NOTE: As new scientific information becomes available through basic and clinical research, recommended treatments and drug therapies undergo changes. The authors and publisher have done everything possible to make this book accurate, up to date, and in accord with accepted standards at the time of publication. However, the reader is advised always to check product information (package inserts) for changes and new information regarding dose and contraindications before administering any drug. Caution is especially urged when using new or infrequently ordered drugs.

Authorization to photocopy items for internal or personal use, of specific clients, is granted by F. A. Davis Company for users registered with the Copyright Clearance Center (CCC) Transactional Reporting Service, provided that the fee of $.25 per copy is paid directly to CCC, 222 Rosewood Drive, Danvers, MA 01923. For those organizations that have been granted a photocopy license by CCC, a separate system of payment has been arranged. The fee code for users of the Transactional Reporting Service is 8036-2308/10 0 (with CD) and 8036-2309/10 0 (without CD) + $.25.

## DEDICATION

In loving memory of my older children, Samantha Ann and Randy Eli, both struck and killed by a drinking driver on January 9, 1997. They remain forever in our hearts. The wonder and joy they brought to our lives continue to inspire us.

To Stu, for his continued support and love.

To my daughter Hanna, whose hard work, talent, and grace never cease to amaze me.
To my son Reuben, whose smile warms my heart and whose energy is boundless.
To my parents, Charlotte and Kurt Hopfer, who continue to inspire me.

JHD

To my father, Keith Hazard, whose love and support are always there.
To my mother-in-law, Roberta, who remains a guiding presence in my life.
To my son, Ben, whose sensitivity and sense of humor make even the toughest day easier.
To my daughter, Katharine, whose fearlessness and determination in seeking her goals I admire.
To my husband, Warren, my colleague and friend, whose encouragement and love I have always cherished.

AHV

To my wonderful mother who has provided her continual love, support, and wisdom as I continue to pursue all of my personal and professional goals. To all of my current and former students who have inspired me to undertake this very important project.

CAS

## ACKNOWLEDGMENTS

We offer our thanks to the students and nurses who have used our book for over 20 years. We hope our book provides you with the current knowledge of pharmacotherapeutics you need to continue to give quality care in our rapidly changing health-care environment.

Judi and April

# HOW TO USE *DAVIS'S DRUG GUIDE FOR NURSES*

*Davis's Drug Guide for Nurses* provides comprehensive, up-to-date drug information in well-organized, nursing-focused monographs. It also includes extensive supplemental material in 18 appendices and the accompanying CD-ROM, thoroughly addresses the issue of safe medication administration, and educates the reader about 50 different therapeutic classes of drugs. In this 12th edition, we have continued the tradition of focusing on safe medication administration by adding a new **Medication Safety Tools** color insert and even more information about health care's most vulnerable patients: children, the elderly, pregnant women, and breastfeeding mothers. Look for more Pedi, Geri, OB, and Lactation headings throughout the monographs. In addition, we've included information relevant to Canadian students and nurses. You'll find an appendix comparing Canadian and U.S. pharmaceutical practices, more Canada-only combination drugs in the Combination Drugs appendix, and additional Canadian brand names in the drug monographs. To help you find this information quickly, we've also added a maple leaf icon (🍁) in the index next to each Canadian entry. New to this edition, we have added pharmacogenomic information throughout numerous monographs to guide the nurse in selecting and monitoring various drug therapies. To help you find this information quickly, we've added a double helix icon (🧬) to denote this information as it applies to specific drugs. Use this book to enhance your competence in implementing and evaluating medication therapies. The following sections describe the organization of *Davis's Drug Guide for Nurses* and explain how to quickly find the information you need.

## Safe Medication Use Articles

"Medication Errors: Improving Practices and Patient Safety", "Detecting and Managing Adverse Drug Reactions", "Overview of Risk Evaluation and Mitigation Systems (REMS)", Special Dosing Considerations", and "Educating Patients About Safe Medication Use" comprise the safe medication use articles and provide an overview of the medication safety issues that confront practitioners and patients. Leading off this series, the medication errors article familiarizes you with the systems issues and clinical situations repeatedly implicated in medication errors and suggests practical means to avoid them. It also teaches you about *high alert* medications, which have a greater potential to cause patient harm than other medications. "Detecting and Managing Adverse Drug Reactions" explains the different types of adverse reactions and provides guidance on how to detect and manage them. "Risk Evaluation and Mitigation Strategies (REMS)" explains strategies developed by the pharmaceutical industry and required by the FDA to minimize adverse drug reactions from potentially dangerous drugs. "Special Dosing Considerations" identifies the patient populations, such as neonates and patients with renal impairment, who require careful dose adjustments to ensure optimal therapeutic outcomes. "Educating Patients About Medication Use" reviews the most important teaching points for nurses to discuss with their patients and their families. In addition to these safety articles, other critical information is highlighted in red throughout the drug monographs. This allows the reader to quickly identify important information and to see how nursing practice, including assessment, implementation, and patient teaching, relates to it.

## Classifications Profile

Medications in the same therapeutic class often share similar mechanisms of action, assessment guidelines, precautions, and interactions. The Classifications Profile provides summaries of the major therapeutic classifications used in *Davis's Drug Guide for Nurses*. It also provides patient teaching information common to all agents within the class and a list of drugs within each class.

## Medication Safety Tools

New to this edition is a color insert with tables and charts that nurses can use for a quick but thorough reference to information that will help them avoid making medication errors. It includes lists of drugs

that are associated with adverse reactions and falls in the elderly; high alert drugs; sound-alike, look-alike drugs and more.

## Drug Monographs

Drug monographs are organized in the following manner:

**High Alert Status:** Some medications, such as chemotherapeutic agents, anticoagulants, and insulins, have a greater potential for harm than others. These medications have been identified by the *Institute for Safe Medication Practices* as **high alert drugs**. *Davis's Drug Guide for Nurses* includes a high alert tab in the upper right corner of the monograph header in appropriate medications to alert the nurse to the medication's risk. The term "high alert" is used in other parts of the monograph as well, to help the nurse administer these medications safely. See the new **Medication Safety Tools** color insert for a complete list of high alert medications in *Davis's Drug Guide for Nurses*. Refer to ISMP.org for all solutions, groups, and individual high alert drugs.

**Generic/Trade Name:** The generic name appears first, with a pronunciation key, followed by an alphabetical list of trade names. Canadian trade names are preceded by a maple leaf (🍁). Common names, abbreviations, and selected foreign names are also included.

**Classification:** The therapeutic classification, which categorizes drugs by the disease state they are used to treat, appears first, followed by the pharmacologic classification, which is based on the drug's mechanism of action.

**Controlled Substance Schedule:** All drugs regulated by federal law are placed into one of five schedules, based on the drug's medicinal value, harmfulness, and potential for abuse or addiction. Schedule I drugs, the most dangerous and having no medicinal value, are not included in *Davis's Drug Guide for Nurses*. (See Appendix J for a description of the Schedule of Controlled Substances.)

**Pregnancy Category:** Pregnancy categories (A, B, C, D, and X) provide a basis for determining a drug's potential for fetal harm and are included in each monograph. The designation UK is used when the pregnancy category is unknown. (See Appendix I for more information.)

**Indications:** Medications are approved by the FDA (Food and Drug Administration) for specific disease states. This section identifies the diseases or conditions for which the drug is commonly used and includes significant unlabeled uses as well.

**Action:** This section contains a concise description of how the drug produces the desired therapeutic effect.

**Pharmacokinetics:** Pharmacokinetics refers to the way the body processes a medication by absorption, distribution, metabolism, and excretion. This section also includes information on the drug's half-life.

**Absorption:** Absorption describes the process that follows drug administration and its subsequent delivery to systemic circulation. If only a small fraction is absorbed following oral administration (diminished bioavailability), then the oral dose must be much greater than the parenteral dose. Absorption into systemic circulation also follows other routes of administration such as topical, transdermal, intramuscular, subcutaneous, rectal, and ophthalmic routes. Drugs administered intravenously are usually 100% bioavailable.

**Distribution:** This section comments on the drug's distribution in body tissues and fluids. Distribution becomes important in choosing one drug over another, as in selecting an antibiotic that will penetrate the central nervous system to treat meningitis or in avoiding drugs that cross the placenta or concentrate in breast milk. Information on protein binding is included for drugs that are >95% bound to plasma proteins, which has implications for drug-drug interactions.

**Metabolism and Excretion:** Drugs are primarily eliminated from the body either by hepatic conversion to active or inactive compounds (metabolism or biotransformation) and subsequent excretion by the kidneys, or by renal elimination of unchanged drug. Therefore, drug metabolism and excretion information is important in determining dosage regimens and intervals for patients with impaired renal or hepatic function. The creatinine clearance (CCr) helps quantify renal function and guides dosage adjustments. Formulas to estimate CCr are included in Appendix E.

**Half-Life:** The half-life of a drug is the amount of time it takes for the drug level to decrease by 50% and roughly correlates with the duration of action. Half-lives are given for drugs assuming the patient has normal renal or hepatic function. Conditions that alter the half-life are noted.

**Time/Action Profile:** The time/action profile table provides the onset of drug action, its peak effect, and its duration of activity. This can aid in planning administration schedules and allows the reader to appreciate differences in choosing one route over another.

**Contraindications and Precautions:** Situations in which drug use should be avoided or alternatives strongly considered are listed as contraindications. In general, most drugs are contraindicated in pregnancy or lactation, unless the potential benefits outweigh the possible risks to the mother or baby (e.g., anticonvulsants, antihypertensives, and antiretrovirals). Contraindications may be absolute (i.e., the drug in question should be avoided completely) or relative, in which certain clinical situations may allow cautious use of the drug. The precautions portion includes disease states or clinical situations in which drug use involves particular risks or in which dosage modification may be necessary. Extreme cautions are noted separately to draw attention to conditions under which use of the drug results in serious, potentially life-threatening consequences.

**Adverse Reactions and Side Effects:** Although it is not possible to include all reported reactions, major side effects for all drugs are included. Life-threatening adverse reactions or side effects are **CAPITALIZED**, and the most frequent side effects are underlined. Those underlined generally have an incidence of 10% or greater. Those not underlined occur in fewer than 10% but more than 1% of patients. Although life-threatening reactions may be rare (fewer than 1%), they are included because of their significance. The following abbreviations are used for body systems:

**CNS:** central nervous system
**EENT:** eye, ear, nose, and throat
**Resp:** respiratory
**CV:** cardiovascular
**GI:** gastrointestinal
**GU:** genitourinary
**Derm:** dermatologic
**Endo:** endocrinologic
**F and E:** fluid and electrolyte
**Hemat:** hematologic
**Local:** local
**Metab:** metabolic
**MS:** musculoskeletal
**Neuro:** neurologic
**Misc:** miscellaneous

**Interactions:** Drug interactions are a significant risk for patients. As the number of medications a patient receives increases, so does the likelihood of drug-drug interactions. This section provides the most important drug-drug interactions and their physiological effects. Significant drug-food and drug-natural product interactions are also noted as are recommendations for avoiding or minimizing these interactions.

**Route and Dosage:** Routes of administration are grouped together and include recommended doses for adults, children, and other more specific age groups (such as geriatric patients). Dosage units are expressed in the terms in which they are usually prescribed. For example, penicillin G dosage is given in units rather than in milligrams. Dosing intervals also are provided in the manner in which they are frequently ordered. If a specific clinical situation (indication) requires a different dose or interval, this is listed separately for clarity. Specific dosing regimens for hepatic or renal impairment are also included.

**Availability:** This section lists the strengths and concentrations of available dose forms. Such information is useful in planning more convenient regimens (fewer tablets/capsules, less injection volume) and in determining whether certain dosing forms are available (suppositories, oral concentrates, sustained- or extended-release forms). Flavors of oral liquids and chewable tablets have been included to improve compliance and adherence in pediatric patients. General availability and average wholesale prices of commonly prescribed drugs have also been added as an aid to nurses with prescriptive authority.

**Nursing Implications:** This section helps the nurse apply the nursing process to pharmacotherapeutics. The subsections provide a step-by-step guide to clinical assessment, implementation (drug administration), and evaluation of the outcomes of pharmacologic therapy.

**Assessment:** This section includes guidelines for assessing patient history and physical data before and during drug therapy. Assessments specific to the drug's various indications are also included. The **Lab Test Considerations** section provides the nurse with information regarding which laboratory tests to monitor and how the results may be affected by the medication. **Toxicity and Overdose** alerts the nurse to therapeutic serum drug levels that must be monitored and signs and symptoms of toxicity. The antidote and treatment for toxicity or overdose of appropriate medications also are included.

**Potential Nursing Diagnoses:** The two or three most pertinent North American Nursing Diagnoses Association (NANDA) diagnoses that potentially apply to a patient receiving the medication are listed. Each diagnosis includes the pharmacologic effect from which the diagnosis has been derived. For instance, the patient receiving immunosuppressant drugs should be diagnosed with Risk for Infection. The diagnosis is followed by the term Side Effects in parentheses. Since patient education is fundamental to all nurse-patient interactions, the diagnosis Deficient Knowledge should be assumed to be a nursing diagnosis applicable to all drugs.

**Implementation:** Guidelines specific for medication administration are discussed in this subsection. **High Alert** information, i.e., information that directly relates to preventing medication errors with inherently dangerous drugs, is included first if applicable. Sound-alike look-alike name confusion alerts are also included here. Other headings in this section provide data regarding routes of administration. **PO** describes when and how to administer the drug, whether tablets may be crushed or capsules opened, and when to administer the medication in relation to food. The **IV** section includes specific information about administering the medication intravenously. It has been thoroughly updated for this edition beginning with a more prominent IV Administration heading that introduces this section. New bold, red headings have been added to highlight the recommended **diluents**, and **concentrations**. These new headings complement the **rate** heading and make this critical information easy to find. Wherever possible, new information has been added about these topics. Several subsections comprise the IV Administration section. The first section, **Direct IV**, which refers to administering medications from a syringe directly into a saline lock, Y-site of IV tubing, or a 3–way stopcock, provides details for reconstitution, concentration, dilution, and rate. **Rate** is also included in both other methods of IV administration, direct or intermittent infusion. **Intermittent Infusion** and **Continuous Infusion** specify standard dilution solutions and amounts, stability information, and rates. In addition, a quick reference for information about dilution amounts in neonates and infants, who are extremely sensitive to excess fluids, is contained in the new **Medication Safety Tools** color insert. **Syringe Compatibility/Incompatibility** identifies compatibile medications when mixed in a syringe. Compatibility of medications in a syringe is usually limited to 15 minutes after mixing. **Y-Site Compatibility/Incompatibility** identifies medications compatible or incompatible with each drug when administered via Y-site injection or 3-way stopcock in IV tubing. **Additive Compatibility/Incompatibility** identifies medications compatible or incompatible when admixed in solution. Compatibility of diluted medications administered through a Y-site for continuous or intermittent infusion is usually limited

to 24 hours. **Solution Compatibility/Incompatibility** identifies compatible or incompatible solutions for dilution for administration purposes. Compatibility information is compiled from Trissel's *Handbook of Injectable Drugs*, 14th ed and *Micromedex*. Compatibility and incompatibility information is also located in charts contained in the **Medication Safety Tools** color insert. A printable version of syringe compatibilities is also available at www.drugguide.com.

**Patient/Family Teaching:** This section includes information that should be taught to patients and/or families of patients. Side effects that should be reported, information on minimizing and managing side effects, details on administration, and follow-up requirements are presented. The nurse also should refer to the **Implementation** section for specific information to teach to the patient and family about taking the medication. **Home Care Issues** discusses aspects to be considered for medications taken in the home setting.

**Evaluation:** Outcome criteria for determination of the effectiveness of the medication are provided.

# EVIDENCE-BASED PRACTICE AND PHARMACOTHERAPEUTICS: Implications for Nurses

**Note:** The content below is an excerpt from an article written exclusively for the 12th edition of **Davis's Drug Guide for Nurses**. To access the full article, visit **DavisPlus**, F.A. Davis's online center for student and instructor ancillaries, at http://davisplus.fadavis.com.

The purpose of evidence-based practice is to improve the outcomes of treatment for patients. How pharmacologic agents affect patients is often the subject of research; such research is required by the Food and Drug Administration (FDA) before and after drug approval. Any medication can be the subject of an evidence-based clinical review article. But what does "evidence-based" mean and how does it relate to nursing?

According to Ingersoll, "Evidence-based nursing practice is the conscientious, explicit, and judicious use of theory-derived, research-based information in making decisions about care delivery to individuals or groups of patients and in consideration of individual needs and preferences" (2000, p. 152). Still subject to debate are questions about the sufficiency and quality of evidence. For example, what kind of evidence is needed? How much evidence is necessary to support, modify, or change clinical practice? And, were the studies reviewed of "good" quality and are their results valid?

In general, clinicians use **hierarchy of evidence** schemas to rank types of research reports from the most valuable and scientifically rigorous to the least useful. The hierarchy makes clear that some level of evidence about the effect of a particular treatment or condition exists, even if the evidence is considered weak. Figure 1 illustrates a hierarchy of evidence pyramid with widely accepted rankings: the most scientifically rigorous at the top, the least scientifically rigorous at the bottom. Practitioners and clinicians should look for the highest level of available evidence to answer their clinical questions. However, it is important that clinicians also apply the second fundamental principle of EBP, which is that evidence alone is not sufficient to make clinical decisions. Decision makers must always trade off the benefits and risks, and the costs associated with alternative treatment options, and by doing so, consider the patients' values and preferences.

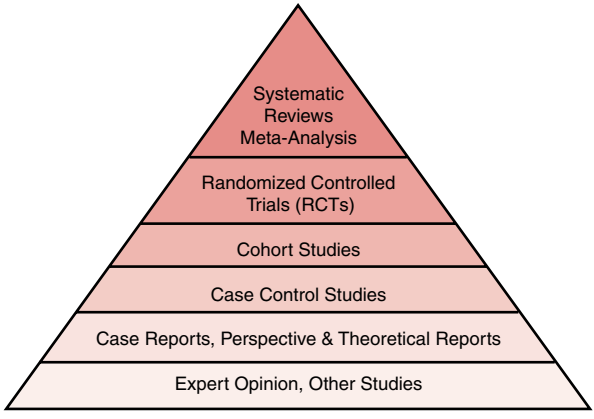

Figure 1: Hierarchy of Scientific Evidence Pyramid

## Evidence-Based Practice and Its Importance in Pharmacology

Evidence-based practices in pharmacology generally are derived from well-designed randomized controlled trials (RCTs) or other experimental designs that investigate drugs' therapeutic and non-therapeutic effects. However, although FDA-approved pharmacologic agents have undergone rigorous testing through RCTs, nurses have the responsibility to evaluate the findings for the best scientific evidence available and to determine the most appropriate, safest, and efficacious drugs for their patients.

While numerous databases are available through Internet searches, two valuable and quickly accessible resources for evaluating the current highest level of pharmacologic evidence are 1) the Cochrane Database of Systematic Reviews and the Central Register of Controlled Trials and 2) the National Guidelines Clearinghouse (NGC), supported by the Agency for Healthcare Research and Quality (AHRQ). The Cochrane library and databases provide full text of high-quality, regularly updated systematic reviews, protocols, and clinical trials. The Web address is http://www.cochrane.org/reviews.clibintro.htm.

AHRQ's Evidence-Based Practice Centers (EPCs) provide evidence reports and technology assessments that can assist nurses in their efforts to provide the highest quality and safest pharmacologic health care available. The EPCs systematically review the relevant scientific literature, conduct additional analyses (when appropriate) prior to developing their reports and assessments, and provide guideline comparisons. The Web address is http://www.guideline.gov.

Evidence-based systematic reports and guidelines provide nurses with instantaneous access to the most current knowledge, enabling them to critically appraise the scientific evidence and its appropriateness to their patient population. This is especially important given the need for nurses to keep abreast of the rapidly changing pharmacologic agents in use. New drugs are approved each month, compelling nurses to know these drugs' intended uses, therapeutic effects, interactions, and adverse effects.

Evidence-based practice requires a shift from the traditional paradigm of clinical practice—grounded in intuition, clinical experience, and pathophysiologic rationale—to a paradigm in which nurses must combine clinical expertise, patient values and preferences, and clinical circumstances with the integration of the best scientific evidence in order to make conscientious, well-informed, research-based decisions that affect nursing patient care.

# PHARMACOGENOMICS

## Introduction

Multiple variables influence the selection and optimization of drug therapy for each individual patient. Pharmacogenomics, the study of the influence of individual genetic variations on drug response in patients, may yield additional information to further enhance safe and effective medication use. Whereas the field originally focused on the effects of specific variants within individual genes on drug response (i.e., pharmacogenetics), efforts increasingly examine the role of multiple variants across the genome and their potential relationship to drug therapy outcomes.

As our understanding of pharmacogenomics and the biological relevance of specific genetic variants in individuals' drug metabolizing enzymes, drug transporter proteins, and drug target receptors to certain drug responses has increased, we have learned that multiple variations across the genome can contribute to significant and relatively predictable treatment outcomes. Virtually every therapeutic area involving medication use includes a drug for which documented genetic variability has the potential to affect drug response. Some of this information is included in the FDA-approved package insert prescribing information. For some agents, the suitability of a specific drug or the determination of an appropriate initial dose for an individual patient based on pharmacogenetic information has been incorporated into dosing algorithms and patient care. As such, it is essential that health care professionals can interpret and utilize this information to facilitate safer and more effective use of medications for individual patients.

## Genetic Variation within the Human Genome

The human genome is comprised of approximately 3 billion nucleotide base pair sequences that encode for molecular DNA with, except for identical twins, each individual having his/her own unique human genome sequence. Four nucleotide bases (adenine, guanine, cytosine, and thymine) are responsible for constituting the sequence of each single strand of DNA. Variations in nucleotide sequences can occur, and contribute to alterations in the expression and activities of certain genes. The location of these variations within a DNA sequence on a particular chromosome can have a profound impact on the ultimate biological activity or characteristic of that gene or lead to little or unknown consequences.

Proteins are involved in most enzymatic, structural, and biologic functions associated with drug disposition and effects. The processes involved in DNA replication, RNA transcription, and translation to synthesized proteins are complex. Each of these processes is potentially susceptible to consequences of DNA sequence variations.

Genetic variations can take many forms, including single nucleotide base substitutions (e.g., a cytosine substituted for an adenine), insertions or deletions of a nucleotide base within a sequence, and deletions or extra copies of entire DNA sequences. Variations in DNA that occur at a frequency of greater than 1% in the population are called polymorphisms. The most common genetic variations in humans are referred to as single nucleotide polymorphisms (SNPs) and result from the substitution of one nucleotide base for another. The specific location of a SNP within a gene is important. As mentioned previously, genetic variations can be of unknown or no clinical consequence or they can lead to a truncated, dysfunctional, or complete lack of protein product that is associated with an alteration in drug response.

## Clinical Significance of Genetic Polymorphisms

SNPs and other genetic variations influence drug response at different levels through alterations in the activities of enzymes or proteins involved in drug absorption, transport, metabolism, elimination, or at the drug target receptor (site of drug action). Clinically relevant polymorphisms have been identified for genes that encode for most of the common enzymes involved in drug metabolism. Most enzymes

are localized intracellularly throughout a wide variety of tissues in the body, including the enterocytes that line the intestine and within hepatocytes. Variants that cause diminished or absent enzyme activity decrease drug metabolism processes. In this case, if the drug is metabolized to an inactive product, then the prolonged persistence of the parent drug in the body could result in excessive pharmacologic effects and potential toxicities may occur. If the drug requires enzymatic conversion to a pharmacologically active metabolite, drug response may be reduced or absent. In contrast, if the variation is due to extra copies of a gene that results in increased enzymatic activity, opposite effects on drug metabolism and response can occur.

Similar outcomes can be associated with polymorphisms in genes that encode for membrane transporter proteins that are responsible for drug transport into cells (influx), as well as proteins that participate in energy-dependent processes that export drugs out of cells (efflux transporters). Polymorphisms in drug transport proteins can influence drug response by altering drug gastrointestinal absorption, uptake and distribution in tissues, exposure to intracellular drug metabolizing enzymes, and elimination via the bile or urine. Finally, some genes that encode for certain drug receptors are highly polymorphic, resulting in attenuated or exaggerated drug responses. The number of polymorphic genes responsible for variations in drug response at drug receptors is relatively small compared to those associated with drug metabolizing enzymes or transport proteins; however, this area has undergone the least amount of study to date.

## Incorporating Pharmacogenomic Information into Clinical Practice

Most drugs are initiated in individual patients based on knowledge about their safety and effectiveness within the general population. Information regarding patient characteristics (e.g., age, ethnicity, renal/hepatic function, concomitant disease, etc.) known to contribute to variability in drug response, when available, is considered at this time. Currently, there are more than 50 drugs with pharmacogenomic information included in the package insert. For selected agents, dosing recommendations based on an individual's genetic information (i.e., genotype) for specific drugs and drug classes are also considered. Genomic biomarkers can play an important role in identifying responders and non-responders, avoiding drug toxicity, and adjusting the dose of drugs to optimize their efficacy and safety. However, the typical strategy for most drug therapy is to monitor the patient's response to treatment and modify regimens as necessary. Patients who develop exaggerated pharmacologic responses or illicit no pharmacologic effect may be expressing a phenotype suggestive of altered drug disposition or target receptor effect that could be associated with an underlying genetic polymorphism. As we continue to learn more about these associations and can incorporate pharmacogenomic information into decisions regarding drug therapy for individual patients, the ultimate goal is to improve therapeutic outcomes by limiting drug exposure to patients that are most likely to derive no therapeutic benefit and/or experience toxic drug effects.

For example, some genetic variants are associated with hypersensitivity reactions to a specific drug. A prescriber who is contemplating initiating that drug for a patient may determine whether the patient possesses that variant in his or her DNA. If that specific variant is present, the prescriber might select an alternate agent, thereby avoiding a potentially life-threatening hypersensitivity reaction. In another example, patients who are determined to have a genetic variant that results in an inactive metabolizing enzyme would not be appropriate candidates for an analgesic drug that requires that enzyme to convert the drug to the active analgesia-producing form. On the other hand, if that metabolizing enzyme is responsible for conversion of an active parent drug to an inactive metabolite, the starting dose of the drug may be reduced or perhaps an alternate drug might be selected.

Several Clinical Laboratory Improvement Amendment (CLIA)-approved laboratories offer pharmacogenetic testing to identify relevant genetic polymorphisms that predict drug response and can be used to initiate appropriate drugs and dosing regimens for individual patients. Some of these tests, while recommended in drug prescribing information, are costly and may not be covered by insurance. Patients may not fully understand the utility of undergoing genetic testing and providing a specimen for DNA analysis, which is typically performed on a blood, saliva, buccal swab, or other tissue collection. On the other hand, patients who are engaged in their medical care may be familiar

with the concept of "personalized medicine" and seek information about available tests to "individualize" their own drug therapy. Currently, four drugs are required to have pharmacogenetic testing performed before they are prescribed: cetuximab, trastuzumab, maraviroc, and dasatinib. Other drugs have labeling that include "test recommended" or "for information only". Health care professionals will need to be familiar with pharmacogenetic tests that are recommended for specific drug therapies, how to interpret the results of those tests, and how to incorporate pharmacogenetic data with other clinical information to optimize patient drug therapy and health care outcomes.

# MEDICATION ERRORS: Improving Practices and Patient Safety

It is widely acknowledged that medication errors result in thousands of adverse drug events, preventable reactions, and deaths per year. Nurses, physicians, pharmacists, patient safety organizations, the Food and Drug Administration, the pharmaceutical industry, and other parties share in the responsibility for determining how medication errors occur and designing strategies to reduce error.

One impediment to understanding the scope and nature of the problem has been the reactive "blaming, shaming, training" culture that singled out one individual as the cause of the error. Also historically, medication errors that did not result in patient harm—near-miss situations in which an error could have but didn't happen—or errors that did not result in serious harm were not reported. In contrast, serious errors often instigated a powerful punitive response in which one or a few persons were deemed to be at fault and, as a result, lost their jobs and sometimes their licenses.

In 1999, the Institute of Medicine (IOM) published *To Err Is Human: Building a Safer Health System*, which drew attention to the problem of medication errors. It pointed out that excellent health care providers do make medication errors, that many of the traditional processes involved in the medication-use system were error-prone, and that other factors, notably drug labeling and packaging, contributed to error. Furthermore, the IOM report, in conjunction with other groups such as the United States Pharmacopeia (USP) and the Institute for Safe Medication Practices (ISMP), called for the redesign of error-prone systems to include processes that anticipated the fallibility of humans working within the system. This initiative is helping shift the way the health care industry addresses medication errors from a single person/bad apple cause to a systems issue.[1]

The National Coordinating Council for Medication Error Reporting and Prevention (NCC-MERP) developed the definition of a medication error that reflects this shift and captures the scope and breadth of the issue:

> "A medication error is any preventable event that may cause or lead to inappropriate medication use or patient harm while the medication is in the control of the health care professional, patient, or consumer. Such events may be related to professional practice, health care products, procedures, and systems, including prescribing; order communication; product labeling, packaging, and nomenclature; compounding; dispensing; distribution; administration; education; monitoring; and use."[2]

Inherent in this definition's mention of related factors are the human factors that are part of the medication use system. For example, a nurse or pharmacist may automatically reach into the bin where dobutamine is usually kept, see "do" and "amine" but select dopamine instead of dobutamine. Working amidst distractions, working long hours or shorthanded, and working in a culture where perfection is expected and questioning is discouraged are other examples of the human factors and environmental conditions that contribute to error.

The goal for the design of any individual or hospital-wide medication use system is to determine where systems are likely to fail and to build in safeguards that minimize the potential for error. One way to begin that process is to become familiar with medications or practices that have historically been shown to be involved in serious errors.

## High Alert Medications

Some medications, because of a narrow therapeutic range or inherent toxic nature, have a high risk of causing devastating injury or death if improperly ordered, prepared, stocked, dispensed, administered, or monitored. Although these medications may not be involved in more errors, they require special attention due to the potential for serious, possibly fatal consequences. These have been termed **high-alert medications**, to communicate the need for extra care and safeguards. Many of

these drugs are used commonly in the general population or are used frequently in urgent clinical situations. The Joint Commission (TJC) monitors the use of frequently prescribed high-alert medications, which include insulin, opiates and narcotics, injectable potassium chloride (or phosphate) concentrate, intravenous anticoagulants (such as heparin), sodium chloride solutions above 0.9 percent, and others. See the High Alert Drugs table in the **Medication Safety Tools** color insert, and Table 2 in this article for a complete list of the high alert meds found in *Davis's Drug Guide for Nurses*. (Visit the Institute for Safe Medication Practices at www.ismp.org for more information on high alert drugs.)

## Causes of Medication Errors

Many contributing factors and discrete causes of error have been identified, including failed communication, poor drug distribution practices, dose miscalculations, drug packaging and drug-device related problems, incorrect drug administration, and lack of patient education.[3]

**Failed Communication:** Failed communication covers many of the errors made in the ordering phase, and although ordering is performed by the prescriber, the nurse, the clerk, and the pharmacist who interpret that order are also involved in the communication process.

- ***Poorly handwritten or verbal orders.*** Handwriting is a major source of error and has led to inaccurate interpretations of the drug intended, the route of administration, the frequency, and dose. Telephone and verbal orders are likewise prone to misinterpretation.
- ***Drugs with similar-sounding or similar-looking names.*** Similar sounding names, or names that look similar when handwritten, are frequently confused. Amiodarone and amrinone (now renamed inamrinone to help prevent confusion), or Zebeta® and Diabeta® are two examples. The USP has identified over 700 "sound-alike, look-alike" drugs. Mix-ups are more likely when each drug has similar dose ranges and frequencies. Several of the sound-alike/look-alike drugs were targeted for labeling intervention by the FDA, which requested manufacturers of 33 drugs with look-alike names to voluntarily revise the appearance of the established names. The revision visually differentiates the drug names by using "tall man" letters (capitals) to highlight distinguishing syllables (ex.: acetoHEXAMIDE versus acetaZOLAMIDE or buPROPrion versus busPIRone. See the TALL MAN Lettering table in the **Medication Safety Tools** color insert for the list of the pairs of drugs that are commonly confused, often with serious consequences.
- ***Misuse of zeroes in decimal numbers.*** Massive, ten-fold overdoses are traceable to not using a leading zero (.2 mg instead of 0.2 mg) or adding an unnecessary trailing zero (2.0 mg instead of 2 mg) in decimal expressions of dose. Similar overdosages are found in decimal expressions in which the decimal point is obscured by poor handwriting, stray marks, or lined orders sheets (e.g., reading 3.1 grams as 31 grams). Under-dosing also may occur by the same mechanism and prevent a desired, perhaps life-saving effect.
- ***Use of apothecary measures (grains, drams) or package units (amps, vials, tablets) instead of metric measures (grams, milligrams, milliequivalents).*** Apothecary measurements are poorly understood and their abbreviations are easily confused with other units of measurement. Use of such measures should be abandoned. Errors also occur when dosage units are used instead of metric weight. For example, orders for 2 tablets, $1\frac{1}{2}$ vials, or 2 ampules can result in overdose or underdose when the medications ordered come in various strengths.
- ***Misinterpreted abbreviations.*** Abbreviations can be misinterpreted or, when used in the dosage part of the order, can result in incorrect dosage of the correct medication. For example, lower or uppercase "U" for units has been read as a zero, making 10 u of insulin look like 100 units when handwritten. The Latin abbreviation "QOD" for every other day has been misinterpreted as QID (4 times per day). See Table 2 for a list of confusing abbreviations and safer alternatives.
- ***Ambiguous or incomplete orders.*** Orders that do not clearly specify dose, route, frequency, or indication do not communicate complete information and are open to misinterpretation.

**Poor Distribution Practices:** Poor distribution includes error-prone storing practices such as keeping similar-looking products next to each other. Dispensing multidose floor stock vials of

potentially dangerous drugs instead of unit doses is also associated with error as is allowing non-pharmacists to dispense medications in the absence of the pharmacist.

**Dose Miscalculations:** Dose miscalculations are a prime source of medication error. Also, many medications need to be dose-adjusted for renal or hepatic impairment, age, height and weight, and body composition (i.e., correct for obesity). Complicated dosing formulas provide many opportunities to introduce error. Often vulnerable populations, such as premature infants, children, the elderly, and those with serious underlying illnesses, are at greatest risk.

**Drug Packaging and Drug Delivery Systems:** Similar packaging or poorly designed packaging encourages error. Drug companies may use the same design for different formulations, or fail to highlight information about concentration or strength. Lettering, type size, color, and packaging methods can either help or hinder drug identification.

Drug delivery systems include infusion pumps and rate controllers. Some models do not prevent free flow of medication, leading to sudden high dose infusion of potent and dangerous medications. The lack of safeguards preventing free flow and programming errors are among the problems encountered with infusion control devices.

**Incorrect Drug Administration:** Incorrect drug administration covers many problems. Misidentification of a patient, incorrect route of administration, missed doses, or improper drug preparation are types of errors that occur during the administration phase.

**Lack of Patient Education:** Safe medication use is enhanced in the hospital and the home when the patient is well informed. The knowledgeable patient can recognize when something has changed in his or her medication regimen and can question the health care provider. At the same time, many issues related to medication errors, such as ambiguous directions, unfamiliarity with a drug, and confusing packaging, affect the patient as well as the health care provider, underscoring the need for careful education. Patient education also enhances adherence, which is a factor in proper medication use.

## Prevention Strategies

Since medication use systems are complex and involve many steps and people, they are error-prone. On an individual basis, nurses can help reduce the incidence of error by implementing the following strategies:

- Clarify any order that is not obviously and clearly legible. Ask the prescriber to print orders using block style letters.
- Do not accept orders with the abbreviation "u" or "IU" for units. Clarify the dosage and ask the prescriber to write out the word units.
- Clarify any abbreviated drug name or the abbreviated dosing frequencies q.d., QD, q.o.d., QOD, and q.i.d or QID. Suggest abandoning Latin abbreviations in favor of spelling out dosing frequency.
- Do not accept doses expressed in package units or volume instead of metric weight. Clarify any order written for number of ampules, vials, or tablets (e.g., calcium chloride, 1 ampule or epinephrine, 1 Bristojet).
- Decimal point errors can be hard to see. Suspect a missed decimal point and clarify any order if the dose requires more than 3 dosing units.
- If dose ordered requires use of multiple dosage units or very small fractions of a dose unit, review the dose, have another health care provider check the original order and recalculate formulas, and confirm the dose with the prescriber.
- If taking a verbal order, ask prescriber to spell out the drug name and dosage to avoid sound-alike confusion (e.g., hearing Cerebyx for Celebrex, or fifty for fifteen). Read back the order to the prescriber after you have written it in the chart. Confirm and document the indication to further enhance accurate communication.
- Clarify any order that does not include metric weight, dosing frequency, or route of administration.
- Check the nurse's/clerk's transcription against the original order. Make sure stray marks or initials do not obscure the original order.

- Do not start a patient on new medication by borrowing medications from another patient. This action bypasses the double check provided by the pharmacist's review of the order.
- Always check the patient's name band before administering medications. Verbally addressing a patient by name does not provide sufficient identification.
- Use the facility's standard drug administration times to reduce the chance of an omission error.
- Be sure to fully understand any drug administration device before using it. This includes infusion pumps, inhalers, and transdermal patches.
- Have a second practitioner independently check original order, dosage calculations, and infusion pump settings for high alert medications.
- Realize that the printing on packaging boxes, vials, ampoules, prefilled syringes, or any container in which a medication is stored can be misleading. Be sure to differentiate clearly the medication and the number of milligrams per milliliter versus the total number of milligrams contained within. Massive overdoses have been administered by assuming that the number of milligrams per ml is all that is contained within the vial or ampule. Read the label when obtaining the medication, before preparing or pouring the medication, and after preparing or pouring the medication.
- Educate patients about the medications they take. Provide verbal and written instructions and ask the patient to restate important points. Refer to Educating Patients about Safe Medication Use on page 27 for recommendations on what patients should understand about their medications.

As stated previously, errors are a result of problems within the medication use system and cannot be eliminated by the vigilance of any one group of health care providers. System redesign involves strong leadership from administration and all involved departments. Health care facilities should consider the following when addressing the issue of medication errors:

- Do not provide unit stock of critical, high alert medications. If eliminating these medications from floor stock is not feasible, consider reducing the number available and standardizing the concentrations or forms in which the medication is available.
- Create committees that address safety issues.
- Install a computer physician order entry (CPOE) system to help reduce prescribing orders. Link order entry to pertinent lab, allergy, and medication data.
- Implement bar code technology to ensure the right drug reaches the right patient.
- Develop policies that discourage error-prone prescribing practices such as inappropriate use of verbal orders, use of confusing dosing symbols, and use of abbreviations.
- Develop policies that encourage better communication of medication information such as requiring block-style printing of medications, including indication in prescription, and using both the trade and generic name in prescriptions.
- Ensure a reasonable workload for pharmacists and nurses, and provide a well-designed work area.
- Limit the availability of varying concentrations of high alert medications.
- Provide standard concentrations and infusion rate tables.
- Supply pharmacy and patient care areas with current reference material.
- Cultivate a culture that does not assign blame when medication errors occur but looks for root causes instead.
- Encourage staff to participate in the USP-ISMP-MERP error reporting program.

| MTX | Methotrexate | Mitoxantrone | Use full drug name |
| Nitro drip | Nitroglycerin | Nitroprusside | Use full drug name |
| Norflox | Norfloxacin | Norflex (orphenadrine) | Use full drug name |
| PCA | Procainamide | Patient controlled analgesia | Use full drug name |
| PIT | Pitocin (oxytocin) | Pitressin (vasopressin) | Use full drug name |
| SSRI | Sliding scale regular insulin | Selective serotonin reuptake inhibitor | Spell out "sliding scale regular insulin" |
| μg† | Microgram | Mg (milligram) | Use mcg |
| / (slash mark) | "per" | "1" (numeral one) | Spell out "per" |
| HS or hs | Half strength or hour of sleep (at bedtime) | One mistaken for the other | Spell out "half strength" or "bedtime" |
| D/C | Discharge or discontinue | One mistaken for the other | Spell out "discharge" or "discontinue" |
| + | Plus sign | "4" (numeral four) | Spell out "and" |
| Zero **after** a decimal point (e.g., 1.0 mg)* | 1 mg | 10 mg | DO NOT USE zero after a decimal point |
| No zero **before** a decimal point (e.g., .1 mg)* | .1 mg | 1 mg | ALWAYS USE zero before a decimal point |
| u or U* | units | 0 (zero), 4 (four) or cc | Spell out "units" |
| I.U.* | International Units | IV or 10 | Spell out "units" |
| q.d. or QD* | Every day | q.i.d. (4 times per day) | Write out "daily" |
| q.o.d. or QOD* | Every other day | q.i.d. (4 times per day) or qd (daily) | Write out "every other day" |
| TIW | 3 times a week | 3 times a day or twice a week | Spell out "3 times weekly" |
| IN | Intranasal | IM or IV | Spell out "intranasal" or use "NAS" |
| SC, SQ, sub q | Subcutaneously | SC mistaken as SL (sublingual), SQ as "5 every" or "every" | Use subcut or write out "subcutaneously" |
| AD, AS, AU | Right ear, left ear, each ear | OD, OS, OU (right eye, left eye, each eye) | Spell out "right ear", "left ear", "each ear" |
| OD, OS, OU | Right eye, left eye, each eye | AD, AS, AU (right ear, left ear, each ear) | Spell out "right eye", "left eye", "each eye" |
| Cc† | cubic centimeters | u (units) | Use ml |
| @† | At | 2 | Use "at" |
| >† | Greater than | 7 or < | Spell out "greater than" |
| <† | Less than | L or > | Spell out "less than" |
| & | And | 2 | Use "and" |
| ° | Hour | Zero (q 1° seen as q 10) | Use "hr", "h", or "hour" |
| Drug name and dose run together. Example: Inderal40 mg | Inderal 40 mg | Inderal 140 mg | Leave space between drug name, dose, and unit of measure |
| Numerical dose and unit of measure run together. Example: 10mg | 10 mg | 100 mg | Leave space between drug dose and unit of measure |

*Appears on TJC's "Do Not Use" list of abbreviations.

†May be considered by TJC for possible inclusion in the "Do Not Use" list in the future.

Modified from The Institute for Safe Medication Practices Safety Alert, Vol 8: Issue 24. Nov 27, 2003.

# DETECTING AND MANAGING ADVERSE DRUG REACTIONS

An *adverse drug reaction* (ADR) is any unexpected, undesired, or excessive response to a medication that results in:

- temporary or permanent serious harm or disability
- admission to a hospital, transfer to a higher level of care, or prolonged stay
- death.

Adverse drug reactions are distinguished from adverse drug events, in which causality is uncertain, and side effects, which may be bothersome to the patient and necessitate a change in therapy but are not considered serious.[1] Although some ADRs are the result of medication errors, many are not.

## Types of ADRs

The Food and Drug Administration (FDA) classifies ADRs into 2 broad categories: Type A and Type B.[2] Type A reactions are predictable reactions based on the primary or secondary pharmacologic effect of the drug. Dose-related reactions and drug-drug interactions are examples of Type A reactions. Type B reactions are unpredictable, are not related to dose, and are not the result of the drug's primary or secondary pharmacologic effect. Idiosyncratic and hypersensitivity reactions are examples of Type B reactions.

**Dose-Related Reactions (Toxic Reactions):** In dose related reactions, the dose prescribed for the patient is excessive. Although a variety of mechanisms may interact, reasons for this type of reaction include:

- renal or hepatic impairment
- extremes in age (neonates and frail elderly)
- drug-drug or drug-food interactions
- underlying illness. Dose-related reactions are often the result of preventable errors in prescribing in which physiologic factors such as age, renal impairment, and weight were not considered sufficiently, or in inadequate therapeutic monitoring. Medications with narrow therapeutic ranges (digoxin, aminoglycosides, antiepileptic drugs) and those that require careful monitoring or laboratory testing (anticoagulants, nephrotoxic drugs) are most frequently implicated in dose-related reactions.[3,4] Dose-related reactions usually are managed successfully by temporarily discontinuing the drug and then reducing the dose or increasing the dosing interval. In some instances, the toxic effects need to be treated with another agent (e.g., Digibind for digoxin toxicity or Kayexalate for drug induced hyperkalemia). Appropriately timed therapeutic drug level monitoring, review of new drugs added to an existing regimen that may affect the drug level, and frequent assessment of relevant laboratory values are critical to safe medical management and prevention of dose-related reactions.

**Drug-Drug Interactions:** Drug-drug interactions occur when the pharmacokinetic or pharmacodynamic properties of an individual drug affect another drug. Pharmacokinetics refers to the way the body processes a medication (absorption, distribution, metabolism, and elimination). In a drug-drug interaction, the pharmacokinetic properties of one drug can cause a change in drug concentration of another drug and an altered response. For example, one drug may block enzymes that metabolize a second drug. The concentration of the second drug is then increased and may become toxic or cause adverse reactions. Pharmacodynamic drug-drug interactions involve the known effects and side-effects of the drugs. For example, two drugs with similar therapeutic effects may act together in a synergistic way. The increased anticoagulant effects that occur when warfarin and aspirin are taken together, or the increased central nervous system (CNS) depression that results when two drugs with CNS depressant effects potentiate each other, are examples of pharmacodymanic drug-drug interactions. Certain classes of drugs are more likely to result in serious drug-drug

interactions, and patients receiving these agents should be monitored carefully. The medication classes include anticoagulants, oral hypoglycemic agents, nonsteroidal anti-inflammatory agents, monoamine oxidase inhibitors, antihypertensives, antiepileptics, and antiretrovirals. In addition, specific drugs such as theophylline, cimetidine, lithium, and digoxin may result in serious ADRs.

**Idiosyncratic Reactions:** Idiosyncratic reactions occur without relation to dose and are unpredictable and sporadic. Reactions of this type may manifest in many different ways, including fever, blood dyscrasias, cardiovascular effects, or mental status changes. The time frame between the occurrence of a problem and initiation of therapy is sometimes the only clue linking drug to symptom. Some idiosyncratic reactions may be explained by genetic differences in drug-metabolizing enzymes.

**Hypersensitivity Reactions:** Hypersensitivity reactions are usually allergic responses. Manifestations of hypersensitivity reactions range from mild rashes, to nephritis, pneumonitis, hemolytic anemia, and anaphylaxis. Protein drugs (vaccines, enzymes) are frequently associated with hypersensitivity reactions. In most instances, antibody formation is involved in the process and therefore cross-sensitivity may occur. An example of this is hypersensitivity to penicillin and cross-sensitivity with other penicillins and/or cephalosporins. Documenting drugs to which the patient is allergic and the specific hypersensitivity reaction is very important. If the reaction to an agent is anaphylaxis the nurse should monitor the patient during administration of a cross-hypersensitive agent, especially during the initial dose, and ensure ready access to emergency resuscitative equipment.

## Recognizing an ADR

Adverse drug reactions should be suspected whenever there is a negative change in a patient's condition, particularly when a new drug has been introduced. Strategies that can enhance recognition include knowing the side effect/adverse reaction profile of medications. Nurses should be familiar with a drug's most commonly encountered side effects and adverse reactions before administering it. (In *Davis's Drug Guide for Nurses*, side effects are underlined, and adverse reactions are CAPITALIZED and appear in second color in the **Adverse Reactions and Side Effects** section.) As always, monitoring the patient's response to a medication and ongoing assessment are key nursing actions. Learn to recognize patient findings that suggest an ADR has occurred. These include:

- rash
- change in respiratory rate, heart rate, blood pressure, or mental state
- seizure
- anaphylaxis
- diarrhea
- fever.

Any of these findings can suggest an ADR and should be reported and documented promptly so that appropriate interventions, including discontinuation of suspect medications, can occur. Prompt intervention can prevent a mild adverse reaction from escalating into a serious health problem. Other steps taken by the health care team when identifying and treating an ADR include:

1. Determining that the drug ordered was the drug given and intended.
2. Determining that the drug was given in the correct dosage by the correct route.
3. Establishing the chronology of events: time drug was taken and onset of symptoms.
4. Stopping the drug and monitoring patient status for improvement (dechallenge).
5. Restarting the drug, if appropriate, and monitoring closely for adverse reactions (rechallenge).[2]

## Prevention

Health care organizations have responded to consumer, regulator, and insurer pressures by developing programs that aim to eliminate preventable ADRs. In the inpatient setting, computer systems can display the patient's age, height, weight, and creatinine clearance or serum creatinine concentration

and send an alert to the clinician if a prescribed dose is out of range for any of the displayed parameters. Allergy alerts and drug-drug interactions can be presented to the clinician at the time an order is entered.

In the outpatient setting, strategies that increase the patient's knowledge base and access to pharmacists and nurses may help prevent adverse reactions.[5] Outpatient pharmacy computer systems that are linked within a chain of pharmacies may allow the pharmacist to view the patient's profile if the patient is filling a prescription in a pharmacy other than the usual one. Many pharmacy computers have dose limits and drug-drug reaction verification to assist pharmacists filling orders.

Such strategies are a valuable auxiliary to, but cannot replace, conscientious history taking, careful patient assessment, and ongoing monitoring. A thorough medication history including all prescription and nonprescription drugs, all side effects and adverse reactions encountered, allergies, and all pertinent physical data should be available to the prescriber. The prescriber is responsible for reviewing this data, along with current medications, laboratory values, and any other variable that affects drug response.

It is not expected that practitioners will remember all relevant information when prescribing. In fact, reliance on memory is error-fraught, and clinicians need to use available resources to verify drug interactions whenever adding a new drug to the regimen. Setting expectations that clinicians use evidence-based information rather than their memories when prescribing, dispensing, administering or monitoring patients has the potential to reduce the incidence of preventable ADRs.

## Food and Drug Administration MedWatch Program

To monitor and assess the incidence of adverse reactions, the FDA sponsors MedWatch, a program that allows health care practitioners and consumers the opportunity to report serious adverse reactions or product defects encountered from medications, medical devices, special nutritional products, or other FDA-regulated items. The FDA considers serious those reactions that result in death, life-threatening illness or injury, hospitalization, disability, congenital anomaly, or those that require medical/surgical intervention.

In addition to reporting serious adverse reactions, health care providers should also report problems related to suspected contamination, questionable stability, defective components, or poor packaging/labeling. Reports should be submitted even if there is some uncertainty about the cause/effect relationship or if some details are missing. This reporting form may be accessed at www.fda.gov/medwatch/report/hcp.htm. Reports also may be faxed to the FDA (1-800-FDA-0178). Reactions to vaccines should be reported to the Vaccine Adverse Event Reporting System (VAERS; 1-800-822-7967). Nurses share with other health care providers an obligation to report adverse reactions to the MedWatch program so that all significant data can be analyzed for opportunities to improve patient care.

# OVERVIEW OF RISK EVALUATION AND MITIGATION SYSTEMS (REMS)

Over the past several decades, the Food and Drug Administration (FDA) has employed a number of "risk management" programs designed to detect, evaluate, prevent, and mitigate drug adverse events for drugs with the potential for serious adverse drug reactions. Some of the risk management plans used by the FDA over the years have included the use of patient package inserts, medication guides, restricted access programs, and classification of drugs as controlled substances. These programs were acknowledged by the FDA as Risk Minimization Action Plans (RiskMAPS) in 2005. With these programs, the FDA only had the authority to mandate postmarketing commitments from drug manufacturers before the drug was approved; however, these requirements could not be enforced after the drug was approved.

The Food and Drug Administration Amendments Act of 2007 has given the FDA the authority to subject drugs to new risk identification and communication strategies in the postmarketing period. These new strategies, called Risk Evaluation and Mitigation Strategies (REMS), can be required for any drug or drug class that is associated with serious risks. The FDA can require a REMS if it believes that this program is necessary to ensure that the benefits outweigh the potential risks of the drug. The FDA can require a REMS either as part of the drug approval process or during the postmarketing period if new information becomes available regarding potentially harmful effects that are associated with the use of the drug.

Components of the REMS may include a medication guide, a patient package insert, a communication plan, other elements to ensure safe use, and/or an implementation system. A REMS for New Drug Applications or Biologics License Applications requires a timetable for submission of assessment of the REMS. A variety of elements to ensure safe use of drugs can be required as part of the REMS if it is believed that a medication guide, patient package insert, or communication plan are not adequate to mitigate the serious risks associated with a particular drug. These elements may include the following:

- Health care providers who prescribe the drug are specifically trained and/or certified.
- Pharmacies, practitioners, or health care settings that dispense the drug are specifically trained and/or certified.
- The drug is dispensed to patients only in certain health care settings, such as hospitals, or physicians' offices.
- The drug is dispensed only to patients with evidence or other documentation of safe-use conditions, such as laboratory test results.
- Patients using the drug are subject to certain monitoring.
- Patients using the drug are enrolled in a registry.

The FDA maintains an updated list of these REMS programs at http://www.fda.gov/Drugs/DrugSafety/PostmarketDrugSafetyInformationforPatientsandProviders/ucm111350.htm. As of December, 2009, the drugs that have approved REMS programs include the following:

| Brand Name | Generic Name |
|---|---|
| (Actiq) | fentanyl (transmucosal) |
| (Actoplus Met/Actoplus Met XR) | pioglitazone/metformin |
| (Actos) | pioglitazone |
| (Advair Diskus/HFA) | fluticasone/salmeterol |
| (Amnesteem/Claravis/Sotret) | isotretinoin |
| (Androgel/Testim) | testosterone |
| (Aplenzin) | bupropion |
| (Avandamet) | rosiglitazone/metformin |
| (Avandaryl) | rosiglitazone/glimepiride |
| (Avelox) | moxifloxacin |
| (Banzel) | rufinamide |
| (Botox/Botox Cosmetic) | onabotulinum toxin A |
| (Cambia) | diclofenac potassium |
| (Cimzia) | certolizumab pegol |
| (Cipro/Proquin XR) | ciprofloxacin |
| (Clozaril/Fazaclo ODT) | clozapine |
| (Colcrys) | colchicine |
| (Creon/Zenpap) | pancrelipase |
| (Darvon/Darvon-N/Darvocet-N) | propoxyphene |

| | |
|---|---|
| (Duetact) | pioglitazone/glimepiride |
| (Dysport) | abobotulinum toxin A |
| (Edluar) | zolpidem (sublingual tablets) |
| (Effexor/Effexor XR) | venlafaxine |
| (Effient) | prasugrel |
| (Embeda) | morphine sulfate/naltrexone |
| (Enbrel) | etanercept |
| (Entereg) | alvimopan |
| (Epzicom) | abacavir/lamivudine |
| (Extavia) | interferon beta-1b |
| (Factive) | gemifloxacin |
| (Forteo) | teriparatide |
| (Infergen) | interferon alfacon-1 |
| (Intron A) | interferon alfa-2a |
| (Kaletra) | lopinavir/ritonavir |
| (Keppra/Keppra XR) | levetiracetam |
| (Lamictal) | lamotrigine |
| (Lariam) | mefloquine |
| (Letairis) | ambrisentan |
| (Levaquin) | levofloxacin |
| (Lotronex) | alosetron |
| (Lyrica) | pregabalin |
| (Metozolv ODT/Reglan) | metoclopramide |
| (Mifeprex) | mifepristone |
| (Multaq) | dronedarone |
| (Myobloc) | rimabotulinum toxin B |
| (Noroxin) | norfloxacin |
| (Nplate) | romiplostim |
| (Nucynta) | tapentadol |
| (Onsolis) | fentanyl (buccal soluble film) |
| (Osmoprep/Visicol) | sodium phosphate, dibasic anhydrous and sodium phosphate, monobasic, monohydrate |
| (Pegasys) | peginterferon alfa-2a |
| (PegIntron) | peginterferon alfa-2b |
| (Plenaxis) | abarelix |
| (Promacta) | eltrombopag |
| (Revlimid) | lenalidomide |
| (Rozerem) | ramelteon |
| (Sabril) | vigabatrin |
| (Samsca) | tolvaptan |
| (Savella) | milnacipran |
| (Simponi) | golimumab |
| (Soliris) | eculizumab |
| (Stelara) | ustekinumab |
| (Sucraid) | sacrosidase |
| (Symbicort) | budesonide/formoterol |
| (Symbyax) | olanzapine/fluoxetine |
| (Thalomid) | thalidomide |
| (Tikosyn) | dofetilide |
| (Topamax) | topiramate |
| (Tracleer) | bosentan |
| (Treximet) | sumatriptan/naproxen sodium |
| (Trilipix) | fenofibric acid |
| (Trizivir) | abacavir/lamivudine/zidovudine |
| (Tysabri) | natalizumab |
| (Tyzeka) | telbivudine |
| (Vibativ) | telavancin |
| (Vimpat) | lacosamide |
| (Viramune) | nevirapine |
| (Votrient) | pazopanib |
| (Xenazine) | tetrabenazine |
| (Xolair) | omalizumab |
| (Xyrem) | sodium oxybate |
| (Ziagen) | abacavir |
| (Zolpimist) | zolpidem (oral spray) |
| (Zonegran) | zonisamide |
| (Zyprexa/Zyprexa Zydis) | olanzapine |

# SPECIAL DOSING CONSIDERATIONS

For many patients the average dose range for a given drug can be toxic. The purpose of this section is to describe vulnerable patient populations for which special dosing considerations must be made to protect the patient and improve clinical outcomes.

## The Pediatric Patient

Most drugs prescribed to children are not approved by the Food and Drug Administration (FDA) for use in pediatric populations. This does not mean it's wrong to prescribe these drugs to children, rather it means that the medications were not tested in children. The lack of pediatric drug information can result in patient harm or death, such as what occurred with the drug chloramphenicol. When given to very young children, chloramphenicol caused toxicity and multiple deaths. Referred to as "gray baby syndrome," this toxic reaction was eventually found to be dose dependent. The FDA now requires that new drugs that may be used in children include information for safe pediatric use. For this edition of *Davis's Drug Guide for Nurses*, we have had the pediatric dosing for the top 100 drugs used in children revised and updated by a pediatric pharmacist with a Doctor of Pharmacy (PharmD) degree.

The main reason for adjusting dosages in pediatric patients is body size, which is measured by body weight or body surface area (BSA). Weight-based pediatric drug dosages are expressed in number of milligrams per kilogram of body weight (mg/kg) while dosages calculated on BSA are expressed in number of milligrams per meter squared ($mg/m^2$). BSA is determined using a BSA nomogram (Appendix F) or calculated by using formulas (Appendix E).

The neonate and the premature infant require additional adjustments secondary to immature function of body systems. For example, absorption may be incomplete or altered secondary to differences in gastric pH or motility. Distribution may be altered because of varying amounts of total body water, and metabolism and excretion can be delayed due to immature liver and kidney function. Furthermore, rapid weight changes and progressive maturation of hepatic and renal function require frequent monitoring and careful dosage adjustments. Gestational age, as well as weight, may be needed to properly dose some drugs in the neonate.

## The Geriatric Patient

Absorption, distribution, metabolism, and excretion are altered in adults over 65 years of age, putting the older patient at risk for toxic reactions. Pharmacokinetic properties in the older patient are affected by

- diminished gastrointestinal (GI) motility and blood flow, which delays absorption
- percentage of body fat, lean muscle mass, and total body water, which alters distribution
- decreased plasma proteins, especially in the malnourished patient, which alters distribution by allowing a larger proportion of free or unbound drug to circulate and exert effects
- diminshed hepatic function, which slows metabolism.
- diminished renal function, which delays excretion

Older patients should be prescribed the lowest possible effective dose at the initiation of therapy followed by careful titration of doses as needed. Just as importantly, they should be monitored very carefully for signs and symptoms of adverse drug reactions.

Another concern is that many elderly patients are prescribed multiple drugs and are at risk for polypharmacy. As the number of medications a patient takes increases, so does the risk for an adverse drug reaction. One drug may negate or potentiate the effects of another drug (drug-drug interaction). This situation is compounded by concurrent use of nonprescription drugs and natural products. In general, doses of most medications (especially digoxin, sedative/hypnotics, anticoagulants, nonsteroidal anti-inflammatory agents, antibiotics, and antihypertensives) should be decreased in the

geriatric population. The Beers List/Criteria, which appears in the *Medication Safety Tools section*, is a list of drugs to be used with caution in the elderly, and is based on these concerns.

## The Patient of Reproductive Age

Generally, pregnant women should avoid medications, except when absolutely necessary. Both the mother and the fetus must be considered. The placenta protects the fetus only from extremely large molecules. The fetus is particularly vulnerable during the first and the last trimesters of pregnancy. During the first trimester, vital organs are forming and ingestion of teratogenic drugs may lead to fetal malformation or miscarriage. Unfortunately, this is the time when a woman is least likely to know that she is pregnant. In the third trimester, drugs administered to the mother and transferred to the fetus may not be safely metabolized and excreted by the fetus. This is especially true of drugs administered near term. After the infant is delivered, he or she no longer has the placenta to help with drug excretion, and drugs administered before delivery may result in toxicity.

Of course, many conditions, such as asthma, diabetes, gastrointestinal disorders, and mental illness affect pregnant women and require long-term medication use. When the medications are used, whether over-the-counter or prescription, prescribing the lowest effective dose for the shortest period of time necessary is the rule.

The possibility of a medication altering sperm quality and quantity in a potential father also is an area of concern. Male patients should be informed of this risk when taking any medications known to have this potential.

## Renal Disease

The kidneys are the major organ of drug elimination. Failure to account for decreased renal function is a preventable source of adverse drug reactions. Renal function is measured by the creatinine clearance (CCr), which can be approximated in the absence of a 24-hour urine collection (Appendix E). In addition, dosages in the renally impaired patient can be optimized by measuring blood levels of certain drugs (e.g., digoxin, aminoglycosides).

Patients with underlying renal disease, premature infants with immature renal function, and elderly patients with an age-related decrease in renal function require careful dose adjustments. Renal function may fluctuate over time and should be re-assessed periodically.

## Liver Disease

The liver is the major organ of drug metabolism. It changes a drug from a relatively fat-soluble compound to a more water-soluble substance, which means that the drug can then be excreted by the kidneys. Liver function is not as easily quantified as renal function, and it therefore is difficult to predict the correct dosage for a patient with liver dysfunction based on laboratory tests.

A patient who is severely jaundiced or who has very low serum proteins (particularly albumin) can be expected to have some problems metabolizing drugs. In advanced liver disease, portal vascular congestion also impairs drug absorption. Examples of drugs that should be carefully dosed in patients with liver disease include theophylline, diuretics, phenytoin, and sedatives. Some drugs (e.g., enalapril, carisoprodol) must be activated in the liver to exert their effect and are known as prodrugs. In patients with liver dysfunction, these drugs may not be converted to the active component, thereby resulting in decreased efficacy.

## Heart Failure

Heart failure results in passive congestion of blood vessels in the gastrointestinal tract, which impairs drug absorption. Heart failure also slows drug delivery to the liver, delaying metabolism. Renal function is frequently compromised as well, adding to delayed elimination and prolonged drug action. Dosages of drugs metabolized mainly by the liver or excreted mainly by the kidneys should be decreased in patients with congestive heart failure.

## Body Size

Drug dosing is often based on total body weight. However, some drugs selectively penetrate fatty tissues. If the drug does not penetrate fatty tissues (e.g., digoxin, gentamicin), dosages for the obese

patient should be determined by ideal body weight or estimated lean body mass. Ideal body weight may be determined from tables of desirable weights or may be estimated using formulas for lean body mass when the patient's height and weight are known (Appendix E). If such adjustments are not made, considerable toxicity can result.

Body size is also a factor in patients who are grossly underweight. Elderly patients, chronic alcoholics, patients with acquired immune deficiency, and patients who are terminally ill from cancer or other debilitating illnesses need careful attention to dosing. Patients who have had a limb amputated also need to have this change in body size taken into account.

## Drug Interactions

Use of multiple drugs, especially those known to interact with other drugs, may necessitate dosage adjustments. Drugs highly bound to plasma proteins, such as warfarin and phenytoin, may be displaced by other highly protein-bound drugs. When this phenomenon occurs, the drug that has been displaced exhibits an increase in its activity because the free or unbound drug is active.

Some drugs decrease the liver's ability to metabolize other drugs. Drugs capable of doing this include cimetidine and ketoconazole. Concurrently administered drugs that are also highly metabolized by the liver may need to be administered in decreased dosages. Other agents such as phenobarbital, other barbiturates, and rifampin are capable of stimulating the liver to metabolize drugs more rapidly, requiring larger doses to be administered. Concurrently administered drugs that are also highly metabolized by the liver may need to be administered in higher dosages.

Drugs that significantly alter urine pH can affect excretion of drugs for which the excretory process is pH dependent. Alkalinizing the urine will hasten the excretion of acidic drugs. An example of this is administering sodium bicarbonate in cases of aspirin overdose to promote the renal excretion of aspirin. Alkalinizing the urine will increase reabsorption of alkaline drugs, which prolongs and enhances drug action. Acidification of the urine will hasten the excretion of alkaline drugs. Acidification of the urine will also enhance reabsorption of acidic drugs, prolonging and enhancing drug action.

Some drugs compete for enzyme systems with other drugs. Allopurinol inhibits the enzyme involved in uric acid production, but it also inhibits metabolism (inactivation) of 6-mercaptopurine, greatly increasing its toxicity. The dosage of mercaptopurine needs to be significantly reduced when coadministered with allopurinol.

The same potential for interactions exists for some foods. Dietary calcium, found in high concentrations in dairy products, combines with tetracycline or fluoroquinolones and prevents their absorption. Foods high in pyridoxine (vitamin $B_6$) can negate the anti-Parkinson effect of levodopa. Grapefruit juice inhibits the enzyme that breaks down some drugs, and concurrent ingestion may significantly increase drug levels and the risk for toxicity.

Many commonly taken natural products interact with pharmaceutical drugs. St. John's wort, garlic, ephedra, and other natural products can interact with medications and cause known or unpredictable reactions.

Nurses and prescribers should consult drug references and remember that the average dosing range for drugs is intended for an average patient. However, every patient is an individual with specific drug-handling capabilities. Taking these special dosing considerations into account allows for an individualized drug regimen that promotes the desired therapeutic outcome and minimizes the risk of toxicity.

# EDUCATING PATIENTS ABOUT SAFE MEDICATION USE

Research has shown that patients need information about several medication-related topics, no matter what the medication. A well-informed patient and/or family can help prevent medication errors by hospital staff and is less likely to make medication errors at home. Adherence to the medication regimen is another goal achieved through patient education.

Before beginning any teaching, however, always assess the patient's current knowledge by asking if he or she is familiar with the medication, how it is taken at home, what precautions or follow-up care is required, and other questions specific to each drug. Based on the patient's current knowledge level and taking into consideration factors such as readiness to learn, environmental and social barriers to learning or adherence, and cultural factors, discuss the following:

1. **Generic and brand names of the medication.** Patients should know both the brand and generic names of each medication for two reasons. It helps them identify their medications when a generic equivalent is substituted for a brand name version, and it prevents patients or health care providers from making sound-alike confusion errors when giving or documenting a medication history. An example of this is saying Celebrex but meaning or hearing Cerebyx.

2. **Purpose of the medication.** Patients have a right to know what the therapeutic benefit of the medication will be but also should be told the consequences of not taking the prescribed medication. This may enhance adherence. For example, a patient may be more likely to take blood pressure medication if told lowering high blood pressure will prevent heart attack, kidney disease, or stroke, rather than saying only that it will lower blood pressure.

3. **Dosage and how to take the medication.** To derive benefit and avoid adverse reactions or other poor outcomes, the patient must know how much of the medication to take and when to take it. Refer to dosages in metric weight (i.e., milligram, gram) rather than dosage unit (tablet) or volume (1 teaspoon). The patient must also be informed of the best time to take the medication, for example, on an empty or a full stomach, before bedtime, or with or without other medications. If possible, help the patient fit the medication schedule into his or her own schedule, so that taking the medication is not difficult or forgotten.

4. **What to do if a dose is missed.** Always explain to patients what to do if a dose is missed. Patients have been reported to take a double dose of medications when a missed dose occurs, putting themselves at risk for side effects and adverse reactions.

5. **Duration of therapy.** It is not uncommon for patients to stop taking a medication when they feel better or to discontinue a medication when they cannot perceive a benefit. For very long term, even lifelong therapy, the patient may need to be reminded that the medication helps maintain the current level of wellness. Patients may need to be reminded to finish short-term courses of medications even though they frequently will feel much better before the prescription runs out. Some medications cannot be discontinued abruptly and patients should be warned to consult a health care professional before discontinuing such agents. Patients will need to know to refill prescriptions several days before running out or to take extra medication if traveling.

6. **Minor side effects and what to do if they occur.** Inform the patient that all medications have potential side effects. Explain the most common side effects associated with the medication and how to avoid or manage them if they occur. An informed patient is less likely to stop taking a medication because of a minor and potentially avoidable side effect.

7. **Serious side effects and what to do if they occur.** Inform the patient of the possibility of serious side effects. Describe signs and symptoms associated with serious side effects, and tell the

patient to immediately inform a physician or nurse should they occur. Tell the patient to call before the next dose of the medication is scheduled and to not assume that the medication is the source of the symptom and prematurely discontinue it.

8. **Medications to avoid.** Drug-drug interactions can dampen drug effects, enhance drug effects, or cause life-threatening adverse events such as cardiac dysrhythmias, hepatitis, renal failure, or internal bleeding. The patient and family need to know which other medications, including which over-the-counter medications, to avoid.

9. **Foods to avoid and other precautions.** Food-drug interactions are not uncommon and can have effects similar to drug-drug interactions. Excessive sun exposure resulting in severe dermal reactions is not uncommon and represents an environmental-drug interaction. Likewise, the patient should be informed of what activities to avoid, in case the medication affects alertness or coordination, for example.

10. **How to store the medication:** Medications must be stored properly to maintain potency. Most medications should not be stored in the bathroom medicine cabinet because of excess heat and humidity. In addition, thoughtful storage practices, such as separating two family members' medications, can prevent mix-ups and inadvertent accessibility by children (or pets). Review storage with patients and ask about current methods for storing medications.

11. **Follow-up care.** Anyone taking medication requires ongoing care to assess effectiveness and appropriateness of medications. Many medications require invasive and noninvasive testing to monitor blood levels; hematopoietic, hepatic, or renal function; or other effects on other body systems. Ongoing medical evaluation may result in dosage adjustments, change in medication, or discontinuation of medication.

12. **What not to take.** Inform patients not to take expired medications or someone else's medication. Warn them not to self-medicate with older, no-longer-used prescriptions even if the remaining supply is not expired. Tell patients to keep a current record of all medications taken and to ask health care providers if new medications are meant to replace a current medication.

As you teach, encourage the patient and the family to ask questions. Providing feedback about medication questions will increase their understanding and help you identify areas that need reinforcement. Also, ask patients to repeat what you have said and return to demonstrate application or administration techniques.

Stress the importance of concurrent therapies. Medications often are only a part of a recommended therapy. Review with the patient and family other measures that will enhance or maintain health. Always consider the cultural context in which health information is provided and plan accordingly. This might include obtaining a same-gender translator or adjusting dosing times to avoid conflict with traditional rituals.

Finally, provide written instructions in a simple and easy-to-read format. Keep in mind that most health care information is written at a 10th grade reading level, while many patients read at a 5th grade level. Tell patients to keep the written instructions, so that they can be reviewed at home, when stress levels are lower and practical difficulties in maintaining the medication plan are known.

# CLASSIFICATIONS

## • ANTI-ALZHEIMER'S AGENTS

### PHARMACOLOGIC PROFILE

#### General Use
Management of Alzheimer's dementia.

#### General Action and Information
All agents act by increasing the amount of acetylcholine in the CNS by inhibiting cholinesterase. No agents to date can slow the progression of Alzheimer's dementia. Current agents may temporarily improve cognitive function and therefore improve quality of life.

#### Contraindications
Hypersensitivity. Tacrine should not be used in patients who have had previous hepatic reactions to the drug.

#### Precautions
Use cautiously in patients with a history of "sick sinus syndrome" or other supraventricular cardiac conduction abnormalities (may cause bradycardia). Cholingeric effects may result in adverse GI effects (nausea, vomiting, diarrhea, weight loss) and may also increase gastric acid secretion resulting in GI bleeding, especially during concurrent NSAID therapy. Other cholinergic effects may include urinary tract obstruction, seizures, or bronchospasm.

#### Interactions
Additive effects with other drugs having cholinergic properties. May exaggerate the effects of succinylcholine-type muscle relaxation during anesthesia. May decrease therapeutic effects of anticholinergics.

### NURSING IMPLICATIONS

#### Assessment
- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) throughout therapy.
- Monitor nausea, vomiting, anorexia, and weight loss. Notify health care professional if these side effects occur.

#### Potential Nursing Diagnoses
- Disturbed thought process (Indications).
- Imbalanced nutrition: less than body requirements.
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

#### Patient/Family Teaching
- Instruct patient and caregiver that medication should be taken as directed.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, anorexia, and weight loss occur.

#### Evaluation/Desired Outcomes
- Temporary improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

## Anti-Alzheimer's agents included in *Davis's Drug Guide for Nurses*

donepezil 470
galantamine 624
rivastigmine 1123
tacrine 1181
memantine 819

# • ANTIANEMICS

## PHARMACOLOGIC PROFILE

### General Use

Prevention and treatment of anemias.

### General Action and Information

Iron (ferrous fumarate, ferrous gluconate, ferrous sulfate, iron dextran, iron sucrose, polysaccharide-iron complex, sodium ferric gluconate complex) is required for production of hemoglobin, which is necessary for oxygen transport to cells. Cyanocobalamin and hydroxocobalamin (Vitamin $B_{12}$) and folic acid are water-soluble vitamins that are required for red blood cell production. Darbepoetin and epoetin stimulate production of red blood cells. Nandrolone stimulates production of erythropoetin.

### Contraindications

Undiagnosed anemias. Hemochromatosis, hemosiderosis, hemolytic anemia (Iron). Uncontrolled hypertension (darbepoetin, epoetin).

### Precautions

Use parenteral iron (iron dextran, iron sucrose, sodium ferric gluconate complex) cautiously in patients with a history of allergy or hypersensitivity reactions.

### Interactions

Oral iron can decrease the absorption of tetracyclines, fluoroquinolones, or penicillamine. Vitamin E may impair the therapeutic response to iron. Phenytoin and other anticonvulsants may decrease the absorption of folic acid. Response to Vitamin $B_{12}$ or folic acid may be delayed by chloramphenicol. Darbepoetin and epoetin may increase the requirement for heparin during hemodialysis.

## NURSING IMPLICATIONS

### Assessment

- Assess patient's nutritional status and dietary history to determine possible causes for anemia and need for patient teaching.

### Potential Nursing Diagnoses

- Activity intolerance (Indications).
- Imbalanced nutrition: less than body requirements (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- Available in combination with many vitamins and minerals (see Appendix B).

### Patient/Family Teaching

- Encourage patients to comply with diet recommendations of health care professional. Explain that the best source of vitamins and minerals is a well-balanced diet with foods from the four basic food groups.

- Patients self-medicating with vitamin and mineral supplements should be cautioned not to exceed RDA. The effectiveness of mega doses for treatment of various medical conditions is unproven and may cause side effects.

### Evaluation/Desired Outcomes

- Resolution of anemia.

## • ANTIANGINALS

### PHARMACOLOGIC PROFILE

### General Use

Nitrates are used to treat and prevent attacks of angina. Only nitrates (sublingual, lingual spray, or intravenous) may be used in the acute treatment of attacks of angina pectoris. Calcium channel blockers and beta blockers are used prophylactically in long-term management of angina.

### General Action and Information

Several different groups of medications are used in the treatment of angina pectoris. The nitrates (isosorbide dinitrate, isosorbide mononitrate, and nitroglycerin) are available as a lingual spray, sublingual tablets, parenterals, transdermal systems, and sustained-release oral dosage forms. Nitrates dilate coronary arteries and cause systemic vasodilation (decreased preload). Calcium channel blockers dilate coronary arteries (some also slow heart rate). Beta blockers decrease myocardial oxygen consumption via a decrease in heart rate. Therapy may be combined if selection is designed to minimize side effects or adverse reactions.

### Contraindications

Hypersensitivity. Avoid use of beta blockers or calcium channel blockers in advanced heart block, cardiogenic shock, or untreated CHF.

### Precautions

Beta blockers should be used cautiously in patients with diabetes mellitus, pulmonary disease, or hypothyroidism.

### Interactions

Nitrates, calcium channel blockers, and beta blockers may cause hypotension with other antihypertensives or acute ingestion of alcohol. Verapamil, diltiazem, and beta blockers may have additive myocardial depressant effects when used with other agents that affect cardiac function. Verapamil has a number of other significant drug-drug interactions.

## NURSING IMPLICATIONS

### Assessment

- Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- Monitor blood pressure and pulse periodically throughout therapy.

### Potential Nursing Diagnoses

- Acute pain (Indications).
- Ineffective tissue perfusion (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- Available in various dose forms. See specific drugs for information on administration.

### Patient/Family Teaching

- Instruct patient on concurrent nitrate therapy and prophylactic antianginals to continue taking both medications as ordered and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional immediately if chest pain does not improve; worsens after therapy; is accompanied by diaphoresis or shortness of breath; or if severe, persistent headache occurs.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol with these medications.

### Evaluation/Desired Outcomes

- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance.

# • ANTIANXIETY AGENTS

## PHARMACOLOGIC PROFILE

### General Use

Antianxiety agents are used in the management of various forms of anxiety, including generalized anxiety disorder (GAD). Some agents are more suitable for intermittent or short-term use (benzodiazepines) while others are more useful long-term (buspirone, doxepin, fluoxetine, paroxetine, sertraline, venlafaxine).

### General Action and Information
Most agents cause generalized CNS depression. Benzodiazepines may produce tolerance with long-term use and have potential for psychological or physical dependence. These agents have NO analgesic properties.

### Contraindications
Hypersensitivity. Should not be used in comatose patients or in those with pre-existing CNS depression. Should not be used in patients with uncontrolled severe pain. Avoid use during pregnancy or lactation.

### Precautions
Use cautiously in patients with hepatic dysfunction, severe renal impairment, or severe underlying pulmonary disease (benzodiazepines only). Use with caution in patients who may be suicidal or who may have had previous drug addictions. Patients may be more sensitive to CNS depressant effects; dosage reduction may be required.

### Interactions
Mainly for benzodiazepines; additive CNS depression with alcohol, antihistamines, some antidepressants, opioid analgesics, or phenothiazines may occur. Most agents should not be used with MAO inhibitors.

## NURSING IMPLICATIONS

### Assessment
- Monitor blood pressure, pulse, and respiratory status frequently throughout IV administration.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.
- **Anxiety:** Assess degree of anxiety and level of sedation (ataxia, dizziness, slurred speech) before and periodically throughout therapy.

### Potential Nursing Diagnoses
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Patients changing to buspirone from other antianxiety agents should receive gradually decreasing doses. Buspirone will not prevent withdrawal symptoms.

### Patient/Family Teaching
- May cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol and other CNS depressants concurrently with these medications.
- Advise patient to inform health care professional if pregnancy is planned or suspected.

### Evaluation/Desired Outcomes
- Decrease in anxiety level.

# • ANTIARRHYTHMICS

## PHARMACOLOGIC PROFILE

### General Use

Suppression of cardiac arrhythmias.

### General Action and Information

Correct cardiac arrhythmias by a variety of mechanisms, depending on the group used. The therapeutic goal is decreased symptomatology and increased hemodynamic performance. Choice of agent depends on etiology of arrhythmia and individual patient characteristics. Treatable causes of arrhythmias should be corrected before therapy is initiated (e.g., electrolyte disturbances, other drugs). Antiarrhythmics are generally classified by their effects on cardiac conduction tissue (see the following table). Adenosine, atropine, and digoxin are also used as antiarrhythmics.

MECHANISM OF ACTION OF MAJOR ANTIARRHYTHMIC DRUGS

| CLASS | DRUGS | MECHANISM |
|---|---|---|
| I | moricizine | Shares properties of IA, IB, and IC agents |
| IA | quinidine, procainamide, disopyramide | Depress Na conductance, increase APD and ERP, decrease membrane responsiveness |
| IB | tocainide, lidocaine, phenytoin, mexiletine | Increase K conductance, decrease APD and ERP |
| IC | flecainide, propafenone | Profound slowing of conduction, markedly depress phase O |
| II | esmolol, propranolol | Interfere with Na conductance, depress cell membrane, decrease automaticity, and increase ERP of the AV node, block excess sympathetic activity |
| III | amiodarone, dofetilide, ibutilide, sotalol | Interfere with norepinephrine, increase APD and ERP |
| IV | diltiazem, verapamil | Increase AV nodal ERP, Ca channel blocker |

APD = action-potential duration; Ca = calcium; ERP = effective refractory period; K = potassium; Na = sodium.

### Contraindications

Differ greatly among various agents. See individual drugs.

### Precautions

Differ greatly among agents used. Appropriate dosage adjustments should be made in elderly patients and those with renal or hepatic impairment, depending on agent chosen. Correctable causes (electrolyte abnormalities, drug toxicity) should be evaluated. See individual drugs.

### Interactions
Differ greatly among agents used. See individual drugs.

## NURSING IMPLICATIONS

### Assessment
- Monitor ECG, pulse, and blood pressure continuously throughout IV administration and periodically throughout oral administration.

### Potential Nursing Diagnoses
- Decreased cardiac output (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Take apical pulse before administration of oral doses. Withhold dose and notify physician or other health care professional if heart rate is <50 bpm.
- Administer oral doses with a full glass of water. Most sustained-release preparations should be swallowed whole. Do not crush, break, or chew tablets or open capsules, unless specifically instructed.

### Patient/Family Teaching
- Instruct patient to take oral doses around the clock, as directed, even if feeling better.
- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- Caution patient to avoid taking OTC medications without consulting health care professional.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.

### Evaluation/Desired Outcomes
- Resolution of cardiac arrhythmias without detrimental side effects.

### Antiarrhythmics included in *Davis's Drug Guide for Nurses*

phenytoin 1020

# • ANTIASTHMATICS

## PHARMACOLOGIC PROFILE

### General Use

Management of acute and chronic episodes of reversible bronchoconstriction. Goal of therapy is to treat acute attacks (short-term control) and to decrease incidence and intensity of future attacks (long-term control). The choice of modalities depends on the continued requirement for short term control agents.

### General Action and Information

Adrenergic bronchodilators and phosphodiesterase inhibitors both work by increasing intracellular levels of cyclic-3', 5'-adenosine monophsphate (cAMP); adrenergics by increasing production and phosphodiesterase inhibitors by decreasing breakdown. Increased levels of cAMP produce bronchodilation. Corticosteroids act by decreasing airway inflammation. Anticholinergics (ipratropium) produce bronchodilation by decreasing intracellular levels of cyclic guanosine monophosphate (cGMP). Leukotriene receptor antagonists and mast cell stabilizers decrease the release of substances that can contribute to bronchospasm.

### Contraindications

Inhaled corticosteroids, long-acting adrenergic agents, and mast cell stabilizers should not be used during acute attacks of asthma.

### Precautions

Adrenergic bronchodilators and anticholinergics should be used cautiously in patients with cardiovascular disease. Chronic use of systemic corticosteroids should be avoided in children or during pregnancy or lactation. Diabetic patients may experience loss of glycemic control during corticosteroid therapy. Corticosteroids should never be abruptly discontinued.

### Interactions

Adrenergic bronchodilators and phosphodiesterase inhibitors may have additive CNS and cardiovascular effects with other adrenergic agents. Cimetidine increases theophylline levels and the risk of toxicity. Coritcosteroids may decrease the effectiveness of antidiabetics. Corticosteroids may cause hypokalemia which may be additive with potassium-losing diuretics and may also increase the risk of digoxin toxicity.

## NURSING IMPLICATIONS

### Assessment

- Assess lung sounds and respiratory function prior to and periodically throughout therapy.
- Assess cardiovascular status of patients taking adrenergic bronchodilators or anticholinergics. Monitor for ECG changes and chest pain.

### Potential Nursing Diagnoses

- Ineffective airway clearance (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

### Patient/Family Teaching

- Instruct patient to take antiasthmatics as directed. Do not take more than prescribed or discontinue without discussing with health care professional.
- Advise patient to avoid smoking and other respiratory irritants.
- Instruct patient in correct use of metered-dose inhaler or other administration devices (see Appendix D).

- Advise patient to contact health care professional promptly if the usual dose of medication fails to produce the desired results, if symptoms worsen after treatment, or if toxic effects occur.
- Patients using inhalation medications and bronchodilators should be advised to use the bronchodilator first and allow 5 minutes to elapse before administering other medications, unless otherwise directed by health care professional.

### Evaluation/Desired Outcomes

- Prevention of and reduction in symptoms of asthma.

### Antiasthmatics included in *Davis's Drug Guide for Nurses*

## • ANTICHOLINERGICS

### PHARMACOLOGIC PROFILE

### General Use

**Atropine—** Bradyarrhythmias. **Ipratropium—** bronchospasm (inhalation) and rhinorrhea (intranasal). **Scopolamine—** Nausea and vomiting related to motion sickness and vertigo. **Propantheline and glycopyrrolate—** Decreasing gastric secretory activity and increasing esophageal sphincter tone. Atropine and scopolamine are also used as ophthalmic mydriatics. Benztropine, biperidin, and trihexyphenidyl are used in the management of Parkinson's disease. Oxybutynin and tolterodine are used as urinary tract spasmodics.

### General Action and Information

Competitively inhibit the action of acetylcholine. In addition, atropine, glycopyrrolate, propantheline, and scopolamine are antimuscarinic in that they inhibit the action of acetylcholine at sites innervated by postganglionic cholinergic nerves.

### Contraindications

Hypersensitivity, narrow-angle glaucoma, severe hemorrhage, tachycardia (due to thyrotoxicosis or cardiac insufficiency), or myasthenia gravis.

### Precautions

Geriatric and pediatric patients are more susceptible to adverse effects. Use cautiously in patients with urinary tract pathology; those at risk for GI obstruction; and those with chronic renal, hepatic, pulmonary, or cardiac disease.

### Interactions

Additive anticholinergic effects (dry mouth, dry eyes, blurred vision, constipation) with other agents possessing anticholinergic activity, including antihistamines, antidepressants, quinidine, and disopyramide. May alter GI absorption of other drugs by inhibiting GI motility and increasing transit time. Antacids may decrease absorption of orally administered anticholinergics.

## NURSING IMPLICATIONS

### Assessment

- Assess vital signs and ECG frequently during IV drug therapy. Report any significant changes in heart rate or blood pressure or increase in ventricular ectopy or angina promptly.
- Monitor intake and output ratios in elderly or surgical patients; may cause urinary retention.
- Assess patient regularly for abdominal distention and auscultate for bowel sounds. Constipation may become a problem. Increasing fluids and adding bulk to the diet may help alleviate constipation.

### Potential Nursing Diagnoses

- Decreased cardiac output (Indications).
- Impaired oral mucous membrane (Side Effects).
- Constipation (Side Effects).

### Implementation

- **PO:** Administer oral doses of atropine, glycopyrrolate, propantheline, or scopolamine 30 min before meals.
- Scopolamine transdermal patch should be applied at least 4 hr before travel.

### Patient/Family Teaching

- Instruct patient that frequent rinses, sugarless gum or candy, and good oral hygiene may help relieve dry mouth.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- **Ophth:** Advise patients that ophthalmic preparations may temporarily blur vision and impair ability to judge distances. Dark glasses may be needed to protect eyes from bright light.

### Evaluation/Desired Outcomes

- Increase in heart rate.
- Decrease in nausea and vomiting related to motion sickness or vertigo.
- Dryness of mouth.
- Dilation of pupils.
- Decrease in GI motility.
- Resolution of signs and symptoms of Parkinson's disease.

### Anticholinergics included in *Davis's Drug Guide for Nurses*

oxybutynin 964
scopolamine 1139
solifenacin 1166
tiotorpium 1232
tolterodine 1238

# • ANTICOAGULANTS

## PHARMACOLOGIC PROFILE

### General Use

Prevention and treatment of thromboembolic disorders including deep vein thrombosis, pulmonary embolism, and atrial fibrillation with embolization. Also used in the management of myocardial infarction (MI) sequentially or in combination with thrombolytics and/or antiplatelet agents.

### General Action and Information

Anticoagulants are used to prevent clot extension and formation. They do not dissolve clots. The two types of anticoagulants in common use are parenteral heparins and oral warfarin. Therapy is usually initiated with heparin or a heparin-like agent because of rapid onset of action, while maintenance therapy consists of warfarin. Warfarin takes several days to produce therapeutic anticoagulation. In serious or severe thromboembolic events, heparin therapy may be preceded by thrombolytic therapy. Low doses of heparin or heparin-like compounds and fondaparinux are mostly used to prevent deep vein thrombosis after certain surgical procedures and in similar situations in which prolonged bedrest increases the risk of thromboembolism. Argatroban and lepirudin are used as anticoagulation in patients who have developed thrombocytopenia during heparin therapy.

### Contraindications

Underlying coagulation disorders, ulcer disease, malignancy, recent surgery, or active bleeding.

### Precautions

Anticoagulation should be undertaken cautiously in any patient with a potential site for bleeding. Pregnant or lactating patients should not receive warfarin. Heparin does not cross the placenta. Heparin and heparin-like agents should be used cautiously in patients receiving epidural analgesia.

### Interactions

Warfarin is highly protein bound and may displace or be displaced by other highly protein-bound drugs. The resultant interactions depend on which drug is displaced. Bleeding may be potentiated by aspirin or large doses of penicillins or penicillin-like drugs, cefotetan, cefoperazone, valproic acid, or NSAIDs.

## NURSING IMPLICATIONS

### Assessment

- Assess patient taking anticoagulants for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; tarry, black stools; hematuria; fall in hematocrit or blood pressure; guaiac-positive stools; urine; or NG aspirate).
- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement.
- **Lab Test Considerations:** Monitor prothrombin time (PT) or international normalized ratio (INR) with warfarin therapy, activated partial thromboplastin time (aPTT) with full-dose heparin therapy and hematocrit, and other clotting factors frequently during therapy.
- Monitor bleeding time throughout antiplatelet therapy. Prolonged bleeding time, which is time and dose dependent, is expected.
- **Toxicity and Overdose:** If overdose occurs or anticoagulation needs to be immediately reversed, the antidote for heparins is protamine sulfate; for warfarin, the antidote is vitamin K (phytonadione [AquaMEPHYTON]). Administration of whole blood or plasma may also be required in severe bleeding due to warfarin because of the delayed onset of vitamin K.

### Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- Inform all health care professionals caring for patient of anticoagulant therapy. Venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation.
- Use an infusion pump with continuous infusions to ensure accurate dosage.

### Patient/Family Teaching

- Caution patient to avoid activities leading to injury, to use a soft toothbrush and electric razor, and to report any symptoms of unusual bleeding or bruising to health care professional immediately.
- Instruct patient not to take OTC medications, especially those containing aspirin, NSAIDs, or alcohol, without advice of health care professional.
- Review foods high in vitamin K (see Appendix M) with patients on warfarin. Patient should have consistent limited intake of these foods, as vitamin K is the antidote for warfarin and greatly alternating intake of these foods will cause PT levels to fluctuate.
- Emphasize the importance of frequent lab tests to monitor coagulation factors.
- Instruct patient to carry identification describing medication regimen at all times and to inform all health care professionals caring for patient of anticoagulant therapy before laboratory tests, treatment, or surgery.

### Evaluation/Desired Outcomes

- Prevention of undesired clotting and its sequelae without signs of hemorrhage. Prevention of stroke, MI, and death in patients at risk.

vigabatrin 1374

## • ANTICONVULSANTS

### PHARMACOLOGIC PROFILE

### General Use

Anticonvulsants are used to decrease the incidence and severity of seizures due various etiologies. Some anticonvulsants are used parenterally in the immediate treatment of seizures. It is not uncommon for patients to require more than one anticonvulsant to control seizures on a long-term basis. Many regimens are evaluated with serum level monitoring. Several anticonvulsants also are used to treat neuropathic pain.

### General Action and Information
Anticonvulsants include a variety of agents, all capable of depressing abnormal neuronal discharges in the CNS that may result in seizures. They may work by preventing the spread of seizure activity, depressing the motor cortex, raising seizure threshold, or altering levels of neurotransmitters, depending on the group. See individual drugs.

### Contraindications
Previous hypersensitivity.

### Precautions
Use cautiously in patients with severe hepatic or renal disease; dose adjustment may be required. Choose agents carefully in pregnant and lactating women. Fetal hydantoin syndrome may occur in offspring of patients who receive phenytoin during pregnancy.

