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Extensively metabolized, primarily by CYP3A4 and CYP2D6 enzyme systems, with individual variability in metabolism (extensive metabolizers [EM] and poor metabolizers [PM] and some in-between; poor metabolizers account for less than 10% of the population). Two major metabolites (P88 and P95) may be partially responsible for pharmacologic activity. 58% excreted in urine as metabolites in EM and 45% in PM; respectively, with feces accounting 20% elimination for EM and 22.1% for PM.
**Half-life:** *Extensive metabolizers*—iloperidone–18 hr, P88–26 hr, P95–23 hr; *poor metabolizers*—iloperidone–33 hr, P88–37 hr, P95–31 hr.

TIME/ACTION PROFILE (antipsychotic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 2–4 wk | 2–4 hr† | unknown |

† Blood level

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent use of drugs known to prolong QTc interval; Bradycardia, recent MI or uncompensated heart failure (↑ risk of serious arrhythmias); Congenital long QT syndrome, QTc >500 ms or history of cardiac arrhythmias; Hepatic impairment; Geri: Elderly patients with dementia-related psychoses (↑ risk of death, CVA or TIA); Lactation: Breastfeeding should be avoided.
**Use Cautiously in:** Known cardiovascular disease including heart failure, history of MI/ische-

mia, conduction abnormalities, cerebrovascular disease, or other conditions known to predispose to hypotension including dehydration, hypovolemia, concurrent antihypertensive therapy (↑ risk of orthostatic hypotension); Electrolyte abnormalities, especially hypomagnesemia or hypokalemia (correct prior to therapy); Concurrent use of inhibitors of the CYP3A4 or CYP2D6 enzyme systems; Known ↓ WBC or history of drug-induced leukopenia/neutropenia; Circumstances that may result in ↑ body temperature, including strenuous exercise, exposure to extreme heat, concurrent anticholinergic activity, or dehydration (may impair thermoregulation); Patients at risk for aspiration; Geri: May have ↑ sensitivity and risk of adverse reactions; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safe and effective use in children/adolescents has not been established.

### Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, dizziness, drowsiness, fatigue, agitation, delusion, restlessness, extrapyramidal disorders. **EENT:** nasal congestion. **CV:** orthostatic hypotension, tachycardia, palpitations, QTc prolongation. **GI:** dry mouth, nausea, abdominal discomfort, diarrhea. **GU:** priapism, urinary incontinence. **Endo:** hyperglycemia, hyperprolactinemia. **Neuro:** tardive dyskinesia. **Metab:** weight gain, weight loss. **MS:** ↓ bone density, musculoskeletal stiffness.

### Interactions

**Drug-Drug:** Avoid use of drugs known to prolong QTc including the **antiarrhythmics quinidine**, **procainamide**, **amiodarone**, and **sotalol**; **antipsychotics** including **chlorpromazine** and **thioridazine**, the **antibiotics gatifloxacin**, **moxifloxacin**, or any other **medications known to prolong the QTc interval** including **pentamidine**, **levomethadyl**, and **methadone**; concurrent use may result in serious, life-threatening arrhythmias. Concurrent use of **CYP2D6 inhibitors** including **fluoxetine** and **paroxetine** ↑ levels and the risk of toxicity; dose reduction is required. A similar effect occurs with **CYP3A4 inhibitors** including **ketoconazole** and **clarithromycin**; dosage reduction is required. Concurrent use of **antihypertensives** including **diuretics** may ↑ risk of orthostatic hypotension. Concurrent **anticholinergics** may ↑ risk of impaired thermoregulation.

### Route/Dosage

**PO (Adults):** Initiate treatment with 1 mg twice daily on the first day, then 2 mg twice daily the second day, then increase by 2 mg/day every day until a target dose of 12–24 mg/day given in two divided doses is reached; *Concurrent CYP2D6 or CYP3A4 inhibitors*—decrease dose by one-half, if inhibitor is withdrawn increase dose to previous amount. Re-titration is required if iloperidone is discontinued >3 days.

### Availability

**Tablets:** 1 mg, 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor patient's mental status (delusions, hallucinations, and behavior) before and periodically during therapy.
- Monitor mood changes. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor blood pressure (sitting, standing, lying down) and pulse before and periodically during therapy. May cause prolonged QT interval, tachycardia, and orthostatic hypotension.
- Observe patient when administering medication to ensure that medication is actually swallowed and not hoarded.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation of medication may be necessary.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately and discontinue therapy; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue iloperidone and notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).

- ***Lab Test Considerations:*** Monitor fasting blood glucose before and periodically during therapy in diabetic patients.
- Monitor CBC frequently during initial months of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.
- Monitor serum potassium and magnesium levels in patients at risk for electrolyte disturbances.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

### Potential Nursing Diagnoses

Risk for self-directed violence (Indications)
Disturbed thought process (Indications)
Risk for injury (Side Effects)

### Implementation

- **PO:** Administer twice daily without regard to food.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Advise patient that appearance of tablets in stool is normal and not of concern.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Extremes in temperature should also be avoided; this drug impairs body temperature regulation.
- Caution patient to avoid concurrent use of alcohol, other CNS depressants, and Rx, OTC, or herbal products without consulting health care professional.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if they are breastfeeding or planning to breastfeed.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, tremors, palpitations, fainting, menstrual abnormalities, galactorrhea or sexual dysfunction occur.
- Emphasize the need for continued follow-up for psychotherapy and monitoring for side effects.

### Evaluation/Desired Outcomes

- Decrease in excited, paranoid, or withdrawn behavior.

HIGH ALERT

## imatinib (i-mat-i-nib)

Gleevec

***Classification***
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

**Pregnancy Category D**

### Indications

Newly diagnosed Philadelphia positive (Ph+) chronic myeloid leukemia (CML). CML in blast crisis, accelerated phase, or in chronic phase after failure of interferon-alpha treatment. Kit (CD117) positive metastatic/unresectable malignant gastrointestinal stomal tumors (GIST). Adjuvant treatment following resection of Kit (CD117) positive GIST. Pediatric patients with Ph+ CML after failure of bone marrow transplant or resistance to interferon-alpha. Adult patients with relapsed or refractory Ph+ acute lymphoblastic leukemia (ALL). Myelodysplastic/myelyproliferative disease (MDS/MPD). Aggressive systemic mastocytosis (ASM). Hypereosinophilic syndrome and/or chronic eosinophilic leukemia (HES/CEL). Unresectable, recurrent, or metastatic dermatofibrosarcoma protuberans (DFSP).

### Action

Inhibits kinases which may be produced by malignant cell lines. **Therapeutic Effects:** Inhibits production of malignant cell lines with decreased proliferation of leukemic cells in CML, HES/CEL, and ALL and malignant cells in GIST, MDS/MPD, ASM, and DFSP.

### Pharmacokinetics

**Absorption:** Well absorbed (98%) following oral administration.
**Distribution:** Unknown.
**Protein Binding:** 95%.
**Metabolism and Excretion:** Mostly metabolized by the CYP3A4 enzyme system to N-demethyl imatinib, which is as active as imatinib. Excreted mostly in feces as metabolites. 5% excreted unchanged in urine.
**Half-life:** *Imatinib*—18 hr; *N-desmethyl imatinib*—40 hr.

TIME/ACTION PROFILE (blood levels of imatinib)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2–4 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB: Potential for fetal harm; Lactation: Potential for serious adverse reactions in nursing infants; breastfeeding should be avoided.

**Use Cautiously in:** Hepatic impairment (dose ↓ recommended if bilirubin >3 times normal or liver transaminases >5 times normal); Cardiac disease (severe congestive heart failure and left ventricular dysfunction may occur); Pedi: Children <3 yr (safety not established); Geri: ↑ risk of edema.

## Adverse Reactions/Side Effects

**CNS:** fatigue, headache, weakness. **Resp:** cough, dyspnea, epistaxis, nasopharyngitis, pneumonia. **GI:** HEPATOTOXICITY, abdominal pain, anorexia, constipation, diarrhea, dyspepsia, nausea, vomiting. **Derm:** petechiae, pruritus, skin rash. **F and E:** edema (including pleural effusion, pericardial infusion, anasarca, superficial edema and fluid retention), hypokalemia. **Endo:** hypothyroidism. **Hemat:** BLEEDING, NEUTROPENIA, THROMBOCYTOPENIA. **Metab:** weight gain. **MS:** arthralgia, muscle cramps, musculoskeletal pain, myalgia. **Misc:** fever, night sweats.

## Interactions

**Drug-Drug:** Blood levels and effects are ↑ by concurrent use of potent CYP3A4 inhibitors (e.g. **ketoconazole**, **itraconazole**, **clarithromycin**, **atazanavir**, **indinavir**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavor**, **telithromycin**, or **voriconazole**). Blood levels and effects may be ↓ by potent CYP3A4 inducers (e.g., **dexamethasone**, **phenytoin**, **carbamazepine**, **rifampin**, **rifabutin**, and **phenobarbital**; if used concurrently, ↑ dose of imatinib by 50%. ↑ blood levels of **simvastatin**. Imatinib inhibits the following enzyme systems: CYP2C9, CYP2D6, CYP3A4/5 and may be expected to alter the effects of other drugs metabolized by these systems.

**Drug-Food:** Blood levels and effects are ↑ by **grapefruit juice**; concurrent use should be avoided.

## Route/Dosage

### Chronic Myeloid Leukemia

**PO (Adults):** *Chronic phase*—400 mg once daily, may be ↑ to 600 mg once daily; *accelerated phase or blast crisis*—600 mg once daily; may be ↑ to 800 mg/day given as 400 mg twice daily based on response and circumstances.
**PO (Children):** *Newly diagnosed Ph + CML*-340 mg/m²/day (not to exceed 600 mg); *CML recurrent after failure of bone marrow transplant or resistance to interferon-alpha*—260 mg/m²/day.

### Gastrointestinal Stromal Tumors

**PO (Adults):** *Metastatic or unresectable*—400 mg/day; may be ↑ to 400 mg twice daily if well tolerated and response insufficient; *Adjuvant treatment after resection*—400 mg/day.

### Ph+ Acute Lymphoblastic Leukemia

**PO (Adults):** 600 mg/day.

### Myelodysplastic/Myeloproliferative Diseases

**PO (Adults):** 400 mg/day.

### Aggressive Systemic Mastocytosis

**PO (Adults):** 400 mg/day. *For patients with eosinophilia*—100 mg/day; ↑ to 400 mg/day if well tolerated and response insufficient.

### Hypereosinophilic Syndrome and/or Chronic Eosinophilic Leukemia

**PO (Adults):** 400 mg/day. *For patients with FIP1L1–PDGFRa fusion kinase*100 mg/day; increase to 400 mg/day if well tolerated and response insufficient.

### Dermatofibrosarcoma Protuberans

**PO (Adults):** 800 mg/day.

### Hepatic Impairment

**PO (Adults):** ↓ dose by 25% in severe hepatic impairment.

### Renal Impairment

**PO (Adults):** *CCr 40–59 mL/min*—Do not exceed dose of 600 mg/day; *CCr 20–39 mL/min*—↓ initial dose by 50%; ↑ as tolerated.

## Availability

**Tablets:** 100 mg, 400 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor for fluid retention. Weigh regularly, and assess for signs of pleural effusion, pericardial effusion, pulmonary edema, ascites (dyspnea, periorbital edema, swelling in feet and ankles, weight gain). Evaluate unexpected weight gain. Edema is usually managed with diuretics. General fluid retention is usually dose related, more common in accelerated phase or blast crisis, and is more common in the elderly. Treatment usually involves diuretics, supportive therapy, and interruption of imatinib.
- Monitor vital signs; may cause fever.
- ***Lab Test Considerations:*** Monitor liver function before and monthly during treatment or when clinically indicated. May cause ↑ transamininases and bilirubin which usually lasts 1 wk and may require dose reduction or interruption. If bilirubin is >3 times the upper limit of normal or transaminases are >5 times the upper limit of normal withhold dose until bilirubin levels return to <1.5 times the upper limit of normal and transaminase levels to < 2.5 times the upper limit of normal. Treatment may then be continued at reduced levels (patients on 400 mg/day should receive 300 mg/day and patients receiving 600 mg/day should receive 400 mg/day).
- Monitor CBC weekly for the first month, biweekly for the second month, and periodically during therapy. May cause neutropenia and thrombocytopenia, usually lasting 2–3 wk or 3–4 wk, respectively, and anemia. Usually requires dose reduction, but may require discontinuation (see Implementation).
- May cause hypokalemia.

### Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

### Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order and dose calculations. Therapy should be initiated by physician experienced in the treatment of patients with chronic myeloid leukemia.
- Patients requiring anticoagulation should receive low-molecular-weight or standard heparin, not warfarin.
- Treatment should be continued as long as patient continues to benefit.
- **PO:** Administer with food and a full glass of water to minimize GI irritation.
- Tablets may be dispersed in water or apple juice (50 mL for the 100 mg and 100 mL for the 400 mg tablet) and stirred with a spoon for patients unable to swallow pills. Administer immediately after suspension.
- Patients receiving *chronic phase, myelodysplastic/myeloproliferative disease, aggressive systemic mastocytosis, and hypereosinophilic syndrome and/or chronic eosinophilic leukemia* treatment who develop an ANC $<1.0 \times 10^9$/L and/or platelets $<50 \times 10^9$/L should stop imatinib until ANC $\geq 1.5 \times 10^9$/L and platelets are $\geq 75 \times 10^9$/L. Then resume imatinib treatment at 400 mg or 600 mg/day.
- *Patients receiving accelerated phase and blast crisis treatment or Ph+ acute lymphoblastic leukemia* who develop an ANC $<0.5 \times 10^9$/L and/or platelets $<10 \times 10^9$/L should determine if cytopenia is related to leukemia via marrow aspirate or biopsy. If cytopenia is unrelated to leukemia, reduce dose to 400 mg/day. If cytopenia persists for 2 wk, reduce dose to 300 mg/day. If cytopenia persists for 4 wk and is still unrelated to leukemia, stop imatinib until ANC $\geq 1 \times 10^9$/L and platelets are $\geq 20 \times 10^9$/L. Then resume imatinib treatment at 300 mg/day.
- *Patients receiving aggressive systemic mastocytosis with eosinophilia or hypereosinophilic syndrome and/or chronic eosinophilic leukemia with FIP1L1–PDGFRa fusion kinase*—who develop ANC $<1.0 \times 10^9$/L and platelets $<50 \times 10^9$/L should stop imatinib until ANC $\geq 1.5 \times 10^9$/L and platelets $\geq 75 \times 10^9$/L. Resume treatment at previous dose.

### Patient/Family Teaching

- Explain purpose of imatinib to patient.
- Advise patient to avoid grapefruit and grapefruit juice during therapy.

### Evaluation/Desired Outcomes

- Decrease in production of leukemic cells in patients with CML, HES/CEL, and ALL and malignant cells in GIST, MDS/MPD, ASM, and DFSP.

## imipenem/cilastatin

(i-me-**pen**-em/sye-la-**stat**-in)

Primaxin

***Classification***
Therapeutic: anti-infectives
Pharmacologic: carbapenems

**Pregnancy Category C**

## Indications
Treatment of: Lower respiratory tract infections, Urinary tract infections, Abdominal infections, Gynecologic infections, Skin and skin structure infections, Bone and joint infections, Bacteremia, Endocarditis, Polymicrobic infections.

## Action
Imipenem binds to the bacterial cell wall, resulting in cell death. Combination with cilastatin prevents renal inactivation of imipenem, resulting in high urinary concentrations. Imipenem resists the actions of many enzymes that degrade most other penicillins and penicillin-like anti-infectives.
**Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Spectrum is broad. Active against most gram-positive aerobic cocci: *Streptococcus pneumoniae*, Group A beta-hemolytic streptococci, *Enterococcus*, *Staphylococcus aureus*. Active against many gram-negative bacillary organisms: *Escherichia coli*, *Klebsiella*, *Acinetobacter*, *Proteus*, *Serratia*, *Pseudomonas aeruginosa*. Also displays activity against: *Salmonella*, *Shigella*, *Neisseria gonorrhoeae*, Numerous anaerobes.

## Pharmacokinetics
**Absorption:** Well absorbed after IM administration (imipenem 95%, cilastatin 75%). IV administration results in complete bioavailability.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk.
**Metabolism and Excretion:** *Imipenem and cilastatin* —70% excreted unchanged by the kidneys.
**Half-life:** *Imipenem and cilastatin*—1 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | rapid | 1–2 hr | 12 hr |
| IV | rapid | end of infusion | 6–8 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Cross-sensitivity may occur with penicillins and cephalosporins.
**Use Cautiously in:** Previous history of multiple hypersensitivity reactions; Seizure disorders; Renal impairment (dose ↓ required if CCr ≤70 mL/min/1.73 m²); OB, Lactation, Pedi: Safety not established; Geri: May be at ↑ risk for toxic reactions due to age-related ↑ in renal function.

## Adverse Reactions/Side Effects
**CNS:** SEIZURES, dizziness, somnolence. **CV:** hypotension. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **Derm:** rash, pruritus, sweating, urticaria. **Hemat:** eosinophilia. **Local:** phlebitis at IV site. **Misc:** allergic reaction including ANAPHYLAXIS, fever, superinfection.

## Interactions
**Drug-Drug:** Do not admix with **aminoglycosides** (inactivation may occur). **Probenecid** ↓ renal excretion and ↑ blood levels. ↑ risk of seizures with **ganciclovir** or **cyclosporine** (avoid concurrent use of ganciclovir). May ↓ serum **valproate** levels (↑ risk of seizures).

## Route/Dosage
**IV (Adults):** *Mild infections*—250–500 mg q 6 hr. *Moderate infections*—500 mg q 6–8 hr *or* 1 g q 8 hr. *Serious infections*—500 mg q 6 hr to 1 g q 6–8 hr.
**IV (Children ≥3 mo [non-CNS infections]):** 15–25 mg/kg q 6 hr; higher doses have been used in older children with cystic fibrosis.
**IV (Children 4 wk–3 mo):** 25 mg/kg q 6 hr.
**IV (Children 1–4 wk):** 25 mg/kg q 8 hr.
**IV (Children <1 wk):** 25 mg/kg q 12 hr.
**IM (Adults):** 500–750 mg q 12 hr.
**IM (Children):** 10–15 mg/kg q 6 hr.

### Renal Impairment
**IV (Adults): If dose for normal renal function is 1 g/day** *CCr 41–70 mL/min*—125–250 mg q 6–8 hr, *CCr 21–40 mL/min*—125–250 mg q 8–12 hr, *CCr 6–20 mL/min*—125–250 mg q 12 hr; **if dose for normal renal function is 1.5 g/day** *CCr 41–70 mL/min*—125–250 mg q 6–8 hr, *CCr 21–40 mL/min*—125–250 mg q 8–12 hr, *CCr 6–20 mL/min*—125–250 mg q 12 hr; **if dose for normal renal function is 2 g/day** *CCr 41–70 mL/min*—125–500 mg q 6–8 hr, *CCr 21–40 mL/min*—125–250 mg q 8–12 hr, *CCr 6–20 mL/min*—125–250 mg q 12 hr; **if dose for normal renal function is 3 g/day** *CCr 41–70 mL/min*—250–500 mg q 6–8 hr, *CCr 21–40 mL/min*—250–500 mg q 6–8 hr, *CCr 6–20 mL/min*—250–500 mg q 12 hr; **if dose for normal renal function is 4 g/day** *CCr 41–70 mL/min*—250–750 mg q 6–8 hr, *CCr 21–40 mL/min*—

250–500 mg q 6–8 hr, *CCr 6–20 mL/min*—250–250 mg q 12 hr.

### Availability

**Powder for IV injection:** 250 mg imipenem/250 mg cilastatin, 500 mg imipenem/500 mg cilastatin. **Powder for IM injection:** 500 mg imipenem/500 mg cilastatin, 750 mg imipenem/750 mg cilastatin.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician immediately if these occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** BUN, AST, ALT, LDH, serum alkaline phosphatase, bilirubin, and creatinine may be transiently ↑.
- Hemoglobin and hematocrit concentrations may be ↓.
- May cause positive direct Coombs' test.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

### Implementation

- **IM: Only the IM formulation can be used for IM administration.** Reconstitute 500-mg vial with 2 mL and 750-mg vial with 3 mL of lidocaine without epinephrine. Shake well to form a suspension. Withdraw and inject entire contents of vial IM.

#### IV Administration

- **Intermittent Infusion: Only the IV formulation can be used for IV administration.** ***Diluent:*** Reconstitute each 250- or 500-mg vial with 10 mL of D5W or 0.9% NaCl and shake well. Further dilute in 100 mL of D5W or 0.9% NaCl. Solution may range from clear to yellow in color. Infusion is stable for 4 hr at room temperature and 24 hr if refrigerated. ***Concentration:*** 2.5 mg/mL (with 250-mg vial); 5 mg/mL (with 500-mg vial). ***Rate:*** Infuse doses ≤ 500 mg over 20–30 min. Infuse doses ≥ 750 mg over 40–60 min. Pedi: Infuse doses ≤ 500 mg over 15–30 min. Infuse doses > 500 mg over 40–60 min.
- Rapid infusion may cause nausea and vomiting. If these symptoms develop, slow infusion.
- **Y-Site Compatibility:** acyclovir, amifostine, amikacin, anidulafungin, atropine, aztreonam, bumetanide, caspofungin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, cyclosporine, dexamethasone sodium phosphate, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxycycline, enalaprilat, epinephrine, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fludarabine, foscarnet, furosemide, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, idarubicin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, magnesium sulfate, melphalan, methotrexate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, morphine, nafcillin, nitroglycerin, norepinephrine, ondansetron, pantoprazole, penicillin G potassium, phenylephrine, phytonadione, potassium chloride, propranolol, propofol, protamine, ranitidine, remifentanil, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** alopurinol, amiodarone, amphotericin B cholesteryl sulfate, azithromycin, ceftriaxone, daptomycin, diazepam, drotrecogin, etoposide phosphate, fluconazole, galliun nitrate, ganciclovir, gemcitabine, haloperidol, lorazepam, meperidine, midazolam, milrinone, phenytoin, prochlorperazine, quinupristin/dalfopristin, sargramostim, sodium bicarbonate, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** May be inactivated if administered concurrently with aminoglycosides. If administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.

### Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy. Consult health

care professional before treating with antidiarrheals.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.

## Evaluation/Desired Outcomes
- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

**imipramine** (im-**ip**-ra-meen)
Apo-Imipramine, Impril, Norfranil, Novopramine, Tipramine, Tofranil, Tofranil PM

***Classification***
Therapeutic: antidepressants
Pharmacologic: tricyclic antidepressants

**Pregnancy Category C**

## Indications
Various forms of depression. Enuresis in children. **Unlabeled Use:** Adjunct in the management of chronic pain, incontinence (in adults), vascular headache prophylaxis, cluster headache, insomnia.

## Action
Potentiates the effect of serotonin and norepinephrine. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action that develops slowly over several weeks.

## Pharmacokinetics
**Absorption:** Well absorbed from the GI tract.
**Distribution:** Widely distributed. Probably crosses the placenta and enters breast milk.
**Protein Binding:** 89–95%.
**Metabolism and Excretion:** Extensively metabolized by the liver, mostly on first pass; some conversion to active compounds. Undergoes enterohepatic recirculation and secretion into gastric juices.
**Half-life:** 8–16 hr.

TIME/ACTION PROFILE (antidepressant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO, IM | hours | 2–6 wk | weeks |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other antidepressants may occur; Angle-closure glaucoma; Hypersensitivity to tartrazine or sulfites (in some preparations); Recent MI, known history of QTc prolongation, heart failure.

**Use Cautiously in:** Pre-existing cardiovascular disease; Seizures or history of seizure disorder; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; OB: Drug is present in breast milk; discontinue imipramine or bottle feed; Pedi: Suicide risk may be greater in children or adolescents. Safety not established in children <6 yr; Geri: Geriatric patients (more susceptible to adverse reactions). Geriatric males with prostatic hyperplasia are more susceptible to urinary retention.

## Adverse Reactions/Side Effects
**CNS:** drowsiness, fatigue, agitation, confusion, hallucinations, insomnia. **EENT:** blurred vision, dry eyes. **CV:** ARRHYTHMIAS, hypotension, ECG changes. **GI:** constipation, dry mouth, nausea, paralytic ileus, weight gain. **GU:** urinary retention, decreased libido. **Derm:** photosensitivity. **Endo:** gynecomastia. **Hemat:** blood dyscrasias.

## Interactions
**Drug-Drug:** May cause hypotension, tachycardia, and potentially fatal reactions when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk prior to imipramine). Concurrent use with **SSRI antidepressants** may result in increased toxicity and should be avoided (**fluoxetine** should be stopped 5 wk before). Concurrent use with **clonidine** may result in hypertensive crisis and should be avoided. Imipramine is metabolized in the liver by the **cytochrome P450 2D6 enzyme** and its action may be affected by drugs that compete for metabolism by this enzyme including **other antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrhythmics** (**propafenone**, **flecainide**); when used concurrently, dose reduction of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects of imipramine. Concurrent use with **levodopa** may result in delayed/↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by **rifamycins**. ↑ CNS depression with other CNS **depressants** including **alcohol**, **antihistamines**,

**clonidine**, **opioids**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other **agents having these properties**. **Phenothiazines** or **hormonal contraceptives** ↑ levels and may cause toxicity. **Cigarette smoking (nicotine)** may increase metabolism and alter effects.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can increase CNS depression. ↑ anticholinergic effects with **jimson weed** and **scopolia**.

### Route/Dosage

**PO (Adults):** 25–50 mg 3–4 times daily (not to exceed 300 mg/day); total daily dose may be given at bedtime.
**PO (Geriatric Patients):** 25 mg at bedtime initially, up to 100 mg/day in divided doses.
**PO (Children >12 yr):** *Antidepressant*—25–50 mg/day in divided doses (not to exceed 100 mg/day).
**PO (Children 6–12 yr):** *Antidepressant*—10–30 mg/day in 2 divided doses.
**PO (Children ≥6 yr):** *Enuresis*—25 mg once daily 1 hr before bedtime; increase if necessary by 25 mg at weekly intervals to 50 mg in children <12 yr, up to 75 mg in children >12 yr.
**IM (Adults):** Up to 100 mg/day in divided doses (not to exceed 300 mg/day).

### Availability (generic available)

**Tablets:** 10 mg, 25 mg, 50 mg, ✱75 mg. **Capsules:** 75 mg, 100 mg, 125 mg, 150 mg. **Injection:** 12.5 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse rate prior to and during initial therapy.
- Monitor plasma levels in treatment-resisant patients.
- Monitor weight and BMI initially and periodically throughout therapy.
- For overweight/obese individuals, obtain FBS and cholesterol levels. Refer as appropriate for nutrition/weight management and medical management.
- Obtain weight and BMI initially and regularly throughout therapy.
- Assess for sexual dysfunction (decreased libido; erectile dysfunction).
- Pedi, Geri: Monitor baseline and periodic ECGs in elderly patients or patients with heart disease and before increasing dose with children treated for enuresis. May cause prolonged PR and QT intervals and may flatten T waves.
- **Depression:** Assess mental status (orientation, mood, behavior) frequently. Confusion, agitation, and hallucinations may occur during initiation of therapy and may require dosage reduction. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Enuresis:** Assess frequency of bedwetting during therapy. Ask patient or caretaker to maintain diary.
- **Pain:** Assess location, duration, and severity of pain periodically during therapy. Use pain scale to monitor effectiveness of therapy.
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts and renal and hepatic functions prior to and periodically during prolonged or high-dose therapy.
- Serum levels may be monitored in patients who fail to respond to usual therapeutic dose. Therapeutic plasma concentration range for depression is 150–300 ng/mL.
- May cause alterations in blood glucose levels.
- ***Toxicity and Overdose:*** Symptoms of acute overdose include disturbed concentration, confusion, restlessness, agitation, seizures, drowsiness, mydriasis, arrhythmias, fever, hallucinations, vomiting, and dyspnea.
- Treatment of overdose includes gastric lavage, activated charcoal, and a stimulant cathartic. Maintain respiratory and cardiac function (monitor ECG for at least 5 days) and temperature. Medications may include digoxin for CHF, antiarrhythmics, and anticonvulsants.

### Potential Nursing Diagnoses

Ineffective coping (Indications)
Chronic pain (Indications)
Impaired urinary elimination (Indications, Side Effects)
Sexual dysfunction (Side Effects)

### Implementation

- Do not confuse imipramine with desipramine.
- Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take weeks to months. May be given as a single dose at bedtime to minimize sedation during the day.
- Taper to avoid withdrawal effects. Reduce by 50% for 3 days, then reduce by 50% for 3 days, then discontinue.
- **PO:** Administer medication with or immediately following a meal to minimize gastric irritation.
- **IM:** May be slightly yellow or red in color. Crystals may develop if solution is cool; place

ampule under warm running water for 1 min to dissolve.

### Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to notify health care professional if visual changes occur. Inform patient that periodic glaucoma testing may be needed during long-term therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Alert patient that urine may turn blue-green in color.
- Inform patient of need to monitor dietary intake, as possible increase in appetite may lead to undesired weight gain. Inform patient that increased amounts of riboflavin in the diet may be required; consult health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams to evaluate progress and improve coping skills.
- Pedi: Inform parents that the side effects most likely to occur include nervousness, insomnia, unusual tiredness, and mild nausea and vomiting. Notify health care professional if these symptoms become pronounced.
- Advise parents to keep medication out of reach of children to prevent inadvertent overdose.
- Refer to local support group.

### Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Pain relief.
- Diminished incidence of enuresis.
- Improved sleep in patients treated for depression. Patient may require 2–6 wk of therapy before full therapeutic effects of medication are noticeable.
- Control of bedwetting in children >6 yr.
- Decrease in chronic neurogenic pain.

## imiquimod (i-mi-kwi-mod)

Aldara

***Classification***

Therapeutic: antivirals, immune modifiers
Pharmacologic: immune response modifiers

**Pregnancy Category B**

### Indications

External genital or perianal warts/condylomata (condyloma acuminatum). Typical, nonhyperkeratotic, nonhypertrophic actinic keratoses on the face or scalp. Biopsy-confirmed, primary superficial basal cell carcinoma.

### Action

May induce the formation of interferons that have antiproliferative and antiviral properties. **Therapeutic Effects:** Regression of external genital or perianal warts/condylomata, actinic keratoses, or basal cell carcinoma lesions.

### Pharmacokinetics

**Absorption:** Minimal absorption.
**Distribution:** Action is primarily local.
**Metabolism and Excretion:** <0.9% excreted in urine and feces.
**Half-life:** Unknown.

TIME/ACTION PROFILE (regression of lesions)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Topical | days–wk | 10–16 wk | unknown |

### Contraindications/Precautions

**Contraindicated in:** None known.
**Use Cautiously in:** Previous treatment/surgery in affected area (area should be healed prior to use); Pre-existing inflammatory skin lesions (may be exacerbated); Immunocompromised patients (safety not established); OB, Lactation, Pedi: Pregnancy, lactation, or children <12 yr (safety not established).

### Adverse Reactions/Side Effects

**Local:** irritation, pain, pruritus, burning, swelling, fungal infections (women).

### Interactions

**Drug-Drug:** None known.

### Route/Dosage

### External Genital Warts

**Topical (Adults and children > 12 yr):** Apply thin layer to warts at bedtime every other day (3 times weekly); leave on for 6–10 hr, then rinse off with mild soap and water. Repeat until lesions are completely cleared or up to 16 wk.

### Actinic Keratoses

**Topical (Adults):** Apply thin layer to clean, dry affected area twice weekly; leave on for 8 hr, then rinse off with mild soap and water. Continue for 16 wk.

### Superficial Basal Cell Carcinoma

**Topical (Adults):** Apply thin layer to clean, dry affected area 5 times per week; leave on for 8 hr, then rinse off with mild soap and water. Continue for 6 wk.

### Availability

**Cream:** 5% in single-use packets in boxes of 12.
**Cost:** $185.59/box.

## NURSING IMPLICATIONS

### Assessment

- Assess affected area(s) prior to and periodically during therapy.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Risk for infection (Patient/Family Teaching)

### Implementation

- **Topical:** Apply a thin film to clean and dry skin as directed prior to bedtime. Rub in well and leave on skin for time period specified. Remove by washing with mild soap and water. Discard unused cream from single-dose packet. A rest period of several days may be taken if required for patient comfort or severity of skin reaction. Resume therapy when reaction subsides.
- Do not use occlusive dressings. If covering is needed, use cotton gauze or cotton underclothes.

### Patient/Family Teaching

- Instruct patient on proper application technique. Emphasize the importance of washing hands before and after application and avoiding contact with eyes. Advise patient not to use more cream than was prescribed. Missed doses should be applied as soon as possible; then return to regular schedule.
- Advise patient to delay next dose for several days when experiencing discomfort or severe reactions. Notify health care professional if severe reactions occur.
- Advise patient to avoid sharing this medication with others.
- Instruct patient to avoid contact with affected areas while the cream is on the skin. Wash cream off of genital areas before engaging in sexual activities. Inform patient that oils in the cream weaken latex contraceptive devices, such as cervical caps, condoms, and diaphragms.
- Advise patient to avoid use of other topical medications on same treatment area unless recommended by health care professional.

### Evaluation/Desired Outcomes

- Healing of genital or perianal warts. Treatment is continued until wart is healed or up to 16 wk.
- Healing of actinic keratosis. Treatment is continued for 16 wk.
- Resolution of superficial basal cell carcinoma lesions. Treatment is continued for 6 wk.

## indapamide (in-dap-a-mide)

Lozide

***Classification***
Therapeutic: antihypertensives, diuretics
Pharmacologic: thiazide-like diuretics

**Pregnancy Category B**

### Indications

Mild to moderate hypertension. Edema associated with CHF and other causes.

### Action

Increases excretion of sodium and water by inhibiting sodium reabsorption in the distal tubule. Promotes excretion of chloride, potassium, magnesium, and bicarbonate. May produce arteriolar dilation. **Therapeutic Effects:** Lowering of

blood pressure in hypertensive patients and diuresis with subsequent mobilization of edema.

### Pharmacokinetics

**Absorption:** Well absorbed from the GI tract after oral administration.
**Distribution:** Widely distributed.
**Metabolism and Excretion:** Mostly metabolized by the liver. Small amounts (7%) excreted unchanged by the kidneys.
**Half-life:** 14–18 hr.

TIME/ACTION PROFILE (antihypertensive effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (single dose) | unknown | 24 hr | unknown |
| PO (multiple dose) | 1–2 wk | 8–12 wk | up to 8 wk |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with sulfonamides may occur; Anuria.
**Use Cautiously in:** Renal or severe hepatic impairment; Lactation: May be taken while breastfeeding although higher doses followed by significant diuresis may ↓ milk production; Pedi: Safety not established; Geri: ↑ sensitivity to drug effects.

### Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, lethargy. **CV:** arrhythmias, hypotension. **GI:** anorexia, cramping, nausea, vomiting. **Derm:** photosensitivity, rashes. **Endo:** hyperglycemia. **F and E:** hypokalemia, dehydration, hypochloremic alkalosis, hyponatremia, hypovolemia. **Metab:** hyperuricemia. **MS:** muscle cramps.

### Interactions

**Drug-Drug:** Additive hypotension with other **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. Additive hypokalemia with **corticosteroids**, **amphotericin B**, **piperacillin**, or **ticarcillin**. ↓ excretion of **lithium**; may cause toxicity. Hypokalemia may ↑ risk of **digoxin** toxicity.
**Drug-Natural Products: Licorice** and **stimulant laxative herbs** (**aloe**, **senna**) may ↑ risk of potassium depletion.

### Route/Dosage

**PO (Adults):** *Hypertension*—1.25–5 mg once daily in the morning; may be ↑ at 4-wk intervals up to 5 mg/day. *Edema secondary to CHF*—2.5 mg once daily in the morning; may be ↑ after 1 wk to 5 mg/day.

### Availability (generic available)

**Tablets:** 1.25 mg, 2.5 mg. **Cost:** *Generic*—1.25 mg $12.60/90, 2.5 mg $12.60/90.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, intake and output, and daily weight and assess feet, legs, and sacral area for edema daily.
- Assess patient, especially if taking digoxin, for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion; report signs of electrolyte imbalance. Patients taking digoxin have an increased risk of digitalis toxicity due to the potassium-depleting effect of the diuretic.
- Assess patient for allergy to sulfonamides.
- ***Lab Test Considerations:*** Monitor electrolytes (especially potassium), blood glucose, BUN, serum creatinine, and uric acid levels periodically during therapy. May cause ↓ potassium, sodium, and chloride concentrations. May ↑ serum glucose; diabetic patients may require ↑ oral hypoglycemic or insulin dose. ↑ uric acid level an average of 1.0 mg/100 mL; may precipitate an episode of gout.

### Potential Nursing Diagnoses

Excess fluid volume (Indications)
Risk for deficient fluid volume (Side Effects)

### Implementation

- Administer in the morning to prevent disruption of sleep cycle.
- **PO:** May be given with food or milk to minimize GI irritation.

### Patient/Family Teaching

- Instruct patient to take this medication at the same time each day. Take missed doses as soon as remembered but not just before next dose is due. Do not double doses. Advise patients using indapamide for hypertension to continue taking the medication even if feeling well. Indapamide controls but does not cure hypertension.
- Caution patient to change positions slowly to minimize orthostatic hypotension. This may be potentiated by alcohol.
- Advise patient to use sunscreen (avoid those containing PABA) and protective clothing when in the sun to prevent photosensitivity reactions.

- Instruct patient to follow a diet high in potassium (see Appendix M).
- Advise patient to report muscle weakness, cramps, nausea, or dizziness to health care professional.
- Advise patient to consult health care professional before taking OTC medication concurrently with this therapy.
- Emphasize the importance of routine follow-up exams.
- **Hypertension:** Instruct patient and family on proper technique of blood pressure monitoring. Advise them to check blood pressure at least weekly and to report significant changes.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).

### Evaluation/Desired Outcomes

- Control of hypertension.
- Decrease in edema secondary to CHF.

## indomethacin

(in-doe-**meth**-a-sin)

Apo-Indomethacin, Indameth, Indocid, Indocin, Indocin I.V, Indocin PDA, Indocin SR, Novo-Methacin, Nu-Indo

***Classification***

Therapeutic: antirheumatics, ductus arteriosus patency adjuncts (IV only), nonsteroidal anti-inflammatory agents

**Pregnancy Category B (first trimester)**

### Indications

**PO:** Inflammatory disorders including: Rheumatoid arthritis, Gouty arthritis, Osteoarthritis , Ankylosing spondylitis. Generally reserved for patients who do not respond to less toxic agents. **IV:** Alternative to surgery in the management of patent ductus arteriosus (PDA) in premature neonates.

### Action

Inhibits prostaglandin synthesis. **Therapeutic Effects: PO:** Suppression of pain and inflammation. **IV:** Closure of PDA.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration in adults, incomplete oral absorption in neonates.

**Distribution:** Crosses the blood-brain barrier and the placenta. Enters breast milk.

**Protein Binding:** 99%.

**Metabolism and Excretion:** Mostly metabolized by the liver.

**Half-life:** Neonates <2 weeks: 20 hr; >2 weeks: 11 hr; Adults: 2.6–11 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (analgesic) | 30 min | 0.5–2 hr | 4–6 hr |
| PO-ER (analgesic) | 30 min | unknown | 4–6 hr |
| PO (anti-inflammatory) | up to 7 days | 1–2 wk | 4–6 hr |
| PO-ER (anti-inflammatory) | up to 7 days | 1–2 wk | 4–6 hr |
| IV (closure of PDA) | up to 48 hr | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Known alcohol intolerance (suspension); Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Proctitis or recent history of rectal bleeding; Intraventricular hemorrhage; Thrombocytopenia; Pedi: ↑ risk of necrotizing enterocolitis and bowel perforation in premature infants with PDA.

**Use Cautiously in:** Severe cardiovascular, renal, or hepatic disease; History of ulcer disease; Epilepsy; Hypertension; OB: Not recommended during 2nd half of pregnancy (potential for causing premature closure of ductus arteriosus); Lactation: Usually compatible with breastfeeding (AAP); Geri: ↑ risk of adverse reactions.

### Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, headache, psychic disturbances. **EENT:** blurred vision, tinnitus. **CV:** hypertension, edema. **GI:** *PO*—DRUG-INDUCED HEPATITIS, GI BLEEDING, constipation, dyspepsia, nausea, vomiting, discomfort, necrotizing enterocolitis. **GU:** cystitis, hematuria, renal failure. **Derm:** rashes. **F and E:** hyperkalemia; *IV*, dilutional hyponatremia; *IV*, hypoglycemia. **Hemat:** thrombocytopenia, blood dyscrasias, prolonged bleeding time. **Local:** phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug:** Concurrent use with **aspirin** may ↓ effectiveness. Additive adverse GI effects with **aspirin**, other **NSAIDs**, **corticosteroids**, or **alcohol**. Chronic use of **acetaminophen** ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ hypo-

glycemia from **insulins** or **oral hypoglycemic agents**. May ↑ risk of toxicity from **lithium** or **zidovudine** (avoid concurrent use with zidovudine). ↑ risk of toxicity from **methotrexate**. **Probenecid** ↑ risk of toxicity from indomethacin. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **thrombolytics**, **warfarin**, and **drugs affecting platelet function** including **clopidogrel**, **ticlopidine**, **abciximab**, **eptifibatide**, or **tirofiban**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. ↑ risk of nephrotoxicity with **cyclosporine**. Concurrent use with **potassium-sparing diuretics** may result in hyperkalemia. May ↑ levels of **digitalis glycosides**, **methotrexate**, **lithium**, and **aminoglycosides** when used IV in neonates.
**Drug-Natural Products:** ↑ bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**.

### Route/Dosage

#### Anti-inflammatory

**PO (Adults):** *Antiarthritic*—25–50 mg 2–4 times daily *or* 75-mg extended-release capsule once or twice daily (not to exceed 200 mg or 150 mg of SR/day). A single bedtime dose of 100 mg may be used. *Antigout*—100 mg initially, followed by 50 mg 3 times daily for relief of pain, then ↓ further.
**PO (Children >2 yr):** 1–2 mg/kg/day in 2–4 divided doses (not to exceed 4 mg/kg/day or 150–200 mg/day).

#### PDA Closure

**IV (Neonates):** 0.2 mg/kg initially, then 2 subsequent doses at 12–24 hr intervals of 0.1 mg/kg if age <48 hr at time of initial dose; 0.2 mg/kg if 2–7 days at initial dose; 0.25 mg/kg if age >7 days at initial dose.

### Availability (generic available)

**Capsules:** 25 mg, 50 mg. **Sustained-release capsules:** 75 mg. **Oral suspension (fruit mint, pineapple coconut mint flavors):** 25 mg/5 mL. **Powder for injection:** 1 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- **Arthritis:** Assess limitation of movement and pain—note type, location, and intensity before and 1–2 hr after administration.
- **PDA:** Monitor respiratory status, heart rate, blood pressure, echocardiogram, and heart sounds routinely throughout therapy.
- Monitor intake and output. Fluid restriction is usually instituted throughout therapy.
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, serum potassium levels, and liver function tests periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, AST, and ALT tests may show ↑ levels. Blood glucose concentrations may be altered. Hemoglobin and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- Urine glucose and urine protein concentrations may be ↑.
- Leukocyte and platelet count may be ↓. Bleeding time may be prolonged for several days after discontinuation.

### Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

### Implementation

- If prolonged therapy is used, dose should be reduced to the lowest level that controls symptoms.
- **PO:** Administer after meals, with food, or with antacids to decrease GI irritation. Do not break, crush, or chew sustained-release capsules.
- Shake suspension before administration. Do not mix with antacid or any other liquid.

#### IV Administration

- **Direct IV:** ***Diluent:*** Preservative-free 0.9% NaCl or preservative-free sterile water. Reconstitute with 1 or 2 mL of diluent. ***Concentration:*** 0.5–1 mg/mL. Reconstitute immediately before use and discard any unused solution. Do not dilute further or admix. Do not administer via umbilical catheter into vessels near the superior mesenteric artery, as these can cause vasoconstriction and compromise blood flow to the intestines. Do not administer intra-arterially. ***Rate:*** Administer over 20–30 min. Avoid extravasation, as solution is irritating to tissues.
- **Y-Site Compatibility:** furosemide, insulin, nitroprusside, potassium chloride, sodium bicarbonate.

- **Y-Site Incompatibility:** calcium gluconate, cimetidine, dobutamine, dopamine, gentamicin, levofloxacin, tobramycin, tolazoline.

### Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered if not almost time for next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, other NSAIDs, acetaminophen, or other OTC medications without consulting health care professional.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional if rash, itching, chills, fever, muscle aches, visual disturbances, weight gain, edema, abdominal pain, black stools, or persistent headache occurs.
- **PDA:** Explain to parents the purpose of medication and the need for frequent monitoring.

### Evaluation/Desired Outcomes

- Decrease in severity of moderate pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 2 wk, but maximum effectiveness may require up to 1 mo of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Successful PDA closure.

## **infliximab** (in-**flix**-i-mab)
Remicade

***Classification***
Therapeutic: antirheumatics (DMARDs), gastrointestinal anti-inflammatories
Pharmacologic: monoclonal antibodies

**Pregnancy Category C**

### Indications

Active rheumatoid arthritis (moderate to severe, with methotrexate). Active Crohn's disease (moderate to severe). Active psoriatic arthritis. Active ankylosing spondylitis. Active ulcerative colitis (moderate to severe) with inadequate response to conventional therapy: reducing signs and symptoms, and inducing and maintaining clinical remission and mucosal healing, and eliminating corticosteroid use. Plaque psoriasis (chronic severe).

### Action

Neutralizes and prevents the activity of tumor necrosis factor-alpha (TNF-alpha), resulting in antiinflammatory and antiproliferative activity. **Therapeutic Effects:** Decreased pain and swelling, decreased rate of joint destruction and improved physical function in ankylosing spondylitis, rheumatoid or psoriatic arthritis. Reduction and maintenance of closure of fistulae in Crohn's disease. Decreased symptoms, maintaining remission and mucosal healing with decreased corticosteroid use in ulcerative Colitis. Decrease in induration, scaling and erythema of psoriatic lesions.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Predominantly distributed within the vascular compartment.
**Metabolism and Excretion:** Unknown.
**Half-life:** 9.5 days.

TIME/ACTION PROFILE (symptoms of Crohn's disease)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 1–2 wk | unknown | 12–48 wk† |

†After infusion

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to infliximab, murine (mouse) proteins, or other components in the formulation; Lactation: Lactation; CHF.
**Use Cautiously in:** Patients being retreated after 2 yr without treatment (↑ risk of adverse reactions); History of tuberculosis or exposure (latent tuberculosis should be treated prior to infliximab therapy); Chronic obstructive pulmonary disease (↑ risk of malignancy); Geri: Geriatric patients; OB: Use only if clearly needed; Pedi: Safety not established; ↑ risk of lymphoma, leukemia, and other malignancies.

### Adverse Reactions/Side Effects

**CNS:** fatigue, headache, anxiety, depression, dizziness, insomnia. **EENT:** conjunctivitis. **Resp:** upper respiratory tract infection, bronchitis, cough, dyspnea, laryngitis, pharyngitis, respiratory tract allergic reaction, rhinitis, sinusitis. **CV:**

chest pain, hypertension, hypotension, pericardial effusion, tachycardia, CHF. **GI:** HEPATOSPLENIC T-CELL LYMPHOMA, abdominal pain, nausea, vomiting, constipation, diarrhea, dyspepsia, flatulence, hepatotoxicity, intestinal obstruction, oral pain, tooth pain, ulcerative stomatitis. **GU:** dysuria, urinary frequency, urinary tract infection. **Derm:** acne, alopecia, dry skin, ecchymosis, eczema, erythema, flushing, hematoma, hot flushes, pruritus, psoriasis, rash, sweating, urticaria. **Hemat:** LEUKEMIA, neutropenia. **MS:** arthralgia, arthritis, back pain, involuntary muscle contractions, myalgia. **Neuro:** paresthesia. **Misc:** INFECTIONS (including reactivation tuberculosis, pneumonia, and invasive fungal infections), MALIGNANCY, fever, infusion reactions, chills, flu-like syndrome, herpes simplex, herpes zoster, hypersensitivity reactions, lupus-like syndrome, moniliasis, pain, peripheral edema, vasculitis.

### Interactions

**Drug-Drug:** None significant.

### Route/Dosage

#### Rheumatoid Arthritis

**IV (Adults):** 3 mg/kg followed by 3 mg/kg 2 and 6 wk after initial dose and then every 8 wk; dose may be adjusted in partial responders up to 10 mg/kg or treatment as often as every 4 wk (used with methotrexate).

#### Crohn's Disease

**IV (Adults):** *Moderate-to-severe Crohn's disease*—5 mg/kg as a single infusion. *Fistulizing Crohn's disease*—5 mg/kg repeated 2 and 6 wk after initial infusion; maintenance dose of 5 mg/kg may be given q 8 wk.

#### Ankylosing Spondylitis

**IV (Adults):** 5 mg/kg given as an infusion repeated 2 and 6 wk later, then every 6 wk.

#### Psoriatic Arthritis

**IV (Adults):** 5 mg/kg given as an infusion repeated 2 and 6 wk later, then every 8 wk thereafter (with or without methotrexate).

#### Ulcerative Colitis

**IV (Adults):** 5 mg/kg given as an infusion regimen at 0, 2, and 6 wk followed by a maintenance regimen of 5 mg/kg every 8 wk thereafter.

#### Psoriasis

**IV (Adults):** 5 mg/kg given as an infusion regimen at 0, 2, and 6 wk followed by a maintenance regimen of 5 mg/kg every 8 wk thereafter.

### Availability

**Powder for injection:** 100 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess for infusion-related reactions (fever, chills, urticaria, pruritus) during and for 2 hr after infusion. Symptoms usually resolve when infusion is discontinued. Reactions are more common after 1st or 2nd infusion. Frequency of reactions may be reduced with immunosuppressant agents.
- Assess for signs and symptoms of systemic infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping infliximab until the infection has been diagnosed and adequately treated.
- Assess for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be initiated prior to therapy with infliximab.
- Observe patient for hypersensitivity reactions (urticaria, dyspnea, hypotension) during infusion. Discontinue infliximab if severe reaction occurs. Have medications (antihistamines, acetaminophen, corticosteroids, epinephrine) and equipment readily available in the event of a severe reaction.
- **Rheumatoid Arthritis:** Assess pain and range of motion prior to and periodically during therapy.
- **Crohn's Disease and Ulcerative Colitis:** Assess for signs and symptoms before, during, and after therapy.
- **Psoriasis:** Assess lesions periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ in positive ANA. Frequency may be decreased with baseline immunosuppressant therapy.
- Monitor liver function tests periodically during therapy. May cause mild to moderate AST and

ALT ↑ without progressing to liver dysfunction. If patient develops jaundice or liver enzyme elevations ≥5 times the upper limits of normal, discontinue infliximab.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue infliximab if symptoms of blood dyscrasias (persistent fever) occur.

### Potential Nursing Diagnoses
Chronic pain (Indications)
Diarrhea (Indications)

### Implementation
**IV Administration**
- **Intermittent Infusion:** Calculate the total number of vials needed. Reconstitute each vial with 10 mL of sterile water for injection using a syringe with a 21-gauge needle or smaller. Direct stream to sides of vial. Do not use if vacuum is not present in vial. Gently swirl solution by rotating vial to dilute; do not shake. May foam on reconstitution; allow to stand for 5 min. Solution is colorless to light yellow and opalescent; a few translucent particles may develop because infliximab is a protein. Do not use if opaque particles, discoloration, or other particles occur. ***Diluent:*** Withdraw volume of total infliximab dose from infusion container containing 250 mL with 0.9% NaCl. Slowly add total dose of infliximab. ***Concentration:*** 0.4 to 4 mg/mL. Mix gently. Infusion should begin within 3 hr of preparation. Solution is incompatible with polyvinyl chloride equipment. Prepare in glass infusion bottle or polypropylene or polyolefin bags. Do not reuse or store any portion of infusion solution. ***Rate:*** Administer over at least 2 hr through polyethylene-lined administration set with an in-line, sterile, nonpyrogenic, low protein-building filter with ≤1.2-micron pore size.
- **Y-Site Incompatibility:** Do not administer concurrently in the same line with any other agents.

### Patient/Family Teaching
- Advise patient that adverse reactions (myalgia, rash, fever, polyarthralgia, pruritus) may occur 3–12 days after delayed (>2 yr) retreatment with infliximab. Symptoms usually decrease or resolve within 1–3 days. Instruct patient to notify health care professional if symptoms occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional promptly if symptoms of fungal infection occur.

### Evaluation/Desired Outcomes
- Decreased pain and swelling with decreased rate of joint destruction and improved physical function in patients with ankylosing spondylitis, psoriatic, or rheumatoid arthritis.
- Decrease in the signs and symptoms of Crohn's disease and a decrease in the number of draining enterocutaneous fistulas. Decreased symptoms, maintaining remission and mucosal healing with decreased corticosteroid use in ulcerative colitis.
- Decrease in induration, scaling and erythema of psoriatic lesions.

HIGH ALERT

## INSULIN (mixtures) (in-su-lin)

**insulin lispro protamine suspension/insulin lispro injection mixtures, rDNA origin**
Humalog Mix 75/25, Humalog Mix 50/50

**insulin aspart protamine suspension/insulin aspart injection mixtures, rDNA origin**
NovoLog Mix 70/30, NovoLog Mix 50/50

**NPH/regular insulin mixtures**
Humulin 70/30, Novolin 70/30

***Classification***
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

**Pregnancy Category B (insulin lispro protamine suspension/insulin lispro injection mixtures), C (insulin aspart protamine suspension/insulin aspart injection mixtures, NPH/regular insulin mixtures)**

See Appendix N for more information concerning insulins

### Indications
Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

### Action
Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

## Pharmacokinetics

**Absorption:** Well absorbed from subcutaneous administration sites. Absorption rate is determined by type of insulin, injection site, volume of injectate, and other factors.
**Distribution:** Widely distributed.
**Metabolism and Excretion:** Metabolized by liver, spleen, kidney, and muscle.
**Half-life:** 5–6 min (prolonged in patients with diabetes; biologic half-life is 1–1.5 hr).

TIME/ACTION PROFILE (hypoglycemic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| insulin lispro protamine suspension/ insulin lispro injection mixture subcut | 15–30 min | 2.8 hr | 24 hr |
| insulin aspart protamine suspension/ insulin aspart injection mixture subcut | 15 min | 1–4 hr | 18–24 hr |
| NPH/Regular Insulin mixture subcutaneous | 30 min | 4–8 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
**Use Cautiously in:** Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); OB: Pregnancy may temporarily ↑ insulin requirements; Pedi: Safety of Humalog not established.

## Adverse Reactions/Side Effects

**Endo:** HYPOGLYCEMIA. **Local:** erythema, lipodystrophy, pruritis, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

## Interactions

**Drug-Drug: Beta blockers**, **clonidine**, and **reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates**, may ↓ insulin requirements.
**Drug-Natural Products: Glucosamine** may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

## Route/Dosage

Dose depends on blood glucose, response, and many other factors.
**Subcut (Adults and Children):** 0.5–1 unit/kg/day. *Adolescents during rapid growth*—0.8–1.2 units/kg/day.

## Availability

**NPH insulin/regular insulin suspension mixture:** 70 units NPH/30 units regular insulin/mL—Novolin 70/30, Humulin 70/30 (100 units/mL total) in 10-mL vials and 3 mL prefilled pens[OTC]. **Cost:** *Humulin 70/30 or Novolin 70/30*—$42.99/10-mL vial; *Humulin 70/30 pen (3 mL)*—$117.03/5 pens. **Insulin lispro protamine suspension/insulin lispro injection mixture:** 75% insulin lispro protamine suspension and 25% insulin lispro injection—Humalog Mix 75/25 100 units/mL in 10-mL vials and 3-mL disposable delivery devices, 50% insulin lispro protamine suspension and 50% insulin lispro injection—Humalog Mix 50/50 100 units/mL in 10-mL vials and 3-mL disposable delivery devices. **Cost:** $91.25/10-mL vial *Humalog Mix 75/25 Pens (3 mL)*—$147.50/5 pens. **Insulin aspart protamine suspension/insulin aspart injection mixture:** 70% insulin aspart protamine suspension and 30% insulin aspart inection—NovoLog Mix 70/30 100 units/mL in 10-mL vials and 3-mL disposable delivery devices, 50% insulin aspart protamine suspension and 50% insulin aspart injection—NovoLog Mix 50/50 100 units/mL in 3-mL disposable delivery devices. **Cost:** *Novolog Mix 70/30 Pens (3 mL)*—$166.38/5 pens.

# NURSING IMPLICATIONS

## Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; excessive hunger; headache; irritability; nightmares or trouble sleeping; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion,

drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** May cause ↓ serum inorganic phosphate, magnesium, and potassium levels.
- Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may also be monitored every 3–6 mo to determine effectiveness.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

### Potential Nursing Diagnoses
Noncompliance (Patient/Family Teaching)

### Implementation
- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting physician or other health care professional.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL.
- Store insulin in refrigerator. May also be kept at room temperature for up to 28 days. Do not use if cloudy, discolored, or unusually viscous. Humalog pens must be discarded after 2 wk.
- NPH insulins should not be used in the management of ketoacidosis.
- **Subcut:** Rotate injection sites.
- Administer into abdominal wall, thigh, or upper arm subcutaneously.

### Patient/Family Teaching
- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Caution patient that insulin pens should not be shared with others, even if clean needles are used.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to consult health care professional prior to using alcohol or other Rx, OTC, or herbal products concurrently with insulin.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding or planning to breastfeed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few weeks of therapy.

### Evaluation/Desired Outcomes
- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

## INSULINS (short acting)
(**in**-su-lin)

**insulin, regular (injection, concentrated)**
Humulin R, Humulin R U-500 (concentrated), Insulin-Toronto, Novolin R

***Classification***
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

**Pregnancy Category B**

See Appendix N for more information concerning insulins

## Indications
Control of hyperglycemia in patients with type 1 or type 2 diabetes; can be used to treat diabetic ketoacidosis. *Concentrated insulin U-500*: Only for use in patients with insulin requirements >200 units/day. **Unlabeled Use:** Treatment of hyperkalemia.

## Action
Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

## Pharmacokinetics
**Absorption:** Rapidly absorbed from subcutaneous administration sites.
**Distribution:** Widely distributed.
**Metabolism and Excretion:** Metabolized by liver, spleen, kidney, and muscle.
**Half-life:** 30–60 min.

TIME/ACTION PROFILE (hypoglycemic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Regular insulin IV | 10–30 min | 15–30 min | 30–60 min |
| Regular insulin subcut | 30–60 min | 2–4 hr | 5–7 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
**Use Cautiously in:** Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); OB: Pregnancy may temporarily ↑ insulin requirements.

## Adverse Reactions/Side Effects
**Endo:** HYPOGLYCEMIA. **Local:** erythema, lipodystrophy, pruritis, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

## Interactions
**Drug-Drug: Beta blockers**, **clonidine**, and **reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates**, may ↓ insulin requirements.

**Drug-Natural Products: Glucosamine** may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

## Route/Dosage
Dose depends on blood glucose, response, and many other factors.

## Ketoacidosis—Regular Insulin Only (100 units/mL)
**IV (Adults):** 0.1 unit/kg/hr as a continuous infusion.
**IV (Children):** Loading dose-0.1 unit/kg, then maintenance continuous infusion 0.05–0.2 unit/kg/hr, titrate to optimal rate of ↓ of serum glucose of 80–100 mg/dL/hr.

## Maintenance Therapy
**Subcut (Adults and Children):** 0.5–1 unit/kg/day. *Adolescents during rapid growth*—0.8–1.2 units/kg/day.

## Treatment of Hyperkalemia
**Subcut, IV (Adults and Children):** Dextrose 0.5–1 g/kg combined with insulin 1 unit for every 4–5 g dextrose given.

## Availability
**Insulin injection (regular insulin):** 100 units/mL in 10-mL vials and 3-mL disposable delivery devices OTC. **Regular (concentrated) insulin injection:** 500 units/mL in 20 mL vials.

# NURSING IMPLICATIONS

## Assessment
- Assess for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** May cause ↓ serum inorganic phosphate, magnesium, and potassium levels.

- Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may also be monitored every 3–6 mo to determine effectiveness.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

## Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

## Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses). Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting physician or other health care professional. Do not confuse regular **concentrated (U-500)** insulin with regular insulin.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL. Special syringes for doses <50 units are available. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.
- When mixing insulins, draw regular insulin into syringe first to avoid contamination of regular insulin vial. Mixed insulins should never be used in a pump or for IV infusion.
- Store insulin in refrigerator. May also be kept at room temperature for up to 28 days. Do not use if cloudy, discolored, or unusually viscous.
- **Subcut:** Rotate injection sites.
- Administer into abdominal wall, thigh, or upper arm subcutaneously.
- Administer *regular insulin* within 15–30 min before a meal.

### IV Administration

- **IV:** Regular insulin is the *only* insulin that can be administered IV. ***High Alert:*** Regular (concentrated) insulin U-500 should not be given IV.
- **Direct IV:** May be administered IV undiluted directly into vein or through Y-site. ***Rate:*** Administer up to 50 units over 1 min.
- **Continuous Infusion:** ***Diluent:*** May be diluted in commonly used IV solutions as an infusion; however, insulin potency may be reduced by at least 20–80% by the plastic or glass container or tubing before reaching the venous system. ***Concentration:*** 0.2–1 unit/mL. ***Rate:*** Rate should be ordered by physician (usually 0.05–0.2 units/kg/hr), and infusion should be placed on an IV pump for accurate administration.
- Rate of administration should be decreased when serum glucose level reaches 250 mg/100 mL.
- **Y-Site Compatibility:** amiodarone, ampicillin, ampicillin-sulbactam, aztreonam, cefazolin, cefepime, ceftazidime, dobutamine, doxapram, esmolol, famotadine, gentamicin, heparin, imipenem/cilastatin, indomethacin, magnesium sulfate, meperidine, meropenem, midazolam, milrinone, morphine, nitroglycerin, nitroprusside, oxytocin, pantoprazole, pentobarbital, potassium chloride, propofol, ritodrine, sodium bicarbonate, tacrolimus, terbutaline, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin, vitamin B complex with C.
- **Y-Site Incompatibility:** dopamine, drotrecogin, nafcillin, norepinephrine, ranitidine.
- **Additive Compatibility:** May be added to total parenteral nutrition (TPN) solutions.

## Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen.
- Demonstrate technique for mixing insulins by drawing up regular insulin and rolling intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to consult health care professional prior to using alcohol or other Rx, OTC, or herbal products concurrently with insulin.

- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding or planning to breastfeed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few weeks of therapy.

### Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

## INSULINS (intermediate-acting) (in-su-lin)

### NPH insulin (isophane insulin suspension)

Humulin N, Novolin ge NPH, Novolin N

***Classification***

Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

**Pregnancy Category B**

See Appendix N for more information concerning insulins

### Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

### Action

Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

### Pharmacokinetics

**Absorption:** Well absorbed from subcutaneous administration sites; rate of absorption may vary by site or volume of injection and other factors.
**Distribution:** Widely distributed.
**Metabolism and Excretion:** Metabolized by liver, spleen, kidney, and muscle.
**Half-life:** 5–6 min (prolonged in patients with diabetes; biologic half-life is 1–1.5 hr).

TIME/ACTION PROFILE (hypoglycemic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| NPH | 1–2 hr | 4–12 hr | 18–24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
**Use Cautiously in:** Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements; OB: Pregnancy may temporarily ↑ insulin requirements.

### Adverse Reactions/Side Effects

**Endo:** HYPOGLYCEMIA. **Local:** lipodystrophy, pruritus, erythema, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug: Beta blockers**, **clonidine**, and **reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates**, may ↓ insulin requirements.
**Drug-Natural Products: Glucosamine** may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

### Route/Dosage

Dose depends on blood glucose, response, and many other factors.
**Subcut (Adults and Children):** 0.5–1 unit/kg/day. *Adolescents during rapid growth*—0.8–1.2 units/kg/day.

### Availability

**Isophane insulin suspension (NPH insulin):** 100 units/mL in 10-mL vials, 3 mL prefilled pens.
**Cost:** $42.99/10-mL vial *Humulin N pen (3*

*mL)* — $124.90/5 pens. ***In combination with:*** regular insulin as 70/30 (NPH/Regular) mixture (Humulin 70/30, Novolin 70/30).

## NURSING IMPLICATIONS

### Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; mood changes; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; excessive hunger; headache; irritability; nightmares or trouble sleeping; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** May cause ↓ serum inorganic phosphate, magnesium, and potassium levels.
- Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may also be monitored every 3–6 mo to determine effectiveness.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

### Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

### Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting health care professional.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL.
- When mixing insulins, draw regular insulin, insulin aspart, insulin glulisine, or insulin lispro into syringe first to avoid contamination of regular insulin vial. Mix insulin glulisine *only* with NPH insulin. Mixed insulins should never be used in a pump or for IV infusion.
- Store insulin vials in refrigerator. May also be kept at room temperature for up to 28 days. Humulin N pens should be kept at room temperature and should be discarded after 14 days. Do not use if cloudy, discolored, or unusually viscous.
- Because of short duration of *insulin lispro insulin glulisine* and *insulin aspart*, supplementation with longer-acting insulin may be necessary to control blood glucose levels.
- When transferring from once-daily NPH human insulin to *insulin glargine*, the dose usually remains unchanged. When transferring from twice-daily NPH human insulin to insulin glargine, the initial dose of insulin glargine is usually reduced by 20%.
- NPH insulin should not be used in the management of ketoacidosis.
- **Subcut:** Rotate injection sites.
- Administer into abdominal wall, thigh, or upper arm subcutaneously.
- Administer *NPH insulin* within 30–60 min before a meal.

### Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Caution patient that insulin pens should not be shared with others, even if clean needles are used.
- Demonstrate technique for mixing insulins by drawing up regular insulin, insulin aspart, or insulin lispro first and rolling intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to consult health care professional prior to using alcohol or other Rx, OTC, or herbal products concurrently with insulin.

- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding or planning to breastfeed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few weeks of therapy.

### Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

## INSULINS (long-acting)

(**in**-su-lin)

**insulin detemir**
Levemir

**insulin glargine**
Lantus

***Classification***
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

**Pregnancy Category C**

See Appendix N for more information concerning insulins

### Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

### Action

Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

### Pharmacokinetics

**Absorption:** Physiochemical characteristics of long-acting insulins result in delayed and prolonged absorption.
**Distribution:** Widely distributed.
**Metabolism and Excretion:** Metabolized by liver, spleen, kidney, and muscle.
**Half-life:** 5–6 min (prolonged in patients with diabetes); biologic half-life is 1–1.5 hr; *insulin detemir* 5–7 hr (dose-dependent).

TIME/ACTION PROFILE (hypoglycemic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Insulin detemir | 3–4 hr | 3–14 hr† | 24 hr |
| Insulin glargine | 3–4 hr | none† | 24 hr |

†Small amounts of insulin glargine and insulin detemir are slowly released resulting in a relatively constant effect over time

### Contraindications/Precautions

**Contraindicated in:** Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
**Use Cautiously in:** Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); OB: Pregnancy may temporarily ↑ insulin requirements; Pedi: Children <6 yr (safety not established).

### Adverse Reactions/Side Effects

**Endo:** HYPOGLYCEMIA. **Local:** lipodystrophy, pruritis, erythema, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug: Beta blockers**, **clonidine**, and **reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates**, may ↓ insulin requirements.
**Drug-Natural Products: Glucosamine** may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

### Route/Dosage

#### Insulin Detemir

**Subcut (Adults and Children ≥6 yr):** *Type 2 diabetes patients who are insulin-naive—*

0.1–0.2 units/kg once daily in the morning *or* 10 units once or twice daily. *Patients with type 1 or 2 diabetes receiving basal insulin or basal bolus therapy*—May substitute on an equivalent unit-per-unit basis.

### Insulin Glargine

**Subcut (Adults and Children ≥6 yr):** *Type 1 diabetes*—Administer 50–75% of daily insulin requirements once daily. *Initiation in patients with type 2 diabetes already being treated with oral antidiabetic agents*—10 units once daily; then adjust on the basis of the patient's needs (range 2–100 units/day). *Patients already receiving insulin*—When switching from once daily NPH, same dose of insulin glargine can be administered once daily. When switching from twice daily NPH, use 80% of the total daily NPH dose and administer once daily. Dose can then be adjusted on the basis of the patient's needs.

### Availability

**Insulin detemir:** 100 units/mL in 10-mL vials and 3-mL cartridges or prefilled syringes. **Cost:** $84.15/10-ml vial. **Insulin glargine:** 100 units/mL in 10-mL vials and 3-mL cartridges or prefilled disposable pens. **Cost:** $84.99/10-mL vial.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for signs and symptoms of hypoglycemia (anxiety; restlessness; mood changes; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; tiredness; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may also be monitored every 3–6 mo to determine effectiveness.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine. Recovery from hypoglycemia may be delayed due to the prolonged effect of long-acting insulins.

### Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

### Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting health care professional.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL. Special syringes for doses <50 units are available. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.
- ***High Alert:*** Do not mix *insulin glargine or insulin detemir* with any other insulin or solution, or use syringes containing any other medicinal product or residue. If giving with a short-acting insulin, use separate syringes and different injection sites. Solution should be clear and colorless with no particulate matter.
- Do not use if cloudy, discolored, or unusually viscous. Store unopened vials and cartridges of *insulin glargine and insulin detemir* in the refrigerator; do not freeze. If unable to refrigerate, the 10-mL vial of *insulin glargine* can be kept in a cool place unrefrigerated for up to 28 days. Once the cartridge is placed in an OptiPen One, do not refrigerate. After initial use, *insulin detemir* vials, cartridges, or a prefilled syringe may be stored in a cool place for 42 days. Do not store in-use cartridges and pre-filled syringes in refrigerator or with needle in place. Keep away from direct heat and sunlight.
- When transferring from once-daily NPH human insulin to *insulin glargine*, the dose usually remains unchanged. When transferring from twice-daily NPH human insulin to insulin glargine, the initial dose of insulin glargine is usually reduced by 20%.
- **Subcut:** Rotate injection sites.
- Administer *insulin glargine* once daily at the same time each day.
- Administer *daily insulin detemir* with evening meal or at bedtime. With *twice daily insulin*

*detemir*, administer evening dose with evening meal, at bedtime, or 12 hr after morning dose.
- Do not administer *insulin detemir* or *insulin glargine* IV or in insulin pumps.

### Patient/Family Teaching
- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Patients taking insulin detemir should be given the *Patient Information* circular for this product.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to consult health care professional prior to using alcohol or other Rx, OTC, or herbal products concurrently with insulin.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding or planning to breastfeed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few weeks of therapy.

### Evaluation/Desired Outcomes
- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

## INSULINS (rapid acting)
(**in**-su-lin)

**insulin aspart, rDNA origin**
Novolog

**insulin lispro, rDNA origin**
Humalog

**insulin glulisine**
Apidra

***Classification***
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

**Pregnancy Category B (insulin aspart, insulin lispro), C (insulin glulisine)**

See Appendix N for more information concerning insulins

I

### Indications
Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

### Action
Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lypolysis and proteolysis, enhanced protein synthesis. These are rapid-acting insulins with a more rapid onset and shorter duration than regular insulin; should be used with an intermediate- or long-acting insulin. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

### Pharmacokinetics
**Absorption:** Very rapidly absorbed from subcut administration sites.
**Distribution:** Widely distributed.
**Metabolism and Excretion:** Metabolized by liver, spleen, kidney, and muscle.
**Half-life:** *Insulin aspart*—1–1.5 hr; *Insulin lispro*—1 hr; *insulin glulisine*—42 min.

TIME/ACTION PROFILE (hypoglycemic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Insulin aspart | 10–20 min | 1–3 hr | 3–5 hr |
| Insulin glulisine | within 15 min | 1 hr | 2–4 hr |
| Insulin lispro | within 15 min | 1–1.5 hr | 3–4 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.

**Use Cautiously in:** Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic dysfunction (may ↓ insulin requirements); OB: Pregnancy may temporarily ↑ insulin requirements; Pedi: Safety not established in children <3 yr (for insulin lispro), <4 yr (insulin glulisine), <6 yr (for insulin aspart).

### Adverse Reactions/Side Effects

**Endo:** HYPOGLYCEMIA. **Local:** erythema, lipodystrophy, pruritis, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug: Beta blockers**, **clonidine**, and **reserpine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates**, may ↓ insulin requirements.

**Drug-Natural Products: Glucosamine** may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

### Route/Dosage

Dose depends on blood glucose, response, and many other factors. Only insulin aspart and insulin glulisine can be administered IV.

**Subcut (Adults and Children):** Total insulin dose determined by needs of patient; generally 0.5–1 unit/kg/day; 50–70% of this dose may be given as meal-related boluses of rapid-acting insulin, and the remainder as an intermediate or long-acting insulin. *Subcutaneous infusion pump*—~50% of total dose can be given as meal-related boluses and ~50% of total dose can be given as basal infusion.

### Availability

**Insulin aspart:** 100 units/mL in 10 mL vials and 3 mL disposable delivery devices. **Cost:** $88.99/10–mL vial *NovoLog Pens (3 mL)*—$166.39/5 pens. ***In combination with:*** **Insulin aspart 70/30 mix (Novolog Mix 70/30):** 70% insulin aspart protamine suspension and 30% insulin aspart solution mix 100 units/mL in 10-mL vials and 3-mL disposable delivery devices. **Insulin aspart 50/50 mix (Novolog Mix 50/50):** 50% insulin aspart protamine suspension and 50% insulin aspart solution mix 100 units/mL in 3-mL disposable delivery devices. **Insulin glulisine:** 100 units/mL in 10-mL vials or 3-mL cartridges (for use with OptiClick Insulin Delivery Device), or 3-mL SoloStar prefilled pen. **Cost:** $79.99/10-mL vial. **Insulin lispro:** 100 units/mL in 10-mL vials and 3-mL disposable delivery device. **Cost:** $85.99/10-mL vial. *Humalog Pens (3 mL)*—$172.05/5 pens. ***In combination with:*** **Insulin lispro 75/25 mix (Humalog Mix 75/25):** 75% lispro insulin protamine suspension and 25% insulin lispro mix 100 units/mL in 10-mL vials and 3-mL disposable delivery devices. **Cost:** $91.25/10-mL vial. *Humalog Mix 75/25 Pens (3 mL)*—$147.50/5 pens. **Insulin lispro 50/50 mix (Humalog Mix 50/50):** 50% lispro insulin protamine suspension and 50% insulin lispro mix 100 units/mL in 10-mL vials and 3-mL disposable delivery devices.

## NURSING IMPLICATIONS

### Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- Assess patient for signs of allergic reactions (rash, shortness of breath, wheezing, rapid pulse, sweating, low blood pressure) during therapy.
- ***Lab Test Considerations:*** May cause ↓ serum inorganic phosphate, magnesium, and potassium levels.
- Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may also be monitored every 3–6 mo to determine effectiveness.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine. Early signs of hypoglycemia may be less pronounced by long duration of diabetes, diabetic nerve disease, and use of beta blockers; may result in loss of

consciousness prior to patient's awareness of hypoglycemia.

## Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

## Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units, (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting physician or other health care professional.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL.
- *Insulin aspart, insulin glulisine,* and *insulin lispro* may be mixed with NPH insulin. When mixing insulins, draw insulin aspart, insulin glulisine, or insulin lispro into syringe first to avoid contamination of rapid-acting insulin vial. Mixed insulins should never be used in a pump or for IV infusion.
- Store vials in refrigerator. Vials may also be kept at room temperature for up to 28 days. Do not use if cloudy, discolored, or unusually viscous. Cartridges and pens should be stored at room temperature and used within 28 days. Never use the PenFill cartridge after the expiration date on the PenFill cartridge or on the box.
- Because of their short duration, *insulin lispro*, *insulin glulisine*, and *insulin aspart*, must be used with a longer-acting insulin or insulin infusion pump. In patients with type 2 diabetes, *insulin lispro* may be used without a longer-acting insulin when used in combination with an oral sulfonylurea agent.
- **Subcut:** Administer into abdominal wall, thigh, or upper arm subcut. Rotate injection sites.
- Administer *insulin aspart* within 5–10 min before a meal.
- When used as meal time insulin, administer *insulin glulisine* 15 min before or within 20 min after starting a meal.
- Administer *insulin lispro* within 15 min before or immediately after a meal.
- May also be administered subcut via external insulin pump. Do not mix with other insulins or solution when used with a pump. Change the solution in the reservoir at least every 6 days, change the infusion set, and the infusion set insertion site at least every 3 days. Do not mix with other insulins or with a diluent when used in the pump.

### IV Administration

- **IV:** *Insulin aspart* and *insulin glulisine* may be administered IV in selected situations under appropriate medical supervision. ***Diluent:*** Dilute *insulin aspart* with 0.9% NaCl or D5W in infusion systems using polypropylene infusion bags. Dilute *insulin glulisine* with 0.9% NaCl, using polyvinyl chloride (PVC) Viaflex infusion bags and Polyvinyl chloride (PVC) tubing (Clearlink System Continu-Flo solution set) with a dedicated infusion line. ***Concentration:*** 0.05–1 unit/mL. *Insulin lispro* should not be administered IV.

## Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, external pump, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Caution patient that insulin pens should not be shared with others, even if clean needles are used.
- Demonstrate technique for mixing insulins by drawing up insulin aspart, insulin glulisine, or insulin lispro first. Roll intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Advise patient to consult health care professional prior to using alcohol or other Rx, OTC, or herbal products concurrently with insulin.

- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding or planning to breastfeed.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few weeks of therapy.

### Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

## INTERFERONS, ALPHA

(in-ter-**feer**-onz)

**peginterferon alpha-2a**
Pegasys

**interferon alpha-2b (recombinant)**
Intron A

**peginterferon alpha-2b (pegylated)**
Pegintron

**interferon alpha-n3 (human)**
Alferon N

***Classification***
Therapeutic: immune modifiers
Pharmacologic: interferons

**Pregnancy Category C**

### Indications

**Peginterferon alpha-2a:** Treatment of: Chronic hepatitis C (alone or with ribavirin), Chronic hepatitis B. **Interferon alpha-2b:** Treatment of: Hairy cell leukemia, Malignant melanoma, AIDS-related Kaposi's sarcoma, Condylomata acuminata (intralesional), Chronic hepatitis B, Chronic hepatitis C (with oral ribavirin) which has relapsed following previous treatment with interferon alone, Follicular non-Hodgkin's lymphoma. **Peginterferon alpha–2b:** Chronic hepatitis C (alone or with ribavirin). **Interferon alpha-n3:** Treatment of condylomata acuminata (intralesional).

### Action

Interferons are proteins capable of modifying the immune response and have antiproliferative action against tumor cells. Interferon alpha-2b is produced by recombinant DNA techniques, peginterferon is a "pegylated" formulation of interferon alpha-2b formulated to have a longer duration of action; interferon alpha-n3 is from pooled human leukocytes. Interferons also have antiviral activity. **Therapeutic Effects:** Antineoplastic, antiviral, and antiproliferative activity. Decreased progression of hepatic damage (for patients with hepatitis).

### Pharmacokinetics

**Absorption:** Not absorbed orally. Well absorbed (>80%) following IM and subcut administration. Minimal systemic absorption follows intralesional administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Filtered by the kidneys and subsequently degraded in the renal tubule; *peginterferon alpha-2b*—30% renally excreted.
**Half-life:** *Peginterferon alpha-2a*—50–160 hr; *interferon alpha-2b*—2–3 hr; *peginterferon alpha-2b*—40 hr.

TIME/ACTION PROFILE (clinical effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Interferon alpha-2b IM, subcut | 1–3 mo | unknown | unknown (CR) |
| Interferon alpha-2b IM, subcut | unknown | 3–5 days | 3–5 days (BC) |
| Interferon alpha-2b IM, subcut | 2 wk | unknown | unknown (LFT) |
| Interferon alpha-2b and n3 | unknown | 4–8 wk | unknown (IL) |
| Peginterferon alpha-2b subcut | unknown | 6 mos or more | unknown |

BC = effects on platelet counts; CR = clinical response; IL = regression of lesions; LFT = effects on liver function in patients with hepatitis

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to alpha interferons or human serum albumin; Autoimmune hepatitis; Hepatic decompensation (Child-Pugh class B and C) before or during therapy;

Pedi: Products containing benzyl alcohol should not be used in neonates.
**Use Cautiously in:** Severe cardiovascular, pulmonary, renal, or hepatic disease; Active infections; Underlying CNS pathology or psychiatric history; Decreased bone marrow reserve or underlying immunosuppression; Current history of chickenpox, herpes zoster, or herpes labialis (may reactivate or disseminate disease); Previous or concurrent radiation therapy; Autoimmune disorders (may ↑ risk of exacerbation); OB: ↑ risk of spontaneous abortion in animal studies; use only if potential fetal risks are outweighed by potential maternal benefit; women with childbearing potential should be advised of potential risk to fetus; Lactation: Usually compatible with breastfeeding (AAP); Pedi: Children <3 yr (safety not established); Geri: ↑ risk of adverse reactions.
**Exercise Extreme Caution in:** History of depression/suicide attempt.

## Adverse Reactions/Side Effects

All are more prominent with subcut, IV, or IM administration.
**CNS:** NEUROPSYCHIATRIC DISORDERS, confusion, depression, dizziness, fatigue, headache, insomnia, irritability, anxiety. **EENT:** blurred vision, nose bleeds, rhinitis. **CV:** ISCHEMIC DISORDERS, arrhythmias, chest pain, edema. **GI:** COLITIS, PANCREATITIS, anorexia, abdominal pain, diarrhea, dry mouth, nausea, taste disorder, vomiting, weight loss, drug-induced hepatitis, flatulence. **Derm:** alopecia, dry skin, pruritus, rash, sweating. **Endo:** thyroid disorders. **Hemat:** LEUKOPENIA, THROMBOCYTOPENIA, anemia, hemolytic anemia (with ribavirin). **MS:** arthralgia, myalgia, leg cramps. **Neuro:** paresthesia. **Resp:** cough, dyspnea. **Local:** injection site reactions. **Misc:** AUTOIMMUNE DISORDERS, INFECTIOUS DISORDERS, allergic reactions including ANAPHYLAXIS, chills, fever, flu-like syndrome.

## Interactions

**Drug-Drug:** Additive myelosuppression with other **antineoplastic agents** or **radiation therapy**. ↑ CNS depression may occur with **CNS depressants**, including **alcohol**, **antihistamines**, **sedative/hypnotics**, and **opioids**. May ↓ metabolism and ↑ blood levels and toxicity of **theophylline** and **methadone**. ↑ risk of adverse reactions with **zidovudine**. **Ribavirin** ↑ risk of hemolytic anemia, especially if CCr <50 mL/min (avoid if possible). May ↓ effects of **immunosuppressant agents**.

## Route/Dosage

### Peginterferon Alpha-2a

**Subcut (Adults):** *Chronic hepatitis C*—180 mcg once weekly for 48 wk for Genotypes 1,4 (24 wk for Genotypes 2,3). *Patients with chronic hepatitis C co-infected with HIV*-180 mcg once weekly for 48 wk.

### Interferon Alpha-2b

**IV (Adults):** *Malignant melanoma (induction)*—20 million units/m² for 5 days of each week for 4 wk initially, followed by subcut maintenance dosing.
**IM, Subcut (Adults):** *Hairy cell leukemia*—2 million units/m² IM or subcut 3 times weekly for up to 6 mo. *Malignant melanoma (maintenance)*—10 million units/m² subcut 3 times weekly for 48 wk, following initial IV dosing. *AIDS-related Kaposi's sarcoma*—30 million units/m² IM or subcut 3 times weekly until disease progression or maximum response has been achieved after 16 wk. *Chronic hepatitis C*—3 million units IM or subcut 3 times weekly. If normalization of ALT occurs after 16 wk of therapy, continue treatment for total of 18–24 mo. If normalization of ALT does not occur after 16 wk of therapy, may consider discontinuing treatment. *Chronic hepatitis B*—5 million units/day IM or subcut *or* 10 million units IM or subcut 3 times weekly for 16 wk. *Follicular non-Hodgkin's lymphoma*—5 million units subcut 3 times weekly for up to 18 mo (to be used following completion of anthracycline-containing chemotherapy).
**Subcut (Children > 3 yr):** *Chronic hepatitis B*—3 million units/m² 3 times weekly for the first week of therapy then increase to 6 million units/m² 3 times weekly (not to exceed 10 million units/dose) for 16 to 24 weeks.
**IL (Adults):** *Condylomata acuminata*—1 million units/lesion 3 times weekly for 3 wk; treat only 5 lesions per course. An additional course of treatment may be initiated at 12–16 wk.

### Peginterferon Alpha-2b

#### Monotherapy

**Subcut (Adults):** *137–160 kg*—150 mcg once weekly for 1 yr. *107–136 kg*—120 mcg once weekly for 1 yr. *89–106 kg*—96 mcg once weekly for 1 yr. *73–88 kg*—80 mcg once weekly for 1 year. *57–72 kg*—64 mcg once weekly for 1 yr. *46–56 kg*—50 mcg once weekly for 1 yr. *37–45 kg*—40 mcg once weekly for 1 yr.

### In Combination with Ribavirin (Rebetol)

**Subcut (Adults):** *>85 kg*—150 mcg once weekly. *76–85 kg*—120 mcg once weekly. *61–75 kg*—96 mcg once weekly. *51–60 kg*—80 mcg once weekly. *40–50 kg*—64 mcg once weekly. *<40 kg*—50 mcg once weekly.
**Subcut (Children 3–17 yr):** 60 mcg/m² once weekly.

### Interferon Alpha-n3

**IL (Adults):** 250,000 units/lesion twice weekly for up to 8 wk; for large lesions, divide dose and inject at several sites.

### Availability

### Peginterferon Alpha-2a

**Solution for injection:** 180 mcg/mL in single use vials. **Prefilled syringes:** 180 mcg/0.5 mL.

### Interferon Alpha-2b

**Powder for injection:** 10-million-unit single-use vial, 18-million-unit single-use vial, 50-million-unit single-use vial. **Solution for injection:** 10-million-unit single-use vial, 18-million-unit single-use vial, 18-million-unit multidose pen, 25-million-unit multidose vial, 30-million-unit multidose pen, 60-million-unit multidose pen. ***In combination with:*** oral ribavarin (Rebetrol) as a combination package (Rebetron). See Appendix B (in various dosage packages).

### Peginterferon Alpha-2b

**Powder for injection (Redipen system or vials):** 50 mcg/0.5 mL, 80 mcg/0.5 mL, 120 mcg/0.5 mL, 150 mcg/0.5 mL.

### Interferon Alpha-n3

**Solution for injection:** 5 million units/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for signs of neuropsychiatric disorders (irritability, anxiety, depression, suicidal ideation, aggressive behavior). May require discontinuation of therapy.
- Monitor for signs of infection (vital signs, WBC) during therapy. Discontinue drug therapy in cases of severe infection, and antibiotic therapy instituted.
- Assess for cardiovascular disorders (pulse, blood pressure, chest pain). An ECG should be performed before and periodically during the course of therapy in patients with a history of cardiovascular disease.
- Assess for signs of colitis (abdominal pain, bloody diarrhea, fever) and pancreatitis (nausea, vomiting, abdominal pain) during therapy. Discontinue therapy if these occur; may be fatal. Colitis usually resolves within 1–3 wk of discontinuation.
- Assess for development of flu-like syndrome (fever, chills, myalgia, headache). Symptoms often appear suddenly 3–6 hr after therapy. Symptoms tend to decrease, even with continued therapy. Acetaminophen may be used for control of these symptoms.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums; bruising; petechiae; guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- May cause nausea and vomiting. Antiemetics may be used prophylactically. Monitor intake and output, daily weight, and appetite. Adjust diet as tolerated for anorexia. Encourage fluid intake of at least 2 liters/day.
- Assess pulmonary status (lung sounds, respirations) periodically during therapy.
- Perform a baseline eye exam in all patients prior to initiation of therapy. Eye exams should be performed periodically during therapy in patients with pre-existing diabetic or hypertensive retinopathy. Discontinue therapy if patients develop new or worsening eye disorders.
- Assess for signs of thyroid dysfunction, as hypothyroidism or hyperthyroidism may occur. Discontinue therapy if the patient's thyroid function cannot be controlled with medications (e.g., thyroid hormone supplementation, antithyroid medications).
- **Kaposi's Sarcoma:** Monitor number, size, and character of lesions prior to and throughout therapy.
- ***Lab Test Considerations:*** **Systemic:** Monitor for CBC and differential prior to and periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, decreased hemoglobin and hematocrit, and hemolytic anemia. The nadirs of leukopenia and thrombocytopenia occur in 3–5 days, with recovery 3–5 days after withdrawal of *interferon alpha-2b* For malignant melanoma, if granulocyte count >250/mm³ but <500/mm³, discontinue *interferon alpha-2b* until platelet or granulocyte counts return to normal or baseline levels, then reinstitute at 50% of dose. If granulocyte count <250/mm³ with *interferon alpha-2b*, discontinue permanently. For follicular non-Hodgkin's lymphoma, if granulocyte count <1000/

mm³ or platelet count <50,000/mm³, discontinue *interferon alpha-2b*. *Peginterferon alpha-2b* should be discontinued if granulocyte count <1000/mm³ or platelet count <50,000/mm³. *Peginterferon alpha-2a* should be discontinued if ANC<500/mm³ or platelet count <25,000/mm³ and then may be restarted at a lower dose if the ANC>1000/mm³.

- Platelet count should be ≥90,000 cells/mm³ and ANC ≥1500 cells/mm³ prior to initiation of peginterferon therapy. Commonly causes ↓ hemoglobin, hematocrit, WBC, ANC, lymphocytes and platelet counts within first 2 wk of therapy.
- Monitor liver function tests (AST, ALT, LDH, bilirubin, alkaline phosphatase), triglycerides, and renal function tests (BUN, creatinine, uric acid, urinalysis) prior to and periodically during therapy. CCr should be >50 mL/min prior to initiation of peginterferon therapy.
- Monitor TSH at baseline and if patients develop symptoms consistent with hypothyroidism or hyperthyroidism.
- **Hairy Cell Leukemia:** Monitor number of peripheral blood hairy cells and bone marrow hairy cells prior to and during therapy.

## Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)

## Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers (see Appendix L).

### Interferon Alpha-2b

- **IM, Subcut:** Subcut route is preferred for patients with a platelet count <50,000/mm³.
- Reconstitute 10-, 18-, and 50-million-unit vials with 1 mL of diluent provided by manufacturer (sterile water for injection). Agitate gently. Solution may be colorless to light yellow. Solution should be used immediately; stable for up to 24 hr if refrigerated.
- The solution for injection vials do not require reconstitution prior to use and may be used for IM, subcut, or intralesional administration.
- The solution for injection in multidose pens are for subcut use only. Only the needles provided in the package should be used with the pen. A new needle should be used with each dose. Follow instructions in *Medication Guide* for use of multidose pens.
- **IL:** Reconstitute 10-million-unit vial with 1 mL of diluent provided by manufacturer (sterile water for injection). Use a TB syringe with 25–30-gauge needle to administer. Each 0.1-mL dose is injected into the center of the base of the wart using the intradermal injection approach. As many as 5 lesions can be treated at one time.

**IV Administration**

- **Intermittent Infusion:** (For Malignant Melanoma). ***Diluent:*** Add 1 mL of diluent provided by manufacturer (sterile water for injection) to vial. Further dilute appropriate dose in 100 mL of 0.9% NaCl. Solution should be used immediately; stable for 24 hr if refrigerated. The solution for injection vials are not recommended for IV administration. ***Concentration:*** Final concentration of infusion should not be less than 10 million units/100 mL. ***Rate:*** Infuse over 20 min.

### Peginterferon Alpha–2a

- Vials and pre-filled syringes should be stored in refrigerator. Do not administer solution that is cloudy or contains a precipitate.
- Follow instructions in *Medication Guide* for use of pre-filled syringes.

### Peginterferon Alpha–2b

- Reconstitute vial with 0.7 mL of diluent provided by manufacturer (sterile water for injection). Administer immediately; stable for 24 hr if refrigerated. Solution should be clear and colorless. Discard unused solution.
- *For PEG Intron Redipen*—To reconstitute the drug, hold the Redipen upright (dose button down) and press 2 halves of pen together until a click is heard. Gently invert the pen to mix the solution (do not shake). Solution should be clear and colorless. Follow instructions in *Medication Guide* for *RediPen* use. Dispose of *RediPen* and other materials in puncture-resistant container.

### Interferon Alpha-n3

- Vials should be refrigerated.

## Patient/Family Teaching

- Advise patient to take medication as directed. If a dose is missed, omit dose and return to the regular schedule. Notify health care professional if more than 1 dose is missed.

- **Home Care Issues:** Instruct patient and family on preparation and correct technique for administration of injection and care and disposal of equipment. Advise patient to read *Medication Guide* prior to administration and with each prescription refill to check for changes. Explain to patient that brands should not be switched without consulting health care professional; may result in a change of dose.
- Discuss possibility of flu-like reaction 3–6 hr after dose. Acetaminophen may be taken prior to injection and every 3–4 hr afterward as needed to control symptoms.
- Review side effects with patient. Interferon may be temporarily discontinued or dose decreased by 50% if serious side effects occur.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Inform patient of the potential for depression and advise patient to notify health care professional if depression occurs.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Explain to patient that fertility may be impaired and that contraception is needed during treatment to prevent potential harm to the fetus.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.
- Inform patient that peginterferon alpha-2a may not reduce the risk of transmission of HCV to others or prevent cirrhosis, liver failure, or liver cancer.

### Evaluation/Desired Outcomes

- Normalized blood parameters (hemoglobin, neutrophils, platelets, monocytes, and bone marrow and peripheral hairy cells) in hairy cell leukemia. Response may not be seen for 6 mo with *interferon alpha-2b*.
- Decrease in the size and number of lesions in Kaposi's sarcoma. Therapy may be required for 6 mo before full response is seen. Therapy is continued until disease progresses or a maximum response has been achieved after 4 mo of therapy.
- Improved hematologic parameters in patients with chronic myelogenous leukemia.
- Increase in time to relapse and overall survival in patients with malignant melanoma.
- Disappearance of or decrease in size and number of genital warts. Condylomata acuminata usually respond in 4–8 wk. A second course of therapy may be required if genital warts persist and laboratory values remain in acceptable limits.
- Decrease in symptoms and improvement in liver function tests and ↓ progression of hepatic damage in patients with hepatitis B or hepatitis C infection.

## INTERFERONS, BETA

(in-ter-**feer**-on)

**inteferon beta-1a**
Avonex, Rebif

**interferon beta-1b**
Betaseron

***Classification***
Therapeutic: anti-multiple sclerosis agents, immune modifiers
Pharmacologic: interferons

**Pregnancy Category C**

### Indications

Relapsing forms of multiple sclerosis.

### Action

Antiviral and immunoregulatory properties produced by interacting with specific receptor sites on cell surfaces may explain beneficial effects. Produced by recombinant DNA technology. **Therapeutic Effects:** Reduce incidence of relapse (neurologic dysfunction) and slow physical disability.

### Pharmacokinetics

**Absorption:** *Interferon beta-1b*—50% absorbed following subcut administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** *Interferon beta-1a*—69 hr (subcut), 10 hr (IM); *interferon beta-1b*—8 min–4.3 hr.

TIME/ACTION PROFILE (serum concentrations)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Interferon beta-1a IM, subcut | unknown | 3–15 h | unknown |
| Interferon beta-1b subcut | rapid | 16 h | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to natural or recombinant interferon beta or human albumin.

**Use Cautiously in:** History of suicide attempt or depression; History of seizures (interferon beta-1a); Cardiovascular disease; Liver disease (interferon beta-1a); History of alcohol abuse (interferon beta-1a); Patients with childbearing potential; OB: May ↑ risk of spontaneous abortion; use only if potential maternal benefit outweighs potential fetal risk; Lactation: Safety not established; Pedi: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES (↑ WITH INTERFERON BETA-1A), depression, dizziness, fatigue, headache, insomnia, drowsiness, incoordination, rigors, suicidal ideation. **EENT:** sinusitis, vision abnormalities. **Resp:** dyspnea, upper respiratory tract infection. **CV:** chest pain, edema, hypertension. **GI:** constipation, nausea, vomiting, abdominal pain, autoimmune hepatitis, dry mouth, elevated liver function tests. **GU:** cystitis, erectile dysfunction, polyuria, urinary incontinence. **Derm:** rashes, alopecia. **Endo:** menstrual disorders, hyperthyroidism, hypothyroidism, menorrhagia, spontaneous abortion. **Hemat:** neutropenia, anemia, eosinophilia, thrombocytopenia. **Local:** injection-site reactions, injection site necrosis. **MS:** myalgia, arthralgia, muscle spasm. **Misc:** allergic reactions including ANAPHYLAXIS, chills, fever, flu-like symptoms, pain.

## Interactions

(All interactions below are for Interferon beta-1b).

**Drug-Drug:** ↑ myelosuppression may occur with other myelosuppressives including **antineoplastics**. Concurrent use of **hepatotoxic agents** may ↑ the risk of hepatotoxicity (↑ liver enzymes).

**Drug-Natural Products:** Avoid concommitant use with immmunomodulating natural products such as **astragalus**, **echinacea**, and **melatonin**.

## Route/Dosage

### Interferon Beta-1a

**IM (Adults):** *Avonex*—30 mcg once weekly.

**Subcut (Adults):** *Rebif (target dose of 22 mcg 3 times/wk)*—Start with 4.4 mcg 3 times/wk for 2 wk, then ↑ to 11 mcg 3 times/wk for 2 wk, then ↑ to maintenance dose of 22 mcg 3 times/wk. *Rebif (target dose of 44 mcg 3 times/wk)*—Start with 8.8 mcg 3 times/wk for 2 wk, then ↑ to 22 mcg 3 times/wk for 2 wk, then ↑ to maintenance dose of 44 mcg 3 times/wk.

### Interferon Beta-1b

**Subcut (Adults):** *Betaseron*—Initiate with 0.0625 mg (2 million units) every other day and then ↑ dose by 0.0625 mg q 2 wk over a 6-wk period up to target dose of 0.25 mg (8 million units) every other day.

## Availability

### Interferon Beta-1a (Avonex)

**Powder for injection:** 30 mcg/vial. **Prefilled syringes (Avonex):** 30 mcg/0.5 mL. **Pre-filled syringes (Rebif):** 22 mcg/0.5 mL, 44 mcg/0.5 mL, titration pack of 6 syringes prefilled with 8.8 mcg/0.2 mL and 6 syringes prefilled with 22 mcg/0.5 mL.

### Interferon Beta-1b

**Powder for injection (Betaseron):** 0.3 mg (9.6 million units)/vial.

# NURSING IMPLICATIONS

## Assessment

- Assess frequency of exacerbations of symptoms of multiple sclerosis periodically during therapy.
- Monitor patient for signs of depression during therapy. If depression occurs, notify physician or other health care professional immediately.
- ***Lab Test Considerations:*** Monitor hemoglobin, WBC, platelets, and blood chemistries including liver function tests prior to and 1, 3, and 6 mo after initiation of therapy and periodically thereafter. Therapy may be temporarily discontinued if the absolute neutrophil count is $<750/mm^3$, if AST or ALT exceeds 10 times the upper limit of normal, or if serum bilirubin exceeds 5 times the upper limit of normal. Once

the absolute neutrophil count is >750/mm³ or the hepatic enzymes have returned to normal, therapy can be restarted at 50% of the original dose.
- Thyroid function tests should be monitored every 6 mo, especially in patients with a history of thyroid abnormalities.

### Potential Nursing Diagnoses
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation
- Do not confuse products. Interferon beta-1a and interferon beta-1b are not interchangeable.
- **Interferon Beta-1a:** *Avonex:* Reconstitute with 1.1 mL of diluent and swirl gently to dissolve. Do not shake the vial. Inject into the thigh or upper arm. Keep reconstituted solution in refrigerator; inject within 6 hr of reconstitution.
- *Rebif:* Administer subcut via pre-filled, single-use syringe at the same time (afternoon or evening) on the same days (Monday, Wednesday, Friday) at least 48 hr apart each wk. Rotate sites with each injection to minimize risk of injection site reactions. Discard unused portions. Store in refrigerator.
- **Interferon Beta-1b:** To reconstitute, inject 1.2 mL of diluent supplied into interferon beta-1b vial for a concentration of 0.25 mg/mL. Swirl gently to dissolve completely; do not shake. Do not use solutions that are discolored or contain particulate matter. Keep reconstituted solution refrigerated; inject within 3 hr of reconstitution.
- Following reconstitution, withdraw 1 mL into a syringe with a 27-gauge needle and inject subcut into arm, abdomen, hip, or thigh. Rotate sites with each injection to minimize risk of injection site reactions. Discard unused portion; vials are for single dose only.

### Patient/Family Teaching
- **Home Care Issues:** Instruct patient in correct technique for injection and care and disposal of equipment. Caution patient not to reuse needles or syringes and provide patient with a puncture-resistant container for disposal.
- Instruct patient to take medication as directed; do not change dose or schedule without consulting health care professional. Patients should receive a medication guide with each product.
- Inform patient that flu-like symptoms (fever, chills, myalgia, sweating, malaise) may occur during therapy. Acetaminophen may be used for relief of fever and myalgias.
- Advise patient to notify health care professional if pregnancy is planned or suspected. May cause spontaneous abortion.

### Evaluation/Desired Outcomes
- Decrease in the frequency of relapse (neurologic dysfunction) in patients with relapsing-remitting multiple sclerosis.

## IODINE, IODIDE

**potassium iodide†**
Pima, SSKI, ThyroSafe, ThyroShield

**strong iodine solution**
Lugol's solution

***Classification***
Therapeutic: antithyroid agents
Pharmacologic: iodine containing agents

**Pregnancy Category D**

†For more information on potassium iodide as a radiation protectant see *Potassium Iodide as a Thyroid Blocking Agent in Radiation Emergencies* at www.fda.gov

### Indications
Adjunct with other antithyroid drugs in preparation for thyroidectomy. Treatment of thyrotoxic crisis. Radiation protectant following radiation emergencies or administration of radioactive iodine.

### Action
Rapidly inhibits the release and synthesis of thyroid hormones. Decreases the vascularity of the thyroid gland. Decreases thyroidal uptake of radioactive iodine following radiation emergencies or administration of radioactive isotopes of iodine. Iodine is a necessary component of thyroid hormone. **Therapeutic Effects:** Control of hyperthyroidism. Decreased bleeding during thyroid surgery. Decreased incidence of thyroid cancer following radiation emergencies.

### Pharmacokinetics
**Absorption:** Converted in the GI tract and enters the circulation as iodine; also absorbed through skin and lungs; may also be obtained via recycling of iodothyronines.
**Distribution:** Concentrates in the thyroid gland and muscle; also found in skin, skeleton, breasts, and hair. Readily crosses the placenta; enters breast milk.

**Metabolism and Excretion:** Taken up by the thyroid gland, then eliminated via kidneys, liver, skin, lungs, and intestines.
**Half-life:** Unknown.

TIME/ACTION PROFILE (effects on thyroid)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 24 hr | 10–15 days | variable† |

†Radiation protection lasts 24 hr

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hyperkalemia; Pulmonary edema; Impaired renal function.
**Use Cautiously in:** Tuberculosis; Bronchitis; Cardiovascular disease; OB, Pedi: Pregnancy or lactation (although iodine is required during pregnancy, excess amounts may cause thyroid abnormalities/goiter in the newborn; excess use during lactation may cause skin rash or thyroid suppression in the infant).

### Adverse Reactions/Side Effects

**CNS:** confusion, weakness. **GI:** GI BLEEDING, diarrhea, nausea, vomiting. **Derm:** acneiform eruptions. **Endo:** hypothyroidism, goiter, hyperthyroidism. **F and E:** hyperkalemia. **Neuro:** tingling. **MS:** joint pain. **Misc:** hypersensitivity, iodism.

### Interactions

**Drug-Drug:** Use with **lithium** may cause ↑ hypothyroidism. ↑ antithyroid effect of **methimazole** and **propylthiouracil**. ↑ hyperkalemia may result from combined use with **potassium-sparing diuretics**, **ACE inhibitors**, **angiotensin II receptor antagonists** or **potassium supplements**.

### Route/Dosage

### Preparation for Thyroidectomy

**PO (Adults and Children):** *Strong iodine solution*—3–5 drops (0.1–0.3 mL) 3 times daily for 10 days prior to surgery. *Potassium iodide saturated solution* (SSKI)—1–5 drops (50–250 mg) 3 times daily for 10 days prior to surgery.

### Hyperthyroidism

**PO (Adults and Children):** *Strong iodine solution*—1 mL in water 3 times daily. *Potassium iodide saturated solution (SSKI)*—6–10 drops (300–500 mg) 3 times daily.
**PO (Infants <1 yr):** 3–5 drops (150–250 mg) 3 times daily.

### Radiation Protectant to Radioactive Isotopes of Iodine

**PO (Adults):** *Pima*—195 mg once daily for 10 days (start 24 hr prior to exposure (continue until risk of exposure has passed or other measures have been implemented).
**PO (Children >1 yr):** 130 mg once daily for 10 days (start 24 hr prior to exposure).
**PO (Infants <1 yr):** 65 mg once daily for 10 days (start 24 hr prior to exposure).

### Reduction of Thyroid Cancer after Nuclear Accident

**PO (Adults and Children >68 kg, including pregnant/lactating women):** *Iosat, ThyroSafe, ThyroShield*—130 mg once daily (continue until risk of exposure has passed or other measures have been implemented).
**PO (Children 3–18 yr):** 65 mg once daily.
**PO (Children 1 mo-3 yr):** 32.5 mg once daily.
**PO (Infants <1 mo):** 16.25 mg once daily.

### Availability

### Potassium Iodide (generic available)

**Oral solution:** 65 mg/mL (ThyroShield), 1 g potassium iodide/mL (SSKI). **Syrup (Pima) (black-raspberry flavor):** 325 mg potassium iodide/5 mL. **Tablets:** 65 mg[OTC], 130 mg[OTC] (available only through state and federal agencies).

### Strong Iodine Solution (generic available)

**Oral solution:** Iodine 50 mg/mL plus potassium iodide 100 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for signs and symptoms of iodism (metallic taste, stomatitis, skin lesions, cold symptoms, severe GI upset). Report these symptoms promptly.
- Monitor response symptoms of hyperthyroidism (tachycardia, palpitations, nervousness, insomnia, diaphoresis, heat intolerance, tremors, weight loss).
- Monitor for hypersensitivity reaction (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify physician immediately if these problems occur.
- ***Lab Test Considerations:*** Monitor thyroid function before and periodically during therapy. May alter results of radionuclide thyroid imaging and may ↓ thyroidal uptake of $^{131}I$,

$^{123}I$, and sodium pertechnetate $^{99m}Tc$ in thyroid uptake tests.
- Monitor serum potassium levels periodically during therapy.
- ***Lab Test Considerations:*** Monitor thyroid stimulating hormone (TSH) and free $T_4$ in neonates (within the first month of life) treated with potassium iodide for development of hypothyroidism. Thyroid hormone therapy should be instituted if hypothyroidism develops.

### Potential Nursing Diagnoses
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation
- Do not confuse iodine with Lodine (etodolac).
- For protection against inhaled radioiodines, administer potassium iodide prior to or immediately coincident with passage of the radioactive cloud, though a substantial protective effect lasts 3–4 hr after exposure.
- **PO:** Mix solutions in a full glass of fruit juice, water, broth, formula, or milk. Administer after meals to minimize GI irritation.
- Solution is normally clear and colorless. Darkening upon standing does not affect potency of drug. Solutions that are brownish yellow should be discarded.
- Crystals may form, especially if refrigerated, but redissolve upon warming and shaking.

### Patient/Family Teaching
- Instruct patient to take medication as directed. Take missed doses as soon as possible but not just before next dose; do not double doses.
- Instruct patient to report suspected pregnancy to health care professional before therapy is initiated.
- Advise patient to consult health care professional about avoiding foods high in iodine (seafood, iodized salt, cabbage, kale, turnips) or potassium (see Appendix M).
- Advise patient to consult health care professional before using OTC or herbal cold remedies. Some cold remedies use iodide as an expectorant.
- **Hyperthyroidism:** Instruct patient to take medication as ordered. Missing a dose may precipitate hyperthyroidism.

### Evaluation/Desired Outcomes
- Resolution of the symptoms of thyroid crisis.
- Decrease in size and vascularity of the gland before thyroid surgery. Use of iodides in the treatment of hyperthyroidism is usually limited to 2 wk.
- Protection of the thyroid gland from the effects of radioactive iodine.

## ipratropium (i-pra-**troe**-pee-um)
Atrovent, Atrovent HFA

***Classification***
Therapeutic: allergy, cold, and cough remedies, bronchodilators
Pharmacologic: anticholinergics

**Pregnancy Category B**

### Indications
**Inhaln:** Maintenance therapy of reversible airway obstruction due to COPD, including chronic bronchitis and emphysema. **Intranasal:** Rhinorrhea associated with allergic and nonallergic perennial rhinitis (0.03% solution) or the common cold (0.06% solution). **Unlabeled Use: Inhaln:** Adjunctive management of bronchospasm caused by asthma.

### Action
**Inhaln:** Inhibits cholinergic receptors in bronchial smooth muscle, resulting in decreased concentrations of cyclic guanosine monophosphate (cGMP). Decreased levels of cGMP produce local bronchodilation. **Intranasal:** Local application inhibits secretions from glands lining the nasal mucosa. **Therapeutic Effects: Inhaln:** Bronchodilation without systemic anticholinergic effects. **Intranasal:** Decreased rhinorrhea.

### Pharmacokinetics
**Absorption:** Minimal systemic absorption (2% for inhalation solution; 20% for inhalation aerosol; <20% following nasal use).
**Distribution:** 15% of dose reaches lower airways after inhalation.
**Metabolism and Excretion:** Small amounts absorbed are metabolized by the liver.
**Half-life:** 2 hr.

TIME/ACTION PROFILE (bronchodilation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Inhalation | 1–3 min | 1–2 hr | 4–6 hr |
| Intranasal | 15 min | unknown | 6–12 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to ipratropium, atropine, belladonna alkaloids, or bromide; Avoid use during acute bronchospasm; **Note: Atrovent HFA has replaced the discontinued Atrovent CFC (chlorofluorocarbon). Soy and CFC-allergic patients can now safely use the Atrovent HFA formulation. However,**

**Combivent (ipratropium/albuterol combination) MDI does contain soya lecithin and is contraindicated in patients with a history of hypersensitivity to soy and peanuts.**
**Use Cautiously in:** Patients with bladder neck obstruction, prostatic hyperplasia, glaucoma, or urinary retention; Geri: May be more sensitive to effects.

### Adverse Reactions/Side Effects

**CNS:** dizziness, headache, nervousness. **EENT:** blurred vision, sore throat; *nasal only*, epistaxis, nasal dryness/irritation. **Resp:** bronchospasm, cough. **CV:** hypotension, palpitations. **GI:** GI irritation, nausea. **Derm:** rash. **Misc:** allergic reactions.

### Interactions

**Drug-Drug:** ↑ anticholinergic effects with other **drugs having anticholinergic properties** (**antihistamines**, **phenothiazines**, **disopyramide**).

### Route/Dosage

**Inhaln (Adults and Children > 12 yr):** *Metered-dose inhaler (nonacute)* — 2 inhalations 4 times daily (not to exceed 12 inhalations/24 hr or more frequently than q 4 hr). *Acute exacerbations* — 4–8 puffs using a spacer device as needed. *Via nebulization (nonacute)* — 500 mcg 3–4 times daily. *Via nebulization (acute exacerbations)* — 500 mcg q 30 min for 3 doses then q 2–4 hr as needed.
**Inhaln (Children 5–12 yr):** *Metered-dose inhaler (nonacute)* — 1–2 inhalations q 6 hr as needed (not to exceed 12 inhalations/24 hr). *Acute exacerbations* — 4–8 puffs as needed *Via nebulization (nonacute)* — 250–500 mcg 4 times daily given q 6 hr. *Acute exacerbations* — 250 mcg q 20 min for 3 doses then q 2–4 hr as needed.
**Inhaln (Infants):** *Nebulization* — 125–250 mcg 3 times a day.
**Inhaln (Neonates):** *Nebulization* — 25 mcg/kg/dose 3 times a day.
**Intranasal (Adults and Children > 6 yr):** *0.03% solution* — 2 sprays in each nostril 2–3 times daily (21 mcg/spray).
**Inhaln (Adults and Children > 5 yr):** *0.06% solution* — 2 sprays in each nostril 3–4 times daily (42 mcg/spray).

### Availability (generic available)

**Aerosol inhaler (HFA) (chlorofluorocarbon-free):** 17 mcg/spray in 12.9-g canister (200 inhalations). **Inhalation solution:** 0.0125%, 0.02% in single-dose vials containing 500 mcg, 0.025%. **Nasal spray:** 0.03% solution — 21 mcg/spray in 30-mL bottle (345 sprays/bottle), 0.06% solution — 42 mcg/spray in 15-mL bottle (165 sprays). ***In combination with:*** albuterol (Combivent, Duoneb). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess for allergy to atropine and belladonna alkaloids; patients with these allergies may also be sensitive to ipratropium. Atrovent HFA MDI does not contain CFC or soy and may be used safely in soy or CFC-allergic patients. However, Combivent MDI should be avoided in soy or peanut-allergic patients.
- **Inhaln:** Assess respiratory status (rate, breath sounds, degree of dyspnea, pulse) before administration and at peak of medication. Consult health care professional about alternative medication if severe bronchospasm is present; onset of action is too slow for patients in acute distress. If paradoxical bronchospasm (wheezing) occurs, withhold medication and notify health care professional immediately.
- **Nasal Spray:** Assess patient for rhinorrhea.

### Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Activity intolerance (Indications)

### Implementation

- Do not confuse Atrovent with Alupent (metaproterenol).
- **Inhaln:** See Appendix D for administration of inhalation medications.
- When ipratropium is administered concurrently with other inhalation medications, administer adrenergic bronchodilators first, followed by ipratropium, then corticosteroids. Wait 5 min between medications.
- Solution for *nebulization* can be diluted with preservative-free 0.9% NaCl. Diluted solution should be used within 24 hr at room temperature or 48 hr if refrigerated. Solution can be mixed with preservative-free albuterol, cromolyn, or metaproterenol if used within 1 hr of mixing.

### Patient/Family Teaching

- Instruct patient in proper use of inhaler, nebulizer, or nasal spray and to take medication as directed. Take missed doses as soon as re-

membered unless almost time for the next dose; space remaining doses evenly during day. Do not double doses.
- Advise patient that rinsing mouth after using inhaler, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Health care professional should be notified if stomatitis occurs or if dry mouth persists for more than 2 wk.
- **Inhalation:** Caution patient not to exceed 12 doses within 24 hr. Patient should notify health care professional if symptoms do not improve within 30 min after administration of medication or if condition worsens.
- Explain need for pulmonary function tests prior to and periodically during therapy to determine effectiveness of medication.
- Caution patient to avoid spraying medication in eyes; may cause blurring of vision or irritation.
- Advise patient to inform health care professional if cough, nervousness, headache, dizziness, nausea, or GI distress occurs.
- **Nasal Spray:** Instruct patient in proper use of nasal spray. Clear nasal passages gently before administration. Do not inhale during administration, so medication remains in nasal passages. Prime pump initially with 7 actuations. If used regularly, no further priming is needed. If not used in 24 hr, prime with 2 actuations. If not used for >7 days, prime with 7 actuations.
- Advise patient to contact health care professional if symptoms do not improve within 1–2 wk or if condition worsens.

### Evaluation/Desired Outcomes
- Decreased dyspnea.
- Improved breath sounds.
- Decrease in rhinorrhea from perennial rhinitis or the common cold.

**irbesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.**

## irinotecan
(eye-ri-noe-**tee**-kan)
Camptosar

***Classification***
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

**Pregnancy Category D**

### Indications
Metastatic colorectal cancer (with 5-fluorouracil and leucovorin).

### Action
Interferes with DNA synthesis by inhibiting the enzyme topoisomerase. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Protein Binding:** *Irinotecan*—30–68%; *SN–38 (active metabolite)*—95%.
**Metabolism and Excretion:** Converted by the liver to SN–38, its active metabolite, which is metabolized by the liver by UDP-glucuronosyl 111 transferase 1A1 (UGT1A1). Small amounts excreted by kidneys.
**Half-life:** 6 hr.

TIME/ACTION PROFILE (hematologic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | 21–29 days | 27–34 days |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Previous pelvic or abdominal irradiation or age ≥65 yr (↑ risk of myelosuppression); Presence of infection, underlying bone marrow depression, or concurrent chronic illness; History of prior pelvic/abdominal irradiation and serum bilirubin >1–2 mg/dL (initial dose reduction recommended); Geri: ↑ sensitivity to adverse effects (myelosuppression); initiate at lower dose; Previous severe myelosuppression or diarrhea (reinstitute at lower dose following resolution); Patients with genetically reduced UGT1A1 activity (↑ risk of neutropenia); OB: Patients with childbearing potential; Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** dizziness, headache, insomnia, weakness. **EENT:** rhinitis. **Resp:** coughing, dyspnea. **CV:** edema, vasodilation. **GI:** DIARRHEA, ↑ LIVER ENZYMES, abdominal pain/cramping, anorexia, constipation, dyspepsia, flatulence, nausea, stomatitis, vomiting, abdominal enlargement, colonic ulceration. **Derm:** alopecia, rash, sweating. **F and E:** dehydration. **Hemat:** anemia, leukopenia, neutropenia, thrombocytopenia. **Local:** injection site reactions. **Metab:** weight loss. **MS:** back pain. **Misc:** chills, fever.

### Interactions
**Drug-Drug:** Combination with **fluorouracil** may result in serious toxicity (dehydration, neu-

tropenia, sepsis). ↑ bone marrow depression may occur with other **antineoplastics** or **radiation therapy**. **Laxatives** should be avoided (diarrhea may be ↑). **Diuretics** ↑ risk of dehydration (may discontinue during therapy). **Dexamethasone** used as an antiemetic ↑ risk of hyperglycemia and lymphocytopenia. **Prochlorperazine** given on the same day as irinotecan ↑ risk of akathisia.
**Drug-Natural Products: St. John's wort** ↑ increases levels and risk of toxicity.

### Route/Dosage

Other regimens are used; careful modification required for all levels of toxicity/tolerance.

### Single Agent

**IV (Adults):** *Weekly dosage schedule*—125 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered. *Once-every-3-wk schedule*—350 mg/m² once every 3 wk.
**IV (Geriatric Patients >70 yr):** Initiate at 300 mg/m² every 3 wk.

### Hepatic Impairment

**IV (Adults):** *Bilirubin 1–2 mg/dL and history of prior pelvic/abdominal irradiation—Weekly dosage schedule*—Initiate therapy at lower dose (100 mg/m²); once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated with dose adjusted as tolerated. *Once-every-3-wk schedule*—300 mg/m² once every 3 wk, dose adjusted as tolerated as low as 200 mg/m² and further adjusted in 50-mg increments.

### As Part of Combination Therapy with Leucovorin and 5-Fluorouracil

**IV (Adults):** *Regimen 1 (Bolus regimen)*—125 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered; *Regimen 2 (Infusional regimen)*—180 mg/m² every 2 wk for 3 doses, followed by a 3-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered.

### Availability (generic available)

**Solution for injection:** 20 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor vital signs frequently during administration.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor closely for the development of diarrhea. Two types may occur. The early type occurs within 24 hr of administration and may be preceded by cramps and sweating. Atropine 0.25–1 mg IV may be given to decrease symptoms. Potentially life-threatening diarrhea may occur more than 24 hr after a dose and may be accompanied by severe dehydration and electrolyte imbalance. Loperamide 4 mg initially, followed by 2 mg every 2 hr until diarrhea ceases for at least 12 hr (or 4 mg every 4 hr if given during sleeping hours) should be administered promptly to treat late-occurring diarrhea. Do not administer loperamide at these doses for >48 hr. Careful fluid and electrolyte replacement should be instituted to prevent complications. Subsequent doses should be delayed in patients with active diarrhea until diarrhea is resolved for 24 hr. If diarrhea is grade 2, 3, or 4, decrease subsequent doses of irinotecan.
- Nausea and vomiting are common. Pretreatment with dexamethasone 10 mg along with agents such as ondansetron or granisetron should be started on the same day as irinotecan at least 30 min before administration. Prochlorperazine may be used on subsequent days but may increase risk of akathisia if given on the same day as irinotecan.
- Assess IV site frequently for inflammation. Avoid extravasation. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Flushing site with sterile water and application of ice over the extravasated site are recommended.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count prior to each dose. Temporarily discontinue irinotecan if ab-

solute neutrophil count is <500 cells/mm³ or if neutropenic fever occurs. Administration of a colony-stimulating factor may be considered if clinically significant decreases in WBC (<2000/mm³), neutrophil count (<1000/mm³), hemoglobin (<9 g/dL), or platelet count (<100,000 cells/mm³) occur.
- May cause ↑ serum alkaline phosphatase and AST concentrations.

### Potential Nursing Diagnoses
Risk for infection (Adverse Reactions)

### Implementation
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Dilute before infusion with D5W or 0.9% NaCl. Usual diluent is 500 mL of D5W. ***Concentration:*** 0.12–2.8 mg/mL. Solution is pale yellow. Do not administer solutions that are cloudy or contain particulate matter. Solution is stable for 24 hr at room temperature or 48 hr if refrigerated. To prevent microbial contamination, solutions should be used within 24 hr of dilution if refrigerated or 6 hr at room temperature. Do not refrigerate solutions diluted with 0.9% NaCl. ***Rate:*** Administer dose over 90 min.
- **Y-Site Compatibility:** anidulafungin, bivalirudin, caspofungin, daptomycin, docetaxel, ertapenem, fenoldopam, hetastarch, idarubicin, meperidine, nesiritide, octreotide, oxaliplatin, paclitaxel, palonosetron, pantoprazole, rituximab, teniposide, thiotepa, tigecycline, tirofiban, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** gemcitabine, pemetrexed, trastuzumab.
- **Additive Incompatibility:** Information unavailable. Do not admix with other solutions or medications.

### Patient/Family Teaching
- Instruct patient to report occurrence of diarrhea to health care professional immediately, especially if it occurs more than 24 hr after dose. Diarrhea may be accompanied by severe dehydration and electrolyte imbalance. It may be life-threatening and should be treated promptly.
- Instruct patient to notify health care professional promptly if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or other NSAIDs.
- Instruct patient to notify nurse of pain at injection site immediately.
- Instruct patient to notify health care professional if vomiting, fainting, or dizziness occurs.
- Discuss with patient possibility of hair loss. Explore methods of coping.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy.
- Instruct patient not to receive any vaccinations without consulting health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes
- Decrease in size and spread of malignancy.

## IRON SUPPLEMENTS

**carbonyl iron (100%)** (**kar**-bo-nil **eye**-ern)
Feosol, Icar

**ferrous fumarate (33% elemental iron)** (**fer**-us **fyoo**-ma-rate)
Femiron, Feostat, Fumasorb, Fumerin, Hemocyte, Neo-Fer, Nephro-Fer, Novofumar, Palafer, Span-FF

**ferrous gluconate (12% elemental iron)** (**fer**-us **gloo**-koe-nate)
Apo-Ferrous Gluconate, Fergon, Ferralet, Fertinic, Novoferrogluc, Simron

**ferrous sulfate (30% elemental iron)** (**fer**-us **sul**-fate)
Apo-Ferrous Sulfate, ED-IN-SOL, Fe50, Feosol, Feratab, Fer-gen-sol, Fer-In-Sol, Fer-Iron, Fero-Grad, Novoferrosulfa, PMS Ferrous Sulfate, Slow FE

**iron dextran** (**eye**-ern **dex**-tran)
DexFerrum, InFeD

**iron polysaccharide** (**eye**-ern poll-ee-**sak**-a-ride)
Hytinic, Niferex, Nu-Iron

**iron sucrose** (**eye**-ern **su**-krose)
Venofer

## sodium ferric gluconate complex (**so**-dee-yum **ferr**-ic **gloo**-ko-nate)

Ferrlecit

***Classification***

Therapeutic: antianemics
Pharmacologic: iron supplements

**Pregnancy Category A (ferrous gluconate, ferrous sulfate, iron polysaccharide), B (sodium ferric gluconate, iron sucrose), C (iron dextran)**

### Indications

**PO:** Prevention/treatment of iron-deficiency anemia. **IM, IV:** *Iron dextran*—Treatment of iron-deficiency anemia in patients who cannot tolerate or receive oral iron. *Sodium ferric gluconate complex*—Treatment of iron deficiency in patients undergoing chronic hemodialysis or peritoneal dialysis who are concurrently receiving erythropoietin. Treatment of iron-deficiency anemia in patients with chronic kidney disease including patients who are not on dialysis (with or without erythropoietin) and patients dependent on dialysis (with erythropoietin).

### Action

An essential mineral found in hemoglobin, myoglobin, and many enzymes. Enters the bloodstream and is transported to the organs of the reticuloendothelial system (liver, spleen, bone marrow), where it is separated out and becomes part of iron stores. **Therapeutic Effects:** Prevention/treatment of iron deficiency.

### Pharmacokinetics

**Absorption:** 5–10% of dietary iron is absorbed (up to 30% in deficiency states). Therapeutically administered PO iron may be 60% absorbed via an active and passive transport process. Well absorbed following IM administration.
**Distribution:** Remains in the body for many months. Crosses the placenta; enters breast milk.
**Protein Binding:** ≥90%.
**Metabolism and Excretion:** Mostly recycled; small daily losses occurring via desquamation, sweat, urine, and bile.
**Half-life:** *Iron dextran, iron sucrose*—6 hr.

TIME/ACTION PROFILE (effects on erythropoiesis)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 4 days | 7–10 days | 2–4 mo |
| IM, IV | 4 days | 1–2 wk | wk–mos |

### Contraindications/Precautions

**Contraindicated in:** Hemochromatosis, hemosiderosis, or other evidence of iron overload; Anemias not due to iron deficiency; Some products contain alcohol, tartrazine, or sulfites and should be avoided in patients with known intolerance or hypersensitivity.
**Use Cautiously in: PO:** Peptic ulcer; Ulcerative colitis or regional enteritis (condition may be aggravated); Alcoholism; Severe hepatic impairment; Severe renal impairment (oral products); Pre-existing cardiovascular disease (iron dextran) (may be exacerbated by adverse reactions to this drug); Significant allergies or asthma (iron dextran); Rheumatoid arthritis (iron dextran) (may have exacerbation of joint swelling); OB, Lactation: Pregnancy or lactation (safety of some parenteral products not established); Pedi: Safety not established for infants <4 mo (iron dextran) or children <6 yr (sodium ferric gluconate complex); safety may not be established for other products in the pediatric population.

### Adverse Reactions/Side Effects

**CNS:** *IM, IV*—SEIZURES, dizziness, headache, syncope. **CV:** *IM, IV*—hypotension, hypertension, tachycardia. **GI:** nausea; *PO*, constipation, dark stools, diarrhea, epigastric pain, GI bleeding; *IM, IV*, taste disorder, vomiting. **Derm:** *IM, IV*—flushing, urticaria. **Resp:** *IV*—cough, dyspnea. **Local:** pain at IM site (iron dextran), phlebitis at IV site, skin staining at IM site (iron dextran). **MS:** *IM, IV*—arthralgia, myalgia. **Misc:** *PO*—staining of teeth (liquid preparations); *IM, IV*, allergic reactions including ANAPHYLAXIS, fever, lymphadenopathy, sweating.

### Interactions

**Drug-Drug:** Oral iron supplements ↓ absorption of **tetracyclines**, **bisphosphonates**, **fluoroquinolones**, **levothyroxine**, **mycophenolate mofetil**, and **penicillamine** (simultaneous administration should be avoided). ↓ absorption of and may ↓ effects of **levodopa** and **methyldopa**. Concurrent administration of **$H_2$ antagonists**, **proton pump inhibitors**, and **cholestyramine** may ↓ absorption of iron. Doses of **ascorbic acid** ≥200 mg may ↑ absorption of iron up to ≥30%. **Chloramphenicol** and **vitamin E** may ↓ hematologic response to iron therapy.
**Drug-Food:** Iron absorption is ↓ 33–50% by concurrent administration of food.

### Route/Dosage

Oral Iron Dosage for Iron Deficiency (expressed as mg elemental iron, note individual salt forms, multiple ones exist—see approximate equivalent doses below for dose conversions).

### Approximate Equivalent Doses (mg of iron salt): *Ferrous fumarate*—197; *Ferrous gluconate*—560; *Ferrous sulfate*—324; *Ferrous sulfate, exsiccated*—217.

**PO (Adults):** *Deficiency*—120—240 mg/day (2–3 mg/kg/day) in 2–4 divided doses. *Prophylaxis*—60–100 mg/day.
**PO (Infants and Children):** *Severe deficiency*—4–6 mg/kg/day in 3 divided doses. *Mild to moderate deficiency*—3 mg/kg/day in 1–2 divided doses. *Prophylaxis*—1–2 mg/kg/day in 1–2 divided dose (maximum: 15 mg/day).
**PO (Neonates, premature):** 2–4 mg/kg/day in 1–2 divided doses, maximum: 15 mg/day.

### Iron Dextran

**IM, IV (Adults and Children):** Test dose of 0.5 mL (25 mg) is given 1 hr prior to therapy.
**IM, IV (Infants):** Test dose of 0.25 mL (12.5 mg) is given 1 hr prior to therapy.
**IM, IV (Adults and Children >15 kg):** *Iron deficiency*—Total dose (mL) = 0.0442 × (desired Hgb – actual Hgb) × lean body weight (kg) + [0.26 × lean body weight (kg)]. Divided up and given in small daily doses until total is reached; not to exceed 100 mg/day. *Total dose IV infusion*—Total dose may be diluted and infused over 4–5 hr following a test dose of 10 drops (unlabeled).
**IM, IV (Adults):** *Blood loss*—Dose (mL) = (Blood loss [mL] × hematocrit) × 0.02.
**IM, IV (Children 5–15 kg):** *Iron deficiency*—Total dose (mL) = 0.042 (desried Hgb – actual Hgb) × weight (kg) + [0.26 × weight (kg)]. Divided up and given in small daily doses until total is reached; not to exceed 25 mg/day in children <5 kg; 50 mg/day in children 5–10 kg; or 100 mg/day in children > 10 kg.

### Iron Polysaccharide Complex

**PO (Adults):** 50-100 mg twice daily of tablets/elixir or 150–300 mg/day of the capsules.
**PO (Children >6yr):** 50–100 mg/day (may be given in divided doses).
**PO (Infants):** 1–2 mg/kg/day.
**PO (Adults —Pregnant Women):** 30–60 mg/day.

### Iron Sucrose

**IV (Adults):** *Hemodialysis dependent patients*—100 mg (5 mL) during each dialysis session for 10 doses (total of 1000 mg) additional smaller doses may be necessary; *Peritoneal dialysis dependent patients*—300 mg (15 mL) infusion, followed by another 300 mg (15 mL) infusion 14 days later, followed by 400 mg (20 mL) infusion 14 days later; *Non-dialysis dependent patients*—200 mg (10 mL) on 5 different days within a 14 day period to a total of 1000 mg, may also be given as infusion of 500 mg on day 1 and day 14.

### Sodium Ferric Gluconate Complex

**IV (Adults):** 10 mL (125 mg elemental iron) repeated during 8 sequential dialysis treatments to a total cumulative dose of 1 g.
**IV (Children >6 yr):** 0.12 mL/kg (not to exceed 125 mg/dose) repeated during 8 sequential dialysis treatments.

### Availability

#### Carbonyl Iron (100% Iron)

**Tablets:** 50 mg[OTC]. **Oral suspension:** 15 mg/1.25 mL[OTC].

#### Ferrous Fumarate (33% Elemental Iron) (generic available)

**Tablets:** 63 mg[OTC], 195 mg[OTC], 200 mg[OTC], 324 mg[OTC], 325 mg[OTC]. **Chewable tablets:** 100 mg[OTC]. **Controlled-release capsules:** 325 mg[OTC]. **Suspension (butterscotch flavor):** 100 mg/5 mL[OTC], 300 mg/5 mL[OTC]. **Drops:** 45 mg/0.6 mL[OTC], 60 mg/1 mL[OTC].

#### Ferrous Gluconate (11.6% Elemental Iron) (generic available)

**Tablets:** 300 mg[OTC], 320 mg[OTC], 325 mg[OTC]. **Sustained-release tablets:** 320 mg[OTC]. **Soft gelatin capsules:** 86 mg[OTC]. **Elixir:** 300 mg/5 mL[OTC]. **Syrup:** 300 mg/5 mL[OTC].

#### Ferrous Sulfate (20–30% Elemental Iron)

**Tablets:** 195 mg[OTC], 300 mg[OTC], 325 mg[OTC]. **Capsules:** 150 mg[OTC], 250 mg[OTC]. **Timed-release tablets:** 525 mg[OTC]. **Syrup:** 90 mg/5 mL[OTC]. **Elixir:** 220 mg/5 mL[OTC]. **Drops:** 75 mg/0.6 mL[OTC], 125 mg/1 mL[OTC].

#### Iron Dextran

**Injection:** 50 mg/mL.

#### Iron Polysaccharide (mg Iron)

**Capsules:** 150 mg[OTC]. **Elixir:** 100 mg/5 mL[OTC]. **Tablets:** 50 mg[OTC].

#### Iron Sucrose

**Aqueous complex for injection:** 20 mg/mL in 5 mL single-use vial (100 mg).

#### Sodium Ferric Gluconate Complex

**Injection:** 62.5 mg/5 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess nutritional status and dietary history to determine possible cause of anemia and need for patient teaching.
- Assess bowel function for constipation or diarrhea. Notify health care professional and use appropriate nursing measures should these occur.
- **Iron Dextran, Iron Sucrose, and Sodium Ferric Gluconate Complex:** Monitor blood pressure and heart rate frequently following IV administration until stable. Rapid infusion rate may cause hypotension and flushing.
- Assess patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify physician immediately if these occur. Keep epinephrine and resuscitation equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** Monitor hemoglobin, hematocrit, and reticulocyte values prior to and every 3 wk during the first 2 mo of therapy and periodically thereafter. Serum ferritin and iron levels may also be monitored to assess effectiveness of therapy.
- Occult blood in stools may be obscured by black coloration of iron in stool. Guaiac test results may occasionally be false-positive.
- **Iron Dextran:** Monitor hemoglobin, hematocrit, reticulocyte values, transferrin, ferritin, total iron-binding capacity, and plasma iron concentrations periodically during therapy. Serum ferritin levels peak in 7–9 days and return to normal in 3 wk. Serum iron determinations may be inaccurate for 1–2 wk after therapy with large doses; therefore, hemoglobin and hematocrit are used to gauge initial response.
- May impart a brownish hue to blood drawn within 4 hr of administration. May cause false ↑ in serum bilirubin and false decrease in serum calcium values.
- Prolonged PTT may be calculated when blood sample is anticoagulated with citrate dextrose solution; use sodium citrate instead.
- **Iron Sucrose:** Monitor hemoglobin, hematocrit, serum ferritin, and transferritin saturation prior to and periodically during therapy. Transferrin saturation values increase rapidly after IV administration; therefore, serum iron values may be reliably obtained 48 hr after IV administration. Withhold iron therapy if evidence of iron overload occurs.
- May cause ↑ liver enzymes.
- ***Toxicity and Overdose:*** Early symptoms of overdose include stomach pain, fever, nausea, vomiting (may contain blood), and diarrhea. Late symptoms include bluish lips, fingernails, and palms; drowsiness; weakness; tachycardia; seizures; metabolic acidosis; hepatic injury; and cardiovascular collapse. Patient may appear to recover prior to the onset of late symptoms. Therefore, hospitalization continues for 24 hr after patient becomes asymptomatic to monitor for delayed onset of shock or GI bleeding. Late complications of overdose include intestinal obstruction, pyloric stenosis, and gastric scarring.
- If patient is comatose or seizing, gastric lavage with sodium bicarbonate is performed. Deferoxamine is the antidote. Additional supportive treatments to maintain fluid and electrolyte balance and correction of metabolic acidosis are also indicated.
- If signs of overdose occur during IV administration of iron sucrose, treatment includes IV fluids, corticosteroids, and/or antihistamines. Administering at a slower rate usually relieves symptoms.

### Potential Nursing Diagnoses

Activity intolerance (Indications)

### Implementation

- Discontinue oral iron preparations prior to parenteral administration.
- Sodium ferric gluconate and iron sucrose are for IV use only.
- **PO:** Oral preparations are most effectively absorbed if administered 1 hr before or 2 hr after meals. If gastric irritation occurs, administer with meals. Take tablets and capsules with a full glass of water or juice. Do not crush or chew enteric-coated tablets and do not open capsules.
- Liquid preparations may stain teeth. Dilute in water or fruit juice, full glass (240 mL) for adults and ½ glass (120 mL) for children, and administer with a straw or place drops at back of throat.
- Avoid using antacids, coffee, tea, dairy products, eggs, or whole-grain breads with or within 1 hr after administration of ferrous salts. Iron absorption is decreased by 33% if iron and calcium are given with meals. If calcium supplementation is needed, calcium carbonate

does not decrease absorption of iron salts if supplements are administered between meals.
- **Iron Dextran:** The 2-mL ampule may be used for IM or IV administration.
- Prior to initial IM or IV dose, a test dose of 25 mg should be given by the same route as the dose will be given, to determine reaction. The IV test dose should be administered over 5 min. The IM dose should be administered in the same injection site and by same technique as the therapeutic dose. The remaining portion may be administered after 1 hr, if no adverse symptoms have occurred.
- **IM:** Inject deeply via Z-track technique into upper outer quadrant of buttock, never into arm or other exposed areas. Use a 2–3 in., 19- or 20-gauge needle. Change needles between withdrawal from container and injection to minimize staining of subcut tissues. Stains are usually permanent.

### IV Administration

- **IV: Iron Dextran**: Following IV administration, patient should remain recumbent for at least 30 min to prevent orthostatic hypotension.
- **Direct IV:** ***Diluent:*** May administer undiluted or dilute in 0.9% NaCl or D5W. ***Concentration:*** 50 mg/mL. ***Rate:*** Administer slowly at a rate of 50 mg (1 mL) over at least 1 min.
- **Intermittent Infusion:** May be diluted in 200–1000 mL of 0.9% NaCl or D5W; 0.9% NaCl is the preferred diluent; dilution in D5W increases incidence of pain and phlebitis. ***Rate:*** Administer over 1–6 hr following a test dose of 10 drops/min for 10 min. Flush line with 10 mL of 0.9% NaCl at completion of infusion.
- **Y-Site Incompatibility:** Discontinue other IV solutions during infusion.
- **Additive Incompatibility:** Manufacturers recommend that iron dextran not be mixed with other solutions; however, iron dextran has been added to total parenteral nutrition solutions.
- **Sodium Ferric Gluconate Complex:** ***Diluent:*** Dilute test dose in 50 mL of 0.9% NaCl and administer IV over 60 min.
- To administer therapeutic dose of 10 mL (125 mg of elemental iron) dilute in 100 mL of 0.9% NaCl. Dialysis patients frequently require a cumulative dose of 1 g of elemental iron, administered over 8 sessions of sequential dialysis. ***Concentration:*** 12.5 mg/mL. ***Rate:*** Administer at a maximum rate of 12.5 mg/min.
- **Iron Sucrose:** Each 5-mL vial contains 100 mg of elemental iron.
- *Hemodialysis*—Most patients require a minimum cumulative dose of 1000 mg of elemental iron, administered over 10 sequential dialysis sessions, to achieve a favorable hemoglobin or hematocrit response.
- Solution is brown. Inspect for particulate matter or discoloration. Do not administer solutions that contain particulate matter or are discolored.
- **Direct IV:** May be administered undiluted by slow injection into dialysis line. ***Rate:*** Administer at a rate of 1 mL undiluted solution per minute, not to exceed one vial per injection. Discard any unused portion.
- **Intermittent Infusion:** May also be administered via infusion, into dialysis line for hemodialysis patients. May reduce risk of hypotensive episodes. ***Diluent:*** Each vial must be diluted in a maximum of 100 mL of 0.9% NaCl immediately prior to infusion. Unused diluted solution should be discarded. ***Concentration:*** 1–2 mg/mL. ***Rate:*** Infuse at a rate of 100 mg of iron over at least 15 min, large doses (500 mg) should be given over 3.5–4 hr.
- **Intermittent Infusion:** *For Peritoneal Dialysis Patients*—***Diluent:*** Dilute each dose in a maximum of 250 mL of 0.9% NaCl. ***Rate:*** Administer doses of 300 mg over 1.5 hr and doses of 400 mg over 2.5 hr.
- **Direct IV:** *For Non-dialysis dependent patients*—May be administered as a slow injection of 200 mg undiluted. ***Rate:*** Administer over 2–5 min.
- **Intermittent Infusion:** Dilute 500 mg in 250 mL 0.9% NaCl. ***Rate:*** Infuse over 3.5–4 hr on days 1 and 14. May cause hypotension; monitor closely.
- **Additive Incompatibility:** Do not mix iron sucrose with other medications or add to parenteral nutrition solutions for IV infusion.

### Patient/Family Teaching

- Explain purpose of iron therapy to patient.
- Encourage patient to comply with medication regimen. Take missed doses as soon as remembered within 12 hr; otherwise, return to regular dosing schedule. Do not double doses.
- Advise patient that stools may become dark green or black and that this change is harmless.
- Instruct patient to follow a diet high in iron (see Appendix M).
- Discuss with parents the risk of children's overdosing on iron. Medication should be stored in the original childproof container and kept out of reach of children. Do not refer to

vitamins as candy. In the event of a suspected overdose, parents or guardians should contact the poison control center (1-800-222-1222) or emergency medical services (911) immediately.

- **Iron Dextran:** Delayed reaction may occur 1–2 days after administration and last 3–4 days if IV route used, 3–7 days with IM route. Instruct patient to contact physician if fever, chills, malaise, muscle and joint aches, nausea, vomiting, dizziness, and backache occur.
- **Iron sucrose and sodium ferric gluconate complex:** Instruct patient to immediately report symptoms of hypersensitivity reaction to health care professional.

### Evaluation/Desired Outcomes

- Increase in hemoglobin, which may reach normal parameters after 1–2 mo of therapy. May require 3–6 mo for normalization of body iron stores.
- Improvement in iron deficiency anemia or anemia of chronic renal failure.

## isocarboxazid, See MONOAMINE OXIDASE (MAO) INHIBITORS.

## isoniazid (eye-soe-**nye**-a-zid)

INH, Isotamine, PMS Isoniazid

***Classification***

Therapeutic: antituberculars

**Pregnancy Category C**

### Indications

First-line therapy of active tuberculosis, in combination with other agents. Prevention of tuberculosis in patients exposed to active disease (alone).

### Action

Inhibits mycobacterial cell wall synthesis and interferes with metabolism. **Therapeutic Effects:** Bacteriostatic or bactericidal action against susceptible mycobacteria.

### Pharmacokinetics

**Absorption:** Well absorbed following PO/IM administration.

**Distribution:** Widely distributed; readily crosses the blood-brain barrier. Crosses the placenta; enters breast milk in concentrations equal to plasma.

**Metabolism and Excretion:** 50% metabolized by the liver by N-acetyltransferase (rate of acetylation is genetically determined [slow acetylators have ↑ isoniazid levels and ↑ risk of toxicity; fast acetylators have ↓ isoniazid levels and ↑ risk for treatment failure]); 50% excreted unchanged by the kidneys.

**Half-life:** 1–4 hr in patients with normal renal and hepatic function; 0.5–1.6 hr in fast acetylators; 2–5 hr in slow acetylators.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1–2 hr | up to 24 hr |
| IM | rapid | 1–2 hr | up to 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Acute liver disease; Previous hepatitis from isoniazid.

**Use Cautiously in:** History of liver damage or chronic alcohol ingestion; Black and Hispanic women, women in the postpartum period, or patients >50 yr (↑ risk of drug-induced hepatitis); Severe renal impairment (dosage reduction may be necessary); Malnourished patients, patients with diabetes, or chronic alcoholics (↑ risk of neuropathy); OB, Lactation: Although safety is not established, isoniazid has been used with ethambutol to treat tuberculosis in pregnant women without harm to the fetus.

### Adverse Reactions/Side Effects

**CNS:** psychosis, seizures. **EENT:** visual disturbances. **GI:** DRUG-INDUCED HEPATITIS, nausea, vomiting. **Derm:** rashes. **Endo:** gynecomastia. **Hemat:** blood dyscrasias. **Neuro:** peripheral neuropathy. **Misc:** fever.

### Interactions

**Drug-Drug:** Additive CNS toxicity with other **antituberculars**. **BCG vaccine** may not be effective during isoniazid therapy. Isoniazid inhibits the metabolism of **phenytoin**. **Aluminum-containing antacids** may decrease absorption. Psychotic reactions and coordination difficulties may result with **disulfiram**. Concurrent administration of **pyridoxine** may prevent neuropathy. ↑ risk of hepatotoxicity with other **hepatotoxic agents** including **alcohol** and **rifampin**. Isoniazid may ↓ blood levels and effectiveness of **ketoconazole**. Concurrent use with **carbamazepine** ↑ carbamazepine blood levels and risk of hepatotoxicity.

**Drug-Food:** Severe reactions may occur with ingestion of foods containing high concentrations of **tyramine** (see Appendix M).

### Route/Dosage

**PO, IM (Adults):** 300 mg/day (5 mg/kg) *or* 15 mg/kg (up to 900 mg) 2–3 times weekly.
**PO, IM (Children):** 10–20 mg/kg/day (up to 300 mg/day) *or* 20–40 mg/kg (up to 900 mg) 2–3 times weekly.

### Availability (generic available)

**Tablets:** 100 mg, 300 mg. **Oral solution (orange, raspberry flavor):** 50 mg/5 mL. **Injection:** 100 mg/mL. ***In combination with:*** rifampin (Rifamate) or with rifampin and pyrazinamide (Rifater). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Mycobacterial studies and susceptibility tests should be performed prior to and periodically throughout therapy to detect possible resistance. About 50% to 65% of Caucasians, Black, South Indians and Mexicans are slow acetylators at risk for toxicity, while 80 to 90% of Eskimos, Japanese, and Chinese are rapid acetylators at risk for decreased levels and treatment failure.
- ***Lab Test Considerations:*** Hepatic function should be evaluated prior to and monthly throughout therapy. Increased AST, ALT, and serum bilirubin may indicate drug-induced hepatitis. Black and Hispanic women, postpartal women, and patients >50 yr are at highest risk. The risk is lower in children; therefore, liver function tests are usually ordered less frequently for children.
- ***Toxicity and Overdose:*** If isoniazid overdosage occurs, treatment with pyridoxine (vitamin B) is instituted.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** May be administered with food or antacids if GI irritation occurs, although antacids containing aluminum should not be taken within 1 hr of administration.
- **IM:** Medication may cause discomfort at injection site. Massage site after administration and rotate injection sites.
- Solution may form crystals at low temperatures; crystals will redissolve upon warming to room temperature.

### Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; do not double up on missed doses. Emphasize the importance of continuing therapy even after symptoms have subsided. Therapy may be continued for 6 mo–2 yr.
- Advise patient to notify health care professional promptly if signs and symptoms of hepatitis (yellow eyes and skin, nausea, vomiting, anorexia, dark urine, unusual tiredness, or weakness) or peripheral neuritis (numbness, tingling, paresthesia) occur. Pyridoxine may be used concurrently to prevent neuropathy. Any changes in visual acuity, eye pain, or blurred vision should also be reported immediately.
- Caution patient to avoid the use of alcohol during this therapy, as this may increase the risk of hepatotoxicity. Ingestion of Swiss or Cheshire cheeses, fish (tuna, skipjack, and sardinella), and possibly tyramine-containing foods (see Appendix M) should also be avoided, as they may result in redness or itching of the skin; hot feeling; rapid or pounding heartbeat; sweating; chills; cold, clammy feeling; headache; or lightheadedness.
- Emphasize the importance of regular follow-up physical and ophthalmologic exams to monitor progress and to check for side effects.

### Evaluation/Desired Outcomes

- Resolution of signs and symptoms of tuberculosis.
- Negative sputum cultures.
- Prevention of activation of tuberculosis in persons known to have been exposed.

## ISOSORBIDE

**isosorbide dinitrate**
(eye-soe-**sor**-bide dye-**nye**-trate )
Apo-ISDN, Cedocard-SR, Coronex, Dilatrate-SR, Isordil, Novosorbide, PMS-Isosorbide

**isosorbide mononitrate**
(eye-soe-**sor**-bide mo-noe-**nye**-trate )
Apo-ISMN, IMDUR, ISMO, Monoket

***Classification***
Therapeutic: antianginals
Pharmacologic: nitrates

**Pregnancy Category C**

### Indications

Acute treatment of anginal attacks (SL only). Prophylactic management of angina pectoris. Treatment of chronic CHF (unlabeled).

## Action

Produce vasodilation (venous greater than arterial). Decrease left ventricular end-diastolic pressure and left ventricular end-diastolic volume (preload). Net effect is reduced myocardial oxygen consumption. Increase coronary blood flow by dilating coronary arteries and improving collateral flow to ischemic regions. **Therapeutic Effects:** Relief and prevention of anginal attacks.

## Pharmacokinetics

**Absorption:** Isosorbide dinitrate undergoes extensive first-pass metabolism by the liver, resulting in 25% bioavailability; isosorbide mononitrate has 100% bioavailability (does not undergo first-pass metabolism).
**Distribution:** Unknown.
**Metabolism and Excretion:** Isosorbide dinitrate is metabolized by the liver to 2 active metabolites (5–mononitrate and 2–mononitrate). Isosorbide mononitrate is primarily meteabolized by the liver to inactive metabolites; primarily excreted in urine as metabolites.
**Half-life:** *Isosorbide dinitrate*—1 hr; *isosorbide mononitrate*—5 hr.

TIME/ACTION PROFILE (cardiovascular effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| ISDN-SL | 2–10 min | unknown | 1–2 hr |
| ISDN-PO | 45–60 min | unknown | 4 hr |
| ISDN-PO-ER | 30 min | unknown | up to 12 hr |
| ISMN-PO | 30–60 min | unknown | 7 hr |
| ISMN-ER | unknown | unknown | 12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent use of sildenafil, vardenafil, or tadalafil.
**Use Cautiously in:** Volume depleted patients; Right ventricular infarction; Hypertrophic cardiomyopathy; OB: May compromise maternal/fetal circulation; Lactation: No data available; Pedi: Safety not established; Geri: Initial dose ↓ required due to ↑ potential for hypotension.

## Adverse Reactions/Side Effects

**CNS:** dizziness, headache. **CV:** hypotension, tachycardia, paradoxic bradycardia, syncope. **GI:** nausea, vomiting. **Misc:** flushing, tolerance.

## Interactions

**Drug-Drug:** Concurrent use of **sildenafil**, **tadalafil**, or **vardenafil** may result in significant and potentially fatal hypotension (do not use within 24 hr of isosorbide dinitrate or mononitrate). Additive hypotension with **antihypertensives**, acute ingestion of **alcohol**, **beta blockers**, **calcium channel blockers**, and **phenothiazines**.

## Route/Dosage

### Isosorbide Dinitrate

**SL (Adults):** *Acute attack of angina pectoris*—2.5–5 mg may be repeated q 5–10 min for 3 doses in 15–30 min. *Prophylaxis of angina pectoris*—2.5–5 mg given 15 min prior to activities known to provoke angina.
**PO (Adults):** *Prophylaxis of angina pectoris*—5–20 mg 2–3 times daily; usual maintenance dose is 10–40 mg q 6 hr (immediate-release) or 40–80 mg q 8–12 hr (sustained-release).

### Isosorbide Mononitrate

**PO (Adults):** *ISMO, Monoket*—5–20 mg twice daily with the 2 doses given 7 hr apart. *Imdur*—30–60 mg once daily; may increase to 120 mg once daily (maximum dose = 240 mg/day).

## Availability (generic available)

### Isosorbide Dinitrate

**Sublingual tablets:** 2.5 mg, 5 mg. **Cost:** *Generic*—2.5 mg $39.16/100, 5 mg $18.59/100.
**Tablets:** 5 mg, 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Isordil*—40 mg $91.49/100; *Generic*—5 mg $31.23/100, 10 mg $35.45/100, 20 mg $18.85/100, 30 mg $23.32/100. **Extended-release tablets:** 🍁 20 mg, 40 mg. **Cost:** *Generic*—40 mg $71.29/100. **Sustained-release capsules:** 40 mg. ***In combination with:*** hydralazine (BiDil). See Appendix B.

### Isosorbide Mononitrate (generic available)

**Tablets (ISMO, Monoket):** 10 mg, 20 mg. **Cost:** *Generic*—10 mg $45.99/180, 20 mg $48.98/180. **Extended-release tablets (Imdur):** 30 mg, 60 mg, 120 mg. **Cost:** *Generic*—30 mg $35.99/90, 60 mg $34.97/90, 120 mg $46.97/90.

# NURSING IMPLICATIONS

## Assessment

- Assess location, duration, intensity, and precipitating factors of anginal pain.
- Monitor blood pressure and pulse routinely during period of dosage adjustment.
- ***Lab Test Considerations:*** Excessive doses may ↑ methemoglobin concentrations.

### Potential Nursing Diagnoses
Ineffective tissue perfusion (Indications)
Activity intolerance (Indications)

### Implementation

### Isosorbide Dinitrate
- **PO:** Extended-release capsules should be swallowed whole. Do not break, crush, or chew.
- **SL:** tablets should be held under tongue until dissolved.
- Avoid eating, drinking, or smoking until tablet is dissolved. Replace tablet if inadvertently swallowed.

### Isosorbide Mononitrate
- Do not confuse Imdur with Imuran, Inderal, or K-Dur. Do not confuse Monoket with Monopril (fosinopril).
- **PO:** Extended-release tablets should be swallowed whole. Do not break, crush, or chew.

### Patient/Family Teaching
- Instruct patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered; doses of isosorbide dinitrate should be taken at least 2 hr apart (6 hr with extended-release preparations); daily doses of isosorbide mononitrate should be taken 7 hr apart. Do not double doses. Do not discontinue abruptly.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to take last dose of day (when taking 2–4 doses/day) no later than 7 pm to prevent the development of tolerance.
- Advise patient to avoid concurrent use of alcohol with this medication. Patient should also consult health care professional before taking Rx, OTC, or herbal products while taking isosorbide.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe. Do not alter dose to avoid headache.
- Advise patient to notify health care professional if dry mouth or blurred vision occurs.

### Evaluation/Desired Outcomes
- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance.

## isotretinoin
(eye-soe-**tret**-i-noyn)
Amnesteem, Claravis, Sotret

***Classification***
Therapeutic: antiacne agents
Pharmacologic: retinoids

**Pregnancy Category X**

### Indications
Management of severe nodular acne resistant to more conventional therapy, including topical therapy and systemic antibiotics. Not to be used under any circumstances in pregnant patients.

### Action
A metabolite of vitamin A (retinol); reduces sebaceous gland size and differentiation. **Therapeutic Effects:** Diminution and resolution of severe acne. May also prevent abnormal keratinization.

### Pharmacokinetics
**Absorption:** Rapidly absorbed following (23–25%) oral administration; absorption ↑ when taken with a high-fat meal.
**Distribution:** Appears to be widely distributed; crosses the placenta.
**Protein Binding:** 99.9%.
**Metabolism and Excretion:** Metabolized by the liver and excreted in the urine and feces.
**Half-life:** 10–20 hr.

TIME/ACTION PROFILE (diminution of acne)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | up to 8 wk | unknown |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to retinoids, glycerin, soybean oil, or parabens; OB, Lactation: Pregnancy and lactation; Women of childbearing age who may become or who intend to become pregnant; Patients planning to donate blood.
**Use Cautiously in:** Pre-existing hypertriglyceridemia; Diabetes mellitus; History of alcohol abuse, psychosis, depression, or suicide attempt; Obese patients; Inflammatory bowel disease.

### Adverse Reactions/Side Effects
**CNS:** SUICIDE ATTEMPT, behavior changes, depression, PSEUDOTUMOR CEREBRI, psychosis, suicidal ideation. **EENT:** conjunctivitis, epistaxis, blurred vision, contact lens intolerance, corneal opacities, decreased night vision, dry eyes. **CV:** edema. **GI:** cheilitis, dry mouth, nausea, vomiting, abdominal pain, anorexia, hepatitis, pancreatitis, ↑ appetite. **Derm:** pruritus, palmar desquamation, pho-

tosensitivity, skin infections, thinning of hair. **Hemat:** anemia. **Metab:** ↓ high-density lipoprotein cholesterol, hypercholesterolemia, hypertriglyceridemia, hyperglycemia, hyperuricemia. **MS:** arthralgia, back pain, muscle/bone pain (↑ in adolescents), hyperostosis. **Misc:** SEVERE BIRTH DEFECTS, ↑ thirst.

### Interactions

**Drug-Drug:** Additive toxicity with **vitamin A** and **drugs having anticholinergic properties**. ↑ risk of pseudotumor cerebri with **tetracycline** or **minocycline**. Concurrent use with **alcohol** ↑ risk of hypertriglyceridemia. Drying effects ↑ by concurrent use of **benzoyl peroxide**, **sulfur**, **tretinoin**, and **other topical agents**.
**Drug-Food:** Excessive ingestion of **foods high in vitamin A** may result in additive toxicity.

### Route/Dosage

**PO (Adults):** 0.5–1 mg/kg/day (up to 2 mg/kg/day) in 2 divided doses for 15–20 wk. Once discontinued, if relapse occurs, therapy may be reinstituted after an 8-wk rest period.

### Availability (generic available)

**Capsules:** 10 mg, 20 mg, 30 mg, 40 mg.

## NURSING IMPLICATIONS

### Assessment

- Verify that patient receiving isotretinoin is registered with the iPLEDGE program and is completing all required interactions with their health care provider.
- Assess skin prior to and periodically during therapy. Transient worsening of acne may occur at initiation of therapy. Note number and severity of cysts, degree of skin dryness, erythema, and itching.
- Assess for allergy to parabens; capsules contain parabens as a preservative.
- Monitor patient for behavioral changes throughout therapy. May cause depression, psychosis, and suicide ideation. If behavioral changes occur, they usually resolve with discontinuation of therapy.
- ***Lab Test Considerations:*** Monitor liver function (AST, ALT, and LDH) prior to therapy, after 1 mo of therapy, and periodically thereafter. Inform health care professional if these values become ↑; therapy may need to be discontinued.
- Monitor blood lipids (cholesterol, HDL, triglycerides) under fasting conditions prior to beginning therapy, at 1–2 wk intervals until lipid response to isotretinoin is established (usually within 1 mo), and periodically thereafter. Report ↑ cholesterol and triglyceride levels or ↓ HDL.
- Obtain baseline and periodic CBC, urinalysis, and SMA-12. May cause ↑ blood glucose, CPK, platelet counts, and sedimentation rate. May ↓ RBC and WBC parameters. May cause proteinuria, red and white blood cells in urine, and ↑ uric acid.

### Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications, Side Effects)
Disturbed body image (Indications)

### Implementation

- Isotretinoin is approved for marketing only under the iPLEDGE program, a special restricted distribution program approved by the FDA.
- Only patients who meet all requirements of the iPLEDGE program may receive isotretinoin.
- Isotretinoin may only be prescribed by health care providers registered and activated with the iPLEDGE program.
- Isotretinoin may only be dispensed by pharmacies registered with the iPLEDGE program.
- **PO:** Administer with meals. Do not crush or open capsules.

### Patient/Family Teaching

- Explain the iPLEDGE program and its requirements to patient and parent.
- Instruct patient to take isotretinoin as directed. Do not take more than the amount prescribed. Take missed doses as soon as remembered if not almost time for next dose. Do not double doses. Patients must read *Medication Guide* and sign consent form prior to initiation of therapy.
- Explain to patient that a temporary worsening of acne may occur at beginning of therapy.
- Instruct female patients to use 2 forms of contraception 1 mo before therapy, throughout therapy, and for at least 1 mo after discontinuation of drug. This drug is contraindicated during pregnancy and may cause birth defects. Patient must have 2 negative serum or urine pregnancy tests with a sensitivity ≥25 mIU/mL before receiving initial prescription. First test is obtained by prescriber when decision is made to prescribe isotretinoin. Second pregnancy test should be done during first 5 days of menstrual period immediately preceding beginning

of therapy. For patients with amenorrhea, second test should be done 11 days after last act of unprotected sexual intercourse. Each month of therapy patient must have a negative result from a urine or serum pregnancy test. Pregnancy test must be repeated every month prior to female patient receiving prescription. Manufacturer will make available pregnancy test kits to female patients. Patient should discontinue medication and inform health care professional immediately if pregnancy is suspected. Recommended consent form prepared by manufacturer stresses fetal risk. Parents of minors should also read and sign form. Yellow self-adhesive qualification stickers completed by prescriber must accompany prescription.

- May cause sudden decrease in night vision. Caution patient to avoid driving at night until response to the medication is known.
- Advise patient to consult with health care professional before using other acne preparations while taking isotretinoin. Soaps, cosmetics, and shaving lotion may also worsen dry skin.
- Inform patient that dry skin and chapped lips will occur. Lubricant to lips may help cheilitis.
- Instruct patient that oral rinses, good oral hygiene, and sugarless gum or candy may help minimize dry mouth. Notify health care professional if dry mouth persists for more than 2 wk.
- Discuss possibility of excessively dry eyes with patients who wear contact lenses. Patient should contact health care professional about eye lubricant. Patient may need to switch to glasses during course of therapy and for up to 2 wk following discontinuation.
- Advise patient to avoid alcoholic beverages while taking isotretinoin, as this may further increase triglyceride levels.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions. Health care professional should be consulted about sunscreen, as some sunscreens may worsen acne.
- Instruct patient not to take vitamin A supplements and to avoid excessive ingestion of foods high in vitamin A (liver; fish liver oils; egg yolks; yellow-orange fruits and vegetables; dark green, leafy vegetables; whole milk; vitamin A–fortified skim milk; butter; margarine) while taking isotretinoin; this may result in hypervitaminosis.
- Advise patient not to donate blood while receiving this medication. After discontinuing isotretinoin, wait at least 1 mo before donating blood to prevent the possibility of a pregnant patient receiving the blood.
- Inform diabetic patients that difficulty controlling blood glucose may occur.
- Instruct patient to report burning of eyes, visual changes, rash, abdominal pain, diarrhea, headache, nausea, and vomiting to health care professional.
- Inform patient of need for medical follow-up. Periodic lab tests may be required.

### Evaluation/Desired Outcomes

- Decrease in the number and severity of cysts in severe acne. Therapy may take 4–5 mo before full effects are seen. Therapy is discontinued when the number of cysts is reduced by 70% or after 5 mo. Improvement may occur after discontinuation of therapy; therefore, a delay of at least 8 wk is recommended before a second course of therapy is considered.

## **isradipine** (is-**ra**-di-peen)

DynaCirc, DynaCirc CR

***Classification***

Therapeutic: antianginals, antihypertensives
Pharmacologic: calcium channel blockers

**Pregnancy Category C**

### Indications

Management of hypertension, angina pectoris, and vasospastic (Prinzmetal's) angina.

### Action

Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased blood pressure. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina.

### Pharmacokinetics

**Absorption:** Well absorbed following oral administration but extensively metabolized, resulting in ↓ bioavailability.
**Distribution:** Unknown.
**Protein Binding:** 95%.
**Metabolism and Excretion:** Completely metabolized by the liver.
**Half-life:** 8 hr.

TIME/ACTION PROFILE (antihypertensive effects†)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | <2 hr | 2–3 hr | 12 hr |
| PO-CR | 2 hr | 8–10 hr | 24 hr |

†For single doses, maximal antihypertensive effect during chronic dosing may take 2–4 wk

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Systolic blood pressure <90 mm Hg.
**Use Cautiously in:** Severe hepatic impairment (dose ↓ recommended); Geri: Dose ↓ recommended for most agents; ↑ risk of hypotension; Severe renal impairment; History of serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** abnormal dreams, anxiety, confusion, dizziness, drowsiness, headache, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea. **CV:** ARRHYTHMIAS, CHF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** ↑ liver enzymes, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** dermatitis, erythema multiforme, flushing, sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

## Interactions

**Drug-Drug:** Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF.
**Drug-Food: Grapefruit juice** ↑ serum levels and effect.

## Route/Dosage

**PO (Adults):** 2.5 mg twice daily; may be ↑ q 2–4 wk by 5 mg/day (not to exceed 20 mg/day) *or* 5 mg once daily as CR tablets; may be ↑ q 2–4 wk by 5 mg/day (not to exceed 20 mg/day).

## Availability (generic available)

**Capsules:** 2.5 mg, 5 mg. **Controlled-release tablets:** 5 mg, 10 mg.

# NURSING IMPLICATIONS

## Assessment

- Monitor blood pressure and pulse prior to and periodically throughout therapy. Monitor ECG periodically in patients receiving prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess patient for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia increases risk of arrhythmias; should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. Several days of therapy may cause increase in hepatic enzymes, which return to normal upon discontinuation of therapy.

## Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

## Implementation

- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Swallow controlled-release tablets whole; do not break, crush, or chew.

## Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid drinking grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient to avoid concurrent use of alcohol or other Rx, OTC, or herbal products without consulting health care professional.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.

- Advise patient to notify health care professional if irregular heartbeats, dyspnea, swelling of hands and feet, rash, pronounced dizziness, nausea, constipation, or hypotension occurs.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Inform patient that anginal attacks may occur 30 min after administration because of reflex tachycardia. This is usually temporary and is not an indication for discontinuation.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis or if shortness of breath or persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional prior to exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring BP. Advise patient to take BP weekly and to report significant changes to health care professional.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

## **itraconazole** (it-tra-**kon**-a-zole)

Sporanox

***Classification***

Therapeutic: antifungals (systemic)

**Pregnancy Category C**

### Indications

Histoplasmosis. Blastomycosis. Aspergillosis. Dermatophyte infection of fingernails or toenails in nonimmunocompromised patients (oral capsules only). Oropharyngeal esophageal candidiasis.

### Action

Inhibits enzymes necessary for integrity of the fungal cell membrane. **Therapeutic Effects:** Fungistatic effects against susceptible organisms. **Spectrum:** Active against *Histoplasma capsulatum*, *Blastomyces dermatitidis*, *Cryptococcus neoformans*, *Aspergillus fumigatus*, *Trichophyton* spp., *Candida*, and *Tinea unguium*.

### Pharmacokinetics

**Absorption:** Absorption is enhanced by food. **Distribution:** Tissue concentrations are higher than plasma concentrations. Does not enter CSF; enters breast milk. **Protein Binding:** *Itraconazole*—99.8%; *hydroxyitraconazole*—99.5%. **Metabolism and Excretion:** Mostly metabolized by the liver and excreted in feces. Hydroxyitraconazole, the major metabolite, has antifungal activity. **Half-life:** 21 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 4 hr | 12–24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity. Cross-sensitivity with other azole antifungals (**miconazole**, **ketoconazole**) may occur; Concurrent **quinidine**, **dofetilide**, **pimozide**, oral **midazolam**, **triazolam**, **nisoldipine**, **ergot alkaloids** (**dihydroergotamine**, **ergonovine**, **ergotamine**, **methylergonovine**), **simvastatin**, or **lovastatin**; Severe renal impairment (CCr <30 mL/min); CHF or other evidence of left ventricular dysfunction; Lactation: Lactation. **Use Cautiously in:** Hepatic impairment (dose reduction may be required); Renal impairment; Achlorhydria or hypochlorhydria (absorption will be ↓); OB, Pedi: Safety not established; Geri: ↑ risk of hearing loss.

### Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, fatigue, headache, malaise. **EENT:** hearing loss, tinnitus. **CV:** CHF, edema, hypertension. **GI:** HEPATOXICITY, nausea, abdominal pain, anorexia, diarrhea, flatulence, vomiting. **GU:** albuminuria, ↓ libido, erectile dysfunction. **Derm:** TOXIC EPIDERMAL NECROLYSIS, photosensitivity, pruritus, rash. **Endo:** adrenal insufficiency. **F and E:** hypokalemia. **MS:** rhabdomyolysis. **Neuro:** neuropathy. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

### Interactions

**Drug-Drug:** Itraconazole is a potent inhibitor of the P450 3A hepatic enzyme, which can ↑ blood levels and effects of other drugs which are metabolized by this system. ↑ risk of potentially fatal

arrhythmias with **quinidine**, **dofetilide**, or **pimozide** (concurrent use is contraindicated and may result in QTc prolongation, torsades de pointes, ventricular arrthythmias, and sudden death). ↑ risk of excessive sedation with **midazolam** or **triazolam**, ↑ risk of adverse CNS reactions with **pimozide**, and ↑ risk of myopathy with **simvastatin** or **lovastatin** (concurrent use contraindicated). Concurrent use with **ergot alkaloids**, **(dihydroergotamine**, **ergonovine**, **ergotamine**, **methylergonovine)** ↑ risk of vasoconstriction and is contraindicated. Significantly ↑ **nisoldipine** levels (concurrent use contraindicated). May also ↑ blood levels and the risk of toxicity from **alprazolam**, **diazepam**, **atorvastatin**, **warfarin**, **ritonavir**, **indinavir**, **saquinavir**, **vinca alkaloids**, **busulfan**, **carbamazepine**, **cilostazol**, **diazepam**, **docetaxel**, **eletriptan**, **fentanyl**, **buspirone**, **cyclosporine**, **rifabutin**, **tacrolimus**, **sirolimus**, **clarithromycin**, **erythromycin**, **oral hypoglycemic agents**, **methylprednisolone**, **budesonide**, **dexamethasone**, **fluticasone**, **trimetrexate**, and **digoxin**. May ↑ levels and the negative inotropic effects of **calcium channel blockers**. Absorption ↓ by **antacids**, **histamine $H_2$ blockers**, **sucralfate**, **proton pump inhibitors**, or other **agents that increase gastric pH**, including the buffer in **didanosine** (take 2 hr after itraconazole). **Phenytoin**, **phenobarbital**, **nevirapine**, **isoniazid**, **rifampin**, **rifabutin**, and **carbamazepine** ↑ metabolism and ↓ blood levels of itraconazole (↑ dosage may be necessary). If hypokalemia occurs, the risk of **digoxin** toxicity is ↑.
**Drug-Food: Food** ↑ absorption.

## Route/Dosage

### Aspergillosis

**PO (Adults):** 200 mg once or twice daily for ≥3 mo.

### Blastomycosis, Histoplasmosis

**PO (Adults):** 200 mg once daily; may be ↑ by 100 mg/day up to 200 mg twice daily.

### Onychomycosis

**PO (Adults):** *Toenail fungus with or without fingernail fungus*— 200 mg/day for 12 consecutive wk. *Fingernail fungus* — 200 mg twice daily for 1 wk, then 3 wk without therapy, then 200 mg twice daily an additional wk–6 mo.

### Candidiasis

**PO (Adults):** *Oropharyngeal candidiasis*— 200 mg (20 mL) daily for 1–2 wk. *Oropharyngeal candidiasis unresponsive to fluconazole*— 100 mg (10 mL) twice daily for at least 2–4 wk. *Esophageal candidiasis*— 100 mg (10 mL) once daily for at least 3 wk.

### Availability (generic available)

**Capsules:** 100 mg. **Oral solution (cherry caramel):** 10 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for signs and symptoms of infection (vital signs, lung sounds, sputum, WBC, oral and pharyngeal mucosa, nail beds) before and periodically during therapy.
- Obtain specimens for culture before instituting therapy. Therapy may be started before results are obtained.
- ***Lab Test Considerations:*** Monitor hepatic function tests before and periodically during therapy, especially in patients with pre-existing hepatic function abnormalities. Discontinue itraconazole if abnormal values persist or worsen.
- Monitor serum potassium. May cause hypokalemia.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- Do not interchange capsules and oral solution. Only oral solution is effective for oropharyngeal candidiasis. Oral solution is not recommended for initial treatment of patients at risk for systemic candidiasis.
- **Capsules:** Administer with a full meal to minimize nausea and vomiting and to increase absorption.
- Do not administer with antacids or other medications that may increase gastric pH; may decrease absorption of itraconazole.
- **Oral Solution:** Administer without food if possible. Swish solution in mouth vigorously, 10 mL at a time, for several seconds, then swallow.

### Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Doses should be taken at the same time each day.

- May occasionally cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional if signs and symptoms of liver dysfunction (unusual fatigue, anorexia, nausea, vomiting, jaundice, dark urine, or pale stools) or CHF (dyspnea, peripheral edema, weight gain) occur. If rash or signs of CHF occur, discontinue itraconazole and notify health care professional immediately.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal medications concurrently with itraconazole.
- Advise patient to use sunscreen and wear protective clothing to prevent photosensitivity reactions.

### Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Minimal treatment for systemic fungal infections is 3 mo. Inadequate period of treatment may lead to recurrence of active infection.

## ixabepilone (icks-a-**bep**-i-lone)

Ixempra

***Classification***

Therapeutic: antineoplastics
Pharmacologic: epothilone B analog

**Pregnancy Category D**

### Indications

Combination use with capecitabine for the treatment of metastatic or locally advanced breast cancer currently resistant to a taxane and anthracycline or resistant to a taxane and cannot tolerate further anthracycline. May also be used as monotherapy for breast cancers that are not responding to anthracyclines, taxane, or capecitabine.

### Action

Binds to $\beta$-tubulin subunits on microtubules; this action blocks cells in mitosis, leading to cell death. Also has antiangiogenic activity. **Therapeutic Effects:** Decreased spread of breast cancer.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailablity.
**Distribution:** Unknown.
**Metabolism and Excretion:** Extensively metabolized by the liver, primarily by the CYP3A4 enzyme system. Metabolites are not active and are excreted mainly by the kidneys.
**Half-life:** 52 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | end of infusion | unknown |

### Contraindications/Precautions

**Contraindicated in:** Previous hypersensitivity to any medications containing Cremophor EL or similar derivatives (polyoxyethylated castor oil); Neutrophils <1500 cells/$m^3$ or platelets <100,000 cells/$m^3$; Severe hepatic impairment; Use with capecitabine is contraindicated for hepatic impairment (AST or ALT >2.5 × upper limits of normal or bilirubin >1 × upper limit of normal) due to ↑ risk of toxicity and death associated with neutropenia; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Toxicity; dose adjustments may be required for neuropathy/arthralgia/myalgia/fatigue, neutropenia, thrombocytopenia, moderate hepatic impairment or palmar-plantar erythrodysesthesia; Diluent contains dehydrated alcohol; consider possible CNS effects; Diabetes or history of neuropathy (↑ risk of severe neuropathy); History of cardiac disease (may ↑ risk of myocardial ischemia or ventricular dysfunction; OB: Patients with childbearing potential.

### Adverse Reactions/Side Effects

**CNS:** fatigue, weakness, dizziness, headache, insomnia. **EENT:** ↑ lacrimation. **CV:** chest pain, edema, myocardial ischemia, ventricular dysfunction. **Resp:** dyspnea. **GI:** abdominal pain, anorexia*, constipation, diarrhea, mucositis, nausea, stomatitis, vomiting, altered taste. **Derm:** alopecia, hyperpigmentation, nail disorder, palmar-plantar erythrodysesthesia (combination therapy with capecitabine), exfoliation, pruritus, rash, hot flushes. **Hemat:** MYELOSUPPRESSION. **MS:** arthralgia, musculoskeletal pain, myalgia. **Neuro:** peripheral neuropathy. **Misc:** hypersensitivity reactions.

### Interactions

**Drug-Drug: Strong CYP3A4 inhibitors** including **ketoconazole**, **itraconazole**, **voriconazole**, **clarithromycin**, **telithromycin**, **atazanavir**, **delavirdine**, **ritonavir**, **saquinavir**, **nefazodone** ↑ blood levels and the risk of serious toxicities, concurrent use should be avoided if possible. If concurrent use is required, dose reduction of ixabepilone is recommended. Inducers of the **CYP3A4 enzyme system** including **dexa-**

**mathasone**, **phenytoin**, **carbamazepine**, **phenobarbital**, **rifampin**, **rifampicin**, or **rifabutin** may ↓ levels and effectiveness, avoid if possible.
**Drug-Natural Products: St. John's wort** may ↓ blood levels and should be avoided.
**Drug-Food: Grapefruit juice** may ↑ blood levels and toxicity; avoid concurrent use.

### Route/Dosage

**IV (Adults):** 40 mg/m² every 3 wk; not to exceed dose greater than that calculated for 2.2 m² (88 mg/dose).

### Hepatic Impairment

**IV (Adults):** *Moderate Impairment*—20 mg/m² every 3 wk; not to exceed 30 mg/m².

### Availability

**Powder for injection (requires specific diluent for initial reconstitution):** 15-mg vial (contains 16 mg ixabepilone to allow for withdrawal losses) with 8 mL of diluent in a separate vial as a kit, 45-mg vial (contains 47 mg ixabepilone to allow for withdrawal losses) with 23.5 mL of diluent in a separate vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor for hypersensitivity reaction (flushing, rash, dyspnea, bronchospasm). If severe reactions occur stop infusion and provide aggressive supportive treatment with epinephrine and corticosteroids. In subsequent cycles, add corticosteroids to the premedication regimen.
- Monitor for myelosuppression frequently during therapy. Assess for signs of infection during neutropenia. Assess for bleeding (bleeding gums, bruising, petechiae, blood in stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min.
- Assess patient for signs of peripheral neuropathy (burning sensation, hyperesthesia, hypoesthesia, paresthesia, discomfort, neuropathic pain); may occur early during treatment within the first 3 cycles. Patients experiencing new or worsening symptoms may require a reduction or delay in dose of ixabepilone. If neuropathy is Grade 2 (moderate) lasting for ≥7 days or Grade 3 (severe) lasting for <7 days decrease dose by 20%. If neuropathy is Grade 3 lasting ≥7 days or is disabling discontinue treatment.
- ***Lab Test Considerations:*** Monitor CBC and platelets frequently during therapy. If neutrophil count is <500 cells/mm³ for ≥7 days or patient has febrile neutropenia or if platelet count is <25,000/mm³ or platelets are <50,000/mm³ with bleeding decrease the dose by 20%. Begin new treatment cycle only if neutrophil count is at least 1500 cells/mm³ and nonhematologic toxicities have improved to Grade 1 (mild) or resolved. May also cause leukopenia and anemia.
- Monitor hepatic function prior to therapy. Patients with decreased hepatic function require a decreased dose. If AST and ALT ≤2.5 × the upper limits of normal (ULN) and bilirubin ≤1 × ULN administer ixabepilone at 40 mg/m². If AST and ALT ≤10 × the upper limits of normal (ULN) and bilirubin ≤1 X ULN administer ixabepilone at 32mg/m². If AST and ALT ≤10 × the upper limits of normal (ULN) and bilirubin >1.5 × ULN—≤3 × ULN administer ixabepilone at 20–30 mg/m².

### Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

### Implementation

- Premedicate patient with an $H_1$ and an $H_2$ antagonist approximately 1 hr before ixabepilone infusion. Patients who experienced a hypersensitivity reaction in a previous ixabepilone cycle should also be premedicated with corticosteroids and extension of the infusion time should be considered.
- To minimize risk of dermal exposure, wear impervious gloves when handling ixabepilone vials regardless of setting (unpacking and inspection, transport within a facility, dose preparation and administration).

#### IV Administration

- **Intermittent Infusion:** Remove *Ixempra kit* (containing ixabepilone vial and diluent vial) from refrigerator and allow to stand at room temperature for 30 min prior to diluting. *Ixempra kit* must be stored in refrigerator. When vials are first removed from refrigerator, a white precipitate may be observed in the diluent vial; precipitate will dissolve to form a clear solution once diluent warms to room temperature. ***Diluent:*** Use only diluent supplied in kit for reconstitution. Reconstitute 15-mg vial with 8 mL and 45-mg vial with 23.5 mL of diluent. Gently swirl and invert vial until powder is com-

pletely dissolved. Prior to administration, dilute constituted solution further with only LR supplied in DEHP-free bags. Dilute as soon as possible after constitution, but may be stored at room temperature and room light for up to 1 hr. For most doses use 250 mL bag of LR, 0.9% NaCl (pH adjusted 6.0–9.0 with sodium bicarbonate), or Plasma-lyte A injection (pH 7.4). ***Concentration:*** If final concentration is not between 0.2 mg/mL and 0.6 mg/mL add to appropriate size bag of LR. Thoroughly mix infusion bag by manual rotation. Diluted solution is stable for up to 6 hr at room temperature and room light; must complete infusion during 6-hr period. Administer through an in-line filter with a microporous membrane of 0.2–1.2 microns. DEHP-free infusion containers and administration sets must be used. Discard remaining solution. ***Rate:*** Infuse over 3 hr.

## Patient/Family Teaching

- Advise patient to avoid grapefruit juice during therapy; may lead to increased levels and side effects.
- Solution contains alcohol and may cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional promptly if fever >100.5°F; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; burning, painful or difficulty urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patients to use a soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate bleeding.
- Instruct patient to notify health care professional promptly if signs and symptoms of hypersensitivity (hives, urticaria, pruritus, rash, flushing, swelling, dyspnea, chest tightness), peripheral neuropathy (numbness and tingling in hands and feet), or cardiac adverse reactions (chest pain, difficulty breathing, palpitations, unusual weight gain) occur.
- Advise patient to consult health care professional before taking any Rx, OTC, herbal, or vitamin products, especially St. John's wort, during therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Advise women of childbearing potential to use effective contraception during therapy and to avoid breastfeeding during therapy.

## Evaluation/Desired Outcomes

- Decreased progression of breast cancer.

**kanamycin, See AMINOGLYCOSIDES.**

## ketoconazole (systemic)†

(kee-toe-**koe**-na-zole)
Nizoral

***Classification***
Therapeutic: antifungals (systemic)

**Pregnancy Category C**

†For topical use, see Antifungals (topical)

### Indications
Treatment of: Candidiasis (disseminated and mucocutaneous), Chromomycosis, Coccidioidomycosis, Histoplasmosis, Paracoccidioidomycosis. **Unlabeled Use:** Treatment of advanced prostate cancer. Treatment of Cushing's syndrome.

### Action
Disrupts fungal cell membrane. Interferes with fungal metabolism. Also inhibits the production of adrenal steroids. **Therapeutic Effects:** Fungistatic or fungicidal action against susceptible organisms, depending on organism and site of infection. **Spectrum:** Active against many pathogenic fungi, including: *Blastomyces*, *Candida*, *Coccidioides*, *Cryptococcus*, *Histoplasma*, many dermatophytes.

### Pharmacokinetics
**Absorption:** Absorption from the GI tract is pH dependent; increasing pH decreases absorption.
**Distribution:** Widely distributed. CNS penetration is unpredictable and minimal. Crosses the placenta; enters breast milk.
**Protein Binding:** 99%.
**Metabolism and Excretion:** Partially metabolized by the liver. Excreted in feces via biliary excretion.
**Half-life:** 8 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1–4 hr | 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Concurrent triazolam; OB: Reported association with limb defects (1st trimester) and growth retardation (3rd trimester).
**Use Cautiously in:** History of liver disease; Achlorhydria or hypochlorhydria; Alcoholism; Lactation: Usually compatible with breastfeeding (AAP). Careful timing of dosage may ↓ infant exposure.

### Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness. **EENT:** photophobia. **GI:** DRUG-INDUCED HEPATITIS, nausea, vomiting, abdominal pain, constipation, diarrhea, flatulence. **GU:** azoospermia, ↓ male libido, menstrual irregularities, oligospermia. **Derm:** rashes. **Endo:** gynecomastia.

### Interactions
**Drug-Drug:** Ketoconazole inhibits the hepatic P450 3A4 enzyme system, which results in ↓ metabolism and possibly ↑ effects and/or toxicity from **cyclosporine**, **tacrolimus**, **corticosteroids** (dosage reduction may be necessary), **calcium channel blockers**, **sulfonylurea**, **oral hypoglycemic agents**, **quinidine**, **buspirone**, **clarithromycin**, **troleandomycin**, **erythromycin**, **cyclophosphamide**, **phenytoin**, **warfarin** (↑ risk of bleeding), **tamoxifen**, **tricyclic antidepressants**, **carbamazepine**, **nisoldipine**, **zolpidem**, **vinca alkaloids**, **ifosfamide**, some **benzodiazepines** (effect may persist for several days; use of triazolam is contraindicated), **alfentanil**, **fentanyl**, **sufentanil**, **donepezil**, **atorvastatin**, **lovastatin**, **simvastatin**, **amprenavir**, **indinavir** (dosage ↓ of indinavir recommended), **nelfinavir**, **ritonavir**, **saquinavir**, **quinidine**, **sildenafil** and **vardenafil** (dosage adjustments may be necessary). May alter the effectiveness of **hormonal contraceptives** (alternative method of contraception recommended). Drugs that ↑ gastric pH, including **antacids**, **histamine $H_2$ antagonists**, **didanosine** (chewable tablets, because of buffer), and **gastric acid–pump inhibitors** ↓ absorption (wait 2 hr before administration of ketoconazole). **Sucralfate** and **isoniazid** also ↓ bioavailability. ↑ hepatotoxicity with other **hepatotoxic agents**, including **alcohol**. Disulfiram-like reaction may occur with **alcohol**. **Rifampin** or **isoniazid** may ↓ levels and effectiveness. May ↓ absorption and effectiveness of **theophylline**.

### Route/Dosage
**PO (Adults):** *Antifungal*—200–400 mg/day, single dose. *Prostate cancer*—400 mg 3 times daily (unlabeled).
**PO (Children >2 yr):** 3.3–6.6 mg/kg/day, single dose.

### Availability (generic available)
**Tablets:** 200 mg. **Oral suspension:** 100 mg/5 mL.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for symptoms of infection prior to and periodically during therapy.
- Specimens for culture should be taken prior to instituting therapy. Therapy may be started before results are obtained.
- ***Lab Test Considerations:*** Monitor hepatic function tests prior to and monthly for 3–4 mo and then periodically during therapy. May cause ↑ AST, ALT, serum alkaline phosphatase, and bilirubin concentrations. Ketoconazole should be discontinued if even minor abnormalities occur.
- May cause ↓ serum testosterone concentrations.

### Potential Nursing Diagnoses
Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation
- Do not confuse Nizoral (ketoconazole) with Neoral (cyclosporine).
- **PO:** Administer with meals or snacks to minimize nausea and vomiting.
- Shake suspension well prior to administration.
- Do not administer histamine $H_2$ antagonists or antacids within 2 hr of ketoconazole.
- For patients with achlorhydria, dissolve each tablet in 4 mL of aqueous solution of 0.2 N hydrochloric acid. Use a glass or plastic straw to avoid contact with teeth and follow with a glass of water, swished in mouth and swallowed.

### Patient/Family Teaching
- Instruct patient to take medication as directed, at the same time each day, even if feeling better. Take missed doses as soon as remembered; if almost time for next dose, space missed dose and next dose 10–12 hr apart.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid taking OTC antacids within 2 hr of ketoconazole.
- Caution patient to wear sunglasses and to avoid prolonged exposure to bright light to prevent photophobic reactions.
- Advise patient to use a nonhormonal form of contraception during ketoconazole therapy.
- Advise patient to avoid concurrent use of alcohol while taking ketoconazole; may cause a disulfiram-like reaction (flushing, rash, peripheral edema, nausea, headache) and increase the risk of hepatotoxicity.
- Instruct patient to notify health care professional if abdominal pain, fever, or diarrhea becomes pronounced or if signs and symptoms of liver dysfunction (unusual fatigue, anorexia, nausea, vomiting, jaundice, dark urine, or pale stools) occur.

### Evaluation/Desired Outcomes
- Resolution of clinical and laboratory indications of fungal infections.
- Minimal treatment for candidiasis is 1–2 wk and for other systemic mycoses is 6 mo.
- Chronic mucocutaneous candidiasis usually requires maintenance therapy.

**ketoconazole, See ANTIFUNGALS (TOPICAL).**

## ketoprofen (kee-toe-**proe**-fen)
Apo-Keto, Apo-Keto-E, Orudis-E, Orudis-SR, Rhodis

***Classification***
Therapeutic: antipyretics, antirheumatics, nonopioid analgesics, nonsteroidal anti-inflammatory agents
Pharmacologic: nonopioid analgesics

**Pregnancy Category B (first trimester)**

### Indications
Inflammatory disorders, including: Rheumatoid arthritis, Osteoarthritis. Mild to moderate pain, including dysmenorrhea and fever.

### Action
Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation. Reduction of fever.

### Pharmacokinetics
**Absorption:** Well absorbed from the GI tract.
**Distribution:** Unknown.
**Protein Binding:** 99%.
**Metabolism and Excretion:** Mostly (60%) metabolized by the liver; some renal excretion.
**Half-life:** 2–4 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (analgesic) | within 60 min | 1 hr | 4–6 hr |
| PO (anti-inflammatory) | few days–1 wk | unknown | up to 24 hr (SR products) |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Some products contain tartrazine and should be avoided in patients with known intolerance; Perioperative pain from coronary artery bypass graft (CABG) surgery.

**Use Cautiously in:** Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Severe renal, or hepatic disease; History of ulcer disease; Renal impairment (dosage reduction suggested); Geri: Extended-release product should not be used in geriatric patients, patients of small stature, or patients with renal impairment; ↑ risk of bleeding; Chronic alcohol use/abuse; OB, Lactation, Pedi: Safety not established; avoid use during 2nd half of pregnancy.

## Adverse Reactions/Side Effects

**CNS:** drowsiness, headache, dizziness. **EENT:** blurred vision, tinnitus. **CV:** edema. **GI:** DRUG-INDUCED HEPATITIS, GI BLEEDING, constipation, diarrhea, dyspepsia, nausea, vomiting, anorexia, discomfort, flatulence. **GU:** cystitis, hematuria, renal failure. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, rashes. **Endo:** gynecomastia. **Hemat:** blood dyscrasias, prolonged bleeding time. **MS:** myalgia. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

## Interactions

**Drug-Drug: Aspirin** alters distribution, metabolism, and excretion of ketoprofen (concurrent use not recommended). ↑ adverse GI effects with other **NSAIDs**, **corticosteroids**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ hypoglycemic effects of **insulin** or sulfonylurea **oral hypoglycemic agents**. May ↑ serum **lithium** levels and increase the risk of toxicity. ↑ risk of toxicity from **methotrexate**. **Probenecid** ↑ risk of toxicity from ketoprofen (concurrent use not recommended). ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **thrombolytic agents**, **clopidogrel**, **ticlopidine**, **eptifibatide**, **tirofiban**, or **anticoagulants**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. ↑ risk of nephrotoxicity with **cyclosporine**.

**Drug-Natural Products:** ↑ bleeding risk with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, and **Panax ginseng**.

## Route/Dosage

**PO (Adults):** *Anti-inflammatory*—150–300 mg/day in 3–4 divided doses or 150–200 mg once daily as extended-release product. *Analgesic*—25–50 mg q 6–8 hr.

## Availability (generic available)

**Capsules:** 25 mg, 50 mg, 75 mg. **Extended-release capsules:** 100 mg, 150 mg, 200 mg.

# NURSING IMPLICATIONS

## Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, wheezing, and urticaria.
- **Arthritis:** Assess pain and range of motion prior to and 1 hr following administration.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, and liver function tests periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests may show ↑ levels. Blood glucose, hemoglobin and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- May prolong bleeding time by 3–4 min.
- May alter results of urine albumin, bilirubin, 17-ketosteroid, and 17-hydroxycorticosteroid determinations.

## Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

## Implementation

- Administration in higher-than-recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- Analgesic is more effective if given before pain becomes severe.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. Capsules may be administered with food, milk, or antacids containing aluminum hydroxide and magnesium hydroxide to decrease GI irritation.
- Extended-release capsules should be swallowed whole; do not open or chew.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been proved effective.

## Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patients not to take OTC ketoprofen preparations for more than 10 days for pain or more than 3 days for fever and to consult health care professional if symptoms persist or worsen.
- Caution patient that use of ketoprofen with 3 or more glasses of alcohol may increase risk of GI bleeding.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

## Evaluation/Desired Outcomes

- Improved joint mobility.
- Decrease in severity of pain. Improvement in arthritis may be seen in a few days to 1 wk; 1–2 wk may be required for maximum effectiveness. Patients who do not respond to one NSAID may respond to another.
- Reduction of fever.

# ketorolac† (kee-**toe**-role-ak)

Toradol

***Classification***

Therapeutic: nonsteroidal anti-inflammatory agents, nonopioid analgesics
Pharmacologic: pyrroziline carboxylic acid

**Pregnancy Category C**

†See Appendix C for ophthalmic use

## Indications

Short-term management of pain (not to exceed 5 days total for all routes combined).

## Action

Inhibits prostaglandin synthesis, producing peripherally mediated analgesia. Also has antipyretic and anti-inflammatory properties. **Therapeutic Effects:** Decreased pain.

## Pharmacokinetics

**Absorption:** Rapidly and completely absorbed following all routes of administration.
**Distribution:** Enters breast milk in low concentrations.
**Metabolism and Excretion:** <50% metabolized by the liver. Ketorolac and its metabolites are excreted primarily by the kidneys (92%); 6% excreted in feces.
**Half-life:** 4.5 hr (range 3.8–6.3 hr; ↑ in geriatric patients and patients with impaired renal function).

TIME/ACTION PROFILE (analgesic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2–3 hr | 4–6 hr or longer |
| IM, IV | 10 min | 1–2 hr | 6 hr or longer |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other NSAIDs may exist; Pre- or perioperative use; Known alcohol intolerance (injection only); Perioperative pain from coronary artery bypass graft (CABG) surgery; OB: Chronic use in 3rd trimester may cause constriction of ductus arteriosus. May inhibit labor and ↑ maternal bleeding at delivery; Lactation: Lactation.

**Use Cautiously in:** Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); History of GI bleeding; Renal impairment (dosage reduction may be required); Pedi: Safety not established; Geri: Appears on Beers list; ↑ risk of GI bleeding.

### Adverse Reactions/Side Effects

**CNS:** drowsiness, abnormal thinking, dizziness, euphoria, headache. **Resp:** asthma, dyspnea. **CV:** edema, pallor, vasodilation. **GI:** GI BLEEDING, abnormal taste, diarrhea, dry mouth, dyspepsia, GI pain, nausea. **GU:** oliguria, renal toxicity, urinary frequency. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus, purpura, sweating, urticaria. **Hemat:** prolonged bleeding time. **Local:** injection site pain. **Neuro:** paresthesia. **Misc:** allergic reactions including, anaphylaxis.

### Interactions

**Drug-Drug:** Concurrent use with **aspirin** may ↓ effectiveness. ↑ adverse GI effects with **aspirin**, other **NSAIDs**, **potassium supplements**, **corticosteroids**, or **alcohol**. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ serum **lithium** levels and ↑ risk of toxicity. ↑ risk of toxicity from **methotrexate**. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **clopidogrel**, **ticlopidine**, **tirofiban**, **eptifibatide**, **thrombolytic agents**, or **anticoagulants**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. May ↑ risk of nephrotoxicity from **cyclosporine**. **Probenecid** ↑ ketorolac blood levels and the risk of adverse reactions (concurrent use should be avoided).

**Drug-Natural Products:** ↑ bleeding risk with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**.

### Route/Dosage

Oral therapy is indicated only as a continuation of parenteral therapy; parenteral therapy should not exceed 20 doses/5 days. Total duration of therapy by all routes should not exceed 5 days.

**PO (Adults <65 yr):** 20 mg initially, followed by 10 mg q 4–6 hr as needed (not to exceed 40 mg/day).

**PO (Adults ≥65 yr, <50 kg, or with renal impairment):** 10 mg q 4–6 hr as needed (not to exceed 40 mg/day).

**IM (Adults <65 yr):** *Single dose*—60 mg. *Multiple dosing*—30 mg q 6 hr (not to exceed 120 mg/day).

**IM (Adults ≥65 yr, <50 kg, or with renal impairment):** *Single dose*—30 mg. *Multiple dosing*—15 mg q 6 hr (not to exceed 60 mg/day).

**IV (Adults <65 yr):** *Single dose*—30 mg. *Multiple dosing*—30 mg q 6 hr (not to exceed 120 mg/day).

**IV (Adults ≥65 yr, <50 kg, or with renal impairment):** *Single dose*—15 mg. *Multiple dosing*—15 mg q 6 hr (not to exceed 60 mg/day).

### Availability (generic available)

**Tablets:** 10 mg. **Cost:** *Generic*—$16.66/20. **Injection:** 15 mg/mL, 30 mg/mL.

K

## NURSING IMPLICATIONS

### Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- ***Lab Test Considerations:*** Evaluate liver function tests, especially AST and ALT, periodically in patients receiving prolonged therapy. May cause ↑ levels.
- May cause prolonged bleeding time that may persist for 24–48 hr following discontinuation of therapy.
- May cause ↑ BUN, serum creatinine, or potassium concentrations.

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- Do not confuse Toradol (ketorolac) with tramadol (Ultram).
- Administration in higher-than-recommended doses does not provide increased effectiveness but may cause increased side effects. Duration of ketorolac therapy, by all routes combined, should not exceed 5 days Use lowest effective dose for shortest period of time.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- **PO:** Ketorolac therapy should always be given initially by the IM or IV route. Use oral therapy *only* as a continuation of parenteral therapy.

### IV Administration

- **Direct IV:** Administer undiluted. ***Concentration:*** 15–30 mg/mL. ***Rate:*** Administer over at least 15 sec.
- **Syringe Compatibility:** famotidine, metoclopramide, sufentanil.
- **Syringe Incompatibility:** haloperidol, hydroxyzine, nalbuphine, prochlorperazine, promethazine, thiethylperazine.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophyllins, amphotericin B liposome, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, carboplatin, cefazolin, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, docetaxel, dopamine, doxacurium, doxorubicin hydrochloride, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, etoposide, etoposide phosphate, famotidine, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, methadone, methotrexate, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pemetrexed, penicillin G, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propranolol, ranitidine, remifentanil, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trimethaphan, urokinase, vasopressin, verapamil, vincristine, voriconazole.
- **Y-Site Incompatibility:** acyclovir, amphotericin B colloidal, azathioprine, azithromycin, calcium chloride, caspofungin, chlorpromazine, dantrolene, diazepam, diazoxide, diltiazem, diphenhydramine, dobutamine, doxycycline, epirubicin, erythromycin, esmolol, fenoldopam, ganciclovir, gemcitabine, haloperidol, hydroxyzine, inamrinone, labetalol, metaraminol, methoxamine, midazolam, nalbuphine, pantoprazole, papaverine, pentamidine, pentazocine, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxime, quinupristin/dalfopristin, rocuronium, tolazoline, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, vinorelbine.
- **Solution Compatibility:** D5/0.9% NaCl, D5W, Ringer's injection, lactated Ringer's injection, 0.9% NaCl.

## Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered if not almost time for next dose. Do not double doses. Do not take more than prescribed or for longer than 5 days.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, NSAIDs, acetaminophen, or other OTC medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

## Evaluation/Desired Outcomes

- Decrease in severity of pain. Patients who do not respond to one NSAID may respond to another.

HIGH ALERT

## labetalol (la-bet-a-lole)

Trandate

***Classification***

Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

**Pregnancy Category C**

### Indications

Management of hypertension.

### Action

Blocks stimulation of $beta_1$ (myocardial)- and $beta_2$ (pulmonary, vascular, and uterine)-adrenergic receptor sites. Also has $alpha_1$-adrenergic blocking activity, which may result in more orthostatic hypotension. **Therapeutic Effects:** Decreased blood pressure.

### Pharmacokinetics

**Absorption:** Well absorbed but rapidly undergoes extensive first-pass hepatic metabolism, resulting in 25% bioavailability.
**Distribution:** Some CNS penetration; crosses the placenta.
**Metabolism and Excretion:** Undergoes extensive hepatic metabolism.
**Half-life:** 3–8 hr.

TIME/ACTION PROFILE (cardiovascular effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 20 min–2 hr | 1–4 hr | 8–12 hr |
| IV | 2–5 min | 5 min | 16–18 hr |

### Contraindications/Precautions

**Contraindicated in:** Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
**Use Cautiously in:** Renal impairment; Hepatic impairment; Geriatric patients (increased sensitivity to beta blockers; initial dosage reduction recommended); Pulmonary disease (including asthma); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); OB: May cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Lactation: Usually compatible with breastfeeding (AAP); Pedi: Safety not stablished; Geri: ↑ risk of orthostatic hypotension.

### Adverse Reactions/Side Effects

**CNS:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nightmares. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Resp:** bronchospasm, wheezing. **CV:** ARRHYTHMIAS, BRADYCARDIA, CHF, PULMONARY EDEMA, orthostatic hypotension. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, ↓ libido. **Derm:** itching, rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia. **Misc:** drug-induced lupus syndrome.

### Interactions

**Drug-Drug: General anesthesia** and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**, **verapamil**, or **diltiazem**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulin** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ the effectiveness of **adrenergic bronchodilators** and **theophylline**. May ↓ beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension). Effects may be ↑ by **propranolol** or **cimetidine**. Concurrent **NSAIDs** may ↓ antihypertensive action.

### Route/Dosage

**PO (Adults):** 100 mg twice daily initially, may be ↑ by 100 mg twice daily q 2–3 days as needed (usual range 400–800 mg/day in 2–3 divided doses; doses up to 1.2–2.4 g/day have been used).
**IV (Adults):** 20 mg (0.25 mg/kg) initially, additional doses of 40–80 mg may be given q 10 min as needed (not to exceed 300 mg total dose) *or* 2 mg/min infusion (range 50–300 mg total dose required).

### Availability (generic available)

**Tablets:** 100 mg, 200 mg, 300 mg. **Cost:** *Generic*— 100 mg $54.00/180, 200 mg $76.99/180, 300 mg $101.99/180. **Injection:** 5 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse frequently during dose adjustment and periodically dur-

ing therapy. Assess for orthostatic hypotension when assisting patient up from supine position.
- Check frequency of refills to determine compliance.
- Patients receiving *labetalol IV* must be supine during and for 3 hr after administration. Vital signs should be monitored every 5–15 min during and for several hours after administration.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT levels. Discontinue if jaundice or laboratory signs of hepatic function impairment occur.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify physician or other health care professional immediately if these signs occur.
- Glucagon has been used to treat bradycardia and hypotension.

## Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

## Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous. Before administering intravenously, have second practitioner independently check original order, dosage calculations, and infusion pump settings. Do not confuse labetalol with Lamictal.
- Discontinuation of concurrent clonidine should take place gradually, with beta blocker discontinued first. Then, after several days, discontinue clonidine.
- **PO:** Take apical pulse prior to administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- Administer with meals or directly after eating to enhance absorption.

### IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer slowly over 2 min.
- **Continuous Infusion:** ***Diluent:*** Add 200 mg of labetalol to 160 mL of diluent. May also be administered as undiluted drug. Compatible diluents include D5W, 0.9% NaCl, D5/0.9% NaCl, and LR. ***Concentration:*** Diluted: 1 mg/mL; Undiluted: 5 mg/mL. ***Rate:*** Administer at a rate of 2 mg/min. Titrate for desired response. Infuse via infusion pump to ensure accurate dosage.
- **Y-Site Compatibility:** amikacin, aminophylline, amiodarone, atropine, aztreonam, ampicillin, bivalirudin, bumetanide, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, ceftazidine, ceftizoxime, cimetidine, cyclosporine, daptomycin, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, erythromycin lactobionate, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, ganciclovir, gentamicin, granisetron, hydromorphone, imipenem/cilastatin, isoproterenol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metronidazole, midazolam, milrinone, morphine, nicardipine, nitroglycerin, nitroprusside, norepinephrine, penicillin G, palonosetron, phenylephrine, phytonadione, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propofol, protamine, quinupristin/dalfopristin, ranitidine, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, voriconazole.
- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl sulfate complex, cefotaxime, cefoxitin, ceftriaxone, cefuroxime, dexamethasone sodium phosphate, diazepam, furosemide, hydrocortisone sodium succinate, insulin, ketorolac, lansoprazole, micafungin, nafcillin, pantoprazole, phenytoin, piperacillin/tazobactam, warfarin.

## Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may

precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or blood pressure changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known. Caution patients receiving labetalol IV to call for assistance during ambulation or transfer.
- Advise patients to make position changes slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased. Patients taking oral labetalol should be especially cautious when drinking alcohol, standing for long periods, or exercising, and during hot weather, because orthostatic hypotension is enhanced.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask tachycardia and increased blood pressure as signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

### Evaluation/Desired Outcomes
- Decrease in blood pressure.

## lactulose (lak-tyoo-lose)
Cholac, Constilac, Constulose, Enulose, Generlac, Kristalose

***Classification***
Therapeutic: laxatives
Pharmacologic: osmotics

**Pregnancy Category B**

### Indications
Treatment of chronic constipation. Adjunct in the management of portal-systemic (hepatic) encephalopathy (PSE).

### Action
Increases water content and softens the stool. Lowers the pH of the colon, which inhibits the diffusion of ammonia from the colon into the blood, thereby reducing blood ammonia levels. **Therapeutic Effects:** Relief of constipation. Decreased blood ammonia levels with improved mental status in PSE.

### Pharmacokinetics
**Absorption:** Less than 3% absorbed after oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Absorbed lactulose is excreted unchanged in the urine. Unabsorbed lactulose is metabolized by colonic bacteria to lactic, acetic, and formic acids.
**Half-life:** Unknown.

TIME/ACTION PROFILE (relief of constipation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 24–48 hr | unknown | unknown |

### Contraindications/Precautions
**Contraindicated in:** Patients on low-galactose diets.
**Use Cautiously in:** Diabetes mellitus; Excessive or prolonged use (may lead to dependence); OB, Lactation: Safety not established.

### Adverse Reactions/Side Effects
**GI:** belching, cramps, distention, flatulence, diarrhea. **Endo:** hyperglycemia (diabetic patients).

### Interactions

**Drug-Drug:** Should not be used with other **laxatives** in the treatment of hepatic encephalopathy (leads to inability to determine optimal dose of lactulose). **Anti-infectives** may ↓ effectiveness in treatment of hepatic encephalopathy.

### Route/Dosage

### Constipation

**PO (Adults):** 15–30 mL/day up to 60 mL/day as liquid or 10–20 g as powder for oral solution (up to 40 g /day has been used).
**PO (Children):** 7.5 mL daily after breakfast (unlabeled).

### PSE

**PO (Adults):** 30–45 mL 3–4 times/day; may be given q 1–2 hr initially to induce laxation.
**PO (Infants):** 2.5–10 mL daily in 3–4 divided doses (unlabeled).
**PO (Children and Adolescents):** 40–90 mL daily in 3–4 divided doses (unlabeled).
**Rect (Adults):** 300 mL diluted and administered as a retention enema q 4–6 hr.

### Availability (generic available)

**Oral solution:** 10 g lactulose/15 mL. **Rectal solution:** 10 g lactulose/15 mL. **Single-use packets (Kristalose):** 10 g (equal to 15 mL liquid lactulose), 20 g (equal to 30 mL liquid lactulose).

## NURSING IMPLICATIONS

### Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and normal pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- **PSE:** Assess mental status (orientation, level of consciousness) before and periodically throughout course of therapy.
- ***Lab Test Considerations:*** ↓ blood ammonia concentrations by 25–50%.
- May cause ↑ blood glucose levels in diabetic patients.
- Monitor serum electrolytes periodically when used chronically. May cause diarrhea with resulting hypokalemia and hypernatremia.

### Potential Nursing Diagnoses

Constipation (Indications)

### Implementation

- When used in hepatic encephalopathy, adjust dose until patient averages 2–3 soft bowel movements per day. During initial therapy, 30–45 mL may be given hourly to induce rapid laxation.
- Darkening of solution does not alter potency.
- **PO:** Mix with fruit juice, water, milk, or carbonated citrus beverage to improve flavor. Administer with a full glass (240 mL) of water or juice. May be administered on an empty stomach for more rapid results.
- Dissolve single dose packets (Kristalose) in 4 oz of water. Solution should be colorless to slightly pale yellow.
- **Rect:** To administer enema, use rectal balloon catheter. Mix 300 mL of lactulose with 700 mL of water or 0.9% NaCl. Enema should be retained for 30–60 min. If inadvertently evacuated, may repeat administration.

### Patient/Family Teaching

- Encourage patients to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake, and increasing mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Caution patients that this medication may cause belching, flatulence, or abdominal cramping. Health care professional should be notified if this becomes bothersome or if diarrhea occurs.

### Evaluation/Desired Outcomes

- Passage of a soft, formed bowel movement, usually within 24–48 hr.
- Clearing of confusion, apathy, and irritation and improved mental status in PSE. Improvement may occur within 2 hr after enema and 24–48 hr after oral administration.

## lamivudine (la-**mi**-vyoo-deen)

Epivir, Epivir-HBV , 3TC

***Classification***
Therapeutic: antiretrovirals, antivirals
Pharmacologic: nucleoside reverse transcriptase inhibitors

**Pregnancy Category C**

### Indications

HIV infection (with other antiretrovirals). Chronic hepatitis B infection. **Unlabeled Use:** Part of HIV-postexposure prophylaxis with zidovudine and indinavir.

### Action

After intracellular conversion to its active form (lamivudine-5-triphosphate), inhibits viral DNA synthesis by inhibiting the enzyme reverse transcriptase. **Therapeutic Effects:** Slows the progression of HIV infection and decreases the occurrence of its sequelae. Increases CD4 cell

counts and decreases viral load. Protection from liver damage caused by chronic hepatitis B infection; decreases viral load.

## Pharmacokinetics

**Absorption:** Well absorbed after oral administration (86% in adults, 66% in infants and children).
**Distribution:** Distributes into the extravascular space. Some penetration into CSF; remainder of distribution unknown.
**Metabolism and Excretion:** Mostly excreted unchanged in urine; <5% metabolized by the liver.
**Half-life:** *Adults*—3.7 hr; *children*—2 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 0.9 hr† | 12 hr |

†On an empty stomach; peak levels occur at 3.2 hr if lamivudine is taken with food. Food does not affect total amount of drug absorbed.

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Lactation: Breastfeeding not recommended for HIV positive mothers.
**Use Cautiously in:** Impaired renal function (↑ dosing interval/↓ dose if CCr <50 mL/min); Women, prolonged exposure, obesity, history of liver disease (↑ risk of lactic acidosis and severe hepatomegaly with steatosis); Coinfection with hepatitis B (hepatitis may recur after discontinuation of lamivudine); OB, Pedi: Pregnancy or children <3 mo (safety not established); Geri: ↓ dosage may be necessary due to age-related ↓ in renal function.
**Exercise Extreme Caution in:** Pedi: Pediatric patients with a history of or significant risk factors for pancreatitis (use only if no alternative).

## Adverse Reactions/Side Effects

Noted for combination of lamivudine plus zidovudine.
**CNS:** SEIZURES, fatigue, headache, insomnia, malaise, depression, dizziness. **Resp:** cough. **GI:** HEPATOMEGALY WITH STEATOSIS, PANCREATITIS (↑ in pediatric patients), anorexia, diarrhea, nausea, vomiting, abdominal discomfort, abnormal liver function studies, dyspepsia. **Derm:** alopecia, erythema multiforme, rashes, urticaria. **Endo:** hyperglycemia. **F and E:** lactic acidosis. **Hemat:** anemia, neutropenia, pure red cell aplasia. **MS:** musculoskeletal pain, arthralgia, muscle weakness, myalgia, rhabdomyolysis. **Neuro:** neuropathy. **Misc:** hypersensitivity reactions including ANAPHYLAXIS and STEVENS-JOHNSON SYNDROME.

## Interactions

**Drug-Drug: Trimethoprim/sulfamethoxazole** ↑ lamivudine blood levels (dose alteration may be necessary in renal impairment). ↑ risk of pancreatitis with concurrent use of other **drugs causing pancreatitis**. ↑ risk of neuropathy with concurrent use of other **drugs causing neuropathy**. Combination therapy with **tenofovir** and **abacavir** may lead to virologic nonresponse and should not be used.

## Route/Dosage

### HIV infection

**PO (Adults and Children >16 yr and ≥50 kg):** 150 mg twice daily or 300 mg once daily.
**PO (Adults <50 kg):** 2 mg/kg twice daily.
**PO (Children 3 mo–16 yr):** *Oral solution*–4 mg/kg twice daily (up to 150 mg twice daily); *Tablets*—14–21 kg: 75 mg twice daily; 22–29 kg: 75 mg in AM, 150 mg in PM; ≥30 kg: 150 mg twice daily.

### Renal Impairment

**PO (Adults):** *CCr 30–49 mL/min*—150 mg once daily; *CCr 15–29 mL/min*—150 mg first dose, then 100 mg once daily; *CCr 5–14 mL/min*—150 mg first dose, then 50 mg once daily; *CCr <5 mL/min*—50 mg first dose, then 25 mg once daily.

### Chronic Hepatitis B

**PO (Adults):** 100 mg once daily.

### Renal Impairment

**PO (Adults):** *CCr 30–49 mL/min*—100 mg first dose, then 50 mg once daily; *CCr 15–29 mL/min*—100 mg first dose, then 25 mg once daily; *CCr 5–14 mL/min*—35 mg first dose, then 15 mg once daily; *CCr <5 mL/min*—35 mg first dose, then 10 mg once daily.
**PO (Children 2–17 yr):** 3 mg/kg once daily (up to 100 mg/day).

## Availability

### Epivir

**Tablets:** 150 mg, 300 mg. **Oral solution (strawberry-banana flavor):** 10 mg/mL. ***In combination with:*** abacavir (Epzicom); zidovudine and abacavir (Trizivir). See Appendix B.

### Epivir-HBV

**Tablets:** 100 mg. **Oral solution (strawberry-banana flavor):** 5 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- **HIV:** Assess patient for change in severity of symptoms of HIV infection and for symptoms of opportunistic infection during therapy.
- Monitor patient for signs and symptoms of peripheral neuropathy (tingling, burning, numbness, or pain in hands or feet); may be difficult to differentiate from peripheral neuropathy of severe HIV disease. May require discontinuation of therapy.
- Assess patient, especially pediatric patients, for signs of pancreatitis (nausea, vomiting, abdominal pain) periodically during therapy. May require discontinuation of therapy.
- **Chronic Hepatitis B Infection:** Monitor signs of hepatitis (jaundice, fatigue, anorexia, pruritus) during therapy.
- ***Lab Test Considerations:*** .
- Monitor viral load and CD4 levels before and periodically during therapy.
- Monitor serum amylase, lipase, and triglycerides periodically during therapy. Elevated serum levels may indicate pancreatitis and require discontinuation.
- Monitor liver function. May cause ↑ levels of AST, ALT, CPK, bilirubin, and alkaline phosphatase, which usually resolve after interruption of therapy. Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women.
- May rarely cause neutropenia and anemia.

### Potential Nursing Diagnoses

Risk for infection (Indications)

### Implementation

- Do not confuse lamivudine with lamotrigine. Do not confuse Epivir tablets and oral solution with Epivir-HBV tablets and oral solutions. Epivir Tablets and Oral Solution contain a higher dose of the same active ingredient (lamivudine) than in Epivir-HBV Tablets and Oral Solution. Epivir-HBV was developed for patients with hepatitis B and should not be used for patients dually infected with HIV and hepatitis B; use may lead to lamivudine-resistant HIV due to subtherapeutic dose.
- **PO:** May be administered without regard to food.

### Patient/Family Teaching

- Instruct patient to take lamivudine as directed, every 12 hr. Explain the difference between Epivir and Epivir-HBV to patients. Emphasize the importance of compliance with full course of therapy, not taking more than the prescribed amount, and not discontinuing without consulting health care professional. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Caution patient not to share medication with others.
- Inform patient that lamivudine does not cure HIV disease or prevent associated or opportunistic infections. Lamivudine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and avoid sharing needles or donating blood to prevent spreading HIV to others. Advise patient that the long-term effects of lamivudine are unknown at this time.
- Instruct patient to notify health care professional promptly if signs of peripheral neuropathy or pancreatitis occur.
- Advise patient not to take other Rx, OTC, or herbal products without consulting health care professional.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes

- Slowing of the progression of HIV infection and its sequelae.
- Decrease in viral load and improvement in CD4 levels in patients with advanced HIV infection.
- Protection from liver damage caused by chronic hepatitis B infection; decreases viral load.

## **lamotrigine** (la-**moe**-tri-jeen)

Lamictal

***Classification***

Therapeutic: anticonvulsants

**Pregnancy Category C**

### Indications

Adjunct treatment of partial seizures in adults with epilepsy (immediate-release, extended-release, chewable, and orally disintegrating tablets). Lennox-Gastaut syndrome (immediate-release, chewable, and orally disintegrating tablets only). Primary generalized tonic-clonic seizures in adults and children ≥2 yr (immediate-release, chewable, and orally disintegrating tablets only). Conversion to monotherapy in adults with partial seizures receiving a single enzyme-inducing

antiepileptic drug (immediate-release, chewable, and orally disintegrating tablets only). Maintenance treatment of bipolar disorder (immediate-release, chewable, and orally disintegrating tablets only).

## Action

Stabilizes neuronal membranes by inhibiting sodium transport. **Therapeutic Effects:** Decreased incidence of seizures. Delayed time to recurrence of mood episodes.

## Pharmacokinetics

**Absorption:** 98% absorbed following oral administration.

**Distribution:** Enters breast milk. Highly bound to melanin-containing tissues (eyes, pigmented skin).

**Metabolism and Excretion:** Mostly metabolized by the liver to inactive metabolites; 10% excreted unchanged by the kidneys.

**Half-life:** Children taking enzyme–inducing antiepileptic drugs (AEDs): 7–10 hr; Children taking enzyme inducers and valproic acid : 15–27 hr; Children taking valproic acid: 44–94 hr; Adults: 25.4 hr (during chronic therapy of lamotrigine alone).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1.4–4.8 hr; 4–10 hr (XR) | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Lactation: Lactation.

**Use Cautiously in:** All patients (may ↑ risk of suicidal thoughts/behaviors); Patients with renal dysfunction, impaired cardiac function, and hepatic dysfunction (lower maintenance doses may be required); Prior history of rash to lamotrigine; OB: Exposure during first trimester may ↑ risk of cleft lip/palate; Pedi: Immediate-release, chewable, and orally disintegrating tablets not safe for children <2 yr; extended-release tablets not approved for use in children <13 yr .

## Adverse Reactions/Side Effects

**CNS:** SUICIDAL THOUGHTS, ataxia, dizziness, headache, behavior changes, depression, drowsiness, insomnia, tremor. **EENT:** blurred vision, double vision, rhinitis. **GI:** nausea, vomiting. **GU:** vaginitis. **Derm:** photosensitivity, rash (higher incidence in children, patients taking valproic acid, high initial doses, or rapid dose increases). **MS:** arthralgia. **Misc:** STEVENS-JOHNSON SYNDROME.

## Interactions

**Drug-Drug:** Concurrent use with **carbamazepine** may result in ↓ levels of lamotrigine and ↑ levels of an active metabolite of carbamazepine. Lamotrigine levels are ↓ by concurrent use of **phenobarbital**, **phenytoin**, or **primidone**. Concurrent use with **valproic acid** results in a twofold ↑ in lamotrigine levels, ↑ incidence of rash, and a ↓ in valproic acid level (lamotrigine dose should be ↓ by at least 50%). **Oral contraceptives** may ↓ serum levels of lamotrigine (dose adjustments may be necessary when starting and stopping oral contraceptives).

## Route/Dosage

### Epilepsy

#### In Combination with Other Antiepileptic Agents

**PO (Adults and Children > 12 yr; Immediate-release, chewable, or orally disintegrating tablets):** *Patients taking anti-epileptic drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate*—25 mg daily for first 2 wk, then 50 mg daily for next 2 wk; then ↑ by 50 mg/day every 1–2 wk to maintenance dose of 225–375 mg/day (in 2 divided doses); *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)*—50 mg daily for first 2 wk, then 50 mg twice daily for next 2 wk; then ↑ by 100 mg/day every 1–2 wk to maintenance dose of 300–500 mg/day (in 2 divided doses); *Patients taking regimen containing valproate*—25 mg every other day for first 2 wk, then 25 mg daily for next 2 wk; then ↑ by 25–50 mg/day every 1–2 wk to maintenance dose of 100–400 mg/day (in 1–2 divided doses) (maintenance dose of 100–200 mg/day if receiving valproate alone).

**PO (Adults and Children > 12 yr; Extended-release tablets):** *Patients taking anti-epileptic drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate* -25 mg daily for first 2 wk, then 50 mg daily for next 2 wk; then 100 mg daily for 1 wk, then 150 mg daily for 1 wk, then 200 mg/day for 1 wk, then ↑ by 100 mg/day every week to maintenance dose of 300–400 mg daily; *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)*—50 mg daily for first 2 wk, then 100 mg daily for next 2 wk, then 200 mg daily for

1 wk, then 300 mg daily for 1 wk, then 400 mg daily for 1 wk, then ↑ by 100 mg/day every week to maintenance dose of 400–600 mg daily; *Patients taking regimen containing valproate*—25 mg every other day for first 2 wk, then 25 mg daily for next 2 wk, then 50 mg daily for 1e wk, then 100 mg daily for 1 wk, then 150 mg daily for 1 wk, then maintenance dose of 200–250 mg daily.

**PO (Children 2–12 yr; Immediate-release, chewable, or orally disintegrating tablets):** *Patients taking anti-epileptic drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate*—0.3 mg/kg/day in 1–2 divided doses (rounded down to nearest whole tablet) for first 2 wk, then 0.6 mg/kg/day in 2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then ↑ by 0.6 mg/kg/day (rounded down to nearest whole tablet) every 1–2 wk to maintenance dose of 4.5-7.5 mg/kg/day (not to exceed 300 mg/day in 2 divided doses); *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)*—0.6 mg/kg/day in 2 divided doses (rounded down to nearest whole tablet) for first 2 wk, then 1.2 mg/kg/day in 2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then ↑ by 1.2 mg/kg/day (rounded down to nearest whole tablet) every 1–2 wk to maintenance dose of 5–15 mg/kg/day (not to exceed 400 mg/day in 2 divided doses). *Patients taking regimen containing valproate*—0.15 mg/kg/day in 1–2 divided doses (rounded down to nearest whole tablet) for first 2 wk, then 0.3 mg/kg in 1–2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then ↑ by 0.3 mg/kg/day (rounded down to nearest whole tablet) every 1–2 wk to maintenance dose of 1–5 mg/kg/day (not to exceed 200 mg/day in 1–2 divided doses) (maintenance dose of 1–3 mg/kg/day if receiving valproate alone).

### Conversion to Monotherapy

**PO (Adults ≥ 16 yr):** 50 mg/day for 2 wk, then 50 mg twice daily for 2 wk, then ↑ by 100 mg/day q 1–2 wk to maintenance dose of 300–500 mg/day in 2 divided doses; when target level is reached, ↓ other antiepileptics by 20% weekly over 4 wk.

### Bipolar Disorder

### Escalation Regimen

**PO (Adults):** *Patients not taking cabamazepine, phenobarbital, phenytoin, primidone, rifampin, or valproate*—25 mg daily for first 2 wk, then 50 mg daily for next 2 wk, then 100 mg daily for 1 wk, then 200 mg daily; *Patients taking valproate*—25 mg every other day for first 2 wk, then 25 mg daily for next 2 wk, then 50 mg daily for 1 wk, then 100 mg daily; *Patients taking carbamazepine, phenobarbital, phenytoin, primidone, or rifampin (and not valproate)* 50 mg daily for first 2 wk, then 100 mg/day (in divided doses) for next 2 wk, then 200 mg/day (in divided doses) for one wk, then 300 mg/day (in divided doses) for 1 wk, then up to 400 mg/day (in divided doses).

### Dosage Adjustment Following Discontinuation of Other Psychotropics

**PO (Adults):** *Following discontinuation of valproate (if current dose 100 mg/day)*—↑ to 150 mg/day for 1 wk, then 200 mg/day; *Following discontinuation of carbamazepine, phenobarbital, phenytoin, primidone, or rifampin (if current dose 400 mg/day)*—400 mg/day for 1 wk, then 300 mg/day for 1 wk, then 200 mg/day; *Following discontinuation of other psychotropics*—maintain previous dose.

### Availability (generic available)

**Immediate-release tablets:** 25 mg, 100 mg, 150 mg, 200 mg. **Cost:** 25 mg $668.97/180, 100 mg $708.97/180, 150 mg $819.90/180, 200 mg $905.89/180. **Chewable dispersible tablets:** 2 mg, 5 mg, 25 mg. **Cost:** *Generic*—5 mg $453.96/180, 25 mg $489.92/180. **Orally disintegrating tablets:** 25 mg, 50 mg, 100 mg, 200 mg. **Extended-release tablets:** 25 mg, 50 mg, 100 mg, 200 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess patient for skin rash frequently during therapy. Discontinue lamotrigine at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Rash usually occurs during the initial 2–8 wk of therapy and is more frequent in patients taking multiple antiepileptic agents, especially valproic acid, and much more frequent in patients <16 yr.
- Monitor for hypersensitivity reactions (fever, lymphadenopathy with or without rash) If cause cannot be determined, discontinue lamotrigine immediately.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.

- **Bipolar disorders:** Assess mood, ideation, and behaviors frequently. Initiate suicide precautions if indicated.
- ***Lab Test Considerations:*** Lamotrigine plasma concentrations may be monitored periodically during therapy, especially in patients concurrently taking other anticonvulsants. Therapeutic plasma concentration range has not been established, proposed therapeutic range: 1–5 mcg/mL.

### Potential Nursing Diagnoses

Risk for impaired skin integrity (Adverse Reactions)
Risk for injury (Side Effects)

### Implementation

- Do not confuse lamotrigine (Lamictal) with terbinafine (Lamisil), diphenoxylate/atropine (Lomotil), or lamivudine (Epivir).
- When converting from immediate-release to XR form, initial dose of XR should match the total daily dose of immediate-release lamotrigine; monitor closely and adjust and needed.
- **PO:** May be administered without regard to meals. Swallow XR tablets whole; do not break, crush, or chew.
- Lamotrigine should be discontinued gradually over at least 2 wk, unless safety concerns require a more rapid withdrawal. Abrupt discontinuation may cause increase in seizure frequency.
- **Orally Disintegrating Tablets:** Place on the tongue and move around the mouth. Tablet will rapidly disintegrate, can be swallowed with or without water, and can be taken with or without food.
- **Chewable/Dispersible Tablets:** May be swallowed whole, chewed, or dispersed in water or dispersed in fruit juice. If chewed, follow with water or fruit juice to aid in swallowing. Only use whole tablets, do not attempt to administer partial quantities of dispersible tablets.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Do not discontinue abruptly; may cause increase in frequency of seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- Advise patient to notify health care professional immediately if skin rash, fever, or swollen lymph glands occur or if frequency of seizures increases.
- May cause dizziness, drowsiness, and blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification at all times describing disease process and medication regimen.

### Evaluation/Desired Outcomes

- Decrease in the frequency of or cessation of seizures.
- Decreased incidence of mood swings in bipolar disorders.

## lansoprazole (lan-soe-pra-zole)

Prevacid, Prevacid 24 Hr

***Classification***

Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

**Pregnancy Category B**

### Indications

Erosive esophagitis. Duodenal ulcers (with or without anti-infectives for *Helicobacter pylori*). Active benign gastric ulcer. Short-term treatment of symptomatic GERD. Healing and risk reduction of NSAID-associated gastric ulcer. Pathologic hy-

persecretory conditions, including Zollinger-Ellison syndrome. **OTC:** Heartburn occurring ≥twice/wk.

## Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis.

## Pharmacokinetics

**Absorption:** 80% absorbed after oral administration.
**Distribution:** Unknown.
**Protein Binding:** 97%.
**Metabolism and Excretion:** Extensively metabolized by the liver to inactive compounds. Converted intracellularly to at least two other antisecretory compounds.
**Half-life:** Children: 1.2–1.5 hr; Adults: 1.3–1.7 hr (↑ in geriatric patients and patients with impaired hepatic function).

TIME/ACTION PROFILE (acid suppression)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1.7 hr | more than 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Solutabs contain aspartame; use caution when used in phenylketonurics; Severe hepatic impairment (not to exceed 30 mg/day in these patients); OB, Lactation: Safety not established; Pedi: Safety not established in children <1 yr; Geri: Maintenance dose not to exceed 30 mg/day unless additional acid suppression is required.

## Adverse Reactions/Side Effects

**CNS:** dizziness, headache. **GI:** diarrhea, abdominal pain, nausea. **Derm:** rash.

## Interactions

**Drug-Drug: Sucralfate** ↓ absorption of lansoprazole (take 30 min before sucralfate). May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **atazanavir ampicillin**, **iron salts**, and **digoxin**. May ↑ risk of bleeding with **warfarin** (monitor INR/PT). May ↓ the anti-platelet effects of **clopidogrel**.

## Route/Dosage

**PO (Adults and children ≥12 yr):** *Short-term treatment of duodenal ulcer*—15 mg once daily for 4 wk; *H. pylori eradication to reduce the risk of duodenal ulcer recurrence*—30 mg twice daily with clarithromycin 500 mg twice daily and amoxicillin 1000 mg twice daily for 10–14 days (triple therapy) or 30 mg 3 times daily with 1000 mg amoxicillin 3 times daily for 14 days (dual therapy); *maintenance of healed duodenal ulcers*—15 mg once daily; *short-term treatment of gastric ulcers/healing of NSAID-associated gastric ulcer*—30 mg once daily for up to 8 wk; *risk reduction of NSAID-associated gastric ulcer*—15 mg once daily for up to 12 wk; *short-term treatment of symptomatic GERD*—15 mg once daily for up to 8 wk; *short-term treatment of erosive esophagitis*—30 mg once daily for up to 8 wk (8 additional weeks may be necessary); *maintenance of healing of erosive esophagitis*—15 mg once daily; *pathologic hypersecretory conditions*—60 mg once daily intially, up to 90 mg twice daily (daily dose >120 mg should be given in divided doses).
**PO (Adults):** *OTC*—15 mg once daily for up to 14 days (14 day course may be repeated every 4 mo).
**PO (Children 1–11 yr and >30 kg):** *GERD*—30 mg once to twice daily .
**PO (Children 1–11 yr and 10–30 kg):** *GERD*—15 mg once or twice daily .
**PO (Children 1–11 yr and <10 kg):** *GERD*—7.5 mg once daily.

## Availability (generic available)

**Delayed-release capsules:** 15 mg[Rx, OTC], 30 mg.
**Cost:** 15 mg $136.28/30, 30 mg $444.38/100.
**Delayed-release orally disintegrated tablets (SoluTabs):** 15 mg, 30 mg. ***In combination with:*** amoxicillin and clarithromycin as part of a compliance package (Prevpac). See Appendix B.

# NURSING IMPLICATIONS

## Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** May cause abnormal liver function tests, including ↑ AST, ALT, alkaline phosphatase, LDH, and bilirubin.
- May cause ↑ serum creatinine and ↑ or ↓ electrolyte levels.
- May alter RBC, WBC, and platelet levels.
- May also cause ↑ gastrin levels, abnormal A/G ratio, hyperlipidemia, and ↑ or ↓ cholesterol.
- Monitor INR and prothrombin time in patients taking warfarin.

## Potential Nursing Diagnoses

Acute pain (Indications)

## Implementation

- Do not confuse Prevacid (lansoprazole) with Pravachol (pravastatin).
- **PO:** Administer before meals. Capsules may be opened and sprinkled on 1 tbsp of applesauce, pudding, cottage cheese, or yogurt and swallowed immediately for patients with difficulty swallowing. Do not crush or chew capsule contents.
- For patients with an NG tube, capsules may be opened and intact granules may be mixed in 40 mL of apple, cranberry, grape, orange, pineapple, prune, or V8 vegetable juice and injected through the NG tube into stomach. Flush NG tube with additional apple juice to clear tube. If administered via jejunostomy tube, lansoprazole should be prepared as a suspension with 2.5 mL of 4.2% sodium bicarbonate and 2.5 mL water.
- *Orally disintegrating tablets* may be placed on tongue, allowed to disintegrate and swallowed with or without water. For administration via oral syringe or nasogastric tube, *Prevacid SoluTab* can be administered by placing a 15-mg tablet in oral syringe and drawing up 4 mL of water, or a 30-mg tablet in oral syringe and drawing up 10 mL of water. Shake gently to allow for a quick dispersal. After tablet has dispersed, administer the contents within 15 minutes. Refill syringe with 2 mL (5 mL for the 30-mg tablet) of water, shake gently, and administer any remaining contents and flush nasogastric tube.
- Antacids may be used concurrently.

## Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- May occasionally cause dizziness. Caution patient to avoid driving and other activities that require alertness until response to medication is known.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly.

## Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy. Therapy is continued for at least 2–4 wk. Therapy for pathologic hypersecretory conditions may be long term.
- Healing in patients with erosive esophagitis. Therapy is continued for up to 8 wk, and an additional 8-wk course may be used for patients who do not heal in 8 wk or whose ulcer recurs.

# lanthanum carbonate

(**lan**-than-um)

Fosrenol

***Classification***

Therapeutic: hypophosphatemics

Pharmacologic: phosphate binders

**Pregnancy Category C**

L

## Indications

Reduction of serum phosphate levels associated with end-stage renal disease.

## Action

Dissociates in the upper GI tract forming lanthanate ions, which form an insoluble complex with phosphate. **Therapeutic Effects:** Decreased serum phosphate levels.

## Pharmacokinetics

**Absorption:** Negligible absorption.
**Distribution:** Stays within the GI tract.
**Metabolism and Excretion:** Eliminated almost entirely in feces.
**Half-life:** 53 hr (in plasma).

TIME/ACTION PROFILE (effect on phosphate levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2–3 wk | unknown |

## Contraindications/Precautions

**Contraindicated in:** OB: Congenital abnormalities noted in animal studies; Pedi: Potential negative effect on developing bone.
**Use Cautiously in:** Peptic ulcer disease, ulcerative colitis, Crohn's disease, any predisposition to bowel obstruction; Lactation: Safety not established.

## Adverse Reactions/Side Effects

**GI:** nausea, vomiting, diarrhea.

### Interactions
**Drug-Drug: Drugs known to interact with antacids** may interact with lanthanum carbonate; separate dosing by 2 hr.

### Route/Dosage
**PO (Adults):** 750–1500 mg/day in divided doses; may be titrated upward every 2–3 wk in increments of 750 mg/day up to 3750 mg/day (usual range 1500–3000 mg/day).

### Availability
**Chewable tablets:** 250 mg, 500 mg.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for nausea and vomiting during therapy.
- ***Lab Test Considerations:*** Monitor serum phosphate levels prior to and periodically during therapy.

### Potential Nursing Diagnoses
Nausea (Side Effects)

### Implementation
- Divide total daily dose and administer with meals.
- **PO:** Administer with or immediately after meals. Tablets should be chewed completely before swallowing; intact tablets should not be swallowed.

### Patient/Family Teaching
- Instruct patient to take lanthanum as directed.

### Evaluation/Desired Outcomes
- Decrease in serum phosphate to below than 6.0 mg/dL in patients with end stage renal disease.

## lapatinib (la-pat-i-nib)
Tykerb

***Classification***
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors, kinase inhibitors

**Pregnancy Category D**

### Indications
Advanced metastatic breast cancer with tumor overexpression of the Human Epidermal Receptor Type 2 (HER2) and past therapy with an anthracycline, a taxane and trastuzumab; used in combination with capecitabine (Xeloda).

### Action
Acts as an inhibitor of intracellular tyrosine kinase affecting Epidermal Growth Factor (EGFR, ErbB1) and HER2 (ErbB2). Inhibits the growth of ErbB-driven tumors. Effect is additive with capecitabine. **Therapeutic Effects:** Decreased/slowed spread of metastatic breast cancer.

### Pharmacokinetics
**Absorption:** Incompletely and variably absorbed following oral administration blood levels are increased by food.
**Distribution:** Unknown.
**Protein Binding:** >99%.
**Metabolism and Excretion:** Extensively metabolized by, mostly by CYP3A4 and CYP3A5 enzyme systems; <2% excreted by kidneys.
**Half-life:** 24 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 4 hr | 24 hr |

### Contraindications/Precautions
**Contraindicated in:** ↓ left ventricular ejection fraction (Grade 2 or greater); OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Concurrent use of CYP3A4 inhibitors including ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritoanvir, saquinavir, telithromycin, and voriconazole should be avoided (if necessary, dose reduction of lapatinib is required); Concurrent use of CYP3A4 inducers including dexamathasone, phenytoin, carbamazepine, rifampin, rifabutin, rifapentin and phenobarbital may decrease levels and effectiveness and should be avoided (if necassary, dose of lapatinib may be titrated upward to 4500 mg/day as tolerated); Severe hepatic impairment (dose reduction recommended for Child-Pugh Class C); Known QTc prolongation or co-existing risk factors of QTc prolongation including hypokalemia, hypomagnesemia, concurrent anti-arrhythmics or medications that are known to prolong QTc; Geri: May be more sensitive to effects; Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** fatigue, insomnia. **Resp:** dyspnea, interstitial lung disease, pneumonitis. **CV:** ↓ left ventricular ejection fraction. **GI:** HEPATOTOXICITY, diarrhea, nausea, vomiting, dyspepsia, ↑ liver enzymes, stomatitis. **Derm:** palmar-plantar erythrodysesthesia, rash, dry skin. **Hemat:** neutropenia. **MS:** back pain, extremity pain.

### Interactions
**Drug-Drug:** Lapatinib inhibits CYP3A4, CYP28 and P-glycoprotein; concurrent use of drugs,

which are substrates for these enzyme should be undertaken with caution. Concurrent use of **CYP3A4 inhibitors** including **ketoconazole**, **itraconazole**, **clarithromycin**, **atazanavir**, **indinavir**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, **telithromycin**, and **voriconazole** may ↑ blood levels and the risk of toxicity. Concurrent use should be avoided, but if necessary dosage of lapatinib should be decreased. Concurrent use of **CYP3A4 inducers** including **dexamethasone**, **phenytoin**, **carbamazepine**, **rifampin**, **rifabutin**, **rifapentin**, and **phenobarbital** may ↓ blood levels and effectiveness and should be avoided. If necessary, dose of lapatinib may be titrated upward to 4500 mg/day as tolerated.

**Drug-Food:** Concurrent **grapefruit** may ↑ blood levels and the risk of toxicity and should be avoided.

### Route/Dosage

**PO (Adults):** 1250 mg (5 tablets) once daily for 21 days.

### Hepatic Impairment

**PO (Adults):** *Severe hepatic impairment*—750 mg/day.

### Availability

**Tablets:** 250 mg.

## NURSING IMPLICATIONS

### Assessment

- Evaluate left ventricular ejection fraction (LVEF) prior to therapy to determine if within institution's normal limits. Continue to monitor periodically during therapy to ensure it does not fall below limits. If LVEF decreases Grade 2 or greater discontinue therapy. If returns to normal and patient is asymptomatic after 2 wk, may restart therapy at a reduced dose of 1000 mg/day.
- Monitor ECG prior to and periodically during therapy to monitor QT.
- Monitor for respiratory status for symptoms of interstitial lung disease and pneumonitis (dyspnea, cough); may require discontinuation of therapy.
- ***Lab Test Considerations:*** Monitor liver function tests prior to initiation and every 4–6 wk during therapy and as clinically indicated. Discontinue and do not restart lapatinib if patients experience severe changes in liver function tests.
- Monitor serum potassium and magnesium prior to and periodically during therapy.

### Potential Nursing Diagnoses

Diarrhea (Adverse Reactions)

### Implementation

- Administer antidiarrheals prior to therapy to prevent severe diarrhea.
- Correct hypokalemia and hypomagnesemia prior to therapy.
- **PO:** Administer 5 tablets once daily at least 1 hr before or 1 hr after a meal for 21 days. Capecitabine is taken with food or 30 min after meals twice daily.

### Patient/Family Teaching

- Instruct patient to take lapatinib as directed and to review the *Patient Information Sheet* prior to therapy and with each refill for new information If a dose is missed take as soon remembered that day. If a day is missed, skip the dose; do not double doses. Caution patient not to share this medication with others, even with same condition; may be harmful.
- Advise patient to avoid drinking grapefruit juice or eating grapefruit during therapy.
- Advise patient to report signs or decreased LVEF (shortness of breath, palpitations, fatigue) to health care professional promptly.
- Instruct patient to notify health care professional before taking any Rx, OTC, or herbal products during therapy.
- Advise patient that lapatinib may cause diarrhea, which may become severe. Instruct patient in how to prevent and manage diarrhea.
- Advise female patients to notify health care professional if pregnancy is planned or suspected; therapy may be teratogenic.

### Evaluation/Desired Outcomes

- Decreased/slowed spread of metastatic breast cancer.

## **leflunomide** (le-**flu**-noe-mide)

Arava

***Classification***

Therapeutic: antirheumatics (DMARDs)
Pharmacologic: immune response modifiers

**Pregnancy Category X**

### Indications

Rheumatoid arthritis (disease-modifying agent).

## Action
Inhibits an enzyme required for pyrimidine synthesis; has antiproliferative and anti-inflammatory effects. **Therapeutic Effects:** Decreased pain and inflammation, slowed structural progression and improved physical function.

## Pharmacokinetics
**Absorption:** Tablets are 80% absorbed following oral administration; rapidly converted to the M1 metabolite, which is responsible for pharmacologic activity.
**Distribution:** Crosses the placenta.
**Protein Binding:** 99%.
**Metabolism and Excretion:** Extensively metabolized with metabolites excreted in urine (43%) and feces (48%). Also undergoes biliary recycling.
**Half-life:** 14–18 days.

TIME/ACTION PROFILE (antirheumatic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 mo | 3–6 mo | wk–mos† |

†Due to persistence of active metabolite

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Compromised immune function, including bone marrow dysplasia or severe uncontrolled infection; Concurrent vaccination with live vaccines; OB: May cause fetal abnormalities or death. Contact Pregnancy Registry if accidental exposure occurs; Lactation: Lactation.
**Use Cautiously in:** Renal insufficiency; Pedi: Safety and effectiveness not established; OB: Women with childbearing potential must use two forms of birth control. Should not be used in men attempting to father a child.
**Exercise Extreme Caution in:** Significant hepatic impairment, including positive serology for hepatitis B or C; or concurrent use of other hepatotoxic agents (↑ risk of hepatotoxicity).

## Adverse Reactions/Side Effects
**CNS:** headache, dizziness, weakness. **Resp:** INTERSTITIAL LUNG DISEASE, bronchitis, cough, pharyngitis, pneumonia, respiratory infection, rhinitis, sinusitis. **CV:** chest pain, hypertension. **GI:** diarrhea, nausea, abdominal pain, ↑ liver enzymes, hepatotoxicity (rare), anorexia, dyspepsia, gastroenteritis, mouth ulcers, vomiting. **GU:** urinary tract infection. **Derm:** alopecia, rash, dry skin, eczema, pruritus. **F and E:** hypokalemia. **Metab:** weight loss. **MS:** arthralgia, back pain, joint disorder, leg cramps, synovitis, tenosynovitis. **Neuro:** paresthesia. **Misc:** allergic reactions, flu syndrome, infections including sepsis and tuberculosis reactivation, pain.

## Interactions
**Drug-Drug: Cholestyramine** and **activated charcoal** cause a rapid and significant ↓ in blood levels of active metabolite. Concurrent use of **methotrexate** and other **hepatotoxic drugs** ↑ risk of hepatotoxicity. Concurrent administration of **rifampin** ↑ blood levels of the active metabolite. May ↑ risk of bleeding with **warfarin**.

## Route/Dosage
**PO (Adults):** *Loading dose*—100 mg daily for 3 days; *maintenance dosing*—20 mg/day (if intolerance occurs, dose may be ↓ to 10 mg/day).

## Availability (generic available)
**Tablets:** 10 mg, 20 mg, 100 mg.

# NURSING IMPLICATIONS

## Assessment
- Assess range of motion and degree of swelling and pain in affected joints before and periodically during therapy.
- Monitor for signs and symptoms of interstitial lung disease (new onset or worsening cough or dyspnea, associated with fever). May require discontinuation of therapy; consider drug elimination procedure if needed.
- ***Lab Test Considerations:*** Monitor liver function throughout therapy. Assess ALT at baseline, then monthly during initial 6 mo of therapy, then every 6–8 wk. If given concurrently with methotrexate, monitor ALT, AST, and serum albumin monthly. May cause ↑ ALT and AST, which are usually reversible with reduction in dose or discontinuation, but may be fatal. If ALT is 2–3 times the upper limit of normal, reduce dose to 10 mg/day and continue therapy. Monitor closely after dose reduction; plasma levels may not ↓ for several weeks due to long half-life. If ALT ↑ of 2–3 times the upper limit of normal persists despite dose reduction or if ALT >3 times the upper limit of normal occurs, discontinue leflunomide and administer cholestyramine (see Toxicity and Overdose). Monitor closely and readminister cholestyramine as indicated.
- Monitor CBC with platelets monthly for 6 mo following initiation of therapy and every 6–8 wk thereafter. If used with methotrexate or other immunosuppressive therapy continue monitoring monthly. If bone marrow depression occurs, discontinue leflunomide and begin decreasing levels with cholestyramine (see Implementation).

- May rarely cause ↑ of alkaline phosphatase and bilirubin.
- ***Toxicity and Overdose:*** If overdose or significant toxicity occurs, cholestyramine 8 g 3 times a day for 24 hr, or activated charcoal orally or via nasogastric tube, 50 g every 6 hr for 24 hr, is recommended to accelerate elimination.

## Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)

## Implementation

- Administer a tuberculin skin test prior to administration of leflunomide. Patients with active latent TB should be treated for TB prior to therapy.
- **PO:** Initiate therapy with loading dose of 100 mg/day for 3 days, followed by 20 mg/day dose. May decrease to 10 mg/day if not well tolerated.
- **Drug Elimination Procedure:** Recommended to achieve nondectable plasma levels <0.02 mg/L after stopping treatment with leflunomide. Administer cholestyramine 8 g 3 times daily for 11 days. (Days do not need to be consecutive unless rapid lowering of levels is desired.) Verify plasma levels <0.02 mg/L by 2 separate tests at least 14 days apart. If plasma levels >0.02 mg/L, consider additional cholestyramine treatment. Plasma levels may take up to 2 yr to reach nondetectable levels without drug elimination procedure.

## Patient/Family Teaching

- Instruct patient to take leflunomide as directed.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patients of childbearing age that leflunomide has teratogenic effects. Women wishing to become pregnant must undergo the drug elimination procedure (see Implementation) and verify that the M1 metabolite plasma levels are <0.02 mg/L. Men wishing to father a child should also take cholestyramine 8 g 3 times daily for 11 days to minimize any possible risk.
- Advise patient to consult health care professional prior to taking other Rx, OTC, or herbal products concurrently with leflunomide. Aspirin, NSAIDs, or low-dose corticosteroids may be continued during therapy, but other agents for treatment of rheumatoid arthritis may require discontinuation.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Advise patient to notify health care professional if rash, mucous membrane lesions, unusual tiredness, abdominal pain, jaundice, or symptoms of interstitial lung disease occur.
- Instruct patient to avoid vaccinations with live vaccines during and following therapy without consulting health care professional.

## Evaluation/Desired Outcomes

- Decrease in signs and symptoms of rheumatoid arthritis and slowing of structural damage as evidenced by x-ray erosions and joint narrowings.
- Improved physical function.

L

HIGH ALERT

# lepirudin (rDNA)

(le-**peer**-yoo-din)
Refludan

***Classification***
Therapeutic: anticoagulants
Pharmacologic: thrombin inhibitors

**Pregnancy Category B**

## Indications

Management of thromboembolic disease and prevention of its complications in patients who have experienced heparin-induced thrombocytopenia.

## Action

Acts as an anticoagulant by inhibiting the action of thrombin. Produced by recombinant DNA technology. **Therapeutic Effects:** Anticoagulation with prevention of thromboembolic complications.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Distributes mainly to extracellular fluids.
**Metabolism and Excretion:** Metabolized by release of amino acids caused by breakdown of drug; 48% excreted unchanged in urine.
**Half-life:** 1.3 hr.

TIME/ACTION PROFILE (anticoagulant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | within 30–90 min | unknown | up to 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe renal impairment (CCr <15 mL/min or SCr >6 mg/dL).

**Use Cautiously in:** Recent puncture of large vessels/organ biopsy; Vessel/organ anomaly; Recent CVA, stroke, intracerebral surgery or other neuroaxial procedure; Severe uncontrolled hypertension; Bacterial endocarditis; Hemorrhagic diatheses; Recent major surgery; Recent major bleeding; Severe liver impairment; Moderate renal impairment ( ↓ bolus and maintenance infusion rate recommended if CCr ≤60 mL/min or SCr >1.5 mg/dL); OB: Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**Hemat:** BLEEDING. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug:** ↑ risk of bleeding with **thrombolytic agents**, **NSAIDs**, **valproic acid**, **cefotetan**, **cefoperazone**, platelet aggregation inhibitors including **aspirin**, **dipyridamole**, **clopidogrel**, **ticlopidine**, **tirofiban**, and **eptifibatide**.

### Route/Dosage

**IV (Adults):** 0.4 mg/kg (not to exceed 44 mg) as a bolus over 15–20 sec, followed by 0.15 mg/kg/hr (not to exceed 16.5 mg/hr) initially, further adjustments made on the basis of laboratory assessment (aPTT) but should not exceed infusion rate of 0.21 mg/kg/hr without checking for coagulation abnormalities.

#### Renal Impairment

**IV (Adults):** 0.2 mg/kg as a bolus over 15–20 sec, then if *CCr 45–60 mL/min (or SCr 1.6–2 mg/dL)* — 0.075 mg/kg/hr; if *CCr 30–44 mL/min (or SCr 2.1–3 mg/dL)* — 0.045 mg/kg/hr; if *CCr 15–29 mL/min (or SCr 3.1–6 mg/dL)* — 0.0225 mg/kg/hr.

### Availability

**Powder for injection:** 50 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for signs of bleeding and hemorrhage (bleeding gums, nosebleed, unusual bruising, black tarry stools, hematuria, fall in hematocrit or blood pressure, guaiac-positive stools). Notify physician if these occur.
- Monitor patient for hypersensitivity reactions (chills, fever, urticaria). Report signs to physician.
- ***Lab Test Considerations:*** Dose is adjusted according to aPTT ratio (patient aPTT at a given time over aPTT reference value, usually median of laboratory normal range for aPTT). Target range for aPTT ratio during treatment should be 1.5–2.5.
- Determine baseline aPTT prior to therapy; therapy should not be started in patients with an aPTT ratio of >2.5.
- First aPTT should be drawn 4 hr after initiation of therapy, then at least daily during therapy. More frequent monitoring is required in patients with serious liver injury or renal impairment.
- If aPTT ratio is out of target range, confirm ratio before modifying dose, unless clinically necessitated. If the confirmed ratio is above the target range, stop infusion for 2 hr. Restart infusion at 50% of previous dose without bolus and determine aPTT ratio in 4 hr.
- If confirmed ratio is below target range, increase infusion in steps of 20% and determine ratio in 4 hr.
- ***Toxicity and Overdose:*** If life-threatening bleeding occurs and excessive plasma levels of lepirudin are suspected, immediately stop infusion, determine aPTT and other coagulation levels, determine hemoglobin and prepare for blood transfusion. No specific antidote for lepirudin is available.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Side Effects)

### Implementation

- Inform all personnel caring for patient of anticoagulant therapy. Venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation. IM injections of other medications should be avoided, as hematomas may develop.
- In patients scheduled to receive coumadin derivatives for oral anticoagulation, lepirudin dose should be gradually decreased to reach an aPTT ratio just above 1.5 before initiating oral anticoagulant therapy.

#### IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute each vial with 1 mL of sterile water for injection or 0.9% NaCl. Shake gently. Transfer contents of vial into a 10-mL syringe and dilute to a total volume of 10 mL with sterile water for injection, 0.9% NaCl, or D5W. Clear, colorless solution should be obtained within a few seconds to 3 min. Do not use solutions that are cloudy or

contain particulate matter. Solution is stable for 24 hr at room temperature. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer slowly over 15–20 sec.

- **Continuous Infusion:** ***Diluent:*** Reconstitute 2 vials (50 mg each) with 1 mL each of sterile water for injection or 0.9% NaCl. Transfer the contents into an infusion bag containing 500 mL or 250 mL of 0.9% NaCl or D5W. Solution is stable for 24 hr at room temperature. ***Concentration:*** 0.2–0.4 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Use an infusion pump to ensure accuracy.
- **Y-Site Compatibility:** amiodarone.

### Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising to health care professional immediately.
- Caution patient to avoid IM injections and activities leading to injury and to use a soft toothbrush and electric razor during therapy.

### Evaluation/Desired Outcomes

- Range of aPTT ratio from 1.5–2.5, without signs of hemorrhage.
- Treatment and prevention of thromboembolic disease and its sequelae.

## letrozole (let-roe-zole)

Femara

***Classification***

Therapeutic: antineoplastics

Pharmacologic: aromatase inhibitors

**Pregnancy Category D**

### Indications

First-line treatment of postmenopausal women with hormone receptor positive or hormone receptor unknown metastatic or advanced breast cancer. Advanced breast cancer in postmenopausal patients with disease progression despite antiestrogen therapy. Extended adjuvant treatment of post-menopausal early breast cancer already treated with 5 yr of tamoxifen.

### Action

Inhibits the enzyme aromatase, which is partially responsible for conversion of precursors to estrogen. **Therapeutic Effects:** Lowers levels of circulating estrogen, which may halt progression of estrogen-sensitive breast cancer. Decreased risk of recurrence/metastatic disease.

### Pharmacokinetics

**Absorption:** Rapidly and completely absorbed.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 2 days.

TIME/ACTION PROFILE (effect on lowering of serum estradiol levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2–3 days | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Premenopausal women; OB: Potential for fetal harm.
**Use Cautiously in:** Severe hepatic impairment; Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** anxiety, depression, dizziness, drowsiness, fatigue, headache, vertigo, weakness. **Resp:** coughing, dyspnea, pleural effusion. **CV:** chest pain, edema, hypertension, cerebrovascular events, thromboembolic events. **GI:** nausea, abdominal pain, anorexia, constipation, diarrhea, dyspepsia, vomiting. **Derm:** alopecia, hot flashes, increased sweating, pruritus, rash. **F and E:** hypercalcemia. **Metab:** hypercholesterolemia, weight gain. **MS:** musculoskeletal pain, arthralgia, fractures.

### Interactions

**Drug-Drug:** None significant.

### Route/Dosage

**PO (Adults):** 2.5 mg daily.

### Availability

**Tablets:** 2.5 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for pain and other side effects periodically throughout therapy.
- ***Lab Test Considerations:*** May cause elevated GTT cholesterol levels.

### Potential Nursing Diagnoses

Acute pain (Side Effects)

### Implementation

- **PO:** May be taken without regard to food.

### Patient/Family Teaching

- Instruct patient to take medication as directed.
- Inform patient of potential for adverse reactions and advise her to notify health care professional if side effects are problematic.

- Caution women who are perimenopausal or who recently became menopausal to use adequate contraception during therapy; letrozole may cause fetal harm.

### Evaluation/Desired Outcomes

- Slowing of disease progression in women with advanced breast cancer.
- Decreased risk of recurrence/metastatic disease.

## leucovorin calcium

(loo-koe-**vor**-in)
folinic acid

***Classification***
Therapeutic: antidotes (for methotrexate), vitamins
Pharmacologic: folic acid analogues

**Pregnancy Category C**

### Indications

Minimizes hematologic effects of high-dose methotrexate therapy (leucovorin rescue). Advanced colorectal carcinoma (with 5-fluorouracil). Management of overdoses/prevention of toxicity from folic acid antagonists (pyrimethamine, trimethoprim, trimetrexate). Folic acid deficiency (megaloblastic anemia) unresponsive to oral replacement.

### Action

The reduced form of folic acid that serves as a cofactor in the synthesis of DNA and RNA. **Therapeutic Effects:** Reversal of toxic effects of folic acid antagonists. Reversal of folic acid deficiency.

### Pharmacokinetics

**Absorption:** Well absorbed (38%) following PO administration. Bioavailability decreases with larger doses. Oral absorption is saturated at doses >25 mg.
**Distribution:** Widely distributed. Concentrates in the CNS and liver.
**Metabolism and Excretion:** Extensively converted to tetrahydrofolic derivatives, including 5-methyltetrahydrofolate, a major storage form.
**Half-life:** 3.5 hr.

TIME/ACTION PROFILE (serum folate levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 20–30 min | unknown | 3–6 hr |
| IM | 10–20 min | unknown | 3–6 hr |
| IV | <5 min | unknown | 3–6 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Preparations containing benzyl alcohol should not be used in neonates.
**Use Cautiously in:** Undiagnosed anemia (may mask the progression of pernicious anemia); OB, Lactation: Safety not established but has been used safely to treat megaloblastic anemia in pregnancy; Coadministration with high-dose methotrexate requires crucial timing of dosing and knowledge of methotrexate levels; Ascites; Renal failure; Dehydration; Pleural effusions; Urine pH <7.

### Adverse Reactions/Side Effects

**Hemat:** thrombocytosis (intra-arterial methotrexate only). **Misc:** allergic reactions (rash, urticaria, wheezing).

### Interactions

**Drug-Drug:** May ↓ anticonvulsant effect of **barbiturates**, **phenytoin**, or **primidone**. High doses of the liquid contain significant **alcohol** and may cause ↑ CNS depression when used with **CNS depressants**. Concurrent use with **trimethoprim/sulfamethoxazole** may result in ↓ anti-infective efficacy and poor therapeutic outcome when used to treat *Pneumocystis jirovecii* pneumonia in HIV patients. May ↑ therapeutic effects and toxicity of **fluorouracil**; therapy may be combined for this purpose.