### Interactions
Barbiturates stimulate the metabolism of other drugs that are metabolized by the liver, decreasing their effectiveness. Hydantoins are highly protein-bound and may displace or be displaced by other highly protein-bound drugs. Lamotrigine, tiagabine, and topiramate are capable of interacting with several other anticonvulsants. For more specific interactions, see individual drugs. Many drugs are capable of lowering seizure threshold and may decrease the effectiveness of anticonvulsants, including tricyclic antidepressants and phenothiazines.

## NURSING IMPLICATIONS

### Assessment
- Assess location, duration, and characteristics of seizure activity.
- **Toxicity and Overdose:** Monitor serum drug levels routinely throughout anticonvulsant therapy, especially when adding or discontinuing other agents.

### Potential Nursing Diagnoses
- Risk for injury (Indications) (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Administer anticonvulsants around the clock. Abrupt discontinuation may precipitate status epilepticus.
- Implement seizure precautions.

### Patient/Family Teaching
- Instruct patient to take medication every day, exactly as directed.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizures.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with these medications.
- Advise patient to carry identification describing disease process and medication regimen at all times.

### Evaluation/Desired Outcomes
- Decrease or cessation of seizures without excessive sedation.

# • ANTIDEPRESSANTS

## PHARMACOLOGIC PROFILE

### General Use

Used in the treatment of various forms of endogenous depression, often in conjunction with psychotherapy. Other uses include: Treatment of anxiety (doxepin, fluoxetine, paroxetine, sertraline, venlafaxine); Enuresis (imipramine); Chronic pain syndromes (amitriptyline, doxepin, imipramine, nortriptyline); Smoking cessation (bupropion); Bulimia (fluoxetine); Obsessive-compulsive disorder (fluoxetine, fluvoxamine, paroxetine, sertraline); Social anxiety disorder (paroxetine, sertraline).

### General Action and Information

Antidepressant activity is most likely due to preventing the reuptake of dopamine, norepinephrine, and serotonin by presynaptic neurons, resulting in accumulation of these neurotransmitters. The two major classes of antidepressants are the tricyclic antidepressants and the SSRIs. Most tricyclic agents possess significant anticholinergic and sedative properties, which explains many of their side effects (amitriptyline, amoxapine, doxepin, imipramine, nortriptyline). The SSRIs are more likely to cause insomnia (fluoxetine, fluvoxamine, paroxetine, sertraline).

### Contraindications

Hypersensitivity. Should not be used in narrow-angle glaucoma. Should not be used in pregnancy or lactation or immediately after MI.

### Precautions

Use cautiously in older patients and those with pre-existing cardiovascular disease. Elderly men with prostatic enlargement may be more susceptible to urinary retention. Anticholinergic side effects of tricyclic antidepressants (dry eyes, dry mouth, blurred vision, and constipation) may require dosage modification or drug discontinuation. Dosage requires slow titration; onset of therapeutic response may be 2-4 wk. May decrease seizure threshold, especially bupropion.

### Interactions

**Tricyclic antidepressants—** May cause hypertension, tachycardia, and convulsions when used with MAO inhibitors. May prevent therapeutic response to some antihypertensives. Additive CNS depression with other CNS depressants. Sympathomimetic activity may be enhanced when used with other sympathomimetics. Additive anticholinergic effects with other drugs possessing

anticholinergic properties. **MAO inhibitors—** Hypertensive crisis may occur with concurrent use of MAO inhibitors and amphetamines, methyldopa, levodopa, dopamine, epinephrine, norepinephrine, desipramine, imipramine, reserpine, vasoconstrictors, or ingestion of tyramine-containing foods. Hypertension or hypotension, coma, convulsions, and death may occur with meperidine or other opioid analgesics and MAO inhibitors. Additive hypotension with antihypertensives or spinal anesthesia and MAO inhibitors. Additive hypoglycemia with insulin or oral hypoglycemic agents and MAO inhibitors. SSRIs, bupropion, or venlafaxine should not be used in combination with or within weeks of MAO inhibitors (see individual monographs). Risk of adverse reactions may be increased by almotriptan, frovatriptan, rizatriptan, naratriptan, sumatriptan, or zolmitriptan.

## NURSING IMPLICATIONS

### Assessment

- Monitor mental status and affect. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Toxicity and Overdose:** Concurrent ingestion of MAO inhibitors and tyramine-containing foods may lead to hypertensive crisis. Symptoms include chest pain, severe headache, nuchal rigidity, nausea and vomiting, photosensitivity, and enlarged pupils. Treatment includes IV phentolamine.

### Potential Nursing Diagnoses

- Ineffective coping (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- Administer drugs that are sedating at bedtime to avoid excessive drowsiness during waking hours, and administer drugs that cause insomnia (fluoxetine, fluvoxamine, paroxetine, sertraline, MAO inhibitors) in the morning.

### Patient/Family Teaching

- Caution patient to avoid alcohol and other CNS depressants. Patients receiving MAO inhibitors should also avoid OTC drugs and foods or beverages containing tyramine (see Appendix M) during and for at least 2 wk after therapy has been discontinued, as they may precipitate a hypertensive crisis. Health care professional should be contacted immediately if symptoms of hypertensive crisis develop.
- Inform patient that dizziness or drowsiness may occur. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Advise patient to notify health care professional if dry mouth, urinary retention, or constipation occurs. Frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Advise patient to notify health care professional of medication regimen and any herbal alternative therapies before treatment or surgery. MAO inhibitor therapy usually needs to be withdrawn at least 2 wk before use of anesthetic agents.
- Emphasize the importance of participation in psychotherapy and follow-up exams to evaluate progress.

### Evaluation/Desired Outcomes

- Resolution of depression.
- Decrease in anxiety.
- Control of bedwetting in children over 6 yr of age.
- Management of chronic neurogenic pain.

# • ANTIDIABETICS

## PHARMACOLOGIC PROFILE

### General Use

Insulin is used in the management of type 1 diabetes mellitus. It may also be used in type 2 diabetes mellitus when diet and/or oral medications fail to adequately control blood sugar. The choice of insulin preparation (rapid-acting, intermediate-acting, long-acting) and source (semisynthetic, human recombinant DNA) depend on the degree of control desired, daily blood glucose fluctuations, and history of previous reactions. Oral agents are used primarily in type 2 diabetes mellitus. Oral agents are used when diet therapy alone fails to control blood glucose or symptoms or when patients are not amenable to using insulin. Some oral agents may be used with insulin.

### General Action and Information

Insulin, a hormone produced by the pancreas, lowers blood glucose by increasing transport of glucose into cells and promotes the conversion of glucose to glycogen. It also promotes the conversion of amino acids to proteins in muscle, stimulates triglyceride formation, and inhibits the release of free fatty acids. Sulfonylureas, nateglinide, repaglinide, and metformin lower blood glucose by stimulating endogenous insulin secretion by beta cells of the pancreas and by increasing sensitivity to insulin at intracellular receptor sites. Intact pancreatic function is required. Miglitol delays digestion of ingested carbohydrates, thus lowering blood glucose, especially after meals. It may be combined with sulfonylureas. Pioglitazone and rosiglitazone increase insulin sensitivity.

### Contraindications

**Insulin—** Hypoglycemia. **Oral hypoglycemic agents—** Hypersensitivity (cross-sensitivity with other sulfonylureas and sulfonamides may exist). Hypoglycemia. Type 1 diabetes. Avoid use in patients with severe kidney, liver, thyroid, and other endocrine dysfunction. Should not be used in pregnancy or lactation.

### Precautions

**Insulin—** Infection, stress, or changes in diet may alter requirements. **Oral hypoglycemic agents—** Use cautiously in geriatric patients. Dose reduction may be necessary. Infection,

stress, or changes in diet may alter requirements. Use with Sulfonylureas with caution in patients with a history of cardiovascular disease. Metformin may cause lactic acidosis.

### Interactions

**Insulin—** Additive hypoglycemic effects with oral hypoglycemic agents. **Oral hypoglycemic agents—** Ingestion of alcohol may result in disulfiram-like reaction with some agents. Alcohol, corticosteroids, rifampin, glucagon, and thiazide diuretics may decrease effectiveness. Anabolic steroids, chloramphenicol, clofibrate, MAO inhibitors, most NSAIDs, salicylates, sulfonamides, and warfarin may increase hypoglycemic effect. Beta blockers may produce hypoglycemia and mask signs and symptoms.

## NURSING IMPLICATIONS

### Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions.
- Acarbose, miglitol, and pioglitazone do not cause hypoglycemia when taken alone but may increase the hypoglycemic effect of other hypoglycemic agents.
- Patients who have been well controlled on metformin but develop illness or laboratory abnormalities should be assessed for ketoacidosis or lactic acidosis. Assess serum electrolytes, ketones, glucose, and, if indicated, blood pH, lactate, pyruvate, and metformin levels. If either form of acidosis is present, discontinue metformin immediately and treat acidosis.
- **Lab Test Considerations:** Serum glucose and glycosylated hemoglobin should be monitored periodically throughout therapy to evaluate effectiveness of treatment.

### Potential Nursing Diagnoses

- Imbalanced nutrition: more than body requirements (Indications).
- Deficient knowledge, related to medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

### Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require sliding scale insulin. Withhold oral hypoglycemic agents and reinstitute after resolution of acute episode.
- Patients switching from daily insulin dose may require gradual conversion to oral hypoglycemics.
- **Insulin:** Available in different types and strengths and from different species. Check type, species, source, dose, and expiration date with another licensed nurse. Do not interchange insulins without physician's order. Use only insulin syringes to draw up dose. Use only U100 syringes to draw up insulin lispro dose.

### Patient/Family Teaching

- Explain to patient that medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water (glucose, not table sugar, if taking miglitol), and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops; if unable to eat usual diet; or if blood glucose levels are not controlled.
- Advise patient to carry sugar or a form of glucose and identification describing medication regimen at all times.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.

- **Insulin:** Instruct patient on proper technique for administration; include type of insulin, equipment (syringe and cartridge pens), storage, and syringe disposal. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen.
- **Sulfonylureas:** Advise patient that concurrent use of alcohol may cause a disulfiram-like reaction (abdominal cramps, nausea, flushing, headache, and hypoglycemia).
- **Metformin:** Explain to patient the risk of lactic acidosis and the potential need for discontinuation of metformin therapy if a severe infection, dehydration, or severe or continuing diarrhea occurs or if medical tests or surgery is required.

### Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

## • ANTIDIARRHEALS

### PHARMACOLOGIC PROFILE

### General Use

For the control and symptomatic relief of acute and chronic nonspecific diarrhea.

### General Action and Information

Diphenoxylate/atropine, difenoxin/atropine, and loperamide slow intestinal motility and propulsion. Kaolin/pectin and bismuth subsalicylate affect fluid content of the stool. Bismuth subsalicylate is also used a part of the management of ulcer disease due to *Helicobacter pylori*. Polycar-

bophil acts as an antidiarrheal by taking on water within the bowel lumen to create a formed stool. Polycarbophil may also be used to treat constipation. Octreotide is used specifically for diarrhea associated with GI endocrine tumors.

### Contraindications
Previous hypersensitivity. Severe abdominal pain of unknown cause, especially when associated with fever.

### Precautions
Use cautiously in patients with severe liver disease or inflammatory bowel disease. Safety in pregnancy and lactation not established (diphenoxylate/atropine and loperamide). Octreotide may aggravate gallbladder disease.

### Interactions
Kaolin may decrease absorption of digoxin. Polycarbophil decreases the absorption of tetracycline. Octreotide may alter the response to insulin or oral hypoglycemic agents.

## NURSING IMPLICATIONS

### Assessment
- Assess the frequency and consistency of stools and bowel sounds before and throughout therapy.
- Assess patient's fluid and electrolyte status and skin turgor for dehydration.

### Potential Nursing Diagnoses
- Diarrhea (Indications).
- Constipation (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Shake liquid preparations before administration.

### Patient/Family Teaching
- Instruct patient to notify health care professional if diarrhea persists; or if fever, abdominal pain, or palpitations occur.

### Evaluation/Desired Outcomes
- Decrease in diarrhea.

### Antidiarrheals included in *Davis's Drug Guide for Nurses*

bismuth subsalicylate 231
difenoxin/atropine 453
diphenoxylate/atropine 453
loperamide 794
octreotide 941
polycarbophil 1331

# • ANTIEMETICS

## PHARMACOLOGIC PROFILE

### General Use
Phenothiazines, dolasetron, granisetron, metoclopramide, and ondansetron are used to manage nausea and vomiting of many causes, including surgery, anesthesia, and antineoplastic and radiation therapy. Palonosetron and aprepitant are used specifically with emetogenic chemotherapy. Dimenhydrinate, scopolamine, and meclizine are used almost exclusively to prevent motion sickness.

### General Action and Information
Phenothiazines act on the chemoreceptor trigger zone to inhibit nausea and vomiting. Dimenhydrinate, scopolamine, and meclizine act as antiemetics mainly by diminishing motion sickness. Metoclopramide decreases nausea and vomiting by its effects on gastric emptying. Dolasetron, granisetron, palonosetron, and ondansetron block the effects of serotonin at 5-$HT_3$ receptor sites.

### Contraindications
Previous hypersensitivity.

### Precautions
Use phenothiazines cautiously in children who may have viral illnesses. Choose agents carefully in pregnant patients (no agents are approved for safe use).

### Interactions
Additive CNS depression with other CNS depressants including antidepressants, antihistamines, opioid analgesics, and sedative/hypnotics. Phenothiazines may produce hypotension when used with antihypertensives, nitrates, or acute ingestion of alcohol.

## NURSING IMPLICATIONS

### Assessment
- Assess nausea, vomiting, bowel sounds, and abdominal pain before and following administration.
- Monitor hydration status and intake and output. Patients with severe nausea and vomiting may require IV fluids in addition to antiemetics.

### Potential Nursing Diagnoses
- Deficient fluid volume (Indications).
- Imbalanced nutrition: less than body requirements (Indications).
- Risk for injury (Side Effects).

### Implementation
- For prophylactic administration, follow directions for specific drugs so that peak effect corresponds to time of anticipated nausea.
- Phenothiazines should be discontinued 48 hr before and not resumed for 24 hr following myelography, as they lower seizure threshold.

### Patient/Family Teaching
- Advise patient and family to use general measures to decrease nausea (begin with sips of liquids and small, nongreasy meals; provide oral hygiene; and remove noxious stimuli from environment).
- May cause drowsiness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.

### Evaluation/Desired Outcomes
- Prevention of, or decrease in, nausea and vomiting.

### Antiemetics included in *Davis's Drug Guide for Nurses*

metoclopramide 847
scopolamine 1139

# • ANTIFUNGALS

## PHARMACOLOGIC PROFILE

### General Use
Treatment of fungal infections. Infections of skin or mucous membranes may be treated with topical or vaginal preparations. Deep-seated or systemic infections require oral or parenteral therapy. New parenteral formulations of amphotericin employ lipid encapsulation technology designed to decrease toxicity.

### General Action and Information
Kill (fungicidal) or stop growth of (fungistatic) susceptible fungi by affecting the permeability of the fungal cell membrane or protein synthesis within the fungal cell itself.

### Contraindications
Previous hypersensitivity.

### Precautions
Because most systemic antifungals may have adverse effects on bone marrow function, use cautiously in patients with depressed bone marrow reserve. Amphotericin B commonly causes renal impairment. Fluconazole requires dosage adjustment in the presence of renal impairment. Adverse reactions to fluconazole may be more severe in HIV-positive patients.

### Interactions
Differ greatly among various agents. See individual drugs.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for signs of infection and assess involved areas of skin and mucous membranes before and throughout therapy. Increased skin irritation may indicate need to discontinue medication.

### Potential Nursing Diagnoses
- Risk for infection (Indications).
- Impaired skin integrity (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Available in various dosage forms. Refer to specific drugs for directions for administration.
- **Topical:** Consult physician or other health care professional for cleansing technique before applying medication. Wear gloves during application. Do not use occlusive dressings unless specified by physician or other health care professional.

### Patient/Family Teaching
- Instruct patient on proper use of medication form.
- Instruct patient to continue medication as directed for full course of therapy, even if feeling better.

- Advise patient to report increased skin irritation or lack of therapeutic response to health care professional.

### Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection. Deep-seated fungal infections may require prolonged therapy (weeks–months). Recurrent fungal infections may be a sign of serious systemic illness.

### Antifungals included in *Davis's Drug Guide for Nurses*

## • ANTIHISTAMINES

### PHARMACOLOGIC PROFILE

### General Use

Relief of symptoms associated with allergies, including rhinitis, urticaria, and angioedema, and as adjunctive therapy in anaphylactic reactions. Topical and ophthalmic antihistamines may immunize systemic side effects. Some antihistamines are used to treat motion sickness (dimenhydrinate and meclizine), insomnia (diphenhydramine), Parkinson-like reactions (diphenhydramine), and other nonallergic conditions.

### General Action and Information

Antihistamines block the effects of histamine at the $H_1$ receptor. They do not block histamine release, antibody production, or antigen-antibody reactions. Most antihistamines have anticholinergic properties and may cause constipation, dry eyes, dry mouth, and blurred vision. In addition, many antihistamines cause sedation. Some phenothiazines have strong antihistaminic properties (hydroxyzine and promethazine).

### Contraindications

Hypersensitivity and angle-closure glaucoma. Should not be used in premature or newborn infants.

### Precautions
Elderly patients may be more susceptible to adverse anticholinergic effects of antihistamines. Use cautiously in patients with pyloric obstruction, prostatic hypertrophy, hyperthyroidism, cardiovascular disease, or severe liver disease. Use cautiously in pregnancy and lactation.

### Interactions
Additive sedation when used with other CNS depressants, including alcohol, antidepressants, opioid analgesics, and sedative/hypnotics. MAO inhibitors prolong and intensify the anticholinergic properties of antihistamines.

## NURSING IMPLICATIONS

### Assessment
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically throughout therapy.
- Monitor pulse and blood pressure before initiating and throughout IV therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- **Nausea and Vomiting:** Assess degree of nausea and frequency and amount of emesis when administering for nausea and vomiting.
- **Anxiety:** Assess mental status, mood, and behavior when administering for anxiety.
- **Pruritus:** Observe the character, location, and size of affected area when administering for pruritic skin conditions.

### Potential Nursing Diagnoses
- Ineffective airway clearance (Indications).
- Risk for injury (Adverse Reactions).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- When used for prophylaxis of motion sickness, administer at least 30 min and preferably 1–2 hr before exposure to conditions that may precipitate motion sickness.
- When administering concurrently with opioid analgesics (hydroxyzine, promethazine), supervise ambulation closely to prevent injury secondary to increased sedation.

### Patient/Family Teaching
- Inform patient that drowsiness may occur. Avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to avoid using concurrent alcohol or CNS depressants.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may help relieve dryness of mouth.
- Instruct patient to contact health care professional if symptoms persist.

### Evaluation/Desired Outcomes
- Decrease in allergic symptoms.
- Prevention or decreased severity of nausea and vomiting.
- Decrease in anxiety.
- Relief of pruritus.
- Sedation when used as a hypnotic.

# • ANTIHYPERTENSIVES

## PHARMACOLOGIC PROFILE

### General Use

Treatment of hypertension of many causes, most commonly essential hypertension. Parenteral products are used in the treatment of hypertensive emergencies. Oral treatment should be initiated as soon as possible and individualized to ensure adherence and compliance for long-term therapy. Therapy is initiated with agents having minimal side effects. When such therapy fails, more potent drugs with different side effects are added in an effort to control blood pressure while causing minimal patient discomfort.

### General Action and Information

As a group, the antihypertensives are used to lower blood pressure to a normal level (<90 mm Hg diastolic) or to the lowest level tolerated. The goal of antihypertensive therapy is prevention of end-organ damage. Antihypertensives are classified into groups according to their site of action. These include peripherally-acting antiadrenergics; centrally-acting alpha-adrenergics; beta blockers; vasodilators; ACE inhibitors; angiotensin II antagonists; calcium channel blockers; and diuretics. Hypertensive emergencies may be managed with parenteral agents, such as enalaprilat or fenoldopam.

### Contraindications

Hypersensitivity to individual agents.

### Precautions

Choose agents carefully in pregnancy, during lactation, or in patients receiving digoxin. ACE inhibitors and angiotensin II antagonists should be avoided during pregnancy. Alpha-adrenergic agonists and beta blockers should be used only in patients who will comply, because abrupt discontinuation of these agents may result in rapid and excessive rise in blood pressure (rebound phenomenon). Thiazide diuretics may increase the requirement for treatment of diabetics. Vasodilators may cause tachycardia if used alone and are commonly used in combination with beta blockers. Some antihypertensives cause sodium and water retention and are usually combined with a diuretic.

### Interactions

Many drugs can negate the therapeutic effectiveness of antihypertensives, including antihistamines, NSAIDs, sympathomimetic bronchodilators, decongestants, appetite suppressants, anti-

depressants, and MAO inhibitors. Hypokalemia from diuretics may increase the risk of digoxin toxicity. Potassium supplements and potassium-sparing diuretics may cause hyperkalemia when used with ACE inhibitors.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight.
- Monitor frequency of prescription refills to determine compliance.

### Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

### Implementation

- Many antihypertensives are available as combination products to enhance compliance (see Appendix B).

### Patient/Family Teaching

- Instruct patient to continue taking medication, even if feeling well. Abrupt withdrawal may cause rebound hypertension. Medication controls, but does not cure, hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, discontinuation of smoking, moderation of alcohol consumption, and stress management).
- Instruct patient and family on proper technique for monitoring blood pressure. Advise them to check blood pressure weekly and report significant changes.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercise or hot weather may enhance hypotensive effects.
- Advise patient to consult health care professional before taking any OTC medications, especially cold remedies.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Patients taking ACE inhibitors or angiotensin II antagonists should notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams to monitor progress.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.

### Antihypertensives included in *Davis's Drug Guide for Nurses*

***adrenergics***
clonidine 343

***aldosterone antagonists***
eplerenone 511

***ACE inhibitors***

# • ANTI-INFECTIVES

## PHARMACOLOGIC PROFILE

### General Use
Treatment and prophylaxis of various bacterial infections. See specific drugs for spectrum and indications. Some infections may require additional surgical intervention and supportive therapy.

### General Action and Information
Kill (bactericidal) or inhibit the growth of (bacteriostatic) susceptible pathogenic bacteria. Not active against viruses or fungi. Anti-infectives are subdivided into categories depending on chemical similarities and antimicrobial spectrum.

### Contraindications
Known hypersensitivity to individual agents. Cross-sensitivity among related agents may occur.

### Precautions
Culture and susceptibility testing are desirable to optimize therapy. Dosage modification may be required in patients with hepatic or renal insufficiency. Use cautiously in pregnant and lactating women. Prolonged inappropriate use of broad spectrum anti-infective agents may lead to superinfection with fungi or resistant bacteria.

### Interactions
Penicillins and aminoglycosides chemically inactivate each other and should not be physically admixed. Erythromycins may decrease hepatic metabolism of other drugs. Probenecid increases

serum levels of penicillins and related compounds. Highly protein-bound anti-infectives such as sulfonamides may displace or be displaced by other highly bound drugs. See individual drugs. Extended-spectrum penicillins (ticarcillin, piperacillin) and some cephalosporins (cefoperazone, cefotetan) may increase the risk of bleeding with anticoagulants, thrombolytic agents, antiplatelet agents, or NSAIDs. Fluoroquinolone absorption is decreased by antacids, bismuth subsalicylate, iron salts, sucralfate, and zinc salts.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for signs and symptoms of infection prior to and throughout therapy.
- Determine previous hypersensitivities in patients receiving penicillins or cephalosporins.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.

### Potential Nursing Diagnoses

- Risk for infection (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

### Implementation

- Most anti-infectives should be administered around the clock to maintain therapeutic serum drug levels.

### Patient/Family Teaching

- Instruct patient to continue taking medication around the clock until finished completely, even if feeling better.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy to health care professional.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains pus, blood, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.

### Anti-infectives included in *Davis's Drug Guide for Nurses*

# • ANTINEOPLASTICS

## PHARMACOLOGIC PROFILE

### General Use

Used in the treatment of various solid tumors, lymphomas, and leukemias. Also used in some autoimmune disorders such as rheumatoid arthritis (cyclophosphamide, methotrexate). Often used in combinations to minimize individual toxicities and increase response. Chemotherapy may be combined with other treatment modalities such as surgery and radiation therapy. Dosages vary greatly, depending on extent of disease, other agents used, and patient's condition. Some new formulations (daunorubicin, doxorubicin) encapsulated in a lipid membrane have less toxicity with greater efficacy.

### General Action and Information

Act by many different mechanisms (see the following table). Many affect DNA synthesis or function; others alter immune function or affect hormonal status of sensitive tumors. Action may not be limited to neoplastic cells.

MECHANISM OF ACTION OF VARIOUS ANTINEOPLASTICS

| MECHANISM OF ACTION | AGENT | EFFECTS ON CELL CYCLE |
|---|---|---|
| ALKYLATING AGENTS | busulfan | Cell cycle–nonspecific |
| Cause cross-linking of DNA | carboplatin | |
| | chlorambucil | |
| | cisplatin | |
| | cyclophosphamide | |
| | ifosfamide | |
| | mechlorethamine | |
| | melphalan | |
| | procarbazine | |
| | temozolamide | |
| ANTHRACYCLINES | daunorubicin | Cell cycle–nonspecific |
| Interfere with DNA and RNA synthesis | doxorubicin | |
| | epirubicin | |
| | idarubicin | |
| ANTITUMOR ANTIBIOTIC | bleomycin | Cell cycle–nonspecific (except bleomycin) |
| Interfere with DNA and RNA synthesis | mitomycin | |
| | mitoxantrone | |
| ANTIMETABOLITES | cytarabine | Cell cycle–specific, work mostly in S phase (DNA synthesis) |
| Take the place of normal proteins | fluorouracil | |
| | hydroxyurea | |
| | methotrexate | |
| ENZYMES | asparaginase | Cell-cycle phase–specific |
| Deplete asparagine | pegaspargase | |
| ENZYME INHIBITORS | irinotecan | Cell-cycle phase–specific |
| Inhibits topoisomerase | topotecan | |
| Inhibits kinase | imatinib | Unknown |
| HORMONAL AGENTS | bicalutamide | Unknown |
| Alter hormonal status in tumors that are sensitive | estramustine | |
| | flutamide | |
| | leuprolide | |
| | megestrol | |
| | nilutamide | |
| | tamoxifen | |
| | testosterone (androgens) | |
| | triptorelin | |
| HORMONAL AGENTS—AROMATASE INHIBITORS | anastrazole | Unknown |
| Inhibit enzyme responsible for activating estrogen | letrozole | |
| IMMUNE MODULATORS | aldesleukin | Unknown |
| | alemtuzumab | |
| | gemtuzumab | |
| | toremifene | |
| | trastuzumab | |
| PODOPHYLLOTOXIN DERIVATIVES | etoposide | Cell-cycle phase–specific |
| Damages DNA before mitosis | | |
| TAXOIDS | docetaxel | Cell-cycle phase–specific |
| Interupt interphase and mitosis | paclitaxel | |
| VINCA ALKALOIDS | vinblastine | Cell cycle–specific, work during M phase (mitosis) |
| Interfere with mitosis | vinCRIStine | |
| | vinorelbine | |
| MISCELLANEOUS | aldesleukin | Unknown |
| | altretamine | Unknown |

## Contraindications

Previous bone marrow depression or hypersensitivity. Contraindicated in pregnancy and lactation.

### Precautions

Use cautiously in patients with active infections, decreased bone marrow reserve, radiation therapy, or other debilitating illnesses. Use cautiously in patients with childbearing potential.

### Interactions

Allopurinol decreases metabolism of mercaptopurine. Toxicity from methotrexate may be increased by other nephrotoxic drugs or larger doses of aspirin or NSAIDs. Bone marrow depression is additive. See individual drugs.

## NURSING IMPLICATIONS

### Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, appetite, and nutritional intake. Prophylactic antiemetics may be used. Adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- Monitor IV site carefully and ensure patency. Discontinue infusion immediately if discomfort, erythema along vein, or infiltration occurs. Tissue ulceration and necrosis may result from infiltration.
- Monitor for symptoms of gout (increased uric acid, joint pain, and edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may be given to decrease uric acid levels. Alkalinization of urine may be ordered to increase excretion of uric acid.

### Potential Nursing Diagnoses

- Risk for infection (Side Effects).
- Imbalanced nutrition: less than body requirements (Adverse Reactions).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- Solutions for injection should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers (see Appendix L).
- Check dose carefully. Fatalities have resulted from dosing errors.

### Patient/Family Teaching

- Caution patient to avoid crowds and persons with known infections. Health care professional should be informed immediately if symptoms of infection occur.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions.
- These drugs may cause gonadal suppression; however, patient should still use birth control, as most antineoplastics are teratogenic. Advise patient to inform health care professional immediately if pregnancy is suspected.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Topical agents may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Instruct patient not to receive any vaccinations without advice of health care professional. Antineoplastics may decrease antibody response and increase risk of adverse reactions.
- Advise patient of need for medical follow-up and frequent lab tests.

## Evaluation/Desired Outcomes

- Decrease in size and spread of tumor.
- Improvement in hematologic status in patients with leukemia.

# • ANTIPARKINSON AGENTS

## PHARMACOLOGIC PROFILE

### General Use

Used in the treatment of parkinsonism of various causes: degenerative, toxic, infective, neoplastic, or drug-induced.

### General Action and Information

Drugs used in the treatment of the parkinsonian syndrome and other dyskinesias are aimed at restoring the natural balance of two major neurotransmitters in the CNS: acetylcholine and dopamine. The imbalance is a deficiency in dopamine that results in excessive cholinergic activity. Drugs used are either anticholinergics (benztropine, biperiden, and trihexyphenidyl) or dopaminergic agonists (bromocriptine, levodopa). Pramipexole and ropinerole are two new nonergot dopamine agonists. Entacapone inhibits the enzyme that breaks down levodopa, thereby enhancing its effects.

### Contraindications

Anticholinergics should be avoided in patients with angle-closure glaucoma.

### Precautions

Use cautiously in patients with severe cardiac disease, pyloric obstruction, or prostatic enlargement.

### Interactions

Pyridoxine, MAO inhibitors, benzodiazepines, phenytoin, phenothiazines, and haloperidol may antagonize the effects of levodopa. Agents that antagonize dopamine (phenothiazines, metoclopramide) may decrease effectiveness of dopamine agonists.

## NURSING IMPLICATIONS

### Assessment

- Assess parkinsonian and extrapyramidal symptoms (akinesia, rigidity, tremors, pill rolling, mask facies, shuffling gait, muscle spasms, twisting motions, and drooling) before and throughout course of therapy. On-off phenomenon may cause symptoms to appear or improve suddenly.
- Monitor blood pressure frequently during therapy. Instruct patient to remain supine during and for several hours after first dose of bromocriptine, as severe hypotension may occur.

### Potential Nursing Diagnoses

- Impaired physical mobility (Indications).
- Risk for injury (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- In the carbidopa/levodopa combination, the number following the drug name represents the milligram of each respective drug.

### Patient/Family Teaching

- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities that require alertness until response to medication is known.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Patient should notify health care professional if dryness persists (saliva substitutes may be used). Also notify the dentist if dryness interferes with use of dentures.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies, or drinking alcoholic beverages. Patients receiving levodopa should avoid multivitamins. Vitamin $B_6$ (pyridoxine) may interfere with levodopa's action.
- Caution patient that decreased perspiration may occur. Overheating may occur during hot weather. Patients should remain indoors in an air-conditioned environment during hot weather.
- Advise patient to increase activity, bulk, and fluid in diet to minimize constipating effects of medication.
- Advise patient to notify health care professional if confusion, rash, urinary retention, severe constipation, visual changes, or worsening of parkinsonian symptoms occur.

### Evaluation/Desired Outcomes

- Resolution of parkinsonian signs and symptoms
- Resolution of drug-induced extrapyramidal symptoms.

### Antiparkinson agents included in *Davis's Drug Guide for Nurses*

***anticholinergics***
benztropine 225
biperiden 1320
trihexyphenidyl 1338

***catechol-O-methyltransferase inhibitors***
entacapone 499
tolcapone 1236

***dopamine agonists***
bromocriptine 1321
carbidopa/levodopa 275
pramipexole 1044
ropinirole 1127

***monoamine oxidase type B inhibitors***
rasagline 1100
selegiline 1141

## • ANTIPLATELET AGENTS

### PHARMACOLOGIC PROFILE

### General Use

Antiplatelet agents are used to treat and prevent thromboembolic events such as stroke and MI. Dipyridamole is commonly used after cardiac surgery.

### General Action and Information

Inhibit platelet aggregation, prolong bleeding time, and are used to prevent MI or stroke (aspirin, clopidogrel, dipyridamole, ticlopidine). Eptifibatide and tirofiban are used in the management of various acute coronary syndromes. These agents have been used concurrently/sequentially with anticoagulants and thrombolytics.

### Contraindications

Hypersensitivity, ulcer disease, active bleeding, and recent surgery.

### Precautions

Use cautiously in patients at risk for bleeding (trauma, surgery). History of GI bleeding or ulcer disease. Safety not established in pregnancy, lactation, or children.

### Interactions
Concurrent use with NSAIDs, heparin, thrombolytics, or warfarin may increase the risk of bleeding.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement.
- Assess patient taking antiplatelet agents for symptoms of stroke, peripheral vascular disease, or MI periodically throughout therapy.
- **Lab Test Considerations:** Monitor bleeding time throughout antiplatelet therapy. Prolonged bleeding time, which is time- and dose-dependent, is expected.

### Potential Nursing Diagnoses
- Ineffective tissue perfusion (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Use an infusion pump with continuous infusions to ensure accurate dosage.

### Patient/Family Teaching
- Instruct patient to notify health care professional immediately if any bleeding is noted.

### Evaluation/Desired Outcomes
- Prevention of stroke, MI, and vascular death in patients at risk.

### Antiplatelet agents included in *Davis's Drug Guide for Nurses*

***glycoprotein IIb/IIIa inhibitors***
eptifibatide 515
tirofiban 1233

***platelet adhesion inhibitors***
dipyridamole 454

***platelet aggregation inhibitors***
cilostazol 326
clopidogrel 346
ticlopidine 1225

***thienopyridines***
prasugrel 1048

# • ANTIPSYCHOTICS

## PHARMACOLOGIC PROFILE

### General Use
Treatment of acute and chronic psychoses, particularly when accompanied by increased psychomotor activity. Use of clozapine is limited to schizophrenia unresponsive to conventional therapy. Selected agents are also used as antihistamines or antiemetics. Chlorpromazine is also used in the treatment of intractable hiccups.

### General Action and Information
Block dopamine receptors in the brain; also alter dopamine release and turnover. Peripheral effects include anticholinergic properties and alpha-adrenergic blockade. Most antipsychotics are phenothiazines except for haloperidol, which is a butyrophenone, and clozapine, which is a miscellaneous compound. Newer "atypical" agents such as olanzapine, quetiapine, and risperidone may have fewer adverse reactions. Phenothiazines differ in their ability to produce sedation

(greatest with chlorpromazine and thioridazine), extrapyramidal reactions (greatest with prochlorperazine and trifluoperazine), and anticholinergic effects (greatest with chlorpromazine).

### Contraindications

Hypersensitivity. Cross-sensitivity may exist among phenothiazines. Should not be used in angle-closure glaucoma. Should not be used in patients who have CNS depression.

### Precautions

Safety in pregnancy and lactation not established. Use cautiously in patients with symptomatic cardiac disease. Avoid exposure to extremes in temperature. Use cautiously in severely ill or debilitated patients, diabetic patients, and patients with respiratory insufficiency, prostatic hypertrophy, or intestinal obstruction. May lower seizure threshold. Clozapine may cause agranulocytosis. Most agents are capable of causing neuroleptic malignant syndrome. Should not be used routinely for anxiety or agitation not related to psychoses.

### Interactions

Additive hypotension with acute ingestion of alcohol, antihypertensives, or nitrates. Antacids may decrease absorption. Phenobarbital may increase metabolism and decrease effectiveness. Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioid analgesics, or sedative/hypnotics. Lithium may decrease blood levels and effectiveness of phenothiazines. May decrease the therapeutic response to levodopa. May increase the risk of agranulocytosis with antithyroid agents.

## NURSING IMPLICATIONS

### Assessment

- Assess patient's mental status (orientation, mood, behavior) before and periodically throughout therapy.
- Monitor blood pressure (sitting, standing, lying), pulse, and respiratory rate before and frequently during the period of dosage adjustment.
- Observe patient carefully when administering medication to ensure medication is actually taken and not hoarded.
- Monitor patient for onset of *akathisia*—restlessness or desire to keep moving—and extrapyramidal side effects; *parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; and *dystonia*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs—every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Parkinsonian effects are more common in geriatric patients and dystonias are more common in younger patients. Notify health care professional if these symptoms occur, as reduction in dosage or discontinuation of medication may be necessary. Trihexyphenidyl or diphenhydramine may be used to control these symptoms.
- Monitor for *tardive dyskinesia*—uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue. Notify health care professional immediately if these symptoms occur; these side effects may be irreversible.
- Monitor for development of *neuroleptic malignant syndrome*—fever, respiratory distress, tachycardia, convulsions, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control. Notify health care professional immediately if these symptoms occur.

### Potential Nursing Diagnoses

- Disturbed thought process (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

- Noncompliance (Patient/Family Teaching).

## Implementation

- Keep patient recumbent for at least 30 min following parenteral administration to minimize hypotensive effects.
- To prevent contact dermatitis, avoid getting solution on hands.
- Phenothiazines should be discontinued 48 hr before and not resumed for 24 hr following myelography, as they lower the seizure threshold.
- **PO:** Administer with **food**, **milk**, or a full glass of **water** to minimize gastric irritation.
- Dilute most concentrates in 120 mL of distilled or acidified tap water or **fruit juice** just before administration.

## Patient/Family Teaching

- Advise patient to take medication exactly as directed and not to skip doses or double up on missed doses. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes of temperature should also be avoided, as these drugs impair body temperature regulation.
- Advise patient that increasing activity, bulk, and fluids in the diet helps minimize the constipating effects of this medication.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

## Evaluation/Desired Outcomes

- Decrease in excitable, paranoic, or withdrawn behavior. Relief of nausea and vomiting. Relief of intractable hiccups.

## Antipsychotics included in *Davis's Drug Guide for Nurses*

# • ANTIPYRETICS

## PHARMACOLOGIC PROFILE

### General Use
Used to lower fever of many causes (infection, inflammation, and neoplasms).

### General Action and Information
Antipyretics lower fever by affecting thermoregulation in the CNS and by inhibiting the action of prostaglandins peripherally. Many antipyretics affect platelet function; of these, aspirin has the most profound effect as compared with other salicylates, ibuprofen, or ketoprofen.

### Contraindications
Avoid aspirin, ibuprofen, or ketoprofen in patients with bleeding disorders (risk of bleeding is less with other salicylates). Aspirin and other salicylates should be avoided in children and adolescents.

### Precautions
Use aspirin, ibuprofen, or ketoprofen cautiously in patients with ulcer disease. Avoid chronic use of large doses of acetaminophen.

### Interactions
Large doses of aspirin may displace other highly protein-bound drugs. Additive GI irritation with aspirin, ibuprofen, ketoprofen, and other NSAIDs or corticosteroids. Aspirin, ibuprofen, ketoprofen, or naproxen may increase the risk of bleeding with other agents affecting hemostasis (anticoagulants, thrombolytic agents, antineoplastics, and certain anti-infectives).

## NURSING IMPLICATIONS

### Assessment
- Assess fever; note presence of associated symptoms (diaphoresis, tachycardia, and malaise).

### Potential Nursing Diagnoses
- Risk for imbalanced body temperature (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Administration with food or antacids may minimize GI irritation (aspirin, ibuprofen, ketoprofen, naproxen).
- Available in oral and rectal dosage forms and in combination with other drugs.

### Patient/Family Teaching
- Advise patient to consult health care professional if fever is not relieved by routine doses or if greater than 39.5°C (103°F) or lasts longer than 3 days.
- Centers for Disease Control and Prevention warns against giving aspirin to children or adolescents with varicella (chickenpox) or influenza-like or viral illnesses because of a possible association with Reye's syndrome.

### Evaluation/Desired Outcomes
- Reduction of fever.

### Antipyretics included in *Davis's Drug Guide for Nurses*

acetaminophen 112
aspirin 1131
choline and magnesium salicylates 1131
choline salicylate 1131
ibuprofen, oral 688
ketoprofen 754
magnesium salicylate 1131
naproxen 900
salsalate 1131
sodium salicylate 1131

# • ANTIRETROVIRALS

## PHARMACOLOGIC PROFILE

### General Use

The goal of antiretroviral therapy in the management of HIV infection is to improve CD4 cell counts and decrease viral load. If accomplished, this generally results in slowed progression of the disease, improved quality of life, and decreased opportunistic infections. Perinatal use of agents also prevents transmission of the virus to the fetus. Post-exposure prophylaxis with antiretrovirals is also recommended.

### General Action and Information

Because of the rapid emergence of resistance and toxicities of individual agents, HIV infection is almost always managed by a combination of agents. Selections and doses are based on individual toxicities, underlying organ system disease, concurrent drug therapy, and severity of illness. Various combinations are used; up to 4 agents may be used simultaneously. More than 100 agents are currently being tested in addition to those already approved by the FDA.

### Contraindications

Hypersensitivity. Because of highly varying toxicities among agents, see individual monographs for more specific information.

### Precautions

Many agents require modification for renal impairment. Protease inhibitors may cause hyperglycemia and should be used cautiously in patients with diabetes. Hemophiliacs may also be at risk of bleeding when taking protease inhibitors. See individual monographs for specific information.

### Interactions

There are many significant and potentially serious drug-drug interactions among the antiretrovirals. They are affected by drugs that alter metabolism; some agents themselves affect metabolism. See individual agents.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for change in severity of symptoms of HIV and for symptoms of opportunistic infections throughout therapy.
- **Lab Test Considerations:** Monitor viral load and CD4 counts prior to and periodically during therapy.

### Potential Nursing Diagnoses

- Risk for infection (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

### Implementation

- Administer doses around the clock.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed, around the clock, even if sleep is interrupted. Emphasize the importance of complying with therapy, not taking more than pre-

scribed amount, and not discontinuing without consulting health care professional. Missed doses should be taken as soon as remembered unless almost time for next dose; patient should not double doses. Inform patient that long-term effects are unknown at this time.
- Instruct patient that antiretrovirals should not be shared with others.
- Inform patient that antiretroviral therapy does not cure HIV and does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others.
- Advise patient to avoid taking any Rx, OTC, or herbal products without consulting health care professional.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and to monitor for side effects.

### Evaluation/Desired Outcomes
- Decrease in viral load and increase in CD4 counts in patients with HIV.

## • ANTIRHEUMATICS

### PHARMACOLOGIC PROFILE

### General Use
Antirheumatics are used to manage symptoms of rheumatoid arthritis (pain, swelling) and in more severe cases to slow down joint destruction and preserve joint function. NSAIDs, aspirin, and other salicylates are used to manage symptoms such as pain and swelling, allowing continued motility and improved quality of life. Corticosteroids are reserved for more advanced swelling and discomfort, primarily because of their increased side effects, especially with chronic use. They can be used to control acute flares of disease. Neither NSAIDs nor corticosteroids prevent disease progression or joint destruction. Disease-modifying antirheumatics drugs(DMARDs, sometimes called slow-acting agents) slow the progression of rheumatoid ar-

thritis and delay joint destruction. DMARDs are reserved for severe cases because of their toxicity. Several months of therapy may be required before benefit is noted and maintained. Serious and frequent adverse reactions may require discontinuation of therapy, despite initial benefit.

### General Action and Information

Both NSAIDs and corticosteroids have potent anti-inflammatory properties. DMARDs work by a variety of mechanisms. See individual agents, but most work by suppressing the auto-immune response thought to be responsible for joint destruction.

### Contraindications

Hypersensitivity. Patients who are allergic to aspirin should not receive other NSAIDs. Corticosteroids should not be used in patients with active untreated infections.

### Precautions

NSAIDs and corticosteroids should be used cautiously in patients with a history of GI bleeding. Corticosteroids should be used with caution in diabetic patients. Many DMARDs have immunosuppressive properties and should be avoided in patients for whom immunosuppression poses a serious risk, including patients with active infections, underlying malignancy, and uncontrolled diabetes mellitus.

### Interactions

NSAIDs may diminish the response to diuretics and antihypertensives. Corticosteroids may augment hypokalemia from other medications and increase the risk of digoxin toxicity. DMARDs increase the risk of serious immunosuppression with other immunosuppressants.

## NURSING IMPLICATIONS

### Assessment

- Assess patient monthly for pain, swelling, and range of motion.

### Potential Nursing Diagnoses

- Chronic pain (Indications).
- Deficient knowledge, related to disease process and medication regimen.

### Implementation

- Most agents require regular administration to obtain maximum effects.

### Patient/Family Teaching

- Instruct patient to contact health care professional if no improvement is noticed within a few days.

### Evaluation/Desired Outcomes

- Improvement in signs and symptoms of rheumatoid arthritis.

# • ANTITUBERCULARS

## PHARMACOLOGIC PROFILE

### General Use
Used in the treatment and prevention of tuberculosis. Combinations are used in the treatment of active disease tuberculosis to rapidly decrease the infectious state and delay or prevent the emergence of resistant strains. In selected situations, intermittent (twice weekly) regimens may be employed. Streptomycin is also used as an antitubercular. Rifampin is used in the prevention of meningococcal meningitis and *Haemophilus influenzae* type b disease.

### General Action and Information
Kill (tuberculocidal) or inhibit the growth of (tuberculostatic) mycobacteria responsible for causing tuberculosis. Combination therapy with two or more agents is required, unless used as prophylaxis (isoniazid alone).

### Contraindications
Hypersensitivity. Severe liver disease.

### Precautions
Use cautiously in patients with a history of liver disease or in elderly or debilitated patients. Ethambutol requires ophthalmologic follow-up. Safety in pregnancy and lactation not established, although selected agents have been used without adverse effects on the fetus. Compliance is required for optimal response.

### Interactions
Isoniazid inhibits the metabolism of phenytoin. Rifampin significantly decreases saquinavir levels (combination should be avoided).

## NURSING IMPLICATIONS

### Assessment
- Mycobacterial studies and susceptibility tests should be performed prior to and periodically throughout therapy to detect possible resistance.
- Assess lung sounds and character and amount of sputum periodically throughout therapy.

### Potential Nursing Diagnoses
- Risk for infection (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

### Implementation
- Most medications can be administered with food or antacids if GI irritation occurs.

### Patient/Family Teaching

- Advise patient of the importance of continuing therapy even after symptoms have subsided.
- Emphasize the importance of regular follow-up exams to monitor progress and check for side effects.
- Inform patients taking rifampin that saliva, sputum, sweat, tears, urine, and feces may become red-orange to red-brown and that soft contact lenses may become permanently discolored.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of tuberculosis. Negative sputum cultures.

### Antitubercular included in *Davis's Drug Guide for Nurses*

ethambutol 541
isoniazid 741
pyrazinamide 1080
rifampin 1112

## • ANTIULCER AGENTS

### PHARMACOLOGIC PROFILE

### General Use

Treatment and prophylaxis of peptic ulcer and gastric hypersecretory conditions such as Zollinger-Ellison syndrome. Histamine $H_2$-receptor antagonists (blockers) and proton pump inhibitors are also used in the management of gastroesophageal reflux disease (GERD).

### General Action and Information

Because a great majority of peptic ulcer disease may be traced to GI infection with the organism *Helicobacter pylori*, eradication of the organism decreases symptomatology and recurrence. Anti-infectives with significant activity against the organism include amoxicillin, clarithromycin, metronidazole, and tetracycline. Bismuth also has anti-infective activity against *H. pylori*. Regimens usually include: a histamine $H_2$-receptor antagonist, or a proton pump inhibitor, and 2 anti-infectives with or without bismuth subsalicylate for 1–14 days. Other medications used in the management of gastric/duodenal ulcer disease are aimed at neutralizing gastric acid (antacids), decreasing acid secretion (histamine $H_2$ antagonists, proton pump inhibitors, misoprostol), or protecting the ulcer surface from further damage (misoprostol, sucralfate). Histamine $H_2$-receptor antagonists competitively inhibit the action of histamine at the $H_2$ receptor, located primarily in gastric parietal cells, resulting in inhibition of gastric acid secretion. Misoprostol decreases gastric acid secretion and increases production of protective mucus. Proton pump inhibitors prevent the transport of hydrogen ions into the gastric lumen.

### Contraindications

Hypersensitivity. Pregnancy.

### Precautions

Most histamine $H_2$ antagonists require dose reduction in renal impairment and in elderly patients. Magnesium-containing antacids should be used cautiously in patients with renal impairment. Misoprostol should be used cautiously in women with childbearing potential.

### Interactions

Calcium- and magnesium-containing antacids decrease the absorption of tetracycline and fluoroquinolones. Cimetidine inhibits the ability of the liver to metabolize several drugs, increasing the risk of toxicity from warfarin, tricyclic antidepressants, theophylline, metoprolol, phenytoin, propranolol, and lidocaine. Omeprazole decreases metabolism of phenytoin, diazepam, and warfarin. All agents that increase gastric pH will decrease the absorption of ketoconazole.

## NURSING IMPLICATIONS

### Assessment

- Assess patient routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- **Antacids:** Assess for heartburn and indigestion as well as the location, duration, character, and precipitating factors of gastric pain.
- **Histamine $H_2$ Antagonists:** Assess elderly and severely ill patients for confusion routinely. Notify health care professional promptly should this occur.
- **Misoprostol:** Assess women of childbearing age for pregnancy. Medication is usually begun on 2nd or 3rd day of menstrual period following a negative serum pregnancy test within 2 wk of beginning therapy.
- **Lab Test Considerations:** Histamine $H_2$ antagonists antagonize the effects of pentagastrin and histamine during gastric acid secretion test. Avoid administration during the 24 hr preceding the test.
- May cause false-negative results in skin tests using allergen extracts. These drugs should be discontinued 24 hr prior to the test.

### Potential Nursing Diagnoses

- Acute pain (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- **Antacids:** Antacids cause premature dissolution and absorption of enteric-coated tablets and may interfere with absorption of other oral medications. Separate administration of antacids and other oral medications by at least 1 hr.
- Shake liquid preparations well before pouring. Follow administration with water to ensure passage to stomach. Liquid and powder dosage forms are considered to be more effective than chewable tablets.
- Chewable tablets must be chewed thoroughly before swallowing. Follow with half a glass of water.
- Administer 1 and 3 hr after meals and at bedtime for maximum antacid effect.
- **Misoprostol:** Administer with meals and at bedtime to reduce the severity of diarrhea.
- **Proton Pump Inhibitors:** Administer before meals, preferably in the morning. Capsules should be swallowed whole; do not open, crush, or chew.
- May be administered concurrently with antacids.
- **Sucralfate:** Administer on an empty stomach 1 hr before meals and at bedtime. Do not crush or chew tablets. Shake suspension well prior to administration. If nasogastric administration is required, consult pharmacist, as protein-binding properties of sucralfate have resulted in formation of a bezoar when administered with enteral feedings and other medications.

### Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. If a dose is missed, it should be taken as soon as remembered but not if almost time for next dose. Do not double doses.
- Advise patient to avoid alcohol, products containing aspirin, NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools to health care professional promptly.
- Inform patient that cessation of smoking may help prevent the recurrence of duodenal ulcers.
- **Antacids:** Caution patient to consult health care professional before taking antacids for more than 2 wk or if problem is recurring. Advise patient to consult health care professional if relief is not obtained or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.

- **Misoprostol:** Emphasize that sharing of this medication may be dangerous.
- Inform patient that misoprostol may cause spontaneous abortion. Women of childbearing age must be informed of this effect through verbal and written information and must use contraception throughout therapy. If pregnancy is suspected, the woman should stop taking misoprostol and immediately notify her health care professional.
- **Sucralfate:** Advise patient to continue with course of therapy for 4–8 wk, even if feeling better, to ensure ulcer healing.
- Advise patient that an increase in fluid intake, dietary bulk, and exercise may prevent drug-induced constipation.

### Evaluation/Desired Outcomes

- Decrease in GI pain and irritation. Prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen by x-rays or endoscopy. Therapy with histamine $H_2$ antagonists is continued for at least 6 wk after initial episode. Decreased symptoms of GERD. Increase in the pH of gastric secretions (antacids). Prevention of gastric ulcers in patients receiving chronic NSAID therapy (misoprostol only).

## • ANTIVIRALS

### PHARMACOLOGIC PROFILE

### General Use

Acyclovir, famciclovir, and valacyclovir are used in the management of herpes virus infections. Acyclovir also is used in the management of chickenpox. Oseltamivir and zanamivir are used primarily in the prevention of influenza A viral infections. Cidofovir, ganciclovir, valganciclovir, and foscarnet are used in the treatment of cytomegalovirus (CMV) retinitis. Vidarabine is used only to treat ophthalmic viral infections. Penciclovir and docosanol are used in the treatment and prevention of oral-facial herpes simplex.

### General Action and Information

Most agents inhibit viral replication.

### Contraindications

Previous hypersensitivity.

### Precautions
All except zanamivir require dose adjustment in renal impairment. Acyclovir may cause renal impairment. Acyclovir may cause CNS toxicity. Foscarnet increases risk of seizures.

### Interactions
Acyclovir may have additive CNS and nephrotoxicity with drugs causing similar adverse reactions.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for signs and symptoms of infection before and throughout therapy.
- **Ophth:** Assess eye lesions before and daily during therapy.
- **Topical:** Assess lesions before and daily during therapy.

### Potential Nursing Diagnoses
- Risk for infection (Indications).
- Impaired skin integrity (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Most systemic antiviral agents should be administered around the clock to maintain therapeutic serum drug levels.

### Patient/Family Teaching
- Instruct patient to continue taking medication around the clock for full course of therapy, even if feeling better.
- Advise patient that antivirals and antiretrovirals do not prevent transmission to others. Precautions should be taken to prevent spread of virus.
- Instruct patient in correct technique for topical or ophthalmic preparations.
- Instruct patient to notify health care professional if symptoms do not improve.

### Evaluation/Desired Outcomes
- Prevention or resolution of the signs and symptoms of viral infection. Length of time for complete resolution depends on organism and site of infection.

### Antivirals included in *Davis's Drug Guide for Nurses*

acyclovir 118
cidofovir 324
docosanol 465

oseltamivir 956
penciclovir 1001
ribavirin 1107
trifluridine 1399
valacyclovir 1259
valganciclovir 1260
zanamivir 1301

# • BETA BLOCKERS

## PHARMACOLOGIC PROFILE

### General Use
Management of hypertension, angina pectoris, tachyarrhythmias, hypertrophic subaortic stenosis, migraine headache (prophylaxis), MI (prevention), glaucoma (ophthalmic use), congestive

heart failure (CHF) (carvedilol and sustained-release metoprolol only) and hyperthyroidism (management of symptoms only).

### General Action and Information

Beta blockers compete with adrenergic (sympathetic) neurotransmitters (epinephrine and norepinephrine) for adrenergic receptor sites. $Beta_1$-adrenergic receptor sites are located chiefly in the heart where stimulation results in increased heart rate, contractility, and AV conduction. $Beta_2$-adrenergic receptors are found mainly in bronchial and vascular smooth muscle and the uterus. Stimulation of $beta_2$-adrenergic receptors produces vasodilation, bronchodilation, and uterine relaxation. Blockade of these receptors antagonizes the effects of the neurotransmitters. Beta blockers may be relatively selective for $beta_1$-adrenergic receptors (atenolol, betaxolol, esmolol, and metoprolol) or nonselective (carteolol, carvedilol, labetalol, levobunolol, nadolol, penbutolol, pindolol, propranolol, sotalol, and timolol) blocking both $beta_1$- and $beta_2$-adrenergic receptors. Carvedilol and labetalol have additional alpha-adrenergic blocking properties. Acebutolol, carvedilol, penbutolol, and pindolol possess intrinsic sympathomimetic action (ISA) that may result in less bradycardia than other agents. Ophthalmic beta blockers decrease production of aqueous humor.

### Contraindications

Uncompensated CHF (most beta blockers), acute bronchospasm, some forms of valvular heart disease, bradyarrhythmias, and heart block.

### Precautions

Use cautiously in pregnant and lactating women (may cause fetal bradycardia and hyopoglycemia). Use cautiously in any form of lung disease or underlying compensated CHF (most agents). Use with caution in diabetics and patients with severe liver disease. Beta blockers should not be abruptly discontinued in patients with cardiovascular disease.

### Interactions

May cause additive myocardial depression and bradycardia when used with other agents having these effects (digoxin and some antiarrhythmics). May antagonize the therapeutic effects of bronchodilators. May alter the requirements for insulin or hypoglyemic agents in diabetics. Cimetidine may decrease the metabolism and increase the effects of some beta blockers.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight. Assess patient routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and severity of episodes of chest pain periodically throughout therapy.
- **Migraine Prophylaxis:** Assess frequency and severity of migraine headaches periodically throughout therapy.

### Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

### Implementation

- Take apical pulse prior to administering. If heart rate is $<50$ bpm or if arrhythmias occur, hold medication and notify health care professional.

- Many beta blockers are available in combination products to enhance compliance (see Appendix B).

## Patient/Family Teaching

- Instruct patient to continue taking medication, even if feeling well. Abrupt withdrawal may cause life-threatening arrhythmias, hypertension, or myocardial ischemia. Medication controls, but does not cure, hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).
- Instruct patient and family on proper technique for monitoring blood pressure. Advise them to check blood pressure weekly and report significant changes to health care professional.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercising or hot weather may enhance hypotensive effects.
- Advise patient to consult health care professional before taking any OTC medications or herbal/alternative therapies, especially cold remedies.
- Caution patient that these medications may cause increased sensitivity to cold.
- Diabetics should monitor blood glucose closely, especially if weakness, malaise, irritability, or fatigue occurs.
- Advise patient to advise health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.
- **Ophth:** Instruct patient in correct technique for administration of ophthalmic preparations.

## Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Control of arrhythmias.
- Prevention of myocardial reinfarction.
- Prevention of migraine headaches.
- Decrease in tremors.
- Lowering of intraocular pressure.

## Beta blockers included in *Davis's Drug Guide for Nurses*

***beta blockers (nonselective)***

carvedilol 283

levobunolol 1399
metipranolol 1399
timolol 1399

# • BONE RESORPTION INHIBITORS

## PHARMACOLOGIC PROFILE

### General Use

Bone resorption inhibitors are primarily used to treat and prevent osteoporosis in postmenopausal women. Other uses include treatment of osteoporosis due to other causes, including corticosteroid therapy, treatment of Paget's disease of the bone, and management of hypercalcemia.

### General Action and Information

Biphosphonates (alendronate, etidronate, risedronate, and tiludronate) inhibit resorption of bone by inhibiting hydroxyapatite crystal dissolution and osteoclast activity. Raloxifene binds to estrogen receptors, producing estrogen-like effects on bone including decreased bone resorption and decreased bone turnover.

### Contraindications

Hypersensitivity. Biphosphonates should not be used in patients with hypocalcemia. Raloxifene should not be used in women with childbearing potential or a history of thromboembolic disease.

### Precautions

Use cautiously in patients with renal impairment; some agents should be avoided in moderate to severe renal impairment.

### Interactions

Calcium supplements decrease absorption of biphosphonates. Tilundronate's effects may be altered by aspirin or other NSAIDs. Aspirin may increase GI adverse reactions with alendronate. Cholestyramine decreases absorption of raloxifene (concurrent use is contraindicated).

## NURSING IMPLICATIONS

### Assessment

- Assess patients for low bone density before and periodically during therapy.
- Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size).
- **Lab Test Considerations:** Monitor serum calcium in patients with osteoporosis. Monitor alkaline phosphatase in patients with Paget's disease.

### Potential Nursing Diagnoses

- Risk for injury (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis.

### Evaluation/Desired Outcomes

- Prevention of, or decrease in, the progression of osteoporosis in postmenopausal women. Decrease in the progression of Paget's disease.

## Bone Resorption Inhibitors included in *Davis's Drug Guide for Nurses*

***biphosphonates***
alendronate 130
etidronate 542
ibandronate 687
pamidronate 983
risedronate 1114
zoledronic acid 1309

***selective estrogen receptor modulators***
raloxifene 1096

# • BRONCHODILATORS

## PHARMACOLOGIC PROFILE

### General Use

Used in the treatment of reversible airway obstruction due to asthma or chronic obstructive pulmonary disease (COPD). Recently revised recommendations for management of asthma recommend that rapid-acting inhaled beta-agonist bronchodilators (not salmeterol) be reserved as acute relievers of bronchospasm; repeated or chronic use indicates the need for additional long-term control agents, including inhaled corticosteroids, mast cell stabilizers, and long-acting bronchodilators (oral theophylline or beta-agonists) and leukotriene modifiers (montelukast, zafirlukast).

### General Action and Information

Beta-adrenergic agonists (albuterol, epinephrine, isoproterenol, metaproterenol, pirbuterol, and terbutaline) produce bronchodilation by stimulating the production of cyclic adenosine monophosphate (cAMP). Newer agents (albuterol, metaproterenol, pirbuterol, and terbutaline) are relatively selective for pulmonary ($beta_2$) receptors, whereas older agents produce cardiac stimulation ($beta_2$-adrenergic effects) in addition to bronchodilation. Onset of action allows use in management of acute attacks except for salmeterol, which has delayed onset. Phosphodiesterase inhibitors (aminophylline and theophylline) inhibit the breakdown of cAMP. Ipratropium is an anticholinergic compound that produces bronchodilation by blocking the action of acetylcholine in the respiratory tract. Montelukast, zafirlukast, and zileuton are leukotriene modifiers. Leukotrienes are components of slow-reacting substance of anaphylaxis A (SRS-A), which may be a cause of bronchospasm.

### Contraindications

Hypersensitivity to agents, preservatives (bisulfites), or propellants used in their formulation. Avoid use in uncontrolled cardiac arrhythmias.

### Precautions

Use cautiously in patients with diabetes, cardiovascular disease, or hyperthyroidism.

### Interactions

Therapeutic effectiveness may be antagonized by concurrent use of beta blockers. Additive sympathomimetic effects with other adrenergic (sympathetic) drugs, including vasopressors and decongestants. Cardiovascular effects may be potentiated by antidepressants and MAO inhibitors.

## NURSING IMPLICATIONS

### Assessment

- Assess blood pressure, pulse, respiration, lung sounds, and character of secretions before and throughout therapy.
- Patients with a history of cardiovascular problems should be monitored for ECG changes and chest pain.

### Potential Nursing Diagnoses

- Ineffective airway clearance (Indications).
- Activity intolerance (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- Administer around the clock to maintain therapeutic plasma levels.

### Patient/Family Teaching

- Emphasize the importance of taking only the prescribed dose at the prescribed time intervals.
- Encourage the patient to drink adequate liquids (2000 mL/day minimum) to decrease the viscosity of the airway secretions.
- Advise patient to avoid OTC cough, cold, or breathing preparations without consulting health care professional and to minimize intake of xanthine-containing foods or beverages (colas, coffee, and chocolate), as these may increase side effects and cause arrhythmias.
- Caution patient to avoid smoking and other respiratory irritants.
- Instruct patient on proper use of metered-dose inhaler (see Appendix D).
- Advise patient to contact health care professional promptly if the usual dose of medication fails to produce the desired results, symptoms worsen after treatment, or toxic effects occur.
- Patients using other inhalation medications and bronchodilators should be advised to use bronchodilator first and allow 5 min to elapse before administering the other medication, unless otherwise directed by health care professional.

### Evaluation/Desired Outcomes

- Decreased bronchospasm. Increased ease of breathing.

### Bronchodilators included in *Davis's Drug Guide for Nurses*

ipratropium 732
tiotropium 1232

***leukotriene antagonists***
montelukast 879
zafirlukast 1299

***xanthines***
aminophylline 240
theophylline 240

## • CALCIUM CHANNEL BLOCKERS

### PHARMACOLOGIC PROFILE

### General Use

Used in the treatment of hypertension (amlodipine, diltiazem, felodipine, isradipine, nicardipine, nifedipine, nisoldipine, verapamil) or in the treatment and prophylaxis of angina pectoris or coronary artery spasm (amlodipine, diltiazem, felodipine, nicardipine, verapamil). Verapamil and diltiazem are also used as antiarrhythmics. Nimodipine is used to prevent neurologic damage due to certain types of cerebral vasospasm.

### General Action and Information
Block calcium entry into cells of vascular smooth muscle and myocardium. Dilate coronary arteries in both normal and ischemic myocardium and inhibit coronary artery spasm. Diltiazem and verapamil decrease AV conduction. Nimodipine has a relatively selective effect on cerebral blood vessels.

### Contraindications
Hypersensitivity. Contraindicated in bradycardia, 2nd- or 3rd-degree heart block, or uncompensated CHF (verapamil).

### Precautions
Safety in pregnancy and lactation not established. Use cautiously in patients with liver disease or uncontrolled arrhythmias.

### Interactions
Additive myocardial depression with beta blockers and disopyramide (diltiazem and verapamil). Effectiveness may be decreased by phenobarbital or phenytoin and increased by propranolol or cimetidine. Verapamil and diltiazem may increase serum digoxin levels and cause toxicity.

## NURSING IMPLICATIONS

### Assessment
- Monitor blood pressure and pulse frequently during dosage adjustment and periodically throughout therapy.
- Monitor intake and output ratios and daily weight. Assess patient routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and severity of episodes of chest pain periodically throughout therapy.
- **Arrhythmias:** ECG should be monitored continuously during IV therapy and periodically during long-term therapy with verapamil.
- **Cerebral Vasospasm:** Assess patient's neurological status (level of consciousness, movement) before and periodically during therapy with nimodipine.

### Potential Nursing Diagnoses
- Ineffective tissue perfusion (Indications).
- Acute pain (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- May be administered without regard to meals.
- Do not open, crush, or chew sustained-release capsules.

### Patient/Family Teaching
- Instruct patient to continue taking medication, even if feeling well.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Advise patient that exercising or hot weather may enhance hypotensive effects.
- Instruct patient on the importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Advise patient to consult health care professional before taking any OTC medications or herbal/alternative therapies, especially cold remedies.
- Advise patient to advise health care professional of medication regimen prior to treatment or surgery.

- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of follow-up exams to monitor progress.
- **Angina:** Instruct patients on concurrent nitrate therapy to continue taking both medications as directed and using SL nitroglycerin as needed for anginal attacks. Advise patient to contact health care professional if chest pain worsens or does not improve after therapy, or is accompanied by diaphoresis or shortness of breath, or if severe, persistent headache occurs. Caution patient to discuss exercise precautions with health care professional prior to exertion.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management). Medication controls, but does not cure, hypertension.
- Instruct patient and family on proper technique for monitoring blood pressure. Advise them to check blood pressure weekly and report significant changes to health care professional.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.
- Suppression and prevention of supraventricular tachyarrhythmias.
- Improvement in neurological deficits due to vasospasm following subarachnoid hemorrhage.

### Calcium channel blockers included in *Davis's Drug Guide for Nurses*

amlodipine 157
clevidipine 336
diltiazem 445
felodipine 557
isradipine 746
niCARdipine 915
NIFEdipine 921
nimodipine 925
nisoldipine 926
verapamil 1275

## • CENTRAL NERVOUS SYSTEM STIMULANTS

### PHARMACOLOGIC PROFILE

### General Use

Used in the treatment of narcolepsy and as adjunctive treatment in the management of attention deficit hyperactivity disorder (ADHD).

### General Action and Information

Produce CNS stimulation by increasing levels of neurotransmitters in the CNS. Produce CNS and respiratory stimulation, dilated pupils, increased motor activity and mental alertness, and a diminished sense of fatigue. In children with ADHD these agents decrease restlessness and increase attention span.

### Contraindications

Hypersensitivity. Should not be used in pregnant or lactating women. Should not be used in hyperexcitable states. Avoid using in patients with psychotic personalities or suicidal/homicidal tendencies. Contraindicated in glaucoma and severe cardiovascular disease.

### Precautions

Use cautiously in patients with a history of cardiovascular disease, hypertension, diabetes mellitus, or in elderly or debilitated patients. Continual use may result in psychological dependence or addiction.

### Interactions

Additive sympathomimetic (adrenergic effects). Use with MAO inhibitors can result in hypertensive crises. Alkalinizing the urine (sodium bicarbonate, acetazolamide) decreases excretion and enhances effects of amphetamines. Acidification of the urine (ammonium chloride, large doses of ascorbic acid) decreases effect of amphetamines. Phenothiazines may also decrease effects. Methylphenidate may decrease the metabolism and increase effects of other drugs (warfarin, anticonvulsants, tricyclic antidepressants).

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, pulse, and respiration before administering and periodically during therapy.
- Monitor weight biweekly and inform health care professional of significant loss.
- Monitor height periodically in children; inform health care professional if growth inhibition occurs.
- May produce false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- **ADHD:** Assess attention span, impulse control, and interactions with others in children. Therapy may be interrupted at intervals to determine if symptoms are sufficient to warrant continued therapy.
- **Narcolepsy:** Observe and document frequency of episodes.

### Potential Nursing Diagnoses

- Disturbed thought process (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Patient/Family Teaching

- Instruct patient not to alter dose without consulting health care professional. These medications have high dependence and abuse potential. Abrupt cessation with high doses may cause extreme fatigue and mental depression.
- Advise patient to avoid intake of large amounts of caffeine.
- Medication may impair judgment. Caution patient to avoid driving or other activities requiring judgment until response to medication is known.
- Inform patient that periodic holidays from the drug may be used to assess progress and decrease dependence.

### Evaluation/Desired Outcomes

- Decreased frequency of narcoleptic episodes.
- Improved attention span and social interactions.

### Central nervous system stimulants included in *Davis's Drug Guide for Nurses*

amphetamine mixtures 163
caffeine citrate 262
dexmethylphenidate 424
dextroamphetamine 428
methylphenidate 844
modafinil 875

# • CORTICOSTEROIDS

## PHARMACOLOGIC PROFILE

### General Use

Used in replacement doses (20 mg of hydrocortisone or equivalent) systemically to treat adrenocortical insufficiency. Larger doses are usually used for their antiinflammatory, immunosuppressive, or antineoplastic activity. Used adjunctively in many other situations, including hypercalcemia and autoimmune diseases. Topical corticosteroids are used in a variety of inflammatory and allergic conditions. Inhalant corticosteroids are used in the chronic management of reversible airway disease (asthma); intranasal and ophthalmic corticosteroids are used in the management of chronic allergic and inflammatory conditions.

### General Action and Information

Produce profound and varied metabolic effects, in addition to modifying the normal immune response and suppressing inflammation. Available in a variety of dosage forms, including oral, injectable, topical, and inhalation. Prolonged used of large amounts of topical or inhaled agent may result in systemic absorption and/or adrenal suppression.

### Contraindications

Serious infections (except for certain forms of meningitis). Do not administer live vaccines to patients on larger doses.

### Precautions

Prolonged treatment will result in adrenal suppression. Do not discontinue abruptly. Additional doses may be needed during stress (surgery and infection). Safety in pregnancy and lactation not established. Long-term use in children will result in decreased growth. May mask signs of infection. Use lowest dose possible for shortest time possible. Alternate-day therapy is preferable during long-term treatment.

### Interactions

Additive hypokalemia with amphotericin B and potassium-losing diuretics. Hypokalemia may increase the risk of digoxin toxicity. May increase requirements for insulin or oral hypoglycemic agents. Phenytoin, phenobarbital, and rifampin stimulate metabolism and may decrease effectiveness. Oral contraceptives may block metabolism. Cholestyramine and colestipol may decrease absorption.

## NURSING IMPLICATIONS

### Assessment

- These drugs are indicated for many conditions. Assess involved systems prior to and periodically throughout course of therapy.
- Assess patient for signs of adrenal insufficiency (hypotension, weight loss, weakness, nausea, vomiting, anorexia, lethargy, confusion, restlessness) prior to and periodically throughout course of therapy.
- Children should have periodic evaluations of growth.

### Potential Nursing Diagnoses

- Risk for infection (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Disturbed body image (Side Effects).

### Implementation

- If dose is ordered daily or every other day, administer in the morning to coincide with the body's normal secretion of cortisol.

- **PO:** Administer with meals to minimize gastric irritation.

## Patient/Family Teaching

- Emphasize need to take medication exactly as directed. Review symptoms of adrenal insufficiency that may occur when stopping the medication and that may be life-threatening.
- Encourage patients on long-term therapy to eat a diet high in protein, calcium, and potassium and low in sodium and carbohydrates.
- These drugs cause immunosuppression and may mask symptoms of infection. Instruct patient to avoid people with known contagious illnesses and to report possible infections. Advise patient to consult health care professional before receiving any vaccinations.
- Discuss possible effects on body image. Explore coping mechanisms.
- Advise patient to carry identification in the event of an emergency in which patient cannot relate medical history.

## Evaluation/Desired Outcomes

- Suppression of the inflammatory and immune responses in autoimmune disorders, allergic reactions, and organ transplants.
- Replacement therapy in adrenal insufficiency.
- Resolution of skin inflammation, pruritus, or other dermatologic conditions.

# • DIURETICS

## PHARMACOLOGIC PROFILE

### General Use

Thiazide diuretics and loop diuretics are used alone or in combination in the treatment of hypertension or edema due to CHF or other causes. Potassium-sparing diuretics have weak diuretic and antihypertensive properties and are used mainly to conserve potassium in patients receiving thiazide or loop diuretics. Osmotic diuretics are often used in the management of cerebral edema.

### General Action and Information

Enhance the selective excretion of various electrolytes and water by affecting renal mechanisms for tubular secretion and reabsorption. Groups commonly used are thiazide diuretics and thiazide-like diuretics (chlorothiazide, chlorthalidone, hydrochlorothiazide, indapamide, and metolazone), loop diuretics (bumetanide, furosemide, and torsemide), potassium-sparing diuretics (amiloride, spironolactone, and triamterene), and osmotic diuretics (mannitol). Mechanisms vary, depending on agent.

### Contraindications

Hypersensitivity. Thiazide diuretics may exhibit cross-sensitivity with other sulfonamides.

### Precautions

Use with caution in patients with renal or hepatic disease. Safety in pregnancy and lactation not established.

### Interactions

Additive hypokalemia with corticosteroids, amphotericin B, piperacillin, or ticarcillin. Hypokalemia enhances digitalis glycoside toxicity. Potassium-losing diuretics decrease lithium excretion and may cause toxicity. Additive hypotension with other antihypertensives or nitrates. Potassium-sparing diuretics may cause hyperkalemia when used with potassium supplements or ACE inhibitors.

## NURSING IMPLICATIONS

### Assessment

- Assess fluid status throughout therapy. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes.
- Assess patient for anorexia, muscle weakness, numbness, tingling, paresthesia, confusion, and excessive thirst. Notify health care professional promptly if these signs of electrolyte imbalance occur.
- **Hypertension:** Monitor blood pressure and pulse before and during administration. Monitor frequency of prescription refills to determine compliance in patients treated for hypertension.
- **Increased Intracranial Pressure:** Monitor neurologic status and intracranial pressure readings in patients receiving osmotic diuretics to decrease cerebral edema.
- **Increased Intraocular Pressure:** Monitor for persistent or increased eye pain or decreased visual acuity.
- **Lab Test Considerations:** Monitor electrolytes (especially potassium), blood glucose, BUN, and serum uric acid levels before and periodically throughout course of therapy.
- Thiazide diuretics may cause increased serum cholesterol, low-density lipoprotein (LDL), and triglyceride concentrations.

## Potential Nursing Diagnoses

- Excess fluid volume (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

## Implementation

- Administer oral diuretics in the morning to prevent disruption of sleep cycle.
- Many diuretics are available in combination with antihypertensives or potassium-sparing diuretics.

## Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Advise patients on antihypertensive regimen to continue taking medication, even if feeling better. Medication controls, but does not cure, hypertension.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. Caution patient that the use of alcohol, exercise during hot weather, or standing for long periods during therapy may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding dietary potassium guidelines.
- Instruct patient to monitor weight weekly and report significant changes.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to consult health care professional before taking OTC medication concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to contact health care professional immediately if muscle weakness, cramps, nausea, dizziness, or numbness or tingling of extremities occurs.
- Emphasize the importance of routine follow-up.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, regular exercise, restricted sodium intake, stress reduction, moderation of alcohol consumption, and cessation of smoking).
- Instruct patients with hypertension in the correct technique for monitoring weekly blood pressure.

## Evaluation/Desired Outcomes

- Decreased blood pressure.
- Increased urine output.
- Decreased edema.
- Reduced intracranial pressure.
- Prevention of hypokalemia in patients taking diuretics.
- Treatment of hyperaldosteronism.

## Diuretics included in *Davis's Drug Guide for Nurses*

# • HORMONES

## PHARMACOLOGIC PROFILE

### General Use
Used in the treatment of deficiency states including diabetes (insulin), diabetes insipidus (desmopressin), hypothyroidism (thyroid hormones), and menopause (estrogens or estrogens/progestins). Estrogenic and progestational hormones are used as contraceptive agents in various combinations and sequences. Hormones may be used to treat hormonally sensitive tumors (androgens, estrogens) and in other selected situations. See individual drugs.

### General Action and Information
Natural or synthetic substances that have a specific effect on target tissue. Differ greatly in their effects, depending on individual agent and function of target tissue.

### Contraindications
Differ greatly among individual agents; see individual entries.

### Precautions
Differ greatly among individual agents; see individual entries.

### Interactions
Differ greatly among individual agents; see individual entries.

## NURSING IMPLICATIONS

### Assessment
- Monitor patient for symptoms of hormonal excess or insufficiency.
- **Sex Hormones:** Blood pressure and hepatic function tests should be monitored periodically throughout therapy.

### Potential Nursing Diagnoses
- Sexual dysfunction (Indications).
- Disturbed body image (Indications) (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- **Sex Hormones:** During hospitalization, continue to administer according to schedule followed prior to hospitalization.

### Patient/Family Teaching
- Explain dose schedule (and withdrawal bleeding with female sex hormones).
- Emphasize the importance of follow-up exams to monitor effectiveness of therapy and to ensure proper development of children and early detection of possible side effects.
- **Female Sex Hormones:** Advise patient to report signs and symptoms of fluid retention, thromboembolic disorders, mental depression, or hepatic dysfunction to health care professional.

### Evaluation/Desired Outcomes
- Resolution of clinical symptoms of hormone imbalance including menopause symptoms and contraception.
- Correction of fluid and electrolyte imbalances.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Slowed progression of postmenopausal osteoporosis.

# • IMMUNOSUPPRESSANTS

## PHARMACOLOGIC PROFILE

### General Use

Azathioprine, basiliximab, cyclosporine, daclizumab, mycophenolate, sirolimus, and tacrolimus are used with corticosteroids in the prevention of transplantation rejection reactions. Muro-

monab-CD3 is used to manage rejection reactions not controlled by other agents. Azathioprine, cyclophosphamide, and methotrexate are used in the management of selected autoimmune diseases (nephrotic syndrome of childhood and severe rheumatoid arthritis).

### General Action and Information

Inhibit cell-mediated immune responses by different mechanisms. In addition to azathioprine and cyclosporine, which are used primarily for their immunomodulating properties, cyclophosphamide and methotrexate are used to suppress the immune responses in certain disease states (nephrotic syndrome of childhood and severe rheumatoid arthritis). Muromonab-CD3 is a recombinant immunoglobulin antibody that alters T-cell function. Basiliximab and daclizumab are monoclonal antibodies.

### Contraindications

Hypersensitivity to drug or vehicle.

### Precautions

Use cautiously in patients with infections. Safety in pregnancy and lactation not established.

### Interactions

Allopurinol inhibits the metabolism of azathioprine. Drugs that alter liver-metabolizing processes may change the effect of cyclosporine. The risk to toxicity of methotrexate may be increased by other nephrotoxic drugs, large doses of aspirin, or NSAIDs. Muromonab-CD3 has additive immunosuppressive properties; concurrent immunosuppressive doses should be decreased or eliminated.

## NURSING IMPLICATIONS

### Assessment

- Monitor for infection (vital signs, sputum, urine, stool, WBC). Notify physician or other health care professional immediately if symptoms occur.
- **Organ Transplant:** Assess for symptoms of organ rejection throughout therapy.
- **Lab Test Consideration:** Monitor CBC and differential throughout therapy.

### Potential Nursing Diagnoses

- Risk for infection (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- Protect transplant patients from staff and visitors who may carry infection.
- Maintain protective isolation as indicated.

### Patient/Family Teaching

- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ and stress need to notify health care professional immediately if they occur.
- Advise patient to avoid contact with contagious persons and those who have recently taken oral polio virus vaccine. Patients should not receive vaccinations without first consulting with health care professional.
- Emphasize the importance of follow-up exams and lab tests.

### Evaluation/Desired Outcomes

- Prevention or reversal of rejection of organ transplants or decrease in symptoms of autoimmune disorders.

### Immunosuppressants included in *Davis's Drug Guide for Nurses*

azathioprine 212
basiliximab 220
cyclophosphamide 384
cycloSPORINE 387
methotrexate 836
muromonab-CD3 886
mycophenolate mofetil 887
mycophenolic acid 887
pimecrolimus 1029
sirolimus 1155
tacrolimus (oral, IV) 1182
tacrolimus (topical) 1182
thalidomide 1207

## • LAXATIVES

### PHARMACOLOGIC PROFILE

#### General Use

Used to treat or prevent constipation or to prepare the bowel for radiologic or endoscopic procedures.

#### General Action and Information

Induce one or more bowel movements per day. Groups include stimulants (bisacodyl, sennosides), saline laxatives (magnesium salts and phosphates), stool softeners (docusate), bulk-forming agents (polycarbophil and psyllium), and osmotic cathartics (lactulose, polyethylene glycol/electrolyte). Increasing fluid intake, exercising, and adding more dietary fiber are also useful in the management of chronic constipation.

#### Contraindications

Hypersensitivity. Contraindicated in persistent abdominal pain, nausea, or vomiting of unknown cause, especially if accompanied by fever or other signs of an acute abdomen.

#### Precautions

Excessive or prolonged use may lead to dependence. Should not be used in children unless advised by a physician or other health care professional.

#### Interactions

Theoretically may decrease the absorption of other orally administered drugs by decreasing transit time.

### NURSING IMPLICATIONS

#### Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

#### Potential Nursing Diagnoses

- Constipation (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

#### Implementation

- Many laxatives may be administered at bedtime for morning results.
- Taking oral doses on an empty stomach will usually produce more rapid results.
- Do not crush or chew enteric-coated tablets. Take with a full glass of water or juice.
- Stool softeners and bulk laxatives may take several days for results.

### Patient/Family Teaching

- Advise patients, other than those with spinal cord injuries, that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Advise patient to increase fluid intake to a minimum of 1500–2000 mL/day during therapy to prevent dehydration.
- Encourage patients to use other forms of bowel regulation: increasing bulk in the diet, increasing fluid intake, and increasing mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient that laxatives should not be used when constipation is accompanied by abdominal pain, fever, nausea, or vomiting.

### Evaluation/Desired Outcomes

- A soft, formed bowel movement.
- Evacuation of the colon.

### Laxatives included in *Davis's Drug Guide for Nurses*

***bulk-forming agents***
psyllium 1079

docusate sodium 466

## • LIPID-LOWERING AGENTS

### PHARMACOLOGIC PROFILE

### General Use

Used as a part of a total plan including diet and exercise to reduce blood lipids in an effort to reduce the morbidity and mortality of atherosclerotic cardiovascular disease and its sequelae.

### General Action and Information

HMG-CoA reductase inhibitors (atorvastatin, fluvastatin, lovastatin, pravastatin, simvastatin) inhibit an enzyme involved in cholesterol synthesis. Bile acid sequestrants (cholestyramine, colestipol, colesevelam) bind cholesterol in the GI tract. Fenofibrate, niacin, and gemfibrozil act by other mechanisms (see individual monographs).

### Contraindications

Hypersensitivity.

### Precautions

Safety in pregnancy, lactation, and children not established. See individual drugs. Dietary therapy should be given a 2–3 mo trial before drug therapy is initiated.

### Interactions

Bile acid sequestrants (cholestyramine and colestipol) may bind lipid-soluble vitamins (A, D, E, and K) and other concurrently administered drugs in the GI tract. The risk of myopathy from HMG-CoA reductase inhibitors is increased by niacin, erythromycin, gemfibrozil, and cyclosporine.

## NURSING IMPLICATIONS

### Assessment

- Obtain a diet history, especially in regard to **fat** and alcohol consumption.
- **Lab Test Considerations:** Serum cholesterol and triglyceride levels should be evaluated before initiating and periodically throughout therapy. Medication should be discontinued if paradoxical increase in cholesterol level occurs.
- Liver function tests should be assessed before and periodically throughout therapy. May cause an increase in levels.

### Potential Nursing Diagnoses

- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).
- Noncompliance (Patient/Family Teaching).

### Implementation

- See specific medications to determine timing of doses in relation to meals.

### Patient/Family Teaching

- Advise patient that these medications should be used in conjunction with diet restrictions (**fat**, **cholesterol**, **carbohydrates**, and alcohol), exercise, and cessation of smoking.

### Evaluation/Desired Outcomes

- Decreased serum triglyceride and LDL **cholesterol** levels and improved HDL cholesterol ratios. Therapy is usually discontinued if the clinical response is not evident after 3 mo of therapy.

# • MINERALS/ELECTROLYTES/pH MODIFIERS

## PHARMACOLOGIC PROFILE

### General Use

Prevention and treatment of deficiencies or excesses of electrolytes and maintenance of optimal acid/base balance for homeostasis. Acidifiers and alkalinizers are also used to promote urinary excretion of substances that accumulate in certain disease states (kidney stones, uric acid).

## General Action and Information

Electrolytes and minerals are necessary for many body processes. Maintenance of electrolyte levels within normal limits is required for many physiological processes such as cardiac, nerve, and muscle function; bone growth and stability; and a number of other activities. Minerals and electrolytes may also serve as catalysts in many enzymatic reactions. Acid/base balance allows for normal transfer of substances at the cellular and intracellular level.

## Contraindications

Contraindicated in situations in which replacement would cause excess or when risk factors for retention are present.

## Precautions

Use cautiously in disease states in which electrolyte imbalances are common such as significant hepatic or renal disease, adrenal or pituitary disorders.

## Interactions

Depend on individual agents. Alkalinizers and acidifiers can alter the excretion of drugs for which elimination is pH dependent. See specific entries.

# NURSING IMPLICATIONS

## Assessment

- Observe patient carefully for evidence of electrolyte excess or insufficiency. Monitor lab values before and periodically throughout therapy.

## Potential Nursing Diagnoses

- Imbalanced nutrition: less than body requirements (Indications).
- Deficient knowledge, related to medication regimen (Patient/Family Teaching).

## Implementation

- **Potassium Chloride:** Do not administer potassium chloride undiluted.

## Patient/Family Teaching

- Review diet modifications with patients with chronic electrolyte disturbances.

## Evaluation/Desired Outcomes

- Return to normal serum electrolyte concentrations and resolution of clinical symptoms of electrolyte imbalance.
- Changes in pH or composition of urine, which prevent formation of renal calculi.

# • NATURAL/HERBAL PRODUCTS

## PHARMACOLOGIC PROFILE

### General Use
These remedies are used for a wide variety of conditions. Prescriptions are not required and consumers have the choice of many products.

### General Action and Information
Use of these agents is based on historical and sometimes anecdotal evidence. The FDA has little control over these agents, so currently there is little standardization among products.

### Contraindications
Hypersensitivity. Most products are plant extracts that may contain a variety of impurities.

### Precautions
Elderly, pediatric, and pregnant or lactating patients should be aware that these agents carry many of the same risks as prescription medications. Patients with serious chronic medical conditions should consult their health care professional before use.

### Interactions
These agents have the ability to interact with prescription medications and may prevent or augment a desired therapeutic outcome. St. John's wort and kava-kava have the greatest risk for serious interactions.

## NURSING IMPLICATIONS

### Assessment
- Assess the condition for which the patient is taking the product.

### Potential Nursing Diagnoses
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Patient/Family Teaching

- Discuss with patient the reason for using the product. Encourage patient to choose products with USP label, if possible, to guarantee content and purity of medication.
- Inform patient of known side effects and interactions with other medications.

### Evaluation/Desired Outcomes

- Improvement in condition for which medication was taken.

### Natural/Herbal Products included in *Davis's Drug Guide for Nurses*

## • NONOPIOID ANALGESICS

### PHARMACOLOGIC PROFILE

#### General Use

Used to control mild to moderate pain and/or fever. Phenazopyridine is used only to treat urinary tract pain, and capsaicin is used topically for a variety of painful syndromes.

#### General Action and Information

Most nonopioid analgesics inhibit prostaglandin synthesis peripherally for analgesic effect and centrally for antipyretic effect. Tramadol is a centrally acting agent.

#### Contraindications

Hypersensitivity and cross-sensitivity among NSAIDs may occur.

#### Precautions

Use cautiously in patients with severe hepatic or renal disease, chronic alcohol use/abuse, or malnutrition. Tramadol has CNS depressant properties.

#### Interactions

Long-term use of acetaminophen with NSAIDs may increase the risk of adverse renal effects. Prolonged high-dose acetaminophen may increase the risk of bleeding with warfarin. Hepatotoxicity may be additive with other hepatotoxic agents, including alcohol. NSAIDs increase the risk of bleeding with warfarin, thrombolytic agents, antiplatelet agents, some cephalosporins, and valproates (effect is greatest with aspirin). NSAIDs may also decrease the effectiveness of diuretics and antihypertensives. The risk of CNS depression with tramadol is increased by concurrent use of other CNS depressants, including alcohol, antihistamines, sedative/hypnotics, and some antidepressants.

## NURSING IMPLICATIONS

### Assessment

- Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an increased risk for developing hypersensitivity reactions.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity prior to and at the peak (see Time/Action Profile) following administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- **Lab Test Considerations:** Hepatic, hematologic, and renal function should be evaluated periodically throughout prolonged high-dose therapy. Aspirin and most NSAIDs prolong bleeding time due to suppressed platelet aggregation and, in large doses, may cause prolonged prothrombin time. Monitor hematocrit periodically in prolonged high-dose therapy to assess for GI blood loss.

### Potential Nursing Diagnoses

- Acute pain (Indications).
- Risk for imbalanced body temperature (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- **PO:** Administer salicylates and NSAIDs after meals or with food or an antacid to minimize gastric irritation.

### Patient/Family Teaching

- Instruct patient to take salicylates and NSAIDs with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Adults should not take acetaminophen longer than 10 days and children not longer than 5 days unless directed by health care professional. Short-term doses of acetaminophen with salicylates or NSAIDs should not exceed the recommended daily dose of either drug alone.
- Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may increase the risk of GI bleeding with salicylates or NSAIDs. Caution patient to avoid taking acetaminophen, salicylates, or NSAIDs concurrently for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.
- Advise patients on long-term therapy to inform health care professional of medication regimen prior to surgery. Aspirin, salicylates, and NSAIDs may need to be withheld prior to surgery.

### Evaluation/Desired Outcomes

- Relief of mild to moderate discomfort.
- Reduction of fever.

### Nonopioid analgesics included in *Davis's Drug Guide for Nurses*

# • NONSTEROIDAL ANTI-INFLAMMATORY AGENTS

## PHARMACOLOGIC PROFILE

### General Use

NSAIDs are used to control mild to moderate pain, fever, and various inflammatory conditions, such as rheumatoid arthritis and osteoarthritis. Ophthalmic NSAIDs are used to decrease postoperative ocular inflammation, to inhibit perioperative miosis, and to decrease inflammation due to allergies.

### General Action and Information

NSAIDs have analgesic, antipyretic, and anti-inflammatory properties. Analgesic and anti-inflammatory effects are due to inhibition of prostaglandin synthesis. Antipyretic action is due to vasodilation and inhibition of prostaglandin synthesis in the CNS. COX-2 inhibitors (celecoxib) may cause less GI bleeding.

### Contraindications

Hypersensitivity to aspirin is a contraindication for the whole group of NSAIDs. Cross-sensitivity may occur.

### Precautions

Use cautiously in patients with a history of bleeding disorders, GI bleeding, and severe hepatic, renal, or cardiovascular disease. Safe use in pregnancy is not established and, in general, should be avoided during the second half of pregnancy.