### Route/Dosage

### High-Dose Methotrexate—Leucovorin Rescue. Must start within 24 hr of methotrexate.

**PO, IM, IV (Adults and Children):** *Normal methotrexate elimination*—10 mg/m² q 6 hr (1st dose IV/IM, then change to PO) until methotrexate level is $<5 \times 10^{-8}$ M (0.05 micromolar). Larger doses/longer duration may be required in patients with aciduria, ascites, dehydration, renal impairment, GI obstruction, pleural/peritoneal effusions. Dose of leucovorin should be determined on the basis of plasma methotrexate levels.

### Advanced Colorectal Cancer

**IV (Adults):** 200 mg/m² followed by 5-fluorouracil 370 mg/m² or leucovorin 20 mg/m² is followed by 5-fluorouracil 425 mg/m². Regimen is given daily for 5 days q 4–5 wk.

### Prevention of Hematologic Toxicity from Trimetrexate

**PO, IV (Adults and Children):** 20 mg/m² q 6 hr continued for 72 hr after last trimetrexate dose (oral doses should be rounded up to the next 25

mg); both trimetrexate and leucovorin doses require adjustment for hematologic toxicity.

### Prevention of Hematologic Toxicity from Pyrimethamine

**PO, IV (Adults and Children):** 5–15 mg/day.

### Inadvertent Overdose of Folic Acid Antagonists

**IM, IV (Adults and Children):** *Methotrexate–large doses*—75 mg IV followed by 12 mg IM q 6 hr for 4 doses; *methotrexate–average doses*—6–12 mg IM q 6 hr for 4 doses; *other folic acid antagonists*—amount equal in mg to folic acid antagonist.

### Megaloblastic Anemia

**PO, IM, IV (Adults and Children):** Up to 1 mg/day (up to 6 mg/day for dihydrofolate reductase deficiency).

### Availability (generic available)

**Tablets:** 5 mg, 10 mg, 15 mg, 25 mg. **Solution for injection (preservative-free):** 10 mg/mL. **Powder for injection:** 50 mg, 100 mg, 200 mg, 350 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for nausea and vomiting secondary to methotrexate therapy or folic acid antagonists (pyrimethamine and trimethoprim) overdose. Parenteral route may be necessary to ensure that patient receives dose.
- Monitor for development of allergic reactions (rash, urticaria, wheezing). Notify health care professional if these occur.
- **Megaloblastic Anemia:** Assess degree of weakness and fatigue.
- ***Lab Test Considerations:*** **Leucovorin rescue:** Monitor serum methotrexate levels to determine dose and effectiveness of therapy. Leucovorin calcium levels should be equal to or greater than methotrexate level. Rescue continues until serum methotrexate level is $<5 \times 10M$.
- Monitor CCr and serum creatinine prior to and every 24 hr during therapy to detect methotrexate toxicity. An increase >50% over the pretreatment concentration at 24 hr is associated with severe renal toxicity.
- Monitor urine pH every 6 hr during therapy; pH should be maintained >7 to decrease nephrotoxic effects of high-dose methotrexate. Sodium bicarbonate or acetazolamide may be ordered to alkalinize urine.
- *Megaloblastic anemia*—Monitor plasma folic acid levels, hemoglobin, hematocrit, and reticulocyte count prior to and periodically during therapy.

### Potential Nursing Diagnoses

Risk for injury (Indications)
Imbalanced nutrition: less than body requirements (Indications)

### Implementation

- Do not confuse folinic acid (leucovorin calcium) with folic acid. Do not confuse leucovorin with leukeran (chlorambucil) or leukine (sargramostim).
- Make sure leucovorin calcium is available before administering high-dose methotrexate. Administration must be initiated within 24 hr of methotrexate therapy.
- Administer as soon as possible after toxic dose of folic acid antagonists (pyrimethamine and trimethoprim). Effectiveness of therapy begins to decrease 1 hr after overdose.
- **PO:** Parenteral therapy should be used in patients with GI toxicity, with nausea and vomiting, or with doses >25 mg.
- **IM:** IM route is preferred for treatment of megaloblastic anemia. Ampules of leucovorin calcium injection for IM use do not require reconstitution.

#### IV Administration

- **Direct IV:** ***Diluent:*** Bacteriostatic water or sterile water. Do not use product containing benzyl alcohol. Use immediately if reconstituted with sterile water for injection. Stable for 7 days when reconstituted with bacteriostatic water. ***Concentration:*** reconstitute 50-mg, 100-mg, and 200-mg vials to a concentration of 10 mg/mL; reconstitute 350-mg vial to a concentration of 20 mg/mL. ***Rate:*** Administer by slow injection over a minimum of 3 min; not to exceed 160 mg/min.
- **Intermittent Infusion:** ***Diluent:*** May be diluted in 100–500 mL of D5W, D10W, 0.9% NaCl, Ringer's, or LR. Stable for 24 hr.
- **Y-Site Compatibility:** amifostine, anidulafungin, aztreonam, bivalirudin, bleomycin, caspofungin, cefepime, cisplatin, cladribine, codeine, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexamedetomidine, docetaxel, doxacurium, doxorubicin, doxoru-

bicin liposome, eptifibatide, ertapenem, etoposide, etoposide phosphate, fenoldopam, filgrastim, fluconazole , fludarabine, fluorouracil, furosemide, gemcitabine, granisetron, heparin, hetastarch, idarubicin, ifosfamide, levofloxacin, linezolid, mechlorethamine, meperidine, methotrexate, metoclopramide, mitomycin, mitoxantrone, nesiritide, octreotide, oxaliplatin, oxytocin, paclitaxel, palonosetron, pemetrexed, piperacillin/tazobactam , rituximab, sodium acetate, tacrolimus, teniposide, thiotepa, tigecycline, tirofiban, trastuzumab, vinblastine, vincristine, vinorelbine, voriconazole.

- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B liposome, carboplatin, droperidol, epirubicin, foscarnet, pantoprazole, quinupristin/dalfopristin, sodium bicarbonate.

### Patient/Family Teaching

- Explain purpose of medication to patient. Emphasize need to take exactly as ordered. Advise patient to contact health care professional if a dose is missed.
- **Leucovorin Rescue:** Instruct patient to drink at least 3 liters of fluid each day during leucovorin rescue.
- **Folic Acid Deficiency:** Encourage patient to eat a diet high in folic acid (meat proteins; bran; dried beans; and green, leafy vegetables).

### Evaluation/Desired Outcomes

- Reversal of bone marrow and GI toxicity in patients receiving methotrexate or in overdose of folic acid antagonists.
- Increased sense of well-being and increased production of normoblasts in patients with megaloblastic anemia.

## **leuprolide** (loo-**proe**-lide)

Eligard, Lupron, Lupron Depot , Lupron Depot-Ped, Lupron Depot-3 Month, Lupron Depot-4 Month

***Classification***

Therapeutic: antineoplastics
Pharmacologic: hormones, gonadotropin-releasing hormones

**Pregnancy Category X**

### Indications

Advanced prostate cancer in patients who are unable to tolerate orchiectomy or estrogen therapy (may be used in combination with flutamide or bicalutamide). Central precocious puberty (CPP). Endometriosis. Uterine fibroids (with iron therapy).

### Action

A synthetic analogue of luteinizing hormone–releasing hormone (LHRH). Initially causes a transient increase in testosterone; however, with continuous administration, testosterone levels are decreased. Reduces gonadotropins, testosterone, and estradiol. **Therapeutic Effects:** Decreased testosterone levels and resultant decrease in spread of prostate cancer. Reduction of pain/lesions in endometriosis. Decreased growth of fibroids. Delayed puberty.

### Pharmacokinetics

**Absorption:** Rapidly and almost completely absorbed following subcut administration. More slowly absorbed following IM administration of depot form.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** 3 hr.

TIME/ACTION PROFILE (effect on hormone levels)

| ROUTE | ONSET† | PEAK‡ | DURATION§ |
|---|---|---|---|
| Subcut | within 1st week | 2–4 wk | 4–12 wk |
| IM | within 1st week | 2–4 wk | 4–12 wk |
| IM-depot | within 1st week | 2–4 wk | 4–12 wk |

†Initial transient increase in testosterone and estradiol levels
‡Maximum decline in testosterone and estradiol levels
§Restoration of normal pituitary–gonadal function; in amenorrheic patients, normal menses usually returns 60–90 days after treatment is discontinued

### Contraindications/Precautions

**Contraindicated in:** Intolerance to synthetic analogues of LHRH (GnRH); OB: Potential for fetal harm or spontaneous abortion; Lactation: Potential serious adverse effects.
**Use Cautiously in:** Hypersensitivity to benzyl alcohol (results in induration and erythema at subcut site).

### Adverse Reactions/Side Effects

**CNS:** dizziness, headache, syncope; *Depot*—drowsiness, personality disorder; *Subcut*—anxiety, blurred vision, lethargy, memory disorder, mood swings. **EENT:** blurred vision; *Subcut*—hearing disorder. **Resp:** hemoptysis; *Depot*—epistaxis, throat nodules; *Subcut*—cough, pleural rub, pulmonary fibrosis, pulmonary infiltrate. **CV:** MI, PULMONARY EMBOLI, angina, arrhythmias; *Depot*—vasodilation; *Subcut*—transient ischemic attack/stroke. **GI:** anorexia, diarrhea, dysphagia, nausea, vomiting; *Depot*—gingivitis; *Subcut*—GI BLEEDING, hepatic dysfunction, pep-

tic ulcer, rectal polyps, taste disorders. **GU:** ↓ testicular size, dysuria, incontinence, testicular pain; *Depot*—cervix disorder; *Subcut*—bladder spasm, penile swelling, prostate pain, urinary obstruction. **Derm:** *Depot*—hair growth, rash; *Subcut*, dry skin, hair loss, pigmentation, skin cancer, skin lesions. **Endo:** breast swelling, breast tenderness, hyperglycemia. **F and E:** hypercalcemia, lower extremity edema. **Local:** burning, itching, swelling at injection site. **Metab:** *Depot*—hyperuricemia, ↑ bone density. **MS:** fibromyalgia, transient ↑ in bone pain (prostate cancer only); *Subcut*—ankylosing spondylitis, joint pain, pelvic fibrosis, temporal bone pain. **Neuro:** *Subcut*—peripheral neuropathy. **Misc:** hot flashes, chills, ↓ libido, fever; *Depot*—body odor, epistaxis.

### Interactions

**Drug-Drug:** ↑ antineoplastic effects with **antiandrogens**, (**megestrol**, **flutamide**).

### Route/Dosage

### Prostate Cancer

**Subcut (Adults):** *Lupron*—1 mg/day *or Eligard*—7.5 mg once monthly, 22.5 mg every 3 mo, 30 mg q 4 mo or 45 mg q 6 mo.
**IM (Adults):** *Lupron Depot*—7.5 mg once monthly *or Lupron Depot-3 Month*—22.5 mg q 3 mo *or Lupron Depot-4 Month*—30 mg q 4 mo.

### Endometriosis

**IM (Adults):** *Lupron Depot*—3.75 mg once monthly for up to 6 months *or Lupron Depot-3 Month*—11.25 mg q 3 mo for up to 2 doses.

### Uterine Fibroids (with iron therapy)

**IM (Adults):** *Lupron Depot*—3.75 mg once monthly for up to 3 months *or Lupron Depot-3 Month*—11.25 mg single injection.

### Central Precocious Puberty (CPP)

**Subcut (Children):** *Lupron*—50 mcg/kg/day, may be ↑ by 10 mcg/kg/day as required.
**IM (Children >37.5 kg):** *Lupron Depot-Ped*—15 mg q 4 wk; may be ↑ by 3.75 mg q 4 wk as required.
**IM (Children 25–37.5 kg):** *Lupron Depot-Ped*—11.25 mg q 4 wk; may be ↑ by 3.75 mg q 4 wk as required.
**IM (Children ≤25 kg):** *Lupron Depot-Ped*—7.5 mg q 4 wk; may be ↑ by 3.75 mg q 4 wk as required.

### Availability (generic available)

**Solution for subcut injection (Lupron):** 5 mg/mL. **Lyophilized microspheres for depot injection (Lupron Depot):** 3.75 mg, 7.5 mg. **Lyophilized microspheres for pediatric depot injection (Lupron Depot-Ped):** 7.5 mg, 11.25 mg, 15-mg. **Lyophilized microspheres for 3-mo depot injection (Lupron Depot- 3 Month):** 11.25 mg, 22.5 mg. **Lyophilized microspheres for 4-mo depot injection (Lupron Depot-4 Month):** 30 mg. **Polymeric matrix injectable formulation for subcut injection (Eligard):** 7.5 mg, 22.5 mg, 30 mg, 45 mg.

## NURSING IMPLICATIONS

L

### Assessment

- **Prostate Cancer:** Assess patient for an increase in bone pain, especially during the first few weeks of therapy. Monitor patients with vertebral metastases for increased back pain and decreased sensory/motor function.
- Monitor intake and output ratios; assess for bladder distention in patients with urinary tract obstruction during initiation of therapy.
- **Fibroids:** Assess patient for severity of symptoms (bloating, pelvic pain, pressure, excessive vaginal bleeding) periodically during therapy.
- **Endometriosis:** Assess patient for endometrial pain prior to and periodically during therapy.
- **CPP:** Prior to therapy, diagnosis of CPP should be confirmed by onset of secondary sex characteristics in girls <8 yr or boys <9 yr; a complete physical and endocrinologic examination, including height, weight, hand and wrist x-ray; total sex steroid level (estradiol or testosterone); adrenal steroid level; beta human chorionic gonadotropin level; GnRH stimulation test; and computerized tomography of the head must be performed. These parameters are monitored after 1–2 mo and every 6–12 mo during therapy.
- Assess patient for signs of precocious puberty (menses, breast development, testicular growth) periodically during therapy. Dose is increased until no progression of the disease is noted either clinically or by lab test parameters, then usually maintained throughout therapy. Discontinuation of therapy should be considered before age 11 in girls and age 12 in boys.

- ***Lab Test Considerations:*** Initially ↑, then ↓ luteinizing hormone (LH) and follicle-stimulating hormone (FSH). This leads to castration levels of testosterone in boys 2–4 wk after initial increase in concentrations.
- Monitor testosterone, prostatic acid phosphate, and prostate-specific antigen (PSA) levels to evaluate response to therapy. Transient ↑ in levels may occur during the 1st month of therapy for prostate cancer.
- May cause ↑ BUN, serum calcium, uric acid, hypoproteinemia, LDH, alkaline phosphatase, AST, hyperglycemia, hyperlipidemia, hyperphosphatemia, WBC, PT, or PTT. May also cause ↓ platelets and serum potassium.

## Potential Nursing Diagnoses

Sexual dysfunction (Side Effects)

## Implementation

- **Subcut** *Eligard subcut formulation:* **Bring to room temperature before mixing. Assemble the Eligard kit and reconstitute solution using syringes provided, as directed by manufacturer. Mix in syringes as directed by manufacturer, do not shake. Solution must reach room temperature before administration and must be administered within 30 min of mixing, or be discarded. Solution is light tan to tan in color. Inject into abdomen, upper buttocks, or anywhere that has adequate amounts of subcut tissue without excessive pigment, nodules, lesions, or hair. Vary site with each injection.**
- **IM:** Use syringe supplied by manufacturer. Rotate sites.
- Leuprolide depot is *only* for IM injection.
- *Lupron Depot formulation:* To reconstitute a single vial, use a 22-gauge needle; withdraw 1 mL of diluent and inject into vial to mix. To mix 2 or more vials, withdraw 0.5 mL and inject into each vial for a total volume of 1 mL. Do not use vial if clumping or caking of microspheres (powder) is evident. Shake each vial well; suspension will appear milky. Withdraw entire contents of all vials into syringe and inject immediately. Patients may store medication at room temperature.
- Store at room temperature; stable for 24 hr following reconstitution.

## Patient/Family Teaching

- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome.
- Inform patient of the possibility of the development or worsening of depression and occurrence of memory disorders.
- **Prostate Cancer:** Instruct patient and family on subcut injection technique. Review patient insert provided with leuprolide patient-administration kit.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered unless not remembered until next day.
- Advise patient that bone pain may increase at initiation of therapy, but will resolve with time. Patient should discuss with health care professional use of analgesics to control pain.
- Instruct patient to notify health care professional promptly if difficulty urinating, weakness, or numbness occurs.
- **Endometriosis:** Advise patient to use a form of contraception other than oral contraceptives during therapy. Inform patient that amenorrhea is expected but does not guarantee contraception.
- **Central Precocious Puberty:** Instruct patient and family on the proper technique for subcut injection. Emphasize the importance of administering the medication at the same time each day. Rotate injection sites periodically.
- Inform patient and parents that if injections are not given daily, pubertal process may be reactivated.
- Advise patient and parents that during the first 2 mo of therapy patient may experience a light menstrual flow or spotting. Health care professional should be notified if this continues beyond 2nd mo.
- Instruct patient and parents to notify health care professional immediately if irritation at the injection site or unusual signs or symptoms occur.

## Evaluation/Desired Outcomes

- Decrease in the spread of prostate cancer.
- Decrease in lesions and pain in endometriosis.
- Resolution of the signs of CPP.
- Improvement in preoperative hematologic parameters in patients with anemia from uterine fibroids.

# levalbuterol

(leev-al-**byoo**-ter-ole)

Xopenex, Xopenex HFA

***Classification***
Therapeutic: bronchodilators
Pharmacologic: adrenergics

**Pregnancy Category C**

## Indications
Bronchospasm due to reversible airway disease (short-term control agent).

## Action
R-enantiomer of racemic albuterol. Binds to beta-2 adrenergic receptors in airway smooth muscle leading to activation of adenylcyclase and increased levels of cyclic-3', 5'-adenosine monophosphate (cAMP). Increases in cAMP activate kinases, which inhibit the phosphorylation of myosin and decrease intracellular calcium. Decreased intracellular calcium relaxes bronchial smooth muscle. **Therapeutic Effects:** Relaxation of airway smooth muscle with subsequent bronchodilation. Relatively selective for beta-2 (pulmonary) receptors.

## Pharmacokinetics
**Absorption:** Some absorption occurs following inhalation.
**Distribution:** Unknown.
**Metabolism and Excretion:** Metabolized in the liver to an inactive sulfate and 3–6% excreted unchanged in the urine.
**Half-life:** 3.3–4 hr.

TIME/ACTION PROFILE (bronchodilation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Inhaln | 10–17 min | 90 min | 5–6 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to levalbuterol or albuterol.
**Use Cautiously in:** Cardiovascular disorders (including coronary insufficiency, hypertension, and arrhythmias); History of seizures; Hypokalemia; Hyperthyroidism; Diabetes mellitus; Unusual sensitivity to adrenergic amines; OB, Lactation, Pedi: Pregnancy, lactation, or children <6 yr (for nebulized solution) or <4 yr (for metered-dose inhaler) (safety not established).
**Exercise Extreme Caution in:** Concurrent use or use within 2 weeks of **tricyclic antidepressants** or **MAO inhibitors** (may ↑ risk of adverse cardiovascular reactions).

## Adverse Reactions/Side Effects
**CNS:** anxiety, dizziness, headache, nervousness.
**Resp:** PARADOXICAL BRONCHOSPASM (excessive use of inhalers), increased cough, turbinate edema.
**CV:** tachycardia. **GI:** dyspepsia, vomiting. **Endo:** hyperglycemia. **F and E:** hypokalemia. **Neuro:** tremor.

## Interactions
**Drug-Drug:** Concurrent use or use within 2 weeks of **tricyclic antidepressants** or **MAO inhibitors** may ↑ risk of adverse cardiovascular reactions (use with extreme caution). **Beta blockers** block the beneficial pulmonary effects of adrenergic bronchodilators (choose cardioselective beta blockers if necessary and with caution). May ↑ risk of hypokalemia from **potassium-losing diuretics**. May ↓ serum **digoxin** levels. May ↑ risk of arrhythmias with **hydrocarbon inhalation anesthetics** or **cocaine**.
**Drug-Natural Products:** Use with caffeine-containing herbs (**guarana**, **tea**, **coffee**) ↑ stimulant effect.

## Route/Dosage
**Inhaln (Adults and Children ≥4 yr):** 2 inhalations q 4–6 hr; some patients may respond to 1 inhalation q 4 hr.
**Inhaln (Adults and Children > 12 yr):** 0.63 mg via nebulization 3 times daily (every 6–8 hr); may be increased to 1.25 mg 3 times daily (every 6–8 hr).
**Inhaln (Children 6–11 yr):** 0.31 mg via nebulization 3 times daily (not to exceed 0.63 mg 3 times daily).

## Availability (generic available)
**Metered-dose inhaler:** 45 mcg/actuation in 15-g (200 metered actuations) canisters. **Inhalation solution:** 0.31 mg/3 mL in green foil pouch containing 12 vials, 0.63 mg/3 mL in yellow foil pouch containing 12 vials, 1.25 mg/3 mL in red foil pouch containing 12 vials, 1.25 mg/0.5 mL in unit-dose vials. **Cost:** 0.31 mg/3 mL $83.76/24 vials, 0.63 mg/3 mL $84.15/24 vials, 1.25 mg/3 mL $85.00/24 vials.

# NURSING IMPLICATIONS

## Assessment
- Assess lung sounds, pulse, and blood pressure before administration and during peak of medication. Note amount, color, and character of sputum produced. Closely monitor patients on higher dose for adverse effects.
- Monitor pulmonary function tests before initiating therapy and periodically during course to determine effectiveness of medication.

- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify physician or other health care provider immediately.
- ***Lab Test Considerations:*** May cause ↑ serum glucose and ↓ serum potassium.

### Potential Nursing Diagnoses
Ineffective airway clearance (Indications)

### Implementation
- **Inhaln:** Allow at least 1 min between inhalations of aerosol medication.
- For nebulization, levalbuterol solution does not require dilution prior to administration. Once the foil pouch is opened, vials must be used within 2 weeks; open vials may be stored for 1 week. Discard vial if solution is not clear or colorless.

### Patient/Family Teaching
- Instruct patient in the proper use of metered-dose inhaler and nebulizer (see Appendix D) and to take levalbuterol as directed. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication.
- Advise patient to consult health care professional before taking any OTC medications or alcohol concurrently with this therapy. Caution patient to also avoid smoking and other respiratory irritants.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Advise patients to use levalbuterol first if using other inhalation medications, and allow 5 min to elapse before administering other inhalant medications unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth.
- Instruct patient to notify health care professional if no response to the usual dose of levalbuterol.

### Evaluation/Desired Outcomes
- Prevention or relief of bronchospasm.

## levetiracetam
(le-ve-teer-**a**-se-tam)
Keppra, Keppra XR

***Classification***
Therapeutic: anticonvulsants
Pharmacologic: pyrrolidines

**Pregnancy Category C**

### Indications
Partial onset seizures (adjunct). Primary generalized tonic-clonic seizures (adjunct) (immediate-release and injection only). Myoclonic seizures in patients with juvenile myoclonic epilepsy (adjunct) (immediate-release and injection only).

### Action
Appears to inhibit burst firing without affecting normal neuronal excitability and may selectively prevent hypersynchronization of epileptiform burst firing and propagation of seizure activity.
**Therapeutic Effects:** Decreased incidence and severity of seizures.

### Pharmacokinetics
**Absorption:** Rapidly and completely absorbed following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** 66% excreted unchanged by the kidneys; some metabolism by the liver (metabolites inactive).
**Half-life:** 7.1 hr ( ↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1–1.5 hr†‡ | 12 hr |

†1 hr in the fasting state, 1.5 hr when taken with food
‡ 4 hr with extended-release

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Lactation: Lactation.
**Use Cautiously in:** All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (dose reduction recommended if CCr ≤80 mL/min); Pedi: Children <4 yr (safety not established); <16 yr (for extended-release and injection); OB: Use only during pregnancy if potential benefit justifies potential risk to fetus; Geri: ↓ renal elimination (dose ↓ may be necessary).

### Adverse Reactions/Side Effects
**CNS:** SUICIDAL THOUGHTS, dizziness, fatigue/somnolence, weakness, behavioral abnormalities.
**Neuro:** coordination difficulties (adults only).

### Interactions
**Drug-Drug:** None noted.

## Route/Dosage

### Partial Onset Seizures

**PO, IV (Adults and Children ≥16 yr):** 500 mg 2 times daily initially; may be ↑ by 1000 mg/day at 2-wk intervals up to 3000 mg/day; *Extended-release*— 1000 mg daily; may ↑ by 1000 mg/day at 2–wk intervals up to 3000 mg/day.
**PO (Children 4–15 yrs):** 10 mg/kg twice daily; ↑ by 20 mg/kg/day at 2-wk intervals to recommended dose of 30 mg/kg twice daily.

### Primary Generalized Tonic-Clonic Seizures

**PO, IV (Adults and Children ≥16 yr):** 500 mg 2 times daily initially; ↑ by 1000 mg/day at 2-wk intervals to recommended dose of 3000 mg/day.
**PO (Children 6–15 yrs):** 10 mg/kg twice daily; ↑ by 20 mg/kg/day at 2-wk intervals to recommended dose of 30 mg/kg 2 times daily.

### Myoclonic Seizures

**IV (Adults and Children ≥16 yr):** 500 mg 2 times daily initially; ↑ by 1000 mg/day at 2-wk intervals to recommended dose of 3000 mg/day.
**PO (Children ≥12 yrs):** 500 mg twice daily initially; ↑ by 1000 mg/day at 2-wk intervals to recommended dose of 3000 mg/day.

### Renal Impairment

**PO, IV (Adults):** *CCr 50–80 mL/min*—500–1000 mg q 12 hr (1000–2000 mg q 24 hr for extended-release); *CCr 30–50 mL/min*—250–750 mg q 12 hr (500–1500 mg q 24 hr for extended-release); *CCr <30 mL/min*—250–500 mg q 12 hr (500–1000 mg q 24 hr for extended-release); *Dialysis (immediate–release and injection)* 500–1000 mg q 24 hr with a 250–500–mg supplemental dose after dialysis.

### Availability (generic available)

**Tablets:** 250 mg, 500 mg, 750 mg, 100 mg. **Cost:** 250 mg $385.94/180, 500 mg $519.93/180, 750 mg $699.95/180, 1000 mg $1,021.30/180. **Extended-release tablets:** 500 mg, 750 mg. **Oral solution (grape-flavored):** 100 mg/mL. **Cost:** $282.43/480 mL. **Injection:** 100 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess location, duration, and characteristics of seizure activity.
- Assess patient for CNS adverse effects throughout therapy. These adverse effects are categorized as somnolence and fatigue (asthenia), coordination difficulties (ataxia, abnormal gait, or incoordination), and behavioral abnormalities (agitation, hostility, anxiety, apathy, emotional lability, depersonalization, depression) and usually occur during the first 4 wk of therapy.
- ***Lab Test Considerations:*** May cause ↓ RBC and WBC and abnormal liver function tests.

### Potential Nursing Diagnoses

Risk for injury (Side Effects)

### Implementation

- Do not confuse Keppra with Kaletra (lopinavir/ritonavir).
- IV doses should be used temporarily when oral route is not feasible. To convert IV to PO, equivalent dose and frequency may be used.
- **PO:** May be administered without regard to meals.
- Administer tablets whole; do not administer partial tablets. Do not break, crush, or chew XR tablets.
- Pedi: Patients <20 kg should receive oral solution. Administer with calibrated measuring device for accurate dose.
- Discontinue gradually to minimize the risk of increase in seizure frequency.

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Dilute dose in 100 mL of 0.9% NaCl, D5W, or LR. Do not administer solutions that are cloudy or contain particulate matter. ***Rate:*** Infuse over 15 min.
- **Y-Site Compatibility:** diazepam, lorazepam, valproate.

### Patient/Family Teaching

- Instruct patient to take medication as directed. Pedi: Explain to parents the importance of using calibrated measuring device for accurate dosing. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Do not discontinue abruptly; may cause increase in frequency of seizures.
- May cause dizziness and somnolence. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.

- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage pregnant patients to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334; information is available at www.aedpregnancyregistry.org.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.

### Evaluation/Desired Outcomes

- Decrease in the frequency of or cessation of seizures.

**levonorgestrel, See CONTRACEPTIVES, HORMONAL.**

**levothyroxine, See THYROID PREPARATIONS.**

HIGH ALERT

## LIDOCAINE

**lidocaine (parenteral)**
(**lye**-doe-kane)
LidoPen, Xylocaine, Xylocard

**lidocaine (local anesthetic)**
Xylocaine

**lidocaine (mucosal)**
Anestacon, Xylocaine Viscous

**lidocaine patch**
Lidoderm

**lidocaine (topical)**
L-M-X 4, L-M-X 5, Solarcaine Aloe Extra Burn Relief, Xylocaine, Zilactin-L

***Classification***
Therapeutic: anesthetics (topical/local), antiarrhythmics (class IB)

**Pregnancy Category B**

### Indications

**IV:** Ventricular arrhythmias. **IM:** Self-injected or when IV unavailable (during transport to hospital facilities). **Local:** Infiltration/mucosal/topical anesthetic. **Patch:** Pain due to post-herpetic neuralgia.

### Action

**IV, IM:** Suppresses automaticity and spontaneous depolarization of the ventricles during diastole by altering the flux of sodium ions across cell membranes with little or no effect on heart rate. **Local:** Produces local anesthesia by inhibiting transport of ions across neuronal membranes, thereby preventing initiation and conduction of normal nerve impulses. **Therapeutic Effects:** Control of ventricular arrhythmias. Local anesthesia.

### Pharmacokinetics

**Absorption:** Well absorbed after administration into the deltoid muscle; some absorption follows local use.
**Distribution:** Widely distributed. Concentrates in adipose tissue. Crosses the blood-brain barrier and placenta; enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver; <10% excreted in urine as unchanged drug.
**Half-life:** Biphasic—initial phase, 7–30 min; terminal phase, 90–120 min; increased in CHF and liver impairment.

TIME/ACTION PROFILE (IV, IM = antiarrhythmic effects; local = anesthetic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | immediate | immediate | 10–20 min (up to several hours after continuous infusion) |
| IM | 5–15 min | 20–30 min | 60–90 min |
| Local | rapid | unknown | 1–3 hr |

### Contraindications/Precautions

### Applies mainly to systemic use

**Contraindicated in:** Hypersensitivity; cross-sensitivity may occur; Third-degree heart block.
**Use Cautiously in:** Liver disease, CHF, patients weighing <50 kg, and geriatric patients (reduce bolus and/or maintenance dose); Respiratory depression; Shock; Heart block; OB, Lactation: Safety not established; Pedi: Safety not established for transdermal patch.

### Adverse Reactions/Side Effects

Applies mainly to systemic use.
**CNS:** SEIZURES, confusion, drowsiness, blurred vision, dizziness, nervousness, slurred speech, tremor. **EENT:** *mucosal use*— ↓ or absent gag reflex. **CV:** CARDIAC ARREST, arrhythmias, bradycardia, heart block, hypotension. **GI:** nausea, vomiting. **Resp:** bronchospasm. **Local:** stinging,

burning, contact dermatitis, erythema. **Misc:** allergic reactions, including ANAPHYLAXIS.

### Interactions

Applies mainly to systemic use.

**Drug-Drug:** ↑ cardiac depression and toxicity with **phenytoin**, **amiodarone**, **quinidine**, **procainamide**, or **propranolol**. **Cimetidine**, **azole antifungals**, **clarithromycin**, **erythromycin**, **fluoxetine**, **nefazodone**, **paroxetine**, **protease inhibitors**, **ritonavir**, **verapamil**, and **beta blockers** may ↓ metabolism and ↑ risk of toxicity. Lidocaine may ↑ levels of **calcium channel blockers**, certain **benzodiazepines**, **cyclosporine**, **fluoxetine**, **lovastatin**, **simvastatin**, **mirtazapine**, **paroxetine**, **ritonavir**, **tacrolimus**, **theophylline**, **tricyclic antidepressnts**, and **venlafaxine**. Effects of lidocaine may be ↓ by **carbamazepine**, **phenobarbital**, **phenytoin**, and **rifampin**.

### Route/Dosage

### Ventricular Tachycardia (with a Pulse) or Pulseless Ventricular Tachycardia/Ventricular Fibrillation

**IV (Adults):** 1–1.5 mg/kg bolus; may repeat doses of 0.5–0.75 mg/kg q 5–10 min up to a total dose of 3 mg/kg; may then start continuous infusion of 1–4 mg/min.

**Endotracheal (Adults):** Give 2–2.5 times the IV loading dose down the endotracheal tube, followed by a 10 mL saline flush.

**IV (Children):** 1 mg/kg bolus (not to exceed 100 mg), followed by 20–50 mcg/kg/min continuous infusion (range 20–50 mcg/kg/min); may administer second bolus of 0.5–1 mg/kg if delay between bolus and continuous infusion.

**Endotracheal (Children):** Give 2–3 mg/kg down the endotracheal tube followed by a 5 mL saline flush.

**IM (Adults and Children ≥50 kg):** 300 mg (4.5 mg/kg); may be repeated in 60–90 min.

### Local

**Infiltration (Adults and Children):** Infiltrate affected area as needed (increased amount and frequency of use increases likelihood of systemic absorption and adverse reactions).

**Topical (Adults):** Apply to affected area 2–3 times daily.

**Mucosal (Adults):** *For anesthetizing oral surfaces*—20 mg as 2 sprays/quadrant (not to exceed 30 mg/quadrant) may be used. 15 mL of the viscous solution may be used q 3 hr for oral or pharyngeal pain. *For anesthetizing the female urethra*—3–5 mL of the jelly or 20 mg as 2% solution may be used. *For anesthetizing the male urethra*—5–10 mL of the jelly or 5–15 mL of 2% solution may be used before catheterization or 30 mL of jelly before cystoscopy or similar procedures. Topical solutions may be used to anesthetize mucous membranes of the larynx, trachea, or esophagus.

**Patch (Adults):** Up to 3 patches may be applied once for up to 12 hr in any 24-hr period; consider smaller areas of application in geriatric or debilitated patients.

### Availability (generic available)

**Autoinjector for IM injection:** 300 mg/3 mL. **Direct IV injection:** 10 mg/mL (1%), 20 mg/mL (2%). **For IV admixture:** 100 mg/mL (10%). **Premixed solution for IV infusion:** 4 mg/mL (0.4%), 8 mg/mL (0.8%). **Injection for local infiltration/nerve block:** 0.5%, 1%, 2%, 4%. ***In combination with:*** epinephrine for local infiltration. **Cream:** 4% OTC. **Gel:** 0.5%OTC, 2.5%OTC. **Jelly:** 2%. **Liquid:** 5%. **Ointment:** 5%. **Transdermal system:** 5% patch. **Cost:** $189.98/box of 30 patches. **Solution:** 4%. **Spray:** 10%. **Viscous solution:** 2%. ***In combination with:*** prilocaine (as EMLA cream, Oraquix); with tetracaine (Synera); with bupivacaine (Duocaine); with epinephrine (LidoSite).

## NURSING IMPLICATIONS

### Assessment

- **Antiarrhythmic:** Monitor ECG continuously and blood pressure and respiratory status frequently during administration.
- **Anesthetic:** Assess degree of numbness of affected part.
- **Transdermal:** Monitor for pain intensity in affected area periodically during therapy.
- ***Lab Test Considerations:*** Serum electrolyte levels should be monitored periodically during prolonged therapy.
- IM administration may cause ↑ CPK levels.
- ***Toxicity and Overdose:*** Serum lidocaine levels should be monitored periodically during prolonged or high-dose IV therapy. Therapeutic serum lidocaine levels range from 1.5 to 5 mcg/mL.
- Signs and symptoms of toxicity include confusion, excitation, blurred or double vision, nausea, vomiting, ringing in ears, tremors, twitch-

ing, seizures, difficulty breathing, severe dizziness or fainting, and unusually slow heart rate.
- If symptoms of overdose occur, stop infusion and monitor patient closely.

## Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Acute pain (Indications)

## Implementation

- ***High Alert:*** Lidocaine is readily absorbed through mucous membranes. Inadvertent overdosage of lidocaine jelly and spray has resulted in patient harm or death from neurologic and/or cardiac toxicity. Do not exceed recommended doses.
- **Throat Spray:** Ensure that gag reflex is intact before allowing patient to drink or eat.
- **IM:** IM injections are recommended only when ECG monitoring is not available and benefits outweigh risks. Administer IM injections only into deltoid muscle while frequently aspirating to prevent IV injection.

### IV Administration

- **Direct IV:** Only 1% and 2% solutions are used for direct IV injection. ***Diluent:*** Administer undiluted. ***Rate:*** Administer loading dose over 2–3 min. Follow by IV continuous infusion.
- **Continuous Infusion:** ***Diluent:*** Lidocaine vials need to be further diluted. Dilute 2 g of lidocaine in 250 mL or 500 mL of D5W or 0.9% NaCl. Admixed infusion stable for 24 hr at room temperature. Premixed infusions are already diluted and ready to use. ***Concentration:*** 4–8 mg/mL. ***Rate:*** See Route/Dosage section. Administer via infusion pump for accurate dose.
- **Y-Site Compatibility:** alteplase, amikacin, aminophylline, amiodarone, argatroban, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, eptifibatide, ertapenem, erythromycin, esmolol, etomidate, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanil, sodium bicarbonate, streptokinase, tacrolimus, theophylline, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, vitamin B complex with C , voriconazole, warfarin.
- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl sulfate complex, caspofungin, diazepam, ganciclovir, lansoprazole, pantoprazole, phenytoin, thiopental, trimethoprim/sulfamethoxazole.
- **Infiltration:** Lidocaine with epinephrine may be used to minimize systemic absorption and prolong local anesthesia.
- **Transdermal:** When used concomitantly with other products containing local anesthetic agents, consider amount absorbed from all formulations.

## Patient/Family Teaching

- May cause drowsiness and dizziness. Advise patient to call for assistance during ambulation and transfer.
- **IM:** Available in LidoPen Auto-Injector for use outside the hospital setting. Advise patient to telephone health care professional immediately if symptoms of a heart attack occur. Do not administer unless instructed by health care professional. To administer, remove safety cap and place back end on thickest part of thigh or deltoid muscle. Press hard until needle prick is felt. Hold in place for 10 sec, then massage area for 10 sec. Do not drive after administration unless absolutely necessary.
- **Topical:** Apply *Lidoderm Patch* to intact skin to cover the most painful area. Patch may be cut to smaller sizes with scissors before removing release liner. Clothing may be worn over patch. If irritation or burning sensation occurs during application, remove patch until irritation subsides. Wash hands after application; avoid contact with eyes. Dispose of used patch to avoid access by children or pets.
- Caution women to consult health care professional before using a topical anesthetic for a mammogram or other procedures. If recom-

mended, use lowest drug concentration, and apply it sparingly. Do not apply to broken or irritated skin, do not wrap skin, and do not apply heat to area, to decrease chance that drug may be absorbed into the body. May result in seizures, cardiac arrhythmias, respiratory failure, coma, and death.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

### Evaluation/Desired Outcomes
- Decrease in ventricular arrhythmias.
- Local anesthesia.

## lidocaine/prilocaine
(**lye**-doe-kane/**pri**-loe-kane)
EMLA

***Classification***
Therapeutic: anesthetics (topical/local)

**Pregnancy Category B**

### Indications
Produces local anesthesia prior to minor painful procedures including: Insertion of cannulae or needles, Arterial/venous/lumbar puncture, Intramuscular injections, Subcutaneous injections, Dermal procedures, Laser treatments, Circumcision. When applied to genital mucous membranes in preparation for superficial minor surgery or as preparation for infiltration anesthesia.

### Action
Produces local anesthesia by inhibiting transport of ions across neuronal membranes, thereby preventing initiation and conduction of normal nerve impulses. Combination of two anesthetics is applied as a system consisting of a cream under an occlusive dressing. Active drug is released into the dermal and epidermal skin layers, resulting in accumulation of local anesthetic in the regions of dermal pain receptors and nerve endings. **Therapeutic Effects:** Anesthetic action localized to the area of the application.

### Pharmacokinetics
**Absorption:** Small amounts are systemically absorbed during 4-hr placement of EMLA system.
**Distribution:** Small amounts absorbed are widely distributed and cross the placenta and blood-brain barrier.
**Metabolism and Excretion:** *Lidocaine*—mostly metabolized by the liver. *Prilocaine*—metabolized by the liver and kidneys.
**Half-life:** *Lidocaine*—7–30 min first phase, 90–120 min terminal phase: *Prilocaine*—10–50 min.

TIME/ACTION PROFILE (local anesthesia)

| ROUTE | ONSET | PEAK | DURATION† |
|---|---|---|---|
| Top | 15 min | 3 hr | 1–2 hr |

†Following removal of occlusive dressing

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to lidocaine, prilocaine, or any other amide-type local anesthetic; Hypersensitivity to any other product in the formulation; Should not be applied to middle ear; Pedi: Congenital or idiopathic methemoglobinemia; Infants <6 mo receiving methemoglobin-inducing agents.
**Use Cautiously in:** Repeated use or use on large areas of skin (more likely to result in systemic absorption); Acutely ill, or debilitated patients (↑ risk of absorption and systemic effects); Severe liver disease; Any conditions associated with methemoglobinemia (including glucose-6-phosphate dehydrogenase deficiency); OB: Use only if clearly needed; Lactation: Usually compatible with breastfeeding (AAP); Pedi: Area/duration of treatment should be limited in neonates and children <20 kg or 37 weeks gestation (↑ susceptibility to methemoglobinemia); Geri: May have ↑ absorption and risk of systemic effects.

### Adverse Reactions/Side Effects
**Local:** blanching, redness, alteration in temperature sensation, edema, itching, rash. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions
**Drug-Drug:** Concurrent use with class I antiarrhythmics including **mexiletine** may result in adverse cardiovascular effects. Concurrent use with other **local anesthetics** may result in ↑ toxicity. Concurrent use with **sulfonamides** in children ↑ the risk of methemoglobinemia (avoid concurrent use in children <12 mo).

### Route/Dosage
**Topical (Adults and Children):** *Minor dermal procedures including venipuncture and IV cannulation*—2.5 g (½ of the 5-g tube) applied to 20–25 $cm^2$ (2 in. by 2 in.) area of skin, covered with an occlusive dressing applied for at least 1 hr. *Major dermal procedures including*

*split-thickness skin graft harvesting*—2 g/10 $cm^2$ area of skin, covered with an occlusive dressing for at least 2 hr. *Adult male genital skin*—as an adjunct prior to local anesthetic infiltration, apply a thick layer (1 g/10 $cm^2$) to skin surface for 15 min; local infiltration anesthesia should be performed immediately after removal of cream. *Adult female genital mucous membranes*—apply a thick layer (5–log) for 5–10 min.
**Topical (Children 7–12 yr and >20 kg):** Dose should not exceed 20 g over more than 200 $cm^2$ for more than 4 hr.
**Topical (Children 1–6 yr and >10 kg):** Dose should not exceed 10 g over more than 100 $cm^2$ for more than 4 hr.
**Topical (Children 3 mo–12 mo and >5 kg):** Dose should not exceed 2 g over more than 20 $cm^2$ for more than 4 hr.
**Topical (Children 0–3 mo or <5 kg):** Dose should not exceed 1 g over more than 10 $cm^2$ for more than 1 hr.

### Availability (generic available)
**Cream:** 2.5% lidocaine with 2.5% prilocaine.

## NURSING IMPLICATIONS

### Assessment
- Assess application site for open wounds. Apply only to intact skin.
- Assess application site for anesthesia following removal of system and prior to procedure.

### Potential Nursing Diagnoses
Acute pain (Indications)

### Implementation
- **Topical:** When used for minor dermal procedures (venipuncture, IV cannulation, arterial puncture, lumbar puncture), apply the 2.5-g tube of cream (½ of the 5-g tube) to each 2 in. by 2 in. area of skin in a *thick* layer at the site of the impending procedure. Remove the center cutout piece from an occlusive dressing (supplied with the 5-g tube) and peel the paper liner from the paper-framed dressing. Cover the lidocaine/prilocaine cream so that there is a *thick* layer of cream underneath the occlusive dressing. Do not spread out or rub in the cream. Smooth the dressing edges carefully and ensure it is secure to avoid leakage. Remove the paper frame and mark the time of application on the occlusive dressing. Lidocaine/prilocaine cream must be applied *at least 1 hr* before the start of a minor dermal procedure (venipuncture, IV cannulation). Anesthesia may be more profound with 90 min–2 hr application. Remove the occlusive dressing and wipe off the lidocaine/prilocaine cream. Clean the entire area with antiseptic solution and prepare the patient for the procedure.
- For major dermal procedures (skin graft harvesting), follow the same procedure using larger amounts of lidocaine/prilocaine cream and the appropriate-size occlusive dressing. Lidocaine/prilocaine cream must be applied *at least 2 hr* before major dermal procedures.

### Patient/Family Teaching
- Explain the purpose of cream and occlusive dressing to patient and parents. Inform the patient that lidocaine/prilocaine cream may block all sensations in the treated skin. Caution patient to avoid trauma to the area from scratching, rubbing, or exposure to extreme heat or cold temperatures until all sensation has returned.
- **Home Care Issues:** Instruct patient or parent in proper application. Provide a diagram of location for application.

### Evaluation/Desired Outcomes
- Anesthesia in the area of application.

## lindane (lin-dane)
gamma benzene hexachloride, GBH, Hexit, PMS Lindane

***Classification***
Therapeutic: pediculocides, scabicides

**Pregnancy Category B**

### Indications
Second-line treatment of parasitic arthropod infestation (scabies and head, body, and crab lice) for use only in patients who are intolerant to or do not respond to less toxic agents.

### Action
Causes seizures and death in parasitic arthropods.
**Therapeutic Effects:** Cure of infestation by parasitic arthropods.

### Pharmacokinetics
**Absorption:** Significant systemic absorption (9–13%) greater with topical application to damaged skin.
**Distribution:** Stored in fat.
**Metabolism and Excretion:** Metabolized by the liver.
**Half-life:** 17–22 hr (infants and children).

TIME/ACTION PROFILE (antiparasitic action)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Top | rapid | 6 hr | 190 min |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Areas of skin rash, abrasion, or inflammation (absorption is increased); History of seizures; Lactation: Potentially toxic to infants; may ↓ milk supply; Pedi: Premature neonates (↑ risk of CNS toxicity).

**Use Cautiously in:** Patients with skin conditions (↑ risk of systemic absorption); OB: Do not exceed recommended dose; do not use >2 courses of therapy; Pedi, Geri: Children ≤2 yr and geriatric patients (↑ risk of systemic absorption and CNS side effects).

### Adverse Reactions/Side Effects

All adverse reactions except dermatologic are signs of systemic absorption and toxicity.

**CNS:** SEIZURES, headache. **CV:** tachycardia. **GI:** nausea, vomiting. **Derm:** contact dermatitis (repeated application), local irritation.

### Interactions

**Drug-Drug:** Concurrent use of **medications that lower seizure threshold** (may ↑ risk of seizures). Simultaneous topical use of **skin, scalp,** or **hair** products may ↑ systemic absorption.

### Route/Dosage

### Scabies

**Topical (Adults and Children > 1 month):** 1% lotion applied to all skin surfaces from neck to toes; wash off 6 hr after application in infants, after 6–8 hr in children or after 8–12 hr in adults; may require a 2nd treatment 1 wk later.

### Head Lice or Crab Lice

**Topical (Adults and Children):** 15–30 mL of shampoo applied and lathered for 4 min; may require a 2nd treatment 1 wk later.

### Availability (generic available)

**Lotion:** 1%. **Shampoo:** 1%.

## NURSING IMPLICATIONS

### Assessment

- Assess skin and hair for signs of infestation before and after treatment.
- Examine family members and close contacts for infestation. When used in treatment of pediculosis pubis or scabies, sexual partners should receive concurrent prophylactic therapy.

### Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)

### Implementation

- Due to serious side effects, no more than 2 oz may be dispensed at a time and no refills are allowed.
- **Topical:** When applying medication to another person, wear gloves to prevent systemic absorption.
- Do not apply to open wounds (scratches, cuts, sores on skin or scalp) to minimize systemic absorption. Avoid contact with the eyes. If eye contact occurs, flush thoroughly with water and notify physician or other health care professional.
- Institute appropriate isolation techniques.
- **Lotion:** Instruct patient to bathe with soap and water. Dry skin well and allow to cool before application. Apply lotion in amount sufficient to cover entire body surface with a thin film from neck down (60 mL for an adult). Leave medication on for an age appropriate time frame (see dosing), then remove by washing. If rash, burning, or itching develops, wash off medication and notify physician or other health care professional.
- **Shampoo:** Use a sufficient amount of shampoo to wet hair and scalp (30 mL for short hair, 45 mL for medium hair, 60 mL for long hair). Rub thoroughly into hair and scalp and leave in place for 4 min. Then use enough water to work up a good lather; follow with thorough rinsing and drying. If applied in shower or bath, do not let shampoo run down on other parts of body or into water in which patient is sitting. When hair is dry, use fine-toothed comb to remove remaining nits or nit shells. Shampoo may also be used on combs and brushes to prevent spread of infestation.

### Patient/Family Teaching

- Instruct patient on application technique and provide with a medication guide. Patient should repeat therapy only at the recommendation of health care professional. Discuss hygienic measures to prevent and to control infestation. Discuss potential for infectious contacts with patient. Explain why household members should be examined and sexual partners treated simultaneously.
- Instruct patient to wash all recently worn clothing and used bed linens and towels in very hot water or to dry clean to prevent reinfestation or spreading.

- Instruct patient not to apply other oils or creams during therapy; these increase the absorption of lindane and may lead to toxicity.
- Explain to patient that itching may persist after treatment; consult health care professional about use of topical hydrocortisone or systemic antihistamines.
- Advise patient that eyelashes can be treated by applying petroleum jelly 3 times/day for 1 wk.
- **Instruct patient not to reapply sooner than 1 week if live mites appear.**
- **Shampoo:** Advise patient that shampoo should not be used as a regular shampoo in the absence of infestation. Emphasize need to avoid contact with eyes.
- Pedi: Advise parents to monitor young children closely for evidence of CNS toxicity (seizures, dizziness, clumsiness, fast heartbeat, muscle cramps, nervousness, restlessness, irritability, nausea, vomiting) during and immediately after treatment.
- Pedi: Cover hands of young children to prevent accidental ingestion from thumbsucking.

### Evaluation/Desired Outcomes

- Resolution of signs of infestation with scabies or lice.

## linezolid (li-nez-o-lid)

Zyvox

***Classification***

Therapeutic: anti-infectives
Pharmacologic: oxazolidinones

**Pregnancy Category C**

### Indications

Treatment of: Infections caused by vancomycin-resistant *Enterococcus faecium*, Nosocomial pneumonia caused by *Staphylococcus aureus* (methicillin-susceptible and -resistant strains), Complicated skin/skin structure infections caused by *Staphylococcus aureus* (methicillin-susceptible and -resistant strains), *Streptococcus pyogenes* or *Streptococcus agalactiae* (including diabetic foot infections), Uncomplicated skin/skin structure infections caused by *Staphylococcus aureus* (methicillin-susceptible and -resistant strains), *Streptococcus pyogenes*, Community-acquired pneumonia caused by *Streptococcus pneumoniae* (including multi-drug resistant strains) or *Staphylococcus aureus* (methicillin-susceptible strains only).

### Action

Inhibits bacterial protein synthesis at the level of the 23S ribosome of the 50S subunit. **Therapeutic Effects:** Bactericidal action against streptococci; bacteriostatic action against enterococci and staphylococci.

### Pharmacokinetics

**Absorption:** Rapidly and extensively (100%) absorbed following oral administration.
**Distribution:** Readily distributes to well-perfused tissues.
**Metabolism and Excretion:** 65% metabolized, mostly by the liver; 30% excreted unchanged by the kidneys.
**Half-life:** 6.4 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1–2 hr | 12 hr |
| IV | rapid | end of infusion | 12 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Phenylketonuria (suspension contains aspartame); Uncontrolled HTN, pheochromocytoma, thyrotoxicosis, or concurrent use of sympathomimetic agents, vasopressors, or dopaminergic agents (↑ risk of hypertensive response); Concurrent or recent (< 2 wk) use of monoamine oxidase (MAO) inhibitors (↑ risk of hypertensive response); Carcinoid syndrome or concurrent use of SSRIs, TCAs, triptans, meperidine, or buspirone (↑ risk of serotonin syndrome).
**Use Cautiously in:** Thrombocytopenia, concurrent use of antiplatelet agents or bleeding diathesis (platelet counts should be monitored more frequently); OB: Safety not established; use only if maternal benefit outweighs potential risk to fetus; Lactation: Lactation.

### Adverse Reactions/Side Effects

**CV:** headache, insomnia. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, ↑ liver function tests, nausea, taste alteration, vomiting. **F and E:** lactic acidosis. **Hemat:** thrombocytopenia. **Neuro:** optic neuropathy, peripheral neuropathy.

### Interactions

**Drug-Drug:** ↑ risk of hypertensive response with **MAO inhibitors**, **sympathomimetics** (e.g., **pseudoephedrine**), **vasopressors** (e.g., **epinephrine**, **norepinephrine**), and **dopaminergic agents** (e.g., **dopamine**, **dobutamine**); concurrent or recent use should be avoided. ↑ risk of serotonin syndrome with **SSRIs**, **TCAs**, **5–HT$_1$ agonists**, **meperidine**, or **buspirone**; concurrent use should be avoided.
**Drug-Food:** Because of monoamine oxidase inhibitory properties, consumption of large

amounts of foods or beverages containing tyramine should be avoided ( ↑ risk of pressor response. See Appendix M).

### Route/Dosage

#### Vancomycin-Resistant *Enterococcus faecium* Infections

**PO, IV (Adults):** 600 mg every 12 hr for 14–28 days.
**PO, IV (Children birth-11 yr):** (in the first week of life, pre-term neonates may initially receive 10 mg/kg every 12 hr).

#### Pneumonia, Complicated Skin/Skin Structure Infections

**PO, IV (Adults):** 600 mg every 12 hr for 10–14 days.
**PO, IV (Children birth-11 yr):** 10 mg/kg every 8 hr for 10–14 days (in the first week of life, pre-term neonates may initially receive 10 mg/kg every 12 hr).

#### Uncomplicated Skin/Skin Structure Infections

**PO (Adults):** 400 mg q 12 hr for 10–14 days.
**PO, IV (Children 5-11 yr):** 10 mg/kg every 12 hr for 10–14 days.
**PO, IV (Children < 5 yr):** 10 mg/kg every 8 hr for 10–14 days (in the first week of life, pre-term neonates may initially receive 10 mg/kg every 12 hr).

### Availability (generic available)

**Oral suspension: (orange):** 20 mg/mL. **Tablets:** 400 mg, 600 mg. **Cost:** 600 mg $2,213.46/30. **Premixed infusion:** 200 mg/100 mL, 400 mg/200 mL, 600 mg/300 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving.
- May cause lactic acidosis. Notify health care professional if recurrent nausea and vomiting, unexplained acidosis or low bicarbonate levels occur.
- Monitor visual function in patients receiving linezolid for ≥3 months or who report visual symptoms (changes in acuity or color vision, blurred vision, visual field defect) regardless of length of therapy. If optic neuropathy occurs therapy should be reconsidered.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- ***Lab Test Considerations:*** May cause bone marrow suppression, anemia, leukopenia, pancytopenia. Monitor CBC and platelet count weekly, especially in patients at risk for increased bleeding, having pre-existing bone marrow suppression, receiving concurrent medications that may cause myelosuppression, or requiring >2 weeks of therapy. Discontinue therapy if bone marrow suppression occurs or worsens.
- May cause ↑ AST, ALT, LDH, alkaline phosphatase and BUN.

### Potential Nursing Diagnoses

Risk for infection (Indications)

### Implementation

- Dose adjustment is not necessary when switching from IV to oral dose.
- **PO:** May be administered with or without food.
- Before using oral solution gently invert 3–5 times to mix; do not shake. Store at room temperature.

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Premixed infusions are already diluted and ready to use. Solution is yellowish in color which may intensify over time without affecting its potency. ***Concentration:*** 2 mg/mL. ***Rate:*** Infuse over 30–120 minutes. Flush line before and after infusion.
- **Y-Site Compatibility:** acyclovir, alfentanil, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, aztreonam, buprenorphine, butorphanol, bumetanide, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, daptomycin, dexamethasone sodium phosphate, dexmede-

tomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, esmolol, dexmedetomidine, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, paclitaxel, pentobarbital, phenobarbital, palonosetron, pancuronium, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, sodium bicarbonate, sufentanil, tacrolimus, theophylline, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B, chlorpromazine, diazepam, pantoprazole, pentamidine, phenytoin.

### Patient/Family Teaching

- Advise patients taking oral linezolid to take as directed, for full course of therapy, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose; do not double dose.
- Instruct patient to avoid large quantities of foods or beverages containing tyramine (See Appendix M). May cause hypertensive response.
- Instruct patient to notify health care professional if patient has a history of hypertension and before patient takes other Rx, OTC, or herbal products, especially cold remedies, decongestants, or antidepressants.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Advise patient to notify health care professional if no improvement is seen in a few days.

### Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.

## liothyronine, See THYROID PREPARATIONS.

## liotrix, See THYROID PREPARATIONS.

## lisinopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

## lithium (lith-ee-um)

Carbolith, Duralith, Eskalith, Lithizine, Lithobid

***Classification***

Therapeutic: mood stabilizers

**Pregnancy Category D**

### Indications

Manic episodes of manic depressive illness (treatment, maintenance, prophylaxis).

### Action

Alters cation transport in nerve and muscle. May also influence reuptake of neurotransmitters.
**Therapeutic Effects:** Prevents/decreases incidence of acute manic episodes.

### Pharmacokinetics

**Absorption:** Completely absorbed after oral administration.
**Distribution:** Widely distributed into many tissues and fluids; CSF levels are 50% of plasma levels. Crosses the placenta; enters breast milk.
**Metabolism and Excretion:** Excreted almost entirely unchanged by the kidneys.
**Half-life:** 20–27 hr.

TIME/ACTION PROFILE (antimanic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO, PO–ER | 5–7 days | 10–21 days | days |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe cardiovascular or renal disease; Dehydrated or debilitated patients; Should be used only where therapy, including blood levels, may be closely monitored; Some products contain alcohol or tartrazine and should be avoided in patients with

known hypersensitivity or intolerance; Lactation: Lactation.

**Use Cautiously in:** Any degree of cardiac, renal, or thyroid disease; Diabetes mellitus; OB: Fetal cardiac anomalies are associated with lithium use; however, potential maternal benefit may warrant use in some pregnant women; Geri: Initial dosage ↓ recommended.

### Adverse Reactions/Side Effects

**CNS:** SEIZURES, fatigue, headache, impaired memory, ataxia, sedation, confusion, dizziness, drowsiness, psychomotor retardation, restlessness, stupor. **EENT:** aphasia, blurred vision, dysarthria, tinnitus. **CV:** ARRHYTHMIAS, ECG changes, edema, hypotension. **GI:** abdominal pain, anorexia, bloating, diarrhea, nausea, dry mouth, metallic taste. **GU:** polyuria, glycosuria, nephrogenic diabetes insipidus, renal toxicity. **Derm:** acneiform eruption, folliculitis, alopecia, diminished sensation, pruritus. **Endo:** hypothyroidism, goiter, hyperglycemia, hyperthyroidism. **F and E:** hyponatremia. **Hemat:** leukocytosis. **Metab:** weight gain. **MS:** muscle weakness, hyperirritability, rigidity. **Neuro:** tremors.

### Interactions

**Drug-Drug:** May prolong the action of **neuromuscular blocking agents**. ↑ risk of neurologic toxicity with **haloperidol** or **molindone**. **Diuretics**, **methyldopa**, **probenecid**, **fluoxetine**, and **NSAIDs** may ↑ risk of toxicity. Blood levels may be ↑ by **ACE inhibitors**. Lithium may ↓ effects of **chlorpromazine**. **Chlorpromazine** may mask early signs of lithium toxicity. Hypothyroid effects may be additive with **potassium iodide** or **antithyroid agents**. **Aminophylline**, **phenothiazines**, and **drugs containing large amounts of sodium** ↑ renal elimination and ↓ effectiveness. **Psyllium** can ↓ **lithium** levels.

**Drug-Natural Products:** Caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) may ↓ **lithium** serum levels and efficacy.

**Drug-Food:** Large changes in **sodium** intake may alter the renal elimination of lithium. ↑ sodium intake will ↑ renal excretion.

### Route/Dosage

Precise dosing is based on serum lithium levels. 300 mg lithium carbonate contains 8–12 mEq lithium.

**PO (Adults and children ≥12 yr):** *Tablets/capsules*—300–600 mg 3 times daily initially; usual maintenance dose is 300 mg 3–4 times daily. *Slow-release capsules*—200–300 mg 3 times daily initially; increased up to 1800 mg/day in divided doses. Usual maintenance dose is 300–400 mg 3 times daily. *Extended-release tablets*—450–900 mg twice daily *or* 300–600 mg 3 times daily initially; usual maintenance dose is 450 mg twice daily *or* 300 mg 3 times daily.

**PO (Children <12 yr):** 15–20 mg (0.4–0.5 mEq)/kg/day in 2–3 divided doses; dosage may be adjusted weekly.

### Availability (generic available)

**Capsules:** 150 mg, 300 mg, 600 mg. **Cost:** *Generic*—150 mg $18.88/100, 300 mg $17.77/100, 600 mg $42.30/100—$0. **Tablets:** 300 mg. **Controlled-release tablets:** 300 mg, 450 mg. **Cost:** *Generic*—300 mg $39.97/100, 450 mg $48.32/100. **Slow-release tablets:** 300 mg. **Syrup:** 300 mg (8 mEq lithium)/5 mL. **Cost:** $60.00/500 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess mental status (orientation, mood, behavior) initially and periodically. Assess manic symptoms with Young Mania Rating Scale (YMRS) at baseline and periodically through treatment in patients with mania. Initiate suicide precautions if indicated.
- Monitor intake and output ratios. Report significant changes in totals. Unless contraindicated, fluid intake of at least 2000–3000 mL/day should be maintained. Weight should also be monitored at least every 3 mo.
- ***Lab Test Considerations:*** Evaluate renal and thyroid function, WBC with differential, serum electrolytes, and glucose periodically during therapy.
- ***Lab Test Considerations:*** EKG for patients >50 yr old.
- ***Toxicity and Overdose:*** Monitor serum lithium levels twice weekly during initiation of therapy and every 2–3 mo during chronic therapy. Draw blood samples in the morning immediately before next dose. Therapeutic levels range from 0.5 to 1.5 mEq/L.
- Assess patient for signs and symptoms of lithium toxicity (vomiting, diarrhea, slurred speech, decreased coordination, drowsiness, muscle weakness, or twitching). If these occur, report before administering next dose.

## Potential Nursing Diagnoses

Disturbed thought process (Indications)
Ineffective coping (Indications)
Imbalanced nutrition: risk for more than body requirements (Side Effects)

## Implementation

- Do not confuse Lithobid (lithium) with Levbid (hyoscyamine).
- **PO:** Administer with food or milk to minimize GI irritation. Extended-release preparations should be swallowed whole; do not break, crush, or chew.

## Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling well. Take missed doses as soon as remembered unless within 2 hr of next dose (6 hr if extended release).
- Lithium may cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient that psychotherapy is beneficial in improving coping skills.
- Low sodium levels may predispose patient to toxicity. Advise patient to drink 2000–3000 mL fluid each day and eat a diet with consistent and moderate sodium intake. Excessive amounts of coffee, tea, and cola should be avoided because of diuretic effect. Avoid activities that cause excess sodium loss (heavy exertion, exercise in hot weather, saunas). Notify health care professional of fever, vomiting, and diarrhea, which also cause sodium loss.
- Advise patient that weight gain may occur. Review principles of a low-calorie diet.
- Instruct patient to consult health care professional before taking OTC medications or herbal products concurrently with this therapy.
- Advise patient to use contraception and to consult health care professional if pregnancy is suspected.
- Review side effects and symptoms of toxicity with patient. Instruct patient to stop medication and report signs of toxicity to health care professional promptly.
- Explain to patients with cardiovascular disease or over 40 yr of age the need for ECG evaluation before and periodically during therapy. Patient should inform health care professional if fainting, irregular pulse, or difficulty breathing occurs.
- Emphasize the importance of periodic lab tests to monitor for lithium toxicity.

## Evaluation/Desired Outcomes

- Resolution of the symptoms of mania (hyperactivity, pressured speech, poor judgment, need for little sleep).
- Decreased incidence of mood swings in bipolar disorders.
- Improved affect in unipolar disorders. Improvement in condition may require 1–3 wk.
- Remission of depressive symptoms.

# loperamide (loe-**per**-a-mide)

Diar-aid Caplets, Imodium, Imodium A-D, Kaopectate II Caplets, Maalox Antidiarrheal Caplets, Neo-Diaral, Pepto Diarrhea Control

***Classification***
Therapeutic: antidiarrheals

**Pregnancy Category B**

## Indications

Adjunctive therapy of acute diarrhea. Chronic diarrhea associated with inflammatory bowel disease. Decreases the volume of ileostomy drainage.

## Action

Inhibits peristalsis and prolongs transit time by a direct effect on nerves in the intestinal muscle wall. Reduces fecal volume, increases fecal viscosity and bulk while diminishing loss of fluid and electrolytes. **Therapeutic Effects:** Relief of diarrhea.

## Pharmacokinetics

**Absorption:** Not well absorbed following oral administration.
**Distribution:** Unknown. Does not cross the blood-brain barrier.
**Protein Binding:** 97%.
**Metabolism and Excretion:** Metabolized partially by the liver, undergoes enterohepatic recirculation; 30% eliminated in the feces. Minimal excretion in the urine.
**Half-life:** 10.8 hr.

TIME/ACTION PROFILE (relief of diarrhea)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 hr | 2.5–5 hr | 10 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Patients in whom constipation must be avoided; Abdominal pain of unknown cause, especially if associated with fever; Alcohol intolerance (liquid only).
**Use Cautiously in:** Hepatic dysfunction; Lactation: Usually compatible with breastfeeding

(AAP); OB: Safety not established; Pedi: Children <2 yr (safety not established); Geri: ↑ sensitivity to effects.

### Adverse Reactions/Side Effects

**CNS:** drowsiness, dizziness. **GI:** constipation, abdominal pain/distention/discomfort, dry mouth, nausea, vomiting. **Misc:** allergic reactions.

### Interactions

**Drug-Drug:** ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. ↑ anticholinergic properties with other **drugs having anticholinergic properties**, including **antidepressants** and **antihistamines**. **Drug-Natural Products: Kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

### Route/Dosage

**PO (Adults):** 4 mg initially, then 2 mg after each loose stool. Maintenance dose usually 4–8 mg/day in divided doses (not to exceed 8 mg/day for OTC use or 16 mg/day for Rx use).
**PO (Children 9–11 yr or 30–47 kg):** 2 mg initially; then 1 mg after each loose stool (not to exceed 6 mg/24 hr; OTC use should not exceed 2 days).
**PO (Children 6–8 yr or 24–30 kg):** 1 mg initially, then 1 mg after each loose stool (not to exceed 4 mg/24 hr; OTC use should not exceed 2 days).

### Availability (generic available)

**Tablets:** 2 mg[OTC]. **Capsules:** 2 mg. **Liquid (mint):** 1 mg/5 mL[OTC], 1 mg/7.5 mL[OTC]. ***In combination with:*** simethicone (Immodium Advanced[OTC], see Appendix B).

## NURSING IMPLICATIONS

### Assessment

- Assess frequency and consistency of stools and bowel sounds prior to and during therapy.
- Assess fluid and electrolyte balance and skin turgor for dehydration.

### Potential Nursing Diagnoses

Diarrhea (Indications)
Risk for injury (Side Effects)

### Implementation

- **PO:** Administer with clear fluids to help prevent dehydration, which may accompany diarrhea.

### Patient/Family Teaching

- Instruct patient to take medication as directed. Do not take missed doses, and do not double doses. In acute diarrhea, medication may be ordered after each unformed stool. Advise patient not to exceed the maximum number of doses.
- May cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may relieve dry mouth.
- Caution patient to avoid using alcohol and other CNS depressants concurrently with this medication.
- Instruct patient to notify health care professional if diarrhea persists or if fever, abdominal pain, or distention occurs.

### Evaluation/Desired Outcomes

- Decrease in diarrhea.
- In acute diarrhea, treatment should be discontinued if no improvement is seen in 48 hr.
- In chronic diarrhea, if no improvement has occurred after at least 10 days of treatment with maximum dose, loperamide is unlikely to be effective.

## lopinavir/ritonavir

(loe-**pin**-a-veer/ri-**toe**-na-veer)
Kaletra

***Classification***
Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors, metabolic inhibitors

**Pregnancy Category C**

### Indications

HIV infection (with other antiretrovirals).

### Action

**Lopinavir:** Inhibits HIV viral protease. **Ritonavir:** Although ritonavir has antiretroviral activity of its own (inhibits the action of HIV protease and prevents the cleavage of viral polyproteins), it is combined with lopinavir to inhibit the metabolism of lopinavir thus increasing its plasma levels.
**Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV infection and its sequelae.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration; food enhances absorption.
**Distribution:** *Ritonavir*—poor CNS penetration.
**Protein Binding:** *Lopinavir*—98–99% bound to plasma proteins.
**Metabolism and Excretion:** *Lopinavir*—completely metabolized in the liver by cytochrome P450 P3A (CYP450 P3A); ritonavir is a potent inhibitor of this enzyme. *Ritonavir*—highly metabolized by the liver (by CYP450 P3A and CYP2D6 enzymes); one metabolite has antiretroviral activity; 3.5% excreted unchanged in urine.
**Half-life:** *Lopinavir*—5–6 hr *Ritonavir*—3–5 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Lopinavir PO | rapid | 4 hr | 12 hr |
| Ritonavir PO | rapid | 4 hr* | 12 hr |

*Non-fasting

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent use of dihydroergotamine, ergotamine, ergonovine, lovastatin, methylergonovine, midazolam (PO), pimozide, simvastatin, and triazolam (may result in serious and/or life-threatening events); Concurrent use with St. John's wort or rifampin (may lead to ↓ virologic response and possible resistance); Hypersensitivity or intolerance to alcohol or castor oil (present in liquid); Congenital long QT syndrome, concurrent use of QT-interval prolonging drugs, or hypokalemia (↑ risk of QT interval prolongation).
**Use Cautiously in:** Known alcohol intolerance (oral solution contains alcohol); Impaired hepatic function, history of hepatitis (for ritonavir content); Pre-existing conduction system disease (marked first-degree AV block or second- or third-degree AV block), ischemic heart disease, or concurrent use of other drugs that increase the PR interval (especially those metabolized by CYP3A4 including verapamil or diltiazem); OB, Lactation: Safety not established; breastfeeding not recommended in HIV-infected patients.

## Adverse Reactions/Side Effects

**CNS:** headache, insomnia, weakness. **CV:** TORSADES DE POINTES, ↑ PR interval, heart block, QT interval prolongation. **GI:** HEPATOTOXICITY, PANCREATITIS, diarrhea (↑ in children), abdominal pain, nausea, taste aversion (in children), vomiting (↑ in children). **Derm:** rash.

## Interactions

**Drug-Drug:** Concurrent use of **amiodarone**, **dihydroergotamine**, **ergonovine**, **ergotamine**, **methylergonovine**, **pimozide**, **simvastatin**, **lovastatin**, **midazolam** (oral), and **triazolam**, is contraindicated because of the risk of potentially serious, life-threatening drug interactions. Concurrent use of **rifampin** ↓ effectiveness of lopinavir/ritonavir (contraindicated). May ↑ levels of **sildenafil**, **vardenafil**, or **tadalafil**; may result in hypotension, syncope, visual changes, and prolonged erection (dose ↓ of sildenafil to 25 mg q 48 hr, vardenafil to 2.5 mg q 72 hr, and tadalafil to 10 mg q 72 hr recommended). ↑ risk of rhabdomyolysis with **atorvastatin** or **rosuvastatin** (alternatively consider using **pravastatin** or **fluvastatin**). Concurrent use with **efavirenz** or **nevirapine** ↓ lopinavir/ritonavir levels and effectiveness; dose ↑ recommended. **Delavirdine** ↑ lopinavir levels. ↑ **tenofovir** levels. ↓ **abacavir** and **zidovudine** levels. Concurrent use with **fosamprenavir** ↓ lopinavir and **fosamprenavir** levels. Concurrent use with **nelfinavir** ↓ lopinavir levels and ↑ **nelfinavir** levels. ↑ **indinavir** levels; indinavir dose should be ↓. ↑ **saquinavir** levels. **Tipranavir** ↓ lopinavir levels. ↑ **maraviroc** levels; maraviroc dose should be ↓ to 150 mg twice daily. ↑ levels of **amiodarone**, **lidocaine**, and **quinidine** (blood level monitoring recommended, if possible). Concurrent use of **carbamazepine**, **phenobarbital**, or **phenytoin** may ↓ effectiveness of lopinavir (blood level monitoring recommended); lopinavir may also ↓ **phenytoin** levels. May ↓ **bupropion** levels/effects. ↑ levels/effects of **trazodone**. ↑ levels of dihydropyridine calcium channel blockers including **felodipine**, **nifedipine**, **amlodipine**, and **nicardipine**. May alter levels and effectiveness of **warfarin**. ↑ levels of **clarithromycin** (dose ↓ recommended for patients with CCr ≤60 mL/min. ↑ blood levels of **itraconazole** and **ketoconazole** (high antifungal doses not recommended). ↓ levels of **voriconazole**; concurrent use not recommended. ↑ levels of **rifabutin** (dose ↓ recommended). ↓ levels of **atovaquone** (may require dosage ↑). **Dexamethasone** ↓ levels/effectiveness of lopinavir. Oral solution contains alcohol may produce intolerance when administered with **disulfiram** or **metronidazole**. May ↑ levels and risk of toxicity with immunosuppressants including **cyclosporine**, **tacrolimus**, or **sirolimus** (blood level monitoring recommended). May ↓ levels and effects of **methadone** (dose of **methadone** may need to be ↑). May ↓ levels and contra-

ceptive efficacy of some estrogen-based **hormonal contraceptives** including **ethinyl estradiol** (alternative or additional methods of contraception recommended). ↑ levels of **fluticasone**; avoid concurrent use. ↑ **vincristine** and **vinblastine** levels. Concurrent use of other **drugs known to ↑ PR interval** may ↑ risk of heart block. Concurrent use of other **drugs known to ↑ QT interval** should be avoided. **Drug-Natural Products:** Concurrent use with **St. John's wort** may ↓ levels and beneficial effect of lopinavir/ritonavir (contraindicated).

### Route/Dosage

**PO (Adults and Children >40 kg):** *Therapy-naive*—400/100 mg (two 200/50-mg tablets or 5 mL oral solution) twice daily *or* 800/200 mg (four 200/50—mg tablets or 10 mL oral solution) once daily; single dose approved for adults only; *Therapy-experienced*—400/100 mg (two 200/50-mg tablets or 5 mL oral solution) twice daily.
**PO (Children 14 days–6 mo):** *Oral solution*—16/4 mg/kg lopinavir/ritonavir content twice daily.
**PO (Children ≥6 mo and 15–40 kg):** *Oral solution*—10/2.5 mg/kg lopinavir/ritonavir content twice daily.
**PO (Children ≥6 mo and <15 kg):** *Oral solution*—12/3 mg/kg lopinavir/ritonavir content twice daily.
**PO (Children ≥6 mo):** *Tablets*—15–25 kg: Two 100/25-mg tablets twice daily; 26–35 kg: Three 100/25-mg tablets twice daily; >35 kg: Four 100/25-mg tablets or two 200/50-mg tablets twice daily.

### With Concurrent Efavirenz, Nevirapine, Fosamprenavir, or Nelfinavir

**PO (Adults and Children >40 kg):** *Therapy-naive or therapy-experienced*—500/125 mg (two 200/50-mg tablets and one 100/25-mg tablet) twice daily *or* 533/133 mg (6.5 mL oral solution) twice daily.
**PO (Children 14 days–6 mo):** Not recommended for concomitant administration with these drugs.
**PO (Children ≥6 mo and 15–45 kg):** 11/2.75 mg/kg lopinavir/ritonavir content twice daily.
**PO (Children ≥6 mo and <15 kg):** 13/3.25 mg/kg lopinavir/ritonavir content twice daily.

### Availability

**Tablets:** 100 mg lopinavir/25 mg ritonavir, 200 mg lopinavir/50 mg ritonavir. **Oral solution:** 80 mg lopinavir/20 mg ritonavir per mL (contains 42.4% alcohol).

## NURSING IMPLICATIONS

### Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess patient for signs of pancreatitis (nausea, vomiting, abdominal pain, increased serum lipase or amylase) periodically during therapy. May require discontinuation of therapy.
- ***Lab Test Considerations:*** Monitor viral load and CD4 counts regularly during therapy.
- Monitor triglyceride and cholesterol levels prior to initiating therapy and periodically during therapy.
- May cause hyperglycemia.
- Monitor liver function before and during therapy, especially in patients with underlying hepatic disease, including hepatitis B and hepatitis C, or marked transaminase elevations. May cause ↑ serum AST, ALT, GGT, and total bilirubin concentrations.
- Monitor serum lipase and amylase levels during therapy.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- Do not confuse Kaletra (lopinavir/ritonavir) with Keppra (levetiracetam).
- Patients taking didanosine with Kaletra solution should take didanosine 1 hr before or 2 hr after taking lopinavir/ritonavir.
- **PO:** Tablets may be administered with or without food. Swallow whole, do not break, crush, or chew. Oral solution must be taken with food.
- Oral solution is light yellow to orange.
- Oral solution are stable if refrigerated until expiration date on label or 2 months at room temperature.

### Patient/Family Teaching

- Emphasize the importance of taking lopinavir/ritonavir as directed, at evenly spaced times throughout day. Do not take more than prescribed amount, and do not stop taking this or other antiretrovirals without consulting health care professional. Take missed doses as soon as remembered; do not double doses. Advise patient to read the *Patient Information* prior

to taking this medication and with each Rx refill in case of changes.
- Instruct parent/patient to measure oral solution carefully.
- Instruct patient that lopinavir/ritonavir should not be shared with others.
- Advise patient to avoid taking other medications, RX, OTC, or herbal products, especially St. John's wort, without consulting health care professional.
- Inform patient that lopinavir/ritonavir does not cure AIDS or prevent associated or opportunistic infections. Lopinavir/ritonavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of lopinavir/ritonavir are unknown at this time.
- Instruct patient to notify health care professional immediately if symptoms of lactic acidosis (tiredness or weakness, unusual muscle pain, trouble breathing, stomach pain with nausea and vomiting, cold especially in arms or legs, dizziness, fast or irregular heartbeat) or if signs of hepatotoxicity (yellow skin or whites of eyes, dark urine, light-colored stools, lack of appetite for several days or longer, nausea, abdominal pain) occur.
- Inform patient that lopinavir/ritonavir may cause hyperglycemia. Advise patient to notify health care professional if increased thirst or hunger; unexplained weight loss; or increased urination occurs.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control during lopinavir/ritonavir therapy.
- Caution patients taking sildenafil, vardenafil, or tadalafil of increased risk of associated side effects (hypotension, visual changes, sustained erection). Notify health care professional promptly if these occur.
- Inform patient that redistribution and accumulation of body fat may occur causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Instruct patient to notify health care professional if pregnancy is planned or suspected of if breastfeeding an infant.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

## **loratadine** (lor-**a**-ta-deen)
Alavert, Claritin, Claritin 24-Hour Allergy, Claritin Hives Relief, Children's Loratidine, Claritin Reditabs, Clear-Atadine, Dimetapp Children's ND Non-Drowsy Allergy, Non-Drowsy Allergy Relief for Kids, Tavist ND

***Classification***
Therapeutic: antihistamines

**Pregnancy Category B**

### Indications
Relief of symptoms of seasonal allergies. Management of chronic idiopathic urticaria. Management of hives.

### Action
Blocks peripheral effects of histamine released during allergic reactions. **Therapeutic Effects:** Decreased symptoms of allergic reactions (nasal stuffiness; red, swollen eyes, itching).

### Pharmacokinetics
**Absorption:** Rapidly absorbed after oral administration (80%).
**Distribution:** Unknown.
**Protein Binding:** *Loratadine*—97%; *descarboethoxyloratadine*—73–77%.
**Metabolism and Excretion:** Rapidly and extensively metabolized during first pass through the liver. Much is converted to descarboethoxyloratadine, an active metabolite.
**Half-life:** *Loratadine*—7.8–11 hr; *descarboethoxyloratadine*—20 hr.

TIME/ACTION PROFILE (antihistaminic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–3 hr | 8–12 hr | >24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Patients with hepatic impairment or CCr <30 mL/min (↓ dose to 10 mg every other day); Patients receiving drugs known to affect hepatic metabolism of drugs; Lactation: Usually compatible with breastfeeding (AAP); OB, Pedi: Pregnancy or children <2 yr (safety not established); Geri: ↑ risk of adverse reactions.

### Adverse Reactions/Side Effects
**CNS:** confusion, drowsiness (rare), paradoxical excitation. **EENT:** blurred vision. **GI:** dry mouth, GI upset. **Derm:** photosensitivity, rash. **Metab:** weight gain.

### Interactions
**Drug-Drug:** The following interactions may occur, but are less likely to occur with loratidine than with more sedating antihistamines. **MAO inhibitors** may intensify and prolong effects of antihistamines. ↑ CNS depression may occur with other **CNS depressants**, including **alcohol**, **antidepressants**, **opioid analgesics**, and **sedative/hypnotics**.
**Drug-Natural Products: Kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

### Route/Dosage
**PO (Adults and Children ≥6 yr):** 10 mg once daily.
**PO (Children ≥2–5 yr):** 5 mg once daily.

#### Renal Impairment
**PO (Adults):** *CCr <30 mL/min* — 10 mg every other day.

#### Hepatic Impairment
**PO (Adults):** 10 mg every other day.

### Availability (generic available)
**Rapidly disintegrating tablets (mint):** 5 mg, 10 mg[OTC]. **Tablets:** 10 mg[OTC], 🍁10 mg. **Capsules:** 10 mg[OTC]. **Chewable tablets:** 5 mg[OTC] (grape flavored). **Syrup (grape, fruit):** 5 mg/5 mL[OTC]. ***In combination with:*** pseudoephedrine (Claritin-D)[OTC]. See Appendix B.

## NURSING IMPLICATIONS

### Assessment
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** May cause false-negative result on allergy skin testing.

### Potential Nursing Diagnoses
Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

### Implementation
- **PO:** Administer once daily.
- *For rapidly disintegrating tablets (Alavert, Claritin Reditabs)* — place on tongue. Tablet disintegrates rapidly. May be taken with or without water.

### Patient/Family Teaching
- Instruct patient to take medication as directed.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.
- Instruct patient to contact health care professional immediately if dizziness, fainting, or fast or irregular heartbeat occurs or if symptoms persist.

### Evaluation/Desired Outcomes
- Decrease in allergic symptoms.
- Management of chronic idiopathic urticaria.
- Management of hives.

## lorazepam (lor-az-e-pam)
🍁Apo-Lorazepam, Ativan, 🍁Novo-Lorazem, 🍁Nu-Loraz

***Classification***
Therapeutic: anesthetic adjuncts, antianxiety agents, sedative/hypnotics
Pharmacologic: benzodiazepines

**Schedule IV**

**Pregnancy Category D**

### Indications
Anxiety disorder (oral). Preoperative sedation (injection). Decreases preoperative anxiety and provides amnesia. **Unlabeled Use: IV:** Antiemetic prior to chemotherapy. Insomnia, panic disorder, as an adjunct with acute mania or acute psychosis.

## Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Sedation. Decreased anxiety. Decreased seizures.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration. Rapidly and completely absorbed following IM administration. Sublingual absorption is more rapid than oral and is similar to IM.
**Distribution:** Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk.
**Metabolism and Excretion:** Highly metabolized by the liver.
**Half-life:** Full-term neonates: 18–73 hr; Older children: 6–17 hr; Adults: 10–16 hr.

TIME/ACTION PROFILE (sedation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15–60 min | 1–6 hr | 8–12 hr |
| IM | 30–60 min | 1–2 hr† | 8–12 hr |
| IV | 15–30 min | 15–20 min | 8–12 hr |

†Amnestic response

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Severe hypotension; Sleep apnea; OB: Use in pregnancy and lactation may cause CNS depression, flaccidity, feeding difficulties, hypothermia, seizures, and respiratory problems in the neonate; Lactation: Recommend to discontinue drug or bottle-feed.
**Use Cautiously in:** Severe hepatic/renal/pulmonary impairment; Myasthenia gravis; Depression; Psychosis; History of suicide attempt or drug abuse; COPD; Sleep apnea; Pedi: Use cautiously in children under 12 yr. In ↑ doses, benzyl alcohol in injection may cause potentially fatal "gasping syndrome" in neonates; Geri: Lower doses recommended for geriatric or debilitated patients; Hypnotic use should be short-term; **OVERDOSE:** Administer Flumazenil (do not use with patients with seizure disorder. May induce seizures).

## Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, lethargy, hangover, headache, ataxia, slurred speech, forgetfulness, confusion, mental depression, rhythmic myoclonic jerking in pre-term infants, paradoxical excitation. **EENT:** blurred vision. **Resp:** respiratory depression. **CV:** *rapid IV use only*— APNEA, CARDIAC ARREST, bradycardia, hypotension. **GI:** constipation, diarrhea, nausea, vomiting, weight gain (unusual). **Derm:** rashes. **Misc:** physical dependence, psychological dependence, tolerance.

## Interactions

**Drug-Drug:** Additive CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **antidepressants**, **opioid analgesics**, **clozapine**, and other **sedative/hypnotics** including other benzodiazepines. May ↓ the efficacy of **levodopa**. **Smoking** may ↑ metabolism and ↓ effectiveness. **Valproate** can ↑ serum concentrations and ↓ clearance (↓ dose by 50%). **Probenecid** may ↓ metabolism of lorazepam, enhancing its actions (↓ dose by 50%). **Oral contraceptives** may increase clearance and decrease concentration of lorazepam.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian,** or **chamomile** can ↑ CNS depression.

## Route/Dosage

**PO (Adults):** *Anxiety*—1–3 mg 2–3 times daily (up to 10 mg/day). *Insomnia*—2–4 mg at bedtime.
**PO (Geriatric Patients or Debilitated Patients):** *Anxiety*—0.5–2 mg/day in divided doses initially. *Insomnia*—0.25–1 mg initially, increased as needed.
**PO (Children):** *Anxiety/sedation*—0.02–0.1 mg/kg/dose (not to exceed 2 mg) q 4–8 hr. *Preoperative sedation*—0.02–0.09 mg/kg/dose.
**PO (Infants):** *Anxiety/sedation*—0.02–0.1 mg/kg/dose (not to exceed 2 mg) q 4–8 hr. *Preoperative sedation*—0.02–0.09 mg/kg/dose.
**SL (Adults and adolescents > 18 yr):** *Anxiety*—2–3 mg/day in divided doses, not to exceed 6 mg/day; *preoperative sedation*—0.05 mg/kg, up to 4 mg total given 1–2 hr before surgery.
**SL (Geriatric Patients and debilitated patients):** 0.5 mg/day, dose may be adjusted as necessary.
**IM (Adults):** *Preoperative sedation*—50 mcg (0.05 mg)/kg 2 hr before surgery (not to exceed 4 mg).
**IM (Children):** *Preoperative sedation*—0.02–0.09 mg/kg/dose.
**IM (Infants):** *Preoperative sedation*—0.02–0.09 mg/kg/dose.
**IV (Adults):** *Preoperative sedation*—44 mcg (0.044 mg)/kg (not to exceed 2 mg) 15–20 min before surgery. *Operative amnestic effect*—up to 50 mcg/kg (not to exceed 4 mg). *Antiemetic*—2 mg 30 min prior to chemotherapy; may be repeated q 4 hr as needed (unlabeled).

*Anticonvulsant*—50 mcg (0.05 mg)/kg, up to 4 mg; may be repeated after 10–15 min (not to exceed 8 mg/12 hr; unlabeled).
**IV (Children):** *Preoperative sedation*—0.02–0.09 mg/kg/dose; may use smaller doses (0.01–0.03 mg/kg) and repeat q 20 min. *Antiemetic*—Single dose: 0.04–0.08 mg/kg/dose prior to chemotherapy (not to exceed 4 mg). Multiple doses: 0.02–0.05 mg/kg/dose q 6 hr prn (not to exceed 2 mg). *Anxiety/sedation*—0.02–0.1 mg/kg (not to exceed 2 mg) q 4–8 hr. *Status epilepticus*-0.1 mg/kg over 2–5 min (not to exceed 4 mg); may repeat with 0.05 mg/kg if needed.
**IV (Infants):** *Preoperative sedation:*—0.02–0.09 mg/kg/dose; may use smaller doses (0.01–0.03 mg/kg) and repeat q 20 min. *Anxiety/sedation*—0.02–0.1 mg/kg/dose (not to exceed 2 mg) q 4–8 hr. *Status epilepticus*—0.1 mg/kg over 2–5 min (not to exceed 4 mg); may repeat with 0.05 mg/kg if needed.
**IV (Neonates):** *Status epilepticus*—0.05 mg/kg over 2–5 min; may repeat in 10–15 min.

### Availability (generic available)

**Tablets:** 0.5 mg, 1 mg, 2 mg. **Concentrated oral solution:** 0.5 mg/5 mL, 2 mg/mL. **Sublingual tablets :** 0.5 mg, 1 mg, 2 mg. **Injection:** 2 mg/mL, 4 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Conduct regular assessment of continued need for treatment.
- Pedi: Assess neonates for prolonged CNS depression related to inability to metabolize lorazepam.
- Geri: Assess geriatric patients carefully for CNS reactions as they are more sensitive to these effects. Assess falls risk.
- **Anxiety:** Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically throughout therapy.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient.
- **Status Epilepticus:** Assess location, duration, characteristics, and frequency of seizures. Institute seizure precautions.
- ***Lab Test Considerations:*** Patients on high-dose therapy should receive routine evaluation of renal, hepatic, and hematologic function.

### Potential Nursing Diagnoses

Anxiety (Indications)
Risk for injury (Indications, Side Effects)

### Implementation

- Do not confuse Ativan (lorazepam) with Atarax (hydroxyzine).
- Following parenteral administration, keep patient supine for at least 8 hr and observe closely.
- **PO:** Tablet may also be given sublingually (unlabeled) for more rapid onset.
- Take concentrated liquid solution with water, soda, pudding, or applesauce.
- **IM:** Administer IM doses deep into muscle mass at least 2 hr before surgery for optimum effect.

#### IV Administration

- **Direct IV:** ***Diluent:*** Dilute immediately before use with an equal amount of sterile water for injection, D5W, or 0.9% NaCl for injection. Pedi: To decrease the amount of benzyl alcohol delivered to neonates, dilute the 4 mg/mL injection with preservative-free sterile water for injection to make a 0.4 mg/mL dilution for IV use. Do not use if solution is colored or contains a precipitate. ***Rate:*** Administer at a rate not to exceed 2 mg/min or 0.05 mg/kg over 2–5 min. Rapid IV administration may result in apnea, hypotension, bradycardia, or cardiac arrest.
- **Y-Site Compatibility:** acyclovir, albumin, allopurinol, amifostine, amikacin, amiodarone, amphotericin B cholesteryl sulfate complex, amsacrine, anakinra, argatroban, atracurium, bivalirudin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, clindamycin, cladribine, clonidine, cyclophosphamide, cytarabine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, erythromycin lactobionate, esmolol, etomidate, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fosphenytoin, furosemide, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hy-

dromorphone, hydroxyzine, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, magnesium sulfate, melphalan, meropenem, methadone, methotrexate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, oxaliplatin, paclitaxel, palonosetron, pancuronium, pemetrexed, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, sodium bicarbonate, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** aldesleukin, ampicillin, ampicillin/sulbactam, aztreonam, caspofungin, hydralazine, idarubicin, imipenem/cilastatin, lansoprazole, omeprazole, ondansetron, pantoprazole, phenytoin, potassium phosphate, sargramostim, sufentanil.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed and not to skip or double up on missed doses. If medication is less effective after a few weeks, check with health care professional; do not increase dose.
- Advise patient that lorazepam is usually prescribed for short-term use and does not cure underlying problem.
- Advise patient to taper lorazepam by 0.05 mg q 3 days to decrease withdrawal symptoms; abrupt withdrawal may cause tremors, nausea, vomiting, and abdominal and muscle cramps.
- Teach other methods to decrease anxiety, such as increased exercise, support groups, relaxation techniques. Emphasize that psychotherapy is beneficial in addressing source of anxiety and improving coping skills.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams to determine effectiveness of the medication.

### Evaluation/Desired Outcomes

- Increase in sense of well-being.
- Decrease in subjective feelings of anxiety without excessive sedation.
- Reduction of preoperative anxiety.
- Postoperative amnesia.
- Improvement in sleep patterns.

**losartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.**

**lovastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).**

**magaldrate, See MAGNESIUM AND ALUMINUM SALTS.**

## MAGNESIUM AND ALUMINUM SALTS

**magaldrate (with simethicone)**
(**mag**-al-drate)
Riopan Plus,
Riopan Plus Double Strength

**magnesium hydroxide/aluminum hydroxide**
(mag-**nee**-zhum hye-**drox**-ide/ a-**loo**-mi-num hye-**drox**-ide)
Alamag, Diovol Ex,
Gelusil Extra Strength, Maalox,
Mylanta, Rulox

***Classification***
Therapeutic: antiulcer agents
Pharmacologic: antacids

**Pregnancy Category C**

### Indications
Useful in a variety of GI complaints, including: Hyperacidity, Indigestion, GERD, Heartburn.

### Action
Neutralize gastric acid following dissolution in gastric contents. Inactivate pepsin if pH is raised to ≥4. **Therapeutic Effects:** Neutralization of gastric acid with healing of ulcers and decrease in associated pain.

### Pharmacokinetics
**Absorption:** During routine use, antacids are nonabsorbable. With chronic use, 15–30% of magnesium and smaller amounts of aluminum may be absorbed.
**Distribution:** Small amounts absorbed are widely distributed, cross the placenta, and appear in breast milk. Aluminum concentrates in the CNS.
**Metabolism and Excretion:** Excreted by the kidneys.
**Half-life:** Unknown.

TIME/ACTION PROFILE (effect on gastric pH)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Aluminum PO | slightly delayed | 30 min | 30 min–1 hr (empty stomach); 3 hr (after meals) |
| Magnesium PO | slightly delayed | 30 min | 30 min–1 hr (empty stomach); 3 hr (after meals) |

### Contraindications/Precautions
**Contraindicated in:** Severe abdominal pain of unknown cause, especially if accompanied by fever; Renal failure (CrCl <30 mL/min); Products containing tartrazine or sugar in patients with known intolerance.
**Use Cautiously in:** Antacids containing magnesium in patients with any degree of renal insufficiency; Decreased bowel motility; Dehydration; Upper GI hemorrhage; Pedi: Children <12 yr (safety not established).

### Adverse Reactions/Side Effects
**GI:** *aluminum salts*—constipation; *magnesium salts*, diarrhea. **F and E:** *magnesium salts*—hypermagnesemia; *aluminum salts*, hypophosphatemia.

### Interactions
**Drug-Drug:** Absorption of **tetracyclines**, **phenothiazines**, **ketoconazole**, **itraconazole**, **iron salts**, **fluoroquinolones**, and **isoniazid** may be decreased (separate by at least 2 hr).

### Route/Dosage

#### Magaldrate/Simethicone
**PO (Adults):** 5–10 mL (540–1080 mg) between meals and at bedtime.

#### Magnesium Hydroxide/Aluminum Hydroxide
**PO (Adults and Children ≥12 yr):** 5–30 mL or 1–2 tablets 1–3 hr after meals and at bedtime.

### Availability

#### Magaldrate/Simethicone (generic available)
**Suspension:** 540 mg magaldrate/20 mg simethicone/5 mL[OTC], 1080 mg magaldrate/40 mg simethicone/5 mL[OTC].

### Magnesium Hydroxide/Aluminum Hydroxide (generic available)

**Chewable Tablets:** 300 mg aluminum hydroxide/150 mg magnesium hydroxide[OTC]. **Suspension:** 225 mg aluminum hydroxide/200 mg magnesium hydroxide/5 mL[OTC], 500 mg aluminum hydroxide/500 mg magnesium hydroxide/5 mL[OTC]. ***In combination with:*** simethicone[OTC]. See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- **Antacid:** Assess for heartburn and indigestion as well as location, duration, character, and precipitating factors of gastric pain.
- ***Lab Test Considerations:*** Monitor serum phosphate, potassium, and calcium levels periodically during chronic use. May cause increased serum calcium and decreased serum phosphate concentrations.

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- Magnesium and aluminum are combined as antacids to balance the constipating effects of aluminum with the laxative effects of magnesium.
- **PO:** To prevent tablets from entering small intestine in undissolved form, they must be chewed thoroughly before swallowing. Follow with ½ glass of water.
- Shake suspensions well before administration.
- For an antacid effect, administer 1–3 hr after meals and at bedtime.

### Patient/Family Teaching

- Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if relief is not obtained, or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- Advise patient not to take this medication within 2 hr of taking other medications.
- Pedi: Aluminum- or magnesium-containing medicines can cause serious side effects in children, especially when given to children with renal disease or dehydration. Advise parents or caregivers not to administer OTC antacids to children without a doctor's order.

### Evaluation/Desired Outcomes

- Relief of gastric pain and irritation.

**magnesium salicylate, See SALICYLATES.**

## MAGNESIUM SALTS (ORAL)

**magnesium chloride (12% Mg; 9.8 mEq Mg/g)**
(mag-**nee**-zhum **klor** -ide)
Chloromag, Slo-Mag

**magnesium citrate (16.2% Mg; 4.4 mEq Mg/g)**
(mag-**nee**-zhum **si** -trate)
Citrate of Magnesia, Citroma, Citromag

**magnesium gluconate (5.4 % Mg; 4.4 mEq/g)**
Magtrate, Magonate

**magnesium hydroxide (41.7% Mg; 34.3 mEq Mg/g)**
(mag-**nee**-zhum hye-**drox**-ide)
Dulcolax Magnesia Tablets, Phillips Magnesia Tablets, Phillips Milk of Magnesia, MOM

**magnesium oxide (60.3% Mg; 49.6 mEq Mg/g)**
(mag-**nee**-zhum **ox** -ide)
Mag-Ox 400, Uro-Mag

***Classification***
Therapeutic: mineral and electrolyte replacements/supplements, laxatives
Pharmacologic: salines

**Pregnancy Category UK**

### Indications

Treatment/prevention of hypomagnesemia. As a: Laxative, Bowel evacuant in preparation for surgical/radiographic procedures. Milk of Magnesia has also been used as an antacid.

### Action

Essential for the activity of many enzymes. Play an important role in neurotransmission and muscular excitability. Are osmotically active in GI tract, drawing water into the lumen and causing peristalsis. **Therapeutic Effects:** Replacement in deficiency states. Evacuation of the colon.

### Pharmacokinetics

**Absorption:** Up to 30% may be absorbed orally.
**Distribution:** Widely distributed. Cross the placenta and are present in breast milk.
**Metabolism and Excretion:** Excreted primarily by the kidneys.
**Half-life:** Unknown.

TIME/ACTION PROFILE (laxative effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 3–6 hr | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypermagnesemia; Hypocalcemia; Anuria; Heart block; OB: Unless used for preterm labor, use during active labor or within 2 hr of delivery may ↑ potential for magnesium toxicity in newborn.
**Use Cautiously in:** Any degree of renal insufficiency.

### Adverse Reactions/Side Effects

**GI:** diarrhea. **Derm:** flushing, sweating.

### Interactions

**Drug-Drug:** Potentiates **neuromuscular blocking agents**. May ↓ absorption of **fluoroquinolones**, **nitrofurantoin**, and **tetracyclines** and **penicillamine**.

### Route/Dosage

### Prevention of Deficiency (in mg of Magnesium)

**PO (Adults and Children >10 yr):** *Adolescent and adult men*—270–400 mg/day; *adolescent and adult women*—280–300 mg/day; *pregnant women*—320 mg/day; *breastfeeding women*—340–355 mg/day.
**PO (Children 7–10 yr):** 170 mg/day.
**PO (Children 4–6 yr):** 120 mg/day.
**PO (Children birth–3 yr):** 40–80 mg/day.

### Treatment of Deficiency (Expressed as mg of Magnesium)

**PO (Adults):** 200–400 mg/day in 3–4 divided doses.
**PO (Children 6–11 yr):** 3–6 mg/kg/day in 3–4 divided doses.

### Laxative

**PO (Adults):** *Magnesium citrate*—240 mL; *magnesium hydroxide (Milk of Magnesia)*—30–60 mL single or divided dose or 10–20 mL as concentrate.
**PO (Children 6–12 yr):** *Magnesium citrate*—100 mL; *magnesium hydroxide (Milk of Magnesia)*—15–30 mL single or divided dose.
**PO (Children 2–5 yr):** *magnesium hydroxide (Milk of Magnesia)*—5–15 mL single or divided dose.

### Availability

### Magnesium Chloride (generic available)

**Sustained-release tablets:** 535 mg (64 mg magnesium) OTC. **Enteric-coated tablets:** 833 mg (100 mg magnesium) OTC.

### Magnesium Citrate (generic available)

**Oral solution:** 240-, 296-, and 300-mL bottles (77 mEq magnesium/100 mL) OTC.

### Magnesium Gluconate (generic available)

**Tablets:** 500 mg OTC. **Liquid:** 54 mg/5 mL OTC.

### Magnesium Hydroxide (generic available)

**Liquid:** 400 mg/5 mL (164 mg magnesium/5 mL) OTC. **Concentrated liquid:** 800 mg/5 mL (328 mg magnesium/5 mL) OTC. **Chewable tablets:** 300 mg (130 mg magnesium) OTC, 600 mg (260 mg magnesium) OTC.

### Magnesium Oxide (generic available)

**Tablets:** 400 mg (241.3 mg magnesium) OTC.
**Capsules:** 140 mg (84.5 mg magnesium) OTC.

## NURSING IMPLICATIONS

### Assessment

- **Laxative:** Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- **Antacid:** Assess for heartburn and indigestion as well as location, duration, character, and precipitating factors of gastric pain.

### Potential Nursing Diagnoses

Constipation (Indications)

### Implementation

- **PO:** To prevent tablets entering small intestine in undissolved form, they must be chewed thoroughly before swallowing. Follow with ½ glass of water.
- *Magnesium citrate:* Refrigerate solutions to ensure they retain potency and palatability. May be served over ice. Magnesium citrate in an open container will lose carbonation upon

standing; this will not affect potency but may reduce palatability.
- *Magnesium hydroxide:* Shake solution well before administration.
- **Antacid:** Administer 1–3 hr after meals and at bedtime.
- Powder and liquid forms are considered more effective than tablets.
- **Laxative:** Administer on empty stomach for more rapid results. Follow all oral laxative doses with a full glass of liquid to prevent dehydration and for faster effect. Do not administer at bedtime or late in the day.

## Patient/Family Teaching
- Advise patient not to take this medication within 2 hr of taking other medications, especially fluoroquinolones, nitrofurantoin, and tetracyclines.
- **Antacids:** Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if relief is not obtained, or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- **Laxatives:** Advise patient that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Encourage patient to use other forms of bowel regulation, such as increasing bulk in the diet, fluid intake, and mobility. Normal bowel habits are individualized; frequency of bowel movement may vary from 3 times/day to 3 times/wk.
- Advise patient to notify health care professional if unrelieved constipation, rectal bleeding, or symptoms of electrolyte imbalance (muscle cramps or pain, weakness, dizziness) occur.

## Evaluation/Desired Outcomes
- Relief of gastric pain and irritation.
- Passage of a soft, formed bowel movement, usually within 3–6 hr.
- Prevention and treatment of magnesium deficiency.

HIGH ALERT

# magnesium sulfate (IV, parenteral) (9.9% Mg; 8.1 mEq Mg/g)

(mag-**nee**-zhum **sul**-fate)

***Classification***
Therapeutic: mineral and electrolyte replacements/supplements
Pharmacologic: minerals/electrolytes

**Pregnancy Category D**

## Indications
Treatment/prevention of hypomagnesemia. Treatment of hypertension. Anticonvulsant associated with severe eclampsia, pre-eclampsia, or acute nephritis. **Unlabeled Use:** Preterm labor. Treatment of torsade de pointes. Adjunctive treatment for bronchodilation in moderate to severe acute asthma.

## Action
Essential for the activity of many enzymes. Plays an important role in neurotransmission and muscular excitability. **Therapeutic Effects:** Replacement in deficiency states. Resolution of eclampsia.

## Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability; well absorbed from IM sites.
**Distribution:** Widely distributed. Crosses the placenta and is present in breast milk.
**Metabolism and Excretion:** Excreted primarily by the kidneys.
**Half-life:** Unknown.

TIME/ACTION PROFILE (anticonvulsant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | 60 min | unknown | 3–4 hr |
| IV | immediate | unknown | 30 min |

## Contraindications/Precautions
**Contraindicated in:** Hypermagnesemia; Hypocalcemia; Anuria; Heart block; OB: Unless used for preterm labor, avoid continuous use during active labor or within 2 hr of delivery due to potential for magnesium toxicity in newborn.
**Use Cautiously in:** Any degree of renal insufficiency; Geri: May require ↓ dosage due to age-related ↓ in renal function.

## Adverse Reactions/Side Effects
**CNS:** drowsiness. **Resp:** ↓ respiratory rate. **CV:** arrhythmias, bradycardia, hypotension. **GI:** diarrhea. **MS:** muscle weakness. **Derm:** flushing, sweating. **Metab:** hypothermia.

## Interactions
**Drug-Drug:** May potentiate **calcium channel blockers** and **neuromuscular blocking agents**.

## Route/Dosage

### Treatment of Deficiency (Expressed as mg of Magnesium)

**IM, IV (Adults):** *Severe deficiency*—8–12 g/day in divided doses; *mild deficiency*—1 g q 6 hr for 4 doses or 250 mg/kg over 4 hr.
**IM, IV (Children > 1 month):** 25–50 mg/kg/dose q 4–6 hr for 3–4 doses, maximum single dose: 2 g.
**IV (Neonates):** 25–50 mg/kg/dose q 8–12 hr for 2–3 doses.

### Seizures/Hypertension

**IM, IV (Adults):** 1 g q 6 hr for 4 doses as needed.
**IM, IV (Children):** 20–100 mg/kg/dose q 4–6 hr as needed, may use up to 200 mg/kg/dose in severe cases.

### Torsade de Pointes

**IV (Infants and Children):** 25–50 mg/kg/dose, maximum dose: 2 g.

### Bronchodilation

**IV (Adults):** 2 g single dose.
**IV (Children):** 25 mg/kg/dose, maximum dose: 2 g.

### Eclampsia/Pre-Eclampsia

**IV, IM (Adults):** 4–5 g by IV infusion, concurrently with up to 5 g IM in each buttock; then 4–5 g IM q 4 hr *or* 4 g by IV infusion followed by 1–2 g/hr continuous infusion (not to exceed 40 g/day or 20 g/48 hr in the presence of severe renal insufficiency).

### Part of Parenteral Nutrition

**IV (Adults):** 4–24 mEq/day.
**IV (Children):** 0.25–0.5 mEq/kg/day.

### Availability (generic available)

**Injection:** 500 mg/mL (50%). **Premixed infusion:** 1 g/100 mL, 2 g/100 mL, 4 g/50 mL, 4 g/100 mL, 20 g/500 mL, 40 g/1000 mL.

## NURSING IMPLICATIONS

### Assessment

- **Hypomagnesemia/Anticonvulsant:** Monitor pulse, blood pressure, respirations, and ECG frequently throughout administration of parenteral magnesium sulfate. Respirations should be at least 16/min before each dose.
- Monitor neurologic status before and throughout therapy. Institute seizure precautions. Patellar reflex (knee jerk) should be tested before each parenteral dose of magnesium sulfate. If response is absent, no additional doses should be administered until positive response is obtained.
- Monitor newborn for hypotension, hyporeflexia, and respiratory depression if mother has received magnesium sulfate.
- Monitor intake and output ratios. Urine output should be maintained at a level of at least 100 mL/4 hr.
- ***Lab Test Considerations:*** Monitor serum magnesium levels and renal function periodically throughout administration of parenteral magnesium sulfate.

### Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

### Implementation

- ***High Alert:*** Accidental overdosage of IV magnesium has resulted in serious patient harm and death. Have second practitioner independently double check original order, dose calculations, and infusion pump settings. Do not confuse milligram (mg), gram (g), or milliequivalent (mEq) dosages.
- **IM:** Administer deep IM into gluteal sites. Administer subsequent injections in alternate sides. Dilute to a concentration of 200 mg/mL prior to injection.

#### IV Administration

- **Direct IV:** ***Diluent:*** 50% solution must be diluted in 0.9% NaCl or D5W to a concentration of ≤20% prior to administration. ***Concentration:*** ≤20%. ***Rate:*** Administer at a rate not to exceed 150 mg/min.
- **Continuous Infusion:** ***Diluent:*** Dilute in D5W, 0.9% NaCl, or LR. ***Concentration:*** 0.5 mEq/mL (60 mg/mL) (may use maximum concentration of 1.6 mEq/mL (200 mg/mL) in fluid-restricted patients). ***Rate:*** Infuse over 2-4 hr. Do not exceed a rate of 1 mEq/kg/hr (125 mg/kg/hr). When rapid infusions are needed (severe asthma or torsade de pointes) may infuse over 10–20 min.
- **Y-Site Compatibility:** acyclovir, aldesleukin, amifostine, amikacin, ampicillin, atropine, aztreonam, bivalirudin, bumetanide, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, daptomycin, cefazolin, cefo-

taxime, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, cefazolin, cefotaximedocetaxel, dopamine, cefazolin, cefotaxime, doxorubicin liposome, doxycycline, enalaprilat, epinephrine, cefazolin, cefotaximeerythromycin, ertapenem, esmolol, cefazolin, cefotaximeetoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, gentamicin, granisetron, heparin, hydromorphone, hydroxyzine, idarubicin, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, meperidine, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, paclitaxel, palonosetron, pantoprazole, penicillin G potassium, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, remifentanil, sargramostim, sodium bicarbonate, tacrolimus, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, verapamil, vitamin B complex with C, voriconazole.

- **Y-Site Incompatibility:** aminophylline, amphotericin B cholesteryl sulfate complex, calcium chloride, cefepime, ceftriaxone, cefuroxime, ciprofloxacin, dexamethasone sodium phosphate, diazepam, drotrecogin, haloperidol, lansoprazole, methylprednisolone sodium succinate, phenytoin, phytonadione.

### Patient/Family Teaching

- Explain purpose of medication to patient and family.

### Evaluation/Desired Outcomes

- Normal serum magnesium concentrations.
- Control of seizures associated with toxemias of pregnancy.

## **mannitol** (man-i-tol)

Osmitrol, Resectisol

***Classification***

Therapeutic: diuretics
Pharmacologic: osmotic diuretics

**Pregnancy Category C**

### Indications

**IV:** Adjunct in the treatment of: Acute oliguric renal failure, Edema, Increased intracranial or intraocular pressure, Toxic overdose. **GU irrigant:** During transurethral procedures (2.5–5% solution only).

### Action

Increases the osmotic pressure of the glomerular filtrate, thereby inhibiting reabsorption of water and electrolytes. Causes excretion of: Water, Sodium, Potassium, Chloride, Calcium, Phosphorus, Magnesium, Urea, Uric acid. **Therapeutic Effects:** Mobilization of excess fluid in oliguric renal failure or edema. Reduction of intraocular or intracranial pressure. Increased urinary excretion of toxic materials. Decreased hemolysis when used as an irrigant after transurethral prostatic resection.

### Pharmacokinetics

**Absorption:** IV administration produces complete bioavailability. Some absorption may follow use as a GU irrigant.
**Distribution:** Confined to the extracellular space; does not usually cross the blood-brain barrier or eye.
**Metabolism and Excretion:** Excreted by the kidneys; minimal liver metabolism.
**Half-life:** 100 min.

TIME/ACTION PROFILE (diuretic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 30–60 min | 1 hr | 6–8 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Anuria; Dehydration; Active intracranial bleeding.
**Use Cautiously in:** OB, Lactation: Safety not established).

### Adverse Reactions/Side Effects

**CNS:** confusion, headache. **EENT:** blurred vision, rhinitis. **CV:** transient volume expansion, chest pain, CHF, pulmonary edema, tachycardia. **GI:** nausea, thirst, vomiting. **GU:** renal failure, urinary retention. **F and E:** dehydration, hyperkalemia, hypernatremia, hypokalemia, hyponatremia. **Local:** phlebitis at IV site.

### Interactions

**Drug-Drug:** Hypokalemia ↑ the risk of **digoxin** toxicity.

### Route/Dosage

**IV (Adults):** *Edema, oliguric renal failure*—50–100 g as a 5–25% solution; may precede with a test dose of 0.2 g/kg over 3–5 min. *Reduc-*

*tion of intracranial/intraocular pressure*—0.25–2 g/kg as 15–25% solution over 30–60 min (500 mg/kg may be sufficient in small or debilitated patients). *Diuresis in drug intoxications*—50–200 g as a 5–25% solution titrated to maintain urine flow of 100–500 mL/hr.
**IV (Children):** *Edema, oliguric renal failure*—0.25–2 g/kg (60 g/m²) as a 15–20% solution over 2–6 hr; may precede with a test dose of 0.2 g/kg over 3–5 min. *Reduction of intracranial/intraocular pressure*—1–2 g/kg (30–60 g/m²) as a 15–20% solution over 30–60 min (500 mg/kg may be sufficient in small or debilitated patients). *Diuresis in drug intoxications*—up to 2 g/kg (60 g/m²) as a 5–10% solution.

### Availability (generic available)

**IV injection:** 5%, 10%, 15%, 20%. **GU irrigant:** 5%. ***In combination with:*** sorbitol for GU irrigation.

## NURSING IMPLICATIONS

### Assessment

- Monitor vital signs, urine output, CVP, and pulmonary artery pressures (PAP) before and hourly throughout administration. Assess patient for signs and symptoms of dehydration (decreased skin turgor, fever, dry skin and mucous membranes, thirst) or signs of fluid overload (increased CVP, dyspnea, rales/crackles, edema).
- Assess patient for anorexia, muscle weakness, numbness, tingling, paresthesia, confusion, and excessive thirst. Report signs of electrolyte imbalance.
- **Increased Intracranial Pressure:** Monitor neurologic status and intracranial pressure readings in patients receiving this medication to decrease cerebral edema.
- **Increased Intraocular Pressure:** Monitor for persistent or increased eye pain or decreased visual acuity.
- ***Lab Test Considerations:*** Renal function and serum electrolytes should be monitored routinely throughout course of therapy.

### Potential Nursing Diagnoses

Excess fluid volume (Indications)
Risk for deficient fluid volume (Side Effects)

### Implementation

- Observe infusion site frequently for infiltration. Extravasation may cause tissue irritation and necrosis.
- Do not administer electrolyte-free mannitol solution with blood. If blood must be administered simultaneously with mannitol, add at least 20 mEq NaCl to each liter of mannitol.
- Confer with physician regarding placement of an indwelling Foley catheter (except when used to decrease intraocular pressure).
- **IV:** Administer by IV infusion undiluted. If solution contains crystals, warm bottle in hot water and shake vigorously. Do not administer solution in which crystals remain undissolved. Cool to body temperature. Use an in-line filter for 15%, 20%, and 25% infusions.
- **Test Dose:** Administer over 3–5 min to produce a urine output of 30–50 mL/hr. If urine flow does not increase, administer 2nd test dose. If urine output is not at least 30–50 mL/hr for 2–3 hr after 2nd test dose, patient should be re-evaluated.
- **Oliguria:** Administration rate should be titrated to produce a urine output of 30–50 mL/hr. Administer child's dose over 2–6 hr.
- **Increased Intracranial Pressure:** Infuse dose over 30–60 min in adults and children.
- **Intraocular Pressure:** Administer dose over 30 min. When used preoperatively, administer 60–90 min before surgery.
- **Y-Site Compatibility:** amifostine, aztreonam, fludarabine, fluorouracil, idarubicin, linezolid, melphalan, ondansetron, paclitaxel, piperacillin/tazobactam, sargramostim, teniposide, thiotepa , vinorelbine.
- **Y-Site Incompatibility:** cefepime, filgrastim.
- **Irrigation:** Add contents of two 50-mL vials of 25% mannitol to 900 mL of sterile water for injection for a 2.5% solution for irrigation. Use only clear solutions.

### Patient/Family Teaching

- Explain purpose of therapy to patient.

### Evaluation/Desired Outcomes

- Urine output of at least 30–50 mL/hr or an increase in urine output in accordance with parameters set by physician.
- Reduction in intracranial pressure.
- Reduction of intraocular pressure.
- Excretion of certain toxic substances.
- Irrigation during transurethral prostate resection.

## maraviroc (ma-ra-vi-rok)

Selzentry

***Classification***

Therapeutic: antiretrovirals

Pharmacologic: CCR5 co-receptor antagonists

**Pregnancy Category B**

### Indications

HIV infection (with other antiretrovirals), specifically in patients with only CCR5–tropic HIV-1 detectable, with evidence of viral replication and HIV-1 strains displaying multiple resistance to other antiretrovirals. Use should be determined by treatment history and tropism testing.

### Action

Blocks a specific receptor on CD-4 and T-cell surfaces which prevents CCR5–tropic HIV-1 from entering. **Therapeutic Effects:** Decreased invasion of CD-4 and T-cells by CCR5–tropic HIV-1 virus resulting in viral replication.

### Pharmacokinetics

**Absorption:** 2–33% absorbed following oral administration.

**Distribution:** Unknown.

**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A enzyme system); 8% renal excretion as unchanged drug.

**Half-life:** 14–18 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 0.5–4 hr | 1–2 hr |

### Contraindications/Precautions

**Contraindicated in:** Dual/mixed or CXCR4–tropic HIV-1; OB: Lactation (breastfeeding not recommended for HIV-infected patients).

**Use Cautiously in:** Pre-existing liver disease including hepatitis B or C (may ↑ risk of hepatotoxicity); Cardiovascular disease or risk factors (↑ risk of cardiovascular events); Hepatic impairment; Renal impairment (if CCr <50 mL/min and using a CYP3A inhibitor, use only if necessary); Treatment-naive adults (safety/efficacy not established); Geri: Consider age-related decrease in renal/hepatic function, concurrent drug therapy and concomitant disease; OB: Use only if clearly needed; Pedi: Safety not established in children <16 yr.

### Adverse Reactions/Side Effects

**CNS:** dizziness. **CV:** myocardial ischemia/infarction. **Resp:** cough, upper respiratory tract infection. **GI:** abdominal pain, appetite disorder, HEPATOTOXICITY. **Derm:** RASH. **MS:** musculoskeletal pain. **Misc:** ALLERGIC REACTIONS, fever, immune reconstitution syndrome, ↑ risk of infection.

### Interactions

**Drug-Drug:** Levels are ↑ by **CYP3A inhibitors** including **protease inhibitors** (excluding tipranavir/ritonavir), **delavirdine**, **ketoconazole**, **lopinavir/ritonavir**, **saquinavir**, and **atazanavir**. Levels are ↓ by **CYP3A inducers** including **efavirenz** and **rifampin**.

### Route/Dosage

**PO (Adults):** *Concurrent CYP3A inhibitors (except tipranavir/ritonavir) or delavirdine*—150 mg twice daily; *Concurrent NRTIs, tipranavir/ritonavir, nevirapine and other drugs that are not strong inhibitors/inducers of CYP3A*—300 mg twice daily; *Concurrent CYP3A inducers, including efavirenz*—600 mg twice daily.

### Availability

**Tablets:** 150 mg, 300 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess for signs of hepatitis or allergic reaction (pruritic rash, jaundice, dark urine, vomiting, abdominal pain). If symptoms occur, discontinue maraviroc immediately.
- ***Lab Test Considerations:*** Testing for CCR5–tropic HIV-1 should be obtained prior to initiating therapy.
- Monitor viral load and CD4 cell count regularly during therapy.
- May cause ↑ AST, ALT, total bilirubin, amylase, and lipase.
- May cause ↓ absolute neutrophil count.

### Potential Nursing Diagnoses

Risk for infection (Indications)

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

- **PO:** May be administered without regard to food. Tablets should be swallowed whole; do not break, crush, or chew.

### Patient/Family Teaching

- Emphasize the importance of taking maraviroc as directed, at the same time each day. Advise patient to read the *Patient Information* that comes with the medication with each Rx is refill. Maraviroc must always be used in combi-

nation with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered, then return to regular dose schedule. If it is within 6 hr of next dose, omit dose and take next dose at regular time. Do not double doses.
- Instruct patient that maraviroc should not be shared with others.
- Inform patient that maraviroc does not cure AIDS or prevent associated or opportunistic infections. Maraviroc does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. The long-term effects of maraviroc are unknown at this time. If new symptoms of infection develop after starting maraviroc, notify health care professional.
- Advise patient to discontinue maraviroc and notify health care professional if chest pain, itchy rash, yellow colored skin or eyes, dark urine, vomiting, or abdominal pain occur.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize postural hypotension.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products, especially St. John's Wort; may decrease effectiveness of maraviroc.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

## meclizine (mek-li-zeen)
Antivert, Bonamine, Bonine, Dramamine Less Drowsy Formula

***Classification***
Therapeutic: antiemetics, antihistamines

**Pregnancy Category B**

### Indications
Management/prevention of: Motion sickness, Vertigo.

### Action
Has central anticholinergic, CNS depressant, and antihistaminic properties. Decreases excitability of the middle ear labyrinth and depresses conduction in middle ear vestibular-cerebellar pathways. **Therapeutic Effects:** Decreased motion sickness. Decreased vertigo from vestibular pathology.

### Pharmacokinetics
**Absorption:** Absorbed after oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** 6 hr.

TIME/ACTION PROFILE (antihistaminic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 hr | unknown | 8–24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; OB: Has caused congenital malformations (cleft palate) in animal studies.
**Use Cautiously in:** Prostatic hyperplasia; Angle-closure glaucoma; Lactation: Occasional use may be acceptable; prolonged use may expose infant to drug effects or may interfere with milk supply; Pedi: Children <12 yr (safety not established); Geri: ↑ sensitivity and risk of adverse reactions.

### Adverse Reactions/Side Effects
**CNS:** drowsiness, fatigue. **EENT:** blurred vision. **GI:** dry mouth.

### Interactions
**Drug-Drug:** Additive CNS depression with other **CNS depressants**, including **alcohol**, other **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive anticholinergic effects with other **drugs possessing anticholinergic properties**, including some **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**.

### Route/Dosage

**PO (Adults and Children ≥12 yr):** *Motion sickness*—25–50 mg 1 hr before exposure; may repeat in 24 hr; *vertigo*—25–100 mg/day in divided doses.

### Availability (generic available)

**Tablets:** 12.5 mg, 25 mg[Rx, OTC], 50 mg. **Cost:** 12.5 mg $4.09/100, 25 mg $5.40/100, 50 mg $6.99/100. **Chewable tablets:** 25 mg[Rx, OTC].

## NURSING IMPLICATIONS

### Assessment

- Assess patient for level of sedation after administration.
- **Motion Sickness:** Assess patient for nausea and vomiting before and 60 min after administration.
- **Vertigo:** Assess degree of vertigo periodically in patients receiving meclizine for labyrinthitis.
- ***Lab Test Considerations:*** May cause false-negative results in skin tests using allergen extracts. Discontinue meclizine 72 hr before testing.

### Potential Nursing Diagnoses

Risk for injury (Side Effects)

### Implementation

- **PO:** Administer oral doses with food, water, or milk to minimize GI irritation. Chewable tablet may be chewed or swallowed whole.

### Patient/Family Teaching

- Instruct patient to take meclizine exactly as directed. If a dose is missed, take as soon as possible unless almost time for next dose. Do not double doses.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dryness of mouth.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants with this medication.
- **Motion Sickness:** When used as prophylaxis for motion sickness, advise patient to take medication at least 1 hr before exposure to conditions that may cause motion sickness.

### Evaluation/Desired Outcomes

- Prevention and relief of symptoms in motion sickness.
- Prevention and treatment of vertigo due to vestibular pathology.

## medroxyPROGESTERone†

(me-**drox**-ee-proe-jess-te-rone)

Alti-MPA, Depo-Provera, Depo-Sub Q Provera 104, Gen-Medroxy, Novo-Medrone, Provera, Provera Pak, Ratio-MPA

***Classification***

Therapeutic: antineoplastics, contraceptive hormones

Pharmacologic: hormones, progestins

**Pregnancy Category X**

†For contraceptive use see Contraceptives, Hormonal monograph

### Indications

To decrease endometrial hyperplasia in postmenopausal women receiving concurrent estrogen (0.625 mg/day conjugated estrogens). Treatment of secondary amenorrhea and abnormal uterine bleeding caused by hormonal imbalance. **IM:** Treatment of advanced unresponsive endometrial or renal carcinoma. Management of endometriosis-associated pain (Depo-Sub Q Provera 104 only). **Unlabeled Use:** Obesity-hypoventilation (pickwickian) syndrome, sleep apnea, hypersomnolence.

### Action

A synthetic form of progesterone—actions include secretory changes in the endometrium, increases in basal body temperature, histologic changes in vaginal epithelium, relaxation of uterine smooth muscle, mammary alveolar tissue growth, pituitary inhibition, and withdrawal bleeding in the presence of estrogen. **Therapeutic Effects:** Decreased endometrial hyperplasia in postmenopausal women receiving concurrent estrogen (combination with estrogen decreases vasomotor symptoms and prevents osteoporosis). Restoration of hormonal balance with control of uterine bleeding. Management of endometrial or renal cancer. Prevention of pregnancy.

### Pharmacokinetics

**Absorption:** 0.6–10% absorbed after oral administration.

**Distribution:** Enters breast milk.

**Metabolism and Excretion:** Metabolized by the liver.

**Half-life:** *1st phase*—52 min; *2nd phase*—230 min; *biological*—14.5 hr.

TIME/ACTION PROFILE (IM = antineoplastic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | unknown |
| IM | wk–mos | mo | unknown† |
| SC | unknown | 1 wk | 3 mo |

†Contraceptive effect lasts 3 mo

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hypersensitivity to parabens (IM suspension only); Missed abortion; Thromboembolic disease; Cerebrovascular disease; Severe liver disease; Breast or genital cancer; Porphyria; OB: May ↑ risk of fetal genitourinary malformation.

**Use Cautiously in:** History of liver disease; Renal disease; Cardiovascular disease; Seizure disorders; Mental depression; Lactation: If used as a contraceptive, wait 6 wk after delivery if breastfeeding.

### Adverse Reactions/Side Effects

**CNS:** depression. **EENT:** retinal thrombosis. **CV:** PULMONARY EMBOLISM, thromboembolism, thrombophlebitis. **GI:** drug-induced hepatitis, gingival bleeding. **GU:** cervical erosions. **Derm:** chloasma, melasma, rashes. **Endo:** amenorrhea, breakthrough bleeding, breast tenderness, changes in menstrual flow, galactorrhea, hyperglycemia, spotting. **F and E:** edema. **Metab:** bone loss. **Misc:** allergic reactions including ANAPHYLAXIS and ANGIOEDEMA, weight gain, weight loss.

### Interactions

**Drug-Drug:** May ↓ effectiveness of **bromocriptine** when used concurrently for galactorrhea/amenorrhea. Contraceptive effectiveness may be ↓ by **carbamazepine**, **phenobarbital**, **phenytoin**, **rifampin**, or **rifabutin**. **Aminoglutethimide** may ↓ oral absorption.

### Route/Dosage

### Postmenopausal Women Receiving Concurrent Estrogen

**PO (Adults):** 2.5–5 mg daily concurrently with 0.625 mg conjugated estrogens (monophasic regimen) *or* 5 mg daily on days 15–28 of the cycle with 0.625 mg conjugated estrogens taken daily throughout cycle (biphasic regimen).

### Secondary Amenorrhea

**PO (Adults):** 5–10 mg/day for 5–10 days; start at any time in cycle.

### Dysfunctional Uterine Bleeding/Induction of Menses

**PO (Adults):** 5–10 mg/day for 5–10 days, starting on day 16 or day 21 of menstrual cycle.

### Renal or Endometrial Carcinoma

**IM (Adults):** 400–1000 mg, may be repeated weekly; if improvement occurs, attempt to decrease dosage to 400 mg monthly.

### Endometriosis-Associated Pain

**Subcut (Adults):** 104 mg every 12–14 wk (3 mo), beginning on day 5 of normal menses (not recommended for more than 2 yr).

### Availability (generic available)

**Tablets:** 2.5 mg, 5 mg, 10 mg, 🍁100 mg. **Suspension for depot injection:** 🍁50 mg/mL, 🍁100 mg/mL, 150 mg/mL, 400 mg/mL. **Suspension for subcutaneous injection (Depo-Sub Q Provera 104):** 104 mg/0.65 mL in single-use syringes. ***In combination with:*** conjugated estrogens as Prempro (single combination tablet of 0.626 mg conjugated estrogens plus 2.5 or 5 mg medroxyprogesterone) or Premphase (0.625 mg conjugated estrogens tablet for 14 days followed by combination tablet of 0.625 mg conjugated estrogens plus 5 mg medroxyprogesterone for days 15–28) in convenience packages. See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure periodically during therapy.
- Assess patient's usual menstrual history. Administration of drug may begin on any day of cycle in patients with amenorrhea and on day 16 or 21 of cycle in patients with dysfunctional bleeding.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- ***Lab Test Considerations:*** Monitor hepatic function before and periodically during therapy.
- May cause ↑ alkaline phosphatase levels. May ↓ pregnanediol excretion concentrations.
- May cause ↑ serum LDL concentrations or ↓ HDL concentrations.
- May alter thyroid hormone assays.

### Potential Nursing Diagnoses

Sexual dysfunction (Indications)
Ineffective tissue perfusion (Side Effects)

### Implementation

- Do not confuse Provera (medroxyprogesterone) with Covera (verapamil).
- Only the 150 mg/mL vial should be used for contraception.
- Injectable medroxyprogesterone may lead to bone loss, especially in women younger than 21 yr. Injectable medroxyprogesterone should be used for >2 yr only if other methods of contraception are inadequate. If used long term, women should use supplemental calcium and vitamin D, and monitor bone mineral density.
- **Subcut:** Shake vigorously before use to form a uniform suspension. Inject slowly (over 5–7 seconds) at a 45° angle into fatty area of anterior thigh or abdomen every 12 to 14 wk. If more than 14 wk elapse between injections, rule out pregnancy prior to administration. **Do not rub area after injection**.
- When switching from other hormonal contraceptives, administer within dosing period (7 days after taking last active pill, removing patch or ring, or within the dosing period for IM injection).
- **IM:** Shake vial vigorously before preparing IM dose. Administer deep IM into gluteal or deltoid muscle. If period between injections is >14 wk, determine that patient is not pregnant before administering the drug.
- In patients with cancer, IM dose may initially be required weekly. Once stabilized, IM dose may be required only monthly.

### Patient/Family Teaching

- Explain the dose schedule. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered, but do not double doses.
- Advise patients receiving medroxyprogesterone for menstrual dysfunction to anticipate withdrawal bleeding 3–7 days after discontinuing medication.
- Review patient package insert (PPI) with patient. Emphasize the importance of notifying health care professional if the following side effects occur: visual changes, sudden weakness, incoordination, difficulty with speech, headache, leg or calf pain, shortness of breath, chest pain, changes in vaginal bleeding pattern, yellow skin, swelling of extremities, depression, or rash. Patients receiving medroxyprogesterone for cancer may not receive PPI.
- Advise patient to keep a 1-mo supply of medroxyprogesterone available at all times.
- Instruct patient in correct method of monthly breast self-examination. Increased breast tenderness may occur.
- Advise patient that gingival bleeding may occur. Instruct patient to use good oral hygiene and to receive regular dental care and examinations.
- Instruct patient to notify health care professional if menstrual period is missed or if pregnancy is suspected. Patient should not attempt conception for 3 mo after discontinuing medication in order to decrease risk to fetus.
- Medroxyprogesterone may cause melasma (brown patches of discoloration) on face when patient is exposed to sunlight. Advise patient to avoid sun exposure and to wear sunscreen or protective clothing when outdoors.
- Emphasize the importance of routine follow-up physical exams, including blood pressure; breast, abdomen, and pelvic exams; and Papanicolaou smears every 6–12 mo.
- **IM, Subcut:** Advise patient to maintain adequate amounts of dietary calcium and vitamin D to help prevent bone loss.

### Evaluation/Desired Outcomes

- Regular menstrual periods.
- Decrease in endometrial hyperplasia in postmenopausal women receiving concurrent estrogen.
- Control of the spread of endometrial or renal cancer.

**medroxyprogesterone, See also CONTRACEPTIVES, HORMONAL.**

## **megestrol** (me-**jess**-trole)

Megace

***Classification***

Therapeutic: antineoplastics, hormones
Pharmacologic: progestins

**Pregnancy Category D (tablets), X (suspension)**

### Indications

Palliative treatment of endometrial and breast carcinoma, either alone or with surgery or radiation (tablets only). Treatment of anorexia, weight loss, and cachexia associated with AIDS (oral suspension only).

### Action

Antineoplastic effect may result from inhibition of pituitary function. **Therapeutic Effects:** Regres-

sion of tumor. Increased appetite and weight gain in patients with AIDS.

### Pharmacokinetics

**Absorption:** Well absorbed from the GI tract.
**Distribution:** Unknown.
**Protein Binding:** ≥90%.
**Metabolism and Excretion:** Completely metabolized by the liver.
**Half-life:** 38 hr (range 13–104 hr).

TIME/ACTION PROFILE (antineoplastic activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | wk–mos | 2 mo | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Undiagnosed vaginal bleeding; Severe liver disease; Suspension contains alcohol and should be avoided in patients with known intolerance; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Diabetes; Mental depression; Renal disease; History of thrombophlebitis; Cardiovascular disease; Seizure disorders.

### Adverse Reactions/Side Effects

**CV:** THROMBOEMBOLISM, edema. **GI:** GI irritation. **Derm:** alopecia. **Endo:** asymptomatic adrenal suppression (chronic therapy). **Hemat:** thrombophlebitis. **MS:** carpal tunnel syndrome.

### Interactions

**Drug-Drug:** None significant.

### Route/Dosage

**PO (Adults):** *Breast carcinoma*—160 mg/day single dose or divided doses; *endometrial/ovarian carcinoma*—40–320 mg/day in divided doses; *anorexia associated with AIDS*—800 mg day; may decrease to 400 mg/day after 1 mo (range 400–800 mg/day).

### Availability (generic available)

**Tablets:** 20 mg, 40 mg. **Cost:** *Generic*—20 mg $37.99/100, 40 mg $52.99/100. **Oral suspension (lemon-lime flavor):** 40 mg/mL, 125 mg/mL (Megace ES). **Cost:** *Generic*—40 mg/mL $131.33/240 mL; *Megace ES*—125 mg/mL $526.89/150 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for swelling, pain, or tenderness in legs. Report these signs of deep vein thrombophlebitis.
- **Anorexia:** Monitor weight, appetite, and nutritional intake in patients with AIDS.

### Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

### Implementation

- Because of high dose, suspension is most convenient form for patients with AIDS.
- Do not confuse Megace 800 mg/20 mL with Megace ES 625 mg/5 mL.
- **PO:** May be administered with meals if GI irritation becomes a problem.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed; do not skip or double up on missed doses. Missed doses may be taken as long as it is not right before next dose. Gradually decrease dose prior to discontinuation.
- Advise patient to report to health care professional any unusual vaginal bleeding or signs of deep vein thrombophlebitis.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 4 months after therapy is completed.
- Discuss with patient the possibility of hair loss. Explore methods of coping.

### Evaluation/Desired Outcomes

- Slowing or arresting the spread of endometrial or breast malignancy. Therapeutic effects usually occur within 2 months of initiating therapy.
- Increased appetite and weight gain in patients with AIDS.

## meloxicam (me-lox-i-kam)

Mobic

***Classification***

Therapeutic: nonsteroidal anti-inflammatory agents
Pharmacologic: nonopioid analgesics

**Pregnancy Category C**

### Indications

Relief of signs and symptoms of osteoarthritis and rheumatoid arthritis (including juvenile rheumatoid arthritis).

## Action

Inhibits prostaglandin synthesis, probably by inhibiting the enzyme cyclooxygenase. **Therapeutic Effects:** Decreased pain and inflammation associated with osteoarthritis. Also decreases fever.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration.
**Distribution:** Unknown.
**Protein Binding:** 99.4%.
**Metabolism and Excretion:** Mostly metabolized to inactive metabolites by the liver via the P450 enzyme system; metabolites are excreted in urine and feces.
**Half-life:** 20.1 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK† | DURATION |
|---|---|---|---|
| PO | unknown | 5–6 hr | 24 hr |

†Blood levels

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity may occur with other NSAIDs, including aspirin; Severe renal impairment (CCr ≤15 mL/min); Concurrent use of aspirin (increased risk of adverse reactions); Perioperative pain from coronary artery bypass graft (CABG) surgery; OB: Can cause premature closure of ductus arteriosus if used during third trimester.
**Use Cautiously in:** Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use) Dehydration (correct deficits before initiating therapy); Impaired renal function, heart failure, liver dysfunction, concurrent ACE inhibitor or diuretic therapy (↑ risk of renal dysfunction); Coagulation disorders or concurrent anticoagulant therapy (may ↑ risk of bleeding); Lactation: Safety not established; Pedi: Children <2 yr (safety not established); Geri: ↑ risk of GI bleeding and renal dysfuntion.

## Adverse Reactions/Side Effects

**CV:** edema. **GI:** GI BLEEDING, ↑ liver function tests, diarrhea, dyspepsia, nausea. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus. **Hemat:** anemia, leukopenia, thrombocytopenia.

## Interactions

**Drug-Drug:** May ↓ antihypertensive effects of **ACE inhibitors**. May ↓ diuretic effects of **furosemide** or **thiazide diuretics**. Concurrent use with **aspirin** ↑ meloxicam blood levels and may ↑ risk of adverse reactions. Concurrent use with **cholestyramine** ↓ blood levels. ↑ plasma **lithium** levels (close monitoring recommended when meloxicam is introduced or withdrawn). May ↑ risk of bleeding with **anticoagulants**, including **warfarin**.

## Route/Dosage

**PO (Adults):** 7.5 mg once daily; some patients may require 15 mg/day.
**PO (Children 2–17 yr and > 12 kg):** 0.125 mg/kg once daily up to 7.5mg/day.

## Availability (generic available)

**Tablets:** 7.5 mg, 15 mg. **Cost:** *Generic*—7.5 mg $43.83/90, 15 mg $18.90/90. **Oral suspension (raspberry flavor):** 7.5 mg/5 mL.

# NURSING IMPLICATIONS

## Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- Assess pain and range of motion prior to and 1–2 hr following administration.
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, and liver function periodically in patients receiving prolonged therapy. May cause anemia, thrombocytopenia, leukopenia, and abnormal liver or renal function tests.
- Bleeding time may be prolonged.

## Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

## Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- **PO:** May be administered without regard to food.
- Pedi: Use oral suspension to ensure accuracy of dosing in children.

## Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC

medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, weight gain, edema, black stools, or signs of hepatotoxicity (nausea, fatigue, lethargy, jaundice, upper right quadrant tenderness, flu-like symptoms) occur.

### Evaluation/Desired Outcomes
- Relief of pain.
- Improved joint mobility. Patients who do not respond to one NSAID may respond to another.

## melphalan (mel-fa-lan)
Alkeran, L-PAM, phenylalanine mustard

***Classification***
Therapeutic: antineoplastics
Pharmacologic: alkylating agents

**Pregnancy Category D**

### Indications
Alone or with other therapies for: Multiple myeloma, Ovarian cancer. **Unlabeled Use:** Breast cancer. Prostate cancer. Testicular carcinoma. Chronic myelogenous leukemia. Osteogenic sarcoma.

### Action
Inhibits DNA and RNA synthesis by alkylation (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressive properties.

### Pharmacokinetics
**Absorption:** Incompletely and variably absorbed following oral administration.
**Distribution:** Rapidly distributed throughout total body water.
**Protein Binding:** ≤30%.
**Metabolism and Excretion:** Rapidly metabolized in the bloodstream. Small amounts (10%) excreted unchanged by the kidneys.
**Half-life:** 1.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 5 days | 2–3 wk | 5–6 wk |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to melphalan or chlorambucil; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Active infections; ↓ bone marrow reserve; Impaired renal function (dose ↓ recommended if BUN ≥30 mg/dL); OB: Women with childbearing potential (should be counseled to avoid pregnancy during treatment); Pedi: Safety not established; Geri: Begin at lower end of dosing range due to potential for age-related ↓ in renal, hepatic, or cardiac function.

### Adverse Reactions/Side Effects
**Resp:** bronchopulmonary dysplasia, pulmonary fibrosis. **GI:** diarrhea, hepatitis, nausea, stomatitis, vomiting. **GU:** infertility. **Derm:** alopecia, pruritus, rashes. **Endo:** menstrual irregularities. **Hemat:** leukopenia, thrombocytopenia, anemia. **Metab:** hyperuricemia. **Misc:** allergic reactions, including ANAPHYLAXIS (more common after IV use).

### Interactions
**Drug-Drug:** ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. May ↑ the risk of pulmonary toxicity with **carmustine**. Concurrent IV use with **cyclosporine** may ↑ risk of renal failure. Risk of enterocolitis may be ↑ with concurrent **nalidixic acid**.

### Route/Dosage

#### Multiple Myeloma
**PO (Adults):** 150 mcg (0.15 mg)/kg/day for 7 days, followed by 3-wk rest, then 50 mcg (0.05 mg)/kg/day maintenance dose *or* 100–150 mcg/kg/day or 250 mg (0.25 mg)/kg/day for 4 days followed by 2–4-wk rest, then 2–4 mg/day maintenance dose *or* 7 mg/m² *or* 250 mcg (0.25 mg)/kg daily for 5 days q 5–6 wk.
**IV (Adults):** 16 mg/m² q 2 wk for 4 doses, then q 4 wk.

#### Ovarian Carcinoma
**PO (Adults):** 200 mcg (0.2 mg)/kg/day for 5 days q 4–5 wk.

### Availability

**Tablets:** 2 mg. **Powder for injection:** 50 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, lower back or side pain, difficult or painful urination). Notify health care professional if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- May cause nausea and vomiting. Monitor intake and output, appetite, and nutritional intake. Prophylactic antiemetics may be used. Adjust diet as tolerated.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid per day. Allopurinol may be given to decrease uric acid levels.
- Anemia may occur. Monitor for increased fatigue and dyspnea.
- Assess patient for allergy to chlorambucil. Patients may have cross-sensitivity.
- ***Lab Test Considerations:*** Monitor CBC and differential weekly during therapy. The nadir of leukopenia occurs in 2–3 wk. Notify physician if leukocyte count is $<3000/mm^3$. The nadir of thrombocytopenia occurs in 2–3 wk. Notify physician if platelet count is $<100{,}000/mm^3$. Recovery of leukopenia and thrombocytopenia occurs in 5–6 wk.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically during therapy to detect hepatotoxicity and nephrotoxicity.
- May cause ↑ uric acid. Monitor periodically during therapy.
- May cause ↑ 5-hydroxyindoleacetic acid (5-HIAA) concentrations as a result of tumor breakdown.

### Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)

### Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated container.
- If solution contacts skin or mucosa, immediately wash skin or mucosa with soap and water.
- **PO:** May be ordered in divided doses or as a single daily dose.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute with 10 mL of diluent supplied for a concentration of 5 mg/mL and shake vigorously until solution is clear. ***Concentration:*** Dilute dose immediately with 0.9% NaCl for a concentration not to exceed 2 mg/mL for central line or 0.45 mg/mL for a peripheral line. Administer within 60 min of reconstitution. ***Rate:*** Administer over at least 15 min (not to exceed 10 mg/min).
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, ampicillin, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone, diphenhydramine, doxorubicin, doxycycline, droperidol, enalaprilat, etoposide, famotidine, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, ganciclovir, gentamicin, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, lorazepam, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, minocycline, mitomycin, mitoxantrone, morphine, nalbuphine, ondansetron, pentostatin, potassium chloride, prochlorperazine edisylate, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** amphotericin B, chlorpromazine.

### Patient/Family Teaching

- Instruct patient to take melphalan as directed, even if nausea and vomiting occur. If vomiting occurs shortly after dose is taken, consult health care professional. If a dose is missed, do not take at all.
- Advise patient to notify health care professional if fever; chills; dyspnea; persistent cough; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric ra-

zor. Caution patient not to drink alcoholic beverages or take products containing aspirin or other NSAIDs.
- Instruct patient to notify health care professional if rash, itching, joint pain, or swelling occurs.
- Instruct patient to inspect oral mucosa for redness and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Consult health care professional if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Advise patient that although fertility may be decreased, contraception should be used during melphalan therapy because of potential teratogenic effects on the fetus.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes
- Decrease in size and spread of malignant tissue.

## **memantine** (me-**man**-teen)
Namenda

***Classification***
Therapeutic: anti-Alzheimer's agents
Pharmacologic: N-methyl-D-aspartate antagonist

**Pregnancy Category B**

### Indications
Moderate to severe Alzheimer's dementia.

### Action
Binds to CNS N-methyl-D-aspartate (NMDA) receptor sites, preventing binding of glutamate, an excitatory neurotransmitter. **Therapeutic Effects:** Decreased symptoms of dementia. Does not slow progression. Cognitive enhancement. Does not cure disease.

### Pharmacokinetics
**Absorption:** Well absorbed after oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** 57–82% excreted unchanged in urine by active tubular secretion moderated by pH dependent tubular reabsorption. Remainder metabolized; metabolites are not pharmacologically active.
**Half-life:** 60–80 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 3–7 hr | 12 hr |

### Contraindications/Precautions
**Contraindicated in:** Severe renal impairment.
**Use Cautiously in:** Moderate renal impairment (consider ↓ dose); Concurrent use of other NMDA antagonists (amantadine, rimantadine, ketamine, dextromethorphan); Concurrent use of drugs or diets that cause alkaline urine; Conditions that ↑ urine pH including severe urinary tract infections or renal tubular acidosis (lead to ↓ excretion and ↑ levels); OB, Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** dizziness, fatigue, headache, sedation. **CV:** hypertension. **Derm:** rash. **GI:** weight gain. **GU:** urinary frequency. **Hemat:** anemia.

### Interactions
**Drug-Drug: Medications that ↑ urine pH** lead to ↓ excretion and ↑ blood levels **(carbonic anhydrase inhibitors, sodium bicarbonate)**.

### Route/Dosage
**PO (Adults):** 5 mg once daily initially, increased at weekly intervals to 10 mg/day (5 mg twice daily), then 15 mg/day (5 mg once daily, 10 mg once daily as separate doses, then to target dose of 20 mg/day (as 10 mg twice daily).

### Availability
**Tablets:** 5 mg, 10 mg, titration package containing twenty eight 5 mg tablets and twenty one 10 mg tablets. **Cost:** 5 mg $458.95/180, 10 mg $435.98/180. **Oral solution, sugar-free, alcohol-free (peppermint):** 2 mg/mL.

## NURSING IMPLICATIONS

### Assessment
- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- ***Lab Test Considerations:*** May cause anemia.

### Potential Nursing Diagnoses
Disturbed thought process (Indications)
Risk for injury (Side Effects)
Impaired environmental interpretation syndrome

### Implementation
- Dose increases should occur no more frequently than weekly.
- **PO:** May be administered without regard to food.
- Administer oral solution using syringe provided. Do not dilute or mix with other fluids.

### Patient/Family Teaching
- Instruct caregivers on how and when to administer memantine and how to titrate dose. Provide caregiver with *Patient Instructions* sheet.
- Caution patient and caregiver that memantine may cause dizziness.
- Teach patient and caregivers that improvement in cognitive functioning may take months; degenerative process is not reversed.

### Evaluation/Desired Outcomes
- Improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

HIGH ALERT

## meperidine (me-**per**-i-deen)
Demerol

***Classification***
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

**Schedule II**

**Pregnancy Category C**

### Indications
Moderate or severe pain (alone or with nonopioid agents). Anesthesia adjunct. Analgesic during labor. Preoperative sedation. **Unlabeled Use:** Rigors.

### Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression. **Therapeutic Effects:** Decrease in severity of pain.

### Pharmacokinetics
**Absorption:** 50% from the GI tract; well absorbed from IM sites. Oral doses are about half as effective as parenteral doses.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk.
**Protein Binding:** Neonates: 52%; Infants 3–18 months: 85%; Adults: 60–80%.
**Metabolism and Excretion:** Mostly metabolized by the liver; some converted to normeperidine, which may accumulate and cause seizures. 5% excreted unchanged by the kidneys.
**Half-life:** Neonates: 12–39 hr; Infants 3–18 months: 2.3 hr; Children 5–8 yr: 3 hr; Adults: 2.5–4 hr (↑ in impaired renal or hepatic function [7–11 hr]).

TIME/ACTION PROFILE (analgesia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15 min | 60 min | 2–4 hr |
| IM | 10–15 min | 30–50 min | 2–4 hr |
| Subcut | 10–15 min | 40–60 min | 2–4 hr |
| IV | immediate | 5–7 min | 2–3 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Hypersensitivity to bisulfites (some injectable products); Recent (14–21 days) MAO inhibitor therapy; OB: Chronic use may pose risk to the fetus including possible addiction; Lactation: Excreted in breast milk and can cause respiratory depression in the infant.
**Use Cautiously in:** Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Debilitated patients (dose reduction suggested); Undiagnosed abdominal pain or prostatic hyperplasia; Patients with renal impairment, or extensive burns; High-dose or prolonged therapy (>600 mg/day or >2 days; increased risk of CNS stimulation and seizures due to accumulation of normeperidine); Sickle cell anemia (may require reduced initial doses); OB: Use during labor and delivery can cause respiratory depression in the newborn; Pedi: Syrup contains benzyl alcohol, which can cause "gasping syndrome" in neonates. Children have ↑ risk of seizures due to accumulation of normeperidine; Geri: Appears on Beers list; morphine recommended.

### Adverse Reactions/Side Effects
**CNS:** SEIZURES, confusion, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** allergic reactions including ANAPHYLAXIS, physical dependence, psychological dependence, tolerance.

### Interactions
**Drug-Drug:** Do not use in patients receiving **MAO inhibitors** or **procarbazine** (may cause fatal reaction—contraindicated within 14–21 days of MAO inhibitor therapy). ↑ CNS depression with **alcohol**, **antihistamines**, and **seda-**

**tive/hypnotics**. Administration of **agonist/antagonist opioid analgesics** may precipitate opioid withdrawal in physically dependent patients. **Nalbuphine** or **pentazocine** may ↓ analgesia. **Protease inhibitors** may ↑ effects and adverse reactions (concurrent use should be avoided). **Phenytoin** ↑ metabolism and may ↓ effects. **Chlorpromazine** and **thioridazine** may ↑ the risk of adverse reactions (concurrent use should be avoided). May aggravate side effects of **isoniazid**. **Acyclovir** may ↑ plasma concentrations of meperidine and normeperidine.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian,** or **chamomile** can ↓ CNS depression. **St. John's wort** may ↑ serious side effects, concurrent use is not recommended.

### Route/Dosage

**PO, IM, Subcut (Adults):** *Analgesia*—50 mg q 3-4 hr; may be ↑ as needed (not to exceed 600 mg/24 hr). *Analgesia during labor*—50–100 mg IM or subcut when contractions become regular; may repeat q 1–3 hr. *Preoperative sedation*—50–100 mg IM or subcut 30–90 min before anesthesia.
**PO, IM, Subcut (Children):** *Analgesia*—1–1.5 mg/kg q 3–4 hr (should not exceed 100 mg/dose). *Preoperative sedation*—1–2 mg/kg 30–90 min before anesthesia (not to exceed adult dose).
**IV (Adults):** 15–35 mg/hr as a continuous infusion; *PCA*—10 mg initially; with a range of 1–5 mg/incremental dose, recommended lockout interval is 6–10 min (minimum 5 min).
**IV (Children):** *Continuous infusion*—0.5–1 mg/kg loading dose followed by 0.3 mg/kg/hr, titrate to effect up to 0.5–0.7 mg/kg/hr.

### Availability (generic available)

**Tablets:** 50 mg, 100 mg. **Cost:** 50 mg $99.04/100, 100 mg $188.37/100. **Syrup (banana flavor):** 50 mg/5 mL. **Injection:** 🍁 10 mg/mL, 25 mg/0.5 mL, 25 mg/mL, 50 mg/mL, 75 mg/mL, 100 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following PO, subcut, and IM doses and 5 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive meperidine for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Monitor patients on chronic or high-dose therapy for CNS stimulation (restlessness, irritability, seizures) due to accumulation of normeperidine metabolite. Risk of toxicity increases with doses >600 mg/24 hr, chronic administration (>2 days), and renal impairment.
- Geri: Meperidine has been reported to cause delirium in the elderly; older adults are at increased risk for normeperidine toxicity. Monitor frequently.
- Pedi: Assess pediatric patient frequently; neonates, infants, and children are more sensitive to the effects of opioid analgesics and may experience respiratory complications, excitability and restlessness more frequently.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a

concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. In patients receiving meperidine chronically, naloxone may precipitate seizures by eliminating the CNS depressant effects of meperidine, allowing the convulsant activity of normeperidine to predominate. Monitor patient closely.

## Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings. Do not confuse with morphine or hydromorphone; fatalities have occurred. Pedi: Medication errors with opioid analgesics are common in the pediatric population and include misinterpretation or miscalculation of doses and use of inappropriate measuring devices.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower doses.
- Oral dose is <50% as effective as parenteral. When changing to oral administration, dose may need to be increased (see Appendix K).
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- May be administered via PCA pump.
- **PO:** Doses may be administered with food or milk to minimize GI irritation. Syrup should be diluted in half-full glass of water.
- **IM:** Administration of repeated subcut doses may cause local irritation.

### IV Administration

- **Direct IV:** ***Diluent:*** Dilute with sterile water or 0.9% NaCl for injection. ***Concentration:*** ≤10 mg/mL. ***Rate: High Alert:*** Administer slowly over at least 5 min. Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Intermittent Infusion:** ***Diluent:*** Dilute with D5W, D10W, dextrose/saline combinations, dextrose/Ringer's or lactated Ringer's injection combinations, 0.45% NaCl, 0.9% NaCl, or Ringer's or LR. Administer via infusion pump. ***Concentration:*** 1 mg/mL . ***Rate:*** Administer over 15–30 min.
- **Syringe Compatibility:** atropine, chlorpromazine, cimetidine, dimenhydrinate, diphenhydramine, droperidol, glycopyrrolate, hydroxyzine, ketamine, metoclopramide, midazolam, ondansetron, perphenazine, prochlorperazine, promazine, promethazine, ranitidine, scopolamine.
- **Syringe Incompatibility:** heparin, morphine, pantoprazole, pentobarbital.
- **Y-Site Compatibility:** alfentanil, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, busulfan, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, cisatracurium, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin, daunorubicin liposome, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxacurium, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eftifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, floxuridine, fluconazole, fludarabine, folic acid, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydrocortisone sodium phosphate, ifosfamide, insulin, irinotecan, isoproterenol, kanamycin, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, mannitol, melphalan, mesna, mataraminol, methotrexate, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, mivacurium, morphine, multivitamins, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plicamycin, potassium chloride, procainamide, prochlorperazine, prometha-

zine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, streoptzocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimethaphan, trimethobenzamide, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, azathioprine, cefepime, cefonocid, cefoperazone, dantrolene, diazepam, diazoxide, ganciclovir, idarubicin, indomethacin, lorazepam, micafungin, nafcillin, pantoprazole, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, thiopental.

## Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication.
- Instruct patient to take meperidine as directed. If dose is less effective after a few weeks, do not increase dose without consulting health care professional. Pedi: Teach parents or caregivers how to accurately measure liquid medication and to use only the measuring device dispensed with the medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise ambulatory patients that nausea and vomiting may be decreased by lying down.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

## Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

# **meropenem** (mer-oh-**pen**-nem)
Merrem

***Classification***
Therapeutic: anti-infectives
Pharmacologic: carbapenems

**Pregnancy Category B**

## Indications

Treatment of: Intra-abdominal infections, Bacterial meningitis, Skin and skin structure infections. **Unlabeled Use:** Febrile neutropenia, Hospital-acquired pneumonia and sepsis.

## Action

Binds to bacterial cell wall, resulting in cell death. Meropenem resists the actions of many enzymes that degrade most other penicillins and penicillin-like anti-infectives. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following gram-positive organisms: *Staphylococcus aureus*, *Streptococcus pneumoniae*, Viridans group streptococci, *Enterococcus faecalis*. Also active against the following gram-negative pathogens: *Escherichia coli*, *Haemophilus influenzae*, *Klebsiella pneumoniae*, *Neisseria meningitidis*, *Pseudomonas aeruginosa*, *Proteus mirabilis*. Active against the following anaerobes: *Bacteroides fragilis*, *Bacteroides fragilis* group, *Peptostreptococcus* species.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Widely distributed into body tissues and fluids; enters CSF when meninges are inflamed.
**Metabolism and Excretion:** 65–83% excreted unchanged by the kidneys.
**Half-life:** Premature neonates: 3 hr; Term neonates: 2 hr; Infants 3 mo–2 yr: 1.4 hr; Children >2 yr and Adults: 1 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | 8 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to meropenem or imipenem; Serious hypersensitivity to other beta-lactams (penicillins or cephalosporins; cross-sensitivity may occur).
**Use Cautiously in:** Renal impairment (↑ risk of thrombocytopenia and seizures; dose reduction recommended if CCr <50 mL/min); History

of seizures, brain lesions, or meningitis; OB, Lactation, Pedi: Pregnancy, lactation, or children <3 mo (safety not established).

### Adverse Reactions/Side Effects

**CNS:** SEIZURES, dizziness, headache. **Resp:** APNEA. **GI:** PSEUDOMEMBRANOUS COLITIS, constipation, diarrhea, glossitis (↑ in children), nausea, thrush (↑ in children), vomiting. **Derm:** moniliasis (children only), pruritus, rash. **Local:** inflammation at injection site, phlebitis. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug: Probenecid** ↓ renal excretion and increases blood levels (coadministration not recommended). May ↓ serum **valproate** levels (↑ risk of seizures).

### Route/Dosage

**IV (Adults):** 0.5–1 g q 8 hr. *Meningitis*—2 g q 8 hr.

**IV (Children ≥3 mo–12 yr):** *Intra-abdominal infections*—20 mg/kg q 8 hr; *meningitis*—40 mg/kg q 8 hr (maximum 2 g q 8 hr).

**IV (Neonates <7 days):** 20 mg/kg/dose q 12 hr. *Neonates >7 days, 1200–2000 g*—20 mg/kg/dose q 12 hr. *Neonates >7 days, >2000 g*—20 mg/kg/dose q 8 hr.

### Renal Impairment

**IV (Adults):** *CCr 26–50 mL/min*—1 g q 12 hr; *CCr 10–25 mL/min*—500 mg q 12 hr; *CCr <10 mL/min*—500 mg q 24 hr.

### Availability

**Powder for injection:** 500 mg, 1 g.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify physician immediately if these symptoms occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- Assess injection site for phlebitis, pain, and swelling periodically during administration.
- ***Lab Test Considerations:*** Monitor hematologic, hepatic, and renal functions periodically during therapy.
- BUN, AST, ALT, LDH, serum alkaline phosphatase, bilirubin, and creatinine may be transiently ↑.
- Hemoglobin and hematocrit concentrations may be ↓.
- May cause positive direct or indirect Coombs' test.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

**IV Administration**

- **Direct IV:** ***Diluent:*** Reconstitute 500-mg and 1-g vials with 10 mL and 20 mL, respectively, of sterile water for injection, 0.9% NaCl, or D5W. Vials reconstituted with sterile water for injection are stable for 2 hr at room temperature and 12 hr if refrigerated; if reconstituted with 0.9% NaCl, stable for 2 hr at room temperature and 18 hr if refrigerated; if reconstituted with D5W, stable for 1 hr at room temperature and 8 hr if refrigerated. ***Concentration:*** 50 mg/mL. ***Rate:*** Administer over 3–5 min.
- **Intermittent Infusion:** ***Diluent:*** Reconstitute 500-mg and 1-g vials with 10 mL and 20 mL, respectively, of sterile water for injection, 0.9% NaCl, or D5W. Further dilute in 0.9% NaCl or D5W to achieve concentration below. Infusions further diluted in 0.9% NaCl are stable for 4 hr at room temperature and 24 hr if refrigerated. Infusions further diluted in D5W are stable for 1 hr at room temperature and 4 hr if refrigerated. ***Concentration:*** Final concentration of infusion should be 1–20 mg/mL. ***Rate:*** Infuse over 15–30 min.
- **Y-Site Compatibility:** aminophylline, anidulafungin, atenolol, atropine, caspofungin, cimetidine, daptomycin, dexamethasone, digoxin, diltiazem, diphenhydramine, docetaxel, enalaprilat, fluconazole, furosemide, gentamicin, granisetron, heparin, hydromorphone, insulin, linezolid, lorazepam, metoclopramide, milrinone, morphine, norepinephrine, palonosetron, phenobarbital, potassium chloride, tacrolimus, tirofiban, vancomycin, vasopressin, voriconazole.
- **Y-Site Incompatibility:** amphotericin B, diazepam, fenoldopam, metronidazole, quinupristin/dalfopristin.

### Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

## **mesalamine** (me-**sal**-a-meen)

Apriso, Asacol, Asacol HD, Canasa, Lialda, Pentasa, Rowasa, Salofalk

***Classification***

Therapeutic: gastrointestinal anti-inflammatories

**Pregnancy Category B**

### Indications

Inflammatory bowel diseases including: Ulcerative colitis, Proctitis, Proctosigmoiditis.

### Action

Locally acting anti-inflammatory action in the colon, where activity is probably due to inhibition of prostaglandin synthesis. **Therapeutic Effects:** Reduction in the symptoms of inflammatory bowel disease.

### Pharmacokinetics

**Absorption:** 28% absorbed following oral administration; 10–30% absorbed from the colon, depending on retention time, following rectal administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Some metabolism occurs, site unknown; mostly eliminated unchanged in the feces.
**Half-life:** 12 hr PO (range 2–15 hr); 0.5–1.5 hr rectal.

TIME/ACTION PROFILE (clinical improvement)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | 6–8 hr |
| Extended release | 2 hr | 9–12 hr | 24 hr |
| Rectal | 3–21 days | unknown | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity reactions to sulfonamides, salicylates, mesalamine, or sulfasalazine; Cross-sensitivity with furosemide, sulfonylurea hypoglycemic agents, or carbonic anhydrase inhibitors may exist; G6PD deficiency; Hypersensitivity to bisulfites (mesalamine enema only); Urinary tract or intestinal obstruction; Porphyria.
**Use Cautiously in:** Severe hepatic or renal impairment; OB: Safety not established; Lactation: Has caused side effects in some infants; careful observation required.

### Adverse Reactions/Side Effects

**CNS:** headache, dizziness, malaise, weakness. **EENT:** pharyngitis, rhinitis. **CV:** pericarditis. **GI:** diarrhea, eructation (PO), flatulence, nausea, vomiting. **GU:** interstitial nephritis, pancreatitis, renal failure. **Derm:** hair loss, rash. **Local:** anal irritation (enema, suppository). **MS:** back pain. **Misc:** ANAPHYLAXIS, acute intolerance syndrome, fever.

### Interactions

**Drug-Drug:** May ↓ metabolism and ↑ effects/toxicity of **mercaptopurine** or **thioguanine**.

### Route/Dosage

#### One Asacol HD 800-mg tablet is NOT bioequivalent to two Asacol 400-mg tablets

**PO (Adults):** 800 mg (two 400-mg delayed–release tablets) 3 times daily for 6 wk *or* 1.6 g (two 800-mg delayed–release tablets) 3 times daily for 6 wk *or* 1 g 4 times daily as controlled-release capsules *or* two–four 1.2-g tablets once daily with a meal for a total daily dose of 2.4 or 4.8 g of *Lialda or* 1500 mg daily in morning of *Apriso*.
**Rect (Adults):** 4-g enema (60 mL) at bedtime, retained for 8 hr for 3–6 wk *or* 1 g at bedtime.

### Availability (generic available)

**Delayed-release tablets:** 250 mg, 400 mg, 500 mg, 800 mg (Asacol HD), 1.2 g (Lialda).
**Cost:** 400 mg $132.01/180, 1.2 g $515.96/120.

**Controlled-release capsules:** 250 mg, 500 mg. **Cost:** 250 mg $387.98/480, 500 mg $351.32/240. **Extended-release capsules (Apriso):** 375 mg. **Suppositories:** 1 g. **Cost:** $326.96/30. **Rectal suspension:** 4 g/60 mL. **Cost:** *Generic*—$317.69/28 bottles.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for allergy to sulfonamides and salicylates. Patients allergic to sulfasalazine may take mesalamine or olsalazine without difficulty, but therapy should be discontinued if rash or fever occurs.
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- **Inflammatory Bowel Disease:** Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and during therapy.
- ***Lab Test Considerations:*** Monitor urinalysis, BUN, and serum creatinine prior to and periodically during therapy. Mesalamine may cause renal toxicity.
- Mesalamine may cause ↑ AST and ALT levels, serum alkaline phosphatase, GGTP, LDH, amylase, and lipase.

### Potential Nursing Diagnoses

Acute pain (Indications)
Diarrhea (Indications)

### Implementation

- Do not confuse Asacol (mesalamine) with OsCal (calcium carbonate).
- **PO:** Administer with a full glass of water. Tablets should be swallowed whole; do not break the outer coating, which is designed to remain intact. Take *Lialda* tablets with a meal. Take *Apriso* capsules in the morning without regard to meals. Do not co-administer with antacids; may effect dissolution of the coating of the granules in *Apriso* capsules. Intact or partially intact tablets may occasionally be found in the stool. If this occurs repeatedly, advise patient to notify health care professional.
- **Rect:** Patient should empty bowel prior to administration of rectal dose forms.
- Avoid excessive handling of *suppository*. Remove foil wrapper and insert pointed end first into rectum with gentle pressure. Suppository should be retained for 1–3 hr or more for maximum benefit.
- Administer 60-mL retention enema once daily at bedtime. Solution should be retained for approximately 8 hr. Prior to administration of *rectal suspension*, shake bottle well and remove the protective cap. Have patient lie on left side with the lower leg extended and the upper leg flexed for support or place the patient in knee-chest position. Gently insert the applicator tip into the rectum, pointing toward the umbilicus. Squeeze the bottle steadily to discharge most of the preparation.

### Patient/Family Teaching

- Instruct patient on the correct method of administration. Advise patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose.
- May cause dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, unusual bleeding or bruising, wheezing, fever, or hives occur.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 months of therapy.
- Instruct patient to notify health care professional if symptoms worsen or do not improve. If symptoms of acute intolerance (cramping, acute abdominal pain, bloody diarrhea, fever, headache, rash) occur, discontinue therapy and notify health care professional immediately.
- Inform patient that proctoscopy and sigmoidoscopy may be required periodically during treatment to determine response.
- **Rect:** Instruct patient to use *rectal suspension* at bedtime and retain suspension all night for best results.
- Advise patient not to change brands of mesalamine without consulting health care professional.

### Evaluation/Desired Outcomes

- Decrease in diarrhea and abdominal pain.
- Return to normal bowel pattern in patients with inflammatory bowel disease. Effects may be seen within 3–21 days. The usual course of therapy is 3–6 wk.
- Maintenance of remission in patients with inflammatory bowel disease.

**mesna** (**mes**-na)
Mesnex, Uromitexan

***Classification***
Therapeutic: antidotes
Pharmacologic: ifosfamide detoxifying agents

**Pregnancy Category B**

## Indications
Prevention of ifosfamide-induced hemorrhagic cystitis (see Ifosfamide monograph). **Unlabeled Use:** May also prevent hemorrhagic cystitis from cyclophosphamide.

## Action
Binds to the toxic metabolites of ifosfamide in the kidneys. **Therapeutic Effects:** Prevents hemorrhagic cystitis from ifosfamide.

## Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability; 45–79% absorbed after oral administration. Following IV with PO dosing ↑ systemic exposure.
**Distribution:** Unknown.
**Metabolism and Excretion:** Rapidly converted to mesna disulfide, then back to mesna in the kidneys, where it binds to toxic metabolites of ifosfamide (18–26% excreted as free mesna in urine after IV and PO dosing).
**Half-life:** *Mesna*—0.36 hr (IV); 1.2—8.3 hr (IV followed by PO); *mesna disulfide*—1.17 hr.

TIME/ACTION PROFILE (detoxifying action)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO, IV | rapid | unknown | 4 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to mesna or other thiol (rubber) compounds.
**Use Cautiously in:** OB, Lactation: Safety not established.

## Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness, headache. **GI:** anorexia, diarrhea, nausea, unpleasant taste, vomiting. **Derm:** flushing. **Local:** injection site reactions. **Misc:** flu-like symptoms.

## Interactions
**Drug-Drug:** None significant.

## Route/Dosage
**IV (Adults):** Give a dose of mesna equal to 20% of the ifosfamide dose at the same time as ifosfamide and 4 and 8 hr after.
**PO, IV (Adults):** Give a dose of IV mesna equal to 20% of the ifosfamide dose at the same time as ifosfamide; then give PO mesna equal to 40% of the ifosfamide dose 2 and 6 hours after ifosfamide (total mesna dose is 100% of ifosfamide dose).

## Availability (generic available)
**Tablets:** 400 mg. **Injection:** 100 mg/mL. ***In combination with:*** In a kit with ifosfamide.

# NURSING IMPLICATIONS

## Assessment
- Monitor for development of hemorrhagic cystitis in patients receiving ifosfamide.
- ***Lab Test Considerations:*** Causes a false-positive result when testing urinary ketones.

## Potential Nursing Diagnoses
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

## Implementation
- Initial IV bolus is to be given at time of ifosfamide administration.
- **PO:** If second and third doses are given orally, administer 2 and 6 hours after IV dose.
- If PO mesna is vomited within 2 hr of administration, repeat dose or use IV mesna.

### IV Administration
- **Intermittent Infusion:** 2nd IV dose is given 4 hr later, 3rd dose is given 8 hr after initial dose. This schedule must be repeated with each subsequent dose of ifosfamide. ***Diluent:*** Dilute 2-, 4-, and 10-mL ampules, containing a concentration of 100 mg/mL in 8 mL, 16 mL, or 50 mL, respectively, of D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.2% NaCl, D5/0.33% NaCl, or LR. ***Concentration:*** 20 mg/mL. Refrigerate to store. Use within 6 hr. Discard unused solution. ***Rate:*** Administer over 15–30 min or as a continuous infusion.
- **Syringe Compatibility:** ifosfamide.
- **Y-Site Compatibility:** allopurinol, amifostine, aztreonam, cefepime, docetaxel, doxorubicin liposome, etoposide phosphate, filgrastim, fludarabine, gemcitabine, granisetron, linezolid, melphalan, methotrexate, ondansetron, oxaliplatin, paclitaxel, pemetrexed, piperacillin/tazobactam, sargramostim, sodium bicarbonate, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl complex, lansoprazole.
- **Additive Compatibility:** ifosfamide.
- **Additive Incompatibility:** carboplatin, cisplatin.

### Patient/Family Teaching
- Inform patient that unpleasant taste may occur during administration.
- Advise patient to notify health care professional if nausea, vomiting, or diarrhea persists or is severe.

### Evaluation/Desired Outcomes
- Prevention of hemorrhagic cystitis associated with ifosfamide therapy.

**mestranol/norethindrone, See CONTRACEPTIVES, HORMONAL.**

## metaxalone (me-**tax**-a-lone)
Skelaxin

***Classification***
Therapeutic: skeletal muscle relaxants (centrally acting)

**Pregnancy Category UK**

### Indications
Muscle spasm associated with acute painful musculoskeletal conditions (with rest and physical therapy).

### Action
Skeletal muscle relaxation, probably as a result of CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation.

### Pharmacokinetics
**Absorption:** Well absorbed following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver; metabolites excreted in urine.
**Half-life:** 2–3 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 hr | 2 hr | 4–6 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Significant hepatic/renal impairment; History of drug-induced hemolytic anemia or other anemia.
**Use Cautiously in:** Hepatic impairment; History of seizures; OB, Lactation, Pedi: Pregnancy, lactation or children ≤12 yr (safety not established); Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects.

### Adverse Reactions/Side Effects
**CNS:** drowsiness, dizziness, confusion, headache, irritability, nervousness. **GI:** nausea, anorexia, dry mouth, GI upset, vomiting. **GU:** urinary retention.

### Interactions
**Drug-Drug:** ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

### Route/Dosage
**PO (Adults):** 800 mg 3–4 times daily.

### Availability
**Tablets:** 800 mg. **Cost:** $299.97/100.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for pain, muscle stiffness, and range of motion before and periodically during therapy.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).
- ***Lab Test Considerations:*** Monitor hepatic function tests closely in patients with pre-existing liver damage.
- May cause false-positive Benedict's tests.

### Potential Nursing Diagnoses
Acute pain (Indications)
Impaired bed mobility (Indications)
Risk for injury (Side Effects)

### Implementation
- Provide safety measures as indicated. Supervise ambulation and transfer of patients.
- **PO:** Administer 3–4 times daily.

### Patient/Family Teaching
- Instruct patient to take medication as directed. Take missed doses within 1 hr; if not, return to regular dosing schedule. Do not double doses.
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- Medication may cause dizziness, drowsiness, and blurred vision. Advise patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.

- Instruct patient to notify health care professional if skin rash or yellowish discoloration of the skin or eyes occurs.
- Emphasize the importance of routine follow-up exams to monitor progress.

### Evaluation/Desired Outcomes

- Decreased musculoskeletal pain and muscle spasticity.
- Increased range of motion.

## metformin (met-**for**-min)

Fortamet, Glumetza, Glucophage, Glucophage XR, Novo-Metformin, Riomet

***Classification***

Therapeutic: antidiabetics
Pharmacologic: biguanides

**Pregnancy Category B**

### Indications

Management of type 2 diabetes mellitus; may be used with diet, insulin, or sulfonylurea oral hypoglycemics.

### Action

Decreases hepatic glucose production. Decreases intestinal glucose absorption. Increases sensitivity to insulin. **Therapeutic Effects:** Maintenance of blood glucose.

### Pharmacokinetics

**Absorption:** 50–60% absorbed after oral administration.
**Distribution:** Enters breast milk in concentrations similar to plasma.
**Metabolism and Excretion:** Eliminated almost entirely unchanged by the kidneys.
**Half-life:** 17.6 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | 12 hr |
| XR | unknown | 4–8 hr | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Metabolic acidosis; Dehydration, sepsis, hypoxemia, hepatic impairment, excessive alcohol use (acute or chronic); Renal dysfunction (serum creatinine >1.5 mg/dL in men or >1.4 mg/dL in women); Radiographic studies requiring IV iodinated contrast media (withhold metformin); CHF.

**Use Cautiously in:** Concurrent renal disease; Geri: Geriatric/debilitated patients (↓ doses may be required; avoid in patients >80 yr unless renal function is normal); Chronic alcohol use/abuse; Serious medical conditions (MI, stroke); Patients undergoing stress (infection, surgical procedures); Hypoxia; Pituitary deficiency or hyperthyroidism; OB, Lactation, Pedi: Pregnancy, lactation, or children <10 yr (safety not established; extended release for use in patients >17 yr only).

### Adverse Reactions/Side Effects

**GI:** abdominal bloating, diarrhea, nausea, vomiting, unpleasant metallic taste. **Endo:** hypoglycemia. **F and E:** LACTIC ACIDOSIS. **Misc:** decreased vitamin $B_{12}$ levels.

### Interactions

**Drug-Drug:** Acute or chronic **alcohol** ingestion or **iodinated contrast media** ↑ risk of lactic acidosis. **Amiloride**, **digoxin**, **morphine**, **procainamide**, **quinidine**, **ranitidine**, **triamterene**, **trimethoprim**, **calcium channel blockers**, and **vancomycin** may compete for elimination pathways with metformin. Altered responses may occur. **Cimetidine** and **furosemide** may ↑ effects of metformin. **Nifedipine** ↑ absorption and effects.
**Drug-Natural Products: Glucosamine** may worsen blood glucose control. **Chromium**, and **coenzyme Q-10** may produce ↑ hypoglycemic effects.

### Route/Dosage

**PO (Adults and children >17 yr):** 500 mg twice daily; may ↑ by 500 mg at weekly intervals up to 2000 mg/day. If doses >2000 mg/day are required, give in 3 divided doses (not to exceed 2500 mg/day) or 850 mg once daily; may ↑ by 850 mg at 2-wk intervals (in divided doses) up to 2550 mg/day in divided doses (up to 850 mg 3 times daily); *Extended-release tablets*— 500–1000 mg once daily with evening meal, may ↑ by 500 mg at weekly intervals up to 2500 mg once daily. If 2000 mg once daily is inadequate, 1000 mg twice daily may be used.
**PO (Children >10 yr):** 500 mg twice daily, may be ↑ by 500 mg/day at 1-wk intervals, up to 2000 mg/day in 2 divided doses.

### Availability (generic available)

**Tablets:** 500 mg, 850 mg, 1000 mg. **Cost:** 500 mg $86.72/100, 850 mg $149.95/100, 1000 mg $149.95/100. **Extended-release tablets (Fortamet, Glucophage XR, Glumetza):** 500 mg,

750 mg, 1000 mg. **Oral solution (cherry flavor):** 100 mg/mL. ***In combination with:*** glyburide (Glucovance) glipizide (Metaglip), pioglitazone (Actoplus Met, Actoplus Met XR), repaglinide (PrandiMet), rosiglitazone (Avandamet) and sitagliptin (Janumet). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- When combined with oral sulfonylureas, observe for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Patients who have been well controlled on metformin who develop illness or laboratory abnormalities should be assessed for ketoacidosis or lactic acidosis. Assess serum electrolytes, ketones, glucose, and, if indicated, blood pH, lactate, pyruvate, and metformin levels. If either form of acidosis is present, discontinue metformin immediately and treat acidosis.
- ***Lab Test Considerations:*** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of therapy. May cause false-positive results for urine ketones.
- Monitor blood glucose concentrations routinely by patient and every 3 mo by health care professional to determine effectiveness of therapy.
- Assess renal function before initiating and at least annually during therapy. Discontinue metformin if renal impairment occurs.
- Monitor serum folic acid and vitamin $B_{12}$ every 1–2 yr in long-term therapy. Metformin may interfere with absorption.

### Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin. Withhold metformin and reinstitute after resolution of acute episode.
- Metformin therapy should be temporarily discontinued in patients requiring surgery involving restricted intake of food and fluids. Resume metformin when oral intake has resumed and renal function is normal.
- Withhold metformin before or at the time of studies requiring IV administration of iodinated contrast media and for 48 hr after study.
- **PO:** Administer metformin with meals to minimize GI effects.
- XR tablets must be swallowed whole; do not crush or chew.

### Patient/Family Teaching

- Instruct patient to take metformin at the same time each day, as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses.
- Explain to patient that metformin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Explain to patient the risk of lactic acidosis and the potential need for discontinuation of metformin therapy if a severe infection, dehydration, or severe or continuing diarrhea occurs or if medical tests or surgery is required. Symptoms of lactic acidosis (chills, diarrhea, dizziness, low blood pressure, muscle pain, sleepiness, slow heartbeat or pulse, dyspnea, or weakness) should be reported to health care professional immediately.
- Caution patient to avoid taking other Rx, OTC, herbal products, or alcohol during metformin therapy without consulting health care professional.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Inform patient that metformin may cause an unpleasant or metallic taste that usually resolves spontaneously.
- Inform patients taking XR tablets that inactive ingredients resembling XR tablet may appear in stools.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.

- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Advise patient to report the occurrence of diarrhea, nausea, vomiting, and stomach pain or fullness to health care professional.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose, glycosylated hemoglobin, renal function, and hematologic parameters.

### Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes. Control may be achieved within a few days, but full effect of therapy may be delayed for up to 2 wk. If patient has not responded to metformin after 4 wk of maximum dose therapy, an oral sulfonylurea may be added. If satisfactory results are not obtained with 1–3 months of concurrent therapy, oral agents may be discontinued and insulin therapy instituted.

HIGH ALERT

## methadone (meth-a-done)

Methadose

***Classification***

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

**Schedule II**

**Pregnancy Category C**

### Indications

Severe pain. Suppresses withdrawal symptoms in opioid detoxification. **Unlabeled Use:** Neonatal abstinence syndrome.

### Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression. **Therapeutic Effects:** Decrease in severity of pain. Suppression of withdrawal symptoms during detoxification and maintenance from heroin and other opioids.

### Pharmacokinetics

**Absorption:** Well absorbed from all sites (50% absorbed following oral administration). **Distribution:** Widely distributed. Crosses the placenta; enters breast milk. **Protein Binding:** High. **Metabolism and Excretion:** Mostly metabolized by the liver; some metabolites are active and may accumulate with chronic administration. **Half-life:** 15–25 hr; ↑ with chronic use.

TIME/ACTION PROFILE (analgesic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–60 min | 90–120 min | 4–12 hr |
| IM, subcut | 10–20 min | 60–120 min | 4–6 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Known alcohol intolerance (some oral solutions); Concurrent MAO inhibitor therapy. **Use Cautiously in:** Structural heart disease, concomitant diuretic use, hypokalemia, hypomagnesemia, history of arrhythmia/syncope, or other risk factors for arrhythmias; Concurrent use of drugs that prolong the QTc interval or are CYP3A4 inhibitors; Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hyperplasia or ureteral stricture; OB: Use with addiction control: weigh risk against potential for illicit drug use. Counsel mother about potential harm to fetus; Lactation: Appears in breast milk. Weigh risks against potential for illicit drug use. Counsel mother about potential harm to infant and to wean breastfeeding slowly to prevent abstinence syndrome; Geri: Dose reduction suggested.

### Adverse Reactions/Side Effects

**CNS:** confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia, QT prolongation, torsades de pointes. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

### Interactions

**Drug-Drug:** Use with extreme caution in patients receiving **MAO inhibitors** (may result in severe, unpredictable reactions—reduce initial dose of methadone to 25% of usual dose). Use with extreme caution with any drug known to potentially prolong QT interval, including **class I and III antiarrhythmics**, some **neuroleptics** and **tricyclic antidepressants**, and **calcium channel blockers**. Use with extreme caution with CYP3A4

inhibitors, including **ketoconazole**, **itraconazole**, **erythromycin**, **clarithromycin**, **calcium channel blockers**, or **voriconazole**. Concurrent use with **laxatives**, **diuretics**, or **mineralocorticoids** may ↑ risk of hypomagnesemia or hypokalemia and ↑ risk of arrhythmias. ↑ CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. Administration of **agonist/antagonist opioids** may precipitate opioid withdrawal in physically dependent patients. **Nalbuphine** or **pentazocine** may ↓ analgesia. **Interferons (alpha)** may ↓ metabolism and ↑ effects. **Nevirapine**, **efavirenz**, **ritonavir**, **ritonavir/lopinavir**, **phenobarbital**, **carbamazepinephenytoin**, and **rifampin** may ↑ metabolism and ↓ analgesia; withdrawal may occur. **Fluvoxamine** may ↑ CNS depression; with **fluvoxamine**, opioid withdrawal may occur. May ↑ blood levels and effects of **zidovudine** and **desipramine**. May ↓ level and effects of **didanosine** and **stavudine**.

**Drug-Natural Products: St. John's wort** ↑ metabolism and ↓ blood levels, concurrent use may result in withdrawal. **Kava-kava**, **valerian**, or **chamomile**, can ↑ CNS depression.

### Route/Dosage

Larger doses may be required for analgesia during chronic therapy; interval may be ↓/dose ↑ if pain recurs.

**PO (Adults and Children ≥ 50 kg):** *Analgesic*—20 mg q 6–8 hr. *Opioid detoxification*—15–40 mg once daily or amount needed to prevent withdrawal. Dose may be decreased q 1–2 days; maintenance dose is determined on an individual basis.

**PO (Adults and Children < 50 kg):** *Analgesic*—0.1 mg/kg/dose q 4 hr for 2–3 doses then q 6–8 hr prn; maximum: 10 mg/dose. *Iatrogenic narcotic dependency*—0.05–0.1 mg/kg/dose q 6 hr; increase by 0.05 mg/kg/dose until withdrawal symptoms controlled; after 1–2 days lengthen dosing interval to q 12–24 hr; taper by decreasing dose by 0.05 mg/kg/day.

**PO, IV (Neonates):** Initial 0.05–0.2 mg/kg/dose q 12–24 hr or 0.5 mg/kg/day divided q 8 hr; taper dose by 10–20% per week over 1–1½ months.

**IV, IM, Subcut (Adults and Children ≥50 kg):** *Analgesic*—10 mg q 6–8 hr. *Opioid detoxification*—15–40 mg once daily or amount needed to prevent withdrawal. Dose may be ↓ q 1–2 days; maintenance dose is determined on an individual basis.

**IV, IM, Subcut (Adults and Children <50 kg):** *Analgesic*–0.1 mg/kg q 6–8 hr; maximum: 10 mg/dose.

### Availability (generic available)

**Tablets:** 5 mg, 10 mg. **Dispersible tablets (diskettes):** 40 mg (available only to licensed detoxification/maintenance programs). **Injection:** 10 mg/mL. **Oral solution (contains alcohol) (citrus):** 5 mg/5 mL, 10 mg/5 mL. **Oral concentrate (cherry and unflavored):** 10 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- **Pain:** Assess type, location, and intensity of pain prior to and 1–2 hr (peak) following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Cumulative effects of this medication may require periodic dose adjustments.
- Doses of methadone for patients on methadone maintenance only prevent withdrawal symptoms; *no analgesia is provided*. Additional opioid doses are required for treatment of pain.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is < 10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive methadone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.

- Assess for history of structural heart disease, arrhythmia, and syncope. Obtain a pretreatment ECG to measure QTc interval and follow-up ECG within 30 days and annually. Additional ECGs recommended if dose >100 mg/day or if patients have unexplained syncope or seizures. If QTc interval is >450 ms but <500 ms, discuss potential risks and benefits with patients and monitor more frequently. If the QTc interval >500 ms, consider discontinuing or reducing dose; eliminating contributing factors (drugs that promote hypokalemia) or using an alternative therapy.
- **Opioid Detoxification:** Assess patient for signs of opioid withdrawal (irritability, runny nose and eyes, abdominal cramps, body aches, sweating, loss of appetite, shivering, unusually large pupils, trouble sleeping, weakness, yawning). Methadone maintenance is undertaken only by federally approved treatment centers. This does not preclude maintenance for addicts hospitalized for other conditions and who require temporary maintenance during their care.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing < 40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

## Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if administered before pain becomes severe. For patients in chronic severe pain, the oral solution containing 5 or 10 mg/5 mL is recommended on a fixed dose schedule.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- Diskettes (dispersible tablets) are to be dissolved and used for detoxification and maintenance treatment only.
- **PO:** Doses may be administered with food or milk to minimize GI irritation.
- Dilute each dose of 10 mg/mL oral concentrate with at least 30 mL of water or other liquid prior to administration.
- **Subcut, IM:** IM is the preferred parenteral route for repeated doses. Subcut administration may cause tissue irritation.

## Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication.
- Instruct patient to take methadone exactly as directed. If dose is less effective after a few weeks, do not increase dose without consulting health care professional.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient of the potential for arrhythmias and emphasize the importance of regular ECGs.
- Caution patient notify health care professional if signs of overdose (difficult or shallow breathing, extreme tiredness or sleepiness, blurred vision, inability to think, talk, or walk normally, and feelings of faintness, dizziness, or confusion) occur. Methadone has a prolonged action causing increased risk of overdose.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

### Evaluation/Desired Outcomes
- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Prevention of withdrawal symptoms in detoxification from heroin and other opioid analgesics.

## **methimazole** (meth-**im**-a-zole)
Tapazole

***Classification***
Therapeutic: antithyroid agents

**Pregnancy Category D**

### Indications
Palliative treatment of hyperthyroidism. Used as an adjunct to control hyperthyroidism in preparation for thyroidectomy or radioactive iodine therapy.

### Action
Inhibits the synthesis of thyroid hormones. **Therapeutic Effects:** Decreased signs and symptoms of hyperthyroidism.

### Pharmacokinetics
**Absorption:** Rapidly absorbed following oral administration.
**Distribution:** Crosses the placenta and enters breast milk in high concentrations.
**Metabolism and Excretion:** Mostly metabolized by the liver; <10% eliminated unchanged by the kidneys.
**Half-life:** 3–5 hr.

TIME/ACTION PROFILE (effect on thyroid function)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 wk | 4–10 wk | wk |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Lactation: Lactation.
**Use Cautiously in:** Patients with ↓ bone marrow reserve; Patients >40 yr (↑ risk of agranulocytosis); OB: May be used cautiously; however, thyroid problems may occur in the fetus.

### Adverse Reactions/Side Effects
**CNS:** drowsiness, headache, vertigo. **GI:** diarrhea, hepatotoxicity, loss of taste, nausea, parotitis, vomiting. **Derm:** rash, skin discoloration, urticaria. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia, thrombocytopenia. **MS:** arthralgia. **Misc:** fever, lymphadenopathy.

### Interactions
**Drug-Drug:** Additive bone marrow depression with **antineoplastics** or **radiation therapy**. Antithyroid effect may be ↓ by **potassium iodide** or **amiodarone**. ↑ risk of agranulocytosis with **phenothiazines**. May alter response to **warfarin** and **digoxin**.

### Route/Dosage
**PO (Adults):** *Thyrotoxic crisis*—15–20 mg q 4 hr during the first 24 hr (with other interventions). *Hyperthyroidism*—15–60 mg/day as a single dose or divided doses for 6–8 wk. *Maintenance*—5–30 mg/kg as a single dose or 2 divided doses.
**PO (Children):** *Initial*—400 mcg (0.4 mg)/kg/day in single dose or 2 divided doses. *Maintenance*—200 mcg/kg/day in single dose or 2 divided doses.

### Availability (generic available)
**Tablets:** 5 mg, 10 mg.

## NURSING IMPLICATIONS

### Assessment
- Monitor response for symptoms of hyperthyroidism or thyrotoxicosis (tachycardia, palpitations, nervousness, insomnia, fever, diaphoresis, heat intolerance, tremors, weight loss, diarrhea).
- Assess patient for development of hypothyroidism (intolerance to cold, constipation, dry skin, headache, listlessness, tiredness, or weakness). Dose adjustment may be required.
- Assess patient for skin rash or swelling of cervical lymph nodes. Treatment may be discontinued if this occurs.
- ***Lab Test Considerations:*** Monitor thyroid function studies prior to therapy, monthly during initial therapy, and every 2–3 mo during therapy.
- Monitor WBC and differential counts periodically during therapy. Agranulocytosis may develop rapidly; usually occurs during the first 2 mo and is more common in patients over 40 yr and those receiving >40 mg/day. This necessitates discontinuation of therapy.
- May cause ↑ AST, ALT, LDH, alkaline phosphatase, serum bilirubin, and prothrombin time.

### Potential Nursing Diagnoses
Noncompliance (Patient/Family Teaching)

### Implementation
- **PO:** Administer at same time in relation to meals every day. Food may either increase or decrease absorption.

## Patient/Family Teaching

- Instruct patient to take medication as directed, around the clock. Take missed doses as soon as remembered; take both doses together if almost time for next dose; check with health care professional if more than 1 dose is missed. Consult health care professional prior to discontinuing medication.
- Instruct patient to monitor weight 2–3 times weekly. Notify health care professional of significant changes.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional regarding dietary sources of iodine (iodized salt, shellfish).
- Advise patient to report sore throat, fever, chills, headache, malaise, weakness, yellowing of eyes or skin, unusual bleeding or bruising, rash, or symptoms of hyperthyroidism or hypothyroidism promptly.
- Instruct patient to consult health care professional before taking any OTC medications.
- Advise patient to carry identification describing medication regimen at all times.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of routine exams to monitor progress and to check for side effects.

## Evaluation/Desired Outcomes

- Decrease in severity of symptoms of hyperthyroidism (lowered pulse rate and weight gain).
- Return of thyroid function studies to normal.
- May be used as short-term adjunctive therapy to prepare patient for thyroidectomy or radiation therapy or may be used in treatment of hyperthyroidism. Treatment from 6 mo to several yr may be necessary, usually averaging 1 yr.

# methocarbamol

(meth-oh-**kar**-ba-mole)

Robaxin

***Classification***

Therapeutic: skeletal muscle relaxants (centrally acting)

**Pregnancy Category C**

## Indications

Adjunctive treatment of muscle spasm associated with acute painful musculoskeletal conditions (with rest and physical therapy).

## Action

Skeletal muscle relaxation, probably as a result of CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation.

## Pharmacokinetics

**Absorption:** Rapidly absorbed from the GI tract.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk in small amounts.
**Metabolism and Excretion:** Metabolized by the liver.
**Half-life:** 1–2 hr.

TIME/ACTION PROFILE (skeletal muscle relaxation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | 2 hr | unknown |
| IM | rapid | unknown | unknown |
| IV | immediate | end of infusion | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hypersensitivity to polyethylene glycol (parenteral form); Renal impairment (parenteral form).
**Use Cautiously in:** Seizure disorders (parenteral form); OB, Lactation, Pedi: Safety not established; Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES (IV, IM only), dizziness, drowsiness, light-headedness. **EENT:** blurred vision, nasal congestion. **CV:** *IV*—bradycardia, hypotension. **GI:** anorexia, GI upset, nausea. **GU:** brown, black, or green urine. **Derm:** flushing (IV only), pruritus, rashes, urticaria. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS (IM, IV use only), fever.

## Interactions

**Drug-Drug:** Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

## Route/Dosage

**PO (Adults):** 1.5 g 4 times daily initially (up to 8 g/day) for 2–3 days, then 4–4.5 g/day in 3–6 di-

vided doses; may be followed by maintenance dosing of 750 mg q 4 hr or 1 g 4 times daily or 1.5 g 3 times daily.
**IM, IV (Adults):** 1–3 g/day for not more than 3 days; course may be repeated after a 48-hr rest.

### Availability (generic available)
**Tablets:** 500 mg, 750 mg. **Injection:** 100 mg/mL.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- Monitor pulse and blood pressure every 15 min during parenteral administration.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).
- Assess patient for allergic reactions (skin rash, asthma, hives, wheezing, hypotension) after parenteral administration. Keep epinephrine and oxygen on hand in the event of a reaction.
- Monitor IV site. Injection is hypertonic and may cause thrombophlebitis. Avoid extravasation.
- ***Lab Test Considerations:*** Monitor renal function periodically during prolonged parenteral therapy (>3 days), because polyethylene glycol 300 vehicle is nephrotoxic.
- May cause falsely increased urinary 5-hydroxyindoleacetic acid (5-HIAA) and vanillylmandelic acid (VMA) determinations.

### Potential Nursing Diagnoses
Acute pain (Indications)
Impaired physical mobility (Indications)
Risk for injury (Side Effects)

### Implementation
- Provide safety measures as indicated. Supervise ambulation and transfer of patients.
- **PO:** May be administered with food to minimize GI irritation. Tablets may be crushed and mixed with food or liquids to facilitate swallowing. For administration via NG tube, crush tablet and suspend in water or saline.
- **IM:** Do not administer subcut. IM injections should contain no more than 5 mL (500 mg) at a time in the gluteal region.

**IV Administration**
- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 100 mg/mL. ***Rate:*** Administer at a maximum rate of 180 mg/m2/min but not > 3 mL (300 mg)/min.
- **Intermittent Infusion:** ***Diluent:*** Dilute each dose in no more than 250 mL of 0.9% NaCl or D5W for injection. ***Concentration:*** 4 mg/mL for slower infusions. Do not refrigerate after dilution.
- Have patient remain recumbent during and for at least 10–15 min after infusion to avoid orthostatic hypotension.

### Patient/Family Teaching
- Advise patient to take medication as directed. Take missed doses within 1 hr; if not, return to regular dosing schedule. Do not double doses.
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- May cause dizziness, drowsiness, and blurred vision. Advise patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants.
- Inform patient that urine may turn black, brown, or green, especially if left standing.
- Instruct patient to notify health care professional if skin rash, itching, fever, or nasal congestion occurs.
- Emphasize the importance of routine follow-up exams to monitor progress.

### Evaluation/Desired Outcomes
- Decreased musculoskeletal pain and muscle spasticity.
- Increased range of motion.

HIGH ALERT

## **methotrexate** (meth-o-**trex**-ate)
Rheumatrex, Trexall

***Classification***
Therapeutic: antineoplastics, antirheumatics (DMARDs), immunosuppressants
Pharmacologic: antimetabolites

**Pregnancy Category X**

### Indications
Alone or with other treatment modalities in the treatment of: Trophoblastic neoplasms (choriocarcinoma, chorioadenoma destruens, hydatidiform mole), Leukemias, Breast carcinoma, Head carcinoma, Neck carcinoma, Lung carcinoma. Treatment of severe psoriasis and rheumatoid arthritis unresponsive to conventional therapy. Treatment of mycosis fungoides (cutaneous T-cell lymphoma).

## Action

Interferes with folic acid metabolism. Result is inhibition of DNA synthesis and cell reproduction (cell-cycle S-phase–specific). Also has immunosuppressive activity. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones, and immunosuppression.

## Pharmacokinetics

**Absorption:** Small doses are well absorbed from the GI tract. Larger doses incompletely absorbed.
**Distribution:** Actively transported across cell membranes, widely distributed. Does not reach therapeutic concentrations in the CSF. Crosses placenta; enters breast milk in low concentrations. Absorption in children is variable (23–95%) and dose-dependent.
**Metabolism and Excretion:** Excreted mostly unchanged by the kidneys.
**Half-life:** *Low dose*—3–10 hr; *high dose*—8–15 hr (↑ in renal impairment).

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO, IM, IV | 4–7 days | 7–14 days | 21 days |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB, Lactation: Pregnancy or lactation; Pedi: Products containing benzyl alcohol should not be used in neonates.
**Use Cautiously in:** Renal impairment (CCr must be ≥60 mL/min prior to therapy); Patients with childbearing potential; Active infections; ↓ bone marrow reserve; Geri: May be more sensitive to toxicity and adverse events.

## Adverse Reactions/Side Effects

**CNS:** arachnoiditis (IT use only), dizziness, drowsiness, headache, malaise. **EENT:** blurred vision, dysarthriatransient blindness. **Resp:** PULMONARY FIBROSIS, intestinal pneumonitis. **GI:** anorexia, hepatotoxicity, nausea, stomatitis, vomiting. **GU:** infertility. **Derm:** alopecia, painful plaque erosions (during psoriasis treatment), photosensitivity, pruritus, rashes, skin ulceration, urticaria. **Hemat:** APLASTIC ANEMIA, anemia, leukopenia, thrombocytopenia. **Metab:** hyperuricemia. **MS:** osteonecrosis, stress fracture. **Misc:** nephropathy, chills, fever, soft tissue necrosis.

## Interactions

**Drug-Drug:** The following drugs may ↑ hematologic toxicity of methotrexate: high-dose **salicylates**, **NSAIDs**, **oral hypoglycemic agents (sulfonylureas)**, **phenytoin**, **tetracyclines**, **probenecid**, **trimethoprim/sulfamethoxazole**, **pyrimethamine**, and **chloramphenicol**. ↑ hepatotoxicity with other **hepatotoxic drugs** including **azathioprine**, **sulfasalazine**, and **retinoids**. ↑ nephrotoxicity with other **nephrotoxic drugs**. ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. **Radiation therapy** ↑ risk of soft tissue necrosis and osteonecrosis. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. ↑ risk of neurologic reactions with **acyclovir** (IT methotrexate only). **Asparaginase** may ↓ effects of methotrexate.
**Drug-Natural Products:** Concomitant use with **echinacea** and **melatonin** may interfere with immunosuppression. **Caffeine** may ↓ efficacy of methotrexate, similar effect may occur with **guarana**.

## Route/Dosage

### Trophoblastic Neoplasms

**PO, IM (Adults):** 15–30 mg/day for 5 days; repeat after 1 or more weeks for 3–5 courses.

### Breast Cancer

**IV (Adults):** 40 mg/m² on days 1 and 8 (with other agents; many regimens are used).

### Leukemia

**PO (Adults):** *Induction*—3.3 mg/m²/day, usually with prednisone.
**PO, IM (Adults):** *Maintenance*—20–30 mg/m² twice weekly.
**IV (Adults):** 2.5 mg/kg q 2 wk.
**IT (Adults):** 12 mg/m² or 15 mg.
**IT (Children ≥3 yr):** 12 mg.
**IT (Children 2 yr):** 10 mg.
**IT (Children 1 yr):** 8 mg.
**IT (Children <1 yr):** 6 mg.

### Osteosarcoma

**IV (Adults):** 12 g/m² as a 4-hr infusion followed by leucovorin rescue, usually as part of a combination chemotherapeutic regimen (or increase dose until peak serum methotrexate level is $1 \times 10^{-3}$ M/L but not to exceed 15 g/m²; 12 courses are given starting 4 wk after surgery and repeated at scheduled intervals.

### Psoriasis

Therapy may be preceded by a 5- –10-mg test dose.

**PO (Adults):** 2.5–5 mg q 12 hr for 3 doses *or* q 8 hr for 4 doses once weekly (not to exceed 30 mg/wk).
**PO, IM, IV (Adults):** 10–25 mg/weekly (not to exceed 30 mg/wk).

### Arthritis

Therapy may be preceded by a 5–10-mg test dose in adults.
**PO (Adults):** 7.5 mg weekly (2.5 mg q 12 hr for 3 doses or single dose, not to exceed 20 mg/wk); when response is obtained, dose should be ↓.
**PO (Children):** 10 mg/m² once weekly initially, may be ↑ up to 20–30 mg/m², however response may be better if doses >20 mg/m² are given IM or subcut.

### Mycosis Fungoides

**PO, IM, Subcut (Adults):** 5–50 mg once weekly, if response is poor, dose may be changed to 15–37.5 mg twice weekly.
**IM (Adults):** 50 mg once weekly or 25 mg twice weekly.

### Availability (generic available)

**Tablets:** 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg. **Injection:** 25 mg/mL. **Powder for injection:** 1 g/vial. **Preservative-free injection:** 25 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor vital signs periodically during administration. Report significant changes.
- Monitor for abdominal pain, diarrhea, or stomatitis; therapy may need to be discontinued.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of pulmonary toxicity, which may manifest early as a dry, nonproductive cough.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol and alkalinization of urine may be used to decrease uric acid levels.
- Assess nutritional status. Administering an antiemetic prior to and periodically during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- **IT:** Assess for development of nuchal rigidity, headache, fever, confusion, drowsiness, dizziness, weakness, or seizures.
- **Rheumatoid Arthritis:** Assess patient for pain and range of motion prior to and periodically during therapy.
- **Psoriasis:** Assess skin lesions prior to and periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC and differential prior to and frequently during therapy. The nadir of leukopenia and thrombocytopenia occurs in 7–14 days. Leukocyte and thrombocyte counts usually recover 7 days after the nadirs. Notify health care professional of any sudden drop in values.
- Monitor renal (BUN and creatinine) and hepatic function (AST, ALT, bilirubin, and LDH) prior to and routinely during therapy. Urine pH should be monitored prior to high-dose methotrexate therapy and every 6 hr during leucovorin rescue. Urine pH should be kept above 7.0 to prevent renal damage.
- May cause ↑ serum uric acid concentrations, especially during initial treatment of leukemia and lymphoma.
- ***Toxicity and Overdose:*** Monitor serum methotrexate levels every 12–24 hr during high-dose therapy until levels are $<5 \times 10$ M. This monitoring is essential to plan correct leucovorin dose and determine duration of rescue therapy.
- With high-dose therapy, patient must receive leucovorin rescue within 24–48 hr to prevent fatal toxicity. In cases of massive overdose, hydration and urinary alkalization may be required to prevent renal tubule damage. Monitor fluid and electrolyte status. Intermittent hemodialysis using a high-flux dialyzer may be used for clearance until levels are <0.05 micromolar.

### Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Imbalanced nutrition: less than body requirements (Adverse Reactions)

### Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations and infusion pump settings. Methotrexate for non-oncologic use is given at a much lower dose and fre-

quency—often just once a week. Do not confuse non-oncologic dosing regimens with dosing regimens for cancer patients.

- Solutions for injection should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers (see Appendix L).

### IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute each vial with 25 mL of 0.9% NaCl. Use sterile preservative-free diluents for high-dose regimens to prevent complications from large amounts of benzyl alcohol. Do not use preparations that are discolored or that contain a precipitate. Reconstitute immediately before use. Discard unused portion. ***Concentration:*** < 25 mg/mL for direct IV and intermittent/continuous infusions. ***Rate:*** Administer at a rate of 10 mg/min into Y-site of a free-flowing IV.
- **Intermittent/Continuous Infusion:** ***Diluent:*** Doses >100–300 mg/m2 may also be diluted in D5W, D5/0.9% NaCl, or 0.9% NaCl and infused as intermittent or continuous infusion. ***Rate:*** Administration rates of 4–20 mg/hr have been used.
- **Syringe Compatibility:** bleomycin, cisplatin, cyclophosphamide, doxapram, doxorubicin, fluorouracil, furosemide, heparin, leucovorin, mitomycin, vinblastine, vincristine.
- **Syringe Incompatibility:** droperidol.
- **Y-Site Compatibility:** allopurinol, amifostine, amphotericin B cholesteryl sulfate, asparaginase, aztreonam, bleomycin, cefepime, ceftriaxone, cimetidine, cisplatin, cyclophosphamide, cytarabine, daunorubicin, diphenhydramine, doxorubicin, doxorubicin liposome, etoposide, etoposide phosphate, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, ganciclovir, granisetron, heparin, hydromorphone, imipenem/cilastatin, lansoprazole, leucovorin, linezolid, lorazepam, melphalan, mesna, methylprednisolone sodium succinate, metoclopramide, mitomycin, morphine, ondansetron, oxaliplatin, paclitaxel, piperacillin/tazobactam, prochlorperazine, ranitidine, sargramostim, teniposide, thiotepa, vinblastine, vincristine, vinorelbine.
- **Y-Site Incompatibility:** chlorpromazine, gemcitabine, idarubicin, ifosfamide, midazolam, nalbuphine, promethazine, propofol.
- **Additive Compatibility:** cyclophosphamide, cytarabine, fluorouracil, mercaptopurine, ondansetron, sodium bicarbonate, vincristine.
- **Additive Incompatibility:** bleomycin.
- **IT:** Reconstitute preservative-free methotrexate with preservative-free 0.9% NaCl, Elliot's B solution, or patient's CSF to a concentration not greater than 2 mg/mL. May be administered via lumbar puncture or Ommaya reservoir. To prevent bacterial contamination, use immediately.

### Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, it should be omitted. Consult health care professional if vomiting occurs shortly after a dose is taken.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or other NSAIDs; may precipitate gastric bleeding.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Topical therapy may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Instruct patient to avoid the use of Rx, OTC, or herbal products without first consulting health care professional.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 3 mo for men and 1 ovulatory cycle for women after completion of therapy.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the need for periodic lab tests to monitor for side effects.

## Evaluation/Desired Outcomes

- Improvement of hematopoietic values in leukemia.
- Decrease in symptoms of meningeal involvement in leukemia.
- Decrease in size and spread of non-Hodgkin's lymphomas and other solid cancers.
- Resolution of skin lesions in severe psoriasis.
- Decreased joint pain and swelling.
- Improved mobility in patients with rheumatoid arthritis.
- Regression of lesions in mycosis fungoides.

# methyldopa (meth-ill-doe-pa)

Apo-Methyldopa, Dopamet, Novamedopa, Nu-Medopa

***Classification***

Therapeutic: antihypertensives
Pharmacologic: centrally acting antiadrenergics

**Pregnancy Category B**

## Indications

Management of moderate to severe hypertension (with other agents).

## Action

Stimulates CNS alpha-adrenergic receptors, producing a decrease in sympathetic outflow to heart, kidneys, and blood vessels. Result is decreased blood pressure and peripheral resistance, a slight decrease in heart rate, and no change in cardiac output. **Therapeutic Effects:** Lowering of blood pressure.

## Pharmacokinetics

**Absorption:** 50% absorbed from the GI tract. Parenteral form, methyldopate hydrochloride, is slowly converted to methyldopa.
**Distribution:** Crosses the blood-brain barrier. Crosses the placenta; small amounts enter breast milk.
**Metabolism and Excretion:** Partially metabolized by the liver, partially excreted unchanged by the kidneys.
**Half-life:** 1.7 hr.

TIME/ACTION PROFILE (antihypertensive effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 4–6 hr | 12–24 hr | 24–48 hr |
| IV | 4–6 hr | unknown | 10–16 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Active liver disease.
**Use Cautiously in:** Previous history of liver disease; OB: Has been used safely (may be used for treatment of hypertension in pregnancy); Lactation: Usually compatible with breastfeeding; Geri: ↑ risk of adverse reactions; consider age-related impairment of hepatic, renal and cardiovascular function as well as other chronic illnesses. Appears on Beers list. May cause bradycardia and exacerbate depression.

## Adverse Reactions/Side Effects

**CNS:** sedation, ↓ mental acuity, depression. **EENT:** nasal stuffiness. **CV:** MYOCARDITIS, bradycardia, edema, orthostatic hypotension. **GI:** DRUG-INDUCED HEPATITIS, diarrhea, dry mouth. **GU:** erectile dysfunction. **Hemat:** eosinophilia, hemolytic anemia. **Misc:** fever.

## Interactions

**Drug-Drug:** Additive hypotension with other **antihypertensives**, acute ingestion of **alcohol**, **anesthesia**, and **nitrates**. **Amphetamines**, **barbiturates**, **tricyclic antidepressants**, **NSAIDs**, and **phenothiazines** may ↓ antihypertensive effect of methyldopa. ↑ effects and risk of psychoses with **haloperidol**. Excess sympathetic stimulation may occur with concurrent use of **MAO inhibitors** or other **adrenergics**. May ↑ **lithium** toxicity. Additive hypotension and CNS toxicity with **levodopa**. Additive CNS depression may occur with **alcohol**, **antihistamines**, **sedative/hypnotics**, some **antidepressants**, and **opioid analgesics**. Concurrent use with **nonselective beta blockers** may rarely cause paradoxical hypertension.

## Route/Dosage

**PO (Adults):** 250–500 mg 2–3 times daily (not to exceed 500 mg/day if used with other agents); may be ↑ every 2 days as needed; usual maintenance dose is 500 mg–2 g/day (not to exceed 3 g/day).
**PO (Children):** 10 mg/kg/day (300 mg/m²/day); may be ↑ every 2 days up to 65 mg/kg/day in divided doses (not to exceed 3 g/day).
**IV (Adults):** 250–500 mg q 6 hr (up to 1 g q 6 hr).
**IV (Children):** 5–10 mg/kg q 6 hr; up to 65 mg/kg/day in divided doses (not to exceed 3 g/day).

## Availability (generic available)

**Tablets:** 250 mg, 500 mg. **Injection:** 50 mg/mL.
***In combination with:*** hydrochlorothiazide.
See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse frequently during initial dose adjustment and periodically during therapy. Report significant changes.
- Monitor frequency of prescription refills to determine compliance.
- Monitor intake and output ratios and weight and assess for edema daily, especially at beginning of therapy. Report weight gain or edema; sodium and water retention may be treated with diuretics.
- Assess patient for depression or other alterations in mental status. Notify health care professional promptly if these symptoms develop.
- Monitor temperature during therapy. Drug fever may occur shortly after initiation of therapy and may be accompanied by eosinophilia and hepatic function changes. Monitor hepatic function test if unexplained fever occurs.
- ***Lab Test Considerations:*** Monitor renal and hepatic function and CBC before and periodically during therapy.
- Monitor direct Coombs' test before and after 6 and 12 mo of therapy. May cause a positive direct Coombs' test, rarely associated with hemolytic anemia.
- May cause ↑ BUN, serum creatinine, potassium, sodium, prolactin, uric acid, AST, ALT, alkaline phosphatase, and bilirubin concentrations.
- May cause prolonged prothrombin times.
- May interfere with serum creatinine and AST measurements.

### Potential Nursing Diagnoses

Risk for injury (Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- Do not confuse methyldopa with levodopa or L-dopa.
- Fluid retention and expanded volume may cause tolerance to develop within 2–3 mo after initiation of therapy. Diuretics may be added to regimen at this time to maintain control.
- Dose increases should be made with the evening dose to minimize drowsiness.
- When changing from IV to oral forms, dose should remain consistent.
- **PO:** Shake suspension before administration.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute in 100 mL of D5W, 0.9% NaCl, D5/0.9% NaCl, 5% sodium bicarbonate, or Ringer's solution. ***Concentration:*** ≤10 mg/mL. ***Rate:*** Infuse slowly over 30–60 min.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefonocid, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxine, chlorpromazine, cimetidine, clindamycin, cyanocobalamin, cyclosporine, dactinomycin, daptomycin, dexamethasone, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, insulin, isoproterenol, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methoxamine, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancruonium, pantoprazole, papaverine, pemetrexed, penicillin G, pentazocine, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** acyclovir, amphotericin B colloidal, azathioprine, cefoperazone, chloramphenicol, dantrolene, diazepam, diazoxide, folic acid, furosemide, ganciclovir, imipenem/cilastatin, inamrinone, indomethacin,

pentamidine, pentobarbital, phenobarbital, phenytoin, trimethoprim/sulfamethoxazole, piperacillin/tazobactam.

### Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day; last dose of the day should be taken at bedtime. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Methyldopa controls but does not cure hypertension.
- Instruct patient and family on proper technique for monitoring blood pressure. Advise them to check blood pressure at least weekly and to report significant changes.
- Inform patient that urine may darken or turn red-black when left standing.
- May cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known. Drowsiness usually subsides after 7–10 days of continuous use.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Notify health care professional if dry mouth continues for >2 wk.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to consult health care professional before taking any Rx, OTC, or Herbal products, especially cough, cold, or allergy remedies.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional if fever, muscle aches, or flu-like syndrome occurs.

### Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of side effects.

## methylergonovine

(meth-ill-er-goe-**noe**-veen)

Methergine

***Classification***

Therapeutic: oxytocic

Pharmacologic: ergot alkaloids

**Pregnancy Category C**

### Indications

Prevention and treatment of postpartum or postabortion hemorrhage caused by uterine atony or subinvolution.

### Action

Directly stimulates uterine and vascular smooth muscle. **Therapeutic Effects:** Uterine contraction.

### Pharmacokinetics

**Absorption:** Well absorbed following oral or IM administration.

**Distribution:** Unknown. Enters breast milk in small quantities.

**Metabolism and Excretion:** Probably metabolized by the liver.

**Half-life:** 30–120 min.

TIME/ACTION PROFILE (effects on uterine contractions)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 5–15 min | unknown | 3 hr |
| IM | 2–5 min | unknown | 3 hr |
| IV | immediate | unknown | 45 min–3 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB: Should not be used to induce labor.

**Use Cautiously in:** Hypertensive or eclamptic patients (more susceptible to hypertensive and arrhythmogenic side effects); Severe hepatic or renal disease; Sepsis.

**Exercise Extreme Caution in:** OB: Third stage of labor.

### Adverse Reactions/Side Effects

**CNS:** dizziness, headache. **EENT:** tinnitus. **Resp:** dyspnea. **CV:** HYPERTENSION, arrhythmias, chest pain, palpitations. **GI:** nausea, vomiting. **GU:** cramps. **Derm:** diaphoresis. **Misc:** allergic reactions.

### Interactions

**Drug-Drug:** Excessive vasoconstriction may result when used with heavy cigarette smoking (**nicotine**) or other **vasopressors**, such as **dopamine**.

### Route/Dosage

**PO (Adults):** 200–400 mcg (0.4–0.6 mg) q 6–12 hr for 2–7 days.

**IM, IV (Adults):** 200 mcg (0.2 mg) q 2–4 hr for up to 5 doses.

### Availability (generic available)
**Tablets:** 200 mcg (0.2 mg). **Injection:** 200 mcg (0.2 mg)/mL.

## NURSING IMPLICATIONS

### Assessment
- Monitor blood pressure, heart rate, and uterine response frequently during medication administration. Notify health care professional promptly if uterine relaxation becomes prolonged or if character of vaginal bleeding changes.
- Assess for signs of ergotism (cold, numb fingers and toes, chest pain, nausea, vomiting, headache, muscle pain, weakness).
- ***Lab Test Considerations:*** If no response to methylergonovine, calcium levels may need to be assessed. Effectiveness of medication is ↓ with hypocalcemia.
- May cause ↓ serum prolactin levels.

### Potential Nursing Diagnoses
Acute pain (Side Effects)

### Implementation
**IV Administration**
- **IV:** IV administration is used for emergencies only. Oral and IM routes are preferred.
- **Direct IV:** ***Diluent:*** May be given undiluted or diluted in 5 mL of 0.9% NaCl and administered through Y site. Do not add to IV solutions. Do not mix in syringe with any other drug. Refrigerate; stable for storage at room temperature for 60 days; deteriorates with age. Use only solution that is clear and colorless and that contains no precipitate. ***Concentration:*** 0.2 mg/mL. ***Rate:*** Administer at a rate of 0.2 mg over at least 1 min.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

### Patient/Family Teaching
- Instruct patient to take medication as directed; do not skip or double up on missed doses. If a dose is missed, omit it and return to regular dose schedule.
- Advise patient that medication may cause menstrual-like cramps.
- Caution patient to avoid smoking, because nicotine constricts blood vessels.
- Instruct patient to notify health care professional if infection develops, as this may cause increased sensitivity to the medication.

### Evaluation/Desired Outcomes
- Contractions that maintain uterine tone and prevent postpartum hemorrhage.

## methylnaltrexone
(me-thil-nal-**trex**-one)
Relistor

***Classification***
Therapeutic: laxatives
Pharmacologic: opioid antagonists

**Pregnancy Category B**

### Indications
Treatment of constipation caused by opioid use in patients being treated palliatively, when laxative therapy has failed.

### Action
Acts peripherally as mu-opioid receptor antagonist, blocking opioid effects on the GI tract. **Therapeutic Effects:** Blocks constipating effects of opioids on the GI tract without loss of analgesia.

### Pharmacokinetics
**Absorption:** Absorption follows subcutaneous administration.
**Distribution:** Moderate tissue distribution, does not cross the blood-brain barrier.
**Metabolism and Excretion:** Some metabolism, 85% excreted unchanged in urine.
**Half-life:** 8 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | rapid | 0.5 hr | 24–48 hr |

### Contraindications/Precautions
**Contraindicated in:** Known/suspected mechanical GI obstruction.
**Use Cautiously in:** OB, Lactation: Use in pregnancy only if clearly needed; use cautiously during lactation; Pedi: Safety and efficacy not established.

### Adverse Reactions/Side Effects
**CNS:** dizziness. **GI:** abdominal pain, diarrhea, flatulence, nausea. **Derm:** hyperhidrosis.

### Interactions
**Drug-Drug:** None noted.

### Route/Dosage
**Subcut (Adults):** *38– <62 kg*—8 mg every other day, not to exceed every 24 hr; *62–114*

*kg*—12 mg every other day, not to exceed every 24 hr; *other weights*—0.15 mg/kg every other day, not to exceed every 24 hr.

### Renal Impairment

(Adults): *CCr <30 mL/min*—use 50% of recommended dose based on weight.

### Availability

**Solution for subcutaneous injection:** 12mg/0.6 mL single use vial.

## NURSING IMPLICATIONS

### Assessment

- Assess bowel sounds and frequency, quantity, and consistency of stools periodically during therapy.
- Monitor pain intensity during therapy. Methylnaltrexone does not affect pain or effects of opioid analgesics on pain control.

### Potential Nursing Diagnoses

Constipation (Indications)
Diarrhea (Adverse Reactions)

### Implementation

- **Subcut:** Pinch skin and administer in upper arm, abdomen, or thigh at a 45° angle using a 1-mL syring with a 27-gauge needle inserted the full length of the needle. Do not rub the injection site. Solution is clear and colorless to pale yellow. Do not administer solutions that are discolored or contain a precipitate. Solution is stable for 24 hr at room temperature. Protect vials from light. Do not freeze. Do not use single-use vials for more than 1 dose.

### Patient/Family Teaching

- Instruct patient on administration of methylnaltrexone and disposal of supplies. Usual schedule is one dose every other day, as needed, but no more than one dose in a 24-hr period. Advise patient to read the *Patient Information* prior to starting therapy and with each Rx refill.
- Advise patient that laxation may occur within 30 min, so toilet facilities should be available following administration.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional and discontinue therapy if severe or persistent diarrhea occurs or if abdominal pain, nausea, or vomiting persists or worsens.
- Instruct patient to stop taking methylnaltrexone if they stop taking opioid medications.
- Advise patient to consult health care professional prior to taking other Rx, OTC, or herbal products.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

### Evaluation/Desired Outcomes

- Laxation and relief of opioid-induced constipation.

## methylphenidate (oral)

(meth-ill-**fen**-i-date)
Concerta, Metadate CD, Metadate ER, Methylin, Methylin ER, ✱PMS-Methylphenidate, ✱Riphenidate, Ritalin, Ritalin LA, Ritalin-SR

## methylphenidate (transdermal)

Daytrana

***Classification***
Therapeutic: central nervous system stimulants

**Schedule II**

**Pregnancy Category C**

### Indications

Treatment of ADHD (adjunct). **Oral**: Symptomatic treatment of narcolepsy. **Unlabeled Use:** Management of some forms of refractory depression.

### Action

Produces CNS and respiratory stimulation with weak sympathomimetic activity. **Therapeutic Effects:** Increased attention span in ADHD. Increased motor activity, mental alertness, and diminished fatigue in narcoleptic patients.

### Pharmacokinetics

**Absorption:** Slow and incomplete after oral administration; absorption of sustained or extended-release tablet (SR) is delayed and provides continuous release; well absorbed from skin. *Metadate CD, Concerta, Ritalin LA*—provides initial rapid release followed by a second continuous release (biphasic release).
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized (80%) by the liver.
**Half-life:** 2–4 hr.

TIME/ACTION PROFILE (CNS stimulation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1–3 hr | 4–6 hr |
| PO-ER | unknown | 4–7 hr | 3–12 hr† |
| Transdermal | unknown | unknown | 12 hr |

†Depends on formulation

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hyperexcitable states; Hyperthyroidism; Patients with psychotic personalities or suicidal or homicidal tendencies; Personal or family history of Tourette's syndrome; Glaucoma; Motor tics; Concurrent use or use within 14 days of MAO inhibitors; Fructose intolerance, glucose-galactose malabsorption, or sucrose-isomaltase insufficiency; Surgery.

**Use Cautiously in:** History of cardiovascular disease (sudden death has occurred in children with structural cardiac abnormalities or other serious heart problems); Hypertension; Diabetes mellitus; History of contact sensitization with transdermal product (may be at ↑ risk for systemic sensitization reactions with oral products); Geri: Geriatric or debilitated patients; Continual use (may result in psychological or physical dependence); Seizure disorders (may lower seizure threshold); Concerta product should be used cautiously in patients with esophageal motility disorders or severe GI narrowing (may ↑ the risk of obstruction); OB, Lactation: Safety not established; Pedi: Growth suppression may occur in children with long term use; children <6 yr (transdermal only).

## Adverse Reactions/Side Effects

**CNS:** hyperactivity, insomnia, restlessness, tremor, behavioral disturbances, dizziness, hallucinations, headache, irritability, mania, thought disorder. **EENT:** blurred vision. **CV:** SUDDEN DEATH, hypertension, palpitations, tachycardia, hypotension. **GI:** anorexia, constipation, cramps, diarrhea, dry mouth, metallic taste, nausea, vomiting. **Derm:** erythema, rashes. **Metab:** growth suppression, weight loss (may occur with prolonged use). **Neuro:** akathisia, dyskinesia, tics. **Misc:** fever, hypersensitivity reactions, physical dependence, psychological dependence, tolerance.

## Interactions

**Drug-Drug:** ↑ sympathomimetic effects with other **adrenergics**, including **vasoconstrictors**, **decongestants**, and **halogenated anesthetics**. Use with **MAO inhibitors** or **vasopressors** may result in hypertensive crisis (concurrent use or use within 14 days of MAO inhibitors is contraindicated). Metabolism of **warfarin**, **phenytoin**, **phenobarbital, primidone, phenylbutazone, selective serotonin reuptake inhibitors,** and **tricyclic antidepressants** may be ↓ and effects ↑. Avoid concurrent use with **pimozide** (may mask cause of tics). Concurrent use with **clonidine** may result in serious ECG abnormalities (a 40% dose ↓ of oral methylphenidate is necessary).

**Drug-Natural Products:** Use with caffeine-containing herbs (**guarana**, **tea**, **coffee**) ↑ stimulant effect. **St. John's wort** may ↑ serious side effects (concurrent use is NOT recommended).

**Drug-Food:** Excessive use of **caffeine**-containing foods or beverages (**coffee**, **cola**, **tea**) may cause ↑ CNS stimulation.

## Route/Dosage

**PO (Adults):** *ADHD*—5–20 mg 2–3 times daily as prompt-release tablets. When maintenance dose is determined, may change to extended-release formulation. *Narcolepsy*—10 mg 2–3 times/day; maximum dose 60 mg/day.

**PO (Children >6 yr):** *Prompt release tablets*—0.3 mg/kg/dose or 2.5–5 mg before breakfast and lunch; ↑ by 0.1 mg/kg/dose or by 5–10 mg/day at weekly intervals (not to exceed 60 mg/day or 2 mg/kg/day). When maintenance dose is determined, may change to extended-release formulation. *Ritalin SR, Metadate ER*—may be used in place of the prompt-release tablets when the 8-hour dosage corresponds to the titrated 8-hour dosage of the prompt-release tablets; *Ritalin LA*—can be used in place of twice daily regimen given once daily at same total dose, or in place of SR product at same dose; *Concerta (patients who have not taken methylphenidate previously)*—18 mg once daily in the morning initially, may be titrated as needed up to 54 mg/day. *Concerta (patients are currently taking other forms of methylphenidate)*—18 mg once daily in the morning if previous dose was 5 mg 2–3 times daily or 20 mg daily as SR product, 36 mg once daily in the morning if previous dose was 10 mg 2–3 times daily or 40 mg daily as SR product, 54 mg once daily in the morning if previous dose was 15 mg 2–3 times daily or 60 mg once daily as SR product. *Metadate CD*—20 mg once daily. Dosage may be adjusted in weekly 20-mg increments to a maximum of 60 mg/day taken once daily in the morning.

**Transdermal (Children >6 yr):** Apply one 10-mg patch initially (should be applied 2 hr before desired effect and removed 9 hr after application); may be titrated based on response and tolerability; may ↑ to 15-mg patch after 1 week, and then to 20-mg patch after another week, and then to 30-mg patch after another week.

### Availability (generic available)

**Immediate-release tablets:** 5 mg, 10 mg, 20 mg. **Cost:** *Generic*—5 mg $37.90/100, 10 mg $52.90/100, 20 mg $74.90/100. **Extended-release tablets (Metadate ER, Methylin ER):** 10 mg, 20 mg. **Extended-release tablets (Concerta):** 18 mg, 27 mg, 36 mg, 54 mg. **Cost:** 18 mg $359.96/90, 27 mg $359.98/90, 36 mg $374.96/90, 54 mg $404.96/90. **Sustained-release tablets (Ritalin SR):** 20 mg. **Cost:** $173.96/90. **Extended-release capsules (Metadate CD):** 10 mg, 20 mg, 30 mg. **Cost:** 10 mg $236.97/90, 20 mg $299.99/90, 30 mg $299.95/90$34.68/30. **Extended-release capsules (Ritalin LA):** 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** 10 mg $299.97/90, 20 mg $299.97/90, 30 mg $299.95/90, 40 mg $299.95/90. **Chewable tablets (Methylin) (grape flavor):** 2.5 mg, 5 mg, 10 mg. **Oral solution (Methylin) (grape flavor):** 5 mg/5 mL, 10 mg/5 mL. **Transdermal system:** releases 10 mg/9 hr, releases 15 mg/9 hr, releases 20 mg/9 hr, releases 30 mg/9 hr.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, pulse, and respiration before administering and periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- Monitor closely for behavior change.
- Pedi: Monitor growth, both height and weight, in children on long-term therapy.
- May produce a false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- Methylphenidate has high dependence and abuse potential. Tolerance to abuse of medication occurs rapidly; do not increase dose.
- **ADHD:** Assess children for attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- **Narcolepsy:** Observe and document frequency of episodes.
- **Transdermal:** Assess skin for signs of contact sensitization (erythema with edema, papules, or vesicles that does not improve within 48 hr or spreads beyond patch site) during therapy. May lead to systemic sensitization to other forms of methylphenidate (flare-up of previous dermatitis or prior positive patch-test sites, generalized skin eruptions, headache, fever, malaise, arthralgia, diarrhea, vomiting). If contact sensitization develops and oral methylphenidate is instituted, monitor closely.
- ***Lab Test Considerations:*** Monitor CBC, differential, and platelet count periodically in patients receiving prolonged therapy.

### Potential Nursing Diagnoses

Disturbed thought process (Side Effects)

### Implementation

- **PO:** Immediate and sustained-release tablets should be administered on an empty stomach (30–45 min before a meal). Sustained-release tablets should be swallowed whole; do not break, crush, or chew. Medate CD and Ritalin LA capsules may be opened and sprinkled on cool applesauce; entire mixture should be ingested immediately and followed by a drink of water. Do not store for future use. Concerta may be administered without regard to food, but must be taken with water, milk, or juice.
- **Transdermal:** Apply patch to a clean, dry site on the hip which is not oily, damaged, or irritated; do not apply to waistline where tight clothing may rub it. Press firmly in place with palm of hand for 30 seconds to make sure of good contact with skin, especially around edges. Alternate site daily. Apply patch 2 hr before desired effect and remove 9 hr after applied; effects last several more hours. Do not apply or reapply with dressings, tape, or other adhesives. Do not cut patches.
- If difficulty in separating patch from release liner, tearing, or other damage occurs during removal from liner, discard patch and apply a new patch. Inspect release liner to ensure no adhesive containing medication has transferred to liner; if transfer has occurred, discard patch. Avoid touching adhesive during application; wash hands immediately after application.
- If patch does not fully adhere or partially detaches, remove and replace with another patch. Wear patched for a total of 9 hr, regardless of number used. Exposure to water during bathing, swimming, or showering may affect patch adherence.
- Patches may be removed earlier before decreasing dose if an unacceptable loss of appetite or insomnia occurs.
- Store patches at room temperature in a safe place to prevent abuse and misuse; do not refrigerate or freeze.

- To remove patch, peel off slowly. An oil-based product (petroleum jelly, olive oil, mineral oil) may be applied gently to facilitate removal. Upon removal, fold so that adhesive side of patch adheres to itself and flush down toilet or dispose of in an appropriate lidded container.

### Patient/Family Teaching

- Instruct patient to take medication as directed. If an oral dose is missed, take the remaining doses for that day at regularly spaced intervals; do not double doses. Take the last dose before 6 PM to minimize the risk of insomnia. Instruct patient not to alter dose without consulting health care professional. Abrupt cessation of high doses may cause extreme fatigue and mental depression. Instruct parent/caregiver to read the Medication Guide prior to use and with each Rx refill; new information may be available.
- Advise patient to check weight 2–3 times weekly and report weight loss to health care professional.
- May cause dizziness or blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known.
- Inform patient and/or parents that shell of *Concerta* tablet may appear in the stool. This is no cause for concern.
- Advise patient to avoid using caffeine-containing beverages concurrently with this therapy.
- Advise patient to notify health care professional if nervousness, insomnia, palpitations, vomiting, skin rash, or fever occurs.
- Advise patient and/or parents to notify health care professional of behavioral changes.
- Inform patient that health care professional may order periodic holidays from the drug to assess progress and to decrease dependence.
- Emphasize the importance of routine follow-up exams to monitor progress.
- **Transdermal:** Encourage parent or caregiver to use the administration chart included in package to monitor application and removal time and disposal method.
- Caution patient to avoid exposing patch to direct external heat sources (hair dryers, heating pads, electric blankets, heated water beds, etc). May increase rate and extent of absorption.
- Inform parent/caregiver that skin redness, itching and small bumps on the skin are common. If swelling or blistering occurs, the patch should not be worn and health care professional notified. Caution parent/caregiver not to apply hydrocortisone or other solutions, creams, ointments, or emollients prior to application.
- **Home Care Issues:** Pedi: Advise parents to notify school nurse of medication regimen.

### Evaluation/Desired Outcomes

- Improved attention span and social interactions in ADHD.
- Decreased frequency of narcoleptic symptoms.

**methylPREDNISolone, See CORTICOSTEROIDS (SYSTEMIC).**

## metoclopramide

(met-oh-**kloe**-pra-mide)

Apo-Metoclop, Emex, Maxeran, Metozolv ODT, Reglan

***Classification***

Therapeutic: antiemetics

**Pregnancy Category B**

### Indications

Prevention of chemotherapy-induced emesis. Treatment of postsurgical and diabetic gastric stasis. Facilitation of small bowel intubation in radiographic procedures. Management of gastroesophageal reflux. Treatment and prevention of postoperative nausea and vomiting when nasogastric suctioning is undesirable. **Unlabeled Use:** Treatment of hiccups. Adjunct management of migraine headaches.

### Action

Blocks dopamine receptors in chemoreceptor trigger zone of the CNS. Stimulates motility of the upper GI tract and accelerates gastric emptying. **Therapeutic Effects:** Decreased nausea and vomiting. Decreased symptoms of gastric stasis. Easier passage of nasogastric tube into small bowel.

### Pharmacokinetics

**Absorption:** Well absorbed from the GI tract, from rectal mucosa, and from IM sites.
**Distribution:** Widely distributed into body tissues and fluids. Crosses blood-brain barrier and placenta. Enters breast milk in concentrations greater than plasma.

**Metabolism and Excretion:** Partially metabolized by the liver; 25% eliminated unchanged in the urine.
**Half-life:** 2.5–6 hr.

TIME/ACTION PROFILE (effects on peristalsis)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–60 min | unknown | 1–2 hr |
| IM | 10–15 min | unknown | 1–2 hr |
| IV | 1–3 min | immediate | 1–2 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Possible GI obstruction or hemorrhage; History of seizure disorders; Pheochromocytoma; Parkinson's disease.
**Use Cautiously in:** History of depression; Diabetes (may alter response to insulin); Renal impairment (reduce dose in CCr <50 mL/min); Chronic use > 3 mo (↑ risk for tardive dyskinesia); OB, Lactation: Safety not established; Pedi: Prolonged clearance in neonates can result in high serum concentrations and increase the risk for methemoglobinemia. Side effects are more common in children, especially extrapyramidal reactions; Geri: More susceptible to oversedation, extrapyramidal reactions, and tardive dyskinesia.

## Adverse Reactions/Side Effects

**CNS:** drowsiness, extrapyramidal reactions, restlessness, NEUROLEPTIC MALIGNANT SYNDROME, anxiety, depression, irritability, tardive dyskinesia. **CV:** arrhythmias (supraventricular tachycardia, bradycardia), hypertension, hypotension. **GI:** constipation, diarrhea, dry mouth, nausea. **Endo:** gynecomastia. **Hemat:** methemoglobinemia, neutropenia, leukopenia, agranulocytosis.

## Interactions

**Drug-Drug:** Additive CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. May ↑ absorption and risk of toxicity from **cyclosporine**. May affect the GI absorption of other **orally administered drugs** as a result of effect on GI motility. May exaggerate hypotension during **general anesthesia**. ↑ risk of extrapyramidal reactions with agents such as **haloperidol** or **phenothiazines**. **Opioids** and **anticholinergics** may antagonize the GI effects of metoclopramide. Use cautiously with **MAO inhibitors** (causes release of catecholamines). May ↑ neuromuscular blockade from **succinylcholine**. May ↓ effectiveness of **levodopa**. May ↑ **tacrolimus** serum levels.

## Route/Dosage

### Prevention of Chemotherapy-Induced Vomiting

**PO, IV (Adults and Children):** 1–2 mg/kg 30 min before chemotherapy. Additional doses of 1–2 mg/kg may be given q 2–4 hr, pretreatment with diphenhydramine will ↓ the risk of extrapyramidal reactions to this dosage.

### Facilitation of Small Bowel Intubation

**IV (Adults and Children > 14 yr):** 10 mg over 1–2 min.
**IV (Children 6–14 yr):** 2.5–5 mg (dose should not exceed 0.5 mg/kg) over 1–2 min.
**IV (Children <6 yr):** 0.1 mg/kg over 1–2 min.

### Diabetic Gastroparesis

**PO, IV (Adults):** 10 mg 30 min before meals and at bedtime for 2–8 weeks.

### Gastroesophageal Reflux

**PO, IM, IV (Adults):** 10–15 mg 30 min before meals and at bedtime (not to exceed 0.5 mg/kg/day). A single dose of 20 mg may be given preventively. Some patients may respond to doses as small as 5 mg.
**PO, IM, IV (Neonates , Infants, and Children):** 0.4–0.8 mg/kg/day in 4 divided doses.

### Postoperative Nausea/Vomiting

**IM, IV (Adults and Children > 14 yr):** 10 mg at the end of surgical procedure, repeat in 6–8 hr if needed.
**IM, IV (Children < 14 yr):** 0.1–0.2 mg/kg/dose, repeat in 6–8 hr if needed.

### Treatment of Hiccups

**PO, IM (Adults):** 10–20 mg 4 times daily PO; may be preceded by a single 10-mg dose IM (unlabeled).

## Availability (generic available)

**Tablets:** 5 mg, 10 mg. **Cost:** *Reglan*—5 mg $50.91/100, 10 mg $80.26/100; *generic*—5 mg $29.77/100, 10 mg $21.12/100 . **Orally disintegrating tablets:** 5 mg, 10 mg. **Oral solution (apricot-peach flavor):** 5 mg/5 mL. **Injection:** 5 mg/mL.

# NURSING IMPLICATIONS

## Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds before and after administration.
- Assess patient for extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling,

mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout course of therapy. May occur weeks to months after initiation of therapy and are reversible on discontinuation. Dystonic reactions may occur within minutes of IV infusion and stop within 24 hr of discontinuation of metoclopramide. May be treated with 50 mg of IM diphenhydramine or diphenhydramine 1 mg/kg IV may be administered prophylactically 15 min before metoclopramide IV infusion.

- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Usually occurs after a year or more of continued therapy. Report immediately; may be irreversible.
- Monitor for neuroleptic malignant syndrome (hyperthermia, muscle rigidity, altered consciousness, irregular pulse or blood pressure, tachycardia, and diaphoresis).
- Assess patient for signs of depression periodically throughout therapy.
- ***Lab Test Considerations:*** May alter hepatic function test results.
- May cause ↑ serum prolactin and aldosterone concentrations.

## Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)
Risk for injury (Side Effects)

## Implementation

- **PO:** Administer doses 30 min before meals and at bedtime.
- Do not to remove *orally disintegrating tablets* from the bottle until just prior to dosing. Remove tablet from bottle with dry hands and immediately place on tongue to disintegrate and swallow with saliva. Tablet typically disintegrates in 1–1 ½ minutes. Administration with liquid is not necessary.
- **IM:** For prevention of postoperative nausea and vomiting, inject IM near the end of surgery.

### IV Administration

- **Direct IV:** Administer IV dose 30 min before administration of chemotherapeutic agent. ***Rate:*** Doses may be given slowly over 1–2 min. Rapid administration causes a transient but intense feeling of anxiety and restlessness followed by drowsiness.
- **Intermittent Infusion:** ***Diluent:*** May be diluted for IV infusion in 50 mL of D5W, 0.9% NaCl, D5/0.45% NaCl, Ringer's solution, or LR. Diluted solution is stable for 48 hr if protected from light or 24 hr under normal light. ***Concentration:*** May dilute to 0.2 mg/mL or give undiluted at 5 mg/mL. ***Rate:*** Infuse slowly (maximum rate 5 mg/min) over at least 15–30 min.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alfentanil, amifostine, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefonicid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxapram, doxorubicin hydrochloride, doxycyline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenam, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, folic acid, foscarnet, gallium nitrate, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methadone, methotrexate, methoxamine, methyldopate, methylprednisolone, metoprolol, metronidazole, miconazole, midazolam, milrinone, minocycline, mitomycin, morphine, moxalactam, multiple vitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phe-

nobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, amsacrine, cefepime, dantrolene, diazepam, diazoxide, doxorubicin liposome, ganciclovir, inamrinone, phenytoin, propofol, trimethoprim/sulfamethoxazole.

## Patient/Family Teaching

- Instruct patient to take metoclopramide as directed. Take missed doses as soon as remembered if not almost time for next dose.
- Pedi: Unintentional overdose has been reported in infants and children with the use of metoclopramide oral solution. Teach parents how to accurately read labels and administer medication.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Advise patient to notify health care professional immediately if involuntary or repetitive movements of eyes, face, or limbs occur.

## Evaluation/Desired Outcomes

- Prevention or relief of nausea and vomiting.
- Decreased symptoms of gastric stasis.
- Facilitation of small bowel intubation.
- Decreased symptoms of esophageal reflux.

# metolazone (me-tole-a-zone)

Zaroxolyn

***Classification***

Therapeutic: antihypertensives, diuretics
Pharmacologic: thiazide-like diuretics

**Pregnancy Category B**

## Indications

Mild to moderate hypertension. Edema associated with CHF or the nephrotic syndrome.

## Action

Increases excretion of sodium and water by inhibiting sodium reabsorption in the distal tubule. Promotes excretion of chloride, potassium, magnesium, and bicarbonate. May produce arteriolar dilation. **Therapeutic Effects:** Lowering of blood pressure in hypertensive patients. Diuresis with subsequent mobilization of edema. Effect may continue in renal impairment.

## Pharmacokinetics

**Absorption:** Absorption is variable.
**Distribution:** Unknown.
**Metabolism and Excretion:** Excreted mainly unchanged by the kidneys.
**Half-life:** 8 hr.

TIME/ACTION PROFILE (diuretic effect†)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 hr | 2 hr | 12–24 hr |

†Full antihypertensive effect may take days–weeks

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other sulfonamides may exist; Anuria; Lactation: Lactation .

**Use Cautiously in:** Severe hepatic impairment; OB: Safety not established; Pedi: Safety not established; may be more susceptible to diuretic and hypokalemic effects; Geri: ↑ sensitivity to drug effects.

## Adverse Reactions/Side Effects

**CNS:** drowsiness, lethargy. **CV:** chest pain, hypotension, palpitations. **GI:** anorexia, bloating, cramping, drug-induced hepatitis, nausea, vomiting. **Derm:** photosensitivity, rashes. **Endo:** hyperglycemia. **F and E:** hypokalemia, dehydration, hypercalcemia, hypochloremic alkalosis, hypomagnesemia, hyponatremia, hypophosphatemia, hypovolemia. **Hemat:** blood dyscrasias. **Metab:** hyperuricemia. **MS:** muscle cramps. **Misc:** chills, pancreatitis.

## Interactions

**Drug-Drug:** ↑ risk of hypotension with **nitrates**, acute ingestion of **alcohol**, or other **antihypertensives**. ↑ risk of hypokalemia with **corticosteroids**, **amphotericin B**, **piperacillin**, or **ticarcillin**. May ↑ the risk of **digoxin** toxicity. ↓ the excretion of **lithium**; may cause toxicity. May ↓ the effectiveness of **methenamine**. **Stimulant laxatives** (including **aloe**, **senna**) may ↑ risk of potassium depletion.

**Drug-Food: Food** may ↑ extent of absorption.

### Route/Dosage

**PO (Adults):** *Hypertension*—2.5–5 mg/day; *edema*—5–20 mg/day.

### Availability (generic available)

**Tablets:** 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg $99.99/90, 5 mg $110.09/90, 10 mg $121.97/90.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, intake and output, and daily weight, and assess feet, legs, and sacral area for edema daily.
- Assess patient, especially if taking digoxin, for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Notify physician or other health care professional if these signs of electrolyte imbalance occur. Patients taking digoxin are at risk of digoxin toxicity because of the potassium-depleting effect of the diuretic.
- Assess patient for allergy to sulfonamides.
- **Hypertension:** Monitor blood pressure before and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- ***Lab Test Considerations:*** Monitor electrolytes (especially potassium), blood glucose, BUN, and serum creatinine and uric acid levels before and periodically during therapy.
- May cause ↑ in serum and urine glucose in diabetic patients.
- May cause an ↑ in serum bilirubin, calcium, creatinine, and uric acid, and a ↓ in serum magnesium, potassium, and sodium and urinary calcium concentrations.
- May cause ↓ serum protein-bound iodine (PBI) concentrations.
- May cause ↑ serum cholesterol, low-density lipoprotein, and triglyceride concentrations.

### Potential Nursing Diagnoses

Excess fluid volume (Indications)
Risk for deficient fluid volume (Side Effects)

### Implementation

- Administer in the morning to prevent disruption of sleep cycle.
- Intermittent dose schedule may be used for continued control of edema.
- **PO:** May give with food or milk to minimize GI irritation.

### Patient/Family Teaching

- Instruct patient to take metolazone at the same time each day. Take missed doses as soon as remembered but not just before next dose is due. Do not double doses.
- Instruct patient to monitor weight biweekly and notify health care professional of significant changes.
- Caution patient to change positions slowly to minimize orthostatic hypotension; may be potentiated by alcohol.
- Advise patient to use sunscreen and protective clothing in the sun to prevent photosensitivity reactions.
- Instruct patient to discuss dietary potassium requirements with health care professional (see Appendix M).
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to report muscle weakness, cramps, nausea, vomiting, diarrhea, or dizziness to health care professional.
- Emphasize the importance of routine follow-up exams.
- **Hypertension:** Advise patient to continue taking the medication even if feeling better. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).
- Instruct patient and family in correct technique for monitoring weekly blood pressure.
- Advise patient to consult health care professional before taking OTC medication, especially cough or cold preparations, concurrently with this therapy.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Increase in urine output.
- Decrease in edema.

HIGH ALERT

**metoprolol** (me-**toe**-proe-lole)
Beloc, Beloc-ZOK, Betaloc Durules, Betaloc-ZOK, Lopresor, Lopresor SR, Lopressor, Metoprol, Novo-metoprol, Seloken-ZOK, Toprol-XL

***Classification***
Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

**Pregnancy Category C**

## Indications
Hypertension. Angina pectoris. Prevention of MI and decreased mortality in patients with recent MI. Management of stable, symptomatic (class II or III) heart failure due to ischemic, hypertensive or cardiomyopathc origin (may be used with ACE inhibitors, diuretics and/or digoxin; Toprol XL only). **Unlabeled Use:** Ventricular arrhythmias/tachycardia. Migraine prophylaxis. Tremors. Aggressive behavior. Drug-induced akathisia. Anxiety.

## Action
Blocks stimulation of $beta_1$(myocardial)-adrenergic receptors. Does not usually affect $beta_2$(pulmonary, vascular, uterine)-adrenergic receptor sites. **Therapeutic Effects:** Decreased blood pressure and heart rate. Decreased frequency of attacks of angina pectoris. Decreased rate of cardiovascular mortality and hospitalization in patients with heart failure.

## Pharmacokinetics
**Absorption:** Well absorbed after oral administration.
**Distribution:** Crosses the blood-brain barrier, crosses the placenta; small amounts enter breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 3–7 hr.

TIME/ACTION PROFILE (cardiovascular effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO† | 15 min | unknown | 6–12 hr |
| PO–ER | unknown | 6–12 hr | 24 hr |
| IV | immediate | 20 min | 5–8 hr |

†Maximal effects on BP (chronic therapy) may not occur for 1 wk. Hypotensive effects may persist for up to 4 wk after discontinuation

## Contraindications/Precautions
**Contraindicated in:** Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
**Use Cautiously in:** Renal impairment; Hepatic impairment; Geri: ↑ sensitivity to beta blockers; initial dose reduction recommended; Pulmonary disease (including asthma; $beta_1$ selectivity may be lost at higher doses); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); Untreated pheochromocytoma (initiate only after alpha blocker therapy started); OB, Lactation, Pedi: Safety not established; all agents cross the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression.

## Adverse Reactions/Side Effects
**CNS:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, CHF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, drug-induced hepatitis, dry mouth, flatulence, gastric pain, heartburn, ↑ liver enzymes, nausea, vomiting. **GU:** erectile dysfunction, ↓ libido, urinary frequency. **Derm:** rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

## Interactions
**Drug-Drug: General anesthesia**, **IV phenytoin**, and **verapamil** may cause ↑ myocardial depression. ↑ bradycardia may occur with **digoxin**. ↑ hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamines**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent administration of **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May ↓ the effectiveness of **theophylline**. May ↓ the beneficial $beta_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

## Route/Dosage
**PO (Adults):** *Antihypertensive/antianginal*—25–100 mg/day as a single dose initially or 2 divided doses; may be ↑ q 7 days as needed up to 450 mg/day (for angina, give in divided doses). Extended-release products are given once daily. *MI*—25–50 mg (starting 15 min after last IV dose) q 6 hr for 48 hr, then 100 mg twice daily for a minimum of 3 mo. *Heart failure*—12.5–25 mg once daily, can be doubled every 2 wk up to 200 mg/day. *Migraine prevention*—50–100 mg 2–4 times daily (unlabeled).

**IV (Adults):** *MI*—5 mg q 2 min for 3 doses, followed by oral dosing.

### Availability (generic available)

**Tablets (tartrate):** 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg $28.37/180, 50 mg $27.00/180, 100 mg $22.99/180. **Extended-release tablets (succinate; Toprol XL):** 25 mg, 50 mg, 100 mg, 200 mg. **Cost:** *Generic*—25 mg $66.97/90, 50 mg $73.97/90, 100 mg $99.92/90, 200 mg $176.98/90. **Injection:** 1 mg/mL. ***In combination with:*** hydrochlorothiazide (Lopressor HCT). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, ECG, and pulse frequently during dose adjustment and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- Monitor vital signs and ECG every 5–15 min during and for several hours after parenteral administration. If heart rate <40 bpm, especially if cardiac output is also decreased, administer atropine 0.25–0.5 mg IV.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and characteristics of anginal attacks periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT levels.

### Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous. Before administering intravenously, have second practitioner independently check original order and dose calculations.
- ***High Alert:*** Do not confuse metoprolol with misoprostol. Do not confuse Toprol-XL (metoprolol) with Topamax (topiramate) or Tegretol (carbamazepine).
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer metoprolol with meals or directly after eating.
- Extended-release tablets should be swallowed whole; do not break, crush, or chew.

#### IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 1 mg/mL. ***Rate:*** Administer over 1 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, alteplase, amikacin, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide,

prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, rocuronium, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole.

- **Y-Site Incompatibility:** allopruinol, amphotericin B cholesteryl, amphotericin B colloidal, dantrolene, diazepam, diazoxide, lepirudin, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole.

## Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Teach patient and family how to check pulse daily and blood pressure biweekly and to report significant changes to health care professional.
- May cause drowsiness. Caution patient to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking other Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of caffeinated coffee, tea, and cola.
- Diabetics should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block sweating as a sign of hypoglycemia.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

## Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Reduction in frequency of anginal attacks.
- Increase in activity tolerance.
- Prevention of MI.

# metronidazole

(me-troe-**ni**-da-zole)

Apo-Metronidazole, Flagyl, Flagyl ER, MetroCream, MetroGel, MetroGel-Vaginal, MetroLotion, Metro IV, Nidagel, Noritate, Novonidazol, Trikacide, Vandazole

***Classification***

Therapeutic: anti-infectives, antiprotozoals, antiulcer agents

**Pregnancy Category B**

## Indications

**PO, IV:** Treatment of the following anaerobic infections: Intra-abdominal infections (may be used with a cephalosporin), Gynecologic infections, Skin and skin structure infections, Lower respiratory tract infections, Bone and joint infections, CNS infections, Septicemia, Endocarditis. **IV:** Perioperative prophylactic agent in colorectal surgery. **PO:** Amebicide in the management of amebic dysentery, amebic liver abscess, and trichomoniasis: Treatment of peptic ulcer disease caused by *Helicobacter pylori*. **Topical:** Treatment of acne rosacea. **Vag:** Management of bacterial vaginosis. **Unlabeled Use:** Treatment of giardiasis. Treatment of anti-infective associated pseudomembranous colitis.

## Action

Disrupts DNA and protein synthesis in susceptible organisms. **Therapeutic Effects:** Bactericidal, trichomonacidal, or amebicidal action. **Spectrum:** Most notable for activity against anaerobic bacteria, including: *Bacteroides*, *Clostridium*. In addition, is active against: *Trichomonas vaginalis*, *Entamoeba histolytica*, *Giardia lamblia*, *H. pylori*, *Clostridium difficile*.

## Pharmacokinetics

**Absorption:** 80% absorbed after oral administration. Minimal absorption after topical or vaginal application.
**Distribution:** Widely distributed into most tissues and fluids, including CSF. Crosses the placenta and enters fetal circulation rapidly; enters breast milk in concentrations equal to plasma levels.
**Metabolism and Excretion:** Partially metabolized by the liver (30–60%), partially excreted unchanged in the urine, 6–15% eliminated in the feces.
**Half-life:** Neonates: 25–75 hr; Children and adults: 6–12 hr.

TIME/ACTION PROFILE (PO, IV = blood levels; topical = improvement in rosacea)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1–3 hr | 8 hr |
| PO-ER | rapid | unknown | up to 24 hr |
| IV | rapid | end of infusion | 6–8 hr |
| Topical | 3 wk | 9 wk | 12 hr |
| Vaginal | unknown | 6–12 hr | 12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hypersensitivity to parabens (topical only); OB: First trimester of pregnancy.
**Use Cautiously in:** History of blood dyscrasias; History of seizures or neurologic problems; Severe hepatic impairment (dose ↓ suggested); OB: Although safety not established, has been used to treat trichomoniasis in 2nd- and 3rd-trimester pregnancy—but not as single-dose regimen; Lactation: If needed, use single dose and interrupt nursing for 24 hr thereafter; Patients receiving corticosteroids or predisposed to edema (injection contains 28 mEq sodium/g metronidazole).

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, dizziness, headache, aseptic meningitis (IV), encephalopathy (IV). **EENT:** optical neuropathy, tearing (topical only). **GI:** abdominal pain, anorexia, nausea, diarrhea, dry mouth, furry tongue, glossitis, unpleasant taste, vomiting. **Derm:** STEVENS-JOHNSON SYNDROME, rash, urticaria; *topical only*, burning, mild dryness, skin irritation, transient redness. **Hemat:** leukopenia. **Local:** phlebitis at IV site. **Neuro:** peripheral neuropathy. **Misc:** superinfection.

## Interactions

**Drug-Drug: Cimetidine** may ↓ metabolism. **Phenobarbital** and **rifampin** ↑ metabolism and may ↓ effectiveness. Metronidazole ↑ the effects of **phenytoin, lithium,** and **warfarin**. Disulfiram-like reaction may occur with **alcohol** ingestion. May cause acute psychosis and confusion with **disulfiram**. ↑ risk of leukopenia with **fluorouracil** or **azathioprine**.

## Route/Dosage

**PO (Adults):** *Anaerobic infections*—7.5 mg/kg q 6 hr (not to exceed 4 g/day). *Trichomoniasis*—250 mg q 8 hr for 7 days *or* single 2-g dose *or* 1 g bid for 1 day. *Amebiasis*—500–750 mg q 8 hr for 5–10 days. *H. pylori*—250 mg 4 times daily *or* 500 mg twice daily for 1–2 wk (with other agents). *Bacterial vaginoses*—750 mg once daily as ER tablets for 7 days. *Antibiotic associated pseudomembranous colitis*—250–500 mg 3–4 times/day for 10–14 days.
**PO (Infants and Children):** *Anaerobic infections*-30 mg/kg/day divided q 6 hr, maximum dose: 4 g/day *Trichomoniasis*—15–30 mg/kg/day divided q 8 hr for 7–10 days. *Amebiasis*—35–50 mg/kg/day divided q 8 hr for 5–10 days (not to exceed 750 mg/dose). *Antibiotic associated pseudomembranous colitis*—30 mg/kg/day divided q 6 hr for 7–10 days. *H. pylori*—15–20 mg/kg/day divided twice daily for 4 weeks.
**IV, PO (Neonates 0–4 weeks, <1200 g):** 7.5 mg/kg q 48 hr. *Postnatal age <7 days, 1200–2000 g*—7.5 mg/kg/day q 24 hr. *Postnatal age <7 days, >2000 g*—15 mg/kg/day divided q 12 hr. *Postnatal age >7 days, 1200–2000 g*—15 mg/kg/day divided q 12 hr. *Postnatal age >7 days, >2000 g*—30 mg/kg/day divided q 12 hr.
**IV (Adults):** *Anaerobic infections*—Initial dose 15 mg/kg, then 7.5 mg/kg q 6–8 hr *or* 500 mg q 6–8 hr (not to exceed 4 g/day). *Perioperative prophylaxis*—Initial dose 15 mg/kg 1 hr before surgery, then 7.5 mg/kg 6 and 12 hr later. *Amebiasis*—500–750 mg q 8 hr for 5–10 days.
**IV (Children):** *Anaerobic infections*—30 mg/kg/day divided q 6 hr, maximum dose: 4 g/day.
**Topical (Adults):** *Acne rosacea*—Apply thin film to affected area bid.
**Vag (Adults):** *Bacterial vaginosis*—One applicatorful (5 g) 2 times daily for 5 days.