### Interactions

NSAIDs prolong bleeding time and potentiate the effect of warfarin, thrombolytic agents, some cephalosporins, antiplatelet agents, and valproates. Prolonged use with aspirin may result in increased GI side effects and decreased effectiveness. NSAIDs may also decrease response to diuretics or antihypertensive therapy. Ibuprofen negates the cardioprotective benefits of low-dose aspirin. COX-2 inhibitors do not negate the cardioprotective effect of low-dose aspirin.

## NURSING IMPLICATIONS

### Assessment

- Patients who have asthma, allergies, and nasal polyps or who are allergic to tartrazine are at an increased risk for developing hypersensitivity reactions.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity prior to and at the peak (see Time/Action Profile) following administration.
- **Fever:** Assess fever and note associated signs (diaphoresis, tachycardia, malaise, chills).
- **Lab Test Considerations:** Most NSAIDs prolong bleeding time due to suppressed platelet aggregation and, in large doses, may cause prolonged PT. Monitor periodically in prolonged high-dose therapy to assess for GI blood loss.

### Potential Nursing Diagnoses

- Acute pain (Indications).
- Risk for imbalanced body temperature (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- **PO:** Administer NSAIDs after meals or with food or an antacid to minimize gastric irritation.

### Patient/Family Teaching
- Instruct patient to take NSAIDs with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Caution patient to avoid concurrent use of alcohol with this medication to minimize possible gastric irritation; 3 or more glasses of alcohol per day may increase the risk of GI bleeding with salicylates or NSAIDs. Caution patient to avoid taking acetaminophen, salicylates, or NSAIDs concurrently for more than a few days, unless directed by health care professional to prevent analgesic nephropathy.
- Advise patient on long-term therapy to inform health care professional of medication regimen prior to surgery. NSAIDs may need to be withheld prior to surgery.

### Evaluation/Desired Outcomes
- Relief of mild to moderate discomfort
- Reduction of fever.

ketorolac 756
nepafenac 1402

## • OPIOID ANALGESICS

### PHARMACOLOGIC PROFILE

### General Use
Management of moderate to severe pain. Fentanyl is also used as a general anesthetic adjunct.

### General Action and Information
Opioids bind to opiate receptors in the CNS, where they act as agonists of endogenously occurring opioid peptides (eukephalins and endorphins). The result is alteration to the perception of and response to pain.

### Contraindications
Hypersensitivity to individual agents.

### Precautions
Use cautiously in patients with undiagnosed abdominal pain, head trauma or pathology, liver disease, or history of addiction to opioids. Use smaller doses initially in the elderly and those

with respiratory diseases. Prolonged use may result in tolerance and the need for larger doses to relieve pain. Psychological or physical dependence may occur.

### Interactions

Increases the CNS depressant properties of other drugs, including alcohol, antihistamines, antidepressants, sedative/hypnotics, phenothiazines, and MAO inhibitors. Use of partial-antagonist opioid analgesics (buprenorphine, butorphanol, nalbuphine, and pentazocine) may precipitate opioid withdrawal in physically dependent patients. Use with MAO inhibitors or procarbazine may result in severe paradoxical reactions (especially with meperidine). Nalbuphine or pentazocine may decrease the analgesic effects of other concurrently administered opioid analgesics.

## NURSING IMPLICATIONS

### Assessment

- Assess type, location, and intensity of pain prior to and at peak following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring higher doses of opioid agonist-antagonists should be converted to an opioid agonist.
- Opioid agonist-antagonists are not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess prior analgesic history. Antagonistic properties of agonist-antagonists may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, and increased blood pressure and temperature) in patients physically dependent on opioids.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioid analgesics for pain do not develop psychological dependence. Progressively higher doses may be required to relieve pain with chronic therapy.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, stool softeners, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.
- Monitor intake and output ratios. If significant discrepancies occur, assess for urinary retention and inform physician or other health care professional.
- **Toxicity and Overdose:** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 1–2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

### Potential Nursing Diagnoses

- Acute pain (Indications).
- Disturbed sensory perception (auditory, visual) (Side Effects).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- Do not confuse morphine with hydromorphone or meperidine; errors have resulted in fatalities.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.

### Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Medication may cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.

### Evaluation/Desired Outcomes

- Decreased severity of pain without a significant alteration in level of consciousness or respiratory status.

### Opioid Analgesics included in *Davis's Drug Guide for Nurses*

***opioid agonists/antagonists***

buprenorphine 246, 1419
butorphanol 257, 1419

propoxyphene 1068
tapentadol 1190

## • SEDATIVE/HYPNOTICS

### PHARMACOLOGIC PROFILE

### General Use

Sedatives are used to provide sedation, usually prior to procedures. Hypnotics are used to manage insomnia. Selected agents are useful as anticonvulsants (clorazepate, diazepam, phenobarbital), skeletal muscle relaxants (diazepam), adjuncts in the management of alcohol withdrawal syndrome (chlordiazepoxide, diazepam, oxazepam), adjuncts in general anesthesia (droperidol), or as amnestics (midazolam, diazepam).

### General Action and Information

Cause generalized CNS depression. May produce tolerance with chronic use and have potential for psychological or physical dependence. These agents have NO analgesic properties.

### Contraindications
Hypersensitivity. Should not be used in comatose patients nor in those with pre-existing CNS depression. Should not be used in patients with uncontrolled severe pain. Avoid use during pregnancy or lactation.

### Precautions
Use cautiously in patients with hepatic dysfunction, severe renal impairment, or severe underlying pulmonary disease. Use with caution in patients who may be suicidal or who may have had previous drug addictions. Hypnotic use should be short-term. Geriatric patients may be more sensitive to CNS depressant effects; dosage reduction may be required.

### Interactions
Additive CNS depression with alcohol, antihistamines, some antidepressants, opioid analgesics, or phenothiazines. Barbiturates induce hepatic drug-metabolizing enzymes and can decrease the effectiveness of drugs metabolized by the liver, including oral contraceptives. Should not be used with MAO inhibitors.

## NURSING IMPLICATIONS

### Assessment
- Monitor blood pressure, pulse, and respiratory status frequently throughout IV administration. Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient, especially if patient is depressed, suicidal, or has a history of addiction.
- **Insomnia:** Assess sleep patterns before and periodically throughout course of therapy.
- **Seizures:** Observe and record intensity, duration, and characteristics of seizure activity. Institute seizure precautions.
- **Muscle Spasms:** Assess muscle spasms, associated pain, and limitation of movement before and throughout therapy.
- **Alcohol Withdrawal:** Assess patient experience alcohol withdrawal for tremors, agitation, delirium, and hallucinations. Protect patient from injury.

### Potential Nursing Diagnoses
- Insomnia (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Supervise ambulation and transfer of patients following administration of hypnotic doses. Remove cigarettes. Side rails should be raised and call bell within reach at all times. Keep bed in low position.

### Patient/Family Teaching
- Discuss the importance of preparing the environment for sleep (dark room, quiet, avoidance of nicotine and caffeine). If less effective after a few weeks, consult health care professional; do not increase dose. Gradual withdrawal may be required to prevent reactions following prolonged therapy.
- May cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol and other CNS depressants concurrently with these medications.
- Advise patient to inform health care professional if pregnancy is planned or suspected.

### Evaluation/Desired Outcomes

- Improvement in sleep patterns.
- Control of seizures.
- Decrease in muscle spasms.
- Decreased tremulousness.
- More rational ideation when used for alcohol withdrawal.

### Sedative/hypnotics included in *Davis's Drug Guide for Nurses*

zaleplon 1300
zolpidem 1313

## • SKELETAL MUSCLE RELAXANTS

### PHARMACOLOGIC PROFILE

#### General Use

Two major uses are spasticity associated with spinal cord diseases or lesions (baclofen and dantrolene) or adjunctive therapy in the symptomatic relief of acute painful musculoskeletal conditions (cyclobenzaprine, diazepam, and methocarbamol). IV dantrolene is also used to treat and prevent malignant hyperthermia.

#### General Action and Information

Act either centrally (baclofen, carisoprodol, cyclobenzaprine, diazepam, and methocarbamol) or directly (dantrolene).

#### Contraindications

Baclofen and oral dantrolene should not be used in patients in whom spasticity is used to maintain posture and balance.

#### Precautions

Safety in pregnancy and lactation not established. Use cautiously in patients with a history of previous liver disease.

#### Interactions

Additive CNS depression with other CNS depressants, including alcohol, antihistamines, antidepressants, opioid analgesics, and sedative/hypnotics.

### NURSING IMPLICATIONS

#### Assessment

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.

### Potential Nursing Diagnoses
- Acute pain (Indications).
- Impaired physical mobility (Indications).
- Risk for injury (Side Effects).

### Implementation
- Provide safety measures as indicated. Supervise ambulation and transfer of patients.

### Patient/Family Teaching
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat).
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with these medications.

### Evaluation/Desired Outcomes
- Decreased musculoskeletal pain
- Decreased muscle spasticity
- Increased range of motion
- Prevention or decrease in temperature and skeletal rigidity in malignant hyperthermia.

### Skeletal muscle relaxants included in *Davis's Drug Guide for Nurses*

***centrally-acting***
baclofen 219
carisoprodol 280
chlorzoxazone 321
cyclobenzaprine 383
diazepam 431
metaxalone 828
methocarbamol 835

***direct-acting***
dantrolene 398

## • THROMBOLYTICS

### PHARMACOLOGIC PROFILE

### General Use
Acute management of coronary thrombosis (MI). Streptokinase and urokinase are used in the management of massive pulmonary emboli, deep vein thrombosis, and arterial thromboembolism. Alteplase is used in the management of acute ischemic stroke.

### General Action and Information
Converts plasminogen to plasmin, which then degrades fibrin in clots. Alteplase, reteplase, and urokinase directly activate plasminogen. Streptokinase binds with plasminogen to form activator complexes, which then convert plasminogen to plasmin. Results in lysis of thrombi in coronary arteries, pulmonary emboli, or deep vein thrombosis, or clearing of clots in cannulae/catheters.

### Contraindications
Hypersensitivity. Cross-sensitivity with streptokinase may occur. Contraindicated in active internal bleeding, history of cerebrovascular accident, recent CNS trauma or surgery, neoplasm, or arteriovenous malformation. Severe uncontrolled hypertension and known bleeding tendencies.

### Precautions
Recent (within 10 days) major surgery, trauma, GI or GU bleeding. Severe hepatic or renal disease. Subacute bacterial endocarditis or acute pericarditis. Use cautiously in geriatric patients. Safety not established in pregnancy, lactation, or children.

### Interactions

Concurrent use with aspirin, NSAIDs, warfarin, heparins, ticlopidine, or dipyridamole may increase the risk of bleeding, although these agents are frequently used together or in sequence. Risk of bleeding may also be increased by concurrent use with cefotetan, cefoperazone, and valproic acid.

## NURSING IMPLICATIONS

### Assessment

- Begin therapy as soon as possible after the onset of symptoms.
- Monitor vital signs, including temperature, continuously for coronary thrombosis and at least every 4 hr during therapy for other indications. Do not use lower extremities to monitor blood pressure.
- Assess patient carefully for bleeding every 15 min during the 1st hr of therapy, every 15–30 min during the next 8 hr, and at least every 4 hr for the duration of therapy. Frank bleeding may occur from sites of invasive procedures or from body orifices. Internal bleeding may also occur (decreased neurologic status; abdominal pain with coffee-ground emesis or black, tarry stools; hematuria; joint pain). If uncontrolled bleeding occurs, stop medication and notify physician immediately.
- Inquire about previous reaction to streptokinase therapy. Assess patient for hypersensitivity reaction (rash, dyspnea, fever, changes in facial color, swelling around the eyes, wheezing). If these occur, inform physician promptly. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Inquire about recent streptococcal infection. Streptokinase may be less effective if administered between 5 days and 6 mo of a streptococcal infection.
- Assess neurologic status throughout therapy.
- Altered sensorium or neurologic changes may be indicative of intracranial bleeding.
- **Coronary Thrombosis:** Monitor ECG continuously. Notify physician if significant arrhythmias occur. IV lidocaine or procainamide (Pronestyl) may be ordered prophylactically. Cardiac enzymes should be monitored. Radionuclide myocardial scanning and/or coronary angiography may be ordered 7–10 days following therapy to monitor effectiveness of therapy.
- Monitor heart sounds and breath sounds frequently. Inform physician if signs of CHF occur (rales/crackles, dyspnea, S3 heart sound, jugular venous distention, relieved central venous pressure (CVP)).
- **Pulmonary Embolism:** Monitor pulse, blood pressure, hemodynamics, and respiratory status (rate, degree of dyspnea, arterial blood gases).
- **Deep Vein Thrombosis/Acute Arterial Occlusion:** Observe extremities and palpate pulses of affected extremities every hour. Notify physician immediately if circulatory impairment occurs. Computed tomography, impedance plethysmography, quantitative Doppler effect determination, and/or angiography or venography may be used to determine restoration of blood flow and duration of therapy; however, repeated venograms are not recommended.
- **Cannula/Catheter Occlusion:** Monitor ability to aspirate blood as indicator of patency. Ensure that patient exhales and holds breath when connecting and disconnecting IV syringe to prevent air embolism.
- **Acute Ischemic Stroke:** Assess neurologic status. Determine time of onset of stroke symptoms. Alteplase must be administered within 3 hr of onset.
- **Lab Test Considerations:** Hematocrit, hemoglobin, platelet count, fibrin/fibrin degradation product (FDP/fdp) titer, fibrinogen concentration, prothrombin time, thrombin time, and activated partial thromboplastin time may be evaluated prior to and frequently throughout therapy. Bleeding time may be assessed prior to therapy if patient has received platelet aggregation inhibitors. Obtain type and cross match and have blood available at all times in case of hemorrhage. Stools should be tested for occult blood loss and urine for hematuria periodically during therapy.

- **Toxicity and Overdose:** If local bleeding occurs, apply pressure to site. If severe or internal bleeding occurs, discontinue infusion. Clotting factors and/or blood volume may be restored through infusions of whole blood, packed RBCs, fresh frozen plasma, or cryoprecipitate. Do not administer dextran, as it has antiplatelet activity. Aminocaproic acid (Amicar) may be used as an antidote.

### Potential Nursing Diagnoses

- Ineffective tissue perfusion (Indications).
- Risk for injury (Side Effects).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation

- This medication should be used only in settings in which hematologic function and clinical response can be adequately monitored.
- Starting two IV lines prior to therapy is recommended: one for the thrombolytic agent, the other for any additional infusions.
- Avoid invasive procedures, such as IM injections or arterial punctures, with this therapy. If such procedures must be performed, apply pressure to all arterial and venous puncture sites for at least 30 min. Avoid venipunctures at noncompressible sites (jugular vein, subclavian site).
- Systemic anticoagulation with heparin is usually begun several hours after the completion of thrombolytic therapy.
- Acetaminophen may be ordered to control fever.

### Patient/Family Teaching

- Explain purpose of medication and the need for close monitoring to patient and family. Instruct patient to report hypersensitivity reactions (rash, dyspnea) and bleeding or bruising.
- Explain need for bedrest and minimal handling during therapy to avoid injury. Avoid all unnecessary procedures such as shaving and vigorous tooth brushing.

### Evaluation/Desired Outcomes

- Lysis of thrombi and restoration of blood flow
- Prevention of neurologic sequelae in acute ischemic stroke
- Cannula or catheter patency.

### Thrombolytics included in *Davis's Drug Guide for Nurses*

alteplase 1214
reteplase 1214
streptokinase 1214
tenecteplase 1214
urokinase 1214

## • VACCINES/IMMUNIZING AGENTS

### PHARMACOLOGIC PROFILE

### General Use

Immune globulins provide passive immunization to infectious diseases by providing antibodies. Immunization with vaccines and toxoids containing bacterial or viral antigenic material results in endogenous production of antibodies.

### General Action and Information

Immunity from immune globulins is rapid, but short-lived (up to 3 months). Active immunization with vaccine or toxoids produces prolonged immunity (years).

### Contraindications
Hypersensitivity to product, preservatives, or other additives. Some products contain thimerisol, neomycin, and/or **egg protein**.

### Precautions
Severe bleeding problems (IM injections).

### Interactions
Decreased antibody response to vaccine/toxoids and increased risk of adverse reactions in patients receiving concurrent antineoplastic, immunosuppressive, or radiation therapy.

## NURSING IMPLICATIONS

### Assessment
- Assess previous immunization history and history of hypersensitivity.

### Potential Nursing Diagnoses
- Risk for infection (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Measles, mumps, and rubella vaccine, trivalent oral polio virus vaccine, and diphtheria toxoid, tetanus toxoid, and pertussis vaccine may be given concurrently.
- Administer each immunization by appropriate route.

### Patient/Family Teaching
- Inform patient/parent of potential and reportable side effects of immunization. Health care professional should be notified if patient develops fever over 39.4°C (103°F); difficulty breathing; hives; itching; swelling of the eyes, face, or inside of nose; sudden severe tiredness or weakness; or convulsions occur.
- Review next scheduled immunization with parent. Emphasize the importance of keeping a record of immunizations and dates given.

### Evaluation/Desired Outcomes
- Prevention of diseases through active immunity.

### Vaccines/immunizing agents included in *Davis's Drug Guide for Nurses*

***immune globulins***

$Rh_o$(D) immune globulin standard dose IM 1105
botulism immune globulin 1320
$Rh_o$(D) globulin IV 1105
$Rh_o$(D) globulin microdose IM 1105

***miscellaneous***

cytomegalovirus immune globulin 1323
human papillomavirus quadrivalent (types 6, 11, 16 and 18) vaccine, recombinant 670

# • VASCULAR HEADACHE SUPPRESSANTS

## PHARMACOLOGIC PROFILE

### General Use
Used for acute treatment of vascular headaches (migraine, cluster headaches, migraine variants). Other agents such as some beta blockers and some calcum channel blockers are used for suppression of frequently occurring vascular headaches.

### General Action and Information
Ergot derivatives (ergotamine, dihydroergotamine) directly stimulate alpha-adrenergic and serotonergic receptors, producing vascular smooth muscle vasoconstriction. Almotriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan produce vasoconstriction by acting as serotonin ($5\text{-}HT_1$) agonists.

### Contraindications
Avoid using these agents in patients with ischemic cardiovascular disease.

### Precautions
Use cautiously in patients with a history of, or risk for, cardiovascular disease.

### Interactions
Avoid concurrent use of ergot derivative agents with serotonin agonist agents; see also individual agents.

## NURSING IMPLICATIONS

### Assessment
- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack and frequency of attacks.

### Potential Nursing Diagnoses
- Acute pain (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Medication should be administered at the first sign of a headache.

### Patient/Family Teaching
- Inform patient that medication should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Advise patient that lying down in a darkened room following medication administration may further help relieve headache.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches.

### Evaluation/Desired Outcomes
- Relief of migraine attack.

### Vascular headache suppressants included in *Davis's Drug Guide for Nurses*

***alpha-adrenergic blockers***
dihydroergotamine 518
ergotamine 518

***beta blockers***
propranolol 1071
timolol 1229

***$5\text{-}HT_1$ agonists***
almotriptan 136
eletriptan 497
frovatriptan 619
naratriptan 902
rizatriptan 1125
sumatriptan 1177
zolmitriptan 1312

***miscellaneous***
divalproex sodium 1262
valproate sodium 1262
valproic acid 1262
verapamil 1275

# • VITAMINS

## PHARMACOLOGIC PROFILE

### General Use
Used in the prevention and treatment of vitamin deficiencies and as supplements in various metabolic disorders.

### General Action and Information
Serve as components of enzyme systems that catalyze numerous varied metabolic reactions. Necessary for homeostasis. Water-soluble vitamins (B-vitamins and vitamin C) rarely cause toxicity. Fat-soluble vitamins (vitamins D and E) may accumulate and cause toxicity.

### Contraindications
Hypersensitivity to additives, preservatives, or colorants.

### Precautions
Dose should be adjusted to avoid toxicity, especially for fat-soluble vitamins.

### Interactions
Pyridoxine in large amounts may interfere with the effectiveness of levodopa. Cholestyramine, colestipol, and mineral oil decrease absorption of fat-soluble vitamins.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for signs of vitamin deficiency before and periodically throughout therapy.
- Assess nutritional status through 24-hr diet recall. Determine frequency of consumption of vitamin-rich foods.

### Potential Nursing Diagnoses
- Imbalanced nutrition: less than body requirements (Indications).
- Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching).

### Implementation
- Because of infrequency of single vitamin deficiencies, combinations are commonly administered.

### Patient/Family Teaching
- Encourage patients to comply with diet recommendations of physician or other health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDAs. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects and toxicity.

### Evaluation/Desired Outcomes
- Prevention of, or decrease in, the symptoms of vitamin deficiencies.

### Vitamins included in *Davis's Drug Guide for Nurses*

***fat-soluble vitamins***
calcitriol 1287
doxercalciferol 1287
ergocalciferol 1287
paricalcitol 1287
phytonadione 1026
vitamin E 1291

***water-soluble vitamins***
ascorbic acid 1319
cyanocobalamin 1284

folic acid 606
niacin 914
niaciamide 914
pyridoxine 1083
thiamine 1209
riboflavin 1332
hydroxocobalamin 1284

# • WEIGHT CONTROL AGENTS

## PHARMACOLOGIC PROFILE

### General Use

These agents are used in the management of exogenous obesity as part of a regimen including a reduced-calorie diet. They are especially useful in the presence of other risk factors including hypertension, diabetes, or dyslipidemias.

### General Action and Information

Phentermine and sibutramine are anorexiants that are designed to decrease appetite via their action in the CNS. Orlistat is a lipase inhibitor that decreases absorption of dietary fat.

### Contraindications

None of these agents should be used during pregnancy or lactation. Phentermine and sibutramine should not be used in patients with severe hepatic or renal disease, uncontrolled hypertension, known CHF, or cardiovascular disease. Orlistat should not be used in patients with chronic malabsorption.

### Precautions

Phentermine and sibutramine should be used cautiously in patients with a history of seizures, or angle-closure glaucoma and in geriatric patients.

### Interactions

Phentermine and sibutramine may have additive, adverse effects with CNS stimulants, some vascular headache suppressants, MAO inhibitors, and some opioids (concurrent use should be avoided). Orlistat reduces absorption of some fat-soluble vitamins and beta-carotene.

## NURSING IMPLICATIONS

### Assessment

- Monitor weight and dietary intake prior to and periodically during therapy. Adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.

### Potential Nursing Diagnoses

- Disturbed body image (Indications).
- Imbalanced nutrition: more than body requirements (Indications).
- Deficient knowledge, related to medication regimen (Patient/Family Teaching).

### Patient/Family Teaching

- Advise patient that regular physical activity, approved by healthcare professional, should be used in conjunction with medication and diet.

### Evaluation/Desired Outcomes

- Slow, consistent weight loss when combined with a reduced-calorie diet.

### Weight control agents included in *Davis's Drug Guide for Nurses*

orlistat 954
phentermine 1017
sibutramine 1150

## PEDIATRIC INTRAVENOUS MEDICATION QUICK REFERENCE CHART

Risk of fluid overload in infants and children is always a consideration when administering IV medications. The following table provides maximum concentrations—the smallest amount of fluid necessary for diluting specific medications—and the maximum rate at which the medications be given.

| Drug | Maximum Concentration | Maximum Rate |
|---|---|---|
| acetazolamide | 100 mg/ml | 500 mg/min2 |
| acyclovir | 10 mg/ml | Give over 1 hr |
| adenosine | 3 mg/ml | Give over 1-2 sec |
| allopurinol | 6 mg/ml | Give over 15-20 min |
| amikacin | 10 mg/ml | Give over 30 min |
| aminocaproic acid | 20 mg/ml | Give over 1 hr |
| aminophylline | 25 mg/ml | 25 mg/min |
| amphotericin B | 0.1 mg/ml (peripherally)<br>0.5 mg/ml (centrally) | Give over 2-6 hr |
| amphotericin B liposomal | 2 mg/ml | Give over 2 hr |
| amphotericin B colloidal | 0.83 mg/ml | Give over 2 hr |
| ampicillin | 100 mg/ml | 10 mg/kg/min |
| ampicillin/sulbactam | 30 mg/ml (ampicillin) | Give over 15-30 min |
| anidulafungin | 0.43 mg/ml | 1.1 mg/min |
| atropine | 1 mg/ml | Give over 1 min |
| azithromycin | 2 mg/ml | Give over 1 hr |
| aztreonam | 20 mg/ml | Give over 20-60 min |
| bumetanide | 0.25 mg/ml | Give over 1-2 min |
| caffeine citrate | 20 mg/ml | Give over 10-20 min |
| calcitriol | 2 mcg/ml | Give over 15 sec |
| calcium chloride | 100 mg/ml | 100 mg/min |
| calcium gluconate | 100 mg/ml | 100 mg/min |
| caspofungin | 0.47 mg/ml | Give over 1 hr |
| cefazolin | 138 mg/ml (IVP)<br>20 mg/ml (Intermittent infusion) | Give over 3-5 min<br>Give over 10-60 min |
| cefepime | 160 mg/ml | Give over 30 min |
| cefotaxime | 200 mg/ml (IVP)<br>60 mg/ml (Intermittent infusion) | Give over 3-5 min<br>Give over 10-30 min |
| cefoxitin | 200 mg/ml (IVP)<br>40 mg/ml (Intermittent infusion) | Give over 3-5 min<br>Give over 15-40 min |
| ceftazidime | 200 mg/ml (IVP)<br>40 mg/ml (Intermittent infusion) | Give over 3-5 min<br>Give over 10-30 min |
| ceftriaxone | 40 mg/ml | Give over 10-30 min |
| cefuroxime | 100 mg/ml (IVP)<br>30 mg/ml (Intermittent infusion) | Give over 3-5 min<br>Give over 15-60 min |
| chlorpromazine | 1 mg/ml | 0.5 mg/min |
| ciprofloxacin | 2 mg/ml | Give over 60 min |
| clindamycin | 18 mg/ml | 30 mg/min |
| cyclosporine | 2.5 mg/ml | Give over 2-8 hr |
| dexamethasone | 10 mg/ml | Doses < 10 mg:<br>Give over 1-4 min<br>Doses > 10 mg:<br>Give over 10-20 min |
| diazepam | 5 mg/ml | 2 mg/min |
| diazoxide | 15 mg/ml | Give over 30-60 min |
| digoxin | 100 mcg/ml | Give over 5 min |
| diphenhydramine | 50 mg/ml | 25 mg/min |
| doxycycline | 1 mg/ml | Give over 1 hr |
| enalaprilat | 1.25 mg/ml | Give over 5 min |
| erythromycin | 5 mg/ml | Give over 20-120 min |
| ethacrynic acid | 2 mg/ml | Give over 5-10 min |
| famotidine | 4 mg/ml | Give over 2-10 min |
| fentanyl | 50 mcg/ml | Give over 1-3 min |
| fluconazole | 2 mg/ml | Give over 1-2 hr |
| flumazenil | 0.1 mg/ml | Give over 15-30 sec |
| foscarnet | 12 mg/ml | 60 mg/kg/hr |
| fosphenytoin | 25 mg/ml | 3 mg/kg/min |
| furosemide | 10 mg/ml | 0.5 mg/kg/min |
| ganciclovir | 10 mg/ml | Give over 1 hr |
| gentamicin | 40 mg/ml | Give over 30 min |
| glycopyrrolate | 0.2 mg/ml | Give over 5-10 sec |
| granisetron | 50 mcg/ml (Intermittent infusion)<br>1 mg/ml (IVP) | Give over 2-30 min<br>Give over 30 sec |
| hydralazine | 20 mg/ml | 5 mg/min or 0.2 mg/kg/min |
| hydrocortisone sodium succinate | 60 mg/ml (IVP)<br>5 mg/ml (intermittent infusion) | Give over 30 sec<br>Give over 10-30 min |

| Drug | Maximum Concentration | Maximum Rate |
|---|---|---|
| imipenem/cilastatin | 7 mg/ml | Give over 15-60 min |
| inamrinone | 5 mg/ml | Give over 2-3 min |
| indomethacin | 1 mg/ml | Give over 20-35 min |
| kanamycin | 5 mg/ml | Give over 20-30 min |

## BEERS CRITERIA

The Beers criteria for potentially inappropriate medication use in adults 65 and older in the United States is a compilation of drugs and drug classes found to increase the risk of adverse events in older adults. Frequently, older adults are more sensitive to the medications or their side effects. These adverse events have significant economic and quality of life costs for society and individuals and can result in more frequent hospitalizations, permanent injury, or death. Often, the potential for adverse events can be minimized by prescribing safer alternatives or prescribing at the lowest effective dose. The list below appears in Archives of Internal Medicine, volume 163, published in December 2003. It represents an update to the original list, published in 1991 by Mark H. Beers, MD.

| | |
|---|---|
| alprazolam (Niravam, Xanax) | ethacrynic acid (Edecrin) |
| amiodarone (Cordarone, Pacerone) | ferrous sulfate (iron, Feosol) |
| amitriptyline | fluoxetine (Prozac) |
| amphetamines | flurazepam (Dalmane) |
| anorexic agents | hydroxyzine (Vistaril) |
| barbiturates | hyoscyamine (Anaspaz, Levsin) |
| belladonna alkaloids (Donnatal) | meperidine (Demerol) |
| bisacodyl (Dulcolax) | meprobamate |
| carisoprodol (Soma) | metaxalone (Skelaxin) |
| castor oil | methocarbamol (Robaxin) |
| chlordiazepoxide (Librium) | methyldopa |
| chlordiazepoxide-amitriptyline (Limbitrol) | methyldopa-hydrochlorothiazide |
| chlorpheniramine (Chlor-Trimeton) | methyltestosterone (Android, Testred, Virilon) |
| chlorpropamide (Diabinese) | mineral oil |
| chlorzoxazone (Parafon Forte DSC) | naproxen (Aleve, Anaprox, Naprosyn) |
| cimetidine (Tagamet) | nifedipine (Adalat, Afeditab CR, Procardia) |
| clidinium-chlordiazepoxide (Librax) | nitrofurantoin (Furadantin, Macrobid, Microdantin) |
| clonidine (Catapres, Duraclon) | orphenadrine (Norflex) |
| clorazepate (Tranxene) | oxaprozin (Daypro) |
| cyclobenzaprine (Amrix, Fexmid, Flexeril) | oxazepam (Serax) |
| cyproheptadine | oxybutynin (Ditropan, Gelnique, Oxytrol) |
| dessicated thyroid (Armour Thyroid) | pentazocine (Talwin) |
| dexchlorpheniramine | piroxicam (Feldene) |
| diazepam (Valium) | promethazine (Promethegan) |
| dicyclomine (Bentyl) | propantheline |
| digoxin (Lanoxin) | propoxyphene (Darvon) and combination products |
| diphenhydramine (Benadryl) | quazepam (Doral) |
| dipyridamole (Persantine) | reserpine |
| disopyramide (Norpace) | temazepam (Restoril) |
| doxazosin (Cardura) | thioridazine |
| doxepin (Zonalon) | ticlopidine |
| ergoloid mesylates (Hydergine) | triazolam (Halcion) |
| estrogens | trimethobenzamide (Tigan) |

Frick DM, et al. Potentially Inappropriate Medications for Use in Older Adults (Beers List). Updating the Beers criteria for potentially inappropriate medication use in older adults: results of a US consensus panel of experts. Arch Intern Med. 2003;163:2716-2724.

## DRUGS ASSOCIATED WITH INCREASED RISK OF FALLS IN THE ELDERLY

Many factors are associated with falls in the elderly, including frailty, disease, vision, polypharmacy and certain medications. Below is a list of drugs associated with falls. Assess geriatric patients on these medications for fall risk and implement fall reduction strategies.

### ACE Inhibitors
- benazepril (Lotensin)
- captopril (Capoten)
- enalapril (Vasotec)
- fosinopril (Monopril)
- lisinopril (Prinivil, Zestril)
- moexipril (Univasc)
- perindopril (Aceon)
- quinapril (Accupril)
- ramipril (Altace)
- trandolapril (Mavik)

### Angiotensin II Receptor Antagonists
- candesartan (Atacand)
- eprosartan (Teveten)
- irbesartan (Avapro)
- losartan (Cozaar)
- olmesartan (Benicar)
- telmisartan (Micardis)
- valsartan (Diovan)

### Antiarrhythmics
- digoxin (Lanoxin)
- disopyramide (Norpace)
- Anticonvulsants
- carbamazepine (Tegretol)
- ethosuximide (Zarontin)
- felbamate (Felbatol)
- gabapentin (Neurontin)
- lamotrigine (Lamictal)
- levetiracetam (Keppra)
- methsuximide (Celontin)
- phenobarbital (Luminal)
- phenytoin (Dilantin)
- pregabalin (Lyrica)
- primidone (Mysoline)
- tiagabine (Gabatril)
- topiramate (Topamax)
- valproate (Depakene, Depakote, Stavzor)
- zonisamide (Zonegran)

### Antidepressants
- amitriptyline (Elavil)
- amoxapine
- bupropion (Aplenzin, Wellbutrin)
- citalopram (Celexa)
- clomipramine (Anafranil)
- desipramine (Norpramin)
- doxepin
- duloxetine (Cymbalta)
- escitalopram (Lexapro)
- fluoxetine (Prozac)
- fluvoxamine (Luvox)
- imipramine (Tofranil)
- isocarboxazid (Marplan)
- maprotiline
- mirtazapine (Remeron)
- nefazodone
- paroxetine (Paxil, Pexeva)
- phenelzine (Nardil)
- protriptyline (Vivactil)
- sertraline (Zoloft)
- tranylcypromine (Parnate)
- trazodone
- trimipramine (Surmontil)
- venlafaxine (Effexor)

### Antihistamines/Antinauseants
- dimenhydrinate (Dramamine)
- diphenhydramine (Benadryl)
- hydroxyzine (Vistaril)
- meclizine (Antivert, Bonine)
- metoclopramide (Metozolv ODT, Reglan)
- prochlorperazine (Compro)
- promethazine (Promethegan)
- scopolamine patch (Transderm Scop)

### Antiparkinsonian Agents
- amantadine (Symmetrel)
- bromocriptine (Parlodel)
- entacapone (Comtan)
- levodopa/carbidopa (Parcopa, Sinemet)
- pramipexole (Mirapex)
- selegiline (Eldepryl, Zelapar)

### Antipsychotics (Atypical)
- aripiprazole (Abilify)
- clozapine (Clozaril, FazaClo)
- olanzapine (Zyprexa)
- paliperidone (Invega)
- quetiapine (Seroquel)
- risperidone (Risperdal)
- ziprasidone (Geodon)

### Antipsychotics (Neuroleptics)
- chlorpromazine
- fluphenazine
- haloperidol (Haldol)
- loxapine (Loxitane)
- molindone (Moban)
- perphenazine
- pimozide (Orap)
- thioridazine
- thiothixine (Navane)
- trifluoperazine

### Anxiolytics
- buspirone (Buspar)
- meprobamate

### Benzodiazepines (Long Acting)
- chlordiazepoxide (Librium)
- clonazepam (Klonopin)
- clorazepate (Tranxene)
- diazepam (Valium)
- flurazepam (Dalmane)
- quazepam (Doral)

### Benzodiazepines (Intermediate Acting)
- alprazolam (Niravam, Xanax)
- estazolam (Prosom)
- lorazepam (Ativan)
- oxazepam (Serax)
- temazepam (Restoril)

### Benzodiazepines (Short Acting)
- triazolam (Halcion)

### Beta Blockers
- acebutolol (Sectral)
- atenolol (Tenormin)
- bisoprolol (Zebeta)
- carvedilol (Coreg)
- labetalol (Trandate)
- metoprolol (Lopressor, Toprol XL)
- propranolol (Inderal, InnoPran XL)
- timolol

### Calcium Channel Blockers
- amlodipine (Norvasc)
- diltiazem (Cardizem, Cartia XT, Dilacor XR, Taztia XT, Tiazac)
- felodipine
- isradipine (DynaCirc CR)
- nicardipine (Cardene)
- nifedipine (Adalat CC, Afeditab CC, Procardia XL)
- nisoldipine (Sular)
- verapamil (Calan, Covera HS, Isoptin, Verelan)

### Diuretics
- amiloride/HCTZ
- bumetanide
- furosemide (Lasix)
- hydrochlorothiazide (Microzide)
- triamterene/HCTZ (Dyazide, Maxzide)

### Opioid Analgesics
- codeine
- fentanyl (Actiq, Duragesic, Fentora, Sublimaze)
- hydrocodone
- hydromorphone (Dilaudid)
- levorphanol (Levo-Dromoran)
- meperidine (Demerol)
- methadone (Dolophine)
- morphine (Avinza, DepoDur, Duramorph, Kadian, MS Contin, Oramorph, Roxanol)
- oxycodone (OxyContin, Roxicodone)
- oxymorphone (Opana)
- pentazocine (Talwin)
- propoxyphene (Darvon)

### Skeletal Muscle Relaxants
- Baclofen (Lioresal)

### Vasodilators
- doxazosin (Cardura)
- hydralazine
- isosorbide (Dilatrate SR, Imdur, Ismo, Isordil, Monoket)
- nitroglycerin (Minitran, Nitro-Dur, Nitrostat)
- prazosin (Minipress)
- terazosin (Hytrin)

## LOOK-ALIKE, SOUND-ALIKE (LASA) DRUG NAMES

The Joint Commission established a National Patient Safety Goal that requires accredited organizations to identify a list of look-alike or sound-alike drugs used in their organization and, at a minimum, to review the list annually and take action to prevent errors involving the use of these drugs. Organizations must list at least 10 drug combinations from The Joint Commission's list of LASA drugs.

The following are drug pairs that The Joint Commission and others have rated as most problematic. Names in ALL CAPITALS are brand names; those in lowercase are generic names.

| | |
|---|---|

# DO NOT CRUSH!

**Do not crush any oral medication that is labeled as:**

Enteric-coated **(EC)**
Extended release
Effervescent tablet **(EVT)**
Irritant **(I)**
Mucous Membrane irritant **(MMI)**
Orally Disintegrating tablets **(ODT)**
Slow-release **(SR)**
Sublingual forms of drugs
Sustained-release

**Do not crush any oral medication that ends in the following letters:**

**CD CR LA SR XL XR XT**

**MEDICATIONS THAT SHOULD NOT BE CRUSHED:**

Accutane Capsule **(MMI)**
Aciphex Tablet **(SR)**
Actiq lozenge **(SR)**
Actonel Tablet **(I)**
Adalat CC tablet **(SR)**
Adderall XR Capsule **(SR)** see code "**C**"
AeroHist Plus Tablet **(SR)**
Afeditab CR Tablet **(SR)**
Afinitor Tablet **(MMI)**
Aggrenox Capsule **(SR)**
Alavert Allergy Sinus 12 Hour Tablet **(SR)**
Allegra-D Tablet **(SR)**
Allfen Jr Tablet **(SR)**
Allfen Jr Capsule **(SR)** see code "**C**"
Alpophen Tablet **(EC)**
Alprazolam ER Tabalet **(SR)**
Altoprev Tablet **(SR)**
Ambien CR Tablet **(SR)**
Amitza Capsule **(SR)**
Amrix Capsule **(SR)**
Aprisor Capsule **(SR)** see code "**C**"
Aptivus Capsule
Aquatab C Tablet **(SR)**
may break scored tablet only
Aquatab D Tablet **(SR)**
Arthrotec Tablet **(EC)**
Asacol Tablet **(SR)**
Ascriptin A/D Tablet **(EC)**
Aspirin Bayer Enteric coated Caplet **(EC)**
Aspirin Bayer Low Adult Tablet **(EC)**
Aspirin Bayer Regular StrengthCaplet **(EC)**
Azulfidine EN-tablet **(EC)**
Augmentin XR tablet **(SR)**
see codes "**A**" and "**B**"
Avinza Capsule **(SR)** see code "**C**"
Avodart Capsule (women of childbearing age should not handle this tablet)
Bellahist –D LA Tablet **(SR)**
Biaxin-XL Tablet **(SR)**
Bidhist Tablet **(SR)**
Bidhist –D Tablet **(SR)**
Biltricide tablet see code "**B**"
Bisa-lax Tablet **(EC)** see code "**D**"
Biohist LA Tablet (SR) see code "**B**"
Bisac-Evac Tablet (EC) see code "**D**"
Bisacodyl Tablet (EC) see code "**D**"
Boniva Tablet (alteration of tablet may cause oropharyngeal irritation)
Bromfed PD Capsule **(SR)**
Budeprion SR Tablet **(SR)**
Calan SR Tablet **(SR)** see code "**B**"
Carbatrol Capsule **(SR)** see code "**C**"
Cardene SR Capsule **(SR)**
Cardizem CD Capsule **(SR)**
Cardizem LA Tablet **(SR)**
Cardura XL Capsule **(SR)**
Cartia XT Capsule **(SR)**
Cefaclor Extended-release Tablet **(SR)**
Ceftin Tablet
Cefuroxime Tablet
CellCept Capsule, Tablet (potential for teratogenic reaction)
Chlor-Trimeton 12 Hour Tablet **(SR)**
Cipro XR Tablet **(SR)**
Claritin-D 12 Hour Tablet **(SR)**
Claritin-D 24 Hour Tablet **(SR)**
Colace Capsule
Colestid Tablet **(SR)**
Concerta Tablet **(SR)**
Commit Lozenge
Cotazym-S Capsule **(EC)** see code "**C**"
Covera-HS Tablet **(SR)**
Creon 5,10,20 Capsule **(SR)** see code "**C**"
Crixivan Capsule see code "**C**"
Cymbalta Capsule **(SR)**
Cytovene Capsule
Dallergy Tablet **(SR)**
scored tablet may be broken
Dallergy-JR Capsule **(SR)**
Deconamine SR Capsule **(SR)**
Depakene **(SR, MMI)**
Depakote Tablet **(SR)**
Depakote ER Tablet **(SR)**
Detrol LA Capsule **(SR)**
Dilacor XR Capsule **(SR)**
Dilatrate-SR Capsule **(SR)**
Diltiazem **LA, SR, CD, XR**
Ditropan XL Tablet **(SR)**
Divalproex ER Tablet **(SR)**
Doxidan Tablet **(SR)**
Drixoral Cold/Allergy Tablet **(SR)**
Drixoral Nondrowsy Tablet **(SR)**
Drixoral Allergy Sinus Tablet **(SR)**
Droxia Capsule
(wear gloves to open capsule)
Dulcolax Tablet, Capsule see code "**D**"
DynaCirc CR Tablet **(SR)**
Easprin Tablet **(EC)**
EC-Naprosyn Tablet **(EC)**
E.E.S. 400 Tablet **(EC)**
Effer-K Tablet **(EVT)**
Effexor XR Capsule **(SR)**
Efidac/24 Tablet **(SR)**
Enablex Tablet **(SR)**
Entex LA Capsule **(SR)**
Entocort EC Capsule **(EC)**
Equetro Capsule **(SR)**
Ergomar (Sublingual form)
Ery-Tab Tablet **(EC)**
Erythromycin Stearate Tablet **(EC)**
Erythromycin Base Tablet **(EC)**
Erythomycin Delayed-Release Capsule (pellets) (see code "**C**")
Evista Tablet
(potential for teratogenic reaction)
Feen-a-mint Tablet **(EC)**
Feldene Capsule **(MMI)**
Fentora Tablet
Feosol Tablet **(EC)**
Feratab Tablet **(EC)**
Fergon Tablet **(EC)**
Fero-Grad 500 mg Tablet **(SR)**
Ferro-Sequels Tablet **(SR)**
Flagyl ER Tablet **(SR)**
Fleet Laxative Tablet **(EC)**
Flomax Capsule **(SR)**
Focalin XR Capsule **(SR)** may be opened and sprinkled on food
Fosamax Tablet **(SR)**
Geocillin Tablet
Gleevec Tablet
Glipizide Tablet **(SR)**
Glucophage XR Tablet **(SR)**
Glucophage XL Tablet **(SR)**
Gluocotrol XL Tablet **(SR)**
Glumetza Tablet **(SR)**
Guaifed Capsule **(SR)**
Guaifenesin Tablet **(SR)**
Guaifenex DM, GP, PSE Tablets **(SR)**
Halfprin 81 Tablet **(EC)**
Hydrea Capsule
(wear gloves to administer)
Imdur Tablet **(SR)** see code "**B**"
Inderal LA Capsule **(SR)**
Indocin SR Capsule **(SR)**
InnoPran XL Capsule **(SR)**
Intelence Tablet
(may disperse tablet in water)
Invega Tablet **(SR)**
Isoptin SR Tablet **(SR)**
Isordil Sublingual Tablet
Isorsorbide Dinitrate Sublingual Tablet
Kadian Capsule **(SR)**
Not to be given thru N/G tubes
Kaletra Tablet
Kaon CL-10 Tablet **(SR)**
Keppra Tablet
Ketek Tablet **(SR)**
Klor-Con Tablet **(SR)**
Klotrix Tablet **(SR)**
K-Lyte CL, DS Tablets **(EVT)**
K-Tab Tablet **(SR)**
Lamictal XR Tablet **(SR)**
Lescol XL Tablet **(SR)**
Levbid Tablet **(SR)**
Levsinex Timecaps Capsule **(SR)**
Lexxel Tablet **(SR)**
Liadal Tablet **(SR)**
Lipram UL Capsule **(EC, SR)** see code "**C**"
Lipram
Lithobid Tablet **(SR)**
Lovaza Capsule (do not put contents of capsule in styrofoam or plastic container)
Luvox CR Capsule **(SR)**
Mestinon Timespan Tablet **(SR)**

# DO NOT CRUSH!

**MEDICATIONS THAT SHOULD NOT BE CRUSHED:**

Metadate ER Tablet **(SR)**
Metadate CD Capsule **(SR)**
Methylin ER Tablet **(SR)**
Metoprolol ER Tablet **(SR)** see code "**C**"
Micro K Extendcaps Capsue **(SR)** see codes "**A**" & "**C**"
Modane Tablet **(EC)** see code "**D**"
Moxatag Tablet **(SR)**
Morphine Sulfate extended-release tablet **(SR)**
Motrin Tablet
MS Contin Tablet **(SR)** see code "**A**"
Mucinex Tablet **(SR)**
Mucinex DM Tablet **(SR)**
Myfortic Tablet **(SR)**
Neprelan Tablet **(SR)**
Nasatab LA Tablet **(SR)** see code "**B**"
Nexium Capsule **(SR)** see code "**C**"
Niaspan Tablet **(SR)**
Nicotinic Acid Capsule, Tablet **(SR)** see code "**B**"
Nifedical XL Tablet **(SR)**
Nefedipine extended-release Tablet **(SR)**
NitroQuick Tablet (sublingual only) see code "**E**"
Nitrostat Tablet (sublingual only) see code "**E**"
Norpace CR Capsule **(SR)**
**Opana ER (Crushing tablet may be fatal)
Oramorph SR Tablet **(SR)** see code "**A**"
**OxyContin (Crushing table may be fatal)
Pancrease MT Capsule **(EC)** see code "**C**"
Pancrecarb MS Capsule **(EC)** see code "**C**"
Pancrelipase Capsule **(EC)** see code "**C**"
Paxil CR Tablet **(SR)**
Plendil Tablet **(SR)**
Prevacid Capsule **(SR)**
Prevacid Solu Tablet **(ODT)** may dissolve in water to administer via NG tubes
Prevacid Suspension **(SR)** may mix with water only – **DO NOT** use in NG tubes
Prilosec Capsule **(SR)**
Prilosec OTC Tablet
Procardia XL Capsule **(SR)**
Propecia Tablet (women of child-bearing age should not handle tablet)
Proquin XR Tablet **(SR)**
Proscar Tablet (women of child-bearing age should not handle tablet)
Protonix Tablet **(SR)**
Prozac Weekly Tablet **(EC)**
Ranexa Tablet **(SR)**
Razadyne ER Capsule **(SR)**
Renagel Tablet
Requip XL Tablet **(SR)**
Respa-1st Tablet **(SR)** see code "**B**"
Respa-DM Tablet **(SR)** see code "**B**"
Respahist Capsule **(SR)** see code "**C**"
Respaire 60 SR, 120 SR Capsule **(SR)**
Resperdal M-Tablet **(ODT)**
Revlimid Capsule (potential for teratogenic reaction)
Ritalin LA Capsule **(SR)** see code "**C**"
Ritalin SR Tablet **(SR)**
Rythmol RS Capsule **(SR)**
Seroquel XR Tablet **(SR)**
Sinemet CR Tablet **(SR)**
Slo-Mag Tablet **(EC)**
Solodyne Tablet **(SR)**
Straterra Capsule
Sudafed 12 hr Capsule **(SR)** see code "**A**"
Sudafed 24 hr Capsule **(SR)** see code "**A**"
Sular Tablet **(SR)**
Taztia XT Capsule **(SR)** see code "**C**"
Tegretol-XR Tablet **(SR)**
Temodar Capsule
Tessalon Perles Capsule
Theo-24 Capsule
Tiazac Capsule **(SR)** see code "**C**"
Topomax Tablet/Capsule see code "**C**"
Toprol XLTablet **(SR)** see code "**B**"
Trental Tablet **(SR)**
Tylenol Arthritis Tablet **(SR)**
Ultram ER Tablet **(SR)** (Crushing tablet may be fatal)
Uniphyl Tablet **(SR)**
Uroxatral Tablet **(SR)**
Valcyte Tablet (potential for teratogenic reaction)
Verapamil SR Tablet **(SR)** see code "**B**"
Verelan Capsule **(SR)** see code "**C**"
Verelan PM Capsule **(SR)** see code "**C**"
VesiCare Tablet **(EC)**
Videx EC Capsule **(SR)**
Voltaren XR Tablet **(SR)**
Wellbutrin SR, XL Tablet **(SR)**
Xanax XR Tablet **(SR)**
Zorprin Tablet **(SR)**
Zyban Tablet **(SR)**
Zyflo CR Tablet **(SR)**

**CODES:**

**A:** Liquid forms are available
**B:** Tablets that are scored may be broken in half
**C:** Capsule can be opened – contents may be used in pudding or applesauce
**D:** Do not take with antacids or milk products
**E:** Disintegrate under the tongue – do not chew

**TERATOGENIC REACTION:**

An adverse effect to normal cellular development of an embryo or fetus.

## TALL MAN LETTERING CHANGES

The Food and Drug Administration has asked manufacturers to update the appearance of 33 look-alike drug names. The changes involve using capital letters ("Tall Man") to minimize medication errors resulting from look-alike confusion.

## abacavir (ah-back-ah-veer)

Ziagen

***Classification***

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors

**Pregnancy Category C**

### Indications

Management of HIV infection (AIDS) in combination with other antiretrovirals (not with lamivudine and/or tenofovir).

### Action

Converted inside cells to carbovir triphosphate, its active metabolite. Carbovir triphosphate inhibits the activity of HIV-1 reverse transcriptase, which in turn terminates viral DNA growth. **Therapeutic Effects:** Slows the progression of HIV infection and decreases the occurrence of its sequelae. Increases CD4 cell counts and decreases viral load.

### Pharmacokinetics

**Absorption:** Rapidly and extensively (83%) absorbed.

**Distribution:** Distributes into extravascular space and readily distributes into erythrocytes.

**Metabolism and Excretion:** Mostly metabolized by the liver; 1.2% excreted unchanged in urine.

**Half-life:** 1.5 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity (rechallenge may be fatal); Lactation: Breastfeeding not recommended for HIV-infected patients.

**Use Cautiously in:** Coronary heart disease; OB: Safety not established; Pedi: Children <3 mo (safety not established).

**Exercise Extreme Caution in:** Patients positive for HLA-B*5701 allele (unless exceptional circumstances exist where benefits clearly outweigh the risks).

### Adverse Reactions/Side Effects

**CNS:** headache, insomnia. **CV:** MYOCARDIAL INFARCTION. **GI:** HEPATOMEGALY (WITH STEATOSIS), diarrhea, nausea, vomiting, anorexia. **Derm:** rashes. **F and E:** LACTIC ACIDOSIS. **Misc:** HYPERSENSITIVITY REACTIONS.

### Interactions

**Drug-Drug: Alcohol** ↑ blood levels. May ↑ **methadone** metabolism in some patients; slight ↑ in **methadone** dosing may be needed.

### Route/Dosage

**PO (Adults):** 300 mg twice daily.

**PO (Children 3 mo–16 yr):** 8 mg/kg twice daily (not to exceed 300 mg twice daily).

### Availability

**Tablets:** 300 mg. **Oral solution (strawberry/banana flavor):** 20 mg/mL in 240-mL bottles. ***In combination with:*** lamivudine (Epzicom); lamivudine and zidovudine (Trizivir). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess for signs of hypersensitivity reactions (fever; rash; gastrointestinal—nausea, vomiting, diarrhea, abdominal pain; constitutional—malaise, fatigue, achiness; respiratory—dyspnea, cough, pharyngitis). May also cause elevated liver function tests, increased creatine phosphokinase or creatinine, and lymphopenia. Patients who carry the HLA-B*5701 allele are at high risk for hypersensitivity reaction. Discontinue promptly if hypersensitivity reaction is suspected. Regardless of HLA-B*5701 status, permanently discontinue abacavir if hypersensitivity cannot be ruled out, even when other diagnoses are possible. Following a hypersensitivity reaction, never restart abacavir or abacavir-containing products. More severe symptoms may occur within hours and may include life-threatening hypotension and death. Symptoms usually resolve upon discontinuation.
- May cause lactic acidosis and severe hepatomegaly with steatosis. Monitor patient for signs (↑ serum lactate levels, ↑ liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.

- Screen for HLA-B*5701 allele prior to initiation of therapy to decrease risk of hypersensitivity reaction. Screening is also recommended prior to reinitiation of abacavir in patients of unknown HLA-B*5701 status who have previously tolerated abacavir.
- Monitor liver function. May cause ↑ levels of AST, ALT, and alkaline phosphatase, which usually resolve after interruption of therapy. Lactic acidosis may occur with hepatic toxicity, causing hepatic steatosis; may be fatal, especially in women.
- May cause ↑ serum glucose and triglyceride levels.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** May be administered with or without food. Oral solution may be stored at room temperature or refrigerated; do not freeze. Tablet may be used with children if able to swallow and dose is correctly calculated.

### Patient/Family Teaching

- Emphasize the importance of taking abacavir as directed. Must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount, and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Instruct patient not to share abacavir with others.
- Inform patient that abacavir does not cure AIDS or prevent associated or opportunistic infections. Abacavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom, and avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of abacavir are unknown at this time.
- Advise patient of potential for hypersensitivity reactions that may result in death. Instruct patient to discontinue abacavir and notify health care professional immediately if symptoms of hypersensitivity occur. *Medication guide* for patients should be dispensed with prescription. Advise patient to read it thoroughly with each refill. A warning card summarizing symptoms of abacavir hypersensitivity should be provided with each prescription; instruct patient to carry card at all times.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes

- Delayed progression of AIDS, and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

## acarbose (aye-**kar**-bose)

Precose

***Classification***

Therapeutic: antidiabetics
Pharmacologic: alpha-glucosidase inhibitors

**Pregnancy Category B**

### Indications

Management of type 2 diabetes in conjunction with dietary therapy; may be used with insulin or other hypoglycemic agents.

### Action

Lowers blood glucose by inhibiting the enzyme alpha-glucosidase in the GI tract. Delays and reduces glucose absorption. **Therapeutic Effects:** Lowering of blood glucose in diabetic patients, especially postprandial hyperglycemia.

### Pharmacokinetics

**Absorption:** <2% systemically absorbed; action is primarily local (in the GI tract).
**Distribution:** Unknown.
**Metabolism and Excretion:** Minimal amounts absorbed are excreted by the kidneys.
**Half-life:** 2 hr.

TIME/ACTION PROFILE (effect on blood glucose)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1 hr | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Diabetic ketoacidosis; Cirrhosis; Serum creatinine >2 mg/dL; OB: Lactation, Pedi: Safety not established.
**Use Cautiously in:** Presence of fever, infection, trauma, stress (may cause hyperglycemia, requiring alternative therapy).

### Adverse Reactions/Side Effects

**GI:** abdominal pain, diarrhea, flatulence, ↑ transaminases.

### Interactions

**Drug-Drug: Thiazide diuretics** and **loop diuretics**, **corticosteroids**, **phenothiazines**, **thy-**

**roid preparations**, **estrogens (conjugated)**, **progestins**, **hormonal contraceptives**, **phenytoin**, **niacin**, **sympathomimetics**, **calcium channel blockers**, and **isoniazid** may ↑ glucose levels in diabetic patients and lead to ↓ control of blood glucose. Effects are ↓ by **intestinal adsorbents**, including **activated charcoal** and **digestive enzyme preparations (amylase, pancreatin)**; avoid concurrent use. ↑ effects of **sulfonylurea hypoglycemic agents**. May ↓ absorption of **digoxin**; may require dosage adjustment.

**Drug-Natural Products: Glucosamine** may worsen blood glucose control. **Chromium** and **coenzyme Q-10** may ↑ hypoglycemic effects.

### Route/Dosage

**PO (Adults):** 25 mg 3 times daily; may be increased q 4–8 wk as needed/tolerated (range 50–100 mg 3 times daily; not to exceed 50 mg 3 times daily in patients ≤60 kg or 100 mg 3 times daily in patients >60 kg).

### Availability (generic available)

**Tablets:** 25 mg, 50 mg, 100 mg.

## NURSING IMPLICATIONS

### Assessment

- Observe patient for signs and symptoms of hypoglycemia (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety) when taking concurrently with other oral hypoglycemic agents.
- ***Lab Test Considerations:*** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness.
- Monitor AST and ALT every 3 mo for the 1st yr and then periodically. Elevated levels may require dose reduction or discontinuation of acarbose. Elevations occur more commonly in patients taking more than 300 mg/day and in female patients. Levels usually return to normal without other evidence of liver injury after discontinuation.
- ***Toxicity and Overdose:*** Symptoms of overdose are transient increase in flatulence, diarrhea, and abdominal discomfort. Acarbose alone does not cause hypoglycemia; however, other concurrently administered hypoglycemic agents may produce hypoglycemia requiring treatment.

### Potential Nursing Diagnoses

Imbalanced nutrition: more than body requirements (Indications)

Noncompliance (Patient/Family Teaching)

### Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- Does not cause hypoglycemia when taken while fasting, but may increase hypoglycemic effect of other hypoglycemic agents.
- **PO:** Administer with first bite of each meal 3 times/day.

### Patient/Family Teaching

- Instruct patient to take acarbose at same time each day. If a dose is missed and the meal is completed without taking the dose, skip missed dose and take next dose with the next meal. Do not double doses.
- Explain to patient that acarbose controls hyperglycemia but does not cure diabetes. Therapy is longterm.
- Review signs of hypoglycemia and hyperglycemia (blurred vision; drowsiness; dry mouth; flushed, dry skin; fruit-like breath odor; increased urination; ketones in urine; loss of appetite; stomachache; nausea or vomiting; tiredness; rapid, deep breathing; unusual thirst; unconsciousness) with patient. If hypoglycemia occurs, advise patient to take a form of oral glucose (e.g., glucose tablets, liquid gel glucose) rather than sugar (absorption of sugar is blocked by acarbose) and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and urine ketones. Monitor closely during periods of stress or illness. Notify health care professional if significant changes occur.
- Caution patient to avoid using other medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of oral glucose and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up examinations.

### Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

## acetaminophen

(a-seet-a-**min**-oh-fen)

Abenol, Acephen, Aceta, Aminofen, Apacet, APAP, Apo-Acetaminophen, Aspirin Free Anacin, Aspirin Free Pain Relief, Children's Pain Reliever, Dapacin, Feverall, Extra Strength Dynafed E.X., Extra Strength Dynafed (Billups, P.J.), Genapap, Genebs, Halenol, Infant's Pain Reliever, Liquiprin, Mapap, Maranox, Meda, Neopap, Novo-Gesic, Oraphen-PD, Panadol, paracetamol, Redutemp, Ridenol, Silapap, Tapanol, Tempra, Tylenol, Uni-Ace

***Classification***

Therapeutic: antipyretics, nonopioid analgesics

**Pregnancy Category B**

### Indications

Mild pain. Fever.

### Action

Inhibits the synthesis of prostaglandins that may serve as mediators of pain and fever, primarily in the CNS. Has no significant anti-inflammatory properties or GI toxicity. **Therapeutic Effects:** Analgesia. Antipyresis.

### Pharmacokinetics

**Absorption:** Well absorbed following oral administration. Rectal absorption is variable.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk in low concentrations.
**Metabolism and Excretion:** 85–95% metabolized by the liver. Metabolites may be toxic in overdose situation. Metabolites excreted by the kidneys.
**Half-life:** Neonates: 2–5 hr. Adults: 1–3 hr.

TIME/ACTION PROFILE (analgesia and antipyresis)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 0.5–1 hr | 1–3 hr | 3–8 hr† |
| Rect | 0.5–1 hr | 1–3 hr | 3–4 hr |

†Depends on dose

### Contraindications/Precautions

**Contraindicated in:** Previous hypersensitivity; Products containing alcohol, aspartame, saccharin, sugar, or tartrazine (FDC yellow dye #5) should be avoided in patients who have hypersensitivity or intolerance to these compounds.
**Use Cautiously in:** Hepatic disease/renal disease (lower chronic doses recommended); Chronic alcohol use/abuse; Malnutrition.

### Adverse Reactions/Side Effects

**GI:** HEPATIC FAILURE, HEPATOTOXICITY (overdose). **GU:** renal failure (high doses/chronic use). **Hemat:** neutropenia, pancytopenia, leukopenia. **Derm:** rash, urticaria.

### Interactions

**Drug-Drug:** Chronic high-dose acetaminophen (>2 g/day) may ↑ risk of bleeding with **warfarin** (PT should be monitored regularly and INR should not exceed 4). Hepatotoxicity is additive with other **hepatotoxic substances**, including **alcohol**. Concurrent use of **sulfinpyrazone**, **isoniazid**, **rifampin**, **rifabutin**, **phenytoin**, **barbiturates**, and **carbamazepine** may ↑ the risk of acetaminophen-induced liver damage (limit self-medication); these agents will also ↓ therapeutic effects of acetaminophen. Concurrent **NSAIDs** ↑ the risk of adverse renal effects (avoid chronic concurrent use). **Propranolol** ↓ metabolism and may ↑ effects. May ↓ effects of **lamotrigine** and **zidovudine**.

### Route/Dosage

Children ≤12 yr should not receive >5 doses/24 hr without notifying physician or other health care professional.
**PO (Adults and Children >12 yr):** 325–650 mg q 4–6 hr or 1 g 3–4 times daily or 1300 mg q 8 hr (not to exceed 4 g or 2.5 g/24 hr in patients with hepatic/renal impairment).
**PO (Children 1–12 yr):** 10–15 mg/kg/dose q 4–6 hr as needed (not to exceed 5 doses/24 hr).
**PO (Infants):** 10–15 mg/kg/dose q 4–6 hr as needed (not to exceed 5 doses/24 hr).
**PO (Neonates):** 10–15 mg/kg/dose q 6–8 hr as needed.
**Rect (Adults and Children > 12 yr):** 325–650 mg q 4–6 hr as needed or 1 g 3–4 times/day (not to exceed 4 g/24 hr).
**Rect (Children 1–12 yr):** 10–20 mg/kg/dose q 4–6 hr as needed.
**Rect (Infants):** 10–20 mg/kg/dose q 4–6 hr as needed.
**Rect (Neonates):** 10–15 mg/kg/dose q 6–8 hr as needed.

### Availability (generic available)

**Chewable tablets (fruit, bubblegum, or grape flavor):** 80 mg[OTC], 160 mg[OTC]. **Tablets:** 160 mg[OTC], 325 mg[OTC], 500 mg[OTC], 650 mg[OTC]. **Caplets:** 325 mg[OTC], 500 mg[OTC]. **Solution (berry, fruit, and grape flavor):** 100 mg/mL[OTC]. **Liquid (mint):** 160 mg/5 mL[OTC], 500 mg/15 mL[OTC]. **Elixir (grape and cherry flavor):** 160 mg/5 mL[OTC]. **Drops:** 100 mg/ mL [OTC]. **Suspension:** 🍁 100 mg/mL[OTC], 🍁 160 mg/5 mL[OTC]. **Syrup:** 160 mg/5 mL[OTC]. **Suppositories:** 80 mg[OTC], 120 mg[OTC], 325 mg[OTC], 650 mg[OTC]. ***In combination with:*** many other medications. See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess overall health status and alcohol usage before administering acetaminophen. Patients who are malnourished or chronically abuse alcohol are at higher risk of developing hepatotoxicity with chronic use of usual doses of this drug.
- Assess amount, frequency, and type of drugs taken in patients self-medicating, especially with OTC drugs. Prolonged use of acetaminophen increases the risk of adverse renal effects. For short-term use, combined doses of acetaminophen and salicylates should not exceed the recommended dose of either drug given alone.
- **Pain:** Assess type, location, and intensity prior to and 30–60 min following administration.
- **Fever:** Assess fever; note presence of associated signs (diaphoresis, tachycardia, and malaise).
- ***Lab Test Considerations:*** Evaluate hepatic, hematologic, and renal function periodically during prolonged, high-dose therapy.
- May alter results of blood glucose monitoring. May cause falsely ↓ values when measured with glucose oxidase/peroxidase method, but probably not with hexokinase/G6PD method. May also cause falsely ↑ values with certain instruments; see manufacturer's instruction manual.
- Increased serum bilirubin, LDH, AST, ALT, and prothrombin time may indicate hepatotoxicity.
- ***Toxicity and Overdose:*** If overdose occurs, **acetylcysteine** (Acetadote) is the antidote.

### Potential Nursing Diagnoses

Acute pain (Indications)
Risk for imbalanced body temperature (Indications)

### Implementation

- When combined with opioids do not exceed the maximum recommended daily dose of acetaminophen.
- **PO:** Administer with a full glass of water.
- May be taken with food or on an empty stomach.

### Patient/Family Teaching

- Advise patient to take medication exactly as directed and not to take more than the recommended amount. Chronic excessive use of > 4 g/day (2 g in chronic alcoholics) may lead to hepatotoxicity, renal or cardiac damage. Adults should not take acetaminophen longer than 10 days and children not longer than 5 days unless directed by health care professional. Short-term doses of acetaminophen with salicylates or NSAIDs should not exceed the recommended daily dose of either drug alone.
- Advise patient to avoid alcohol (3 or more glasses per day increase the risk of liver damage) if taking more than an occasional 1–2 doses and to avoid taking concurrently with salicylates or NSAIDs for more than a few days, unless directed by health care professional.
- Pedi: Advise parents or caregivers to check concentrations of liquid preparations. Errors have resulted in serious liver damage. Have parents or caregivers determine the correct formulation and dose for their child (based on the child's age/weight), and demonstrate how to measure it using an appropriate measuring device.
- Inform patients with diabetes that acetaminophen may alter results of blood glucose monitoring. Advise patient to notify health care professional if changes are noted.
- Caution patient to check labels on all OTC products. Advise patients to avoid taking more than one product containing acetaminophen at a time to prevent toxicity.
- Advise patient to consult health care professional if discomfort or fever is not relieved by routine doses of this drug or if fever is greater than 39.5°C (103°F) or lasts longer than 3 days.

### Evaluation/Desired Outcomes

- Relief of mild pain.
- Reduction of fever.

## acetaZOLAMIDE

(a-seet-a-**zole**-a-mide)

Acetazolam, Apo-Acetazolamide, Diamox, Diamox Sequels

***Classification***

Therapeutic: anticonvulsants, antiglaucoma agents, diuretics, ocular hypotensive agent
Pharmacologic: carbonic anhydrase inhibitors

**Pregnancy Category C**

### Indications

Lowering of intraocular pressure in the treatment of glaucoma. Management of acute altitude sickness. Edema due to congestive heart failure. Adjunct to the treatment of refractory seizures. **Unlabeled Use:** Reduce cerebrospinal fluid production in hydrocephalus. Prevention of renal calculi composed of uric acid or cystine.

### Action

Inhibition of carbonic anhydrase in the eye results in decreased secretion of aqueous humor. Inhibition of renal carbonic anhydrase, resulting in self-limiting urinary excretion of sodium, potassium, bicarbonate, and water. CNS inhibition of carbonic anhydrase and resultant diuresis may ↓ abnormal neuronal firing. Alkaline diuresis prevents precipitation of uric acid or cystine in the urinary tract. **Therapeutic Effects:** Lowering of intraocular pressure. Control of some types of seizures. Prevention and treatment of acute altitude sickness. Diuresis and subsequent mobilization of excess fluid. Prevention of uric acid or cystine renal calculi.

### Pharmacokinetics

**Absorption:** Dose dependent; erratic with doses >10 mg/kg/day.
**Distribution:** Crosses the placenta and blood-brain barrier; enters breast milk.
**Protein Binding:** 95%.
**Metabolism and Excretion:** Excreted mostly unchanged in urine.
**Half-life:** 2.4–5.8 hr.

TIME/ACTION PROFILE (lowering of intraocular pressure)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–1.5 hr | 2–4 hr | 8–12 hr |
| PO-ER | 2 hr | 8–18 hr | 18–24 hr |
| IV | 2 min | 15 min | 4–5 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity or cross-sensitivity with sulfonamides may occur; Hepatic disease or insufficiency; Concurrent use with ophthalmic carbonic anhydrase inhibitors (brinzolamide, dorzolamide) is not recommended; OB: Avoid during first trimester of pregnancy.
**Use Cautiously in:** Chronic respiratory disease; Electrolyte abnormalities; Gout; Renal disease (dosage reduction necessary for CCr <50 mL/min); Diabetes mellitus; OB: Use with caution during second or third trimester of pregnancy; Lactation: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** depression, tiredness, weakness, drowsiness. **EENT:** transient nearsightedness. **GI:** anorexia, metallic taste, nausea, vomiting, melena. **GU:** crystalluria, renal calculi. **Derm:** STEVENS-JOHNSON SYNDROME, rashes. **Endo:** hyperglycemia. **F and E:** hyperchloremic acidosis, hypokalemia, growth retardation (in children receiving chronic therapy). **Hemat:** APLASTIC ANEMIA, HEMOLYTIC ANEMIA, LEUKOPENIA. **Metab:** weight loss, hyperuricemia. **Neuro:** paresthesias. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug:** Excretion of **barbiturates**, **aspirin**, and **lithium** is ↑ and may lead to ↓ effectiveness. Excretion of **amphetamine**, **quinidine**, **procainamide**, and possibly **tricyclic antidepressants** is ↓ and may lead to toxicity. May ↑ **cyclosporine** levels.

### Route/Dosage

**PO (Adults):** *Glaucoma (open angle)*—250–1000 mg/day in 1–4 divided doses (up to 250 mg q 4 hr) or 500-mg extended-release capsules twice daily. *Epilepsy*—4–16 mg/kg/day in 1–4 divided doses (maximum 30 mg/kg/day or 1 g/day). *Altitude sickness*—250 mg 2–4 times daily started 24–48 hr before ascent, continued for 48 hr or longer to control symptoms. *Antiurolithic*—250 mg at bedtime. *Edema*—250–375 mg/day. *Urine alkalinization*—5 mg/kg/dose repeated 2–3 times over 24 hr.
**PO (Children):** *Glaucoma*—8–30 mg/kg (300–900 mg/m²/day) in 3 divided doses (usual range 10–15 mg/kg/day). *Edema*—5 mg/kg/dose once daily. *Epilepsy*—4–16 mg/kg/day in 1–4 divided doses (maximum 30 mg/kg/day or 1 g/day).
**PO (Neonates):** *Hydrocephalus*—5 mg/kg/dose q 6 hr ↑ by 25 mg/kg/day up to a maximum of 100 mg/kg/day.
**IV (Adults):** *Glaucoma (closed angle)*—250–500 mg, may repeat in 2–4 hr to a maximum of 1 g/day. *Edema*—250–375 mg/day.

**IV (Children):** *Glaucoma*—5–10 mg/kg q 6 hr, not to exceed 1 g/day. *Edema*—5 mg/kg/dose once daily.
**IV (Neonates):** *Hydrocephalus*—5 mg/kg/dose q 6 hr ↑ by 25 mg/kg/day up to a maximum of 100 mg/kg/day.

### Availability (generic available)

**Tablets:** 125 mg, 250 mg. **Extended-release capsules:** 500 mg. **Injection:** 500 mg.

## NURSING IMPLICATIONS

### Assessment

- Observe for signs of hypokalemia (muscle weakness, malaise, fatigue, ECG changes, vomiting).
- Assess for allergy to sulfonamides.
- **Intraocular Pressure:** Assess for eye discomfort or decrease in visual acuity.
- **Seizures:** Monitor neurologic status in patients receiving acetazolamide for seizures. Initiate seizure precautions.
- **Altitude Sickness:** Monitor for decrease in severity of symptoms (headache, nausea, vomiting, fatigue, dizziness, drowsiness, shortness of breath). Notify health care professional immediately if neurologic symptoms worsen or if patient becomes more dyspneic and rales or crackles develop.
- **Edema:** Monitor intake and output ratios and daily weight during therapy.
- ***Lab Test Considerations:*** Serum electrolytes, complete blood counts, and platelet counts should be evaluated initially and periodically throughout prolonged therapy. May cause ↓ potassium, bicarbonate, WBCs, and RBCs. May cause ↑ serum chloride.
- May cause ↑ in serum and urine glucose; monitor serum and urine glucose carefully in diabetic patients.
- May cause false-positive results for urine protein and 17-hydroxysteroid tests.
- May cause ↑ blood ammonia, bilirubin, uric acid, urine urobilinogen, and calcium. May ↓ urine citrate.

### Potential Nursing Diagnoses

Disturbed sensory perception (visual) (Indications)

### Implementation

- Do not confuse acetazolamide with acetohexamide.
- Encourage fluids to 2000–3000 mL/day, unless contraindicated, to prevent crystalluria and stone formation.
- A potassium supplement without chloride should be administered concurrently with acetazolamide.
- **PO:** Give with food to minimize GI irritation. Tablets may be crushed and mixed with fruit-flavored syrup to minimize bitter taste for patients with difficulty swallowing. Extended-release capsules may be opened and sprinkled on soft food, but do not crush, chew, or swallow contents dry. Extended-release capsules are only indicated for glaucoma and altitude sickness; do not use for epilepsy or diuresis.
- **IM:** Extremely painful; avoid if possible.

#### IV Administration

- **Direct IV:** ***Diluent:*** Dilute 500 mg of acetazolamide in at least 5 mL of sterile water for injection. Use reconstituted solution within 24 hr. ***Concentration:*** 100 mg/mL. ***Rate:*** Not to exceed 500 mg/min.
- **Intermittent Infusion:** ***Diluent:*** Further dilute in 50–100 mL of D5W, D10W, 0.45% NaCl, 0.9% NaCl, LR, or combinations of dextrose and saline or dextrose and LR solution. ***Concentration:*** 5–10 mg/mL. ***Rate:*** Infuse over 15–30 min.

### Patient/Family Teaching

- Instruct patient to take as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Patients on anticonvulsant therapy may need to gradually withdraw medication.
- Advise patient to report numbness or tingling of extremities, weakness, rash, sore throat, unusual bleeding or bruising, fever, or signs/symptoms of a sulfonamide adverse reaction (Stevens-Johnson syndrome [flu-like symptoms, spreading red rash, or skin/mucous membrane blistering], toxic epidermal necrolysis [widespread peeling/blistering of skin]) to health care professional. If hematopoietic reactions, fever, rash, hepatic, or renal problems occur, acetazolamide should be discontinued.
- May occasionally cause drowsiness. Caution patient to avoid driving and other activities that require alertness until response to the drug is known.
- Caution patient to use sunscreen and wear protective clothing to prevent photosensitivity reactions.

- Advise patient to consult health care professional before taking other Rx, OTC, or herbal products.
- **Intraocular Pressure:** Advise patient of the need for periodic ophthalmologic exams; loss of vision may be gradual and painless.

### Evaluation/Desired Outcomes

- Decrease in intraocular pressure when used for glaucoma. If therapy is not effective or patient is unable to tolerate one carbonic anhydrase inhibitor, using another may be effective and more tolerable.
- Decrease in the frequency of seizures.
- Reduction of edema.
- Prevention of altitude sickness.
- Prevention of uric acid or cystine stones in the urinary tract.

## acetylcysteine

(a-se-teel-**sis**-teen)

Acetadote, Mucomyst, Parvolex

***Classification***

Therapeutic: antidotes (for acetaminophen toxicity), mucolytic

**Pregnancy Category B**

### Indications

**PO:** Antidote for the management of potentially hepatotoxic overdosage of acetaminophen (administer within 24 hours of ingestion). **IV:** Antidote for the management of potentially hepatotoxic overdosage of acetaminophen (administer within 8–10 hours of ingestion). **Inhaln:** Mucolytic in the management of conditions associated with thick viscid mucous secretions. **Unlabeled Use:** Prevention of radiocontrast-induced renal dysfunction (oral).

### Action

**PO:** Decreases the buildup of a hepatotoxic metabolite in acetaminophen overdosage. **IV:** Decreases the buildup of a hepatotoxic metabolite in acetaminophen overdosage. **Inhaln:** Degrades mucus, allowing easier mobilization and expectoration. **Therapeutic Effects: PO:** Prevention or lessening of liver damage following acetaminophen overdose. **Inhaln:** Lowers the viscosity of mucus.

### Pharmacokinetics

**Absorption:** Absorbed from the GI tract following oral administration. Action is local following inhalation; remainder may be absorbed from pulmonary epithelium.

**Distribution:** Crosses the placenta; 0.47 L/kg.

**Protein Binding:** 83% bound to plasma proteins.

**Metabolism and Excretion:** Partially metabolized by the liver, 22% excreted renally.

**Half-life:** *Adults*—5.6 hr (↑ in hepatic impairment) *newborns*—11 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (antidote) | unknown | 30–60 min | 4 hr |
| Inhaln (mucolytic) | 1 min | 5–10 min | short |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.

**Use Cautiously in:** Severe respiratory insufficiency, asthma, or history of bronchospasm; History of GI bleeding (oral only); OB, Lactation: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** drowsiness. **CV:** vasodilation. **EENT:** rhinorrhea. **Resp:** bronchospasm, bronchial/tracheal irritation, chest tightness, increased secretions. **GI:** nausea, vomiting, stomatitis. **Derm:** rash, clamminess, pruritus, urticaria. **Misc:** allergic reactions (primarily with IV), including ANAPHYLAXIS, ANGIOEDEMA, chills, fever.

### Interactions

**Drug-Drug: Activated charcoal** may adsorb orally administered acetylcysteine and decrease its effectiveness as an antidote.

### Route/Dosage

### Acetaminophen Overdose

**PO (Adults and Children):** 140 mg/kg initially, followed by 70 mg/kg q 4 hr for 17 additional doses.

**IV (Adults and Children):** *Loading dose*—150 mg/kg over 15 min initially followed by *First maintenance dose*—50 mg/kg over 4 hr, then *second maintenance dose*—100 mg/kg over 16 hr.

### Mucolytic

**Inhaln (Adults and Children):** *Nebulization via face mask*—3–5 mL of 20% solution or 6–10 mL of the 10% solution 3–4 times daily (range—1–10 mL of 20% solution or 2–20 mL of 10% solution q 2–6 hr); *nebulization via tent or croupette*—volume of 10–20% solution required to maintain heavy mist; *direct instillation*—1–2 mL of 10–20% solution q 1–4 hr; *intratracheal instillation via tracheostomy*—1–2 mL of 10–20% solution q 1–4 hr (up to 2–5 mL of 20% solution via tracheal catheter into

particular segments of the bronchopulmonary tree).

### Prevention of Radiocontrast-Induced Renal Dysfunction

**PO (Adults):** 600 mg twice daily for 2 days, beginning the day before the procedure.

### Availability (generic available)

**Solution for inhalation:** 10% in 4-, 10-, and 30-mL vials, 20% in 4-, 10-, 30-, and 100–mL vials. **Solution for injection:** 20% in 30–mL vials.

## NURSING IMPLICATIONS

### Assessment

- **Antidote in Acetaminophen Overdose:** Assess type, amount, and time of acetaminophen ingestion. Assess plasma acetaminophen levels. Initial levels are drawn at least 4 hr after ingestion of acetaminophen. Plasma level determinations may be difficult to interpret following ingestion of extended-release preparations. Do not wait for results to administer dose.
- *IV:* Assess for anaphylactoid reaction. Erythema and flushing are common, usually occurring 30–60 min after initiating infusion, and may resolve with continued administration. If rash, hypotension, wheezing, dyspnea occur, initiate treatment for anaphylaxis (antihistamine and epinephrine). Acetylcysteine infusion should be interrupted until symptoms resolve and carefully restarted. If anaphylactoid reaction recurs, discontinue acetylcysteine and use alternative form of treatment.
- Monitor AST, ALT, and bilirubin levels along with prothrombin time every 24 hr for 96 hr in patients with plasma acetaminophen levels indicating potential hepatotoxicity.
- Monitor cardiac and renal function (creatinine, BUN), serum glucose, and electrolytes. Maintain fluid and electrolyte balance, correct hypoglycemia, and administer vitamin K or fresh frozen plasma or clotting factor concentrate if prothrombin time ratio exceeds 1.5 or 3, respectively.
- Assess patient for nausea, vomiting, and urticaria. Notify health care professional if these occur.
- **Mucolytic:** Assess respiratory function (lung sounds, dyspnea) and color, amount, and consistency of secretions before and immediately following treatment to determine effectiveness of therapy.

### Potential Nursing Diagnoses

Risk for self-directed violence (Indications)
Ineffective airway clearance (Indications)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

- After opening, solution for inhalation may turn light purple; does not alter potency. Refrigerate open vials and discard after 96 hr.
- Drug reacts with rubber and metals (iron, nickel, copper); avoid contact with these substances.
- **PO: Acetaminophen Overdose—** First empty stomach contents by inducing emesis or lavage. Dilute 20% solution with cola, water, or juice to a final concentration of 1:3 for patients weighing up to 20 kg or with enough diluent to make a 5% solution for patients weighing more than 20 kg, to increase palatability. May be administered by duodenal tube if patient is unable to swallow. If patient vomits loading dose or maintenance doses within 1 hr of administration, readminister dose.

#### IV Administration

- **Intermittent Infusion:** Most effective if administered within 8 hr of acetaminophen ingestion. Dilute in D5W. *For loading dose:* Dilute 150 mg/kg in 200 mL. *For 1st Maintenance Dose:* Dilute 50 mg/kg in 500 mL. *For 2nd Maintenance Dose:* Dilute 100 mg/kg in 1000 mL. Adjust fluid volume for patients <40 kg or requiring fluid restriction. Vials are single-use. Discard after using. Reconstituted solution is stable for 24 hr at room temperature. ***Rate:*** Administer *Loading Dose* over 15 min.
- Administer *1st Maintenance Dose* over 4 hr.
- Administer *2nd Maintenance Dose* over 16 hr.
- **Inhaln: Mucolytic—** Encourage adequate fluid intake (2000–3000 mL/day) to decrease viscosity of secretions.
- For nebulization, the 20% solution may be diluted with 0.9% NaCl for injection or inhalation or sterile water for injection or inhalation. May use 10% solution undiluted. May be administered by nebulization, or 1–2 mL may be instilled directly into airway. During administration, when 25% of medication remains in nebulizer, dilute with equal amount of 0.9% NaCl or sterile water.
- An increased volume of liquefied bronchial secretions may occur following administration.

Have suction equipment available for patients unable to effectively clear airways.
- If bronchospasm occurs during treatment, discontinue and consult health care professional regarding possible addition of bronchodilator to therapy. Patients with asthma or hyperactive airway disease should be given a bronchodilator prior to acetylcysteine to prevent bronchospasm.
- Rinse patient's mouth and wash face following treatment, as drug leaves a sticky residue.

### Patient/Family Teaching
- **Acetaminophen Overdose:** Explain purpose of medication to patient.
- **Inhaln:** Instruct patient to clear airway by coughing deeply before taking aerosol treatment.
- Inform patient that unpleasant odor of this drug becomes less noticeable as treatment progresses and medicine dissipates.

### Evaluation/Desired Outcomes
- Decreased acetaminophen levels.
- No further increase in hepatic damage during acetaminophen overdose therapy.
- Decreased dyspnea and clearing of lung sounds when used as a mucolytic.
- Prevention of radiocontrast-induced renal dysfunction.

## **acyclovir** (ay-**sye**-kloe-veer)
Avirax, Zovirax

***Classification***
Therapeutic: antivirals
Pharmacologic: purine analogues

**Pregnancy Category B (PO, IV), C (topical)**

### Indications
**PO:** Recurrent genital herpes infections. Localized cutaneous herpes zoster infections (shingles) and chickenpox (varicella). **IV:** Severe initial episodes of genital herpes in nonimmunosuppressed patients. Mucosal or cutaneous herpes simplex infections or herpes zoster infections (shingles) in immunosuppressed patients. Herpes simplex encephalitis. **Topical:** *Cream*—Recurrent herpes labialis (cold sores). *Ointment*—Treatment of limited non–life-threatening herpes simplex infections in immunocompromised patients (systemic treatment is preferred).

### Action
Interferes with viral DNA synthesis. **Therapeutic Effects:** Inhibition of viral replication, decreased viral shedding, and reduced time for healing of lesions.

### Pharmacokinetics
**Absorption:** Despite poor absorption (15–30%), therapeutic blood levels are achieved.
**Distribution:** Widely distributed. CSF concentrations are 50% of plasma. Crosses placenta; enters breast milk.
**Protein Binding:** <30%.
**Metabolism and Excretion:** >90% eliminated unchanged by kidneys; remainder metabolized by liver.
**Half-life:** Neonates: 4 hr; Children 1–12 yr: 2–3 hr; Adults: 2–3.5 hr (↑ in renal failure).

TIME/ACTION PROFILE (antiviral blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1.5–2.5 hr | 4 hr |
| IV | prompt | end of infusion | 8 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to acyclovir or valacyclovir.
**Use Cautiously in:** Pre-existing serious neurologic, hepatic, pulmonary, or fluid and electrolyte abnormalities; Renal impairment (dose alteration recommended if CCr <50 mL/min); Geri: Due to age related ↓ in renal function; Obese patients (dose should be based on ideal body weight); Patients with hypoxia; OB, Lactation: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** SEIZURES, dizziness, headache, hallucinations, trembling. **GI:** diarrhea, nausea, vomiting, elevated liver enzymes, hyperbilirubinemia, abdominal pain, anorexia. **GU:** RENAL FAILURE, crystalluria, hematuria, renal pain. **Derm:** STEVENS-JOHNSON SYNDROME, acne, hives, skin rashes, unusual sweating. **Endo:** changes in menstrual cycle. **Hemat:** THROMBOTIC THROMBOCYTOPENIC PURPURA/HEMOLYTIC UREMIC SYNDROME (high doses in immunosuppressed patients). **Local:** pain, phlebitis, local irritation. **MS:** joint pain. **Misc:** polydipsia.

### Interactions
**Drug-Drug: Probenecid** ↑ blood levels of acyclovir. ↑ blood levels and risk of toxicity from **theophylline**; dose adjustment may be necessary. ↓ blood levels and may ↓ effectiveness of **valproic acid** or **hydantoins**. Concurrent use of other **nephrotoxic drugs** ↑ risk of adverse renal effects. **Zidovudine** and IT **methotrexate** may ↑ risk of CNS side effects.

## Route/Dosage

### Initial Genital Herpes

**PO (Adults and Children):** 200 mg q 4 hr while awake (5 times/day) for 7–10 days or 400 mg q 8 hr for 7–10 days; maximum dose in children: 80 mg/kg/day in 3–5 divided doses.
**IV (Adults and Children):** 5 mg/kg q 8 hr or 750 mg/m²/day divided q 8 hr for 5–7 days.

### Chronic Suppressive Therapy for Recurrent Genital Herpes

**PO (Adults and Children):** 400 mg twice daily or 200 mg 3–5 times/day for up to 12 mo. Maximum dose in children: 80 mg/kg/day in 2–5 divided doses.

### Intermittent Therapy for Recurrent Genital Herpes

**PO (Adults and Children):** 200 mg q 4 hr while awake (5 times/day) or 400 mg q 8hr or 800 mg q 12 hr for 5 days, start at first sign of symptoms. Maximum dose in children: 80 mg/kg/day in 2–5 divided doses.

### Acute Treatment of Herpes Zoster in Immunosuppressed Patients

**PO (Adults):** 800 mg q 4 hr while awake (5 times/day) for 7–10 days. *Prophylaxis*—400 mg 5 times/day.
**PO (Children):** 250–600 mg/m²/dose 4–5 times/day.

### Herpes Zoster in Immunocompetent Patients

**PO (Adults and Children):** 4000 mg/day in 5 divided doses for 5–7 days, maximum dose in children: 80 mg/kg/day in 5 divided doses.

### Chickenpox

**PO (Adults and Children):** 20 mg/kg (not to exceed 800 mg/dose) qid for 5 days. Start within 24 hr of rash onset.

### Mucosal and Cutaneous Herpes Simplex Infections in Immunosuppressed Patients

**IV (Adults and Children >12 yr):** 5 mg/kg q 8 hr for 7 days.
**IV (Children <12 yr):** 10 mg/kg q 8 hr for 7 days.
**Topical (Adults):** 0.5 in. ribbon of 5% *ointment* for every 4-square-in. area q 3 hr (6 times/day) for 7 days.

### Herpes Simplex Encephalitis

**IV (Adults):** 10 mg/kg q 8 hr for 14–21 days.
**IV (Children 3 mo–12 yr):** 10 mg/kg q 8 hr for 14–21 days.
**IV (Children birth–3 mo):** 20 mg/kg q 8 hr for 14–21 days.
**IV (Neonates, premature):** 10 mg/kg q 12 hr for 14–21 days.

### Varicella Zoster Infections in Immunosuppressed Patients

**IV (Adults):** 10 mg/kg q 8 hr for 7–10 days.
**IV (Children <12 yr):** 10 mg/kg q 8 hr for 7–10 days.

### Renal Impairment

**PO, IV (Adults and Children):** *CCr >50 mL/min/1.73 m²*—no dosage adjustment needed; *CCr 25 –50 mL/min/1.73 m²*—administer normal dose q 12 hr; *CCr 10–25 mL/min/1.73 m²*—administer normal dose q 24 hr; *CCr 0–10 mL/min/1.73 m²*—50% of dose q 24 hr.
**IV (Neonates):** *SCr 0.8–1.1 mg/dL:* Administer 20 mg/kg/dose q 12 hr; *SCr 1.2–1.5 mg/dL:* Administer 20 mg/kg/dose q 24 hr; *SCr >1.5 mg/dL:* Administer 10 mg/kg/dose q 24 hr.

### Herpes labialis

**Topical (Adults and Children >12 yr):** Apply 5 times/day for 4 days; start at first symptoms.

### Availability (generic available)

**Capsules:** 200 mg. **Cost:** *Generic*—$12.99/30.
**Tablets:** 400 mg, 800 mg. **Cost:** *Generic*—400 mg $14.50/30, 800 mg $24.99/30. **Suspension (banana flavor):** 200 mg/5 mL. **Cost:** $123.97/473 mL. **Powder for injection:** 500 mg/vial, 1000 mg/vial. **Solution for injection:** 25 mg/mL in 20-mL and 40-mL vials, 50 mg/mL in 10-mL and 20-mL vials. **Cream:** 5% in 2-g and 5-g tubes. **Cost:** $51.36/2-g tube, $115.99/5-g tube. ***In combination with:*** hydrocortisone (Lipsovir). See Appendix B. **Ointment:** 5% in 15-g tubes. **Cost:** $129.99/15-g tube.

## NURSING IMPLICATIONS

### Assessment

- Assess lesions before and daily during therapy.
- Monitor neurologic status in patients with herpes encephalitis.
- ***Lab Test Considerations:*** Monitor BUN, serum creatinine, and CCr before and during therapy. ↑ BUN and serum creatinine levels or ↓ CCr may indicate renal failure.

## Potential Nursing Diagnoses

Risk for impaired skin integrity (Indications)
Risk for infection (Patient/Family Teaching)

## Implementation

- Acyclovir treatment should be started as soon as possible after herpes simplex symptoms appear and within 24 hr of a herpes zoster outbreak.
- **PO:** Acyclovir may be administered with food or on an empty stomach, with a full glass of water.
- Shake oral suspension well before administration.

### IV Administration

- **IV:** Maintain adequate hydration (2000–3000 mL/day), especially during first 2 hr after IV infusion, to prevent crystalluria.
- Observe infusion site for phlebitis. Rotate infusion site to prevent phlebitis.
- Acyclovir injectable should not be administered topically, IM, subcut, PO, or in the eye.
- **Intermittent Infusion:** Reconstitute 500-mg or 1-g vial with 10 mL or 20 mL, respectively, of sterile water for injection. Do not reconstitute with bacteriostatic water with benzyl alcohol or parabens. Shake well to dissolve completely. ***Diluent:*** Dilute in at least 100 mL of D5W, 0.9% NaCl, dextrose/saline combinations or LR. ***Concentration:*** 7 mg/mL. Patients requiring fluid restriction: 10 mg/mL. ***Rate:*** Administer via infusion pump over 1 hr to minimize renal tubular damage.
- Use reconstituted solution within 12 hr. Once diluted for infusion, the solution should be used within 24 hr. Refrigeration results in precipitation, which dissolves at room temperature.
- **Y-Site Compatibility:** alfentanil, allopurinol, amikacin, aminophylline, amphotericin B cholesteryl, amphotericin B liposome, ampicillin, anidulafungin, argatroban, atracurium, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dantrolene, dexamethasone, dexmeditomidine, digoxin, dimenhydrinate, diphenhydramine, docetaxel, doripenem, doxacurium, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, ertapenem, erythromycin lactobionate, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fluorouracil, furosemide, gentamicin, glycopyrrolate, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, methohexital, methotrexate, methylprednisolone, metoprolol, metronidazole, milrinone, mitoxantrone, multivitamin infusion, nafcillin, naloxone, nesiritide, nitroglycerin, octreotide, oxacillin, oxytocin, paclitaxel, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, pentobarbital, perphenazine, phenobarbital, potassium chloride, propofol, propranolol, ranitidine, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, teniposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vincristine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** amifostine, amphotericin B colloidal, ampicillin/sulbactam, amsacrine, aztreonam, cefepime, chlorpromazine, ciprofloxacin, codeine, daptomycin, diazepam, dobutamine, dopamine, doxorubicin hydrochloride, epinephrine, epirubicin, eftifibatide, esmolol, fenoldopam, fludarabine, foscarnet, gemcitabine, haloperidol, hydralazine, hydroxyzine, idarubicin, ketorolac, labetalol, levofloxacin, lidocaine, methyldopate, midazolam, nitroprusside, ondansetron, palonosetron, pentamidine, phenylephrine, phenytoin, piperacillin/tazobactam, potassium phosphates, procainamide, prochlorperazine, promethazine, quinupristin/dalfopristin, sargramostim, sodium phosphates, streptozocin, tacrolimus, ticarcillin/clavulanate, vecuronium, verapamil, vinorelbine.
- **Topical:** Apply to skin lesions only; do not use in the eye.

## Patient/Family Teaching

- Advise patient to take medication as directed for the full course of therapy. Take missed doses as soon as possible but not just before next dose is due; do not double doses. Acyclovir should not be used more frequently or longer than prescribed.
- Advise patients that the additional use of OTC creams, lotions, and ointments may delay healing and may cause spreading of lesions.
- Inform patient that acyclovir is not a cure. The virus lies dormant in the ganglia, and acyclovir

will not prevent the spread of infection to others.
- Advise patient that condoms should be used during sexual contact and that no sexual contact should be made while lesions are present.
- Patient should consult health care professional if symptoms are not relieved after 7 days of topical therapy or if oral acyclovir does not decrease the frequency and severity of recurrences. Immunocompromised patients may require a longer time, usually 2 weeks, for crusting over of lesions.
- Instruct women with genital herpes to have yearly Papanicolaou smears because they may be more likely to develop cervical cancer.
- **Topical:** Instruct patient to apply ointment in sufficient quantity to cover all lesions every 3 hr, 6 times/day for 7 days. 0.5-in. ribbon of ointment covers approximately 4 square in. Use a finger cot or glove when applying to prevent inoculation of other areas or spread to other people. Keep affected areas clean and dry. Loose-fitting clothing should be worn to prevent irritation.
- Avoid drug contact in or around eyes. Report any unexplained eye symptoms to health care professional immediately; ocular herpetic infection can lead to blindness.

### Evaluation/Desired Outcomes
- Crusting over and healing of skin lesions.
- Decrease in frequency and severity of recurrences.
- Acceleration of complete healing and cessation of pain in herpes zoster.
- Decrease in intensity of chickenpox.

## **adalimumab** (a-da-li-**mu**-mab)
Humira

***Classification***
Therapeutic: antirheumatics
Pharmacologic: DMARDs, monoclonal antibodies

**Pregnancy Category B**

### Indications
Treatment of moderately to severely active rheumatoid arthritis in patients who have responded inadequately to other DMARDs; may be used with methotrexate or other DMARDs. Psoriatic arthritis. Active ankylosing spondylitis. Crohn's disease. Moderate to severely active polyarticular juvenile (≥4 yr) idiopathic arthritis (to be used as monotherapy or with methotrexate). Moderate to severe chronic plaque psoriasis in patients who are candidates for systemic therapy or phototherapy and when other systemic therapies are deemed inappropriate.

### Action
Neutralizes and prevents the action of tumor necrosis factor (TNF), resulting in anti-inflammatory and antiproliferative activity. **Therapeutic Effects:** Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis, psoriatic arthritis, juvenile arthritis, and ankylosing spondylitis. Reduced signs and symptoms of Crohn's disease. Reduced severity of plaques.

### Pharmacokinetics
**Absorption:** 64% absorbed after subcut administration.
**Distribution:** Synovial fluid concentrations are 31–96% of serum.
**Metabolism and Excretion:** Unknown.
**Half-life:** 14 days (range 10–20 days).

TIME/ACTION PROFILE (improvement)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | 8–26 wk | 131 hr* | 2 wk† |

*Blood level
†Following discontinuation

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Concurrent use of anakinra; Active infection (including chronic or localized); Lactation: Potential for serious side effects in the infant; discontinue drug or provide formula.
**Use Cautiously in:** History of recurrent infection or underlying illness/treatment predisposing to infection; Patients residing, or who have resided, where tuberculosis or histoplasmosis is endemic; Pre-existing or recent onset CNS demyelinating disorders; History of lymphoma; Geri: ↑ risk of infection/malignancy; OB: Use only if clearly needed; Pedi: Children <4 yr (safety not established); ↑ risk of lymphoma, leukemia, and other malignancies.

### Adverse Reactions/Side Effects
**CNS:** headache. **CV:** hypertension. **GI:** abdominal pain, nausea. **GU:** hematuria. **Derm:** rash, psoriasis. **Hemat:** LEUKEMIA, neutropenia, thrombocytopenia. **Local:** injection site reactions. **Metab:** hypercholesterolemia, hyperlipidemia. **MS:** back

pain. **Misc:** allergic reactions including ANAPHYLAXIS, INFECTIONS (including reactivation tuberculosis and invasive fungal infections), MALIGNANCY.

### Interactions

**Drug-Drug:** Concurrent use with **anakinra** or other **TNF blocking agents** ↑ risk of serious infections and is contraindicated. **Live vaccinations** should not be given concurrently.

### Route/Dosage

### Rheumatoid Arthritis, Ankylosing Spondylitis, and Psoriatic Arthritis

**Subcut (Adults):** 40 mg every other week; patients not receiving concurrent methotrexate may receive additional benefit by increasing dose to 40 mg once weekly.

### Crohn's Disease

**Subcut (Adults):** 160 mg initially on Day 1 (given as four 40-mg injections in one day or as two 40-mg injections given in two consecutive days), followed by 80 mg 2 wk later on Day 15. Two wk later (Day 29), begin maintenance dose of 40 mg every other wk. Aminosalicylates, corticosteroids, and/or immunomodulatory agents may be continued during therapy.

### Juvenile Idiopathic Arthritis

**Subcut (Children 4–17 yr):** *15– <30 kg*—30 mg every other wk; *≥30 kg*—40 mg every other wk.

### Plaque Psoriasis

**Subcut (Adults):** 80 mg initially, then in 1 wk, begin regimen of 40 mg every other wk.

### Availability

**Solution for subcut injection (prefilled syringes):** 20 mg/0.4 mL, 40 mg/0.8 mL. **Pen:** Single use prefilled glass syringe containing 40 mg (0.8 mL).

## NURSING IMPLICATIONS

### Assessment

- Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to injection. Adalimumab is contraindicated in patients with active infection. New infections should be monitored closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Infections may be fatal, especially in patients taking immunosuppressive therapy.
- Monitor for injection site reactions (redness and/or itching, rash, hemorrhage, bruising, pain, or swelling). Rash will usually disappear within a few days. Application of a towel soaked in cold water may relieve pain or swelling.
- Assess patient for latex allergy. Needle cover of syringe contains latex and should not be handled by persons sensitive to latex.
- Monitor patient for signs of anaphylaxis (urticaria, dyspnea, facial edema) following injection. Medications (antihistamines, corticosteroids, epinephrine) and equipment should be readily available in the event of a severe reaction. Discontinue adalimumab immediately if anaphylaxis or other severe allergic reaction occurs.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with adalimumab.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dypsnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping adalimumab until the infection has been diagnosed and adequately treated.
- ***Lab Test Considerations:*** May cause agranulocytosis, granulocytopenia, leukopenia, pancytopenia, and polycythemia.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue adalimumab if symptoms of blood dyscrasias (persistent fever) occur.

### Potential Nursing Diagnoses

Acute pain (Indications)
Risk for infection (Side Effects)

### Implementation

- Administer a tuberculin skin test prior to administration of adalimumab. Patients with active latent TB should be treated for TB prior to therapy.
- Immunizations should be current prior to initiating therapy. Patients on adalimumab may receive concurrent vaccinations, except for live vaccines.
- Administer initial injection under supervision of a health care professional.

- Do not administer solutions that are discolored or contain particulate matter. Discard unused solution.
- Other DMARDs should be continued during adalimumab therapy.
- **Subcut:** Administer at a 45° angle in upper thighs or abdomen, avoiding the 2 inches around the navel. Put pressure on injection site for 10 sec, do not rub. Rotate injection sites; avoid areas that are tender, bruised, hard, or red.

### Patient/Family Teaching

- Instruct patient on the correct technique for administering adalimumab. Review patient information sheet, preparation of dose, administration sites and technique, and disposal of equipment into a puncture-resistant container.
- Advise patient to use calendar stickers provided by manufacturer to assist in remembering when dose is due. If a dose is missed, instruct patient to administer as soon as possible, then take next dose according to regular schedule. If more than prescribed dose is taken, caution patient to consult health care professional or the HUMIRA Patient Resource Center at 1-800-4HUMIRA (448-6472).
- Caution patient to notify health care professional immediately if signs of infection, severe rash, swollen face, or difficulty breathing occurs while taking adalimumab.
- Advise patient to consult health care professional before taking other Rx or OTC medications or herbal products.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- **Pen:** Clean area for injection with alcohol swab. Hold pen with gray cap pointing up. Check solution through window; if discolored, cloudy, or contains flakes, discard solution. Turn pen over and point cap down to make sure solution reaches fill line; if not, do not use and contact pharmacist. Remove gray cap exposing the needle and the plum cap exposing the button; removing the plum cap activates the pen. Pinch skin and place pen, with window visible, against skin at a 90° angle and press button until a click is heard. Hold pen in place until all solution is injected (10 seconds) and yellow marker is visible in window and has stopped moving. Continue to pinch skin throughout injection. Remove needle and press with a gauze pad or cotton ball for 10 seconds. Do not rub injection site. Dispose of pen into a puncture-resistant container.

### Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.
- Decreased signs and symptoms, slowed progression of joint destruction, and improved physical function in patients with psoriatic arthritis.
- Reduced signs and symptoms of ankylosing spondylitis.
- Decreased signs and symptoms and maintenance of remission in patients with Crohn's disease.
- Reduced pain and swelling in patients moderate to severe polyarticular juvenile idiopathic arthritis (JIA) in children 4 yr of age and older.
- Reduced severity of plaques in patients with severe chronic plaque psoriasis.

## **adenosine** (a-**den**-oh-seen)

Adenocard, Adenoscan

***Classification***

Therapeutic: antiarrhythmics

**Pregnancy Category C**

### Indications

Conversion of paroxysmal supraventricular tachycardia (PSVT) to normal sinus rhythm when vagal maneuvers are unsuccessful. As a diagnostic agent (with noninvasive techniques) to assess myocardial perfusion defects occurring as a consequence of coronary artery disease.

### Action

Restores normal sinus rhythm by interrupting reentrant pathways in the AV node. Slows conduction time through the AV node. Also produces coronary artery vasodilation. **Therapeutic Effects:** Restoration of normal sinus rhythm.

### Pharmacokinetics

**Absorption:** Following IV administration, absorption is complete.
**Distribution:** Taken up by erythrocytes and vascular endothelium.
**Metabolism and Excretion:** Rapidly converted to inosine and adenosine monophosphate.
**Half-life:** <10 sec.

TIME/ACTION PROFILE (antiarrhythmic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | immediate | unknown | 1–2 min |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; 2nd- or 3rd-degree AV block or sick sinus syndrome, unless a functional artificial pacemaker is present. **Use Cautiously in:** Patients with a history of asthma (may induce bronchospasm); Unstable angina; OB, Lactation: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** apprehension, dizziness, headache, head pressure, light-headedness. **EENT:** blurred vision, throat tightness. **Resp:** shortness of breath, chest pressure, hyperventilation. **CV:** facial flushing, transient arrhythmias, chest pain, hypotension, palpitations. **GI:** metallic taste, nausea. **Derm:** burning sensation, facial flushing, sweating. **MS:** neck and back pain. **Neuro:** numbness, tingling. **Misc:** heaviness in arms, pressure sensation in groin.

## Interactions

**Drug-Drug: Carbamazepine** may ↑ risk of progressive heart block. **Dipyridamole** ↑ effects of adenosine (dosage reduction of adenosine recommended). Effects of adenosine ↑ by **theophylline** or **caffeine** (larger doses of adenosine may be required). Concurrent use with **digoxin** may ↑ risk of ventricular fibrillation.

## Route/Dosage

**IV (Adults and Children >50 kg):** *Antiarrhythmic*—6 mg by rapid IV bolus; if no results, repeat 1–2 min later as 12-mg rapid bolus. This dose may be repeated (single dose not to exceed 12 mg). *Diagnostic use*—140 mcg/kg/min for 6 min (0.84 mg/kg total).

**IV (Children <50 kg):** *Antiarrhythmic*—0.05–0.1 mg/kg as a rapid bolus, may repeat in 1–2 min; if response is inadequate, may increase by 0.05–0.1 mg/kg until sinus rhythm is established or maximum dose of 0.3 mg/kg is used.

## Availability (generic available)

**Injection:** 6-mg/2-mL vial (Adenocard), 3 mg/1 mL in 30-mL vial (Adenoscan).

# NURSING IMPLICATIONS

## Assessment

- Monitor heart rate frequently (every 15–30 sec) and ECG continuously during therapy. A short, transient period of 1st-, 2nd-, or 3rd-degree heart block or asystole may occur following injection; usually resolves quickly due to short duration of adenosine. Once conversion to normal sinus rhythm is achieved, transient arrhythmias (premature ventricular contractions, atrial premature contractions, sinus tachycardia, sinus bradycardia, skipped beats, AV nodal block) may occur, but generally last a few seconds.
- Monitor blood pressure during therapy.
- Assess respiratory status (breath sounds, rate) following administration. Patients with history of asthma may experience bronchospasm.

## Potential Nursing Diagnoses

Decreased cardiac output (Indications)

## Implementation

- Do not confuse adenosine (Adenocard) with adenosine phosphate.

### IV Administration

- **IV:** Crystals may occur if adenosine is refrigerated. Warm to room temperature to dissolve crystals. Solution must be clear before use. Do not administer solutions that are discolored or contain particulate matter. Discard unused portions.
- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 3 mg/mL. ***Rate:*** Administer over 1–2 seconds via peripheral IV as proximal as possible to trunk. Slow administration may cause increased heart rate in response to vasodilation. Follow each dose with 20 mL rapid saline flush to ensure injection reaches systemic circulation.
- **Intermittent Infusion (for use in diagnostic testing):** ***Diluent:*** Administer 30-mL vial undiluted. ***Concentration:*** 3 mg/mL. ***Rate:*** Administer at a rate of 140 mcg/kg/min over 6 min for a total dose of 0.84 mg/kg. Thallium-201 should be injected as close to the venous access as possible at the midpoint (after 3 min) of the infusion.
- **Y-Site Compatibility:** abciximab, Thallium-201.

## Patient/Family Teaching

- Caution patient to change positions slowly to minimize orthostatic hypotension. Doses >12 mg decrease blood pressure by decreasing peripheral vascular resistance.
- Instruct patient to report facial flushing, shortness of breath, or dizziness.

## Evaluation/Desired Outcomes

- Conversion of supraventricular tachycardia to normal sinus rhythm.
- Diagnosis of myocardial perfusion defects.

## albumin (human)

(al-**byoo**-min)

Albuminar, Albutein, Buminate, normal human serum albumin, Plasbumin

***Classification***

Therapeutic: volume expanders

Pharmacologic: blood products, colloids

**Pregnancy Category C**

### Indications

Expansion of plasma volume and maintenance of cardiac output in situations associated with fluid volume deficit, including shock, hemorrhage, and burns. Temporary replacement of albumin in diseases associated with low levels of plasma proteins, such as nephrotic syndrome or end-stage liver disease, resulting in relief or reduction of associated edema.

### Action

Provides colloidal oncotic pressure, which serves to mobilize fluid from extravascular tissues back into the intravascular space. Requires concurrent administration of appropriate crystalloid. **Therapeutic Effects:** Increase in intravascular fluid volume.

### Pharmacokinetics

**Absorption:** Following IV administration, absorption is essentially complete.

**Distribution:** Confined to the intravascular space, unless capillary permeability is increased.

**Metabolism and Excretion:** Probably degraded by the liver.

**Half-life:** 2–3 wk.

TIME/ACTION PROFILE (oncotic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 15–30 min | unknown | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Allergic reactions to albumin; Severe anemia; CHF; Normal or increased intravascular volume.

**Use Cautiously in:** Severe hepatic or renal disease; Dehydration (additional fluids may be required); Patients requiring sodium restriction; Preterm neonates (infuse slowly due to increased risk of intravascular hemorrhage).

### Adverse Reactions/Side Effects

**CNS:** headache. **CV:** PULMONARY EDEMA, fluid overload, hypertension, hypotension, tachycardia. **GI:** increased salivation, nausea, vomiting. **Derm:** rash, urticaria. **MS:** back pain. **Misc:** chills, fever, flushing.

### Interactions

**Drug-Drug:** None significant.

### Route/Dosage

Dose is highly individualized and depends on condition being treated.

#### Hypovolemic shock—5% Albumin

**IV (Adults):** 25 g (500 mL), may be repeated within 30 min.

**IV (Children):** 0.5–1 g/kg/dose (10–20 mL/kg/dose) may repeat as needed (maximum 6 g/kg/day).

**IV (Infants and Neonates):** 0.25–0.5 g/kg/dose (5–10 mL/kg/dose).

#### Hypoproteinemia—25% Albumin

**IV (Adults):** 50–75 g.

**IV (Children, Infants, and Neonates):** 0.5–1 g/kg/dose, may repeat every 1–2 days; doses up to 1.5 g/kg/day have been added to hyperalimentation solutions and given over 24 hr.

#### Nephrotic Syndrome—25% Albumin

**IV (Adults):** 12.5–50 g/day in 3–4 divided doses.

**IV (Children and Infants):** 0.25–1 g/kg/dose.

### Availability

**Injection:** 5% (50 mg/mL), 25% (250 mg/mL).

## NURSING IMPLICATIONS

### Assessment

- Monitor vital signs, CVP, and intake and output before and frequently throughout therapy. If fever, tachycardia, or hypotension occurs, stop infusion and notify physician immediately. Antihistamines may be required to suppress this hypersensitivity response. Hypotension may also result from infusing too rapidly. May be given without regard to patient's blood group.
- Assess for signs of vascular overload (elevated CVP, rales/crackles, dyspnea, hypertension, jugular venous distention) during and after administration.
- **Surgical Patients:** Assess for increased bleeding after administration caused by increased blood pressure and circulating blood volume. Albumin does not contain clotting factors.
- ***Lab Test Considerations:*** Serum albumin levels should increase with albumin therapy.

- Monitor serum sodium levels; may cause ↑ concentrations.
- Infusions of normal serum albumin may cause false ↑ of alkaline phosphatase levels.
- Hemorrhage: Monitor hemoglobin and hematocrit levels. These values may ↓ because of hemodilution.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Deficient fluid volume (Indications)
Excess fluid volume (Side Effects)

### Implementation

- Follow manufacturer's recommendations for administration. Administer through a large-gauge (at least 20-gauge) needle or catheter. Record lot number in patient record.
- Solution should be clear amber; 25% albumin solution is equal to 5 times the osmotic value of plasma. Do not administer solutions that are discolored or contain particulate matter. Each liter of both 5% and 25% albumin contains 130–160 mEq of sodium and is thus no longer labeled "salt-poor" albumin.
- Administration of large quantities of normal serum albumin may need to be supplemented with whole blood to prevent anemia. If more than 1000 mL of 5% normal serum albumin is given or if hemorrhage has occurred, the administration of whole blood or packed RBCs may be needed. Hydration status should be monitored and maintained with additional fluids.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Administer 5% normal serum albumin undiluted. Normal serum albumin 25% may be administered undiluted or diluted in 0.9% NaCl, D5W, or sodium lactate injection; do not dilute in sterile water (may result in hypotonic-associated hemolysis which may be fatal). Infusion must be completed within 4 hr. ***Concentration:*** 5%: 50 mg/mL undiluted. 25%: 250 mg/mL undiluted. ***Rate:*** Rate of administration is determined by concentration of solution, blood volume, indication, and patient response (usual rate over 30–60 min). In patients with normal blood volume, rate of 5% and 25% solutions should not exceed 2–4 mL/min and 1 mL/min, respectively, for both adults and children.
- **Hypovolemia:** 5% or 25% normal serum albumin may be administered as rapidly as tolerated and repeated in 15–30 min if necessary. **Burns:** Rate after the first 24 hr should be set to maintain a plasma albumin level of 2.5 g/100 mL or a total serum protein level of 5.2 g/100 mL. **Hypoproteinemia:** Normal serum albumin 25% is the preferred solution because of the increased concentration of protein. The rate should not exceed 2–3 mL/min of 25% or 5–10 mL/min of 5% solution to prevent circulatory overload and pulmonary edema. This treatment provides a temporary rise in plasma protein until the hypoproteinemia is corrected.
- **Y-Site Compatibility:** diltiazem, lorazepam.
- **Y-Site Incompatibility:** fat emulsion, midazolam, vancomycin, verapamil.
- **Solution Compatibility:** 0.9% NaCl, D5W, D5/0.9% NaCl, D5/0.45% NaCl, sodium lactate ⅙M, D5/LR, and LR.

### Patient/Family Teaching

- Explain the purpose of this solution to the patient.
- Instruct patient to report signs and symptoms of hypersensitivity reaction.

### Evaluation/Desired Outcomes

- Increase in blood pressure and blood volume when used to treat shock and burns.
- Increased urinary output reflects the mobilization of fluid from extravascular tissues.
- Elevated serum plasma protein in patients with hypoproteinemia.

## albuterol (al-**byoo**-ter-ole)

Accuneb, Apo-Salvent, Gen-Salbutamol, Novo-Salmol, Proair HFA, Proventil HFA, Ventodisk, Ventolin HFA, Ventolin nebules, VoSpire ER

***Classification***
Therapeutic: bronchodilators
Pharmacologic: adrenergics

**Pregnancy Category C**

### Indications

Used as a bronchodilator to control and prevent reversible airway obstruction caused by asthma or COPD. **Inhaln:** Used as a quick-relief agent for acute bronchospasm and for prevention of exercise-induced bronchospasm. **PO:** Used as a long-term control agent in patients with chronic/persistent bronchospasm.

### Action

Binds to beta$_2$-adrenergic receptors in airway smooth muscle, leading to activation of adenyl cyclase and increased levels of cyclic-3′, 5′-adenosine monophosphate (cAMP). Increases in cAMP

activate kinases, which inhibit the phosphorylation of myosin and decrease intracellular calcium. Decreased intracellular calcium relaxes smooth muscle airways. Relaxation of airway smooth muscle with subsequent bronchodilation. Relatively selective for beta$_2$ (pulmonary) receptors. **Therapeutic Effects:** Bronchodilation.

## Pharmacokinetics

**Absorption:** Well absorbed after oral administration but rapidly undergoes extensive metabolism.
**Distribution:** Small amounts appear in breast milk.
**Metabolism and Excretion:** Extensively metabolized by the liver and other tissues.
**Half-life:** Oral 2.7–5 hr; Inhalation: 3.8 hr.

TIME/ACTION PROFILE (bronchodilation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15–30 min | 2–3 hr | 4–6 hr or more |
| PO–ER | 30 min | 2–3 hr | 12 hr |
| Inhaln | 5–15 min | 60–90 min | 3–6 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to adrenergic amines.
**Use Cautiously in:** Cardiac disease; Hypertension; Hyperthyroidism; Diabetes; Glaucoma; Seizure disorders; Excess inhaler use may lead to tolerance and paradoxical bronchospasm; OB, Lactation, Pedi: Safety not established for pregnant women near term, breastfeeding women, and children <2 yr; Geri: ↑ risk of adverse reactions; may require dose ↓.

## Adverse Reactions/Side Effects

**CNS:** nervousness, restlessness, tremor, headache, insomnia (Pedi: occurs more frequently in young children than adults), hyperactivity in children. **Resp:** PARADOXICAL BRONCHOSPASM (excessive use of inhalers). **CV:** chest pain, palpitations, angina, arrhythmias, hypertension. **GI:** nausea, vomiting. **Endo:** hyperglycemia. **F and E:** hypokalemia. **Neuro:** tremor.

## Interactions

**Drug-Drug:** Concurrent use with other **adrenergic agents** will have ↑ adrenergic side effects. Use with **MAO inhibitors** may lead to hypertensive crisis. **Beta blockers** may negate therapeutic effect. May ↓ serum **digoxin** levels. Cardiovascular effects are potentiated in patients receiving **tricyclic antidepressants**. Risk of hypokalemia ↑ concurrent use of **potassium-losing diuretics**. Hypokalemia ↑ the risk of **digoxin** toxicity.
**Drug-Natural Products:** Use with caffeine-containing herbs (**cola nut**, **guarana**, **tea**, **coffee**) ↑ stimulant effect.

## Route/Dosage

**PO (Adults and Children ≥12 yr):** 2–4 mg 3–4 times daily (not to exceed 32 mg/day) or 4–8 mg of extended-release tablets twice daily.
**PO (Geriatric Patients):** Initial dose should not exceed 2 mg 3–4 times daily, may be ↑ carefully (up to 32 mg/day).
**PO (Children 6–12 yr):** 2 mg 3–4 times daily or 0.3–0.6 mg/kg/day as extended-release tablets divided twice daily; may be carefully ↑ as needed (not to exceed 8 mg/day).
**PO (Children 2–6 yr):** 0.1 mg/kg 3 times daily (not to exceed 2 mg 3 times daily initially); may be carefully ↑ to 0.2 mg/kg 3 times daily (not to exceed 4 mg 3 times daily).
**Inhaln (Adults and Children ≥4 yr):** *Via metered-dose inhaler*—2 inhalations q 4–6 hr or 2 inhalations 15 min before exercise (90 mcg/spray); some patients may respond to 1 inhalation. *NIH Guidelines for acute asthma exacerbation: Children*—4–8 puffs q 20 min for 3 doses then q 1–4 hr; *Adults*—4–8 puffs q 20 min for up to 4 hr then q 1–4 hr prn.
**Inhaln (Adults and Children >12 yr):** *NIH Guidelines for acute asthma exacerbation via nebulization or IPPB*—2.5–5 mg q 20 min for 3 doses then 2.5–10 mg q 1–4 hr prn; *Continuous nebulization*—10–15 mg/hr.
**Inhaln (Children 2–12 yr):** *NIH Guidelines for acute asthma exacerbation via nebulization or IPPB*—0.15 mg/kg/dose (minimum dose 2.5 mg) q 20 min for 3 doses then 0.15–0.3 mg/kg (not to exceed 10 mg) q 1–4 hr prn *or* 1.25 mg 3–4 times daily for children 10–15 kg *or* 2.5 mg 3–4 times daily for children >15 kg; *Continuous nebulization*—0.5–3 mg/kg/hr.

## Availability (generic available)

**Tablets:** 2 mg, 4 mg. **Cost:** *Generic*—2 mg $62.96/270, 4 mg $49.49/270. **Extended-release tablets:** 4 mg, 8 mg. **Cost:** 4 mg $265.43/180, 8 mg $488.93/180. **Oral syrup (strawberry-flavored):** 2 mg/5 mL. **Cost:** *Generic*—$11.42/480 mL. **Metered-dose aerosol:** 90 mcg/inhalation in 6.7-g, 8.5-g, 17-g, and 18-g canisters (200 metered inhalations), 100 mcg/spray. **Cost:** *Proair HFA*—$35.99/8.5-g canister;

*Proventil HFA*—$45.99/6.7-g canister; *Ventolin HFA*—$37.99/18-g canister. **Inhalation solution:** 0.63 mg/3 mL, 1.25 mg/3 mL, 0.83 mg/mL in vials and 3 mL unit dose, 🍁 1 mg/mL, 🍁 2 mg/mL, 5 mg/mL. **Cost:** *Generic*—5 mg/mL $15.99/20 mL, 0.63 mg/mL $8.99/3 mL, 0.83 mg/mL $18.99/3 mL (25 vials). **Powder for inhalation (Ventodisk):** 🍁 200 mcg, 🍁 400 mcg. ***In combination with:*** ipratropium (Combivent, DuoNeb). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess lung sounds, pulse, and blood pressure before administration and during peak of medication. Note amount, color, and character of sputum produced.
- Monitor pulmonary function tests before initiating therapy and periodically during therapy.
- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify health care professional immediately.
- ***Lab Test Considerations:*** May cause transient ↓ in serum potassium concentrations with nebulization or higher-than-recommended doses.

### Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

### Implementation

- **PO:** Administer oral medication with meals to minimize gastric irritation.
- Extended-release tablets should be swallowed whole; do not break, crush, or chew.
- **Inhaln:** Shake inhaler well, and allow at least 1 min between inhalations of aerosol medication. Prime the inhaler before first use by releasing 4 test sprays into the air away from the face. Pedi: Use spacer for children < 8 yr of age.
- For nebulization or IPPB, the 0.5-, 0.83-, 1-, and 2-mg/mL solutions do not require dilution before administration. The 5 mg/mL (0.5%) solution must be diluted with 1–2.5 mL of 0.9% NaCl for inhalation. Diluted solutions are stable for 24 hr at room temperature or 48 hr if refrigerated.
- For nebulizer, compressed air or oxygen flow should be 6–10 L/min; a single treatment of 3 mL lasts about 10 min.
- IPPB usually lasts 5–20 min.

### Patient/Family Teaching

- Instruct patient to take albuterol as directed. If on a scheduled dosing regimen, take missed dose as soon as remembered, spacing remaining doses at regular intervals. Do not double doses or increase the dose or frequency of doses. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm (more likely with first dose from new cannister), or loss of effectiveness of medication.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Instruct patient to prime unit with 4 sprays before using and to discard cannister after 200 sprays. Actuators should not be changed among products.
- Inform patient that these products contain hydrofluoralkane (HFA) and the propellant and are described as non-CFC or CFC-free (contain no chlorofluorocarbons).
- Advise patient to consult health care professional before taking any OTC medications, natural/herbal products, or alcohol concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Inform patient that albuterol may cause an unusual or bad taste.
- **Inhaln:** Instruct patient in the proper use of the metered-dose inhaler or nebulizer (see Appendix D).
- Advise patients to use albuterol first if using other inhalation medications and allow 5 min to elapse before administering other inhalant medications unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth.
- Instruct patient to notify health care professional if no response to the usual dose of albuterol or if contents of one canister are used in less than 2 wk.
- Pedi: Caution adolescents and their parents about overuse of inhalers, which can cause heart damage and life-threatening arrhythmias.

### Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.

**alclometasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

HIGH ALERT

**alemtuzumab**
(a-lem-**too**-zoo-mab)
Campath

***Classification***
Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

**Pregnancy Category C**

## Indications
Treatment of B-cell chronic lymphocytic leukemia in patients who have been treated with alkylating agents and in which fludarabine therapy has failed.

## Action
Binds to the CD52 antigen found on the surface of B- and T-lymphocytes and other white blood cells; resulting in lysis. **Therapeutic Effects:** Lysis of leukemic cells with eventual improvement in hematologic parameters.

## Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Binds to CD52 receptors.
**Metabolism and Excretion:** Unknown.
**Half-life:** 12 days.

TIME/ACTION PROFILE (hematologic parameters)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | 2–4 mos‡ | 7–11 mos‡‡ |

‡Median time to response
‡‡Duration of response

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Systemic infections; Underlying immunodeficiency, including HIV infection; Lactation: Discontinue breastfeeding during and for 3 mos following last dose of alemtuzumab.
**Use Cautiously in:** Patients with ischemic heart disease or in patients on antihypertensive medications; Women and men with reproduction potential should use contraception during treatment and for 6 mos after therapy; OB: Should be administered only if clearly needed.

## Adverse Reactions/Side Effects
**CNS:** depression, dizziness, drowsiness, fatigue, headache, weakness. **Resp:** bronchospasm, cough, dyspnea. **CV:** hypertension, hypotension, tachycardia. **GI:** abdominal pain, anorexia, constipation, stomatitis. **Derm:** rash, sweating. **F and E:** edema. **Hemat:** NEUTROPENIA, PANCYTOPENIA/MARROW HYPOPLASIA, anemia, lymphopenia, thrombocytopenia. **MS:** back pain, skeletal pain. **Misc:** infusion-related events, infection, sepsis.

## Interactions
**Drug-Drug:** Additive bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to and increase the risk of adverse reactions to **live-virus vaccines**.

## Route/Dosage
**IV (Adults):** 3 mg/day initially, as tolerated increase dose to 10 mg/day and then 30 mg/day given three times weekly for up to 12 weeks; single doses should not exceed 30 mg or more than 90 mg/wk.

## Availability
**Solution for injection (requires further dilution):** 30 mg/3 mL in single-use ampules.

# NURSING IMPLICATIONS

## Assessment
- Monitor for infusion reactions (hypotension, rigors, fever, shortness of breath, bronchospasm, chills, rash). Premedicate with an oral antihistamine and acetaminophen 30 min prior to initial dose, dose increases, and as clinically indicated. Monitor blood pressure and hypotensive symptoms in patients with ischemic heart disease with extra care. Antihistamines, acetaminophen, antiemetics, meperidine, corticosteroids, and incremental dose escalation have been used to prevent and treat infusion-related reactions. Initiate therapy at lowest dose and increase gradually. If therapy is interrupted for 7 or more days, reinstitute with gradual dose escalation.
- ***Lab Test Considerations:*** Obtain CBC and platelet counts weekly during therapy and more frequently if worsening anemia, neutropenia, or thrombocytopenia is observed. For first occurrence of ANC <250 cells/mm$^3$ and/or platelet count <25,000 cells/mm$^3$, withhold alemtuzumab therapy. When ANC >500 cells/mm$^3$ and platelet count is >50,000 cells/mm$^3$, resume at same dose. If delay of 7 days or more occurred initiate therapy at 3 mg and escalate to 10 mg and then to 30 mg as tolerated. For second occurrence of ANC <250 cells/mm$^3$ and/or platelet count <25,000 cells/mm$^3$, withhold alemtuzumab. When ANC >500 cells/mm$^3$ and platelet count >50,000 cells/mm$^3$, resume therapy at 10 mg. If delay is 7 days or more, initiate therapy at 3 mg and escalate to 10 mg only. For third occurrence of ANC <250 cells/mm$^3$ and/or platelet count <25,000 cells/

mm³, discontinue alemtuzumab therapy permanently. For a decrease of ANC and/or platelet count of 50% of baseline value in patients initiating therapy with a baseline ANC of <500 cells/mm³ and/or a baseline platelet count of 25,000 cells/mm³, withhold therapy. When baseline levels return, resume therapy. If delay is 7 days or more, initiate therapy at 3 mg and escalate to 10 mg and 30 mg as tolerated.
- Assess CD4 counts after treatment until recovery to ≥200 cells cells/mm³.

### Potential Nursing Diagnoses
Risk for infection (Side Effects)
Risk for injury (Adverse Reactions)

### Implementation
- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations, and infusion pump settings. Alemtuzumab should only be administered under the supervision of a physician experienced in the use antineoplastic therapy.
- Administer via IV only. Inspect solution for particulate matter or discoloration. Do not administer solutions that contain particulate matter or are discolored.

#### IV Administration
- Withdraw necessary amount from ampule into syringe. Filter with a sterile low-protein binding, non–fiber-releasing 5 micron filter prior to dilution.
- **Intermittent Infusion:** ***Diluent:*** Dilute with 100 mL of 0.9% NaCl or D5W. Gently invert bag to mix. Dispose of syringe and unused drug product according to institutional guidelines. Use within 8 hr of dilution. Store at room temperature or in refrigerator. Protect solution from light. ***Rate:*** Administer over 2 hr.
- **Y-Site Incompatibility:** No data is available regarding mixing with other solutions and medications. Do not add to or infuse simultaneously with other solutions or medications.

### Patient/Family Teaching
- Inform patient and family of purpose of alemtuzumab.
- Caution patient to avoid immunizations with a live virus due to immunosuppression.

### Evaluation/Desired Outcomes
- Improvement in hematologic parameters in patients with B-cell chronic lymphocytic leukemia.

## alendronate (a-**len**-drone-ate)
Fosamax

***Classification***
Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates

**Pregnancy Category C**

### Indications
Treatment and prevention of postmenopausal osteoporosis. Treatment of osteoporosis in men. Treatment of Paget's disease of the bone. Treatment of corticosteroid-induced osteoporosis in patients (men and women) who are receiving ≥7.5 mg of prednisone/day (or equivalent) with evidence of decreased bone mineral density.

### Action
Inhibits resorption of bone by inhibiting osteoclast activity. **Therapeutic Effects:** Reversal of the progression of osteoporosis with decreased fractures. Decreased progression of Paget's disease.

### Pharmacokinetics
**Absorption:** Poorly absorbed (0.6–0.8%) after oral administration.
**Distribution:** Transiently distributes to soft tissue, then distributes to bone.
**Metabolism and Excretion:** Excreted in urine.
**Half-life:** 10 yr (reflects release of drug from skeleton).

TIME/ACTION PROFILE (inhibition of bone resorption)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 mo | 3–6 mo | 3 wk–7 mo† |

†After discontinuation of alendronate

### Contraindications/Precautions
**Contraindicated in:** Renal insufficiency (CCr <35 mL/min); OB, Lactation: Safety not established.
**Use Cautiously in:** Patients with active GI pathology (dysphagia, esophageal disease, gastritis, duodenitis, ulcers); Pre-existing hypocalcemia or vitamin D deficiency; Concurrent dental surgery (may ↑ risk of jaw osteonecrosis).

### Adverse Reactions/Side Effects
**CNS:** headache. **EENT:** blurred vision, conjunctivitis, eye pain/inflammation. **CV:** atrial fibrillation. **GI:** abdominal distention, abdominal pain, acid regurgitation, constipation, diarrhea, dyspepsia, dysphagia, esophageal cancer, esophageal ulcer, flatulence, gastritis, nausea, taste perversion, vomiting. **Derm:** erythema, photosensitivity, rash.

**MS:** musculoskeletal pain, osteonecrosis (primarily of jaw).

### Interactions

**Drug-Drug: Calcium supplements**, **antacids**, and **other oral medications** ↓ the absorption of alendronate. Doses >10 mg/day ↑ risk of adverse GI events when used with **NSAIDs**. IV **ranitidine** ↑ blood levels.
**Drug-Food: Food** significantly ↓ absorption. **Caffeine (coffee, tea, cola)**, **mineral water**, and **orange juice** also ↓ absorption.

### Route/Dosage

**PO (Adults):** *Treatment of osteoporosis*—10 mg once daily or 70 mg once weekly. *Prevention of osteoporosis*—5 mg once daily or 35 mg once weekly. *Paget's disease*—40 mg once daily for 6 mo. Re-treatment may be considered for patients who relapse. *Treatment of corticosteroid-induced osteoporosis in men and premenopausal women*—5 mg once daily. *Treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving estrogen*—10 mg once daily.

### Availability (generic available)

**Tablets:** 5 mg, 10 mg, 35 mg, 40 mg, 70 mg. **Cost:** 5 mg $248.19/90, 10 mg $240.97/90, 35 mg $235.97/12, 40 mg $177.89/30, 70 mg $239.96/12. **Oral solution (raspberry flavor):** 70 mg/75 mL. **Cost:** $27.99/75 mL. ***In combination with:*** Cholecalciferol (Fosamax plus D) See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- **Osteoporosis:** Assess patients for low bone mass before and periodically during therapy.
- **Paget's Disease:** Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size).
- ***Lab Test Considerations:*** *Osteoporosis:* Assess serum calcium before and periodically during therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating alendronate therapy. May cause mild, transient elevations of calcium and phosphate.
- **Paget's Disease:** Monitor alkaline phosphatase before and periodically during therapy. Alendronate is indicated for patients with alkaline phosphatase twice the upper limit of normal.

### Potential Nursing Diagnoses

Risk for injury (Indications)

### Implementation

- Do not confuse Fosamax (alendronate) with Flomax (tamsulosin).
- **PO:** Administer first thing in the morning with 6–8 oz plain water 30 min before other medications, beverages, or food. Swallow tablets whole; do not crush, break, or chew.

### Patient/Family Teaching

- Instruct patient on the importance of taking exactly as directed, first thing in the morning, 30 min before other medications, beverages, or food. Waiting longer than 30 min will improve absorption. Alendronate should be taken with 6–8 oz plain water (mineral water, orange juice, coffee, and other beverages decrease absorption). If a dose is missed, skip dose and resume the next morning; do not double doses or take later in the day. If a weekly dose is missed, take the morning after remembered and resume the following week on the chosen day. Do not take 2 tablets on the same day. Do not discontinue without consulting health care professional.
- Caution patient to remain upright for 30 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation. Advise patient to discontinue alendronate and notify health care provider if pain or difficulty swallowing, retrosternal pain, or new/worsening heartburn occur.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise patient to inform health care professional of alendronate therapy prior to dental surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional if blurred vision, eye pain, or inflammation occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if she is breastfeeding.

### Evaluation/Desired Outcomes
- Prevention of or decrease in the progression of osteoporosis in postmenopausal women.
- Treatment of osteoporosis in men.
- Decrease in the progression of Paget's disease.
- Treatment of corticosteroid-induced osteoporosis.

## alfuzosin (al-**fyoo**-zo-sin)
Uroxatral

***Classification***
Therapeutic: urinary tract antispasmodics
Pharmacologic: peripherally acting antiadrenergics

**Pregnancy Category B**

### Indications
Management of symptomatic benign prostatic hyperplasia (BPH).

### Action
Selectively blocks alpha$_1$- adrenergic receptors in the lower urinary tract to relax smooth muscle in the bladder neck and prostate. **Therapeutic Effects:** Increased urine flow and decreased symptoms of BPH.

### Pharmacokinetics
**Absorption:** 49% absorbed following oral administration; food enhances absorption.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A4 enzyme system); 11% excreted unchanged in urine.
**Half-life:** 10 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO-ER | within hr | 8 hr | 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Moderate to severe hepatic impairment; Potent inhibitors of the CYP3A4 enzyme system; Concurrent use of other alpha-adrenergic blocking agents; Severe renal impairment; Pedi: Children.
**Use Cautiously in:** Congenital or acquired QTc prolongation or concurrent use of other drugs known to prolong QTc; Mild hepatic impairment; Symptomatic hypotension; Concurrent use of antihypertensive agents or nitrates (↑ risk of postural hypotension); Previous hypotensive episode with other medications; Geri: Consider age-related changes in body mass and cardiac, renal, and hepatic function when prescribing.

### Adverse Reactions/Side Effects
**CNS:** dizziness, fatigue, headache. **EENT:** intraoperative floppy iris syndrome. **Resp:** bronchitis, sinusitis, pharyngitis. **CV:** postural hypotension. **GI:** abdominal pain, constipation, dyspepsia, nausea. **GU:** erectile dysfunction.

### Interactions
**Drug-Drug: Ketoconazole**, **itraconazole**, and **ritonavir** ↓ metabolism and significantly ↑ levels and effects (concurrent use contraindicated). Levels are ↑ by **cimetidine**, **atenolol**, and **diltiazem**. Alfuzosin ↑ levels and may ↑ effects of **atenolol** and **diltiazem** (monitor blood pressure and heart rate). ↑ risk of hypotension with **antihypertensives**, **nitrates**, and acute ingestion of **alcohol**.

### Route/Dosage
**PO (Adults):** 10 mg once daily.

### Availability
**Extended-release tablets:** 10 mg. **Cost:** $229.96/90.

## NURSING IMPLICATIONS

### Assessment
- Assess for symptoms of benign prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Assess patient for orthostatic reaction and syncope. Monitor BP (lying and standing) and pulse frequently during initial dose adjustment and periodically thereafter. May occur within a few hr after initial doses and occasionally thereafter.
- Rule out prostatic carcinoma before therapy; symptoms are similar.

### Potential Nursing Diagnoses
Risk for injury (Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation
- **PO:** Administer with food at the same meal each day. Tablets must be swallowed whole; do not crush, break, or chew.

### Patient/Family Teaching
- Instruct patient to take medication with the same meal each day. Take missed doses as soon as remembered. If not remembered until next day, omit; do not double doses.
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requir-

ing alertness until response to the medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension.
- Advise patient to consult health care professional before taking any cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication regimen before any surgery, especially cataract surgery.
- Advise patient to notify health care professional if angina, frequent dizziness, or fainting occurs.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- Geri: Assess risk for falls; implement fall prevention program and instruct patient and family in preventing falls at home.

### Evaluation/Desired Outcomes
- Decreased symptoms of benign prostatic hyperplasia.

## aliskiren (a-lis-ki-ren)
Tekturna

***Classification***
Therapeutic: antihypertensives
Pharmacologic: renin inhibitors

**Pregnancy Category C**

### Indications
Treatment of hypertension (alone or with other agents).

### Action
Inhibition of renin results in decreased formation of angiotensin II, a powerful vasoconstrictor.
**Therapeutic Effects:** Decreased blood pressure.

### Pharmacokinetics
**Absorption:** Poorly absorbed (bioavailability 2.5%).
**Distribution:** Unknown.
**Metabolism and Excretion:** 2% excreted unchanged in urine, remainder is probably metabolized (CYP3A4 enzyme system).
**Half-life:** 24 hr.

TIME/ACTION PROFILE (antihypertensive effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2 wk | 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; OB: May cause fetal injury or death; Concurrent use with cyclosporine.
**Use Cautiously in:** Salt or volume depletion (correct before use); Severe renal impairment; Pedi: Safety not established.

### Adverse Reactions/Side Effects
**Resp:** cough. **GI:** abdominal pain, diarrhea (↑ in females and elderly), dyspepsia, reflux. **Misc:** ANGIOEDEMA.

### Interactions
**Drug-Drug:** Blood levels are ↓ by **irbesartan**. Blood levels are ↑ by **atorvastatin**, **ketoconazole**, and **cyclosporine** (concurrent use with cyclosporine not recommended). May ↓ effects of **furosemide**. Antihypertensive effects may be ↑ by other **antihypertensives**, **diuretics**, and **nitrates**. ↑ risk of hyperkalemia with concurrent use of **ACE inhibitors**, **angiotensin II receptor antagonists**, **potassium supplements**, **potassium-sparing diuretics**, or **potassium-containing salt substitutes**.
**Drug-Food: High fat meals** significantly ↓ absorption.

### Route/Dosage
**PO (Adults):** 150 mg/day initially; may be ↑ to 300 mg/day.

### Availability
**Tablets:** 150 mg, 300 mg. ***In combination with:*** hydrochlorothiazide (Tekturna HCT) and valsartan (Valturna); see Appendix B.

## NURSING IMPLICATIONS

### Assessment
- Monitor blood pressure and pulse frequently during initial dose adjustment and periodically during therapy. Notify health care professional of significant changes. If an excessive fall in BP occurs, place patient in a supine position and administer IV 0.9% NaCl, if necessary. A transient hypotensive response does not contraindicate further therapy.
- Monitor frequency of prescription refills to determine adherence.
- ***Lab Test Considerations:*** May cause minor ↑ in BUN, serum creatinine, potassium, uric acid, and creatine kinase.
- May cause small ↓ in hemoglobin and hematocrit.

### Potential Nursing Diagnoses
Noncompliance (Patient/Family Teaching)

### Implementation
- Correct volume or sodium depletion prior to initiating therapy.
- **PO:** Administer at the same time each day without regard to meals.

### Patient/Family Teaching
- Instruct patient to take aliskiren as directed at the same time each day, even if feeling better. Take missed doses as soon as remembered, but not if almost time for next dose. Do not double doses. Do not share medication with others, even with same condition; may be harmful.
- May cause dizziness. Caution patient to lie down and notify health care professional. Also, avoid driving and other activities requiring alertness until response to aliskiren is known.
- Advise patient to report signs and symptoms of angioedema (swelling of face, extremities, eyes, lips, tongue, difficulty swallowing, or breathing) to health care professional immediately.
- Instruct patient to notify health care professional prior to taking other Rx, OTC, or herbal products.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding. If pregnancy is detected, discontinue aliskiren as soon as possible.

### Evaluation/Desired Outcomes
- Decrease in blood pressure without appearance of side effects. Antihypertensive effect is 90% attained by 2 wk.

## **allopurinol** (al-oh-**pure**-i-nole)
Alloprim, Apo-Allopurinol, Lopurin, Purinol, Zyloprim

***Classification***
Therapeutic: antigout agents, antihyperuricemics
Pharmacologic: xanthine oxidase inhibitors

**Pregnancy Category C**

### Indications
**PO:** Prevention of attack of gouty arthritis and nephropathy. **PO, IV:** Treatment of secondary hyperuricemia, which may occur during treatment of tumors or leukemias.

### Action
Inhibits the production of uric acid by inhibiting the action of xanthine oxidase. **Therapeutic Effects:** Lowering of serum uric acid levels.

### Pharmacokinetics
**Absorption:** Well absorbed (80%) following oral administration.
**Distribution:** Widely distributed in tissue and breast milk.
**Protein Binding:** <1%.
**Metabolism and Excretion:** Metabolized to oxypurinol, an active compound with a long half-life. 12% excreted unchanged, 76% excreted as oxypurinol.
**Half-life:** 1–3 hr (oxypurinol 18–30 hr).

TIME/ACTION PROFILE (hypouricemic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO, IV | 1–2 days | 1–2 wk | 1–3 wk† |

†Duration after discontinuation of allopurinol

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Acute attacks of gout; Renal insufficiency (dose reduction required if CCr <20 mL/min); Dehydration (adequate hydration necessary); OB, Lactation: Rarely used; Geri: Begin at lower end of dosage range.

### Adverse Reactions/Side Effects
**CV:** hypotension, flushing, hypertension, bradycardia, and heart failure (reported with IV administration). **CNS:** drowsiness. **GI:** diarrhea, hepatitis, nausea, vomiting. **GU:** renal failure, hematuria. **Derm:** rash (discontinue drug at first sign of rash), urticaria. **Hemat:** bone marrow depression. **Misc:** hypersensitivity reactions.

### Interactions
**Drug-Drug:** Use with **mercaptopurine** and **azathioprine** ↑ bone marrow depressant properties—doses of these drugs should be ↓. Use with **ampicillin** or **amoxicillin** ↑ risk of rash. Use with **oral hypoglycemic agents** and **warfarin** ↑ effects of these drugs. Use with **thiazide diuretics** or **ACE inhibitors** ↑ risk of hypersensitivity reactions. Large doses of allopurinol may ↑ risk of **theophylline** toxicity. May ↑ **cyclosporine** levels.

### Route/Dosage

### Management of Gout
**PO (Adults and Children >10 yr):** *Initially*—100 mg/day; increase at weekly intervals based on serum uric acid (not to exceed 800 mg/day). Doses >300 mg/day should be given in divided

doses; *Maintenance dose*—100–200 mg 2–3 times daily. Doses of ≤300 mg may be given as a single daily dose.

### Management of Secondary Hyperuricemia

**PO (Adults and Children >10 yr):** 600–800 mg/day in 2–3 divided doses starting 1–2 days before chemotherapy or radiation.
**PO (Children 6–10 yr):** 10 mg/kg/day in 2–3 divided doses (maximum 800 mg/day) or 300 mg daily in 2–3 divided doses.
**PO (Children <6 yr):** 10 mg/kg/day in 2–3 divided doses (maximum 800 mg/day) or 150 mg daily in 3 divided doses.
**IV (Adults and Children >10 yr):** 200–400 mg/m²/day (up to 600 mg/day) as a single daily dose or in divided doses q 8–24 hr.
**IV (Children <10 yr):** 200 mg/m²/day initially as a single daily dose or in divided doses q 8–24 hr (maximum dose 600 mg/day).

### Renal Impairment

(Adults and Children): *CCr >50 mL/min*—No dosage change; *CCr 10–50 mL/min*—Reduce dosage to 50% of recommended; *CCr <10 mL/min*—Reduce dosage to 30% of recommended.

### Availability (generic available)

**Tablets:** 100 mg, 300 mg. **Cost:** *Generic*—100 mg $12.99/100, 300 mg $22.99/100. **Injection:** 500 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor intake and output ratios. Decreased kidney function can cause drug accumulation and toxic effects. Ensure that patient maintains adequate fluid intake (minimum 2500–3000 mL/day) to minimize risk of kidney stone formation.
- Assess patient for rash or more severe hypersensitivity reactions. Discontinue allopurinol immediately if rash occurs. Therapy should be discontinued permanently if reaction is severe. Therapy may be reinstated after a mild reaction has subsided, at a lower dose (50 mg/day with very gradual titration). If skin rash recurs, discontinue permanently.
- **Gout:** Monitor for joint pain and swelling. Addition of colchicine or NSAIDs may be necessary for acute attacks. Prophylactic doses of colchicine or an NSAID should be administered concurrently during the first 3–6 mo of therapy because of an increased frequency of acute attacks of gouty arthritis during early therapy.
- ***Lab Test Considerations:*** Serum and urine uric acid levels usually begin to ↓ 2–3 days after initiation of oral therapy.
- Monitor blood glucose in patients receiving oral hypoglycemic agents. May cause hypoglycemia.
- Monitor hematologic, renal, and liver function tests before and periodically during therapy, especially during the first few months. May cause ↑ serum alkaline phosphatase, bilirubin, AST, and ALT levels. ↓ CBC and platelets may indicate bone marrow depression. ↑ BUN, serum creatinine, and CCr may indicate nephrotoxicity. These are usually reversed with discontinuation of therapy.

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- **PO:** May be administered after milk or meals to minimize gastric irritation; give with plenty of fluid. May be crushed and given with fluid or mixed with food for patients who have difficulty swallowing.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 500 mg vial with 25 mL of sterile water for injection. Solution should be clear and almost colorless with only slight opalescence. Dilute to desired concentration with 0.9% NaCl or D5W. Administer within 10 hr of reconstitution; do not refrigerate. Do not administer solutions that are discolored or contain particulate matter. ***Concentration:*** Not >6 mg/mL. ***Rate:*** Infusion should be initiated 24–48 hr before start of chemotherapy known to cause tumor cell lysis. Rate of infusion depends on volume of infusate (100–300 mg doses may be infused over 30 minutes). May be administered as a single infusion or equally divided infusions at 6-, 8-, or 12-hr intervals.
- **Y-Site Compatibility:** acyclovir, aminophylline, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefotetan, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cisplatin, cyclophosphamide, dactinomycin, dexamethasone sodium phosphate, doxorubicin liposome, enalaprilat, etoposide, famotidine, filgrastim, fluconazole, fludarabine, fluorouracil,

furosemide, ganciclovir, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, lorazepam, mannitol, mesna, methotrexate, metronidazole, mitoxandrone, morphine, piperacillin, potassium chloride, ranitidine, teniposide, thiotepa, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, zidovudine.

- **Y-Site Incompatibility:** amikacin, amphotericin B, carmustine, cefotaxime, chlorpromazine, cimetidine, clindamycin, cytarabine, dacarbazine, daunorubicin, diphenhydramine, doxorubicin, doxycycline, droperidol, floxuridine, gentamicin, haloperidol, idarubicin, imipenem/cilastatin, mechlorethamine, meperidine, methylprednisolone sodium succinate, metoclopramide, minocycline, nalbuphine, ondansetron, prochlorperazine, promethazine, sodium bicarbonate, streptozocin, tobramycin, vinorelbine.

## Patient/Family Teaching

- Instruct patient to take allopurinol as directed. Take missed doses as soon as remembered. If dosing schedule is once daily, do not take if remembered the next day. If dosing schedule is more than once a day, take up to 300 mg for the next dose.
- Instruct patient to continue taking allopurinol along with an NSAID or colchicine during an acute attack of gout. Allopurinol helps prevent, but does not relieve, acute gout attacks.
- Alkaline diet may be ordered. Urinary acidification with large doses of vitamin C or other acids may increase kidney stone formation (see Appendix M). Advise patient of need for increased fluid intake.
- May occasionally cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to report skin rash, blood in urine, or influenza symptoms (chills, fever, muscle aches and pains, nausea, or vomiting) to health care professional immediately; skin rash may indicate hypersensitivity.
- Advise patient that large amounts of alcohol increase uric acid concentrations and may decrease the effectiveness of allopurinol.
- Emphasize the importance of follow-up exams to monitor effectiveness and side effects.

## Evaluation/Desired Outcomes

- Decreased serum and urinary uric acid levels. May take 2–6 wk to observe clinical improvement in patients treated for gout.

# **almotriptan** (al-moe-**trip**-tan)

Axert

***Classification***

Therapeutic: vascular headache suppressants

Pharmacologic: 5-$HT_1$ agonists

**Pregnancy Category C**

## Indications

Acute treatment of migraine headache (for adolescents, migraines should be ≥4 hr in duration).

## Action

Acts as an agonist at specific 5-$HT_1$ receptor sites in intracranial blood vessels and sensory trigeminal nerves. **Therapeutic Effects:** Cranial vessel vasoconstriction with associated decrease in release of neuropetides and resultant decrease in migraine headache.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration (70%).
**Distribution:** Unknown.
**Metabolism and Excretion:** 40% excreted unchanged in urine; 27% metabolized by monoamine oxidase-A (MAO-A); 12% metabolized by cytochrome P450 hepatic enzymes (3A4 and 2D6); 13% excreted in feces as unchanged and metabolized drug.
**Half-life:** 3–4 hr.

TIME/ACTION PROFILE (Blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1–3 hr | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Ischemic cardiovascular, cerebrovascular, or peripheral vascular syndromes (including ischemic bowel disease); History of significant cardiovascular disease; Uncontrolled hypertension; Should not be used within 24 hr of other 5-$HT_1$ agonists or ergot-type compounds (dihydroergotamine); Basilar or hemiplegic migraine; Concurrent MAO-A inhibitor therapy or within 2 wk of discontinuing MAO-A inhibitor therapy.
**Use Cautiously in:** Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and first dose is administered under supervision; Impaired hepatic or renal function; Hypersensitivity to sulfonamides (cross-

sensitivity may occur); OB, Lactation: Safety not established; Pedi: Safety not established in children <12 yr.

### Adverse Reactions/Side Effects

**CNS:** drowsiness, headache. **CV:** CORONARY ARTERY VASOSPASM, MI, myocardial ischemia, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA. **GI:** dry mouth, nausea. **Neuro:** paresthesia.

### Interactions

**Drug-Drug:** Concurrent use with **MAO-A inhibitors** ↑ blood levels and the risk of adverse reactions (concurrent use or use within 2 wk or MAO inhibitor is contraindicated). Concurrent use with other **5-HT$_1$ agonists** or **ergot-type compounds** (**dihydroergotamine**) may result in additive vasoactive properties (avoid use within 24 hr of each other). ↑ serotonin levels and serotonin syndrome may occur when used concurrently with **SSRI and SNRI antidepressants**. Blood levels and effects may be ↑ by **ketoconazole**, **itraconazole**, **ritonavir**, and **erythromycin** (inhibitors of CYP3A4 enzymes).

### Route/Dosage

**PO (Adults and Children ≥12 yr):** 6.25–12.5 mg initially, may repeat in 2 hr; not to exceed 2 doses per 24-hr period.

### Hepatic/Renal Impairment

**PO (Adults):** 6.25 mg initially, may repeat in 2 hr; not to exceed 2 doses per 24-hr period.

### Availability

**Tablets:** 6.25 mg, 12.5 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Monitor for serotonin syndrome in patients taking SSRIs or SNRIs concurrently with almotriptan.

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- **PO:** Tablets should be swallowed whole with liquid.

### Patient/Family Teaching

- Inform patient that almotriptan should only be used during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer almotriptan as soon as symptoms of a migraine attack appear, but it may be administered any time during an attack. If migraine symptoms return, a second dose may be used. Allow at least 2 hr between doses, and do not use more than 2 doses in any 24-hr period.
- If first dose does not relieve headache, additional almotriptan doses are not likely to be effective; notify health care professional.
- Caution patient not to take almotriptan within 24 hr of another vascular headache suppressant.
- Advise patient that lying down in a darkened room following almotriptan administration may further help relieve headache.
- Caution patient not to use almotriptan if she is pregnant, suspects she is pregnant, plans to become pregnant, or is breastfeeding. Adequate contraception should be used during therapy.
- Advise patient to notify health care professional prior to next dose of almotriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop discuss with health care professional at next visit.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during almotriptan use.
- Advise patient to consult health care professional before taking other Rx, OTC, or herbal products concurrently with almotriptan. Patients concurrently taking SSRI or SNRI antidepressants should notify health care professional promptly if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile blood pressure, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.

### Evaluation/Desired Outcomes

- Relief of migraine attack.

**alprazolam** (al-**pray**-zoe-lam)
Apo-Alpraz, Novo-Alprazol, Niravam, Nu-Alpraz, Xanax, Xanax XR

***Classification***
Therapeutic: antianxiety agents
Pharmacologic: benzodiazepines

**Schedule IV**

**Pregnancy Category D**

## Indications
Treatment of Generalized Anxiety Disorder (GAD). Panic Disorder. Management of anxiety associated with depression. **Unlabeled Use:** Management of symptoms of premenstrual syndrome (PMS). Insomnia, irritable bowel syndrome (IBS) and other somatic symptoms associated with anxiety. Used as an adjunct with acute mania, acute psychosis.

## Action
Acts at many levels in the CNS to produce anxiolytic effect. May produce CNS depression. Effects may be mediated by GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Relief of anxiety.

## Pharmacokinetics
**Absorption:** Well absorbed (90%) from the GI tract; absorption is slower with extended-release tablets.
**Distribution:** Widely distributed, crosses blood-brain barrier. Probably crosses the placenta and enters breast milk. Accumulation is minimal.
**Metabolism and Excretion:** Metabolized by the liver (CYP3A4 enzyme system) to an active compound that is subsequently rapidly metabolized.
**Half-life:** 12–15 hr.

TIME/ACTION PROFILE (sedation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–2 hr | 1–2 hr | up to 24 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Pre-existing CNS depression; Severe uncontrolled pain; Angle-closure glaucoma, obstructive sleep apnea, pulmonary disease; Pregnancy and lactation; Concurrent itraconazole or ketoconazole; OB, Lactation: Use in pregnancy or lactation may cause CNS depression, flaccidity, feeding difficulties, and seizures in infant.
**Use Cautiously in:** Renal Impairment, Hepatic dysfunction (↓ dose required); Concurrent use with nefazodone, fluvoxamine, cimetidine, fluoxetine, hormonal contraceptives, propoxyphene, diltiazem, isoniazid, erythromycin, clarithromycin, grapefruit juice (↓ dose may be necessary); History of suicide attempt or alcohol/drug dependence, debilitated patients (↓ dose required); Pedi: Safety and efficacy not established. Decreased dosage and frequent monitoring required; Geri: Elderly patients have increased sensitivity to benzodiazepines. Appears on Beers list and is associated with increased risk of falls (↓ dose required) and excessive CNS effects.

## Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness, lethargy, confusion, hangover, headache, mental depression, paradoxical excitation. **EENT:** blurred vision. **GI:** constipation, diarrhea, nausea, vomiting, weight gain. **Derm:** rashes. **Misc:** physical dependence, psychological dependence, tolerance.

## Interactions
**Drug-Drug: Alcohol**, **antidepressants**, other **benzodiazepines**, **antihistamines**, and **opioid analgesics**—concurrent use results in ↑ CNS depression. **Hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **metoprolol**, **propoxyphene**, **propranolol**, **valproic acid**, **CYP3A4 inhibitors** (**erythromycin**, **ketoconazole**, **itraconazole**, **fluvoxamine**, **cimetidine**, **nefazodone**) ↓ metabolism of alprazolam, ↑ blood levels and ↑ its actions (dose adjustments may be necessary). May ↓ efficacy of **levodopa**. **CYP3A4 inducers** (**rifampin**, **carbamazepine**, or **barbiturates**) ↑ metabolism and ↓ effects of alprazolam. Sedative effects may be ↓ by **theophylline**. **Cigarette smoking** ↓ blood levels and effects.
**Drug-Natural Products: Kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.
**Drug-Food:** Concurrent ingestion of **grapefruit juice** ↑ blood levels.

## Route/Dosage
### Anxiety
**PO (Adults):** 0.25–0.5 mg 2–3 times daily (not >4 mg/day; begin with 0.25 mg 2–3 times daily in geriatric/debilitated patients).

### Panic Attacks
**PO (Adults):** 0.5 mg 3 times daily; may be increased by 1 mg or less every 3–4 days as needed (not >10 mg/day). *Extended-release tablets (Xanax XR)*—0.5–1 mg once daily in the morning, may be increased every 3–4 days by not more than 1 mg/day; up to 10 mg/day (usual range 3–6 mg/day).

### Availability (generic available)

**Tablets:** 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost:** 0.25 mg $98.21/100, 0.5 mg $122.35/100, 1 mg $163.25/100, 2 mg $277.56/100. **Extended-release tablets:** 0.5 mg, 1 mg, 2 mg, 3 mg. **Orally disintegrating tablets (orange):** 0.25 mg, 0.5 mg, 1 mg, 2 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess patient for drowsiness, light-headedness, and dizziness. These symptoms usually disappear as therapy progresses. Dose should be reduced if these symptoms persist.
- Geri: Assess CNS effects and risk of falls. Institute falls prevention strategies.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Risk is greater in patients taking >4 mg/day. Restrict the amount of drug available to patient. Assess regularly for continued need for treatment.
- ***Lab Test Considerations:*** Monitor CBC and liver and renal function periodically during long-term therapy. May cause ↓ hematocrit and neutropenia.
- ***Toxicity and Overdose:*** Flumazenil is the antidote for alprazolam toxicity or overdose. (Flumazenil may induce seizures in patients with a history of seizures disorder or who are on tricyclic antidepressants.)

### Potential Nursing Diagnoses

Anxiety (Indications)
Risk for injury (Side Effects)
Risk for falls (Side Effects)

### Implementation

- Do not confuse Xanax (alprazolam) with Zantac (ranitidine).
- If early morning anxiety or anxiety between doses occurs, the same total daily dose should be divided into more frequent intervals.
- **PO:** May be administered with food if GI upset occurs. Administer greatest dose at bedtime to avoid daytime sedation.
- Tablets may be crushed and taken with food or fluids if patient has difficulty swallowing. Do not crush, break, or chew extended-release tablets.
- Taper by 0.5 mg q 3 days to prevent withdrawal. Some patients may require longer tapering period (months).
- For *orally disintegrating tablets:* Remove tablet from bottle with dry hands just prior to taking medication. Place tablet on tongue. Tablet will dissolve with saliva; may also be taken with water. Remove cotton from bottle and reseal tightly to prevent moisture from entering bottle. If only ½ tablet taken, discard unused portion immediately; may not remain stable.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed; do not skip or double up on missed doses. If a dose is missed, take within 1 hr; otherwise, skip the dose and return to regular schedule. If medication is less effective after a few weeks, check with health care professional; do not increase dose. Abrupt withdrawal may cause sweating, vomiting, muscle cramps, tremors, and seizures.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the medication is known. Geri: Instruct patient and family how to reduce falls risk at home.
- Advise patient to avoid drinking grapefruit juice during therapy.
- Advise patient to avoid the use of alcohol or other CNS depressants concurrently with alprazolam. Instruct patient to consult health care professional before taking Rx, OTC, or herbal products concurrently with this medication.
- Inform patient that benzodiazepines are usually prescribed for short-term use and do not cure underlying problems.
- Teach other methods to decrease anxiety (exercise, support group, relaxation techniques).
- Advise patient to not share medication with anyone.

### Evaluation/Desired Outcomes

- Decreased sense of anxiety without CNS side effects.
- Decreased frequency and severity of panic attacks.
- Decreased symptoms of premenstrual syndrome.

**alteplase, See THROMBOLYTIC AGENTS.**

## aluminum hydroxide

AlternaGEL, Alu-Cap, Alugel, Aluminet, Alu-Tab, Amphojel, Basalgel, Dialume

***Classification***

Therapeutic: antiulcer agents, hypophosphatemics

Pharmacologic: antacids, phosphate binders

**Pregnancy Category UK**

### Indications

Lowering of phosphate levels in patients with chronic renal failure. Adjunctive therapy in the treatment of peptic, duodenal, and gastric ulcers. Hyperacidity, indigestion, reflux esophagitis.

### Action

Binds phosphate in the GI tract. Neutralizes gastric acid and inactivates pepsin. **Therapeutic Effects:** Lowering of serum phosphate levels. Healing of ulcers and decreased pain associated with ulcers or gastric hyperacidity. Constipation limits use alone in the treatment of ulcer disease. Frequently found in combination with magnesium-containing compounds.

### Pharmacokinetics

**Absorption:** With chronic use, small amounts of aluminum are systemically absorbed.
**Distribution:** If absorbed, aluminum distributes widely, crosses the placenta, and enters breast milk. Concentrates in the CNS with chronic use.
**Metabolism and Excretion:** Mostly excreted in feces. Small amounts absorbed are excreted by the kidneys.
**Half-life:** Unknown.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO† | hr–days | days–wk | days |
| PO‡ | 15–30 min | 30 min | 30 min–3 hr |

†Hypophosphatemic effect
‡Antacid effect

### Contraindications/Precautions

**Contraindicated in:** Severe abdominal pain of unknown cause.
**Use Cautiously in:** Hypercalcemia; Hypophosphatemia; OB: Generally considered safe; chronic high-dose therapy should be avoided.

### Adverse Reactions/Side Effects

**GI:** constipation. **F and E:** hypophosphatemia.

### Interactions

**Drug-Drug:** Absorption of **tetracyclines**, **chlorpromazine**, **iron salts**, **isoniazid**, **digoxin**, or **fluoroquinolones** may be decreased. **Salicylate** blood levels may be decreased. **Quinidine**, **mexiletine**, and **amphetamine** levels may be increased if enough antacid is ingested such that urine pH is increased.

### Route/Dosage

#### Hypophosphatemia

**PO (Adults):** 1.9–4.8 g (30–40 mL of regular suspension or 15–20 mL of concentrated suspension) 3–4 times daily.
**PO (Children):** 50–150 mg/kg/24 hr in 4–6 divided doses; titrate to normal serum phosphate levels.

#### Antacid

**PO (Adults):** 500–1500 mg (5–30 mL) 3–6 times daily.

### Availability (generic available)

**Capsules:** 475 mg[OTC], 500 mg[OTC]. **Tablets:** 300 mg[OTC], 500 mg[OTC], 600 mg[OTC]. **Suspension:** 320 mg/5 mL[OTC], 450 mg/5 mL[OTC], 600 mg/5 mL[OTC], 675 mg/5 mL[OTC]. ***In combination with:*** magnesium carbonate, calcium carbonate, simethicone, and mineral oil. See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess location, duration, character, and precipitating factors of gastric pain.
- ***Lab Test Considerations:*** Monitor serum phosphate and calcium levels periodically during chronic use of aluminum hydroxide.
- May cause increased serum gastrin and decreased serum phosphate concentrations.
- In treatment of severe ulcer disease, guaiac stools, and emesis, monitor pH of gastric secretions.

### Potential Nursing Diagnoses

Acute pain (Indications)
Constipation (Side Effects)

### Implementation

- Antacids cause premature dissolution and absorption of enteric-coated tablets and may interfere with absorption of other oral medications. Separate administration of aluminum hydroxide and oral medications by at least 1–2 hr.

- Tablets must be chewed thoroughly before swallowing to prevent their entering small intestine in undissolved form. Follow with a glass of water.
- Shake liquid preparations well before pouring. Follow administration with water to ensure passage into stomach.
- Liquid dosage forms are considered more effective than tablets.
- **Hypophosphatemic:** For phosphate lowering, follow dose with full glass of water or fruit juice.
- **Antacid:** May be given in conjunction with magnesium-containing antacids to minimize constipation, except in patients with renal failure. Administer 1 and 3 hr after meals and at bedtime for maximum antacid effect.
- For treatment of peptic ulcer, aluminum hydroxide may be administered every 1–2 hr while the patient is awake or diluted with 2–3 parts water and administered intragastrically every 30 min for 12 or more hr per day. Physician may order NG tube clamped after administration.
- For reflux esophagitis, administer 15 mL 20–40 min after meals and at bedtime.

### Patient/Family Teaching

- Instruct patient to take aluminum hydroxide exactly as directed. If on a regular dosing schedule and a dose is missed, take as soon as remembered if not almost time for next dose; do not double doses.
- Advise patient not to take aluminum hydroxide within 1–2 hr of other medications without consulting health care professional.
- Advise patients to check label for sodium content. Patients with CHF or hypertension, or those on sodium restriction, should use low-sodium preparations.
- Inform patients of potential for constipation from aluminum hydroxide.
- **Hypophosphatemia:** Patients taking aluminum hydroxide for hyperphosphatemia should be taught the importance of a low-phosphate diet.
- **Antacid:** Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if taking other medications, if relief is not obtained, or if symptoms of gastric bleeding (black tarry stools, coffee-ground emesis) occur.

### Evaluation/Desired Outcomes

- Decrease in serum phosphate levels.
- Decrease in GI pain and irritation.
- Increase in the pH of gastric secretions. In treatment of peptic ulcer, antacid therapy should be continued for at least 4–6 wk after symptoms have disappeared because there is no correlation between disappearance of symptoms and healing of ulcers.

**amcinonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

## amifostine (a-mi-**fos**-teen)

Ethyol

***Classification***

Therapeutic: cytoprotective agents

**Pregnancy Category C**

### Indications

Reduces renal toxicity from cisplatin. Reduces the incidence of moderate to severe xerostomia from postoperative radiation for head and neck cancer in which the radiation port includes a large portion of the parotid glands.

### Action

Converted by alkaline phosphatase in tissue to a free thiol compound that binds and detoxifies damaging metabolites of cisplatin and reactive oxygen species generated by radiation. **Therapeutic Effects:** Decreased renal damage from cisplatin. Decreased severity of xerostomia following radiation for head and neck cancer.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Rapidly cleared from plasma; converted to cytoprotective compounds by alkaline phosphatase in tissues.
**Half-life:** 8 min.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Known sensitivity to aminothiol compounds; Hypotension or dehydration;

Lactation: Use an alternative to breast milk; Concurrent antineoplastic therapy for other tumors (especially malignancies of germ cell origin). **Use Cautiously in:** OB, Pedi: Safety not established; Geri: Geriatric patients or patients with cardiovascular disease have ↑ risk of adverse reactions.

### Adverse Reactions/Side Effects

**CNS:** dizziness, somnolence. **EENT:** sneezing. **CV:** hypotension. **GI:** hiccups, nausea, vomiting. **Derm:** flushing. **F and E:** hypocalcemia. **Misc:** allergic reactions including ANAPHYLAXIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, TOXODERMA, ERYTHEMA MULTIFORMA, EXFOLIATIVE DERMATITIS ( ↑ when used as a radioprotectant), chills.

### Interactions

**Drug-Drug:** Concurrent use of **antihypertensives** ↑ risk of hypotension.

### Route/Dosage

### Reduction of Renal Damage with Cisplatin

**IV (Adults):** 910 mg/m² once daily, within 30 min before chemotherapy; if full dose is poorly tolerated, subsequent doses should be ↓ to 740 mg/m².

### Reduction of Xerostomia from Radiation

**IV (Adults):** 200 mg/m² once daily, as a 3-minute infusion starting 15–30 min before standard fraction radiation therapy.

### Availability (generic available)

**Powder for injection:** 500 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure before and every 5 min during infusion. Discontinue antihypertensives 24 hr prior to treatment. If significant hypotension requiring interruption of therapy occurs, place patient in Trendelenburg position and administer an infusion of 0.9% NaCl using a separate IV line. If blood pressure returns to normal in 5 min and patient is asymptomatic, infusion may be resumed so that full dose may be given.
- Assess fluid status before administration. Correct dehydration before instituting therapy. Nausea and vomiting are frequent and may be severe. Administer prophylactic antiemetics including dexamethasone 20 mg IV and a serotonin-antagonist antiemetic (dolasetron, granisetron, ondansetron, palonosetron) before and during infusion. Monitor fluid status closely.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify physician or other health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- **Xerostomia:** Assess patient for dry mouth and mouth sores periodically during therapy.
- Monitor patient for skin reactions before, during, and after amifostine administration; reactions may be delayed by several weeks after initiation of therapy. Permanently discontinue amifostine in patients who experience serious or severe cutaneous reactions or cutaneous reactions associated with fever or other symptoms of unknown cause. Withhold therapy and obtain dermatologic consultation and biopsy for cutaneous reactions or mucosal lesions of unknown cause appearing outside of injection site or radiation port, and for erythematous, edematous, or bullous lesions on the palms of the hand or soles of the feet.
- ***Lab Test Considerations:*** Monitor serum calcium concentrations before and periodically during therapy. May cause hypocalcemia. Calcium supplements may be necessary.

### Potential Nursing Diagnoses

Risk for injury (Indications)

### Implementation

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Reconstitute with 9.7 mL of sterile 0.9% NaCl. Dilute further with 0.9% NaCl. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 5 hr at room temperature or 24 hr if refrigerated. ***Concentration:*** Adults: dilute dose to a final volume of 50 mL; Children: 5–40 mg/mL. ***Rate:*** *For renal toxicity:* Administer over 15 min within 30 min before chemotherapy administration. Longer infusion times are not as well tolerated. *For xerostomia:* Administer over 3 min starting 15–30 min prior to radiation therapy.
- **Y-Site Compatibility:** amikacin, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime,

ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, epirubicin, ertapenem, etoposide, etoposide phosphate, famotidine, fenoldopam, floxuridine, fluconazole, fludarabine, fluorouracil, furosemide, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, leucovorin, levofloxacin, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, milrinone, mitomycin, morphine, nalbuphine, nesiritide, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pantoprazole, pemetrexed, piperacillin/tazobactam, plicamycin, potassium chloride, promethazine, ranitidine, rituximab, sodium acetate, sodium bicarbonate, streptozocin, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, trimetrexate, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** acyclovir, amphotericin B colloidal, cefoperazone, cisplatin, ganciclovir, hydroxyzine , minocycline, prochlorperazine, quinupristin/dalfopristin.
- **Additive Incompatibility:** Do not mix with other solutions or medications.

### Patient/Family Teaching

- Explain the purpose of amifostine infusion to patient.
- Inform patient that amifostine may cause hypotension, nausea, vomiting, flushing, chills, dizziness, somnolence, hiccups, and sneezing.
- Advise patient to notify health care professional if skin reactions occur.

### Evaluation/Desired Outcomes

- Prevention of renal toxicity associated with repeated administration of cisplatin in patients with ovarian cancer.
- Decreased severity of xerostomia from radiation treatment of head and neck cancer.

## amikacin, See AMINOGLYCOSIDES.

## amiloride, See DIURETICS (POTASSIUM-SPARING).

## aminocaproic acid

(a-mee-noe-ka-**pro**-ik)
Amicar, epsilon aminocaproic acid

***Classification***
Therapeutic: hemostatic agents
Pharmacologic: fibrinolysis inhibitors

**Pregnancy Category C**

### Indications

Management of acute, life-threatening hemorrhage due to systemic hyperfibrinolysis or urinary fibrinolysis. **Unlabeled Use:** Prevention of recurrent subarachnoid hemorrhage. Prevention of bleeding following oral surgery in hemophiliacs. Management of severe hemorrhage caused by thrombolytic agents.

### Action

Inhibits activation of plasminogen. **Therapeutic Effects:** Inhibition of fibrinolysis. Stabilization of clot formation.

### Pharmacokinetics

**Absorption:** Rapidly absorbed following oral administration.
**Distribution:** Widely distributed.
**Metabolism and Excretion:** Mostly eliminated unchanged by the kidneys.
**Half-life:** Unknown.

TIME/ACTION PROFILE (peak blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2 hr | N/A |
| IV | unknown | 2 hr | N/A |

### Contraindications/Precautions

**Contraindicated in:** Active intravascular clotting.
**Use Cautiously in:** Upper urinary tract bleeding; Cardiac, renal, or liver disease (dosage reduction may be required); Disseminated intravascular coagulation (should be used concurrently with heparin); OB, Lactation: Safety not established; Pedi: Do not use products containing benzyl alcohol with neonates.

### Adverse Reactions/Side Effects

**CNS:** dizziness, malaise. **EENT:** nasal stuffiness, tinnitus. **CV:** arrhythmias, hypotension (IV only). **GI:** anorexia, bloating, cramping, diarrhea, nausea. **GU:** diuresis, renal failure. **MS:** myopathy.

### Interactions

**Drug-Drug:** Concurrent use with **estrogens, conjugated** may result in a hypercoagulable state. Concurrent use with **clotting factors** may ↑ risk of thromboses.

### Route/Dosage

#### Acute Bleeding Syndromes due to Elevated Fibrinolytic Activity

**PO (Adults):** 5 g 1st hr, followed by 1–1.25 g q hr for 8 hr or until hemorrhage is controlled; or 6 g over 24 hr after prostate surgery (not >30 g/day).
**IV (Adults):** 4–5 g over 1st hr, followed by 1 g/hr for 8 hr or until hemorrhage is controlled; or 6 g over 24 hr after prostate surgery (not >30 g/day).
**PO, IV (Children):** 100 mg/kg or 3 g/m² over 1st hr, followed by continuous infusion of 33.3 mg/kg/hr; or 1 g/m²/hr (total dosage not >18 g/m²/24 hr).

#### Subarachnoid Hemorrhage

**PO (Adults):** *To follow IV*—3 g q 2 hr (36 g/day). If no surgery is performed, continue for 21 days after bleeding stops, then decrease to 2 g q 2 hr (24 g/day) for 3 days, then 1 g q 2 hr (12 g/day) for 3 days.
**IV (Adults):** 36 g/day for 10 days followed by PO.

#### Prevention of Bleeding Following Oral Surgery in Hemophiliacs

**PO (Adults):** 75 mg/kg (up to 6 g) immediately after procedure, then q 6 hr for 7–10 days; syrup may also be used as an oral rinse of 1.25 g (5 mL) 4 times a day for 7–10 days.
**IV, PO (Children):** *Also for epistaxis*—50–100 mg/kg/dose administered IV every 6 hr for 2–3 days starting 4 hr before the procedure. After completion of IV therapy, aminocaproic acid should be given as 50–100 mg/kg/dose orally every 6 hr for 5–7 days.

### Availability

**Tablets:** 500 mg. **Syrup (raspberry flavor):** 1.25 g/5 mL. **Injection:** 250 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, pulse, and respiratory status as indicated by severity of bleeding.
- Monitor for overt bleeding every 15–30 min.
- Monitor neurologic status (pupils, level of consciousness, motor activity) in patients with subarachnoid hemorrhage.
- Monitor intake and output ratios frequently; notify physician if significant discrepancies occur.
- Assess for thromboembolic complications (especially in patients with history). Notify physician of positive Homans' sign, leg pain and edema, hemoptysis, dyspnea, or chest pain.
- ***Lab Test Considerations:*** Monitor platelet count and clotting factors prior to and periodically throughout therapy in patients with systemic fibrinolysis.
- ↑ CPK, AST, and serum aldolase may indicate myopathy.
- May ↑ serum potassium.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Indications, Side Effects)

### Implementation

- Do not confuse Amicar (aminocaproic acid) with Amikin (amikacin).
- **PO:** Syrup may be used as an oral rinse, swished for 30 sec 4 times/day for 7–10 days for the control of bleeding during dental and oral surgery in hemophilic patients. Small amounts may be swallowed, except during 1st and 2nd trimesters of pregnancy. Syrup may be applied with an applicator in children or unconscious patients.

#### IV Administration

- **IV:** Stabilize IV catheter to minimize thrombophlebitis. Monitor site closely.
- **Intermittent Infusion:** ***Diluent:*** Do not administer undiluted. Dilute initial 4–5 g dose in 250 mL of sterile water for injection, 0.9% NaCl, D5W, or LR. Do not dilute with sterile water in patients with subarachnoid hemorrhage. ***Concentration:*** 20 mg/mL. ***Rate:*** Single doses: Administer over 1 hr. Rapid infusion rate may cause hypotension, bradycardia, or other arrhythmias.
- **Continuous Infusion:** Administer IV solution using infusion pump to ensure accurate dose. Administer via slow IV infusion.
- ***Rate:*** Initial dose may be followed by a continuous infusion of 1–1.25 g/hr in adults or 33.3 mg/kg/hr in children.
- **Additive Incompatibility:** Do not admix with other medications.

### Patient/Family Teaching

- Instruct patient to notify the nurse immediately if bleeding recurs or if thromboembolic symptoms develop.
- **IV:** Caution patient to make position changes slowly to avoid orthostatic hypotension.

### Evaluation/Desired Outcomes

- Cessation of bleeding.
- Prevention of rebleeding in subarachnoid hemorrhage without occurrence of undesired clotting.

## AMINOGLYCOSIDES

**amikacin** (am-i-**kay**-sin)

**gentamicin†** (jen-ta-**mye**-sin)
Cidomycin, Garamycin, G-Mycin, Jenamicin

**kanamycin** (kan-a-**mye**-sin)

**neomycin** (neo-oh-**mye**-sin)
Neo-Fradin

**streptomycin** (strep-toe-**mye**-sin)

**tobramycin†** (toe-bra-**mye**-sin)
Nebcin, TOBI

***Classification***
Therapeutic: anti-infectives
Pharmacologic: aminoglycosides

**Pregnancy Category C (gentamicin, topical use of others), D (amikacin, kanamycin, neomycin, streptomycin, tobramycin)**

†See Appendix C for ophthalmic use

### Indications

**Amikacin, gentamicin, kanamycin, and tobramycin:** Treatment of serious gram-negative bacillary infections and infections caused by staphylococci when penicillins or other less toxic drugs are contraindicated. **Streptomycin:** In combination with other agents in the management of active tuberculosis. **Neomycin:** Used orally to prepare the GI tract for surgery, to decrease the number of ammonia-producing bacteria in the gut as part of the management of hepatic encephalopathy, and to treat diarrhea caused by *Escherichia coli*. **Tobramycin by inhalation:** Management of *Pseudomonas aeruginosa* in cystic fibrosis patients. **Gentamicin, streptomycin:** In combination with other agents in the management of serious enterococcal infections. **Gentamicin IV:** Prevention of infective endocarditis. **Gentamicin (topical):** Treatment of localized infections caused by susceptible organisms. **Unlabeled Use:** Amikacin**:** In combination with other agents in the management of *Mycobacterium avium* complex infections.

### Action

Inhibits protein synthesis in bacteria at level of 30S ribosome. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Most aminoglycosides notable for activity against: *P. aeruginosa*, *Klebsiella pneumoniae*, *E.coli*, *Proteus*, *Serratia*, *Acinetobacter*, *Staphylococcus aureus*. In treatment of enterococcal infections, synergy with a penicillin is required. Streptomycin and amikacin also active against *Mycobacterium*.

### Pharmacokinetics

**Absorption:** Well absorbed after IM administration. IV administration results in complete bioavailability. Some absorption follows administration by other routes. Minimal systemic absorption with neomycin (may accumulate in patients with renal failure).
**Distribution:** Widely distributed throughout extracellular fluid; cross the placenta; small amounts enter breast milk. Poor penetration into CSF ( ↑ when meninges are inflammed).
**Metabolism and Excretion:** Excretion is >90% renal.
**Half-life:** 2–4 hr ( ↑ in renal impairment).

TIME/ACTION PROFILE (blood levels*)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (neomycin) | rapid | 1–4 hr | N/A |
| IM | rapid | 30–90 min | 6–24 hr |
| IV | rapid | 15–30 min† | 6–24 hr |

*All parenterally administered aminoglycosides
†Postdistribution peak occurs 30 min after the end of a 30-min infusion and 15 min after the end of a 1-hr infusion

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to aminoglycosides; Most parenteral products contain bisulfites and should be avoided in patients with known intolerance; Pedi: Products containing benzyl alcohol should be avoided in neonates; Intestinal obstruction (neomycin only).
**Use Cautiously in:** Renal impairment (dose adjustments necessary; blood level monitoring useful in preventing ototoxicity and nephrotoxicity); Hearing impairment; Neuromuscular diseases

such as myasthenia gravis; Obese patients (dose should be based on ideal body weight); OB: Tobramycin and streptomycin may cause congenital deafness; Lactation: Safety not established; Pedi: Neonates have ↑ risk of neuromuscular blockade; difficulty in assessing auditory and vestibular function and immature renal function; Geri: Difficulty in assessing auditory and vestibular function and age-related renal impairment.

## Adverse Reactions/Side Effects

**CNS:** ataxia, vertigo. **EENT:** ototoxicity (vestibular and cochlear). **GU:** nephrotoxicity. **GI:** *Neomycin*—diarrhea, nausea, vomiting. **F and E:** hypomagnesemia. **MS:** muscle paralysis (high parenteral doses). **Neuro:** ↑ neuromuscular blockade. **Resp:** apnea. **Misc:** hypersensitivity reactions.

## Interactions

**Drug-Drug:** Inactivated by **penicillins** and **cephalosporins** when coadministered to patients with renal insufficiency. Possible respiratory paralysis after **inhalation anesthetics** or **neuromuscular blocking agents**. ↑ incidence of ototoxicity with **loop diuretics**. ↑ incidence of nephrotoxicity with other **nephrotoxic drugs**. Neomycin may ↑ anticoagulant effects of **warfarin**. Neomycin may ↓ absorption of **digoxin** and **methotrexate**.

## Route/Dosage

### Amikacin

**IM, IV (Adults and Children):** 5 mg/kg q 8 hr or 7.5 mg/kg q 12 hr (not to exceed 1.5 g/day).
*Mycobacterium avium complex*—7.5–15 mg/kg/day divided q 12–24 hr.
**IM, IV (Neonates):** *Loading dose*—10 mg/kg; *Maintenance dose*—7.5 mg/kg q 12 hr.

#### Renal Impairment

**IM, IV (Adults):** *Loading dose*—7.5 mg/kg, further dosing based on blood level monitoring and renal function assessment.

### Gentamicin

Many regimens are used; most involve dosing adjusted on the basis of blood level monitoring and assessment of renal function.
**IM, IV (Adults):** 1–2 mg/kg q 8 hr (up to 6 mg/kg/day in 3 divided doses); *Once-daily dosing (unlabeled)*—4–7 mg/kg q 24 hr.
**IM, IV (Children > 5 yr):** 2–2.5 mg/kg/dose q 8 hr; *Once daily*—5–7.5 mg/kg/dose q 24 hr; *Cystic fibrosis*—2.5–3.3 mg/kg/dose q 6–8 hr; *Hemodialysis*—1.25–1.75 mg/kg/dose postdialysis.
**IM, IV (Children 1 mo-5 yr):** 2.5 mg/kg/dose q 8 hr; *Once daily*—5–7.5 mg/kg/dose q 24 hr; *Cystic fibrosis*—2.5–3.3 mg/kg/dose q 6–8 hr; *Hemodialysis*—1.25–1.75 mg/kg/dose postdialysis.
**IM, IV (Neonates full term and/or > 1 wk):** *Weight <1200 g*—2.5 mg/kg/dose q 18–24 hr; *Weight 1200–2000 g*—2.5 mg/kg/dose q 8–12 hr; *Weight >2000 g*—2.5 mg/kg/dose q 8 hr; *ECMO*—2.5 mg/kg/dose q 18 hr, subsequent doses based on serum concentrations; *Once daily*—3.5–5 mg/kg/dose q 24 hr.
**IM, IV (Neonates premature and/or ≤1 wk):** *Weight <1000 g*—3.5 mg/kg/dose q 24 hr; *Weight 1000–1200 g*—2.5 mg/kg/dose q 18–24 hr; *Weight >1200 g*—2.5 mg/kg/dose q 12 hr; *Once daily*—3.5–4 mg/kg/dose q 24 hr.
**IT (Adults):** 4–8 mg/day.
**IT (Infants >3 months and Children):** 1–2 mg/day.
**IT (Neonates):** 1 mg/day.
**Topical (Adults and Children >1 month):** Apply cream or ointment 3–4 times daily.