## Availability (generic available)

**Tablets:** 250 mg, 500 mg. **Cost:** *Generic*—250 mg $16.99/30, 500 mg $9.99/30. **Extended-**

**release (ER) tablets:** 750 mg. **Cost:** $297.98/30. **Capsules:** 375 mg, ✱500 mg. **Premixed injection:** 500 mg/100 mL. **Topical gel:** 0.75%, 1%. **Cost:** $132.99/60 g. **Topical cream:** 0.75%, 1%. **Cost:** *Generic*—$59.99/45 g. **Topical lotion:** 0.75%. **Cost:** *Generic*—$79.99/59 mL. **Vaginal gel:** 0.75% (37.5 mg/5 g applicatorful). **Cost:** $32.22/70 g. ***In combination with:*** bismuth subsalicylate tablets and tetracycline capsules (Helidac) as part of a compliance package; bismuth subcitrate potassium and tetracycline (Pylera). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Monitor neurologic status during and after IV infusions. Inform physician if numbness, paresthesia, weakness, ataxia, or seizures occur.
- Monitor intake and output and daily weight, especially for patients on sodium restriction. Each 500 mg of Flagyl IV for dilution contains 5 mEq of sodium; each 500 mg of Flagyl RTU contains 14 mEq of sodium.
- **Giardiasis:** Monitor three stool samples taken several days apart, beginning 3–4 wk after treatment.
- ***Lab Test Considerations:*** May alter results of serum AST, ALT, and LDH tests.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Diarrhea (Indications)

### Implementation

- **PO:** Administer on an empty stomach, or may administer with food or milk to minimize GI irritation. Tablets may be crushed for patients with difficulty swallowing. Swallow extended-release tablets whole; do not break, crush, or chew.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Administer premixed injection (500 mg/100 mL) undiluted. Do not refrigerate. Once taken out of overwrap, premixed infusion stable for 30 days at room temperature. ***Concentration:*** 5 mg/mL. ***Rate:*** Infuse over 30–60 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifistine, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, atracurium, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefepime, cefoperazone, cefotetan, cefotaxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, codeine, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxapram, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erirubicin, eptifibatide, ertapenam, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, inamrinone, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pentamidine, pentazocine, pentobarbital, perphenazine, phentobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propranolol, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trastuzumab, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, aztreonam, dantrolene, daptomycin, diazepam, drotrecogin, filgrastim,

ganciclovir, pantoprazole, pemetrexed, phenytoin, procainamide, quinupristin/dalfopristin.
- **Topical:** Cleanse affected area before application. Apply and rub in a thin film twice daily, morning and evening. Avoid contact with eyes.

## Patient/Family Teaching
- Instruct patient to take medication as directed with evenly spaced times between doses, even if feeling better. Do not skip doses or double up on missed doses. Take missed doses as soon as remembered if not almost time for next dose.
- Advise patients treated for trichomoniasis that sexual partners may be asymptomatic sources of reinfection and should be treated concurrently. Patient should also refrain from intercourse or use a condom to prevent reinfection.
- Caution patient to avoid intake of alcoholic beverages or preparations containing alcohol during and for at least 3 days after treatment with metronidazole, including vaginal gel. May cause a disulfiram-like reaction (flushing, nausea, vomiting, headache, abdominal cramps).
- May cause dizziness or light-headedness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that medication may cause an unpleasant metallic taste.
- Advise patient not to take OTC medications concurrently without consulting health care professional.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Notify health care professional if dry mouth persists for more than 2 wk.
- Advise patient to inform health care professional if pregnancy is suspected before taking this medication.
- Inform patient that medication may cause urine to turn dark.
- Advise patient to consult health care professional if no improvement in a few days or if signs and symptoms of superinfection (black, furry overgrowth on tongue; vaginal itching or discharge; loose or foul-smelling stools) develop.
- **Vag:** Instruct patient in correct technique for intravaginal instillation. Advise patient to avoid intercourse during treatment with vaginal gel.
- **Topical:** Instruct patient on correct technique for application of topical gel. Cosmetics may be used after application of gel.

## Evaluation/Desired Outcomes
- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.
- Significant results should be seen within 3 wk of application of topical gel. Application may be continued for 9 wk.

# micafungin (my-ka-fun-gin)
Mycamine

***Classification***
Therapeutic: antifungals
Pharmacologic: echinocandins

**Pregnancy Category C**

M

## Indications
Esophageal candidiasis. Candidemia/acute disseminated candidiasis/Candidal peritonitis and abscesses. Prophylaxis of *Candida* infections during hematopoetic stem cell transplantation.

## Action
Inhibits synthesis of glucan required for the formation of fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi. **Spectrum:** Active against the following *Candida* spp.: *C. albicans*, *C. glabrata*, *C. krusei*, *C. parapsilosis*, *C. tropicalis*.

## Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Protein Binding:** >99 %.
**Metabolism and Excretion:** Mostly metabolized; 71% fecal elimination.
**Half-life:** 15 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | 24 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Severe hepatic impairment; OB: Use only if clearly needed; Lactation, Pedi: Safety not established.

## Adverse Reactions/Side Effects
**GI:** worsening hepatic function/hepatitis. **GU:** renal impairment. **Hemat:** hemolysis/hemolytic anemia. **Local:** injection site reactions. **Misc:** allergic reactions including ANAPHYLAXIS (rare).

### Interactions

**Drug-Drug:** ↑ blood levels and risk of toxicity with **sirolimus** and **nifedipine** (dose adjustments may be necessary).

### Route/Dosage

**IV (Adults):** *Esophageal candidiasis*—150 mg/day for 15 days (range 10–30 days); *Candidemia/acute disseminated candidiasis/Candida peritonitis and abscesses*—100 mg/day for 15 days (range 10–47 days) *Prevention of Candida infections in stem cell transplantation*—50 mg/day.

### Availability

**Lyophilized powder for injection:** 50 mg/vial, 100 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess symptoms of esophageal candidiasis (dysphagia, odynophagia, retrosternal pain) prior to and during therapy.
- Monitor for signs of anaphylaxis (rash, pruritus, wheezing, laryngeal edema, abdominal pain). Discontinue micafungin and notify health care professional immediately if these occur.
- Assess for injection site reactions (phlebitis, thrombophlebitis) during therapy. These occur more frequently in patients receiving micafungin via peripheral IV infusion.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, bilirubin, ALT, AST, and LDH levels. If elevations occur, monitor for worsening liver function; may require discontinuation of therapy.
- May cause ↑ BUN and serum creatinine.
- May cause leukopenia, neutropenia, thrombocytopenia, and anemia. Monitor for worsening levels; may require discontinuation of therapy.
- May cause hypokalemia, hypocalcemia, and hypomagnesemia.

### Potential Nursing Diagnoses

Risk for infection (Indications)

### Implementation

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 50-mg vial with 5 mL of 0.9% NaCl or D5W to achieve concentration of 10 mg/mL. Reconstitute each 100-mg vial with 5 mL of 0.9% NaCl or D5w to achieve concentration of 20 mg/mL. Dissolve by gently swirling vial; do not shake vigorously. Directions for further dilution based on indication for use. For prophylaxis of *Candida* infections, add 50 mg of micafungin to 100 mL of 0.9% NaCl or D5W. For treatment of esophageal candidiasis, add 150 mg of micafungin to 100 mL of 0.9% NaCl or D5W. Reconstituted vials and infusion are stable for 24 hr at room temperature. Protect diluted solution from light. ***Concentration:*** 0.5–1.5 mg/mL. ***Rate:*** Flush line with 0.9% NaCl prior to administration. Infuse over 1 hr. More rapid infusions may result in more frequent histamine mediated reactions.
- **Y-Site Compatibility:** aminophylline, bumetanide, calcium chloride, calcium gluconate, cyclosporine, dopamine, eptifibatide, esmolol, fenoldopam, furosemide, heparin, hydromorphone, lidocaine, lorazepam, magnesium sulfate, milrinone, nitroglycerin, nitroprusside, norepinephrine, phenylephrine, potassium chloride, potassium phosphate, tacrolimus, vasopressin.
- **Y-Site Incompatibility:** amiodarone, cisatracurium, diltiazem, dobutamine, epinephrine, insulin, labetalol, meperidine, midazolam, morphine, mycophenolate mofetil, nesiritide, nicardipine, octreotide, ondansetron, phenytoin, vecuronium.

### Patient/Family Teaching

- Inform patient of the purpose of micafungin.
- Advise patient to notify health care professional immediately if signs of anaphylaxis occur.

### Evaluation/Desired Outcomes

- Resolution of signs and symptoms of esophageal candidiasis, candidemia, acute disseminated candidiasis, candidal peritonitis and abscesses.
- Prevention of *Candida* infections during hematopoetic stem cell transplantation.

**miconazole, See ANTIFUNGALS (TOPICAL).**

**miconazole, See ANTIFUNGALS (VAGINAL).**

HIGH ALERT

**midazolam** (mid-**ay**-zoe-lam)
Versed

***Classification***
Therapeutic: antianxiety agents, sedative/hypnotics
Pharmacologic: benzodiazepines

**Schedule IV**

**Pregnancy Category D**

## Indications

**PO:** Preprocedural sedation and anxiolysis in pediatric patients. **IM, IV:** Preoperative sedation/anxiolysis/amnesia. **IV:** Provides sedation/anxiolysis/amnesia during therapeutic, diagnostic, or radiographic procedures (conscious sedation). Aids in the induction of anesthesia and as part of balanced anesthesia. As a continuous infusion, provides sedation of mechanically ventilated patients during anesthesia or in a critical care setting. Status epilepticus.

## Action

Acts at many levels of the CNS to produce generalized CNS depression. Effects may be mediated by GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Short-term sedation. Postoperative amnesia.

## Pharmacokinetics

**Absorption:** Rapidly absorbed following oral and nasal administration; undergoes substantial intestinal and first-pass hepatic metabolism. Well absorbed following IM administration; IV administration results in complete bioavailability.
**Distribution:** Crosses the blood-brain barrier and placenta; excreted in breast milk.
**Protein Binding:** 97%.
**Metabolism and Excretion:** Almost exclusively metabolized by the liver, resulting in conversion to hydroxymidazolam, an active metabolite, and 2 other inactive metabolites (metabolized by cytochrome P450 3A4 enzyme system); metabolites are excreted in urine.
**Half-life:** Preterm neonates: 2.6–17.7 hr; Neonates: 4–12 hr; Children: 3–7 hr; Adults: 2–6 hr (increased in renal impairment, CHF, or cirrhosis).

TIME/ACTION PROFILE (sedation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IN | 5 min | 10 min | 30–60 min |
| IM | 15 min | 30–60 min | 2–6 hr |
| IV | 1.5–5 min | rapid | 2–6 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Shock; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Acute angle-closure glaucoma; OB: Benzodiazepine drugs may ↑ risk of congenital malformations; use in the last weeks of pregnancy has caused CNS depression in the neonate; Lactation: Lactation; Pedi: Products containing benzyl alcohol should not be used in neonates.
**Use Cautiously in:** Pulmonary disease; CHF; Renal impairment; Severe hepatic impairment; Obese pediatric patients (calculate dose on the basis of ideal body weight); Pedi: Rapid injection in neonates has caused severe hypotension and seizures, especially when used with fentanyl; Geri: Older patients (especially >70 yr) are more susceptible to cardiorespiratory depressant effects; dosage ↓ required.

## Adverse Reactions/Side Effects

**CNS:** agitation, drowsiness, excess sedation, headache. **EENT:** blurred vision. **Resp:** APNEA, LARYNGOSPASM, RESPIRATORY DEPRESSION, bronchospasm, coughing. **CV:** CARDIAC ARREST, arrhythmias. **GI:** hiccups, nausea, vomiting. **Derm:** rashes. **Local:** phlebitis at IV site, pain at IM site.

## Interactions

**Drug-Drug:** ↑ CNS depression with **alcohol**, **antihistamines**, **opioid analgesics**, and other **sedative/hypnotics** ( ↓ midazolam dose by 30–50% if used concurrently). ↑ risk of hypotension with **antihypertensives**, **opioid analgesics,**acute ingestion of **alcohol**, or **nitrates**. Midazolam is metabolized by the cytochrome P450 3A4 enzyme system; drugs that induce or inhibit this system may be expected to alter the effects of midazolam. **Carbamazepine**, **phenytoin**, **rifampin**, **rifabutin**, and **phenobarbital** ↓ levels. **Erythromycin**, **cimetidine**, **ranitidine**, **diltiazem**, **verapamil**, **fluconazole**, **itraconazole**, and **ketoconazole** ↓ metabolism and may ↑ risk of toxicity.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. Long term use of **St. John's wort** may significantly ↓ levels.
**Drug-Food: Grapefruit juice** ↓ metabolism and may ↑ risk of toxicity.

### Route/Dosage

Dose must be individualized, taking caution to reduce dose in geriatric patients and in those who are already sedated.

### Preoperative Sedation/Anxiolysis/Amnesia

**PO (Children 6 mo–16 yr):** 0.25–0.5 mg/kg, may require up to 1 mg/kg (dose should not exceed 20 mg); *patients with cardiac/respiratory compromise or concurrent CNS depressants*—0.25 mg/kg.
**IM (Adults Otherwise Healthy and <60 yr):** 0.07–0.08 mg/kg 1 hr before surgery (usual dose 5 mg).
**IM (Adults ≥60 yr, Debilitated or Chronically Ill):** 0.02–0.03 mg/kg 1 hr before surgery (usual dose 1–3 mg).
**IM (Children):** 0.1–0.15 mg/kg up to 0.5 mg/kg 30–60 min prior to procedure; not to exceed 10 mg/dose.

### Conscious Sedation for Short Procedures

**IV (Adults and Children Otherwise Healthy >12 yr and <60 yr):** 1–2.5 mg initially; dosage may be ↑ further as needed. Total doses >5 mg are rarely needed (↓ dose by 50% if other CNS depressants are used). Maintenance doses of 25% of the dose required for initial sedation may be given as necessary.
**IV (Children 6–12 yr):** 0.025–0.05 mg/kg initially, then titrate dose carefully, may need up to 0.4 mg/kg total, maximum dose 10 mg.
**IV (Children 6 months–5 yr):** 0.05 mg/kg initially, then titrate dose carefully, may need up to 0.6 mg/kg total, maximum dose 6 mg.
**IV (Geriatric Patients ≥60 yr, Debilitated or Chronically Ill):** 1–1.5 mg initially; dose may be ↑ further as needed. Total doses >3.5 mg are rarely needed (↓ dose by 30% if other CNS depressants are used). Maintenance doses of 25% of the dose required for initial sedation may be given as necessary.
**Intranasal (Children):** 0.2–0.3 mg/kg, may repeat in 5–15 min.

### Status Epilepticus

**IV (Children >2 months):** 0.15 mg/kg load followed by a continuous infusion of 1 mcg/kg/min. Titrate dose upward q 5 min until seizure controlled, range: 1–18 mcg/kg/min.

### Induction of Anesthesia (Adjunct)

May give additional dose of 25% of initial dose if needed.
**IV (Adults Otherwise Healthy and <55 yr):** 300–350 mcg/kg initially (up to 600 mcg/kg total). If patient is premedicated, initial dose should be further ↓.
**IV (Geriatric Patients >55 yr):** 150–300 mcg/kg as initial dose. If patient is premedicated, initial dose should be further ↓.
**IV (Adults — Debilitated):** 150–250 mcg/kg initial dose. If patient is premedicated, initial dose should be further ↓.

### Sedation in Critical Care Settings

**IV (Adults):** 0.01–0.05 mg/kg (0.5–4 mg in most adults) initially if a loading dose is required; may repeat q 10–15 min until desired effect is obtained; may be followed by infusion at 0.02–0.1 mg/kg/hr (1–7 mg/hr in most adults).
**IV (Children):** *Intubated patients only*—0.05–0.2 mg/kg initially as a loading dose; follow with infusion at 0.06–0.12 mg/kg/hr (1–2 mcg/kg/min), titrate to effect, range: 0.4–6 mcg/kg/min.
**IV (Neonates >32 wk):** *Intubated patients only*—0.06 mg/kg/hr (1 mcg/kg/min).
**IV (Neonates <32 wk):** *Intubated patients only*—0.03 mg/kg/hr (0.5 mcg/kg/min).

### Availability (generic available)

**Injection:** 1 mg/mL, 5 mg/mL. **Syrup (cherry flavor):** 2 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess level of sedation and level of consciousness throughout and for 2–6 hr following administration.
- Monitor blood pressure, pulse, and respiration continuously during IV administration. Oxygen and resuscitative equipment should be immediately available.
- ***Toxicity and Overdose:*** If overdose occurs, monitor pulse, respiration, and blood pressure continuously. Maintain patent airway and assist ventilation as needed. If hypotension occurs, treatment includes IV fluids, repositioning, and vasopressors.
- The effects of midazolam can be reversed with flumazenil (Romazicon).

### Potential Nursing Diagnoses

Ineffective breathing pattern (Adverse Reactions)
Risk for injury (Side Effects)

### Implementation

- ***High Alert:*** Accidental overdose of oral midazolam syrup in children has resulted in serious harm or death. Do not accept orders prescribed by volume (5 mL, or 1 tsp); instead, request dose be expressed in milligrams. Have

second practitioner independently check original order and dose calculations. Midazolam syrup should only be administered by health care professionals authorized to administer conscious sedation. Do not confuse Versed (midazolam) with VePesid (etoposide).

- **PO:** To use the *Press-in Bottle Adaptor (PIBA),* remove the cap and push bottle adaptor into neck of bottle. Close bottle tightly with cap. Solution is a clear red to purplish-red cherry-flavored syrup. Then remove cap and insert tip of oral dispenser in bottle adaptor. Push the plunger completely down toward tip of oral dispenser and insert firmly into bottle adaptor. Turn entire unit (bottle and oral dispenser) upside down. Pull plunger out slowly until desired amount of medication is withdrawn into oral dispenser. Turn entire unit right side up and slowly remove oral dispenser from the bottle. Tip of dispenser may be covered with tip of cap until time of use. Close bottle with cap after each use.
- Dispense directly into mouth. Do not mix with any liquid prior to dispensing.
- **Intranasal:** Administer using a 1 mL needleless syringe into the nares over 15 sec. Using the 5 mg/mL injection, administer half dose into each nare.
- **IM:** Administer IM doses deep into muscle mass, maximum concentration 1 mg/mL.

### IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted or diluted with D5W or 0.9% NaCl. ***Concentration:*** Undiluted: 1 mg/mL or 5 mg/mL. Diluted: 0.03–3 mg/mL. ***Rate:*** Administer slowly over at least 2–5 min. Titrate dose to patient response. Rapid injection, especially in neonates, has caused severe hypotension.
- **Continuous Infusion:** ***Diluent:*** Dilute with 0.9% NaCl or D5W. ***Concentration:*** 0.5–1 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titrate to desired level of sedation. Assess sedation at regular intervals and adjust rate up or down by 25–50% as needed. Dose should also be decreased by 10–25% every few hours to find minimum effective infusion rate, which prevents accumulation of midazolam and provides more rapid recovery upon termination.
- **Y-Site Compatibility:** abciximab, amikacin, amiodarone, anidulafungin, argatroban, atropine, aztreonam, bivalirudin, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftizoxime, ceftriaxone, cimetidine, ciprofloxacin, cisatracurium, cyclosporine, daptomycin, digoxin, diltiazem, diphenhydramine, dopamine, doxycycline, enalaprilat, epinephrine, eptifibatide, erythromycin lactobionate, esmolol, etomidate, famotidine, fenoldopam, fentanyl, fluconazole, gentamicin, granisetron, heparin, hydromorphone, hydroxyzine, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pancuronium, penicillin G potassium, phenylephrine, phytonadione, potassium chloride, procainamide, promethazine, propranolol, protamine, quinupristin/dalfopristin, ranitidine, rifampin, tobramycin, vancomycin, vecuronium.
- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl sulfate, aminophylline, ampicillin, ampicillin/sulbactam, bumetanide, cefepime, ceftazidime, cefuroxime, chloramphenicol, dexamethasone sodium phosphate, diazepam, ertapenem, furosemide, ganciclovir, ketorolac, lansoprazole, micafungin, pantoprazole, phenytoin, piperacillin/tazobactam, prochlorperazine, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole.

### Patient/Family Teaching

- Inform patient that this medication will decrease mental recall of the procedure.
- May cause drowsiness or dizziness. Advise patient to request assistance prior to ambulation and transfer and to avoid driving or other activities requiring alertness for 24 hr following administration.
- Instruct patient to inform health care professional prior to administration if pregnancy is suspected.
- Advise patient to avoid alcohol or other CNS depressants for 24 hr following administration of midazolam.

### Evaluation/Desired Outcomes

- Sedation during and amnesia following surgical, diagnostic, and radiologic procedures.
- Sedation and amnesia for mechanically ventilated patients in a critical care setting.

## mifepristone (mi-fe-priss-tone)

Mifeprex

***Classification***

Therapeutic: abortifacients
Pharmacologic: antiprogestational agents

**Pregnancy Category UK**

### Indications

Medical termination of intrauterine pregnancy up to day 49 of pregnancy.

### Action

Antagonizes endometrial and myometrial effects of progesterone. Sensitizes the myometrium to contraction-inducing activity of prostaglandins.
**Therapeutic Effects:** Termination of pregnancy.

### Pharmacokinetics

**Absorption:** Rapidly absorbed following oral administration (69% bioavailability).
**Distribution:** Unknown.
**Protein Binding:** 98%.
**Metabolism and Excretion:** Mostly metabolized by the liver (cytochrome CYP450 3A4 [CYP450 3A4] enzyme system).
**Half-life:** 18 hr.

TIME/ACTION PROFILE (termination of pregnancy)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | within 2 days | unknown |

### Contraindications/Precautions

**Contraindicated in:** Presence of an intrauterine device (IUD); Confirmed or suspected ectopic pregnancy; Undiagnosed adnexal mass; Chronic adrenal failure; Concurrent long-term corticosteroid therapy; Bleeding disorders or concurrent anticoagulant therapy; Inherited porphyrias.
**Use Cautiously in:** Chronic medical conditions such as cardiovascular, hypertensive, hepatic, renal, or respiratory disease (safety and efficacy not established); Women >35 yrs old or who smoke ≥10 cigarettes/day.

### Adverse Reactions/Side Effects

**CNS:** dizziness, fainting, headache, weakness. **GI:** abdominal pain, diarrhea, nausea, vomiting. **GU:** uterine bleeding, uterine cramping, ruptured ectopic pregnancy, pelvic pain.

### Interactions

**Drug-Drug:** Blood levels and therapeutic effectiveness may be ↑ by **ketoconazole**, **itraconazole**, and **erythromycin**. Blood levels and effects may be ↓ by **rifampin**, **dexamethasone**, **phenytoin**, **phenobarbital**, and **carbamazepine**. Mifepristone may ↓ metabolism and ↑ effects of other **drugs metabolized by the CYP 450 3A4 enzyme system**, including **some agents used during general anesthesia**.
**Drug-Natural Products:** Blood levels and effects may be ↓ by **St. John's wort**.
**Drug-Food:** Blood levels and effects may be ↑ by **grapefruit juice**.

### Route/Dosage

**PO (Adults):** *Day 1*—600 mg (given as three 200 mg tablets) as a single dose, followed on *day 3* by 400 mcg misoprostol (Cytotec), unless abortion has occurred and has been confirmed by clinical or ultrasonographic examination (see misoprostol monograph).

### Availability

**Tablets:** 200 mg.

## NURSING IMPLICATIONS

### Assessment

- Determine duration of pregnancy. Pregnancy is dated from the first day of the last menstrual period in a presumed 28-day cycle with ovulation occurring at mid-cycle and can be determined by menstrual history and clinical examination; use ultrasound if duration is uncertain or if ectopic pregnancy is suspected.
- Assess amount of bleeding and cramping during treatment. Determine if termination is complete on day 14.
- ***Lab Test Considerations:*** Decrease in hemoglobin, hematocrit, and RBCs may occur in women who bleed heavily.
- Changes in quantitative human chorionic gonadotropin (hCG) levels are not accurate until at least 10 days after mifepristone administration; complete termination of pregnancy must be confirmed by clinical examination.

### Potential Nursing Diagnoses

Acute pain (Side Effects)

### Implementation

- Mifepristone should be administered only by health care professionals who have read and understood the prescribing information, are able to assess gestational age of an embryo and diagnose ectopic pregnancies, and who are able to provide surgical intervention in cases of incomplete abortion or severe bleeding.
- Any IUD should be removed prior to mifepristone adminstration.
- Measures to prevent rhesus immunization, similar to those of surgical abortion, should be taken.

- **PO:** On *day 1*, after the patient has read the *Medication Guide* and signed the Patient Agreement, administer three 200 mg tablets of mifepristone as a single dose. On *day 3*, unless abortion has occurred and been confirmed by clinical examination or ultrasound, administer two 200-mcg tablets of misoprostol. On *day 14*, confirm that termination of pregnancy has occurred by clinical examination or ultrasound.

### Patient/Family Teaching

- Advise patient of the treatment and its effects. Patients must be given a copy of the *Medication Guide and Patient Agreement.* Patient must understand the necessity of completing the treatment schedule of three office visits (day 1, day 3, and day 14).
- Inform patient that vaginal bleeding and uterine cramping will probably occur and that prolonged or heavy vaginal bleeding is not proof of complete expulsion. Bleeding or spotting occurs for an average of 9–16 days; but may continue for more than 30 days. Advise patient that if the treatment fails, there is a risk of fetal malformation; medical abortion failures are managed by surgical termination.
- **Caution patient to notify health care professional immediately if she develops weakness, nausea, vomiting, diarrhea, with or without abdominal pain or fever more than 24 hr after taking mifepristone; may indicate life-threatening sepsis.**
- Instruct patient in the steps to take in an emergency situation, including precise instructions and a telephone number to call if she has problems or concerns.
- May cause dizziness or fainting. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient that pregnancy can occur following termination of pregnancy and before resumption of normal menses. Contraception can be initiated as soon as pregnancy termination is confirmed, or before sexual intercourse is resumed.
- Advise patient to notify health care professional if she smokes at least 10 cigarettes a day.

### Evaluation/Desired Outcomes

- Termination of an intrauterine pregnancy of less than 49 days' duration.

## miglitol (mi-gli-tole)

Glyset

***Classification***

Therapeutic: antidiabetics
Pharmacologic: alpha-glucosidase inhibitors

**Pregnancy Category B**

### Indications

Management of non–insulin-dependent diabetes mellitus (type 2) in conjunction with dietary therapy; may be used concurrently with sulfonyl-urea oral hypoglycemic agents.

### Action

Lowers blood glucose by inhibiting the enzyme alpha-glucosidase in the GI tract, resulting in delayed glucose absorption. **Therapeutic Effects:** Lowering of blood glucose in diabetic patients, especially postprandial hyperglycemia.

### Pharmacokinetics

**Absorption:** Completely absorbed at lower doses (25 mg); 50–70% absorbed at higher doses (100 mg).
**Distribution:** Distributes primarily into extracellular fluid; small amounts enter breast milk.
**Metabolism and Excretion:** Not metabolized; action is primarily local in the GI tract; amounts that are absorbed are excreted mostly unchanged in urine.
**Half-life:** 2 hr.

TIME/ACTION PROFILE (effect on glucose absorption)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | within 1 hr | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Diabetic ketoacidosis; Inflammatory bowel disease or other chronic intestinal conditions resulting in impaired absorption or predisposition to obstruction; Lactation: Lactation.
**Use Cautiously in:** Patients with fever, infection, trauma, or stress (may cause hyperglycemia requiring alternate therapy); Renal impairment (use not recommended if creatinine >2 mg/dL); OB, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**GI:** abdominal pain, diarrhea, flatulence. **Hemat:** low serum iron.

### Interactions
**Drug-Drug:** May ↓ absorption of **ranitidine** and **propranolol**. Effects may be ↓ by **intestinal adsorbents** (such as **charcoal**) and **digestive enzyme products**; concurrent use should be avoided.
**Drug-Food:** Concurrent **carbohydrates** may ↑ diarrhea.

### Route/Dosage
**PO (Adults):** 25 mg 3 times daily; may begin with 25 mg once daily; may be ↑ up to 100 mg 3 times daily.

### Availability
**Tablets:** 25 mg, 50 mg, 100 mg.

## NURSING IMPLICATIONS

### Assessment
- Observe patient for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety), especially when taking concurrently with other oral hypoglycemic agents.
- ***Lab Test Considerations:*** Serum glucose and glycosylated hemoglobin levels should be monitored periodically throughout therapy to evaluate effectiveness of therapy.
- ***Toxicity and Overdose:*** Symptoms of overdose are transient increase in flatulence, diarrhea, and abdominal discomfort. Miglitol alone does not cause hypoglycemia; however, other concurrently administered hypoglycemic agents may produce hypoglycemia requiring treatment. Mild hypoglycemia may be treated with administration of oral glucose.

### Potential Nursing Diagnoses
Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- Does not cause hypoglycemia when taken while fasting but may increase hypoglycemic effect of other hypoglycemic agents.
- **PO:** Administer miglitol 3 times daily with the first bite of each meal. Dose may be started lower and increased gradually to minimize GI effects.

### Patient/Family Teaching
- Instruct patient to take miglitol at the same time each day, exactly as directed.
- Explain to patient that miglitol helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice, 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose or urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified of significant changes.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry a form of oral glucose (dextrose, D-glucose) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose and glycosylated hemoglobin.

### Evaluation/Desired Outcomes
- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

## **milnacipran** (mil-na-**sip**-ran)
Savella

***Classification***
Therapeutic: antifibromyalgia agents
Pharmacologic: selective norepinephrine reuptake inhibitors

**Pregnancy Category C**

### Indications
Management of fibromyalgia.

### Action
Inhibits neuronal reuptake of norepinephrine and serotonin. **Therapeutic Effects:** Decreased pain associated with fibromyalgia.

## Pharmacokinetics

**Absorption:** 85–90% absorbed following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly excreted urine as unchanged drug (55%) and inactive metabolites.
**Half-life:** *D*-isomer 8–10 hr; *L*-isomer 4–6 hr.

TIME/ACTION PROFILE (decrease in pain)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 wk | unknown | unknown |

## Contraindications/Precautions

**Contraindicated in:** Uncontrolled narrow-angle glaucoma; Concurrent use of or in close temporal proximity to MAO inhibitors; End-stage renal disease; Significant history of alcohol use/abuse; Chronic liver disease.
**Use Cautiously in:** History of suicide risk or attempt; History of seizures; Moderate-to-severe renal impairment; for CCr <30 mL/min reduced dose is required; Severe hepatic impairment; Obstructive uropathy (↑ risk of adverse genitourinary effects); Geri: Consider age-related decrease in renal function, chronic disease state and concurrent drug therapy; OB: Use only if clearly required during pregnancy weighing benefit to mother versus potential harm to fetus; Lactation: Potential for serious adverse reactions in infant; discontinue drug or discontinue breastfeeding; Pedi: Increased risk of suicidal thinking and behavior (suicidality) in adolescents and young adults up to 24 yrs with Major Depressive Disorder (MDD) and other psychiatric disorders.

## Adverse Reactions/Side Effects

**CNS:** dizziness, headache, insomnia. **CV:** hypertension, tachycardia. **GI:** constipation, dry mouth, liver function abnormalities, nausea, vomiting. **Derm:** hot flushes, hyperhidrosis.

## Interactions

**Drug-Drug:** Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of milnacipran. Wait at least 5 days after discontinuing milnacipran before initiation of MAO inhibitor. Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of milnacipran. Wait at least 5 days after discontinuing milnacipran before initiation of MAO inhibitor. Concurrent use of **serotonergic drugs** (including **triptans**, **lithium**, and **tramadol**) may ↑ the risk of serotinin syndrome; also ↑ risk of coronary vasoconstriction and hypertension. Concurrent use of **NSAIDs**, **aspirin**, or other **drugs that affect coagulation** may ↑ the risk of bleeding. May ↓ antihypertensive effectiveness of **clonidine**. ↑ risk of hypertension and arrhythmias with **epinephrine** or **norepinephrine**. ↑ risk of euphoria and hypotension when switching from **clomipramine**. Concurrent use with **digoxin** may result in adverse hemodynamics, including hypotension and tachycardia; avoid concurrent use with IV digoxin.

## Route/Dosage

**PO (Adults):** *Day 1*—12.5 mg; *Day 2–3*—12.5 mg twice daily; *Day 4–7*—25 mg twice daily; *After Day 7*—50 mg twice daily. Some patients may be require up to 100 mg twice daily depending on response.

### Renal Impairment

**PO (Adults):** *CCr 5–29 mL/min*—maintenance dose is 25 mg twice daily; some patients may be require up to 50 mg twice daily depending on response.

## Availability

**Tablets (contain tartrazine):** 12.5 mg, 25 mg, 50 mg, 100 mg.

# NURSING IMPLICATIONS

## Assessment

- Assess intensity, quality, and location of pain periodically during therapy. May require several wk for effects to be seen.
- Monitor blood pressure and heart rate before and periodically during therapy. Treat per-existing hypertension and cardiac disease prior to therapy. Sustained hypertension may be dose related; decrease dose or discontinue therapy if this occurs.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- ***Lab Test Considerations:*** May cause ↑ ALT, AST, and bilirubin.

## Potential Nursing Diagnoses

Chronic pain (Indications)
Risk for suicide (Adverse Reactions)

### Implementation
- **PO:** May be administered without regard to meals; may be more tolerable if taken with food.

### Patient/Family Teaching
- Instruct patient to take milnacipran as directed at the same time each day. Take missed doses as soon as possible unless time for next dose. Do not stop abruptly; must be decreased gradually. Advise patient to read the *Medication Guide* prior to therapy and with each Rx refill.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. Assess symptoms on a day-to-day basis as changes may be abrupt. If these symptoms occur, notify health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional prior to taking any Rx, OTC, or herbal products. Avoid use of aspirin, NSAIDs, and warfarin due to increased risk for bleeding.
- Instruct patient to notify health care professional if signs of liver damage (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained "flu-like" symptoms) or hyponatremia (headache, difficulty concentrating, memory impairment, confusion, weakness, unsteadiness) occur.
- Advise patient to avoid taking alcohol during milnacipran therapy.
- Instruct patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Encourage patient to maintain routine follow-up visits with health care provider to determine effectiveness.

### Evaluation/Desired Outcomes
- Reduction in pain and soreness associated with fibromyalgia.

HIGH ALERT

## milrinone (mill-ri-none)
Primacor

***Classification***
Therapeutic: inotropics

**Pregnancy Category C**

### Indications
Short-term treatment of CHF unresponsive to conventional therapy with digoxin, diuretics, and vasodilators.

### Action
Increases myocardial contractility. Decreases preload and afterload by a direct dilating effect on vascular smooth muscle. **Therapeutic Effects:** Increased cardiac output (inotropic effect).

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** 80–90% excreted unchanged by the kidneys.
**Half-life:** 2.3 hr (increased in renal impairment).

TIME/ACTION PROFILE (hemodynamic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 5–15 min | unknown | 3–6 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Severe aortic or pulmonic valvular heart disease; Hypertrophic subaortic stenosis (may increase outflow tract obstruction).
**Use Cautiously in:** History of arrhythmias, electrolyte abnormalities, abnormal digoxin levels, or insertion of vascular catheters (↑ risk of ventricular arrhythmias); Renal impairment (↓ infusion rate if CCr is <50 mL/min); OB, Lactation: Pregnancy or lactation.

### Adverse Reactions/Side Effects
**CNS:** headache, tremor. **CV:** VENTRICULAR ARRHYTHMIAS, angina pectoris, chest pain, hypotension, supraventricular arrhythmias. **CV:** skin rash. **GI:** ↑ liver function tests. **F and E:** hypokalemia. **Hemat:** thrombocytopenia.

### Interactions
**Drug-Drug:** None significant.

### Route/Dosage
**IV (Adults):** *Loading dose*—50 mcg/kg followed by *continuous infusion* at 0.5 mcg/kg/min (range 0.375–0.75 mcg/kg/min).
**IV (Infants and Children):** *Loading dose*—50 mcg/kg over 10 min followed by *continuous infusion* at 0.5 mcg/kg/min (range 0.25–0.75 mcg/kg/min).

### Availability (generic available)
**Injection:** 1 mg/mL. **Premixed infusion:** 20 mg/100 mL, 40 mg/200 mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor heart rate and blood pressure continuously during administration. Milrinone should be slowed or discontinued if blood pressure drops excessively.
- Monitor intake and output and daily weight. Assess patient for resolution of signs and symptoms of CHF (peripheral edema, dyspnea, rales/crackles, weight gain) and improvement in hemodynamic parameters (increase in cardiac output and cardiac index, decrease in pulmonary capillary wedge pressure). Correct effects of previous aggressive diuretic therapy to allow for optimal filling pressure.
- Monitor ECG continuously during infusion. Arrhythmias are common and may be life threatening. The risk of ventricular arrhythmias is increased in patients with a history of arrhythmias, electrolyte abnormalities, abnormal digoxin levels, or insertion of vascular catheters.
- ***Lab Test Considerations:*** Monitor electrolytes and renal function frequently during administration. Correct hypokalemia prior to administration to decrease the risk of arrhythmias.
- Monitor platelet count during therapy.
- ***Toxicity and Overdose: High Alert:*** Overdose manifests as hypotension. Dose should be decreased or discontinued. Supportive measures may be necessary.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications)

### Implementation

- ***High Alert:*** Accidental overdose of milrinone can cause patient harm or death. Have second practitioner independently check original order, dose calculations, and infusion pump settings.

#### IV Administration

- **Direct IV:** ***Diluent:*** Loading dose may be administered undiluted. May also be diluted in 0.9% NaCl, 0.45% NaCl, or D5W for ease of administration. ***Concentration:*** 1 mg/mL. ***Rate:*** Administer the loading dose over 10 min.
- **Continuous Infusion:** ***Diluent:*** Milrinone drawn from vials must be diluted. Dilute 10 mg (10 mL) of milrinone in 40 mL of diluent or 20 mg (20 mL) of milrinone in 80 mL of diluent. Compatible diluents include 0.45% NaCl, 0.9% NaCl, and D5W. Premixed infusions are already diluted and ready to use. Admixed solutions are stable for 72 hr at room temperature. Stability of premixed infusions based on manufacturer's expiration date. Do not use solutions that are discolored or contain particulate matter. ***Concentration:*** 200 mcg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titrate according to hemodynamic and clinical response.
- **Y-Site Compatibility:** acyclovir, amikacin, amiodarone, ampicillin, argatroban, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, ceftazidime, cefuroxime, cimetidine, ciprofloxacin, clindamycin, daptomycin, dexamethasone sodium phosphate, digoxin, diltiazem, dobutamine, dopamine, epinephrine, ertapenem, fenoldopam, fentanyl, gentamicin, granisetron, heparin, hydromorphone, insulin, isoproterenol, labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, meropenem, methylprednisolone sodium succinate, metronidazole, micafungin, midazolam, morphine, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, palonosetron, pancuronium, piperacillin/tazobactam, potassium chloride, propofol, propranolol, quinupristin/dalfopristin, ranitidine, rocuronium, sodium bicarbonate, tacrolimus, theophylline, thiopental, tirofiban, tobramycin, torsemide, vancomycin, vasopressin, vecuronium, voriconazole.
- **Y-Site Incompatibility:** furosemide, imipenem/cilastatin, pantoprazole, procainamide.

### Patient/Family Teaching

- Inform patient and family of reasons for administration. Milrinone is not a cure but is a temporary measure to control the symptoms of CHF.

### Evaluation/Desired Outcomes

- Decrease in the signs and symptoms of CHF.
- Improvement in hemodynamic parameters.

**minocycline, See TETRACYCLINES.**

## mirtazapine (meer-taz-a-peen)

Remeron, Remeron Soltabs

***Classification***
Therapeutic: antidepressants
Pharmacologic: tetracyclic antidepressants

**Pregnancy Category C**

## Indications
Major Depressive Disorder. **Unlabeled Use:** Panic Disorder. Generalized Anxiety Disorder (GAD). Post-traumatic Stress Disorder (PTSD).

## Action
Potentiates the effects of norepinephrine and serotonin. **Therapeutic Effects:** Antidepressant action, which may develop only after several weeks.

## Pharmacokinetics
**Absorption:** Well absorbed but rapidly metabolized, resulting in 50% bioavailability.
**Distribution:** Unknown.
**Protein Binding:** 85%.
**Metabolism and Excretion:** Extensively metabolized by the liver (P450 2D6, 1A2 and 3A enzymes involved); metabolites excreted in urine (75%) and feces (15%).
**Half-life:** 20–40 hr.

TIME/ACTION PROFILE (antidepressant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–2 wk | 6 wk or more | unknown |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Concurrent MAO inhibitor therapy.
**Use Cautiously in:** History of seizures; History of suicide attempt; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; History of mania/hypomania; Patients with hepatic or renal impairment; OB: Safety not established; Lactation: Discontinue drug or bottle-feed; Pedi: Safety not established. Suicide risk may be greater in chilren or adolscents; Geri: ↑ sensitivity to CNS effects and oversedation. Begin at lower doses and titrate carefully.

## Adverse Reactions/Side Effects
**CNS:** drowsiness, abnormal dreams, abnormal thinking, agitation, anxiety, apathy, confusion, dizziness, malaise, weakness. **EENT:** sinusitis. **Resp:** dyspnea, increased cough. **CV:** edema, hypotension, vasodilation. **GI:** constipation, dry mouth, increased appetite, abdominal pain, anorexia, elevated liver enzymes, nausea, vomiting. **GU:** urinary frequency. **Derm:** pruritus, rash. **F and E:** increased thirst. **Hemat:** AGRANULOCYTOSIS. **Metab:** weight gain, hypercholesterolemia, increased triglycerides. **MS:** arthralgia, back pain, myalgia. **Neuro:** hyperkinesia, hypesthesia, twitching. **Misc:** flu-like syndrome.

## Interactions
**Drug-Drug:** May cause hypertension, seizures, and death when used with **MAO inhibitors**; do not use within 14 days of MAO inhibitor therapy. ↑ CNS depression with other **CNS depressants**, including **alcohol** and **benzodiazepines**. **Drugs affecting P450 enzymes**, **CYP2D6**, **CYP1A2**, and **CYP3A4** may alter the effects of mirtazapine.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression. ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

## Route/Dosage
**PO (Adults):** 15 mg/day as a single bedtime dose initially; may be increased q 1–2 wk up to 45 mg/day.

## Availability (generic available)
**Tablets:** 15 mg, 30 mg, 45 mg. **Cost:** *Generic*— 15 mg $50.00/30, 30 mg $45.99/30, 45 mg $45.99/30. **Orally disintegrating tablets (orange flavor):** 15 mg, 30 mg, 45 mg. **Cost:** *Generic*— 15 mg $70.38/30, 30 mg $65.99/30, 45 mg $71.49/30.

# NURSING IMPLICATIONS

## Assessment
- Assess mental status (orientation, mood, behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout therapy.
- Monitor blood pressure and pulse rate periodically during initial therapy. Report significant changes.
- For overweight/obese individuals, obtain BFS and cholesterol levels. Refer as appropriate for nutritional/weight management and medical management.
- Monitor for seizure activity in patients with a history of seizures or alcohol abuse. Institute seizure precautions.
- ***Lab Test Considerations:*** Assess CBC and hepatic function before and periodically during therapy.

## Potential Nursing Diagnoses
Ineffective coping (Indications)
Anxiety (Indications)
Imbalanced nutrition: risk for more than body requirements (Side Effects)

### Implementation
- May be given as a single dose at bedtime to minimize excessive drowsiness or dizziness.
- May be taken without regard to food.
- For *orally disintegrating tablets*, do not attempt to push through foil backing; with dry hands, peal back backing and remove tablet. Immediately place tablet on tongue; tablet will dissolve in seconds, then swallow with saliva. Administration with liquid is not necessary.

### Patient/Family Teaching
- Instruct patient to take mirtazapine as directed. Take missed doses as soon as remembered; if almost time for next dose, skip missed dose and return to regular schedule. If single bedtime dose regimen is used, do not take missed dose in morning, but consult health care professional. Do not discontinue abruptly; gradual dose reduction may be required.
- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for at least 3–7 days after therapy has been discontinued.
- Advise patient to notify health care professional if dry mouth, urinary retention, or constipation occurs. Frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Advise patient to consult health care professional before taking any OTC cold remedies or herbal products with this medication.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Therapy for depression may be prolonged. Emphasize the importance of follow-up exam to monitor effectiveness and side effects.

### Evaluation/Desired Outcomes
- Resolution of the symptoms of depression.
- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Therapeutic effects may be seen within 1 wk, although several wk are usually necessary before improvement is observed.

## misoprostol
(mye-soe-**prost**-ole)
Cytotec

***Classification***
Therapeutic: antiulcer agents, cytoprotective agents
Pharmacologic: prostaglandins

**Pregnancy Category X**

### Indications
Prevention of gastric mucosal injury from NSAIDs, including aspirin, in high-risk patients (geriatric patients, debilitated patients, or those with a history of ulcers). With mifepristone for termination of pregnancy. **Unlabeled Use:** Treatment of duodenal ulcers. Cervical ripening and labor induction.

### Action
Acts as a prostaglandin analogue, decreasing gastric acid secretion (antisecretory effect) and increasing the production of protective mucus (cytoprotective effect). Causes uterine contractions. **Therapeutic Effects:** Prevention of gastric ulceration from NSAIDs. With mifepristone terminates pregnancy of less than 49 days.

### Pharmacokinetics
**Absorption:** Well absorbed following oral administration and rapidly converted to its active form (misoprostol acid).
**Distribution:** Unknown.
**Protein Binding:** 85%.
**Metabolism and Excretion:** Undergoes some metabolism and is then excreted by the kidneys.
**Half-life:** 20–40 min.

TIME/ACTION PROFILE (effect on gastric acid secretion)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | unknown | 3–6 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to prostaglandins; OB: Should not be used to prevent NSAID-induced gastric injury due to potential for fetal harm or death; Lactation: May cause severe diarrhea in the nursing infant.

**Use Cautiously in:** OB: Patients with childbearing potential should be counseled to avoid pregnancy during misoprostol therapy for prevention of NSAID-induced gastric injury. Pregnancy status should be determined before initiating therapy; Pedi: Safety not established in children <18 yr. **Exercise Extreme Caution in:** When used for cervical ripening (unlabeled use) may cause uterine rupture (risk factors are late trimester pregnancy, previous caesarian section or uterine surgery or ≥ 5 previous pregnancies).

### Adverse Reactions/Side Effects

**CNS:** headache. **GI:** abdominal pain, diarrhea, constipation, dyspepsia, flatulence, nausea, vomiting. **GU:** miscarriage, menstrual disorders.

### Interactions

**Drug-Drug:** ↑ risk of diarrhea with **magnesium-containing antacids**.

### Route/Dosage

**PO (Adults):** *Antiulcer*—200 mcg 4 times daily with or after meals and at bedtime, *or* 400 mcg twice daily, with the last dose at bedtime. If intolerance occurs, dose may be decreased to 100 mcg 4 times daily. *Termination of pregnancy*—400 mcg single dose 2 days after mifepristone if abortion has not occurred.
**Intravaginally** (Adults): 25 mcg (1/4 of 100–mcg tablet); may repeat q 3–6 hr, if needed.

### Availability (generic available)

**Tablets:** 100 mcg (0.1 mg), 200 mcg (0.2 mg). ***In combination with:*** 50 mg diclofenac/200 mcg misoprostol and 75 mg diclofenac/200 mcg misoprostol (Arthrotec). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in the stool, emesis, or gastric aspirate.
- Assess women of childbearing age for pregnancy. Misoprostol is usually begun on 2nd or 3rd day of menstrual period following a negative pregnancy test result.
- **Termination of pregnancy:** Monitor uterine cramping and bleeding during therapy.
- **Cervical Ripening:** Assess dilation of cervix periodically during therapy.

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- Do not confuse Cytotec (misoprostol) with Cytoxan (cyclophosphamide).
- Misoprostol therapy should be started at the onset of treatment with NSAIDs.
- **PO:** Administer medication with meals and at bedtime to reduce severity of diarrhea.
- Antacids may be administered before or after misoprostol for relief of pain. Avoid those containing magnesium, because of increased diarrhea with misoprostol.

### Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as possible unless next dose is due within 2 hr; do not double doses. Emphasize that sharing of this medication may be dangerous.
- Inform patient that misoprostol will cause spontaneous abortion. Women of childbearing age must be informed of this effect through verbal and written information and must use contraception throughout therapy. If pregnancy is suspected, the woman should stop taking misoprostol and immediately notify her health care professional.
- Inform patient that diarrhea may occur. Health care professional should be notified if diarrhea persists for more than 1 wk. Also advise patient to report onset of black, tarry stools or severe abdominal pain.
- Advise patient to avoid alcohol and foods that may cause an increase in GI irritation.

### Evaluation/Desired Outcomes

- The prevention of gastric ulcers in patients receiving chronic NSAID therapy.
- Termination of pregnancy.
- Cervical ripening and induction of labor.

## mitomycin (mye-toe-**mye**-sin)

Mutamycin

***Classification***

Therapeutic: antineoplastics
Pharmacologic: antitumor antibiotics

**Pregnancy Category D**

### Indications

Used with other agents in the management of disseminated adenocarcinoma of the stomach or pancreas. **Unlabeled Use:** Palliative treatment of: Carcinoma of the colon or breast, Head and neck tumors, Advanced biliary, lung, and cervical squamous cell carcinomas.

### Action

Primarily inhibits DNA synthesis by causing cross-linking; also inhibits RNA and protein synthesis

(cell-cycle phase–nonspecific but is most active in S and G phases). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Widely distributed, concentrates in tumor tissue. Does not enter CSF.
**Metabolism and Excretion:** Mostly metabolized by the liver. Small amounts (<10%) excreted unchanged by the kidneys and in bile.
**Half-life:** 50 min.

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 3–8 wk | 4–8 wk | up to 3 mo |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Pregnancy or lactation.
**Use Cautiously in:** Active infections; ↓ bone marrow reserve; Hepatic dysfunction; History of pulmonary problems; OB: Patients with childbearing potential should be counseled to avoid pregnancy during treatment; Geri: May have ↑ sensitivity to drug effects.

## Adverse Reactions/Side Effects

**Resp:** PULMONARY TOXICITY. **CV:** edema. **GI:** nausea, vomiting, anorexia, stomatitis. **GU:** infertility, renal failure. **Derm:** alopecia, desquamation. **Hemat:** leukopenia, thrombocytopenia, anemia. **Local:** phlebitis at IV site. **Misc:** HEMOLYTIC UREMIC SYNDROME, fever, prolonged malaise.

## Interactions

**Drug-Drug:** Additive bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. Concurrent or sequential use with **vinca alkaloids** may result in respiratory toxicity.

## Route/Dosage

**IV (Adults):** 20 mg/m² every 6–8 wk.

## Availability (generic available)

**Powder for injection:** 5 mg/vial, 20 mg/vial, 40 mg/vial.

# NURSING IMPLICATIONS

## Assessment

- Monitor vital signs periodically during administration.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output, appetite, and nutritional intake. Nausea and vomiting usually occur within 1–2 hr. Vomiting may stop within 3–4 hr; nausea may persist for 2–3 days. Antiemetics may be administered prophylactically. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- Assess respiratory status and chest x-ray examination prior to and periodically throughout course of therapy. Cough, bronchospasm, hemoptysis, or dyspnea usually occurs after several doses and may be indicative of pulmonary toxicity, which may be life threatening.
- Monitor for potentially fatal hemolytic uremic syndrome in patients receiving long-term therapy. Symptoms include microangiopathic hemolytic anemia, thrombocytopenia, renal failure, and hypertension.
- ***Lab Test Considerations:*** Monitor CBC with differential, platelet count, and observation for fragmented RBCs on peripheral blood smears prior to and periodically throughout therapy and for several months following therapy.
- The nadirs of leukopenia and thrombocytopenia occur in 4–8 wk. Notify physician if leukocyte count is <4000/mm³ or if platelet count is <150,000/mm³ or is progressively declining. Recovery from leukopenia and thrombocytopenia occurs within 10 wk after cessation of therapy. Myelosuppression is cumulative and may be irreversible. Repeat courses of therapy are held until leukocyte count is >4000/mm³ and platelet count is >100,000/mm³.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically throughout therapy to detect hepatotoxicity and nephrotoxicity. Notify physician if creatinine is >1.7 mg/dL.

### Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)
Disturbed body image (Side Effects)

### Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Ensure patency of IV. Extravasation may cause severe tissue necrosis. If patient complains of discomfort at IV site, discontinue immediately and restart infusion at another site. Promptly notify physician of extravasation.

**IV Administration**

- **Direct IV:** ***Diluent:*** Reconstitute 5-mg vial with 10 mL and 10-mg vial with 40 mL of sterile water for injection or 0.9% NaCl. Shake the vial; may need to stand at room temperature for additional time to dissolve. Final solution is blue-gray. Reconstituted solution is stable for 7 days at room temperature, 14 days if refrigerated. ***Concentration:*** Dilute drug in vial to a concentration of 0.5–1 mg/mL and then may further dilute to 20–40 mcg/mL for administration. ***Rate:*** May be administered IV push over 5–10 min through free-flowing IV of 0.9% NaCl or D5W.
- **Y-Site Compatibility:** amifostine, bleomycin, cisplatin, cyclophosphamide, doxorubicin, droperidol, fluorouracil, furosemide, granisetron, heparin, leucovorin, melphalan, methotrexate, metoclopramide, ondansetron, teniposide, thiotepa, vinblastine, vincristine.
- **Y-Site Incompatibility:** aztreonam, cefepime, etoposide phosphate, filgrastim, gemcitabine, piperacillin/tazobactam, sargramostim, topotecan, vinorelbine.

### Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to notify health care professional if decreased urine output, edema in lower extremities, shortness of breath, skin ulceration, or persistent nausea occurs.
- Instruct patient to inspect oral mucosa for redness and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Topical agents may be used if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient that, although mitomycin may cause infertility, contraception during therapy is necessary because of teratogenic effects.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Decrease in size and spread of malignant tissue.

## mitoxantrone

(mye-toe-**zan**-trone)
Novantrone

***Classification***
Therapeutic: antineoplastics, immune modifiers
Pharmacologic: antitumor antibiotics

**Pregnancy Category D**

### Indications

Acute nonlymphocytic leukemia (ANLL) in adults (with other antineoplastics). Initial chemotherapy for patients with pain associated with advanced hormone-refractory prostate cancer. Secondary (chronic) progressive, progressive relapsing, or worsening relapsing-remitting multiple sclerosis (MS). **Unlabeled Use:** Breast cancer, liver cancer, and non-Hodgkin's lymphoma.

### Action

Inhibits DNA synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Decreased pain in patients with advanced prostate cancer. Decreased disability and slowed progression of MS.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Widely distributed; limited penetration of CSF.

**Metabolism and Excretion:** Mostly eliminated by hepatobiliary clearance; <10% excreted unchanged by the kidneys.
**Half-life:** 5.8 days.

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | 10 days | 21 days |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Pregnancy or lactation.
**Use Cautiously in:** Previous cardiac disease; OB: Patients with childbearing potential; Active infection; ↓ bone marrow reserve; Previous mediastinal radiation; Impaired hepatobiliary function; Pedi: Safety not established; Geri: May have ↑ sensitivity to drug effects.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, headache. **EENT:** blue-green sclera, conjunctivitis. **Resp:** cough, dyspnea. **CV:** CARDIOTOXICITY, arrhythmias, ECG changes. **GI:** abdominal pain, diarrhea, hepatic toxicity, nausea, stomatitis, vomiting. **GU:** blue-green urine, gonadal suppression, renal failure. **Derm:** alopecia, rashes. **Hemat:** anemia, leukopenia, secondary leukemia, thrombocytopenia. **Metab:** hyperuricemia. **Misc:** fever, hypersensitivity reactions.

## Interactions

**Drug-Drug:** ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. Risk of cardiomyopathy ↑ by previous **anthracycline antineoplastics** (**daunorubicin**, **doxorubicin**, **idarubicin**) or **mediastinal radiation**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

## Route/Dosage

### Acute Nonlymphatic Leukemia

**IV (Adults):** *Induction*—12 mg/m²/day for 3 days (usually given with cytosine arabinoside 100 mg/m²/day for 7 days); if incomplete remission occurs, a 2nd induction may be given. *Consolidation*—12 mg/m²/day for 2 days (usually given with cytosine arabinoside 100 mg/m²/day for 5 days), given 6 wk after induction with another course 4 wk later.

### Advanced Prostate Cancer

**IV (Adults):** 12–14 mg/m² single dose as a short infusion (with corticosteroids).

### Multiple Sclerosis

**IV (Adults):** 12 mg/m² q 3 mo.

### Availability (generic available)

**Solution for injection:** 2 mg/mL.

# NURSING IMPLICATIONS

## Assessment

- Monitor for hypersensitivity reaction (rash, urticaria, bronchospasm, tachycardia, hypotension). If these occur, stop infusion and notify physician. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output, appetite, and nutritional intake. Assess patient for nausea and vomiting. Antiemetics may be administered prophylactically. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- Monitor chest x-ray, ECG, echocardiography or MUGA, and radionuclide angiography to determine ejection fraction prior to and periodically during therapy. Multiple sclerosis patients with baseline left ventricular ejection fraction (LVEF) <50% should not receive mitoxantrone. May cause cardiotoxicity, especially in patients who have received daunorubicin or doxorubicin. Assess for rales/crackles, dyspnea, edema, jugular vein distention, ECG changes, arrhythmias, and chest pain. Monitor LVEF with echocardiogram or MUGA if signs of CHF occur and prior to each dose in patients with multiple sclerosis. Potentially fatal CHF may occur during or for months or yr after therapy. Risk is greater in patients receiving a cumulative dose >140mg/m².
- Monitor for symptoms of gout (↑ uric acid levels and joint pain and swelling). Encourage patient to drink at least 2 L of fluid per day. Allopurinol may be given to decrease serum uric acid levels.

- **Multiple sclerosis:** Asses frequency of exacerbations of symptoms of multiple sclerosis periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count prior to and periodically during therapy. The nadir of leukopenia usually occurs within 10 days, and recovery usually occurs within 21 days.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically during therapy to detect hepatotoxicity and nephrotoxicity.
- May cause ↑ uric acid concentrations. Monitor periodically during therapy.

## Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)
Disturbed body image (Side Effects)

## Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Avoid contact with skin. Use Luer-Lok tubing to prevent accidental leakage. If contact with skin occurs, immediately wash skin with soap and water.
- Clean all spills with an aqueous solution of calcium hypochlorite. Mix solution by adding 5.5 parts (per weight) of calcium hypochlorite to 13 parts water.

### IV Administration

- **IV:** Monitor IV site. If extravasation occurs, discontinue IV and restart at another site. Mitoxantrone is not a vesicant.
- **Direct IV:** ***Diluent:*** Dilute dark blue mitoxantrone solution in at least 50 mL of 0.9% NaCl or D5W. Discard unused solution appropriately. ***Rate:*** Administer slowly over at least 3 min into the tubing of a free-flowing IV of 0.9% NaCl or D5W.
- **Intermittent Infusion:** May be further diluted in D5W, 0.9% NaCl, or D5/0.9% NaCl and used immediately. ***Concentration:*** 0.02-0.5 mg/mL. ***Rate:*** Administer over 15–30 min.
- **Continuous Infusion:** May also be administered over 24 hr.
- **Y-Site Compatibility:** allopurinol, amifostine, cladribine, etoposide, etoposide phosphate, filgrastim, fludarabine, gemcitabine, granisetron, linezolid, melphalan, ondansetron, oxaliplatin, sargramostim, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, aztreonam, cefepime, doxorubicin liposome, paclitaxel, pemetrexed, piperacillin/tazobactam, propofol.
- **Additive Compatibility:** cyclophosphamide, cytarabine, etoposide, fluorouracil, hydrocortisone sodium succinate, potassium chloride.
- **Additive Incompatibility:** heparin.

## Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDS; may precipitate gastric bleeding.
- Instruct patient to notify health care professional if abdominal pain, yellow skin, cough, diarrhea, or decreased urine output occurs.
- Inform patient that medication may cause the urine and sclera to turn blue-green.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Topical agents may be used if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient that, although mitoxantrone may cause infertility, contraception during therapy is necessary because of possible teratogenic effects.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

## Evaluation/Desired Outcomes

- Decrease in the production and spread of leukemic cells.
- Decreased pain in patients with prostate cancer.
- Decrease in the frequency of relapse (neurologic dysfunction) in patients with relapsing-remitting multiple sclerosis.

# **modafinil** (mo-**daf**-i-nil)

Provigil

***Classification***
Therapeutic: central nervous system stimulants

**Pregnancy Category C**

## Indications
To improve wakefulness in patients with excessive daytime drowsiness due to narcolepsy, obstructive sleep apnea, or shift work sleep disorder.

## Action
Produces CNS stimulation. **Therapeutic Effects:** Decreased daytime drowsiness in patients with narcolepsy and obstructive sleep apnea. Decreased drowsiness during work in patients with shift work sleep disorder.

## Pharmacokinetics
**Absorption:** Rapidly absorbed; bioavailability unknown.
**Distribution:** Well distributed; moderately (60%) bound to plasma proteins.
**Metabolism and Excretion:** Highly (90%) metabolized by the liver; <10% eliminated unchanged.
**Half-life:** 15 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 2–4 hr | 24 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; History of left ventricular hypertrophy or ischemic ECG changes, chest pain, arrhythmia, or other significant manifestations of mitral valve prolapse in association with CNS stimulant use.
**Use Cautiously in:** History of MI or unstable angina; Severe hepatic impairment with or without cirrhosis (dosage ↓ recommended); Concurrent use of MAO inhibitors; OB, Lactation, Pedi: Pregnancy, lactation, or children <16 yr (safety not established); Geri: Lower doses may be necessary due to ↑ sensitivity to drug effects.

## Adverse Reactions/Side Effects
**CNS:** headache, amnesia, anxiety, cataplexy, confusion, depression, dizziness, insomnia, nervousness. **EENT:** rhinitis, abnormal vision, amblyopia, epistaxis, pharyngitis. **Resp:** dyspnea, lung disorder. **CV:** arrhythmias, chest pain, hypertension, hypotension, syncope, vasodilation. **GI:** nausea, ↑ liver function tests, anorexia, diarrhea, gingivitis, mouth ulcers, thirst, vomiting. **GU:** abnormal ejaculation, albuminuria, urinary retention. **Derm:** dry skin, herpes simplex. **Endo:** hyperglycemia. **Hemat:** eosinophilia. **MS:** joint disorder, neck pain. **Neuro:** ataxia, dyskinesia, hypertonia, paresthesia, tremor. **Misc:** infection.

## Interactions
**Drug-Drug:** May ↓ the metabolism and ↑ the effects of **diazepam**, **phenytoin**, **propranolol**, or **tricyclic antidepressants** (dosage adjustments may be necessary). May ↑ the metabolism and ↓ the effects of **hormonal contraceptives**, **cyclosporine**, and **theophylline** (dosage adjustments or additional methods of contraception may be necessary).
**Drug-Natural Products:** Use with **caffeine-containing herbs** (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) may ↑ stimulant effect.

## Route/Dosage
**PO (Adults):** 200 mg/day as a single dose.

### Hepatic Impairment
**PO (Adults):** *Severe hepatic impairment*—100 mg/day as a single dose.

## Availability
**Tablets:** 100 mg, 200 mg. **Cost:** 100 mg $176.99/30, 200 mg $269.97/30.

# NURSING IMPLICATIONS

## Assessment
- Observe and document frequency of narcoleptic episodes.
- ***Lab Test Considerations:*** May cause elevated liver enzymes.

## Potential Nursing Diagnoses
Disturbed thought process (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

## Implementation
- **PO:** Administer as a single dose in the morning for patients with narcolepsy or obstructive sleep apnea. Administer 1 hour before the start of work shift for patients with shift work sleep disorder.

## Patient/Family Teaching
- Instruct patient to take medication as directed.
- Medication may impair judgment. Advise patient to use caution when driving or during other activities requiring alertness.
- Nonhormonal methods of contraception should be used during and for 1 month following discontinuation of therapy. Instruct patient

to notify health care professional promptly if pregnancy is planned or suspected or if breast-feeding.
- Instruct patient to avoid taking other prescription or OTC medication without consulting health care professional. If alcohol is used during therapy, intake should be limited to moderate amounts.
- Instruct patient to notify physician if rash, hives, or other allergic reactions occur.

### Evaluation/Desired Outcomes
- Decrease in narcoleptic symptoms and an enhanced ability to stay awake.

**moexipril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.**

**mometasone, See CORTICOSTEROIDS (INHALATION).**

**mometasone, See CORTICOSTEROIDS (NASAL).**

**mometasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

## MONOAMINE OXIDASE (MAO) INHIBITORS

**isocarboxazid**
(eye-soe-kar-**boks**-a-zid)
Marplan

**phenelzine** (**fen**-el-zeen)
Nardil

**tranylcypromine**
(tran-ill-**sip**-roe-meen)
Parnate

***Classification***
Therapeutic: antidepressants
Pharmacologic: monamine oxidase (MAO) inhibitors

**Pregnancy Category C**

### Indications
Depression in patients who have failed other modes of therapy (tricyclic antidepressants, SSRIs, SSNRIs or electroconvulsive therapy). **Unlabeled Use:** Treatment-resistant depression, panic disorder, social anxiety disorder (social phobia).

### Action
Inhibit the enzyme monoamine oxidase, resulting in an accumulation of various neurotransmitters (dopamine, epinephrine, norepinephrine, and serotonin) in the body. **Therapeutic Effects:** Improved mood in depressed patients.

### Pharmacokinetics
**Absorption:** *Phenelzine*—well absorbed from the GI tract; *isocarboxazid* and *tranylcypromine*—unknown.
**Distribution:** *Phenelzine* and *tranylcypromine*—cross the placenta and enter breast milk; *isocarboxazid*—unknown.
**Metabolism and Excretion:** *Phenelzine*—metabolized by the liver and excreted in urine as metabolites and unchanged drug; *isocarboxazid* and *tranylcypromine*-unknown.
**Half-life:** *Phenelzine*—12 hr; *tranylcypromine*—90–190 min; *isocarboxazid*—unknown.

TIME/ACTION PROFILE (antidepressant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Isocarboxazid | unknown | 3–6 wk | unknown |
| Phenelzine | 2–4 wk | 3–6 wk | 2 wk |
| Tranylcypromine | 2 days–3 wk | 2–3 wk | 3–5 days |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Liver disease; Severe renal disease; Cardiovascular disease; Uncontrolled hypertension; Cerebrovascular disease; Pheochromocytoma; CHF; History of severe or frequent headache; Patients undergoing elective surgery requiring anesthesia (should be discontinued at least days before surgery); Concurrent meperidine, SSRI antidepressants, SSNRI antidepressants, tricyclic antidepressants, tetracyclic antidepressants, nefazodone, trazodone, procarbazine, selegilene, linezolid, carbamazepine, cyclobenzaprine, bupropion, buspirone, sympathomimetics, dextromethorphan, narcotics, alcohol, anesthetics, diuretics, tryptophan, or antihistamines; Excessive consumption of caffeine; Concurrent use of food containing high concentrations of tyramine (see Appendix M); Lactation: Lactation.
**Use Cautiously in:** Patients who may be suicidal or have a history of drug dependency; Schizophrenia; Bipolar disorder; Diabetes mellitus (↑ risk of hypoglycemia); Hyperthyroidism; Seizure disorders; OB: Safety not established; Pedi: Safe use in children/adolescents not established. May ↑ risk of suicide attempt/ideation especially dur-

ing first early treatment or dose adjustments; risk may be greater in children or adolescents; Geri: ↑ risk of adverse reactions; begin therapy at lower end of dosage ranges.

### Adverse Reactions/Side Effects

**CNS:** SEIZURES, dizziness, headache, anxiety, ataxia, confusion, drowsiness, euphoria, insomnia, restlessness, tremor, weakness. **EENT:** blurred vision, glaucoma, nystagmus. **CV:** HYPERTENSIVE CRISIS, arrhythmias, edema, orthostatic hypotension. **GI:** diarrhea, weight gain, abdominal pain, anorexia, constipation, dry mouth, ↑ liver function tests, nausea, vomiting. **GU:** dysuria, sexual dysfunction, urinary incontinence, urinary retention. **Derm:** pruritis, rashes. **Endo:** hypoglycemia. **MS:** arthralgia. **Neuro:** paresthesia.

### Interactions

**Drug-Drug:** Serious, potentially fatal adverse reactions may occur with concurrent use of other **antidepressants (SSRIs, SSNRIs, bupropion, tricyclics, tetracyclics, nefazodone, trazodone)**, **carbamazepine**, **cyclobenzaprine**, **sibutramine**, **linezolid**, **procarbazine**, or **selegiline**. Avoid using within 2 wk of each other (wait 5 wk from end of **fluoxetine** therapy). Hypertensive crisis may occur with **amphetamines**, **methyldopa**, **levodopa**, **dopamine**, **epinephrine**, **norepinephrine**, **methylphenidate**, **reserpine**, or **vasoconstrictors**. Hypertension or hypotension, coma, seizures, respiratory depression, and death may occur with **meperidine** (avoid using within 2–3 wk of MAO inhibitor therapy). Concurrent use with **dextromethorphan** may produce psychosis or bizarre behavior. Hypertension may occur with concurrent use of **buspirone**; avoid using within 10 days of each other. Additive hypotension may occur with **antihypertensives**, **spinal anesthesia**, **opioids**, or **barbiturates**. Additive hypoglycemia may occur with **insulins** or **oral hypoglycemic agents**. Risk of seizures may be ↑ with **tramadol**.

**Drug-Natural Products:** Serious, potentially fatal adverse effects (serotonin syndrome) may occur with concomitant use of **St. John's wort** and **SAMe**. Hypertensive crises may occur with large amounts of **caffeine-containing herbs (cola nut**, **guarana**, **malt**, **coffee**, **tea)**. Insomnia, headache, tremor, hypomania may occur with **ginseng**. Hypertensive crises, disorientation, and memory impairment may occur with **tryptophan** or supplements containing **tyrosine** or **phenylalanine**.

**Drug-Food:** Hypertensive crisis may occur with ingestion of foods containing high concentrations of **tyramine** (see Appendix M). Consumption of foods or beverages with high **caffeine** content ↑ the risk of hypertension and arrhythmias.

### Route/Dosage

#### Isocarboxazid

**PO (Adults and Children ≥16 yr):** 10 mg twice daily; may be ↑ every 2–4 days by 10 mg, up to 40 mg/day by the end of the first wk, then may ↑ by up to 20 mg every wk, up to 60 mg/day in 2–4 divided doses. After optimal response is obtained, dose should be slowly decreased to lowest effective amount (40 mg/day or less).

#### Phenelzine

**PO (Adults):** 15 mg 3 times daily; ↑ to 60–90 mg/day in divided doses; after maximal benefit achieved, gradually reduce to smallest effective dose (15 mg/day or every other day).

#### Tranylcypromine

**PO (Adults):** 30 mg/day in 2 divided doses (morning and afternoon); after 2 wk can ↑ by 10 mg/day, at 1–3 wk intervals, up to 60 mg/day.

### Availability

#### Isocarboxazid

**Tablets:** 10 mg.

#### Phenelzine

**Tablets:** 15 mg.

#### Tranylcypromine

**Tablets:** 10 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess mental status (orientation, mood, behavior) and anxiety level frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor blood pressure and pulse before and frequently during therapy. Report significant changes promptly. Headache is often first symptom of a hypertensive crisis.
- Monitor intake and output ratios and daily weight. Assess patient for urinary retention.
- Monitor weight and BMI initially and throughout treatment.

- For overweight/obese individuals, moitor fasting blood sugar and cholesterol levels.
- ***Lab Test Considerations:*** Assess hepatic function periodically during prolonged or high-dose therapy.
- Monitor serum glucose closely in diabetic patients; hypoglycemia may occur.
- ***Toxicity and Overdose:*** Concurrent ingestion of tyramine-rich foods and many medications may result in a life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, tachycardia, severe headache, nausea, vomiting, photosensitivity, neck stiffness, sweating, and enlarged pupils. Treatment includes IV phentolamine or a single dose of oral calcium channel blocker (nifedipine).
- Symptoms of overdose include anxiety, irritability, tachycardia, hypertension or hypotension, respiratory distress, dizziness, drowsiness, hallucinations, confusion, seizures, sluggish reflexes, fever, and diaphoresis. Treatment includes induction of vomiting or gastric lavage and supportive therapy as symptoms arise.

## Potential Nursing Diagnoses

Ineffective coping (Indications)
Ineffective therapeutic regimen management (Patient/Family Teaching)
Risk for falls (Side Effects)
Imbalanced nutrition: more than body requirements (Side Effects)
Sexual dysfunction (Side Effects)
Impaired oral mucous membrane (Side Effects)

## Implementation

- Do not administer these medications in the evening because the psychomotor stimulating effects may cause insomnia or other sleep disturbances.
- **PO:** Tablets may be crushed and mixed with food or fluids for patients with difficulty swallowing.

## Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses if remembered within 2 hr; otherwise, omit and return to regular dosage schedule. Do not discontinue abruptly as withdrawal symptoms (nausea, vomiting, malaise, nightmares, agitation, psychosis, seizures) may occur.
- Caution patient to avoid alcohol, CNS depressants, OTC drugs, and foods or beverages containing tyramine (see Appendix M) or excessive caffeine during and for at least 2 wk after therapy has been discontinued; they may precipitate a hypertensive crisis. Instruct patient to notify health care professional immediately if symptoms of hypertensive crisis (e.g., severe headache, palpitations, chest or throat tightness, sweating, dizziness, neck stiffness, nausea, or vomiting) develop.
- Instruct patient and caregivers to contact health care professional if child exhibits any suicidal thoughts or behaviors (e.g., worsening depression, new or worsening anxiety, agitation, panic attacks, insomnia, new or worsening irritability, violent behavior, impulsive actions, excessive talking, unusual changes in mood or behavior).
- May cause dizziness or drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Geriatric patients are at increased risk for this side effect.
- Instruct patient to consult with health care professional before taking any new Rx, OTC, or herbal product.
- Advise patient to notify health care professional if dry mouth, urinary retention, or constipation occurs. Frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Advise patient to notify health care professional of medication regimen before treatment or surgery. If possible, therapy should be discontinued at least 2 wk before surgery.
- Instruct patient to carry identification describing medication regimen at all times.
- Emphasize the importance of participation in psychotherapy to improve coping skills. Refer for ophthalmic testing periodically during long-term therapy.
- Advise patient of possibility of weight gain and cholesterol elevation and recommend appropriate nutritional, weight, or medical management.
- Refer patient/family to local support group.

## Evaluation/Desired Outcomes

- Improved mood in depressed patients.
- Increased sense of well-being.
- Decreased anxiety.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Patients may require 3–6 wk of therapy before therapeutic effects of medication are seen.

## montelukast (mon-te-**loo**-kast)
Singulair

***Classification***
Therapeutic: allergy, cold, and cough remedies, bronchodilators
Pharmacologic: leukotriene antagonists

**Pregnancy Category B**

### Indications
Prevention and chronic treatment of asthma. Management of seasonal allergic rhinitis. Prevention of exercise-induced bronchoconstriction in patients 15 yr and older.

### Action
Antagonizes the effects of leukotrienes, which mediate the following: Airway edema, Smooth muscle constriction, Altered cellular activity. Result is decreased inflammatory process, which is part of asthma and allergic rhinitis. **Therapeutic Effects:** Decreased frequency and severity of acute asthma attacks. Decreased severity of allergic rhinitis. Decreased attacks of exercise-induced bronchoconstriction.

### Pharmacokinetics
**Absorption:** Rapidly absorbed (63–73%) following oral administration.
**Distribution:** Unknown.
**Protein Binding:** 99%.
**Metabolism and Excretion:** Mostly metabolized by the liver (by P450 3A4 and 2C9 enzyme systems); metabolites eliminated in feces via bile; negligible renal excretion.
**Half-life:** 2.7–5.5 hr.

TIME/ACTION PROFILE (improved symptoms of asthma)

| ROUTE | ONSET | PEAK† | DURATION |
|---|---|---|---|
| PO (swallow) | within 24 hr | 3–4 hr | 24 hr |
| PO (chew) | within 24 hr | 2–2.5 hr | 24 hr |

†Blood levels

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Acute attacks of asthma; Phenylketonuria (chewable tablets contain aspartame); Hepatic impairment (may need lower doses); Reduction of corticosteroid therapy (may ↑ the risk of eosinophilic conditions); OB, Lactation, Pedi: Pregnancy, lactation, or children <1 yr (safety not established).

### Adverse Reactions/Side Effects
**CNS:** SUICIDAL THOUGHTS, agitation, aggression, anxiety, depression, dream abnormalities, fatigue, hallucinations, headache, insomnia, irritability, restlessness, tremor, weakness. **EENT:** nosebleed, otitis (children), sinusitis (children). **Resp:** cough, rhinorrhea. **GI:** abdominal pain, diarrhea (children), dyspepsia, nausea (children), ↑ liver enzymes. **Neuro:** tremor. **Derm:** rash. **Misc:** eosinophilic conditions (including CHURG-STRAUSS SYNDROME), fever.

### Interactions
**Drug-Drug:** Drugs which induce the CYP450 enzyme system (**phenobarbital** and **rifampin**) may ↓ the effects of montelukast.

### Route/Dosage

#### Asthma and Allergic Rhinitis
**PO (Adults and Children ≥14 yr):** 10 mg once daily.
**PO (Children 6–14 yr):** 5 mg once daily (as chewable tablet).
**PO (Children 2–5 yr):** 4 mg once daily (as chewable tablet or granules).
**PO (Children 6–23 months):** 4 mg once daily (as oral granules).

#### Exercise-Induced Bronchoconstriction (EIB)
**PO (Adults and Children ≥15 yrs):** 10 mg at least 2 hr before exercise. Do not take within 24 hr of another dose; if taking daily doses, do not take dose for EIB.

### Availability
**Tablets:** 10 mg. **Cost:** $302.99/90. **Chewable tablets (cherry flavor):** 4 mg, 5 mg. **Cost:** 4 mg $294.97/90, 5 mg $305.97/90. **Oral granules:** 4 mg/packet in 30-packet cartons. **Cost:** $110.00/carton.

## NURSING IMPLICATIONS

### Assessment
- Assess lung sounds and respiratory function prior to and periodically during therapy.
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Monitor closely for changes in behavior that could indicate the emergence or worsening of depression or suicidal thoughts.
- ***Lab Test Considerations:*** May cause ↑ AST and ALT concentrations.

### Potential Nursing Diagnoses
Ineffective airway clearance (Indications)

### Implementation
- Doses of inhaled corticosteroids may be gradually decreased with supervision of health care professional; do not discontinue abruptly.
- **PO:** For asthma, administer once daily in the evening. For allergic rhinitis, may be administered at any time of day.
- Administer granules directly into mouth or mixed in a spoonful of cold or room temperature foods (use only applesauce, mashed carrots, rice, or ice cream). Do not open packet until ready to use. After opening packet, administer full dose within 15 min. Do not store mixture. Discard unused portion. Do not dissolve granules in fluid, but fluid may be taken following administration. Granules may be administered without regard to meals.

### Patient/Family Teaching
- Instruct patient to take medication daily in the evening, even if not experiencing symptoms of asthma. Do not double doses. Do not discontinue therapy without consulting health care professional.
- Instruct patient not to discontinue or reduce other asthma medications without consulting health care professional.
- Advise patient that montelukast is not used to treat acute asthma attacks, but may be continued during an acute exacerbation. Patient should carry rapid-acting therapy for bronchospasm at all times. Advise patient to notify health care professional if more than the maximum number of short-acting bronchodilator treatments prescribed for a 24-hr period are needed.
- Advise patient to notify health care professional of behavioral changes or thoughts of suicide.

### Evaluation/Desired Outcomes
- Prevention of and reduction in symptoms of asthma.
- Decrease in severity of allergic rhinitis.
- Prevention of exercise-induced bronchoconstriction.

HIGH ALERT

## morphine (mor-feen)
Astramorph, Astramorph PF, Avinza, DepoDur, Duramorph, Embeda, Epimorph, Infumorph, Kadian, M-Eslon, Morphine H.P, Morphitec, M.O.S, M.O.S.-S.R, MS Contin, MS • IR, MSIR, Oramorph SR, Roxanol, Roxanol Rescudose, Roxanol-T, Statex

***Classification***
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

**Schedule II**

**Pregnancy Category C**

### Indications
Severe pain. Pulmonary edema. Pain associated with MI.

### Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression.
**Therapeutic Effects:** Decrease in severity of pain. Addition of naltrexone in *Embeda* product is designed to prevent abuse or misuse by altering the formulation. Naltrexone has no effect unless the capsule is crushed or chewed.

### Pharmacokinetics
**Absorption:** Variably absorbed (about 30%) following oral administration. More reliably absorbed from rectal, subcut, and IM sites. Following epidural administration, systemic absorption and absorption into the intrathecal space via the meninges occurs.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk in small amounts.
**Protein Binding:** Premature infants: <20%; Adults: 35%.
**Metabolism and Excretion:** Mostly metabolized by the liver. Active metabolites excreted renally.
**Half-life:** Premature neonates: 10–20 hr; Neonates: 7.6 hr; Infants 1–3 mo: 6.2 hr; Children 6 mo–2.5 yr: 2.9 hr; Children 3–6 yr: 1–2 hr; Children 6–19 yr with sickle cell disease: 1.3 hr; Adults: 2–4 hr.

TIME/ACTION PROFILE (analgesia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 60 min | 4–5 hr |
| PO-ER, SR | unknown | 3–4 hr | 8–24 hr |
| IM | 10–30 min | 30–60 min | 4–5 hr |
| Subcut | 20 min | 50–90 min | 4–5 hr |
| Rect | unknown | 20–60 min | 3–7 hr |
| IV | rapid | 20 min | 4–5 hr |
| Epidural | 6–30 min | 1 hr | up to 24 hr (48 hr for liposomal injection) |
| IT | rapid (min) | unknown | up to 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Some products contain tartrazine, bisulfites, or alcohol and should be avoided in patients with known hypersensitivity.

**Use Cautiously in:** Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; History of substance abuse; Geri: Geriatric or debilitated patients (dose reduction suggested); Undiagnosed abdominal pain; Prostatic hyperplasia; Patients undergoing procedures that rapidly ↓ pain (cordotomy, radiation); long-acting agents should be discontinued 24 hr before and replaced with short-acting agents; OB, Lactation: Avoid chronic use; has been used during labor but may cause respiratory depression in the newborn; Pedi: Epidural liposomal injection only-not recommended; Pedi: Neonates and infants <3 mo (more susceptible to respiratory depression); Pedi: Neonates (oral solution contains sodium benzoate which can cause potentially fatal gasping syndrome).

## Adverse Reactions/Side Effects

**CNS:** confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** RESPIRATORY DEPRESSION. **CV:** hypotension, bradycardia. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, itching, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

## Interactions

**Drug-Drug:** Use with **extreme caution** in patients receiving **MAO inhibitors** within 14 days prior (may result in unpredictable, severe reactions— ↓ initial dose of morphine to 25% of usual dose). ↑ CNS depression with **alcohol**, **sedative/hypnotics**, **clomipramine**, **barbiturates**, **tricyclic antidepressants**, and **antihistamines**. Administration of **partial-antagonist opioid analgesics** may precipitate opioid withdrawal in physically dependent patients. **Buprenorphine**, **nalbuphine**, **butorphanol**, or **pentazocine** may ↓ analgesia. May ↑ the anticoagulant effect of **warfarin**. **Cimetidine** ↓ metabolism and may ↑ effects. Epidural test dose of lidocaine/epinephrine may alter release of liposomal injection.

**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

## Route/Dosage

Larger doses may be required during chronic therapy.

**PO, Rect (Adults ≥50 kg):** *Usual starting dose for moderate to severe pain in opioid-naive patients*—30 mg q 3–4 hr initially *or* once 24-hr opioid requirement is determined, convert to controlled-, extended-, *or* sustained-release morphine by administering total daily oral morphine dose every 24 hr (as *Kadian* or *Avinza*), 50% of the total daily oral morphine dose every 12 hr (as *Oramorph SR, Kadian, MS Contin*), or 33% of the total daily oral morphine dose every 8 hr (as *MS Contin*). See equianalgesic chart, Appendix K. *Avinza* dose should not exceed 1600 mg/day because of fumaric acid in formulation.

**PO, Rect (Adults and Children <50 kg):** *Usual starting dose for moderate to severe pain in opioid-naive patients*—0.3 mg/kg q 3–4 hr initially.

**PO (Children >1 mo):** *Prompt-release tablets and solution*—0.2–0.5 mg/kg/dose q 4–6 hr as needed. *Controlled-release tablet*—0.3–0.6 mg/kg/dose q 12 hr.

**IM, IV, Subcut (Adults ≥50 kg):** *Usual starting dose for moderate to severe pain in opioid-naive patients*—4–10 mg q 3–4 hr. *MI*—8–15 mg, for very severe pain additional smaller doses may be given every 3–4 hr.

**IM, IV, Subcut (Adults and Children <50 kg):** *Usual starting dose for moderate to severe pain in opioid-naive patients*—0.05–0.2 mg/kg q 3–4 hr, maximum: 15 mg/dose.

**IM, IV, Subcut (Neonates):** 0.05 mg/kg q 4–8 hr, maximum dose: 0.1 mg/kg. Use preservative-free formulation.

**IV, Subcut (Adults):** *Continuous infusion*—0.8–10 mg/hr; may be preceded by a bolus of 15 mg (infusion rates vary greatly; up to 400 mg/hr have been used).

**IV, Subcut (Children >1 mo):** *Continuous infusion, postoperative pain*—0.01–0.04 mg/kg/hr. *Continuous infusion, sickle cell or cancer pain*—0.02–2.6 mg/kg/hr.

**IV (Neonates):** *Continuous infusion*—0.01–0.03 mg/kg/hr.

**Epidural (Adults):** *Intermittent injection*—5 mg/day (initially); if relief is not obtained at 60 min, 1–2 mg increments may be made; (total dose not to exceed 10 mg/day. *Continuous infusion*—2–4 mg/24 hr; may increase by 1–2 mg/day (up to 30 mg/day); *single-dose extended-*

*release liposomal injection*—lower extremity orthopedic surgery: 15 mg, lower abdominal/pelvic surgery: 10–15 mg, cesarean section: 10 mg. Use preservative-free formulation.
**Epidural (Children >1 mo):** 0.03–0.05 mg/kg, maximum dose: 0.1 mg/kg or 5 mg/24 hr. Use preservative-free formulation.
**IT (Adults):** 0.2–1 mg. Use preservative-free formulation.

### Availability (generic available)

**Soluble tablets:** 10 mg, 15 mg, 30 mg. **Tablets:** 15 mg, 30 mg. **Cost:** *MSIR*—15 mg $18.32/100, 30 mg $31.22/100. **Extended (controlled, sustained)-release tablets:** 15 mg, 30 mg, 60 mg, 100 mg, 200 mg. **Cost:** *MS Contin*—15 mg $99.63/100, 30 mg $189.34/100, 60 mg $369.44/100, 100 mg $546.99/100, 200 mg $1001.71/100; *Oramorph SR*—15 mg $90.03/100, 30 mg $171.09/100, 60 mg $333.83/100, 100 mg $511.24/100. **Sustained-release capsules (Kadian):** 10 mg, 20 mg, 30 mg, 50 mg, 60 mg, 80 mg, 200 mg. **Cost:** *Kadian*—20 mg $105.49/60, 30 mg $119.00/60, 50 mg $223.05/60, 60 mg $227.39/60 , 100 mg $383.80/60. **Extended-release capsules (Avinza):** 30 mg, 60 mg, 90 mg, 120 mg. **Cost:** *Avinza*—30 mg $231.00/100, 60 mg $445.00/100, 90 mg $675.00/100, 120 mg $790.00/100. **Oral solution (Roxanol-T—20 mg/mL fruit and mint flavor; also unflavored):** 10 mg/5 mL, 20 mg/5 mL, 100 mg/5 mL, 2 mg/mL, 4 mg/mL, 20 mg/mL (concentrate). **Cost:** *Roxanol*—20 mg/mL $20.76/30 mL. **Rectal suppositories:** 5 mg, 10 mg, 20 mg, 30 mg. **Solution for IM, subcut, IV injection:** 1 mg/mL, 2 mg/mL, 4 mg/mL, 5 mg/mL, 8 mg/mL, 10 mg/mL, 15 mg/mL, 25 mg/mL, 50 mg/mL. **Solution for epidural, IV injection (preservative-free):** 0.5 mg/mL, 1 mg/mL. **Solution for epidural or IT use (continuous microinfusion device; preservative-free):** 10 mg/mL in 20-mL vial, 25 mg/mL in 20-mL vial. **Extended-release liposome injection for epidural use:** 10 mg/mL in 1–, 2.5– and 2-mL vials. **Solution for IV injection (PCA device):** 1 mg/mL, 2 mg/mL, 3 mg/mL, 5 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following PO, subcut, IM, and 20 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. When titrating doses of short-acting morphine, a repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients on a continuous infusion should have additional bolus doses provided every 15–30 min, as needed, for breakthrough pain. The bolus dose is usually set to the amount of drug infused each hour by continuous infusion.
- Patients taking sustained-release morphine may require additional short-acting opioid doses for breakthrough pain. Doses should be equivalent to 10–20% of 24 hr total and given every 2 hr as needed.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- ***High Alert:*** Assess level of consciousness, blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Subsequent doses may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Geri: Assess geriatric patients frequently; older adults are more sensitive to the effects of opioid analgesics and may experience side effects and respiratory complications more frequently. Pedi: Assess pediatric patient frequently; children are more sensitive to the effects of opioid analgesics and may experience respiratory complications, excitability and restlessness more frequently.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive morphine for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Institute prevention of constipation with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the anti-

dote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and adults weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

## Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Do not confuse morphine with hydromorphone or meperidine—errors have resulted in death. Other errors associated with morphine include overdose and infusion pump miscalculations, especially in children. Consider patients' previous analgesic use and current requirements, but clarify doses that greatly exceed normal range. Have second practitioner independently check original order, dose calculations, and infusion pump settings. Use only preservative-free formulations in neonates, and for epidural and intrathecal routes in all patients.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- When transferring from other opioids or other forms of morphine to extended-release tablets, administer a total daily dose of oral morphine equivalent to previous daily dose (see Appendix K) and divided every 8 hr (MS Contin), every 12 hr (Embeda, Kadian, MS Contin, Oramorph SR), every 24 hr (Kadian or Avinza).
- Morphine should be discontinued gradually to prevent withdrawal symptoms after long-term use.
- **PO:** Doses may be administered with food or milk to minimize GI irritation.
- Administer oral solution with properly calibrated measuring device; may be diluted in a glass of fruit juice just prior to administration to improve taste.
- Extended-release and controlled-release tablets should be swallowed whole; do not break, crush, dissolve, or chew (could result in rapid release and absorption of a potentially toxic dose).
- *Embeda, Kadian, and Avinza* capsules may be opened and the pellets sprinkled onto applesauce immediately prior to administration. Patients should rinse mouth and swallow to assure ingestion of entire dose. Pellets should not be chewed, crushed, or dissolved. *Kadian* capsules may also be opened and sprinkled on approximately 10 mL of water and flushed while swirling through a pre-wetted 16 French gastrostomy tube fitted with a funnel at the port end. Additional water should be used to transfer and flush any remaining pellets. *Kadian* should not be administered via a nasogastric tube.
- **Rect:** *MS Contin* and *Oramorph SR* have been administered rectally.
- **IM, Subcut:** Use IM route for repeated doses, because morphine is irritating to subcut tissues.

### IV Administration

- **IV:** Solution is colorless; do not administer discolored solution.
- **Direct IV:** ***Diluent:*** Dilute with at least 5 mL of sterile water or 0.9% NaCl for injection. ***Concentration:*** 0.5–5 mg/mL. ***Rate: High Alert:*** Administer 2.5–15 mg over 5 min. Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Continuous Infusion:** ***Diluent:*** May be added to D5W, D10W, 0.9% NaCl, 0.45% NaCl, Ringer's or LR, dextrose/saline solution, or dextrose/Ringer's or LR. ***Concentration:*** 0.1–1 mg/mL or greater for continuous infusion. ***Rate:*** Administer via infusion pump to control the rate. Dose should be titrated to ensure adequate pain relief without excessive sedation, respiratory depression, or hypotension. May be administered via patient-controlled analgesia (PCA) pump.
- **Syringe Compatibility:** alfentanil, alprostadil, atropine, bupivacaine, caffeine citrate, chlorpromazine, cimetidine, clonidine, diphenhydramine, droperidol, fentanyl, glycopyrrolate, hydroxyzine, ketamine, lidocaine, metoclopra-

mide, milrinone, ondansetron, perphenazine, promazine, ranitidine, salbutamol, scopolamine, ziconatide.
- **Syringe Incompatibility:** meperidine, pantoprazole, thiopental.
- **Y-Site Compatibility:** aldesleukin, alfentanyl, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amsacrine, anikinra, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefonocid, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisatracurium, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripemen, doxacurium, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eftifibatide, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, isoproterenol, kanamycin, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, metaraminol, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, multivitamins, nafcillin, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pemetrexed, penicillin G, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quniupristin/dalfopristin, ranitidine, remifentanil, rituximab, rocuronium, scopolamine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trtimetaphan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole, warfarin, zidovudine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, azathioprine, azithromycin, dantrolene, diazoxide, doxorubicin liposome, folic acid, ganciclovir, inamrinone, indomethacin, micafungin, pentobarbital, phenytoin, sargramostim, trastuzumab.
- **Epidural:** Invert vial gently to re-suspend liposomal product immediately prior to administration; do not shake. Administer undiluted. If a lidocaine test dose is administered, flush catheter with 0.9% NaCl and wait 15 min before administration of *DepoDur*. Do not use an in-lint filter. Do not admix or administer other medications in epidural space for 48 hr after administration. Administer within 4 hr after removing from vial. Store in refrigerator; do not freeze.

## Patient/Family Teaching

- Instruct patient how and when to ask for pain medication.
- ***High Alert:*** Instruct family not to administer PCA doses to the sleeping patient. Overmedication, sedation, and respiratory depression can result.
- May cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patients who are immobilized or on prolonged bedrest to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- **Home Care Issues:** ***High Alert:*** Explain to patient and family how and when to administer morphine and how to care for infusion equipment properly. Pedi: Teach parents or caregivers how to accurately measure liquid medication and to use only the measuring device dispensed with the medication.
- Emphasize the importance of aggressive prevention of constipation with the use of morphine.

## Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Decrease in symptoms of pulmonary edema.

**mupirocin** (myoo-**peer**-oh-sin)
Bactroban, Bactroban Nasal

***Classification***
Therapeutic: anti-infectives

**Pregnancy Category B**

## Indications
**Topical:** Treatment of: Impetigo, Secondarily infected traumatic skin lesions (up to 10 cm in length or 100 $cm^2$ area) caused by *Staphylococcus aureus* and *Streptococcus pyogenes*. **Intranasal:** Eradicates nasal colonization with methicillin-resistant *S. aureus*.

## Action
Inhibits bacterial protein synthesis. **Therapeutic Effects:** Inhibition of bacterial growth and reproduction. **Spectrum:** Greatest activity against gram-positive organisms, including: *S. aureus*, Beta-hemolytic streptococci. Resolution of impetigo. Eradication of *S. aureus* carrier state.

## Pharmacokinetics
**Absorption:** Minimal systemic absorption.
**Distribution:** Remains in the stratum corneum after topical use for prolonged periods of time (72 hr).
**Metabolism and Excretion:** Metabolized in the skin, removed by desquamation.
**Half-life:** 17–36 min.

TIME/ACTION PROFILE (anti-infective effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Nasal | unknown | unknown | 12 hr |
| Topical† | unknown | 3–5 days | 72 hr |

†Resolution of lesions

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to mupirocin or polyethylene glycol.
**Use Cautiously in:** Impaired renal function; Burn patients; OB, Lactation: Safety not established.

## Adverse Reactions/Side Effects
**CNS:** *nasal only*—headache. **EENT:** *nasal only*—cough, itching, pharyngitis, rhinitis, upper respiratory tract congestion. **GI:** nausea; *nasal only*, altered taste. **Derm:** *topical only*—burning, itching, pain, stinging.

## Interactions
**Drug-Drug:** Nasal mupirocin should not be used concurrently with other **nasal products**.

## Route/Dosage
**Topical (Adults and Children ≥2 mo):** Ointment: Apply 3–5 times daily for 5–14 days.
**Topical (Adults and Children ≥3 mo):** Cream: Apply small amount 3 times/day for 10 days.
**Intranasal (Adults and Children ≥1 yr):** Apply small amount nasal ointment to each nostril 2–4 times/day for 5–14 days.

## Availability (generic available)
**Ointment:** 2%. **Cost:** *Generic*—$34.99/22 g.
**Cream:** 2%. **Cost:** $47.99/15 g, $77.13/30 g. **Nasal ointment:** 2% in 1-g single-use tubes.

# NURSING IMPLICATIONS

## Assessment
- Assess lesions before and daily during therapy.

## Potential Nursing Diagnoses
Impaired skin integrity (Indications)
Risk for infection (Indications, Patient/Family Teaching)

## Implementation
- **Topical:** Wash affected area with soap and water and dry thoroughly. Apply a small amount of mupirocin to the affected area 3 times daily and rub in gently. Treated area may be covered with gauze if desired.
- **Nasal:** Apply one half of the ointment from the single-use tube to each nostril twice daily (morning and evening) for 5 days. After application, close nostrils by pressing together and releasing sides of the nose repeatedly for 1 min.

## Patient/Family Teaching
- Instruct patient on the correct application of mupirocin. Advise patient to apply medication exactly as directed for the full course of therapy. If a dose is missed, apply as soon as possible unless almost time for next dose. Avoid contact with eyes.
- **Topical:** Teach patient and family appropriate hygienic measures to prevent spread of impetigo.
- Instruct parents to notify school nurse for screening and prevention of transmission.
- Patient should consult health care professional if symptoms have not improved in 3–5 days.

### Evaluation/Desired Outcomes

- Healing of skin lesions. If no clinical response is seen in 3–5 days, condition should be re-evaluated.
- Eradication of methicillin-resistant *S. aureus* carrier state in patients and health care workers during institutional outbreaks.

## muromonab-CD3

(myoo-roe-**moe**-nab CD3)
Orthoclone OKT3

***Classification***
Therapeutic: immunosuppressants
Pharmacologic: monoclonal antibodies

**Pregnancy Category C**

### Indications

Acute renal allograft rejection reactions in transplant patients that have occurred despite conventional antirejection therapy. Acute corticosteroid-resistant hepatic or cardiac allograft rejection reactions.

### Action

A purified immunoglobulin antibody that acts as an immunosuppressant by interfering with normal T-cell function. **Therapeutic Effects:** Reversal of graft rejection in transplant patients.

### Pharmacokinetics

**Absorption:** Administered IV only, resulting in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Eliminated by binding to T lymphocytes.
**Half-life:** 18 hr.

TIME/ACTION PROFILE (noted as levels of circulating CD3-positive T cells)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | mins | 2–7 days | 1 wk |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to muromonab-CD3, murine (mouse) proteins, or polysorbate; Previous muromonab therapy; Fluid overload; Fever >37.8°C or 100°F; Chickenpox or recent exposure to chickenpox; Herpes zoster.
**Use Cautiously in:** Active infections; Depressed bone marrow reserve; Chronic debilitating illnesses; CHF; OB, Lactation, Pedi: Pregnancy, lactation, or children <2 yr (safety not established).

### Adverse Reactions/Side Effects

**CNS:** tremor, aseptic meningitis, dizziness. **Resp:** PULMONARY EDEMA, dyspnea, shortness of breath, wheezing. **CV:** chest pain. **GI:** diarrhea, nausea, vomiting. **Misc:** CYTOKINE RELEASE SYNDROME, INFECTIONS, chills, fever, hypersensitivity reactions, ↑ risk of lymphoma.

### Interactions

**Drug-Drug:** Additive immunosuppression with other **immunosuppressives**. Concurrent **prednisone** and **azathioprine** dosages should be ↓ during muromonab therapy (↑ risk of infection and lymphoproliferative disorders). **Cyclosporine** should be ↓ or discontinued during muromonab-CD3 therapy (↑ risk of infection and lymphoproliferative disorders). ↑ risk of adverse CNS reactions with **indomethacin**. May ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.
**Drug-Natural Products:** Concomitant use with **astragalus**, **echinacea**, and **melatonin** may interfere with immunosuppression.

### Route/Dosage

**IV (Adults):** 5 mg/day for 10–14 days (pretreatment with corticosteroids, acetaminophen, and/or antihistamines recommended).
**IV (Children):** 0.1 mg (100 mcg)/kg/day for 10–14 days.

### Availability

**Solution for injection:** 1 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for fluid overload (monitor weight and intake and output, assess for edema and rales/crackles). Notify health care professional if patient has experienced 3% or more weight gain in the previous week. Chest x-ray examination should be obtained within 24 hr before beginning therapy. Fluid-overloaded patients are at high risk of developing pulmonary edema. Monitor vital signs and breath sounds closely.
- Assess for cytokine release syndrome (CRS), usually manifested by high fever and chills, headache, tremor, nausea and vomiting, chest pain, muscle and joint pain, generalized weakness, shortness of breath, dizziness, abdominal pain, malaise, diarrhea, and trembling of hands, but may occasionally cause a severe, life-threatening, shock-like reaction. The severity of this reaction is greatest with initial dose. Reaction occurs within 30–48 hr and may persist for up to 6 hr. Acetaminophen and antihistamines may be used to treat early reactions.

Patient temperature should be maintained below 37.8°C (100°F) at administration of each dose. Manifestations of CRS may be prevented or minimized by pretreatment with methylprednisolone sodium succinate 8 mg/kg IV given 1–4 hr before 1st dose of muromonab-CD3. Hydrocortisone 100 mg IV may also be given 30 min after the 1st and possibly 2nd dose to control respiratory side effects. Serious symptoms of CRS may require oxygen, IV fluids, corticosteroids, vasopressors, antihistamines, and intubation.

- Monitor for signs of anaphylactic or hypersensitivity reactions at each dose. Resuscitation equipment should be readily available.
- Monitor for infection (fever, chills, rash, sore throat, purulent discharge, dysuria). Notify physician immediately if these symptoms occur; may necessitate discontinuation of therapy.
- Monitor for development of aseptic meningitis. Onset is usually within 3 days of beginning therapy. Assess for fever, headache, nuchal rigidity, and photophobia.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and periodically throughout therapy.
- Monitor assays of T cells (CD3, CD4, CD8); target CD3 is <25 cells/mm³ or plasma levels as determined by ELISA daily; target levels should be ≥800 ng/mL.
- Monitor BUN, serum creatinine, and hepatic enzymes (AST, ALT, alkaline phosphatase, bilirubin), especially during the first 1–3 days of therapy. May cause transient ↑.

## Potential Nursing Diagnoses

Risk for infection (Side Effects)
Excess fluid volume (Side Effects)

## Implementation

- Physician will reduce dose of corticosteroids and azathioprine and discontinue cyclosporine during 10–14-day course of muromonab-CD3. Cyclosporine may be resumed 3 days before end of therapy.
- Initial dose is administered during hospitalization; patient should be monitored closely for 48 hr. Subsequent doses may be administered on outpatient basis.
- Keep medication refrigerated at 2–8°C. Do not shake vial. Solution may contain a few fine translucent particles that do not affect potency. Discard unused portion.

### IV Administration

- **Direct IV:** Draw solution into syringe via low-protein-binding 0.2- or 0.22-micrometer filter to ensure removal of translucent protein particles that may be present. Discard filter and attach 20-gauge needle for IV administration. ***Concentration:*** 1 mg/mL (undiluted). ***Rate:*** Administer IV push over <1 min. Do not administer as an infusion.
- **Y-Site Incompatibility:** Do not admix; do not administer in IV line containing other medications. If line must be used for other medications, flush with 0.9% NaCl before and after muromonab-CD3.

## Patient/Family Teaching

- Explain purpose of medication to patient. Inform patient of possible initial-dose side effects, which are markedly reduced in subsequent doses. Explain that patient will need to resume lifelong therapy with other immunosuppressive drugs after completion of muromonab-CD3 course.
- Inform patient of potential for CRS. Describe reportable symptoms.
- Instruct patient to continue to avoid crowds and persons with known infections, as this drug also suppresses the immune system.
- Advise patient to notify health care professional at first sign of rash, urticaria, tachycardia, dyspnea, or difficulty swallowing.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response is known.
- Instruct patient not to receive any vaccinations and to avoid contact with persons receiving oral polio vaccine without advice of health care professional.

## Evaluation/Desired Outcomes

- Reversal of the symptoms of acute organ rejection.

**mycophenolate mofetil**
(mye-koe-**fee**-noe-late **moe**-fe-til)
CellCept

**mycophenolic acid**
(mye-koe-**fee**-noe-lik)
Myfortic

***Classification***
Therapeutic: immunosuppressants

**Pregnancy Category D**

## Indications

**Mycophenolate mofetil**: Prevention of rejection in allogenic renal, hepatic, and cardiac transplantation (used concurrently with cyclosporine and corticosteroids). **Mycophenolic acid**: Prevention of rejection in allogenic renal transplantation (used concurrently with cyclosporine and corticosteroids).

## Action

Inhibits the enzyme inosine monophosphate dehydrogenase, which is involved in purine synthesis. This inhibition results in suppression of T- and B-lymphocyte proliferation. **Therapeutic Effects:** Prevention of heart, kidney, or liver transplant rejection.

## Pharmacokinetics

**Absorption:** Following oral and IV administration, mycophenolate mofetil is rapidly hydrolyzed to mycophenolic acid (MPA), the active metabolite. Absorption of enteric-coated mycophenolic acid (Myfortic) is delayed compared with mycophenolate mofetil (CellCept).
**Distribution:** Cross the placenta and enter breast milk.
**Protein Binding:** *MPA*—97%.
**Metabolism and Excretion:** MPA is extensively metabolized; <1% excreted unchanged in urine. Some enterohepatic recirculation of MPA occurs.
**Half-life:** *MPA*—8–18 hr.

TIME/ACTION PROFILE (blood levels of MPA)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| mycophenolate mofetil-PO | rapid | 0.25–1.25 hr | N/A |
| mycophenolic acid | rapid | 1.5–2.75 hr | N/A |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hypersensitivity to polysorbate 80 (for IV mycophenolate mofetil); OB, Lactation: ↑ risk of congenital anomalies or spontaneous abortion.
**Use Cautiously in:** Active serious pathology of the GI tract (including history of ulcer disease or GI bleeding); Phenylketonuria (oral suspension contains aspartame); Severe chronic renal impairment (dose not to exceed 1 g twice daily (CellCept) if CCr <25 mL/min/1.73 m²); careful monitoring recommended; Delayed graft function following transplantation (observe for increased toxicity); Geri: ↑ risk of adverse reactions related to immunosuppression; OB: Patients with childbearing potential; Pedi: Mycophenolate mofetil approved in children ≥3 mo for renal transplant; mycophenolic acid approved in children ≥5 yr for renal transplant; safety not established for other age groups.

## Adverse Reactions/Side Effects

**CNS:** PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY, anxiety, dizziness, headache, insomnia, paresthesia, tremor. **CV:** edema, hypertension, hypotension, tachycardia. **Derm:** rashes. **Endo:** hypercholesterolemia, hyperglycemia, hyperkalemia, hypocalcemia, hypokalemia, hypomagnesemia. **GI:** GI BLEEDING, anorexia, constipation, diarrhea, nausea, vomiting, abdominal pain. **GU:** renal dysfunction. **Hemat:** leukocytosis, leukopenia, thrombocytopenia, anemia, pure red cell aplasia. **Resp:** cough, dyspnea. **Misc:** fever, infection (including activation of latent viral infections such as BK virus-associated nephropathy), ↑ risk of malignancy.

## Interactions

**Drug-Drug:** Combined use with **azathioprine** is not recommended (effects unknown). **Acyclovir** and **ganciclovir** compete with MPA for renal excretion and, in patients with renal dysfunction, may ↑ each other's toxicity. **Magnesium and aluminum hydroxide** antacids ↓ the absorption of MPA (avoid simultaneous administration). **Cholestyramine** and **colestipol** ↓ the absorption of MPA (avoid concurrent use). May interfere with the action of **oral contraceptives** (additional contraceptive method should be used). May ↓ the antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**, although influenza vaccine may be useful. **Amoxicillin/clavulanic acid** or **ciprofloxacin** may ↓ MPA trough levels.
**Drug-Food:** When administered with food, peak blood levels of MPA are significantly ↓ (should be administered on an empty stomach).

## Route/Dosage

### Mycophenolate Mofetil (CellCept)

#### Renal Transplantation

**PO, IV (Adults):** 1 g twice daily; IV should be started ≤24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥14 days).

**PO (Children 3 mo–18 yr):** 600 mg/m² twice daily (not to exceed 2 g/day).

### Hepatic Transplantation

**PO, IV (Adults):** 1 g twice daily IV, or 1.5 g twice daily PO. IV should be started ≤24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥14 days).

### Cardiac Transplantation

**PO, IV (Adults):** 1.5 g twice daily; IV should be started ≤24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥14 days).

### Renal Impairment

**PO, IV (Adults):** *CCr <25 mL/min*—daily dose should not exceed 2 g.

### Mycophenolic Acid (Myfortic)

Mycophenolate mofetil and mycophenolic acid should not be used interchangeably without the advice of a health care professional..

### Renal Transplantation

**PO (Adults):** 720 mg twice daily.
**PO (Children 5–16 yr and ≥1.19 m²):** 400 mg/m² twice daily (not to exceed 720 mg twice daily).

### Availability (generic available)

### Mycophenolate Mofetil (CellCept)

**Capsules:** 250 mg. **Tablets:** 500 mg. **Oral suspension (fruit flavor):** 200 mg/mL in 225 mL bottles. **Powder for injection:** 500 mg vial.

### Mycophenolic Acid (Myfortic)

**Delayed-release tablets (Myfortic):** 180 mg, 360 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess for symptoms of organ rejection throughout therapy.
- Assess for signs of progressive multifocal leukoencephalopathy (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC with differential weekly during the 1st month, twice monthly for the 2nd and 3rd month of therapy, and then monthly during the 1st yr. Neutropenia occurs most frequently from 31–180 days post-transplant. If ANC is <1000/mm³, dose should be reduced or discontinued.
- Monitor hepatic and renal status and electrolytes periodically during therapy. May cause ↑ serum alkaline phosphatase, AST, ALT, LDH, BUN, and creatinine. May also cause hyperkalemia, hypokalemia, hypocalcemia, hypomagnesemia, hyperglycemia, and hyperlipidemia.

### Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

### Implementation

- The initial dose of mycophenolate (usually IV) should be given within 24 hr of transplant.
- Women of childbearing yr should have a negative serum or urine pregnancy test within 1 wk prior to initiation of therapy.
- **PO:** Administer on an empty stomach, 1 hr before or 2 hr after meals. Capsules and delayed-release tablets should be swallowed whole; do not open, crush, or chew. Mycophenolate may be teratogenic; contents of capsules should not be inhaled or come in contact with skin or mucous membranes.
- Do not administer mycophenolate concurrently with antacids containing magnesium or aluminum.

#### IV Administration

- **IV:** IV route should only be used for patients unable to take oral medication and should be switched to oral dose form as soon as patient can tolerate capsules or tablets.
- **Intermittent Infusion:** ***Diluent:*** Reconstitute each vial with 14 mL of D5W. Shake gently to dissolve. Solution is slightly yellow; discard if solution is discolored or contains particulate matter. Dilute contents of 2 vials (1-g dose) further with 140 mL of D5W or 3 vials (1.5-g dose) with 210 mL of D5W. ***Concentration:*** 6 mg/mL. Solution is stable for 4 hr. ***Rate:*** Administer via slow IV infusion over 2 hr. Do not administer as a bolus or via rapid infusion.
- **Y-Site Compatibility:** anidulafungin, bivalirudin, caspofungin, cefepime, daptomycin, dopamine, norepinephrine, octreotide, oxytocin, tacrolimus, tigecycline, tirofiban, vancomycin.
- **Y-Site Incompatibility:** mycafungin.

### Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. Do not skip or double up on missed doses. Do not discontinue without consulting health care professional.

- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for the transplanted organ, and stress need to notify health care professional immediately if signs of rejection or infection occur.
- Inform female patients of the importance of simultaneously using two reliable forms of contraception, unless abstinence is the chosen method, prior to beginning, during, and for 6 wk following discontinuation of therapy.
- Advise patient to avoid contact with persons with contagious diseases.
- Inform patient of the increased risk of lymphoma and other malignancies. Advise patient to use sunscreen and wear protective clothing to decrease risk of skin cancer.
- Advise patient to consult health care professional prior to taking other medications concurrently with mycophenolate.
- Emphasize the importance of routine follow-up laboratory tests.

### Evaluation/Desired Outcomes

- Prevention of rejection of transplanted organs.

## nabumetone (na-byoo-me-tone)

Relafen

***Classification***

Therapeutic: antirheumatics, nonsteroidal anti-inflammatory agents

**Pregnancy Category C**

### Indications

Symptomatic management of rheumatoid arthritis and osteoarthritis.

### Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation.

### Pharmacokinetics

**Absorption:** Nabumetone (a prodrug) is 80% absorbed after oral administration; 35% is rapidly converted to 6-methoxy-2-naphthylacetic acid (6-MNA), which is the active drug.
**Distribution:** Unknown.
**Protein Binding:** >99%.
**Metabolism and Excretion:** 6-MNA is metabolized by the liver to inactive compounds.
**Half-life:** 24 hr (increased in severe renal impairment).

TIME/ACTION PROFILE (analgesia/anti-inflammatory effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–2 days | few days–2 wk | 12–24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Use with other NSAIDs, including aspirin; cross-sensitivity may occur; Active GI bleeding or ulcer disease; Peri-operative pain from coronary artery bypass graft (CABG) surgery; Lactation: Lactation.
**Use Cautiously in:** Severe renal, or hepatic disease; History of ulcer disease; OB: Avoid using during 2nd half of pregnancy due to potential of NSAIDs to cause premature closure of ductus arteriosus; Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** agitation, anxiety, confusion, depression, dizziness, drowsiness, fatigue, headache, insomnia, malaise, weakness. **EENT:** abnormal vision, tinnitus. **Resp:** dyspnea, hypersensitivity pneumonitis. **CV:** edema, fluid retention, vasculitis. **GI:** GI BLEEDING, abdominal pain, diarrhea, ↑ liver function tests, anorexia, constipation, dry mouth, dyspepsia, flatulence, gastritis, gastroenteritis, ↑ appetite, nausea, stomatitis, vomiting. **GU:** albuminuria, azotemia, interstitial nephritis. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, increased sweating, photosensitivity, pruritus, rash. **Hemat:** prolonged bleeding time. **Metab:** weight gain. **Neuro:** paresthesia, tremor. **Misc:** allergic reactions including ANAPHYLAXIS, ANGIONEUROTIC EDEMA.

### Interactions

**Drug-Drug:** ↑ adverse GI effects with **aspirin**, other **NSAIDs**, **potassium supplements**, **corticosteroids**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ hypoglycemic effects of **insulins** or **oral hypoglycemic agents**. ↑ risk of toxicity from **methotrexate**. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **valproic acid**, **anticoagulants**, **ticlopidine**, **clopidogrel**, **eptifibatide**, **tirofiban**, or **thrombolytic agents**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. Concurrent use with **cyclosporine** may ↑ risk of renal toxicity.

### Route/Dosage

**PO (Adults):** 1000 mg/day as a single dose or divided dose twice daily; may be ↑ up to 2000 mg/day; use lowest effective dose during chronic therapy.

### Availability (generic available)

**Tablets:** 500 mg, 750 mg.

## NURSING IMPLICATIONS

### Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- Assess pain and range of motion before and periodically throughout therapy.
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, and liver function periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests may show ↑ levels. Blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- May cause prolonged bleeding time.

## Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

## Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for the shortest duration possible to minimize cardiac risks.
- **PO:** Administer with meals or antacids to decrease GI irritation and increase absorption.

## Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness, dizziness, or visual disturbances. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

## Evaluation/Desired Outcomes

- Decreased pain and improved joint mobility. Partial arthritic relief is usually seen within 1 wk, but maximum effectiveness may require 2 wk or more of continuous therapy. Patients who do not respond to one NSAID may respond to another.

# nadolol (nay-doe-lole)

Corgard, Syn-Nadolol

***Classification***

Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

**Pregnancy Category C**

## Indications

Management of hypertension. Management of angina pectoris. **Unlabeled Use:** Arrhythmias. Migraine prophylaxis. Tremors (essential, lithium-induced, parkinsonian). Aggressive behavior. Antipsychotic-associated akathisia. Situational anxiety. Esophageal varices. Reduction of intraocular pressure.

## Action

Blocks stimulation of $beta_1$ (myocardial) and $beta_2$ (pulmonary, vascular, and uterine) receptor sites. **Therapeutic Effects:** Decreased heart rate and blood pressure.

## Pharmacokinetics

**Absorption:** 30% absorbed after oral administration.
**Distribution:** Minimal penetration of the CNS. Crosses the placenta and enters breast milk.
**Metabolism and Excretion:** 70% excreted unchanged by the kidneys.
**Half-life:** 10–24 hr (↑ in renal impairment).

TIME/ACTION PROFILE (anithypertensive effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO† | up to 5 days | 6–9 days | 24 hr |

†With chronic dosing

## Contraindications/Precautions

**Contraindicated in:** Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
**Use Cautiously in:** Renal impairment (CCr <50 mL/min); Hepatic impairment; Pulmonary disease (including asthma); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); OB: Crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; ); Lactation, Pedi: Safety not established; Geri: ↑ sensitivity to beta blockers; initial dose ↓ recommended.

## Adverse Reactions/Side Effects

**CNS:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nightmares. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Resp:** bronchospasm, wheezing. **CV:** ARRHYTHMIAS, BRADYCARDIA, CHF, PULMONARY EDEMA, orthostatic hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, ↓ libido. **Derm:** itching, rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** ar-

thralgia, back pain, muscle cramps. **Neuro:** paresthesia. **Misc:** drug-induced lupus syndrome.

### Interactions

**Drug-Drug: General anesthesia**, **IV phenytoin**, **diltiazem**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamines**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent use with **clonidine** ↑ hypotension and bradycardia. Concurrent **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May ↓ the effectiveness of **theophylline**. May ↓ the effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor therapy** (may result in hypertension). Concurrent **NSAIDs** may ↓ antihypertensive action.

### Route/Dosage

**PO (Adults):** *Antianginal*—40 mg once daily initially; may ↑ by 40–80 mg/day q 3–7 days as needed (up to 240 mg/day). *Antihypertensive*—40 mg once daily initially; may ↑ by 40–80 mg/day q 7 days as needed (up to 320 mg/day).

### Renal Impairment

**PO (Adults):** *CCr 31–50 mL/min*— ↑ dosing interval to 24–36 hr; *CCr 10–30 mL/min*— ↑ dosing interval to 24–48 hr; *CCr <10 mL/min*— ↑ dosing interval to 40–60 hr.

### Availability (generic available)

**Tablets:** 20 mg, 40 mg, 80 mg. ***In combination with:*** bendroflumethiazide (Corzide). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse frequently during dose adjustment and periodically during therapy. Assess for orthostatic hypotension when assisting patient up from supine position.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- **Hypertension:** Check frequency of refills to determine compliance.
- **Angina:** Assess frequency and characteristics of angina periodically during therapy.
- ***Lab Test Considerations:*** May cause increased BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify physician or other health care professional immediately if these signs occur.

### Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- Discontinuation of concurrent clonidine should be done gradually, with beta blocker discontinued first; then, after several days, discontinue clonidine.
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- May be administered with food or on an empty stomach.
- Tablets may be crushed and mixed with food.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to ensure that enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet for emergencies.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or if blood pressure changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that re-

quire alertness until response to the drug is known.
- Advise patients to make position changes slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any OTC medications, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask some signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.
- **Angina:** Caution patient to avoid overexertion with decrease in chest pain.

### Evaluation/Desired Outcomes
- Decrease in blood pressure.
- Reduction in frequency of angina.
- Increase in activity tolerance. May require up to 5 days before therapeutic effects are seen.

## nafarelin (na-**fare**-e-lin)
Synarel

***Classification***
Therapeutic: hormones
Pharmacologic: gonadotropin-releasing hormones

**Pregnancy Category X**

### Indications
Management of endometriosis. Management of central precocious puberty (gonadotropin-dependent) in children.

### Action
Acts as a synthetic analogue of gonadotropin-releasing hormone (GnRH). Initially increases pituitary production of luteinizing hormone (LH) and follicle-stimulating hormone (FSH), which cause ovarian steroid production. Chronic administration leads to decreased production of gonadotropins. Endometriotic lesions are sensitive to ovarian hormones. **Therapeutic Effects:** Reduction in lesions and associated pain in endometriosis. Arrest and regression of puberty in children with central precocious puberty.

### Pharmacokinetics
**Absorption:** Well absorbed following intranasal administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** 20–40% excreted in feces; 3% excreted unchanged by the kidneys.
**Half-life:** 3 hr.

TIME/ACTION PROFILE (decreased ovarian steroid production)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Intranasal | within 4 wk | 3–4 wk | 3–6 mo† |

†Relief of symptoms of endometriosis following discontinuation

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to GnRH, its analogues, or sorbitol; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Rhinitis.

### Adverse Reactions/Side Effects
**CNS:** emotional instability, headaches, depression, insomnia. **EENT:** nasal irritation. **CV:** edema. **GU:** vaginal dryness. **Derm:** acne, hirsutism, seborrhea. **Endo:** cessation of menses, impaired fertility, ↓ breast size. **MS:** ↓ bone density, myalgia. **Misc:** ↓ libido, hot flashes, hypersensitivity reactions, weight gain.

### Interactions
**Drug-Drug:** Concurrent **topical nasal decongestants** may ↓ absorption of nafarelin (administer decongestant at least 2 hr after nafarelin).

### Route/Dosage
**Intranasal (Adults):** *Endometriosis*—1 spray (200 mcg) in 1 nostril in the morning and 1 spray in the other nostril in the evening (400 mcg/day). May be ↑ to 1 spray in each nostril in the morning and evening (800 mcg/day).
**Intranasal (Children):** *Central precocious puberty*—2 sprays in each nostril in the morning and in the evening (1600 mcg/day); may be ↑

up to 1800 mcg/day (3 sprays in alternating nostrils 3 times daily).

### Availability

**Nasal spray:** 2 mg/mL (200 mcg/spray).

## NURSING IMPLICATIONS

### Assessment

- **Endometriosis:** Assess patient for endometriotic pain periodically throughout therapy.
- **Central Precocious Puberty:** Prior to therapy, a complete physical and endocrinologic examination including height, weight, hand and wrist x-ray, total sex steroid level (estradiol or testosterone), adrenal steroid level, beta human chorionic gonadotropin level, GnRH stimulation test, pelvic/adrenal/testicular ultrasound, and CTof the head must be performed. These parameters are monitored after 6–8 wk and every 3–6 mo during therapy.
- Assess patient for signs of precocious puberty (menses, breast development, testicular growth) periodically throughout therapy.
- Nafarelin is discontinued when the onset of normal puberty is desired. Monitor the onset of normal puberty and assess menstrual cycle, reproductive function, and final adult height.

### Potential Nursing Diagnoses

Acute pain (Indications)
Sexual dysfunction (Indications, Side Effects)

### Implementation

- **Endometriosis:** Treatment should be started between days 2 and 4 of the menstrual cycle and continued for up to 6 mo.

### Patient/Family Teaching

- Instruct patient on the correct technique for nasal spray: The head should be tilted back slightly; wait 30 sec between sprays.
- Advise patient to consult health care professional if rhinitis occurs during therapy. If a topical decongestant is needed, do not use decongestant until 2 hr after nafarelin dosing. If possible, avoid sneezing during and immediately after nafarelin dose.
- **Endometriosis:** Inform patient that 1 spray should be administered into 1 nostril in the morning and 1 spray into the other nostril in the evening for the 400 mcg/day dose. If dose is increased to 800 mcg/day, administer 1 spray to each nostril (2 sprays) morning and evening; 1 bottle should provide a 30-day supply at the 400 mcg/day dose.
- Advise patient to use a form of contraception other than oral contraceptives during therapy. Inform patient that amenorrhea is expected. Instruct patient to notify health care professional if regular menstruation persists or if successive doses are missed.
- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome.
- **Central Precocious Puberty:** Instruct patient on correct timing and number of sprays. The 1600 mcg/day dose is achieved by 2 sprays to each nostril in the morning (4 sprays) and 2 sprays to each nostril in the evening (4 sprays), for a total of 8 sprays. The 1800 mcg/day dose is achieved by 3 sprays into alternating nostrils 3 times per day, for a total of 9 sprays. Inform patient and parents that if doses are not taken as directed pubertal process may be reactivated. One bottle should provide a 7-day supply at the 1600 mcg/day dose.
- Advise patient and parents that during 1st mo of therapy some signs of puberty (vaginal bleeding, breast enlargement) may occur. These should resolve after the 1st mo of therapy. If these signs persist after the 2nd mo of therapy, notify health care professional.

### Evaluation/Desired Outcomes

- Reduction in lesions and associated pain in endometriosis.
- Resolution of the signs of precocious puberty.

**nafcillin, See PENICILLINS, PENICILLINASE RESISTANT.**

**naftifine, See ANTIFUNGALS (TOPICAL).**

HIGH ALERT

## nalbuphine (nal-byoo-feen)

Nubain

***Classification***

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists/analgesics

**Pregnancy Category C**

## Indications
Moderate to severe pain. Also provides: Analgesia during labor, Sedation before surgery, Supplement to balanced anesthesia.

## Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. In addition, has partial antagonist properties, which may result in opioid withdrawal in physically dependent patients. **Therapeutic Effects:** Decreased pain.

## Pharmacokinetics
**Absorption:** Well absorbed after IM and subcut administration.
**Distribution:** Probably crosses the placenta and enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver and eliminated in the feces via biliary excretion. Minimal amounts excreted unchanged by the kidneys.
**Half-life:** 5 hr.

TIME/ACTION PROFILE (analgesia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | <15 min | 60 min | 3–6 hr |
| Subcut | <15 min | unknown | 3–6 hr |
| IV | 2–3 min | 30 min | 3–6 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to nalbuphine or bisulfites; Patients physically dependent on opioids and who have not been detoxified (may precipitate withdrawal).
**Use Cautiously in:** Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hyperplasia; Patients who have recently received opioid agonists; OB: Has been used during labor but may cause respiratory depression in the newborn; Lactation, Pedi: Safety not established; Geri: Dose ↓ suggested.

## Adverse Reactions/Side Effects
**CNS:** dizziness, headache, sedation, confusion, dysphoria, euphoria, floating feeling, hallucinations, unusual dreams. **EENT:** blurred vision, diplopia, miosis (high doses). **Resp:** respiratory depression. **CV:** hypertension, orthostatic hypotension, palpitations. **GI:** dry mouth, nausea, vomiting, constipation, ileus. **GU:** urinary urgency. **Derm:** clammy feeling, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

## Interactions
**Drug-Drug:** Use with extreme caution in patients receiving **MAO inhibitors** (may result in unpredictable, severe reactions— ↓ initial dose of nalbuphine to 25% of usual dose). Additive CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. May precipitate withdrawal in patients who are physically dependent on **opioid agonists**. Avoid concurrent use with other **opioid analgesic agonists** (may diminish analgesic effect).
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

## Route/Dosage

### Analgesia
**IM, Subcut, IV (Adults):** Usual dose is 10 mg q 3–6 hr (single dose not to exceed 20 mg; total daily dose not to exceed 160 mg).

### Supplement to Balanced Anesthesia
**IV (Adults):** *Initial*—0.3–3 mg/kg over 10–15 min. *Maintenance*—0.25–0.5 mg/kg as needed.

## Availability (generic available)
**Injection:** 10 mg/mL, 20 mg/mL.

## NURSING IMPLICATIONS

### Assessment
- Assess type, location, and intensity of pain before and 1 hr after IM or 30 min (peak) after IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring doses higher than 20 mg should be converted to an opioid agonist. Nalbuphine is not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Nalbuphine produces respiratory depression, but

this does not markedly increase with increased doses.
- Assess previous analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, and increased blood pressure and temperature) in patients physically dependent on opioids.
- Although this drug has a low potential for dependence, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive nalbuphine for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

## Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)
Disturbed sensory perception (visual, auditory) (Side Effects)

## Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if administered before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive effects and permit lower opioid doses.
- **IM:** Administer deep into well-developed muscle. Rotate sites of injections.

### IV Administration

- **Direct IV:** May give IV undiluted-*Concentration:* 10–20 mg/mL. *Rate:* Administer slowly, each 10 mg over 3–5 min.
- **Syringe Compatibility:** atropine, cimetidine, diphenhydramine, droperidol, glycopyrrolate, hydroxyzine, lidocaine, midazolam, prochlorperazine, ranitidine, scopolamine.
- **Syringe Incompatibility:** diazepam, ketorolac, pentobarbital.
- **Y-Site Compatibility:** amifostine, aztreonam, bivalirudin, cisatracurium, cladribine, dexmedetomidine, etoposide phosphate, fenoldopam, filgrastim, fludarabine, gemcitabine, granisetron, lansoprazole, linezolid, melphalan, oxaliplatin, paclitaxel, propofol, remifentanil, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate complex, cefepime, docetaxel, methotrexate, pemetrexed, piperacillin/tazobactam, sargramostim, sodium bicarbonate.

## Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.

## Evaluation/Desired Outcomes

- Decrease in severity of pain without significant alteration in level of consciousness or respiratory status.

## naloxone (nal-**ox**-one)

***Classification***
Therapeutic: antidotes (for opioids)
Pharmacologic: opioid antagonists

**Pregnancy Category B**

### Indications
Reversal of CNS depression and respiratory depression because of suspected opioid overdose.
**Unlabeled Use:** Opioid-induced pruritus (low dose IV infusion). Management of refractory circulatory shock.

### Action
Competitively blocks the effects of opioids, including CNS and respiratory depression, without producing any agonist (opioid-like) effects. **Therapeutic Effects:** Reversal of signs of opioid excess.

### Pharmacokinetics
**Absorption:** Well absorbed after IM or subcut administration.
**Distribution:** Rapidly distributed to tissues. Crosses the placenta.
**Metabolism and Excretion:** Metabolized by the liver.
**Half-life:** 60–90 min (up to 3 hr in neonates).

TIME/ACTION PROFILE (reversal of opioid effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 1–2 min | unknown | 45 min |
| IM, Subcut | 2–5 min | unknown | >45 min |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Cardiovascular disease; Patients physically dependent on opioids (may precipitate severe withdrawal); OB: May cause acute withdrawal syndrome in mother and fetus if mother is opioid dependent; Lactation: Safety not established; Pedi: May cause acute withdrawal syndrome in neonates of opioid-dependent mothers.

### Adverse Reactions/Side Effects
**CV:** VENTRICULAR ARRHYTHMIAS, hypertension, hypotension. **GI:** nausea, vomiting.

### Interactions
**Drug-Drug:** Can precipitate withdrawal in patients physically dependent on **opioid analgesics**. Larger doses may be required to reverse the effects of **buprenorphine**, **butorphanol**, **nalbuphine**, **pentazocine**, or **propoxyphene**. Antagonizes postoperative **opioid analgesics**.

### Route/Dosage
#### Postoperative Opioid-Induced Respiratory Depression
**IV (Adults):** 0.02–0.2 mg q 2–3 min until response obtained; repeat q 1–2 hr if needed.
**IV (Children):** 0.01 mg/kg; may repeat q 2–3 min until response obtained. Additional doses may be given q 1–2 hr if needed.
**IM, IV, Subcut (Neonates):** 0.01 mg/kg; may repeat q 2–3 min until response obtained. Additional doses may be given q 1–2 hr if needed.

#### Opioid-Induced Respiratory Depression During Chronic (>1 wk) Opioid Use
**IV, IM, Subcut (Adults >40 kg):** 20–40 mcg (0.02–0.04 mg) given as small, frequent (q min) boluses or as an infusion titrated to improve respiratory function without reversing analgesia.
**IV, IM, Subcut (Adults and Children <40 kg):** 0.005–0.02 mg/dose given as small, frequent (q min) boluses or as an infusion titrated to improve respiratory function without reversing analgesia.

#### Overdose of Opioids
**IV, IM, Subcut (Adults):** *Patients not suspected of being opioid dependent*—0.4 mg (10 mcg/kg); may repeat q 2–3 min (IV route is preferred). Some patients may require up to 2 mg. *Patients suspected to be opioid dependent*—Initial dose should be decreased to 0.1–0.2 mg q 2–3 min. May also be given by IV infusion at rate adjusted to patient's response.
**IV, IM, Subcut (Children > 5 yr or > 20 kg):** 2 mg/dose, may repeat q 2–3 min.
**IV, IM, Subcut (Infants up to 5 yr or 20 kg):** 0.1 mg/kg, may repeat q 2–3 min.

#### Opioid-Induced Pruritus
**IV (Children):** 2 mcg/kg/hr continuous infusion, may ↑ by 0.5 mcg/kg/hr every few hours if pruritus continues.

### Availability (generic available)
**Injection:** 0.4 mg/mL, 1 mg/mL. ***In combination with:*** pentazocine (Talwin NX). See Appendix B.

## NURSING IMPLICATIONS

### Assessment
- Monitor respiratory rate, rhythm, and depth; pulse, ECG, blood pressure; and level of consciousness frequently for 3–4 hr after the expected peak of blood concentrations. After a moderate overdose of a short half-life opioid, physical stimulation may be enough to prevent

significant hypoventilation. The effects of some opioids may last longer than the effects of naloxone, and repeat doses may be necessary.
- Patients who have been receiving opioids for >1 wk are extremely sensitive to the effects of naloxone. Dilute and administer carefully.
- Assess patient for level of pain after administration when used to treat postoperative respiratory depression. Naloxone decreases respiratory depression but also reverses analgesia.
- Assess patient for signs and symptoms of opioid withdrawal (vomiting, restlessness, abdominal cramps, increased blood pressure, and temperature). Symptoms may occur within a few minutes to 2 hr. Severity depends on dose of naloxone, the opioid involved, and degree of physical dependence.
- Lack of significant improvement indicates that symptoms are caused by a disease process or other non-opioid CNS depressants not affected by naloxone.
- ***Toxicity and Overdose:*** Naloxone is a pure antagonist with no agonist properties and minimal toxicity.

## Potential Nursing Diagnoses

Ineffective breathing pattern (Indications)
Ineffective coping (Indications)
Acute pain

## Implementation

- Larger doses of naloxone may be necessary when used to antagonize the effects of buprenorphine, butorphanol, nalbuphine, pentazocine, and propoxyphene.
- Resuscitation equipment, oxygen, vasopressors, and mechanical ventilation should be available to supplement naloxone therapy as needed.
- Doses should be titrated carefully in postoperative patients to avoid interference with control of postoperative pain.

### IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted for *suspected opioid overdose*. For *opioid-induced respiratory depression*, dilute with sterile water for injection. For children or adults weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of sterile water or 0.9% NaCl for injection. ***Concentration:*** 0.4 mg/mL, 1 mg/mL, or 10 mcg/mL (depending on preparation used). ***Rate:*** Administer over 30 seconds for patients with a *suspected opioid overdose*. For patients who develop *opioid-induced respiratory depression*, administer dilute solution of 0.4 mg/10 mL at a rate of 0.5 mL (0.02 mg) direct IV every 2 min. Titrate to avoid withdrawal and severe pain. Excessive dose in postoperative patients may cause excitement, pain, hypotension, hypertention, pulmonary edema, ventricular tachycardia and fibrillation, and seizures. For children and adults weighing <40 kg, administer 10 mcg/mL solution at a rate of 0.5 mcg/kg every 1–2 min.
- **Continuous Infusion:** ***Diluent:*** Dilute 2 mg of naloxone in 500 mL of 0.9% NaCl or D5W. Infusion is stable for 24 hr. ***Concentration:*** 4 mcg/mL. ***Rate:*** Titrate dose according to patient response.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, atropine, aztreonam, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, ganciclovir, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydroxyzine, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, nafcillin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, quinupristin/dalfopristin, ranitidine, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, vancomycin, vasopressin, verapamil, voriconazole.
- **Y-Site Incompatibility:** diazepam, lansoprazole, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Incompatible with preparations containing bisulfite, sulfite, and solutions with an alkaline pH.

N

### Patient/Family Teaching

- As medication becomes effective, explain purpose and effects of naloxone to patient.

### Evaluation/Desired Outcomes

- Adequate ventilation.
- Alertness without significant pain or withdrawal symptoms.

## naproxen (na-**prox**-en)

Aleve, Anaprox, Anaprox DS, Apo-Napro-Na, Apo-Naproxen, EC-Naprosyn, Naprelan, Naprosyn, Naprosyn-E, Naprosyn-SR, Naxen, Novo-Naprox, Novo-Naprox Sodium DS, Nu-Naprox, Synflex, Synflex DS

***Classification***

Therapeutic: nonopioid analgesics, nonsteroidal anti-inflammatory agents, antipyretics

**Pregnancy Category B (first trimester)**

### Indications

Mild to moderate pain. Dysmenorrhea. Fever. Inflammatory disorders, including: Rheumatoid arthritis (adults and children), Osteoarthritis.

### Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Decreased pain. Reduction of fever. Suppression of inflammation.

### Pharmacokinetics

**Absorption:** Completely absorbed from the GI tract. Sodium salt is more rapidly absorbed.
**Distribution:** Crosses the placenta; enters breast milk in low concentrations.
**Protein Binding:** >99%.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** Children <8 yr: 8–17 hr; Children 8–14 yr: 8–10 hr; Adults: 10–20 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (analgesic) | 1 hr | unknown | 8–12 hr |
| PO (anti-inflammatory) | 14 days | 2–4 wk | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity may occur with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Lactation: Passes into breast milk and should not be used by nursing mothers.

**Use Cautiously in:** Severe cardiovascular, renal, or hepatic disease; History of ulcer disease or any other history of gastrointestinal bleeding (may ↑ risk of GI bleeding); Underlying cardiovascular disease (may ↑ risk of MI or stroke); Chronic alcohol use/abuse; OB: Avoid using during third trimester; may cause premature closure of the ductus arteriosus; Pedi: Safety not established in children <2 yr ; Geri: ↑ risk of adverse reactions.

### Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, headache. **EENT:** tinnitus, visual disturbances. **Resp:** dyspnea. **CV:** edema, palpitations, tachycardia. **GI:** DRUG-INDUCED HEPATITIS, GI BLEEDING, constipation, dyspepsia, nausea, anorexia, diarrhea, discomfort, flatulence, vomiting. **GU:** cystitis, hematuria, renal failure. **Derm:** photosensitivity, rashes, sweating, pseudoporphyria (12% incidence in children with juvenile rheumatoid arthritis—discontinue therapy if this occurs). **Hemat:** blood dyscrasias, prolonged bleeding time. **Misc:** allergic reactions including ANAPHYLAXIS and STEVENS-JOHNSON SYNDROME.

### Interactions

**Drug-Drug:** Concurrent use with **aspirin** ↓ naproxen blood levels and may ↓ effectiveness. ↑ risk of bleeding with **anticoagulants**, **thrombolytic agents**, **eptifibatide**, **tirofiban**, **cefotetan**, **cefoperazone**, **valproic acid**, **corticosteroids**, **clopidogrel**, and **ticlopidine**. Additive adverse GI side effects with **aspirin**, **corticosteroids**, **alcohol**, and other **NSAIDs**. **Probenecid** ↑ blood levels and may ↑ toxicity. May ↑ risk of toxicity from **methotrexate**, **antineoplastics**, or **radiation therapy**. May ↑ serum levels and risk of toxicity from **lithium**. ↑ risk of adverse renal effects with **cyclosporine** or chronic use of **acetaminophen**. May ↓ response to **ACE Inhibitors**, **angiotensin II antagonists,** or **furosemide**. May ↑ risk of hypoglycemia with **insulin** or **oral hypoglycemic agents**. **Oral potassium supplements** may ↑ GI adverse effects.
**Drug-Natural Products:** ↑ anticoagulant effect and bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, **licorice**, and others.

### Route/Dosage

275 mg naproxen sodium is equivalent to 250 mg naproxen.

### Anti-Inflammatory/Analgesic/Antidysmenorrheal

**PO (Adults):** *Naproxen*—250–500 mg twice daily (up to 1.5 g/day). *Delayed-release naproxen*—375–500 mg twice daily. *Naproxen sodium*—275–550 mg twice daily (up to 1.65 g/day).
**PO (Children >2 yr):** *Analgesia:* 5–7 mg/kg/dose q 8–12 hr. *Inflammatory disease:* 10–15 mg/kg/day divided q 12 hr, maximum: 1000 mg/day.

### Antigout

**PO (Adults):** *Naproxen*—750 mg naproxen initially, then 250 mg q 8 hr. *Naproxen sodium*—825 mg initially, then 275 mg q 8 hr.

### OTC Use (naproxen sodium)

**PO (Adults):** 200 mg q 8–12 hr or 400 mg followed by 200 mg q 12 hr (not to exceed 600 mg/24 hr).
**PO (Geriatric Patients >65 yr):** Not to exceed 200 mg q 12 hr.

### Availability

#### Naproxen (generic available)

**Tablets (Naprosyn, Apo-Naproxen, Naxen, Novo-Naprox, Nu-Naprox):** 🍁 125 mg, 250 mg, 375 mg, 500 mg. **Controlled-release tablets (Naprelan):** 375 mg, 500 mg. **Delayed-release tablets (EC-Naprosyn, Naprosyn-E):** 🍁 250 mg, 375 mg, 500 mg. **Extended-release tablets (Naprosyn-SR):** 🍁 750 mg. **Oral suspension (Naprosyn):** 125 mg/5 mL. **Suppositories (Naprosyn, Naxen):** 🍁 500 mg.

#### Naproxen Sodium (generic available)

**Tablets (Aleve, Anaprox, Anaprox DS, Novo-Naprox Sodium, Novo-Naprox Sodium DS, Synaflex, Synaflex DS):** 220 mg[OTC], 275 mg, 550 mg. ***In combination with:*** pseudoephedrine (Aleve Cold and Sinus Tablets, Aleve Sinus and Headache Tablets), sumatriptan (Treximet). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- **Arthritis:** Assess pain and range of motion prior to and 1–2 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, and liver function tests periodically in patients receiving prolonged therapy.
- May ↑ serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests levels. May ↓ blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr.
- Bleeding time may be prolonged up to 4 days following discontinuation of therapy.
- May alter test results for urine 5-HIAA and urine steroid determinations.

### Potential Nursing Diagnoses

Acute pain (Indications)
Chronic pain (Indications)
Impaired physical mobility (Indications)

### Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for the shortest duration possible to minimize cardiac risks.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- Analgesic is more effective if given before pain becomes severe.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids to decrease GI irritation. Food slows but does not reduce the extent of absorption. Do not mix suspension with antacid or other liquid prior to administration. Swallow extended-release, delayed-release, and controlled-release tablets whole; do not break, crush, or chew.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.

### Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but

not if almost time for the next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional. Use of naproxen with 3 or more glasses of alcohol per day may increase risk of GI bleeding.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions (especially in children with JRA).
- Instruct patients not to take OTC naproxen preparations for more than 3 days for fever and to consult health care professional if symptoms persist or worsen.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

## Evaluation/Desired Outcomes
- Relief of pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 2 wk, but maximum effectiveness may require 2–4 wk of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Reduction of fever.

# naratriptan (nar-a-**trip**-tan)
Amerge

***Classification***
Therapeutic: vascular headache suppressants
Pharmacologic: 5-$HT_1$ agonists

**Pregnancy Category C**

## Indications
Acute treatment of migraine headache.

## Action
Acts as an agonist at specific 5-$HT_1$ receptor sites in intracranial blood vessels and sensory trigeminal nerves. **Therapeutic Effects:** Cranial vessel vasoconstriction with resultant decrease in migraine headache.

## Pharmacokinetics
**Absorption:** Well absorbed (70%) following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** 60% excreted unchanged in urine; 30% metabolized by the liver.
**Half-life:** 6 hr (↑ in renal impairment).

TIME/ACTION PROFILE (↓ migraine pain)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–60 min | 2–3 hr† | up to 24 hr |

†3–4 hr during migraine attack

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Ischemic cardiovascular, cerebrovascular, or peripheral vascular syndromes (including ischemic bowel disease); History of significant cardiovascular disease; Uncontrolled hypertension; Severe renal impairment (CCr <15 mL/min); Severe hepatic impairment; Should not be used within 24 hr of other 5-$HT_1$ agonists or ergot-type compounds (dihydroergotamine); Geri: Age-related ↓ in renal function and ↑ likelihood of CAD greatly ↑ risk of fatal adverse events.
**Use Cautiously in:** Mild to moderate renal or hepatic impairment (dose should not exceed 2.5 mg/24 hr; initial dose should be ↓); OB, Lactation, Pedi: Safety not established.
**Exercise Extreme Caution in:** Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision.

## Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness, malaise/fatigue. **CV:** CORONARY ARTERY VASOSPASM, MI, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA, myocardial ischemia. **GI:** nausea. **Neuro:** paresthesia. **Misc:** pain/pressure sensation in throat/neck.

## Interactions
**Drug-Drug:** Concurrent use with **SSRI or SNRI antidepressants** may result in serotonin syndrome. **Cigarette smoking** ↑ the metabolism of naratriptan. Blood levels and effects are ↑ by **hormonal contraceptives**. Avoid concurrent use (within 24 hr of each other) with **ergot-containing drugs (dihydroergotamine)** may result in prolonged vasospastic reactions. Avoid concurrent (within 2 wk) use with **MAO inhibitors**; produces ↑ systemic exposure and risk of adverse reactions to naratriptan. Serotonin syndrome may occur with **sibutramine**.

**Drug-Natural Products:** ↑ risk of serotinergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

### Route/Dosage

**PO (Adults):** 1 or 2.5 mg; dose may be repeated in 4 hr if response is inadequate (not to exceed 5 mg/24 hr or treatment of more than 4 headaches/mo).

### Availability

**Tablets:** 1 mg, 2.5 mg. **Cost:** 1 mg $210.69/9, 2.5 mg $210.97/9.

## NURSING IMPLICATIONS

### Assessment

- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Monitor for serotonin syndrome in patients taking SSRIs or SNRIs concurrently with naratriptan.

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- **PO:** Tablets may be administered at any time after the headache starts.

### Patient/Family Teaching

- Inform patient that naratriptan should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer naratriptan as soon as symptoms of a migraine attack appear, but it may be administered any time during an attack. If migraine symptoms return, a 2nd dose may be used. Allow at least 4 hr between doses, and do not use more than 2 tablets in any 24-hr period. Do not use to treat more than 4 headaches per month.
- Advise patient that lying down in a darkened room following naratriptan administration may further help relieve headache.
- Advise patient to notify health care professional prior to next dose of naratriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately and do not take more naratriptan without approval of health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- Instruct patient not to take additional naratriptan if no response is seen with initial dose without consulting health care professional. There is no evidence that 5 mg provides greater relief than 2.5-mg dose. Additional naratriptan doses are not likely to be effective and alternative medications, as previously discussed with health care professional, may be used.
- Naratriptan may cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during naratriptan use.
- Advise patient to consult health care professional before taking other Rx, OTC, or herbal products concurrently with naratriptan. Patients concurrently taking SSRI or SNRI antidepressants should notify health care professional promptly if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile blood pressure, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.
- Caution patient not to use naratriptan if pregnancy is planned or suspected or if breastfeeding. Adequate contraception should be used during therapy.

### Evaluation/Desired Outcomes

- Relief of migraine attack.

## nateglinide (na-teg-li-nide)

Starlix

***Classification***

Therapeutic: antidiabetics
Pharmacologic: meglitinides

**Pregnancy Category C**

### Indications

To improve glycemic control in patients with type 2 diabetes (with diet and exercise); may also be used with metformin or a thiazolidinedione (pioglitazone, rosiglitazone).

## Action
Stimulates the release of insulin from pancreatic beta cells by closing potassium channels, which results in the opening of calcium channels in beta cells. This is followed by release of insulin. Requires functioning pancreatic beta cells. **Therapeutic Effects:** Lowering of blood glucose.

## Pharmacokinetics
**Absorption:** Well absorbed (73%) following oral administration; absorption is rapid.
**Distribution:** Unknown.
**Protein Binding:** 98%.
**Metabolism and Excretion:** Mostly metabolized by the liver (cytochrome P2 C9 and P3 A4 [CYP2C9 and CYP3A4] enzyme systems); 16% excreted unchanged in urine.
**Half-life:** 1.5 hr.

TIME/ACTION PROFILE (effect on blood glucose)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 20 min | 1 hr | 4 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Diabetic ketoacidosis; Type 1 diabetes; OB: Insulin recommended to control diabetes during pregnancy; Lactation: Effects on nursing infant unknown.
**Use Cautiously in:** Malnourished patients, patients with pituitary or adrenal insufficiency (↑ susceptibility to hypoglycemia); Strenuous physical exercise, insufficient caloric intake (increased risk of hypoglycemia); Autonomic neuropathy (hypoglycemia may be masked); Moderate to severe liver impairment; Fever, infection, trauma, or surgery (may lead to transient loss of glycemic control; insulin may be required); Pedi: Safety not established; Geri: May have ↑ sensitivity to drug effects (↑ risk of hypoglycemia).

## Adverse Reactions/Side Effects
**CNS:** dizziness. **Resp:** bronchitis, coughing, upper respiratory infection. **GI:** diarrhea. **Endo:** HYPOGLYCEMIA. **MS:** arthropathy, back pain. **Misc:** flu symptoms.

## Interactions
**Drug-Drug:** Concurrent use with **beta blockers** may mask hypoglycemia. **Alcohol**, combination with other **antidiabetics**, **NSAIDs**, **MAO inhibitors**, **nonselective beta blockers** may ↑ the risk of hypoglycemia. Hypoglycemic effects may be ↓ by **thiazide diuretics**, **corticosteroids**, **thyroid supplements**, or **sympathomimetic (adrenergic) agents**.
**Drug-Food:** Blood levels and effects are significantly ↓ when administered prior to a **liquid meal**.

## Route/Dosage
**PO (Adults):** 120 mg 3 times daily before meals; patients who are approaching glycemic control may be started at 60 mg 3 times daily.

## Availability (generic available)
**Tablets:** 60 mg, 120 mg.

# NURSING IMPLICATIONS

## Assessment
- Observe for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- ***Lab Test Considerations:*** Monitor serum glucose and $HbA_{1c}$ periodically during therapy to evaluate effectiveness.
- May cause ↑ uric acid levels.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated with administration of oral glucose. Severe hypoglycemia should be treated with IV D50W followed by continuous IV infusion of more dilute dextrose solution at a rate sufficient to keep serum glucose at approximately 100 mg/dL.

## Potential Nursing Diagnoses
Imbalanced nutrition: more than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

## Implementation
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** Administer 1–30 min prior to meals.
- May be administered concurrently with metformin, pioglitazone, or rosiglitazole.

## Patient/Family Teaching
- Instruct patient to take medication at same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not take if unable to eat.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.

- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified if significant changes occur.
- May occasionally cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid other medications, especially aspirin and alcohol, while on this therapy without consulting health care professional.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams.

## Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

# nebivolol (ne-bi-vi-lole)

Bystolic

***Classification***

Therapeutic: antihypertensives
Pharmacologic: beta blockers (selective)

**Pregnancy Category C**

## Indications

Hypertension (alone and with other antihypertensives).

## Action

Blocks stimulation of beta adrenergic receptor sites; selective for $beta_1$ (myocardial) receptors in most patients. In some patients (poor metabolizers, higher blood levels may result in some $beta_2$ [pulmonary, vascular, uterine] adrenergic) blockade. **Therapeutic Effects:** Lowering of blood pressure.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration.
**Distribution:** Unknown.
**Protein Binding:** 98%.
**Metabolism and Excretion:** Mostly metabolized by the liver, including the CYP2D6 enzyme system; some have antihypertensive action; minimal excretion of unchanged drug.
**Half-life:** *Extensive metabolizers*—12 hr; *poor metabolizers*—19 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1.5–4 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe bradycardia, heart block greater than first degree. cardiogenic shock, decompensated heart failure or sick sinus syndrome (without pacemaker); Severe hepatic impairment (Child-Pugh >B); Bronchospastic disease; OB: Lactation.
**Use Cautiously in:** Coronary artery disease (rapid cessation should be avoided); Compensated congestive heart failure; Major surgery (anesthesia may augment myocardial depression); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Moderate hepatic impairment (↓ metabolism); Severe renal impairment (↓ initial dose if CCr <30 mL/min); History of severe allergic reactions (↑ intensity of reactions); Pheochromocytoma (alpha blockers required prior to beta blockers); Geri: Consider increased sensitivity, concurrent chronic diseases, medications and presence of age-related decrease in clearance; OB: Use in pregnancy only if maternal benefit outweighs fetal risk; Pedi: Safe use in children <18 yr not established.

## Adverse Reactions/Side Effects

**CNS:** dizziness, fatigue, headache.

## Interactions

**Drug-Drug: Drugs that affect the CYP2D6 enzyme system** are expected to alter levels and possibly effects of nebivolol; dose alterations may be required. **Fluoxetine**, a known inhibitor of CYP2D6, ↑ levels and effects; similar effects may

be expected from **quinidine**, **propafenone**, and **paroxetine**. Blood levels are also ↑ by **cimetine**. **Anesthetic agents** including **ether**, **trichloroethylene**, and **cyclopropane** as well as **other myocardial depressants** or **inhibitors of AV conduction**, such as **diltiazem** and **verapamil** may ↑ risk of myocardial depression and bradycardia. Avoid concurrent use with **beta blockers**. Concurrent use with **reserpine** or **guanethidine** may excessively reduce sympathetic activity. If used concurrently with **clonidine**, nebivolol should be tapered and discontinued several days prior to gradual withdrawal of clonidine.

### Route/Dosage

**PO (Adults):** 5 mg once daily initially, may increase at 2 wk intervals up to 40 mg/day.

### Hepatic/Renal Impairment

**PO (Adults):** 2.5 mg once daily initially; titrate upward cautiously.

### Availability

**Tablets:** 2.5, 5 mg, 10 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, ECG, and pulse prior to and periodically during therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- ***Lab Test Considerations:*** May cause ↑ BUN, uric acid, triglycerides and ↓ HDL cholesterol and platelet court.

### Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)

### Implementation

- **PO:** May be administered without regard to food.
- When discontinuation is planned, observe patient carefully and advise to minimize physical activity. Taper over 1–2 wk when possible. If angina worsens or acute coronary insufficiency develops, reinstitute nebivolol promptly, at least temporarily.

### Patient/Family Teaching

- Instruct patient to take nebivolol as directed, at the same time each day, even if feeling well. If a dose is missed, skip missed dose and take next scheduled dose; do not double doses. Do not discontinue without consulting health care professional. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to ensure that enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in the wallet for emergencies.
- Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly and to report significant changes to health care professional.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of coffee, tea, and cola.
- May mask some signs of hypoglycemia, especially tachycardia. Diabetics should closely monitor blood sugar, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block dizziness or sweating as signs of hypoglycemia.
- May cause dizziness. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if difficulty breathing or signs and symptoms of worsening CHF (weight gain, increasing shortness or breath, excessive bradycardia) occur.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Advise female patients that breastfeeding should be avoided during nebivolol therapy.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.

## **nefazodone** (neff-**a**-zoe-done)

***Classification***

Therapeutic: antidepressants

**Pregnancy Category C**

## Indications
Major depression. **Unlabeled Use:** Panic disorder, post-traumatic stress disorder (PTSD).

## Action
Inhibits the reuptake of serotonin and norepinephrine by neurons. Antagonizes alpha$_1$-adrenergic receptors. **Therapeutic Effects:** Antidepressant action, which may develop only after several weeks.

## Pharmacokinetics
**Absorption:** Well absorbed but undergoes extensive and variable first-pass hepatic metabolism (bioavailability about 20%).
**Distribution:** Widely distributed; enters the CNS.
**Protein Binding:** ≥99%.
**Metabolism and Excretion:** Extensively metabolized. One metabolite (hydroxynefazodone) has antidepressant activity.
**Half-life:** *Nefazodone*—2–4 hr; *hydroxynefazodone*—1.5–4 hr.

TIME/ACTION PROFILE (antidepressant action)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | days–wk | several wk | unknown |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Concurrent MAO inhibitor therapy; Active liver disease or baseline elevated serum transaminases.
**Use Cautiously in:** May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; History of suicide attempt or drug abuse; Underlying cardiovascular or cerebrovascular disease; History of mania; OB: Safety no established; Lactation: Discontinue drug or bottle-feed; Pedi: Safety not established in children; suicide risk may be greater in children and adolescents ; Geri: Iinitiate therapy at lower doses.

## Adverse Reactions/Side Effects
**CNS:** dizziness, insomnia, somnolence, agitation, confusion, weakness. **EENT:** abnormal vision, blurred vision, eye pain, tinnitus. **Resp:** dyspnea. **CV:** bradycardia, hypotension. **GI:** HEPATIC FAILURE, HEPATOTOXICITY, constipation, dry mouth, nausea, gastroenteritis. **GU:** erectile dysfunction. **Derm:** rashes. **Hemat:** decreased hematocrit.

## Interactions
**Drug-Drug:** Serious, potentially fatal reactions may occur during concurrent use with **MAO inhibitors** (do not use concurrently or within 2 wk of MAO inhibitors; discontinue nefazodone at least 14 days before starting MAO inhibitor therapy). ↑ CNS depression with other CNS depressants including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. May ↑ blood levels and effects of **alprazolam** or **triazolam**. May increase serum **digoxin** levels. Additive hypotension may occur with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. May ↑ risk of myopathy with **HMG-CoA reductase inhibitors**. Decreased **antidepressant** action with concomitant use of **carbamazepine**. May reduce clearance of **haloperidol**, so **haloperidol** dose may need to be decreased.
**Drug-Natural Products:** ↑ risk of seritonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**. **Kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

## Route/Dosage
**PO (Adults):** 100 mg twice daily initially; may be increased weekly up to 600 mg/day in 2 divided doses.
**PO (Geriatric Patients):** 50 mg twice daily initially; may be increased weekly as tolerated.

## Availability (generic available)
**Tablets:** 50 mg, 100 mg, 150 mg, 200 mg, 250 mg.

# NURSING IMPLICATIONS

## Assessment
- Assess mental status (orientation, mood, behavior) frequently. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess suicidal tendencies, especially in early therapy. Restrict amount of drug available to patient.
- Monitor blood pressure and pulse before and periodically during therapy.
- Monitor liver function tests prior to and routinely during therapy. Obtain LFTs at first sign of hepatic dysfunction (nausea, vomiting, abdominal pain, fatigue, anorexia, dark urine).
- Assess for sexual dysfunction throughout treatment.
- ***Lab Test Considerations:*** May cause decrease in hematocrit and leukopenia.
- Monitor liver function periodically. If serum AST or ALT levels are >3 times the upper limit of normal discontinue nefazodone.
- May also cause hypercholesterolemia and hypoglycemia.

### Potential Nursing Diagnoses
Ineffective coping (Indications)
Risk for injury (Side Effects)

### Implementation
- Discontinue nefazodone prior to elective surgery to prevent potential interactions with general anesthesia.
- **PO:** Administer doses twice daily.

### Patient/Family Teaching
- Instruct patient to take medication as directed. Several weeks may be required to obtain a full antidepressant response. Once response is obtained, therapy should be continued for at least 6 mo. If a dose is missed, take as soon as possible unless almost time for next dose. Do not double doses.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Caution patient to avoid taking alcohol or other CNS depressant drugs during therapy and not to take other prescription, OTC medications, or herbal products without consulting health care professional.
- Advise patient to notify health care professional immediately if signs of liver dysfunction (jaundice, anorexia, GI complaints, malaise, dark urine) occur.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Instruct female patient to inform health care professional if pregnancy is planned or suspected or if breastfeeding.
- Instruct patient to notify health care professional of signs of allergy (rash, hives) or if agitation, blurred or other changes in vision, confusion, dizziness, unsteadiness, difficult or frequent urination, difficulty concentrating, or memory problems occur.
- Emphasize the importance of follow-up examinations to monitor progress. Encourage patient participation in psychotherapy.
- Refer to local support group.
- Inform patient that some side effects may go away with time.

### Evaluation/Desired Outcomes
- Increased sense of well-being.
- Renewed interest in surroundings. May require several weeks of therapy to obtain full response. Need for therapy should be periodically reassessed. Therapy is usually continued for 6 months or more.

**neomycin, See AMINOGLYCOSIDES.**

## neostigmine
(nee-oh-**stig**-meen)
Prostigmin

***Classification***
Therapeutic: antimyasthenics
Pharmacologic: cholinergics

**Pregnancy Category C**

### Indications
Improvement in muscle strength in symptomatic treatment of myasthenia gravis. Prevention and treatment of postoperative bladder distention and urinary retention or ileus. Reversal of nondepolarizing neuromuscular blockers.

### Action
Inhibits the breakdown of acetylcholine so that it accumulates and has a prolonged effect. Effects include miosis, increased intestinal and skeletal muscle tone, bronchial and ureteral constriction, bradycardia, increased salivation, lacrimation, and sweating. **Therapeutic Effects:** Improved muscular function in patients with myasthenia gravis, improved bladder-emptying in patients with urinary retention, or reversal of nondepolarizing neuromuscular blockers.

### Pharmacokinetics
**Absorption:** Poorly absorbed following oral administration, necessitating large oral doses compared with parenteral doses.
**Distribution:** Probably does not cross the placenta or enter breast milk.
**Metabolism and Excretion:** Metabolized by plasma cholinesterases and the liver.
**Half-life:** *PO, IV*—40–60 min; *IM*—50–90 min.

TIME/ACTION PROFILE (cholinergic effects, increased muscle tone)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 45–75 min | unknown | 2–4 hr |
| IM | 10–30 min | 20–30 min | 2–4 hr |
| IV | 10–30 min | 20–30 min | 2–4 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Mechanical obstruction of the GI or GU tract; Lactation: Lactation.

**Use Cautiously in:** History of asthma; Ulcer disease; Cardiovascular disease; Epilepsy; Hyperthyroidism; OB: May cause uterine irritability after IV administration near term; newborns may display muscle weakness.

### Adverse Reactions/Side Effects

**CNS:** SEIZURES, dizziness, weakness. **EENT:** lacrimation, miosis. **Resp:** bronchospasm, excess secretions. **CV:** bradycardia, hypotension. **GI:** abdominal cramps, diarrhea, excess salivation, nausea, vomiting. **Derm:** sweating, rash.

### Interactions

**Drug-Drug:** Action may be antagonized by **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**. Prolongs action of **depolarizing muscle-relaxing agents (succinylcholine, decamethonium)**.

### Route/Dosage

### Myasthenia Gravis

**PO (Adults):** 15 mg q 3–4 hr initially; ↑ at daily intervals until optimal response is achieved. Usual maintenance dose is 150 mg/day (up to 375 mg/day may be needed).
**PO (Children):** 2 mg/kg/day (60 mg/m²) in 6–8 divided doses.
**Subcut, IM (Adults):** 0.5 mg.
**Subcut, IM (Children):** 10–40 mcg/kg q 2–3 hr; may give with 10 mcg/kg atropine.

### Bladder Atony, Abdominal Distention: Prevention

**IM, Subcut (Adults):** 250 mcg q 4–6 hr for 2–3 days.

### Bladder Atony, Abdominal Distention: Treatment

**IM, Subcut (Adults):** 500 mcg as needed; may repeat q 3 hr for 5 doses after bladder has been emptied for bladder atony.

### Antidote for Nondepolarizing Neuromuscular Blockers

**IV (Adults):** 0.5–2 mg slowly; pretreat with 0.6–1.2 mg atropine IV (may be repeated to a total dose of 5 mg).
**IV (Children):** 40 mcg/kg with 20 mcg/kg atropine.

### Availability (generic available)

**Tablets:** 15 mg. **Injection:** 0.5 mg/mL, 1 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess pulse, respiratory rate, and blood pressure prior to administration. Report significant changes in heart rate.
- **Myasthenia Gravis:** Assess neuromuscular status, including vital capacity, ptosis, diplopia, chewing, swallowing, hand grasp, and gait, prior to administering and at peak effect. Patients with myasthenia gravis may be advised to keep a daily record of their condition and the effects of this medication.
- Assess patient for overdose and underdose or resistance. Both have similar symptoms (muscle weakness, dyspnea, dysphagia), but symptoms of overdose usually occur within 1 hr of administration, whereas underdose symptoms occur 3 or more hr after administration. Overdose (cholinergic crisis) symptoms may also include increased respiratory secretions and saliva, bradycardia, nausea, vomiting, cramping, diarrhea, and diaphoresis. A Tensilon test (edrophonium chloride) may be used to distinguish between overdose and underdose.
- **Postoperative Ileus:** Monitor abdominal status (assess for distention, auscultate bowel sounds). A rectal tube may be inserted to facilitate expulsion of flatus.
- **Postoperative Urinary Retention:** Assess for bladder distention. Monitor intake and output. If patient is unable to void within 1 hr of neostigmine administration, consider catheterization.
- **Antidote to Nondepolarizing Neuromuscular Blocking Agents:** Monitor reversal of effects of neuromuscular blocking agents with a peripheral nerve stimulator. Recovery usually occurs consecutively in the following muscles: diaphragm, intercostal muscles, muscles of the glottis, abdominal muscles, limb muscles, muscles of mastication, and levator muscles of the eyelids. Closely observe the patient for residual muscle weakness and respiratory distress throughout the recovery period. Maintain airway patency and ventilation until recovery of normal respiration occurs.
- ***Toxicity and Overdose:*** If overdose occurs, atropine is the antidote.

### Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Ineffective breathing pattern (Indications)

## Implementation

- Oral and parenteral doses are not interchangeable.
- When used as an antidote to nondepolarizing neuromuscular blocking agents, atropine may be used prior to or concurrently with neostigmine to prevent or treat bradycardia.
- **PO:** Administer with food or milk to minimize side effects. For patients who have difficulty chewing, neostigmine may be taken 30 min before meals.

### IV Administration

- **Direct IV:** Administer doses undiluted. May be given through Y-site of an IV of D5W, 0.9% NaCl, Ringer's solution, or LR. ***Concentration:*** 0.5–1 mg/mL. ***Rate:*** Administer each 0.5 mg over 1 min.
- **Syringe Compatibility:** glycopyrrolate, heparin, ondansetron, pentobarbital, thiopental.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

## Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Do not skip or double up on missed doses. Patients with a history of dysphagia should have a nonelectric or battery-operated backup alarm clock to remind them of exact dosage time. Patients with dysphagia may not be able to swallow the medication if the dose is not taken exactly on time. Taking the dose late may result in myasthenic crisis. Taking the dose early may result in cholinergic crisis. Patients with myasthenia gravis must continue this regimen as lifelong therapy.
- Instruct patient with myasthenia gravis to space activities to avoid fatigue.
- Advise patient to carry identification describing disease and medication regimen at all times.

## Evaluation/Desired Outcomes

- Relief of ptosis and diplopia.
- Improved chewing, swallowing, extremity strength, and breathing without the appearance of cholinergic symptoms in myasthenia gravis.
- Relief or prevention of postoperative gastrointestinal ileus.
- Relief of nonobstructive postoperative urinary retention.
- Reversal of nondepolarizing neuromuscular blocking agents in general anesthesia.

HIGH ALERT

# nesiritide (ne-**sir**-i-tide)

Natrecor

***Classification***

Therapeutic: none assigned

Pharmacologic: vasodilators (human B-type natriuretic peptide)

**Pregnancy Category C**

## Indications

Acutely decompensated CHF in hospitalized patients who have dyspnea at rest or with minimal activity; has been used with digoxin, diuretics, and ACE inhibitors. Should not be used for intermittent outpatient infusion, scheduled repetitive use, as a diuretic or to improve renal function.

## Action

Binds to guanyl cyclase receptors in vascular smooth muscle and endothelial cells, producing increased intracellular guanosine 3′5′-cyclic monophosphate (cGMP) and smooth muscle cell relaxation. cGMP acts as a "second messenger" to dilate veins and arteries. **Therapeutic Effects:** Dose-dependent reduction in pulmonary capillary wedge pressure (PCWP) and systemic arterial pressure in patients with heart failure with resultant decrease in dyspnea.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Cleared from circulation by binding to cell surface clearance receptors resulting in cellular internalization and proteolysis, proteolytic breakdown by endopeptidases, and renal filtration.
**Half-life:** 18 min.

TIME/ACTION PROFILE (effects on cardiovascular parameters)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 15 min | 1 hr | 60 min† |

†Longer with higher than recommended doses

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cardiogenic shock; Systolic blood pressure <90 mm Hg; Low cardiac filling pressure, significant valvular stenosis, restrictive/subtractive cardiomyopathy, constrictive pericarditis/cardiac tamponade, or other conditions in which cardiac output is dependent on venous return.
**Use Cautiously in:** Heart failure where renal function is dependent on activity of the renin/an-

giotensin/aldosterone system (may cause azotemia); Cardiogenic shock (should not be used as primary therapy); OB, Lactation, Pedi: Pregnancy, lactation, or children (safety not established); Geri: May have ↑ sensitivity to effects.

### Adverse Reactions/Side Effects

**CNS:** anxiety, confusion, dizziness, headache, hypotension (dose related), insomnia, drowsiness. **EENT:** amblyopia. **Resp:** APNEA, cough, hemoptysis. **CV:** hypotension, arrhythmias, bradycardia. **GI:** abdominal pain, nausea, vomiting. **GU:** ↑ creatinine, renal failure. **Derm:** itching, rash, sweating. **Hemat:** anemia. **Local:** injection site reactions. **MS:** back pain, leg cramps. **Neuro:** paresthesia, tremor. **Misc:** fever.

### Interactions

**Drug-Drug:** None reported.

### Route/Dosage

**IV (Adults):** 2 mcg/kg bolus followed by 0.01 mcg/kg/min as a continuous infusion. May ↑ by 0.005 mcg/kg/min every 3 hr up to a maximum infusion rate of 0.03 mcg/kg/min (based on response).

### Availability

**Powder for injection:** 1.5 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, pulse, ECG, respiratory rate, cardiac index, PCWP, and central venous pressure frequently during administration. May cause hypotension, especially in patients with a BP <100 mm Hg. Reduce dose or discontinue nesiritide if patient develops hypotension. Hypotension may cause renal compromise. Use IV fluids and changes in body position to support blood pressure if symptomatic hypotension occurs. Nesiritide may be restarted at a dose reduced by 30% with no bolus administration once patient is stabilized. Hypotension may be prolonged for hours, requiring a period of monitoring prior to restarting administration.
- Monitor intake and output and weigh daily. Assess for decrease in signs of CHF (dyspnea, rales/crackles, peripheral edema, weight gain).
- ***Lab Test Considerations:*** Monitor BUN and serum creatinine. May cause ↑ in serum creatinine; ↑ serum creatinine may be dose-related.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Activity intolerance (Indications)
Excess fluid volume (Indications)

### Implementation

- ***High Alert:*** Intravenous vasoactive medications have an increased potential for causing harm. Have second practitioner independently check original order, dose calculations, and infusion pump settings. Administer only in settings where blood pressure can be closely monitored.
- Prime the IV tubing with an infusion of 25 mL prior to connecting to the patient's vascular access port and prior to administering bolus or infusion. Flush catheter between administration of nesiritide and other medications. Do not administer through a central heparin-coated catheter as nesiritide binds to heparin. Concomitant administration of a heparin infusion through a separate catheter is acceptable.

#### IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute 1.5-mg vial of nesiritide by adding 5 mL of diluent removed from a pre-filled 250-mL plastic IV bag containing D5W, 0.9% NaCl, D5/0.45% NaCl, or D5/0.2% NaCl. Do not shake vial; rock gently so all surfaces including stopper are in contact with diluent to ensure complete reconstitution. Withdraw entire content of reconstituted vial and add back to 250-mL plastic IV bag. Invert IV bag several times to ensure complete mixing of solution. Infusion stable for 24 hr. After preparation of infusion bag, withdraw bolus volume from infusion bag. To calculate amount: bolus volume (mL) = 0.33 × patient weight (kg). ***Concentration:*** 6 mcg/mL. ***Rate:*** Administer bolus over 60 seconds through a port in the IV tubing.
- **Intermittent Infusion:** ***Diluent:*** See Diluent section under Direct IV section above for preparation instructions for infusion bag. Immediately follow bolus with infusion. ***Concentration:*** 6 mcg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** amiodarone, argatroban, digoxin, diltiazem, metoprolol, milrinone, nicardipine, nitroglycerin, nitroprusside, palonosetron, propranolol, tirofiban, torsemide, verapamil.

- **Y-Site Incompatibility:** bumetanide, daptomycin, enalaprilat, ethacrynic acid, furosemide, heparin, hydralazine, insulin, micafungin.

### Patient/Family Teaching

- Explain purpose of nesiritide to patient and family.

### Evaluation/Desired Outcomes

- Improvement in dyspnea and reduction in mean PCWP in patients with decompensated CHF.

## nevirapine (ne-**veer**-a-peen)

Viramune

***Classification***

Therapeutic: antiretrovirals
Pharmacologic: non-nucleoside reverse transcriptase inhibitors

**Pregnancy Category C**

### Indications

Management of HIV infection in combination with a nucleoside analogue.

### Action

Binds to the enzyme reverse transcriptase, which results in disruption of DNA synthesis. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae.

### Pharmacokinetics

**Absorption:** >90% absorbed after oral administration.
**Distribution:** Crosses placenta and enters breast milk; CSF levels are 45% of those in plasma.
**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A4 enzyme system); minor amounts excreted unchanged in urine.
**Half-life:** 25–30 hr (during multiple dosing).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 4 hr | 12 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent ketoconazole, rifampin, or St. John's wort; Moderate to severe hepatic impairment (Child-Pugh Class B or C); Women with CD4+ cell counts >250 cells/mm$^3$ (↑ risk of liver toxicity).
**Use Cautiously in:** Women (↑ risk of liver toxicity); Hepatic or renal impairment; Concurrent clarithromycin, fluconazole, methadone, or rifabutin (careful monitoring required; alternative therapy should be considered); OB, Lactation: Pedi: Safety not established; breastfeeding not recommended in HIV-infected patients.

### Adverse Reactions/Side Effects

Reflects combination therapy.
**CNS:** headache. **GI:** HEPATOTOXICITY, elevated liver enzyme levels, nausea, abdominal pain, diarrhea, hepatitis, ulcerative stomatitis. **Derm:** RASH (MAY PROGRESS TO TOXIC EPIDERMAL NECROLYSIS). **Hemat:** granulocytopenia (increased in children). **MS:** myalgia. **Neuro:** paresthesia, peripheral neuropathy. **Misc:** STEVENS-JOHNSON SYNDROME, fever.

### Interactions

**Drug-Drug:** Nevirapine induces the hepatic CYP3A4 enzyme system and can affect the behavior of drugs metabolized by this system. Significantly ↓ **ketoconazole** levels (concurrent use contraindicated). May induce **methadone** withdrawal within 2 weeks of starting therapy in patients physically dependent on methadone. May ↓ levels and effectiveness **hormonal contraceptives** (concurrent use of hormonal contraceptives should be avoided). **Rifampin** significantly ↓ levels and effectiveness of nevirapine (concurrent use contraindicated). ↓ Levels and effectiveness of **clarithromycin** (consider other agents). Also may ↓ levels and effectiveness of the following: **lopinavir**, **saquinavir**, **nelfnavir**, **indinavir**, **efavirenz**, **amiodarone**, **disopyramide**, **lidocaine**, **itraconazole**, **carbamazepine**, **clonazepam**, **ethosuximide**, **diltiazem**, **nifedipine**, **verapamil**, **cyclosporine**, **tacrolimus**, **sirolimus**, **cyclophosphamide**, **ergotamine fentanyl rifabutin** (use together only with careful monitoring). **Fluconazole** ↑ nevirapine levels and risk of toxicity. May ↑ risk of bleeding with **warfarin**. Use of **prednisone** during first 2 wk of therapy may ↑ risk of rash. Initiating other **drugs that often cause rash**, including **trimethoprim/sulfamethoxazole** and **abacavir** simultaneously with nevirapine may ↑ risk of rash.
**Drug-Natural Products: St. John's wort** may ↓ efficacy.

### Route/Dosage

**PO (Adults):** 200 mg daily for the first 2 wk, then 200 mg twice daily (in combination with a nucleoside analogue antiretroviral).
**PO (Children ≥15 days):** 150 mg/m$^2$ once daily for first 2 wk, then 150 mg/m$^2$ twice daily.

### Availability

**Tablets:** 200 mg. **Oral suspension:** 50 mg/5 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess for rash (mild to moderate rash = erythema or maculopapular rash; urticaria, pruritic raised rash with welts; constitutional symptoms—fever, blistering, oral erosive lesions, conjunctivitis, facial edema, myalgia, arthralgia), especially during 1st 6 wk of therapy. If rash is severe (extensive erythematous or maculopapular rash with moist desquamation or angioedema) or accompanied by systemic symptoms (serum sickness-like reaction, Stevens-Johnson syndrome, toxic epidermal necrolysis), therapy must be discontinued immediately. Prednisone and antihistamines are not effective in preventing or treating the rash. If mild to moderate rash occurs during 2 wk lead-in period, do not increase dose until rash resolves. If not resolved within 28 days, reconsider therapy.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- Monitor for liver function at baseline and frequently during the first 18 wk for toxicity, especially during first 6 wk of therapy. May be asymptomatic with ↑ AST and ALT without clinical signs or symptoms, or symptomatic with ↑ liver enzymes and at least one symptom (rash, flu-like symptoms, fever). May progress to liver failure and death. If signs of liver toxicity occur, permanently discontinue nevirapine.
- Assess patient for hepatitis B and C. Patients with HBV and/or HCV are at risk for liver toxicity.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- Do not confuse nevirapine (Viramune) with nelfinavir (Viracept).
- **PO:** May be administered with or without food.
- Shake oral solution prior to administration. Use an oral dosing syringe for amounts <5 mL. Rinse syringe or cup and readminister to ensure patient receives full dose.
- If therapy is interrupted for more than 7 days, restart therapy at 200 mg daily for 14 days, then increase dose to 200 mg twice daily.

### Patient/Family Teaching

- Emphasize the importance of taking nevirapine as directed, at evenly spaced times throughout day. Instruct patient to read the *Medication Guide* prior to initiating therapy and with each Rx refill. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Instruct patient not to share nevirapine with others.
- Advise patient to avoid taking other Rx, OTC, and herbal products without consulting health care professional.
- Inform patient that nevirapine does not cure AIDS or prevent associated or opportunistic infections. Nevirapine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of nevirapine are unknown at this time.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control during nevirapine therapy.
- Instruct patient to notify health care professional immediately if signs and symptoms of hepatitis (flu-like symptoms, tiredness, nausea, lack of appetite, yellow skin or eyes, dark urine, pale stools, pain or sensitivity to touch on right side below ribs), or skin reactions with symptoms (flu-like symptoms, fever, muscle aches, conjunctivitis, blisters, mouth sores, swelling of face, tiredness) occur. Nevirapine should be discontinued immediately.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

**niacin** (**nye**-a-sin)
Edur-Acin, Nia-Bid, Niac, Niacels, Niacor, Niaspan, Nicobid, Nico-400, Nicolar, Nicotinex, nicotinic acid, ✱Novo-Niacin, Slo-Niacin, vitamin B

**niacinamide** (nye-a-**sin**-a-mide)
nicotinamide

***Classification***
Therapeutic: lipid-lowering agents, vitamins
Pharmacologic: water soluble vitamins

**Pregnancy Category C**

## Indications
Treatment and prevention of niacin deficiency (pellagra). Adjunctive therapy in certain hyperlipidemias (niacin only).

## Action
Required as coenzymes (for lipid metabolism, glycogenolysis, and tissue respiration). Large doses decrease lipoprotein and triglyceride synthesis by inhibiting the release of free fatty acids from adipose tissue and decreasing hepatic lipoprotein synthesis (niacin only). Cause peripheral vasodilation in large doses (niacin only). **Therapeutic Effects:** Decreased blood lipids (niacin only). Supplementation in deficiency states.

## Pharmacokinetics
**Absorption:** Well absorbed following oral administration.
**Distribution:** Widely distributed following conversion to niacinamide. Enters breast milk.
**Metabolism and Excretion:** Amounts required for metabolic processes are converted to niacinamide. Large doses of niacin are excreted unchanged in the urine.
**Half-life:** 45 min.

TIME/ACTION PROFILE (effects on blood lipids)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (cholesterol) | several days | unknown | unknown |
| PO (triglycerides) | several hr | unknown | unknown |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to niacin; Some products may contain tartrazine and should be avoided in patients with known hypersensitivity; Alcohol intolerance (Nicotinex only).
**Use Cautiously in:** Liver disease; Arterial bleeding; History of peptic ulcer disease; Gout; Glaucoma; Diabetes mellitus.

## Adverse Reactions/Side Effects
Adverse reactions and side effects refer to doses used to treat hyperlipidemia.
**CNS:** dizziness, nervousness, panic. **EENT:** blurred vision, loss of central vision, proptosis, toxic amblyopia. **CV:** orthostatic hypotension. **GI:** HEPATOTOXICITY, GI upset, bloating, diarrhea, dry mouth, flatulence, heartburn, hunger pains, nausea, peptic ulceration. **Derm:** flushing of the face and neck, pruritus, burning, dry skin, hyperpigmentation, ↑ sebaceous gland activity, rashes, stinging or tingling of skin. **Metab:** glycosuria, hyperglycemia, hyperuricemia. **MS:** myalgia.

## Interactions
**Drug-Drug:** ↑ risk of myopathy with concurrent use of **HMG-CoA reductase inhibitors**. Additive hypotension with **antihypertensive agents**. Large doses may ↓ uricosuric effects of **probenecid**.

## Route/Dosage
**PO (Adults and Children):** *Dietary supplement*—10–20 mg/day. *Dietary deficiency*—Up to 500 mg/day in divided doses. *Hyperlipidemias–Niacin only*—100–500 mg/day initially; ↑ slowly up to 1–2 g tid (up to 8 g/day).
**PO (Children 7–10 yr):** *Prevention of deficiency*—13 mg/day.
**PO (Children 4–6 yr):** *Prevention of deficiency*—12 mg/day.
**PO (Children birth–3 yr):** *Prevention of deficiency*—5–9 mg/day.

## Availability
### Niacin (generic available)
**Tablets:** 25 mg$^{OTC}$, 50 mg$^{OTC}$, 100 mg$^{OTC}$, 125 mg$^{OTC}$, 250 mg$^{OTC}$, 400 mg$^{OTC}$, 500 mg$^{Rx, OTC}$. **Extended-release tablets:** 125 mg$^{Rx, OTC}$, 250 mg$^{Rx, OTC}$, 400 mg$^{OTC}$, 500 mg$^{Rx, OTC}$, 750 mg$^{Rx, OTC}$, 1000 mg$^{OTC}$. **Cost:** 500 mg $184.97/90, 750 mg $255.96/90, 1000 mg $331.97/90. **Extended-release capsules:** 125 mg$^{Rx, OTC}$, 250 mg$^{Rx, OTC}$, 300 mg$^{Rx, OTC}$, 400 mg$^{Rx, OTC}$, 500 mg$^{Rx, OTC}$. **Elixir:** 50 mg/5 mL in pints and gallons$^{OTC}$. ***In combination with:*** lovastatin (Advicor); simvastatin (Simcor). See Appendix B.

### Niacinamide (generic available)
**Tablets:** 50 mg$^{OTC}$, 100 mg$^{OTC}$, 125 mg$^{OTC}$, 250 mg$^{OTC}$, 500 mg$^{Rx, OTC}$.

# NURSING IMPLICATIONS

## Assessment
- **Vitamin Deficiency:** Assess patient for signs of niacin deficiency (*pellagra*—dermatitis, stomatitis, glossitis, anemia, nausea and vomit-

ing, confusion, memory loss, and delirium) prior to and periodically during therapy.
- **Hyperlipidemia:** Obtain a diet history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Monitor serum glucose and uric acid levels and hepatic function tests periodically during prolonged high-dose therapy. Notify health care professional if AST, ALT, or LDH becomes elevated. May ↑ prothrombin times and ↓ serum albumin.
- High-dose therapy may cause ↑ serum glucose and uric acid levels.
- When niacin is used as a lipid-lowering agent, serum cholesterol and triglyceride levels should be monitored prior to and periodically during therapy.

### Potential Nursing Diagnoses
Imbalanced nutrition: less than body requirements (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation
- Because of infrequency of single B-vitamin deficiencies, combinations are commonly administered.
- **PO:** Administer with meals or milk to minimize GI irritation.
- Timed-release tablets and capsules should be swallowed whole, without breaking, crushing, or chewing. Use calibrated measuring device to ensure accurate dose of solution.

### Patient/Family Teaching
- Inform patient that cutaneous flushing and a sensation of warmth, especially in the face, neck, and ears; itching or tingling; and headache may occur within the first 2 hr after taking the drug. These effects are usually transient and subside with continued therapy. If flushing is distressing or persistent, aspirin 300 mg given 30 min before each dose or slow upward titration of dose may decrease flushing.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patients taking long-term OTC extended-release niacin to report signs of hepatotoxicity (darkening of urine, light gray–colored stool, loss of appetite, severe stomach pain, yellow eyes or skin) to health care professional.
- Emphasize the importance of follow-up examinations to evaluate progress.
- **Vitamin Deficiency:** Encourage patient to comply with dietary recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups.
- Foods high in niacin include meats, eggs, milk, and dairy products; little is lost during ordinary cooking.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects.
- **Hyperlipidemia:** Advise patient that this medication should be used in conjunction with dietary restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.

### Evaluation/Desired Outcomes
- Prevention and treatment of niacin deficiency.
- Decrease in serum cholesterol and triglyceride levels.

## niCARdipine (nye-**kar**-di-peen)
Cardene, Cardene SR, Cardene IV

***Classification***
Therapeutic: antianginals, antihypertensives
Pharmacologic: calcium channel blockers

**Pregnancy Category C**

### Indications
Management of: Hypertension, Angina pectoris, Vasospastic (Prinzmetal's) angina.

### Action
Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased blood pressure. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina.

### Pharmacokinetics
**Absorption:** Well absorbed following oral administration but extensively metabolized, resulting in ↓ bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver; ≤10% excreted unchanged by kidneys.
**Half-life:** 2–4 hr.

TIME/ACTION PROFILE (cardiovascular effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 20 min | 0.5–2 hr | 8 hr |
| PO-ER | unknown | unknown | 12 hr |
| IV | within min | 45 min | 50 hr† |

†Following discontinuation

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); SBP <90 mm Hg; Advanced aortic stenosis.

**Use Cautiously in:** Severe hepatic impairment (dose ↓ recommended); Severe renal impairment (dose ↓ may be necessary); History of serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Safety not established; Geri: Dose ↓/slower IV infusion rates recommended due to ↑ risk of hypotension.

## Adverse Reactions/Side Effects

**CNS:** abnormal dreams, anxiety, confusion, dizziness, drowsiness, headache, jitteriness, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea, shortness of breath. **CV:** ARRHYTHMIAS, CHF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** ↑ liver function tests, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** dermatitis, erythema multiforme, flushing, ↑ sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

## Interactions

**Drug-Drug:** Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF. **Cimetidine** and **propranolol** may ↓ metabolism and ↑ risk of toxicity. May ↓ the metabolism of and ↑ risk of toxicity from **cyclosporine**, **prazosin**, **quinidine**, or **carbamazepine**.

**Drug-Food: Grapefruit and Grapefruit juice** ↑ serum levels and effect.

## Route/Dosage

**PO (Adults):** 20 mg 3 times daily, may ↑ q 3 days (range 20–40 mg 3 times daily); or 30 mg twice daily as sustained-release form (up to 60 mg twice daily).

**IV (Adults):** *To replace PO use* —0.5–2.2 mg/hr continuous infusion. *For acute hypertensive episodes*—5 mg/hr titrated as needed (up to 15 mg/hr).

## Availability (generic available)

**Capsules:** 20 mg, 30 mg. **Sustained-release capsules:** 30 mg, 45 mg, 60 mg. **Injection:** 2.5 mg/mL. **Premixed infusion:** 20 mg/200 mL D5W or 0.9% NaCl, 40 mg/200 mL D5W or 0.9% NaCl.

# NURSING IMPLICATIONS

## Assessment

- Monitor blood pressure and pulse prior to therapy, during dose titration, and periodically throughout therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ risk of arrhythmias; should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. Several days of therapy may cause ↑ hepatic enzymes, which return to normal upon discontinuation of therapy.

## Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Acute pain (Indications)

## Implementation

- Do not confuse nicardipine with nifedipine or nimodipine. Do not confuse Cardene (nicardipine) with Cardura (doxazosin), codeine, or Cardizem (diltiazem).
- To transfer from IV nicardipine infusion to oral therapy with other antihypertensive, start oral therapy simultaneously with discontinuation of nicardipine infusion. If transferring to oral nicardipine therapy, administer first dose of a 3-

times-a-day regimen 1 hr prior to discontinuation of infusion.
- Dose adjustments of nicardipine should be made no more frequently than every 3 days.
- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Do not open, break, crush, or chew sustained-release capsules.

### IV Administration

- **Continuous Infusion:** ***Diluent:*** Dilute each 25-mg ampule with 240 mL of D5W, D5/0.45% NaCl, D5/0.9% NaCl, 0.45% NaCl, or 0.9% NaCl. Infusion is stable for 24 hr at room temperature. ***Concentration:*** 0.1 mg/mL. ***Rate:*** Titrate rate according to blood pressure response. Administer through large peripheral veins or central veins to reduce risk of venous thrombosis, phlebitis, local irritation, swelling, extravasation, and vascular impairment. Change infusion site every 12 hours to minimize risk of peripheral venous irritation.
- **Y-Site Compatibility:** amikacin, aminophylline, aztreonam, bivalirudin, butorphanol, calcium gluconate, carboplatin, caspofungin, cefazolin, ceftizoxime, chloramphenicol, cimetidine, cisplatin, clindamycin, cytarabine, daptomycin, dexmedetomidine, diltiazem, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, enalaprilat, epinephrine, epirubicin, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, gentamicin, hydrocortisone sodium succinate, hydromorphone, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, mechlorethamine, methylprednisolone sodium succinate, metronidazole, midazolam, milrinone, morphine, nafcillin, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, palonosetron, penicillin G potassium, potassium chloride, potassium phosphate, quinupristin/dalfopristin, ranitidine, rocuronium, tacrolimus, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vincristine, voriconazole.
- **Y-Site Incompatibility:** amphotericin B liposome, ampicillin, ampicillin/sulbactam, cefepime, cefoperazone, ertapenem, fluorouracil, furosemide, methotrexate, micafungin, pantoprazole, pemetrexed, thiopental, thiotepa, tigecycline.

### Patient/Family Teaching

- Advise patient to take medication exactly as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Instruct patient on technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and to use sunscreen to prevent photosensitivity reactions.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath; or if persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional prior to exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes to health care professional.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

## NICOTINE (nik-o-teen)

**nicotine chewing gum**
Nicorette, Thrive

**nicotine inhaler**
Nicotrol Inhaler

**nicotine lozenge**
Commit

**nicotine nasal spray**
Nicotrol NS

**nicotine transdermal**
Nicoderm CQ

***Classification***
Therapeutic: smoking deterrents

**Pregnancy Category D**

### Indications

Adjunct therapy (with behavior modification) in the management of nicotine withdrawal in patients desiring to give up cigarette smoking.

### Action

Provides a source of nicotine during controlled withdrawal from cigarette smoking. **Therapeutic Effects:** Lessened sequelae of nicotine withdrawal (irritability, insomnia, somnolence, headache, and increased appetite).

### Pharmacokinetics

**Absorption:** *Gum, lozenge*—Slowly absorbed from buccal mucosa during chewing/sucking. *Inhaler*—50% of dose is systemically absorbed; most of nicotine released from inhaler is deposited in the mouth; absorption from buccal mucosa is slow,. *Nasal spray*—53% absorbed from nasal mucosa. *Transdermal*—70% of nicotine released from the system is absorbed through the skin.
**Distribution:** Enter breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver. Small amounts are metabolized by kidneys and lungs; 10–20% excreted unchanged by kidneys.
**Half-life:** 1–2 hr.

TIME/ACTION PROFILE (nicotine blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| gum | rapid | 15–30 min | unknown |
| inhaler | slow | within 15 min | unknown |
| lozenge | unknown | unknown | unknown |
| nasal spray | rapid | 4–15 min | unknown |
| transdermal | rapid | 2–4 hr | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Recent history of MI (inhaler or nasal spray); Arrhythmias (inhaler or nasal spray); Severe or worsening angina (inhaler or nasal spray); Severe cardiovascular disease; OB: Effects on fetus unknown; spontaneous abortion has been reported. Encourage behavioral approaches to smoking cessation. Lactation: Excreted in breast milk; weigh risks of nicotine product use against risk of continued smoking. Pedi: Safety not established.
**Use Cautiously in:** Cardiovascular disease including hypertension; Recent history of MI (gum, lozenge, patch); Arrhythmias (gum, lozenge, patch); Severe or worsening angina (gum, lozenge, patch); Diabetes mellitus; Pheochromocytoma; Peripheral vascular diseases; Hyperthyroidism; Diabetes; Continued smoking; Peptic ulcer disease; Hepatic disease; Bronchospastic lung disease (inhaler or nasal spray); Geri: Begin at lower dosages.

### Adverse Reactions/Side Effects

**CNS:** headache, insomnia, abnormal dreams, dizziness, drowsiness, impaired concentration, nervousness, weakness. **EENT:** sinusitis; *gum*, pharyngitis; *nasal spray*, nasopharyngeal irritation, sneezing, watering eyes, change in smell, earache, epistaxis, eye irritation, hoarseness; *inhaler*, local mouth/throat irritation. **Resp:** *Nasal spray, inhaler*—cough, dyspnea. **CV:** tachycardia, chest pain, hypertension. **GI:** abdominal pain, abnormal taste, constipation, diarrhea, dry mouth, dyspepsia, hiccups, nausea, vomiting; *gum*, belching, ↑ appetite, ↑ salivation, oral injury, sore mouth. **Derm:** *transdermal*—burning at patch site, erythema, pruritus, cutaneous hypersensitivity, rash, sweating. **Endo:** dysmenorrhea. **MS:** arthralgia, back pain, myalgia; *gum*, jaw muscle ache. **Neuro:** paresthesia. **Misc:** allergy.

### Interactions

**Drug-Drug:** Effects of **acetaminophen**, **caffeine**, **imipramine**, **insulin**, **oxazepam**, **pentazocine**, **propranolol**, or other **beta blockers**, **adrenergic antagonists** (**prazosin**, **labetalol**), and **theophylline** may be ↑ during

smoking cessation because of ↓ metabolism; dose ↓ at cessation may be necessary. Doses of adrenergic agonists (e.g., **isoproterenol**, **phenylephrine**) may need to be ↑ because of lower levels of circulating catecholamines at cessation of smoking. Concurrent treatment with **bupropion** may cause treatment-emergent hypertension.

### Route/Dosage

**Gum (Adults):** If patient smokes < 25 cigarettes/day start with 2 mg gum, if patient smokes ≥ 25 cigarettes/day start with 4 mg gum; Patients should chew one piece of gum every 1–2 hr for 6 wk, then one piece of gum every 2–4 hr for 2 wk, then one piece of gum every 4–8 hr for 2 wk, then discontinue. Should not exceed 24 pieces of gum/day.

**Lozenge (Adults):** If first cigarette is desired > 30 min after awakening, start with 2 mg lozenge, if first cigarette is desired < 30 min after awakening, start with 4 mg lozenge. Patients should use one lozenge every 1–2 hr for 6 wk, then one lozenge every 2–4 hr for 2 wk, then one lozenge every 4–8 hr for 2 wk, then discontinue. Should not exceed 20 lozenges/day or more than 5 lozenges in 6 hr.

**Intranasal (Adults):** One spray in each nostril 1–2 times/hr (up to 5 times/hr); may be ↑ up to maximum of 40 times/day (should not exceed 3 mo of therapy).

**Inhaln (Adults):** Patients are encouraged to use at least 6 cartridges/day for first 3–6 wk, with additional cartridges as necessary (up to 16/day) for 12 wk. Patients are self-titrated to level of nicotine they require (usual usage 6–16 cartridges/day) followed by gradual withdrawal over 6–12 wk (maximum duration of use = 6 mo).

**Transdermal (Adults):** *Patients smoking >10 cigarettes/day*—Begin with Step 1 (21 mg/day) for 6 wk, followed by Step 2 (14 mg/day) for 2 wk, and then Step 3 (7 mg/day) for 2 wk, then stop (total of 10 wk) (new patch should be applied every 24 hr); *Patients smoking ≤10 cigarettes/day*—Begin with Step 2 (14 mg/day) for 6 wk, followed by Step 3 (7 mg/day) for 2 wk, then stop (total of 8 wk) (new patch should be applied every 24 hr).

### Availability (generic available)

**Chewing gum (cinnamon, mint, orange, and fruit chill flavors):** 2 mg[OTC], 4 mg[OTC]. **Inhalation:** each system contains 168 cartridges, each containing 10 mg of nicotine (deliver 4 mg). **Lozenge (original, mint, cherry, and cappuccino flavors):** 2 mg[OTC], 4 mg[OTC]. **Nasal spray:** 10 mg/mL (0.5 mg/spray) in 10-mL bottles (200 sprays). **Transdermal patch:** 7 mg/day[OTC], 14 mg/day[OTC], 21 mg/day[OTC].

## NURSING IMPLICATIONS

### Assessment

- Prior to therapy, assess smoking history (number of cigarettes smoked daily, smoking patterns, nicotine content of preferred brand, degree to which patient inhales smoke).
- Assess patient for symptoms of smoking withdrawal (irritability, drowsiness, fatigue, headache, nicotine craving) periodically during nicotine replacement therapy (NRT).
- Evaluate progress in smoking cessation periodically during therapy.
- ***Toxicity and Overdose:*** Monitor for nausea, vomiting, diarrhea, increased salivation, abdominal pain, headache, dizziness, auditory and visual disturbances, weakness, dyspnea, hypotension, and irregular pulse.

### Potential Nursing Diagnoses

Ineffective coping (Indications)

### Implementation

- **Gum:** Protect gum from light; exposure to light causes gum to turn brown.
- **Lozenge:** Lozenge should be allowed to dissolve slowly in the mouth; it should not be chewed or swallowed.
- **Transdermal:** Patch can be worn for 16 or 24 hr; the patch can be removed before the patient goes to bed (especially if patient has vivid dreams or sleep distrubances) or can remain on while the patient sleeps (especially if patient craves cigarettes upon awakening).
- **Nasal Spray and Inhaler:** Regular use of the spray or inhaler during the first week of therapy may help patient adjust to irritant effects of the spray.

### Patient/Family Teaching

- Explain to patient the necessity of immediate cessation of smoking upon initiation and throughout therapy.
- Encourage patient to participate in a smoking cessation program while using this product.
- Review the patient instruction sheet enclosed in the package.
- Instruct patient in proper method of disposal of unit. Emphasize need to keep out of the reach of children or pets.

- Nicotine in any form can be harmful to a pregnant woman and/or the fetus. Assist patient in determining risk/benefit of nicotine replacement therapy (NRT) and harm to the fetus versus the likelihood of stopping smoking without NRT.
- Emphasize the importance of regular visits to health care professional to monitor progress of smoking cessation.
- **Gum:** Explain purpose of nicotine gum to patient. The patient should chew 1 piece of gum whenever a craving for nicotine occurs or according to a fixed schedule (every 1–2 hr while awake) as directed. The gum should be chewed slowly until a tingling sensation is felt (about 15 chews). Then, patient should stop chewing and store the gum between the cheek and gums until the tingling sensation disappears (about 1 min). The process of stopping, then resuming chewing should be repeated for approximately 30 min until most of the tingle has disappeared. Rapid, vigorous chewing may result in side effects similar to those of smoking too many cigarettes (headache, dizziness, nausea, increased salivation, heartburn, and hiccups).
- Inform patient that the gum has a slight tobacco/pepper-like taste. Many patients initially find it unpleasant and slightly irritating to the mouth. This usually resolves after several days of therapy.
- Advise patient to carry gum at all times during therapy.
- Advise patient to avoid eating or drinking for 15 min before and during chewing of nicotine gum; these interfere with buccal absorption of nicotine.
- The gum usually can be chewed by denture wearers. Contact dentist if the gum adheres to bridgework.
- Inform patient that they should stop using the gum at the end of 12 wk; if they still feel the need to use the gum after this time period, advise them to contact a health care professional.
- Instruct patient not to swallow gum.
- Dispose of the gum by wrapping in wrapper to prevent ingestion by children and animals. Call the poison control center, emergency department, or health care professional immediately if a child ingests the gum.
- Emphasize the need to discontinue the gum and to inform health care professional if pregnancy occurs.
- **Transdermal:** Instruct patient in application and use of patch. Apply patch at the same time each day. Keep patch in sealed pouch until ready to apply. Apply to clean, dry skin of upper arm or torso free of oil, hair, scars, cuts, burns, or irritation. Press patch firmly in place with palm for 10 sec, making sure there is good contact, especially around the edges. Keep patch in place during showering, bathing, or swimming; replace patches that have fallen off. Wash hands with soap and water after handling patches. Do not trim or cut patch. No more than 1 patch should be worn at a time. Alternate application sites. Dispose of used patches by folding adhesive sides together and replacing in protective pouch or aluminum foil; keep out of reach of children.
- Advise patient that redness, itching, and burning at application site usually subside within 1 hr. Instruct patient to notify health care professional and not apply new patch if signs of allergic reaction (urticaria, generalized rash, hives) or persistent local skin reactions (severe erythema, pruritus, edema) occur.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **Nasal Spray:** Instruct patient in proper use of spray. Tilt head back slightly. Do not sniff, swallow, or inhale through nose as spray is being administered. Patients who have successfully stopped smoking should continue to use the same dose for up to 8 wk, after which the spray should be discontinued over the next 4–6 wk.
- Discontinue nasal spray by using ½ dose (1 spray at a time), using the spray less frequently, skipping a dose by not using every hour, or setting a planned stop date for use of the spray.
- Treatment should be discontinued in patients who are unable to stop smoking by the 4th wk of therapy (patient is unlikely to quit on that attempt).
- Patients who fail to stop smoking should be given a therapy holiday before another attempt.
- Instruct patient to replace childproof cap after using and before disposal.
- **Inhalation:** Inhalation regimens should consist of frequent, continuous puffing for 20 minutes.
- Treatment should be discontinued in patients who are unable to stop smoking by the 4th wk of therapy (patient is unlikely to quit on that attempt).

- Patients who fail to stop smoking should be given a therapy holiday before another attempt.
- **Lozenge:** Instruct patient to place lozenge in mouth and allow it to slowly dissolve (20–30 min). Minimize swallowing; advise patient not to chew or swallow lozenge. May cause a warm tingling sensation in mouth. Advise patient to occasionally move lozenge from side to side of mouth until completely dissolved. Instruct patient not to eat or drink 15 min before or while lozenge is in mouth. For best chances of quitting, use at least 9 lozenges/day during 1st 6 wk. Do not use more than 1 lozenge at a time or use continuously one after the another. Lozenge should not be used after 12 wk without consulting health care professional.

### Evaluation/Desired Outcomes

- Lessened sequelae of nicotine withdrawal (irritability, insomnia, somnolence, headache, and increased appetite) during smoking cessation.

## NIFEdipine (nye-fed-i-peen)

Adalat CC, Adalat PA, Adalat XL, Afeditab CR, Apo-Nifed, Nifedical XL, Novo-Nifedin, Nu-Nifed, Procardia, Procardia XL

***Classification***

Therapeutic: antianginals, antihypertensives
Pharmacologic: calcium channel blockers

**Pregnancy Category C**

### Indications

Management of: Hypertension (extended-release only), Angina pectoris, Vasospastic (Prinzmetal's) angina. **Unlabeled Use:** Prevention of migraine headache. Management of CHF or cardiomyopathy.

### Action

Inhibits calcium transport into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation, resulting in decreased blood pressure. Coronary vasodilation, resulting in decreased frequency and severity of attacks of angina.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration, but large amounts are rapidly metabolized (primarily by CYP3A4 enzyme system), resulting in ↓ bioavailability (45–70%); bioavailability is ↑ (80%) with long-acting (CC, PA, XL) forms.
**Distribution:** Unknown.
**Protein Binding:** 92–98%.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 2–5 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 20 min | unknown | 6–8 hr |
| PO–PA | unknown | 4 hr | 12 hr |
| PO–CC, PA, XL | unknown | 6 hr | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Systolic blood pressure <90 mm Hg; Coadministration with grapefruit juice.
**Use Cautiously in:** Severe hepatic impairment (↓ dose recommended); History of porphyria; Severe renal impairment (↓ dose may be necessary); History of serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Safety not established; Geri: Short-acting forms appear on Beers list due to ↑ risk of hypotension and constipation (↓ dose recommended); also associated with ↑ incidence of falls.

### Adverse Reactions/Side Effects

**CNS:** headache, abnormal dreams, anxiety, confusion, dizziness, drowsiness, jitteriness, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea, shortness of breath. **CV:** ARRHYTHMIAS, CHF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** ↑ liver function tests, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** flushing, dermatitis, erythema multiforme, ↑ sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

### Interactions

**Drug-Drug:** Additive hypotension may occur when used concurrently with **fentanyl**, other **anti-**

**hypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. May ↑ serum levels and risk of toxicity from **digoxin**. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF. **Cimetidine** and **propranolol** may ↓ metabolism and ↑ risk of toxicity. May ↓ metabolism of and ↑ risk of toxicity from **cyclosporine**, **prazosin**, **quinidine**, or **carbamazepine**.
**Drug-Food: Grapefruit** and **grapefruit juice** ↑ serum levels and effect.

### Route/Dosage

**PO (Adults):** 10–30 mg 3 times daily (not to exceed 180 mg/day), *or* 10–20 mg twice daily as immediate—release form, *or* 30–90 mg once daily as sustained-release (CC, XL) form (not to exceed 90–120 mg/day).

### Availability (generic available)

**Capsules:** 5 mg, 10 mg, 20 mg. **Cost:** *Generic*—10 mg $62.99/90, 20 mg $104.97/90.
**Tablets:** 10 mg. **Extended-release tablets, (Adalat CC, Afeditab CR, Nifedical XL, Procardia XL):** 10 mg, 20 mg, 30 mg, 60 mg, 90 mg. **Cost:** *Generic*—30 mg $94.00/90, 60 mg $164.99/90, 90 mg $174.99/90.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse before therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Geri: Assess fall risk and institute fall prevention strategies.
- Patients receiving digoxin concurrently with nifedipine should have routine tests of serum digoxin levels and be monitored for signs and symptoms of digoxin toxicity.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia increases risk of arrhythmias; should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. Several days of therapy may cause increase in hepatic enzymes, which return to normal upon discontinuation of therapy.
- Nifedipine may cause positive ANA and direct Coombs' test results.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Acute pain (Indications)

### Implementation

- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Do not open, break, crush, or chew extended-release tablets. Empty tablets that appear in stool are not significant.
- Avoid administration with grapefruit juice.
- Sublingual use is not recommended due to serious adverse drug reactions.

### Patient/Family Teaching

- Advise patient to take medication exactly as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Instruct patient on technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Geri: Teach patients and family about risk for falls and how to reduce risk in the home.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to avoid concurrent use of alcohol or OTC medications and natural/herbal products, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.

- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and use SL nitroglycerin as needed for anginal attacks.
- Inform patient that anginal attacks may occur 30 min after administration because of reflex tachycardia. This is usually temporary and is not an indication for discontinuation.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath occurs; or if persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes to health care professional.

## Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

# nilotinib (ni-lo-ti-nib)

Tasigna

***Classification***

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors, kinase inhibitors

**Pregnancy Category D**

## Indications

Chronic or accelerated phase Philadelphia chromosome positive (Ph+) chronic myelogenous leukemia (CML) which has not responded to other treatment, including imatinib.

## Action

Inhibits kinases which may be produced by malignant cell lines. **Therapeutic Effects:** Inhibits production of malignant cells lines with decreased proliferation of leukemic cells.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration. Blood levels are significantly increased by food.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver; metabolites are not active.
**Half-life:** 17 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 3 hr | 12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypokalemia or hypomagnesemia; Long QT syndrome; Concurrent use of medications known to prolong QT interval; Concurrent use of strong inhibitors of the CYP3A4 enzyme system (↑ risk of toxicity); Concurrent use of strong inducers of the CYP3A4 enzyme system (may ↓ effectiveness); Concurrent grapefruit juice (may ↑ risk of toxicity); Galactose intolerance, severe lactase deficiency or glucose-galactose malabsorption (capsules contain lactose); OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Concurrent use of other drugs that prolong QT interval; Electrolyte abnormalities; correct prior to administration to ↓ risk of arrhythmias; Hepatic impairment (↓ dose required for Grade 3 elevated bilirubin, transaminases or lipase); OB: Women with child-bearing potential (effective contraception required); Pedi: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** fatigue, headache, dizziness. **EENT:** vertigo. **CV:** ARRHYTHMIAS, hypertension, palpitations, QT prolongation. **GI:** constipation, diarrhea, nausea, vomiting, abdominal discomfort, anorexia, dyspepsia, flatulence, hepatotoxicity. **Derm:** pruritus, rash, alopecia, flushing. **F and E:** hyperkalemia, hypocalcemia, hypokalemia, hyponatremia, hypophosphatemia. **Hemat:** MYELOSUPRESSION. **Metab:** ↑ lipase, hyperglycemia. **MS:** musculoskeletal pain. **Neuro:** paresthesia. **Misc:** fever, night sweats.

## Interactions

**Drug-Drug:** Strong **inhibitors of the CYP3A4 enzyme system** including **ketoconazole**, **itraconaole**, **voriconazole**, **clarithromycin**, **telithromycin**, **atazanavir**, **indinavir**, **nelfinavir**,

**indinavir**, **ritonavir**, **saquinavir**, and **nefazodone** may result in ↑ blood levels and toxicity and should be avoided; if concurrent use in necessary, dose ↓ by 50% (400 mg once daily) may be required. Strong **inducers of the CYP3A4 enzyme system** including **carbamazepine**, **dexamethasone**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampin**, and **rifapentin** may ↓ blood levels and effectiveness and should be avoided if possible; if required, dose ↑ may be necessary. Nilotinib inhibits the following enzyme systems: **CYP3A4**, **CYP2C8**, **CYP2C9**, and **CYP2D6**; concurrent use of drugs metabolized by these systems may result in toxicity of these agents. Nilotinib induces the following enzyme systems: **CYP2D6**, **CYP2C8**, **CYP2C9**; concurrent use of drugs metabolized by these systems may result ↓ therapeutic effectiveness of these agents. Concurrent use of other **drugs that prolong QT interval**; may ↑ risk of serious arrhythmias; avoid concomitant use.
**Drug-Natural Products: St. John's wort** may ↓ levels and effectiveness; avoid concurrent use.
**Drug-Food: Grapefruit juice** may ↑ blood levels and should be avoided.

### Route/Dosage
**PO (Adults):** 400 mg twice daily; adjustment may be required for toxicity and/or drug interactions.

### Availability
**Capsules:** 200 mg.

## NURSING IMPLICATIONS

### Assessment
- Monitor ECG to assess the QTc interval at baseline, 7 days after initiation of therapy, and periodically thereafter. For ECGs with QTc >480 msec, withhold nilotinib and check serum potassium and magnesium. If below lower limit of normal, correct to normal with supplements. Review concommitant medications for effects on electrolytes. If QTc returns to <450 msec and within 20 msec of baseline within 2 wk, return ot prior dose. If QTc is <480 msec and >450 msec after 2 wk, reduce nilotinib dose to 400 mg once daily. Following dose reduction to 400 mg once daily, if QTc return to >480 msec, discontinue nilotinib. Repeat ECG approximately 7 days after any dose adjustment.
- Monitor for myelosuppression. Assess for bleeding (bleeding gums, bruising, petechiae, blood in stools, urine, emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for at least 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for fatigue, dyspnea, and othrostatic hypotension.
- ***Lab Test Considerations:*** Monitor serum electrolytes prior to and periodically during therapy. May cause hypokalemia, hypomagnesemia, hypophosphatemia, hyperkalemia, hypocalcemia, hyperglycemia, and hyponatremia.
- Monitor CBC every 2 wk for first 2 mo and monthly thereafter or as indicated. May cause Grade 3/4 thrombocytopenia, neutropenia, and anemia. If ANC is $<1.0 \times 10^9$/L and/or platelet counts $<50 \times 10^9$/L, stop nilotinib and monitor blood counts. Resume within 2 wk at prior dose if ANC $>1.0 \times 10^9$/L and platelets $>50 \times 10^9$/L. If blood counts remain low for >2 wk, reduce dose to 400 mg once daily. Myelosuppression is generally reversible.
- May cause ↑ serum lipase or amylase. If ↑ to ≥Grade 3, withhold nilotinib and monitor serum levels. Resume treatment at 400 mg once daily if serum lipase or amylase return to ≤Grade 1.
- May cause ↑ serum bilirubin. If ↑ to ≥Grade 3, withhold nilotinib and monitor bilirubin. Resume treatment at 400 mg once daily if serum lipase or amylase return to ≤Grade 1.
- May cause ↑ serum hepatic tranaminases. If ↑ to ≥Grade 3, withhold nilotinib and monitor serum ALT, AST, and alkaline phosphatase. Resume treatment at 400 mg once daily if serum lipase or amylase return to ≤Grade 1.

### Potential Nursing Diagnoses
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation
- Correct hypokalemia and hypomagnesemia prior to beginning therapy.
- **PO:** Administer twice daily at 12-hr intervals on an empty stomach, at least 2 hr before and 1 hr after food. Capsule should be swallowed whole with water; do not open capsule.

### Patient/Family Teaching
- Instruct patient to take nilotinib as directed, approximately 12 hr apart. If a dose is missed, skip dose and resume taking next prescribed dose. Advise patients to avoid grapefruit products during therapy. Nilotinib is a long-term treatment; do not stop medication or change dose without consulting health care professional. Advise patient to read the *Medication Guide* before starting and with each Rx refill.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

- Advise patient to consult health care professional before taking any Rx, OTC, herbal, or vitamin products, especially St. John's wort, during therapy.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficulty urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patients to use a soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate bleeding.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Advise women of childbearing potential to use effective contraception during therapy.

### Evaluation/Desired Outcomes

- Decrease in production of leukemic cells.

## nimodipine (nye-**moe**-di-peen)

***Classification***

Therapeutic: subarachnoid hemorrhage therapy agents

Pharmacologic: calcium channel blockers

**Pregnancy Category C**

### Indications

Management of subarachnoid hemorrhage.

### Action

Inhibits the transport of calcium into vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. Potent peripheral vasodilator. **Therapeutic Effects:** Prevention of vascular spasm after subarachnoid hemorrhage, resulting in decreased neurologic impairment.

### Pharmacokinetics

**Absorption:** Well absorbed following oral administration but extensively metabolized, resulting in ↓ bioavailability.
**Distribution:** Crosses the blood-brain barrier; remainder of distribution unknown.
**Protein Binding:** >95%.
**Metabolism and Excretion:** Mostly metabolized by the liver; ≤10% excreted unchanged by kidneys.
**Half-life:** 1–2 hr.

TIME/ACTION PROFILE (vasodilation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1 hr | 4 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless a pacemaker is present); Systolic BP <90 mm Hg.
**Use Cautiously in:** Severe hepatic impairment (dose ↓ recommended); Severe renal impairment; History of serious ventricular arrhythmias or CHF; OB, Lactation, Pedi: Safety not established; Geri: Dose ↓ recommended due to ↑ risk of hypotension.

### Adverse Reactions/Side Effects

**CNS:** abnormal dreams, anxiety, confusion, dizziness, drowsiness, headache, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea. **CV:** ARRHYTHMIAS, CHF, bradycardia, chest pain, hypotension, palpitations, peripheral edema, syncope, tachycardia. **GI:** ↑ liver enzymes, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** dermatitis, erythema multiforme, flushing, increased sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

### Interactions

**Drug-Drug:** Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF.
**Drug-Natural Products: Grapefruit** and **grapefruit juice** ↑ serum levels and effect.

### Route/Dosage
**PO (Adults):** 60 mg q 4 hr for 21 days; therapy should be started within 96 hr of subarachnoid hemorrhage.

### Hepatic Impairment
**PO (Adults):** 30 mg q 4 hr for 21 days; therapy should be started within 96 hr of subarachnoid hemorrhage.

### Availability (generic available)
**Capsules:** 30 mg.

## NURSING IMPLICATIONS

### Assessment
- Assess patient's neurologic status (level of consciousness, movement) prior to and periodically following administration.
- Monitor blood pressure and pulse prior to therapy and periodically during therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ risk of arrhythmias; should be corrected.
- Monitor renal and hepatic functions periodically. Several days of therapy may cause ↑ hepatic enzymes, which return to normal upon discontinuation of therapy.
- May occasionally cause ↓ platelet count.

### Potential Nursing Diagnoses
Ineffective tissue perfusion (Indications)

### Implementation
- Do not confuse nimodipine with nicardipine or nifedipine.
- Begin administration within 96 hr of subarachnoid hemorrhage and continue every 4 hr for 21 consecutive days.
- **PO:** If patient is unable to swallow capsule, make a hole in both ends of the capsule with a sterile 18-gauge needle and extract the contents into a syringe. Empty contents into water or nasogastric tube and flush with 30 mL normal saline.

### Patient/Family Teaching
- Advise patient to take medication as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeats, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.

### Evaluation/Desired Outcomes
- Improvement in neurologic deficits due to vasospasm following subarachnoid hemorrhage.

## **nisoldipine** (nye-**sole**-di-peen)
Sular

***Classification***
Therapeutic: antihypertensives
Pharmacologic: calcium channel blockers

**Pregnancy Category C**

### Indications
Management of hypertension.

### Action
Inhibits the transport of calcium into vascular smooth muscle cells, resulting in inhibition of vasoconstriction and dilation of arterioles. **Therapeutic Effects:** Systemic vasodilation, resulting in decreased blood pressure.

### Pharmacokinetics
**Absorption:** Well absorbed (87%) following oral administration but rapidly and extensively metabolized in the gut wall, resulting in 5% bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Highly metabolized CYP3A4 enzyme system.
**Half-life:** 7–12 hr.

TIME/ACTION PROFILE (antihypertensive effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 6–12 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with calcium channel blockers may occur; Concurrent phenytoin use.

**Use Cautiously in:** CHF/left ventricular dysfunction; Hepatic impairment (dose ↓ may be necessary); Coronary artery disease (may precipitate angina); OB, Lactation, Pedi: Safety not established; Geri: Dose ↓ may be necessary due to age-related ↓ in hepatic, renal or cardiac function.

## Adverse Reactions/Side Effects

**CNS:** headache, dizziness. **EENT:** pharyngitis, sinusitis. **CV:** peripheral edema, chest pain, hypotension, palpitations. **GI:** nausea. **Derm:** rash. **Endo:** gynecomastia.

## Interactions

**Drug-Drug:** Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Antihypertensive effects may be decreased by concurrent use of **NSAIDs**. **Phenytoin** or **other CYP3A4 inducers** ↓ blood levels and effectiveness (avoid concurrent use).

**Drug-Food: Grapefruit** and **grapefruit juice** ↑ serum levels and effect. Blood levels are ↑ by concurrent ingestion of a **high-fat meal** and should be avoided.

## Route/Dosage

**PO (Adults):** *Extended-release tablets*—20 mg/day as a single dose initially; may be ↑ by 10 mg/day q 7 days, up to 60 mg/day (usual range 20–40 mg/day); *Geomatric extended-release tablets*—17 mg/day as a single dose initially; may be ↑ by 8.5 mg/day q 7 days, up to 34 mg/day (usual range 8.5–34 mg/day).

### Hepatic Impairment

**PO (Adults):** *Geomatric extended-release tablets*—Initial dose should not exceed 8.5 mg/day.

## Availability (generic available)

**Extended-release tablets:** 20 mg, 30 mg, 40 mg. **Cost:** 10 mg $179.98/90, 20 mg $225.97/90, 30 mg $239.99/90, 40 mg $240.32/90. **Geomatrix extended-release tablets:** 8.5 mg, 17 mg, 25.5 mg, 34 mg.

# NURSING IMPLICATIONS

## Assessment

- Monitor blood pressure and pulse prior to therapy, during dosage titration, and periodically throughout therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.

## Potential Nursing Diagnoses

Decreased cardiac output (Indications)

## Implementation

- **PO:** Avoid administration within 1 hr of high-fat meals or grapefruit products.
- Do not break, crush, or chew tablets.

## Patient/Family Teaching

- Advise patient to take medication exactly as directed, even if feeling well. If a dose is missed, take as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes to health care professional.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.

### Evaluation/Desired Outcomes
- Decrease in blood pressure.

## nitrofurantoin
(nye-troe-fyoor-**an**-toyn)
Apo-Nitrofurantoin, Furadantin, Macrobid, Macrodantin

***Classification***
Therapeutic: anti-infectives

**Pregnancy Category B**

### Indications
Prevention and treatment of urinary tract infections caused by susceptible organisms; not effective in systemic bacterial infections.

### Action
Interferes with bacterial enzymes. **Therapeutic Effects:** Bactericidal or bacteriostatic action against susceptible organisms. **Spectrum:** Many gram-negative and some gram-positive organisms, specifically: *Citrobacter*, *Corynebacterium*, *Enterobacter*, *Escherichia coli*, *Klebsiella*, *Neisseria*, *Salmonella*, *Shigella*, *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Enterococcus*.

### Pharmacokinetics
**Absorption:** Readily absorbed after oral administration. Absorption is slower but more complete with macrocrystals (Macrodantin).
**Distribution:** Crosses placenta; enters breast milk.
**Protein Binding:** 40%.
**Metabolism and Excretion:** Partially metabolized by the liver; 30–50% excreted unchanged by the kidneys.
**Half-life:** 20 min (↑ in renal impairment).

TIME/ACTION PROFILE (urine levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 30 min | 6–12 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Hypersensitivity to parabens (suspension); Oliguria, anuria, or significant renal impairment (CCr <60 mL/min); History of cholestatic jaundice or hepatic impairment with previous use of nitrofurantoin; Pregnancy near term and infants <1 mo (↑ risk of hemolytic anemia).
**Use Cautiously in:** Glucose-6-phosphate dehydrogenase (G6PD) deficiency (↑ risk of hemolytic anemia, especially in Blacks and Mediterranean and Near-Eastern ethnic groups); Patients with diabetes or debilitated patients (neuropathy may be more common); OB: Safety not established but has been used safely in pregnant women. Lactation: May cause hemolysis in infants with G6PD deficiency who are breastfed; Geri: Appears on Beers list; ↑ risk for renal, hepatic, and pulmonary reactions.

### Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness, headache. **EENT:** nystagmus. **Resp:** PNEUMONITIS, PULMONARY FIBROSIS. **CV:** chest pain. **GI:** HEPATOTOXICITY, PSEUDOMEMBRANOUS COLITIS, anorexia, nausea, vomiting, abdominal pain, diarrhea. **GU:** rust/brown discoloration of urine. **Derm:** photosensitivity. **Hemat:** blood dyscrasias, hemolytic anemia. **Neuro:** peripheral neuropathy. **Misc:** hypersensitivity reactions.

### Interactions
**Drug-Drug: Probenecid** and **sulfinpyrazone** prevent high urinary concentrations; may ↓ effectiveness. **Antacids** may ↓ absorption. ↑ risk of neurotoxicity with **neurotoxic drugs**. ↑ risk of hepatotoxicity with **hepatotoxic drugs**. ↑ risk of pneumonitis with **drugs having pulmonary toxicity**.

### Route/Dosage
**PO (Adults):** *Treatment of active infection*—50–100 mg q 6–8 hr *or* 100 mg q 12 hr as extended-release product. *Chronic suppression*—50–100 mg single evening dose.
**PO (Children >1 mo):** *Treatment of active infection*—5–7 mg/kg/day divided q 6 hr; maximum dose: 400 mg/day. *Chronic suppression*—1–2 mg/kg/day as a single dose at bedtime; maximum dose: 100 mg/day (unlabeled).

### Availability (generic available)
**Tablets:** 50 mg, 100 mg. **Oral suspension:** 25 mg/5 mL. **Capsules:** 25 mg, 50 mg, 100 mg. **Extended-release capsules:** 100 mg.

## NURSING IMPLICATIONS

### Assessment
- Assess for signs and symptoms of urinary tract infection (frequency, urgency, pain, and burning on urination; fever; cloudy or foul-smelling urine) before and periodically during therapy.
- Obtain specimens for culture and sensitivity before and during drug administration.
- Monitor intake and output ratios. Report significant discrepancies in totals.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May

begin up to several weeks following cessation of therapy.
- Assess for signs and symptoms of pulmonary reactions periodically during therapy. Acute reactions (fever, chills, cough, chest pain, dyspnea, pulmonary infiltration with consolidation or pleural effusion on x-ray, eosinophilia) usually occur within first week of treatment and resolve when therapy is discontinued. Chronic reactions (malaise, dyspnea on exertion, cough, altered pulmonary function) may indicate pneumonitis or pulmonary fibrosis and are more common in patients taking nitrofurantoin for 6 mo or longer.
- ***Lab Test Considerations:*** Monitor CBC routinely with patients on prolonged therapy.
- Monitor liver function tests periodically during therapy. May cause ↑ serum glucose, bilirubin, alkaline phosphatase, BUN, and creatinine. If hepatotoxicity occurs, discontinue therapy.
- Monitor renal function periodically during therapy.

### Potential Nursing Diagnoses
Risk for infection (Indications)

### Implementation
- **PO:** Administer with food or milk to minimize GI irritation, to delay and increase absorption, to increase peak concentration, and to prolong duration of therapeutic concentration in the urine.
- Do not crush tablets or open capsules.
- Administer liquid preparations with calibrated measuring device. Shake well before administration. Oral suspension may be mixed with water, milk, fruit juices, or infant formula. Rinse mouth with water after administration of oral suspension to avoid staining teeth.

### Patient/Family Teaching
- Instruct patient to take medication around the clock, as directed. Take missed doses as soon as remembered and space next dose 2–4 hr apart. Do not skip or double up on missed doses.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that medication may cause a rust-yellow to brown discoloration of urine, which is not significant.
- Advise patient to notify health care professional if fever, chills, cough, chest pain, dyspnea, skin rash, numbness or tingling of the fingers or toes, or intolerable GI upset occurs. Signs of superinfection (milky, foul-smelling urine; perineal irritation; dysuria) should also be reported.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to consult health care professional if no improvement is seen within a few days after initiation of therapy.

### Evaluation/Desired Outcomes
- Resolution of the signs and symptoms of infection. Therapy should be continued for a minimum of 7 days and for at least 3 days after the urine has become sterile.
- Decrease in the frequency of infections in chronic suppressive therapy.

N

## nitroglycerin
(nye-tro-**gli**-ser-in)

**extended-release capsules**
Nitro-Time, Nitrogard SR

**intravenous**
Nitro-Bid IV, Tridil

**translingual spray**
Nitrolingual, Nitromist

**ointment**
Nitro-Bid

**sublingual**
Nitrostat, NitroQuick

**transdermal system**
Minitran, Nitrek, Nitro-Dur

***Classification***
Therapeutic: antianginals
Pharmacologic: nitrates

**Pregnancy Category C**

### Indications
Acute (**translingual and SL**) and long-term prophylatic (**oral, transdermal**) management of angina pectoris. **PO:** Adjunct treatment of CHF. **IV:** Adjunct treatment of acute MI. Production of controlled hypotension during surgical procedures. Treatment of CHF associated with acute MI.

## Action

Increases coronary blood flow by dilating coronary arteries and improving collateral flow to ischemic regions. Produces vasodilation (venous greater than arterial). Decreases left ventricular end-diastolic pressure and left ventricular end-diastolic volume (preload). Reduces myocardial oxygen consumption. **Therapeutic Effects:** Relief or prevention of anginal attacks. Increased cardiac output. Reduction of blood pressure.

## Pharmacokinetics

**Absorption:** Well absorbed after oral, buccal, and sublingual administration. Also absorbed through skin. Orally administered nitroglycerin is rapidly metabolized, leading to decreased bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Undergoes rapid and almost complete metabolism by the liver; also metabolized by enzymes in bloodstream.
**Half-life:** 1–4 min.

TIME/ACTION PROFILE (cardiovascular effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| SL | 1–3 min | unknown | 30–60 min |
| PO-ER | 40–60 min | unknown | 8–12 hr |
| TD-Oint | 20–60 min | unknown | 4–8 hr |
| TD-Patch | 40–60 min | unknown | 8–24 hr |
| IV | immediate | unknown | several min |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe anemia; Pericardial tamponade; Constrictive pericarditis; Alcohol intolerance (large IV doses only); Concurrent use of PDE-5 inhibitor (sildenafil, tadalafil, vardenafil).
**Use Cautiously in:** Head trauma or cerebral hemorrhage; Glaucoma; Hypertrophic cardiomyopathy; Severe liver impairment; Malabsorption or hypermotility (PO); Hypovolemia (IV); Normal or decreased pulmonary capillary wedge pressure (IV); Cardioversion (remove transdermal patch before procedure); OB: May compromise maternal/fetal circulation; Lactation, Pedi: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** dizziness, headache, apprehension, restlessness, weakness. **EENT:** blurred vision. **CV:** hypotension, tachycardia, syncope. **GI:** abdominal pain, nausea, vomiting. **Derm:** contact dermatitis (transdermal or ointment). **Misc:** alcohol intoxication (large IV doses only), cross-tolerance, flushing, tolerance.

## Interactions

**Drug-Drug:** Concurrent use of nitrates in any form with **sildenafil**, **tadalafil**, and **vardenafil** ↑ risk of serious and potentially fatal hypotension; concurrent use is contraindicated. Additive hypotension with **antihypertensives**, acute ingestion of **alcohol**, **beta blockers**, **calcium channel blockers**, **haloperidol**, or **phenothiazines**. Agents having anticholinergic properties (**tricyclic antidepressants**, **antihistamines**, **phenothiazines**) may ↓ absorption of lingual, or sublingual nitroglycerin.

## Route/Dosage

**SL (Adults):** 0.3–0.6 mg; may repeat q 5 min for 2 additional doses for acute attack.
**Translingual Spray (Adults):** 1–2 sprays; may be repeated q 5 min for 2 additional doses for acute attack. Both may also be used prophylactically 5–10 min before activities that may precipitate an acute attack.
**PO (Adults):** 2.5–9 mg q 8–12 hr .
**IV (Adults):** 5 mcg/min; increase by 5 mcg/min q 3–5 min to 20 mcg/min; if no response, increase by 10–20 mcg/min q 3–5 min (dosing determined by hemodynamic parameters; max: 200 mcg/min).
**Transdermal (Adults):** *Ointment*—1–2 in. q 6–8 hr. *Transdermal patch*—0.2–0.4 mg/hr initially; may titrate up to 0.4–0.8 mg/hr. Patch should be worn 12–14 hr/day and then taken off for 10–12 hr/day.

## Availability (generic available)

**Extended-release capsules:** 2.5 mg, 6.5 mg, 9 mg. **Sublingual tablets:** 0.3 mg, 0.4 mg, 0.6 mg. **Cost:** *NitroQuick*—0.3 mg $6.82/100, 0.4 mg $6.82/100, 0.6 mg $6.82/100; *Nitrostat*—0.3 mg $9.09/100, 0.4 mg $9.09/100, 0.6 mg $9.09/100. **Translingual spray (Nitrolingual):** 400 mcg/spray in 4.9-g canister (60 doses) or 12-g (200 doses) bottle), NitroMist 400 mcg/spray in 8.5 g canister (230 doses). **Transdermal systems:** 0.1 mg/hr, 0.2 mg/hr, 0.3 mg/hr, 0.4 mg/hr, 0.6 mg/hr, 0.8 mg/hr. **Transdermal ointment:** 2%. **Injection:** 5 mg/mL. **Premixed solution:** 25 mg/250 mL, 50 mg/250 mL, 50 mg/500 mL, 100 mg/250 mL, 200 mg/500 mL.

# NURSING IMPLICATIONS

## Assessment

- Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- Monitor blood pressure and pulse before and after administration. Patients receiving IV nitroglycerin require continuous ECG and blood

pressure monitoring. Additional hemodynamic parameters may be monitored.
- ***Lab Test Considerations:*** May cause ↑ urine catecholamine and urine vanillylmandelic acid concentrations.
- Excessive doses may cause ↑ methemoglobin concentrations.
- May cause falsely ↑ serum cholesterol levels.

## Potential Nursing Diagnoses

Acute pain (Indications)
Ineffective tissue perfusion (Indications)

## Implementation

- **PO:** Administer dose 1 hr before or 2 hr after meals with a full glass of water for faster absorption. Sustained-release preparations should be swallowed whole; do not break, crush, or chew.
- **SL:** Tablet should be held under tongue until dissolved. Avoid eating, drinking, or smoking until tablet is dissolved.
- **Translingual spray:** Spray *Nitrolingual* under tongue. Spray *Nitromist* on or under tongue.

### IV Administration

- **IV:** Doses must be diluted and administered as an infusion. Standard infusion sets made of polyvinyl chloride (PVC) plastic may absorb up to 80% of the nitroglycerin in solution. Use glass bottles only and special tubing provided by manufacturer.
- **Continuous Infusion:** ***Diluent:*** Vials must be diluted in D5W or 0.9% NaCl. Premixed infusions already diluted in D5W and are ready to be administered (no further dilution needed). Admixed solutions stable for 48 hr at room temperature or 7 days if refrigerated. Stability of premixed solutions based on manufacturer's expiration date. ***Concentration:*** Should not exceed 400 mcg/mL. ***Rate:*** See Route/Dosage section. Administer via infusion pump to ensure accurate rate. Titrate rate according to patient response.
- **Y-Site Compatibility:** acyclovir, alfentanil, amikacin, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B liposome, argatroban, ascorbic acid, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisatracurium, cisplatin, clindamycin, clonidine, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, drotrecogin, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem-cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopa, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, miconazole, midazolam, milrinone, minocycline, mitoxantrone, morphine, moxalactam, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G sodium, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinapristin-dalfopristin, ranitidine, remifentanil, ritodrine, rocuronium, sodium bicarbinate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiopental, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethophan, urokinase, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, warfarin.
- **Y-Site Incompatibility:** alteplase, dantrolene, daptomycin, diazepam, diazoxide, lansoprazole, levofloxacin, phenytoin, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Manufacturer recommends that nitroglycerin not be admixed with other medications.

- **Topical:** Sites of topical application should be rotated to prevent skin irritation. Remove patch or ointment from previous site before application.
- Doses may be increased to the highest dose that does not cause symptomatic hypotension.
- Apply ointment by using dose-measuring application papers supplied with ointment. Squeeze ointment onto measuring scale printed on paper. Use paper to spread ointment onto nonhairy area of skin (chest, abdomen, thighs; avoid distal extremities) in a thin, even layer, covering a 2–3-in. area. Do not allow ointment to come in contact with hands. Do not massage or rub in ointment; this will increase absorption and interfere with sustained action. Apply occlusive dressing if ordered.
- Transdermal patches may be applied to any hairless site (avoid distal extremities or areas with cuts or calluses). Apply firm pressure over patch to ensure contact with skin, especially around edges. Apply a new dose unit if the first one becomes loose or falls off. Units are waterproof and not affected by showering or bathing. Do not cut or trim system to adjust dosage. Do not alternate between brands of transdermal products; dose may not be equivalent. Remove patches before MRI, cardioversion or defibrillation to prevent patient burns. Patch may be worn for 12–14 hr and removed for 10–12 hr at night to prevent development of tolerance.

### Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless next dose is scheduled within 2 hr (6 hr with extended-release preparations). Do not double doses. Do not discontinue abruptly; gradual dose reduction may be necessary to prevent rebound angina.
- Caution patient to change positions slowly to minimize orthostatic hypotension. First dose should be taken while in a sitting or reclining position, especially in geriatric patients.
- Advise patient to avoid concurrent use of alcohol with this medication. Patient should also consult health care professional before taking OTC medications while taking nitroglycerin.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe.
- Advise patient to notify health care professional if dry mouth or blurred vision occurs.
- **Acute Anginal Attacks:** Advise patient to sit down and use medication at first sign of attack. Relief usually occurs within 5 min. Dose may be repeated if pain is not relieved in 5–10 min. Call health care professional or go to nearest emergency room if anginal pain is not relieved by 3 tablets in 15 min.
- **SL:** Inform patient that tablets should be kept in original glass container or in specially made metal containers, with cotton removed to prevent absorption. Tablets lose potency in containers made of plastic or cardboard or when mixed with other capsules or tablets. Exposure to air, heat, and moisture also causes loss of potency. Instruct patient not to open bottle frequently, handle tablets, or keep bottle of tablets next to body (i.e., shirt pocket) or in automobile glove compartment. Advise patient that tablets should be replaced 6 mo after opening to maintain potency.
- **Lingual Spray:** Instruct patient to lift tongue and spray dose under tongue (*Nitrolingual, NitroMist*) or on tongue (*NitroMist*).

### Evaluation/Desired Outcomes

- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance. During long-term therapy, tolerance may be minimized by intermittent administration in 12–14 hr or 10–12 hr off intervals.
- Controlled hypotension during surgical procedures.
- Treatment of CHF associated with acute MI.

HIGH ALERT

## nitroprusside

(nye-troe-**pruss**-ide)

Nitropress

***Classification***

Therapeutic: antihypertensives

Pharmacologic: vasodilators

**Pregnancy Category C**

### Indications

Hypertensive crises. Controlled hypotension during anesthesia. Cardiac pump failure or cardiogenic shock (alone or with dopamine).

### Action

Produces peripheral vasodilation by a direct action on venous and arteriolar smooth muscle. **Therapeutic Effects:** Rapid lowering of blood pressure. Decreased cardiac preload and afterload.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Rapidly metabolized in RBCs and tissues to cyanide and subsequently by the liver to thiocyanate.
**Half-life:** 2 min.

TIME/ACTION PROFILE (hypotensive effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | immediate | rapid | 1–10 min |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; ↓ cerebral perfusion.
**Use Cautiously in:** Renal disease (↑ risk of thiocyanate accumulation); Hepatic disease (↑ risk of cyanide accumulation); Hypothyroidism; Hyponatremia; Vitamin B deficiency; OB, Lactation: Safety not established; Geri: May have ↑ sensitivity to drug effects.

### Adverse Reactions/Side Effects

**CNS:** dizziness, headache, restlessness. **EENT:** blurred vision, tinnitus. **CV:** dyspnea, hypotension, palpitations. **GI:** abdominal pain, nausea, vomiting. **F and E:** acidosis. **Local:** phlebitis at IV site. **Misc:** CYANIDE TOXICITY, thiocyanate toxicity.

### Interactions

**Drug-Drug:** ↑ hypotensive effect with **ganglionic blocking agents**, **general anesthetics**, and other **antihypertensives**. **Estrogens** and **sympathomimetics** may ↓ the response to nitroprusside.

### Route/Dosage

**IV (Adults and Children):** 0.3 mcg/kg/min initially; may be ↑ as needed up to 10 mcg/kg/min (usual dose is 3 mcg/kg/min; not to exceed 10 min of therapy at 10 mcg/kg/min infusion rate).

### Availability (generic available)

**Injection:** 25 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, heart rate, and ECG frequently throughout therapy; continuous monitoring is preferred. Consult physician for parameters. Monitor for rebound hypertension following discontinuation of nitroprusside.
- Pulmonary capillary wedge pressure (PCWP) may be monitored in patients with MI or CHF.
- ***Lab Test Considerations:*** May cause ↓ bicarbonate concentrations, $P_{CO_2}$, and pH.
- May cause ↑ lactate concentrations.
- May cause ↑ serum cyanide and thiocyanate concentrations.
- Monitor serum methemoglobin concentrations in patients receiving >10 mg/kg and exhibiting signs of impaired oxygen delivery despite adequate cardiac output and arterial $P_{CO_2}$ (blood is chocolate brown without change on exposure to air). Treatment of methemoglobinemia is 1–2 mg/kg of methylene blue IV administered over several minutes.
- ***Toxicity and Overdose:*** If severe hypotension occurs, drug effects are quickly reversed, within 1–10 min, by decreasing rate or temporarily discontinuing infusion. May place patient in Trendelenburg position to maximize venous return.
- Monitor plasma thiocyanate levels daily in patients receiving prolonged infusions at a rate >3 mcg/kg/min or 1 mcg/kg/min in patients with anuria. Thiocyanate levels should not exceed 1 millimole/liter.
- Signs and symptoms of thiocyanate toxicity include tinnitus, toxic psychoses, hyperreflexia, confusion, weakness, seizures, and coma.
- Cyanide toxicity may manifest as lactic acidosis, hypoxemia, tachycardia, altered consciousness, seizures, and characteristic breath odor similar to almonds.
- Acute treatment of cyanide toxicity includes 4–6 mg/kg of *sodium nitrite* (as a 3% solution) over 2–4 min. This acts as a buffer for cyanide by converting 10% of hemoglobin to methemoglobin. If administration of sodium nitrite is delayed, inhalation of crushed ampule (vaporole, aspirole) of *amyl nitrite* for 15–30 sec of every minute should be started until sodium nitrite is running. Following completion of sodium nitrite infusion, administer *sodium thiosulfate* 150–200 mcg/kg (available as 25% and 50% solutions). This will convert cyanide to thiocyanate, which may then be eliminated. If required, entire regimen may be repeated in 2 hr at 50% of the initial doses.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

### Implementation

- If infusion of 10 mcg/kg/min for 10 min does not produce adequate reduction in blood pres-

sure, manufacturer recommends nitroprusside be discontinued.
- May be administered in left ventricular CHF concurrently with an inotropic agent (dopamine, dobutamine) when effective doses of nitroprusside restore pump function and cause excessive hypotension.

**IV Administration**

- **Continuous Infusion:** ***Diluent:*** Dilute 50 mg of nitroprusside in 250–1000 mL of D5W. Wrap infusion in aluminum foil to protect from light; administration set tubing need not be covered. Amber plastic bags do not offer sufficient protection from light; wrap must be opaque. Freshly prepared solution has a slight brownish tint; discard if solution is dark brown, orange, blue, green, or dark red. Solution must be used within 24 hr of preparation. ***Concentration:*** 50–200 mcg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Administer via infusion pump to ensure accurate dosage rate.
- **Y-Site Compatibility:** amikacin, aminophylline, argatroban, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, digoxin, diltiazem, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, furosemide, ganciclovir, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, insulin, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nesiritide, nicardipine, nitroglycerin, norepinephrine, ondansetron, palonosetron, pancuronium, pantoprazole, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, propofol, propranolol, protamine, ranitidine, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, vancomycin, vasopressin, verapamil.
- **Y-Site Incompatibility:** acyclovir, ampicillin, caspofungin, ceftazidime, diazepam, diphenhydramine, erythromycin, hydralazine, hydroxyzine, levofloxacin, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole, voriconazole.

### Patient/Family Teaching

- Advise patient to report the onset of tinnitus, dyspnea, dizziness, headache, or blurred vision immediately.

### Evaluation/Desired Outcomes

- Decrease in blood pressure without the appearance of side effects.
- Treatment of cardiac pump failure or cardiogenic shock.

## nizatidine, See HISTAMINE $H_2$ ANTAGONISTS.

HIGH ALERT

## norepinephrine

(**nor**-ep-i-nef-rin)

Levophed

***Classification***

Therapeutic: vasopressors

**Pregnancy Category C**

### Indications

Produces vasoconstriction and myocardial stimulation, which may be required after adequate fluid replacement in the treatment of severe hypotension and shock.

### Action

Stimulates alpha-adrenergic receptors located mainly in blood vessels, causing constriction of both capacitance and resistance vessels. Also has minor beta-adrenergic activity (myocardial stimulation). **Therapeutic Effects:** Increased blood pressure. Increased cardiac output.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Concentrates in sympathetic nervous tissue. Does not cross the blood-brain barrier but readily crosses the placenta.
**Metabolism and Excretion:** Taken up and metabolized rapidly by sympathetic nerve endings.
**Half-life:** Unknown.

TIME/ACTION PROFILE (effects on blood pressure)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | immediate | rapid | 1–2 min |

### Contraindications/Precautions

**Contraindicated in:** Vascular, mesenteric, or peripheral thrombosis; OB: ↓ uterine blood flow; Hypoxia; Hypercarbia; Hypotension secondary to hypovolemia (without appropriate volume replacement); Hypersensitivity to bisulfites.
**Use Cautiously in:** Hypertension; Concurrent use of MAO inhibitors, tricyclic antidepressants, or cyclopropane or halothane anesthetics; Hyperthyroidism; Cardiovascular disease; Lactation: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** anxiety, dizziness, headache, insomnia, restlessness, tremor, weakness. **Resp:** dyspnea. **CV:** arrhythmias, bradycardia, chest pain, hypertension. **GU:** decreased urine output, renal failure. **Endo:** hyperglycemia. **F and E:** metabolic acidosis. **Local:** phlebitis at IV site. **Misc:** fever.

### Interactions

**Drug-Drug:** Use with **cyclopropane** or **halothane anesthesia**, **cardiac glycosides**, **doxapram**, or local use of **cocaine** may result in ↑ myocardial irritability. Use with **MAO inhibitors**, **methyldopa**, **doxapram**, or **tricyclic antidepressants** may result in severe hypertension. **Alpha-adrenergic blockers** can prevent pressor response. **Beta blockers** may exaggerate hypertension or block cardiac stimulation. Concurrent use with **ergot alkaloids** (**ergotamine**, **ergonovine**, **methylergonovine**, or **oxytocin** may result in enhanced vasoconstriction and hypertension.

### Route/Dosage

**IV (Adults):** 0.5–1 mcg/min initially, followed by maintenance infusion of 2–12 mcg/min titrated by blood pressure response (average rate 2–4 mcg/min, up to 30 mcg/min for refractory shock have been used).
**IV (Children):** 0.1 mcg/kg/min initially; may be followed by infusion titrated to blood pressure response, up to 1 mcg/kg/min.

### Availability

**Injection:** 1 mg/mL in 4-mL ampules.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure every 2–3 min until stabilized and every 5 min thereafter. Systolic blood pressure is usually maintained at 80–100 mm Hg or 30–40 mm Hg below the previously existing systolic pressure in previously hypertensive patients. Consult physician for parameters. Continue to monitor blood pressure frequently for hypotension following discontinuation of norepinephrine.
- ECG should be monitored continuously. CVP, intra-arterial pressure, pulmonary artery diastolic pressure, pulmonary capillary wedge pressure (PCWP), and cardiac output may also be monitored.
- Monitor urine output and notify health care professional if it decreases to <30 mL/hr.
- Assess IV site frequently throughout infusion. A large vein should be used to minimize risk of extravasation, which may cause tissue necrosis. Phentolamine 5–10 mg may be added to each liter of solution to prevent sloughing of tissue in extravasation. If extravasation occurs, the site should be infiltrated promptly with 10–15 mL of 0.9% NaCl solution containing 5–10 mg of phentolamine to prevent necrosis and sloughing. If prolonged therapy is required or if blanching along the course of the vein occurs, change injection sites to provide relief from vasoconstriction.
- ***Toxicity and Overdose:*** If overdose occurs, discontinue norepinephrine and administer fluid and electrolyte replacement therapy. An alpha-adrenergic blocking agent (phentolamine 5–10 mg) may be administered intravenously to treat hypertension.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Ineffective tissue perfusion (Indications)

### Implementation

- ***High Alert:*** Vasoactive medications are inherently dangerous. Have second practitioner independently check original order, dose calculations, and infusion pump programming. Establish maximum dose limits. Norepinephrine overdose can result in severe peripheral vasoconstriction with resultant ischemia and necrosis of peripheral tissue. Assess peripheral circulation frequently.
- Volume depletion should be corrected, if possible, prior to initiation of norepinephrine.
- Heparin may be added to each 500 mL of solution to prevent thrombosis in the infused vein, perivenous reactions, and necrosis in patients with severe hypotension following MI.
- Norepinephrine may deplete plasma volume and cause ischemia of vital organs, resulting in hypotension when discontinued, if used for

prolonged periods. Prolonged or large doses may also decrease cardiac output.
- Infusion should be discontinued gradually, upon adequate tissue perfusion and maintenance of blood pressure, to prevent hypotension. Do not resume therapy unless blood pressure falls to 70–80 mm Hg.

### IV Administration

- **Continuous Infusion:** ***Diluent:*** Dilute 4 mg in 1000 mL of D5W or D5/0.9% NaCl. Do not dilute in 0.9% NaCl without dextrose. ***Concentration:*** 4 mcg/mL Do not use discolored solutions (pink, yellow, brown) or those containing a precipitate. ***Rate:*** Titrate infusion rate according to patient response, using slowest possible rate to correct hypotension. Administer via infusion pump to ensure accurate dosage.
- **Y-Site Compatibility:** alfentanil, amikacin, amiodarone, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefonicid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chrlopromazine, cimetidine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, daptomycin, dexamethasone, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, miconazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, ranitidine, remifentanil, streoptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasorpessin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole.
- **Y-Site Incompatibility:** aminophylline, amphotericin B colloidal, azathioprine, dantrolene, diazepam, diazoxide, drotrecogin, folic acid, ganciclovir, indomethacin, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole.

### Patient/Family Teaching

- Instruct patient to report headache, dizziness, dyspnea, chest pain, or pain at infusion site promptly.

### Evaluation/Desired Outcomes

- Increase in blood pressure to normal range.
- Increased tissue perfusion.

**norethindrone, See CONTRACEPTIVES, HORMONAL.**

**norethindrone/ethinyl acetate, See CONTRACEPTIVES, HORMONAL.**

## **nortriptyline** (nor-**trip**-ti-leen)

Aventyl, Pamelor

***Classification***

Therapeutic: antidepressants
Pharmacologic: tricyclic antidepressants

**Pregnancy Category D**

### Indications

Various forms of depression. **Unlabeled Use:** Management of chronic neurogenic pain.

### Action

Potentiates the effect of serotonin and norepinephrine. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action that develops slowly over several weeks.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration.
**Distribution:** Widely distributed. Enters breast milk in small amounts; probably crosses the placenta.

**Protein Binding:** 92%.
**Metabolism and Excretion:** Extensively metabolized by the liver, much of it on its first pass. Some is converted to active compounds. Undergoes enterohepatic recirculation and secretion into gastric juices.
**Half-life:** 18–28 hr.

TIME/ACTION PROFILE (antidepressant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 2–3 wk | 6 wk | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Angle-closure glaucoma; Alcohol intolerance (solution only).
**Use Cautiously in:** Pre-existing cardiovascular disease; History of seizures; Asthma; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children and adolescents; OB: Use only if clearly needed and maternal benefits outweigh risk to fetus; Lactation: May result in sedation in infant; discontinue drug or bottle-feed; Pedi: Safety not established; Geri: More susceptible to adverse reactions; dose reduction recommended). Pre-existing cardiovascular disease. Geriatric men with prostatic hyperplasia may be more susceptible to urinary retention.

## Adverse Reactions/Side Effects

**CNS:** drowsiness, fatigue, lethargy, agitation, confusion, extrapyramidal reactions, hallucinations, headache, insomnia. **EENT:** blurred vision, dry eyes, dry mouth. **CV:** ARRHYTHMIAS, hypotension, ECG changes. **GI:** constipation, nausea, paralytic ileus, unpleasant taste, weight gain. **GU:** urinary retention. **Derm:** photosensitivity. **Endo:** gynecomastia. **Hemat:** blood dyscrasias.

## Interactions

**Drug-Drug:** May cause hypertension, hyperpyrexia, seizures, and death when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk before starting nortriptyline). May prevent the therapeutic response to most **antihypertensives**. Hypertensive crisis may occur with **clonidine**. ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioids**, and **sedative/hypnotics**. Adrenergic effects may be ↑ with other **adrenergic agents**, including **vasoconstrictors** and **decongestants**. ↑ anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**. **Cimetidine**, **fluoxetine**, or **hormonal contraceptives** ↑ blood levels and risk of toxicity. ↑ risk of agranulocytosis with **antithyroid agents**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. **St. John's wort** may ↓ serum concentrations and efficacy. ↑ anticholinergic effects with **jimson weed** and **scopolia**.

## Route/Dosage

**PO (Adults):** 25 mg 3–4 times daily, up to 150 mg/day.
**PO (Geriatric Patients or Adolescents):** 30–50 mg/day in divided doses or as a single dose.

## Availability (generic available)

**Capsules:** 10 mg, 25 mg, 50 mg, 75 mg. **Oral solution:** 10 mg/5 mL.

N

# NURSING IMPLICATIONS

## Assessment

- Monitor mental status (orientation, mood, behavior). Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout treatment.
- Monitor blood pressure and pulse rate before and during initial therapy. Report significant decreases in blood pressure or a sudden increase in pulse rate.
- Monitor baseline and periodic ECGs in geriatric patients or patients with heart disease. May cause prolonged PR and QT intervals and may flatten T waves.
- For overweight/obese individuals, monitor FBS and cholesterol levels.
- **Pain:** Assess type, location, and severity of pain before and periodically during therapy. Use pain scale to monitor effectiveness of medication.
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts, liver function, and serum glucose periodically. May cause ↑ serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be ↑ or ↓.
- Serum levels may be monitored in patients who fail to respond to usual therapeutic dose. Therapeutic plasma concentration range is 50–150 ng/mL.

- May cause alterations in blood glucose levels.
- ***Toxicity and Overdose:*** Symptoms of acute overdose include disturbed concentration, confusion, restlessness, agitation, seizures, drowsiness, mydriasis, arrhythmias, fever, hallucinations, vomiting, and dyspnea.
- Treatment of overdose includes gastric lavage, activated charcoal, and a stimulant cathartic. Maintain respiratory and cardiac function (monitor ECG for at least 5 days) and temperature. Medications may include digoxin for CHF, antiarrhythmics, and anticonvulsants.

### Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)
Chronic pain (Indications)
Sexual dysfunction (Side Effects)

### Implementation

- Do not confuse nortriptyline with desipramine.
- Taper to avoid withdrawal effects. Reduce dose 50% for 3 days, then by 50% for 3 more days, then discontinue.
- **PO:** Administer medication with meals to minimize gastric irritation.
- May be given as a single dose at bedtime to minimize sedation during the day. Dose increases should be made at bedtime because of sedation.

### Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to notify health care professional if visual changes occur. Inform patient that periodic glaucoma testing may be required during long-term therapy.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. (This side effect is less pronounced with this medication than with other tricyclic antidepressants.).
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention occurs or if dry mouth or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Alert patient that urine may turn blue-green in color.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain. Refer as appropriate for nutritional, weight, or medical management.
- May have teratogenic effects. Instruct patient to notify health care professional immediately if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams and participation in prescribed psychotherapy to improve coping skills.
- Refer to local support group.

### Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in severity of chronic neurogenic pain. Patients may require 2–6 wk of therapy before full therapeutic effects of medication are seen.

**NPH insulin (isophane insulin suspension), See INSULINS (intermediate-acting).**

**NPH/regular insulin mixtures, See INSULIN (mixtures).**

**nystatin** (nye-**stat**-in)
Mycostatin, Nadostine, Nilstat, PMS-Nystatin

***Classification***
Therapeutic: antifungals (topical/local)

**Pregnancy Category B**

For other nystatin dosage forms, see antifungals (topical) and antifungals (vaginal)

## Indications
**Lozenges, oral suspension:** Local treatment of oropharyngeal candidiasis. Treatment of intestinal candidiasis.

## Action
Binds to fungal cell membrane, allowing leakage of cellular contents. **Therapeutic Effects:** Fungistatic or fungicidal action. **Spectrum:** Active against most pathogenic *Candida* species, including *C. albicans*.

## Pharmacokinetics
**Absorption:** Poorly absorbed; action is primarily local.
**Distribution:** Unknown.
**Metabolism and Excretion:** Excreted unchanged in the feces after oral administration.
**Half-life:** Unknown.

TIME/ACTION PROFILE (antifungal effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Top | rapid | unknown | 2 hr† |

†Maintenance of saliva levels required to inhibit growth of Candida species after oral dissolution of 2 lozenges

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Some products may contain ethyl alcohol or benzyl alcohol—avoid use in patients who may be hypersensitive to or intolerant of these additives.
**Use Cautiously in:** Denture wearers (dentures require soaking in nystatin suspension); Pedi: Lozenges, pastilles, or troches may pose a choking risk for children <5 yr .

## Adverse Reactions/Side Effects
**GI:** diarrhea, nausea, stomach pain (large doses), vomiting. **Derm:** contact dermatitis, Stevens-Johnson syndrome.

## Interactions
**Drug-Drug:** None significant.

## Route/Dosage
**PO (Adults and Children):** 400,000–600,000 units 4 times daily as oral suspension or 200,000–400,000 units 4–5 times daily as pastilles (lozenges).
**PO (Infants):** 200,000 units 4 times daily or 100,000 units to each side of the mouth 4 times daily.
**PO (Neonates, Premature, and Low Birth Weight):** 100,000 units 4 times daily or 50,000 units to each side of the mouth 4 times a day.

## Availability (generic available)
**Oral suspension:** 100,000 units/mL. **Oral pastilles (lozenges, troches):** 200,000 units/troche. **Powder for oral suspension:** ⅛ tsp = 500,000 unitss. **Oral tablets:** 500,000 units.

# NURSING IMPLICATIONS

## Assessment
- Inspect oral mucous membranes before and frequently throughout therapy. Increased irritation of mucous membranes may indicate need to discontinue medication.

## Potential Nursing Diagnoses
Risk for impaired skin integrity (Indications)
Risk for infection (Indications)

## Implementation
- **PO:** Suspension should be administered by placing ½ of dose in each side of mouth. Patient should hold suspension in mouth or swish throughout mouth for several minutes before swallowing, then gargle and swallow. Use calibrated measuring device for liquid doses. Shake well before administration. Pedi: For neonates and infants, paint suspension into recesses of the mouth.
- To prepare oral solution from powder, add ⅛ tsp (approximately 500,000 units) to 120 mL of water and stir well. Prepare immediately before use; contains no preservatives.
- Lozenges (pastilles) should be allowed to dissolve slowly and completely in mouth; do not chew or swallow whole. Nystatin vaginal tablets can be administered orally for treatment of oral candidiasis.