#### Renal Impairment

**IM, IV (Adults):** Initial dose of 2 mg/kg. Subsequent doses/intervals based on blood level monitoring and renal function assessment.

### Kanamycin

**IM, IV (Adults and Children and Infants):** 5 mg/kg q 8 hr *or* 7.5 mg/kg q 12 hr (not to exceed 15 mg/kg/day).
**Inhaln (Adults):** 250 mg 2–4 times daily.

#### Renal Impairment

**IM, IV (Adults):** 7.5 mg/kg; further dosing and intervals determined by blood level monitoring and assessment of renal function.

### Neomycin

**PO (Adults):** *Preoperative intestinal antisepsis*—1 g q hr for 4 doses, then 1 g q 4 hr for 5 doses *or* 1 g at 1 PM, 2 PM, and 11 PM on day before surgery; *Hepatic encephalopathy*—1–3 g q 6 hr for 5–6 days; may be followed by 4 g/day chronically.
**PO (Children):** *Preoperative intestinal antisepsis*—15 mg/kg q 4 hr for 2 days *or* 25 mg/kg at 1 PM, 2 PM, and 11 PM on day before surgery; *Hepatic encephalopathy*—12.5–25 mg/kg q 6 hr for 5–6 days (maximum dose = 12 g/day).

### Streptomycin

**IM (Adults):** *Tuberculosis*—1 g/day initially, decreased to 1 g 2–3 times weekly; *Other infections*—250 mg–1 g q 6 hr *or* 500 mg–2 g q 12 hr.

**IM (Children):** *Tuberculosis*—20 mg/kg/day (not to exceed 1 g/day); *Other infections*—5–10 mg/kg q 6 hr *or* 10–20 mg/kg q 12 hr.

### Renal Impairment

**IM (Adults):** 1 g initially, further dosing determined by blood level monitoring and assessment of renal function.

### Tobramycin

**IM, IV (Adults):** 1–2 mg/kg q 8 hr *or* 4–6.6 mg/kg/day q 24 hr.
**IM, IV (Adults):** 3–6 mg/kg/day in 3 divided doses, or 4–6.6 mg/kg once daily.
**IM, IV (Children > 5 yr):** 6–7.5 mg/kg/day divided q 8 hr, up to 13 mg/kg/day divided q 6–8 hr in cystic fibrosis patients (dosing interval may vary from q 6 hr–q 24 hr, depending on clinical situation).
**IM, IV (Children 1 mo–5 yr):** 7.5 mg/kg/day divided q 8 hr, up to 13 mg/kg/day divided q 6–8 hr in cystic fibrosis.
**IM, IV (Neonates ):** *Preterm <1000 g*—3.5 mg/kg/dose q 24 hr; *0–4 weeks, <1200 g*—2.5 mg/kg/dose q 18 hr; *Postnatal age <7 days*—2.5 mg/kg/dose q 12 hr; *Postnatal age >7 days,1200–2000 g*—2.5 mg/kg/dose q 8–12 hr; *Postnatal age >7 days, >2000 g*—2.5 mg/kg/dose q 8 hr.
**Inhaln (Adults and Children):** Standard dose: 40–80 mg 2–3 times/day; High dose: 300 mg twice daily for 28 days, then off for 28 days, then repeat cycle.

### Renal Impairment

**IM, IV (Adults):** 1 mg/kg initially, further dosing determined by blood level monitoring and assessment of renal function.

### Availability

#### Amikacin (generic available)

**Injection:** 50 mg/mL, 250 mg/mL.

#### Gentamicin (generic available)

**Injection:** 10 mg/mL, 40 mg/mL. **Premixed injection:** 40 mg/50 mL, 60 mg/50 mL, 60 mg/100 mL, 70 mg/50 mL, 80 mg/50 mL, 80 mg/100 mL, 90 mg/100 mL, 100 mg/50 mL, 100 mg/100 mL, 120 mg/100 mL. **Topical cream:** 0.1%. **Topical ointment:** 0.1%.

#### Kanamycin (generic available)

**Injection:** 250 mg/mL, 333.3 mg/mL.

#### Neomycin (generic available)

**Oral solution:** 125 mg/5 mL. **Tablets:** 500 mg. ***In combination with:*** other topical antibiotics or anti-inflammatory agents for skin, ear, and eye infections. See Appendix B.

#### Streptomycin (generic available)

**Injection:** 500 mg/mL, 1 g.

#### Tobramycin (generic available)

**Injection:** 10 mg/mL, 40 mg/mL, 1.2-g vial. **Nebulizer solution:** 300 mg/5 mL in 5-mL ampules.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs, wound appearance, sputum, urine, stool, WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Evaluate eighth cranial nerve function by audiometry before and throughout therapy. Hearing loss is usually in the high-frequency range. Prompt recognition and intervention are essential in preventing permanent damage. Also monitor for vestibular dysfunction (vertigo, ataxia, nausea, vomiting). Eighth cranial nerve dysfunction is associated with persistently elevated peak aminoglycoside levels. Discontinue aminoglycosides if tinnitus or subjective hearing loss occurs.
- Monitor intake and output and daily weight to assess hydration status and renal function.
- Assess for signs of superinfection (fever, upper respiratory infection, vaginal itching or discharge, increasing malaise, diarrhea).
- **Hepatic Encephalopathy:** Monitor neurologic status. Before administering oral medication, assess patient's ability to swallow.
- ***Lab Test Considerations:*** Monitor renal function by urinalysis, specific gravity, BUN, creatinine, and CCr before and during therapy.
- May cause ↑ BUN, AST, ALT, serum alkaline phosphatase, bilirubin, creatinine, and LDH concentrations.
- May cause ↓ serum calcium, magnesium, potassium, and sodium concentrations (streptomycin and tobramycin).
- ***Toxicity and Overdose:*** Monitor blood levels periodically during therapy. Timing of blood levels is important in interpreting results. Draw blood for peak levels 1 hr after IM injection and 30 min after a 30-min IV infusion is

completed. Draw trough levels just before next dose. Peak level for **amikacin** and **kanamycin** is 20–30 mcg/mL; trough level should be <10 mcg/mL. Peak level for **gentamicin** and **tobramycin** should not exceed 10 mcg/mL; trough level should not exceed 2 mcg/mL. Peak level for **streptomycin** should not exceed 25 mcg/mL.

## Potential Nursing Diagnoses

Risk for infection (Indications)
Disturbed sensory perception (auditory) (Side Effects)

## Implementation

Keep patient well hydrated (1500–2000 mL/day) during therapy.

- **Preoperative Bowel Prep:** Neomycin is usually used in conjunction with erythromycin, a low-residue diet, and a cathartic or enema.
- **PO:** Neomycin may be administered without regard to meals.
- **IM:** IM administration should be deep into a well-developed muscle. Alternate injection sites.
- **IV:** If aminoglycosides and penicillins or cephalosporins must be administered concurrently, administer in separate sites, at least 1 hr apart.

## Amikacin

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute with D5W, D10W, 0.9% NaCl, dextrose/saline combinations, or LR. Solution may be pale yellow without decreased potency. Stable for 24 hr at room temperature. ***Concentration:*** 10 mg/mL. ***Rate:*** Infuse over 30–60 min for adults and children and over 1–2 hr in infants.
- **Syringe Incompatibility:** heparin.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alfentanil, amifostine, aminophylline, amiodarone, amsacrine, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefepime, cefonicid, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisatracurium, cisplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxorubicin hydrochloride, doxycycline, eftifibatide, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, papaverine, pemetrexed, penicillin G, pentazocine, perphenazine, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, strepotkinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, warfarin, zidovudine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, azathioprine, azithromycin, cefoperazone, dantrolene, diazepam, diazoxide, folic acid, ganciclovir, heparin, indomethacin, pentamidine, pentobarbital, phenytoin, propofol, trastuzumab, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Manufacturer does not recommend admixing.

## Gentamicin

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute each dose with D5W, 0.9% NaCl, or LR. Do not use solutions that are discolored or that contain a precipitate. ***Concentration:*** 10 mg/mL. ***Rate:*** Infuse slowly over 30 min–2 hr.
- **Syringe Incompatibility:** ampicillin, heparin.

- **Y-Site Compatibility:** aldesleukin, alfentanil, alprostadil, amifostine, amikacin, aminophylline, amiodarone, amsacrine, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxapram, doxorubicin, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, eftifibatide, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, gemcitabine, glycopyrrolate, granisetron, hydromorphone, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin , linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, midazolam, metaraminol, methoxamine, methyldopate, methylprednisolone, metoclorpamide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, papaverine, penicillin G, pentazocine, perphenazine, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, vitamin B complex with C, voriconazole, zidovudine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B chloesteryl, amphotericin B colloidal, amphotericin B liposome, azathioprine, azithromycin, cefoperazone, cefotetan, chloramphenicol, dantrolene, dexamethasone, diazepam, diazoxide, drotrecogin, folic acid, ganciclovir, heparin, idarubicin, indomethacin, methotrexate, pemetrexed, pentamidine, pentobarbital, phenytoin, propofol, trimethoprim/sulfamethoxazole, warfarin.

## Kanamycin

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute each 500 mg in 100–200 mL or each 1 g in 200–400 mL of D5W, D10W, D5/0.9% NaCl, 0.9% NaCl, or LR. Dilute in a proportionately smaller volume for pediatric patients. Darkening of solution does not alter potency. ***Concentration:*** 2.5–5 mg/mL. ***Rate:*** Infuse slowly over 30–60 min.
- **Syringe Incompatibility:** heparin.
- **Y-Site Compatibility:** cyclophosphamide, epinephrine, furosemide, heparin, hydrocortisone, hydromorphone, magnesium sulfate, meperidine, morphine, perphenazine, potassium chloride, vitamin B complex with C.
- **Additive Incompatibility:** Manufacturer does not recommend admixing with other antibacterial agents.

## Tobramycin

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute each dose of tobramycin in 50–100 mL of D5W, D10W, D5/0.9% NaCl, 0.9% NaCl, Ringer's or lactated Ringer's solution. ***Concentration:*** not >10 mg/mL. Pediatric doses may be diluted in proportionately smaller amounts. Stable for 24 hr at room temperature, 96 hr if refrigerated. ***Rate:*** Infuse slowly over 30–60 min in both adult and pediatric patients.
- **Syringe Incompatibility:** heparin.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alfentanil, alprostadil, amifostine, aminophylline, amiodarone, amsacrine, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhyrdamine, dobutamine, docetaxel,

dopamine, doripenem, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydromorphone, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methcillin, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, miconazole, midazolam, milrinone, minocycline, mitoxantrone, morphine, moxalactam, multiple vitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, papaverine, penicillin G, pentazocine, perphenazine, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinapristin/dalfopristin, ranitidine, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, azathioprine, azithromycin, cefazolin, cefoperazone, cefotetan, ceftriaxone, dantrolene, dexamethasone, diazepam, diazoxide, drotrecogin, folic acid, ganciclovir, heparin, hetastarch, indomethacin, oxacillin, pemetrexed, pentamidine, pentobarbital, phenytoin, piperacillin/tazobactam, propofol, sargramostim, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Manufacturer recommends administering separately; do not admix.
- **Topical:** Cleanse skin before application. Wear gloves during application.

### Patient/Family Teaching

- Instruct patient to report signs of hypersensitivity, tinnitus, vertigo, hearing loss, rash, dizziness, or difficulty urinating.
- Advise patient of the importance of drinking plenty of liquids.
- Teach patients with a history of rheumatic heart disease or valve replacement the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- **PO:** Instruct patient to take neomycin as directed for full course of therapy. Take missed doses as soon as possible if not almost time for next dose; do not take double doses.
- Caution patient that neomycin may cause nausea, vomiting, or diarrhea.
- **Topical:** Instruct patient to wash affected skin gently and pat dry. Apply a thin film of ointment. Apply occlusive dressing only if directed by health care professional. Patient should assess skin and inform health care professional if skin irritation develops or infection worsens.
- **Inhaln:** Instruct patient to take inhalation twice daily as close to 12 hr apart as possible; not < 6 hr apart. Administer over 10–15 min period using a hand-held PARI LC PLUS reusable nebulizer with a *DeVilbiss Pulmo-Aide* compressor. Do not mix with dornase alpha in nebulizer. Instruct patient on multiple therapies to take others first and use tobramycin last. Tobramycin-induced bronchospasm may be reduced if tobramycin is administered after bronchodilators. Instruct patient to sit or stand upright during inhalation and breathe normally through mouthpiece of nebulizer. Nose clips may help patient breath through mouth. Advise patient to disinfect the nebulizer parts (except tubing) by boiling them in water for a full 10 minutes every other treatment day.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. If no response is seen within 3–5 days, new cultures should be taken.
- Prevention of infection in intestinal surgery (neomycin).
- Improved neurologic status in hepatic encephalopathy (neomycin).
- Endocarditis prophylaxis (gentamicin).

**aminophylline, See BRONCHODILATORS (XANTHINES).**

HIGH ALERT

# amiodarone

(am-ee-**oh**-da-rone)

Cordarone, Nexterone, Pacerone

***Classification***

Therapeutic: antiarrhythmics (class III)

**Pregnancy Category D**

## Indications

Life-threatening ventricular arrhythmias unresponsive to less toxic agents. **Unlabeled Use: PO:** Management of supraventricular tachyarrhythmias. **IV:** As part of the Advanced Cardiac Life Support (ACLS) and Pediatric Advanced Life Support (PALS) guidelines for the management of ventricular fibrillation/pulseless ventricular tachycardia after cardiopulmonary resuscitation and defibrillation have failed; also for other life-threatening tachyarrhythmias.

## Action

Prolongs action potential and refractory period. Inhibits adrenergic stimulation. Slows the sinus rate, increases PR and QT intervals, and decreases peripheral vascular resistance (vasodilation). **Therapeutic Effects:** Suppression of arrhythmias.

## Pharmacokinetics

**Absorption:** Slowly and variably absorbed from the GI tract (35–65%). IV administration results in complete bioavailability.

**Distribution:** Distributed to and accumulates slowly in body tissues. Reaches high levels in fat, muscle, liver, lungs, and spleen. Crosses the placenta and enters breast milk.

**Protein Binding:** 96% bound to plasma proteins.

**Metabolism and Excretion:** Metabolized by the liver, excreted into bile. Minimal renal excretion. One metabolite has antiarrhythmic activity.

**Half-life:** 13–107 days.

TIME/ACTION PROFILE (suppression of ventricular arrhythmias)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 2–3 days (up to 2–3 mo) | 3–7 hr | wk–mos |
| IV | 2 hr | 3–7 hr | unknown |

## Contraindications/Precautions

**Contraindicated in:** Patients with cardiogenic shock; Severe sinus node dysfunction; 2nd- and 3rd-degree AV block; Bradycardia (has caused syncope unless a pacemaker is in place); Hypersensitivity to amiodarone or iodine; OB: Can cause fetal hypo- or hyperthyroidism; Lactation: Enters breast milk and can cause harm to the neonate; use an alternative to breast milk; Pedi: Safety not established; products containing benzyl alcohol should not be used in neonates.

**Use Cautiously in:** History of CHF; Thyroid disorders; Corneal refractive laser surgery; Severe pulmonary or liver disease; Geri: Initiate therapy at the low end of the dosing range due to ↓ hepatic, renal, or cardiac function; comorbid disease; or other drug therapy.

## Adverse Reactions/Side Effects

**CNS:** confusional states, disorientation, hallucinations, dizziness, fatigue, malaise, headache, insomnia. **EENT:** corneal microdeposits, abnormal sense of smell, dry eyes, optic neuritis, optic neuropathy, photophobia. **Resp:** ADULT RESPIRATORY DISTRESS SYNDROME (ARDS), PULMONARY FIBROSIS, PULMONARY TOXICITY. **CV:** CHF, WORSENING OF ARRHYTHMIAS, bradycardia, hypotension. **GI:** anorexia, constipation, nausea, vomiting, abdominal pain, abnormal sense of taste, liver function abnormalities. **GU:** decreased libido, epididymitis. **Derm:** TOXIC EPIDERMAL NECROLYSIS (rare), photosensitivity, blue discoloration. **Endo:** hypothyroidism, hyperthyroidism. **Neuro:** ataxia, involuntary movement, paresthesia, peripheral neuropathy, poor coordination, tremor.

## Interactions

**Drug-Drug:** ↑ risk of QT prolongation with **fluoroquinolones**, **macrolides**, and **azole antifungals** (undertake concurrent use with caution). ↑ levels of **digoxin** (↓ dose of digoxin by 50%). ↑ levels of **class I antiarrhythmics** (**quinidine**, **mexiletine**, **lidocaine**, or **flecainide**— ↓ doses of other drugs by 30–50%). ↑ levels of **cyclosporine**, **dextromethorphan**, **methotrexate**, **phenytoin**, **carvedilol**, and **theophylline**. **Phenytoin** ↓ amiodarone levels. ↑ activity of **warfarin** (↓ dose of warfarin by 33–50%). ↑ risk of bradyarrhythmias, sinus arrest, or AV heart block with **beta blockers** or **calcium channel blockers**. **Cholestyramine** may ↓ amiodarone levels. **Cimetidine** and **ritonavir** ↑ amiodarone levels. Risk of myocardial depression is ↑ by **volatile anesthetics**. ↑ risk of myopathy with **lovastatin** and **simvastatin** (do not exceed 40 mg/day of regular-release

lovastatin, 20 mg/day of extended-release lovastatin, or 20 mg/day of simvastatin).
**Drug-Natural Products: St. John's wort** induces enzymes that metabolize amiodarone; may ↓ levels and effectiveness. Avoid concurrent use.
**Drug-Food: Grapefruit juice** inhibits enzymes in the GI tract that metabolize amiodarone resulting in ↑ levels and risk of toxicity; avoid concurrent use.

## Route/Dosage

### Ventricular Arrhythmias

**PO (Adults):** 800–1600 mg/day in 1–2 doses for 1–3 wk, then 600–800 mg/day in 1–2 doses for 1 mo, then 400 mg/day maintenance dose.
**PO (Children):** 10 mg/kg/day (800 mg/1.72 $m^2$/day) for 10 days or until response or adverse reaction occurs, then 5 mg/kg/day (400 mg/1.72 $m^2$/day) for several weeks, then decreased to 2.5 mg/kg/day (200 mg/1.72 $m^2$/day) or lowest effective maintenance dose.
**IV (Adults):** 150 mg over 10 min, followed by 360 mg over the next 6 hr and then 540 mg over the next 18 hr. Continue infusion at 0.5 mg/min until oral therapy is initiated. If arrhythmia recurs, a small loading infusion of 150 mg over 10 min should be given; in addition, the rate of the maintenance infusion may be increased. *Conversion to initial oral therapy*—If duration of IV infusion was <1 wk, oral dose should be 800–1600 mg/day; if IV infusion was 1–3 wk, oral dose should be 600–800 mg/day; if IV infusion was >3 wk, oral dose should be 400 mg/day. *ACLS guidelines for pulseless VFib/VTach*—300 mg IV push, may repeat once after 3–5 min with 150 mg IV push (maximum cumulative dose 2.2 g/24 hr; unlabeled).
**IV: Intraosseous (Children and infants):** *PALS guidelines for pulseless VFib/VTach*—5 mg/kg as a bolus; *perfusion tachycardia*—5 mg/kg loading dose over 20–60 min (maximum of 15 mg/kg/day; unlabeled).

### Supraventricular Tachycardia

**PO (Adults):** 600–800 mg/day for 1 wk or until desired response occurs or side effects develop, then decrease to 400 mg/day for 3 wk, then maintenance dose of 200–400 mg/day.
**PO (Children):** 10 mg/kg/day (800 mg/1.72 $m^2$/day) for 10 days or until response or side effects occur, then 5 mg/kg/day (400 mg/1.72 $m^2$/day) for several weeks, then decreased to 2.5 mg/kg/day (200 mg/1.72 $m^2$/day) or lowest effective maintenance dose.

## Availability (generic available)

**Tablets:** 200 mg, 400 mg. **Cost:** 200 mg $235.39/60. **Injection:** 50 mg/mL (Nexterone does not contain polysorbate 80 or benzyl alcohol). **Cost:** 50 mg $1057.13/10 ampules.

# NURSING IMPLICATIONS

## Assessment

- Monitor ECG continuously during IV therapy or initiation of oral therapy. Monitor heart rate and rhythm throughout therapy; PR prolongation, slight QRS widening, T-wave amplitude reduction with T-wave widening and bifurcation, and U waves may occur. QT prolongation may be associated with worsening of arrhythmias and should be monitored closely during IV therapy. Report bradycardia or increase in arrhythmias promptly; patients receiving IV therapy may require slowing rate, discontinuing infusion, or inserting a temporary pacemaker.
- Assess pacing and defibrillation threshold in patients with pacemakers and implanted defibrillators at beginning and periodically during therapy.
- Assess for signs of pulmonary toxicity (rales/crackles, decreased breath sounds, pleuritic friction rub, fatigue, dyspnea, cough, wheezing, pleuritic pain, fever, hemoptysis, hypoxia). Chest x-ray and pulmonary function tests are recommended before therapy. Monitor chest x-ray every 3–6 months during therapy to detect diffuse interstitial changes or alveolar infiltrates. Bronchoscopy or gallium radionuclide scan may also be used for diagnosis. Usually reversible after withdrawal, but fatalities have occurred.
- **IV:** Assess for signs and symptoms of ARDS throughout therapy. Report dyspnea, tachypnea, or rales/crackles promptly. Bilateral, diffuse pulmonary infiltrates are seen on chest x-ray.
- Monitor blood pressure frequently. Hypotension usually occurs during first several hours of therapy and is related to rate of infusion. If hypotension occurs, slow rate.
- **PO:** Assess for neurotoxicity (ataxia, proximal muscle weakness, tingling or numbness in fingers or toes, uncontrolled movements, tremors); common during initial therapy, but may occur within 1 wk to several months of initiation of therapy and may persist for more than 1 yr after withdrawal. Dose reduction is recommended. Assist patient during ambulation to prevent falls.
- Ophthalmic exams should be performed before and regularly during therapy and whenever vi-

sual changes (photophobia, halos around lights, decreased acuity) occur. May cause permanent loss of vision.

- Assess for signs of thyroid dysfunction, especially during initial therapy. Lethargy; weight gain; edema of the hands, feet, and periorbital region; and cool, pale skin suggest hypothyroidism and may require decrease in dose or discontinuation of therapy and thyroid supplementation. Tachycardia; weight loss; nervousness; sensitivity to heat; insomnia; and warm, flushed, moist skin suggest hyperthyroidism and may require discontinuation of therapy and treatment with antithyroid agents.
- ***Lab Test Considerations:*** Monitor liver and thyroid functions before and every 6 months during therapy. Drug effects persist long after discontinuation. Thyroid function abnormalities are common, but clinical thyroid dysfunction is uncommon.
- Monitor AST, ALT, and alkaline phosphatase at regular intervals during therapy, especially in patients receiving high maintenance dose. If liver function studies are 3 times normal or double in patients with elevated baseline levels or if hepatomegaly occurs, dose should be reduced.
- May cause asymptomatic elevations in ANA titer concentrations.

## Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Impaired gas exchange (Side Effects)

## Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous; fatalities have occurred from medication errors involving amiodarone. Before administering, have second practitioner check original order, dose calculations, and infusion pump settings. Patients should be hospitalized and monitored closely during IV therapy and initiation of oral therapy. IV therapy should be administered only by physicians experienced in treating life-threatening arrhythmias.
- Hypokalemia and hypomagnesemia may decrease effectiveness or cause additional arrhythmias; correct before therapy.
- Monitor closely when converting from IV to oral therapy, especially in geriatric patients.
- **PO:** May be administered with meals and in divided doses if GI intolerance occurs or if daily dose exceeds 1000 mg.

### IV Administration

- **IV:** Administer via volumetric pump; drop size may be reduced, causing altered dosing with drop counter infusion sets.
- Administer through an in-line filter.
- Infusions exceeding 2 hr must be administered in glass or polyolefin bottles to prevent adsorption. However, polyvinyl chloride (PVC) tubing must be used during administration because concentrations and infusion rate recommendations have been based on PVC tubing.
- **Direct IV:** ***Diluent:*** Administer undiluted. May also be diluted in 20–30 mL of D5W or 0.9% NaCl. ***Concentration:*** 50 mg/mL. ***Rate:*** Administer IV push.
- **Intermittent Infusion:** ***Diluent:*** Dilute 150 mg of amiodarone in 100 mL of D5W. Infusion stable for 2 hr in PVC bag. ***Concentration:*** 1.5 mg/mL. ***Rate:*** Infuse over 10 min. Do not administer IV push.
- **Continuous Infusion:** ***Diluent:*** Dilute 900 mg (18 mL) of amiodarone in 500 mL of D5W. Infusion stable for 24 hr in glass or polyolefin bottle. ***Concentration:*** 1.8 mg/mL. Concentration may range from 1–6 mg/mL (concentrations >2 mg/mL must be administered via central venous catheter). ***Rate:*** Infuse at a rate of 1 mg/min for the first 6 hr, then decrease infusion rate to 0.5 mg/min and continue until oral therapy initiated.
- **Y-Site Compatibility:** amikacin, amphotericin B colloidal, atracurium, atropine, bumetanide, calcium chloride, calcium gluconate, carboplatin, caspofungin, ceftizoxime, ceftriaxone, cefuroxime, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, dactinomycin, daptomycin, dexmedetomidine, diltiazem, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxarubicin, doxycycline, epinephrine, eptifibatide, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, gemcitabine, gentamicin, granisetron, ifosfamide, insulin, isoproterenol, labetalol, lepirudin, lidocaine, linezolid, lorazepam, meperidine, metaraminol, methylprednisolone, metronidazole, midazolam, milrinone, mitoxantrone, morphine, nesiritide, nitroglycerin, norepinephrine, octreotide, oxaliplatin, palonosetron, pemetrexed, penicillin G potassium, phentolamine, phenylephrine, potassium chloride, procainamide, quinupristin/dalfopristin, rifampin, rocuronium, tacrolimus, teniposide,

tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, vincristine, voriconazole.
- **Y-Site Incompatibility:** aminophylline, ampicillin/sulbactam, argatroban, bivalirudin, ceftazidime, cytarabine, digoxin, doxorubicin hydrochloride, drotrecogin, ertapenem, fludarabine, fluorouracil, heparin, imipenem-cilastatin, levofloxacin, mechlorethamine, methotrexate, micafungin, paclitaxel, piperacillin/tazobactam, potassium phosphates, sodium acetate, sodium bicarbonate, sodium phosphates, thiotepa, tigecycline.

## Patient/Family Teaching
- Instruct patient to take amiodarone as directed. Patient should read the *Medication Guide* prior to first dose and with each Rx refill. If a dose is missed, do not take at all. Consult health care professional if more than two doses are missed.
- Advise patient to avoid drinking grapefruit juice during therapy.
- Inform patient that side effects may not appear until several days, weeks, or yr after initiation of therapy and may persist for several months after withdrawal.
- Teach patients to monitor pulse daily and report abnormalities.
- Advise patients that photosensitivity reactions may occur through window glass, thin clothing, and sunscreens. Protective clothing and sunblock are recommended during and for 4 months after therapy. If photosensitivity occurs, dosage reduction may be useful.
- Inform patients that bluish discoloration of the face, neck, and arms is a possible side effect of this drug after prolonged use. This is usually reversible and will fade over several months. Notify health care professional if this occurs.
- Instruct male patients to notify health care professional if signs of epididymitis (pain and swelling in scrotum) occur. May require reduction in dose.
- Advise patient to consult health care professional before taking any other Rx, OTC, or herbal product, especially St. John's wort or cough medicine.
- Caution female patients to avoid breastfeeding during therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to notify health care professional if signs and symptoms of thyroid dysfunction occur.
- Emphasize the importance of follow-up exams, including chest x-ray and pulmonary function tests every 3–6 mo and ophthalmic exams after 6 mo of therapy, and then annually.

## Evaluation/Desired Outcomes
- Cessation of life-threatening ventricular arrhythmias. Adverse effects may take up to 4 mo to resolve.

# amitriptyline
(a-mee-**trip**-ti-leen)
Apo-Amitriptyline, Elavil, Levate

***Classification***
Therapeutic: antidepressants
Pharmacologic: tricyclic antidepressants

**Pregnancy Category C**

## Indications
Depression. **Unlabeled Use:** Anxiety, insomnia, treatment-resistant depression. Chronic pain syndromes (i.e., fibromyalgia, neuropathic pain/chronic pain, headache, low back pain).

## Action
Potentiates the effect of serotonin and norepinephrine in the CNS. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action.

## Pharmacokinetics
**Absorption:** Well absorbed from the GI tract.
**Distribution:** Widely distributed.
**Protein Binding:** 95% bound to plasma proteins.
**Metabolism and Excretion:** Extensively metabolized by the liver. Some metabolites have antidepressant activity. Undergoes enterohepatic recirculation and secretion into gastric juices. Probably crosses the placenta and enters breast milk.
**Half-life:** 10–50 hr.

TIME/ACTION PROFILE (antidepressant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 2–3 wk (up to 30 days) | 2–6 wk | days–wk |

## Contraindications/Precautions
**Contraindicated in:** Angle-closure glaucoma; Known history of QTc prolongation, recent MI, heart failure.
**Use Cautiously in:** May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; Patients with pre-existing cardiovascular disease; Prostatic hyperplasia (in-

creased risk of urinary retention); History of seizures (threshold may be ↓); OB: Use only if clearly needed and maternal benefits outweigh risk to fetus Lactation: May cause sedation in infant; Pedi: Safety not established in children <12 yr; Geri: Appears on Beers list. ↑ risk of adverse reactions including falls secondary to sedative and anticholinergic effects.

### Adverse Reactions/Side Effects

**CNS:** SUICIDAL THOUGHTS, lethargy, sedation. **EENT:** blurred vision, dry eyes, dry mouth. **CV:** ARRHYTHMIAS, hypotension, ECG changes. **GI:** constipation, hepatitis, paralytic ileus, increased appetite, weight gain. **GU:** urinary retention, ↓ libido. **Derm:** photosensitivity. **Endo:** changes in blood glucose, gynecomastia. **Hemat:** blood dyscrasias.

### Interactions

**Drug-Drug:** Amitriptyline is metabolized in the liver by the cytochrome P450 2D6 enzyme, and its action may be affected by drugs that compete for metabolism by this enzyme, including other **antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrhythmics** including **propafenone**, and **flecainide**; when these drugs are used concurrently with amitriptyline, dosage ↓ of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects of amitriptyline. May cause hypotension, tachycardia, and potentially fatal reactions when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk before starting amitriptyline). Concurrent use with **SSRI antidepressants** may result in ↑ toxicity and should be avoided (**fluoxetine** should be stopped 5 wk before starting amitriptyline). Concurrent use with **clonidine** may result in hypertensive crisis and should be avoided. Concurrent use with **levodopa** may result in delayed or ↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by **rifamycins** (**rifampin**, **rifapentine**, and **rifabutin**). Concurrent use with **moxifloxacin** ↑ risk of adverse cardiovascular reactions. ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioids**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other agents having **anticholinergic** properties. **Phenothiazines** or **oral contraceptives** ↑ levels and may cause toxicity. **Nicotine** may ↑ metabolism and alter effects.

**Drug-Natural Products: St. John's wort** may decrease serum concentrations and efficacy. Concomitant use of **kava-kava**, **valerian**, or **chamomile** can increase CNS depression. Increased anticholinergic effects with **jimson weed** and **scopolia**.

### Route/Dosage

**PO (Adults):** 75 mg/day in divided doses; may be increased up to 150 mg/day *or* 50–100 mg at bedtime, may increase by 25–50 mg up to 150 mg (in hospitalized patients, may initiate with 100 mg/day, increasing total daily dose up to 300 mg). **PO (Geriatric Patients and Adolescents):** 10 mg tid and 20 mg at bedtime *or* 25 mg at bedtime initially, slowly increased to 100 mg/day as a single bedtime dose or divided doses.

### Availability (generic available)

**Tablets:** 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Cost:** *Generic*—10 mg $13.32/100, 25 mg $12.22/100, 50 mg $14.20/100, 75 mg $12.21/100, 100 mg $12.21/100, 150 mg $24.42/100. **Syrup:** 10 mg/5 mL.

## NURSING IMPLICATIONS

### Assessment

- Obtain weight and BMI initially and periodically during treatment.
- Assess fasting glucose and cholesterol levels in overweight/obese individuals.
- Monitor blood pressure and pulse before and during initial therapy. Notify health care professional of decreases in blood pressure (10–20 mm Hg) or sudden increase in pulse rate. Patients taking high doses or with a history of cardiovascular disease should have ECG monitored before and periodically during therapy.
- **Depression:** Monitor mental status (orientation, mood behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3

wk for next 4 wk, and on advice of health care professional thereafter.

- **Pain:** Assess intensity, quality, and location of pain periodically during therapy. May require several weeks for effects to be seen. Use pain scale to monitor effectiveness of medication. Assess for sexual dysfunction (decreased libido; erectile dysfunction). Geri: Geriatric patients started on amitriptyline may be at an increased risk for falls; start with low dose and monitor closely. Assess for anticholinergic effects (weakness and sedation).
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts, liver function, and serum glucose before and periodically during therapy. May cause an ↑ serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be ↑ or ↓.

## Potential Nursing Diagnoses

Ineffective coping (Indications)
Chronic pain (Indications)
Risk for injury (Side Effects)

## Implementation

- Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take weeks to months. May give entire dose at bedtime. Sedative effect may be apparent before antidepressant effect is noted. May require tapering to avoid withdrawal effects.
- **PO:** Administer medication with or immediately after a meal to minimize gastric upset. Tablet may be crushed and given with food or fluids.

## Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, take as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Orthostatic hypotension, sedation, and confusion are common during early therapy, especially in geriatric patients. Protect patient from falls and advise patient to make position changes slowly. Institute fall precautions. Advise patient to make position changes slowly. Refer as appropriate for nutrition/weight management and medical management.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for 3–7 days after therapy has been discontinued.
- Advise patient, family and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior occur.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for >2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions. Alert patient that medication may turn urine blue-green in color.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Advise patient to notify health care professional of medication regimen before treatment or surgery. Medication should be discontinued as long as possible before surgery.
- Therapy for depression is usually prolonged and should be continued for at least 3 months to prevent relapse. Emphasize the importance of follow-up exams to monitor effectiveness, side effects, and improve coping skills. Advise patient and family that treatment is not a cure and symptoms can recur after discontinuation of medication. Refer patient to local support group.

## Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in chronic pain symptoms.

- Full therapeutic effects may be seen 2–6 wk after initiating therapy.

## amlodipine (am-**loe**-di-peen)

Norvasc

***Classification***

Therapeutic: antihypertensives
Pharmacologic: calcium channel blockers

**Pregnancy Category C**

### Indications

Alone or with other agents in the management of hypertension, angina pectoris, and vasospastic (Prinzmetal's) angina.

### Action

Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased blood pressure. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration (64–90%).
**Distribution:** Probably crosses the placenta.
**Protein Binding:** 95–98%.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 30–50 hr (↑ in geriatric patients and patients with hepatic impairment).

TIME/ACTION PROFILE (cardiovascular effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 6–9 | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Systolic blood pressure <90 mm Hg.
**Use Cautiously in:** Severe hepatic impairment (dosage reduction recommended); Aortic stenosis; History of CHF; OB, Lactation, Pedi: Safety not established; Geri: Dose reduction recommended; ↑ risk of hypotension.

### Adverse Reactions/Side Effects

**CNS:** headache, dizziness, fatigue. **CV:** peripheral edema, angina, bradycardia, hypotension, palpitations. **GI:** gingival hyperplasia, nausea. **Derm:** flushing.

### Interactions

**Drug-Drug:** Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **nonsteroidal anti-inflammatory agents**. May ↑ risk of neurotoxicity with **lithium**.
**Drug-Food: Grapefruit juice** ↑ serum levels and effect.

### Route/Dosage

**PO (Adults):** 5–10 mg once daily; *antihypertensive in fragile or small patients or patients already receiving other antihypertensives*—initiate at 2.5 mg/day, ↑ as required/tolerated (up to 10 mg/day) as an antihypertensive therapy with 2.5 mg/day in patients with hepatic insufficiency.
**PO (Geriatric Patients):** *Antihypertensive*—Initiate therapy at 2.5 mg/day, ↑ as required/tolerated (up to 10 mg/day); *antianginal*—initiate therapy at 5 mg/day, ↑ as required/tolerated (up to 10 mg/day).

### Hepatic Impairment

**PO (Adults):** *Antihypertensive*—Initiate therapy at 2.5 mg/day, ↑ as required/tolerated (up to 10 mg/day); *antianginal*—initiate therapy at 5 mg/day, ↑ as required/tolerated (up to 10 mg/day).

### Availability (generic available)

**Tablets:** 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg $99.97/90, 5 mg $105.97/90, 10 mg $135.96/90. ***In combination with:*** atorvastatin (Caduet), benazepril (Lotrel), olmesartan (Azor), valsartan (Exforge), and valsartan/hydrochlorothiazide (Exforge HCT). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse before therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.

- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Acute pain (Indications)

### Implementation

- **PO:** May be administered without regard to meals.

### Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid large amounts (6–8 glasses of grapefruit juice/day) during therapy.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeats, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve or worsens after therapy, if it occurs with diaphoresis, if shortness of breath occurs, or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes to health care professional.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.

## **amoxicillin** (a-mox-i-**sil**-in)

Amoxil, Apo-Amoxi, DisperMox, Moxatag, Novamoxin, Nu-Amoxi, Trimox

***Classification***

Therapeutic: anti-infectives, antiulcer agents
Pharmacologic: aminopenicillins

**Pregnancy Category B**

### Indications

Treatment of: Skin and skin structure infections, Otitis media, Sinusitis, Respiratory infections, Genitourinary infections. Endocarditis prophylaxis. Postexposure inhalational anthrax prophylaxis. Management of ulcer disease due to *Helicobacter pylori*. **Unlabeled Use:** Lyme disease in children <8 yr.

### Action

Binds to bacterial cell wall, causing cell death. **Therapeutic Effects:** Bactericidal action; spectrum is broader than penicillins. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Shigella*, *Chlamydia trachomatis*, *Salmonella*, *Borrelia burgdorferi*, *H. pylori*.

### Pharmacokinetics

**Absorption:** Well absorbed from duodenum (75–90%). More resistant to acid inactivation than other penicillins.

**Distribution:** Diffuses readily into most body tissues and fluids. CSF penetration increased when meninges are inflamed. Crosses placenta; enters breast milk in small amounts.
**Metabolism and Excretion:** 70% excreted unchanged in the urine; 30% metabolized by the liver.
**Half-life:** Neonates: 3.7 hr; Infants and Children: 1–2 hr; Adults: 0.7–1.4 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | 1–2 hr | 8–12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to penicillins (cross-sensitivity exists to cephalosporins and other beta-lactams); Tablets for oral suspension (DisperMox) contain aspartame; avoid in patients with phenylketonuria.
**Use Cautiously in:** Severe renal insufficiency (↓ dose if CCr <30 mL/min); Infectious mononucleosis, acute lymphocytic leukemia, or cytomegalovirus infection (↑ risk of rash); OB, Lactation: Has been used safely.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting, ↑ liver enzymes. **Derm:** rashes, urticaria. **Hemat:** blood dyscrasias. **Misc:** allergic reactions including ANAPHYLAXIS, SERUM SICKNESS, superinfection.

## Interactions

**Drug-Drug: Probenecid** ↓ renal excretion and ↑ blood levels of amoxicillin—therapy may be combined for this purpose. May ↑ effect of **warfarin**. May ↓ effectiveness of **oral contraceptives**. **Allopurinol** may ↑ frequency of rash.

## Route/Dosage

### Most Infections

**PO (Adults):** 250–500 mg q 8 hr *or* 500–875 mg q 12 hr (not to exceed 2–3 g/day).
**PO (Adults and Children ≥12 yr):** *Extended-release tablets (for Strep throat)*—775 mg once daily for 10 days.
**PO (Children >3 mo):** 25–50 mg/kg/day in divided doses q 8 hr *or* 25–50 mg/kg/day individual doses q 12 hr; *Acute otitis media due to highly resistant strains of S. pneumoniae*—80–90 mg/kg/day divided q 12 hr; *Postexposure inhalational anthrax prophylaxis*—<40 kg: 45 mg/kg/day in divided doses q 8 hr; >40 kg: 500 mg q 8 hr.
**PO (Infants ≤3 mo and neonates):** 20–30 mg/kg/day in divided doses q 12 hr.

### *H. Pylori*

**PO (Adults):** *Triple therapy*—1000 mg amoxicillin twice daily with lansoprazole 30 mg twice daily and clarithromycin 500 mg twice daily for 14 days *or* 1000 mg amoxicillin twice daily with omeprazole 20 mg twice daily and clarithromycin 500 mg twice daily for 14 days *or* amoxicillin 1000 mg twice daily with esomeprazole 40 mg daily and clarithromycin 500 mg twice daily for 10 days. *Dual therapy*—1000 mg amoxicillin three times daily with lansoprazole 30 mg three times daily for 14 days.

### Endocarditis Prophylaxis

**PO (Adults):** 2 g 1 hr prior to procedure.
**PO (Children):** 50 mg/kg 1 hr prior to procedure (not to exceed adult dose).

### Gonorrhea

**PO (Adults and Children ≥40 kg):** single 3 g dose.
**PO (Children >2 yr and <40 kg):** 50 mg/kg with probenecid 25 mg/kg as a single dose.

### Renal Impairment

**PO (Adults CCr 10–30 mL/min):** 250–500 mg q 12 hr.

### Renal Impairment

**PO (Adults CCr <10 mL/min):** 250–500 mg q 24 hr.

## Availability (generic available)

**Chewable tablets (cherry, banana, peppermint flavors):** 125 mg, 200 mg, 250 mg, 400 mg. **Cost:** *Generic*—125 mg $17.13/30, 200 mg $16.99/20, 250 mg $13.99/30, 400 mg $16.36/30. **Tablets:** 500 mg, 875 mg. **Cost:** *Generic*—500 mg $12.80/21, 875 mg $24.99/30. **Extended-release tablets:** 775 mg. **Capsules:** 250 mg, 500 mg. **Cost:** *Generic*—250 mg $7.99/30, 500 mg $7.99/30. **Suspension (pediatric drops) (bubblegum flavor):** 50 mg/mL. **Cost:** *Generic*—$7.99/30 mL. **Suspension (strawberry [125 mg/5 mL] and bubblegum [200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL] flavors):** 125 mg/5 mL, 200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL. **Cost:** *Generic*—125 mg/5 mL $11.25/100 mL, 200 mg/5 mL $16.92/100 mL, 250 mg/5 mL $7.99/150 mL, 400 mg/5 mL $17.47/100 mL. **Tablets for oral suspension**

**(strawberry):** 200 mg, 400 mg, 600 mg. ***In combination with:*** clarithromycin and lansoprazole in a compliance package (Prevpac). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify health care professional immediately if these occur.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- May cause false-positive direct Coombs' test result.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Administer around the clock. May be given without regard to meals or with meals to decrease GI side effects. Capsule contents may be emptied and swallowed with liquids. Extended-release tablets should be swallowed whole; do not crush. break, or chew. Chewable tablets should be crushed or chewed before swallowing with liquids.
- Shake oral suspension before administering. Suspension may be given straight or mixed in formula, milk, fruit juice, water, or ginger ale. Administer immediately after mixing. Discard refrigerated reconstituted suspension after 10 days.
- Mix each *tablet for oral suspension (DisperMox)* in 2 tsp of water. Patient should drink entire mixture, rinse container with a small amount of water and drink to make sure entire dose is taken. Do not chew or swallow tablet. Tablets will not dissolve in mouth. Use only water to dissolve tablets, other liquids are not recommended. Store tablets at room temperature.

### Patient/Family Teaching

- Instruct patients to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication may be dangerous.
- Review use and preparation of *tablets for oral suspension (DisperMox)*.
- Instruct female patients taking oral contraceptives to use an alternate or additional nonhormonal method of contraception during therapy with amoxicillin and until next menstrual period.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professional.
- Instruct the patient to notify health care professional if symptoms do not improve.
- Teach patients with a history of rheumatic heart disease or valve replacement the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- Pedi: Teach parents or caregivers to calculate and measure doses accurately. Reinforce importance of using measuring device supplied by pharmacy or with product, not household items.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.
- Eradication of *H. pylori* with resolution of ulcer symptoms.
- Prevention of inhalational anthrax (postexposure).

## amoxicillin/clavulanate

(a-mox-i-**sill**-in/klav-yoo-**lan** -ate)
Amoclan, Augmentin, Augmentin ES, Augmentin XR, Clavulin

***Classification***
Therapeutic: anti-infectives
Pharmacologic: aminopenicillins/beta lactamase inhibitors

**Pregnancy Category B**

## Indications
Treatment of a variety of infections including: Skin and skin structure infections, Otitis media, Sinusitis, Respiratory tract infections, Genitourinary tract infections.

## Action
Binds to bacterial cell wall, causing cell death; spectrum of amoxicillin is broader than penicillin. Clavulanate resists action of beta-lactamase, an enzyme produced by bacteria that is capable of inactivating some penicillins. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Staphylococcus aureus*, *Klebsiella pneumoniae*, *Shigella*, *Salmonella*, *Moraxella catarrhalis*.

## Pharmacokinetics
**Absorption:** Well absorbed from the duodenum (75–90%). More resistant to acid inactivation than other penicillins.
**Distribution:** Diffuses readily into most body tissues and fluids. Does not readily enter brain/CSF; CSF penetration is ↑ in the presence of inflamed meninges. Crosses the placenta and enters breast milk in small amounts.
**Metabolism and Excretion:** 70% excreted unchanged in the urine; 30% metabolized by the liver.
**Half-life:** 1–1.3 hr.

TIME/ACTION PROFILE (peak blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | 1–2 hr | 8–12 hrhr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to penicillins or clavulanate; Suspension and chewable tablets contain aspartame and should be avoided in phenylketonurics; History of amoxicillin/clavulanate-associated cholestatic jaundice.
**Use Cautiously in:** Severe renal insufficiency (dose ↓ necessary); Infectious mononucleosis (↑ risk of rash); Hepatic impairment (dose cautiously, monitor liver function).

## Adverse Reactions/Side Effects
**CNS:** SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, hepatic dysfunction, nausea, vomiting. **GU:** vaginal candidiasis. **Derm:** rashes, urticaria. **Hemat:** blood dyscrasias. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

## Interactions
**Drug-Drug: Probenecid** ↓ renal excretion and ↑ blood levels of amoxicillin—therapy may be combined for this purpose. May ↑ the effect of **warfarin**. Concurrent **allopurinol** therapy ↑ risk of rash. May ↓ the effectiveness of **hormonal contraceptives**.
**Drug-Food:** Clavulanate absorption is ↓ by a **high fat** meal.

## Route/Dosage

### Most Infections (Dosing based on amoxicillin component)
**PO (Adults and Children >40 kg):** 250 mg q 8 hr or 500 mg q 12 hr.

### Serious Infections and Respiratory Tract Infections
**PO (Adults and Children >40 kg):** 875 mg q 12 hr *or* 500 mg q 8 hr; *Acute bacterial sinusitis*—2000 mg q 12 hr for 10 days as extended release (XR) product; *Community-acquired pneumonia*—2000 mg every 12 hr for 7–10 days as extended release (XR) product.

### Recurrent/persistent acute otitis media due to Multidrug-resistant *Streptococcus pneumonia, H. influenzae,* or *M. catarrhalis*
**PO (Children <40 kg):** 80–90 mg/kg/day in divided doses q 12 hr for 10 days (as ES formulation only).

### Renal Impairment
**PO (Adults):** *CCr 10–30 mL/min*—250–500 mg q 12 hr (do not use 875 mg tablet); *CCr <10 mL/min*—250–500 mg q 24 hr.

### Otitis Media, Sinusitis, Lower Respiratory Tract Infections, Serious Infections
**PO (Children ≥3 mo):** *200 mg/5 mL or 400 mg/5 mL suspension*—45 mg/kg/day divided q 12 hr; *125 mg/5 mL or 250 mg/5 mL suspension*—40 mg/kg/day divided q 8 hr.

### Less Serious Infections
**PO (Children ≥3 mo):** *200 mg/5 mL or 400 mg/5 mL suspension*—25 mg/kg/day divided q

12 hr *or* 20 mg/kg/day divided q 8 hr (as 125 mg/5 mL or 250 mg/5 mL suspension).
**PO (Children <3 mo):** 15 mg/kg q 12 hr (125 mg/mL suspension recommended).

### Availability (generic available)

**Tablets:** 250 mg amoxicillin with 125 mg clavulanate, 500 mg amoxicillin with 125 mg clavulanate, 875 mg amoxicillin with 125 mg clavulanate. **Cost:** *Generic*—250 mg $97.19/30, 500 mg $45.99/20, 875 mg $83.99/20. **Chewable tablets (125 mg and 250 mg are lemon-lime flavor; 200 mg and 400 mg are cherry-banana flavor):** 125 mg amoxicillin with 31.25 mg clavulanate, 200 mg amoxicillin with 28.5 mg clavulanate, 250 mg amoxicillin with 62.5 mg clavulanate, 400 mg amoxicillin with 57 mg clavulanate. **Cost:** *Generic*—125 mg $39.88/30, 200 mg $36.90/20, 250 mg $76.06/30, 400 mg $63.79/20. **Extended-release tablets (scored):** 1000 mg amoxicillin with 62.5 mg clavulanate. **Cost:** 1000 mg $101.53/28. **Powder for oral suspension (125 mg/5 mL is banana flavor; 200 mg/5ml is fruit flavor; 250 mg/5 mL is orange flavor; 400 mg/5 mL is fruit flavor; 600 mg/5 mL is orange or strawberry-creme flavor):** 125 mg amoxicillin with 31.25 mg clavulanate/5 mL, 200 mg amoxicillin with 28.5 mg clavulanate/5 mL, 250 mg amoxicillin with 62.5 mg clavulanate/5 mL, 400 mg amoxicillin with 57 mg clavulanate/5 mL, 600 mg amoxicillin with 42.9 mg clavulanate/5 mL (ES formulation). **Cost:** *Generic*—125 mg $27.11/100 mL, 200 mg $40.85/100 mL, 250 mg $51.77/100 mL, 400 mg $69.21/100 mL, 600 mg $35.99/75 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify health care professional immediately if these occur.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations. Elderly men and patients receiving prolonged treatment are at ↑ risk for hepatic dysfunction.
- May cause false-positive direct Coombs' test result.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Administer around the clock. Administer at the start of a meal to enhance absorption and to decrease GI side effects. Do not administer with high fat meals; clavulanate absorption is decreased. XR tablet is scored and can be broken for ease of administration. Capsule contents may be emptied and swallowed with liquids. Chewable tablets should be crushed or chewed before swallowing with liquids. Shake oral suspension before administering. Refrigerated reconstituted suspension should be discarded after 10 days.
- Two 250-mg tablets are not bioequivalent to one 500-mg tablet; 250-mg tablets and 250-mg chewable tablets are also not interchangeable. Two 500-mg tablets are not interchangeable with one 1000-mg XR tablet; amounts of clavulanic acid and durations of action are different. Augmentin ES 600 (600 mg/5 mL) does not contain the same amount of clavulanic acid as any of the other Augmentin suspensions. Suspensions are not interchangeable.
- Pedi: Do not administer 250-mg chewable tablets to children <40 kg due to clavulanate content. Children <3 months should receive the 125-mg/5 mL oral solution.

### Patient/Family Teaching

- Instruct patients to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication may be dangerous.
- Instruct female patients taking oral contraceptives to use an alternate or additional method of contraception during therapy and until next menstrual period.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.

- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Instruct the patient to notify health care professional if symptoms do not improve or if nausea or diarrhea persists when drug is administered with food.
- Pedi: Teach parents or caregivers to calculate and measure doses accurately. Reinforce importance of using measuring device supplied by pharmacy or with product, not household items.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

## amphetamine mixtures

(am-**fet**-a-meen)

Amphetamine Salt, Adderall, Adderall XR

***Classification***

Therapeutic: central nervous system stimulants

**Schedule II**

**Pregnancy Category C**

### Indications

ADHD. Narcolepsy.

### Action

Causes release of norepinephrine from nerve endings. Pharmacologic effects are: CNS and respiratory stimulation, Vasoconstriction, Mydriasis (pupillary dilation). **Therapeutic Effects:** Increased motor activity, mental alertness, and decreased fatigue in narcoleptic patients. Increased attention span in ADHD.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration.

**Distribution:** Widely distributed in body tissues, with high concentrations in the brain and CSF. Crosses placenta and enters breast milk.

**Metabolism and Excretion:** Some metabolism by the liver. Urinary excretion is pH-dependent. Alkaline urine promotes reabsorption and prolongs action.

**Half-life:** Children 6–12 yrs: 9–11 hr; Adults: 10–13 hr (depends on urine pH).

TIME/ACTION PROFILE (CNS stimulation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | tablet: 0.5–1 hr | tablet: 3 hr<br>capsule: 7 hr | 4–6 hr |

### Contraindications/Precautions

**Contraindicated in:** Hyperexcitable states including hyperthyroidism; Psychotic personalities; Suicidal or homicidal tendencies; Chemical dependence; Glaucoma; Structural cardiac abnormalities (may ↑ the risk of sudden death); OB: Potentially embryotoxic.

**Use Cautiously in:** Cardiovascular disease (sudden death has occurred in children with structural cardiac abnormalities or other serious heart problems); History of substance abuse (misuse may result in serious cardiovascular events/sudden death); Hypertension; Diabetes mellitus; Tourette's syndrome (may exacerbate tics); Geri: Geriatric or debilitated patients may be more susceptible to side effects.

### Adverse Reactions/Side Effects

**CNS:** hyperactivity, insomnia, restlessness, tremor, behavioral disturbances, dizziness, hallucinations, headache, mania, irritability, thought disorder. **CV:** SUDDEN DEATH, palpitations, tachycardia, cardiomyopathy (increased with prolonged use, high doses), hypertension, hypotension. **GI:** anorexia, constipation, cramps, diarrhea, dry mouth, metallic taste, nausea, vomiting. **GU:** erectile dysfunction, ↑ libido. **Derm:** urticaria. **Endo:** growth inhibition (with long term use in children). **Misc:** psychological dependence.

### Interactions

**Drug-Drug:** Use with **MAO inhibitors** or **meperidine** can result in hypertensive crisis. ↑ adrenergic effects with other **adrenergics** or **thyroid preparations**. **Drugs that alkalinize urine** (**sodium bicarbonate**, **acetazolamide**) ↓ excretion, ↑ effects. **Drugs that acidify urine** (**ammonium chloride**, large doses of **ascorbic acid**) ↑ excretion, ↓ effects. ↑ risk of hypertension and bradycardia with **beta blockers**. ↑ risk of arrhythmias with **digoxin**. **Tricyclic antidepressants** may ↑ effect of amphetamine but may ↑ risk of arrhythmias, hypertension, or hyperpyrexia.

**Drug-Natural Products:** Use with **St. John's wort** may ↑ serious side effects (avoid concurrent use).
**Drug-Food: Foods that alkalinize the urine (fruit juices)** can ↑ effect of amphetamine.

### Route/Dosage

Dose is expressed in total amphetamine content (amphetamine + dextroamphetamine).

### ADHD

**PO (Children ≥6 yr):** 5 mg/day 1–2 times daily; ↑ daily dose by 5 mg at weekly intervals. Sustained-release capsules can be given once daily, tablets every 8–12 hr. If starting therapy with extended-release capsules, start with 10 mg once daily and ↑ by 10 mg/day at weekly intervals (up to 40 mg/day).
**PO (Adults):** 20 mg/day initially (as extended-release product).
**PO (Children 3–5 yr):** 2.5 mg/day in the morning; ↑ daily dose by 2.5 mg at weekly intervals not to exceed 40 mg/day.

### Narcolepsy

**PO (Adults and Children ≥ 12 yr):** 10–60 mg/day in divided doses; start with 10 mg/day, ↑ by 10 mg/day at weekly intervals. Sustained-release capsules can be given once daily, tablets every 8–12 hr.
**PO (Children 6–12 yr):** 5 mg once daily; may ↑ by 5 mg/day at weekly intervals to a maximum of 60 mg/day.

### Availability (generic available)

Amount is expressed in total amphetamine content (amphetamine + dextroamphetamine.
**Tablets:** 5 mg, 7.5 mg, 10 mg, 12.5 mg, 15 mg, 20 mg, 30 mg. **Extended-release capsules:** 5 mg, 10 mg, 15 mg, 20 mg, 25 mg, 30 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, pulse, and respiration before and periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- May produce a false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- Monitor closely for behavior change.
- Has high dependence and abuse potential. Tolerance to medication occurs rapidly; do not increase dose.
- **ADHD:** Monitor weight biweekly and inform physician of significant loss. Pedi: Monitor height periodically in children; inform physician of growth inhibition.
- Assess child's attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- **Narcolepsy:** Observe and document frequency of narcoleptic episodes.
- ***Lab Test Considerations:*** May interfere with urinary steroid determinations.
- May cause ↑ plasma corticosteroid concentrations; greatest in evening.

### Potential Nursing Diagnoses

Disturbed thought process (Side Effects)

### Implementation

- **PO:** Use the lowest effective dose.
- May be taken without regard to food.
- Extended-release capsules may be swallowed whole or opened and sprinkled on applesauce; swallow contents without chewing. Applesauce should be swallowed immediately; do not store. Do not divide contents of capsule; entire contents of capsule should be taken.
- **ADHD:** Pedi: When symptoms are controlled, dose reduction or interruption of therapy may be possible during summer months or may be given on each of the 5 school days, with medication-free weekends and holidays.

### Patient/Family Teaching

- Instruct patient to take medication at least 6 hr before bedtime to avoid sleep disturbances. Missed doses should be taken as soon as remembered up to 6 hr before bedtime. With extended release capsule, avoid afternoon doses to prevent insomnia. Do not double doses. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill. Instruct patient not to alter dose without consulting physician. Abrupt cessation of high doses may cause extreme fatigue and mental depression.
- Inform patient that sharing this medication may be dangerous.
- Inform patient that the effects of drug-induced dry mouth can be minimized by rinsing frequently with water or chewing sugarless gum or candies.
- Advise patient to limit caffeine intake.

- May impair judgment. Advise patient to use caution when driving or during other activities requiring alertness.
- Inform patient that periodic holidays from the drug may be used to assess progress and decrease dependence. Pedi: Children should be given a drug-free holiday each year to reassess symptoms and treatment. Doses will change as children age due to pharmacokinetic changes such as slower hepatic metabolism.
- Advise patient and/or parents to notify health care professional of behavioral changes.
- Advise patient to notify health care professional if nervousness, restlessness, insomnia, dizziness, anorexia, or dry mouth becomes severe. Pedi: If reduced appetite and weight loss are a problem, advise parents to provide high calorie meals when drug levels are low (at breakfast and or bedtime).
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breastfeeding.
- Caution patients to inform health care professional if they have ever abused or been dependent on alcohol or drugs, or if they are now abusing or dependent on alcohol or drugs.
- Emphasize the importance of routine follow-up exams to monitor progress.
- **Home Care Issues:** Advise parents to notify school nurse of medication regimen.

## Evaluation/Desired Outcomes

- Improved attention span.
- Decrease in narcoleptic symptoms.

HIGH ALERT

# amphotericin B deoxycholate

(am-foe-**ter**-i-sin)

Fungizone

# amphotericin B cholesteryl sulfate

Amphotec

# amphotericin B lipid complex

Abelcet

# amphotericin B liposome

AmBisome

***Classification***

Therapeutic: antifungals

**Pregnancy Category B**

## Indications

**IV:** Treatment of progressive, potentially fatal fungal infections. The cholesteryl sulfate, lipid complex, and liposome formulations should be considered for patients who are intolerant (e.g., renal dysfunction) or refractory to amphotericin B dexycholate. **Amphotericin B liposome:** Management of suspected fungal infections in febrile neutropenic patients: Treatment of visceral leishmaniasis, Treatment of cryptococcal meningitis in HIV patients.

## Action

Binds to fungal cell membrane, allowing leakage of cellular contents. Toxicity (especially acute infusion reactions and nephrotoxicity) is less with lipid formulations. **Therapeutic Effects:** Can be fungistatic or fungicidal (depends on concentration achieved and susceptibility of organism). **Spectrum:** Active against: Aspergillosis, Blastomycosis, Candidiasis, Coccidioidomycosis, Cryptococcosis, Histoplasmosis, Leishmaniasis (liposomal formulation only), Mucormycosis.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Extensively distributed to body tissues and fluids. Poor penetration into CSF.
**Metabolism and Excretion:** Elimination is very prolonged. Detectable in urine up to 7 wk after discontinuation.
**Half-life:** Biphasic—initial phase, 24–48 hr; terminal phase, 15 days. *Cholesteryl sulfate*—28 hr. *Lipid complex*—174 hr. *Liposomal*—100–153 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Lactation: Potential for distribution into breast milk and toxicity in infant; discontinue nursing.
**Use Cautiously in:** Renal impairment or electrolyte abnormalities; Patients receiving concurrent leukocyte transfusions (↑ risk of pulmonary toxicity); OB: Has been used safely.

## Adverse Reactions/Side Effects

**CNS:** anxiety, confusion, headache, insomnia. **Resp:** dyspnea, hypoxia, wheezing. **CV:** chest pain, hypotension, tachycardia, edema, hyperten-

sion. **GI:** diarrhea, hyperbilirubinemia, ↑ liver enzymes, nausea, vomiting, abdominal pain. **GU:** nephrotoxicity, hematuria. **F and E:** hyperglycemia, hypocalcemia, hypokalemia, hypomagnesemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Derm:** pruritis, rashes. **Local:** phlebitis. **MS:** arthralgia, myalgia. **Misc:** HYPERSENSITIVITY REACTIONS, chills, fever, acute infusion reactions.

### Interactions

**Drug-Drug:** ↑ risk of nephrotoxicity, bronchospasm, and hypotension with **antineoplastics**. Concurrent use with **corticosteroids** ↑ risk of hypokalemia. Concurrent use with **zidovudine** may ↑ the risk of myelotoxicity and nephrotoxicity. Concurrent use with **flucytosine** ↑ antifungal activity but may ↑ the risk of toxicity from flucytosine. Combined use with **azole antifungals** may induce fungal resistance. ↑ risk of nephrotoxicity with other **nephrotoxic agents** such as **aminoglycosides**, **cyclosporine**, or **tacrolimus**. Hypokalemia from amphotericin ↑ the risk of **digoxin** toxicity. Hypokalemia may enhance the curariform effects of **neuromuscular blocking agents**.

### Route/Dosage

Specific dosage and duration of therapy depend on nature of infection being treated.

### Amphotericin Deoxycholate

**IV (Adults):** Give test dose of 1 mg. If test dose tolerated, initiate therapy with 0.25 mg/kg/day (doses up to 1.5 mg/kg/day may be used, depending on type of infection) (alternate-day dosing may also be used); *Bladder irrigation*—Instill 50 mcg/mL solution into bladder daily for 5–10 days.
**IV (Infants and Children):** Give test dose of 0.1 mg/kg (maximum dose 1 mg) or may administer initial dose of 0.25–1 mg/kg/day over 6 hr (without test dose) (some infections may require 1.5 mg/kg/day; alternate-day dosing may be used).
**IT (Adults):** 25–300 mcg q 48–72 hr, ↑ to 500 mcg–1 mg as tolerated (maximum total dose = 15 mg).
**IT (Children):** 25–100 mcg q 48–72 hr; ↑ to 500 mcg as tolerated.

### Amphotericin B Cholesteryl Sulfate (Amphotec)

**IV (Adults and Children):** 3–4 mg/kg q 24 hr (no test dose needed).

### Amphotericin B Lipid Complex (Abelcet)

**IV (Adults and Children):** 2.5–5 mg/kg q 24 hr (no test dose needed).

### Amphotericin B Liposome (AmBisome)

**IV (Adults and Children):** *Empiric therapy*—3 mg/kg q 24 hr; *Documented infections*—3–5 mg/kg q 24 hr; *Visceral leishmaniasis (immunocompetent patients)*—3 mg/kg q 24 hr on days 1–5, then 3 mg/kg q 24 hr on days 14 and 21; *Visceral leishmaniasis (immunosuppressed patients)*—4 mg/kg q 24 hr on days 1–5, then 4 mg/kg q 24 hr on days 10, 17, 24, 31, and 38; *Cryptococcal meningitis in HIV patients*—6 mg/kg q 24 hr.

### Availability (generic available)

**Amphotericin Deoxycholate**
**Powder for injection:** 50 mg/vial.

**Amphotericin B Cholesteryl Sulfate**
**Powder for injection:** 50 mg/vial, 100 mg/vial.

**Amphotericin B Lipid Complex**
**Suspension for injection:** 5 mg/mL.

**Amphotericin B Liposome**
**Powder for injection:** 50 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor patient closely during test dose and the first 1–2 hr of each dose for fever, chills, headache, anorexia, nausea, or vomiting. Premedicating with antipyretics, corticosteroids, antihistamines, meperidine, and antiemetics may decrease these reactions. Febrile reaction usually subsides within 4 hr after the infusion is completed.
- Assess injection site frequently for thrombophlebitis or leakage. Drug is very irritating to tissues.
- Monitor vital signs every 15 min during test dose and every 30 min for 2–4 hr after administration. Meperidine and dantrolene have been used to prevent and treat rigors. Assess respiratory status (lung sounds, dyspnea) daily. If respiratory distress occurs, discontinue infusion immediately; anaphylaxis may occur. Equipment for cardiopulmonary resuscitation should be readily available.
- Monitor intake and output and weigh daily. Adequate hydration (2000–3000 mL/day) and maintaining sodium balance may minimize nephrotoxicity.
- ***Lab Test Considerations:*** Monitor CBC, BUN and serum creatinine, and potassium and magnesium levels daily. If BUN and serum creatinine ↑ significantly, may need to discontinue or consider switching to cholesteryl sulfate, lipid complex, or liposomal formulation.

## Potential Nursing Diagnoses

Risk for infection (Indications)

## Implementation

- Do not confuse amphotericin B cholesteryl sulfate (Amphotec) with amphotericin deoxycholate, amphotericin B lipid complex (Abelcet), or amphotericin B liposome (AmBisome); they are not interchangeable.
- This drug should be administered IV only to hospitalized patients or those under close supervision. Diagnosis should be confirmed before administration.

## Amphotericin B Deoxycholate

### IV Administration

- **Test dose:** Reconstitute 50-mg vial with 10 mL of sterile water for injection to achieve a concentration of 5 mg/mL. Reconstituted vial stable for 24 hr at room temperature or 1 wk if refrigerated. ***Diluent:*** Further dilute with 500 mL of D5W. May be diluted in 250 mL of D5W if being administered via a central venous catheter. Protect infusion from light. Infusion stable for 24 hr at room temperature or 2 days if refrigerated. To obtain test dose, withdraw 1 mg (10 mL) from 500 mL infusion and further dilute with D5W to a total volume of 20 mL. ***Concentration:*** 0.05 mg/mL. ***Rate:*** Infuse over 10–30 min to determine patient tolerance. Pedi: Infuse over 30–60 min.
- **Intermittent Infusion:** ***Diluent:*** Reconstitute and dilute 50-mg vial as per the directions above. ***Concentration:*** Final concentration of infusion should not exceed 0.1 mg/mL for peripheral infusion or 0.25 mg/mL for central line administration. ***Rate:*** Infuse slowly over 4–6 hr.
- **Y-Site Compatibility:** aldesleukin, amiodarone, dactinomycin, diltiazem, etoposide, hydromorphone, ifosfamide, lorazepam, nesiritide, octreotide, oxaliplatin, tacrolimus, teniposide, thiotepa, zidovudine.
- **Y-Site Incompatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, ampicillin, ampicillin/sulbactam, amsacrine, anidulafungin, atracurium, atropine, aztreonam, benztropine, bivalirudin, bumetanide, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefepime, cefonocid, cefotetan, ceftizoxime, chloramphenicol, cimetidine, cisplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cytarabine, dantrolene, daptomycin, dexamethasone, dexmedetonidine, diazepam, diazoxide, digoxin, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxorubicin liposome, doxycycline, ephedrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hetastarch, hydralazine, hydrocortisone, hydroxyzine, idarubicin, inamrinone, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, melphalan, meperidine, merchlorethamine, meropenem, metaraminol, methotrexate, methoxamine, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, nafcillin, nalbuphine, nitroprusside, norepinephrine, ondansetron, oxacillin, paclitaxel, palonosetron, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phenytoin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, thiamine, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethoprim/sulfamethoxazole, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole.
- **Solution Incompatibility:** LR injection, saline solutions.

## Amphotericin B Cholesteryl Sulfate

### IV Administration

- **Test Dose:** ***Diluent:*** Reconstitute 50-mg vial with 10 mL and 100-mg vial with 20 mL of sterile water for injection to achieve a concentration of 5 mg/mL. Reconstituted vials are stable for 24 hr if refrigerated. Further dilute with D5W to achieve concentration below. Do not use other diluents. Infusion stable for 24 hr if refrigerated. Protect from light. To obtain test dose, withdraw 10 mL from final preparation. ***Concentration:*** Final concentration of infusion should be approximately 0.6 mg/mL (range 0.16–0.83 mg/mL). ***Rate:*** Infuse over 15–30 min.

- **Intermittent Infusion:** ***Diluent:*** Prepare infusion according to directions above. ***Concentration:*** Final concentration of infusion should be approximately 0.6 mg/mL (range 0.16–0.83 mg/mL). ***Rate:*** Infuse at a rate of 1 mg/kg/hr. If patient tolerates infusion without adverse reactions, infusion time may be shortened to a minimum of 2 hr. If reactions occur or patient cannot tolerate volume, infusion time may be extended. Rapid infusions may cause hypotension, hypokalemia, arrhythmias, and shock.
- **Y-Site Compatibility:** acyclovir, aminophylline, cefoxitin, ceftizoxime, clindamycin, dexamethasone, fentanyl, furosemide, ganciclovir, granisetron, hydrocortisone, ifosfamide, lorazepam, mannitol, methotrexate, methylprednisolone, nitroglycerin, sufentanil, trimethoprim/sulfamethoxazole, vinblastine, vincristine, zidovudine.
- **Y-Site Incompatibility:** alfentanil, amikacin, ampicillin, ampicillin/sulbactam, aztreonam, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefepime, ceftazidime, ceftriaxone, cimetidine, cisatracurium, cisplatin, cyclophosphamide, cyclosporine, cytarabine, diazepam, digoxin, diphenhydramine, dobutamine, dopamine, doxorubicin, doxorubicin liposome, droperidol, enalaprilat, esmolol, famotidine, fluconazole, fluorouracil, gentamicin, haloperidol, heparin, hydromorphone, hydroxyzine, imipenem/cilastatin, labetalol, leucovorin, lidocaine, magnesium sulfate, meperidine, mesna, metoclopramide, metoprolol, metronidazole, midazolam, mitoxantrone, morphine, nalbuphine, naloxone, ondansetron, paclitaxel, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, propranolol, ranitidine, remifentanil, sodium bicarbonate, ticarcillin-clavulanate, tobramycin, vancomycin, vecuronium, verapamil, vinorelbine.
- **Solution Incompatibility:** saline solutions.

## Amphotericin B Lipid Complex

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Shake vial gently until yellow sediment at bottom has dissolved. Withdraw dose from required number of vials with 18-gauge needle. Replace needle from syringe filled with amphotericin B lipid complex with 5-micron filter needle. Each filter needle may be used to filter the contents of no more than 4 vials. Insert filter needle of syringe into IV bag of D5W and empty contents of syringe into bag. Protect from light. Infusion is stable for 6 hr at room temperature or 48 hr if refrigerated. ***Concentration:*** Final concentration of infusion should be 1 mg/mL; a concentration of 2 mg/mL can be used for pediatric patients or patients who cannot tolerate large volumes of fluid. ***Rate:*** Do not use an in-line filter. Infuse at a rate of 2.5 mg/kg/hr via infusion pump. If infusion exceeds 2 hr, mix contents by shaking infusion bag every 2 hr. If administering through an existing line, flush line with D5W before infusion or use a separate line.
- **Y-Site Compatibility:** anidulafungin, ertapenem, octreotide.
- **Y-Site Incompatibility:** bivalirudin, caspofungin, daptomycin, tirofiban.
- **Solution Incompatibility:** saline solutions.

## Amphotericin B Liposome

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 50–mg vial with 12 mL of sterile water for injection to achieve concentration of 4 mg/mL. Immediately shake vial vigorously for at least 30 seconds until all particulate matter is completely dispersed. Reconstituted vials are stable for 24 hr if refrigerated. Withdraw appropriate volume for dilution into a syringe. Attach the 5-micron filter to the syringe and inject syringe contents into an appropriate volume of D5W. Infusion should be administered within 6 hr of dilution. ***Concentration:*** Final concentration of infusion should be 1–2 mg/mL; a lower concentration (0.2–0.5 mg/mL) may be used for infants and small children. ***Rate:*** Infuse over 2 hr. Infusion time may be shortened to 1 hr if patient tolerates infusion without any adverse reactions. If discomfort occurs during infusion, duration of infusion may be increased. May be administered through an in-line filter with pore diameter of at least 1 micron. If administering through an existing line, flush line with D5W before infusion or use a separate line.
- **Y-Site Compatibility:** acyclovir, amifostine, aminophylline, anidulafungin, atropine, azithromycin, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, carboplatin, carmustine, cefazolin, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, clindamycin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetonidine, diphenhydramine, doxacurium,

enalaprilat, ephedrine, epinephrine, eptifibatide, ertapenem, esmolol, etoposide, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, fosphenytoin, furosemide, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, ifosfamide, isoproterenol, ketorolac, levorphanol, lidocaine, linezolid, mesna, methotrexate, methylprednisolone, metoprolol, milrinone, mitomycin, nesiritide, nitroglycerin, nitroprusside, octreotide, oxaliplatin, oxytocin, palonosetron, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium chloride, procainamide, ranitidine, sufetanil, tacrolimus, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, trimethoprim/sulfamethoxazole, vasopressin, vincristine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** alfentanil, amikacin, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, calcium chloride, calcium gluconate, caspofungin, cefepime, cefotaxime, ceftazidime, ciprofloxacin, cisplatin, cyclosporine, dacarbazine, daunorubicin, dexrazoxane, diazepam, digoxin, diltiazem, dobutamine, docetaxel, dolasetron, dopamine, doxorubicin, doxycycline, droperidol, epirubicin, erythromycin, etoposide phosphate, gemcitabine, gentamicin, hetastarch, hydroxyzine, idarubicin, imipenem/cilastatin, inamrinone, labetalol, leucovorin, levofloxacin, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, metoclopramide, metronidazole, midazolam, mitoxantrone, morphine, nalbuphine, naloxone, nicardipine, ondansetron, paclitaxel, pentamidine, phenytoin, potassium phosphates, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, sodium bicarbonate, sodium phosphates, teniposide, tobramycin, trimethobenzamide, vancomycin, verapamil, vinblastine, vinorelbine.
- **Solution Incompatibility:** Do not dilute or admix with saline solutions, other medications, or solutions containing a bacteriostatic agent.

### Patient/Family Teaching

- Explain need for long duration of IV or topical therapy.
- **IV:** Inform patient of potential side effects and discomfort at IV site. Advise patient to notify health care professional if side effects occur.
- **Home Care Issue:** Instruct family or caregiver on dilution, rate, and administration of drug and proper care of IV equipment.

### Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Several weeks to months of therapy may be required to prevent relapse.

## ampicillin (am-pi-**sil**-in)

Ampicin, Apo-Ampi, Marcillin, Nu-Ampi, Novo-Ampicillin, Omnipen, Penbritin, Principen, Polycillin, Totacillin

***Classification***

Therapeutic: anti-infectives
Pharmacologic: aminopenicillins

**Pregnancy Category B**

### Indications

Treatment of the following infections: Skin and skin structure infections, Soft-tissue infections, Otitis media, Sinusitis, Respiratory infections, Genitourinary infections, Meningitis, Septicemia. Endocarditis prophylaxis. **Unlabeled Use:** Prevention of infection in certain high-risk patients undergoing cesarean section.

### Action

Binds to bacterial cell wall, resulting in cell death. **Therapeutic Effects:** Bactericidal action; spectrum is broader than penicillin. **Spectrum:** Active against: Streptococci, nonpenicillinase-producing staphylococci, *Listeria*, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Enterobacter*, *Klebsiella*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Shigella*, *Salmonella*.

### Pharmacokinetics

**Absorption:** Moderately absorbed from the duodenum (30–50%).
**Distribution:** Diffuses readily into body tissues and fluids. CSF penetration is increased in the presence of inflamed meninges. Crosses the placenta; enters breast milk in small amounts.
**Metabolism and Excretion:** Variably metabolized by the liver (12–50%). Renal excretion is variable (25–60% after oral dosing; 50–85% after IM administration).
**Half-life:** Neonates: 1.7–4 hr; Children and Adults: 1–1.5 hr (increased in renal impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1.5–2 hr | 4–6 hr |
| IM | rapid | 1 hr | 4–6 hr |
| IV | rapid | end of infusion | 4–6 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to penicillins.

**Use Cautiously in:** Severe renal insufficiency (dosage reduction required if CCr <10 mL/min); Infectious mononucleosis, acute lymphocytic leukemia or cytomegalovirus infection (increased incidence of rash); Patients allergic to cephalosporins; OB: Has been used during pregnancy; Lactation: Is distributed into breast milk. Can cause rash, diarrhea, and sensitization in the infant.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **Derm:** rashes, urticaria. **Hemat:** blood dyscrasias. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

## Interactions

**Drug-Drug: Probenecid** decreases renal excretion and increases blood levels of ampicillin—therapy may be combined for this purpose. Large doses may increase the risk of bleeding with **warfarin**. Incidence of rash increases with concurrent **allopurinol** therapy. May decrease the effectiveness of oral **hormonal contraceptives**.

## Route/Dosage

### Respiratory and Soft-Tissue Infections

**PO (Adults and Children ≥20 kg):** 250–500 mg q 6 hr.

**PO (Children <20 kg):** 50–100 mg/kg/day in divided doses q 6–8 hr (not to exceed 2–3 g/day).

**IM, IV (Adults and Children ≥40 kg ):** 500 mg to 3 g q 6 hr (not to exceed 14 g/day).

**IM, IV (Children <40 kg):** 100–200 mg/kg/day in divided doses q 6–8 hr (not to exceed 12 g/day).

### Bacterial Meningitis Caused by *H. influenzae, Streptococcus pneumoniae*, Group B streptococcus or *N. meningitidis* or Septicemia

**IM, IV (Adults):** 500 mg to 3 g q 6 hr (not to exceed 14 g/day).

**IM, IV (Children >1 mo):** 200–400 mg/kg/day in divided doses q 6 hr (not to exceed 12 g/day).

**IM, IV (Neonates ≤7 days):** 200 mg/kg/day divided q 8 hr.

**IM, IV (Neonates >7 days):** 300 mg/kg/day divided q 6 hr.

### GI/GU Infections Other Than *N. gonorrhoeae*

**PO (Adults and Children >20 kg):** 250–500 mg q 6 hr (larger doses for more serious/chronic infections).

**PO (Children ≤20 kg):** 50–100 mg/kg/day in divided doses q 6 hr.

### *N. gonorrhoeae*

**PO (Adults):** 3 g with 1 g probenecid.

**IM, IV (Adults and Children ≥40 kg ):** 500 mg q 6 hr.

**IM, IV (Children <40 kg):** 100–200 mg/kg/day in divided doses q 6–8 hr.

### Urethritis Caused by *N. gonorrhoeae* in Men

**IM, IV (Adults and Children ≥40 kg ):** 500 mg, repeated 8–12 hr later; additional doses may be necessary for more complicated infections (prostatitis, epididymitis).

### Prevention of Bacterial Endocarditis

**IM, IV (Adults):** 2 g 30 min before procedure (gentamicin may be added for high-risk patients); additional 1 g may be given 6 hr later for high-risk patients.

**IM, IV (Children):** 50 mg/kg (not to exceed 2 g) 30 min before procedure (gentamicin may be added for high-risk patients); additional 25 mg/kg may be given 6 hr later for high-risk patients.

### Renal Impairment

(Adults and Children): CCr ≤10 mL/min—Increase dosing interval to q 12 hr.

## Availability

**Capsules:** 250 mg, 500 mg. **Suspension (wild cherry flavor):** 125 mg/5 mL, 250 mg/5 mL. **Powder for injection:** 125 mg, 250 mg, 500 mg, 1 g, 2 g, 10 g.

# NURSING IMPLICATIONS

## Assessment

- Assess patient for infection (vital signs, wound appearance, sputum, urine, stool, and WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.

- Obtain specimens for culture and sensitivity before therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician or other health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Assess skin for "ampicillin rash," a nonallergic, dull red, macular or maculopapular, mildly pruritic rash.
- ***Lab Test Considerations:*** May cause increased AST and ALT.
- May cause transient decreases in estradiol, total conjugated estriol, estriol-glucuronide, or conjugated estrone in pregnant women.
- May cause a false-positive direct Coombs' test result.
- May cause a false-positive urinary glucose.

## Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

## Implementation

- Do not confuse with omnipen with imipenem.
- Reserve IM or IV route for moderately severe or severe infections or patients unable to take oral medication. Change to PO as soon as possible.
- **PO:** Administer around the clock on an empty stomach at least 1 hr before or 2 hr after meals with a full glass of water. Capsules may be opened and mixed with water. Reconstituted oral suspensions retain potency for 7 days at room temperature and 14 days if refrigerated. Combination with probenecid should be used immediately after reconstitution.
- **IM:** Reconstitute for IM or IV use by adding sterile water for injection 0.9–1.2 mL to the 125-mg vial, 0.9–1.9 mL to the 250-mg vial, 1.2–1.8 mL to the 500-mg vial, 2.4–7.4 mL to the 1-g vial, and 6.8 mL to the 2-g vial.

### IV Administration

- **Direct IV:** ***Diluent:*** Sterile water for injection. ***Concentration:*** Add 5 mL of sterile water for injection to each 125-, 250-, or 500-mg vial or at least 7.4–10 mL of diluent to each 1- or 2-g vial. Solution should be used within 1 hr of reconstitution. ***Rate:*** Doses of 125–500 mg may be given over 3–5 min (not to exceed 100 mg/min). Rapid administration may cause seizures.
- **Intermittent Infusion:** ***Diluent:*** Reconstitute vials as per the directions above. Further dilute in 50 mL or more of 0.9% NaCl, D5W, D5/0.45% NaCl, or LR. Administer within 4 hr (more stable in NaCl). ***Concentration:*** Final concentration of infusion should not exceed 30 mg/mL. ***Rate:*** Infuse over 10–15 min.
- **Y-Site Compatibility:** acyclovir, anidulafungin, bivalirudin, daptomycin, filgrastim, granisetron, heparin, levofloxacin, linezolid, milrinone, palonosetron, pantoprazole, propofol, tacrolimus, voriconazole.
- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart, aminophylline, amphotericin B, caspofungin, diazepam, diphenhydramine, dobutamine, dopamine, doxycycline, fenoldopam, fluconazole, ganciclovir, haloperidol, hydroxyzine, lansoprazole, lorazepam, midazolam, nafcillin, nicardipine, nitroprusside, ondansetron, penicillin G potassium, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, trimethoprim/sulfamethoxazole, verapamil.

## Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Advise patients that sharing of this medication can be dangerous. Pedi: Instruct parents and caregivers not to save or use this medication for other infections.
- Advise patient to report the signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Advise patients taking oral contraceptives to use an alternate or additional nonhormonal method of contraception while taking ampicillin and until next menstrual period.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.
- Instruct the patient to notify health care professional if symptoms do not improve.

- Patients with a history of rheumatic heart disease or valve replacement need to be taught the importance of using antimicrobial prophylaxis before invasive medical or dental procedures.
- Lactation: Small amounts of ampicillin in breast milk can cause sensitization and alter intestinal flora of the infant. Instruct patient to monitor infant for reactions and discuss with health care provider possible need to temporarily avoid breastfeeding .

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.

## ampicillin/sulbactam

(am-pi-**sil**-in/sul-**bak** -tam)
Unasyn

***Classification***
Therapeutic: anti-infectives
Pharmacologic: aminopenicillins/beta lactamase inhibitors

**Pregnancy Category B**

### Indications

Treatment of the following infections: Skin and skin structure infections, soft-tissue infections, Otitis media, Intra-abdominal infections, Sinusitis, Respiratory infections, Genitourinary infections, Meningitis, Septicemia.

### Action

Binds to bacterial cell wall, resulting in cell death; spectrum is broader than that of penicillin. Addition of sulbactam increases resistance to beta-lactamases, enzymes produced by bacteria that may inactivate ampicillin. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Active against: Streptococci, Pneumococci, Enterococci, *Haemophilus influenzae*, *Escherichia coli*, *Proteus mirabilis*, *Neisseria meningitidis*, *N. gonorrhoeae*, *Shigella*, *Salmonella*, *Bacteroides fragilis*, *Moraxella catarrhalis*. Use should be reserved for infections caused by beta-lactamase–producing strains.

### Pharmacokinetics

**Absorption:** Well absorbed from IM sites.
**Distribution:** Ampicillin diffuses readily into bile, blister and tissue fluids. Poor CSF penetration unless meninges are inflamed. Crosses the placenta; enters breast milk in small amounts.
**Metabolism and Excretion:** Ampicillin is variably metabolized by the liver (12–50%). Renal excretion is also variable. Sulbactam is eliminated unchanged in urine.
**Protein Binding:** *Ampicillin*—28%; *sulbactam*—38%.
**Half-life:** *Ampicillin*—1–1.8 hr; *sulbactam*—1–1.3 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | rapid | 1 hr | 6–8 hr |
| IV | immediate | end of infusion | 6–8 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to penicillins or sulbactam.
**Use Cautiously in:** Severe renal insufficiency (dosage reduction required if CCr <30 mL/min); Epstein-Barr virus infection, acute lymphocytic leukemia, or cytomegalovirus infection (increased incidence of rash).

### Adverse Reactions/Side Effects

**CNS:** SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **Derm:** rashes, urticaria. **Hemat:** blood dyscrasias. **Local:** pain at IM site, pain at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection, elevated liver enzymes.

### Interactions

**Drug-Drug: Probenecid** decreases renal excretion and increases blood levels of ampicillin—therapy may be combined for this purpose. May potentiate the effect of **warfarin**. Concurrent **allopurinol** therapy (increased incidence of rash). May decrease the effectiveness of **hormonal contraceptives**.

### Route/Dosage

Dosage based on ampicillin component.
**IM, IV (Adults and Children ≥40 kg ):** 1–2 g ampicillin q 6–8 hr (not to exceed 12 g ampicillin/day).
**IM, IV (Children ≥1 yr):** 100–200 mg ampicillin/kg/day divided q 6 hr; *Meningitis*—200–400 mg ampicillin/kg/day divided every 6 hr; maximum dose: 8 g ampicillin/day.
**IM, IV (Infants >1 month):** 100–150 mg ampicillin/kg/day divided q 6 hr.

#### Renal Impairment

**IM, IV (Adults , Children, and Infants):** *CCr 15–29 mL/min*—Administer q 12 hr; *CCr 5–14*—Administer q 24 hr.

### Availability

**Powder for injection:** 1.5 g (1 g ampicillin with 500 mg sulbactam), 3 g (2 g ampicillin with 1 g sulbactam), 15 g (10 g ampicillin with 5 g sulbactam).

## NURSING IMPLICATIONS

### Assessment

- Assess patient for infection (vital signs, wound appearance, sputum, urine, stool, and WBCs) at beginning and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of, and reactions to, penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician or other health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause increased AST, ALT, LDH, bilirubin, alkaline phosphatase, BUN, and creatinine.
- May cause decreased hemoglobin, hematocrit, RBC, WBC, neutrophils, and lymphocytes.
- May cause transient decreases in estradiol, total conjugated estriol, estriol-glucuronide, or conjugated estrone in pregnant women.
- May cause a false-positive Coombs' test result.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

### Implementation

- **IM:** Reconstitute for IM use by adding 3.2 mL of sterile water or 0.5% or 2% lidocaine HCl to the 1.5-g vial or 6.4 mL to the 3-g vial. Administer within 1 hr of preparation, deep IM into well-developed muscle.

**IV Administration**

- **Direct IV:** ***Diluent:*** Reconstitute 1.5-g vial with 3.2 mL of sterile water for injection and the 3-g vial with 6.4 mL. ***Concentration:*** 375 mg ampicillin/sulbactam per mL. ***Rate:*** Administer over at least 10–15 min within 1 hr of reconstitution. More rapid administration may cause seizures.
- **Intermittent Infusion:** ***Diluent:*** Reconstitute vials as per the directions above. Further dilute in 50–100 mL of 0.9% NaCl, D5W, D5/0.45% NaCl, or LR. Stability of solution varies from 2–8 hr at room temperature or 3–72 hr if refrigerated, depending on concentration and diluent. ***Concentration:*** Final concentration of infusion should be 3–45 mg of ampicillin/sulbactam per mL. ***Rate:*** Infuse over 15–30 min.
- **Y-Site Compatibility:** anidulafungin, bivalirudin, daptomycin, fenoldopam, filgrastim , fluconazole, granisetron, hydromorphone, levofloxacin, linezolid, palonosetron, pantoprazole, tacrolimus, tirofiban, voriconazole.
- **Y-Site Incompatibility:** acyclovir, amiodarone, amphotericin B cholesteryl sulfate, caspofungin, cefotaxime, cefoxitin, ciprofloxacin, diazepam, dobutamine, doxycycline, ganciclovir, haloperidol, hydralazine, hydroxyzine, lansoprazole, lorazepam, methylprednisolone sodium succinate, midazolam, nicardipine, ondansetron, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole, verapamil. If aminoglycosides and penicillins must be given concurrently, administer in separate sites at least 1 hr apart.

### Patient/Family Teaching

- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Advise patients taking oral contraceptives to use an alternative or additional nonhormonal method of contraception while taking ampicillin/sulbactam and until next menstrual period.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.
- Instruct the patient to notify health care professional if symptoms do not improve.

### Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

## anakinra (a-na-**kin**-ra)

Kineret

***Classification***

Therapeutic: antirheumatics (DMARD)
Pharmacologic: interleukin antagonists

**Pregnancy Category B**

### Indications

Reduction of the signs and symptoms of moderately to severely active rheumatoid arthritis in patients who have failed other DMARDs (may be used in combination with other DMARDs other than tumor necrosis factor [TNF] blocking agents).

### Action

Blocks the destructive effects of interleukin-1 on cartilage and bone resorption by inhibiting its binding at specific tissue receptor sites. **Therapeutic Effects:** Slowed progression of rheumatoid arthritis.

### Pharmacokinetics

**Absorption:** Well absorbed (95%) following subcut administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** 4–6 hr.

TIME/ACTION PROFILE (clinical response)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | within 12 wk | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Active infections; Hypersensitivity; Hypersensitivity to other *Escherichia coli*–derived products.
**Use Cautiously in:** Other chronic debilitating illness; Underlying immunosuppression; Renal impairment; OB, Lactation, Pedi: Safety not established; Geri: May be more sensitive to toxicity due to age-related decline in renal function; increased incidence of infection in geriatric population.
**Exercise Extreme Caution in:** Concurrent use of TNF blocking agents such as etanercept (higher risk of serious infections).

### Adverse Reactions/Side Effects

**CNS:** headache. **GI:** diarrhea, nausea. **Hemat:** neutropenia. **Local:** injection site reactions. **Misc:** INFECTIONS, hypersensitivity reactions (rare).

### Interactions

**Drug-Drug:** ↑ risk of serious infection with **TNF blocking agents**, such as **etanercept**. May ↓ antibody response to and increase the risk of adverse reactions from **vaccines**; avoid concurrent administration of **live vaccines**.

### Route/Dosage

**Subcut (Adults ≥18 yr):** 100 mg/day.

### Availability

**Solution for injection:** 100 mg/mL in 1-mL prefilled glass syringes.

## NURSING IMPLICATIONS

### Assessment

- Assess patient's range of motion and degree of swelling and pain in affected joints before and periodically during therapy.
- Assess for signs and symptoms of infection (fever, elevated WBC) prior to and periodically during therapy. Anakinra should not be instituted in patients with active infections and should be discontinued if patient develops a serious infection.
- Observe patient for hypersensitivity reactions (urticaria, dyspnea, hypotension). Discontinue anakinra if severe reaction occurs. Medications (antihistamines, acetaminophen, corticosteroids, epinephrine) and equipment should be readily available in the event of a severe reaction.
- ***Lab Test Considerations:*** Monitor neutrophil count prior to and during therapy, then monthly for 3 mo and quarterly thereafter for up to 1 yr.

### Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)

### Implementation

- Administration of higher than recommended doses did not result in higher responses.
- **Subcut:** Administer 1 dose/day. Do not administer solutions that are discolored or contain particulate matter. Provided in single-use 1-mL prefilled glass syringes.

### Patient/Family Teaching

- Inform patient of the signs and symptoms of hypersensitivity reactions and other adverse reactions. Advise patient of appropriate actions if reactions occur.
- Advise patients not to receive live vaccines during therapy with anakinra without consulting health care professional.
- **Home Care Issues:** Instruct patient and family on preparation and correct technique for administration of injection and care and disposal of equipment. Caution patients and caregivers not to reuse needles, syringes, or drug product.

### Evaluation/Desired Outcomes

- Reduction of signs and symptoms and slowed progression of moderate to severe active rheumatoid arthritis.

## anastrozole (a-nass-troe-zole)

Arimidex

***Classification***

Therapeutic: antineoplastics
Pharmacologic: aromatase inhibitors

**Pregnancy Category X**

### Indications

Adjuvant treatment of postmenopausal hormone receptor-positive early breast cancer. Initial therapy in women with postmenopausal hormone receptor-positive or hormone receptor unknown, locally advanced, or metastatic breast cancer. Advanced postmenopausal breast cancer in women with disease progression despite tamoxifen therapy.

### Action

Inhibits the enzyme aromatase, which is partially responsible for conversion of precursors to estrogen. **Therapeutic Effects:** Lowers levels of circulating estrogen, which may halt progression of estrogen-sensitive breast cancer.

### Pharmacokinetics

**Absorption:** 83–85% absorbed following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** 85% metabolized by the liver; 11% excreted renally.
**Half-life:** 50 hr.

TIME/ACTION PROFILE (lowering of serum estradiol)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 24 hr | 14 days | 6 days† |

†Following cessation of therapy

### Contraindications/Precautions

**Contraindicated in:** OB: Potential harm to fetus or spontaneous abortion.
**Use Cautiously in:** Women with childbearing potential; Ischemic heart disease; Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** headache, weakness, dizziness. **EENT:** pharyngitis. **Resp:** dyspnea, increased cough. **CV:** MYOCARDIAL INFARCTION, angina, peripheral edema. **GI:** nausea, abdominal pain, anorexia, constipation, diarrhea, dry mouth, vomiting. **GU:** pelvic pain, vaginal bleeding, vaginal dryness. **Derm:** rash, including mucocutaneous disorders, sweating. **Metab:** hypercholesterolemia, weight gain. **MS:** back pain, arthritis, bone pain, carpal tunnel syndrome, fracture. **Neuro:** paresthesia. **Misc:** allergic reactions including ANGIOEDEMA, URTICARIA, and ANAPHYLAXIS, hot flashes, pain.

### Interactions

**Drug-Drug:** None significant.

### Route/Dosage

**PO (Adults):** 1 mg daily.

### Availability

**Tablets:** 1 mg. **Cost:** $795.94/90.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for pain and other side effects periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ GTT, AST, ALT, alkaline phosphatase, total cholesterol, and LDL cholesterol levels.

### Potential Nursing Diagnoses

Acute pain (Side Effects)

### Implementation

- **PO:** Take medication consistently with regard to food.

### Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless it is almost time for next dose. Do not double doses. Advise patient to read the *Patient Information* leaflet before starting and with each Rx refill; changes may occur.
- Inform patient of potential for adverse reactions, and advise patient to notify health care professional immediately if allergic reactions (swelling of the face, lips, tongue, and/or throat, difficulty in swallowing and/or breathing), liver problems (general feeling of not being well, yellowing of skin or whites of eyes, pain on the right side of abdomen), skin reactions (lesions, ulcers, or blisters), or chest pain occurs.
- Advise patient that vaginal bleeding may occur during first few weeks after changing over from other hormonal therapy. Continued bleeding should be evaluated.

- Teach patient to report increase in pain so treatment can be initiated.
- Advise patient to notify health care professional immediately if pregnancy is planned or suspected.

### Evaluation/Desired Outcomes

- Slowing of disease progression in women with advanced breast cancer.

## ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS

**benazepril** (ben-**aye**-ze-pril)
Lotensin

**captopril** (**kap**-toe-pril)
Capoten

**enalapril/enalaprilat** (e-**nal**-a-pril/e-**nal**-a-pril-at)
Vasotec, Vasotec IV

**fosinopril** (foe-**sin**-oh-pril)
Monopril

**lisinopril** (lyse-**in**-oh-pril)
Prinivil, Zestril

**moexipril** (moe-**eks**-i-pril)
Univasc

**perindopril** (pe-**rin**-do-pril)
Aceon, ✱Coversyl

**quinapril** (**kwin**-a-pril)
Accupril

**ramipril** (ra-**mi**-pril)
Altace

**trandolapril** (tran-**doe**-la-pril)
Mavik

***Classification***
Therapeutic: antihypertensives
Pharmacologic: ACE inhibitors

**Pregnancy Category C (first trimester), D (second and third trimester; all trimesters for perindopril)**

### Indications

Alone or with other agents in the management of hypertension. **Captopril, enalapril, fosinopril, lisinopril, quinapril, ramipril, trandolapril:** Management of CHF. **Captopril, lisinopril, ramipril, trandolapril:** Reduction of risk of death or development of CHF following MI. **Enalapril:** Slowed progression of left ventricular dysfunction into overt heart failure. **Ramipril:** Reduction of the risk of MI, stroke, and death from cardiovascular disease in patients at risk (>55 yr old with a history of CAD, stroke, peripheral vascular disease, or diabetes with another cardiovascular risk factor). **Captopril:** ↓ progression of diabetic nephropathy. **Perindopril:** Reduction of risk of death from cardiovascular causes or non-fatal MI in patients with stable CAD.

### Action

ACE inhibitors block the conversion of angiotensin I to the vasoconstrictor angiotensin II. ACE inhibitors also prevent the degradation of bradykinin and other vasodilatory prostaglandins. ACE inhibitors also ↑ plasma renin levels and ↓ aldosterone levels. Net result is systemic vasodilation. **Therapeutic Effects:** Lowering of blood pressure in hypertensive patients. Improved symptoms in patients with CHF (selected agents only). ↓ development of overt heart failure (enalapril only). Improved survival and ↓ development of overt CHF after MI (selected agents only). ↓ risk of death from cardiovascular causes or MI in patients with stable CAD (perindopril only). ↓ risk of MI, stroke or death from cardiovascular causes in high-risk patients (ramipril only). ↓ progression of diabetic nephropathy (captopril only).

### Pharmacokinetics

**Absorption:** *Benazepril*—37% absorbed after oral administration. *Captopril*—60–75% absorbed after oral administration (↓ by food). *Enalapril*—55–75% absorbed after oral administration. *Enalaprilat*—IV administration results in complete bioavailability. *Fosinopril*—36% absorbed after oral administration. *Lisinopril*—25% absorbed after oral administration (much variability). *Moexipril*—13% bioavailability as moexiprilat after oral administration (↓ by food). *Perindopril*—25% bioavailability as perindoprilat after oral administration. *Quinapril*—60% absorbed after oral administration (high-fat meal may ↓ absorption). *Ramipril*—50–60% absorbed after oral administration. *Trandolapril*—70% bioavailability as trandolapril at after oral administration.
**Distribution:** All ACE inhibitors cross the placenta. *Benazepril, captopril, enalapril, fosinopril, quinapril* and *trandolapril*—Enter breast milk. *Lisinopril*—Minimal penetration of CNS. *Ramipril*—Probably does not enter breast milk. *Trandolapril*—Enters breast milk.
**Protein Binding:** *Benazepril*—95%, *Fosinopril*—99.4%, *Moexipril*—90%, *Quinapril*—97%.

**Metabolism and Excretion:** *Benazepril*—Converted by the liver to benazeprilat, the active metabolite. 20% excreted by kidneys; 11–12% nonrenal (biliary elimination). *Captopril*—50% metabolized by the liver to inactive compounds, 50% excreted unchanged by the kidneys. *Enalapril, enalaprilat*—Enalapril is converted by the liver to enalaprilat, the active metabolite; primarily eliminated by the kidneys. *Fosinopril*—Converted by the liver and GI mucosa to fosinoprilat, the active metabolite—50% excreted in urine, 50% in feces. *Lisinopril*—100% eliminated by the kidneys. *Moexipril*—Converted by liver and GI mucosa to moexiprilat, the active metabolite; 13% excreted in urine, 53% in feces. *Perindopril*—Converted by the liver to perindoprilat, the active metabolite; primarily excreted in urine. *Quinapril*—Converted by the liver, GI mucosa, and tissue to quinaprilat, the active metabolite: 96% eliminated by the kidneys. *Ramipril*—Converted by the liver to ramiprilat, the active metabolite; 60% excreted in urine, 40% in feces. *Trandolapril*—Converted by the liver to trandolaprilat, the active metabolite; 33% excreted in urine, 66% in feces.

**Half-life:** *Benazeprilat*—10–11 hr. *Captopril*—2 hr (↑ in renal impairment). *Enalapril*-2 hr (↑ in renal impairment). *Enalaprilat*—35–38 hr (↑ in renal impairment). *Fosinoprilat*—12 hr. *Lisinopril*—12 hr (↑ in renal impairment). *Moexiprilat*—2–9 hr (↑ in renal impairment). *Perindoprilat*—3–10 hr (↑ in renal impairment). *Quinaprilat*—3 hr (↑ in renal impairment). *Ramiprilat*—13–17 hr (↑ in renal impairment). *Trandolaprilat*—10 hr (↑ in renal impairment).

TIME/ACTION PROFILE (effect on blood pressure—single dose†)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Benazepril | within 1 hr | 2–4 hr | 24 hr |
| Captopril | 15–60 min | 60–90 min | 6–12 hr |
| Enalapril PO | 1 hr | 4–8 hr | 12–24 hr |
| Enalapril IV | 15 min | 1–4 hr | 4–6 hr |
| Fosinopril | within 1 hr | 2–6 hr | 24 hr |
| Lisinopril | 1 hr | 6 hr | 24 hr |
| Moexipril | within 1 hr | 3–6 hr | up to 24 hr |
| Perindoprilat | within 1–2 hr | 3–7 hr | up to 24 hr |
| Quinapril | within 1 hr | 2–4 hr | up to 24 hr |
| Ramipril | within 1–2 hr | 3–6 hr | 24 hr |
| Trandolapril | within 1–2 hr | 4–10 hr | up to 24 hr |

†Full effects may not be noted for several weeks

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; History of angioedema with previous use of ACE inhibitors; OB: Can cause injury or death of fetus; Lactation: Certain ACE inhibitors appear in breast milk; discontinue drug or use formula.

**Use Cautiously in:** Renal impairment, hepatic impairment, hypovolemia, hyponatremia, concurrent diuretic therapy; ⛓ Black patients with hypertension (monotherapy less effective, may require additional therapy; ↑ risk of angioedema); Women of childbearing potential; Surgery/anesthesia (hypotension may be exaggerated); Pedi: Safety not established for most agents; benazepril, fosinopril, and lisinopril may be used in children ≥6 yr (captopril and enalapril may be used in children of all ages); Geri: Initial dose reduction recommended for most agents due to age-related decline in renal function.

**Exercise Extreme Caution in:** Family history of angioedema.

## Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, fatigue, headache, insomnia, vertigo, weakness. **Resp:** cough, dyspnea. **CV:** hypotension, chest pain, edema, tachycardia. **Endo:** hyperuricemia. **GI:** taste disturbances, abdominal pain, anorexia, constipation, diarrhea, nausea, vomiting. **GU:** erectile dysfunction, proteinuria, renal dysfunction, renal failure. **Derm:** flushing, pruritis, rashes. **F and E:** hyperkalemia. **Hemat:** AGRANULOCYTOSIS, neutropenia (captopril only). **MS:** back pain, muscle cramps, myalgia. **Misc:** ANGIOEDEMA, fever.

## Interactions

**Drug-Drug:** Excessive hypotension may occur with concurrent use of **diuretics** and other **antihypertensives**. ↑ risk of hyperkalemia with concurrent use of **potassium supplements**, **potassium-sparing diuretics**, **potassium-containing salt substitutes**, or **angiotensin II receptor antagonists**. Antihypertensive response may be ↓ by **NSAIDs**. Absorption of fosinopril may be ↓ by **antacids** (separate administration by 1–2 hr). ↑ levels and may ↑ risk of **lithium** toxicity. Quinapril may ↓ absorption of **tetracycline**, **doxycycline**, and **fluoroquinolones** (because of magnesium in tablets). Telmisartan may ↑ **ramipril** levels; concurrent use not recommended.

**Drug-Food:** Food significantly ↓ absorption of captopril and moexipril (administer drugs 1 hr before meals).

## Route/Dosage

### Benazepril

**PO (Adults):** 10 mg once daily, ↑ gradually to maintenance dose of 20–40 mg/day in 1–2 divided doses (begin with 5 mg/day in patients receiving diuretics).
**PO (Children ≥6 yr):** 0.2 mg/kg once daily; may be titrated up to 0.6 mg/kg/day (or 40 mg/day).

#### Renal Impairment

**PO (Adults):** *CCr < 30 mL/min*—Initiate therapy with 5 mg once daily.

#### Renal Impairment

**PO (Children ≥6 yr):** *CCr < 30 mL/min*—Contraindicated.

### Captopril

**PO (Adults):** *Hypertension*—12.5–25 mg 2–3 times daily, may be ↑ at 1–2 wk intervals up to 150 mg 3 times daily (begin with 6.25–12.5 mg 2–3 times daily in patients receiving diuretics) (maximum dose = 450 mg/day); *CHF*—25 mg 3 times daily (6.25–12.5 mg 3 times daily in patients who have been vigorously diuresed); titrated up to target dose of 50 mg 3 times daily; *Post-MI*—6.25-mg test dose, followed by 12.5 mg 3 times daily, may be ↑ up to 50 mg 3 times daily; *Diabetic nephropathy*—25 mg 3 times daily.
**PO (Children):** *CHF*—0.3 mg/kg–0.5 mg/kg/dose 3 times daily, titrate up to a maximum of 6 mg/kg/day in 2–4 divided doses; *Older Children*—6.25–12.5 mg/dose q 12–24 hr, titrate up to a maximum of 6 mg/kg/day in 2–4 divided doses.
**PO (Infants):** *CHF*—0.15–0.3 mg/kg/dose, titrate up to a maximum of 6 mg/kg/day in 1–4 divided doses.
**PO (Neonates):** *CHF*—0.05–0.1 mg/kg/dose q 8–24 hr, may ↑ as needed up to 0.5 mg/kg q 6–24 hr; *Premature neonates*—0.01 mg/kg/dose q 8–12 hr.

#### Renal Impairment

**PO (Adults):** *CCr 10–50 mL/min*—Administer 75% of dose; *CCr <10 mL/min*—Administer 50% of dose.

### Enalapril/Enalaprilat

**PO (Adults):** *Hypertension*—2.5–5 mg once daily, ↑ as required up to 40 mg/day in 1–2 divided doses (initiate therapy at 2.5 mg once daily in patients receiving diuretics); *CHF*—2.5 mg 1–2 times daily, titrated up to target dose of 10 mg twice daily; begin with 2.5 mg once daily in patients with hyponatremia (serum sodium <130 mEq/L); *Asymptomatic left ventricular dysfunction*—2.5 mg twice daily, titrated up to a target dose of 10 mg twice daily.
**PO (Children and Neonates):** *Hypertension*—0.1 mg/kg/day q 12–24 hr (once a day in neonates); may be slowly titrated up to a maximum of 0.5 mg/kg/day.
**IV (Adults):** *Hypertension*—0.625–1.25 mg (0.625 mg if receiving diuretics) q 6 hr; can be titrated up to 5 mg q 6 hr.
**IV (Children and Neonates):** *Hypertension*—5–10 mcg/kg/dose given q 8–24 hr.

#### Renal Impairment

**PO, IV (Adults):** *Hypertension CCr 10–50 mL/min*—Administer 75% of dose; *CCr < 10 mL/min*—Administer 50% of dose.

#### Renal Impairment

**PO, IV (Children and Neonates):** *CCr <30 mL/min*—Contraindicated.

### Fosinopril

**PO (Adults):** *Hypertension*—10 mg once daily, may be ↑ as required up to 80 mg/day. *CHF*—10 mg once daily (5 mg once daily in patients who have been vigorously diuresed), may be ↑ over several weeks up to 40 mg/day.
**PO (Children ≥6 yr and > 50 kg):** *Hypertension*-5–10 mg once daily.

### Lisinopril

**PO (Adults):** *Hypertension*—10 mg once daily, can be ↑ up to 20–40 mg/day (initiate therapy at 5 mg/day in patients receiving diuretics); *CHF*—5 mg once daily; may be titrated every 2 wk up to 40 mg/day; begin with 2.5 mg once daily in patients with hyponatremia (serum sodium <130 mEq/L); *Post-MI*—5 mg once daily for 2 days, then 10 mg daily.
**PO (Children ≥6 yr):** *Hypertension*—0.07 mg/kg once daily (up to 5 mg/day), may be titrated every 1–2 wk up to 0.6 mg/kg/day (or 40 mg/day).

#### Renal Impairment

**PO (Adults):** *CCr 10–30 mL/min*—Begin with 5 mg once daily; may be slowly titrated up to 40 mg/day; *CCr <10ml/min*—Begin with 2.5 mg once daily; may be slowly titrated up to 40 mg/day.

### Renal Impairment

(Children ≥6 yr): *CCr <30 mL/min*—Contraindicated.

### Moexipril

**PO (Adults):** 7.5 mg once daily, may be ↑ up to 30 mg/day in 1–2 divided doses (begin with 3.75 mg/day in patients receiving diuretics).

### Renal Impairment

**PO (Adults):** *CCr ≤40 mL/min*—Initiate therapy at 3.75 mg once daily, may be titrated upward carefully to 15 mg/day.

### Perindopril

**PO (Adults):** *Hypertension*—4 mg once daily, may be slowly titrated up to 16 mg/day in 1–2 divided doses (should not exceed 8 mg/day in elderly patients) (begin with 2–4 mg/day in 1–2 divided doses in patients receiving diuretics); *Stable CAD*—4 mg once daily for 2 weeks, may be ↑, if tolerated, to 8 mg once daily; for elderly patients, begin with 2 mg once daily for 1 week (may be ↑, if tolerated, to 4 mg once daily for 1 week, then, ↑ as tolerated to 8 mg once daily).

### Renal Impairment

**PO (Adults):** *CCr 30–60 mL/min*—2 mg/day initially, may be slowly titrated up to 8 mg/day in 1–2 divided doses.

### Quinapril

**PO (Adults):** *Hypertension*—10–20 mg once daily initially, may be titrated q 2 wk up to 80 mg/day in 1–2 divided doses (initiate therapy at 5 mg/day in patients receiving diuretics); *CHF*—5 mg twice daily initially, may be titrated at weekly intervals up to 20 mg twice daily.

### Renal Impairment

**PO (Adults):** *CCr >60 mL/min*—Initiate therapy at 10 mg/day; *CCr 30–60 mL/min*—Initiate therapy at 5 mg/day; *CCr 10–30 mL/min*—Initiate therapy at 2.5 mg/day.

### Ramipril

**PO (Adults):** *Hypertension*—2.5 mg once daily, may be ↑ slowly up to 20 mg/day in 1–2 divided doses (initiate therapy at 1.25 mg/day in patients receiving diuretics). *CHF post-MI*—1.25–2.5 mg twice daily initially, may be ↑ slowly up to 5 mg twice daily. *Reduction in risk of MI, stroke, and death from cardiovascular causes*—2.5 mg once daily for 1 wk, then 5 mg once daily for 3 wk, then ↑ as tolerated to 10 mg once daily (can also be given in 2 divided doses).

### Renal Impairment

**PO (Adults):** *CCr <40 mL/min*—Initiate therapy at 1.25 mg once daily, may be slowly titrated up to 5 mg/day in 1–2 divided doses.

### Trandolapril

**PO (Adults):** *Hypertension*—1 mg once daily (2 mg once daily in black patients); *CHF post-MI*—Initiate therapy at 1 mg once daily, titrate up to 4 mg once daily if possible.

### Renal Impairment

**PO (Adults):** *CCr <30 mL/min*—Initiate therapy at 0.5 mg once daily, may be slowly titrated upward (maximum dose = 4 mg/day).

### Hepatic Impairment

**PO (Adults):** Initiate therapy at 0.5 mg once daily, may be slowly titrated upward (maximum dose = 4 mg/day).

### Availability

**Benazepril (generic available)**
**Tablets:** 5 mg, 10 mg, 20 mg, 40 mg. ***In combination with:*** amlodipine (Lotrel) and hydrochlorothiazide (Lotensin HCT). See Appendix B.

**Captopril (generic available)**
**Tablets:** 12.5 mg, 25 mg, 50 mg, 100 mg. ***In combination with:*** hydrochlorothiazide (Capozide). See Appendix B.

**Enalapril (generic available)**
**Tablets:** 2.5 mg, 5 mg, 10 mg, 20 mg. ***In combination with:*** hydrochlorothiazide (Vaseretic). See Appendix B.

**Enalaprilat (generic available)**
**Injection:** 1.25 mg/mL.

**Fosinopril (generic available)**
**Tablets:** 10 mg, 20 mg, 40 mg. ***In combination with:*** hydrochlorothiazide. See Appendix B.

**Lisinopril (generic available)**
**Tablets:** 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg. ***In combination with:*** hydrochlorothiazide (Prinzide, Zestoretic). See Appendix B.

**Moexipril (generic available)**
**Tablets:** 7.5 mg, 15 mg. ***In combination with:*** hydrochlorothiazide (Uniretic).

**Perindopril (generic available)**
**Tablets:** 2 mg, 4 mg, 8 mg.

### Quinapril (generic available)

**Tablets:** 5 mg, 10 mg, 20 mg, 40 mg. ***In combination with:*** hydrochlorothiazide (Accuretic, Quinaretic). See Appendix B.

### Ramipril (generic available)

**Capsules:** 1.25 mg, 2.5 mg, 5 mg, 10 mg. **Cost:** 1.25 mg $133.41/90, 2.5 mg $165.97/90, 5 mg $175.98/90, 10 mg $195.97/90.

### Trandolapril (generic available)

**Tablets:** 1 mg, 2 mg, 4 mg. ***In combination with:*** verapamil (Tarka). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- **Hypertension:** Monitor blood pressure and pulse frequently during initial dose adjustment and periodically during therapy. Notify health care professional of significant changes.
- Monitor frequency of prescription refills to determine adherence.
- Assess patient for signs of angioedema (dyspnea, facial swelling).
- **CHF:** Monitor weight and assess patient routinely for resolution of fluid overload (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Monitor BUN, creatinine, and electrolyte levels periodically. Serum potassium, BUN and creatinine may be ↑, whereas sodium levels may be ↓. If ↑ BUN or serum creatinine concentrations occur, dose reduction or withdrawal may be required.
- Monitor CBC periodically during therapy. Certain drugs may rarely cause slight ↓ in hemoglobin and hematocrit, leukopenia, and eosinophilia.
- May cause ↑ AST, ALT, alkaline phosphatase, serum bilirubin, uric acid, and glucose.
- Assess urine protein prior to and periodically during therapy for up to 1 yr in patients with renal impairment or those receiving >150 mg/day of captopril. If excessive or ↑ proteinuria occurs, re-evaluate ACE inhibitor therapy.
- *Captopril:* May cause positive ANA titer.
- *Captopril:* May cause false-positive test results for urine acetone.
- *Captopril:* Monitor CBC with differential prior to initiation of therapy, every 2 wk for the first 3 mo, and periodically for up to 1 yr in patients at risk for neutropenia (patients with renal impairment or collagen-vascular disease) or at first sign of infection. Discontinue therapy if neutrophil count is $<1000/mm^3$.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- Do not confuse Lotensin (benazepril) with Loniten (minoxidil) or lovastatin. Do not confuse enalapril with Eldepryl (seligiline). Do not confuse Monopril (fosinopril) with Accupril (quinapril), minoxidil, or Monoket (isosorbide mononitrate). Do not confuse Prinivil (lisinopril) with Plendil (felodipine) or Prilosec (omeprazole). Do not confuse Accupril (quinapril) with Accutane (isotretinoin). Do not confuse Altace (ramipril) with Artane (trihexyphenidyl).
- Correct volume depletion, if possible, before initiation of therapy.
- **PO:** Precipitous drop in blood pressure during first 1–3 hr after first dose may require volume expansion with normal saline but is not normally considered an indication for stopping therapy. Discontinuing diuretic therapy or cautiously increasing salt intake 2–3 days before initiation may ↓ risk of hypotension. Monitor closely for at least 1 hr after blood pressure has stabilized. Resume diuretics if blood pressure is not controlled.

### Benazepril

- **PO:** For patients with difficulty swallowing tablets, pharmacist may compound oral suspension; stable for 30 days if refrigerated. Shake suspension before each use.

### Captopril

- **PO:** Administer 1 hr before or 2 hr after meals. May be crushed if patient has difficulty swallowing. Tablets may have a sulfurous odor.
- An oral solution may be prepared by crushing a 25-mg tablet and dissolving it in 25–100 mL of water. Shake for at least 5 min and administer within 30 min.

### Enalapril

- **PO:** For patients with difficulty swallowing tablets, pharmacist may compound oral suspension. Shake suspension before each use.

### Enalaprilat

**IV Administration**

- **Direct IV:** ***Diluent:*** May be administered undiluted. ***Concentration:*** 1.25 mg/mL. ***Rate:*** Administer over at least 5 min.
- **Intermittent Infusion:** ***Diluent:*** Dilute in up to 50 mL of D5W, 0.9% NaCl, D5/0.9% NaCl,

or D5/LR. Diluted solution is stable for 24 hr.
***Rate:*** Administer as a slow infusion over at least 5 min.

- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B liposome, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefonicid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cephalothin, cephapirin, chloramphenicol, cimetidine, cisatracurium, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, dextran 40, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, ephedrine, epinephrine, epirubicin, epoetin, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methicillin, methotrexate, methoxamine, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, mezlocillin, miconazole, midazolam, milrinone, minocycline, mitoxantrone, morphine, moxalactam, multiple vitamin infusion, nafcillin, nalbuphine, naloxone, netilmicin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, papaverine, pemetrexed, penicillin G potassium, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanil, ritodrine, rituximab, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, tetracycline, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, caspofungin, cefepime, dantrolene, diazepam, diazoxide, lansoprazole, phenytoin.
- **Additive Compatibility:** dobutamine, dopamine, heparin, meropenem, nitroglycerin, nitroprusside, potassium chloride.

### Lisinopril

- **PO:** For patients with difficulty swallowing tablets, pharmacist may compound oral suspension; stable at room temperature for 4 wk. Shake suspension before each use.

### Moexipril

- **PO:** Administer moexipril on an empty stomach, 1 hr before a meal.

### Ramipril

- **PO:** Capsules may be opened and sprinkled on applesauce, or dissolved in 4 oz water or apple juice for patients with difficulty swallowing. Effectiveness is same as capsule. Prepared mixtures can be stored for up to 24 hr at room temperature or up to 48 hr if refrigerated.

### Trandolapril

- **PO:** May be taken with or without food.

### Patient/Family Teaching

- Instruct patient to take medication as directed at the same time each day, even if feeling well. Take missed doses as soon as possible but not if almost time for next dose. Do not double doses. Warn patient not to discontinue ACE inhibitor therapy unless directed by health care professional.
- Caution patient to avoid salt substitutes or foods containing high levels of potassium or sodium unless directed by healthcare professional (see Appendix M).
- Caution patient to change positions slowly to minimize hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may ↑ orthostatic hypotension.

- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products, especially cough, cold, or allergy remedies.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient that medication may cause impairment of taste that generally resolves within 8–12 wk, even with continued therapy.
- Instruct patient to notify health care professional if rash; mouth sores; sore throat; fever; swelling of hands or feet; irregular heart beat; chest pain; dry cough; hoarseness; swelling of face, eyes, lips, or tongue; difficulty swallowing or breathing occur; or if taste impairment or skin rash persists. Persistent dry cough may occur and may not subside until medication is discontinued. Consult health care professional if cough becomes bothersome. Also notify health care professional if nausea, vomiting, or diarrhea occurs and continues.
- Emphasize the importance of follow-up examinations to monitor progress.
- Advise women of childbearing age to use contraception and notify health care professional if pregnancy is planned or suspected. If pregnancy is detected, discontinue medication as soon as possible.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family on correct technique for monitoring blood pressure. Advise them to check blood pressure at least weekly and to report significant changes to health care professional.

## Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of excessive side effects.
- Decrease in signs and symptoms of CHF (some drugs may also improve survival).
- Decrease in development of overt CHF (enalapril).
- Reduction of risk of death or development of CHF following MI.
- Reduction of risk of death from cardiovascular causes and MI in patients with stable CAD (perindopril).
- Reduction of risk of MI, stroke, or death from cardiovascular causes in patients at high-risk for these events (ramipril).
- Decrease in progression of diabetic nephropathy (captopril).

## ANGIOTENSIN II RECEPTOR ANTAGONISTS

**candesartan** (can-de-**sar**-tan)
Atacand

**eprosartan** (ep-roe-**sar**-tan)
Teveten

**irbesartan** (ir-be-**sar**-tan)
Avapro

**losartan** (loe-**sar**-tan)
Cozaar

**olmesartan** (ole-me-**sar**-tan)
Benicar

**telmisartan** (tel-mi-**sar**-tan)
Micardis

**valsartan** (val-**sar**-tan)
Diovan

***Classification***
Therapeutic: antihypertensives
Pharmacologic: angiotensin II receptor antagonists

**Pregnancy Category C (first trimester), D (second and third trimesters)**

### Indications

Alone or with other agents in the management of hypertension. Treatment of diabetic nephropathy in patients with type 2 diabetes and hypertension (irbesartan and losartan only). Management of CHF (New York Heart Association class II-IV) in patients who cannot tolerate ACE inhibitors (candesartan and valsartan only) or in combination with an ACE inhibitor and beta-blocker (candesartan only). Prevention of stroke in patients with hypertension and left ventricular hypertrophy (losartan only). Reduction of risk of death from cardiovascular causes in patients with left ventricular systolic dysfunction after MI (valsartan only).

### Action

Blocks vasoconstrictor and aldosterone-producing effects of angiotensin II at receptor sites, including vascular smooth muscle and the adrenal

glands. **Therapeutic Effects:** Lowering of blood pressure. Slowed progression of diabetic nephropathy (irbesartan and losartan only). Reduced cardiovascular death and hospitalizations due to CHF in patients with CHF (candesartan and valsartan only). Decreased risk of cardiovascular death in patients with left ventricular systolic dysfunction who are post-MI (valsartan only). Decreased risk of stroke in patients with hypertension and left ventricular hypertrophy (effect may be less in black patients) (losartan only).

## Pharmacokinetics

**Absorption:** *Candesartan*—Candesartan cilexetil is converted to candesartan, the active component; 15% bioavailability of candesartan; *Eprosartan*—13% absorbed after oral administration; *Irbesartan*—60–80% absorbed after oral administration; *Losartan*—well absorbed, with extensive first-pass hepatic metabolism, resulting in 33% bioavailability; *Olmesartan*—Olmesartan medoxomil is converted to olmesartan, the active component; 26% bioavailability of olmesartan; *Telmisartan*—42–58% absorbed following oral administration (bioavailability ↑ in patients with hepatic impairment); *Valsartan*—10–35% absorbed following oral administration.

**Distribution:** All angiotensin receptor blockers (ARBs) cross the placenta; *Candesartan*—enters breast milk.

**Protein Binding:** All ARBs are >90% protein-bound.

**Metabolism and Excretion:** *Candesartan*—Minor metabolism by the liver; 33% excreted in urine, 67% in feces (via bile); *Eprosartan*—Excreted primarily unchanged in feces via biliary excretion; *Irbesartan*—Some hepatic metabolism; 20% excreted in urine, 80% in feces; *Losartan*—Undergoes extensive first-pass hepatic metabolism; 14% is converted to an active metabolite. 4% excreted unchanged in urine; 6% excreted in urine as active metabolite; some biliary elimination; *Olmesartan*—30–50% excreted unchanged in urine, remainder eliminated in feces via bile; *Telmisartan*—Excreted mostly unchanged in feces via biliary excretion; *Valsartan*—Minor metabolism by the liver; 13% excreted in urine, 83% in feces.

**Half-life:** *Candesartan*—9 hr; *Eprosartan*—20 hr; *Irbesartan*—11–15 hr; *Losartan*—2 hr (6–9 hr for metabolite); *Olmesartan*—13 hr; *Telmisartan*—24 hr; *Valsartan*—6 hr.

TIME/ACTION PROFILE (antihypertensive effect with chronic dosing)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Candesartan | 2–4 hr | 4 wk | 24 hr |
| Eprosartan | 1–2 hr | 2–3 wk | 12–24 hr |
| Irbesartan | within 2 hr | 2 wk | 24 hr |
| Losartan | 6 hr | 3–6 wk | 24 hr |
| Olmesartan | within 1 wk | 2 wk | 24 hr |
| Telmisartan | within 3 hr | 4 wk | 24 hr |
| Valsartan | within 2 hr | 4 wk | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB: Can cause injury or death of fetus; Lactation: Discontinue drug or provide formula.

**Use Cautiously in:** CHF (may result in azotemia, oliguria, acute renal failure and/or death); Volume- or salt-depleted patients or patients receiving high doses of diuretics (correct deficits before initiating therapy or initiate at lower doses); Black patients (may not be effective); Impaired renal function due to primary renal disease or CHF (may worsen renal function); Obstructive biliary disorders (telmisartan) or hepatic impairment (candesartan, losartan, or telmisartan); Women of childbearing potential; Pedi: Safety not established in children <18 yr (< 6 yr for losartan).

## Adverse Reactions/Side Effects

**CNS:** dizziness, anxiety, depression, fatigue, headache, insomnia, weakness. **CV:** hypotension, chest pain, edema, tachycardia. **Derm:** rashes. **EENT:** nasal congestion, pharyngitis, rhinitis, sinusitis. **GI:** abdominal pain, diarrhea, drug-induced hepatitis, dyspepsia, nausea, vomiting. **GU:** impaired renal function. **F and E:** hyperkalemia. **MS:** arthralgia, back pain, myalgia. **Misc:** ANGIOEDEMA.

## Interactions

**Drug-Drug:** Antihypertensive effect may be blunted by **NSAIDs**. ↑ antihypertensive effects with other **antihypertensives** and **diuretics**. Telmisartan may ↑ serum **digoxin** levels. Concurrent use of **potassium-sparing diuretics**, **potassium-containing salt substitutes**, **angiotensin-converting enzyme inhibitors**, or **potassium supplements** may ↑ risk of hyperkalemia. Candesartan may ↑ serum **lithium** levels. Irbesartan and losartan may ↑ effects of **amiodarone**, **fluoxetine**, **glimepiride**, **glipizide**, **phenytoin**, **rosiglitazone**, and **warfarin**. **Rifampin** may ↓ effects of losartan.

## Route/Dosage

### Candesartan

**PO (Adults):** *Hypertension*—16 mg once daily; may be ↑ up to 32 mg/day in 1–2 divided doses (begin therapy at a lower dose in patients who are receiving diuretics or are volume depleted). *CHF*—4 mg once daily initially, dose may be doubled at 2 wk intervals up to target dose of 32 mg once daily.

#### Hepatic Impairment

**PO (Adults):** *Moderate hepatic impairment*—Initiate at a lower dose.

### Eprosartan

**PO (Adults):** 600 mg once daily; may be ↑ to 800 mg/day (in 1–2 divided doses) (usual range 400–800 mg/day).

#### Renal Impairment

**PO (Adults):** *CCr <60 mL/min*—Do not exceed 600 mg/day.

### Irbesartan

**PO (Adults):** *Hypertension*—150 mg once daily; may be ↑ to 300 mg once daily. Initiate therapy at 75 mg once daily in patients who are receiving diuretics or are volume depleted. *Type 2 diabetic nephropathy*—300 mg once daily.

### Losartan

**PO (Adults):** *Hypertension*—50 mg once daily initially (range 25–100 mg/day as a single daily dose or 2 divided doses) (initiate therapy at 25 mg once daily in patients who are receiving diuretics or are volume depleted). *Prevention of stroke in patients with hypertension and left ventricular hypertrophy*—50 mg once daily initially; hydrochlorothiazide 12.5 mg once daily should be added and/or dose of losartan ↑ to 100 mg once daily followed by an ↑ in hydrochlorothiazide to 25 mg once daily based on blood pressure response. *Type 2 diabetic nephropathy*—50 mg once daily, may ↑ to 100 mg once daily depending on blood pressure response.

#### Hepatic Impairment

**PO (Adults):** 25 mg once daily initially; may be ↑ as tolerated.

**PO (Children > 6 yr):** *Hypertension*—0.7 mg/kg once daily (up to 50 mg/day), may be titrated up to 1.4 mg/kg/day (or 100 mg/day).

#### Renal Impairment

**PO (Children > 6 yr):** *CCr <30 mL/min*—Contraindicated.

### Olmesartan

**PO (Adults):** 20 mg once daily; may be ↑ up to 40 mg once daily (patients who are receiving diuretics or are volume-depleted should be started on lower doses).

### Telmisartan

**PO (Adults):** 40 mg once daily (volume-depleted patients should start with 20 mg once daily); may be titrated up to 80 mg/day.

### Valsartan

**PO (Adults):** *Hypertension*—80 mg or 160 mg once daily initially in patients who are not volume-depleted; may be ↑ to 320 mg once daily; *CHF*—40 mg twice daily, may be titrated up to target dose of 160 mg twice daily as tolerated; *Post-MI*—20 mg twice daily (may be initiated ≥ 12 hr after MI); dose may be titrated up to target dose of 160 mg twice daily, as tolerated.

## Availability

### Candesartan

**Tablets:** 4 mg, 8 mg, 16 mg, 32 mg. **Cost:** 4 mg $154.54/90, 8 mg $155.97/90, 16 mg $155.97/90, 32 mg $215.96/90. ***In combination with:*** hydrochlorothiazide (Atacand HCT; see Appendix B).

### Eprosartan

**Tablets:** 400 mg, 600 mg. ***In combination with:*** hydrochlorothiazide (Teveten HCT; see Appendix B).

### Irbesartan

**Tablets:** 75 mg, 150 mg, 300 mg. **Cost:** 75 mg $149.97/90, 150 mg $165.97/90, 300 mg $199.97/90. ***In combination with:*** hydrochlorothiazide (Avalide; see Appendix B).

### Losartan

**Tablets:** 25 mg, 50 mg, 100 mg. **Cost:** 25 mg $157.96/90, 50 mg $162.98/90, 100 mg $219.97/90. ***In combination with:*** hydrochlorothiazide (Hyzaar; see Appendix B).

### Olmesartan

**Tablets:** 5 mg, 20 mg, 40 mg. **Cost:** 5 mg $149.97/90, 20 mg $153.50/90, 40 mg $179.96/90. ***In combination with:*** hydrochlorothiazide (Benicar HCT; amlodipine (Azor); see Appendix B).

### Telmisartan

**Tablets:** 20 mg, 40 mg, 80 mg. **Cost:** 20 mg $50.32/28, 40 mg $58.99/30, 80 mg $65.99/30. ***In combination with:*** hydrochlorothiazide (Micardis HCT; see Appendix B).

### Valsartan

**Tablets:** 40 mg, 80 mg, 160 mg, 320 mg. **Cost:** 40 mg $151.97/90, 80 mg $179.97/90, 160 mg $179.97/90, 320 mg $261.95/90. ***In combination with:*** aliskiren (Valturna); amlodipine (Exforge); hydrochlorothiazide (Diovan HCT); amlodipine and hydrochlorothiazide (Exforge HCT; See Appendix B).

## NURSING IMPLICATIONS

### Assessment

- Assess blood pressure (lying, sitting, standing) and pulse periodically during therapy. Notify health care professional of significant changes.
- Monitor frequency of prescription refills to determine adherence.
- Assess patient for signs of angioedema (dyspnea, facial swelling). May rarely cause angioedema.
- **CHF:** Monitor daily weight and assess patient routinely for resolution of fluid overload (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Monitor renal function and electrolyte levels periodically. Serum potassium, BUN, and serum creatinine may be ↑.
- May cause ↑ AST, ALT, and serum bilirubin (candesartan and olmesartan only).
- May cause ↑ uric acid, slight ↓ in hemoglobin and hematocrit, neutropenia, and thrombocytopenia.

### Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)
Noncompliance (Patient/Family Teaching)

### Implementation

- Do not confuse valsartan with losartan.
- Correct volume depletion, if possible, prior to initiation of therapy.
- **PO:** May be administered without regard to meals.

### Losartan

- **PO:** For patients with difficulty swallowing tablets, pharmacist can compound oral suspension; stable for 4 wk if refrigerated. Shake suspension before each use.

### Patient/Family Teaching

- Emphasize the importance of continuing to take as directed, even if feeling well. Take missed doses as soon as remembered if not almost time for next dose; do not double doses. Instruct patient to take medication at the same time each day. Warn patient not to discontinue therapy unless directed by health care professional.
- Caution patient to avoid salt substitutes containing potassium or food containing high levels of potassium or sodium unless directed by health care professional. See Appendix M.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may increase orthostatic hypotension.
- Advise women of childbearing age to use contraception and notify health care professional if pregnancy is suspected or planned. If pregnancy is detected, discontinue medication as soon as possible.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional before taking any OTC or herbal cough, cold, or allergy remedies or other medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional if swelling of face, eyes, lips, or tongue occurs, or if difficulty swallowing or breathing occurs.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, stress management). Medication controls but dose not cure hypertension.
- Instruct patient and family on proper technique for monitoring blood pressure. Advise them to check blood pressure at least weekly and to report significant changes.

### Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of excessive side effects.
- Slowed progression of diabetic nephropathy (irbesartan, losartan).
- Decreased cardiovascular death and CHF-related hospitalizations in patients with CHF (candesartan).

- Decreased hospitalizations in patients with CHF (valsartan).
- Decreased risk of cardiovascular death in patients with left ventricular systolic dysfunction after MI (valsartan).
- Reduced risk of stroke in patients with hypertension and left ventricular hypertrophy (losartan).

## anidulafungin

(a-**ni**-du-la-fun-gin)
Eraxis

***Classification***
Therapeutic: antifungals
Pharmacologic: echinocandins

**Pregnancy Category C**

### Indications
Candidemia and other serious candidal infections including intra-abdominal abscess, peritonitis. Esophageal candidiasis.

### Action
Inhibits the synthesis of fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi. **Spectrum:** Active against *Candida albicans*, *C. glabrata*, *C. parapsilosis*, and *C. tropicalis*.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Crosses the placenta.
**Metabolism and Excretion:** Undergoes chemical degradation without hepatic metabolism; <1% excreted in urine.
**Half-life:** 40–50 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Underlying liver disease (may worsen); OB, Lactation: Pregnancy or lactation; Pedi: Safe use in children not established.

### Adverse Reactions/Side Effects
**Resp:** dyspnea. **CV:** hypotension. **GI:** diarrhea, ↑ liver enzymes. **Derm:** flushing, rash, urticaria. **F and E:** hypokalemia.

### Interactions
**Drug-Drug:** None noted.

### Route/Dosage
**IV (Adults):** *Esophageal candidiasis*—100 mg loading dose on day 1, then 50 mg daily. *Candidemia and other candidal infections*—200 mg loading dose on day 1, then 100 mg daily.

### Availability
**Lyophilized powder for IV use (requires reconsitution):** 50 mg/vial.

## NURSING IMPLICATIONS

### Assessment
- Assess infected area and monitor cultures before and periodically during therapy.
- Specimens for culture should be taken before instituting therapy. Therapy may be started before results are obtained.
- ***Lab Test Considerations:*** May cause ↑ ALT, AST, alkaline phosphatase, and hepatic enzymes.
- May cause hypokalemia.
- May cause neutropenia and leukopenia.

### Potential Nursing Diagnoses
Risk for infection (Indications)

### Implementation
**IV Administration**

- **Intermittent Infusion:** Reconstitute each 50 mg vial with 15 mL of companion diluent (20% Dehydrated Alcohol in Water for injection) for a concentration of 3.33 mg/mL. ***Diluent:*** Further dilute within 24 hr by transferring contents of reconstituted vial into IV bag of D5W or 0.9% NaCl. For the 50 mg dose, dilute with 85 mL for an infusion volume of 100 mL. For the 100 mg dose, dilute with 170 mL for an infusion volume of 200 mL. For the 200 mg dose, dilute with 340 mL for a total infusion volume of 400 mL. ***Concentration:*** Final concentration should not exceed 0.5 mg/mL. Do not administer solutions that are discolored or contain particulate matter. Store reconstituted solution at room temperature; do not freeze. ***Rate:*** Administer at a rate not to exceed 1.1 mg/min.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, bivalirudin, carboplatin, cefazolin, cefepime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, daunorubicin hydrochloride, dexamethasone, digoxin, dobutamine, docetaxel, dopamine,

doripenem, doxorubicin hydrochloride, epinephrine, erythromycin, etoposide phosphate, famotidine, fentanyl, fluconazole, fluorouracil, furosemide, ganciclovir, gemcitabine, gentamicin, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, leucovorin, levofloxacin, linezolid, meperidine, meropenem, methylprednisolone, metronidazole, midazolam, morphine, mycophenolate, norepinephrine, octreotide, oxytocin, paclitaxel, pantoprazole, phenylephrine, piperacillin/tazobactam, potassium chloride, quinupristin/dalfopristin, ranitidine, tacrolimus, ticarcillin/clavulanate, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vincristine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B colloidal, ertapenem, sodium bicarbonate.

### Patient/Family Teaching

- Explain purpose of medication to patient.
- Instruct patient to notify health care professional if diarrhea becomes pronounced.

### Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Duration of therapy should be based on the patients clinical response. Therapy should be continued for at least 14 days after the last positive culture. For esophageal candidiasis, treatment should continue for at least 7 days following resolution of symptoms.

## ANTIFUNGALS (TOPICAL)

**butenafine** (byoo-**ten**-a-feen)
Lotrimin Ultra, Mentax

**ciclopirox** (sye-kloe-**peer**-ox)
Loprox, Penlac, Stieprox

**clotrimazole** (kloe-**trye**-ma-zole)
Canesten, Clotrimaderm, Cruex, Lotrimin AF, Lotriderm, Mycelex

**econazole** (ee-**kon**-a-zole)

**ketoconazole** (kee-toe-**kon**-a-zole)
Extina, Kuric, Nizoral, Nizoral A-D, Xolegel

**miconazole** (mye-**kon**-a-zole)
Fungoid, Lotrimin AF, Micatin, Micozole, Zeasorb-AF

**naftifine** (**naff**-ti-feen)
Naftin

**nystatin** (nye-**stat**-in)
Mycostatin, Nadostine, Nyaderm, Nystop

**oxiconazole** (ox-i-**kon**-a-zole)
Oxistat

**sulconazole** (sul-**kon**-a-zole)
Exelderm

**terbinafine** (ter-**bin**-a-feen)
Lamisil AT

**tolnaftate** (tol-**naff**-tate)
Pitrex, Podactin, Tinactin, Ting

***Classification***
Therapeutic: antifungals (topical)

**Pregnancy Category B (butenafine, ciclopirox, clotrimazole, naftifine, oxiconazole, terbinafine), C (econazole, ketoconazole, miconazole, sulconazole, tolnaftate), UK (nystatin)**

### Indications

Treatment of a variety of cutaneous fungal infections, including cutaneous candidiasis, tinea pedis (athlete's foot), tinea cruris (jock itch), tinea corporis (ringworm), tinea versicolor, seborrheic dermatitis, dandruff, and onychomycosis of fingernails and toes.

### Action

Butenafine, nystatin, clotrimazole, econazole, ketoconazole, miconazole, naftifine, oxiconazole, sulconazole, and terbinafine affect the synthesis of the fungal cell wall, allowing leakage of cellular contents. Tolnaftate distorts the hyphae and stunts mycelial growth in fungi. Ciclopirox inhibits the transport of essential elements in the fungal cell, disrupting the synthesis of DNA, RNA, and protein. **Therapeutic Effects:** Decrease in symptoms of fungal infection.

### Pharmacokinetics

**Absorption:** Absorption through intact skin is minimal.
**Distribution:** Distribution after topical administration is primarily local.
**Metabolism and Excretion:** Metabolism and excretion not known following local application.
**Half-life:** *Butenafine*—35 hr; *Ciclopirox*—5.5 hr (gel); *Terbinafine*—21 hr.

TIME/ACTION PROFILE (resolution of symptoms/lesions†)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Butenafine | unknown | up to 4 wk | unknown |
| Tolnaftate | 24–72 hr | unknown | unknown |

† Only the drugs with known information included in this table

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to active ingredients, additives, preservatives, or bases; Some products contain alcohol or bisulfites and should be avoided in patients with known intolerance.

**Use Cautiously in:** Nail and scalp infections (may require additional systemic therapy); OB, Lactation: Safety not established.

## Adverse Reactions/Side Effects

**Local:** burning, itching, local hypersensitivity reactions, redness, stinging.

## Interactions

**Drug-Drug:** Either not known or insignificant.

## Route/Dosage

### Butenafine

**Topical (Adults and Children >12 yr):** Apply once daily for 2 wk for tinea corporis, tinea cruris, or tinea versicolor. Apply once daily for 4 wk or once daily for 7 days for tinea pedis.

### Ciclopirox

**Topical (Adults and Children >10 yr):** *Cream/lotion*—Apply twice daily for 2–4 wk; *Topical solution (nail lacquer)*—Apply to nails at bedtime or 8 hr prior to bathing for up to 48 wk. Each daily application should be made over the previous coat and then removed with alcohol every 7 days; *Gel*—Apply twice daily for 4 wk; *Shampoo*—5–10 mL applied to scalp, lather and leave on for 3 min, rinse; repeat twice weekly for 4 wk (at least 3 days between applications).

### Clotrimazole

**Topical (Adults and Children >3 yr):** Apply twice daily for 1–4 wk.

### Econazole

**Topical (Adults and Children):** Apply once daily for tinea pedis (for 4 wk), tinea cruris (for 2 wk), tinea corporis (for 2 wk), or tinea versicolor (for 2 wk). Apply twice daily for cutaneous candidiasis (for 2 wk).

### Ketoconazole

**Topical (Adults):** Apply cream once daily for cutaneous candidiasis (for 2 wk), tinea corporis (for 2 wk), tinea cruris (for 2 wk), tinea pedis (for 6 wk), or tinea versicolor (for 2 wk). Apply cream twice daily for seborrheic dermatitis (for 4 wk). For dandruff, use shampoo twice weekly (wait 3–4 days between treatments) for 4 wk, then intermittently.

### Miconazole

**Topical (Adults and Children >2 yr):** Apply twice daily. Treat tinea cruris for 2 wk and tinea pedis or tinea corporis for 4 wk.

### Naftifine

**Topical (Adults):** Apply cream once daily for up to 4 wk. Apply gel twice daily for up to 4 wk.

### Nystatin

**Topical (Adults and Children):** Apply 2–3 times daily until healing is complete.

### Oxiconazole

**Topical (Adults and Children):** Apply cream or lotion 1–2 times daily for tinea pedis (for 4 wk), tinea corporis (for 2 wk), or tinea cruris (for 2 wk). Apply cream once daily for tinea versicolor (for 2 wk).

### Sulconazole

**Topical (Adults):** Apply 1–2 times daily (twice daily for tinea pedis). Treat tinea corporis, tinea cruris, or tinea versicolor for 3 wk, and tinea pedis for 4 wk.

### Terbinafine

**Topical (Adults):** Apply twice daily for tinea pedis (for 1 wk) or daily for tinea cruris or tinea corporis for 1 wk.

### Tolnaftate

**Topical (Adults):** Apply twice daily for tinea cruris (for 2 wk), tinea pedis (for 4 wk), or tinea corporis (for 4 wk).

## Availability

### Butenafine

**Cream:** 1%[Rx, OTC].

### Ciclopirox (generic available)

**Cream:** 0.77%. **Lotion:** 0.77%. **Nail lacquer:** 8%. **Shampoo:** 1%.

### Clotrimazole (generic available)

**Cream:** 1%[OTC]. **Solution:** 1%[OTC]. ***In combination with:*** betamethasone (Lotrisone). See Appendix B.

### Econazole (generic available)

**Cream:** 1%.

### Ketoconazole (generic available)
**Cream:** 2%. **Shampoo:** 1%[OTC], 2%. **Foam:** 2%. **Gel:** 2%.

### Miconazole (generic available)
**Cream:** 2%[Rx, OTC]. **Lotion powder:** 2%[OTC]. **Ointment:** 2%[OTC]. **Powder:** 2%[OTC]. **Spray powder:** 2%[OTC]. **Spray liquid:** 2%[OTC]. **Solution:** 2%[OTC]. **Tincture:** 2%[OTC]. ***In combination with:*** zinc oxide (Vusion). See Appendix B.

### Naftifine
**Cream:** 1%[Rx, OTC]. **Gel:** 1%[OTC].

### Nystatin (generic available)
**Cream:** 100,000 units/g[Rx, OTC]. **Ointment:** 100,000 units/g[Rx, OTC]. **Powder:** 100,000 units/g[Rx, OTC]. ***In combination with:*** triamcinolone. See Appendix B.

### Oxiconazole
**Cream:** 1%. **Lotion:** 1%.

### Sulconazole
**Cream:** 1%. **Solution:** 1%.

### Terbinafine (generic available)
**Cream:** 1%[OTC]. **Spray liquid:** 1%[OTC].

### Tolnaftate (generic available)
**Cream:** 1%[OTC]. **Solution:** 1%[OTC]. **Powder:** 1%[OTC]. **Spray powder:** 1%[OTC]. **Spray liquid:** 1%[OTC].

## NURSING IMPLICATIONS

### Assessment
- Inspect involved areas of skin and mucous membranes before and frequently during therapy. Increased skin irritation may indicate need to discontinue medication.

### Potential Nursing Diagnoses
Risk for impaired skin integrity (Indications)
Risk for infection (Indications)

### Implementation
- Do not confuse Lotrimin (clotrimazole) with Lotrisone (betamethasone/clotrimazole). Do not confuse Kuric (ketoconazole) with Carac (fluorouracil).
- Consult health care professional for proper cleansing technique before applying medication.
- Choice of vehicle is based on use. Ointments, creams, and liquids are used as primary therapy. Lotion is usually preferred in intertriginous areas; if cream is used, apply sparingly to avoid maceration. Powders are usually used as adjunctive therapy but may be used as primary therapy for mild conditions (especially for moist lesions).
- **Topical:** Apply small amount to cover affected area completely. Avoid the use of occlusive wrappings or dressings unless directed by health care professional.
- **Nail lacquer:** Avoid contact with skin other than skin immediately surrounding treated nail. Avoid contact with eyes or mucous membranes. Removal of unattached, infected nail, as frequently as monthly, by health care professional is needed with use of this medication. Up to 48 wk of daily application and professional removal may be required to achieve clear or almost clear nail. Six months of treatment may be required before results are noticed.
- **Ciclopirox or Ketoconazole shampoo:** Moisten hair and scalp thoroughly with water. Apply sufficient shampoo to produce enough lather to wash scalp and hair and gently massage it over the entire scalp area for approximately 1 min. Rinse hair thoroughly with warm water. Repeat process, leaving shampoo on hair for an additional 3 min. After the 2nd shampoo, rinse and dry hair with towel or warm air flow. Shampoo twice a week for 4 wk with at least 3 days between each shampooing and then intermittently as needed to maintain control.
- **Ketoconazole foam:** Hold container upright and dispense foam into cap of can or other smooth surface; dispensing directly on to hand is not recommended as the foam begins to melt immediately on contact with warm skin. Pick up small amounts with fingertips and gently massage into affected areas until absorbed. Move hair to allow direct application to skin.

### Patient/Family Teaching
- Instruct patient to apply medication as directed for full course of therapy, even if feeling better. Emphasize the importance of avoiding the eyes.
- Caution patient that some products may stain fabric, skin, or hair. Check label information. Fabrics stained from cream or lotion can usually be cleaned by handwashing with soap and warm water; stains from ointments can usually be removed with standard cleaning fluids.
- Patients with athlete's foot should be taught to wear well-fitting, ventilated shoes, to wash affected areas thoroughly, and to change shoes and socks at least once a day.

- Advise patient to report increased skin irritation or lack of response to therapy to health care professional.
- **Nail lacquer:** File away loose nail and trim nails every 7 days after solution is removed with alcohol. Do not use nail polish on treated nails. Inform health care professional if patient has diabetes mellitus before using.

### Evaluation/Desired Outcomes

- Decrease in skin irritation and resolution of infection. Early relief of symptoms may be seen in 2–3 days. For *Candida,* tinea cruris, and tinea corporis, 2 wk are needed, and for tinea pedis, therapeutic response may take 3–4 wk. Recurrent fungal infections may be a sign of systemic illness.

## ANTIFUNGALS (VAGINAL)

**butoconazole** (byoo-toe-**kon**-a-zole)
Gynezole-1, Mycelex-3

**clotrimazole** (kloe-**trye**-ma-zole)
Canesten, Clotrimaderm, Gyne-Lotrimin-3, Mycelex-7, Trivagizole-3

**miconazole** (mye-**kon**-a-zole)
Monistat-1, Monistat-3, Monistat-7, Vagistat-3

**nystatin** (nye-**stat**-in)
Mycostatin

**terconazole** (ter-**kon**-a-zole)
Terazol-3, Terazol-7

**tioconazole** (tye-oh-**kon**-a-zole)
1–Day, Monistat-1Day, Vagistat-1

***Classification***
Therapeutic: antifungals (vaginal)

**Pregnancy Category A (nystatin), B (clotrimazole), C (butoconazole, miconazole, terconazole, tioconazole)**

### Indications

Treatment of vulvovaginal candidiasis.

### Action

Affects the permeability of the fungal cell wall, allowing leakage of cellular contents. Not active against bacteria. **Therapeutic Effects:** Inhibited growth and death of susceptible *Candida*, with decrease in accompanying symptoms of vulvovaginitis (vaginal burning, itching, discharge).

### Pharmacokinetics

**Absorption:** Absorption through intact skin is minimal.
**Distribution:** Unknown. Action is primarily local.
**Metabolism and Excretion:** Negligible with local application.
**Half-life:** Not applicable.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| All agents | rapid | unknown | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to active ingredients, additives, or preservatives; OB: Safety not established; Lactation: Safety not established.
**Use Cautiously in:** None noted.

### Adverse Reactions/Side Effects

**GU:** itching, pelvic pain, vulvovaginal burning.

### Interactions

**Drug-Drug:** Concurrent use of vaginal miconazole with **warfarin** ↑ risk of bleeding/bruising (appropriate monitoring recommended).

### Route/Dosage

#### Butoconazole

**Vag (Adults and Children ≥12 yr):** 1 applicatorful (5 g) at bedtime for 3 days (Mycelex-3) *or* one applicatorful single dose (Gynezole-1).

#### Clotrimazole

**Vag (Adults and Children >12 yr):** *Vaginal tablets*—100 mg at bedtime for 7 nights (preferred regimen for pregnancy) *or* 200 mg at bedtime for 3 nights. *Vaginal cream*—1 applicatorful (5 g) of 1% cream at bedtime for 7 days *or* 1 applicatorful (5 g) of 2% cream at bedtime for 3 days.

#### Miconazole

**Vag (Adults and Children ≥12 yr):** *Vaginal suppositories*—one 100-mg suppository at bedtime for 7 days *or* one 200-mg suppository at bedtime for 3 days *or* one 1200-mg suppository as a single dose. *Vaginal cream*—1 applicatorful of 2% cream at bedtime for 7 days *or* 1 applicatorful of 4% cream at bedtime for 3 days. *Combination packages*—contain a cream or suppositories as well as an external vaginal cream (may be used twice daily for up to 7 days, as needed, for symptomatic management of itching).

#### Nystatin

**Vag (Adults):** 100,000 units (1 tablet) daily for 2 wk.

### Terconazole

**Vag (Adults):** *Vaginal cream*—1 applicatorful (5 g) of 0.4% cream at bedtime for 7 days *or* 1 applicatorful (5 g) of 0.8% cream at bedtime for 3 days. *Vaginal suppositories*—1 suppository (80 mg) at bedtime for 3 days.

### Tioconazole

**Vag (Adults and Children ≥12 yr):** 1 applicatorful (4.6 g) at bedtime as a single dose.

### Availability

### Butoconazole

**Vaginal cream:** 2%[Rx, OTC].

### Clotrimazole (generic available)

**Vaginal tablets:** 100 mg[OTC], 200 mg[OTC]. **Vaginal cream:** 1%[OTC], 2%[OTC].

### Miconazole (generic available)

**Vaginal cream:** 2%[OTC], 4%[OTC]. **Vaginal suppositories:** 100 mg[OTC], 200 mg[Rx, OTC]. ***In combination with:*** combination package of 3 200-mg suppositories and 2% external cream[OTC]; one 1200-mg suppository and 2% external cream[OTC]; 4% vaginal cream and 2% external cream[OTC]; 7 100-mg suppositories and 2% external cream[OTC]; 2% vaginal cream and 2% external cream[OTC].

### Nystatin (generic available)

**Vaginal tablets:** 100,000 units.

### Terconazole (generic available)

**Vaginal cream:** 0.4%, 0.8%. **Vaginal suppositories:** 80 mg.

### Tioconazole

**Vaginal ointment:** 6.5%[OTC].

## NURSING IMPLICATIONS

### Assessment

- Inspect involved areas of skin and mucous membranes before and frequently during therapy. Increased skin irritation may indicate need to discontinue medication.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Risk for impaired skin integrity (Indications)

### Implementation

- Consult physician or other health care professional for proper cleansing technique before applying medication.
- Nystatin vaginal tablets should be refrigerated.
- **Vag:** Applicators are supplied for vaginal administration.

### Patient/Family Teaching

- Instruct patient to apply medication as directed for full course of therapy, even if feeling better. Therapy should be continued during menstrual period.
- Instruct patient on proper use of vaginal applicator. Medication should be inserted high into the vagina at bedtime. Instruct patient to remain recumbent for at least 30 min after insertion. Advise use of sanitary napkins to prevent staining of clothing or bedding.
- Advise patient to avoid using tampons while using this product.
- Advise patient to consult health care professional regarding intercourse during therapy. Vaginal medication may cause minor skin irritation in sexual partner. Advise patient to refrain from sexual contact during therapy or have male partner wear a condom. Some products may weaken latex contraceptive devices. Another method of contraception should be used during treatment.
- Advise patient to report to health care professional increased skin irritation or lack of response to therapy. A second course may be necessary if symptoms persist.
- Advise patient to dispose of applicator after each use (except for terconazole).

### Evaluation/Desired Outcomes

- Decrease in skin irritation and vaginal discomfort. Therapeutic response is usually seen after 1 wk. Diagnosis should be reconfirmed with smears or cultures before a second course of therapy to rule out other pathogens associated with vulvovaginitis. Recurrent vaginal infections may be a sign of systemic illness.

## aprepitant (a-**prep**-i-tant)

Emend

***Classification***

Therapeutic: antiemetics
Pharmacologic: neurokinin antagonists

**Pregnancy Category B**

### Indications

Prevention of acute and delayed nausea and vomiting caused by initial/repeat treatment with highly emetogenic chemotherapy (with other antiemetics). Prevention of postoperative nausea and vomiting.

## Action

Acts as a selective antagonist at substance P/neurokinin 1 ($NK_1$) receptors in the brain. **Therapeutic Effects:** Decreased nausea and vomiting associated with chemotherapy. Augments the antiemetic effects of dexamethasone and 5-$HT_3$ antagonists (ondansetron).

## Pharmacokinetics

**Absorption:** 60–65% absorbed following oral administration.
**Distribution:** Crosses the blood brain barrier; remainder of distribution unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A4 enzyme system); not renally excreted.
**Half-life:** 9–13 hr.

TIME/ACTION PROFILE (antiemetic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 hr | 4 hr* | 24 hr |

*Blood level

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent use with pimozide (risk of life-threatening adverse cardiovascular reactions); Lactation: May cause unwanted effects in nursing infants.
**Use Cautiously in:** Concurrent use with any agents metabolized by CYP3A4 (see Drug-Drug Interactions); OB: Use only if clearly needed; Pedi: Safety not established.

## Adverse Reactions/Side Effects

**CV:** dizziness, fatigue, weakness. **GI:** diarrhea. **Misc:** hiccups.

## Interactions

**Drug-Drug:** Aprepitant inhibits, induces, and is metabolized by the CYP3A4 enzyme system; it also induces the CYP2C9 system. Concurrent use with other medications that are metabolized by CYP3A4 may result in increased toxicity from these agents including **docetaxel**, **paclitaxel**, **etoposide**, **irinotecan**, **ifosfamide**, **imatinib**, **vinorelbine**, **vinblastine**, **vincristine**, **midazolam**, **triazolam**, and **alprazolam**; concurrent use should be undertaken with caution. Concurrent use with **drugs that significantly inhibit the CYP3A4 enzyme system** including (**ketoconazole**, **itraconazole**, **nefazodone**, **clarithromycin**, **ritonavir**, **nelfinavir**, and **diltiazem**) may ↑ blood levels and effects of aprepitant. Concurrent use with **drugs that induce the CYP3A4 enzyme system** including **rifampin**, **carbamazepine**, and **phenytoin** may ↓ blood levels and effects of aprepitant. ↑ blood levels and effects of **dexamethasone** (regimen reflects a 50% dose reduction); a similar effect occurs with **methylprednisolone** ( ↓ IV dose by 25%, ↓ PO dose by 50% when used concurrently). May ↓ the effects of **warfarin** (careful monitoring for 2 wk recommended), **oral contraceptives** (use alternate method), **tolbutamide**, and **phenytoin**.

## Route/Dosage

**PO (Adults):** *Chemotherapy*—125 mg 1 hr prior to chemotherapy, then 80 mg once daily for 2 days (with dexamethasone 12 mg PO 30 min prior to chemotherapy, then 8 mg once daily for 3 days and ondansetron 32 mg IV 30 min prior to chemotherapy); *Postoperative*—40 mg given within 3 hr prior to induction of anesthesia.

## Availability

**Capsules:** 40 mg, 80 mg, 125 mg.

# NURSING IMPLICATIONS

## Assessment

- Assess nausea, vomiting, appetite, bowel sounds, and abdominal pain prior to and following administration.
- Monitor hydration, nutritional status, and intake and output. Patients with severe nausea and vomiting may require IV fluids in addition to antiemetics.
- ***Lab Test Considerations:*** Monitor clotting status closely during the 2 wk period, especially at 7–10 days, following aprepitant therapy in patients on chronic warfarin therapy.
- May cause mild, transient ↑ in alkaline phosphatase, AST, ALT, and BUN.
- May cause proteinuria, erythrocyturia, leukocyturia, hyperglycemia, hyponatremia, and ↑ leukocytes.
- May cause ↓ hemoglobin and WBC.

## Potential Nursing Diagnoses

Risk for deficient fluid volume (Indications)
Imbalanced nutrition: less than body requirements (Indications)

## Implementation

- For chemotherapy, aprepitant is given as part of a regimen that includes a corticosteroid and a 5-$HT_3$ antagonist (see Route/Dosage).
- **PO:** Administer daily for 3 days. *Day 1*—administer 125 mg 1 hr prior to chemotherapy. *Days 2 and 3*—administer 80 mg once in the morning. May be administered without regard to food.

## Patient/Family Teaching

- Instruct patient to take aprepitant as directed. Direct patient to read the patient package insert

before starting therapy and to reread it each time the prescription is renewed.
- Instruct patient to notify health care professional if nausea and vomiting occur prior to administration.
- Advise patient to notify health care professional prior to taking any other Rx, OTC, or herbal products.
- Caution patient that aprepitant may decrease the effectiveness of oral contraceptives. Advise patient to use alternate nonhormonal methods of contraception. Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Advise patient and family to use general measures to decrease nausea (begin with sips of liquids and small, nongreasy meals; provide oral hygiene; remove noxious stimuli from environment).
- Advise patient to notify health care professional promptly if symptoms of allergic reactions (hives, rash, itching, difficulty breathing, or swallowing) occur.

### Evaluation/Desired Outcomes
- Decreased nausea and vomiting associated with chemotherapy.
- Prevention of postoperative nausea and vomiting.

HIGH ALERT

## argatroban (ar-gat-tro-ban)
Argatroban

***Classification***
Therapeutic: anticoagulants
Pharmacologic: thrombin inhibitors

**Pregnancy Category B**

### Indications
Prophylaxis or treatment of thrombosis in patients with heparin-induced thrombocytopenia. As an anticoagulant in patients with or at risk for heparin-induced thrombocytopenia who are undergoing percutaneous coronary intervention (PCI).

### Action
Inhibits thrombin by binding to its receptor sites. Inhibition of thrombin prevents activation of factors V, VIII, and XII; the conversion of fibrinogen to fibrin; platelet adhesion and aggregation.
**Therapeutic Effects:** Decreased thrombus formation and extension with decreased sequelae of thrombosis (emboli, postphlebitic syndromes).

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver; excreted primarily in feces via biliary excretion. 16% excreted unchanged in urine, 14% excreted unchanged in feces.
**Half-life:** 39–51 min (↑ in hepatic impairment).

TIME/ACTION PROFILE (anticoagulant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | immediate | 1–3 hr | 2–4 hr |

### Contraindications/Precautions
**Contraindicated in:** Major bleeding; Hypersensitivity; Lactation: Lactation.
**Use Cautiously in:** Hepatic impairment (↓ initial infusion rate recommended); OB: Use only if clearly needed; Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CV:** hypotension. **GI:** diarrhea, nausea, vomiting. **Hemat:** BLEEDING. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

### Interactions
**Drug-Drug:** Risk of bleeding may be ↑ by concurrent use of **antiplatelet agents, thrombolytic agents,** or **other anticoagulants**.
**Drug-Natural Products:** ↑ bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

### Route/Dosage
**IV (Adults):** 2 mcg/kg/min as a continuous infusion; adjust infusion rate on the basis of activated partial thromboplastin time (aPTT). *Patients undergoing PCI*—350 mcg/kg bolus followed by infusion at 25 mcg/kg/min, activated clotting time (ACT) should be assessed 5–10 min later. If ACT is 300–450 sec, procedure may be started. If ACT < 300 sec, give additional bolus of 150 mcg/kg and ↑ infusion rate to 30 mcg/kg/min. If ACT is >450 sec infusion rate should be ↓ to 15 mcg/kg/min and ACT rechecked after 5–10 min. If thrombotic complications occur or ACT drops to < 300 sec, an additional bolus of 150 mcg/kg may be given and the infusion rate ↑ to 40 mcg/kg/min followed by ACT monitoring. If anticoagulation is required after surgery, lower infusion rates should be used.

### Hepatic Impairment

**IV (Adults):** 0.5 mcg/kg/min as a continuous infusion; adjust infusion rate on the basis of aPTT.

### Availability

**Solution for injection:** 100 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor vital signs periodically during therapy. Unexplained decreases in blood pressure may indicate hemorrhage. Assess patient for bleeding. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and nasogastric tubes should be minimized. Noncompressible sites for IV access should be avoided. Monitor for blood in urine, lower back pain, pain or burning on urination. If bleeding cannot be controlled with pressure, decrease dose or discontinue argatroban immediately.
- Monitor for signs of anaphylaxis (rash, coughing, dyspnea) throughout therapy.
- ***Lab Test Considerations:*** Monitor aPTT prior to initiation of continuous infusion, 2 hours after initiation of therapy, and periodically during therapy to confirm aPTT is within desired therapeutic range.
- For patients undergoing PCI, monitor ACT as described in Route and Dose section.
- Assess hemoglobin, hematocrit, and platelet count prior to, and periodically during, argatroban therapy. May cause ↓ hemoglobin and hematocrit. Unexplained ↓ hematocrit may indicate hemorrhage.
- Use of argatroban concurrently with multiple doses of warfarin will result in more prolonged prothrombin time and international normalized ratio (INR) (although there is not an ↑ in vitamin K-dependent factor $X_a$ activity) than when warfarin is used alone. Monitor INR daily during concomitant therapy. Repeat INR 4–6 hr after argatroban is discontinued. If the repeat value is below the desired therapeutic value for warfarin alone, restart argatroban therapy and continue until the desired therapeutic range for warfarin alone is reached. To obtain the INR for warfarin alone when the dose of argatroban is >2 mcg/kg/min the argatroban dose should be temporarily reduced to 2 mcg/kg/min; the INR for combined therapy may then be obtained 4–6 hr after argatroban dose was reduced.
- ***Toxicity and Overdose:*** There is no specific antidote for argatroban. If overdose occurs, discontinue argatroban. Anticoagulation parameters usually return to baseline within 2–4 hr after discontinuation.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

### Implementation

- All parenteral anticoagulants should be discontinued before argatroban therapy is initiated. Oral anticoagulation may be initiated with maintenance dose of warfarin; do not administer loading dose. Discontinue argatroban therapy when INR for combined therapy is >4.

#### IV Administration

- **IV:** Solution is slightly viscous, clear, and colorless to pale yellow. Do not administer solutions that are cloudy or contain particulate matter. Discard unused portion.
- **Direct IV:** ***Diluent:*** Bolus dose of 350 mcg/kg should be given prior to continuous infusion in patients undergoing PCI. For Diluent information, see Continuous Infusion section below. ***Rate:*** Administer bolus over 3–5 min.
- **Continuous Infusion:** ***Diluent:*** Dilute each 100 mg/mL in 0.9% NaCl, D5W, or LR. Mix by repeated inversion for 1 min. Solution may show a slight haziness that disappears upon mixing. ***Concentration:*** 1 mg/mL. ***Rate:*** Based on patient's weight (See Route/Dosage section). Dose adjustment may be made 2 hr after starting infusion or changing dose until steady-state aPTT is 1.5–3 times the initial baseline value (not to exceed 100 sec).
- **Y-Site Compatibility:** acyclovir, anidulafungin, atropine, bivalirudin, daptomycin, diltiazem, diphenhydramine, dobutamine, dopamine, eptifibatide, ertapenem, fenoldopam, fentanyl, furosemide, hydrocortisone, hydromorphone, lidocaine, lorazepam, metoprolol, midazolam, milrinone, morphine, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin, pancuronium, phenylephrine, teniposide, tigecycline, tirofiban, vasopressin, vecuronium, verapamil.
- **Y-Site Incompatibility:** amiodarone.

### Patient/Family Teaching

- Inform patient of the purpose of argatroban.
- Instruct patient to notify health care professional immediately if any bleeding is noted.

### Evaluation/Desired Outcomes

- Decreased thrombus formation and extension.
- Decreased sequelae of thrombosis (emboli, post-phlebitic syndromes).

A

## aripiprazole (a-ri-pip-ra-zole)

Abilify

***Classification***

Therapeutic: antipsychotics, mood stabilizers

Pharmacologic: dihydrocarbostyril

**Pregnancy Category C**

### Indications

Schizophrenia. Acute and maintenance therapy of manic and mixed episodes associated with bipolar disorder (as monotherapy or with lithium or valproate). Adjunct treatment of depression in adults. Agitation associated with schizophrenia or bipolar disorder.

### Action

Psychotropic activity may be due to agonist activity at dopamine $D_2$ and serotonin 5-$HT_{1A}$ receptors and antagonist activity at the 5-$HT_{2A}$ receptor. Also has alpha$_1$ adrenergic blocking activity. **Therapeutic Effects:** Decreased manifestations of schizophrenia. Decreased mania in bipolar patients. Decreased symptoms of depression. Decreased agitation associated with schizophrenia or bipolar disorder.

### Pharmacokinetics

**Absorption:** Well absorbed (87%) following oral administration; 100% following IM injection.
**Distribution:** Extensive extravascular distribution.
**Protein Binding:** *aripiprazole and dehydro-aripiprazole*—>99%.
**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A4 and CYP2D6 isoenzymes); the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly ↑ aripiprazole concentrations and an ↑ risk of adverse effects (may need smaller doses); one metabolite (dehydro-aripiprazole) has antipsychotic activity. 18% excreted unchanged in feces; <1% excreted unchanged in urine.
**Half-life:** *Aripiprazole*—75 hr; *dehydro-aripiprazole—94 hr.*

TIME/ACTION PROFILE (antipsychotic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2 wk | unknown |
| IM | unknown | 1–3 hr | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Lactation: Presumed to be excreted in breast milk; discontinue drug or bottle feed.
**Use Cautiously in:** Known cardiovascular or cerebrovascular disease; Conditions which cause hypotension (dehydration, treatment with antihypertensives or diuretics); Diabetes (may ↑ risk of hyperglycemia); Seizure disorders; Patients at risk for aspiration pneumonia; Concurrent ketoconazole or other potential CYP3A4 inhibitors ( ↓ aripiprazole dose by 50%); Concurrent quinidine, fluoxetine, paroxetine, or other potential CYP2D6 inhibitors; Concurrent carbamazepine or other potential CYP3A4 inducers; OB: Use only if benefit outweighs risk to fetus; Pedi: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children, adolescents, and young adults taking antidepressants (safe use in children/adolescents not established); Geri: ↑ risk of mortality in elderly patients treated for dementia-related psychosis.

### Adverse Reactions/Side Effects

**CNS:** SUICIDAL THOUGHTS, drowsiness, extrapyramidal reactions, akathisia, confusion, depression, fatigue, hostility, insomnia, lightheadedness, manic reactions, impaired cognitive function, nervousness, restlessness, seizures, tardive dyskinesia. **Resp:** dyspnea. **CV:** bradycardia, chest pain, edema, hypertension, orthostatic hypotension, tachycardia. **EENT:** blurred vision, conjunctivitis, ear pain. **GI:** constipation, anorexia, ↑ salivation, nausea, vomiting, weight loss. **GU:** urinary incontinence. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia, neutropenia. **Derm:** dry skin, ecchymosis, skin ulcer, sweating. **MS:** muscle cramps, neck pain. **Metab:** hyperglycemia. **Neuro:** abnormal gait, tremor. **Misc:** NEUROLEPTIC MALIGNANT SYNDROME, ↓ heat regulation.

### Interactions

**Drug-Drug: Ketoconazole** or **other potential CYP3A4 inhibitors** ↓ metabolism and ↑ effects ( ↓ aripiprazole dose by 50%). **Quinidine**, **fluoxetine**, **paroxetine**, or **other potential CYP2D6 inhibitors** ↓ metabolism and ↑ effects ( ↓ aripiprazole dose by at least 50%). Concurrent **carbamazepine** or **other potential CYP3A4 inducers** ↑ metabolism and ↓ effects (double aripiprazole dose; then ↓ to 10–15 mg/day when interfering drug is withdrawn).

## Route/Dosage

### Schizophrenia

**PO (Adults):** 10 or 15 mg daily; doses up to 30 mg/day have been used; increments in dosing should not be made before 2 wk at a given dose.
**PO (Children 13–17 yr):** 2 mg daily; ↑ to 5 mg daily after 2 days, and then to target dose of 10 mg daily after another 2 days; may further ↑ dose in 5-mg increments if needed (max: 30 mg/day).

### Bipolar mania

**PO (Adults):** 15 mg daily as monotherapy or with lithium or valproate; may ↑ to 30 mg daily, based on response.
**PO (Children 10–17 yr):** 2 mg daily; ↑ to 5 mg daily after 2 days, and then to target dose of 10 mg daily after another 2 days; may further ↑ dose in 5-mg increments if needed (max: 30 mg/day).

### Depression

**PO (Adults):** 2–5 mg daily, may titrate upward at 1-wk intervals to 5–10 mg daily; not to exceed 15 mg/day.

### Agitation Associated with Schizophrenia or Bipolar Disorder

**IM (Adults):** 9.75 mg/day, may use a dose of 5.25 mg based on clinical situation. May give additional doses up to a cumulative dose of 30 mg/day, if needed.

### Availability

**Tablets:** 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg. **Cost:** 2 mg $999.90/90, 5 mg $999.90/90, 10 mg $1,035.88/90, 15 mg $999.88/90, 20 mg $1,375.83/90, 30 mg $1,375.83/90. **Tablets, orally disintegrating:** 10 mg, 15 mg. **Oral solution (orange cream):** 1 mg/mL. **Injection:** 9.75 mg/1.3 mL single-dose vials.

## NURSING IMPLICATIONS

### Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Assess for suicidal tendencies, especially during early therapy for depression. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs.
- Assess weight and BMI initially and throughout therapy.
- Obtain fasting blood glucose and cholesterol levels initially and periodically during therapy.
- Monitor blood pressure (sitting, standing, lying), pulse, and respiratory rate before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, masklike face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or wormlike movements of tongue). Notify health care professional immediately if these symptoms occur, as these side effects may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Notify health care professional immediately if these symptoms occur.
- ***Lab Test Considerations:*** May cause ↑ creatinine phosphokinase.
- Monitor CBC frequently during initial months of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.

### Potential Nursing Diagnoses

Disturbed thought process (Indications)
Imbalanced nutrition: risk for more than body requirements (Side Effects)

### Implementation

- **PO:** Administer once daily without regard to meals.
- Do not open the blister until ready to administer. For single tablet removal, open the package and peel back the foil on the blister to expose the tablet. Do not push the tablet through the foil; may damage tablet. Immediately upon opening the blister, using dry hands, remove the tablet and place the entire orally disintegrating tablet on the tongue. Tablet disintegration occurs rapidly in saliva. Take tablet without liquid; but if needed, it can be taken with liquid. Do not attempt to split the tablet.

- **IM:** IM route should be used for agitation. Convert to oral dose as soon as possible. Administer IM; for dose of 5.25 mg use 0.7 mL, 9.75 mg use 1.3 mL, and 15 mg use 2 mL of aripiprazole solution. Solution should be clear and colorless; do not administer solutions that are discolored or contain a precipitate.

## Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for the next dose.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness and lightheadedness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

## Evaluation/Desired Outcomes

- Decrease in excitable, paranoic, or withdrawn behavior.
- Decrease incidence of mood swings in patients with bipolar disorders.
- Increased sense of well-being in patients with depression.
- Decreased agitation associated with schizophrenia or bipolar disorder.

# asenapine (a-sen-a-peen)

Saphris

***Classification***

Therapeutic: antipsychotics, mood stabilizers

Pharmacologic: dibenzo-oxepino pyrroles

**Pregnancy Category C**

## Indications

Acute treatment of schizophrenia. Acute treatment of manic/mixed episodes associated with bipolar I disorder.

## Action

May act through combined antagonism of dopaminergic ($D_2$) and 5-$HT_{2A}$ receptors. **Therapeutic Effects:** Decreased symptoms of acute schizophrenia and mania/mixed episodes of bipolar I disorder.

## Pharmacokinetics

**Absorption:** 35% absorbed following sublingual administration.

**Distribution:** Rapidly distributed throughout the body. Vd is approximately 20–25 L/kg: 95% bound to plasma proteins.

**Metabolism and Excretion:** Highly metabolized; primarily by CYP1A2 and UGTA14 enzyme systems 50% excreted in urine, 40% in feces, primarily as metabolites.

**Half-life:** 24 hr.

TIME/ACTION PROFILE (anitpsychotic effect))

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| SL | unknown | 0.5–1.5 hr† | 12–24 hr |

† Blood levels.

## Contraindications/Precautions

**Contraindicated in:** Dementia-related psychoses; Severe hepatic impairment; Lactation: Avoid use during lactation.

**Use Cautiously in:** History of cardiac arrhythmias, congenital QT prolongation, electrolyte abnormalities (especially hypomagnesemia or hypokalemia; correct prior to use) or concurrent use of medications known to prolong the QTc interval; may ↑ risk of life-threatening arrhythmias; History of seizures or conditions/medications known to ↓ seizure threshhold; History of leukopenia/neutropenia; Strenuous exercise, exposure to extreme heat, concurrent medications with anticholinergic activity, or risk of dehydration; Geri: ↑

risk of adverse reactions; consider age-related ↓ in hepatic function, cardiovascular status, and concurrent medications; History of suicide attempt; Geri: ↑ risk of mortality in elderly patients treated for dementia-related psychosis; OB: Use only when potential benefit justifies the potential risk; Pedi: safe and effective use has not been established.

### Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, akathisia, dizziness, drowsiness, extrapyramidal symptoms, anxiety, fatigue, syncope, tardive dyskinesia. **CV:** bradycardia, orthostatic hypotension, QTc prolongation, tachycardia. **GI:** oral hypoesthesia, dry mouth, dyspepsia. **Endo:** hyperglycemia, hyperprolactinemia. **Metab:** weight gain, ↑ appetite.

### Interactions

**Drug-Drug:** Concurrent use of **drugs known to prolong QTc** including **Class 1A antiarrhythmics** such as **quinidine** and **procainamide** or **Class 3 antiarrhythmics** including **amiodarone** and **sotalol** or other **antipsychotics** including **ziprasidone**, **chlorpromazine** or **thioridazine** or certain **antibiotics** such as **gatifloxacin** or **moxifloxacin**; may ↑ risk of torsade de pointes and/or sudden death. Concurrent use should be avoided. **Fluvoxamine**, a strong inhibitor of CYP1A2, ↑ levels and risk of toxicity; use cautiously. Similar effects may occur with **paroxetine**, a CYP2D6 substrate and inhibitor . Drugs having similar properties (**substrates/inhibitors of CYP2D6**) should also be used cautiously with asenapine. ↑ risk of CNS depression with other **CNS depressants** including **antihistamines**, some **antidepressants**, **sedative/hypnotics**, and **alcohol**.

### Route/Dosage

**SL (Adults):** *Schizophrenia*—5 mg twice daily ; *Bipolar Disorder*—10 mg twice daily, may be decreased to 5 mg twice daily if tolerated poorly.

### Availability

**Sublingual tablets:** 5 mg, 10 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Assess for suicidal tendencies. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs.
- Assess weight and BMI initially and throughout therapy.
- Monitor blood pressure (sitting, standing, lying) and pulse before and periodically during therapy.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, masklike face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout therapy. Report these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or wormlike movements of tongue). Notify health care professional immediately if these symptoms occur, as these side effects may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Discontinue asenapine and notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- ***Lab Test Considerations:*** Obtain fasting blood glucose and cholesterol levels initially and periodically during therapy.
- Monitor CBC frequently during initial months of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Monitor patients with neutropenia for fever or other symptoms of infection and treat promptly. Discontinue therapy if ANC $<1000/mm^3$ occurs.
- May cause transient ↑ in serum ALT.

### Potential Nursing Diagnoses

Disturbed thought process (Indications)

### Implementation

- **SL:** Open packet immediately before use by firmly pressing thumb button and pulling out tablet pack. Do not push tablet through or cut or tear tablet pack. Peel back colored tab and gently remove tablet. Place tablet under tongue and allow to dissolve completely; dissolves in saliva within seconds. Avoid eating or drinking

for 10 min after administration. Slide tablet pack back into case until it clicks.

## Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for the next dose.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Caution patient to notify health care professional before taking other Rx, OTC, or herbal products and to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient that extremes in temperature should be avoided, because this drug impairs body temperature regulation.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected and to avoid breastfeeding during therapy.
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy as indicated.

## Evaluation/Desired Outcomes

- Decrease in excitable, paranoic, or withdrawn behavior.
- Decrease incidence of mood swings in patients with bipolar disorders.
- Decreased agitation associated with schizophrenia or bipolar disorder.

HIGH ALERT

# asparaginase

(a-**spare**-a-ji-nase)

Elspar, Kidrolase

***Classification***

Therapeutic: antineoplastics

Pharmacologic: enzymes

**Pregnancy Category C**

## Indications

Part of combination chemotherapy in the treatment of acute lymphocytic leukemia (ALL).

## Action

Catalyst in the conversion of asparagine (an amino acid) to aspartic acid and ammonia. Depletes asparagine in leukemic cells. **Therapeutic Effects:** Death of leukemic cells.

## Pharmacokinetics

**Absorption:** Is absorbed from IM sites.
**Distribution:** Remains in the intravascular space. Poor penetration into the CSF.
**Metabolism and Excretion:** Slowly sequestered in the reticuloendothelial system.
**Half-life:** IV: 8–30 hr; IM: 39–49 hr.

TIME/ACTION PROFILE (depletion of asparagine)

| ROUTE | ONSET | PEAK† | DURATION |
|---|---|---|---|
| IM | immediate | 14–24 hr | 23–33 days |
| IV | immediate | unknown | 23–33 days |

†Plasma levels of asparaginase

## Contraindications/Precautions

**Contraindicated in:** Previous hypersensitivity; Lactation: May cause unwanted effects in the nursing infant.
**Use Cautiously in:** History of hypersensitivity reactions; Severe liver disease; Renal or pancreatic disease; CNS depression; Clotting abnormalities; Chronic debilitating illnesses; OB: Use only if the potential benefit justifies the potential risk to the fetus.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, agitation, coma, confusion, depression, dizziness, fatigue, hallucinations, headache, irritability, somnolence. **GI:** nausea, vomiting, anorexia, cramps, hepatotoxicity, pancreatitis, weight loss. **Derm:** rashes, urticaria. **Endo:** hyperglycemia. **Hemat:** coagulation abnormalities, transient bone marrow depression.

**Metab:** hyperammonemia, hyperuricemia. **Misc:** hypersensitivity reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug:** May negate the antineoplastic activity of **methotrexate**. May enhance the hepatotoxicity of other **hepatotoxic drugs**. Concurrent IV use with or immediately preceding **vincristine** and **prednisone** may result in ↑ neurotoxicity and hyperglycemia. May alter the response to **live vaccines** (↓ antibody response, ↑ risk of adverse reactions).

### Route/Dosage

Various other regimens may be used.

### Multiple-Agent Induction Regimen (in Combination with Vincristine and Prednisone)

**IV (Children):** 1000 IU/kg/day for 10 successive days beginning on day 22 of regimen.
**IM (Children):** 6000 IU/m² on days 4, 7, 10, 13, 16, 19, 22, 25, 28.

### Single-Agent Therapy for Acute Lymphocytic Leukemia

**IV (Adults and Children):** 200 IU/kg daily for 28 days.

### Desensitization Regimen

**IV (Adults and Children):** Administer 1 IU, then double dose every 10 min until total dose for that day has been given or reaction occurs.

### Test Dose

**Intradermal (Adults and Children):** 2 IU.

### Availability

**Injection:** 10,000-IU vial (with mannitol).

## NURSING IMPLICATIONS

### Assessment

- Monitor vital signs before and frequently during therapy. Inform physician if fever or chills occur.
- Monitor intake and output. Notify physician of significant discrepancies. Encourage patient to drink 2000–3000 mL/day to promote excretion of uric acid. Allopurinol and alkalinization of the urine may be used to prevent urate stone formation.
- Monitor for hypersensitivity reaction (urticaria, diaphoresis, facial swelling, joint pain, hypotension, bronchospasm). Epinephrine and resuscitation equipment should be readily available. Reaction may occur up to 2 hr after administration. If patient requires continued therapy, pegaspargase is an alternative.
- Assess nausea, vomiting, and appetite. Weigh weekly. An antiemetic may be given before administration.
- Monitor effect and neurologic status. Notify physician if depression, drowsiness, or hallucinations occur. Symptoms usually resolve 2–3 days after drug is discontinued.
- ***Lab Test Considerations:*** Monitor CBC before and periodically throughout therapy. May alter coagulation studies. Platelets, PT, PTT, and thrombin time may be ↑. May cause ↑ BUN.
- Hepatotoxicity may be manifested by ↑ AST, ALT, alkaline phosphatase, bilirubin, or cholesterol. Liver function test results usually return to normal after therapy. May cause pancreatitis; monitor frequently for ↑ amylase or glucose.
- Monitor blood glucose during therapy. May cause hyperglycemia treatable with fluids and insulin. May be fatal.
- May cause ↑ serum and urine uric acid concentrations.
- May interfere with thyroid function tests.