## Patient/Family Teaching
- Instruct patient to take medication as directed. If a dose is missed, take as soon as remembered but not if almost time for next dose. Do not double doses. Therapy should be continued for at least 2 days after symptoms subside.
- Pedi: Instruct parents or caregivers of infants and children on correct dose and administration. Remind them to use only the measuring devise dispensed with the product.

- Advise patient to report increased irritation of mucous membranes or lack of therapeutic response to health care professional.

### Evaluation/Desired Outcomes

- Decrease in stomatitis.
- To prevent relapse after oral therapy, therapy should be continued for 48 hr after symptoms have disappeared and cultures are negative.
- Therapy for a period of 2 wk is usually sufficient, but more prolonged therapy may be necessary.

**nystatin, See ANTIFUNGALS (TOPICAL).**

**nystatin, See ANTIFUNGALS (VAGINAL).**

## octreotide (ok-tree-oh-tide)

Sandostatin, Sandostatin LAR

***Classification***

Therapeutic: antidiarrheals, hormones

**Pregnancy Category B**

### Indications

Treatment of severe diarrhea and flushing episodes in patients with GI endocrine tumors, including metastatic carcinoid tumors and vasoactive intestinal peptide tumors (VIPomas). Treatment of acromegaly. **Unlabeled Use:** Management of diarrhea in AIDS patients, patients with fistulas, chemotherapy-induced diarrhea, and graft- vs. host–disease-induced diarrhea. Treatment of hyperinsulinemic hypoglycemia of infancy. Management of postoperative chylothorax.

### Action

Suppresses secretion of serotonin and gastroenterohepatic peptides. Increases absorption of fluid and electrolytes from the GI tract and increases transit time. Decreases levels of serotonin metabolites. Also suppresses growth hormone, insulin, and glucagon. **Therapeutic Effects:** Control of severe flushing and diarrhea associated with GI endocrine tumors.

### Pharmacokinetics

**Absorption:** Well absorbed following subcut administration and IM administration of depot form.
**Distribution:** Unknown.
**Protein Binding:** 65%.
**Metabolism and Excretion:** Extensive hepatic metabolism; 32% excreted unchanged in urine.
**Half-life:** 1.5 hr.

TIME/ACTION PROFILE (control of symptoms)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut, IV | unknown | unknown | up to 12 hr |
| IM (LAR) | unknown | 2 wk | up to 4 wk |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Gallbladder disease (↑ risk of stone formation); Renal impairment (dose ↓ may be necessary); Hyperglycemia or hypoglycemia (changes in blood glucose may occur); Fat malabsorption (may be aggravated); OB, Lactation: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, fatigue, headache, weakness. **EENT:** visual disturbances. **CV:** bradycardia, edema, orthostatic hypotension, palpitations. **GI:** ILEUS, abdominal pain, cholelithiasis, diarrhea, fat malabsorption, nausea, vomiting. **Derm:** flushing. **Endo:** hyperglycemia, hypoglycemia, hypothyroidism. **Local:** injection-site pain.

### Interactions

**Drug-Drug:** May alter requirements for **insulin** or **oral hypoglycemic agents**. May ↓ blood levels of **cyclosporine**. May ↑ levels of QTc-prolonging agents.

### Route/Dosage

#### Carcinoid Tumors

**Subcut, IV (Adults):** *Sandostatin* — 100–600 mcg/day in 2–4 divided doses during first 2 wk of therapy (range 50–1500 mcg/day).
**IM (Adults):** *Sandostatin LAR* — 20 mg q 4 wk for 2 mo; dose may be further adjusted.

#### VIPomas

**Subcut, IV (Adults):** *Sandostatin* — 200–300 mcg/day in 2–4 divided doses during first 2 wk of therapy (range 150–750 mcg/day).
**IM (Adults):** *Sandostatin LAR* — 20 mg q 2 wk for 2 mo; dose may be further adjusted.

#### Suppression of Growth Hormone (Acromegaly)

**Subcut, IV (Adults):** *Sandostatin* — 50–100 mcg 3 times daily; titrate to achieve growth hormone levels <5 ng/mL or IGF-I levels <1.9 units/mL (males) or <2.2 units/mL (females) (usual effective dose = 100–200 mcg 3 times daily.
**IM (Adults):** *Sandostatin LAR* — 20 mg q 4 wk for 3 mo, then adjusted on the basis of growth hormone levels.

#### Antidiarrheal

**Subcut, IV (Adults):** *AIDS-related*-100–1800 mcg/day (unlabeled).
**Subcut, IV (Children):** 1–10 mcg/kg q 12 hr or 1 mcg/kg IV bolus followed by a continuous infusion of 1 mcg/kg/hr.

#### Persistent Hyperinsulinemic Hypoglycemia of Infancy

**IV (Infants):** Initially 2–10 mcg/kg/day divided q 12 hr up to 40 mcg/kg/day divided q 6–8 hr.

#### Chylothorax

**Subcut (Adults):** 50–100 mcg q 8 hr.
**Subcut (Children):** 40 mcg/kg/day.

**IV (Children):** 0.3–10 mcg/kg/hr continuous infusion.

### Availability (generic available)

**Injection:** 0.05 mg/mL, 0.1 mg/mL, 0.2 mg/mL, 0.5 mg/mL, 1 mg/mL. **Depot injection:** 10 mg, 20 mg, 30 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess frequency and consistency of stools and bowel sounds throughout therapy.
- Monitor pulse and blood pressure prior to and periodically during therapy.
- Assess patient's fluid and electrolyte balance and skin turgor for dehydration.
- Monitor diabetic patients for signs of hypoglycemia. May require reduction in requirements for insulin and sulfonylureas and treatment with diazoxide.
- Assess for gallbladder disease; assess for pain and monitor ultrasound examinations of gallbladder and bile ducts prior to and periodically during prolonged therapy.
- ***Lab Test Considerations:*** Monitor 5-HIAA (urinary 5-hydroxyindoleacetic acid), plasma serotonin, and plasma substance P in patients with carcinoid; plasma vasoactive intestinal peptide (VIP) in patients with VIPoma; and free $T_4$ and serum glucose concentrations prior to and periodically during therapy in all patients taking octreotide.
- Monitor quantitative 72-hr fecal fat and serum carotene determinations periodically for possible drug-induced aggravations of fat malabsorption.
- May cause a slight ↑ in liver enzymes.
- May cause ↓ serum thyroxine ($T_4$) concentrations.

### Potential Nursing Diagnoses

Diarrhea (Indications)

### Implementation

- Do not use solution that is discolored or contains particulate matter. Ampules should be refrigerated but may be stored at room temperature for the days they will be used. Discard unused solution.
- **Subcut:** Administer the smallest volume needed to achieve required dose to prevent pain at injection site. Rotate injection sites; avoid multiple injections in same site within short periods of time. Preferred injection sites are the hip, thigh, or abdomen.
- Administer injections between meals and at bedtime to avoid GI side effects.
- Allow medication to reach room temperature prior to injection to minimize local reactions at injection site.
- **IM:** Mix IM solution by adding diluent included in kit. Administer immediately after mixing into the gluteal muscle. Avoid using deltoid site due to pain of injection.
- Patients with carcinoid tumors and VIPomas should continue to receive subcut dose for 2 wk following switch to IM depot form to maintain therapeutic level.

#### IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. ***Rate:*** Administer over 3 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute in 50–200 mL of 0.9% NaCl or D5W. ***Concentration:*** 1.5–250 mcg/mL. ***Rate:*** Infuse over 15–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanyl, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B colloidal, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atenolol, atracurium, azithromycin, aztreoman, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, capreomycin, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclosporine, cytarabine, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin hydrochloride, daunorubicin liposome, dexamethasone sodium phosphate, dexmeditomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibitide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, galium nitrate, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium hydroxice, mannitol, mechlorethamine, mel-

phalan, meperidine, meropenem, mesna, methylprednisolone, methotrexate, methyldopate, metoclopromide, metoprolol, metronidazole, midazolam, milrinone, minocycline, mitomycin, mitoxantrone, mivacurium, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinapristin/dalfopristin, ranitidine, remifentanyl, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zolendronic acid.

- **Y-Site Incompatibility:** dantrolene, diazepam, micafungin, phenytoin.

## Patient/Family Teaching

- May cause dizziness, drowsiness, or visual disturbances. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- **Home Care Issues:** Instruct patients administering octreotide at home on correct technique for injection, storage, and disposal of equipment.
- Instruct patient to administer octreotide exactly as directed. If a dose is missed, administer as soon as possible, then return to regular schedule. Do not double doses.

## Evaluation/Desired Outcomes

- Decrease in severity of diarrhea and improvement of electrolyte imbalances in patients with carcinoid or VIP-secreting tumors.
- Relief of symptoms and suppressed tumor growth in patients with pituitary tumors associated with acromegaly.
- Management of diarrhea in patients with AIDS.

# **olanzapine** (oh-**lan**-za-peen)

Zyprexa, Zyprexa Zydis

***Classification***

Therapeutic: antipsychotics, mood stabilizers

Pharmacologic: thienobenzodiazepines

**Pregnancy Category C**

## Indications

Acute and maintenance treatment of schizophrenia. Acute treatment of manic episodes associated with bipolar I disorder (may be used alone or with lithium or valproate). Maintenance therapy of bipolar I disorder. Acute agitation due to schizophrenia or bipolar I mania (IM). Depressive episodes associated with bipolar I disorder (when used with fluoxetine). Treatment-resistant depression (when used with fluoxetine). **Unlabeled Use:** Management of anorexia nervosa. Treatment of nausea and vomiting related to highly emetogenic chemotherapy.

## Action

Antagonizes dopamine and serotonin type 2 in the CNS. Also has anticholinergic, antihistaminic, and anti–alpha$_1$-adrenergic effects. **Therapeutic Effects:** Decreased manifestations of psychoses.

## Pharmacokinetics

**Absorption:** Well absorbed but rapidly metabolized by first-pass effect, resulting in 60% bioavailability. Conventional tablets and orally disintegrating tablets (Zydis) are bioequivalent. IM administration results in significantly higher blood levels (5 times that of oral).
**Distribution:** Extensively distributed.
**Protein Binding:** 93%.
**Metabolism and Excretion:** Highly metabolized (mostly by the hepatic P450 CYP 1A2 system); 7% excreted unchanged in urine.
**Half-life:** 21–54 hr.

TIME/ACTION PROFILE (antipsychotic effects)

| ROUTE | ONSET | PEAK* | DURATION |
|---|---|---|---|
| PO | unknown | 6 hr | unknown |
| IM | rapid | 15–45 min | 2–4 hr |

*Blood levels

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Lactation: Discontinue drug or bottle feed; **Orally disintegrating tablets only:** Phenylketonuria (orally disintegrating tablets contain aspartame).

**Use Cautiously in:** Patients with hepatic impairment; Patients at risk for aspiration; Cardiovascular or cerebrovascular disease; History of seizures; History of attempted suicide; Diabetes or risk factors for diabetes (may worsen glucose control); Prostatic hyperplasia; Angle-closure glaucoma; History of paralytic ileus; Dysphagia and aspiration have been associated with antipsychotic drug use; use with caution in patients at risk for aspiration; OB, Pedi: Safety not established; Geri: Geriatric patients (may require ↓ doses; ↑ risk of mortality in elderly patients treated for dementia-related psychosis).

## Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, agitation, dizziness, headache, restlessness, sedation, weakness, dystonia, insomnia, mood changes, personality disorder, speech impairment, tardive dyskinesia. **EENT:** amblyopia, rhinitis, ↑ salivation, pharyngitis. **Resp:** cough, dyspnea. **CV:** orthostatic hypotension, tachycardia, chest pain. **GI:** constipation, dry mouth, abdominal pain, ↑ appetite, weight loss or gain, nausea, ↑ thirst. **GU:** ↓ libido, urinary incontinence. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **Derm:** photosensitivity. **Endo:** amenorrhea, galactorrhea, gynecomastia, hyperglycemia, goiter. **Metab:** dyslipidemia. **MS:** hypertonia, joint pain. **Neuro:** tremor. **Misc:** fever, flu-like syndrome.

## Interactions

**Drug-Drug:** Effects may be ↓ by concurrent **carbamazepine**, **omeprazole**, or **rifampin**. ↑ hypotension may occur with **antihypertensives**. ↑ CNS depression may occur with concurrent use of **alcohol** or other **CNS depressants**. May antagonize the effects of **levodopa** or other **dopamine agonists**. **Nicotine** can ↓ olanzapine levels.

## Route/Dosage

**PO (Adults — Most Patients):** *Schizophrenia*— 5–10 mg/day initially; may ↑ at weekly intervals by 5 mg/day (not to exceed 20 mg/day). *Bipolar I mania*— 10–15 mg/day initially (use 10 mg/day when used with lithium or valproate); may ↑ every 24 hr by 5 mg/day (not to exceed 20 mg/day); *Depressive episodes associated with bipolar I disorder*— 5 mg/day with fluoxetine 20 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 12.5 mg/day; *Treatment-resistant depression*— 5 mg/day with fluoxetine 20 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 20 mg/day.

**PO (Adults — Debilitated or Nonsmoking Female Patients ≥65 yr):** Initiate therapy at 5 mg/day.

**IM (Adults):** *Acute agitation*— 5–10 mg, may repeat in 2 hr, then 4 hr later.

**IM (Adults >65 yr):** Initiate therapy with 5 mg.

## Availability

**Tablets:** 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg. **Cost:** 2.5 mg $556.93/90, 5 mg $645.82/90, 7.5 mg $805.91/90, 10 mg $1,007.96/90, 15 mg $1,475.96/90, 20 mg $1,860.77/90. **Orally disintegrating tablets (Zydis):** 5 mg, 10 mg, 15 mg, 20 mg. **Cost:** 5 mg $765.95/90, 10 mg $1,139.83/90, 15 mg $1,648.53/90, 20 mg $2,163.23/90. **Powder for injection:** 10 mg/vial. ***In combination with:*** fluoxetine (Symbyax; see Appendix B).

# NURSING IMPLICATIONS

## Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor blood pressure (sitting, standing, lying), ECG, pulse, and respiratory rate before and frequently during dose adjustment.
- Assess weight and BMI initially and throughout therapy.
- Assess fasting blood glucose and cholesterol levels initially and throughout therapy.
- Observe patient carefully when administering medication to ensure that medication is taken and not hoarded or cheeked.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet may help minimize constipation.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*— difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*— muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Report these symptoms if they occur, as reduction in dose or discontinuation of medication may be necessary. Trihexyphenidyl or benztropine may be used to control symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and ex-

tremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue, excessive blinking of eyes). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- ***Lab Test Considerations:*** Evaluate CBC, liver function tests, and ocular examinations periodically during therapy. May cause ↓ platelets. May cause ↑ bilirubin, AST, ALT, GGT, CPK, and alkaline phosphatase.
- Monitor blood glucose prior to and periodically during therapy.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.
- Monitor CBC frequently during initial months of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.

## Potential Nursing Diagnoses

Disturbed thought process (Indications)
Impaired oral mucous membrane (Side Effects)
Sexual dysfunction (Side Effects)

## Implementation

- Do not confuse Zyprexa (olanzapine) with Celexa (citalopram) or Zyrtec (cetirizine).
- **PO:** May be administered without regard to meals.
- For orally disintegrating tablets, peel back foil on blister, do not push tablet through foil. Using dry hands, remove from foil and place entire tablet in mouth. Tablet will disintegrate with or without liquid.
- **IM:** Reconstitute with 2.1 mL of sterile water for injection for a concentration of 5 mg/mL. Solution should be clear and yellow; do not administer solutions that are discolored or contain particulate matter. Inject slowly, deep into muscle. Do not administer IV or subcutaneously. Administer within 1 hr of reconstitution. Discard unused solution.

## Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. May need to discontinue gradually.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Caution patient to avoid taking alcohol and to notify health care professional prior to taking other Rx, OTC, or herbal products concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun. Extremes of temperature (exercise, hot weather, hot baths or showers) should also be avoided; this drug impairs body temperature regulation.
- Instruct patient to use saliva substitute, frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth. Consult dentist if dry mouth continues for >2 wk.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, visual disturbances, dark-colored urine, clay-colored stools, menstrual abnormalities, galactorrhea or sexual dysfunction occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breastfeeding or planning to breastfeed.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy.

### Evaluation/Desired Outcomes
- Decrease in excitable, manic behavior.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunted affect) of schizophrenia.
- Increased sense of well-being.
- Decreased agitation.

**olmesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.**

## olopatadine (nasal spray)
(o-lo-**pa**-ta-deen)
Patanase

***Classification***
Therapeutic: allergy, cold, and cough remedies
Pharmacologic: antihistamines

**Pregnancy Category C**

### Indications
Relief of symptoms of allergic rhinitis.

### Action
Antagonizes the effects of histamine at histamine$_1$ receptor sites; does not bind to or inactivate histamine. **Therapeutic Effects:** Decreased symptoms of histamine excess including rhinorrhea, sneezing, and nasal itching.

### Pharmacokinetics
**Absorption:** 57% absorbed from nasal mucosa.
**Distribution:** Unknown.
**Metabolism and Excretion:** Minimal metabolism; 70% eliminated in urine mostly as unchanged drug; 17% fecal elimination.
**Half-life:** 8–12 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Nasal | rapid | unknown | 12 hr |

### Contraindications/Precautions
**Contraindicated in:** None noted.
**Use Cautiously in:** Nasal pathology other than allergic rhinitis; Geri: Dose cautiously in elderly patients; consider age-related decrease in organ function and concurrent medications; Lactation, OB: Use in pregnancy or lactation only when maternal benefit outweighs fetal risk; Pedi: Safe use in children <12 yr not established.

### Adverse Reactions/Side Effects
**CNS:** drowsiness, headache. **EENT:** epistaxis, nasal perforation, nasal ulcerations, pharyngolaryngeal pain, postnasal drip. **GI:** bitter taste. **Resp:** cough.

### Interactions
**Drug-Drug:** ↑ CNS depression may occur with **alcohol**; avoid concurrent use.

### Route/Dosage
**Intranasal (Adults and Children ≥ 12 yr):** 2 sprays in each nostril twice daily.

### Availability
**Nasal spray:** 665 mcg/100 microliter (0.6%) spray in 30.5-g bottle (provides 240 metered sprays).

## NURSING IMPLICATIONS

### Assessment
- Assess for symptoms of seasonal allergic rhinitis (sneezing, runny nose, nasal itching) prior to and during therapy.

### Potential Nursing Diagnoses
Ineffective airway clearance (Indications)

### Implementation
- Administer 2 sprays per nostril twice daily.

### Patient/Family Teaching
- Instruct patient to prime nasal spray by releasing 5 sprays or spraying until a fine mist appears before initial use. If unit has not been used within 7 days, re-prime with 2 sprays.
- May cause drowsiness. Advise patient to avoid driving or other activities that require alertness until response to medication is known.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants.

### Evaluation/Desired Outcomes
- Relief of symptoms of seasonal allergic rhinitis.

## olsalazine (ole-**sal**-a-zeen)
Dipentum

***Classification***
Therapeutic: gastrointestinal anti-inflammatories

**Pregnancy Category C**

### Indications
Ulcerative colitis (when patients cannot tolerate sulfasalazine).

### Action
Locally acting anti-inflammatory action in the colon, where activity is probably due to inhibition of

prostaglandin synthesis. **Therapeutic Effects:** Reduction in the symptoms of inflammatory bowel disease.

### Pharmacokinetics

**Absorption:** Acts locally in colon, where 98–99% is converted to mesalamine (5-aminosalicylic acid).
**Distribution:** Action is primarily local and remains in the colon.
**Metabolism and Excretion:** 2% absorbed into systemic circulation is rapidly metabolized; mostly eliminated as mesalamine in the feces.
**Half-life:** 0.9 hr.

TIME/ACTION PROFILE (levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1 hr; 4–8 hr | 12 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity reactions to salicylates; Cross-sensitivity with furosemide, sulfonylurea hypoglycemic agents, or carbonic anhydrase inhibitors may exist; Glucose-6–phosphate dehydrogenase (G6PD) deficiency; Urinary tract or intestinal obstruction; Porphyria; Lactation: Lactation; Pedi: Children <2 yr (safety not established).
**Use Cautiously in:** Severe hepatic or renal impairment; Renal impairment (↑ risk of renal tubular damage); OB: Pregnancy; Geri: Consider ↓ body mass, hepatic/renal/cardiac function, intercurrent illness and drug therapies.

### Adverse Reactions/Side Effects

**CNS:** ataxia, confusion, dizziness, drowsiness, headache, mental depression, psychosis, restlessness. **GI:** diarrhea, abdominal pain, anorexia, exacerbation of colitis, drug-induced hepatitis, nausea, vomiting. **Derm:** itching, rash. **Hemat:** blood dyscrasias.

### Interactions

**Drug-Drug:** ↑ risk of bleeding after neuraxial anesthesia with **low molecular weight heparins** and **heparinoids**; discontinue olsalazine before initiation of therapy or monitor closely if discontinuation not possible. May ↓ metabolism, and ↑ effects/toxicity of **mercaptopurine** or **thioguanine** with and ↑ risk of myelosuppression (use lowest possible dose and monitor closely). ↑ risk of developing Reye's syndrome; avoid olsalazine during 6 wk after **varicella vaccine**.

### Route/Dosage

**PO (Adults):** 500 mg twice daily.

### Availability

**Capsules:** 250 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for allergy to sulfonamides and salicylates. Patients allergic to sulfasalazine may take mesalamine or olsalazine without difficulty, but therapy should be discontinued if rash or fever occur.
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- **Inflammatory Bowel Disease:** Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and throughout therapy.
- ***Lab Test Considerations:*** Monitor urinalysis, BUN, and serum creatinine prior to and periodically during therapy.
- Olsalazine may cause ↑ AST and ALT levels.
- ***Lab Test Considerations:*** Monitor CBC prior to and every 3–6 mo during prolonged therapy. Discontinue olsalazine if blood dyscrasias occur.

### Potential Nursing Diagnoses

Acute pain (Indications)
Diarrhea (Indications)

### Implementation

- **PO:** Administer with food in evenly divided doses every 12 hr.

### Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose.
- May cause dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, unusual bleeding or bruising, wheezing, fever, or hives occurs.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 mo of therapy.
- Instruct patient to notify health care professional if symptoms worsen or do not improve.

If symptoms of acute intolerance (cramping, acute abdominal pain, bloody diarrhea, fever, headache, rash) occur, discontinue therapy and notify health care professional immediately.
- Inform patient that proctoscopy and sigmoidoscopy may be required periodically during treatment to determine response.

### Evaluation/Desired Outcomes
- Decrease in diarrhea and abdominal pain.
- Return to normal bowel pattern in patients with inflammatory bowel disease. Effects may be seen within 3–21 days. The usual course of therapy is 3–6 wk.
- Maintenance of remission in patients with inflammatory bowel disease.
- Decrease in pain and inflammation, and increase in mobility in patients with rheumatoid arthritis.

## **omalizumab** (o-ma-**liz**-u-mab)
Xolair

***Classification***
Therapeutic: antiasthmatics
Pharmacologic: monoclonal antibodies

**Pregnancy Category B**

### Indications
Moderate to severe asthma not controlled by inhaled corticosteroids.

### Action
Inhibits binding of IgE to receptors on mast cells and eosinophils; preventing the release of mediators of the allergic response. Also decreases amount of IgE receptors on basophils. **Therapeutic Effects:** Decreased incidence of exacerbations of asthma.

### Pharmacokinetics
**Absorption:** 62% absorbed slowly from subcut sites.
**Distribution:** Enters breast milk.
**Metabolism and Excretion:** Degraded similarly to IgG via binding degradation, reticuloendothelial system and the liver.
**Half-life:** 26 days.

TIME/ACTION PROFILE (effects on IgE levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | within 1 hr | unknown | up to 1 yr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Acute bronchospasm.

**Use Cautiously in:** Chronic use of inhaled corticosteroids; OB: Use in pregnancy only if clearly needed; enroll pregnant women with at least one exposure to omalizumab in the Xolair Pregnancy Exposure Registry (1-866-496-5247); Lactation: Safety not established; Pedi: Children <12 yr (safety not established).

### Adverse Reactions/Side Effects
**Local:** injection site reactions. **Misc:** allergic reactions including ANAPHYLAXIS, ↑ risk of malignancy.

### Interactions
**Drug-Drug:** None noted.

### Route/Dosage
**Subcut (Adults and Children >12 yr):** 150–375 mg every 2–4 wk (determined by pretreatment serum IgE level and body weight).

### Availability
**Powder for injection:** 150 mg/vial.

## NURSING IMPLICATIONS

### Assessment
- Assess lung sounds and respiratory function prior to and periodically during therapy.
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically throughout therapy.
- Assess for allergic reactions (urticaria, tongue and/or throat edema) within 2 hr of first or subsequent injections. Observe patient following injection. Epinephrine, diphenhydramine, and corticosteroids should be available in case of anaphylaxis.
- Monitor for injection site reactions (bruising, redness, warmth, burning, stinging, itching, hives, pain, induration, mass, inflammation). Usually occur within 1 hr of injection, last <8 days, and decrease in frequency with subsequent dosing.
- ***Lab Test Considerations:*** Serum IgE levels will ↑ following administration and may persist for up to 1 year following discontinuation. Serum total IgE levels obtained <1 year following discontinuation may not reflect steady state free IgE levels and should not be used to reassess the dosing regimen.

### Potential Nursing Diagnoses
Ineffective airway clearance

### Implementation
- Doses of inhaled corticosteroids may be gradually decreased with supervision of health care professional; do not discontinue abruptly.

- **Subcut:** To reconstitute draw 1.4 mL of sterile water for injection into a 3-cc syringe with a 1-inch 18-gauge needle. With the vial upright on a flat surface, inject the sterile water into vial. Keep vial upright and gently swirl for approximately 1 min to evenly wet powder. Do not shake. Lyophilized omalizumab takes 15–20 min to dissolve. Gently swirl vial for 5–10 seconds every 5 min to dissolve any remaining particles. Solution should be clear or slightly opalescent and may have small bubbles or foam around edge of vial. Do not use if particles are visible or if contents do not dissolve completely within 40 min. Invert vial for 15 seconds to allow solution to drain toward stopper. Solution may be somewhat viscous. In order to obtain full 1.2 mL dose, all of solution must be withdrawn from the vial using a new 3-cc syringe with an 18-gauge needle, before expelling any air or excess solution from syringe. Administer within 8 hr if refrigerated or within 4 hr if stored at room temperature. Discard unused solution.
- Replace the 18-gauge needle with a 25-gauge needle for subcut injection. Because solution is slightly viscous, injection may take 5–10 seconds to administer. Divide doses >150 mg into 2 injection sites.

### Patient/Family Teaching

- Explain purpose of medication to patient. Inform patient that they may not see immediate results from omalizumab therapy.
- Instruct patient not to discontinue or reduce other asthma medications, especially inhaled corticosteroids, without consulting health care professional.

### Evaluation/Desired Outcomes

- Decreased incidence of exacerbations of asthma.

## omega-3-acid ethyl esters

(oh**me**-ga three **as**-id **eth**-il **es**-ters)

Lovaza

***Classification***

Therapeutic: lipid-lowering agents
Pharmacologic: fatty acids

**Pregnancy Category C**

### Indications

Hypertriglyceridemia (triglycerides ≥500 mmg/dL) in adults; used with specific diet.

### Action

Inhibits synthesis of triglycerides. **Therapeutic Effects:** Lowering of triglycerides.

### Pharmacokinetics

**Absorption:** Well absorbed.
**Distribution:** Unknown.
**Metabolism and Excretion:** Incorporated into phospholipids.
**Half-life:** Unknown.

TIME/ACTION PROFILE (lowering of triglycerides)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2 mo | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Allery/hypersensitivity to fish; OB, Lactation: Pregnancy or lactation; Pedi: Children (safety not established).

### Adverse Reactions/Side Effects

**GI:** altered taste, eructation. **Derm:** rash.

### Interactions

**Drug-Drug:** May ↑ risk of bleeding with **aspirin** or **warfarin**.

### Route/Dosage

**PO (Adults):** 4 g/day; may be given as a single dose or 2 g twice daily.

### Availability

**Gelatin capsules (oil-filled):** 1 g.

## NURSING IMPLICATIONS

### Assessment

- Obtain a diet history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Monitor serum triglyceride levels prior to and periodically during therapy.
- Monitor serum ALT periodically during therapy. May cause ↑ serum ALT without concurrent ↑ in AST levels.
- Monitor serum LDL cholesterol levels periodically during therapy. May cause ↑ in serum LDL levels.

### Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

### Implementation
- An appropriate lipid-lowering diet should be followed before therapy and should continue during therapy.
- **PO:** May be taken as a single 4-g dose or as 2 g twice daily. May be administered with meals.

### Patient/Family Teaching
- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Medication helps control but does not cure elevated serum triglyceride levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, weight loss in overweight patients, and control of medical problems (such as diabetes mellitus and hypothyroidism) that may contribute to hypertriglyceridemia.
- Emphasize the importance of follow-up exams to determine effectiveness.

### Evaluation/Desired Outcomes
- Lowering of serum triglyceride levels. Patients who do not have an adequate response after 2 mo of treatment should be withdrawn from therapy.

## omeprazole (o-mep-ra-zole)
Losec, Prilosec, Prilosec OTC

***Classification***
Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

**Pregnancy Category C**

### Indications
GERD/maintenance of healing in erosive esophagitis. Duodenal ulcers (with or without anti-infectives for *Helicobacter pylori*). Short-term treatment of active benign gastric ulcer. Pathologic hypersecretory conditions, including Zollinger-Ellison syndrome. Reduction of risk of GI bleeding in critically ill patients. **OTC:** Heartburn occurring ≥twice/wk.

### Action
Binds to an enzyme on gastric parietal cells in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen with lessened gastroesophageal reflux. Healing of duodenal ulcers.

### Pharmacokinetics
**Absorption:** Rapidly absorbed following oral administration; immediate release formulation contains bicarbonate to prevent acid degradation.
**Distribution:** Good distribution into gastric parietal cells.
**Protein Binding:** 95%.
**Metabolism and Excretion:** Extensively metabolized by the liver.
**Half-life:** 0.5–1 hr (↑ in liver disease to 3 hr).

TIME/ACTION PROFILE (antisecretory effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO-delayed release | within 1 hr | within 2 hr | 72–96 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Lactation: Discontinue omeprazole or discontinue breastfeeding.
**Use Cautiously in:** Liver disease (dose ↓ may be necessary); OB, Lactation, Pedi: Safety not established in pregnant or breastfeeding women, or children <1 yr; Geri: ↑ risk of hip fractures in patients using high doses for >1 year.

### Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness, fatigue, headache, weakness. **CV:** chest pain. **GI:** abdominal pain, acid regurgitation, constipation, diarrhea, flatulence, nausea, vomiting. **Derm:** itching, rash. **Misc:** allergic reactions.

### Interactions
**Drug-Drug:** Omeprazole is metabolized by the CYP450 enzyme system and may compete with other agents metabolized by this system. ↓ metabolism and may ↑ effects of **antifungal agents**, **diazepam**, **digoxin**, **flurazepam**, **triazolam**, **cyclosporine**, **phenytoin**, **saquinavir**, **tacrolimus**, and **warfarin**. May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **ampicillin**, **iron salts**, and **digoxin**. Has been used safely with **antacids**. May significantly ↓ effects of **atazanavir** and **nelfinavir** (concurrent use not recommended). May ↑ risk of bleeding with **warfarin** (monitor INR/PT). May ↓ the antiplatelet effects of **clopidogrel**.

### Route/Dosage
**PO (Adults):** *GERD/erosive esophagitis*—20 mg once daily. *Duodenal ulcers associated with H. pylori*—40 mg once daily in the morning with clarithromycin for 2 wk, then 20 mg once daily for 2 wk *or* 20 mg twice daily with clarithromycin 500 mg twice daily and amoxicillin 1000 mg twice daily for 10 days (if ulcer is present at beginning of therapy, continue omeprazole 20 mg daily for 18 more days); has also been used with clarithromycin and metronidazole. *Gastric ulcer*—40 mg

once daily for 4–6 wk. *Reduction of the risk of GI bleeding in critically ill patients*—40 mg initially, then another 40 mg 6–8 hr later, followed by 40 mg once daily for up to 14 days. *Gastric hypersecretory conditions*—60 mg once daily initially; may be increased up to 120 mg 3 times daily (doses >80 mg/day should be given in divided doses); *OTC*—20 mg once daily for up to 14 days.
**PO (Children 1–16 yr and 5–9 kg):** *GERD/erosive esophagitis*—5 mg once daily.
**PO (Children 1–16 yr and 10–19 kg):** *GERD/erosive esophagitis*—10 mg once daily.
**PO (Children 1–16 yr and ≥20 kg):** *GERD/erosive esophagitis*—20 mg once daily.

### Availability (generic available)

**Delayed-release capsules:** 10 mg, 20 mg[Rx, OTC], 40 mg. **Delayed-release powder for oral suspension (peach-mint):** 2.5 mg/packet, 10 mg/packet. ***In combination with:*** metronidazole and clarithromycin in a compliance package (Losec 1-2-3 M); with amoxicillin and clarithromycin in a compliance package (Losec 1-2-3-A) (both in Canada only); with sodium bicarbonate (Zegerid; see Appendix B).

## NURSING IMPLICATIONS

### Assessment

- Assess patient routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** Monitor CBC with differential periodically during therapy.
- May cause ↑ AST, ALT, alkaline phosphatase, and bilirubin.
- May cause serum gastrin concentrations to ↑ during first 1–2 wk of therapy. Levels return to normal after discontinuation of omeprazole.
- Monitor INR and prothrombin time in patients taking warfarin.

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- Do not confuse Prilosec (omeprazole) with Prinivil (lisinopril).
- **PO:** Administer doses before meals, preferably in the morning. Capsules should be swallowed whole; do not crush or chew. Capsules may be opened and sprinkled on cool applesauce, entire mixture should be ingested immediately and followed by a drink of water. Do not store for future use.
- *Powder for oral suspension:* Administer on empty stomach, as least 1 hr before a meal. For patients with nasogastric or enteral feeding, suspend feeding for 3 hr before and 1 hr after administration. Empty packet contents into a small cup containing 1–2 tablespoons of water. **Do not use other liquids or foods.** If administered through a nasogastric tube, suspend in 20 mL of water. Stir well and drink immediately. Refill cup with water and drink again.
- May be administered concurrently with antacids.

### Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- May cause occasional drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products with omeprazole.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.

### Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy.
- Decrease in symptoms of GERD and erosive esophagitis. Therapy is continued for 4–8 wk after initial episode.

## ondansetron (on-dan-se-tron)

Zofran, Zofran ODT

***Classification***
Therapeutic: antiemetics
Pharmacologic: 5-$HT_3$ antagonists

**Pregnancy Category B**

### Indications

Prevention of nausea and vomiting associated with chemotherapy or radiation therapy. **IM, IV:** Pre-

vention and treatment of postoperative nausea and vomiting.

### Action

Blocks the effects of serotonin at 5-$HT_3$–receptor sites (selective antagonist) located in vagal nerve terminals and the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following chemotherapy or surgery.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability; 100% absorbed following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Extensively metabolized by the liver; 5% excreted unchanged by the kidneys.
**Half-life:** *Adults:* 3.5–5.5 hr; *Children 5 mo–12 yrs:* 2.9 hr.

TIME/ACTION PROFILE (antiemetic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO, IV | rapid | 15–30 min | 4 hr–8 hr |
| IM | rapid | 40 min | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Orally disintegrating tablets contain aspartame and should not be used in patients with phenylketonuria.
**Use Cautiously in:** Liver impairment (daily dose not to exceed 8 mg); Abdominal surgery (may mask ileus); OB, Lactation, Pedi: Pregnancy, lactation, or children ≤3 yr (safety not established) .

### Adverse Reactions/Side Effects

**CNS:** headache, dizziness, drowsiness, fatigue, weakness. **GI:** constipation, diarrhea, abdominal pain, dry mouth, ↑ liver enzymes. **Neuro:** extrapyramidal reactions.

### Interactions

**Drug-Drug:** May be affected by **drugs altering the activity of liver enzymes**.

### Route/Dosage

**PO (Adults and Children >11 yr):** *Prevention of chemotherapy-induced nausea/vomiting*—8 mg 30 min prior to chemotherapy and repeated 8 hr later; 8 mg q 12 hr may be given for 1–2 days following chemotherapy. *Prevention of radiation-induced nausea/vomiting*—8 mg 1–2 hr prior to radiation; may be repeated q 8 hr, depending on type, location, and extent of radiation. *Prevention of postoperative nausea/vomiting*—16 mg 1 hr before induction of anesthesia.
**PO (Children 4–11 yr):** *Prevention of chemotherapy-induced nausea/vomiting*—4 mg 30 min prior to chemotherapy and repeated 4 and 8 hr later; 4 mg q 8 hr may be given for 1–2 days following chemotherapy.
**IV (Adults):** *Prevention of chemotherapy-induced nausea/vomiting*—0.15 mg/kg 15–30 min prior to chemotherapy, repeated 4 and 8 hr later, or 32-mg single dose 30 min prior to chemotherapy (lower doses have been used).
**IM, IV (Adults):** *Prevention of postoperative nausea/vomiting*—4 mg before induction of anesthesia or postoperatively.
**IV (Children 6 mo–18 yr):** *Prevention of chemotherapy-induced nausea/vomiting*—0.15 mg/kg 15–30 min prior to chemotherapy, repeated 4 and 8 hr later.
**IV (Children 2–12 yr and ≤40 kg):** *Prevention of postoperative nausea/vomiting*—0.1 mg/kg.
**IV (Children >40 kg):** *Prevention of postoperative nausea/vomiting*—4 mg.

#### Hepatic Impairment

**PO, IM, IV (Adults):** Not to exceed 8 mg/day.

### Availability (generic available)

**Orally disintegrating tablets (contain aspartame) (strawberry flavor):** 4 mg, 8 mg. **Cost:** *Generic*—4 mg $549.00/30. **Tablets:** 4 mg, 8 mg, 24 mg. **Cost:** *Generic*—4 mg $569.99/30, 8 mg $1,048.95/30. **Oral solution (strawberry flavor):** 4 mg/5 mL. **Solution for injection:** 2 mg/mL. **Premixed infusion:** 32 mg/50 mL D5W.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- Assess patient for extrapyramidal effects (involuntary movements, facial grimacing, rigidity, shuffling walk, trembling of hands) periodically during therapy.
- ***Lab Test Considerations:*** May cause transient ↑ in serum bilirubin, AST, and ALT levels.

### Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)
Diarrhea (Side Effects)
Constipation (Side Effects)

### Implementation

- Do not confuse Zofran (ondansetron) with Zosyn (piperacillin/tazobactam).
- First dose is administered prior to emetogenic event.

- **PO:** For orally disintegrating tablets, do not attempt to push through foil backing; with dry hands, peel back backing and remove tablet. Immediately place tablet on tongue; tablet will dissolve in seconds, then swallow with saliva. Administration of liquid is not necessary.

**IV Administration**

- **Direct IV:** Administer undiluted (2 mg/mL) immediately before induction of anesthesia or postoperatively if nausea and vomiting occur shortly after surgery. ***Rate:*** Administer over at least 30 sec and preferably over 2–5 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute doses for prevention of nausea and vomiting associated with chemotherapy in 50 mL of D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.45% NaCl. Solution is clear and colorless. Stable for 7 days at room temperature following dilution. ***Concentration:*** 1 mg/mL. ***Rate:*** Administer each dose over 15 min.
- **Syringe Compatibility:** alfentanil, atropine, fentanyl, glycopyrrolate, meperidine, metoclopramide, midazolam, morphine, naloxone, neostigmine, propofol.
- **Syringe Incompatibility:** droperidol.
- **Y-Site Compatibility:** aldesleukin, amifostine, amikacin, azithromycin, aztreonam, bleomycin, carboplatin, carmustine, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chlorpromazine, cimetidine, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, dexmedetomidine, diphenhydramine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, etoposide, etoposide phosphate, famotidine, fenoldopam, filgrastim, floxuridine, fluconazole, fludarabine, gemcitabine, gentamicin, haloperidol, heparin, hydrocortisone sodium succinate, hydrocortisone sodium phosphate, hydromorphone, ifosfamide, imipenem/cilastatin, linezolid, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, mitomycin, mitoxantrone, morphine, oxaliplatin, paclitaxel, pentostatin, piperacillin/tazobactam, potassium chloride, promethazine, prochlorperazine edisylate, ranitidine, remifentanil, sodium acetate, streptozocin, teniposide, thiotepa, ticarcillin/clavulanate, topotecan, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B, amphotericin B cholesteryl sulfate, ampicillin, ampicillin/sulbactam, amsacrine, cefepime, cefoperazone, furosemide, ganciclovir, lansoprazole, lorazepam, methylprednisolone sodium succinate, pemetrexed, sargramostim, sodium bicarbonate.

### Patient/Family Teaching

- Instruct patient to take ondansetron as directed.
- Advise patient to notify health care professional immediately if involuntary movement of eyes, face, or limbs occurs.

### Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with initial and repeat courses of emetogenic cancer chemotherapy.
- Prevention of postoperative nausea and vomiting.
- Prevention of nausea and vomiting due to radiation therapy.

O

## oprelvekin (o-prell-ve-kin)

Neumega

***Classification***

Therapeutic: colony-stimulating factors
Pharmacologic: interleukins, thrombopoetic growth factors

**Pregnancy Category C**

### Indications

Prevention of severe thrombocytopenia and reduction of the need for platelet transfusions following myelosuppressive chemotherapy in patients with nonmyeloid malignancies at risk for thrombocytopenia.

### Action

Stimulates production of megakaryocytes and platelets. **Therapeutic Effects:** Increased platelet count.

### Pharmacokinetics

**Absorption:** >80% absorbed following subcut administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Appears to be mostly metabolized, with metabolites eliminated by kidneys.
**Half-life:** 6.9 hr.

TIME/ACTION PROFILE (↑ in platelet count)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | 5–9 days | unknown | 7–14 days† |

†Counts continue to rise for 7 days following discontinuation and then return to baseline by 14 days

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Lactation: Lactation.

**Use Cautiously in:** Any condition in which sodium and water retention would pose problems (CHF, renal disease); Pre-existing pericardial effusion or ascites (may be exacerbated); History of atrial arrhythmias (especially if receiving cardiac medications or previous doxorubicin therapy); Pre-existing papilledema or tumors of the CNS; OB, Pedi: Safety not established.

### Adverse Reactions/Side Effects

These effects occurred in patients who had recently received myelosuppressive chemotherapy. **CNS:** dizziness, headache, insomnia, nervousness, weakness. **EENT:** conjunctival hemorrhage, blurred vision, changes in visual acutiy, blindness, papilledema, pharyngitis, rhinitis. **Resp:** cough, dyspnea, pleural effusions. **CV:** VENTRICULAR ARRHYTHMIAS, atrial fibrillation, edema, palpitations, syncope, tachycardia, vasodilation, ventricular arrhythmias. **GI:** anorexia, constipation, diarrhea, dyspepsia, mucositis, nausea, oral moniliasis, vomiting, abdominal pain. **Derm:** alopecia, ecchymoses, rash. **F and E:** sodium and water retention. **Local:** injection site reactions. **MS:** bone pain, myalgia. **Misc:** chills, fever, infection, pain.

### Interactions

**Drug-Drug:** None significant.

### Route/Dosage

**Subcut (Adults):** 50 mcg/kg once daily for 10–21 days.

### Availability

**Powder for injection:** 5 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for signs of fluid retention (dyspnea on exertion, peripheral edema) during therapy. Fluid retention is a common side effect that usually resolves within several days following discontinuation of oprelvekin.
- ***Lab Test Considerations:*** Monitor platelet count prior to and periodically during therapy, especially at expected nadir. Therapy is continued until postnadir platelet count is ≥50,000 cells/mL.
- CBC should be monitored prior to and at regular intervals during therapy. Decrease in hemoglobin concentration, hematocrit, and RBC count may occur because of increased plasma volume (dilutional anemia); usually begins within 3–5 days of therapy and is reversible within a week of discontinuation of therapy.
- Monitor electrolyte concentrations in patients receiving chronic diuretic therapy. Hypokalemia may be fatal.
- May cause an ↑ in plasma fibrinogen.

### Potential Nursing Diagnoses

Excess fluid volume (Side Effects)

### Implementation

- Therapy should be started within 6–24 hr after completion of chemotherapy and continued for 10–21 days.
- Treatment should be discontinued at least 2 days prior to next planned chemotherapy cycle.
- **Subcut:** Reconstitute with 1 mL of sterile water for injection without preservatives for a concentration of 5 mg/mL. Direct diluent to sides of vial and swirl gently. Solution is clear and colorless. Do not administer solutions that are discolored or contain particulate matter. Do not shake or agitate vigorously. Do not freeze. Do not reuse vials. Administer within 3 hr of reconstitution as a single injection in abdomen, hip, thigh, or upper arm.

### Patient/Family Teaching

- Instruct patient in proper technique for preparation and administration of medication. Provide a puncture-resistant container for disposal of needles.
- May cause transient blurred vision or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Inform patient of side effects and advise patient to notify health care professional if chest pain, shortness of breath, fatigue, blurred vision, or irregular heartbeat persists.

### Evaluation/Desired Outcomes

- Increase in postnadir platelet count to ≥50,000 cells/mL.

**orlistat** (**or**-li-stat)
Alli, Xenical

***Classification***
Therapeutic: weight control agents
Pharmacologic: lipase inhibitors

**Pregnancy Category B**

## Indications
Obesity management (weight loss and maintenance) when used in conjunction with a reduced-calorie diet in patients with an initial BMI ≥30 kg/m² or ≥27 kg/m² in the presence of additional risk factors (diabetes, hypertension, hyperlipidemia). Reduces the risk of weight regain after prior loss. May delay onset of type 2 diabetes in prediabetic patients.

## Action
Decreases the absorption of dietary fat by reversibly inhibiting enzymes (lipases), which are necessary for the breakdown and subsequent absorption of fat. **Therapeutic Effects:** Weight loss and maintenance in obese patients. Delayed onset of type 2 diabetes.

## Pharmacokinetics
**Absorption:** Minimal systemic absorption.
**Distribution:** Action is local, within the GI tract.
**Protein Binding:** Minimally absorbed drug is >99% bound to plasma proteins.
**Metabolism and Excretion:** Major route is fecal elimination of unabsorbed drug.
**Half-life:** 1–2 hr.

TIME/ACTION PROFILE (effects on fecal fat)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 24–48 hr | unknown | 48–72 hr† |

†Following discontinuation

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Chronic malabsorption syndrome or cholestasis; OB, Lactation: Effects of orlistat on developing fetus or breastfeeding infant are unknown.
**Use Cautiously in:** Pedi: Safety not established for children < 12 .

## Adverse Reactions/Side Effects
With initial use; incidence decreases with prolonged use.
**GI:** HEPATOTOXICITY, fecal urgency, flatus with discharge, increased defecation, oily evacuation, oily spotting, fecal incontinence.

## Interactions
**Drug-Drug:** ↓ absorption of some **fat-soluble vitamins**, **beta-carotene**, and **levothyroxine** (separate orlistat and levothyroxine by ≥4 hr).

## Route/Dosage
**PO (Adults and adolescents ≥ 12 yr):** 60–120 mg 3 times daily with each meal containing fat.

## Availability
**Capsules:** 60 mg[OTC], 120 mg.

# NURSING IMPLICATIONS

## Assessment
- Monitor patients for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.

## Potential Nursing Diagnoses
Disturbed body image (Indications)
Imbalanced nutrition: more than body requirements (Indications)

## Implementation
- **PO:** Administer one capsule 3 times daily with or up to 1 hour after a meal. If a meal is missed or contains no fat, dose of orlistat can be omitted.
- A supplemental multivitamin containing vitamins A, D, E, K, and beta-carotene should be taken daily, at least 2 hr before or after orlistat dose.
- Psyllium 6 g with each dose or 12 g at bedtime may decrease GI side effects.

## Patient/Family Teaching
- Instruct patient to take orlistat with meals as directed. If a meal is missed or contains no fat, orlistat dose can be omitted. Do not take more than recommended dose; does not improve benefit.
- Instruct patient to adhere to a reduced-calorie diet. Daily intake of fat should be distributed over three main meals. Meals should contain no more than 30% fat. Taking orlistat with a meal high in fat may increase the GI side effects.
- Advise patient that regular physical activity, approved by a health care professional, should be used in conjunction with orlistat and diet.
- Inform patient of common GI side effects (oily spotting, gas with discharge, urgent need to go to the bathroom, oily or fatty stools, an oily discharge, increased number of bowel movements, inability to control bowel movements). Oil in bowel movement may be clear or have orange or brown colorations. GI side effects usually occur in first weeks of treatment and are more increased following a meal high in

fat. May lessen or disappear, or may continue for 6 mo or longer.
- Advise patient to notify health care professional if signs and symptoms of hepatotoxicity (weakness, fatigue, fever, jaundice, brown urine, abdominal pain, nausea, vomiting, light-colored stools, itching, loss of appetite) occur.
- Advise patient to notify health care professional prior to taking other Rx, OTC, or herbal products.
- Advise patient to notify health care professional if pregnancy is planned or suspected.

### Evaluation/Desired Outcomes
- Slow, consistent weight loss when combined with a reduced-calorie diet.
- Delayed onset of type 2 diabetes.

## oseltamivir (o-sel-tam-i-vir)
Tamiflu

***Classification***
Therapeutic: antivirals
Pharmacologic: neuramidase inhibitors

**Pregnancy Category C**

### Indications
Treatment of uncomplicated acute illness due to influenza infection in adults and children ≥1 yr who have had symptoms for ≤2 days. Prevention of influenza in patients ≥1 yr.

### Action
Inhibits the enzyme neuraminidase, which may alter virus particle aggregation and release. **Therapeutic Effects:** Reduced duration or prevention of flu-related symptoms.

### Pharmacokinetics
**Absorption:** Rapidly absorbed from the GI tract and converted by the liver to the active form, oseltamivir carboxylate. 75% reaches systemic circulation as the active drug.
**Distribution:** Unknown.
**Metabolism and Excretion:** Rapidly metabolized by the liver to oseltamivir carboxylate, the active drug. >99% excreted unchanged in urine.
**Half-life:** *Oseltamivir carboxylate*—6–10 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | 12 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Pedi: Children <1 yr.

**Use Cautiously in:** Pedi: Children ≥1 yr (may be at ↑ risk for neuropsychiatric events); OB, Lactation: Safety not established; use only if potential benefits outweigh possible risks.

### Adverse Reactions/Side Effects
**CNS:** SEIZURES, abnormal behavior, agitation, confusion, delirium, hallucinations, insomnia, nightmares, vertigo. **Resp:** bronchitis. **GI:** nausea, vomiting.

### Interactions
**Drug-Drug:** None significant.

### Route/Dosage

#### Treatment of Influenza
**PO (Adults and Children > 40kg):** 75 mg twice daily for 5 days.
**PO (Children 23–40 kg):** 60 mg twice daily.
**PO (Children 15–23 kg):** 45 mg twice daily.
**PO (Children ≤ 15 kg and ≥ 1 yr):** 30 mg twice daily.

#### Renal Impairment
**PO (Adults):** *CCr < 30 mL/min*—75 mg once daily for 5 days.

#### Influenza Prevention
**PO (Adults and Children ≥ 13 yrs):** 75 mg once daily for at least 10 days.
**PO (Children >40 kg):** 75 mg once daily for 10 days.
**PO (Children 23–40 kg):** 60 mg once daily for 10 days.
**PO (Children 15–23 kg):** 45 mg once daily for 10 days.
**PO (Children ≤15 kg and ≥1 yr):** 30 mg once daily.

#### Renal Impairment
**PO (Adults and Children ≥ 13 yrs):** *CCr 10–30 mL/min*—75 mg every other day *or* 30 mg every day.

### Availability
**Capsules:** 30 mg, 45 mg, 75 mg. **Cost:** 75 mg $84.99/10. **Oral suspension (tutti-frutti flavor):** 12 mg/mL.

## NURSING IMPLICATIONS

### Assessment
- Monitor influenza symptoms (sudden onset of fever, cough, headache, fatigue, muscular weakness, sore throat). Additional supportive treatment may be indicated to treat symptoms.

### Potential Nursing Diagnoses
Risk for infection (Indications)

### Implementation

- Treatment with oseltamivir should be started as soon as possible from the first sign of flu symptoms.
- Consider available information on influenza drug susceptibility patterns and treatment effects before using oseltamivir for prophylaxis.
- **PO:** May be administered with food or milk to minimize GI irritation.
- To prepare oral solution, tap closed bottle to loosen powder. Add total amount of water for constitution and shake closed bottle for 15 seconds. Remove childproof cap and push bottle adaptor into neck of bottle. Close bottle with childproof top tightly, assuring proper seating of bottle adaptor and childproof status. Shake well before use. Use within 10 days of constitution. If oral suspension is not available, capsules can be opened and mixed with sweetened liquids, such as regular or sugar-free chocolate syrup.
- Dosing errors have occurred due to oseltamivir dosing in mg and solution in mL. Make sure units of measure on prescription instructions match dosing device provided with the drug.

### Patient/Family Teaching

- Instruct patient to take oseltamivir as soon as influenza symptoms appear and to continue to take it as directed, for the full course of therapy, even if feeling better. Take missed doses as soon as remembered unless within 2 hr of next dose. Do not double doses.
- Caution patient that oseltamivir should not be shared with anyone, even if they have the same symptoms.
- Advise patient that oseltamivir is not a substitute for a flu shot. Patients should receive annual flu shot according to immunization guidelines.
- Advise patients to report behavioral changes (hallucinations, delirium, and abnormal behavior) to health care professional immediately.
- Advise patient to consult health care professional before taking other medications concurrently with oseltamivir.

### Evaluation/Desired Outcomes

- Reduced duration or prevention of flu-related symptoms.

## oxacillin, See PENICILLINS, PENICILLINASE RESISTANT.

## oxaliplatin (ox-a-li-pla-tin)

Eloxatin

***Classification***

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

**Pregnancy Category D**

### Indications

Used in combination with 5–fluorouracil and leucovorin in the treatment of advanced or metastatic colon or rectal cancer. **Unlabeled Use:** Treatment of ovarian cancer that has progressed despite treatment with other agents.

### Action

Inhibits DNA replication and transcription by incorporating platinum into normal cross-linking (cell-cycle nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Extensive tissue distribution.
**Protein Binding:** >90% (platinum).
**Metabolism and Excretion:** Undergoes rapid and extensive nonenzymatic biotransformation; excreted mostly by the kidneys.
**Half-life:** 391 hours.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hypersensitivity to other platinum compounds; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Renal impairment; Geri: ↑ risk of adverse reactions; Pedi: Safety not established.

### Adverse Reactions/Side Effects

Adverse reactions are noted for the combination of oxaliplatin, 5–FU and leucovorin.
**CNS:** fatigue. **CV:** chest pain, edema, thromboembolism. **EENT:** visual abnormalities. **Resp:** PULMONARY FIBROSIS, coughing, dyspnea. **GI:** diar-

rhea, nausea, vomiting, abdominal pain, anorexia, gastroesophageal reflux, stomatitis. **F and E:** dehydration, hypokalemia. **Hemat:** leukopenia, NEUTROPENIA, THROMBOCYTOPENIA, anemia. **Local:** injection site reactions. **MS:** back pain. **Neuro:** neurotoxicity. **Misc:** ANAPHYLAXIS/ANAPHYLACTOID REACTIONS, fever.

### Interactions

**Drug-Drug:** Concurrent use of **nephrotoxic agents** may ↑ toxicity.

### Route/Dosage

**IV (Adults):** *Day 1*—85 mg/m² with leucovorin 200 mg/m² at the same time over 2 hr, followed by 5–fluorouracil 400 mg/m² bolus over 2–4 min, then 5–fluorouracil 600 mg/m² as a 22 hr infusion. *Day 2*—leucovorin 200 mg/m² over 2 hr, followed by 5–fluorouracil 400 mg/m² bolus over 2–4 min, then 5–fluorouracil 600 mg/m² as a 22 hr infusion. Cycle is repeated every 2 wk. Dosage reduction/alteration may be required for neurotoxicity or other serious adverse effects.

### Availability (generic available)

**Solution for injection:** 5 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for peripheral sensory neuropathy. *Acute onset* occurs within hr to 1–2 days of dosing, resolves within 14 days, and frequently recurs with further dosing (transient paresthesia, dysesthesia and hypothesia of hands, feet, perioral area, or throat). Symptoms may be precipitated or exacerbated by exposure to cold or cold objects. May also cause jaw spasm, abnormal tongue sensation, dysarthria, eye pain, and a feeling of chest pressure. *Persistent* (>14 days) causes paresthesias, dysesthesias, and hypoesthesias, but may also include deficits in proprioception that may interfere with daily activities (walking, writing, swallowing). Persistent neuropathy may occur without prior acute neuropathy and may improve upon discontinuation of oxaliplatin.
- Assess for signs of pulmonary fibrosis (nonproductive cough, dyspnea, crackles, radiological; infiltrates). May be fatal. Discontinue oxaliplatin if pulmonary fibrosis occurs.
- Monitor for signs of anaphylaxis (rash, hives, swelling or lips or tongue, sudden cough). Epinephrine, corticosteroids, and antihistamines should be readily available.
- ***Lab Test Considerations:*** Monitor WBC with differential, hemoglobin, platelet count, and blood chemistries (ALT, AST, bilirubin, and creatinine) before each oxaliplatin cycle.

### Potential Nursing Diagnoses

Nausea (Adverse Reactions)

### Implementation

- Extravasation may result in local pain and inflammation that may be severe and lead to necrosis.
- Premedicate patient with antiemetics with or without dexamethasone. Prehydration is not required.

#### IV Administration

- **Intermittent Infusion:** Protect concentrated solution from light; do not freeze. ***Diluent:*** Must be further diluted with 250–500 mL of D5W. **Do not use 0.9% NaCl or any other chloride-containing solution for final solution.** Do not use aluminum needles or administration sets containing aluminum parts; aluminum may cause degradation of platinum compounds. May be stored in refrigerator for 24 hr or 6 hr at room temperature. Diluted solution is not light-sensitive. Do not administer solutions that are discolored or contain particulate matter. ***Concentration:*** 0.2–0.6 mg/mL. ***Rate:*** Administer oxaliplatin simultaneously with leucovorin in separate bags via Y-line over 120 min. Prolonging infusion time to 6 hr may decrease acute toxicities. Infusion times for fluorouracil and leucovorin do not need to change.
- **Y-Site Compatibility:** alfentanil, amifostine, amikacin, aminocaproic acid, amiodarone, amphotericin B colloid, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone sodium phosphate, dexmeditomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gemcita-

bine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, inamrinone, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metaraminol, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, paclitaxel, palonosetron, pancuronium, pemetrexed, pentamidine, pentazocine, phentolamine, phenylephrine, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, rocuronium, sodium acetate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** cefepime, cefoperazone, dantrolene, diazepam. Alkaline solutions, chloride-containing solutions. Infusion line should be flushed with D5W prior to administration of other solutions or medications.

## Patient/Family Teaching

- Inform patients and caregivers of potential for peripheral neuropathy and potentiation by exposure to cold or cold objects. Advise patient to avoid cold drinks, use of ice in drinks or as ice packs, and to cover exposed skin prior to exposure to cold temperature or cold objects. Caution patients to cover themselves with a blanket during infusion, do not breathe deeply when exposed to cold air, wear warm clothing, and cover mouth and nose with a scarf or pull-down ski cap to warm the air that goes to their lungs, do not take things from the freezer or refrigerator without wearing gloves, drink fluids warm or at room temperature, always drink through a straw, do not use ice chips for nausea, be aware that most metals (car doors, mailbox) are cold; wear gloves to touch, do not run air conditioning at high levels in house or car, if hands get cold wash them with warm water. Advise health care professional of how you did since last treatment before next infusion.
- Instruct patient to notify health care professional immediately if signs of low blood cell counts (fever, persistent diarrhea, infection) or if persistent vomiting, signs of dehydration, cough or breathing difficulty, thirst, dry mouth, dizziness, decreased urination or signs of allergic reactions occur.

## Evaluation/Desired Outcomes

- Decrease in size and spread of malignancies.

# oxaprozin (ox-a-proe-zin)

Daypro

***Classification***

Therapeutic: antirheumatics, nonsteroidal anti-inflammatory agents

**Pregnancy Category C (first and second trimester), D (third trimester)**

O

## Indications

Osteoarthritis. Rheumatoid arthritis. Juvenile rheumatoid arthritis.

## Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration (80%); 35% is rapidly converted to an active metabolite.
**Distribution:** Unknown.
**Protein Binding:** 99.9%.
**Metabolism and Excretion:** The active metabolite is metabolized by the liver to inactive compounds.
**Half-life:** 42–50 hr.

TIME/ACTION PROFILE (antirheumatic action)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 7 days | unknown | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding or ulcer disease; Peri-operative pain from coronary artery bypass graft (CABG) surgery; Lactation: Lactation.
**Use Cautiously in:** Cardiovascular disease or risk factors for cardiovascular disease (may ↑

risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Severe hepatic disease; Renal impairment (lower initial dose may be necessary); History of ulcer disease; OB: May cause premature closure of the ductus arteriosus; not recommended for use in the second half of pregnancy; Pedi: Children <6 yr (safety not established); Geri: Appears on Beers list; at ↑ risk of GI bleeding; may require ↓ dose due to age-related ↓ in renal function.

### Adverse Reactions/Side Effects

**CNS:** agitation, anxiety, confusion, depression, dizziness, drowsiness, fatigue, headache, insomnia, malaise, weakness. **EENT:** abnormal vision, tinnitus. **Resp:** dyspnea, hypersensitivity pneumonitis. **CV:** edema, vasculitis. **GI:** GI BLEEDING, abdominal pain, diarrhea, dyspepsia, ↑ liver enzymes, anorexia, cholestatic jaundice, constipation, dry mouth, duodenal ulcer, flatulence, gastritis, increased appetite, nausea, stomatitis, vomiting. **GU:** albuminuria, azotemia, interstitial nephritis. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, ↑ sweating, photosensitivity, pruritus, rash. **Hemat:** prolonged bleeding time. **Metab:** weight gain. **Neuro:** paresthesia, tremor. **Misc:** allergic reactions including ANAPHYLAXIS, ANGIONEUROTIC EDEMA.

### Interactions

**Drug-Drug:** ↑ adverse GI effects and toxicity with **aspirin**, other **NSAIDs**, **potassium supplements**, **corticosteroids**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensive** therapy. May ↑ hypoglycemic effects of **insulin** or **oral hypoglycemic agents**. ↑ risk of toxicity from **methotrexate**. ↑ risk of bleeding with **cefotetan**, **cefoperazone**, **thrombolytic agents**, **anticoagulants**, **ticlopidine**, **clopidogrel**, **eptifibatide**, or **tirofiban**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**.

**Drug-Natural Products:** ↑ anticoagulant effect and bleeding risk with **arnica**, **chamomile**, **clove**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng** , and others.

### Route/Dosage

### Osteoarthritis or Rheumatoid Arthritis

**PO (Adults):** 1200 mg once daily; onset may be more rapid with an initial 1800-mg dose. Patients with low body weight, mild disease, or renal impairment may be started at 600 mg/day (not to exceed 1800 mg/day or 26 mg/kg/day). Daily doses >1200 mg should be given in 2–3 divided doses. Consideration should be given to decreasing dose to lowest effective amount.

### Juvenile Rheumatoid Arthritis

**PO (Children 6–16 yr):** ≥*55 kg*-1200 mg once daily; *32–54 kg*-900 mg once daily; *22–31 kg*-600 mg once daily.

### Availability (generic available)

**Tablets:** 600 mg.

## NURSING IMPLICATIONS

### Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- Assess pain and range of motion prior to and periodically during therapy.
- ***Lab Test Considerations:*** May cause prolonged bleeding time, which may persist for up to 2 wk following discontinuation of therapy.
- Evaluate BUN, serum creatinine, CBC, and liver function tests periodically in patients receiving prolonged therapy. Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests may show ↑ levels. Blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓ .

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- **PO:** Administer with food or antacids to decrease GI irritation.

### Patient/Family Teaching

- Advise patient to take oxaprozin with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- May cause drowsiness and dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, and other

OTC or herbal products without consulting health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery. Oxaprozin should be discontinued 2 wk prior to surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.

## Evaluation/Desired Outcomes

- Decreased pain and improved joint mobility. Maximum effectiveness may require 2 wk or more of continuous therapy. Patients who do not respond to one NSAID may respond to another.

# oxazepam (ox-az-e-pam)

Apo-Oxazepam, Novoxapam, Serax

***Classification***

Therapeutic: antianxiety agents, sedative/hypnotics
Pharmacologic: benzodiazepines

**Schedule IV**

**Pregnancy Category D**

## Indications

Management of anxiety, anxiety associated with depression. Symptomatic treatment of alcohol withdrawal.

## Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Decreased anxiety. Diminished symptoms of alcohol withdrawal.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration. Absorption is slower than with other benzodiazepines.
**Distribution:** Widely distributed. Crosses the blood-brain barrier. May cross the placenta and enter breast milk.
**Metabolism and Excretion:** Metabolized by the liver to inactive compounds.
**Protein Binding:** 97%.
**Half-life:** 5–15 hr.

TIME/ACTION PROFILE (sedation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 45–90 min | unknown | 6–12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Some products contain tartrazine and should be avoided in patients with known intolerance; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Hepatic dysfunction (may be preferred over some benzodiazepines due to short half-life); History of suicide attempt or drug abuse; Debilitated patients (initial dosage ↓ recommended); Severe chronic obstructive pulmonary disease; Myasthenia gravis; Pedi: Children <6 yr (safety not established) for children <6 yr.; Geri: Appears on Beers list (associated with ↑ risk of falls; ↓ dose required); ↑ sensitivity to benzodiazepines.

## Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, confusion, hangover, headache, impaired memory, mental depression, paradoxical excitation, slurred speech. **EENT:** blurred vision. **Resp:** respiratory depression. **CV:** tachycardia. **GI:** constipation, diarrhea, drug-induced hepatitis, nausea, vomiting, weight gain (unusual). **GU:** urinary problems. **Derm:** rashes. **Hemat:** leukopenia. **Misc:** physical dependence, psychological dependence, tolerance.

## Interactions

**Drug-Drug:** Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioid analgesics**, and other **sedative/hypnotics** (including other **benzodiazepines**). May ↓ the therapeutic effectiveness of **levodopa**. **Hormonal contraceptives** or **phenytoin** may ↓ effectiveness. **Theophylline** may ↓ sedative effects.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

## Route/Dosage

**PO (Adults):** *Antianxiety agent*—10–30 mg 3–4 times daily. *Sedative/hypnotic/management of alcohol withdrawal*—15–30 mg 3–4 times daily.

**PO (Geriatric Patients):** 5 mg 1–2 times daily initially or 10 mg 3 times daily; may be ↑ as needed.

### Availability (generic available)

**Capsules:** 10 mg, 15 mg, 30 mg. **Tablets:** 10 mg, 15 mg, 30 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for anxiety and orientation, mood and behavior.
- Assess level of sedation (ataxia, dizziness, slurred speech) periodically throughout therapy.
- Assess regularly for continued need for treatment.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient.
- Geri: Assess CNS effects and risk of falls. Institute falls prevention strategies.
- ***Lab Test Considerations:*** Monitor CBC and liver function tests periodically during prolonged therapy.
- May cause decreased thyroidal uptake of sodium iodide $^{123}I$ and $^{131}I$.

### Potential Nursing Diagnoses

Anxiety (Indications)
Ineffective coping (Indications)
Risk for injury (Side Effects)

### Implementation

- Medication should be tapered at the completion of therapy (taper by 0.5 mg q 3 days). Sudden cessation of medication may lead to withdrawal (insomnia, irritability, nervousness, tremors).
- **PO:** Administer with food if GI irritation becomes a problem.

### Patient/Family Teaching

- Instruct patient to take oxazepam exactly as directed. Missed doses should be taken within 1 hr; if remembered later, omit and return to regular dosing schedule. Do not double or increase doses. If dose is less effective after a few weeks, notify health care professional.
- Inform patient that oxazepam is usually prescribed for short-term use. Encourage patient to participate in psychotherapy to address source of anxiety and improve coping skills. Teach other methods to decrease anxiety, such as increased exercise, support group, relaxation techniques.
- Encourage patient to participate in psychotherapy to address source of anxiety and improve coping skills.
- Teach other methods to decrease anxiety, such as increased exercise, support group, relaxation techniques.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol and to consult health care professional prior to the use of OTC preparations that contain antihistamines or alcohol.
- Advise patient to inform health care professional if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of follow-up exams to monitor effectiveness of medication.
- Geri: Instruct patient and family how to reduce falls risk at home.

### Evaluation/Desired Outcomes

- Decreased sense of anxiety.
- Increased ability to cope.
- Prevention or relief of acute agitation, tremor, and hallucinations during alcohol withdrawal.

## oxcarbazepine

(ox-kar-**baz**-e-peen)
Trileptal

***Classification***
Therapeutic: anticonvulsants
Pharmacologic: carbamazepine analogues

**Pregnancy Category C**

### Indications

Monotherapy or adjunctive therapy of partial seizures in adults and children 4 yr and older with epilepsy. Adjunctive therapy in patients 2–16 yr with epilepsy. **Unlabeled Use:** Management of trigeminal neuralgia.

### Action

Blocks sodium channels in neural membranes, stabilizing hyperexcitable states, inhibiting repetitive neuronal firing, and decreasing propagation of synaptic impulses. **Therapeutic Effects:** Decreased incidence of seizures.

### Pharmacokinetics

**Absorption:** Rapidly absorbed after oral administration and rapidly converted to the active 10-hydroxy metabolite (MHD).

**Distribution:** Enters breast milk in significant amounts.
**Metabolism and Excretion:** Extensively converted to MHD, which is then primarily excreted by the kidneys.
**Half-life:** *Oxcarbazepine*—2 hr; *MHD*—9 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO 12 hr | PO | rapid | 4.5 hr† |

†Steady-state levels of MHD are reached after 2–3 days during twice-daily dosing

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; cross-sensitivity with carbamazepine may occur; Lactation: Lactation.
**Use Cautiously in:** All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (dose ↓ recommended if CCr <30 mL/min); OB: May be teratogenic; use only if potential benefit justifies potential risk to the fetus; Pedi: Children <4 yr (safety not established).

## Adverse Reactions/Side Effects

**CNS:** SUICIDAL THOUGHTS, dizziness/vertigo, drowsiness/fatigue, headache, cognitive symptoms. **EENT:** abnormal vision, diplopia, nystagmus. **GI:** abdominal pain, dyspepsia, nausea, vomiting, thirst. **Derm:** acne, rash, urticaria. **F and E:** hyponatremia. **Neuro:** ataxia, gait disturbances, tremor. **Misc:** allergic reactions, hypersensitivity reactions including STEVENS-JOHNSON SYNDROME and MULTIORGAN REACTIONS, lymphadenopathy.

## Interactions

**Drug-Drug:** May inhibit the CYP 2C19 enzyme system and would be expected to alter the effects of other drugs that are metabolized by this system. Oxcarbazepine and MHD induce the P450 3A4/5 enzyme systems and would be expected to alter the effects of other drugs that are metabolized by this system. This may result in ↓ levels and effectiveness of **hormonal contraceptives**, **felodipine**, **isradipine**, **nicardipine**, **nifedipine**, and **nimodipine**. In addition, oxcarbazepine itself is metabolized by cytochrome P450 system and other **drugs that alter the activity of this system**. ↑ CNS depression may occur with other CNS depressants, including **alcohol**, **antihistamines**, **antidepressants**, **sedative/hypnotics**, and **opioids**. **Carbamazepine**, **phenobarbital**, **phenytoin**, **valproic acid**, and **verapamil** ↓ levels. May ↑ serum levels and effects of **phenytoin** (dose ↓ of phenytoin may be required).

## Route/Dosage

(Tablets and oral suspension can be interchanged at equal doses.)
**PO (Adults):** *Adjunctive therapy*—300 mg twice daily, may be ↑ by up to 600 mg/day at weekly intervals up to 1200 mg/day (up to 2400 mg/day may be needed); *Conversion to monotherapy*—300 mg twice daily; may be ↑ by 600 mg/day at weekly intervals, whereas other antiepileptic drugs are tapered over 3–6 wk; dose of oxcarbazepine should be ↑ up to 2400 mg/day over a period of 2–4 wk; *Initiation of monotherapy*—300 mg twice daily, ↑ by 300 mg/day every third day, up to 1200 mg/day. Maximum maintenance dose should be achieved over 2–4 wk.
**PO (Children 2–16 yr):** *Adjunctive therapy*—4–5 mg/kg twice daily (up to 600 mg/day), ↑ over 2 wk to achieve 900 mg/day in patients 20–29 kg, 1200 mg/day in patients 29.1–39 kg and 1800 mg/day in patients >39 kg (range 6–51 mg/kg/day). In patients <20 kg, initial dose of 16–20 mg/kg/day may be used not to exceed 60 mg/kg/day. *Conversion to monotherapy*—8–10 mg/kg/day given twice daily; may be ↑ by 10 mg/kg/day at weekly intervals, whereas other antiepileptic drugs are tapered over 3–6 wk; dose of oxcarbazepine should be ↑ up to 600–900 mg/day in patients ≤20 kg, 900–1200 mg/day in patients 25–30 kg, 900–1500 mg/day in patients 35–40 kg. 1200–1500 mg/day in patients 45 kg, 1200–1800 mg/day in patients 50–55 kg, 1200–2100 mg/day in patients 60–65 kg, and 1500–2100 mg/day in patients 70 kg. Maximum maintenance dose should be achieved over 2–4 wk.

### Renal Impairment

**PO (Adults):** *CCr<30 mL/min*—Initiate therapy at 300 mg/day and ↑ slowly to achieve desired response.

## Availability (generic available)

**Tablets:** 150 mg, 300 mg, 600 mg. **Cost:** *Generic*—150 mg $53.79/100, 300 mg $375.97/180 , 600 mg $742.97/180, 150 mg $96.21/100, 300 mg $175.70/100, 600 mg $322.94/100. **Oral suspension:** 300 mg/5 mL. **Cost:** $155.23/250 mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- **Seizures:** Assess frequency, location, duration, and characteristics of seizure activity. Hyponatremia may increase frequency and severity of seizures.
- Monitor patient for CNS changes. May manifest as cognitive symptoms (psychomotor slowing, difficulty with concentration, speech or language problems), somnolence or fatigue, or coordination abnormalities (ataxia, gait disturbances).
- ***Lab Test Considerations:*** Monitor ECG and serum electrolytes before and periodically during therapy. May cause hyponatremia. Usually occurs during the first 3 mo of therapy. May require dose reduction, fluid restriction, or discontinuation of therapy. Sodium levels return to normal within a few days of discontinuation.

### Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

### Implementation

- Implement seizure precautions as indicated.
- **PO:** Administer twice daily with or without food.
- Shake oral suspension well and prepare dose immediately after. Withdraw using oral dosing syringe supplied by manufacturer. May be mixed in a small glass of water just prior to administration or swallowed directly from syringe. Rinse syringe with warm water and allow to dry.

### Patient/Family Teaching

- Instruct patient to take oxcarbazepine in equally spaced doses, as directed. Take missed doses as soon as possible but not just before next dose; do not double dose. Notify health care professional if more than 1 dose is missed. Medication should be gradually discontinued to prevent seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- May cause dizziness, drowsiness, or CNS changes. Advise patients to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient not to take alcohol or other CNS depressants concurrently with this medication.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Advise female patients to use an additional nonhormonal method of contraception during therapy and until next menstrual period. Instruct patient to notify health care professional if pregnancy is planned or suspected.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patients to carry identification describing disease and medication regimen at all times.

### Evaluation/Desired Outcomes

- Absence or reduction of seizure activity.

**oxiconazole, See ANTIFUNGALS (TOPICAL).**

## OXYBUTYNIN (ox-i-**byoo**-ti-nin)

**oxybutynin (oral)**
Ditropan, Ditropan XL

**oxybutynin (gel)**
Gelnique

**oxybutynin (transdermal system)**
Oxytrol

***Classification***
Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

**Pregnancy Category B**

### Indications

Urinary symptoms that may be associated with neurogenic bladder including: Frequent urination, Urgency, Nocturia, Urge incontinence. Overactive bladder with symptoms of urge incontinence, urgency, and frequency.

### Action

Inhibits the action of acetylcholine at postganglionic receptors. Has direct spasmolytic action on smooth muscle, including smooth muscle lining the GU tract, without affecting vascular smooth

muscle. **Therapeutic Effects:** Increased bladder capacity. Delayed desire to void. Decreased urge incontinence, urinary urgency, and frequency and decreased number of urinary accidents associated with overactive bladder.

## Pharmacokinetics

**Absorption:** Rapidly absorbed following oral administration, but undergoes extensive first-pass metabolism; XL tablets provide extended release. Transdermal absorption occurs by passive diffusion through intact skin and bypasses the first-pass effect.
**Distribution:** Widely distributed.
**Metabolism and Excretion:** Extensively metabolized by the liver (CYP3A4 enzyme system); one metabolite is pharmacologically active; metabolites are renally excreted with negligible (<0.1%) excretion of unchanged drug.
**Half-life:** 7–8 hr (oral and patch); 64 hr (gel).

TIME/ACTION PROFILE (urinary spasmolytic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–60 min | 3–6 hr | 6–10 hr (up to 24 hr with XL tablet) |
| TD-patch | within 24 hr | 36 hr | 3–4 days |
| TD-gel | unknown | unknown | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Uncontrolled angle-closure glaucoma; Intestinal obstruction or atony; Urinary retention.
**Use Cautiously in:** Hepatic/renal impairment; Bladder outflow obstruction; Ulcerative colitis; Benign prostatic hyperplasia; Cardiovascular disease; Reflux esophagitis or gastrointestinal obstructive disorders; Patients with dementia receiving acetylcholinesterase inhibitors; Myasthenia gravis; OB, Lactation: Pregnancy or lactation; Pedi: Oral: Safety not established in children <5 yr; Patch and gel: Safety not established in children <18 yr; Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects. Initiate treatment at lower doses.

## Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, agitation, confusion, hallucinations, headache. **EENT:** blurred vision. **CV:** tachycardia. **GI:** constipation, dry mouth, nausea, abdominal pain, diarrhea. **GU:** urinary retention. **Derm:** ↓ sweating, *transdermal only:* application site reactions, pruritus. **Metab:** hyperthermia.

## Interactions

**Drug-Drug:** ↑ anticholinergic effects with other **agents having anticholinergic properties**, including **amantadine**, **antidepressants**, **phenothiazines**, **disopyramide**, and **haloperidol**. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioids**, and **sedative/hypnotics**. **Ketoconazole**, **itraconazole**, **erythromycin**, and **clarithromycin** may ↑ effects.

## Route/Dosage

**PO (Adults):** *Immediate-release tablets*—5 mg 2–3 times daily (not to exceed 5 mg 4 times daily) (may start with 2.5 mg 2–3 times daily in elderly). *Extended-release tablets*—5–10 mg once daily; may ↑, as needed, (in 5-mg increments) up to maximum dose of 30 mg/day.
**PO (Children >5 yr):** *Immediate-release tablets*—5 mg 2–3 times daily (not to exceed 15 mg/day). *Extended-release tablets (children ≥6 yr)*—5 mg once daily; may ↑, as needed, (in 5-mg increments) up to maximum dose of 20 mg/day.
**PO (Children 1–5 yr):** 0.2 mg/kg/dose 2–3 times daily.
**Transdermal (Adults):** *Patch*—Apply one 3.9 mg system twice weekly (every 3–4 days); *Gel*—Apply contents of one sachet (100 mg/g) once daily.

## Availability (generic available)

**Tablets:** 5 mg. **Cost:** *Generic*—$29.97/180. **Extended-release tablets:** 5 mg, 10 mg, 15 mg. **Cost:** *Generic*—5 mg $260.98/90, 10 mg $262.80/90, 15 mg $269.99/90. **Syrup:** 5 mg/5 mL. **Cost:** *Generic*—$35.95/480 mL. **Gel:** 1 g unit dose (sachet) contains 100 mg/g (10%). **Transdermal system:** 3.9 mg/day system. **Cost:** $106.50/8 patches.

# NURSING IMPLICATIONS

## Assessment

- Monitor voiding pattern and intake and output ratios, and assess abdomen for bladder distention prior to and periodically during therapy. Catheterization may be used to assess postvoid residual. Cystometry is usually performed to diagnose type of bladder dysfunction prior to prescription of oxybutynin.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).

### Potential Nursing Diagnoses

Impaired urinary elimination (Indications)
Acute pain (Indications)

### Implementation

- Do not confuse Ditropan (oxybutynin) with diazepam.
- **PO:** Immediate release tabs should be administered on an empty stomach; XL tablets may be given with or without food. XL tablets should be swallowed whole; do not break, crush, or chew.
- **Transdermal patch:** Apply patch on same two days each week (Sunday/Wednesday, Monday/Thursday) to hip, abdomen, or buttock in an area that is clean, dry, and without irritation. Patch should be worn continuously.
- **Transdermal gel:** Apply clear, colorless gel once daily to intact skin on abdomen (avoid area around navel), upper arms/shoulders, or thighs until dry. Rotate sites; do not use same site on consecutive days.

### Patient/Family Teaching

- Instruct patient to take oxybutinin as directed. Take missed doses as soon as remembered unless almost time for next dose. Advise patient to read *Information for the Patient* prior to beginning therapy and with each Rx refill in case of new information.
- May cause drowsiness or blurred vision. Advise patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Health care professional should be notified if mouth dryness persists >2 wk.
- Inform patient that oxybutynin decreases the body's ability to perspire. Avoid strenuous activity in a warm environment because overheating may occur.
- Advise patient to notify health care professional if urinary retention occurs or if constipation persists. Discuss methods of preventing constipation, such as increasing dietary bulk, increasing fluid intake, and increasing mobility.
- Instruct patient to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Discuss need for continued medical follow-up. Periodic cystometry may be used to evaluate effectiveness. Ophthalmic exams should be performed periodically to detect glaucoma, especially in patients over 40 yr of age.
- **Transdermal patch:** Instruct patient on correct application and disposal of patch. Open pouch by tearing along arrows; apply immediately. Apply ½ patch to skin by removing ½ protective cover and applying firmly to skin. Apply second half by bending in half and rolling patch onto skin while removing protective liner. Press patch firmly in place.
- Remove slowly; fold in half, sticky sides together, and discard. Wash site with mild soap and water or a small amount of baby oil.
- Advise patient referred for MRI to remove patch prior to test and give directions for replacing patch.
- **Transdermal gel:** Instruct patient on correct application of oxybutynin gel. Do not apply to recently shaved skin, skin with rashes, or areas treated with lotions, oils, or powders; may be used with sunscreen. Wash area with mild soap and water and dry completely before applying. Tear packet open just before use and squeeze entire contents into hand or directly onto application site. Amount of gel will be size of a nickel on the skin. Gently rub into skin until dry. Wash hands immediately following application. Avoid application near open fire or when smoking; medication is flammable. Do not shower, bathe, swim, exercise, or immerse the application site in water within 1 hr after application. Cover application site with clothing if close skin-to-skin contact at application site is anticipated.

### Evaluation/Desired Outcomes

- Relief of bladder spasm and associated symptoms (frequency, urgency, nocturia, and incontinence) in patients with a neurogenic or overactive bladder.

HIGH ALERT

**oxycodone** (ox-i-**koe**-done)
Endocodone, M-Oxy, Oxycontin, Oxy-FAST, OxyIR, Percolone, Roxicodone, Supeudol
**oxycodone/acetaminophen†**
Endocet, Magnacet, Oxycet, Percocet, Primalev, Roxicet, Roxilox, Tylox
**oxycodone/aspirin†**
Endodan, Oxycodan, Percodan
**oxycodone/ibuprofen**

## Combunox

***Classification***
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists, opioid agonists/nonopioid analgesic combinations

**Schedule II**

**Pregnancy Category C (oxycodone alone or with acetaminophen or ibuprofen), D (with aspirin)**

†See also acetaminophen, ibuprofen, and salicylates monographs

### Indications
Moderate to severe pain.

### Action
Binds to opiate receptors in the CNS. Alter the perception of and response to painful stimuli, while producing generalized CNS depression.
**Therapeutic Effects:** Decreased pain.

### Pharmacokinetics
**Absorption:** Well absorbed from the GI tract.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 2–3 hr.

TIME/ACTION PROFILE (analgesic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 10–15 min | 60–90 min | 3–6 hr |
| PO-CR | 10–15 min | 3 hr | 12 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to oxycodone (cross-sensitivity may exist to other opioids); Hypersensitivity to acetaminophen/aspirin/ibuprofen (for combination products); Aspirin- and ibuprofen-containing products should be avoided in patients with bleeding disorders or thrombocytopenia; Acetaminophen-containing products should be avoided in patients with severe hepatic or renal disease; Ibuprofen-containing products should be avoided in patients undergoing coronary artery bypass graft surgery; OB, Lactation: Avoid chronic use; Some products contain alcohol or bisulfites and should be avoided in patients with known intolerance or hypersensitivity.
**Use Cautiously in:** Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Cardiovascular disease (ibuprofen-containing products only); History of peptic ulcer disease (ibuprofen-containing products only); Hypothyroidism; Adrenal insufficiency; Alcoholism; Geri: Geriatric or debilitated patients (initial dose ↓ recommended); Undiagnosed abdominal pain; Prostatic hyperplasia.

### Adverse Reactions/Side Effects
Noted for oxycodone only; see acetaminophen/aspirin/ibuprofen monographs for specific information on individual components.
**CNS:** confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** RESPIRATORY DEPRESSION. **CV:** orthostatic hypotension. **GI:** constipation, dry mouth, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

### Interactions
**Drug-Drug:** Use with caution in patients receiving **MAO inhibitors** (may result in unpredictable reactions— ↓ initial dose of oxycodone to 25% of usual dose). ↑ CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. Administration of **partial-antagonist opioid analgesics** may precipitate withdrawal in physically dependent patients. **Nalbuphine**, **buprenorphine**, or **pentazocine** may ↓ analgesia.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

### Route/Dosage
Larger doses may be required during chronic therapy. Consider cumulative effects of additional acetaminophen/aspirin/ibuprofen; if toxic levels are exceeded, change to pure oxycodone product.
**PO (Adults ≥50 kg):** 5–10 mg q 3–4 hr initially, as needed. Controlled-release tablets (Oxycontin) may be given q 12 hr after careful consideration as to dose, indication, and previous analgesic use/abuse history; if using combination products, acetaminophen or aspirin dose should not exceed 4 g/day and should not exceed 4 tablets/day of ibuprofen-containing products.
**PO (Adults <50 kg or Children 6–12 yr):** 1.25 mg every 6 hr as needed or 0.2 mg/kg q 3–4 hr initially, as needed.
**PO (Children >12):** 2.5 mg every 6 hr as needed.
**Rect (Adults):** 10–40 mg 3–4 times daily initially, as needed.

## Availability (generic available)

### Oxycodone

**Tablets (Percolone, Roxicodone):** 5 mg, 15 mg, 30 mg. **Cost:** *Generic*—5 mg $24.99/30, 15 mg $26.99/30, 30 mg $36.99/30. **Immediate-release capsules (OxyIR):** 5 mg. **Cost:** *Generic*—$13.99/30. **Controlled-release tablets (Oxycontin):** 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** *Generic*—10 mg $43.99/30, 20 mg $79.99/30, 40 mg $139.99/30, 80 mg $250.01/30. **Oral solution (Roxicodone) (burgundy cherry):** 5 mg/5 mL in 500-mL bottle. **Concentrated oral solution (Roxicodone Intensol, OxyFAST):** 20 mg/mL in 30-mL bottle with dropper. **Cost:** *Generic*—$33.99/30 mL. **Suppositories:** 🍁 10 mg, 🍁 20 mg.

### Oxycodone/Acetaminophen

**Tablets:** 2.5 mg oxycodone with 300 mg acetaminophen (Primalev), 2.5 mg oxycodone with 325 mg acetaminophen (Percocet), 2.5 mg oxycodone with 400 mg acetaminophen (Magnacet), 5 mg oxycodone with 300 mg acetaminophen (Primalev), 5 mg oxycodone with 325 mg acetaminophen (Endocet, Oxycet, Percocet, Roxicet), 5 mg oxycodone with 400 mg acetaminophen (Magnacet), 7.5 mg oxycodone with 300 mg acetaminophen (Primalev), 7.5 mg oxycodone with 325 mg acetaminophen (Endocet, Percocet), 7.5 mg oxycodone with 400 mg acetaminophen (Magnacet), 7.5 mg oxycodone with 500 mg acetaminophen (Endocet), 10 mg oxycodone with 300 mg acetaminophen (Primalev), 10 mg oxycodone with 325 mg acetaminophen (Endocet, Percocet), 10 mg oxycodone with 400 mg acetaminophen (Magnacet), 10 mg oxycodone with 650 mg acetaminophen (Endocet, Percocet). **Cost:** *Generic*—5/325 mg $16.99/30, 7.5/325 mg $47.99/30, 10/325 mg $60.99/30, 10/650 mg $49.99/30. **Capsules (Roxilox, Tylox):** 5 mg oxycodone with 500 mg acetaminophen. **Cost:** *Generic*—$23.99/30. **Caplets (Roxicet 5/500):** 5 mg oxycodone with 500 mg acetaminophen. **Oral solution (Roxicet) (mint):** 5 mg oxycodone with 325 mg acetaminophen/5 mL. **Cost:** $43.43/500 mL.

### Oxycodone/Aspirin

**Tablets:** 4.88 mg oxycodone with 325 mg aspirin.

### Oxycodone/Ibuprofen

**Tablets:** 5 mg oxycodone with 400 mg ibuprofen.

## NURSING IMPLICATIONS

### Assessment

- Assess type, location, and intensity of pain prior to and 1 hr (peak) after administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients taking controlled-release tablets may require additional short-acting opioid doses for breakthrough pain. Doses should be equivalent to 10–20% of 24 hr total and given every 2 hr as needed.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive oxycodone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

### Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

### Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations. Do not confuse oxycodone with OxyContin.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses. Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** May be administered with food or milk to minimize GI irritation.
- Administer solution with properly calibrated measuring device.
- Controlled-release tablets should be swallowed whole; do not crush, break, or chew. Taking broken, chewed, or crushed controlled-release tablets leads to rapid release and absorption of a potentially fatal dose of oxycodone.
- **Controlled Release:** Dose should be based on 24-hr opioid requirement determined with short-acting opioids then converted to controlled-release form.

### Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication. Caution patient not to increase the dose of controlled-release oxycodone without consulting health care professional.
- Caution patient that controlled-release oxycodone is a potential drug of abuse. Medication should be protected from theft and never given to anyone other than the individual for whom it was prescribed.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patients taking *Oxycontin* tablets that empty matrix tablets may appear in stool.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

### Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

HIGH ALERT

## oxymorphone (ox-i-**mor**-fone)

Opana, Opana ER

***Classification***

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

**Schedule II**

**Pregnancy Category C**

O

### Indications

Management of moderate to severe pain. Extended-release tablets should only be used in patients who require continuous 24–hr management of chronic pain. Supplement in balanced anesthesia.

### Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression.
**Therapeutic Effects:** Decrease in pain.

### Pharmacokinetics

**Absorption:** 10% absorbed following oral administration. Food and alcohol significantly ↑ absorption (38%). Well absorbed following IM, subcut or rectal administration.
**Distribution:** Widely distributed; crosses placenta, enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver; at least 2 metabolites are pharmacologically active, <1% excreted unchanged in urine.
**Half-life:** 2.6–4 hr.

TIME/ACTION PROFILE (analgesic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | 4–6 hr |
| PO ER | unknown | unknown | 12 hr |
| IM | 10–15 min | 30–90 min | 3–6 hr |
| IV | 5–10 min | 15–30 min | 3–6 hr |
| Subcut | 10–20 min | unknown | 3–4 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent alcohol; Moderate/severe hepatic impairment; Respiratory depression (unless monitoring and resuscitative equipment are readily available); Known/suspected paralytic ileus.

**Use Cautiously in:** Acute alcoholism or delirium tremens or other toxic psychoses; Mild hepatic impairment; Head injury/↑ intracranial pressure (may obscure neurologic signs and further ↑ pressure); Volume depletion or drugs that may cause hypotension including diuretics and phenothiazines (↑ risk of severe hypotension); Circulatory shock (may ↑ risk of severe hypotension); Adrenocortical insufficiency; Hypothyroidism; Prostatic hypertrophy or ureteral stricture; Severe pulmonary or renal impairment; Biliary tract disease or pancreatitis; OB: Use only in pregnancy if maternal benefit outweighs fetal risk ; Lactation: Lactation; Geri: Blood levels are ↑ ; dose accordingly.

**Exercise Extreme Caution in:** Conditions association with hypoxia, hypercapnea, ↓ respiratory reserve (including asthma, COPD, cor pulmonale, morbid obesity, sleep apnea, myxedema, kyphoscoliosis, CNS depression and coma).

## Adverse Reactions/Side Effects

**CNS:** confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** RESPIRATORY DEPRESSION. **CV:** orthostatic hypotension. **GI:** constipation, dry mouth, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

## Interactions

**Drug-Drug:** Use with caution in patients receiving **MAO inhibitors** (may result in unpredictable reactions— ↓ initial dose of oxymorphone to 25% of usual dose). ↑ risk of CNS depression, hypotension and respiratory depression with **alcohol**, other **opioids** or **CNS depressants** including **sedatives**, **hypnotics**, **general anesthetics**, **phenothiazines**, **tranquilizers**, **skeletal muscle relaxants**, or **sedating antihistamines**; may initiate therapy with ⅓ to ½ usual starting dose. **Drugs that may cause volume depletion or hypotension** including **diuretics**, **phenothiazines** may ↑ risk of severe hypotension. Administration of **partial-antagonist opioid analgesics** may precipitate withdrawal in physically dependent patients. **Nalbuphine**, **buprenorphine**, or **pentazocine** ↓ analgesia.

**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

## Route/Dosage

Larger doses may be required during chronic therapy.

**PO (Adults):** *Opioid-naive patients*— 10–20 mg every 4–6 hr, some patients may require initial dose of 5 mg, not to exceed 20 mg. Once optimal analgesia is obtained, chronic pain patients may be converted to an equivalent 24-hour dose given as extended release tablets every 12 hr.

**Subcut, IM (Adults):** 1–1.5 mg q 3–6 hr as needed. *Analgesia during labor*— 0.5–1 mg.

**IV (Adults):** 0.5 mg q 3–6 hr as needed; increase as needed.

## Availability

**Tablets (Opana):** 5 mg, 10 mg. **Extended-release tablets (Opana ER):** 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg, 30 mg, 40 mg. **Solution for injection:** 1 mg/mL.

# NURSING IMPLICATIONS

## Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following IM and 15–30 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients taking controlled-release tablets should also be given supplemental short-acting opioid doses for breakthrough pain.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.

- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive oxymorphone for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

## Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** Administer at least 1 hr prior to or 2 hr after eating.
- Controlled-release tablets should be swallowed whole; do not break, crush, or chew.
- **Controlled Release:** Patients should be titrated to mild to no pain with the regular use of no more than 2 doses of supplemental analgesia (rescue) per 24 hr. Dose should be based on 24-hr opioid requirement determined with short-acting opioids then converted to controlled-release form.
- If patient is opioid-naive, start with 5 mg every 12 hr, then titrate in increments of 5–10 mg every 12 hr every 3–7 days to a level that provides adequate analgesia with minimal side effects.
- If converting from *Opana* to *Opana ER*, administer half the patient's total daily dose of *Opana* as *Opana ER* every 12 hr.
- If converting from parenteral oxymorphone, administer 10 times the patient's total daily parenteral oxymorphone dose as *Opana ER* in two equally divided doses every 12 hr.
- If converting from other opioids, 10 mg of oral oxymorphone is equianalgesic to hydrocodone 20 mg, oxycodone 20 mg, methadone 20 mg, and morphine 30 mg orally.

### IV Administration

- **Direct IV:** Administer undiluted. ***Concentration:*** 1 mg/mL. ***Rate:*** Give over 2–3 min.
- **Syringe Compatibility:** glycopyrrolate, hydroxyzine, ranitidine.

## Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Instruct patient to take oxymorphone as directed and not to adjust dose without consulting health care professional. Take missed doses as soon as possible if on chronic therapy. If almost time for next dose, skip dose and return to regular schedule. Do not double doses unless advised by health care professional. Do not stop taking oxymorphone abruptly, may cause withdrawal symptoms. Discontinue gradually under supervision of health care professional. Caution patient to keep medication out of reach of children and pets.
- Caution patient not to share this medication; may cause harm or death and is against the law.

- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Caution patient not to take any new Rx, OTC, or herbal products without notifying health care professional.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- OB: Advise patient to notify health care professional if pregnancy is planned or suspected.

### Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

HIGH ALERT

## oxytocin (ox-i-toe-sin)

Pitocin, Syntocinon

***Classification***

Therapeutic: hormones
Pharmacologic: oxytocics

**Pregnancy Category X**

### Indications

**IV:** Induction of labor at term. **IV:** Facilitation of threatened abortion. **IV, IM:** Postpartum control of bleeding after expulsion of the placenta.

### Action

Stimulates uterine smooth muscle, producing uterine contractions similar to those in spontaneous labor. Has vasopressor and antidiuretic effects. **Therapeutic Effects:** Induction of labor. Control of postpartum bleeding.

### Pharmacokinetics

**Absorption:** IV administration results in 100% bioavailability.
**Distribution:** Widely distributed in extracellular fluid. Small amounts reach fetal circulation.
**Metabolism and Excretion:** Rapidly metabolized by liver and kidneys.
**Half-life:** 3–9 min.

TIME/ACTION PROFILE (reduction in uterine contractions)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | immediate | unknown | 1 hr |
| IM | 3–5 min | unknown | 30–60 min |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Anticipated nonvaginal delivery.
**Use Cautiously in:** OB: First and second stages of labor; slow infusion over 24 hr has caused water intoxication with seizure and coma or maternal death due to oxytocin's antidiuretic effect.

### Adverse Reactions/Side Effects

Maternal adverse reactions are noted for IV use only.
**CNS:** *maternal*—COMA, SEIZURES; *fetal*, INTRACRANIAL HEMORRHAGE. **Resp:** *fetal*—ASPHYXIA, hypoxia. **CV:** *maternal*—hypotension; *fetal*, arrhythmias. **F and E:** *maternal*—hypochloremia, hyponatremia, water intoxication. **Misc:** *maternal*—↑ uterine motility, painful contractions, abruptio placentae, ↓ uterine blood flow, hypersensitivity.

### Interactions

**Drug-Drug:** Severe hypertension may occur if oxytocin follows administration of **vasopressors**. Concurrent use with **cyclopropane** anesthesia may result in excessive hypotension.

### Route/Dosage

#### Induction/Stimulation of Labor

**IV (Adults):** 0.5–2 milliunits/min; ↑ by 1–2 milliunits/min q 15–60 min until pattern established (usually 5–6 milliunits/min; maximum 20 milliunits/min), then ↓ dose.

#### Postpartum Hemorrhage

**IV (Adults):** 10 units infused at 20–40 milliunits/min.
**IM (Adults):** 10 units after delivery of placenta.

#### Incomplete/Inevitable Abortion

**IV (Adults):** 10 units at a rate of 20–40 milliunits/min.

### Availability (generic available)

**Solution for injection:** 10 units/mL.

## NURSING IMPLICATIONS

### Assessment

- Fetal maturity, presentation, and pelvic adequacy should be assessed prior to administration of oxytocin for induction of labor.
- Assess character, frequency, and duration of uterine contractions; resting uterine tone; and

fetal heart rate frequently throughout administration. If contractions occur <2 min apart and are >50–65 mm Hg on monitor, if they last 60–90 sec or longer, or if a significant change in fetal heart rate develops, stop infusion and turn patient on her left side to prevent fetal anoxia. Notify health care professional immediately.
- Monitor maternal blood pressure and pulse frequently and fetal heart rate continuously throughout administration.
- This drug occasionally causes water intoxication. Monitor patient for signs and symptoms (drowsiness, listlessness, confusion, headache, anuria) and notify physician or other health care professional if they occur.
- ***Lab Test Considerations:*** Monitor maternal electrolytes. Water retention may result in hypochloremia or hyponatremia.

## Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

## Implementation

- Do not confuse Pitocin (oxytocin) with Pitressin (vasopressin).
- Do not administer oxytocin simultaneously by more than one route.

### IV Administration

- **Continuous Infusion:** Rotate infusion container to ensure thorough mixing. Store solution in refrigerator, but do not freeze.
- Infuse via infusion pump for accurate dose. Oxytocin should be connected via Y-site injection to an IV of 0.9% NaCl for use during adverse reactions.
- Magnesium sulfate should be available if needed for relaxation of the myometrium.
- **Induction of Labor:** ***Diluent:*** Dilute 1 mL (10 units) in 1 L of compatible infusion fluid (0.9% NaCl, D5W, or LR). ***Concentration:*** 10 milliunits/mL. ***Rate:*** Begin infusion at 0.5–2 milliunits/min (0.05–0.2 mL); increase in increments of 1–2 milliunits/min at 15–30-min intervals until contractions simulate normal labor.
- **Postpartum Bleeding:** ***Diluent:*** For control of postpartum bleeding, dilute 1–4 mL (10–40 units) in 1 L of compatible infusion fluid. ***Concentration:*** 10–40 milliunits/mL. ***Rate:*** Begin infusion at a rate of 20–40 milliunits/min to control uterine atony. Adjust rate as indicated.
- **Incomplete or Inevitable Abortion:** ***Diluent:*** For incomplete or inevitable abortion, dilute 1 mL (10 units) in 500 mL of 0.9% NaCl or D5W. ***Concentration:*** 20 milliunits/mL. ***Rate:*** Infuse at a rate of 20–40 milliunits/min.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, insulin, meperidine, morphine, potassium chloride, vitamin B complex with C, warfarin, zidovudine.
- **Solution Compatibility:** dextrose/Ringer's or lactated Ringer's combinations, dextrose/saline combinations, Ringer's or lactated Ringer's injection, D5W, D10W, 0.45% NaCl, 0.9% NaCl.

## Patient/Family Teaching

- Advise patient to expect contractions similar to menstrual cramps after administration has started.

## Evaluation/Desired Outcomes

- Onset of effective contractions.
- Increase in uterine tone.
- Reduction in postpartum bleeding.

# paclitaxel (pak-li-tax-el)
Onxol, Taxol

# paclitaxel protein-bound particles (albumin-bound)
Abraxane

***Classification***
Therapeutic: antineoplastics
Pharmacologic: taxoids

**Pregnancy Category D**

## Indications
**Paclitaxel:** Advanced ovarian cancer (with cisplatin). Non-small cell lung cancer when potentially curative surgery and/or radiation therapy is not an option. Metastatic breast cancer unresponsive to other therapy. Node-positive breast cancer when administered sequentially to standard combination chemotherapy that includes doxorubicin. Treatment of AIDS-related Kaposi's sarcoma. **Paclitaxel (albumin-bound):** Metastatic breast cancer after treatment failure or relapse where therapy included an anthracycline.

## Action
Interferes with the normal cellular microtubule function that is required for interphase and mitosis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

## Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Cross the placenta.
**Protein Binding:** 89–98%.
**Metabolism and Excretion:** Highly metabolized by the liver, <10% excreted unchanged in urine.
**Half-life:** *Paclitaxel*—13–52 hr; *Paclitaxel protein-bound particles (albumin-bound)*—27 hr.

TIME/ACTION PROFILE (effect on WBCs)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | 11 days | 3 wk |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to paclitaxel or to castor oil (non-protein-bound vehicle contains polyoxyethylated castor oil); Known alcohol intolerance; OB, Lactation: Pregnancy or lactation; ANC ≤1500/mm³ in patients with ovarian, lung, or breast cancer; ANC ≤1000/mm³ in patients with AIDS-related Kaposi's sarcoma.
**Use Cautiously in:** Moderate or severe hepatic impairment; Geri: ↑ risk of neuropathy, myelosuppression, and cardiovascular events; OB: Childbearing potential; Active infection; Decreased bone marrow reserve; Pedi: Safety and effectiveness not established.

## Adverse Reactions/Side Effects
**CV:** ECG changes, hypotension, bradycardia. **GI:** abnormal liver function tests, diarrhea, mucositis, nausea, vomiting. **Derm:** alopecia. **Hemat:** anemia, neutropenia, thrombocytopenia. **MS:** arthralgia, myalgia. **Neuro:** peripheral neuropathy. **Resp:** cough, dyspnea. **Local:** injection site reactions. **Misc:** hypersensitivity reactions including ANAPHYLAXIS and STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS.

## Interactions
**Drug-Drug: Ketoconazole**, **verapamil**, **quinidine**, **cyclosporine**, **diazepam**, **dexamethasone**, **teniposide**, **etoposide**, or **vincristine** may ↓ metabolism and ↑ risk of serious toxicity; concurrent use should be undertaken with caution. ↑ risk of myelosuppression with other **antineoplastics** or **radiation therapy**. Myelosuppression ↑ when given after **cisplatin**. May ↑ levels and toxicity of **doxorubicin**. May ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.

## Route/Dosage
Many other regimens are used.

### Paclitaxel

#### Ovarian Cancer
**IV (Adults):** *Previously untreated patients*—175 mg/m² over 3 hr every 3 wk, or 135 mg/m² over 24 hr every 3 wk, followed by cisplatin; *Previously treated patients*—135 mg/m² or 175 mg/m² over 3 hr every 3 wk.

#### Breast Cancer
**IV (Adults):** *Adjuvant treatment of node-positive breast cancer*—175 mg/m² over 3 hr every 3 wk for 4 courses administered sequentially to doxorubicin-containing combination chemotherapy; *Failure of initial therapy for metastatic disease or relapse within 6 mo of adjuvant therapy*—175 mg/m² over 3 hr every 3 wk.

### Non-Small Cell Lung Cancer
**IV (Adults):** 135 mg/m² over 24 hr every 3 wk, followed by cisplatin.

### AIDS-Related Kaposi's Sarcoma
**IV (Adults):** 135 mg/m² over 3 hr every 3 wk or 100 mg/m² over 3 hr every 2 wk (dose reduction/adjustment may be necessary in patients with advanced HIV infection).

### Paclitaxel Protein-Bound Particles (albumin-bound)
**IV (Adults):** 260 mg/m² over 30 min every 3 wk.

### Hepatic Impairment
**IV (Adults):** *Moderate hepatic impairment (AST levels <10× ULN and bilirubin levels 1.26–2× ULN)* — 200 mg/m² over 30 min every 3 wk; *Severe hepatic impairment (AST levels <10× ULN and bilirubin levels 2.01–5× ULN)* — 130 mg/m² over 30 min every 3 wk; dose may be ↑ to 200 mg/m² for subsequent courses based on individual tolerance; *Severe hepatic impairment (AST levels >10× ULN or bilirubin levels >5× ULN)* — Avoid use.

### Availability

### Paclitaxel (generic available)
**Solution for injection:** 6 mg/mL.

### Paclitaxel Protein-Bound Particles (albumin-bound)
**Powder for injection:** 100 mg/vial.

## NURSING IMPLICATIONS

### Assessment
- Monitor vital signs frequently, especially during first hr of the infusion.
- Monitor cardiovascular status especially during first 3 hr of infusion. Hypotension and bradycardia are common but usually do not require treatment. Continuous ECG monitoring is recommended only for patients with serious underlying conduction abnormalities.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for dyspnea and orthostatic hypotension. Granulocyte-colony stimulating factor (G-CSF) may be used if necessary.
- Assess for development of peripheral neuropathy. If severe symptoms occur, subsequent dose should be reduced by 20%.
- Monitor intake and output, appetite, and nutritional intake. Paclitaxel causes nausea and vomiting in 50% of patients. Prophylactic antiemetics may be used. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- Assess patient for arthralgia and myalgia, which usually begin 2–3 days after therapy and resolve within 5 days. Pain is usually relieved by nonopioid analgesics but may be severe enough to require treatment with opioid analgesics.
- **Paclitaxel:** Monitor for hypersensitivity reactions continuously during the first 30 min and frequently thereafter. These occur frequently (19%), usually during the first 10 min of paclitaxel infusion, after the first or second dose. Pretreatment is recommended for **all** patients and should include dexamethasone 20 mg PO (10 mg for patients with advanced HIV disease) 12 and 6 hours prior to paclitaxel, diphenhydramine 50 mg IV 30–60 min prior to paclitaxel, and cimetidine 300 mg or ranitidine 50 mg IV 30–60 min prior to paclitaxel. Most common manifestations are dyspnea, flushing, tachycardia, rash, hypotension, and chest pain. If these occur, stop infusion and notify health care professional. Treatment may include bronchodilators, epinephrine, antihistamines, and corticosteroids. Keep these agents and resuscitative equipment close by in the event of an anaphylactic reaction. Other manifestations of hypersensitivity reactions include flushing and rash.
- No premedication for hypersensitivity is required for paclitaxel protein-bound (albumin-bound).
- ***Lab Test Considerations:*** Monitor CBC and differential prior to and periodically during therapy. The nadir of leukopenia occurs in 11 days, with recovery by days 15–21. Notify health care professional if the leukocyte count is <1500/mm³ (1000/mm³ in AIDS-related Kaposi's sarcoma) or if the platelet count is <100,000/mm³. Subsequent doses are usually held until leukocyte count is >1500/mm³ (1000/mm³ in AIDS-related Kaposi's sarcoma) and platelet count is >100,000/mm³.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) prior to and periodically during therapy to detect hepatotoxicity.

### Potential Nursing Diagnoses
Risk for infection (Adverse Reactions)
Risk for injury (Adverse Reactions)

## Implementation

- Do not confuse Taxol (paclitaxel) with Taxotere (docetaxel). Do not confuse paclitaxel with Paxil (paroxetine).

## Paclitaxel

### IV Administration

- **Continuous Infusion:** Paclitaxel must be diluted prior to injection. ***Diluent:*** Dilute contents of 5-mL (30-mg) vials with the following diluents: 0.9% NaCl, D5W, D5/0.9% NaCl, or dextrose in Ringer's solution. ***Concentration:*** 0.3–1.2 mg/mL. Although haziness in the solution is normal, inspect for particulate matter or discoloration before use. Use an in-line filter of not >0.22-micron pore size. Solutions are stable for 27 hr at room temperature and lighting. Do not use PVC containers or administration sets. ***Rate:*** Dose for *breast cancer or AIDS-related Kaposi's sarcoma* is administered over 3 hr. Dose for *ovarian cancer* is administered as a 24-hr infusion.
- **Y-Site Compatibility:** acyclovir, alfentanyl, allopurinol, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, anidulafungin, atracurium, aztreonam, bivalirudin, bleomycin, bumetanice, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin hydrochloride, dexamethasone sodium phosphate, dexrazoxane, diltiazem, diphenhydramine, dobutamine, dopamine, doripenem, doxorubicin hydrochloride, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin , esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, inamrinone, insulin, irinotecan, isoproterenol, ketorolac, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pancuronium, pantoprazole, pemetrexed, pentamidine, pentazocine, pentobarbital, pentostatin, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine edisylate, promethazine, propofol, quinupriatin/dalfopriatin, ranitidine, remifentanil, rituximab, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** amiodarone, amphotericin B cholesteryl , amphotericin B colloidal, amphotericin B liposome, chlorpromazine, diazepam, digoxin, doxorubicin liposome, hydroxyzine, idarubicin, indomethacin, labetalol, methylprednisolone sodium succinate, mitoxantrone, phenytoin, propranolol.

## Paclitaxel Protein-Bound Particles (albumin-bound)

### IV Administration

- **Intermittent Infusion:** Reconstitute by slowly adding 20 mL to each vial over at least 1 min for a concentration of 5 mg/mL. Direct solution to inside wall of vial to prevent foaming. Allow vial to sit for at least 5 min to ensure proper wetting of cake/powder. Gently swirl or invert vial for at least 2 min until powder is completely dissolved; avoid foaming. If foaming or clumping occurs, allow vial to stand for 15 min until foaming dissolves. Solution should be milky and homogenous without visible particles. If particles or settling are visible, gently invert vial to resuspend. Inject appropriate amount into sterile PVC IV bag. Do not use an in-line filter during administration. Do not administer solutions that are discolored or contain particulate matter. Reconstituted solution should be administered immediately but is sta-

P

ble for 8 hr if refrigerated. Discard unused portion. ***Rate:*** Administer over no more than 30 min. Monitor infusion site closely for infiltration.

### Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or to take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to notify health care professional if abdominal pain, yellow skin, weakness, paresthesia, gait disturbances, or joint or muscle aches occur.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis usually resolves in 5–7 days.
- Discuss with patient the possibility of hair loss. Complete hair loss usually occurs between days 14 and 21 and is reversible after discontinuation of therapy. Explore coping strategies.
- Advise patient to use a nonhormonal method of contraception. Advise male patients not to father a child while receiving paclitaxel.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Decrease in size or spread of malignancy.

## palifermin (pa-liff-er-min)

Kepivance

***Classification***

Therapeutic: cytoprotective agents
Pharmacologic: keratinocyte growth factors (rDNA)

**Pregnancy Category C**

### Indications

To decrease incidence/duration of severe oral mucositis associated with myelotoxic therapy requiring stem cell support for hematologic malignancies.

### Action

Enhances proliferation of epithelial cells. **Therapeutic Effects:** Decreased incidence/duration of mucositis.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Distributes into extravascular space.
**Metabolism and Excretion:** Unknown.
**Half-life:** 4.5 hr.

TIME/ACTION PROFILE (levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | end of dose | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to palifermin or other *E. coli*-derived proteins.
**Use Cautiously in:** OB: Use only if maternal benefit outweighs fetal risk; Lactation: Pedi: Safety not established .

### Adverse Reactions/Side Effects

**Derm:** skin toxicity. **GI:** oral toxicity. **Metab:** ↑ amylase, ↑ lipase. **MS:** arthralgia. **Neuro:** dysesthesia.

### Interactions

**Drug-Drug:** Binds to and inactivates **heparin** (flush tubing between use). Administration within 24 hr after **myelotoxic therapy (chemotherapy/radiation)** ↑ severity and duration of mucositis.

### Route/Dosage

**IV (Adults):** 60 mcg/kg/day for 3 days before and 3 days after myelotoxic therapy.

### Availability

**Powder for injection:** 6.25 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess level of oral mucositis prior to and periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ serum lipase and amylase; usually reversible.
- May cause proteinuria.

### Potential Nursing Diagnoses

Acute pain (Indications)
Impaired oral mucous membrane (Indications)

### Implementation

- Do not administer palifermin within 24 hr before, during infusion, or 24 hr after infusion of myelotoxic chemotherapy.

- Administer doses for 3 consecutive days before (third dose 24–48 hr prior to chemotherapy) and 3 consecutive days after myelotoxic chemotherapy (fourth dose on same days as hematopoietic stem cells infusion and at least 4 days after most recent palifermin administration) for a total of 6 doses.

**IV Administration**

- **Direct IV:** ***Diluent:*** Reconstitute palifermin powder by slowly injecting 1.2 mL of sterile water for injection aseptically. ***Concentration:*** 5 mg/mL. Swirl gently; do not shake or vigorously agitate. Solution should be clear and colorless; do not administer solution that is discolored or contains particulate matter. Dissolution usually takes less than 3 minutes. Administer immediately after reconstitution or refrigerate and administer within 24 hr. Do not freeze. Allow to reach room temperature for up to 1 hr. Protect from light. Discard palifermin after expiration date or if left at room temperature for more than 1 hr. ***Rate:*** Administer via bolus injection. Do not use a filter.
- **Y-Site Incompatibility:** heparin. If heparin solution is used to maintain IV line, flush with 0.9% NaCl prior to and after use of palifermin.

## Patient/Family Teaching

- Inform patient of evidence of tumor growth and stimulation in cell culture and animal models.
- Advise patient to notify health care professional if rash, erythema, edema, pruritus, oral/perioral dysesthesia (tongue discoloration, tongue thickening, alteration of taste) occur.

## Evaluation/Desired Outcomes

- Decrease in incidence and duration of oral mucositis in patients receiving myelotoxic therapy requiring hematopoietic stem cell support.

# paliperidone (pa-li-**per**-i-done)

Invega, Invega Sustenna

***Classification***

Therapeutic: antipsychotics
Pharmacologic: benzisoxazoles

**Pregnancy Category C**

## Indications

**PO, IM:** Acute and maintenance treatment of schizophrenia. **PO:** Acute treatment of schizoaffective disorder (as monotherapy or as adjunct to mood stabilizers and/or antidepressants).

## Action

May act by antagonizing dopamine and serotonin in the CNS. Paliperidone is the active metabolite of risperidone. **Therapeutic Effects:** Decreased manifestations of schizophrenia. Decreased manifestations of schizoaffective disorder.

## Pharmacokinetics

**Absorption:** 28% absorbed following oral administration, food ↑ absorption; slowly absorbed after IM administration (concentrations higher and more rapidly achieved with administration into deltoid muscle).
**Distribution:** Unknown.
**Metabolism and Excretion:** 59% excreted unchanged in urine; 32% excreted in urine as metabolites.
**Half-life:** 23 hr (PO); 25–49 days (IM).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 24 hr | 24 hr |
| IM | unknown | 13 days | 1 mo |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to paliperidone or risperidone; Concurrent use of drugs known to cause QTc prolongation (including quinidine, procainamide, sotalol, amiodarone, chlorpromazine, thioridazine, moxifloxacin); History of congenital QTc prolongation or other cardiac arrhythmias; Bradycardia, hypokalemia, hypomagnesemia (↑ risk of QTc prolongation); Pre-existing severe GI narrowing (due to nature of tablet formulation); CCr < 50 mL/min (for IM); Lactation: Discontinue drug or bottle feed.
**Use Cautiously in:** Patients with Parkinson's Disease or dementia with Lewy Bodies (↑ sensitivity to effects of antipsychotics); History of suicide attempt; Patients at risk for aspiration pneumonia; History of seizures; Conditions which may ↑ body temperature (strenuous exercise, exposure to extreme heat, concurrent anticholinergics or risk of dehydration); ↓ GI transit time (may ↑ blood levels); May mask symptoms of some drug overdoses, intestinal obstruction, Reye's Syndrome or brain tumor (due to antiemetic effect); Diabetes mellitus; Severe hepatic impairment; Renal impairment (dose ↓ recommended if CCr <80 mL/min); OB: Safety not established; use only if maternal benefit outweighs fetal risk; Pedi: Safety not established; Geri: ↑ risk of mortality in elderly patients treated for dementia-related psychosis; consider age-related ↓ in renal function.

### Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, drowsiness, headache, anxiety, confusion, dizziness, extrapyramidal disorders (dose related), fatigue, Parkinsonism (dose related), syncope, tardive dyskinesia, weakness. **EENT:** blurred vision. **Resp:** dyspnea, cough. **CV:** palpitations, tachycardia (dose related), bradycardia, orthostatic hypotension, ↑ QTc interval. **GI:** abdominal pain, dry mouth, dyspepsia, nausea, swollen tongue. **GU:** impotence, priapism. **Endo:** amenorrhea, galactorrhea, gynecomastia, hyperglycemia. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **MS:** back pain, dystonia (dose related). **Neuro:** akithisia, dyskinesia, tremor (dose related). **Misc:** fever.

### Interactions

**Drug-Drug:** ↑ risk of CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **sedative/hypnotics**, or **opioid analgesics**. May antagonize the effects of **levodopa** or other **dopamine agonists**. ↑ risk of orthostatic hypotension with **antihypertensives**, **nitrates**, or other **agents that lower blood pressure**. **Carbamazepine** may ↓ levels/effects.

### Route/Dosage

#### Schizophrenia

**PO (Adults):** 6 mg/day; may titrate by 3 mg/day at intervals of at least 5 days (range 3–12 mg/day).

**IM (Adults):** 234 mg initially, then 156 mg one week later; continue with monthly maintenance dose of 117 mg (range of 39–234 mg based on efficacy and/or tolerability).

#### Renal Impairment

**PO (Adults):** *CCr 50–79 mL/min*—3 mg/day initially; dose may be ↑ to maximum of 6 mg/day; *CCr 10–<50 mL/min*—1.5 mg/day initially; dose may be ↑ to maximum of 3 mg/day.

#### Renal Impairment

**IM (Adults):** *CCr 50–79 mL/min*—156 mg initially, then 117 mg one week later; continue with monthly maintenance dose of 78 mg; *CCr <50 mL/min*—Contraindicated.

#### Schizoaffective Disorder

**PO (Adults):** 6 mg/day; may titrate by 3 mg/day at intervals of at least 4 days (range 3–12 mg/day).

#### Renal Impairment

**PO (Adults):** *CCr 50–79 mL/min*—3 mg/day initially; dose may be ↑ to maximum of 6 mg/day; *CCr 10–<50 mL/min*—1.5 mg/day initially; dose may be ↑ to maximum of 3 mg/day.

### Availability

**Extended-release tablets (Invega):** 1.5 mg, 3 mg, 6 mg, 9 mg. **Intramuscular injection (Invega Sustenna):** 39 mg, 78 mg, 117 mg, 156 mg, 234 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression, especially during early therapy. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout therapy.
- Monitor blood pressure (sitting, standing, lying down) and pulse before and periodically during therapy. May cause prolonged QT interval, tachycardia, and orthostatic hypotension.
- Observe patient when administering medication to ensure that medication is actually swallowed and not hoarded or cheeked.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation of medication may be necessary.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue paliperidone and notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- ***Lab Test Considerations:*** Monitor fasting blood glucose and cholesterol levels before and periodically during therapy.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

- Monitor CBC frequently during initial months of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.

### Potential Nursing Diagnoses

Risk for self-directed violence (Indications)
Impaired oral mucous membrane (Side Effects)
Disturbed sensory perception : (specify: visual, auditory, kinesthetic, gustatory, tactile, olfactory) (Indications)

### Implementation

- **PO:** Administer once daily in the morning without regard to food. Tablets should be swallowed whole; do not crush, break or chew.
- **IM:** Administer initial and second doses in deltoid using a 1 ½-inch, 22G needle for patients ≥90 kg (≥200 lb) or 1-inch 23G needle for patients <90 kg (<200 lb). Monthly maintenance doses can be administered in either deltoid or gluteal sites. For gluteal injection, use 1 ½-inch, 22G needle regardless of patient weight. To avoid missed dose, may give second dose 2 days before or after the one-week timepoint. Monthly doses may be given up to 7 days before or after the monthly timepoint. *After 1st month, if missed dose is within 6 wk of scheduled dose*, administer previous dose as soon as possible. *If >6 wk and < 6 mo of scheduled dose*, resume with previous dose by administering dose in deltoid as soon as possible, a second dose in deltoid in 1 wk, followed by monthly doses in deltoid or gluteal sites. *If >6 mo since scheduled dose,* administer using initial dosing schedule.

### Patient/Family Teaching

- Instruct patient to take medication as directed. Advise patient that appearance of tablets in stool is normal and not of concern.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Advise patient that extremes in temperature should also be avoided; this drug impairs body temperature regulation.
- Caution patient to avoid concurrent use of alcohol, other CNS depressants, and Rx, OTC, or herbal products without consulting health care professional.
- Advise patient to seek nutritional, weight, or medical management as needed for weight gain or cholesterol elevation.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breastfeeding or planning to breastfeed.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, tremors, menstrual abnormalities, galactorrhea, or sexual dysfunction occur.
- Emphasize the importance of routine follow-up exams to monitor side effects and continued participation in psychotherapy to improve coping skills.

### Evaluation/Desired Outcomes

- Decrease in excited, manic behavior.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunted affect) of schizophrenia.

## palonosetron

(pa-lone-**o**-se-tron)
Aloxi

***Classification***
Therapeutic: antiemetics
Pharmacologic: 5-$HT_3$ antagonists

**Pregnancy Category B**

### Indications

Prevention of acute and delayed nausea and vomiting caused by initial or repeat courses of moderate or highly emetogenic chemotherapy (intravenous). Prevention of acute nausea and vomiting

caused by initial or repeat courses of moderately emetogenic chemotherapy (oral). Prevention of postoperative nausea and vomiting (PONV) for up to 24 hr after surgery (intravenous).

### Action
Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zones in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following emetogenic chemotherapy or surgery.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability; oral bioavailability = 97%.
**Distribution:** Unknown.
**Metabolism and Excretion:** 50% metabolized; 40% excreted unchanged in urine.
**Half-life:** 40 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | within 30 min | unknown | 7 days |
| PO | within 1 hr | unknown | 7 days |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; cross sensitivity with other 5-$HT_3$ antagonists may occur; Lactation: Lactation.
**Use Cautiously in:** OB, Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** dizziness, headache. **GI:** constipation, diarrhea.

### Interactions
**Drug-Drug:** None significant.

### Route/Dosage
**IV (Adults):** *Prevention of chemotherapy-induced nausea/vomiting*—0.25 mg 30 min before start of chemotherapy; *Prevention of PONV*—0.075 mg given immediately before induction of anesthesia .
**PO (Adults):** 0.5 mg 1 hr before start of chemotherapy.

### Availability
**Solution for IV injection:** 0.05 mg/mL. **Capsules:** 0.5 mg.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- ***Lab Test Considerations:*** May cause transient ↑ in serum bilirubin, AST, and ALT levels.

### Potential Nursing Diagnoses
Imbalanced nutrition: less than body requirements (Indications)
Diarrhea (Side Effects)
Constipation (Side Effects)

### Implementation
- First dose is administered prior to emetogenic event.
- Repeated dose within a 7 day period is not recommended.
- **PO:** May be administered with or without food 1 hr prior to the start of chemotherapy.

#### IV Administration
- **Direct IV:** Administer dose undiluted 30 min prior to chemotherapy or immediately prior to the induction of anesthesia. Flush line prior to and after administration with 0.9% NaCl. Do not administer solutions that are discolored or contain particulate matter. ***Concentration:*** 0.05 mg/mL. ***Rate:*** Administer over 30 seconds for chemotherapy and over 10 seconds for postoperative nausea and vomiting.
- **Syringe Compatibility:** dexamethasone.
- **Y-Site Compatibility:** alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline , amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin hydrochloride, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibitide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, inamrinone,

insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, mivacurium, morphine, nalbuphine, naloxone, neostigmine, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pentazocine, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine.

- **Y-Site Incompatibility:** acyclovir, allopurinol, amphotericin B colloidal, diazepam, doxycycline, ganciclovir, imipenem/cilastatin, methylprednisolone, minocycline, nafcillin, pantoprazole, pentamidine, pentobarbital, phenytoin, thiopental.

## Patient/Family Teaching

- Inform patient of purpose of medication.
- Advise patient to notify health care professional if nausea or vomiting occur.

## Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with initial and repeat courses of emetogenic cancer chemotherapy or surgery.

# pamidronate (pa-mid-roe-nate)

Aredia

***Classification***

Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates, hypocalcemics

**Pregnancy Category D**

## Indications

Moderate to severe hypercalcemia associated with malignancy. Osteolytic bone lesions associated with multiple myeloma or breast cancer. Moderate to severe Paget's disease.

## Action

Inhibits resorption of bone. **Therapeutic Effects:** Decreased serum calcium. Decreased skeletal destruction in multiple myeloma or breast cancer. Decreased skeletal complications in Paget's disease.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Rapidly absorbed by bone. Reaches high concentrations in bone, liver, spleen, teeth, and tracheal cartilage. Approximately 50% of a dose is retained by bone and then slowly released.
**Metabolism and Excretion:** 50% is excreted unchanged in the urine.
**Half-life:** Elimination half-life from plasma is biphasic—1st phase 1.6 hr, 2nd phase 27.2 hr. Elimination half-life from bone is 300 days.

TIME/ACTION PROFILE (effect on serum calcium)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 24 hr | 7 days | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to pamidronate, other biphosphonates, or mannitol; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Underlying cardiovascular disease, especially CHF (initiate saline hydration cautiously); Concurrent dental surgery (may ↑ risk of jaw osteonecrosis); History of thyroid surgery (may be at ↑ risk for hypocalcemia); Renal impairment (dose ↓ recommended); Pedi: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** fatigue. **EENT:** conjunctivitis, blurred vision, eye pain/inflammation, rhinitis. **Resp:** rales. **CV:** arrhythmias, hypertension, syncope, tachycardia. **GI:** nausea, abdominal pain, anorexia, constipation, vomiting. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hypophosphatemia, fluid overload. **GU:** nephrotoxicity. **Hemat:** leukopenia, anemia. **Local:** phlebitis at injection site. **Metab:** hypothyroidism. **MS:** muscle

stiffness, musculoskeletal pain, osteonecrosis (primarily of jaw). **Misc:** fever, generalized pain.