### Potential Nursing Diagnoses

Risk for injury (Side Effects)
Risk for infection (Side Effects)

### Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order and dose calculations. Do not confuse asparaginase with pegaspargase.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers. See Appendix L.
- If coagulopathy develops, apply pressure to venipuncture sites; avoid IM injections.
- **Test Dose:** Intradermal test dose must be performed before initial dose; doses must be separated by more than 1 wk. Reconstitute vial with 5 mL of sterile water for injection or 0.9% NaCl for injection (without preservatives). Add 0.1 mL of this 2000-IU/mL solution to 9.9 mL additional diluent to yield a 20-IU/mL solution. Inject 0.1 mL (2 IU) intradermally. Observe site for 1 hr for formation of wheal. Wheal is indicative of a positive reaction.
- **Desensitization Therapy:** Begin by administering 1 IU intravenously. Double dose every 10 min if hypersensitivity does not occur until full daily dose is administered.

- **IM:** Prepare for IM dose by adding 2 mL of 0.9% NaCl for injection (without preservatives) to the 10,000-IU vial. Shake vial gently. Administer no more than 2 mL per injection site.

**IV Administration**

- **Direct IV:** ***Diluent:*** Prepare *Elspar* IV dose by diluting 10,000-IU vial with 5 mL of sterile water for injection or 0.9% NaCl (without preservatives). If gelatinous fibers are present, administration through a 5-micron filter will not alter potency. Administration through a 0.2-micron filter may cause loss of potency. Solution should be clear after reconstitution. Discard if cloudy. Stable for 8 hr if refrigerated. Prepare *Kidrolase* for IM or IV administration by adding 4 mL sterile water to 10,000 IU vial and rotate gently to dissolve. Unused reconstituted solution is stable for 14 days if refrigerated. May be further diluted with 0.9% NaCl or D5W. ***Concentration:*** Dilute doses in 50–250 mL of diluent. ***Rate:*** Administer through Y-site of rapidly flowing IV of D5W or 0.9% NaCl over 30–60 min. Maintain IV infusion for 2 hr after dose.
- **Y-Site Compatibility:** methotrexate, sodium bicarbonate.
- **Additive Incompatibility:** Information unavailable. Do not admix with other drugs.

## Patient/Family Teaching

- Instruct patient to notify health care professional if abdominal pain, severe nausea and vomiting, jaundice, fever, chills, sore throat, bleeding or bruising, excess thirst or urination, or mouth sores occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor, and to be especially careful to avoid falls. Patients should also be cautioned not to drink alcoholic beverages or take medication containing aspirin or NSAIDs because these may precipitate gastric bleeding.
- Advise both men and women not to conceive a child while taking asparaginase. Barrier methods of contraception are recommended.
- Instruct patient not to receive any vaccinations without advice of health care professional. Advise parents that this may alter immunization schedule.
- Emphasize need for periodic lab tests to monitor for side effects.

## Evaluation/Desired Outcomes

- Improvement of hematologic status in patients with leukemia.

## aspirin, See SALICYLATES.

## atazanavir (a-ta-zan-a-veer)

Reyataz

***Classification***

Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors

**Pregnancy Category B**

## Indications

HIV infection (with other antiretrovirals).

## Action

Inhibits the action of HIV protease, preventing maturation of virions. **Therapeutic Effects:** ↑ CD4 cell counts and ↓ viral load with subsequent slowed progression of HIV and its sequelae.

## Pharmacokinetics

**Absorption:** Rapidly absorbed ( ↑ by food).
**Distribution:** Enters cerebrospinal fluid and semen.
**Metabolism and Excretion:** 80% metabolized (CYP3A); 13% excreted unchanged in urine.
**Half-life:** 7 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 2.5 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe hepatic impairment; Concurrent use of ergotamine, ergonovine, dihydroergotamine, methylergonovine, midazolam, pimozide, triazolam, rifampin, irinotecan, lovastatin, simvastatin, indinavir, proton-pump inhibitors (for treatment-experienced patients), efavirenz (for treatment-experienced patients), or St. John's wort; Pedi: ↑ risk of kernicterus in infants <3 mo.
**Use Cautiously in:** Mild to moderate hepatic impairment; Pre-existing conduction system disease (marked first-degree AV block or second- or third-degree AV block) or concurrent use of other drugs that increase the PR interval (especially those metabolized by CYP3A4, including verapamil or diltiazem); Diabetes mellitus; Hemo-

philia ( ↑ risk of bleeding); Pedi: Children <6 yr (safety not established); OB: Use only if clearly needed; Breastfeeding is not recommended if HIV-infected.

## Adverse Reactions/Side Effects

When used in combination with other antiretrovirals.

**CNS:** headache, depression, dizziness, insomnia. **CV:** ↑ PR interval, heart block. **GI:** nausea, abdominal pain, ↑ bilirubin, cholelithiasis, diarrhea, jaundice, vomiting, ↑ transaminases. **Derm:** rash. **Endo:** hyperglycemia. **Metab:** fat redistribution. **MS:** myalgia. **Misc:** fever.

## Interactions

**Drug-Drug:** Atazanavir is an inhibitor of CYP3A and UGT1A1 enzyme systems. It is also a substrate of CYP3A. ↑ levels of **ergotamine**, **ergonovine**, **dihydroergotamine**, **methylergonovine**, **midazolam**, **pimozide**, **triazolam**, **lovastatin**, **simvastatin**, and **irinotecan**; concurrent use may result in life-threatening CNS, cardiovascular, hematologic, or musculoskeletal toxicity and is contraindicated. Combination therapy with **tenofovir** may lead to ↓ virologic response and possible resistance (100 mg **ritonavir** should be added to boost blood levels and dose of atazanavir ↓ to 300 mg/day). Levels are significantly ↓ by **rifampin** and **St. John's wort**; may promote viral resistance, avoid concurrent use. Levels are significantly ↓ by **omeprazole**; do not exceed omeprazole dose of 20 mg/day when used with atazanavir and ritonavir in treatment-naive patients (should be taken at least 12 hr before atazanavir and ritonavir); should not be used in treatment-experienced patients. Concurrent use with **indinavir** may ↑ risk of hyperbilirubinemia and should be avoided. Concurrent use with **didanosine** buffered tablets will ↓ absorption and levels; give atazanavir with food 2 hr before or 1 hr after **didanosine**. **Efavirenz** ↓ levels and may promote viral resistance; 600 mg efavirenz should be given with atazanavir 400 mg/day and ritonavir 100 mg/day to counteract this effect in treatment-naive patients (should not be used with atazanavir in treatment-experienced patients). ↑ **saquinavir** levels. Levels are ↑ by **ritonavir**; ↓ atazanavir dose to 300 mg/day. **Nevirapine** may ↓ levels and atazanavir may ↑ **nevirapine** levels; avoid concurrent use. **Antacids** or **buffered medications** will ↓ absorption; atazanavir should be given 2 hr before or 1 hr after. ↑ levels of **lidocaine**, **amiodarone**, or **quinidine**; blood level monitoring is recommended. ↑ risk of bleeding with **warfarin**. ↑ of **tricyclic antidepressants**; blood level monitoring is recommended. ↑ levels of **rifabutin**; ↓ rifabutin dose by 75% (150 mg every other day or 3 times weekly). ↑ levels of **diltiazem** and its active metabolite; ↓ diltiazem dose by 50% and ECG monitoring recommended. Similar precautions may be needed with **felodipine**, **nifedipine**, **nicardipine**, and **verapamil**. ↑ levels of **fluticasone**; consider alternative therapy; should not be used when atazanavir used with ritonavir. ↓ levels of **voriconazole** when atazanavir is used with ritonavir; avoid concurrent use. **Voriconazole** may also ↑ levels of atazanavir (when used without ritonavir). ↑ levels of **ketoconazole** or **itraconazole** when atazanavir is used with ritonavir. ↑ levels of **trazodone**; ↓ dose of trazodone. ↑ levels of **sildenafil**, **vardenafil**, and **tadalafil**; ↓ **sildenafil** dose to 25 mg every 48 hr; ↓ **vardenafil** dose to 2.5 mg every 72 hr; ↓ **tadalafil** dose to 10 mg every 72 hr. Exercise caution and monitor for hypertension, visual changes, and priapism. ↑ levels and risk of myopathy from **atorvastatin** or **rosuvastatin** (use lowest dose of these agents or consider fluvastatin or pravastatin). Levels may be ↓ by **histamine $H_2$ antagonists**, promoting viral resistance; separate doses by at least 10 hr. ↑ levels of **cyclosporine**, **sirolimus**, and **tacrolimus**; monitor immunosuppressant blood levels. ↑ levels of **clarithromycin**; ↓ clarithromycin dose by 50% or consider alternative therapy. May ↓ levels of some **estrogens** found in **hormonal contraceptives**; use alternative nonhormonal method of contraception. Concurrent use of other **drugs known to ↑ PR interval** may ↑ risk of heart block.

## Route/Dosage

**PO (Adults):** *Therapy-naive*—400 mg once daily *or* 300 mg once daily with ritonavir 100 mg once daily; should be used at a dose of 300 mg once daily with ritonavir 100 mg once daily if used concomitantly with tenofovir, H2 receptor antagonist, or proton pump inhibitor; should be used at a dose of 400 mg once daily with ritonavir 100 mg once daily if used concomitantly with efavirenz. *Therapy-experienced*—300 mg once daily with ritonavir 100 mg once daily; should be used at dose of 400 mg once daily with ritonavir 100 mg once daily if used with tenofovir and a H2 receptor antagonist.

**PO (Children ≥6 yr and Therapy-Naive):** *15–24 kg*—150 mg once daily with ritonavir 80 mg once daily; *25–31 kg*—200 mg once daily with ritonavir 100 mg once daily; *32–38 kg*—250 mg once daily with ritonavir 100 mg once daily; *6–12 yr and ≥39 kg*—300 mg once daily with ritonavir

100 mg once daily; ≥*13 yr and* ≥*39 kg*— 400 mg once daily.

**PO (Children ≥6 yr and Therapy-Experienced):** *25–31 kg*— 200 mg once daily with ritonavir 100 mg once daily; *32–38 kg*— 250 mg once daily with ritonavir 100 mg once daily; ≥*39 kg*— 300 mg once daily with ritonavir 100 mg once daily.

### Renal Impairment

**PO (Adults):** *Therapy-Naive and HD*— 300 mg once daily with ritonavir 100 mg once daily; *Therapy-Experienced and HD*— contraindicated.

### Hepatic Impairment

**PO (Adults):** *Moderate hepatic impairment*— 300 mg once daily (do not use with ritonavir).

### Availability

**Capsules:** 100 mg, 150 mg, 200 mg, 300 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections throughout therapy.
- Assess for rash which can occur within initial 8 wk of therapy. Usually resolves within 2 weeks without altering therapy. Discontinue therapy if rash becomes severe.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- May cause ↑ serum amylase, lipase and hyperglycemia.
- May ↑ liver enzymes.
- May ↑ creatine kinase.
- May cause ↓ hemoglobin, neutrophils, and platelets.
- May cause ↑ in unconjugated bilirubin; reversible on discontinuation.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Administer daily with food to enhance absorption. Capsules should be swallowed whole; do not open.

### Patient/Family Teaching

- Emphasize the importance of taking atazanavir with food as directed. Advise patient to read the *Patient Information* before taking and with each Rx refill; may be updated. Atazanavir must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered, then return to regular dose schedule. If within 6 hr of next dose, omit dose and take next dose at regular time. Do not double doses.
- Instruct patient that atazanavir should not be shared with others.
- Inform patient that atazanavir does not cure HIV or prevent associated or opportunistic infections. Atazanavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the HIV virus to others. Advise patient that atazanavir may cause lipodystrophy (redistribution or accumulation of body fat) and the long-term effects of atazanavir are unknown at this time.
- Instruct patient to consult health care professional before taking other Rx, OTC, or herbal products, especially St. John's wort; interactions may be fatal.
- May cause dizziness. Caution patient to notify health care professional if this occurs and to avoid driving and other activities requiring alertness until response to medication is known.
- Notify health care professional immediately if yellowing of eyes, change in heart rhythm, or high blood sugar occur.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Instruct females using hormonal contraceptives to use an alternative nonhormonal method of contraception. Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding. If pregnant patient is exposed to atazanavir, register patient in *Antiretroviral Pregnancy Registry* by calling 1-800-258-4263.

### Evaluation/Desired Outcomes

- Delayed progression of HIV and decreased opportunistic infections in patients with HIV.

- Decrease in viral load and increase in CD4 cell counts.

**atenolol** (a-**ten**-oh-lole)
Apo-Atenolol, Novo-Atenolol, Tenormin

***Classification***
Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

**Pregnancy Category D**

## Indications
Management of hypertension. Management of angina pectoris. Prevention of MI.

## Action
Blocks stimulation of $beta_1$(myocardial)-adrenergic receptors. Does not usually affect $beta_2$(pulmonary, vascular, uterine)-receptor sites. **Therapeutic Effects:** Decreased blood pressure and heart rate. Decreased frequency of attacks of angina pectoris. Prevention of MI.

## Pharmacokinetics
**Absorption:** 50–60% absorbed after oral administration.
**Distribution:** Minimal penetration of CNS. Crosses the placenta and enters breast milk.
**Metabolism and Excretion:** 40–50% excreted unchanged by the kidneys; remainder excreted in feces as unabsorbed drug.
**Half-life:** 6–9 hr.

TIME/ACTION PROFILE (cardiovascular effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 hr | 2–4 hr | 24 hr |

## Contraindications/Precautions
**Contraindicated in:** Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
**Use Cautiously in:** Renal impairment (dosage reduction recommended if CCr ≤35 mL/min); Hepatic impairment; Geriatric patients (increased sensitivity to beta blockers; initial dosage reduction recommended); Pulmonary disease (including asthma; beta selectivity may be lost at higher doses); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); OB: Crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Lactation, Pedi: Safety not established.

## Adverse Reactions/Side Effects
**CNS:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, CHF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, liver function abnormalities, nausea, vomiting. **GU:** erectile dysfunction, decreased libido, urinary frequency. **Derm:** rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

## Interactions
**Drug-Drug: General anesthesia**, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid** administration may decrease effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May decrease the effectiveness of **theophylline**. May decrease the beneficial $beta_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

## Route/Dosage
**PO (Adults):** *Antianginal*—50 mg once daily; may be increased after 1 wk to 100 mg/day (up to 200 mg/day). *Antihypertensive*—25–50 mg once daily; may be increased after 2 wk to 50–100 mg once daily. *MI*—50 mg, then 50 mg 12 hr later, then 100 mg/day as a single dose or in 2 divided doses for 6–9 days or until hospital discharge.

### Renal Impairment
**PO (Adults):** *CCr 15–35 mL/min*—dosage should not exceed 50 mg/day; *CCr <15 mL/min*—dosage should not exceed 50 mg every other day.

## Availability (generic available)
**Tablets:** 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg $11.99/90, 50 mg $12.99/90, 100 mg $15.89/90. ***In combination with:*** chlorthalidone (Tenoretic). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, ECG, and pulse frequently during dosage adjustment period and periodically throughout therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- **Angina:** Assess frequency and characteristics of angina periodically throughout therapy.
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify physician immediately if these signs occur.

### Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Take apical pulse before administering drug. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.

### Patient/Family Teaching

- Instruct patient to take atenolol as directed at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may cause life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly and to report significant changes.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Caution patient that atenolol may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any OTC medications, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block sweating as a sign of hypoglycemia.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Reduction in frequency of angina.
- Increase in activity tolerance.
- Prevention of MI.

## atomoxetine

(a-to-**mox**-e-teen)
Strattera

***Classification***

Therapeutic: agents for attention deficit disorder
Pharmacologic: selective norepinephrine reuptake inhibitors

**Pregnancy Category C**

### Indications

Attention-Deficit/Hyperactivity Disorder (ADHD).

## Action
Selectively inhibits the presynaptic transporter of norepinephrine. **Therapeutic Effects:** Increased attention span.

## Pharmacokinetics
**Absorption:** Well absorbed following oral administration.
**Distribution:** Unknown.
**Protein Binding:** 98%.
**Metabolism and Excretion:** Mostly metabolized by the liver (CYP2D6 enzyme pathway). A small percentage of the population are poor metabolizers and will have higher blood levels with ↑ effects.
**Half-life:** 5 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1–2 hr | 12–24 hr |

## Contraindications/Precautions
**Contraindicated in:** Concurrent or within 2 wk therapy with MAO inhibitors; Angle-closure glaucoma.
**Use Cautiously in:** Hypertension, tachycardia, cardiovascular or cerebrovascular disease; Pre-existing psychiatric illness; May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; Concurrent albuterol or vasopressors (↑ risk of adverse cardiovascular reactions); OB: Use only if benefits outweigh risks to fetus; Lactation, Pedi: Safety not established.

## Adverse Reactions/Side Effects
**CNS:** SUICIDAL THOUGHTS, dizziness, fatigue, mood swings, behavioral disturbances, hallucinations, mania, thought disorder; *Adults*, insomnia. **CV:** hypertension, orthostatic hypotension, syncope, tachycardia. **GI:** dyspepsia, severe liver injury (rare), nausea, vomiting; *Adults*, dry mouth, constipation. **Derm:** rash, urticaria. **GU:** *Adults*—dysmenorrhea, ejaculatory problems, ↓ libido, erectile dysfunction, urinary hesitation, urinary retention. **Metab:** ↓ appetite, weight/growth loss. **Misc:** allergic reactions including ANGIONEUROTIC EDEMA.

## Interactions
**Drug-Drug:** Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions (do not use within 2 wk of each other). ↑ risk of cardiovascular effects with **albuterol** or **vasopressors** (use cautiously). **Drugs which inhibit the CYP2D6 enzyme pathway (quinidine, fluoxetine, paroxetine)** will increase blood levels and effects, dose ↓ recommended.

## Route/Dosage
**PO (Children and adolescents <70 kg):** 0.5 mg/kg/day initially, may be ↑ every 3 days to a daily target dose of 1.2 mg/kg, given as a single dose in the morning or evenly divided doses in the morning and late afternoon/early evening (not to exceed 1.4 mg/kg/day or 100 mg/day whichever is less). *If taking concurrent CYP2D6 inhibitor (quinidine, fluoxetine, paroxetine)*—0.5 mg/kg/day initially, may ↑ if needed to 1.2 mg/kg/day after 4 wk.
**PO (Adults, adolescents, and children >70 kg):** 40 mg/day initially, may be ↑ every 3 days to a daily target dose of 80 mg/day given as a single dose in the morning or evenly divided doses in the morning and late afternoon/early evening; may be further ↑ after 2–4 wk up to 100 mg/day. *If taking concurrent CYP2D6 inhibitor (quinidine, fluoxetine, paroxetine)*—40 mg/day initially, may ↑ if needed to 80 mg/day after 4 wk.

### Hepatic Impairment
**PO (Adults and Children):** *Moderate hepatic impairment (Child-Pugh Class B)*— ↓ initial and target dose by 50%; *Severe hepatic impairment (Child-Pugh Class C)*— ↓ initial and target dose to 25% of normal.

## Availability
**Capsules:** 10 mg, 18 mg, 25 mg, 40 mg, 60 mg, 80 mg, 100 mg. **Cost:** 10 mg $368.58/90, 18 mg $433.13/90, 25 mg $369.98/90, 40 mg $389.95/90, 60 mg $389.95/90, 80 mg $435.93/90, 100 mg $439.96/90.

# NURSING IMPLICATIONS

## Assessment
- Assess attention span, impulse control, and interactions with others.
- Monitor blood pressure and pulse periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- Monitor growth, body height, and weight in children.
- Assess for signs of liver injury (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained "flu-like" symptoms) during

therapy. Monitor liver function tests at first sign of liver injury. Discontinue and do not restart atomoxetine in patients with jaundice or laboratory evidence of liver injury.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.

### Potential Nursing Diagnoses
Disturbed thought process (Indications)
Impaired social interaction (Indications)

### Implementation
- **PO:** Administer without regard to food. Capsules should be swallowed whole; do not open, crush, or chew. Doses may be discontinued without tapering.

### Patient/Family Teaching
- Instruct patient to take medication as directed. Take missed doses as soon as possible, but should not take more than the total daily amount in any 24-hr period. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill.
- Inform patient that sharing this medication may be dangerous.
- Advise patient to notify health care professional immediately if signs of liver injury occur.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Caution patient to consult health care professional prior to taking other Rx, OTC, dietary supplements, or herbal products.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if they are breastfeeding.
- Pedi: Advise parents to notify school nurse of medication regimen.

### Evaluation/Desired Outcomes
- Improved attention span and social interactions in ADHD.

## atorvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

## atovaquone (a-toe-va-kwone)
Mepron

***Classification***
Therapeutic: anti-infectives

**Pregnancy Category C**

### Indications
Treatment of mild to moderate *Pneumocystis jirovecii* pneumonia (PCP) in patients who are unable to tolerate trimethoprim/sulfamethoxazole. Prophylaxis of *PCP*.

### Action
Inhibits the action of enzymes necessary to nucleic acid and ATP synthesis. **Therapeutic Effects:** Active against *P. jirovecii*.

### Pharmacokinetics
**Absorption:** Absorption is poor but is increased by food, particularly fat.
**Distribution:** Enters CSF in very low concentrations (<1% of plasma levels).
**Protein Binding:** >99.9%.
**Metabolism and Excretion:** Undergoes enterohepatic recycling; elimination occurs in feces.
**Half-life:** 2.2–2.9 days.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1–8 hr; 24–96 hr† | 12 hr |

†Two peaks are due to enterohepatic recycling.

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Lactation: May appear in breast milk.
**Use Cautiously in:** ↓ hepatic, renal, or cardiac function (dose modification may be necessary); GI disorders (absorption may be limited); OB: Safety not established; Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** headache, insomnia. **Resp:** cough. **GI:** diarrhea, nausea, vomiting. **Derm:** rash. **Misc:** fever.

### Interactions
**Drug-Drug:** May interact with **drugs that are highly bound to plasma proteins** (does not appear to interact with phenytoin).

**Drug-Food: Food** ↑ absorption.

### Route/Dosage

### Treatment

**PO (Adults):** 750 mg twice daily for 21 days.
**PO (Children):** 40 mg/kg/day (unlabeled).

### Prevention

**PO (Adults and Adolescents 13–16 yr):** 1500 mg once daily.

### Availability

**Suspension:** 750 mg/5 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for signs of infection (vital signs, lung sounds, sputum, WBCs) at beginning of and throughout therapy.
- Obtain specimens prior to initiating therapy. First dose may be given before receiving results.
- ***Lab Test Considerations:*** Monitor hematologic and hepatic functions. May cause mild, transient anemia and neutropenia. May also cause ↑ serum amylase, AST, ALT, and alkaline phosphatase.
- Monitor electrolytes. May cause hyponatremia.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

- **PO:** Administer with food twice daily for 21 days for treatment and once daily for prevention.

### Patient/Family Teaching

- Instruct patient to take atovaquone exactly as directed around the clock for the full course of therapy, even if feeling better. Emphasize the importance of taking atovaquone with food, especially foods high in fat; taking without food may decrease plasma concentrations and effectiveness.
- Advise patient to notify health care professional if rash occurs.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection.

## atropine† (at-ro-peen)

Atro-Pen

***Classification***
Therapeutic: antiarrhythmics
Pharmacologic: anticholinergics, antimuscarinics

**Pregnancy Category C**

†See Appendix C for ophthalmic use

### Indications

**IM:** Given preoperatively to decrease oral and respiratory secretions. **IV:** Treatment of sinus bradycardia and heart block. **PO:** Adjunctive therapy in the management of peptic ulcer and irritable bowel syndrome. **IV:** Reversal of adverse muscarinic effects of anticholinesterase agents (neostigmine, physostigmine, or pyridostigmine). **IM, IV:** Treatment of anticholinesterase (organophosphate pesticide) poisoning. **Inhaln:** Treatment of exercise-induced bronchospasm.

### Action

Inhibits the action of acetylcholine at postganglionic sites located in: Smooth muscle, Secretory glands , CNS (antimuscarinic activity). Low doses decrease: Sweating, Salivation, Respiratory secretions. Intermediate doses result in: Mydriasis (pupillary dilation), Cycloplegia (loss of visual accommodation), Increased heart rate. GI and GU tract motility are decreased at larger doses. **Therapeutic Effects:** Increased heart rate. Decreased GI and respiratory secretions. Reversal of muscarinic effects. May have a spasmolytic action on the biliary and genitourinary tracts.

### Pharmacokinetics

**Absorption:** Well absorbed following oral, subcut, or IM administration.
**Distribution:** Readily crosses the blood-brain barrier. Crosses the placenta and enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver; 30–50% excreted unchanged by the kidneys.
**Half-life:** Children <2 yr: 4–10 hr; Children >2 yr: 1.5–3.5 hr; Adults: 4–5 hr.

TIME/ACTION PROFILE (inhibition of salivation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | 30–60 min | 4–6 hr |
| IM, subcut | rapid | 15–50 min | 4–6 hr |
| IV | immediate | 2–4 min | 4–6 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Angle-closure glaucoma; Acute hemorrhage; Tachycardia secondary to cardiac insufficiency or thyrotoxicosis; Obstructive disease of the GI tract.

**Use Cautiously in:** Intra-abdominal infections; Prostatic hyperplasia; Chronic renal, hepatic, pulmonary, or cardiac disease; OB, Lactation: Safety not established; IV administration may produce fetal tachycardia; Pedi: Infants with Down syndrome have increased sensitivity to cardiac effects and mydriasis. Children may have increased susceptibility to adverse reactions. Exercise care when prescribing to children with spastic paralysis or brain damage; Geri: Increased susceptibility to adverse reactions.

### Adverse Reactions/Side Effects

**CNS:** drowsiness, confusion, hyperpyrexia. **EENT:** blurred vision, cycloplegia, photophobia, dry eyes, mydriasis. **CV:** tachycardia, palpitations, arrhythmias. **GI:** dry mouth, constipation, impaired GI motility. **GU:** urinary hesitancy, retention, impotency. **Resp:** tachypnea, pulmonary edema. **Misc:** flushing, decreased sweating.

### Interactions

**Drug-Drug:** ↑ anticholinergic effects with other **anticholinergics**, including **antihistamines**, **tricyclic antidepressants**, **quinidine**, and **disopyramide**. Anticholinergics may alter the absorption of other **orally administered drugs** by slowing motility of the GI tract. **Antacids** ↓ absorption of **anticholinergics**. May ↑ GI mucosal lesions in patients taking oral **potassium chloride** tablets. May alter response to **beta-blockers**.

### Route/Dosage

### Preanesthesia (To Decrease Salivation/Secretions)

**IM, IV, Subcut, PO (Adults):** 0.4–0.6 mg 30–60 min pre-op.
**IM, IV, Subcut, PO (Children > 5 kg):** 0.01–0.02 mg/kg/dose 30–60 min preop to a maximum of 0.4 mg/dose; minimum: 0.1 mg/dose.
**IM, IV, Subcut, PO (Children < 5 kg):** 0.02 mg/kg/dose 30–60 min preop then q 4–6 hr as needed.

### Bradycardia

**IV (Adults):** 0.5–1 mg; may repeat as needed q 5 min, not to exceed a total of 2 mg (q 3–5 min in Advanced Cardiac Life Support guidelines) or 0.04 mg/kg (total vagolytic dose).
**IV (Children):** 0.02 mg/kg (maximum single dose is 0.5 mg in children and 1 mg in adolescents); may repeat q 5 min up to a total dose of 1 mg in children (2 mg in adolescents).
**Endotracheal (Children):** use the IV dose and dilute before administration.

### Reversal of Adverse Muscarinic Effects of Anticholinesterases

**IV (Adults):** 0.6–12 mg for each 0.5–2.5 mg of neostigmine methylsulfate or 10–20 mg of pyridostigmine bromide concurrently with anticholinesterase.

### Organophosphate Poisoning

**IM (Adults):** 2 mg initially, then 2 mg q 10 min as needed up to 3 times total.
**IV (Adults):** 1–2 mg/dose q 10–20 min until atropinic effects observed then q 1–4 hr for 24 hr; up to 50 mg in first 24 hr and 2 g over several days may be given in severe intoxication.
**IM (Children >10 yr >90 lbs):** 2 mg.
**IM (Children 4–10 yr 40–90 lbs):** 1 mg.
**IM (Children 6 mo–4 yr 15–40 lbs):** 0.5 mg.
**IV (Children):** 0.02–0.05 mg/kg q 10–20 min until atropinic effects observed then q 1–4 hr for 24 hr.

### Bronchospasm

**Inhaln (Adults):** 0.025–0.05 mg/kg/dose q 4–6 hr as needed; maximum 2.5 mg/dose.
**Inhaln (Children):** 0.03–0.05 mg/kg/dose 3–4 times/day; maximum 2.5 mg/dose.

### Availability (generic available)

**Tablets:** 0.4 mg. ***In combination with:*** phenobarbital oral solution (Antrocol). See Appendix B. **Injection:** 0.05 mg/mL, 0.1 mg/mL, 0.4 mg/mL, 1 mg/mL, 0.5 mg/0.7 mL Auto-injector, 1 mg/0.7 mL Auto-injector, 2 mg/0.7 mL Auto-injector.

## NURSING IMPLICATIONS

### Assessment

- Assess vital signs and ECG tracings frequently during IV drug therapy. Report any significant changes in heart rate or blood pressure, or increased ventricular ectopy or angina to physician promptly.
- Monitor intake and output ratios in elderly or surgical patients because atropine may cause urinary retention.
- Assess patients routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate constipation.
- ***Toxicity and Overdose:*** If overdose occurs, physostigmine is the antidote.

## Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Impaired oral mucous membrane (Side Effects)
Constipation (Side Effects)

## Implementation

- **PO:** Oral doses of atropine may be given without regard to food.
- **IM:** Intense flushing of the face and trunk may occur 15–20 min following IM administration. In children, this response is called "atropine flush" and is not harmful.

### IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Rate:*** Administer over 1 min; more rapid administration may be used during cardiac resuscitation (follow with 20 mL saline flush). Slow administration (over >1 min) may cause a paradoxical bradycardia (usually resolved in approximately 2 min).
- **Y-Site Compatibility:** abciximab, amikacin, aminophylline, amiodarone, argatroban, buprenorphine, butorphanol, etomidate, famotidine, fenoldopam, fentanyl, heparin, hydrocortisone sodium succinate, hydromorphone, inamrinone, meropenem, methadone, morphine, nafcillin, potassium chloride, sufentanil, tirofiban, vitamin B complex with C.
- **Y-Site Incompatibility:** thiopental.
- **Endotracheal:** Dilute with 5–10 mL of 0.9% NaCl.
- ***Rate:*** Inject directly into the endotracheal tube followed by several positive pressure ventilations.

## Patient/Family Teaching

- Instruct patient to take as directed. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- May cause drowsiness. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient that oral rinses, sugarless gum or candy, and frequent oral hygiene may help relieve dry mouth.
- Caution patients that atropine impairs heat regulation. Strenuous activity in a hot environment may cause heat stroke.
- Instruct patient to consult health care professional before taking any OTC medications or herbal products concurrently with atropine.
- Pedi: Instruct parents or caregivers that medication may cause fever and to notify health care professional before administering to a febrile child.
- Geri: Inform male patients with benign prostatic hyperplasia that atropine may cause urinary hesitancy and retention. Changes in urinary stream should be reported to health care professional.

## Evaluation/Desired Outcomes

- Increase in heart rate.
- Dryness of mouth.
- Reversal of muscarinic effects.

# azacitidine (a-za-**sye**-ti-deen)

Vidaza

***Classification***

Therapeutic: antineoplastics
Pharmacologic: nucleoside analogues

**Pregnancy Category D**

## Indications

Myelodysplastic syndromes including: some refractory anemias, chronic myelomonocytic leukemia.

## Action

Inhibits DNS synthesis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

## Pharmacokinetics

**Absorption:** Rapidly absorbed following subcutaneous administration; 89% bioavailable.
**Distribution:** Unknown.
**Metabolism and Excretion:** 85% excreted in urine; some hepatic metabolism may occur. Less than 1% fecal elimination.
**Half-life:** 4 hr.

TIME/ACTION PROFILE (effects on bone marrow)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | unknown | unknown | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Advanced malignant hepatic tumors; OB: Potential for congenital anomalies; Lactation: Potential for serious side effects in infants.
**Use Cautiously in:** Renal impairment; Liver disease; OB: Patients with child-bearing potential (male and female) due to potential fetal harm; Pedi: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** fatigue. **GI:** HEPATOTOXICITY, constipation, diarrhea, nausea, vomiting. **GU:** nephrotoxicity, renal tubular acidosis. **Derm:** ecchymosis. **F and**

**E:** hypokalemia. **Hemat:** anemia, neutropenia, thrombocytopenia. **Local:** injection site erythema. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

### Interactions

**Drug-Drug:** Additive bone marrow depression may occur with other **antineoplastics**.

### Route/Dosage

**Subcut, IV (Adults):** 75 mg/m²/day for 7 days every 4 wk; may be increased to 100 mg/m²/day for 7 days every 4 wk if no beneficial effect occurs after 2 cycles. Continue for as long as patient benefits.

### Availability

**Suspension for injection (requires reconstitution):** 100 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess patient for nausea and vomiting during therapy. Premedicate patient before each dose.
- Monitor for signs of anaphylaxis (facial edema, wheezing, dizziness, fainting, tachycardia, hypotension). Discontinue medication immediately and report symptoms. Epinephrine and resuscitation equipment should be readily available.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count prior to each dosing cycle. If baseline WBC is more than 3 x $10^9$/L, ANC is more than 1.5 x $10^9$/L, and platelets are more than 75 x $10^9$/L, then dose is adjusted based on nadir counts for each cycle. If ANC is less than 0.5 x $10^9$ and platelets are less than 25 x $10^9$ then decrease dose by 50%. If ANC is 0.5–1.5 x $10^9$ and platelets are 25–50 x $10^9$ then decrease dose to 67% in next course. If ANC is greater than 1.5 x $10^9$ and platelets are greater than 50, then 100% of dose can be given in subsequent cycle.
- Obtain liver chemistries and serum creatinine prior to initiation of therapy.
- Monitor renal function during therapy. If serum bicarbonate is less than 20 mEq/L, reduce dose by 50% in next course. If unexplained ↑ in BUN or serum creatinine occur, delay next cycle until values return to normal or baseline and decrease dose by 50% in next course.
- May cause hypokalemia.

### Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Adverse Reactions)

### Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers (see Appendix L).
- **Subcut:** Reconstitute by adding 4 mL of sterile water for injection slowly into the azacitadine vial for a concentration of 25 mg/mL. Invert vial 2–3 times and rotate gently until suspension is uniform. Suspension will be cloudy. Stable for up to 1 hr at room temperature; must be administered within 1 hr of reconstitution. Suspension may also be refrigerated for up to 8 hr; may be allowed to equilibrate to room temperature for up to 30 min. Invert syringe 2–3 times and roll syringe gently between palms immediately prior to administration to mix suspension.
- Divide doses greater than 4 mL equally into 2 syringes and administer into separate sites. Rotate sites (thigh, abdomen, upper arm) with new injections at least one inch from old site. Do not use site that is bruised, tender, red, or hard.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each vial with 10 mL sterile water for injection. Shake vigorously or roll vial until all solids are dissolved. Solution should be clear; do not administer solutions that are not clear or contain particulate matter. ***Concentration:*** 10 mg/mL. Withdraw solution from required number of vials and inject into 50–100 mL of 0.9% NaCl or LR. Solution is stable for 1 hr at room temperature. ***Rate:*** Infuse over 10–40 min. Infusion must be completed within 1 hr of reconstitution.
- **Solution Incompatibility:** 5% dextrose, hespan, solutions containing bicarbonate.

## Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if they have underlying liver or renal disease.
- OB: Advise both male and female patients of the need for contraception during therapy.

## Evaluation/Desired Outcomes

- Improved bone marrow and blood counts.

# azathioprine

(ay-za-**thye**-oh-preen)

Azasan, Imuran

***Classification***

Therapeutic: immunosuppressants

Pharmacologic: purine antagonists

**Pregnancy Category D**

## Indications

Prevention of renal transplant rejection (with corticosteroids, local radiation, or other cytotoxic agents). Treatment of severe, active, erosive rheumatoid arthritis unresponsive to more conventional therapy. **Unlabeled Use:** Management of Crohn's disease.

## Action

Antagonizes purine metabolism with subsequent inhibition of DNA and RNA synthesis. **Therapeutic Effects:** Suppression of cell-mediated immunity and altered antibody formation.

## Pharmacokinetics

**Absorption:** Readily absorbed after oral administration.

**Distribution:** Crosses the placenta. Enters breast milk in low concentrations.

**Metabolism and Excretion:** Metabolized to mercaptopurine, which is further metabolized (one route is by thiopurine methyltransferase [TPMT] to form an inactive metabolite). Minimal renal excretion of unchanged drug.

**Half-life:** 3 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (anti-inflammatory) | 6–8 wk | 12 wk | unknown |
| IV (immunosuppression) | days–wk | unknown | days–wk |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent use of mycophenolate; OB: Has been shown to cause fetal harm; Lactation: Appears in breast milk .

**Use Cautiously in:** Infections; Malignancies; ↓ bone marrow reserve; Previous or concurrent radiation therapy; Other chronic debilitating illnesses; Severe renal impairment/oliguria (↑ sensitivity); Patients with TPMT enzyme deficiency (substantial dosage ↓ are required to avoid hematologic adverse events); OB: Patients with childbearing potential.

## Adverse Reactions/Side Effects

**EENT:** retinopathy. **Resp:** pulmonary edema. **GI:** anorexia, hepatotoxicity, nausea, vomiting, diarrhea, mucositis, pancreatitis. **Derm:** alopecia, rash. **Hemat:** anemia, leukopenia, pancytopenia, thrombocytopenia. **MS:** arthralgia. **Misc:** SERUM SICKNESS, chills, fever, Raynaud's phenomenon, retinopathy.

## Interactions

**Drug-Drug:** Additive myelosuppression with **antineoplastics**, **cyclosporine**, and **myelosuppressive agents**. **Allopurinol** inhibits the metabolism of azathioprine, increasing toxicity. Dose of azathioprine should be ↓ by 25–33% with concurrent allopurinol. May ↓ antibody response to **live-virus vaccines** and ↑ the risk of adverse reactions.

**Drug-Natural Products:** Concommitant use with **echinacea** and **melatonin** may interfere with immunosuppression.

## Route/Dosage

### Renal Allograft Rejection Prevention

**PO, IV (Adults and Children):** 3–5 mg/kg/day initially; maintenance dose 1–3 mg/kg/day.

### Rheumatoid Arthritis

**PO (Adults and Children):** 1 mg/kg/day for 6–8 wk, ↑ by 0.5 mg/kg/day q 4 wk until response

or up to 2.5 mg/kg/day, then ↓ by 0.5 mg/kg/day q 4–8 wk to minimal effective dose.

### Availability (generic available)

**Tablets:** 50 mg, 75 mg, 100 mg. **Injection:** 100 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs, sputum, urine, stool, WBC) during therapy.
- Monitor intake and output and daily weight. Decreased urine output may lead to toxicity with this medication.
- **Rheumatoid Arthritis:** Assess range of motion; degree of swelling, pain, and strength in affected joints; and ability to perform activities of daily living before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor renal, hepatic, and hematologic functions before beginning therapy, weekly during the 1st mo, bimonthly for the next 2–3 mo, and monthly thereafter.
- Leukocyte count of <3000 or platelet count of <100,000/mm$^3$ may necessitate a reduction in dose or temporary discontinuation.
- A ↓ in hemoglobin may indicate bone marrow suppression.
- Hepatotoxicity may be manifested by ↑ alkaline phosphatase, bilirubin, AST, ALT, and amylase concentrations. Usually occurs within 6 mo of transplant, rarely with rheumatoid arthritis, and is reversible on discontinuation of azathioprine.
- May ↓ serum and urine uric acid and plasma albumin.

### Potential Nursing Diagnoses

Risk for infection (Indications)

### Implementation

- Do not confuse Imuran (azathioprine) with IMDUR (isosorbide mononitrate). Do not confuse azaTHIOprine with azaCITIDine.
- Protect transplant patients from staff members and visitors who may carry infection. Maintain protective isolation as indicated.
- **PO:** May be administered with or after meals or in divided doses to minimize nausea.

#### IV Administration

- **IV:** Reconstitute 100 mg with 10 mL of sterile water for injection. Swirl vial gently until completely dissolved. Reconstituted solution may be administered up to 24 hr after preparation.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers (see Appendix L).
- **Direct IV:** ***Diluent:*** 0.9% NaCl, 0.45%NaCl, or D5W. ***Concentration:*** 10 mg/mL. ***Rate:*** Give over 5 min.
- **Intermittent Infusion:** ***Diluent:*** Solution may be further diluted in 50 mL with 0.9% NaCl, 0.45% NaCl, or D5W. Do not admix. ***Rate:*** Usually infused over 30–60 min; may range 5 min–8 hr.
- **Y-Site Compatibility:** alfentanil, atracurium, atropine, benztropine, calcium gluconate, cyanocobalamin, cyclosporine, enalaprilat, epoetin alfa, erythromycin, fentanyl, fluconazole, folic acid, furosemide, glycopyrrolate, heparin, insulin, mannitol, mechlorethamine, metoprolol, naloxone, nitroglycerin, oxytocin, penicillin G, potassium chloride, propranolol, protamine, sufentanil, trimetaphan, vasopressin.
- **Y-Site Incompatibility:** amikacin, ampicillin/sulbactam, ascorbic acid, aztreonam, bumetanide, buprenorphine, butorphanol, calcium chloride, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, clindamycin, dantrolene, diazepam, diazoxide, diphenhydramine, dobutamine, doxycycline, ephedrine, epinephrine, esmolol, famotidine, ganciclovir, gentamicin, haloperidol, hydralazine, hydrocortisone, hydroxyzine, imipenem/cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, lidocaine, magnesium sulfate, meperidine, metaraminol, methoxamine, methyldopate, miconazole, midazolam, morphine, multivitamins, nafcillin, nalbuphine, nitroprusside, norepinephrine, ondansetron, papaverine, pentamidine, pentazocine, phenylephrine, phenytoin, procainamide, prochlorperazine, promethazine, pyridoxime, rocuronium, sodium bicarbonate, streptokinase, succinylcholine, tacrolimus, theophylline, thiamine, tobramycin, tolazoline, trimethoprim/sulmethoxazole, vancomycin, verapamil.

### Patient/Family Teaching

- Instruct patient to take azathioprine as directed. If a dose is missed on a once-daily regimen, omit dose; if on several-times-a-day dosing, take as soon as possible or double next

dose. Consult health care professional if more than 1 dose is missed or if vomiting occurs shortly after dose is taken. Do not discontinue without consulting health care professional.
- Advise patient to report unusual tiredness or weakness; cough or hoarseness; fever or chills; lower back or side pain; painful or difficult urination; severe diarrhea; black, tarry stools; blood in urine; or transplant rejection to health care professional immediately.
- Reinforce the need for lifelong therapy to prevent transplant rejection.
- Instruct the patient to consult health care professional before taking any Rx, OTC, or herbal products, or receiving any vaccinations while taking this medication.
- Advise patient to avoid contact with persons with contagious diseases and persons who have recently taken oral poliovirus vaccine or other live viruses.
- This drug may have teratogenic properties. Advise patient to use contraception during and for at least 4 mo after therapy is completed.
- Emphasize the importance of follow-up exams and lab tests.
- **Rheumatoid Arthritis:** Concurrent therapy with salicylates, NSAIDs, or corticosteroids may be necessary. Patient should continue physical therapy and adequate rest. Explain that joint damage will not be reversed; goal is to slow or stop disease process.

### Evaluation/Desired Outcomes
- Prevention of transplant rejection.
- Decreased stiffness, pain, and swelling in affected joints in 6–8 wk in rheumatoid arthritis. Therapy is discontinued if no improvement in 12 wk.

## azithromycin
(aye-**zith**-roe-mye-sin)
Zithromax, Zmax

***Classification***
Therapeutic: agents for atypical mycobacterium, anti-infectives
Pharmacologic: macrolides

**Pregnancy Category B**

### Indications
Treatment of the following infections due to susceptible organisms: Upper respiratory tract infections, including streptococcal pharyngitis, acute bacterial exacerbations of chronic bronchitis and tonsillitis; Lower respiratory tract infections, including bronchitis and pneumonia; Acute otitis media; Skin and skin structure infections; Nongonococcal urethritis, cervicitis, gonorrhea, and chancroid. Prevention of disseminated *Mycobacterium avium* complex (MAC) infection in patients with advanced HIV infection. *Extended-release suspension (ZMax)* Acute bacterial sinusitis and community-acquired pneumonia in adults. **Unlabeled Use:** Prevention of bacterial endocarditis. Treatment of cystic fibrosis lung disease.

### Action
Inhibits protein synthesis at the level of the 50S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action against susceptible bacteria.
**Spectrum:** Active against the following gram-positive aerobic bacteria: *Staphylococcus aureus*, *Streptococcus pneumoniae*, *S. pyogenes* (group A strep). Active against these gram-negative aerobic bacteria: *Haemophilus influenzae*, *Moraxella catarrhalis*, *Neisseria gonorrhoeae*. Also active against: *Mycoplasma*, *Legionella*, *Chlamydia pneumoniae*, *Ureaplasma urealyticum*, *Borrelia burgdorferi*, *M. avium*. Not active against methicillin-resistant *S. aureus*.

### Pharmacokinetics
**Absorption:** Rapidly absorbed (40%) after oral administration. IV administration results in complete bioavailability.
**Distribution:** Widely distributed to body tissues and fluids. Intracellular and tissue levels exceed those in serum; low CSF levels.
**Metabolism and Excretion:** Mostly excreted unchanged in bile; 4.5% excreted unchanged in urine.
**Half-life:** 11–14 hr after single dose; 2–4 days after several doses; 59 hr after extended release suspension.

TIME/ACTION PROFILE (serum)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 2.5–3.2 hr | 24 hr |
| IV | rapid | end of infusion | 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to azithromycin, erythromycin, or other macrolide anti-infectives.
**Use Cautiously in:** Severe liver impairment (dose adjustment may be required); Severe renal impairment (CCr <10 mL/min); Myasthenia gravis (may worsen symptoms); OB, Lactation: Safety not established; Pedi: Safety not established in children <5 yr.

### Adverse Reactions/Side Effects

**CNS:** dizziness, seizures, drowsiness, fatigue, headache. **CV:** chest pain, hypotension, palpitations, QT prolongation (rare). **GI:** PSEUDOMEMBRANOUS COLITIS, abdominal pain, diarrhea, nausea, cholestatic jaundice, elevated liver enzymes, dyspepsia, flatulence, melena, oral candidiasis. **GU:** nephritis, vaginitis. **Hemat:** anemia, leukopenia, thrombocytopenia. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, rashes. **EENT:** ototoxicity. **F and E:** hyperkalemia. **Misc:** ANGIOEDEMA.

### Interactions

**Drug-Drug: Aluminum-** and **magnesium-containing antacids** ↓ peak levels. **Nelfinavir** ↑ levels (monitor carefully); azithromycin also ↓ nelfinavir levels. **Efavirenz** ↑ levels. May ↑ the effects and risk of toxicity of **warfarin** and **zidovudine**. Other macrolide anti-infectives have been known to ↑ levels and effects of **digoxin**, **theophylline**, **ergotamine**, **dihydroergotamine**, **triazolam**, **carbamazepine**, **cyclosporine**, **tacrolimus,** and **phenytoin**; careful monitoring of concurrent use is recommended.

### Route/Dosage

### Most Respiratory and Skin Infections

**PO (Adults):** 500 mg on 1st day, then 250 mg/day for 4 more days (total dose of 1.5 g); *Acute bacterial sinusitis*— 500 mg once daily for 3 days or single 2-g dose of extended-release suspension (Zmax).
**PO (Children ≥ 6 months):** 10 mg/kg (not >500 mg/dose) on 1st day, then 5 mg/kg (not >250 mg/dose) for 4 more days. *Pharyngitis/tonsilitis*— 12 mg/kg once daily for 5 days (not >500 mg/dose); *Acute bacterial sinusitis*— 10 mg/kg/day for three days.

### Otitis media

**PO (Children ≥6 mo):** 30 mg/kg single dose (not >1500 mg/dose) *or* 10 mg/kg/day as a single dose (not >500 mg/dose) for 3 days *or* 10 mg/kg as a single dose (not >500 mg/dose) on 1st day, then 5 mg/kg as a single dose (not >250 mg/dose) daily for 4 more days.

### Acute bacterial exacerbations of chronic bronchitis

**PO (Adults):** 500 mg on 1st day, then 250 mg/day for 4 more days (total dose of 1.5 g) *or* 500 mg daily for 3 days.

### Community-Acquired Pneumonia

**IV, PO (Adults):** *More severe*— 500 mg IV q 24 hr for at least 2 doses, then 500 mg PO q 24 hr for a total of 7–10 days; *less severe*— 500 mg PO, then 250 mg/day PO for 4 more days or 2 g single dose as extended-release suspension (Zmax).
**PO (Children >6 mo):** 10 mg/kg on 1st day, then 5 mg/kg for 4 more days.

### Pelvic Inflammatory Disease

**IV, PO (Adults):** 500 mg IV q 24 hr for 1–2 days, then 250 mg PO q 24 hr for a total of 7 days.

### Endocarditis Prophylaxis

**PO (Adults):** 500 mg 1 hr before procedure.
**PO (Children):** 15 mg/kg 1 hr before procedure.

### Nongonococcal Urethritis, Cervicitis, Chancroid, Chlamydia

**PO (Adults):** Single 1-g dose.
**PO (Children):** *Chancroid:* Single 20-mg/kg dose (not >1000 mg/dose). *Urethritis or cervicitis:* Single 10-mg/kg dose (not >1000 mg/dose).

### Gonorrhea

**PO (Adults):** Single 2-g dose.

### Prevention of Disseminated MAC Infection

**PO (Adults):** 1.2 g once weekly (alone or with rifabutin).
**PO (Children):** 5 mg/kg once daily (not >250 mg/dose) or 20 mg/kg (not >1200 mg/dose) once weekly (alone or with rifabutin).

### Cystic Fibrosis

**PO (Children ≥6 yrs, weight ≥25 kg to <40 kg):** 250 mg q MWF. ≥40 kg: 500 mg q MWF.

### Availability (generic available)

**Tablets:** 250 mg, 500 mg, 600 mg. **Cost:** *Generic*— 250 mg $15.99/6, 500 mg $44.32/3, 600 mg $399.99/30. **Powder for oral suspension (cherry, creme de vanilla, and banana flavor):** 1 g/pkt. **Cost:** $93.99/3 packets. **Powder for oral suspension (cherry, creme de vanilla, and banana flavor):** 100 mg/5 mL in 15-mL bottles, 200 mg/5 mL in 15-mL, 22.5-mL, and 30-mL bottles. **Cost:** *Zithromax*— 100 mg/5 mL $44.99/15 mL, 200 mg/5 mL $43.99/22.5 mL, 200 mg/5 mL $43.99/30 mL; *Generic*— 200 mg/5 mL $32.27/15 mL. **Extended-release oral suspension (ZMax) (cherry-banana):** 2-g

single-dose bottle. **Powder for injection:** 500 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Notify health care professional immediately if these occur.
- Assess patient for skin rash frequently during therapy. Discontinue azithromycin at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- ***Lab Test Considerations:*** May cause ↑ serum bilirubin, AST, ALT, LDH, and alkaline phosphatase concentrations.
- May cause ↑ creatine phosphokinase, potassium, prothrombin time, BUN, serum creatinine, and blood glucose concentrations.
- May occasionally cause ↓ WBC and platelet count.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- Do not confuse azithromycin with erythromycin.
- *Zmax extended release oral suspension* is not bioequivalent or interchangeable with azithromycin oral suspension.
- **PO:** Administer 1 hr before or 2 hr after meals.
- For administration of single 1-g packet, thoroughly mix entire contents of packet with 2 oz (60 mL) of water. Drink entire contents immediately; add an additional 2 oz of water, mix and drink to assure complete consumption of dose. Do not use the single packet to administer doses other than 1000 mg of azithromycin. Pedi: 1-g packet is not for pediatric use.
- For *Zmax*, shake suspension well and drink entire contents of bottle. Use within 12 hr of reconstitution. If patient vomits within 1 hr of administration, contact prescriber for instructions. *Zmax* may be taken without regard to antacids containing magnesium or aluminum hydroxide.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each 500-mg vial with 4.8 mL of sterile water for injection to achieve a concentration of 100 mg/mL. Reconstituted solution is stable for 24 hr at room temperature. Further dilute the 500-mg dose in 250 mL or 500 mL of 0.9% NaCl, 0.45% NaCl, D5W, LR, D5/0.45% NaCl, or D5/LR. Infusion is stable for 24 hr at room temperature or for 7 days if refrigerated. ***Concentration:*** Final concentration of infusion is 1–2 mg/mL. ***Rate:*** Administer the 1-mg/mL solution over 3 hr or the 2-mg/mL solution over 1 hr. Do not administer as a bolus.
- **Y-Site Compatibility:** amphotericin B liposome, bivalirudin, carboplatin, cisplatin, daptomycin, dexmedetomidine, diphenhydramine, docetaxel, dolasetron, doripenem, droperidol, ertapenem, fenoldopam, fluorouracil, hetastarch, mechlorethamine, meperidine, nesiritide, octreotide, ondansetron, oxaliplatin, oxytocin, palonosetron, pantoprazole, pemetrexed, rocuronium, sodium acetate, thiotepa, tigecycline, tirofiban, vasopressin, vincristine, voriconazole.
- **Y-Site Incompatibility:** amikacin, aztreonam, cefotaxime, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, clindamycin, epirubicin, famotidine, fentanyl, furosemide, gentamicin, imipenem-cilastatin, ketorolac, mitoxantrone, morphine, piperacillin-tazobactam, potassium chloride, quinupristin/dalfopristin, ticarcillin-clavulanate, tobramycin.

### Patient/Family Teaching

- Instruct patients to take medication as directed and to finish the drug completely, even if they are feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patients that sharing of this medication may be dangerous.
- Instruct patient not to take azithromycin with food or antacids.
- May cause drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to report symptoms of chest pain, palpitations, yellowing of skin or eyes, or signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) or rash.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially

if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without advice of health care professional.

- Advise patients being treated for nongonococcal urethritis or cervicitis that sexual partners should also be treated.
- Instruct parents, caregivers, or patient to notify health care professional if symptoms do not improve.
- Pedi: Tell parents or caregivers that medication is generally well tolerated in children. Most common side effects in children are mild diarrhea and rash. Tell parents to notify health care practitioner if these occur.

## Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

## baclofen (bak-loe-fen)

Kemstro, Lioresal

***Classification***

Therapeutic: antispasticity agents, skeletal muscle relaxants (centrally acting)

**Pregnancy Category C**

### Indications

**PO:** Treatment of reversible spasticity due to multiple sclerosis or spinal cord lesions. **IT:** Treatment of severe spasticity originating in the spinal cord. **Unlabeled Use:** Management of pain in trigeminal neuralgia.

### Action

Inhibits reflexes at the spinal level. **Therapeutic Effects:** Decreased muscle spasticity; bowel and bladder function may also be improved.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration.
**Distribution:** Widely distributed; crosses the placenta.
**Metabolism and Excretion:** 70–80% eliminated unchanged by the kidneys.
**Half-life:** 2.5–4 hr.

TIME/ACTION PROFILE (effects on spasticity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | hr–wk | unknown | unknown |
| IT | 0.5–1 hr | 4 hr | 4–8 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Orally-disintegrating tablets contain aspartame and should not be used in patients with phenylketonuria.
**Use Cautiously in:** Patients in whom spasticity maintains posture and balance; Patients with epilepsy (may ↓ seizure threshold); Renal impairment (↓ dose may be required); OB, Lactation, Pedi: Safety not established; Geri: Geriatric patients are at ↑ risk of CNS side effects.

### Adverse Reactions/Side Effects

**CNS:** SEIZURES (IT), dizziness, drowsiness, fatigue, weakness, confusion, depression, headache, insomnia. **EENT:** nasal congestion, tinnitus. **CV:** edema, hypotension. **GI:** nausea, constipation. **GU:** frequency. **Derm:** pruritus, rash. **Metab:** hyperglycemia, weight gain. **Neuro:** ataxia. **Misc:** hypersensitivity reactions, sweating.

### Interactions

**Drug-Drug:** ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Use with **MAO inhibitors** may lead to ↑ CNS depression or hypotension.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

### Route/Dosage

**PO (Adults):** 5 mg 3 times daily. May increase q 3 days by 5 mg/dose up to 80 mg/day (some patients may have a better response to 4 divided doses).
**IT (Adults):** 100–800 mcg/day infusion; dose is determined by response during screening phase.
**IT (Children):** 25–1200 mcg/day infusion (average 275 mcg/day); dose is determined by response during screening phase.

### Availability (generic available)

**Tablets:** 10 mg, 20 mg. **Cost:** *Generic*— 10 mg $78.16/270, 20 mg $137.92/270. **Orally-disintegrating tablets (Kemstro) (orange):** 10 mg, 20 mg. **Intrathecal injection:** 50 mcg/mL, 500 mcg/mL, 2000 mcg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess muscle spasticity before and periodically during therapy.
- Observe patient for drowsiness, dizziness, or ataxia. May be alleviated by a change in dose.
- **IT:** Monitor patient closely during test dose and titration. Resuscitative equipment should be immediately available for life-threatening or intolerable side effects.
- ***Lab Test Considerations:*** May cause ↑ in serum glucose, alkaline phosphatase, AST, and ALT levels.

### Potential Nursing Diagnoses

Impaired wheelchair mobility (Indications)
Risk for injury (Adverse Reactions)

### Implementation

- **PO:** Administer with milk or food to minimize gastric irritation.
- For *orally disintegrating tablets,* just prior to administration place tablet on tongue with dry hands. Tablet will disintegrate, then swallow with saliva or water. Administration with liquid is not necessary.

- **IT:** For *screening phase,* dilute for a concentration of 50 mcg/mL with sterile preservative-free NaCl for injection. Test dose should be administered over at least 1 min. Observe patient for a significant decrease in muscle tone or frequency or severity of spasm. If response is inadequate, 2 additional test doses, each 24 hr apart, 75 mcg/1.5 mL and 100 mcg/2 mL respectively, may be administered. Patients with an inadequate response should not receive chronic IT therapy.
- Dose titration for implantable IT pumps is based on patient response. If no substantive response after dose increase, check pump function and catheter patency.

## Patient/Family Teaching

- Instruct patient to take baclofen as directed. Take a missed dose within 1 hr; do not double doses. Caution patient to avoid abrupt withdrawal of this medication because it may precipitate an acute withdrawal reaction (hallucinations, increased spasticity, seizures, mental changes, restlessness). Discontinue baclofen gradually over 2 wk or more.
- May cause dizziness and drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants while taking this medication.
- Instruct patient to notify health care professional if frequent urge to urinate or painful urination, constipation, nausea, headache, insomnia, tinnitus, depression, or confusion persists. Geri: Geriatric patients are at greater risk for these side effects.
- Advise patient to report signs and symptoms of hypersensitivity (rash, itching) promptly.
- **IT:** Caution patient and caregiver not to discontinue IT therapy abruptly. May result in fever, mental status changes, exaggerated rebound spasticity, and muscle rigidity. Advise patient not to miss scheduled refill appointments and to notify health care professional promptly if signs of withdrawal occur.

## Evaluation/Desired Outcomes

- Decrease in muscle spasticity and associated musculoskeletal pain with an increased ability to perform activities of daily living.
- Decreased pain in patients with trigeminal neuralgia. May take weeks to obtain optimal effect.

# basiliximab (ba-sil-**ix**-i-mab)

Simulect

***Classification***

Therapeutic: immunosuppressants
Pharmacologic: monoclonal antibodies

**Pregnancy Category B**

## Indications

Prevention of acute organ rejection in patients undergoing renal transplantation; used with corticosteroids and cyclosporine.

## Action

Binds to and blocks specific interleukin-2 (IL-2) receptor sites on activated T lymphocytes. **Therapeutic Effects:** Prevention of acute organ rejection following renal transplantation.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** 7.2 days.

TIME/ACTION PROFILE (effect on immune function)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 2 hr | unknown | 36 days |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB: May affect fetal developing immune system; Lactation: May enter breast milk.
**Use Cautiously in:** Women with childbearing potential; Geri: Due to greater incidence of infection.

## Adverse Reactions/Side Effects

Noted for patients receiving corticosteroids and cyclosporine in addition to basiliximab.
**CNS:** dizziness, headache, insomnia, weakness. **EENT:** abnormal vision, cataracts. **Resp:** coughing. **CV:** HEART FAILURE, edema, hypertension, angina, arrhythmias, hypotension. **GI:** abdominal pain, constipation, diarrhea, dyspepsia, moniliasis, nausea, vomiting, GI bleeding, gingival hyperplasia, stomatitis. **Derm:** acne, wound complications, hypertrichosis, pruritus. **Endo:** hyperglycemia, hypoglycemia. **F and E:** acidosis, hypercholesterolemia, hyperkalemia, hyperuricemia, hypocalcemia, hypokalemia, hypophosphatemia. **Hemat:** bleeding, coagulation abnormalities. **MS:** back pain, leg pain. **Neuro:** tremor, neuropathy, paresthesia. **Misc:** hypersensitivity

reactions including ANAPHYLAXIS, infection, weight gain, chills.

### Interactions

**Drug-Drug:** Immunosuppression may be ↑ with other **immunosuppressants**.
**Drug-Natural Products:** Concommitant use with **echinacea** and **melatonin** may interfere with immunosuppression.

### Route/Dosage

**IV (Adults and Children ≥35 kg):** 20 mg given 2 hr before transplantation; repeated 4 days after transplantation. Second dose should be withheld if complications or graft loss occurs.
**IV (Children <35 kg):** 10 mg given 2 hr before transplantation; repeated 4 days after transplantation. Second dose should be withheld if complications or graft loss occurs.

### Availability

**Powder for reconstitution:** 20 mg/vial, 10 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor for signs of anaphylactic or hypersensitivity reactions (hypotension, tachycardia, cardiac failure, dyspnea, wheezing, bronchospasm, pulmonary edema, respiratory failure, urticaria, rash, pruritus, sneezing) at each dose. Onset of symptoms is usually within 24 hr. Resuscitation equipment and medications for treatment of severe hypersensitivity should be readily available. If a severe hypersensitivity reaction occurs, basiliximab therapy should be permanently discontinued. Patients who have previously received basiliximab should only receive subsequent therapy with extreme caution.
- Monitor for infection (fever, chills, rash, sore throat, purulent discharge, dysuria). Notify physician immediately if these symptoms occur; may necessitate discontinuation of therapy.
- ***Lab Test Considerations:*** May cause ↑ or ↓ hemoglobin, hematocrit, serum glucose, potassium, and calcium concentrations.
- May cause ↑ serum cholesterol levels.
- May cause ↑ BUN, serum creatinine, and uric acid concentrations.
- May cause ↓ serum magnesium, phosphate, and platelet levels.

### Potential Nursing Diagnoses

Risk for infection (Side Effects)

### Implementation

#### IV Administration

- Basiliximab is usually administered concurrently with cyclosporine and corticosteroids.
- Reconstitute with 2.5 mL or 5 mL of sterile water for injection for the 10 mg or 20 mg vial, respectively. Shake gently to dissolve powder.
- **Direct IV:** ***Diluent:*** May be administered undiluted. Bolus administration may be associated with nausea, vomiting, and local reactions (pain). ***Concentration:*** 4 mg/mL. ***Rate:*** Administer over 20–30 min via peripheral or central line.
- **Intermittent Infusion:** ***Diluent:*** Dilute further with 25–50 mL of 0.9% NaCl or D5W. Gently invert bag to mix; do not shake, to avoid foaming. Solution is clear to opalescent and colorless; do not administer solutions that are discolored or contain particulate matter. Discard unused portion. Administer within 4 hr or may be refrigerated for up to 24 hr. Discard after 24 hr. ***Concentration:*** 0.08–0.16 mg/mL. ***Rate:*** Administer over 20–30 min via peripheral or central line.
- **Additive Incompatibility:** Do not admix; do not administer in IV line containing other medications.

### Patient/Family Teaching

- Explain purpose of medication to patient. Explain that patient will need to resume lifelong therapy with other immunosuppressive drugs after completion of basiliximab course.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response is known.
- Instruct patient to continue to avoid crowds and persons with known infections, because basiliximab also suppresses the immune system.

### Evaluation/Desired Outcomes

- Prevention of acute organ rejection in patients receiving renal transplantation.

## becaplermin (be-**kap**-lerm-in)

Regranex

***Classification***

Therapeutic: wound/ulcer/decubiti healing agent

Pharmacologic: platelet-derived growth factors

**Pregnancy Category C**

### Indications

Treatment of lower extremity diabetic neuropathic ulcers extending to subcut tissue or beyond and having adequate blood supply.

### Action

Promotes chemotaxis of cells involved in wound repair and enhances formation of granulation tissue. **Therapeutic Effects:** Improved healing.

### Pharmacokinetics

**Absorption:** Minimal absorption (<3%).
**Distribution:** Action is primarily local.
**Metabolism and Excretion:** Unknown.
**Half-life:** Unknown.

TIME/ACTION PROFILE (improvement in ulcer healing)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Topical | within 10 wk | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Known hypersensitivity to becaplermin or parabens; Known neoplasm at site of application; Wounds that close by primary intention.
**Use Cautiously in:** Known malignancy; OB, Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**Derm:** erythematous rash at application site.
**Misc:** MALIGNANCY (MAY LEAD TO ↑ MORTALITY, ESPECIALLY WITH USE OF ≥3 TUBES).

### Interactions

**Drug-Drug:** None known.

### Route/Dosage

**Topical (Adults):** Length of gel *in inches* from 15- or 7.5-g tube = length × width of ulcer area × 0.6; from the 2-g tube = length × width of ulcer area × 1.3. Length of gel *in centimeters* from 15- or 7.5-g tube = length × width of ulcer area ÷ 4; from the 2-g tube = length × width of ulcer area ÷ 2; for 12 hr each day.

### Availability

**Gel:** 100 mcg/g (0.01%) in 2-, 7.5-, and 15-g tubes.

## NURSING IMPLICATIONS

### Assessment

- Assess size, color, drainage, and skin surrounding wound at weekly or biweekly intervals. Amount of gel to be applied is recalculated based on wound size.

### Potential Nursing Diagnoses

Impaired tissue integrity (Indications)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

- **Topical:** Calculated amount is applied as a thin layer (1/16-in. thick) and covered with a moist saline dressing for 12 hr; dressing is removed, ulcer rinsed and redressed with moist dressing without becaplermin for rest of day. Process is repeated daily.
- Store gel in refrigerator; do not freeze. Do not use beyond expiration date on crimped end of tube.

### Patient/Family Teaching

- Instruct patient on proper technique for application. Wash hands before applying gel and use cotton swab or tongue depressor to aid in application. Tip of tube should not come in contact with ulcer or any other surface; recap tightly after each use. Squeeze calculated amount of gel onto a clean, firm, nonabsorbable surface (wax paper). Spread gel with swab or tongue depressor over the ulcer surface in an even layer to the thickness of a dime. Cover with a saline-moistened gauze dressing.
- Do not apply more than calculated amount; has not been shown to be beneficial. If a dose is missed, apply as soon as remembered. If not remembered until next day, skip dose and return to regular dosing schedule. Do not double doses.
- After 12 hr, rinse ulcer gently with saline or water to remove residual gel and cover with saline-moistened gauze.
- Emphasize the importance of strict wound care and non–weight-bearing program.

### Evaluation/Desired Outcomes

- Improved healing of ulcers. If the ulcer does not decrease in size by 30% within 10 wk or if complete healing has not occurred within 20 wk, continuation of therapy should be reassessed.

**beclomethasone, See CORTICOSTEROIDS (INHALATION).**

**beclomethasone, See CORTICOSTEROIDS (NASAL).**

**benazepril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.**

## bendamustine

(ben-da-**muss**-teen)
Treanda

***Classification***
Therapeutic: antineoplastics
Pharmacologic: benzimidazoles

**Pregnancy Category D**

### Indications
Chronic lymphocytic leukemia. Indolent B-cell non-Hodgkin's lymphoma that has progressed during or within 6 months of receiving rituximab or a rituximab-containing regimen.

### Action
Damages DNA resulting in death of rapidly replicating cells. **Therapeutic Effects:** Decreased proliferation of leukemic cells. Death of lymphoma cells.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Distributes freely into red blood cells.
**Protein Binding:** 94–96%.
**Metabolism and Excretion:** Mostly metabolized (partially by the CYP1A2 enzyme system; 90% excreted in feces; some renal elimination. Although metabolites have antineoplastic activity, levels are extremely low.
**Half-life:** 40 min.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | unknown |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to bendamustine or mannitol; CCr <40 mL/min. Use with caution in lesser degrees of renal impairment; Moderate or severe hepatic impairment; OB: Pregnancy or lactation.
**Use Cautiously in:** Patients at risk for tumor lysis syndrome (concurrent allopurinol recommended); Mild hepatic impairment; Mild to moderate renal impairment; Patients with child-bearing potential; Geri: Elderly patients may be more susceptible to adverse reactions; Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** fatigue, weakness. **Resp:** cough. **GI:** nausea, vomiting, diarrhea. **Derm:** TOXIC EPIDERMAL NECROLYSIS, STEVENS-JOHNSON SYNDROME, skin reactions. **Hemat:** anemia, LEUKOPENIA, NEUTROPENIA, THROMBOCYTOPENIA. **Metab:** hyperuricemia. **Misc:** MALIGNANCY, TUMOR LYSIS SYNDROME, allergic reactions including ANAPHYLAXIS, fever, infusion reactions.

### Interactions
**Drug-Drug:** Concurrent use of **CYP1A2 inducers/inhibitors** can alter levels of bendamustine. **Inhibitors of CYP1A2** including **fluvoxamine** and **ciprofloxacin** may ↑ levels of bendamustine and ↓ levels of active metabolites. **Inducers of CYP1A2** including **omeprazole** and **smoking** may ↓ levels of bendamustine and ↑ levels of its active metabolites. Consider alternative treatments.

### Route/Dosage

#### Chronic Lymphocytic Leukemia
**IV (Adults):** 100 mg/m² on days 1 and 2 of a 28-day cycle, up to 6 cycles; dose modification required for toxicity.

#### Non-Hodgkin's Lymphoma
**IV (Adults):** 120 mg/m² on days 1 and 2 of a 21-day cycle, up to 8 cycles; dose modification required for toxicity.

### Availability
**Lyophilized powder for injection (requires reconstitution):** 100 mg vial.

## NURSING IMPLICATIONS

### Assessment
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and

avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia; anemia may occur; monitor for increased fatigue, dyspnea, and orthostatic hypotension.

- Monitor for symptoms of infusion reactions (fever, chills, pruritus, rash). May rarely cause severe allergic and anaphylactic reactions, especially in second and subsequent cycles. Discontinue therapy if severe reactions occur. Ask patient about symptoms suggestive of infusion reactions after first cycle of therapy. Consider using antihistamines, antipyretics, and corticosteroids in patients who previously experienced Grade 1 or 2 reactions. Consider discontinuation of therapy in patients with Grade 3 or 4 reactions.
- Assess for tumor lysis syndrome. Usually occurs during first cycle of bendamustine. May lead to acute renal failure and death. Maintain adequate volume status, close monitoring of blood chemistry, especially potassium and uric acid levels, and use allopurinol during first 1–2 wk of therapy in high risk patients.
- Assess for skin reactions (rash, toxic skin reactions, bullous exanthema). Withhold or discontinue therapy if reactions are progressive or severe. If non-hematologic toxicity is ≥ Grade 3, reduce dose to 50 mg/m² on Days 1 and 2 of each cycle.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting. Administration of an antiemetic before and during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and during therapy. The hematologic nadirs occur wk 3. Recovery usually occurs in 28 days. Withhold dose and notify physician if ANC is $\geq 1 \times 10^9$/L and platelet count is $\geq 75{,}000 \times 10^9$/L. *For patients treated for chronic lymphocytic leukemia:* If hemotologic toxicity ≥Grade 3, reduce dose to 50 mg/m² on Days 1 and 2. If Grade 3 or greater toxicity recurs, reduce dose to 25 mg/m² on Days 1 and 2. *For patients treated for non-Hodgkin's lymphoma:* If hematologic toxicity ≥Grade 4, reduce dose to 90 mg/m² on Days 1 and 2. If Grade 4 or greater toxicity recurs, reduce dose to 60 mg/m² on Days 1 and 2.
- Monitor blood chemistry, especially serum potassium and uric acid before and periodically during therapy. Allopurinol may be used during first wk of therapy to prevent tumor lysis syndrome.

## Potential Nursing Diagnoses

Risk for infection (Side Effects)

## Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

### IV Administration

- Prepare solution in a biologic cabinet. Wear gloves and safety glasses while handling medication. Discard equipment in designated containers.
- **Intermittent Infusion:** Reconstitute each 100-mg vial with 20 mL of Sterile Water for Injection. Solution should be clear, colorless to pale yellow. Do not administer solutions that are discolored or contain a precipitate. ***Concentration:*** 5 mg/mL. ***Diluent:*** Withdraw volume needed and transfer to 500 mL of 0.9% NaCl or 2.5% dextrose/0.45% NaCl within 30 min of reconstitution. Mix thoroughly.
- Diluted solution is stable for 24 hr when refrigerated or 3 hr at room temperature; administration must be completed within this period. Solution contains no preservatives; discard unused solution. ***Rate:*** *Chronic Lymphocytic Leukemia*—Administer 100 mg/m² over 30 min. *Non-Hodgkin's lymphoma*—Administer 120 mg/m² over 60 min.
- **Additive Incompatibility:** Do not admix or dilute with other solutions or medication.

## Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; lower back or side pain; difficult or painful urination; shortness of breath; fatigue; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs.
  Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patients to avoid alcoholic beverages and products containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to notify health care professional immediately if symptoms of allergic reactions (rash, facial swelling, or difficulty breathing) or nausea, vomiting or diarrhea occur.

- May cause tiredness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient this medication may have teratogenic effects. Contraception should be used by both men and women during and for at least 3 months following completion of therapy. Advise women not to breastfeed during therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Improvement in hematologic parameters.

## benzathine penicillin G, See PENICILLINS.

## benztropine (benz-troe-peen)

Apo-Benztropine, Cogentin

***Classification***

Therapeutic: antiparkinson agents
Pharmacologic: anticholinergics

**Pregnancy Category C**

### Indications

Adjunctive treatment of all forms of Parkinson's disease, including drug-induced extrapyramidal effects and acute dystonic reactions.

### Action

Blocks cholinergic activity in the CNS, which is partially responsible for the symptoms of Parkinson's disease. Restores the natural balance of neurotransmitters in the CNS. **Therapeutic Effects:** Reduction of rigidity and tremors.

### Pharmacokinetics

**Absorption:** Well absorbed following PO and IM administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** Unknown.

TIME/ACTION PROFILE (antidyskinetic activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–2 hr | several days | 24 hr |
| IM, IV | within min | unknown | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Children <3 yr; Angle-closure glaucoma; Tardive dyskinesia.
**Use Cautiously in:** Prostatic hyperplasia; Seizure disorders; Cardiac arrhythmias; OB, Lactation: Safety not established; Geri: ↑ risk of adverse reactions.

### Adverse Reactions/Side Effects

**CNS:** confusion, depression, dizziness, hallucinations, headache, sedation, weakness. **EENT:** blurred vision, dry eyes, mydriasis. **CV:** arrhythmias, hypotension, palpitations, tachycardia. **GI:** constipation, dry mouth, ileus, nausea. **GU:** hesitancy, urinary retention. **Misc:** decreased sweating.

### Interactions

**Drug-Drug:** Additive anticholinergic effects with **drugs sharing anticholinergic properties**, such as **antihistamines**, **phenothiazines**, **quinidine**, **disopyramide**, and **tricyclic antidepressants**. Counteracts the cholinergic effects of **bethanechol**. **Antacids** and **antidiarrheals** may ↓ absorption.
**Drug-Natural Products:** ↑ anticholinergic effect with **angel's trumpet**, **jimson weed**, and **scopolia**.

### Route/Dosage

#### Parkinsonism

**PO (Adults):** 1–2 mg/day in 1–2 divided doses (range 0.5–6 mg/day).

#### Acute Dystonic Reactions

**IM, IV (Adults):** 1–2 mg, then 1–2 mg PO twice daily.

#### Drug-Induced Extrapyramidal Reactions

**PO, IM, IV (Adults):** 1–4 mg given once or twice daily (1–2 mg 2–3 times daily may also be used PO).

### Availability (generic available)

**Tablets:** 0.5 mg, 1 mg, 2 mg. **Injection:** 1 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess parkinsonian and extrapyramidal symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, masklike face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) before and throughout therapy.

- Assess bowel function daily. Monitor for constipation, abdominal pain, distention, or absence of bowel sounds.
- Monitor intake and output ratios and assess patient for urinary retention (dysuria, distended abdomen, infrequent voiding of small amounts, overflow incontinence).
- Patients with mental illness are at risk of developing exaggerated symptoms of their disorder during early therapy with benztropine. Withhold drug and notify physician or other health care professional if significant behavioral changes occur.
- **IM/IV:** Monitor pulse and blood pressure closely and maintain bedrest for 1 hr after administration. Advise patients to change positions slowly to minimize orthostatic hypotension.

### Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications)

### Implementation

- **PO:** Administer with food or immediately after meals to minimize gastric irritation. May be crushed and administered with food if patient has difficulty swallowing.
- **IM:** Parenteral route is used only for dystonic reactions.

#### IV Administration

- **Direct IV:** IV route is rarely used because onset is same as with IM route. ***Rate:*** Administer at a rate of 1 mg over 1 min.
- **Syringe Compatibility:** metoclopramide, perphenazine.
- **Y-Site Compatibility:** fluconazole, tacrolimus.

### Patient/Family Teaching

- Encourage patient to take benztropine as directed. Take missed doses as soon as possible, up to 2 hr before the next dose. Taper gradually when discontinuing or a withdrawal reaction may occur (anxiety, tachycardia, insomnia, return of parkinsonian or extrapyramidal symptoms).
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities that require alertness until response to the drug is known.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Patient should notify health care professional if dryness persists (saliva substitutes may be used). Also, notify the dentist if dryness interferes with use of dentures.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional if difficulty with urination, constipation, abdominal discomfort, rapid or pounding heartbeat, confusion, eye pain, or rash occurs.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies, or drinking alcoholic beverages.
- Caution patient that this medication decreases perspiration. Overheating may occur during hot weather. Patient should notify health care professional if unable to remain indoors in an air-conditioned environment during hot weather.
- Advise patient to avoid taking antacids or antidiarrheals within 1–2 hr of this medication.
- Emphasize the importance of routine follow-up exams.

### Evaluation/Desired Outcomes

- Decrease in tremors and rigidity and an improvement in gait and balance. Therapeutic effects are usually seen 2–3 days after the initiation of therapy.

## betamethasone, See CORTICOSTEROIDS (SYSTEMIC).

## betamethasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

## bevacizumab

(be-va-**kiz**-oo-mab)
Avastin

***Classification***
Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

**Pregnancy Category C**

### Indications

Metastatic colon or rectal carcinoma (with IV 5–fluorouracil). First line treatment of patients with unresectable, locally advanced, recurrent or metastatic non-squamous, non-small cell lung cancer with carboplatin and paclitaxel. Patients who have not received chemotherapy for metastatic HER2 negative breast cancer (with paclitaxel). Patients with progressive glioblastoma fol-

lowing prior therapy. Metastatic renal cell carcinoma (with interferon alfa).

### Action
A monoclonal antibody that binds to vascular endothelial growth factor (VEGF), preventing its attachment to binding sites on vascular endothelium, thereby inhibiting growth of new blood vessels (angiogenesis). **Therapeutic Effects:** Decreased metastatic disease progression and microvascular growth.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** 20 days (range 11–50 days).

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | 14 days |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Recent hemoptysis or other serious recent bleeding episode; First 28 days after major surgery; OB: Angiogenesis is critical to the developing fetus. Contraindicated unless benefit to mother outweighs potential fetal harm. Lactation: Discontinue nursing during treatment and, due to long half-life, for several weeks following treatment.
**Use Cautiously in:** Cardiovascular disease; Pedi: Safety not established; Geri: ↑ risk of serious adverse reactions including arterial thromboembolic events.

### Adverse Reactions/Side Effects
**CNS:** reversible posterior leukoencephalopathy syndrome (RPLS). **CV:** CHF, THROMBOEMBOLIC EVENTS, hypertension, hypotension. **Resp:** HEMOPTYSIS, non-gastrointestinal fistulas, nasal septum perforation. **GI:** GI PERFORATION. **GU:** nephrotic syndrome, proteinuria. **Hemat:** BLEEDING. **Misc:** WOUND DEHISCENCE, impaired wound healing, infusion reactions.

### Interactions
**Drug-Drug:** ↑ blood levels of SN 38 (the active metabolite of **irinotecan**); significance is not known. ↑ risk of microangiopathic hemolytic anemia when used with **sunitinib**; concurrent use should be avoided.

### Route/Dosage
#### Colon Cancer
**IV (Adults):** 5 mg/kg infusion every 14 days.

#### Lung Cancer
**IV (Adults):** 15 mg/kg infusion every 3 wk.

#### Breast Cancer
**IV (Adults):** 10 mg/kg infusion q 14 days.

#### Glioblastoma
**IV (Adults):** 10 mg/kg infusion q 14 days.

#### Renal Cell Carcinoma
**IV (Adults):** 10 mg/kg infusion q 14 days.

### Availability
**Solution for injection (requires dilution):** 100 mg/4 mL vial, 400 mg/16 mL vial.

## NURSING IMPLICATIONS

### Assessment
- Assess for signs of GI perforation (abdominal pain associated with constipation and vomiting), fistula formation, and wound dehiscence during therapy; therapy should be discontinued.
- Assess for signs of hemorrhage (epistaxis, hemoptysis, bleeding) and thromboembolic events (stroke, MI, deep vein thrombosis, pulmonary embolus) during therapy; may require discontinuation.
- Monitor BP every 2–3 wk during therapy. Temporarily suspend therapy during severe hypertension not controlled with medical management; permanently discontinue if hypertensive crisis occurs.
- Assess for infusion reactions (stridor, wheezing) during therapy.
- Assess for signs of CHF (dyspnea, peripheral edema, rales/crackles, jugular venous distension) during therapy.
- Monitor for signs of RPLS (headache, seizure, lethargy, confusion, blindness). Hypertension may or may not be present. May occur with in 16 hr to 1 yr of initiation of therapy. Treat hypertension if present and discontinue bevacizumab therapy. Symptoms usually resolve within days.
- ***Lab Test Considerations:*** Monitor serial urinalysis for proteinuria during therapy. Patients with a 2+ or greater urine dipstick require further testing with a 24–hr urine collec-

tion. Suspend therapy for ≥2 grams of proteinuria/24 hours and resume when proteinuria is <2 gm/24 hours. Discontinue therapy in patients with nephrotic syndrome.
- May cause leukopenia, thrombocytopenia, hypokalemia, and bilirubinemia.

### Potential Nursing Diagnoses
Ineffective tissue perfusion (Adverse Reactions)

### Implementation
- Avoid administration for at least 28 days following major surgery; surgical incision should be fully healed due to potential for impaired wound healing.

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Dilute prescribed dose in 100 mL of 0.9% NaCl. Do not shake. Discard unused portions. Do not administer solution that is discolored or contains particulate matter. Stable if refrigerated for up to 8 hr. ***Rate:*** Administer initial dose over 90 min. If well tolerated, second infusion may be administered over 60 min. If well tolerated, all subsequent infusions may be administered over 30 min. **Do not administer as an IV push or bolus**.
- **Additive Incompatibility:** Do not mix or administer with dextrose solutions.

### Patient/Family Teaching
- Inform patient of purpose of medication.
- Advise patient to report any signs of bleeding immediately to health care professional.

### Evaluation/Desired Outcomes
- Decreased metastatic disease progression and microvascular growth.

## bicalutamide
(bye-ka-**loot**-a-mide)
Casodex

***Classification***
Therapeutic: antineoplastics
Pharmacologic: antiandrogens

**Pregnancy Category X**

### Indications
Treatment of metastatic prostate carcinoma in conjunction with luteinizing hormone–releasing hormone (LHRH) analogs (goserelin, leuprolide).

### Action
Antagonizes the effects of androgen at the cellular level. **Therapeutic Effects:** Decreased spread of prostate carcinoma.

### Pharmacokinetics
**Absorption:** Well absorbed after oral administration.
**Distribution:** Unknown.
**Protein Binding:** 96%.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 5.8 days.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 31.3 hr | unknown |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Women.
**Use Cautiously in:** Moderate to severe liver impairment; Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** weakness, dizziness, headache, insomnia. **Resp:** dyspnea. **CV:** chest pain, hypertension, peripheral edema. **GI:** constipation, diarrhea, nausea, abdominal pain, ↑ liver enzymes, vomiting. **GU:** hematuria, erectile dysfunction, incontinence, nocturia, urinary tract infections. **Derm:** alopecia, rashes, sweating. **Endo:** breast pain, gynecomastia. **Hemat:** anemia. **Metab:** hyperglycemia, weight loss. **MS:** back pain, pelvic pain, bone pain. **Neuro:** paresthesia. **Misc:** generalized pain, hot flashes, flu-like syndrome, infection.

### Interactions
**Drug-Drug:** May ↑ the effect of **warfarin**. ↑ risk of hyperglycemia with **LHRH analogs**.

### Route/Dosage
**PO (Adults):** 50 mg once daily (must be given concurrently with LHRH analog or following surgical castration).

### Availability (generic available)
**Tablets:** 50 mg.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for adverse GI effects. Diarrhea is the most common cause of discontinuation of therapy.
- ***Lab Test Considerations:*** Monitor serum prostate-specific antigen (PSA) periodically to determine response to therapy. If levels rise, assess patient for disease progression. May require periodic LHRH analogue administration without bicalutamide.
- Monitor liver function tests before and periodically during therapy. May cause ↑ serum alkaline phosphatase, AST, ALT, and bilirubin con-

centrations. If transaminases ↑ >2 times normal, bicalutamide should be discontinued; levels usually return to normal after discontinuation.
- May cause ↑ BUN and serum creatinine, and ↓ hemoglobin and WBCs.

### Potential Nursing Diagnoses
Diarrhea (Adverse Reactions)

### Implementation
- Start treatment with bicalutamide at the same time as LHRH analogue.
- **PO:** May be administered in the morning or evening, without regard to food.

### Patient/Family Teaching
- Instruct patient to take bicalutamide as directed at the same time each day. Do not discontinue without consulting health care professional.
- Advise patient not to take other medications without consulting health care professional.
- Instruct patient to report severe or persistent diarrhea.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress; monitor for side effects.

### Evaluation/Desired Outcomes
- Decreased spread of prostate carcinoma.

## bimatoprost (lash, ophthalmic) (bi-mat-o-prost)
Latisse

***Classification***
Therapeutic: hair regrowth stimulants
Pharmacologic: prostaglandins

**Pregnancy Category C**

### Indications
Treatment of eyelash hypotrichosis.

### Action
Increases the percent of hair in eyelashes and prolongs the duration of growth phase. **Therapeutic Effects:** Increases eyelash growth, improving length, thickness, and darkness.

### Pharmacokinetics
**Absorption:** Minimal systemic absorption.
**Distribution:** Small amounts absorbed are widely distributed.
**Metabolism and Excretion:** Highly metabolized; 67% excreted in urine, 25% in feces mostly as metabolites.
**Half-life:** 45 min.

TIME/ACTION PROFILE (improvement in eyelash growth)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Topical | 2 mos | 4 mos | 4 wk or more* |

*Following discontinuation.

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Active intraocular inflammation; Patients with aphakia, pseudoaphakia with a torn posterior lens capsule, or know risk factors for macular edema; OB: Use in pregnancy only if potential benefit justifies potential risk to the fetus; Lactation: Use cautiously during lactation; Pedi: Safe and effective use in children has not been established.

### Adverse Reactions/Side Effects
**EENT:** conjunctival hyperemia, eye pruritus, hyperpigmentation of eyelids, macular edema, permanent pigmentation of the iris.

### Interactions
**Drug-Drug:** May ↓ the intraocular pressure lowering effect of **prostaglandin analogs**.

### Route/Dosage
**Topical (Adults):** Apply to upper eyelid margin nightly.

### Availability
**Ophthalmic solution:** 0.3 mg/mL provided as 3 mL in a 5-mL bottle.

## NURSING IMPLICATIONS

### Assessment
- Monitor intraocular pressure in patients with a history of increased intraocular pressure or who are using prostaglandin analogs for intraocular pressure reduction concurrently.

### Potential Nursing Diagnoses
Disturbed body image (Indications)

### Implementation
- **Topical:** Apply once each night using the accompanying sterile applicators. Additional applications will not increase the growth of eyelashes.

### Patient/Family Teaching
- Instruct patient on correct application of bimatoprost. If a dose is missed, omit and apply next

evening; do not double dose. Patient should wash face and remove all makeup and contact lenses prior to application. Contact lenses may be reinserted 15 min following administration. Place one drop of medication on the disposable sterile applicator and brush cautiously along the skin of the upper eyelid margin at the base of the eyelashes. Use only the applicator supplied with the product. Use each applicator for one eye then discard; reuse may result in contamination and infection. If solution gets into the eye, it is not harmful and does not need to be rinsed. Do not apply to lower lash line. Blot any excess solution outside upper eyelid margin with a tissue or other absorbent material. Do not allow tip of bottle or applicator to come in contact with surrounding structures, fingers, or any other unintended surface to avoid contamination. Instruct patient to read the *Patient Information* guide prior to use and with each Rx refill, in case of new information.

- Inform patient that eyelid skin may darken with use of bimatoprost; may be reversible with discontinuation of medication. Instillation directly into eye may result in increased brown iris pigmentation; usually permanent.
- Inform patient of potential for hair growth occurring outside target treatment area if medication repeatedly touched same area of skin.
- Advise patient to notify health care professional immediately if eye trauma or infection, sudden decrease in visual acuity, conjunctivitis, or eyelid reactions occur or if having ocular surgery.
- Instruct patient to notify health care professional of bimatoprost use prior to intraocular pressure examinations.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

### Evaluation/Desired Outcomes

- Increased length, thickness, and darkness of eyelashes. Onset is gradual and may not be noticed for 2 mos. Length, thickness, number of eyelashes, and/or direction of eyelash growth may vary between eyes. Upon discontinuation, eyelashes usually return to pretreatment level within 4 wk to mos.

## **bisacodyl** (bis-a-**koe**-dill)

Bisac-Evac, Bisaco-Lax, Bisacolax, Caroid, Carter's Little Pills, Dacodyl, Deficol, Dulcagen, Dulcolax, Feen-a-Mint, Fleet Laxative, Laxit, Modane, Reliable Gentle Laxative, Theralax, Women's Gentle Laxative

***Classification***
Therapeutic: laxatives
Pharmacologic: stimulant laxatives

**Pregnancy Category UK**

### Indications

Treatment of constipation. Evacuation of the bowel before radiologic studies or surgery. Part of a bowel regimen in spinal cord injury patients.

### Action

Stimulates peristalsis. Alters fluid and electrolyte transport, producing fluid accumulation in the colon. **Therapeutic Effects:** Evacuation of the colon.

### Pharmacokinetics

**Absorption:** Variable absorption follows oral administration; rectal absorption is minimal; action is local in the colon.
**Distribution:** Small amounts of metabolites excreted in breast milk.
**Metabolism and Excretion:** Small amounts absorbed are metabolized by the liver.
**Half-life:** Unknown.

TIME/ACTION PROFILE (evacuation of bowel)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 6–12 hr | unknown | unknown |
| Rectal | 15–60 min | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Abdominal pain; Obstruction; Nausea or vomiting (especially with fever or other signs of an acute abdomen).
**Use Cautiously in:** Severe cardiovascular disease; Anal or rectal fissures; Excess or prolonged use (may result in dependence); OB, Lactation: May be used during pregnancy and lactation.