### Interactions

**Drug-Drug:** Hypokalemia and hypomagnesemia may ↑ risk of **digoxin** toxicity. **Calcium** and **vitamin D** will antagonize the beneficial effects of pamidronate. Concurrent use of **thalidomide** may ↑ risk of renal dysfunction.

### Route/Dosage

Single doses should not exceed 90 mg.

### Hypercalcemia of Malignancy

**IV (Adults):** *Moderate hypercalcemia*—30–90 mg; may be repeated after 7 days.

### Osteolytic Lesions from Multiple Myeloma

**IV (Adults):** 90 mg monthly.

### Osteolytic Lesions from Metastatic Breast Cancer

**IV (Adults):** 90 mg q 3–4 wk.

### Paget's Disease

**IV (Adults):** 90–180 mg/treatment; may be given as 30 mg daily for 3 days up to 30 mg/wk for 6 wk. Single doses of 60–90 mg may also be effective.

### Availability (generic available)

**Powder for injection:** 30 mg/vial, 90 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor intake/output ratios and blood pressure frequently during therapy. Assess for signs of fluid overload (edema, rales/crackles).
- Monitor symptoms of hypercalcemia (nausea, vomiting, anorexia, weakness, constipation, thirst, and cardiac arrhythmias).
- Observe for evidence of hypocalcemia (paresthesia, muscle twitching, laryngospasm, and Chvostek's or Trousseau's sign). Protect symptomatic patients by elevating and padding side rails; keep bed in low position.
- Monitor IV site for phlebitis (pain, redness, swelling). Symptomatic treatment should be used if this occurs.
- Assess for bone pain. Treatment with nonopioid or opioid analgesics may be necessary.
- ***Lab Test Considerations:*** Assess serum creatinine prior to each treatment. Withhold dose if renal function has deteriorated in patients treated for bone metastases.
- Monitor serum electrolytes (including calcium, phosphate, potassium, and magnesium), hemoglobin, and creatinine closely. Monitor CBC and platelet count during the first 2 wk of therapy. May cause hyperkalemia or hypokalemia, hypernatremia, and hematuria.
- Monitor renal function periodically during therapy.

### Potential Nursing Diagnoses

Acute pain (Indications, Side Effects)
Risk for injury (Indications)

### Implementation

- Initiate a vigorous saline hydration, maintaining a urine output of 2000 mL/24 hr, concurrently with pamidronate therapy. Patients should be adequately hydrated, but avoid overhydration. Use caution in patients with underlying cardiovascular disease, especially CHF. Do not use diuretics prior to treatment of hypovolemia.
- Patients with severe hypercalcemia should be started at the 90-mg dose.

#### IV Administration

- **IV:** Reconstitute by adding 10 mL of sterile water for injection to each vial. ***Concentration:*** 30 mg/10 mL or 90 mg/10 mL. Allow drug to dissolve before withdrawing. Solution is stable for 24 hr if refrigerated.
- **Hypercalcemia:** ***Diluent:*** Dilute further in 1000 mL of 0.45% NaCl, 0.9% NaCl, or D5W. Solution is stable for 24 hr at room temperature. ***Rate:*** Administer 60-mg infusion over at least 4 hr and 90-mg infusion over 24 hr.
- **Multiple Myeloma:** ***Diluent:*** Dilute reconstituted solution in 500 mL of 0.45% NaCl, 0.9% NaCl, or D5W. ***Rate:*** Administer over 4 hr.
- **Paget's Disease:** Dilute reconstituted solution in 500 mL of 0.45% NaCl, 0.9% NaCl, or D5W.
- ***Rate:*** Administer over 4 hr.
- **Y-Site Compatibility:** bivalirudin, daptomycin, ertapenem, nesiritide, octreotide, oxytocin, palonosetron, pemetrexed, teniposide, thiotepa, tigecycline, tirofiban, voriconazole.
- **Y-Site Incompatibility:** caspofungin.
- **Additive Incompatibility:** Calcium-containing solutions, such as Ringer's solution.

### Patient/Family Teaching

- Advise patient to report signs of hypercalcemic relapse (bone pain, anorexia, nausea, vomiting, thirst, lethargy) or eye problems (pain, inflammation, blurred vision, conjunctivitis) to health care professional promptly.
- Advise patient to notify nurse of pain at the infusion site.

- Encourage patient to comply with dietary recommendations. Diet should contain adequate amounts of calcium and vitamin D.
- Advise patient to notify health care professional if bone pain is severe or persistent.
- Advise patient to inform health care professional of pamidronate therapy prior to dental surgery.
- Emphasize the need for keeping follow-up exams to monitor progress, even after medication is discontinued, to detect relapse.

### Evaluation/Desired Outcomes

- Lowered serum calcium levels.
- Decreased pain from lytic lesions.

## pancrelipase (pan-kre-**li**-pase)

Creon, Enzymase-16, Ilozyme, Pancrease MT 4, Pancrease MT 10, Pancrease MT 16, Pancrease MT 20, Pancrebarb MS-8, Ultrase MT 12, Ultrase MT 20, Viokase, Zenpep

***Classification***

Therapeutic: digestive agent
Pharmacologic: pancreatic enzymes

**Pregnancy Category C**

### Indications

Pancreatic insufficiency associated with: Chronic pancreatitis, Pancreatectomy, Cystic fibrosis, GI bypass surgery, Ductal obstruction secondary to tumor.

### Action

Contains lipolytic, amylolytic, and proteolytic activity. **Therapeutic Effects:** Increased digestion of fats, carbohydrates, and proteins in the GI tract.

### Pharmacokinetics

**Absorption:** Unknown.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** Unknown.

TIME/ACTION PROFILE (digestant effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to hog proteins.
**Use Cautiously in:** OB, Lactation: Safety not established.

### Adverse Reactions/Side Effects

**EENT:** nasal stuffiness. **Resp:** dyspnea, shortness of breath, wheezing. **GI:** abdominal pain (high doses only), diarrhea, nausea, stomach cramps, oral irritation. **GU:** hematuria. **Derm:** hives, rash. **Metab:** hyperuricemia. **Misc:** allergic reactions.

### Interactions

**Drug-Drug:** Antacids (**calcium carbonate** or **magnesium hydroxide**) may ↓ effectiveness of pancrelipase. May ↓ the absorption of concurrently administered **iron supplements**.
**Drug-Food: Alkaline foods** destroy coating on enteric-coated products.

### Route/Dosage

**PO (Adults):** 1–3 capsule(s) before or with meals; dose may be increased as needed (up to 8 capsules may be needed), *or* 1–2 delayed-release capsule(s), *or* 0.7 g powder.
**PO (Children):** 1–3 capsule(s) before or with meals; dose may be increased as needed, *or* 1–2 delayed-release capsule(s), *or* 0.7 g powder.

### Availability (generic available)

**Capsules:** 8000 units lipase/30,000 units protease and amylase. **Delayed-release capsules:** 4000 units lipase/12,000 units protease and amylase, 4000 units lipase/25,000 units protease/25,000 units amylase, 4500 units lipase/25,000 units protease/20,000 units amylase, 5000 units lipase/17,000 units protease/27,000 units amylase, 6000 units lipase/19,000 units protease/30,000 units amylase, 8000 units lipase/45,000 units protease/40,000 units amylase, 8000 units lipase/30,000 units protease and amylase, 10,000 units lipase/30,000 units protease and amylase, 10000 units lipase/34,000 units protease/55,000 units amylase, 12,000 units lipase/39,000 units protease and amylase, 12,000 units lipase/38,000 units protease/60,000 units amylase, 15,000 units lipase/51,000 units protease/82,000 units amylase, 16,000 units lipase/48,000 units protease and amylase, 16,000 units lipase/52,000 units protease and amylase, 20,000 units lipase/44,000 units protease/56,000 units amylase, 20,000 units lipase/55,000 units protease and amylase, 20,000 units lipase/65,000 units protease and amylase, 20,000 units lipase/68,000 units protease/109,000 units amylase, 24,000 units lipase/76,000 units protease/120,000 units amylase. **Powder:** 16,800 units lipase/70,000 units protease and amylase.

## NURSING IMPLICATIONS

### Assessment

- Assess patient's nutritional status (height, weight, skin-fold thickness, arm muscle circumference, and lab values) prior to and periodically throughout therapy.
- Monitor stools for high fat content (steatorrhea). Stools will be foul-smelling and frothy.
- Assess patient for allergy to pork; sensitivity to pancrelipase may exist.
- ***Lab Test Considerations:*** May cause ↑ serum and urine uric acid concentrations.

### Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

### Implementation

- **PO:** Administer immediately before or with meals and snacks.
- Swallow capsules whole. If unable to swallow, capsules may be opened and sprinkled on foods. Capsules filled with enteric-coated beads should not be chewed (sprinkle on soft, acidic foods that can be swallowed without chewing, such as applesauce or Jell-O).
- Pancrelipase is destroyed by acid. Concurrent sodium bicarbonate or aluminum-containing antacids may be used with nonenteric-coated preparations to neutralize gastric pH. Enteric-coated beads are designed to withstand the acid pH of the stomach. These medications should not be chewed or mixed with alkaline foods prior to ingestion or coating will be destroyed.
- Do not mix *Zenpep* capsule contents directly into formula or breast milk prior to administration. Administer with applesauce, bananas, or pears (commercially prepared) and follow with breast milk or formula. *Zenpep* product is not interchangeable with other pancrealipase products.

### Patient/Family Teaching

- Encourage patients to comply with diet recommendations of health care professional (generally high-calorie, high-protein, low-fat). Dose should be adjusted for fat content of diet. Usually 300 mg of pancrelipase is necessary to digest every 17 g of dietary fat. If a dose is missed, it should be omitted.
- Instruct patient not to chew tablets and to swallow them quickly with plenty of liquid to prevent mouth and throat irritation. Patient should be sitting upright to enhance swallowing. Eating immediately after taking medication helps further ensure that the medication is swallowed and does not remain in contact with mouth and esophagus for a prolonged period. Patient should avoid sniffing powdered contents of capsules, as sensitization of nose and throat may occur (nasal stuffiness or respiratory distress).
- Instruct patient to notify health care professional if joint pain, swelling of legs, gastric distress, or rash occurs.
- Advise female patients to notify health care professional if pregnancy is planned or suspected.

### Evaluation/Desired Outcomes

- Improved nutritional status in patients with pancreatic insufficiency.
- Normalization of stools in patients with steatorrhea.

HIGH ALERT

## pancuronium

(pan-cure-**oh**-nee-yum)

***Classification***

Therapeutic: neuromuscular blocking agents—nondepolarizing

**Pregnancy Category C**

### Indications

Induction of skeletal muscle paralysis and facilitation of intubation after induction of anesthesia in surgical procedures. Facilitation of compliance during mechanical ventilation.

### Action

Prevents neuromuscular transmission by blocking the effect of acetylcholine at the myoneural junction. Has no analgesic or anxiolytic properties.
**Therapeutic Effects:** Skeletal muscle paralysis.

### Pharmacokinetics

**Absorption:** Following IV administration, absorption is essentially complete.
**Distribution:** Rapidly distributes into extracellular fluid; small amounts cross the placenta.
**Metabolism and Excretion:** Excreted mostly unchanged by the kidneys; small amounts are eliminated in bile.
**Half-life:** 2 hr.

TIME/ACTION PROFILE (neuromuscular blockade)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 30–45 sec | 3–4.5 min | 40–60 min |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hypersensitivity to bromides; Lactation: Lactation.

**Use Cautiously in:** Patients with underlying cardiovascular disease ( ↑ risk of arrhythmias); Dehydration or electrolyte abnormalities (should be corrected); Situations in which histamine release would be problematic; Fractures or muscle spasm; Patients with impaired renal function ( ↓ elimination); Hyperthermia ( ↑ duration/intensity of paralysis); Patients with significant hepatic impairment (altered response); Shock; Extensive burns (may be more resistant to effects); Low plasma pseudocholinesterase levels (may be seen in association with anemia, dehydration, cholinesterase inhibitors/insecticides, severe liver disease, pregnancy, or hereditary predisposition); Obese patients; OB: Safety not established; may be used during caesarian section; Pedi: Contains benzyl alcohol which can cause potentially fatal gasping syndrome in neonates; Geri: Age-related ↓ in renal function may result in prolonged effects.
**Exercise Extreme Caution in:** Patients with neuromuscular diseases such as myasthenia gravis (small test dose may be used to assess response).

### Adverse Reactions/Side Effects

**Resp:** bronchospasm. **CV:** hypertension, tachycardia. **GI:** excessive salivation. **Derm:** rash. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug:** Intensity and duration of paralysis may be prolonged by pretreatment with **succinylcholine**, **general anesthesia** (inhalation), **aminoglycosides**, **vancomycin**, **tetracyclines**, **polymyxin B**, **colistin**, **cyclosporine, calcium channel blockers, clindamycin**, **lidocaine**, and other **local anesthetics**, **lithium**, **quinidine**, **procainamide**, **beta blockers**, **potassium-losing diuretics**, or **magnesium**. **Inhalation anesthetics** including **enflurane**, **isoflurane**, **halothane**, **desflurane**, **sevoflurane** may enhance effects. Higher infusion rates may be required and duration of action may be shortened in patients receiving long-term **carbamazepine**, **steroids (chronic)**, **azathioprine** or **phenytoin**.

### Route/Dosage

**IV (Adults and Children >12 yr):** 0.15 mg/kg initially; incremental doses of 0.15 mg/kg may be given q 20–60 min as needed to maintain paralysis or as a continuous infusion of 0.02–0.04 mg/kg/hr or 0.4–0.6 mcg/kg/min. .
**IV (Children > 1 yr):** 0.15 mg/kg q 30–60 min as needed or as a continuous infusion of 0.03–0.1 mg/kg/hr or 0.5–1.7 mcg/kg/min.
**IV (Neonates and Infants):** 0.1 mg/kg q 30–60 min as needed or as a continuous infusion of 0.02–0.04 mg/kg/hr or 0.4–0.6 mcg/kg/min.

### Availability (generic available)

**Injection:** 1 mg/mL, 2 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess respiratory status continuously throughout therapy with neuromuscular blocking agents. These medications should be used only to facilitate intubation or in patients already intubated.
- Neuromuscular response should be monitored with a peripheral nerve stimulator intraoperatively. Paralysis is initially selective and usually occurs sequentially in the following muscles: levator muscles of eyelids, muscles of mastication, limb muscles, abdominal muscles, muscles of the glottis, intercostal muscles, and the diaphragm. Recovery of muscle function usually occurs in reverse order.
- Monitor ECG, heart rate, and blood pressure throughout administration.
- Observe the patient for residual muscle weakness and respiratory distress during the recovery period.
- Monitor infusion site frequently. If signs of tissue irritation or extravasation occur, discontinue and restart in another vein.
- ***Toxicity and Overdose:*** If overdose occurs, use peripheral nerve stimulator to determine the degree of neuromuscular blockade. Maintain airway patency and ventilation until recovery of normal respirations occurs.
- Administration of anticholinesterase agents (neostigmine, pyridostigmine) may be used to antagonize the action of neuromuscular blocking agents once the patient has demonstrated some spontaneous recovery from neuromuscular block. Atropine is usually administered prior to or concurrently with anticholinesterase agents to counteract the muscarinic effects.
- Administration of fluids and vasopressors may be necessary to treat severe hypotension or shock.

### Potential Nursing Diagnoses

Ineffective breathing pattern (Indications)
Impaired verbal communication (Side Effects)
Fear (Side Effects)

## Implementation

- ***High Alert:*** Unintended administration of a neuromuscular blocking agent instead of administration of the intended medication or administration of a neuromuscular blocking agent in the absence of ventilatory support has resulted in serious harm or death. Confusing similarities in packaging and insufficiently controlled access to these medications are often implicated in these medication errors. Store these products in a separate, locked container.
- Dose is titrated to patient response.
- Neuromuscular blocking agents have *no* effect on consciousness or pain threshold. Adequate anesthesia/analgesia should *always* be used when neuromuscular blocking agents are used as an adjunct to surgical procedures or when painful procedures are performed. Benzodiazepines and/or analgesics should be administered concurrently when prolonged neuromuscular blocker therapy is used for ventilator patients, because patient is awake and able to feel all sensations.
- If eyes remain open throughout prolonged administration, protect corneas with artificial tears.
- Store pancuronium in refrigerator. To prevent absorption by plastic, pancuronium should not be stored in plastic syringes. May be administered in plastic syringes.
- Most neuromuscular blocking agents are incompatible with barbiturates and sodium bicarbonate. Do not admix.

### IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. ***Concentration:*** 1 mg/mL (10-mL vial); 2 mg/mL (2-mL or 5-mL vial). ***Rate:*** Administer over 1–2 min.
- **Intermittent Infusion:** ***Diluent:*** Add 100 mg of pancuroniuum to 250 mL of D5W , 0.9% NaCl, D5/0.9% NaCl, or LR. ***Concentration:*** 0.4 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** aminophylline, cefazolin, cefuroxime, cimetidine, daptomycin, diltiazem, dobutamine, dopamine, epinephrine, ertapenem, esmolol, etomidate, fenoldopam, fentanyl, fluconazole, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, isoproterenol, levofloxacin, linezolid, lorazepam, midazolam, morphine, nitroglycerin, nitroprusside, palonosetron, piperacillin/tazobactam, quinupristin/dalfopristin, ranitidine, trimethoprim/sulfamethoxazole , tacrolimus, tirofiban, vancomycin, voriconazole.
- **Y-Site Incompatibility:** caspofungin, diazepam, pantoprazole, thiopental.

## Patient/Family Teaching

- Explain all procedures to patient receiving neuromuscular blocker therapy without general anesthesia, because consciousness is not affected by neuromuscular blocking agents alone.
- Reassure patient that communication abilities will return as the medication wears off.

## Evaluation/Desired Outcomes

- Adequate suppression of the twitch response when tested with peripheral nerve stimulation and subsequent muscle paralysis.
- Improved compliance during mechanical ventilation.

# panitumumab

(pan-i-**tu**-mu-mab)

Vectibix

***Classification***

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies

**Pregnancy Category C**

## Indications

Treatment of metastatic colorectal cancer that expresses EGFR (epidermal growth factor receptor) and has failed conventional treatments (to be used as monotherapy).

## Action

Binds to EGFR resulting in inactivation of kinases that regulate proliferation and transformation.

**Therapeutic Effects:** Decreased progression of colorectal cancer.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.

**Distribution:** Monoclonal antibodies cross the placenta and enter breast milk.

**Metabolism and Excretion:** Unknown.

**Half-life:** 7.5 days.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | end of infusion | unknown |

## Contraindications/Precautions

**Contraindicated in:** Concurrent leucovorin; Patients whose tumors have KRAS mutations in

codon 12 or 13 (not effective); OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** fatigue. **EENT:** OCULAR TOXICITY, eyelash growth. **Resp:** PULMONARY FIBROSIS, cough. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, stomatitis. **Derm:** DERMATOLOGIC TOXICITY, paromychia, photosensitivity. **F and E:** edema, hypocalcemia, hypomagnesemia. **Misc:** INFUSION REACTIONS.

### Interactions

**Drug-Drug:** None noted.

### Route/Dosage

**IV (Adults):** 6 mg/kg as a 60-min infusion every 14 days; ↓ infusion rates and dose modifications are recommended for infusion reactions and other serious toxicities.

### Availability

**Solution for IV administration (requires dilution):** 20 mg/mL in 5-mL vials (100 mg/vial).

## NURSING IMPLICATIONS

### Assessment

- Assess for dermatologic toxicity (dermatitis acneiform, pruritus, erythema, rash, skin exfoliation, paronychia, dry skin, skin fissures). If severe, may lead to infection (sepsis, septic death, abscesses requiring incision and drainage). With severe reactions, withhold panitumumab and monitor for inflammatory or infectious sequelae.
- Monitor for severe infusion reactions (anaphylactic reaction, bronchospasm, fever, chills, hypotension). If severe reaction occurs, stop panitumumab; may require permanent discontinuation.
- Assess for pulmonary fibrosis (cough, wheezing, exertional dyspnea, interstitial lung disease, pneumonitis, lung infiltrates). Permanently discontinue panitumumab if these signs occur.
- Monitor for diarrhea during therapy.
- ***Lab Test Considerations:*** Monitor electrolyte levels periodically during and for 8 wk after completion of therapy. May cause hypomagnesemia and hypocalcemia.

### Potential Nursing Diagnoses

Risk for impaired skin integrity (Adverse Reactions)
Impaired gas exchange (Adverse Reactions)

### Implementation

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Withdraw necessary amount of panitumumab. Dilute to a volume of 100 mL with 0.9% NaCl; dilute doses >1000 mg with 150 mL. ***Concentration:*** 10 mg/mL. Mix by inverting gently; do not shake. Administer via infusion pump using a low-protein binding 0.2 mcg or 0.22 mcg in-line filter. Solution is colorless and may contain a small amount of visible translucent to white, amorphous, proteinaceous particles. Do not administer solutions that are discolored or contain particulate matter. Store in refrigerator; do not freeze. Use diluted solution within 6 hr of preparation if stored at room temperature or within 24 hr if refrigerated. ***Rate:*** Administer over 60 min every 14 days. Administer doses >1000 mg over 90 min.
- If mild to moderate infusion reaction (Grade 1 or 2) occurs decrease infusion rate by 50%. If severe reaction (Grade 3 or 4) occurs, immediately and permanently discontinue panitumumab.
- If severe dermatologic toxicities (Grade 3 or higher) or those considered intolerable occur, withhold panitumumab. If toxicity does not improve to ≤ grade 2 within 1 mo, discontinue permanently. If toxicity improves to ≤ grade 2 and patient improves symptomatically after withholding no more than 2 doses, resume therapy at 50% dose. If toxicities recur, permanently discontinue panitumumab.
  If toxicities do not recur, increase subsequent doses in 25% increments of the original dose until recommended dose of 6 mg/kg is reached.
- **Y-Site Incompatibility:** Flush line before and after administration with 0.9% NaCl. Do not mix with other medications or solutions.

### Patient/Family Teaching

- May cause photosensitivity. Caution patient to wear sunscreen and hats and to limit sun exposure.
- Advise patient that panitumumab may cause fertility impairment and may have teratogenic effects. Caution women of childbearing yr to use contraception during and for at least 6 mo after the last dose and not to breastfeed during and for at least 2 mo after the last dose of panitumumab.

P

- Inform patient of potential for dermatologic toxicity, infusion reactions, pulmonary fibrosis, and impairment of fertility. Advise patient to notify health care professional if skin or ocular changes or dyspnea occur. Advise patient that periodic electrolyte monitoring is required.

### Evaluation/Desired Outcomes

- Decreased progression of colorectal cancer.

## pantoprazole

(pan-**toe**-pra-zole)

Pantoloc, Protonix, Protonix IV

***Classification***

Therapeutic: antiulcer agents

Pharmacologic: proton-pump inhibitors

**Pregnancy Category B**

### Indications

Erosive esophagitis associated with GERD. Decrease relapse rates of daytime and nighttime heartburn symptoms on patients with GERD. Pathologic gastric hypersecretory conditions. **Unlabeled Use:** Adjunctive treatment of duodenal ulcers associated with *Helicobacter pylori*.

### Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis. Decreased acid secretion in hypersecretory conditions.

### Pharmacokinetics

**Absorption:** Tablet is enteric-coated; absorption occurs only after tablet leaves the stomach.
**Distribution:** Unknown.
**Protein Binding:** 98%.
**Metabolism and Excretion:** Mostly metabolized by the liver via the cytochrome P450 (CYP) system (primarily CYP2C19 isoenzyme, but also the CYP3A4 isoenzyme) (the CYP2C19 enzyme system exhibits genetic polymorphism; 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ pantoprazole concentrations and an ↑ risk of adverse effects); inactive metabolites are excreted in urine (71%) and feces (18%).
**Half-life:** 1 hr.

TIME/ACTION PROFILE (effect on acid secretion)

| ROUTE | ONSET† | PEAK | DURATION† |
|---|---|---|---|
| PO | 2.5 hr | unknown | 1 wk |
| IV | 15–30 min | 2 hr | unknown |

†Onset = 51% inhibition; duration = return to normal following discontinuation

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB: Should be used during pregnancy only if clearly needed. Lactation: Discontinue breastfeeding due to potential for serious adverse reactions in infants.
**Use Cautiously in:** Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** headache. **GI:** abdominal pain, diarrhea, eructation, flatulence. **Endo:** hyperglycemia.

### Interactions

**Drug-Drug:** May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **atazanavir**, **ampicillin esters**, and **iron salts**. May ↑ risk of bleeding with **warfarin** (monitor INR/PT). May ↓ the antiplatelet effects of **clopidogrel**.

### Route/Dosage

**PO (Adults):** *GERD*—40 mg once daily; *Gastric hypersecretory conditions*—40 mg twice daily, up to 120 mg twice daily.
**PO (Children):** 0.5–1 mg/kg/day .
**IV (Adults):** *GERD*—40 mg once daily for 7–10 days. *Gastric hypersecretory conditions*—80 mg q 12 hr (up to 240 mg/day).

### Availability (generic available)

**Delayed-release tablets:** 20 mg, 40 mg. **Cost:** 20 mg $353.61/90, 40 mg $351.97/90. **Powder for injection:** 40 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** May cause abnormal liver function tests, including ↑ AST, ALT, alkaline phosphatase, and bilirubin.

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- Patients receiving pantoprazole IV should be converted to PO dosing as soon as possible.
- **PO:** May be administered with or without food. Do not break, crush, or chew tablets.

- Antacids may be used concurrently.

**IV Administration**

- **IV:** Reconstitute each vial with 10 mL of 0.9% NaCl. Reconstituted solution is stable for 6 hr at room temperature.
- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 4 mg/mL. ***Rate:*** Administer over at least 2 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute further with D5W, 0.9% NaCl, or LR. ***Concentration:*** 0.4–0.8 mg/mL. Diluted solution is stable for 24 hr at room temperature. ***Rate:*** Administer over 15 min at a rate of <3 mg/min.
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, amikacin, animocaproic acid, aminophylline, amphotericin B liposome, ampicillin, amipcillin/sulbactam, anidulafungin, azithromycin, bleomycin, calcium gluconate, carboplatin, carmustine, cefazolin, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, clindamycin, cyclophosphamide, cyclosporine, cytarabine, digoxin, dimenhydrinate, docetaxel, dopamine, doripenem, doxycycline, enalaprilat, epinephrine, ertapenem, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, imipenem/cilastatin, inamrinone, insulin, irinotecan, isoproterenol, magnesium sulfate, mannitol, mesna, methohexital, methyldopate, metoclopramide, nafcillin, nitroglycerin, nitroprusside, ofloxacin, oxytocin, paclitaxel, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, rifampin, sodium bicarbonate, succinylcholine, sufentanyl, tacrolimus, teniposide, theophylline, thiopental, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vasopressin, zidovudine.
- **Y-Site Incompatibility:** alfentanil, amphotericin B colloidal, atracurium, aztreonam, buprenorphine, butorphanol, calcium acetate, calcium chloride, cefoeprazone, cefotaxime, cefotetan, chloramphenicol, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, diltiazem, diphenhydramine, dobutamine, dolasetron, doxacurium, doxorubicin hydrochloride, droperidol, ephedrine, epirubicin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, gemcitabine, glycopyrrolate, haloperidol, hydralazine, hydroxyzine, idarubicin, ifosfamide, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, mechlorethamine, melphalan, meperidine, methotrexate, methylprednisolone, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, mivacurium, nalbuphine, naloxone, nesiritide, nicardipine, ondansetron, palonosetron, pancuronium, pemetrexed, pentamidine, phenytoin, potassium phosphates, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, sodium phosphates, streptozocin, thiotepa, tolazoline, topotecan, trimethobenzamide, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, solutions containing zinc.

P

## Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Instruct patient to consult health care professional prior to taking other Rx, OTC, or herbal products.

## Evaluation/Desired Outcomes

- Decrease in abdominal pain heartburn, gastric irritation and bleeding in patients with GERD; may require up to 4 wk of therapy.
- Healing in patients with erosive esophagitis. Therapy is continued for up to 8 wk.

**paricalcitol, See VITAMIN D COMPOUNDS.**

# paroxetine hydrochloride
(par-**ox**-e-teen)
Paxil, Paxil CR

# paroxetine mesylate
Pexeva

***Classification***
Therapeutic: antianxiety agents, antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

**Pregnancy Category D**

## Indications
**Paxil, Paxil CR, Pexeva:** Major depressive disorder, panic disorder. **Paxil, Pexeva:** Obsessive compulsive disorder (OCD), generalized anxiety disorder (GAD). **Paxil, Paxil CR:** Social anxiety disorder. **Paxil:** Post-traumatic stress disorder (PTSD). **Paxil CR:** Premenstrual dysphoric disorder (PMDD).

## Action
Inhibits neuronal reuptake of serotonin in the CNS, thus potentiating the activity of serotonin; has little effect on norepinephrine or dopamine.
**Therapeutic Effects:** Antidepressant action. Decreased frequency of panic attacks, OCD, or anxiety. Improvement in manifestations of post-traumatic stress disorder. Decreased dysphoria prior to menses.

## Pharmacokinetics
**Absorption:** Completely absorbed following oral administration. Controlled-release tablets are enteric-coated and control medication release over 4–5 hr.
**Distribution:** Widely distributed throughout body fluids and tissues, including the CNS; cross the placenta and enter breast milk.
**Protein Binding:** 95%.
**Metabolism and Excretion:** Highly metabolized by the liver (partly by P450 2D6 enzyme system); 2% excreted unchanged in urine.
**Half-life:** 21 hr.

TIME/ACTION PROFILE (antidepressant action)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–4 wk | unknown | unknown |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Concurrent MAO inhibitor, thioridazine, or pimozide therapy.

**Use Cautiously in:** Risk of suicide (may ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment); History of seizures; History of bipolar disorder; OB: Use during the first trimester may be associated with an increased risk of cardiac malformations—consider fetal risk/maternal benefit; use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; Lactation: Safety not established; discontinue drug or bottle feed; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; may be greater in children and adolescents (safety in children/adolescents not established); Geri: Severe renal hepatic impairment; geriatric or debilitated patients (daily dose should not exceed 40 mg); history of mania/risk of suicide.

## Adverse Reactions/Side Effects
**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, anxiety, dizziness, drowsiness, headache, insomnia, weakness, agitation, amnesia, confusion, emotional lability, hangover, impaired concentration, malaise, mental depression, syncope. **EENT:** blurred vision, rhinitis. **Resp:** cough, pharyngitis, respiratory disorders, yawning. **CV:** chest pain, edema, hypertension, palpitations, postural hypotension, tachycardia, vasodilation. **GI:** constipation, diarrhea, dry mouth, nausea, abdominal pain, decreased appetite, dyspepsia, flatulence, increased appetite, taste disturbances, vomiting. **GU:** ejaculatory disturbance, decreased libido, genital disorders, urinary disorders, urinary frequency. **Derm:** sweating, photosensitivity, pruritus, rash. **Metab:** weight gain, weight loss. **MS:** back pain, myalgia, myopathy. **Neuro:** paresthesia, tremor. **Misc:** SEROTONIN SYNDROME, chills, fever.

## Interactions
**Drug-Drug:** Serious, potentially fatal reactions (hyperthermia, rigidity, myoclonus, autonomic instability, with fluctuating vital signs and extreme agitation, which may proceed to delirium and coma) may occur with concurrent **MAO inhibitor** therapy. MAO inhibitors should be stopped at least 14 days prior to paroxetine therapy. Paroxetine should be stopped at least 14 days prior to MAO inhibitor therapy. May ↓ metabolism and ↑ effects of certain **drugs that are metabolized by the liver**, including other **antidepressants**, **phenothiazines**, **class IC antiarrhythmics**, **risperidone**, **atomoxetine**, **theophylline**, **procyclidine**, and **quinidine**. Concurrent use should be undertaken with caution. Concurrent use with **pimozide** or **thiorida-**

**zine** may ↑ risk of QT interval prolongation and torsades de pointes. Concurrent use is contraindicated. **Cimetidine** ↑ blood levels. **Phenobarbital** and **phenytoin** may ↓ effectiveness. Concurrent use with **alcohol** is not recommended. May ↓ the effectiveness of **digoxin** and **tamoxifen**. May ↑ risk of bleeding with **warfarin**, **aspirin**, or **NSAIDS**. Concurrent use with **5-HT$_1$ agonists** (**frovatriptan**, **naratriptan**, **rizatriptan**, **sumatriptan**, **zolmitriptan**), **linezolid**, **lithium**, or **tramadol** may result in ↑ serotonin levels and lead to serotonin syndrome.
**Drug-Natural Products:** ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort**, **SAMe**, and **tryptophan**.

### Route/Dosage

### Depression

**PO (Adults):** 20 mg as a single dose in the morning; may be ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day). *Controlled-release tablets*— 25 mg once daily initially. May ↑ at weekly intervals by 12.5 mg (not to exceed 62.5 mg/day).
**PO (Geriatric Patients or Debilitated Patients):** 10 mg/day initially; may be slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*— 12.5 mg once daily initially; may be slowly ↑ (not to exceed 50 mg/day).

### Obsessive-Compulsive Disorder

**PO (Adults):** 20 mg/day initially; ↑ by 10 mg/day at weekly intervals up to 40 mg (not to exceed 60 mg/day).

### Panic Disorder

**PO (Adults):** 10 mg/day initially; ↑ by 10 mg/day at weekly intervals up to 40 mg (not to exceed 60 mg/day). *Controlled-release tablets*— 12.5 mg/day initially; ↑ by 12.5 mg/day at weekly intervals (not to exceed 75 mg/day).

### Social Anxiety Disorder

**PO (Adults):** 20 mg/day. *Controlled-release tablets*— 12.5 mg/day initially; may ↑ by 12.5 mg/day weekly intervals (not to exceed 37.5 mg/day).

### Generalized anxiety disorder

**PO (Adults):** 20 mg once daily initially; ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day).

### Post-traumatic Stress Disorder

**PO (Adults):** 20 mg/day initially; may be ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day).

### Premenstrual Dysphoric Disorder

**PO (Adults):** *Controlled-release tablets*— 12.5 mg once daily throughout menstrual cycle or during luteal phase of menstrual cycle only; may be ↑ to 25 mg/day after one week.

### Hepatic Impairment

**PO (Adults):** *Severe hepatic impairment*— 10 mg/day initially; may be slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*— 12.5 mg once daily initially; may be slowly ↑ (not to exceed 50 mg/day).

### Renal Impairment

**PO (Adults):** *Severe renal impairment*— 10 mg/day initially; may be slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*— 12.5 mg once daily initially; may be slowly ↑ increased (not to exceed 50 mg/day).

### Availability (generic available)

**Paroxetine hydrochloride tablets:** 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Generic*— 10 mg $89.96/90, 20 mg $28.99/90, 30 mg $101.97/90, 40 mg $110.96/90. **Paroxetine hydrochloride controlled-release tablets:** 12.5 mg, 25 mg, 37.5 mg. **Cost:** 12.5 mg $297.99/90, 25 mg $303.95/90, 37.5 mg $317.99/90. **Paroxetine hydrochloride oral suspension (orange flavor):** 10 mg/5 mL. **Cost:** $166.90/250 mL. **Paroxetine mesylate tablets:** 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** 20 mg $352.95/90, 30 mg $256.21/90, 40 mg $383.97/90.

## NURSING IMPLICATIONS

### Assessment

- Monitor appetite and nutritional intake. Weigh weekly. Notify health care professional of continued weight loss. Adjust diet as tolerated to support nutritional status.
- **Depression:** Monitor mental status (orientation, mood, behavior). Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile blood pressure, hyperthermia], neuromuscular aberrations [hyper reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]),

especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **OCD:** Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning.
- **Panic Attacks:** Assess frequency and severity of panic attacks.
- **Social Anxiety Disorder:** Assess frequency and severity of episodes of anxiety.
- **Post-traumatic Stress Disorder:** Assess manifestations of post-traumatic stress disorder periodically during therapy.
- **Premenstrual Dysphoria:** Assess symptoms of premenstrual distress prior to and during therapy.
- ***Lab Test Considerations:*** Monitor CBC and differential periodically during therapy. Report leukopenia or anemia.

### Potential Nursing Diagnoses
Ineffective coping (Indications)
Risk for injury (Side Effects)

### Implementation
- Do not confuse paroxetine (Paxil) with paclitaxel (Taxol).
- Paroxetine mesylate (Pexeva) cannot be substituted with paroxetine (Paxil or Paxil CR) or generic paroxetine.
- Periodically reassess dose and continued need for therapy.
- **PO:** Administer as a single dose in the morning. May administer with food to minimize GI irritation.
- Tablets should be swallowed whole. Do not crush, break, or chew.
- Taper to avoid potential withdrawal reactions.

### Patient/Family Teaching
- Instruct patient to take paroxetine as directed. Take missed doses as soon as possible and return to regular dosing schedule. Do not double doses. Caution patient to consult health care professional before discontinuing paroxetine. Daily doses should be decreased slowly. Abrupt withdrawal may cause dizziness, sensory disturbances, agitation, anxiety, nausea, and sweating.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient, family and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to avoid alcohol or other CNS-depressant drugs during therapy and to consult with health care professional before taking other medications or herbal products with paroxetine.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Saliva substitute may be used. Consult dentist if dry mouth persists for more than 2 wk.
- Instruct female patient to inform health care professional if pregnancy is planned or suspected or if she is breastfeeding.
- Advise patient to notify health care professional if headache, weakness, nausea, anorexia, anxiety, or insomnia persists.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy to improve coping skills.
- Refer patient to local support group.

### Evaluation/Desired Outcomes
- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.
- Decrease in obsessive-compulsive behaviors.
- Decrease in frequency and severity of panic attacks.
- Decrease in frequency and severity of episodes of anxiety.
- Improvement in manifestations of post-traumatic stress disorder.
- Decreased dysphoria prior to menses.

## **pazopanib** (paz-**oh**-pi-nab)
Votrient

***Classification***
Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

**Pregnancy Category D**

### Indications
Treatment of advanced renal cell carcinoma.

### Action
Acts as a tyrosine kinase inhibitor of several vascular endothelial growth factor receptors

(VEGFRs), platelet-derived growth factor receptor, fibroblast growth factor receptor, cytokine receptor, interleukin-2 receptor inducible T-cell kinase, leukocyte-specific protein tyrosine kinase, and transmembrane glycoprotein receptor tyrosine kinase . Overall effect is decreased angiogenesis in tumors. **Therapeutic Effects:** Decreased growth and spread of renal cell carcinoma.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration; crushing tablet and ingesting food ↑ absorption.
**Distribution:** unknown.
**Protein Binding:** >99%.
**Metabolism and Excretion:** Mostly metabolized by the liver (primarily by the CYP3A4 enzyme system, minor amounts by CYP1A2 and CYP2C8) followed by elimination in feces; <4% excreted by the kidneys.
**Half-life:** 30.9 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | PO | 2–4 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Severe hepatic impairment; History of hemoptysis, cerebral or GI bleeding in preceding 6 mo; Risk/history of arterial thrombotic events, including MI, angina or ischemic stroke within preceding 6 mo; Concurrent use of strong CYP3A4 inhibitors (if concurrent use is necessary, consider dose reduction of pazopanib); Concurrent use of strong CYP3A4 inducers (may ↓ effectiveness); Concurrent use of drugs that have narrow therapeutic windows and that are metabolized by CYP3A4, CYP2D6, or CYP2C8 enzyme systems (CYP substrates); OB: May cause fetal harm, avoid use during pregnancy; Lactation: Avoid use during breast feeding.
**Use Cautiously in:** Congenital prolonged QTc interval or concurrent medications/diseases that prolong QTc (may ↑ risk of Torsade de Pointes, a serious arrhythmia); Electrolyte abnormalities (correct prior to use; may ↑ risk of potentially serious arrhythmia); Patients at risk for gastrointestinal perforation/fistula; Surgery; interruption of therapy recommended; Hypertension; control before therapy is initiated; Hypothyroidism (may worsen condition); Concurrent use of inducers of the CYP3A4 enzyme system; consider alternate concurrent medication with little or no enzyme induction potential or avoid pazopanib; Moderate hepatic impairment (dose reduction recommended; Geri: may be more sensitive to drug effects, consider age-related decrease in cardiac, renal, and hepatic function, concurrent disease states and drug therapy; OB: Women with childbearing potential; Pedi: Safe and effective use in children has not been established.

## Adverse Reactions/Side Effects

**CNS:** fatigue, weakness. **CV:** PROLONGED QT INTERVAL, hypertension, altered taste, chest pain, dyspepsia. **GI:** GI PERFORATION/FISTULA, HEPATOTOXICITY, abdominal pain, anorexia, diarrhea, nausea, vomiting. **GU:** proteinuria. **Derm:** alopecia, facial edema, palmar-plantar erythrodysesthesia (hand-foot syndrome), rash, skin depigmentation. **Endo:** hypothyroidism. **Hemat:** BLEEDING, aterial thrombosis. **Metab:** ↑ lipase, weight loss. **Misc:** hair color changes (depigmentation).

## Interactions

**Drug-Drug:** Concurrent use of **strong CYP3A4 inhibitors**, including **ketoconazole**, **ritonavir** and **clarithromycin** may ↑ pazopanib and should be avoided; if required, dose of pazopanib should be decreased to 400 mg daily or more if necessary. Concurrent use of **strong CYP3A4 inducers**, including **rifampin**, may ↓ levels and effectiveness and should be avoided. Concurrent use with **drugs with narrow therapeutic windows that are metabolized by CYP3A4, CYP2D6, or CYP2C8** may ↑ levels of such drugs and the risk of toxicity/adverse reactions is not recommended.

## Route/Dosage

**PO (Adults):** 800 mg once daily; *strong inhibitors or CYP3A4*— 400 mg once daily, further reductions may be necessary.

### Hepatic Impairment

**PO (Adults):** *Moderate hepatic impairment*— 200 mg once daily.

## Availability

**Tablets:** 200 mg, 400 mg.

# NURSING IMPLICATIONS

## Assessment

- Monitor BP during frequent therapy; may cause hypertension. BP should be well-controlled prior to initiating therapy. If persistent hypertension occurs despite antihypertensive therapy, reduce dose. If hypertension persists and is severe, discontinue therapy.

- Obtain baseline ECG and monitor periodically during therapy. Maintain serum calcium, magnesium, and potassium within normal range during therapy.
- Monitor for signs and symptoms of GI perforation and fistula (abdominal pain, GI bleeding) during therapy.
- ***Lab Test Considerations:*** Monitor serum liver tests before initiation and at least every 4 wk for first 4 mo or as indicated, then periodically during therapy. *If isolated ALT ↑ between 3 and 8 times the upper limit of normal*, therapy may continue with weekly monitoring of liver function until ALT returns to Grade 1 or baseline. *If isolated ALT ↑ >8 times the upper limit of normal,* stop therapy until ALT returns to Grade 1 or baseline. If benefit outweighs risk, may reintroduce at reduced dose of 400 mg/day with weekly serum liver tests for 8 wk. Following reintroduction, if ALT ↑ >3 times the upper limit of normal recurs, permanently discontinue pazopanib. *If ALT ↑ occurs concurrently with ↑ serum bilirubin >2 times the upper limit of normal*, discontinue pazopanib permanently. Monitor liver function tests until return to baseline. *Patients with only mild indirect hyperbilirubinemia (Gilbert's syndrome) and ↑ ALT >3 times the upper limit of normal* should be managed as per recommendations for ↑ ALT.
- Monitor thyroid function periodically during therapy. May cause hypothyroidism.
- Obtain baseline urinalysis and monitor periodically. May cause proteinuria. Discontinue therapy if Grade 4 proteinuria develops.
- May cause leukopenia, neutropenia, thrombocytopenia, and lymphocytopenia.
- May cause ↑ AST and ↓ serum phosphorous, sodium, and magnesium. May cause ↑ or ↓ serum glucose.

## Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

## Implementation

- **PO:** Administer at least 1 hr before or 2 hr after a meal. Swallow tablets whole; do not crush tablets.

## Patient/Family Teaching

- Instruct patient to take pazopanib on an empty stomach as dierected. Take missed doses as soon as remembered; if less than 12 hr before next dose, omit dose. Advise patient to read the Medication Guide prior to taking pazopanib and with each Rx refill; new information may be available.
- Advise patient to notify health care professional if yellowing of skin or whites of eyes, unusual darkening of urine, unusual tiredness, or pain in the right upper stomach area occurs.
- Inform patient that diarrhea frequently occurs. Instruct patient on ways to manage diarrhea and to notify health care professional if moderate to severe diarrhea occurs.
- Inform patient that loss of color (depigmentation) of skin or hair may occur during therapy. Explore methods of coping.
- Advise patient to consult health care professional before taking other Rx, OTC, or herbal products.
- Advise female patients to use effective contraception during therapy and to notify health care professional immediately if pregnancy is suspected.

## Evaluation/Desired Outcomes

- Decreased growth and spread of renal cell carcinoma.

# pegaspargase

(peg-ass-**par**-jase)

Oncaspar, PEG-L-asparaginase

***Classification***

Therapeutic: antineoplastics

Pharmacologic: enzymes

**Pregnancy Category C**

## Indications

Treatment (usually with other agents) of acute lymphoblastic leukemia (ALL) in patients who have had a previous hypersensitivity reaction to native asparaginase.

## Action

Consists of L-asparaginase bound to polyethylene glycol (PEG). This compound depletes asparagine, which leukemic cells cannot synthesize. Normal cells are able to produce their own asparagine and are less susceptible to the effects of asparaginase. Binding to PEG renders asparaginase less antigenic and therefore less likely to induce hypersensitivity reactions. **Therapeutic Effects:** Death of leukemic cells.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.

**Distribution:** Unknown.

**Metabolism and Excretion:** Metabolized by serum proteases and in the reticuloendothelial system.
**Half-life:** 5.7 days (less in patients with previous hypersensitivity to native L-asparaginase).

TIME/ACTION PROFILE (hematologic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | unknown | 14 days |

## Contraindications/Precautions

**Contraindicated in:** Pancreatitis or history of pancreatitis; History of previous hemorrhagic reaction to asparaginase therapy; Previous hypersensitivity reactions to pegaspargase.
**Use Cautiously in:** History of previous hypersensitivity reactions to other drugs; Patients with childbearing potential; OB: Lactation: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, headache, malaise. **GI:** PANCREATITIS, abdominal pain, abnormal liver function tests, anorexia, diarrhea, lip edema, nausea, vomiting. **Derm:** jaundice. **Endo:** hyperglycemia. **F and E:** peripheral edema. **Hemat:** decreased fibrinogen, disseminated intravascular coagulation, hemolytic anemia, increased thromboplastin, leukopenia, pancytopenia, thrombocytopenia. **Local:** injection site hypersensitivity, injection site pain, thrombosis. **MS:** arthralgia, myalgia, pain in extremities. **Neuro:** paresthesia. **Misc:** chills, hypersensitivity reactions, night sweats.

## Interactions

**Drug-Drug:** May alter response to **anticoagulants** or **antiplatelet agents**. May alter the response to other **drugs that are metabolized by the liver**.

## Route/Dosage

**IM, IV (Adults up to 21 yr, and Children with Body Surface Area ≥0.6 m²):** 2500 IU/m² q 14 days (usually in combination with other agents).
**IM, IV (Children with Body Surface Area <0.6 m²):** 82.5 IU/kg q 14 days (usually in combination with other agents).

## Availability

**Injection:** 750 IU/mL.

# NURSING IMPLICATIONS

## Assessment

- Assess patient for previous hypersensitivity reactions to native L-asparaginase. Monitor for hypersensitivity reaction (urticaria, diaphoresis, facial swelling, joint pain, hypotension, bronchospasm). Epinephrine and resuscitation equipment should be readily available. Reaction may occur up to 2 hr after administration.
- Monitor for development of bone marrow depression. Assess for fever, sore throat, and signs of infection. Monitor platelet count throughout therapy. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac test stools, urine, and emesis). Avoid giving IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor patient frequently for signs of pancreatitis (nausea, vomiting, abdominal pain).
- Assess nausea, vomiting, and appetite. Weigh patient weekly. Prophylactic antiemetics may be used prior to administration.
- ***Lab Test Considerations:*** Monitor CBC prior to and periodically throughout therapy. May alter coagulation studies. Fibrinogen may be decreased; PT and partial thromboplastin time (PTT) may be ↑.
- Monitor serum amylase frequently to detect pancreatitis.
- Monitor blood glucose; may cause hyperglycemia.
- May cause elevated BUN and serum creatinine.
- Hepatotoxicity may be manifested by increased AST, ALT, or bilirubin. Liver function tests usually return to normal after therapy.
- May cause ↓ serum calcium.
- May cause elevated serum and urine uric acid and hyponatremia.

## Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

## Implementation

- Do not confuse pegaspargase with asparaginase.
- IM is the preferred route because of a lower incidence of adverse reactions.
- Solutions should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- **IM:** Limit single injection volume to 2 mL. If volume of injection is >2 mL, use multiple injection sites.

P

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute each dose in 100 mL of 0.9% NaCl or D5W. Do not shake or agitate. Do not use if solution is cloudy or has formed a precipitate.
- Use only 1 dose per vial; do not re-enter the vial. Discard unused portions.
- Keep refrigerated but do not freeze. Freezing destroys activity but does not change the appearance of pegaspargase. ***Rate:*** Administer over 1–2 hr via Y-site through an infusion that is already running.
- **Additive Incompatibility:** Information unavailable. Do not admix with other medications or solutions.

## Patient/Family Teaching

- Inform patient of the possibility of hypersensitivity reactions, including anaphylaxis.
- Advise patient that concurrent use of other medications may increase the risk of bleeding and the toxicity of pegaspargase. Consult health care professional before taking any other medications, including OTC drugs.
- Instruct patient to notify health care professional if abdominal pain, severe nausea and vomiting, jaundice, fever, chills, sore throat, bleeding or bruising, excess thirst or urination, or mouth sores occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush, electric razor, and to be especially careful to avoid falls. Patients should also be cautioned not to drink alcoholic beverages or take medications containing aspirin or NSAIDs because these may precipitate gastric bleeding.
- Instruct patient not to receive any vaccinations without advice of health care professional. Advise parents that this may alter child's immunization schedule.
- Emphasize the need for periodic lab tests to monitor for side effects.

## Evaluation/Desired Outcomes

- Improvement of hematologic status in patients with leukemia.

# pegfilgrastim (peg-fil-**gra**-stim)

Neulasta

***Classification***

Therapeutic: colony-stimulating factors

**Pregnancy Category C**

## Indications

To decrease the incidence of infection (febrile neutropenia) in patients with nonmyeloid malignancies receiving myelosuppressive antineoplastics associated with a high risk of febrile neutropenia.

## Action

Filgrastim is a glycoprotein that binds to and stimulates neutrophils to divide and differentiate. Also activates mature neutrophils. Binding to a polyethylene glycol molecule prolongs its effects.
**Therapeutic Effects:** Decreased incidence of infection in patients who are neutropenic from chemotherapy.

## Pharmacokinetics

**Absorption:** Well absorbed following subcut administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** 15–80 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | unknown | unknown | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to filgrastim or *Escherichia coli*-derived proteins.
**Use Cautiously in:** Patients with sickle cell disease (↑ risk of sickle cell crisis); Concurrent use of lithium; Malignancy with myeloid characteristics; OB, Lactation: Pregnancy or lactation; Pedi: 6 mg fixed dose should not be used in infants, children, and adolescents weighing <45 kg.

## Adverse Reactions/Side Effects

**Resp:** ADULT RESPIRATORY DISTRESS SYNDROME (ARDS). **GI:** SPLENIC RUPTURE. **Hemat:** SICKLE CELL CRISIS, leukocytosis. **MS:** medullary bone pain. **Misc:** allergic reaction including ANAPHYLAXIS.

## Interactions

**Drug-Drug:** Simultaneous use with **antineoplastics** may have adverse effects on rapidly proliferating neutrophils; avoid use for 24 hr before and 24 hr following chemotherapy. **Lithium** may potentiate the release of neutrophils; concurrent use should be undertaken cautiously.

## Route/Dosage

**Subcut (Adults and Children >45 kg):** 6 mg per chemotherapy cycle.

## Availability

**Solution for injection:** 6 mg/0.6 mL in prefilled syringes.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for bone pain throughout therapy. Pain is usually mild to moderate and controllable with nonopioid analgesics, but may require opioid analgesics.
- Assess patient periodically for signs of ARDS (fever, lung infiltration, respiratory distress). If ARDS occurs, treat condition and discontinue pegfilgrastim and/or withold until symptoms resolve.
- ***Lab Test Considerations:*** Obtain CBC and platelet count before chemotherapy. Monitor hematocrit and platelet count regularly.
- May cause elevated LDH, alkaline phosphatase, and uric acid.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Acute pain (Side Effects)

### Implementation

- Pegfilgrastim should not be administered between 14 and 24 days after administration of cytotoxic chemotherapy.
- Keep patients with sickle cell disease receiving pegfilgrastim well hydrated and monitor for sickle cell crisis.
- **Subcut:** Administer subcut once per chemotherapy cycle. Do not administer solutions that are discolored or contain particulate matter. Do not shake. Store refrigerated; may be allowed to reach room temperature for a maximum of 48 hr, but protect from light.
- Supplied in prefilled syringes. Following administration, activate UltraSafe Needle Guard to prevent needle sticks by placing hands behind needle, grasping guard with one hand, and sliding guard forward until needle is completely covered and guard clicks into place. If audible click is not heard, guard may not be completely activated. Dispose of by placing entire prefilled syringe with guard activated into puncture-proof container.

### Patient/Family Teaching

- Advise patient to notify health care professional immediately if signs of allergic reaction (shortness of breath, hives, rash, pruritus, laryngeal edema) or signs of splenic rupture (left upper abdominal or shoulder tip pain) occur.
- Emphasize the importance of compliance with therapy and regular monitoring of blood counts.
- **Home Care Issues:** Instruct patient on correct disposal technique for home administration. Caution patient not to reuse needle, syringe, or drug product. Provide patient with a puncture-proof container for disposal of prefilled syringe.

### Evaluation/Desired Outcomes

- Decreased incidence of infection in patients who receive bone marrow–depressing antineoplastics.

**peginterferon alpha-2a, See INTERFERONS, ALPHA.**

**peginterferon alpha-2b, See INTERFERONS, ALPHA.**

## **pemetrexed** (pe-me-**trex**-ed)

Alimta

***Classification***

Therapeutic: antineoplastics
Pharmacologic: antimetabolites, folate antagonists

**Pregnancy Category D**

P

### Indications

Malignant pleural mesothelioma (with cisplatin) when tumor is unresectable or patient is not a candidate for surgery. Local advanced or metastatic nonsquamous non–small cell lung cancer as initial therapy (with cisplatin), in previously treated patients (as monotherapy), or as maintenance treatment in patients whose disease has not progressed after four cycles of platinum-based chemotherapy.

### Action

Disrupts folate dependent metabolic processes involved in thymidine and purine synthesis. Converted intracellularly to polyglutamate form which increases duration of action. **Therapeutic Effects:** Decreases growth and spread of mesothelioma. Improved survival in patients with nonsquamous non-small cell lung cancer.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.

**Metabolism and Excretion:** Minimal metabolism; 70–90% excreted unchanged in urine.
**Half-life:** 3.5 hr (normal renal function).

TIME/ACTION PROFILE (hematologic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | 8–15 days | 21 days |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; CCr <45 mL/min; **OB:** OB, Lactation: Pregnancy, lactation.
**Use Cautiously in:** Concurrent use of NSAIDs in patients with CCr 45–79 mL/min (avoid those with short half-lives); Third space fluid accumulation (ascites, pleural effusions); consider drainage prior to therapy; Hepatic impairment (dose alteration recommended); Pedi: Safety not established.

## Adverse Reactions/Side Effects

**Resp:** pharyngitis. **CV:** chest pain. **GI:** constipation, nausea, stomatitis, vomiting, anorexia, diarrhea, esophagitis, mouth pain. **Derm:** desquamation, rash. **Hemat:** anemia, leukopenia, thrombocytopenia. **Neuro:** neuropathy. **Misc:** fever, infection.

## Interactions

**Drug-Drug: NSAIDs**, especially those with short half-lives, ↑ blood levels and risk of toxicity; avoid for 2 days before, day of, and 2 days after treatment. **Probenecid** ↑ blood levels. Concurrent use of **nephrotoxic agents** ↑ risk of nephrotoxicity.

## Route/Dosage

**IV (Adults):** *Mesothelioma and non–small cell lung cancer (with cisplatin)* 500—mg/m² on day 1 of each 21-day cycle (with cisplatin); concurrent hydration, folic acid, and vitamin $B_{12}$ therapy, and pretreatment with dexamethasone required. *Non–small cell lung cancer (as monotherapy)*—500 mg/m² on day 1 of each 21-day cycle (concurrent folic acid, and vitamin $B_{12}$ therapy, and pretreatment with dexamethasone required).

## Availability

**Lyophilized powder for IV infusion:** 500 mg/vial.

# NURSING IMPLICATIONS

## Assessment

- Monitor for rash during therapy. Pretreatment with dexamethasone 4 mg orally twice daily the day before, the day of, and the day after administration reduces incidence and severity or reaction.
- Monitor for hematologic and GI (mucositis, diarrhea) toxicities. If any Grade 3 or 4 toxicities, except mucositis or diarrhea, requiring hospitalization occur, decrease doses of pemetrexed and cisplatin by 75%. If Grade 3 or 4 mucositis occurs decrease pemetrexed dose by 50% and cisplatin by 100% of previous dose.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur; monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess for neurotoxicity during therapy. If Grade 0–1 neurotoxicity occurs, decrease pemetrexed and cisplatin doses by 100% of previous dose. If Grade 2 neurotoxicity occurs, decrease pemetrexed dose by 100% and cisplatin dose by 50% of previous dose. If Grade 3 or 4 neurotoxicity occurs, discontinue therapy.
- ***Lab Test Considerations:*** Monitor CBC and platelet counts for nadir and recovery, before each dose and on days 8 and 15 of each cycle and chemistry for renal and liver functions periodically. May cause neutropenia, thrombocytopenia, leukopenia, and anemia. A new cycle should not be started unless the ANC is at least 1500 cells/mm³, platelet count is at least 100,000 cells/mm³, and creatinine clearance is at least 45 mL/min. If nadir of ANC is less than 500/mm³ and nadir of platelets are at least 50,000/mm³ decrease doses of pemetrexed and cisplatin by 75%. If nadir of platelets is less than 50,000/mm³ regardless of ANC nadir decrease pemetrexed and cisplatin doses by 50%.

## Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

## Implementation

- Pemetrexed should be administered under supervision of a physician experienced in the use of chemotherapeutic agents.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- To reduce toxicity, at least 5 mg of folic acid must be taken daily for 7 days preceding first dose of pemetrexed and should continue during and for 21 days after last dose. Patients must also receive an injection of vitamin $B_{12}$ 1000 mcg during the week preceding first dose of pemetrexed and every 3 cycles thereafter.

Subsequent doses of vitamin $B_{12}$ may be given on same day as pemetrexed.

### IV Administration

- **Intermittent Infusion:** Calculate number of pemetrexed 500-mg vials needed; vials contain excess to facilitate delivery. Reconstitute 500 mg with 20 mL of preservative–free 0.9% NaCl. ***Concentration:*** 25 mg/mL. Swirl gently until powder is completely dissolved. Solution is clear and colorless to yellow or green-yellow. Do not administer if discolored or containing particulate matter. ***Diluent:*** Dilute further to 100 mL with preservative–free 0.9% NaCl. Solution is stable at room temperature or if refrigerated for up to 24 hr. ***Rate:*** Administer over 10 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, amipicillin/sulbactam, atenolol, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bretylium, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dolasetron, dopamine, doxacurium, enalaprilat, ephedrine, epinephrine, eptifibitide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, milrinone, mitomycin, mivacurium, morphine, moxifloxacin, nafcillin, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, oxaliplatin, paclitaxel, pamidronate, pancuronium, pentobarbital, phenobarbital, phentolamine, piperacillin/tazobactam, potassium chloride, potassium phosphates, procainamide, promethazine, propranolol, ranitidine, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** amphotericin B colloidal, calcium acetate, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, chloramphenicol, chlorpromazine, ciprofloxacin, dacarbazine, dantrolene, daunorubicin, diazepam, dobutamine, doxorubicin, doxycycline, droperidol, erythromycin, gemcitabine, gentamicin, hydralazine, idarubicin, inamrinone, irinotecan, metronidazole, minocycline, mitoxantrone, nalbuphine, nicardipine, nitroprusside, ondansetron, pantoprazole, pentamidine, pentazocine, phenytoin, prochlorperazine, quinapristin/dalfopristin, tobramycin, topotecan, vasopressin.
- **Additive Incompatibility:** Solutions containing calcium, including Lactated Ringer's and Ringer's solution.

### Patient/Family Teaching

- Emphasize the importance of taking prophylactic folic acid and vitamin $B_{12}$ to reduce treatment-related hematologic and GI toxicity.
- Advise patient to avoid becoming pregnant during therapy. If pregnancy is planned or suspected, notify health care professional promptly.

### Evaluation/Desired Outcomes

- Decreased growth and spread of mesothelioma or non–small cell lung cancer.

## penciclovir (pen-**sye**-kloe-veer)

Denavir

***Classification***

Therapeutic: antivirals (topical)

**Pregnancy Category B**

### Indications

Recurrent herpes labialis (cold sores).

### Action

Inhibits viral DNA synthesis and replication.

**Therapeutic Effects:** Death of herpes virus. Decreased lesion duration and pain. Active against herpes viruses.

### Pharmacokinetics
**Absorption:** Not absorbed following topical use.
**Distribution:** Unknown.
**Metabolism and Excretion:** Converted intracellularly to active triphosphate form; excreted in urine.
**Half-life:** 2–2.5 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Topical | unknown | unknown | unknown |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to penciclovir or other components of the formulation.
**Use Cautiously in:** OB: Lactation: Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** headache. **Local:** application site reactions.

### Interactions
**Drug-Drug:** None significant.

### Route/Dosage
**PO (Adults):** Apply q 2 hr for 4 days while awake.

### Availability
**Cream:** 1%.

## NURSING IMPLICATIONS

### Assessment
- Assess lesions prior to and daily during therapy.

### Potential Nursing Diagnoses
Risk for impaired skin integrity (Indications)
Risk for infection (Indications, Patient/Family Teaching)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation
- Do not confuse Denavir (penciclovir) with indinivir.
- Begin treatment as early as possible, during prodrome or when lesions appear.
- **Topical:** Apply to lesions every 2 hr for 4 days while awake.
- Apply to lips and face only; avoid application to mucous membranes or near the eyes.

### Patient/Family Teaching
- Advise patient to apply medication exactly as directed for the full course of therapy. If a dose is missed, apply as soon as possible but not just before next dose is due; do not double doses. Penciclovir should not be used more frequently or longer than prescribed.
- Advise patients that the additional use of OTC creams, lotions, and ointments may delay healing and may cause spreading of lesions.

### Evaluation/Desired Outcomes
- More rapid healing of lesions and relief of pain in herpes labialis.

## PENICILLINS (pen-i-**sill**-ins)

**penicillin G**
Pfizerpen

**penicillin V**
Apo-Pen VK, Crystapen, Novo-Pen-VK, Nu-Pen-VK, Penicilline V

**procaine penicillin G**
Wycillin

**benzathine penicillin G**
Bicillin L-A, Permapen

***Classification***
Therapeutic: anti-infectives
Pharmacologic: penicillins

**Pregnancy Category B**

### Indications
Treatment of a wide variety of infections including: Pneumococcal pneumonia, Streptococcal pharyngitis, Syphilis, Gonorrhea strains. Treatment of enterococcal infections (requires the addition of an aminoglycoside). Prevention of rheumatic fever. Should not be used as a single agent to treat anthrax. **Unlabeled Use:** Treatment of Lyme disease. Prevention of recurrent *Streptococcal pneumoniae* septicemia in children with sickle-cell disease.

### Action
Bind to bacterial cell wall, resulting in cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against: Most gram-positive organisms, including many streptococci (*Streptococcus pneumoniae*, group A beta-hemolytic streptococci), staphylococci (non–penicillinase-producing strains) and *Bacillus anthracis*; Some gram-negative organisms, such as *Neisseria meningitidis* and *Neisseria gonorrhoeae* (only penicillin susceptible strains); Some anaerobic bacteria and spirochetes including *Borellia burgdorferi*.

### Pharmacokinetics
**Absorption:** Variably absorbed from the GI tract. *Penicillin V*— resists acid degradation in the GI

tract. *Procaine and benzathine penicillin*—IM absorption is delayed and prolonged and results in sustained therapeutic blood levels.
**Distribution:** Widely distributed, although CNS penetration is poor in the presence of uninflamed meninges. Cross the placenta and enter breast milk.
**Metabolism and Excretion:** Minimally metabolized by the liver, excreted mainly unchanged by the kidneys.
**Half-life:** 30–60 min.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Penicillin V PO | rapid | 0.5–1 hr | 4–6 hr |
| Penicillin G IM | rapid | 0.25–0.5 hr | 4–6 hr |
| Benzathine penicillin IM | delayed | 12–24 hr | 3 wk |
| Procaine penicillin IM | delayed | 1–4 hr | 12 hr |
| Penicillin G IV | rapid | end of infusion | 4–6 hr |

## Contraindications/Precautions

**Contraindicated in:** Previous hypersensitivity to penicillins (cross-sensitivity may exist with cephalosporins and other beta-lactams); Hypersensitivity to procaine or benzathine (procaine and benzathine preparations only); Some products may contain tartrazine and should be avoided in patients with known hypersensitivity.
**Use Cautiously in:** Severe renal insufficiency (dose ↓ recommended); OB: Although safety not established, has been used safely; Lactation: Safety not established; Geri: Consider ↓ body mass, age-related ↓ in renal, hepatic, and cardiac function, comorbidities, and concurrent drug therapy when prescribing and dosing.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES. **GI:** diarrhea, epigastric distress, nausea, vomiting, pseudomembranous colitis. **GU:** interstitial nephritis. **Derm:** rashes, urticaria. **Hemat:** eosinophilia, hemolytic anemia, leukopenia. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

## Interactions

**Drug-Drug:** May ↓ effectiveness of oral contraceptive agents. **Probenecid** ↓ renal excretion and ↑ levels therapy may be combined for this purpose). **Neomycin** may ↓ absorption of penicillin V. ↓ elimination of **methotrexate** and ↑ risk of serious toxicity.

## Route/Dosage

### Penicillin G (aqueous)

**IM, IV (Adults):** *Most infections*—1–5 million units q 4–6 hr.
**IM, IV (Children):** 8333–16,667 units/kg q 4 hr; 12,550–25,000 units/kg q 6 hr; up to 250,000 units/kg/day in divided doses, some infections may require up to 300,000 units/kg/day.
**IV (Infants >7 days):** 25,000 units/kg q 8 hr; *meningitis*—50,000–75,000 units/kg q 6 hr.
**IV (Infants <7 days):** 25,000 units/kg q 12 hr; *Streptococcus B meningitis*—100,000–150,000 units/kg/day in divided doses.

### Penicillin V

**PO (Adults and Children ≥12 yr):** *Most infections*—125–500 mg q 6–8 hr. *Rheumatic fever prevention*—125–250 mg q 12 hr.
**PO (Children <12 yr):** *Lyme disease*—12.5 mg/kg q 6 hr (unlabeled); prevention of *Streptococcus pneumoniae* sepsis in children with sickle cell disease—125 mg twice daily.

### Benzathine Penicillin G

**IM (Adults):** *Streptococcal infections/erysipeloid*—1.2 million units single dose. *Primary, secondary, and early latent syphilis*—2.4 million units single dose. *Tertiary and late latent syphilis (not neurosyphilis)*—2.4 million units once weekly for 3 wk. *Prevention of rheumatic fever*—1.2 million units q 3–4 wk.
**IM (Children >27 kg):** *Streptococcal infections/erysipeloid*—900,000–1.2 million units (single dose). *Primary, secondary, and early latent syphilis*—up to 2.4 million units single dose. *Late latent or latent syphilis of undetermined duration*—50,000 units/kg weekly for 3 wk. *Prevention of rheumatic fever*—1.2 million units q 2–3 wk.
**IM (Children <27 kg):** *Streptococcal infections/erysipeloid*—300,000–600,000 units single dose. *Primary, secondary, and early latent syphilis*—up to 2.4 million units single dose. *Late latent or latent syphilis of undetermined duration*—50,000 units/kg weekly for 3 wk. *Prevention of rheumatic fever*—1.2 million units q 2–3 wk.

### Procaine Penicillin G

**IM (Adults):** *Moderate or severe infections*—600,000–1.2 million units/day as a single dose or in 2 divided doses. *Neurosyphilis*—2.4 million

units/day with 500 mg probenecid PO 4 times daily for 10–14 days.
**IM (Children):** *Congenital syphilis*—50,000 units/kg/day for 10–14 days.

### Availability

#### Penicillin G Potassium (generic available)
**Powder for injection:** 5 million units/vial, 20 million units/vial. **Premixed (frozen) solution for injection:** 1 million units/50 mL, 2 million units/50 mL, 3 million units/50 mL.

#### Penicillin G Sodium (generic available)
**Powder for injection:** 5 million units/vial.

#### Penicillin V Potassium (generic available)
**Tablets:** 250 mg, 500 mg. **Oral solution:** 125 mg/5 mL, 250 mg/5 mL.

#### Procaine Penicillin G (generic available)
**Suspension for IM injection:** 600,000 units/mL.

#### Benzathine Penicillin G
**Suspension for IM injection:** 600,000 units/mL.

## NURSING IMPLICATIONS

### Assessment
- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history to determine previous use of and reactions to penicillins, cephalosporins, or other beta-lactam antibiotics. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause positive direct Coombs' test results.
- Hyperkalemia may develop after large doses of penicillin G potassium.
- Monitor serum sodium concentrations in patient with hypertension or CHF. Hypernatremia may develop after large doses of penicillin sodium.
- May cause ↑ AST, ALT, LDH, and serum alkaline phosphatase concentrations.
- May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.

### Potential Nursing Diagnoses
Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation
- Do not confuse penicillin with penicillamine. Do not confuse penicillin G aqueous (potassium or sodium salt) with penicillin G procaine.
- **PO:** Administer around the clock. Penicillin V may be administered without regard for meals.
- Use calibrated measuring device for liquid preparations. Solution is stable for 14 days if refrigerated.
- **IM:** Reconstitute according to manufacturer's directions with sterile water for injection, D5W, or 0.9% NaCl.
- **IM:** Shake medication well before injection. Inject penicillin deep into a well-developed muscle mass at a slow, consistent rate to prevent blockage of the needle. Massage well. Accidental injury near or into a nerve can result in severe pain and dysfunction.
- Penicillin G potassium or sodium may be diluted with lidocaine (without epinephrine) 1% or 2% to minimize pain from IM injection.
- Never give penicillin G benzathine or penicillin G procaine suspensions IV. May cause embolism or toxic reactions.

#### IV Administration
- **IV:** Change IV sites every 48 hr to prevent phlebitis.
- Administer slowly and observe patient closely for signs of hypersensitivity.
- **Intermittent Infusion:** ***Diluent:*** Doses of 3 million units or less should be diluted in at least 50 mL of D5W or 0.9% NaCl; doses of more than 3 million units should be diluted with 100 mL. ***Concentration:*** 100,000–500,000 units/mL (50,000 units/mL in neonates). ***Rate:*** Infuse over 1–2 hr in adults or 15–30 min in children.
- **Continuous Infusion:** Doses of 10 million units or more may be diluted in 1 or 2 L.
- ***Rate:*** Infuse over 24 hr.

#### Penicillin G Potassium
- **Y-Site Compatibility:** acyclovir, amiodarone, cyclophosphamide, diltiazem, enalaprilat, esmolol, fluconazole, foscarnet, heparin, hydro-

morphone, labetalol, magnesium sulfate, meperidine, morphine, nicardipine, perphenazine, potassium chloride, tacrolimus, theophylline, verapamil, vitamin B complex with C.

- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart.
- **Additive Incompatibility:** Incompatible with aminoglycosides; do not admix.

### Penicillin G Sodium

- **Y-Site Compatibility:** levofloxacin.
- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart.
- **Additive Incompatibility:** Incompatible with aminoglycosides; do not admix.

### Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish drug completely as directed, even if feeling better. Advise patient that sharing this medication may be dangerous.
- Advise patient to report signs of superinfection (black, furry overgrowth on tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.
- Advise patient taking oral contraceptives to use an additional nonhormonal method of contraception during therapy with penicillin and until next menstrual period.
- Patient with an allergy to penicillin should be instructed to always carry an identification card with this information.

### Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

## PENICILLINS, PENICILLINASE RESISTANT

**dicloxacillin** (dye-klox-a-**sill**-in)

**nafcillin** (naf-**sill**-in)

**oxacillin** (ox-a-**sill**-in)

Bactocill

***Classification***

Therapeutic: anti-infectives

Pharmacologic: penicillinase resistant penicillins

**Pregnancy Category B**

### Indications

Treatment of the following infections due to penicillinase-producing staphylococci: Respiratory tract infections, Sinusitis, Skin and skin structure infections. **Dicloxacillin:** Osteomyelitis. **Nafcillin, oxacillin:** Are also used to treat: Bone and joint infections, Urinary tract infections, Endocarditis, Septicemia, Meningitis.

### Action

Bind to bacterial cell wall, leading to cell death. Not inactivated by penicillinase enzymes. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Active against most gram-positive aerobic cocci but less so than penicillin. Spectrum is notable for activity against: Penicillinase-producing strains of *Staphylococcus aureus*, *Staphylococcus epidermidis*. Not active against methicillin-resistant staphylococci.

### Pharmacokinetics

**Absorption:** *Dicloxacillin*—Rapidly but incompletely (35–76%) absorbed from the GI tract. *Nafcillin and oxacillin*—Completely absorbed following IV administration; well absorbed from IM sites.

**Distribution:** Widely distributed; penetration into CSF is minimal, but sufficient in the presence of inflamed meninges; cross the placenta and enter breast milk.

**Metabolism and Excretion:** *Dicloxacillin*—Some metabolism by the liver (6–10%) and some renal excretion of unchanged drug (60%); small amounts eliminated in the feces via the bile. *Nafcillin, oxacillin*—Partially metabolized by the liver (nafcillin 60%, oxacillin 49%), partially excreted unchanged by the kidneys.

**Half-life:** *Dicloxacillin*—0.5–1.1 hr (↑ in severe hepatic and renal dysfunction); *nafcillin*—Neonates: 1–5 hr; Children 1 month – 14 yr: 0.75–1.9 hr; Adults: 0.5–1.5 hr (↑ in renal impairment); *oxacillin*—Neonates: 1.6 hr; Children up to 2 yr: 0.9–1.8 hr; Adults: 0.3–0.8 hr (↑ in severe hepatic impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Dicloxacillin PO | 30 min | 30–120 min | 6 hr |
| Nafcillin IM | 30 min | 60–120 min | 4–6 hr |
| Nafcillin IV | rapid | end of infusion | 4–6 hr |
| Oxacillin IM | rapid | 30 min | 4–6 hr |
| Oxacillin IV | rapid | end of infusion | 4–6 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to penicillins (cross-sensitivity with cephalosporins may exist).

**Use Cautiously in:** Severe renal or hepatic impairment; OB: Lactation: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting, drug-induced hepatitis. **GU:** interstitial nephritis. **Derm:** rashes, urticaria. **Hemat:** eosinophilia, leukopenia. **Local:** pain at IM sites, phlebitis at IV sites. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

### Interactions

**Drug-Drug: Probenecid** ↓ renal excretion and ↑ blood levels (treatment may be combined for this purpose). May ↓ effectiveness of **oral contraceptive agents**. May ↓ elimination of **methotrexate** and ↑ risk of serious toxicity.

### Route/Dosage

#### Dicloxacillin

**PO (Adults and Children ≥40 kg):** 125–250 mg q 6 hr (up to 2 g/day).
**PO (Children <40 kg):** 6.25–12.5 mg/kg q 6 hr; (up to 12.25 mg/kg q 6 hr has been used for osteomyelitis), maximum: 2 g/day.

#### Nafcillin

**IM (Adults):** 500 mg q 4–6 hr.
**IM, IV (Children and Infants):** 50–200 mg/kg/day divided q 4–6 hr, maximum: 12 g/day.
**IM, IV (Neonates 0–4 weeks, < 1200 g):** 25 mg/kg q 12 hr.
**IM, IV (Neonates 1.2–2 kg):** —25 mg/kg q 12 hr for the first 7 days of life, then 25 mg/kg q 8 hr.
**IM, IV (Neonates >2 kg):** —25 mg/kg q 8 hr for the first 7 days of life, then 25 mg/kg q 6 hr.
**IV (Adults):** 500–2000 mg q 4–6 hr.

#### Oxacillin

**IM, IV (Adults and Children ≥40 kg):** 250–2000 mg q 4–6 hr (up to 12 g/day).
**IM, IV (Children <40 kg):** 100–200 mg/kg/day divided q 4–6 hr, maximum: 12 g/day.
**IM, IV (Neonates < 1200 g):** —25 mg/kg q 12 hr.
**IM, IV (Neonates ≥2 kg):** —25 mg/kg q 8 hr for the first 7 days of life, then 25 mg/kg q 6 hr.
**IM, IV (Neonates 1.2–2 kg):** —25 mg/kg q 12 hr for the first 7 days of life, then 25 mg/kg q 8 hr.

### Availability

#### Dicloxacillin (generic available)

**Capsules:** 250 mg, 500 mg. **Oral suspension:** 62.5 mg/5 mL.

#### Nafcillin (generic available)

**Powder for injection:** 500 mg/vial, 1 g/vial, 2 g/vial, 10 g/vial.

#### Oxacillin (generic available)

**Powder for injection:** 250 mg/vial, 500 mg/vial, 1 g/vial, 2 g/vial, 4 g/vial, 10 g/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins, cephalosporins, or other beta-lactam antibiotics. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing, abdominal pain). Discontinue the drug and notify the physician or other health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Assess vein for signs of irritation and phlebitis. Change IV site every 48 hr to prevent phlebitis.
- ***Lab Test Considerations:*** May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.
- May cause positive direct Coombs' test result.
- May cause ↑ AST, ALT, LDH, and serum alkaline phosphatase concentrations.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Administer around the clock on an empty stomach at least 1 hr before or 2 hr after meals. Take with a full glass of water; acidic juices may decrease absorption of penicillins.
- Use calibrated measuring device for liquid preparations. Shake well. Solution is stable for 14 days if refrigerated.

### Nafcillin

#### IV Administration

- **IV, IM:** To reconstitute, add 3.4 mL to each 1-g vial or 6.8 mL to each 2-g vial, for a concentration of 250 mg/mL. Stable for 2–7 days if refrigerated.
- **Direct IV:** ***Diluent:*** Dilute reconstituted solution with 15–30 mL of sterile water, 0.45% NaCl, or 0.9% NaCl for injection. ***Concentration:*** 100 mg/mL. ***Rate:*** Administer over 5–10 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute with sterile water for injection, 0.9% NaCl, D5W, D10W, D5/0.25% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, D5/LR, Ringer's or LR. Stable for 24 hr at room temperature, 96 hr if refrigerated. ***Concentration:*** 2–40 mg/mL. ***Rate:*** Infuse over at least 30–60 min to avoid vein irritation.
- **Y-Site Compatibility:** acyclovir, atropine, cyclophosphamide, diazepam, enalaprilat, esmolol, famotidine, fentanyl, fluconazole, foscarnet, heparin, hydromorphone, magnesium sulfate, morphine, nicardipine, perphenazine, propofol, theophylline, zidovudine.
- **Y-Site Incompatibility:** droperidol, insulin, labetalol, midazolam, nalbuphine, pentazocine, verapamil. If penicillins and aminoglycosides must be administered concurrently, administer at separate sites.

### Oxacillin

#### IV Administration

- **IV, IM:** To reconstitute for IM or IV use, add 1.4 mL of sterile water for injection to each 250-mg vial, 2.7 mL to each 500-mg vial, 5.7 mL to each 1-g vial, 11.5 mL to each 2-g vial, and 23 mL to each 4-g vial, for a concentration of 250 mg/1.5 mL. Stable for 3 days at room temperature or 7 days if refrigerated.
- **Direct IV:** ***Diluent:*** Further dilute each reconstituted 250-mg or 500-mg vial with 5 mL of sterile water or 0.9% NaCl for injection, 10 mL for each 1-g vial, 20 mL for each 2-g vial, and 40 mL for each 4-g vial. ***Concentration:*** 100 mg/mL. ***Rate:*** Administer slowly over 10 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute with 0.9% NaCl, D5W, D5/0.9% NaCl, or LR. ***Concentration:*** 0.5–40 mg/mL. ***Rate:*** May be infused for up to 6 hr.
- **Y-Site Compatibility:** acyclovir, cyclophosphamide, diltiazem, doxapram, famotidine, fluconazole, foscarnet, heparin, hydrocortisone sodium succinate, hydromorphone, labetalol, levofloxacin, magnesium sulfate, meperidine, methotrexate, milrinone, morphine, perphenazine, potassium chloride, tacrolimus, vitamin B complex with C, zidovudine.
- **Y-Site Incompatibility:** sodium bicarbonate, verapamil. If penicillins and aminoglycosides must be administered concurrently, administer at separate sites.

### Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Missed doses should be taken as soon as remembered. Advise patient that sharing of this medication may be dangerous.
- Advise patient to report signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

## **pentamidine** (pen-**tam**-i-deen)

NebuPent, Pentam 300

***Classification***

Therapeutic: anti-infectives

**Pregnancy Category C**

### Indications

**IV:** Treatment of *Pneumocystis jirovecii* pneumonia (PCP). **Inhaln:** Prevention of PCP in AIDS

or HIV-positive patients who have had PCP or who have a peripheral CD4 lymphocyte count of ≤200/mm³. **Unlabeled Use: Inhaln:** Treatment of PCP.

## Action

Appears to disrupt DNA or RNA synthesis. Also has a direct toxic effect on pancreatic islet cells.
**Therapeutic Effects:** Death of susceptible organism.

## Pharmacokinetics

**Absorption:** Minimal systemic absorption occurs following inhalation.
**Distribution:** Widely and extensively distributed but does not cross the blood-brain barrier. Concentrates in liver, kidneys, lungs, and spleen, with prolonged storage in some tissues.
**Metabolism and Excretion:** 1–30% excreted unchanged by the kidneys. Remainder of metabolic fate unknown.
**Half-life:** 6.4–9.4 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | end of infusion | 24 hr |
| Inhaln | unknown | unknown | unknown |

## Contraindications/Precautions

**Contraindicated in:** History of previous anaphylactic reaction to pentamidine.
**Use Cautiously in:** Hypotension; Hypertension; Hypoglycemia; Hyperglycemia; Hypocalcemia; Leukopenia; Thrombocytopenia; Anemia; Renal impairment (dose reduction required); Diabetes mellitus; Liver impairment; Cardiovascular disease; Bone marrow depression, previous antineoplastic therapy, or radiation therapy; OB, Lactation: Safety not established during pregnancy; breastfeeding not recommended.

## Adverse Reactions/Side Effects

For parenteral form, unless otherwise indicated. **CNS:** anxiety, headache, confusion, dizziness, hallucinations. **EENT:** *inhalation*—burning in throat. **Resp:** *inhalation*—bronchospasm, cough. **CV:** ARRHYTHMIAS, HYPOTENSION. **GI:** PANCREATITIS, abdominal pain, anorexia, drug-induced hepatitis, nausea, unpleasant metallic taste, vomiting. **GU:** nephrotoxicity. **Derm:** pallor, rash. **Endo:** HYPOGLYCEMIA, hyperglycemia. **F and E:** hyperkalemia, hypocalcemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** *IV*—phlebitis, pruritus, urticaria at IV site; *IM*—sterile abscesses at IM sites. **Misc:** allergic reactions including ANAPHYLAXIS, STEVENS-JOHNSON SYNDROME, chills, fever.

## Interactions

Interactions listed for parenteral administration.
**Drug-Drug:** Concurrent use with **erythromycin** IV may ↑ risk of potentially fatal arrhythmias. Additive nephrotoxicity with other **nephrotoxic agents**, including **aminoglycosides**, **amphotericin B**, and **vancomycin**. Additive bone marrow depression with **antineoplastics** or previous **radiation therapy**. ↑ risk of pancreatitis with **didanosine**. ↑ risk of nephrotoxicity, hypocalcemia, and hypomagnesemia with **foscarnet**.

## Route/Dosage

**IV (Adults and Children ):** 4 mg/kg once daily for 14–21 days (longer treatment may be required in AIDS patients; some patients may respond to 3 mg/kg/day).
**Inhaln (Adults):** *NebuPent*—300 mg q 4 wk, using a Respirgard II jet nebulizer (150 mg q 2 wk has also been used).
**Inhaln (Children >5 yr):** *NebuPent*—300 mg q 4 wk, using a Respirgard II jet nebulizer (for patients who cannot tolerate trimethoprim/sulfamethoxazole; unlabeled).

## Availability (generic available)

**Powder for injection:** 300 mg. **Solution for aerosol use (NebuPent):** 300 mg.

# NURSING IMPLICATIONS

## Assessment

- Assess patient for infection (vital signs, sputum, WBC) and monitor respiratory status (rate, character, lung sounds, dyspnea, sputum) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- **IV, IM:** Monitor blood pressure frequently during and following IM or IV administration of pentamidine. Patient should be lying down during administration. Sudden, severe hypotension may occur following a single dose. Resuscitation equipment should be immediately available.
- Assess patient for signs of hypoglycemia (anxiety; chills; diaphoresis; cold, pale skin; headache; increased hunger; nausea; nervousness; shakiness) and hyperglycemia (drowsiness; flushed, dry skin; fruit-like breath odor; increased thirst; increased urination; loss of appetite), which may occur up to several months after therapy is discontinued.
- Pulse and ECG should be monitored prior to and periodically during therapy. Fatalities due

to cardiac arrhythmias, tachycardia, and cardiotoxicity have been reported.

- **Inhaln:** A tuberculin skin test, chest x-ray, and sputum culture should be performed prior to administration to rule out tuberculosis.
- ***Lab Test Considerations:*** *IM, IV*—Monitor blood glucose concentrations prior to, daily during, and for several months following therapy. Severe hypoglycemia and permanent diabetes mellitus have occurred.
- Monitor BUN and serum creatinine prior to and daily during therapy to monitor for nephrotoxicity. Concentrations may be ↑.
- Monitor CBC and platelet count prior to and every 3 days during therapy. Pentamidine may cause leukopenia, anemia, and thrombocytopenia.
- May cause ↑ serum bilirubin, alkaline phosphatase, AST, and ALT concentrations. Monitor liver function tests prior to and every 3 days during therapy.
- Monitor serum calcium and magnesium concentrations prior to and every 3 days during therapy; may cause hypocalcemia and hypomagnesemia.
- May cause ↑ serum potassium concentrations.

## Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

## Implementation

- Pentamidine must be given on a regular schedule for the full course of therapy. Administer missed doses as soon as remembered. If almost time for the next dose, skip the missed dose and return to the regular schedule. Do not double doses.
- **IM:** Dilute 300 mg of pentamidine with 3 mL of sterile water for injection for a concentration of 100 mg/mL. IM administration should be used only for patients with adequate muscle mass and given deep IM via Z-track technique. May cause sterile abscesses.

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** To reconstitute, add 3–5 mL of sterile water for injection or D5W to each 300-mg vial for a concentration of 100, 75, or 60 mg/mL, respectively. Withdraw dose and dilute further in 50–250 mL of D5W. Solution is stable for 48 hr at room temperature. Discard unused portions. ***Concentration:*** Not to exceed 6 mg/mL for administration. ***Rate:*** Administer slowly over 1–2 hr.
- **Y-Site Compatibility:** alfentanyl, anidulafungin, atropine, atracurium, benztropine, buprenorphine, calcium gluconate, carboplatin, caspofungin, chlorpromazine, cimetidine, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxycycline, enalaprilat, epinephrine, epirubicin, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, gemcitabine, glycopyrrolate, granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, isoproterenol, labetalol, levofloxacin, lidocaine, lorazepam, mannitol, mechlorethamine, meperidine, metaraminol, methoxamine, metoclopramide, metoprolol, metronidazole, miconazole, midazolam, milrinone, mitoxantrone, multivitamins, naloxone, nesiritide, nitroglycerin, nitroprusside norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, pancuronium, papaverine, pentazocine, phentolamine, phytonadione, procainamide, promethazine, propranolol, pyridoxime, quinupristin/dalfopristin, ranitidine, rituximab, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tigecycline, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, verapamil, vincristine, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** acyclovir, aldesleukin, amikacin, aminophylline, amphotericin B colloidal, amphotericin B liposome, ampicillin, ampicillin/sulbactam, ascorbic acid, azathioprine, azotreonam, bivalirudin, bumetanide, butorphanol, cefazolin, cefonicid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, diazoxide, digoxin, doxorubicin, ephedrine, epoetin alfa, eftifibatide, ertapenem, fluorouracil, folic acid, foscarnet, furosemide, gentamicin, heparin, hydrocortisone, inamrinone, indomethacin, insulin, ketorolac, linezolid, magnesium sulfate, methotrexate, methyldopate, methylprednisolone, morphine, nafcillin, nalbuphine, oxacillin, palonosetron, pantoprazole, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenylephrine, phe-

nytoin, piperacillin/tazobactam, potassium chloride, prochlorperazine, protamine, sodium bicarbonate, streptokinase, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vecuronium.

- **Inhaln:** If using inhalation bronchodilator, administer bronchodilator 5–10 min prior to pentamidine administration.
- Administer in a well-ventilated area.
- Administration with patient in supine or recumbent position appears to provide a more uniform distribution of pentamidine.
- *NebuPent* Dilute 300 or 600 mg (for prophylaxis or treatment, respectively) in 6 mL of sterile water for injection. Place reconstituted solution into Respirgard II nebulizer. Do not dilute with 0.9% NaCl or admix with other medications, as solution will form a precipitate. Do not use Respirgard II nebulizer for other medications.
- Administer inhalation dose through nebulizer until chamber is empty, approximately 30–45 min.
- Administer with the flow rate of the nebulizer at the midflow mark (5–7 L/min) over approximately 15 min until the chamber is empty.

## Patient/Family Teaching

- Inform patient of the importance of completing the full course of pentamidine therapy, even if feeling better.
- **IV:** Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding of gums; unusual bruising; petechiae; or blood in stool, urine, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should not be given IM injections or rectal thermometers. Patient should be cautioned not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, as these may precipitate gastric bleeding.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- **Inhaln:** Advise patient that an unpleasant metallic taste may occur with pentamidine administration but is not significant.
- Inform patients who continue to smoke that bronchospasm and coughing during therapy are more likely.

## Evaluation/Desired Outcomes

- Prevention or resolution of the signs and symptoms of PCP in HIV-positive patients.

HIGH ALERT

# pentazocine (pen-taz-oh-seen)

Talwin, Talwin NX

***Classification***

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists/antagonists

**Schedule IV**

**Pregnancy Category C**

## Indications

Moderate to severe pain. Also used for: Analgesia during labor, Sedation prior to surgery, Supplemention in balanced anesthesia.

## Action

Binds to opiate receptors in the CNS. Alters perception of and response to painful stimuli, while producing generalized CNS depression. Has partial antagonist properties, which may result in opioid withdrawal in physically dependent patients. **Therapeutic Effects:** Decrease in moderate to severe pain.

## Pharmacokinetics

**Absorption:** Well absorbed following oral, IM, and subcut administration. Small amount (0.5 mg) of naloxone in tablets included to prevent parenteral abuse.
**Distribution:** Widely distributed. Crosses the placenta.
**Metabolism and Excretion:** Mostly metabolized by the liver. Small amounts excreted unchanged by the kidneys.
**Half-life:** 2–3 hr.

TIME/ACTION PROFILE (analgesia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15–30 min | 60–90 min | 3 hr |
| IM, subcut | 15–20 min | 30–60 min | 2–3 hr |
| IV | 2–3 min | 15–30 min | 2–3 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Patients who are physically dependent on opioids (may precipitate withdrawal).
**Use Cautiously in:** Head trauma; History of drug abuse; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Debilitated patients or patients with severe liver impairment (dose ↓ recommended); Undiagnosed abdominal pain; Prostatic hyperplasia; Patients who have recently received opioid agonists; OB: Has been used during labor but may cause respiratory depression in the newborn; Lactation: Pedi: Safety

not established; Geri: Appears on Beers list and is associated with ↑ risk of falls. More susceptible to adverse CNS effects; dose ↓ recommended.

### Adverse Reactions/Side Effects

**CNS:** dizziness, euphoria, hallucinations, headache, sedation, confusion, dysphoria, floating feeling, unusual dreams. **EENT:** blurred vision, diplopia, miosis (high doses). **Resp:** respiratory depression. **CV:** hypertension, hypotension, palpitations. **GI:** nausea, constipation, dry mouth, ileus, vomiting. **GU:** urinary retention. **Derm:** clammy feeling, sweating. **Local:** severe tissue damage at subcut sites. **Misc:** physical dependence, psychological dependence, tolerance.

### Interactions

**Drug-Drug:** Use with caution in patients receiving **MAO inhibitors** (may result in unpredictable reactions— ↓ initial dose of pentazocine to 25% of usual dose). Additive CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. May precipitate withdrawal in patients who are physically dependent on **opioid analgesic agonists**. May ↓ analgesic effects of other **opioids**.

**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

### Route/Dosage

**PO (Adults):** 50–100 mg q 3–4 hr (not to exceed 600 mg/day).

**Subcut, IV, IM (Adults):** 30 mg q 3–4 hr (not to exceed 30 mg/dose IV or 60 mg/dose IM or subcut; not to exceed 360 mg/day subcut, IV, or IM). *Obstetrical use*— 20 mg IV or 30 mg IM when contractions become regular, may repeat q 2–3 hr for 2–3 doses.

### Availability

**Tablets:** 50 mg (with 0.5 mg naloxone), ✱50 mg. **Injection:** 30 mg/mL. ***In combination with:*** acetaminophen (Talacen). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following PO, subcut, or IM and 15–30 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring doses higher than 100 mg should be converted to an opioid agonist. Pentazocine is not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Pentazocine produces respiratory depression, but this does not markedly increase with increased doses.
- Assess prior analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, and increased blood pressure and temperature) in patients physically dependent on opioids.
- Although this drug has a low potential for dependence, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients receiving pentazocine for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- Geri: Assess falls risk and implement prevention strategies. Assess for adverse CNS effects.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

### Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)

Disturbed sensory perception (visual, auditory) (Side Effects)

### Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order and dose calculations.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if administered before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive effects and may permit lower opioid doses.
- **PO:** Talwin NX contains 0.5 mg of naloxone, which has no pharmacologic activity when administered orally. If the product is abused by injection, naloxone antagonizes pentazocine. Parenteral use of oral pentazocine may lead to severe, potentially fatal reactions (pulmonary emboli, vascular occlusion, ulceration and abscess, and withdrawal symptoms in opioid-dependent individuals).
- **IM, Subcut:** Administer IM injections deep into well-developed muscle. Rotate sites of injections. Subcut route may cause tissue damage with repeated injections.

#### IV Administration

- **Direct IV:** ***Diluent:*** Manufacturer recommends diluting each 5 mg with at least 1 mL of sterile water for injection. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer slowly, each 5 mg over at least 1 min.
- **Syringe Compatibility:** atropine, chlorpromazine, cimetidine, dimenhydrinate, diphenhydramine, droperidol, hydroxyzine, metoclopramide, perphenazine, prochlorperazine edisylate, promazine, promethazine, ranitidine, scopolamine.
- **Syringe Incompatibility:** glycopyrrolate, heparin, pentobarbital.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.
- **Y-Site Incompatibility:** nafcillin.

### Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Medication may cause drowsiness, dizziness, or hallucinations, particularly in geriatric patients. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to medication is known. Institute fall prevention strategies and teach patient or family how to prevent falls at home.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth.

### Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

**perindopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.**

## permethrin (per-meth-rin)

Acticin, Elimite, Nix

***Classification***

Therapeutic: pediculocides

**Pregnancy Category B**

### Indications

**1% lotion:** Eradication of *Pediculus humanus capitis* (head lice and their eggs): Prevention of infestation of head lice during epidemics. **5% cream:** Eradication of *Sarcoptes scabiei* (scabies).

### Action

Causes repolarization and paralysis in lice by disrupting sodium transport in normal nerve cells.
**Therapeutic Effects:** Death of parasites.

### Pharmacokinetics

**Absorption:** Small amounts (<2%) systemically absorbed. Remains on hair for 10 days.
**Distribution:** Unknown.
**Metabolism and Excretion:** Rapidly inactivated by enzymes.
**Half-life:** Unknown.

TIME/ACTION PROFILE (pediculocidal action)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Topical | 10 min | unknown | 14 days |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to permethrin, pyrethrins (insecticides or veterinary pesticides), chrysanthemums, or isopropyl alcohol; Lactation: Lactation.

**Use Cautiously in:** OB: Use only if clearly needed; Pedi: Children <2 yr (1% lotion); Children <2 mo (5% cream).

### Adverse Reactions/Side Effects

**Derm:** burning, itching, rash, redness, stinging, swelling. **Neuro:** numbness, tingling.

### Interactions

**Drug-Drug:** No significant interactions.

### Route/Dosage

### Head Lice (Treatment and Prevention)

**Topical (Adults and Children >2 yr):** 1% lotion applied to the hair, left on for 10 min, then rinsed, for 1 application.

### Scabies

**Topical (Adults and Children):** Massage 5% cream into all skin surfaces. Leave on for 8–14 hr, then wash off.

**Topical (Infants >2 mo):** Massage 5% cream into hairline, scalp, neck, temple, and forehead. Leave on for 8–14 hr, then wash off.

### Availability (generic available)

**Liquid cream rinse (lotion):** 1%[OTC]. **Cream:** 5%.

## NURSING IMPLICATIONS

### Assessment

- **Head Lice:** Assess scalp for presence of lice and their ova (nits) prior to and 1 wk after application of permethrin.
- **Scabies:** Assess skin for scabies prior to and following therapy.

### Potential Nursing Diagnoses

Impaired home maintenance (Indications)
Bathing/hygiene self-care deficit (Indications)

### Implementation

- **Topical:** For topical application only.

### Patient/Family Teaching

- Instruct patient to notify health care professional if scalp itching, numbness, redness, or rash occurs.
- Instruct patient to avoid getting Elimite cream in eyes. If this occurs, eyes should be flushed thoroughly with water. Health care professional should be contacted if eye irritation persists.
- Advise patient that others residing in the home should also be checked for lice.
- Instruct patient on methods of preventing reinfestation. All clothes, including outdoor apparel and household linens, should be machine-washed using very hot water and dried for at least 20 min in a hot dryer. Dry-clean nonwashable clothes. Brushes and combs should be soaked in hot (130°F), soapy water for 5–10 min. Remind patient that brushes and combs should not be shared. Wigs and hairpieces should be shampooed. Rugs and upholstered furniture should be vacuumed. Toys should be washed in hot, soapy water. Items that cannot be washed should be sealed in a plastic bag for 2 wk.
- If patient is a child, instruct parents to notify school nurse or day care center so that classmates and playmates can be checked.
- **Head Lice:** Instruct patient to wash hair with regular shampoo, rinse, and towel dry. Each container holds enough medication for one treatment. Shake the container well. Thoroughly wet scalp and hair with the lotion. The patient should use as much of the solution as needed to coat entire head of hair, then discard remainder of solution. Allow lotion to remain on hair for 10 min, then thoroughly rinse hair and towel dry with a clean towel. Comb hair with a fine-toothed comb to remove dead lice and eggs (not necessary but may be desired for cosmetic effects). Products are available for removal of nits (Rid Lice Egg Loosener Gel®Step 2). Schools usually require children to be nit-free prior to returning to school.
- Explain to patient that permethrin will protect from reinfestation for 2 wk. These effects continue even when the patient resumes regular shampooing.
- **Scabies:** Instruct patient to massage thoroughly into the skin from head to soles of feet. Treat infants on the hairline, neck, scalp, temple, and forehead. Remove the cream by washing after 8–14 hr. Usually 30 g (½ tube) is sufficient for adults. One application is curative.

### Evaluation/Desired Outcomes

- The absence of lice and eggs 1 wk after therapy. A second application is indicated if lice are detected at this time.
- Prevention of infestation of head lice during epidemics.
- Eradication of scabies following one application.

- If resistance to permethrin develops, malathion may be used.

## phenazopyridine

(fen-az-oh-**peer**-i-deen)

Azo-Standard, Baridium, Phenazo, Prodium, Pyridium, Pyridium Plus, UTI Relief

***Classification***

Therapeutic: nonopioid analgesics
Pharmacologic: urinary tract analgesics

**Pregnancy Category B**

### Indications

Provides relief from the following urinary tract symptoms, which may occur in association with infection or following urologic procedures: Pain, Itching, Burning, Urgency, Frequency.

### Action

Acts locally on the urinary tract mucosa to produce analgesic or local anesthetic effects. Has no antimicrobial activity. **Therapeutic Effects:** Diminished urinary tract discomfort.

### Pharmacokinetics

**Absorption:** Appears to be well absorbed following oral administration.
**Distribution:** Unknown. Small amounts cross the placenta.
**Metabolism and Excretion:** Rapidly excreted unchanged in the urine.
**Half-life:** Unknown.

TIME/ACTION PROFILE (urinary analgesia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 5–6 hr | 6–8 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Glomerulonephritis; Severe hepatitis, uremia, or renal failure; Renal insufficiency; Glucose-6–phosphate dehydrogenase (G6PD) deficiency.
**Use Cautiously in:** Hepatitis; OB: Lactation: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** headache, vertigo. **GI:** hepatotoxicity, nausea. **GU:** bright-orange urine, renal failure.
**Derm:** rash. **Hemat:** hemolytic anemia, methemoglobinemia.

### Interactions

**Drug-Drug:** None significant.

### Route/Dosage

**PO (Adults):** 200 mg 3 times daily for 2 days.
**PO (Children):** 4 mg/kg 3 times daily for 2 days.

### Availability (generic available)

**Tablets:** 95 mg[OTC], 100 mg, 100 mg[OTC], 200 mg[OTC], 200 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for urgency, frequency, and pain on urination prior to and throughout therapy.
- ***Lab Test Considerations:*** Renal function should be monitored periodically during course of therapy.
- Interferes with urine tests based on color reactions (glucose, ketones, bilirubin, steroids, protein).

### Potential Nursing Diagnoses

Acute pain (Indications)
Impaired urinary elimination (Indications)

### Implementation

- Medication should be discontinued after pain or discomfort is relieved (usually 2 days for treatment of urinary tract infection). Concurrent antibiotic therapy should continue for full prescribed duration.
- **PO:** Administer medication with or following meals to decrease GI irritation. Do not crush, break, or chew tablet.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If a dose is missed, take as soon as remembered unless almost time for next dose.
- Advise patient that while phenazopyridine administration is stopped once pain or discomfort is relieved, concurrent antibiotic therapy must be continued for full duration of therapy. Do not save unused portion of phenazopyridine without consulting health care professional.
- Inform patient that drug causes reddish-orange discoloration of urine that may stain clothing or bedding. Sanitary napkin may be worn to avoid clothing stains. May also cause staining of soft contact lenses.
- Instruct patient to notify health care professional if rash, skin discoloration, or unusual tiredness occurs.

### Evaluation/Desired Outcomes

- Decrease in pain and burning on urination.

## phenelzine, See MONOAMINE OXIDASE (MAO) INHIBITORS.

# phenobarbital
(fee-noe-**bar**-bi-tal)
Ancalixir, Luminal, Solfoton

***Classification***
Therapeutic: anticonvulsants, sedative/hypnotics
Pharmacologic: barbiturates

**Schedule IV**

**Pregnancy Category D**

## Indications
Anticonvulsant in tonic-clonic (grand mal), partial, and febrile seizures in children. Preoperative sedative and in other situations in which sedation may be required. Hypnotic (short-term). **Unlabeled Use:** Prevention/treatment of hyperbilirubinemia in neonates.

## Action
Produces all levels of CNS depression. Depresses the sensory cortex, decreases motor activity, and alters cerebellar function. Inhibits transmission in the nervous system and raises the seizure threshold. Capable of inducing (speeding up) enzymes in the liver that metabolize drugs, bilirubin, and other compounds. **Therapeutic Effects:** Anticonvulsant activity. Sedation.

## Pharmacokinetics
**Absorption:** Absorption is slow but relatively complete (70–90%).
**Distribution:** Unknown.
**Metabolism and Excretion:** 75% metabolized by the liver, 25% excreted unchanged by the kidneys.
**Half-life:** Neonates: 1.8–8.3 days; Infants: 0.8–5.5 days; Children: 1.5–3 days; Adults: 2–6 days.

TIME/ACTION PROFILE (sedation†)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–60 min | unknown | >6 hr |
| IM, subcut | 10–30 min | unknown | 4–6 hr |
| IV | 5 min | 30 min | 4–6 hr |

†Full anticonvulsant effects occur after 2–3 wk of chronic dosing unless a loading dose has been used

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Comatose patients or those with pre-existing CNS depression; Severe respiratory disease with dyspnea or obstruction; Uncontrolled severe pain; Known alcohol intolerance (elixir only); Lactation: Discontinue drug or bottle feed.

**Use Cautiously in:** Hepatic dysfunction; Severe renal impairment; History of suicide attempt or drug abuse; Hypnotic use should be short-term. Chronic use may lead to dependence; OB: Chronic use during pregnancy results in drug dependency in the infant; may result in coagulation defects and fetal malformation; acute use at term may result in respiratory depression in the newborn; Geri: Iinitial dose reduction recommended; Hypnotic use should be short-term. Chronic use may lead to dependence.

## Adverse Reactions/Side Effects
**CNS:** hangover, delirium, depression, drowsiness, excitation, lethargy, vertigo. **Resp:** respiratory depression; *IV*, LARYNGOSPASM, bronchospasm. **CV:** *IV*—hypotension. **GI:** constipation, diarrhea, nausea, vomiting. **Derm:** photosensitivity, rashes, urticaria. **Local:** phlebitis at IV site. **MS:** arthralgia, myalgia, neuralgia. **Misc:** hypersensitivity reactions including ANGIOEDEMA and SERUM SICKNESS, physical dependence, psychological dependence.

## Interactions
**Drug-Drug:** Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and other **sedative/hypnotics**. May induce hepatic enzymes that metabolize other drugs, ↓ their effectiveness, including **hormonal contraceptives**, **warfarin**, **chloramphenicol**, **cyclosporine**, **dacarbazine**, **corticosteroids**, **tricyclic antidepressants**, **felodipine**, **clonazepam**, **carbamazepine**, **verapamil**, **theophylline**, **metronidazole**, and **quinidine**. May ↑ risk of hepatic toxicity of **acetaminophen**. **MAO inhibitors**, **valproic acid**, or **divalproex** may ↓ metabolism of phenobarbital, ↑ sedation. **Rifampin** may ↑ metabolism of and ↓ effects of phenobarbital. May ↑ risk of hematologic toxicity with **cyclophosphamide**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**,, **chamomile**, or **hops** can ↑ CNS depression. **St. John's wort** may ↓ effects.

## Route/Dosage

### Status Epilepticus
**IV (Adults and Children >1 month):** 15–18 mg/kg in a single or divided dose, maximum loading dose 20 mg/kg.
**IV (Neonates):** 15–20 mg/kg in a single or divided dose.

### Maintenance Anticonvulsant

**IV, PO (Adults and Children > 12 yr):** 1–3 mg/kg/day as a single dose or 2 divided doses.
**IV, PO (Children 5–12 yr):** 4–6 mg/kg/day in 1–2 divided doses.
**IV, PO (Children 1–5 yr):** 6–8 mg/kg/day in 1–2 divided doses.
**IV, PO (Infants):** 5–6 mg/kg/day in 1–2 divided doses.
**IV, PO (Neonates):** 3–4 mg/kg/day once daily, may need to increase up to 5 mg/kg/day by 2nd week of therapy.

### Sedation

**PO, IM (Adults):** 30–120 mg/day in 2–3 divided doses. *Preoperative sedation*—100–200 mg IM 1–1.5 hours before the procedure.
**PO (Children):** 2 mg/kg 3 times daily. *Preoperative sedation*—1–3 mg/kg PO/IM/IV 1–1.5 hours before the procedure.

### Hypnotic

**PO, Subcut, IV, IM (Adults):** 100–320 mg at bedtime.
**IV, IM, Subcut (Children):** 3–5 mg/kg at bedtime.

### Hyperbilirubinemia

**PO (Adults):** 90–180 mg/day in 2–3 divided doses.
**PO (Children <12 yr):** 3–8 mg/kg/day in 2–3 divided doses, doses up to 12 mg/kg/day have been used.

### Availability (generic available)

**Tablets:** 8 mg, 15 mg, 30 mg, 60 mg, 100 mg. **Capsules:** 15 mg. **Elixir:** 20 mg/5 mL. **Injection:** 30 mg/mL in 1-mL prefilled syringes, 60 mg/mL in 1-mL prefilled syringes, 65 mg/mL in 1-mL vials, 130 mg/mL in 1-mL prefilled syringes, 1-mL vials, and 1-mL ampules. ***In combination with:*** phenytoin. See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor respiratory status, pulse, and blood pressure frequently in patients receiving phenobarbital IV. Equipment for resuscitation and artificial ventilation should be readily available. Respiratory depression is dose-dependent.
- Prolonged therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient, especially if depressed, suicidal, or with a history of addiction.
- Geri: Elderly patients may react to phenobarbital with marked excitement, depression, and confusion. Monitor for these adverse reactions.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Sedation:** Assess level of consciousness and anxiety when used as a preoperative sedative.
- Assess postoperative patients for pain with a pain scale. Phenobarbital may increase sensitivity to painful stimuli.
- ***Lab Test Considerations:*** Patients on prolonged therapy should have hepatic and renal function and CBC evaluated periodically.
- Monitor serum folate concentrations periodically during therapy because of increased folate requirements of patients on long-term anticonvulsant therapy with phenobarbital.
- May cause ↓ serum bilirubin concentrations in neonates, in patients with congenital nonhemolytic unconjugated hyperbilirubinemia, and in epileptics.
- ***Toxicity and Overdose:*** Serum phenobarbital levels may be monitored when used as an anticonvulsant. Therapeutic blood levels are 10–40 mcg/mL. Symptoms of toxicity include confusion, drowsiness, dyspnea, slurred speech, and staggering.

### Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)
Acute confusion (Side Effects)

### Implementation

- Do not confuse phenobarbital with pentobarbital.
- Supervise ambulation and transfer of patients following administration. Two side rails should be raised and call bell within reach at all times. Keep bed in low position. Institute seizure and fall precautions.
- When changing from phenobarbital to another anticonvulsant, gradually decrease phenobarbital dose while concurrently increasing dose of replacement medication to maintain anticonvulsant effects.
- **PO:** Tablets may be crushed and mixed with food or fluids (do not administer dry) for patients with difficulty swallowing. Oral solution may be taken undiluted or mixed with water, milk, or fruit juice. Use calibrated measuring device for accurate measurement of liquid doses.
- **IM:** Injections should be given deep into the gluteal muscle to minimize tissue irritation. Do not inject >5 mL into any one site, because of tissue irritation.

#### IV Administration

- **IV:** Doses may require 15–30 min to reach peak concentrations in the brain. Administer

minimal dose and wait for effectiveness before administering 2nd dose to prevent cumulative barbiturate-induced depression.

- **Direct IV:** ***Diluent:*** Reconstitute sterile powder for IV dose with a minimum of 3 mL of sterile water for injection. Dilute further with 10 mL of sterile water. Do not use solution that is not absolutely clear within 5 min after reconstitution or that contains a precipitate. Discard powder or solution that has been exposed to air for longer than 30 min.
- Solution is highly alkaline; avoid extravasation, which may cause tissue damage and necrosis. If extravasation occurs, injection of 5% procaine solution into affected area and application of moist heat may be ordered. ***Concentration:*** 130 mg/mL (undiluted). ***Rate:*** Do not inject IV faster than 1 mg/kg/min with a maximum of 30 mg over 1 min in infants and children and 60 mg over 1 min in adults. Titrate slowly for desired response. Rapid administration may result in respiratory depression.
- **Y-Site Compatibility:** doxapram, enalaprilat, fentanyl, fosphenytoin, levofloxacin, linezolid, meropenem, methadone, morphine, propofol, sufentanil.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, lansoprazole.

### Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered if not almost time for next dose; do not double doses.
- Advise patients on prolonged therapy not to discontinue medication without consulting health care professional. Abrupt withdrawal may precipitate seizures or status epilepticus.
- Medication may cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise female patients using oral contraceptives to use an additional nonhormonal contraceptive during therapy and until next menstrual period. Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.
- Advise patient to notify health care professional if fever, sore throat, mouth sores, unusual bleeding or bruising, nosebleeds, or petechiae occur.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoid nicotine and caffeine).
- Pedi: Advise parents or caregivers that child may experience irritability, hyperactivity, and/or sleep disturbances, which may diminish in a few days to a few weeks or may persist until drug is stopped. An alternative medication can be considered. Instruct parents to monitor for skin rash occurring 7-20 days after treatment begins and to contact a health care provider if rash occurs. Teach family about symptoms of toxicity (staggering, drowsiness, slurred speech).

### Evaluation/Desired Outcomes

- Decrease or cessation of seizure activity without excessive sedation. Several weeks may be required to achieve maximum anticonvulsant effects.
- Preoperative sedation.
- Improvement in sleep patterns.
- Decrease in serum bilirubin levels.

P

## phentermine (fen-ter-meen)

Adipex-P, Banobese, Fastin, Ionamin, Obi-Nix, OBY-CAP, Phentercot, Phentride, T-Diet, Teramine, Zantryl

***Classification***

Therapeutic: weight control agents
Pharmacologic: appetite suppressants

**Schedule IV**

**Pregnancy Category UK**

### Indications

Short-term treatment of obesity in conjunction with other interventions (dietary restriction, exercise); used to produce and maintain weight loss in patients with a BMI $\geq$30 kg/m$^2$ or $\geq$27 kg/m$^2$ in the presence of other risk factors (diabetes, hypertension, hyperlipidemia).

### Action

Decreases hunger by altering the chemical control of nerve impulse transmission in the appetite control center of the hypothalamus. **Therapeutic Effects:** Appetite suppression with resultant weight loss.

### Pharmacokinetics
**Absorption:** Unknown.
**Distribution:** Unknown.
**Metabolism and Excretion:** Metabolized by the liver.
**Half-life:** 19–24 hr.

TIME/ACTION PROFILE (appetite suppression)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO-hydrochloride | unknown | unknown | 4 hr† |
| PO-resin complex | unknown | unknown | 12–14 hr |

†For 8-mg tablets, increase to 12–14 hr for 30-mg capsules or 37.5-mg tablets

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity or known intolerance to sympathomimetic amines; Cardiovascular disease; Hyperthyroidism; Moderate to severe hypertension; History of drug abuse; Agitation; Glaucoma; Concurrent or recent (within 14 days) MAO inhibitor therapy; Concurrent SSRI antidepressants.
**Use Cautiously in:** Mild hypertension; Diabetes mellitus; Pregnancy, lactation, or children <12 yr (safety not established).

### Adverse Reactions/Side Effects
**CNS:** CNS stimulation, confusion, dizziness, dysphoria, euphoria, headache, insomnia, mental depression, restlessness. **EENT:** blurred vision. **CV:** hypertension, palpitations, tachycardia. **GI:** constipation, diarrhea, dry mouth, nausea, unpleasant taste, vomiting. **GU:** changes in libido, erectile dysfunction.

### Interactions
**Drug-Drug:** Concurrent use with **MAO inhibitors** may result in hypertensive crisis (do not use within 14 days of MAO inhibitors). Increased risk of adverse CNS events with **alcohol**. Concurrent use with **SSRI antidepressants** is not recommended. May decrease **insulin** requirements in diabetic patients.

### Route/Dosage
**PO (Adults):** *Phentermine hydrochloride tablets or capsules*—8 mg 3 times daily or 15–37.5 mg once daily; *Phentermine resin complex capsules*—15–30 mg once daily.

### Availability (generic available)
**Phentermine hydrochloride tablets:** 8 mg, 37.5 mg. **Phentermine hydrochloride capsules:** 15 mg, 18.75 mg, 30 mg, 37.5 mg. **Phentermine resin complex capsules:** 15 mg, 30 mg.

## NURSING IMPLICATIONS

### Assessment
- Monitor patients for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.

### Potential Nursing Diagnoses
Disturbed body image (Indications)
Imbalanced nutrition: more than body requirements (Indications)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation
- **PO:** Administer 30 min before meals or as a single dose before breakfast or 10–14 hr before retiring.

### Patient/Family Teaching
- Instruct patient to take medication as directed and not to exceed dose recommended. Medication may need to be discontinued gradually.
- May cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid using alcohol or other CNS depressants with this medication.
- Advise patient to notify health care professional immediately if chest pain, decreased exercise tolerance, fainting, or swelling of the feet or lower legs occurs.

### Evaluation/Desired Outcomes
- Gradual weight loss.

## phentolamine
(fen-**tole**-a-meen)
Oraverse, Regitine, Rogitine

***Classification***
Therapeutic: agents for pheochromocytoma
Pharmacologic: alpha-adrenergic blockers

**Pregnancy Category C**

### Indications
**IV:** Control of blood pressure during surgical removal of a pheochromocytoma. **IV, Infiltration:** Prevention and treatment of dermal necrosis and sloughing following extravasation of norepinephrine, phenylephrine, or dopamine. **Local:** Reversal of soft-tissue anesthesia (of lip and tongue) resulting from an intraoral submucosal injection of a local anesthetic containing a vasconstrictor. **Unlabeled Use: IM, IV:** Treatment of hypertension associated with pheochromocytoma or adrenergic (sympathetic) excess, such as administration of phenylephrine, tyramine-containing foods in

patients on MAO inhibitor therapy, or clonidine withdrawal.

### Action

Produces incomplete and short-lived blockade of alpha-adrenergic receptors located primarily in smooth muscle and exocrine glands. Induces hypotension by direct relaxation of vascular smooth muscle and by alpha blockade. Increases blood flow to submucosal tissue through blockade of alpha receptors. **Therapeutic Effects:** Reduction of blood pressure in situations in which hypertension is due to adrenergic (sympathetic) excess. When infiltrated locally, reverses vasoconstriction caused by norepinephrine or dopamine. Reverses local anesthetic effects (restores normal lip and tongue sensation).

### Pharmacokinetics

**Absorption:** Well absorbed following IM administration; completely available after local injection.
**Distribution:** Unknown.
**Metabolism and Excretion:** 10% excreted unchanged by kidneys.
**Half-life:** 19 min (IV); 2–3 hr (local injection).

TIME/ACTION PROFILE (alpha-adrenergic blockade)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | unknown | 20 min | 30–45 min |
| IV | immediate | 2 min | 15–30 min |
| Local | rapid | 10–20 min | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Coronary or cerebral arteriosclerosis; Renal impairment.
**Use Cautiously in:** Peptic ulcer disease; OB, Lactation: Safety not established; Pedi: Children <6 yr or <15 kg (Oraverse) (safety not established); Geri: More susceptible to hypotensive effects; ↓ dose recommended.

### Adverse Reactions/Side Effects

With parenteral use.
**CNS:** CEREBROVASCULAR SPASM, dizziness, weakness. **EENT:** nasal stuffiness. **CV:** HYPOTENSION, MI, angina, arrhythmias, tachycardia. **GI:** abdominal pain, diarrhea, nausea, vomiting, aggravation of peptic ulcer. **Derm:** flushing. **Local:** injection site pain (local).

### Interactions

**Drug-Drug:** Antagonizes the effects of **alpha-adrenergic stimulants**. May ↓ pressor response to **ephedrine** or **phenylephrine**. Severe hypotension may occur with concurrent use of **epinephrine** or **methoxamine**. Use with **guanadrel** may result in exaggerated hypotension and bradycardia. ↓ peripheral vasoconstriction from high doses of **dopamine**.

### Route/Dosage

#### Hypertension Associated with Pheochromocytoma—Before/During Surgery

**IV (Adults):** 5 mg given 1–2 hr preop, repeated as necessary. May be infused at a rate of 0.5–1 mg/min during surgery.
**IV, IM (Children):** 1 mg or 0.1 mg/kg (3 mg/$m^2$) given 1–2 hr preop, repeated IV as necessary during surgery.

#### Prevention of Dermal Necrosis during Infusion of Norepinephrine, Phenylephrine, or Dopamine

**IV (Adults):** Add 10 mg phentolamine to every 1000 mL of fluid containing norepinephrine.

#### Treatment of Dermal Necrosis Following Extravasation of Norepinephrine, Phenylephrine, or Dopamine

**Infiltrate** (Adults): 5–10 mg.
**Infiltrate (Children):** 0.1–0.2 mg/kg (up to 10 mg).

#### Reversal of Intraoral Submucosal Anesthesia Following Dental Procedures (Oraverse)

**Infiltrate or Block Injection** (Adults and Children ≥6 yr and >30 kg): Dose administered is based on number of cartridges of local anesthetic with vasoconstrictor administered: *½ cartridge local anesthetic*—0.2 mg phentolamine (½ cartridge); *1 cartridge local anesthetic*—0.4 mg phentolamine (1 cartridge); *2 cartridges local anesthetic*—0.8 mg phentolamine (2 cartridges).
**Infiltrate or Block Injection (Children ≥6 yr and 15–30 kg):** Do not exceed dose of 0.2 mg (½ cartridge).

### Availability (generic available)

**Powder for injection:** 5 mg/vial. **Injection for local infiltration/block injection:** 0.4 mg/cartridge.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, pulse, and ECG every 2 min until stable during IV administration. If

hypotensive crisis occurs, epinephrine is contraindicated and may cause paradoxic further decrease in blood pressure; norepinephrine may be used.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Indications)

### Implementation

- Patient should remain supine throughout parenteral administration.

**IV Administration**

- **IV:** ***Diluent:*** Reconstitute each 5 mg with 1 mL of sterile water for injection or 0.9% NaCl. Discard unused solution. ***Concentration:*** 5 mg/mL. ***Rate:*** Inject each 5 mg over 1 min.
- **Continuous Infusion:** Dilute 5–10 mg in 500 mL of D5W.
- ***Rate:*** Titrate infusion rate according to patient response.
- May also add 10 mg to every 1000 mL of fluid containing norepinephrine for prevention of dermal necrosis and sloughing. Does not affect pressor effect of norepinephrine.
- **Syringe Compatibility:** papaverine.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, amiodarone, ascorbic acid, atropine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, ceftazidime, ceftriaxone, chlorpromazine, cimetidine, cyanocobalamin, cyclosporine, dactinomycin, daptomycin, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dobutamine, docetaxel, dopamine, doxycycline, enalaprilat, epinephrine, epoetin, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, folic acid, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, imipenem-cilastatin, isoproterenol, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methoxamine, methyldopa, metoclopramide, metoprolol, metronidazole, midazolam, minocycline, mitoxantrone, morphine, multivitamin injection, nafcillin, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, pemetrexed, pentamidine, pentazocine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinidine, ranitidine, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, trimethophan, vancomycin, vasopressin, verapamil, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** amphotericin B colloidal, cefazolin, cefoperazone, cefotetan, cefoxitin, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, diazoxide, furosemide, ganciclovir, insulin, ketorolac, moxalactam, penicillin G, pentobarbital, phenobarbital, phenytoin, trimethoprim/sulfamethoxazole.
- **Additive Compatibility:** dobutamine, norepinephrine.
- **Infiltration:** Dilute 5–10 mg of phentolamine in 10 mL of 0.9% NaCl. For children, use 0.1–0.2 mg/kg up to a maximum of 10 mg. Infiltrate site of extravasation promptly. Must be given within 12 hr of extravasation to be effective.

### Patient/Family Teaching

- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional if chest pain occurs during IV infusion.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Prevention of dermal necrosis and sloughing in extravasation of norepinephrine, dopamine, and phenylephrine.
- Restoration of normal lip and tongue sensation following local anesthesia.

## phenytoin (fen-i-toyn)

Dilantin, Phenytek

***Classification***

Therapeutic: antiarrhythmics (group IB), anticonvulsants
Pharmacologic: hydantoins

**Pregnancy Category D**

### Indications

Treatment/prevention of tonic-clonic (grand mal) seizures and complex partial seizures. **Unlabeled Use:** As an antiarrhythmic, particularly for ventricular arrhythmias associated with digoxin toxicity, prolonged QT interval, and surgical repair of congenital heart diseases in children. Management of neuropathic pain, including trigeminal neuralgia.

## Action

Limits seizure propagation by altering ion transport. May also decrease synaptic transmission. Antiarrhythmic properties as a result of shortening the action potential and decreasing automaticity. **Therapeutic Effects:** Diminished seizure activity. Termination of ventricular arrhythmias.

## Pharmacokinetics

**Absorption:** Absorbed slowly from the GI tract. Bioavailability differs among products; the Dilantin and Phenytek preparations are considered to be "extended" products. Other products are considered to be prompt release.

**Distribution:** Distributes into CSF and other body tissues and fluids. Enters breast milk; crosses the placenta, achieving similar maternal/fetal levels. Preferentially distributes into fatty tissue.

**Protein Binding:** Adults 90–95%; decreased protein binding in neonates (up to 20% free fraction available), infants (up to 15% free), and patients with hyperbilirubinemia, hypoalbuminemia, severe renal dysfunction or uremia.

**Metabolism and Excretion:** Mostly metabolized by the liver; minimal amounts excreted in the urine.

**Half-life:** 22 hr (range 7–42 hr).

TIME/ACTION PROFILE (anticonvulsant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 2–24 hr (1 wk)* | 1.5–3 hr | 6–12 hr |
| PO-ER | 2–24 hr (1 wk) | 4–12 hr | 12–36 hr |
| IV | 0.5–1 hr (1 wk) | rapid | 12–24 hr |

*( ) = time required for onset of action without a loading dose

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hypersensitivity to propylene glycol (phenytoin injection only); Alcohol intolerance (phenytoin injection and liquid only); Sinus bradycardia, sinoatrial block, 2nd- or 3rd-degree heart block, or Stokes-Adams syndrome (phenytoin injection only).

**Use Cautiously in:** All patients (may ↑ risk of suicidal thoughts/behaviors); Hepatic or renal disease (↑ risk of adverse reactions; dose reduction recommended for hepatic impairment); Patients with severe cardiac or respiratory disease (use of IV phenytoin may result in an ↑ risk of serious adverse reactions); OB: Safety not established; may result in fetal hydantoin syndrome if used chronically or hemorrhage in the newborn if used at term; use with extreme caution; Lactation: Safety not established; Pedi: Suspension contains sodium benzoate, a metabolite of benzyl alcohol that can cause potentially fatal gasping syndrome in neonates; Geri: Use of IV phenytoin may result in an ↑ risk of serious adverse reactions.

**Exercise Extreme Caution in:** Patients positive for HLA-B*1502 allele (unless exceptional circumstances exist where benefits clearly outweigh the risks).

## Adverse Reactions/Side Effects

Most listed are for chronic use of phenytoin.

**CNS:** SUICIDAL THOUGHTS, ataxia, agitation, confusion, dizziness, drowsiness, dysarthria, dyskinesia, extrapyramidal syndrome, headache, insomnia, weakness. **EENT:** diplopia, nystagmus. **CV:** hypotension (↑ with IV phenytoin), tachycardia. **GI:** gingival hyperplasia, nausea, constipation, drug-induced hepatitis, vomiting. **Derm:** hypertrichosis, rash, exfoliative dermatitis, pruritus, purple glove syndrome. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, megaloblastic anemia, thrombocytopenia. **MS:** osteomalacia, osteoporosis. **Misc:** allergic reactions including STEVENS-JOHNSON SYNDROME, fever, lymphadenopathy.

## Interactions

**Drug-Drug: Disulfiram**, acute ingestion of **alcohol**, **amiodarone**, **ethosuximide**, **isoniazid**, **chloramphenicol**, **sulfonamides**, **fluoxetine**, **gabapentin**, **H2 antagonists**, **benzodiazepines**, **omeprazole**, **ketoconazole**, **fluconazole**, **estrogens**, **succinamides**, **halothane**, **methylphenidate**, **phenothiazines**, **salicylates**, **ticlopidine**, **tolbutamide**, **topiramate**, **trazodone**, **felbamate**, and **cimetidine** may ↑ phenytoin blood levels. **Barbiturates**, **carbamazepine**, **reserpine**, and chronic ingestion of **alcohol** may ↓ phenytoin blood levels. Phenytoin may ↓ the effects of **amiodarone**, **benzodiazepines**, **carbamazepine**, **chloramphenicol**, **corticosteroids**, **disopyramide**, **warfarin**, **felbamate**, **doxycycline**, **lamotrigine**, **oral contraceptives**, **paroxetine**, **propafenone**, **rifampin**, **ritonavir**, **quinidine**, **tacrolimus**, **theophylline**, **topiramate**, **tricyclic antidepressants**, **zonisamide**, **methadone**, **cyclosporine**, and **estrogens**. IV phenytoin and **dopamine** may cause additive hypotension. Additive CNS depression with other