### Adverse Reactions/Side Effects

**GI:** abdominal cramps, nausea, diarrhea, rectal burning. **F and E:** hypokalemia (with chronic use). **MS:** muscle weakness (with chronic use). **Misc:** protein-losing enteropathy, tetany (with chronic use).

### Interactions

**Drug-Drug: Antacids, histamine $H_2$-receptor antagonists**, and **gastric acid–pump inhibitors** may remove enteric coating of tablets resulting in gastric irritation/dyspepsia. May ↓ the absorption of other **orally administered drugs** because of ↑ motility and ↓ transit time.

**Drug-Food: Milk** may remove enteric coating of tablets, resulting in gastric irritation/dyspepsia.

### Route/Dosage

**PO (Adults and Children ≥12 yr):** 5–15 mg (up to 30 mg/day) as a single dose.
**PO (Children 3–11 yr):** 5–10 mg (0.3 mg/kg) as a single dose.
**Rect (Adults and Children ≥12 yr):** 10 mg single dose.
**Rect (Children 2–11 yr):** 5–10 mg single dose.
**Rect (Children <2 yr):** 5 mg single dose.

### Availability (generic available)

**Enteric-coated tablets:** 5 mg[OTC]. **Enteric coated and delayed release:** 5 mg[OTC]. **Suppositories:** 5 mg[OTC], 10 mg[OTC]. **Rectal suspension:** 10 mg/30 mL[OTC]. ***In combination with:*** In Bowel Preparation kits with Magnesium citrate (Evac-Q-Kwik[OTC], EZ-EM Prep Kit[OTC], LiquiPrep Bowel Evacuant[OTC], Tridate Bowel Cleansing Kit[OTC]), Phosphate/biphosphate (Fleet Prep Kit. No. 1[OTC], Fleet Prep Kit No.2[OTC], Fleet Prep Kit No.3[OTC]), sennosides (X-Prep Bowel Evacuant Kit #1[OTC]), sennosides, magnesium citrate, magnesium sulfate (X-Prep Bowel Evacuant Kit #2[OTC]). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

### Potential Nursing Diagnoses

Constipation (Indications)

### Implementation

- May be administered at bedtime for morning results.
- **PO:** Taking on an empty stomach will produce more rapid results.
- Do not crush or chew enteric-coated tablets. Take with a full glass of water or juice.
- Do not administer oral doses within 1 hr of milk or antacids; this may lead to premature dissolution of tablet and gastric or duodenal irritation.
- **Rect:** Suppository or enema can be given at the time a bowel movement is desired. Lubricate suppositories with water or water-soluble lubricant before insertion. Encourage patient to retain the suppository or enema 15–30 min before expelling.

### Patient/Family Teaching

- Advise patients, other than those with spinal cord injuries, that laxatives should be used only for short-term therapy. Prolonged therapy may cause electrolyte imbalance and dependence.
- Advise patient to increase fluid intake to at least 1500–2000 mL/day during therapy to prevent dehydration.
- Encourage patients to use other forms of bowel regulation (increasing bulk in the diet, increasing fluid intake, or increasing mobility). Normal bowel habits may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient that bisacodyl should not be used when constipation is accompanied by abdominal pain, fever, nausea, or vomiting.

### Evaluation/Desired Outcomes

- Soft, formed bowel movement when used for constipation.
- Evacuation of colon before surgery or radiologic studies, or for patients with spinal cord injuries.

## bismuth subsalicylate

(**biz**-muth sub-sa-**lis**-i-late )

Bismatrol, Kaopectate, Kao-Tin, Kapectolin, Peptic Relief, Pepto-Bismol

***Classification***

Therapeutic: antidiarrheals, antiulcer agents
Pharmacologic: adsorbents

**Pregnancy Category C**

### Indications

Mild to moderate diarrhea. Nausea, abdominal cramping, heartburn, and indigestion that may accompany diarrheal illnesses. Treatment of ulcer disease associated with *Helicobacter pylori* (with anti-infectives). Treatment/prevention of traveler's (enterotoxigenic *Escherichia coli*) diarrhea. **Unlabeled Use:** Chronic infantile diarrhea.

### Action

Promotes intestinal adsorption of fluids and electrolytes. Decreases synthesis of intestinal prostaglandins. **Therapeutic Effects:** Relief of diar-

rhea. Eradication of *H. pylori* with decreased recurrence of ulcer disease (with other agents).

### Pharmacokinetics

**Absorption:** Bismuth is not absorbed; salicylate split from parent compound is >90% absorbed from the small intestine. Salicylate is highly bound to albumin.
**Distribution:** Salicylate crosses the placenta and enters breast milk.
**Metabolism and Excretion:** Bismuth is excreted unchanged in the feces. Salicylate undergoes extensive hepatic metabolism.
**Half-life:** Salicylate—2–3 hr for low doses; 15–30 hr with larger doses.

TIME/ACTION PROFILE (relief of diarrhea and other GI symptoms)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 24 hr | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Aspirin hypersensitivity; cross-sensitivity with NSAIDs or oil of wintergreen may occur. Pedi: During or after recovery from chickenpox or flu-like illness (contains salicylate, which can cause Reye's syndrome). Geri: Geriatric patients who may have fecal impaction.
**Use Cautiously in:** Patients undergoing radiologic examination of the GI tract (bismuth is radiopaque); Diabetes mellitus; Gout; OB, Lactation: Safety not established; avoid chronic use of large doses; Pedi, Geri: Potential for impaction.

### Adverse Reactions/Side Effects

**GI:** constipation, gray-black stools, impaction (infants, debilitated patients).

### Interactions

**Drug-Drug:** If taken with **aspirin**, may ↑ the risk of salicylate toxicity. May ↓ absorption of **tetracycline** or **fluoroquinolones** (separate administration by 2–4 hr). May ↓ effectiveness of **probenecid** (large doses).

### Route/Dosage

**PO (Adults):** *Antidiarrheal*—2 tablets or 30 mL (15 mL of extra/maximum strength) q 30 min *or* 2 tablets q 60 min as needed (not to exceed 4.2 g/24 hr). *Antiulcer*—524 mg 4 times daily (as 2 tablets, 30 mL of regular strength suspension or 15 mL of extra/maximum strength).
**PO (Children 9–12 yr):** 1 tablet or 15 mL (7.5 mL of extra/maximum strength) q 30–60 min (not to exceed 2.1 g/24 hr).
**PO (Children 6–9 yr):** 10 mL (5 mL of extra/maximum strength) q 30–60 min (not to exceed 1.4 g/24 hr).
**PO (Children 3–6 yr):** 5 mL (2.5 mL of extra/maximum strength) q 30–60 min (not to exceed 704 mg/24 hr).

### Availability (generic available)

**Tablets:** 262 mg[OTC]. **Chewable tablets (cherry and other flavors):** 262 mg[OTC], 300 mg[OTC]. **Liquid (cherry, caramel, peppermint, and other flavors):** 262 mg/15 mL[OTC], 264 mg/15 mL[OTC], 525 mg/15 mL[OTC]. ***In combination with:*** metronidazole and tetracycline (Helidac—convenience package) (Pylera—combination capsule). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- **Diarrhea:** Assess the frequency and consistency of stools, presence of nausea and indigestion, and bowel sounds before and during therapy.
- Assess fluid and electrolyte balance and skin turgor for dehydration if diarrhea is prolonged.
- **Ulcers:** Assess for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** Chronic high doses may cause falsely ↑ uric acid levels with colorimetric assay.
- May interfere with radiologic examination of the GI tract.
- May cause abnormal results with alkaline phosphatase, AST, and ALT tests.
- May cause ↓ potassium levels and serum $T_3$ and $T_4$ concentrations.
- Large doses of salicylates may also cause prolonged prothrombin time (PT).
- For additional lab test considerations related to salicylate content, see salicylates monograph.

### Potential Nursing Diagnoses

Diarrhea (Indications)
Constipation (Side Effects)

### Implementation

- **PO:** Shake liquid before using. Chewable tablets may be chewed or allowed to dissolve before swallowing.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed.
- Inform patient that medication may temporarily cause stools and tongue to appear gray-black.
- Instruct patient that this medication contains aspirin. Advise patient taking concurrent aspirin products to discontinue bismuth subsalicylate if tinnitus, ringing in the ears, occurs.

- **Diarrhea:** Instruct patient to notify health care professional if diarrhea persists for more than 2 days or if accompanied by a high fever.
- U.S. Centers for Disease Control and Prevention warn against giving salicylates to children or adolescents with varicella (chickenpox) or influenza-like or viral illnesses because of a possible association with Reye's syndrome.
- **Ulcers:** Advise patient to consult health care professional before taking other OTC ulcer remedies concurrently with bismuth subsalicylate.

## Evaluation/Desired Outcomes

- Decrease in diarrhea.
- Decrease in symptoms of indigestion.
- Prevention of traveler's diarrhea.
- Treatment of ulcers.

# **bisoprolol** (bis-**oh**-proe-lol)

Monocor, Zebeta

***Classification***

Therapeutic: antihypertensives
Pharmacologic: beta blockers

**Pregnancy Category C**

## Indications

Management of hypertension.

## Action

Blocks stimulation of $beta_1$(myocardial)-adrenergic receptors. Does not usually affect $beta_2$(pulmonary, vascular, uterine)-receptor sites. **Therapeutic Effects:** Decreased blood pressure and heart rate.

## Pharmacokinetics

**Absorption:** Well absorbed after oral administration, but 20% undergoes first-pass hepatic metabolism.
**Distribution:** Unknown.
**Metabolism and Excretion:** 50% excreted unchanged by the kidneys; remainder renally excreted as metabolites; 2% excreted in feces.
**Half-life:** 9–12 hr.

TIME/ACTION PROFILE (antihypertensive effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1–4 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Uncompensated CHF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
**Use Cautiously in:** Renal impairment (dosage reduction recommended); Hepatic impairment (dosage reduction recommended); Pulmonary disease (including asthma; $beta_1$ selectivity may be lost at higher doses); avoid use if possible; Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be increased); OB, Lactation, Pedi: Safety not established; crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Geri: Increased sensitivity to beta blockers; initial dosage reduction recommended.

## Adverse Reactions/Side Effects

**CNS:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, stuffy nose. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, CHF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **GI:** constipation, diarrhea, liver function abnormalities, nausea, vomiting. **GU:** erectile dysfunction, decreased libido, urinary frequency. **Derm:** rashes. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, joint pain. **Misc:** drug-induced lupus syndrome.

## Interactions

**Drug-Drug: General anesthetics**, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent thyroid preparation administration may decrease effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dosage adjustments may be necessary). May decrease the effectiveness of **theophylline**. May decrease the beneficial $beta_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

### Route/Dosage

**PO (Adults):** 5 mg once daily, may be increased to 10 mg once daily (range 2.5–20 mg/day).

### Renal Impairment

### Hepatic Impairment

**PO (Adults):** *CCr <40 mL/min*—Initiate therapy with 2.5 mg/day, titrate cautiously.

### Availability (generic available)

**Tablets:** 5 mg, 10 mg. **Cost:** 5-mg and 10-mg tablets $35.75/30 tablets. ***In combination with:*** hydrochlorothiazide (Ziac). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, ECG, and pulse frequently during dosage adjustment period and periodically throughout therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of CHF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- ***Lab Test Considerations:*** May cause increased BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.

### Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- May be administered without regard to meals.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. If a dose is missed, it should be taken as soon as possible up to 4 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly and to report significant changes to health care professional.
- May cause drowsiness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any OTC medications, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of coffee, tea, and cola.
- Diabetics should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block dizziness or sweating as signs of hypoglycemia.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.

HIGH ALERT

## bivalirudin (bi-val-i-**roo**-din)

Angiomax

***Classification***

Therapeutic: anticoagulants
Pharmacologic: thrombin inhibitors

**Pregnancy Category B**

### Indications

Used in conjunction with aspirin to reduce the risk of acute ischemic complications in patients with unstable angina who are undergoing percutaneous transluminal angioplasty (PCTA) or percutaneous coronary intervention (PCI). Patients with or at risk of heparin-induced thrombocyto-

penia (HIT) and thrombosis syndrome (HITTS) who are undergoing PCI.

### Action

Specifically and reversibly inhibits thrombin by binding to its receptor sites. Inhibition of thrombin prevents activation of factors V, VIII, and XII; the conversion of fibrinogen to fibrin; platelet adhesion and aggregation. **Therapeutic Effects:** Decreased acute ischemic complications in patients with unstable angina (death, MI, or the urgent need for revascularization procedures).

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Cleared from plasma by a combination of renal mechanisms and proteolytic breakdown.
**Half-life:** 25 min (↑ in renal impairment).

TIME/ACTION PROFILE (anticoagulant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | immediate | unknown | 1–2 hr |

### Contraindications/Precautions

**Contraindicated in:** Active major bleeding; Hypersensitivity.
**Use Cautiously in:** Any disease state associated with an ↑ risk of bleeding; Heparin-induced thrombocytopenia or heparin-induced thrombocytopenia-thrombosis syndrome; Patients with unstable angina not undergoing PTCA; Patients with other acute coronary syndromes; Concurrent use with other platelet aggregation inhibitors (safety not established); Renal impairment (↓ infusion rate if GFR <30 mL/min); Lactation, Pedi: Safety not established; OB: Use only if clearly needed.

### Adverse Reactions/Side Effects

**CNS:** headache, anxiety, insomnia, nervousness. **CV:** hypotension, bradycardia, hypertension. **GI:** nausea, abdominal pain, dyspepsia, vomiting. **Hemat:** BLEEDING. **Local:** injection site pain. **MS:** back pain. **Misc:** pain, fever, pelvic pain.

### Interactions

**Drug-Drug:** Risk of bleeding may be ↑ by concurrent use of **abciximab**, **heparin**, **low molecular weight heparins**, **clopidogrel**, **thrombolytics**, or any other **drugs that inhibit coagulation**.
**Drug-Natural Products:** ↑ risk of bleeding with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **gingko**, **Panax ginseng**, and others.

### Route/Dosage

**IV (Adults):** 0.75 mg/kg as a bolus injection, followed by an infusion at a rate of 1.75 mg/kg/hr for the duration of the PCI procedure. An activated clotting time (ACT) should be performed 5 min after bolus dose and an additional bolus dose of 0.3 mg/kg may be administered if needed. Continuation of the infusion (at a rate of 1.75 mg/kg/hr) for up to 4 hr post-procedure is optional. If needed, the infusion may be continued beyond this initial 4 hr at a rate of 0.2 mg/kg/hr for up to 20 hr. Therapy should be initiated prior to the procedure and given in conjunction with aspirin.

### Renal Impairment

**IV (Adults):** No ↓ in the bolus dose is needed in any patient with renal impairment. *GFR 10–29 mL/min*— ↓ infusion rate to 1 mg/kg/hr; *Dialysis-dependent patients (off dialysis)*— ↓ infusion rate to 0.25 mg/kg/hr. ACT should be monitored in all patients with renal impairment.

### Availability

**Powder for injection:** 250 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess for bleeding. Most common is oozing from the arterial access site for cardiac catheterization. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and nasogastric tubes should be minimized. Noncompressible sites for IV access should be avoided. If bleeding cannot be controlled with pressure, discontinue bivalirudin immediately.
- Monitor vital signs. May cause bradycardia, hypertension, or hypotension. An unexplained decrease in blood pressure may indicate hemorrhage.
- ***Lab Test Considerations:*** Assess hemoglobin, hematocrit, and platelet count prior to bivalirudin therapy and periodically during therapy. May cause ↓ hemoglobin and hematocrit. An unexplained ↓ in hematocrit may indicate hemorrhage.
- Monitor ACT periodically in patients with renal dysfunction.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

## Implementation

- Administer IV just prior to PTCA, in conjunction with aspirin 300 mg to 325 mg/day. Do not administer IM.

### IV Administration

- **Direct IV:** (for bolus dose) Reconstitute each 250-mg vial with 5 mL of sterile water for injection. Reconstituted vials are stable for 24 hr if refrigerated. ***Diluent:*** Further dilute in 50 mL of D5W or 0.9% NaCl. Withdraw bolus dose out of bag. Infusion is stable for 24 hr at room temperature. ***Concentration:*** Final concentration of infusion is 5 mg/mL. ***Rate:*** Administer as a bolus injection.
- **Intermittent Infusion:** Reconstitute each 250-mg vial as per the above directions. ***Diluent:*** Further dilute in 50 mL of D5W or 0.9% NaCl. If infusion is to be continued after 4 hr (at a rate of 0.2 mg/kg/hr), reconstituted vial should be diluted in 500 mL of D5W or 0.9% NaCl. Infusion is stable for 24 hr at room temperature. ***Concentration:*** 5 mg/mL (for infusion rate of 1.75 mg/kg/hr); 0.5 mg/mL (for infusion rate of 0.2 mg/kg/hr). ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** acyclovir, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin-sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, atropine, azithromycin, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftozoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dolasetron, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enaprilat, ephedrine, epinephrine, epirubicin, epoprostenol, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, inamrinone, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melaphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin-tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, promethazine, ranitidine, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin-clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, warfarin, zidovudine, zolendronic acid.
- **Y-Site Incompatibility:** alteplase, amiodarone, amphotericin B, amphotericin B lipid complex, caspofungin, chlorpromazine, dantrolene, diazepam, pentamidine, pentazocine, phenytoin, prochlorperazine, quinupristin/dalfopristin, reteplase, streptokinase, vancomycin.

## Patient/Family Teaching

- Inform patient of the purpose of bivalirudin.
- Instruct patient to notify health care professional immediately if any bleeding is noted.

## Evaluation/Desired Outcomes

- Decreased acute ischemic complications in patients with unstable angina (death, MI or the urgent need for revascularization procedures).

HIGH ALERT

# bleomycin (blee-oh-**mye**-sin)

Blenoxane

***Classification***

Therapeutic: antineoplastics
Pharmacologic: antitumor antibiotics

**Pregnancy Category D**

## Indications

Treatment of: Lymphomas, Squamous cell carcinoma, Testicular embryonal cell carcinoma, Choriocarcinoma, Teratocarcinoma. Intrapleural ad-

ministration to prevent the reaccumulation of malignant effusions.

### Action

Inhibits DNA and RNA synthesis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** Well absorbed from IM and subcut sites. Absorption follows intrapleural and intraperitoneal administration.
**Distribution:** Widely distributed, concentrates in skin, lungs, peritoneum, kidneys, and lymphatics.
**Metabolism and Excretion:** 60–70% excreted unchanged by the kidneys.
**Half-life:** 2 hr (↑ in renal impairment).

TIME/ACTION PROFILE (tumor response)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV, IM, Subcut | 2–3 wk | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB, Lactation: Potential for fetal, infant harm.
**Use Cautiously in:** Renal impairment (dose ↓ required if CCr <35 mL/min); Pulmonary impairment; Nonmalignant chronic debilitating illness; Patients with childbearing potential; Geri: ↑ risk of pulmonary toxicity and reduction in renal function.

### Adverse Reactions/Side Effects

**CNS:** aggressive behavior, disorientation, weakness. **Resp:** PULMONARY FIBROSIS, pneumonitis. **CV:** hypotension, peripheral vasoconstriction. **GI:** anorexia, nausea, stomatitis, vomiting. **Derm:** hyperpigmentation, mucocutaneous toxicity, alopecia, erythema, rashes, urticaria, vesiculation. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** pain at tumor site, phlebitis at IV site. **Metab:** weight loss. **Misc:** ANAPHYLACTOID REACTIONS, chills, fever.

### Interactions

**Drug-Drug:** Hematologic toxicity ↑ with concurrent use of **radiation therapy** and other **antineoplastics**. Concurrent use with **cisplatin** ↓ elimination of bleomycin and may ↑ toxicity. ↑ risk of pulmonary toxicity with other **antineoplastics** or thoracic **radiation therapy**. **General anesthesia** ↑ the risk of pulmonary toxicity. ↑ risk of Raynaud's phenomenon when used with **vinblastine**.

### Route/Dosage

Lymphoma patients should receive initial test doses of 2 units or less for the first 2 doses.
**IV, IM, Subcut (Adults and Children):** 0.25–0.5 unit/kg (10–20 units/m²) weekly or twice weekly initially. If favorable response, lower maintenance doses given (1 unit/day or 5 units/wk IM or IV). May also be given as continuous IV infusion at 0.25 unit/kg or 15 units/m²/day for 4–5 days.
**Intrapleural** (Adults): 15–20 units instilled for 4 hr, then removed.

### Availability (generic available)

**Injection:** 15 units/vial, 30 units/vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor vital signs before and frequently during therapy.
- Assess for fever and chills. May occur 3–6 hr after administration and last 4–12 hr.
- Monitor for anaphylactic (fever, chills, hypotension, wheezing) and idiosyncratic (confusion, hypotension, fever, chills, wheezing) reactions. Keep resuscitation equipment and medications on hand. Lymphoma patients are at particular risk for idiosyncratic reactions that may occur immediately or several hours after therapy, usually after the first or second dose.
- Assess respiratory status for dyspnea and rales/crackles. Monitor chest x-ray before and periodically during therapy. Pulmonary toxicity occurs primarily in geriatric patients (age 70 or older) who have received 400 or more units or at lower doses in patients who received other antineoplastics or thoracic radiation. May occur 4–10 wk after therapy. Discontinue and do not resume bleomycin if pulmonary toxicity occurs.
- Assess nausea, vomiting, and appetite. Weigh weekly. Modify diet as tolerated. Antiemetics may be given before administration.
- ***Lab Test Considerations:*** Monitor CBC before and periodically during therapy. May cause thrombocytopenia and leukopenia (nadir occurs in 12 days and usually returns to pretreatment levels by day 17).
- Monitor baseline and periodic renal and hepatic function.

## Potential Nursing Diagnoses

Risk for injury (Side Effects)
Disturbed body image (Side Effects)

## Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- Lymphoma patients should receive a 1- or 2-unit test dose 2–4 hr before initiation of therapy. Monitor closely for anaphylactic reaction. May not detect reactors.
- Premedication with acetaminophen, corticosteroids, and diphenhydramine may reduce drug fever and risk of anaphylaxis.
- Reconstituted solution is stable for 24 hr at room temperature and for 14 days if refrigerated.
- **IM, Subcut:** Reconstitute vial with 1–5 mL of sterile water for injection, 0.9% NaCl, or bacteriostatic water for injection. Do not reconstitute with diluents containing benzyl alcohol when used for neonates.

### IV Administration

- **Intermittent Infusion:** Prepare IV doses by diluting 15-unit vial with at least 5 mL of 0.9% NaCl. ***Diluent:*** Further dilute dose in 50 to 1000 mL of D5W or 0.9% NaCl. ***Rate:*** Administer slowly over 10 min.
- **Y-Site Compatibility:** allopurinol, amifostine, aminocaproic acid, aminophylline, amiodarone, anidulafungin, atracurium, aztreonam, bivalirudin, bumetanide, busulfan, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefepime, chlorpromazine, cimetidine, cisatracurium, cisplatin, codeine, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxorubicin liposome, droperidol, enalaprilat, epinephrine, epirubicin, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, filgrastim, fludarabine, fluorouracil, fospehnytoin, furosemide, gemcitabine, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, idarubicin, ifosfamide, inamrinone, insulin, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, mesna, metaraminol, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, milrinone, mitomycin, mitoxantrone, naloxone, nesiritide, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pantoprazole, pemetrexed, phentolamine, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphates, procainamide, quinupristin/dalfopristin, rituximab, sargramostim, sodium acetate, teniposide, thiotepa, tirofiban, trastuzumab, vinblastine, vincristine, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** amphotericin B liposome, dantrolene, phenytoin, tigecycline.
- **Intrapleural:** Dissolve 60 units in 50–100 mL of 0.9% NaCl.
- May be administered through thoracotomy tube. Position patient as directed.

## Patient/Family Teaching

- Instruct patient to notify health care professional if fever, chills, wheezing, faintness, diaphoresis, shortness of breath, prolonged nausea and vomiting, or mouth sores occur.
- Encourage patient not to smoke because this may worsen pulmonary toxicity.
- Explain to the patient that skin toxicity may manifest itself as skin sensitivity, hyperpigmentation (especially at skin folds and points of skin irritation), and skin rashes and thickening.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Opioid analgesics may be required if pain interferes with eating.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient of the need for contraception during therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

## Evaluation/Desired Outcomes

- Decrease in tumor size without evidence of hypersensitivity or pulmonary toxicity.

## bortezomib (bor-tez-o-mib)

Velcade

***Classification***

Therapeutic: antineoplastics
Pharmacologic: proteasome inhibitors

**Pregnancy Category D**

### Indications

Multiple myeloma (as initial therapy or after progression); with melphalan and prednisone). Mantle cell lymphoma after at least one other therapy.

### Action

Inhibits proteasome, a regulator of intracellular protein catabolism, resulting in disruption of various intracellular processes. Cytotoxic to a variety of cancerous cells. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver (P450 enzymes); excretion is unknown.
**Half-life:** 9–15 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | 38 days* | unknown |

*Median time to response based on clinical parameters

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to bortezomib, boron, or mannitol; OB: Potential fetal harm.; Lactation: Potential for serious adverse reaction in nursing infants.
**Use Cautiously in:** OB: Women with childbearing potential; Hepatic impairment (may ↑ levels, risk of toxicity); History of or risk factors for CHF; Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** fatigue, malaise, weakness, dizziness, syncope. **EENT:** blurred vision, diplopia. **CV:** hypotension, CHF. **Resp:** pneumonia. **GI:** anorexia, constipation, diarrhea, nausea, vomiting. **Hemat:** BLEEDING, anemia, neutropenia, thrombocytopenia. **Neuro:** peripheral neuropathy. **Misc:** fever, tumor lysis syndrome.

### Interactions

**Drug-Drug:** Concurrent neurotoxic medications including **amiodarone**, some **antivirals**, **nitrofuratoin**, **isoniazid**, or **HMG-CoA reductase inhibitors** may ↑ risk of peripheral neuropathy.

### Route/Dosage

**IV (Adults):** 1.3 mg/m² twice weekly for 2 wk (days 1, 4, 8, and 11) followed by a 10-day rest; further cycles/doses depend on response and toxicity.

### Availability

**Lyophilized powder for injection (requires reconstitution):** 3.5 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor vital signs frequently during therapy. May cause fever and orthostatic hypotension requiring adjustment of antihypertensives, hydration, or administration of mineralocorticoids.
- Monitor for GI adverse effects. May require antidiarrheals, antiemetics, and fluid and electrolyte replacement to prevent dehydration. Weigh weekly; modify diet as tolerated.
- Monitor for signs and symptoms of tumor lysis syndrome (tachypnea, tachycardia, hypotension, pulmonary edema). Patients with high tumor burden prior to treatment are at increased risk.
- ***Lab Test Considerations:*** Monitor CBC and platelet count frequently during therapy. The nadir of thrombocytopenia is day 11 and recovery is usually by next cycle. Occurs more commonly in cycles 1 and 2, but may occur throughout therapy. May require discontinuation of therapy.
- Monitor blood glucose levels closely in patients taking oral hypoglycemic agents; may require adjustment of antidiabetic agent dose.

### Potential Nursing Diagnoses

Risk for injury (Adverse Reactions)

### Implementation

- Should be administered under the supervision of a physician experienced in the use of antineoplastic therapy.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask, while handling medication. Discard equipment in specially designated containers.

### IV Administration

- **Direct IV:** Reconstitute each vial with 3.5 mL of 0.9% NaCl. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. Administer reconstituted solution within 8 hr at room temperature; 3 of the 8 hr may be stored in a syringe. ***Rate:*** Administer as a bolus injection twice weekly for 2 wk followed by a 10-day rest period. At least 72 hr should elapse between consecutive doses.
- *If peripheral neuropathy is Grade 1 (paresthesia or loss of reflexes without pain or loss of function)* continue prescribed dose. *If paresthesia is Grade 1 with pain or Grade 2 (interfering with function but not with daily activities)* reduce dose to 1.0 mg/m$^2$. *If peripheral neuropathy is Grade 2 with pain or Grade 3 (interfering with activities of daily living)* withhold dose until toxicity resolves, then re-initiate with a reduced dose of 0.7 mg/m$^2$ and decrease frequency to once/wk. *If peripheral neuropathy is Grade 4 (permanent sensory loss that interferes with daily function)* discontinue bortezomib.

### Patient/Family Teaching

- Caution the patient that dehydration may occur with vomiting or diarrhea. Advise patient to maintain fluid intake and to notify health care professional if dizziness or fainting occurs.
- Instruct patient to contact health care professional if they experience new or worsening signs of peripheral neuropathy.
- May cause dizziness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional before taking Rx, OTC, or herbal products.
- Advise patient of the need for contraception and to avoid breastfeeding during therapy.

### Evaluation/Desired Outcomes

- Decrease in serum and urine myeloma protein.
- Decrease in size and spread of malignancy.

## BRONCHODILATORS (XANTHINES)

**aminophylline** (am-in-**off**-i-lin)
Phyllocontin, Truphylline

**theophylline** (thee-**off**-i-lin)
Apo-Theo LA, Novo-Theophyl SR, PMS-Theophylline, Pulmophylline, Quibron-T, Theochron, Theo-24, Uniphyl

***Classification***
Therapeutic: bronchodilators
Pharmacologic: xanthines

**Pregnancy Category C**

### Indications

Long-term control of reversible airway obstruction caused by asthma or COPD. Increases diaphragmatic contractility (aminophylline). **Unlabeled Use:** Respiratory and myocardial stimulant in premature infant apnea (apnea of prematurity) (aminophylline).

### Action

Inhibit phosphodiesterase, producing increased tissue concentrations of cyclic adenosine monophosphate (cAMP). Increased levels of cAMP result in: Bronchodilation, CNS stimulation, Positive inotropic and chronotropic effects, Diuresis, Gastric acid secretion. **Therapeutic Effects:** Bronchodilation.

### Pharmacokinetics

**Absorption:** Aminophylline releases theophylline after administration. Well absorbed from oral dosage forms; absorption from extended-release dosage forms is slow but complete.
**Distribution:** Widely distributed; crosses the placenta; breast milk concentrations are 70% of plasma levels; not distributed into adipose tissue.
**Metabolism and Excretion:** Aminophylline is converted to theophylline; theophylline is 90% metabolized by the liver to several metabolites (including the active metabolites, caffeine and 3–methylxanthine) which may accumulate in neonates; metabolites are renally excreted; 10% excreted unchanged by the kidneys.
**Half-life:** *Theophylline*— Premature infants: 20–30 hr; Term infants: 11–25 hr; Children 1–4 yr: 3.4 hr; Children 6–17 yr: 3.7 hr; Adults: 9–10 hr (increased in patients >60 yr, patients with CHF or liver disease; decreased in cigarette smokers).

TIME/ACTION PROFILE (bronchodilation)

| ROUTE | ONSET† | PEAK | DURATION |
|---|---|---|---|
| Aminophylline PO | 15–60 min | 1–2 hr | 6–8 hr |
| Aminophylline PO–ER | unknown | 4–7 hr | 8–12 hr |
| Aminophylline IV | rapid | end of infusion | 6–8 hr |
| Theophylline PO | rapid | 1–2 hr | 6 hr |

| | | | |
|---|---|---|---|
| Theophylline PO–ER | delayed | 4–8 hr | 8–24 hr |
| Theophylline IV | rapid | end of infusion | 6–8 hr |

†Provided that a loading dose has been given and steady-state blood levels exist

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to aminophylline or theophylline.

**Use Cautiously in:** CHF, liver disease, or hypothyroidism (dosage reduction required); Cardiac arrhythmias; Peptic ulcer disease; Seizure disorder; OB: Has been used safely; Lactation: Safety not established; Pedi: Dosage reduction required in children <1 yr; Geri, OB: Dosage reduction required due to enhanced potential for adverse reaction.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, anxiety, headache, insomnia, irritability. **CV:** ARRHYTHMIAS, tachycardia, angina, palpitations. **GI:** nausea, vomiting, anorexia. **Neuro:** tremor. **Derm:** rashes.

## Interactions

**Drug-Drug:** Additive CV and CNS side effects with **adrenergics (sympathomimetic)**. May ↓ the therapeutic effect of **lithium** and **phenytoin**. **Nicotine** (cigarettes, gum, transdermal patches), **barbiturates**, **phenytoin**, **nevirapine**, and **rifampin** may ↑ metabolism and may ↓ effectiveness. **Erythromycin**, **beta blockers**, **clarithromycin**, **calcium channel blockers**, **cimetidine**, **doxycycline**, **estrogens**, **hormonal contraceptives**, **disulfiram**, **fluvoxamine**, **isoniazid**, **ketoconazole**, **mexiletine**, **nefazodone**, **protease inhibitors**, **quinidine**, some **fluoroquinolones**, and large doses of **allopurinol** ↓ metabolism and may lead to toxicity.

**Drug-Natural Products:** Caffeine-containing herbs (**cola nut**, **guarana**, **maté**, **tea**, **coffee**) may ↑ serum levels and risk of CNS and cardiovascular side effects. ↓ serum levels and effectiveness with **St. John's wort**.

**Drug-Food:** Excessive regular intake of **charcoal-broiled foods** may ↓ effectiveness.

## Route/Dosage

Dose should be determined by theophylline serum level monitoring. Loading dose should be decreased or eliminated if theophylline preparation has been used in preceding 24 hr. Aminophylline is 80% theophylline (100 mg aminophylline = 80 mg theophylline). Extended-release (controlled-release, sustained-release) products may be given q 8–24 hr, depending upon the formulation.

### Aminophylline

**PO (Adults and Children):** See theophylline for oral doses.

**IV (Adults):** *Loading dose*—6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.7 mg/kg/hr (0.56 mg/kg/hr of theophylline) via continuous infusion (non-smokers); an infusion rate of 0.9 mg/kg/hr (0.72 mg/kg/hr of theophylline) should be used for smokers.

**IV (Geriatric Patients and Adult Patients with Cor Pulmonale):** *Loading dose*—6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.6 mg/kg/hr (0.47 mg/kg/hr of theophylline) via continuous infusion.

**IV (Adults with CHF or Liver Failure):** *Loading dose*—6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.5 mg/kg/hr (0.39 mg/kg/hr of theophylline) via continuous infusion.

**IV (Children 12–16 yr ):** *Loading dose:* 6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.7 mg/kg/hr (0.56 mg/kg/hr of theophylline) via continuous infusion.

**IV (Children 9–12 yr):** *Loading dose:* 6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.9 mg/kg/hr (0.72 mg/kg/hr of theophylline) via continuous infusion.

**IV (Children 1–9 yr):** *Loading dose:* 6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 1–1.2 mg/kg/hr (0.8–0.96 mg/kg/hr of theophyllne) via continuous infusion.

**IV (Children 6 mo–1 yr):** *Loading dose:* 6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.6–0.7 mg/kg/hr (0.48–0.56 mg/kg/hr of theophylline) via continuous infusion.

**IV (Infants 6 wk–6 mo):** *Loading dose*—6 mg/kg (4.7 mg/kg of theophylline) given over 20–30 min, followed by 0.5 mg/kg/hr (0.4 mg/kg/hr of theophylline) via continuous infusion.

### Theophylline

**PO (Adults Healthy, Non-smoking):** *Loading dose*—5 mg/kg, followed by 10 mg/kg/day divided q 8–12 hr (not to exceed 900 mg/day).

**PO (Adults with CHF, Cor Pulmonale, or Liver Dysfunction):** *Loading dose*—5 mg/kg, followed by 5 mg/kg/day divided q 8–12 hr (not to exceed 400 mg/day).

**PO (Children 12–16 yr, Non-smoking):** *Loading dose*—5 mg/kg, followed by 13 mg/kg/day divided q 8–12 hr.
**PO (Children 9–12 yr, adolescent and adult smokers < 50 yr):** *Loading dose*—5 mg/kg, followed by 16 mg/kg/day divided q 8–12 hr.
**PO (Children 1–9 yr):** *Loading dose*—5 mg/kg, followed by 20–24 mg/kg/day divided q 8–12 hr.
**PO (Infants 6 mo–1 yr):** *Loading dose*—5 mg/kg, followed by 12–18 mg/kg/day divided q 6–8 hr.
**PO (Infants 6 wk–6 mo):** *Loading dose*—5 mg/kg, followed by 10 mg/kg/day divided q 6–8 hr.
**PO (Neonates up to 6 wk):** *Loading dose*—4 mg/kg, followed by 4 mg/kg/day divided q 12 hr.
**IV (Adults and Children):** See aminophylline for IV doses.

### Availability

#### Aminophylline (generic available)

**Tablets:** 100 mg, 200 mg. **Extended-release tablets:** 225 mg, 350 mg. **Oral solution:** 105 mg/5 mL. **Suppositories:** 250 mg, 500 mg. **Injection:** 25 mg/mL.

#### Theophylline (generic available)

**Sustained-release tablets (8–12 hr):** 300 mg. **Extended-release tablets (12–24 hr):** 100 mg, 200 mg, 300 mg, 450 mg. **Controlled-release tablets (24 hr):** 400 mg, 600 mg. **Extended-release capsules (12 hr):** 125 mg, 200 mg, 300 mg. **Extended-release capsules (24 hr):** 100 mg, 200 mg, 300 mg, 400 mg. **Elixir (orange/raspberry, mixed fruit, and other flavors):** 80 mg/15 mL. **Injection (with dextrose):** 0.8 mg/mL, 1.6 mg/mL, 2 mg/mL, 3.2 mg/mL, 4 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess blood pressure, pulse, respiratory status (rate, lung sounds, use of accessory muscles, number and severity of apnea spells in infants) before and throughout therapy. Ensure that oxygen therapy is correctly instituted during acute asthma attacks.
- Monitor intake and output ratios for an increase in diuresis or fluid overload.
- Patients with a history of cardiovascular problems should be monitored for chest pain and ECG changes (PACs, supraventricular tachycardia, PVCs, ventricular tachycardia). Resuscitative equipment should be readily available.
- Monitor pulmonary function tests before and periodically during therapy to determine therapeutic efficacy in patients with chronic bronchitis or emphysema.
- ***Lab Test Considerations:*** Monitor ABGs, acid-base, and fluid and electrolyte balance in patients receiving parenteral therapy or whenever required by patient's condition.
- ***Toxicity and Overdose:*** Monitor drug levels routinely, especially in patients requiring high doses or during prolonged intensive therapy. Serum sample should be obtained at time of peak absorption. Peak levels should be evaluated 30 min after a 30 min IV loading dose, 12–24 hr after initiation of a continuous infusion and 1–2 hr after rapid-acting oral forms, and 4–12 hr after extended-release oral forms. Therapeutic plasma levels range from 10–15 mcg/mL for asthma and 6–14 mcg/mL for apnea of prematurity. Drug levels in excess of 20 mcg/mL are associated with toxicity. Caffeine ingestion may falsely elevate drug concentration levels.
- Observe patient for symptoms of drug toxicity (anorexia, nausea, vomiting, stomach cramps, diarrhea, confusion, headache, restlessness, flushing, increased urination, insomnia, tachycardia, arrhythmias, seizures). Notify physician or other health care professional immediately if these occur. Tachycardia, ventricular arrhythmias, or seizures may be the first sign of toxicity. Geri: Patients over 60 yr have increased risk of toxicity and sensitivity to toxic effects due to age-related pharmacodynamic and pharmacokinetic changes. Theophylline doses should not exceed 400 mg/d. Assess frequently.

### Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Activity intolerance (Indications)

### Implementation

- Administer around the clock to maintain therapeutic plasma levels. Once-a-day doses should be administered in the morning.
- Do not refrigerate elixirs; crystals may form. Crystals should dissolve when liquid is warmed to room temperature.
- Wait at least 4–6 hr after stopping IV therapy to begin immediate-release oral dosage; for extended-release oral dosage form, give first oral dose at time of IV discontinuation.
- **PO:** Administer oral preparations with food or a full glass of water to minimize GI irritation. Food slows but does not reduce the extent of absorption. May be administered 1 hr before or 2 hr after meals for more rapid absorption.

Swallow tablets whole; do not crush, break, or chew enteric-coated or extended-release tablets (extended-release tablets may be broken if scored). Pedi: Use calibrated measuring device to ensure accurate dose of liquid preparations.

## Aminophylline

### IV Administration

- **IV:** ***Diluent:*** May be diluted in D5W, D10W, D20W, 0.9% NaCl, 0.45% NaCl, D5/0.9% NaCl, D5/0.45% NaCl, D5/0.25% NaCl, or LR. ***Concentration:*** 1 mg/mL (maximum 25 mg/mL). Mixture is stable for 24 hr if refrigerated.
- Do not administer discolored or precipitated solution. Flush main IV line before administration.
- If extravasation occurs, local injection of 1% procaine and application of heat may relieve pain and promote vasodilation.
- **Loading Dose:** Administer over 20–30 min.
- ***Rate:*** Do not exceed 20–25 mg/min in adults or 0.36 mg/kg/min in children. Administer via infusion pump to ensure accurate dosage. Rapid administration may cause chest pain, dizziness, hypotension, tachypnea, flushing, arrhythmias, or a reaction to the solution or administration technique (chills; fever; redness, pain, or swelling at injection site).
- **Continuous Infusion:** Usually given as a loading dose in a small volume followed by continuous infusion in larger volume.
- ***Rate:*** See Route and Dosage section for rates.
- **Syringe Compatibility:** heparin, metoclopramide.
- **Syringe Incompatibility:** doxapram.
- **Y-Site Compatibility:** allopurinol, amifostine, amphotericin B cholesteryl sulfate complex, ceftazidime, cimetidine, cladribine, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide, famotidine, filgrastim, fluconazole, fludarabine, foscarnet, gemcitabine, granisetron, inamrinone, labetalol, melphalan, meropenem, morphine, paclitaxel, pancuronium, piperacillin/tazobactam, potassium chloride, propofol, ranitidine, remifentanil, sargramostim, tacrolimus, teniposide, thiotepa, tolazoline, vecuronium, vitamin B complex with vitamin C.
- **Y-Site Incompatibility:** amiodarone, ciprofloxacin, dobutamine, hydralazine, ondansetron, vinorelbine, warfarin.
- **Additive Incompatibility:** Admixing is not recommended because of dose titration and incompatibilities.

## Theophylline

### IV Administration

- **Continuous Infusion:** Premixed IV theophylline and 5% dextrose are packed in a moisture-barrier overwrap. Remove immediately before administration and squeeze bag to check for leaks. Discard if solution is not clear.
- **Loading Dose:** Administer over 20–30 min. If patient has had another form of theophylline before loading dose, serum theophylline level should be obtained and loading dose proportionately reduced.
- ***Rate:*** Do not exceed 20–25 mg/min. Rapid administration may cause chest pain, dizziness, hypotension, tachypnea, flushing, arrhythmias, or a reaction to the solution or administration technique (chills; fever; redness, pain, or swelling at injection site). Infusion rate may be increased after 12 hr. Administer via infusion pump to ensure accurate dosage. Monitor ECG continuously; tachyarrhythmias may occur.
- **Y-Site Compatibility:** acyclovir, ampicillin, ampicillin/sulbactam, aztreonam, cefazolin, cefotetan, ceftazidime, ceftriaxone, cimetidine, cisatracurium, clindamycin, diltiazem, dobutamine, dopamine, doxycycline, erythromycin lactobionate, famotidine, fluconazole, gentamicin, haloperidol, heparin, hydrocortisone sodium succinate, lidocaine, methyldopate, methylprednisolone sodium succinate, metronidazole, midazolam, milrinone, nafcillin, nitroglycerin, nitroprusside, penicillin G potassium, piperacillin, potassium chloride, ranitidine, remifentanil, ticarcillin, ticarcillin/clavulanate, tobramycin, vancomycin.
- **Y-Site Incompatibility:** hetastarch, phenytoin.
- **Additive Incompatibility:** Admixing is not recommended because of dose titration and incompatibilities .

## Patient/Family Teaching

- Emphasize the importance of taking only the prescribed dose at the prescribed time intervals. Missed doses should be taken as soon as possible or omitted if close to next dose.
- Encourage the patient to drink adequate liquids (2000 mL/day minimum) to decrease the viscosity of the airway secretions.

- Advise patient to avoid OTC cough, cold, or breathing preparations without consulting health care professional. These medications may increase side effects and cause arrhythmias.
- Encourage patients not to smoke. A change in smoking habits may necessitate a change in dosage.
- Advise patient to minimize intake of xanthine-containing foods or beverages (colas, coffee, chocolate) and not to eat charcoal-broiled foods daily.
- Instruct patient not to change brands without consulting health care professional.
- Advise patient to contact health care professional promptly if the usual dose of medication fails to produce the desired results, symptoms worsen after treatment, or toxic effects occur.
- Emphasize the importance of having serum levels routinely tested every 6–12 mo.

### Evaluation/Desired Outcomes

- Increased ease in breathing.
- Clearing of lung fields on auscultation.
- Respiratory and myocardial stimulation in apnea of infancy (aminophylline).

**budesonide, See CORTICOSTEROIDS (INHALATION).**

**budesonide, See CORTICOSTEROIDS (NASAL).**

**budesonide, See CORTICOSTEROIDS (SYSTEMIC).**

## **bumetanide** (byoo-**met**-a-nide)

Bumex, Burinex

***Classification***

Therapeutic: diuretics
Pharmacologic: loop diuretics

**Pregnancy Category C**

### Indications

Edema due to heart failure, hepatic disease, or renal impairment.

### Action

Inhibits the reabsorption of sodium and chloride from the loop of Henle and distal renal tubule. Increases renal excretion of water, sodium chloride, magnesium, potassium, and calcium. Effectiveness persists in impaired renal function.
**Therapeutic Effects:** Diuresis and subsequent mobilization of excess fluid (edema, pleural effusions).

### Pharmacokinetics

**Absorption:** Well absorbed after oral or IM administration.
**Distribution:** Widely distributed.
**Protein Binding:** 72–96%.
**Metabolism and Excretion:** Partially metabolized by liver; 50% eliminated unchanged by kidneys and 20% excreted in feces.
**Half-life:** 60–90 min (6 hr in neonates).

TIME/ACTION PROFILE (diuretic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–60 min | 1–2 hr | 4–6 hr |
| IM | 30–60 min | 1–2 hr | 4–6 hr |
| IV | 2–3min | 15–45 min | 2–3 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with thiazides and sulfonamides may occur; Hepatic coma or anuria.
**Use Cautiously in:** Severe liver disease (may precipitate hepatic coma; concurrent use with potassium-sparing diuretics may be necessary); Electrolyte depletion; Diabetes mellitus; Increasing azotemia; Lactation, Pedi: Safety not established; bumetanide is a potent displacer of bilirubin and should be used cautiously in critically ill or jaundiced neonates because of risk of kernicterus. Injection contains benzyl alcohol, which may cause gasping syndrome in neonates; Geri: May have increased risk of side effects, especially hypotension and electrolyte imbalance, at usual doses.

### Adverse Reactions/Side Effects

**CNS:** dizziness, encephalopathy, headache. **EENT:** hearing loss, tinnitus. **CV:** hypotension. **GI:** diarrhea, dry mouth, nausea, vomiting. **GU:** excessive urination. **Derm:** photosensitivity, pruritis, rash. **Endo:** hyperglycemia, hyperuricemia. **F and E:** dehydration, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, hypovolemia, metabolic alkalosis. **MS:** arthralgia, muscle cramps, myalgia. **Misc:** increased BUN.

### Interactions

**Drug-Drug:** ↑ hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. ↑ risk of hypokalemia with other **diuretics**, **amphotericin B**, **stimulant laxatives**, and **corticosteroids**. Hypokalemia may ↑ risk of **digoxin** toxicity and ↑ risk of arrhythmia in

patients taking drugs that prolong the QT interval. ↓ **lithium** excretion, may cause **lithium** toxicity. ↑ risk of ototoxicity with **aminoglycosides**. **NSAIDS** ↓ effects of bumetanide.

### Route/Dosage

**PO (Adults):** 0.5–2 mg/day given in 1–2 doses; titrate to desired response (maximum daily dose = 10 mg/day).
**IM, IV (Adults):** 0.5–1 mg/dose, may repeat q 2–3 hr as needed (up to 10 mg/day).

### Availability (generic available)

**Tablets:** 0.5 mg, 1 mg, 2 mg, 5 mg. **Cost:** *Generic*—0.5 mg $37.32/100, 1 mg $31.31/100, 2 mg $49.97/100. **Injection:** 0.25 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess fluid status during therapy. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes. Notify physician or other health care professional if thirst, dry mouth, lethargy, weakness, hypotension, or oliguria occurs.
- Monitor blood pressure and pulse before and during administration. Monitor frequency of prescription refills to determine compliance.
- Assess patients receiving digoxin for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion; ↑ risk of digoxin toxicity due to potassium-depleting effect of diuretic. Potassium supplements or potassium-sparing diuretics may be used concurrently to prevent hypokalemia.
- Assess patient for tinnitus and hearing loss. Audiometry is recommended for patients receiving prolonged high-dose IV therapy. Hearing loss is most common after rapid or high-dose IV administration in patients with decreased renal function or those taking other ototoxic drugs.
- Assess for allergy to sulfonamides.
- Geri: Diuretic use is associated with increased risk for falls in older adults. Assess falls risk and implement fall prevention strategies.
- ***Lab Test Considerations:*** Monitor electrolytes, renal and hepatic function, serum glucose, and uric acid levels before and periodically during therapy. May cause ↓ serum sodium, potassium, calcium, and magnesium concentrations. May also cause ↑ BUN, serum glucose, creatinine, and uric acid levels.

### Potential Nursing Diagnoses

Excess fluid volume (Indications)
Risk for deficient fluid volume (Side Effects)

### Implementation

- Do not confuse Bumex (bumetanide) with Buprenex (buprenorphine).
- If administering twice daily, give last dose no later than 5pm to minimize disruption of sleep cycle.
- IV is preferred over IM for parenteral administration.
- **PO:** May be taken with food to minimize gastric irritation.

#### IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 0.25 mg/mL. ***Rate:*** Administer slowly over 1–2 min.
- **Continuous Infusion:** ***Diluent:*** May dilute in D5W or 0.9% NaCl. May also administer as undiluted drug. Protect from light. ***Concentration:*** Not to exceed 0.25 mg/mL. ***Rate:*** Infuse over 5 min. May be administered over 12 hr for patients with renal impairment.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amiodarone, atropine, aztreonam, bivalirudin, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, cisatracurium, clindamycin, cyclosporine, daptomycin, dexamethasone, dexmedetomidate, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fentanyl, filgrastim, fluconazole, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, milrinone, morphine, nafcillin, nitroglycerin, nitroprusside, norepinephrine, ondansetron, palonosetron, pantoprazole, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, ranitidine, rifampin, sodium bicarbonate, tacrolimus, ticarcillin/clavulanate, tirofi-

ban, tobramycin, vancomycin, vasopressin, verapamil, voriconazole.
- **Y-Site Incompatibility:** diazepam, fenoldopam, ganciclovir, haloperidol, nesiritide, phenytoin, quinupristin/dalfopristin, sulfamethoxazole/trimethoprim.

### Patient/Family Teaching
- Instruct patient to take bumetanide as directed. Take missed doses as soon as possible; do not double doses.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Caution patient that drinking alcohol, exercising during hot weather, or standing for long periods may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding a diet high in potassium. See Appendix M.
- Advise patient to contact health care professional of gain more than 3 lbs in one day.
- Advise patient to consult health care professional before taking Rx, OTC, or herbal products concurrently with therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to contact health care professional immediately if muscle weakness, cramps, nausea, dizziness, numbness, or tingling of extremities occurs.
- Advise patients with diabetes to monitor blood glucose closely; may cause increased levels.
- Emphasize the importance of routine follow-up examinations.
- Geri: Caution older patients or their caregivers about increased risk for falls. Suggest strategies for fall prevention.

### Evaluation/Desired Outcomes
- Decrease in edema.
- Decrease in abdominal girth and weight.
- Increase in urinary output.

**bupivacaine, See EPIDURAL LOCAL ANESTHETICS.**

HIGH ALERT

## buprenorphine
(byoo-pre-**nor**-feen)
Buprenex, Subutex

***Classification***
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists/antagonists

**Schedule III**

**Pregnancy Category C**

### Indications
**IM, IV:** Management of moderate to severe acute pain. **SL:** Treatment of opioid dependence; suppresses withdrawal symptoms in opioid detoxification.

### Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Has partial antagonist properties that may result in opioid withdrawal in physically dependent patients when used as an analgesic. **Therapeutic Effects: IM, IV:** Decreased severity of pain. **SL:** Suppression of withdrawal symptoms during detoxification and maintenance from heroin or other opioids. Produces a relatively mild withdrawal compared to other agents.

### Pharmacokinetics
**Absorption:** Well absorbed after IM and SL use; IV administration results in complete bioavailability.
**Distribution:** Crosses the placenta; enters breast milk. CNS concentration is 15–25% of plasma.
**Protein Binding:** 96%.
**Metabolism and Excretion:** Mostly metabolized by the liver mostly via the CYP3A4 enzyme system; one metabolite is active.
**Half-life:** 2–3 hr (parenteral).

TIME/ACTION PROFILE (analgesia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | 15 min | 60 min | 6 hr† |
| IV | rapid | less than 60 min | 6 hr† |

†4–5 hr in children

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Lactation: Enters breast milk; avoid use or discontinue nursing.
**Use Cautiously in:** Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Debilitated patients (dose reduction required); Undiagnosed abdominal pain; Prostatic hyperplasia; OB: Safety not established; neonatal withdrawal may occur in infants born to patients receiving SL buprenorphine during pregnancy; Geri: Dose reduction required.

### Adverse Reactions/Side Effects

**CNS:** confusion, dysphoria, hallucinations, sedation, dizziness, euphoria, floating feeling, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis (high doses). **Resp:** respiratory depression. **CV:** hypertension, hypotension, palpitations. **GI:** nausea, constipation, dry mouth, ileus, vomiting. **GU:** urinary retention. **Derm:** sweating, clammy feeling. **Misc:** physical dependence, psychological dependence, tolerance.

### Interactions

**Drug-Drug:** Use with extreme caution in patients receiving **MAO inhibitors** ( ↑ CNS and respiratory depression and hypotension— ↓ buprenorphine dose by 50%; may need to ↓ **MAO inhibitor** dose). ↑ CNS depression with **alcohol**, **antihistamines**, **antidepressants**, and **sedative/hypnotics**. May ↓ effectiveness of other **opioid analgesics**. Inhibitors of the CYP3A4 enzyme system including **azole antifungals (itraconazole, ketoconazole)**, **erythromycin**, **protease inhibitor antiretrovirals (ritonavir, indinavir, saquinavir)** ↑ blood levels and effects; dose reduction may be necessary during concurrent use. Inducers of the CYP3A4 enzyme system including **carbamazepine**, **rifampin**, or **phenytoin** ↓ blood levels and effects; dose modification may be necessary during concurrent use. Concurrent abuse of IV buprenorphine and **benzodiazepines** may result in coma and death. **Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

### Route/Dosage

#### Analgesia

**IM, IV (Adults):** 0.3 mg q 4–6 hr as needed. May repeat initial dose after 30 min (up to 0.3 mg q 4 hr or 0.6 mg q 6 hr); 0.6-mg doses should be given only IM.
**IM, IV (Children 2–12 yr):** 2–6 mcg (0.002–0.006 mg)/kg q 4–6 hr.

#### Treatment of opioid dependence

**SL (Adults):** 12–16 mg/day as a single dose.

#### Availability (generic available)

**Sublingual tablets:** 2 mg, 8 mg. ***In combination with:*** naloxone (Suboxone). See Appendix B. **Injection:** 300 mcg (0.3 mg)/mL.

## NURSING IMPLICATIONS

### Assessment

- **Pain:** Assess type, location, and intensity of pain before and 1 hr after IM and 5 min (peak) after IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Single doses of 600 mcg (0.6 mg) should be administered IM. Patients requiring doses higher than 600 mcg (0.6 mg) should be converted to an opioid agonist. Buprenorphine is not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Assess level of consciousness, blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Buprenorphine 0.3–0.4 mg has approximately equal analgesic and respiratory depressant effects to morphine 10 mg.
- Assess previous analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, increased blood pressure and temperature) in patients who are physically dependent on opioid agonists. Symptoms may occur up to 15 days after discontinuation and persist for 1–2 wk.
- Buprenorphine has a lower potential for dependence than other opioids; however, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients receiving buprenorphine for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- **Opioid Dependence:** Assess patient for signs and symptoms of opioid withdrawal before and during therapy.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase levels.
- Monitor liver function tests prior to and periodically during therapy for opioid dependence.

- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 1–2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Naloxone may not completely reverse respiratory depressant effects of buprenorphine; may require mechanical ventilation, oxygen, IV fluids, and vasopressors.

## Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)
Ineffective coping (Indications)

## Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, route of administration, and infusion pump programming. Do not confuse Buprenex (buprenorphine) with Bumex (bumetanide).
- **Pain:** Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics has additive effects and may permit lower opioid doses.
- **SL:** Administer sublingually. Usually takes 2–10 min for tablets to dissolve. If more than one tablet is prescribed, place multiple tablets under the tongue or 2 at a time until all tablets are dissolved. Do not chew or swallow; decreases amount of medication absorbed.
- **IM:** Administer IM injections deep into well-developed muscle. Rotate sites of injections.

### IV Administration

- **Direct IV:** May give IV undiluted. ***High Alert:*** Administer slowly. Rapid administration may cause respiratory depression, hypotension, and cardiac arrest. ***Rate:*** Give over at least 2 minutes.
- **Syringe Compatibility:** glycopyrrolate, heparin, midazolam.
- **Y-Site Compatibility:** allopurinol, amifostine, aztreonam, cefipime, cisatracurium, cladribine, docetaxel, etoposide phosphate, filgrastim, gemcitabine, granisetron, linezolid, melphalan, oxaliplatin, pemetrexed, piperacillin/tazobactam, propofol, remifentanil, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate, doxorubicin liposome.
- **Solution Compatibility:** 0.9% NaCl, D5W, D5/0.9% NaCl, lactated Ringer's injection, Ringer's injection.
- **Opioid Dependence:** Must be prescribed by health care professional with special training. Induction is usually started with buprenorphine (Subutex) over 3–4 days. Initial dose should be administered at least 4 hr after last opioid dose and preferably when early signs of opioid whitdrawal appear. Once patient is on a stable dose, maintenance therapy with buprenorphine/naloxone (Suboxone) is preferred for continued, unsupervised treatment.

## Patient/Family Teaching

- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to notify health care professional before taking other Rx or OTC medication or herbal products.
- **Pain:** Instruct patient on how and when to ask for pain medication.
- Encourage patients on bedrest to turn, cough, and deep-breathe every 2 hr to prevent atelectasis.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- **Opioid Dependence:** Instruct patient in the correct use of medication; directions for use must be followed exactly. Medication must be used regularly, not occasionally. Take missed doses as soon as remembered; if almost time for next dose, skip missed dose and return to regular dosing schedule. Do not take 2 doses at once unless directed by health care professional. Do not discontinue use without consulting health care professional; abrupt discontinuation may cause withdrawal symptoms. If

medication is discontinued, flush unused tablets down the toilet.
- Caution patient that buprenorphine may be a target for people who abuse drugs; store medications in a safe place to protect them from theft. Selling or giving this medication to others is against the law.
- Caution patient that injection of *Suboxone* can lead to bad withdrawal symptoms.
- Advise patient if admitted to the emergency room to inform treating physician and emergency room staff of physical dependence on opioids and of treatment regimen.
- Advise patient to notify health care professional promptly if faintness, dizziness, confusion, slowed breathing, skin or whites of eyes turn yellow, urine turns dark, light-colored stools, decreased appetite, nausea, or abdominal pain occur.

## Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of withdrawal symptoms during detoxification and maintenance from heroin or other opioids.

# buPROPion (byoo-proe-pee-on)

Aplenzin, Budeprion SR, Budeprion XL, Wellbutrin, Wellbutrin SR, Wellbutrin XL, Zyban

***Classification***

Therapeutic: antidepressants, smoking deterrents
Pharmacologic: aminoketones

**Pregnancy Category B**

## Indications

Treatment of depression (with psychotherapy). Depression in patients with seasonal affective disorder (XL only). Smoking cessation (Zyban only). **Unlabeled Use:** Treatment of ADHD in adults (SR only). To increase sexual desire in women.

## Action

Decreases neuronal reuptake of dopamine in the CNS. Diminished neuronal uptake of serotonin and norepinephrine (less than tricyclic antidepressants). **Therapeutic Effects:** Diminished depression. Decreased craving for cigarettes.

## Pharmacokinetics

**Absorption:** Although well absorbed, rapidly and extensively metabolized by the liver.
**Distribution:** Unknown.
**Metabolism and Excretion:** Extensively metabolized by the liver. Some conversion to active metabolites.
**Half-life:** 14 hr (active metabolites may have longer half-lives).

TIME/ACTION PROFILE (antidepressant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–3 wk | unknown | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; History of bulimia, and anorexia nervosa; Concurrent MAO inhibitor or ritonavir therapy; Lactation: Potential for serious adverse reactions in nursing infants.
**Use Cautiously in:** Renal/hepatic impairment (↓ dose recommended); Recent history of MI; History of suicide attempt; Unstable cardiovascular status; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; this risk appears to be greater in adolescents or children; OB: Use only if benefit to patient outweighs potential risk to fetus; Geri: ↑ risk of drug accumulation; ↑ sensitivity to effects.
**Exercise Extreme Caution in:** History of seizures, head trauma or concurrent medications that ↓ seizure threshold (theophylline, antipsychotics, antidepressants, systemic corticosteroids); Severe hepatic cirrhosis (↓ dose required); Pedi: ↑ risk of suicidal thinking and behavior. Observe carefully, especially at initiation of therapy and during ↑ or ↓ in dose.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, SUICIDAL THOUGHTS/BEHAVIOR, agitation, headache, depression, hostility, insomnia, mania, psychoses. **GI:** dry mouth, nausea, vomiting, change in appetite, weight gain, weight loss. **Derm:** photosensitivity. **Endo:** hyperglycemia, hypoglycemia, syndrome of inappropriate ADH secretion. **Neuro:** tremor.

## Interactions

**Drug-Drug:** ↑ risk of adverse reactions when used with **amantadine**, **levodopa**, or **MAO inhibitors** (concurrent use of MAO inhibitors is contraindicated). ↑ risk of seizures with **phenothiazines**, **antidepressants**, **theophylline**, **corticosteroids**, **OTC stimulants/anorectics**,

or cessation of **alcohol** or **benzodiazepines** (avoid or minimize alcohol use). Blood levels ↑ by **ritonavir** (avoid concurrent use). **Carbamazepine** may ↓ blood levels and effectiveness. Concurrent use with **nicotine** replacement may cause hypertension. ↑ risk of bleeding with **warfarin**. Bupropion and one of its metabolites inhibit the CYP2D6 enzyme system and may ↑ levels and risk of toxicity from **antidepressants** (SSRIs and tricyclic), some **beta blockers**, **antiarrhythmics**, and **antipsychotics**.

### Route/Dosage

### Depression

**PO (Adults):** *Immediate-release*— 100 mg twice daily initially; after 3 days may ↑ to 100 mg 3 times daily; after at least 4 wk of therapy, may ↑ up to 450 mg/day in divided doses (not to exceed 150 mg/dose; wait at least 6 hr between doses at the 300 mg/day dose or at least 4 hr between doses at the 450-mg/day dose). *Sustained-release*— 150 mg once daily in the morning; after 3 days, may ↑ to 150 mg twice daily with at least 8 hr between doses; after at least 4 wk of therapy, may ↑ to a maximum daily dose of 400 mg given as 200 mg twice daily. *Extended-release (Wellbutrin XL)*— 150 mg once daily in the morning, may be ↑ after 4 days to 300 mg once daily; some patients may require up to 450 mg/day as a single daily dose. *Extended-release (Aplenzin)*— 174 mg once daily in the morning, may be ↑ after 4 days to 348 mg once daily; some patients may require up to 522 mg/day as a single daily dose.

### Seasonal Affective Disorder

**PO (Adults):** 150 mg/day in the morning; if dose is well tolerated, ↑ to 300 mg/day in one wk. Doses should be tapered to 150 mg/day for 2 wk before discontinuing.

### Smoking cessation

**PO (Adults):** *Zyban*— 150 mg once daily for 3 days, then 150 mg twice daily for 7–12 wk (doses should be at least 8 hr apart).

### Availability (generic available)

**Tablets:** 75 mg, 100 mg. **Cost:** *Generic*— 75 mg $54.99/90, 100 mg $66.99/90. **Sustained-release tablets:** 100 mg, 150 mg, 200 mg. **Cost:** *Generic*— 100 mg $189.97/180, 150 mg $163.93/180, 200 mg $334.96/180. **Extended-release tablets (Wellbutrin XL):** 150 mg, 300 mg. **Cost:** *Generic*— 150 mg $367.97/90, 300 mg $365.96/90. **Extended-release tablets (Aplenzin):** 174 mg, 348 mg, 522 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor mood changes. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess mental status and mood changes, especially during initial few months of therapy and during dose changes. Risk may be increased in children, adolescents, and adults ≤24 yrs. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, significant change in weight and/or appetite, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings of guilt or worthlessness, slowed thinking or impaired concentration, suicide attempt or suicidal ideation). Restrict amount of drug available to patient.
- ***Lab Test Considerations:*** Monitor hepatic and renal function closely in patients with kidney or liver impairment to prevent ↑ serum and tissue bupropion concentrations.

### Potential Nursing Diagnoses

Ineffective coping (Indications)

### Implementation

- Do not confuse bupropion with buspirone. Do not administer bupropion (Wellbutrin) with Zyban, which contain the same ingredients.
- Administer doses in equally spaced time increments during the day to minimize the risk of seizures. Risk of seizures increases four fold in doses greater than 450 mg per day.
- May be initially administered concurrently with sedatives to minimize agitation. This is not usually required after the 1st wk of therapy.
- Insomnia may be decreased by avoiding bedtime doses. May require treatment during 1st wk of therapy.
- May be administered with food to lessen GI irritation.
- Nicotine patches, gum, inhalers, and spray may be used concurrently with bupropion.
- When converting from other brands of bupropion to *Aplenzin*, 348 mg/day *Aplenzin* is equivalent to 300 mg/day bupropion HCl and 174 mg/day *Aplenzin* is equivalent to 150 mg/day bupropion HCl.
- **PO:** Sustained-release or extended-release tablets should be swallowed whole; do not break, crush, or chew.
- **Seasonal Affective Disorder:** Begin administration in autumn prior to the onset of depressive symptoms. Continue therapy through win-

ter and begin to taper and discontinue in early spring.

### Patient/Family Teaching

- Instruct patient to take bupropion as directed. Take missed doses as soon as possible and space day's remaining doses evenly at not less than 4-hr intervals. Missed doses for smoking cessation should be omitted. Do not double doses or take more than prescribed. May require 4 wk or longer for full effects. Do not discontinue without consulting health care professional. May require gradual reduction before discontinuation.
- May impair judgment or motor and cognitive skills. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior occur.
- Advise patient to avoid alcohol during therapy and to consult with health care professional before taking other medications with bupropion, such as Zyban.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Advise patient to notify health care professional if rash or other troublesome side effects occur.
- Inform patient that unused shell of XL tablets may appear in stool; this is normal.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy.
- **Smoking Cessation:** Smoking should be stopped during the 2nd week of therapy to allow for the onset of bupropion and to maximize the chances of quitting.
- Advise patient to stop taking bupropion and contact a health care professional immediately if agitation, depressed mood, and any changes in behavior that are not typical of nicotine withdrawal, or if suicidal thoughts or behavior occur.

### Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Acute episodes of depression may require several months of treatment.
- Cessation of smoking.

## busPIRone (byoo-spye-rone)

BuSpar

***Classification***

Therapeutic: antianxiety agents

**Pregnancy Category B**

### Indications

Management of anxiety.

### Action

Binds to serotonin and dopamine receptors in the brain. Increases norepinephrine metabolism in the brain. **Therapeutic Effects:** Relief of anxiety.

### Pharmacokinetics

**Absorption:** Rapidly absorbed.
**Distribution:** Unknown.
**Protein Binding:** 95% bound to plasma proteins.
**Metabolism and Excretion:** Extensively metabolized by the liver (CYP3A4 enzyme system); 20–40% excreted in feces.
**Half-life:** 2–3 hr.

TIME/ACTION PROFILE (relief of anxiety)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 7–10 days | 3–4 wk | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe hepatic or renal impairment; Concurrent use of MAO inhibitors; Ingestion of large amounts of grapefruit juice.
**Use Cautiously in:** Patients receiving other antianxiety agents (other agents should be slowly withdrawn to prevent withdrawal or rebound phenomenon); Patients receiving other psychotropics; Lactation, OB, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, excitement, fatigue, headache, insomnia, nervousness, weakness, personality changes. **EENT:** blurred vision, nasal congestion, sore throat, tinnitus, altered taste or smell, conjunctivitis. **Resp:** chest congestion, hyperventilation, shortness of breath. **CV:** chest pain, palpitations, tachycardia, hypertension, hypotension, syncope. **GI:** nausea, abdominal pain, constipation, diarrhea, dry mouth, vomiting. **GU:** changes in libido, dysuria, urinary frequency, urinary hesitancy. **Derm:** rashes, alopecia, blisters, dry skin, easy bruising, edema, flushing, pruritus. **Endo:** irregular menses. **MS:** myalgia. **Neuro:** incoordination, numbness, paresthesia, tremor. **Misc:** clamminess, sweating, fever.

### Interactions

**Drug-Drug:** Use with **MAO inhibitors** may result in hypertension and is not recommended. **Erythromycin**, **nefazodone**, **ketoconazole**, **itraconazole**, **ritonavir**, and other **inhibitors of CYP3A4** ↑ blood levels and effects of buspirone; dose reduction is recommended (decrease to 2.5 mg twice daily with erythromycin, decrease to 2.5 mg once daily with nefazodone). **Rifampin**, **dexamethasone**, **phenytoin**, **phenobarbital**, **carbamazepine**, and other **inducers of CYP3A4** ↓ blood levels and effects of buspirone; dose adjustment may be necessary. Avoid concurrent use with **alcohol**.

**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

**Drug-Food: Grapefruit juice** ↑ serum levels and effect; ingestion of large amounts of grapefruit juice is not recommended.

### Route/Dosage

**PO (Adults):** 7.5 mg twice daily; increase by 5 mg/day q 2–4 days as needed (not to exceed 60 mg/day). Usual dose is 20–30 mg/day (in 2 divided doses).

### Availability (generic available)

**Tablets:** 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg.
**Cost:** *Generic*—5 mg $79.97/180, 7.5 mg $110.97/180, 10 mg $128.99/180, 15 mg $129.40/180, 30 mg $267.93/180.

## NURSING IMPLICATIONS

### Assessment

- Assess degree and manifestations of anxiety before and periodically during therapy.
- Buspirone does not appear to cause physical or psychological dependence or tolerance. However, patients with a history of drug abuse should be assessed for tolerance or dependence. Restrict amount of drug available to these patients.

### Potential Nursing Diagnoses

Anxiety (Indications)
Risk for injury (Side Effects)

### Implementation

- Do not confuse buspirone with bupropion.
- Patients changing from other antianxiety agents should receive gradually decreasing doses. Buspirone will not prevent withdrawal symptoms.
- **PO:** May be administered with food to minimize gastric irritation. Food slows but does not alter extent of absorption.

### Patient/Family Teaching

- Instruct patient to take buspirone exactly as directed. Take missed doses as soon as possible if not just before next dose; do not double doses. Do not take more than amount prescribed.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to consult health care professional before taking OTC medications or herbal products with this drug.
- Instruct patient to notify health care professional if any chronic abnormal movements occur (dystonia, motor restlessness, involuntary movements of facial or cervical muscles) or if pregnancy is suspected.
- Emphasize the importance of follow-up exams to determine effectiveness of medication.

### Evaluation/Desired Outcomes

- Increase in sense of well-being.
- Decrease in subjective feelings of anxiety. Some improvement may be seen in 7–10 days. Optimal results take 3–4 wk of therapy. Buspirone is usually used for short-term therapy (3–4 wk). If prescribed for long-term therapy, efficacy should be periodically assessed.

HIGH ALERT

## busulfan (byoo-**sul**-fan)

Busulfex, Myleran

***Classification***

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

**Pregnancy Category D**

## Indications

**PO:** Treatment of chronic myelogenous leukemia (CML) and bone marrow disorders. **IV:** With cyclophosphamide as a conditioning regimen before allogenic hematopoietic progenitor cell transplantation for CML.

## Action

Disrupts nucleic acid function and protein synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly growing cells, especially malignant ones.

## Pharmacokinetics

**Absorption:** Rapidly absorbed from the GI tract.
**Distribution:** Unknown.
**Metabolism and Excretion:** Extensively metabolized by the liver.
**Half-life:** 2.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–2 wk | weeks | up to 1 mo† |
| IV | unknown | unknown | 13 days‡ |

†Complete recovery may take up to 20 mo
‡After administration of last dose

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Failure to respond to previous courses; OB, Lactation: Potential for serious side effects in fetus or infant.
**Use Cautiously in:** Active infections; ↓ bone marrow reserve; Obese patients (base dose on ideal body weight); Other chronic debilitating diseases; Patients with childbearing potential; Geri: Begin therapy at lower end of dose range due to ↑ frequency of impaired cardiac, hepatic, or renal function.

## Adverse Reactions/Side Effects

Incidence and severity of adverse reactions and side effects are increased with IV use.
**CNS:** *IV*—SEIZURES, CEREBRAL HEMORRHAGE/COMA, anxiety, confusion, depression, dizziness, headache, encephalopathy, mental status changes, weakness. **EENT:** *PO*—cataracts; *IV*, epistaxis, pharyngitis, ear disorders. **CV:** hepatic veno-occlusive disease (↑ allogenic transplantation). **Resp:** *PO*—PULMONARY FIBROSIS; *IV*, alveolar hemorrhage, asthma, atelectasis, cough, hemoptysis, hypoxia, pleural effusion, pneumonia, rhinitis, sinusitis. **CV:** *PO*—CARDIAC TAMPONADE (WITH HIGH-DOSE CYCLOPHOSPHAMIDE); *IV*, chest pain, hypotension, tachycardia, thrombosis, arrhythmias, atrial fibrillation, cardiomegaly, ECG changes, edema, heart block, hypertension, left-sided heart failure, pericardial effusion, ventricular extrasystoles. **GI:** *PO*—drug-induced hepatitis, nausea, vomiting; *IV*, abdominal enlargement, anorexia, constipation, diarrhea, dry mouth, hematemesis, nausea, rectal discomfort, vomiting, abdominal pain, dyspepsia, hepatomegaly, pancreatitis, stomatitis. **GU:** oliguria, dysuria, hematuria. **Derm:** *PO*—itching, rashes, acne, alopecia, erythema nodosum, exfoliative dermatitis, hyperpigmentation. **Endo:** *PO*—sterility, gynecomastia. **F and E:** hypokalemia, hypomagnesemia, hypophosphatemia. **Hemat:** BONE MARROW DEPRESSION. **Local:** inflammation/pain at injection site. **Metab:** *PO and IV*—hyperuricemia; *IV*, hyperglycemia. **MS:** arthralgia, myalgia, back pain. **Misc:** allergic reactions, chills, fever, infection.

## Interactions

**Drug-Drug:** Concurrent or previous (within 72 hr) use of **acetaminophen** may ↓ elimination and ↑ toxicity. Concurrent use with high-dose **cyclophosphamide** in patients with thalassemia may result in cardiac tamponade. Concurrent use with **itraconazole** or **phenytoin** ↓ blood level effectiveness. Long-term continuous therapy with **thioguanine** may ↑ risk of hepatic toxicity. ↑ bone marrow suppression with other **antineoplastics** or **radiation therapy**. May ↓ the antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.

## Route/Dosage

Many other regimens are used. See current protocols for up-to-date dosage.
**PO (Adults):** *Induction*—1.8 mg/m²/day or 60 mcg (0.06 mg)/kg/day until WBCs <15,000/mm³. Usual dose is 4–8 mg/day (range 1–12 mg/day). *Maintenance*—1–3 mg/day.
**PO (Children):** 0.06–0.12 mg/kg/day or 1.8–4.6 mg/m²/day initially. Titrate dose to maintain WBC of approximately 20,000/mm³.
**IV (Adults):** 0.8 mg/kg q 6 hr (dose based on ideal body weight or actual weight, whichever is less; in obese patients, dosage should be based on adjusted ideal body weight) for 4 days (total of 16 doses); given in combination with cyclophosphamide.

## Availability

**Tablets:** 2 mg. **Solution for injection:** 6 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- ***High Alert:*** Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, emesis) and avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for at least 10 min. Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, lower back or side pain, difficult or painful urination) during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension. Notify health care professional if these symptoms occur.
- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of gout (increased uric acid, joint pain, lower back or side pain, swelling of feet or lower legs). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may be given to decrease uric acid levels. Alkalinization of urine may be ordered to increase excretion of uric acid.
- Assess for pulmonary fibrosis (fever, cough, shortness of breath) periodically during and after therapy. Discontinue therapy at the first sign of pulmonary fibrosis. Usually occurs 8 mo–10 yr (average 4 yr) after initiation of therapy.
- **IV:** Premedicate patient with phenytoin before IV administration to minimize the risk of seizures.
- Administer antiemetics before IV administration and on a fixed schedule throughout IV administration.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and weekly during therapy. The nadir of leukopenia occurs within 10–15 days and the nadir of WBC at 11–30 days. Recovery usually occurs within 12–20 wk. Notify physician if WBC is $<15{,}000/mm^3$ or if a precipitous drop occurs. Institute thrombocytopenia precautions if platelet count is $<150{,}000/mm^3$. Bone marrow depression may be severe and progressive, with recovery taking 1 mo–2 yr after discontinuation of therapy.
- Monitor serum ALT, bilirubin, alkaline phosphatase, and uric acid before and periodically during therapy. May cause ↑ uric acid levels.
- May cause false-positive cytology results of breast, bladder, cervix, and lung tissues.

### Potential Nursing Diagnoses

Disturbed body image (Side Effects)
Risk for injury (Side Effects)
Risk for infection (Side Effects)

### Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations, and infusion pump settings.
- **PO:** Administer at the same time each day. Administer on an empty stomach to decrease nausea and vomiting.

#### IV Administration

- **IV:** Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **Intermittent Infusion:** ***Diluent:*** Dilute with 10 times the volume of busulfan using 0.9% NaCl or D5W. ***Concentration:*** ≥0.5 mg/mL. When drawing busulfan from vial, use needle with 5-micron nylon filter provided, remove calculated volume from vial, remove needle and filter, replace needle and inject busulfan into diluent. Do not use polycarbonate syringes with busulfan. Only use filters provided with busulfan. Always add busulfan to diluent, not diluent to busulfan. Solution diluted with 0.9% NaCl or D5W is stable for 8 hr at room temperature and solution diluted with 0.9% NaCl is stable for 12 hr if refrigerated. Administration must be completed during this time. Solution is clear and colorless; do not administer solutions that are discolored or contain a precipitate. ***Rate:*** Administer via central venous catheter over 2 hr every 6 hr for 4 days for a total of 16 doses. Use infusion pump to administer entire dose over 2 hr.
- **Y-Site Compatibility:** acyclovir, amphotericin B liposome, anidulafungin, bivalirudin, bleomycin, caspofungin, codeine, daptomycin, dexmedetomidine, diltiazem, docetaxel, ertapenem, fenoldopam, granisetron, hetastarch, hydromorphone, levofloxacin, linezolid, lorazepam, meperidine, metronidazole, milrinone, nesiritide, octreotide, ondansetron, paclitaxel, palonosetron, pancuronium, piperacillin/tazobactam, quinupristin/dalfopristin, rituximab, sodium acetate, tacrolimus, tigecycline, tirofiban, trastuzumab, vasopressin.

- **Y-Site Incompatibility:** idarubicin, thiotepa, vecuronium, voriconazole.

### Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if nausea and vomiting are a problem. Consult health care professional if vomiting occurs shortly after dose is taken. If a dose is missed, do not take at all; do not double doses.
- Advise patient to notify health care professional if fever; sore throat; signs of infection; lower back or side pain; difficult or painful urination; sores in the mouth or on the lips; chills; dyspnea; persistent cough; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Caution patient to avoid crowds and persons with known infections. Health care professional should be informed immediately if symptoms of infection occur.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Review with patient the need for contraception during therapy. Women need to use contraception even if amenorrhea occurs.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient to notify health care professional if unusual bleeding; bruising; or flank, stomach, or joint pain occurs. Advise patients on long-term therapy to notify health care professional immediately if cough, shortness of breath, and fever occur or if darkening of skin, diarrhea, dizziness, fatigue, anorexia, confusion, or nausea and vomiting become pronounced.
- Inform patient of increased risk of a second malignancy with busulfan.

### Evaluation/Desired Outcomes

- Decrease in leukocyte count to within normal limits.
- Decreased night sweats.
- Increase in appetite.
- Increased sense of well-being. Therapy is resumed when leukocyte count reaches 50,000/mm$^3$.

## BUTALBITAL COMPOUND

(byoo-**tal**-bi-tal)

**butalbital, acetaminophen†**

Axocet, Bucet, Bupap, Butex Forte, Dolgic, Marten-Tab, Phrenilin, Phrenilin Forte, Repap CF, Sedapap, Tencon, Triaprin

**butalbital, acetaminophen, caffeine†**

Endolor, Esgic, Esgic-Plus, Fioricet, Margesic, Medigesic, Repan, Triad

**butalbital, aspirin, caffeine‡**

Fiorinal, Fiortal, Tecnal

***Classification***

Therapeutic: nonopioid analgesics (combination with barbiturate)
Pharmacologic: barbiturates

**Schedule III (products with aspirin only)**

**Pregnancy Category D**

†For information on acetaminophen component in formulation, see acetaminophen monograph

‡For information on aspirin component in formulation, see salicylates monograph

### Indications

Management of mild to moderate pain.

### Action

Contain an analgesic (aspirin or acetaminophen) for relief of pain, a barbiturate (butalbital) for its sedative effect, and some contain caffeine, which may be of benefit in vascular headaches. **Therapeutic Effects:** Decreased severity of pain with some sedation.

### Pharmacokinetics

**Absorption:** Well absorbed.
**Distribution:** Widely distributed; cross the placenta and enter breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 35 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15–30 min | 1–2 hr | 2–6 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to individual components; Cross-sensitivity may occur; Co-

matose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Aspirin should be avoided in patients with bleeding disorders or thrombocytopenia; Acetaminophen should be avoided in patients with severe hepatic or renal disease; Caffeine should be avoided in patients with severe cardiovascular disease; Pregnancy or lactation; Porphyria.
**Use Cautiously in:** History of suicide attempt or drug addiction; Chronic alcohol use/abuse (for aspirin and acetaminophen content); Geri: Appears on Beers list. Geriatric patients are at increased risk for side effects (dosage reduction recommended); Use should be short-term only; Children (safety not established).

### Adverse Reactions/Side Effects
**CNS:** *caffeine*—drowsiness, hangover, delirium, depression, excitation, headache (with chronic use), insomnia, irritability, lethargy, nervousness, vertigo. **Resp:** respiratory depression. **CV:** *caffeine*—palpitations, tachycardia. **GI:** *caffeine*—constipation, diarrhea, epigastric distress, heartburn, nausea, vomiting. **Derm:** dermatitis, rash. **Misc:** hypersensitivity reactions including ANGIOEDEMA and SERUM SICKNESS, physical dependence, psychological dependence, tolerance.

### Interactions
**Drug-Drug:** Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioid analgesics**, and **sedative/hypnotics**. May increase the liver metabolism and decrease the effectiveness of other drugs including **hormonal contraceptives**, **chloramphenicol**, **acebutolol**, **propranolol**, **metoprolol**, **timolol**, **doxycycline**, **corticosteroids**, **tricyclic antidepressants**, **phenothiazines**, **phenylbutazone**, and **quinidine**. **MAO inhibitors**, **primidone**, and **valproic acid** may prevent metabolism and increase the effectiveness of butalbital. May enhance the hematologic toxicity of **cyclophosphamide**.
**Drug-Natural Products: St. John's wort** may decrease barbiturate effect. Concurrent use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can increase CNS depression.

### Route/Dosage
**PO (Adults):** 1–2 capsules or tablets (50–100 mg butalbital) every 4 hr as needed for pain (not to exceed 4 g acetaminophen or aspirin/24 hr).

### Availability (generic available)
**Tablets and capsules:** 50 mg. ***In combination with:*** aspirin, acetaminophen, caffeine, and codeine Rx. See Appendix B.

## NURSING IMPLICATIONS

### Assessment
- Assess type, location, and intensity of pain before and 60 min following administration.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive butalbital compound for pain do not develop psychological dependence.
- Assess frequency of use. Frequent, chronic use may lead to daily headaches in headache-prone individuals because of physical dependence on caffeine and other components. Chronic headaches from overmedication are difficult to treat and may require hospitalization for treatment and prophylaxis.

### Potential Nursing Diagnoses
Acute pain (Indications)
Risk for injury (Side Effects)

### Implementation
- Do not confuse Fiorinal with Fioricet.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- **PO:** Oral doses should be administered with food, milk, or a full glass of water to minimize GI irritation.

### Patient/Family Teaching
- Instruct patient to take medication exactly as directed. Do not increase dose because of the habit-forming potential of butalbital. If medication appears less effective after a few weeks, consult health care professional. Doses of acetaminophen or aspirin should not exceed the maximum recommended daily dose. Chronic excessive use of >4 g/day (2 g in chronic alcoholism) may lead to hepatotoxicity, renal or cardiac damage.
- Advise patients with vascular headaches to take medication at first sign of headache. Lying down in a quiet, dark room may also be helpful. Medications taken for prophylaxis should be continued.
- May cause drowsiness or dizziness. Advise patient to avoid driving and other activities requiring alertness until response to medication is known.

- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to use an additional nonhormonal method of contraception while taking butalbital compound.

### Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness.

## butenafine, See ANTIFUNGALS (TOPICAL).

## butoconazole, See ANTIFUNGALS (VAGINAL).

HIGH ALERT

## butorphanol (byoo-tor-fa-nole)

Stadol, Stadol NS

***Classification***

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists/antagonists

**Schedule IV**

**Pregnancy Category C**

### Indications

Management of moderate to severe pain. Analgesia during labor. Sedation before surgery. Supplement in balanced anesthesia.

### Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Has partial antagonist properties that may result in opioid withdrawal in physically dependent patients. **Therapeutic Effects:** Decreased severity of pain.

### Pharmacokinetics

**Absorption:** Well absorbed from IM sites and nasal mucosa.
**Distribution:** Crosses the placenta and enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver; 11–14% excreted in the feces. Minimal renal excretion.
**Half-life:** 3–4 hr.

TIME/ACTION PROFILE (analgesia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | within 15 min | 30–60 min | 3–4 hr |
| IV | within mins | 4–5 min | 2–4 hr |
| Intranasal | within 15 min | 1–2 hr | 4–5 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Patients physically dependent on opioids (may precipitate withdrawal).
**Use Cautiously in:** Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease (increase interval to q 6–8 hr initially in hepatic/renal impairment); Hypothyroidism; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hyperplasia; OB, Lactation, Pedi: Safety not established but has been used during labor (may cause respiratory depression in the newborn); Geri: Decrease usual dose by 50%; give at twice the usual interval initially.

### Adverse Reactions/Side Effects

**CNS:** confusion, dysphoria, hallucinations, sedation, euphoria, floating feeling, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis (high doses). **Resp:** respiratory depression. **CV:** hypertension, hypotension, palpitations. **GI:** nausea, constipation, dry mouth, ileus, vomiting. **GU:** urinary retention. **Derm:** sweating, clammy feeling. **Misc:** physical dependence, psychological dependence, tolerance.

### Interactions

**Drug-Drug:** Use with extreme caution in patients receiving **MAO inhibitors** (may produce severe, potentially fatal reactions—reduce initial dose of butorphanol to 25% of usual dose). Additive CNS depression with **alcohol**, **antidepressants**, **antihistamines**, and **sedative/hypnotics**. May precipitate withdrawal in patients who are physically dependent on **opioids** and have not been detoxified. May ↓ effects of concurrently administered **opioids**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

### Route/Dosage

**IM (Adults):** 2 mg q 3–4 hr as needed (range 1–4 mg).
**IV (Adults):** 1 mg q 3–4 hr as needed (range 0.5–2 mg).
**IM, IV (Geriatric Patients):** 1 mg q 4–6 hr, increased as necessary.

**Intranasal (Adults):** 1 mg (1 spray in 1 nostril) initially. An additional dose may be given 60–90 min later. This sequence may be repeated in 3–4 hr. If pain is severe, an initial dose of 2 mg (1 spray in each nostril) may be given. May be repeated in 3–4 hr.
**Intranasal (Geriatric Patients):** 1 mg (1 spray in 1 nostril) initially. An additional dose may be given 90–120 min later. This sequence may be repeated in 3–4 hr.

### Availability (generic available)

**Injection:** 1 mg/mL, 2 mg/mL. **Intranasal solution:** 10 mg/mL, in 2.5-mL metered-dose spray pump (14–15 doses; 1 mg/spray).

## NURSING IMPLICATIONS

### Assessment

- Assess type, location, and intensity of pain before and 30–60 min after IM, 5 min after IV, and 60–90 min after intranasal administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring doses higher than 4 mg should be converted to an opioid agonist. Butorphanol is not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Respiratory depression does not increase in severity, only in duration, with increased dosage.
- Assess previous analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, increased blood pressure and temperature) in patients who are physically dependent on opioid agonists.
- Butorphanol has a lower potential for dependence than other opioids; however, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent the patient from receiving adequate analgesia. Most patients receiving butorphanol for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 1–2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

### Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)
Disturbed sensory perception (visual, auditory) (Side Effects)

### Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, route of administration, and infusion pump programming. Do not confuse Stadol with Haldol.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- **IM:** Administer IM injections deep into well-developed muscle. Rotate sites of injections.

#### IV Administration

- **Direct IV:** ***Diluent:*** May give IV undiluted. ***Concentration:*** 1–2 mg/mL. ***Rate:*** Administer over 3–5 min. ***High Alert:*** Rapid administration may cause respiratory depression, hypotension, and cardiac arrest.
- **Syringe Compatibility:** atropine, chlorpromazine, cimetidine, diphenhydramine, droperidol, fentanyl, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, pentazocine, perphenazine, prochlorperazine, promethazine, scopolamine, thiethylperazine.
- **Syringe Incompatibility:** dimenhydrinate, pentobarbital.
- **Y-Site Compatibility:** allopurinol sodium, amifostine, aztreonam, bivalirudin, cefepime,

cisatracurium, cladribine, dexmedetomidine, docetaxel, doxorubicin liposome, enalaprilat, esmolol, etoposide phosphate, fenoldopam, filgrastim, fludarabine, gemcitabine, granisetron, labetalol, linezolid, melphalan, nicardipine, oxaliplatin, paclitaxel, pemetrexed, piperacillin/tazobactam, propofol, remifentanil, sargramostim, teniposide, thiotepa, vinorelbine.

- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, lansoprazole, midazolam.
- **Intranasal:** Administer 1 spray in 1 nostril.

## Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to the medication is known.
- Encourage patients on bedrest to turn, cough, and deep-breathe every 2 hr to prevent atelectasis.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- **Intranasal:** Instruct patient on proper use of nasal spray. See package insert for detailed instructions. Instruct patient to replace protective clip and clear cover after use and to store the unit in the child resistant container. Caution patient that medication should not be used by anyone other than the person for whom it was prescribed. Excess medication should be disposed of as soon as it is no longer needed. To dispose of, unscrew cap, rinse bottle and pump with water, and dispose of in waste can.
- If 2-mg dose is prescribed, administer additional spray in other nostril. May cause dizziness and dysphoria. Patient should remain recumbent after administration of 2-mg dose until response to medication is known.

## Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

## cabergoline (ka-ber-goe-leen)

***Classification***
Therapeutic: antihyperprolactinemic
Pharmacologic: dopamine agonists

**Pregnancy Category B**

### Indications
Treatment of hyperprolactinemia (idiopathic or pituitary in origin). **Unlabeled Use:** Adjunctive treatment of Parkinson's disease.

### Action
Inhibits secretion of prolactin by acting as a dopamine agonist. In Parkinson's, dopamine agonists directly stimulate neural dopamine receptors.
**Therapeutic Effects:** Decreased secretion of prolactin in hyperprolactinemia. Reduced involuntary movements associated with Parkinson's disease.

### Pharmacokinetics
**Absorption:** Well absorbed but undergoes extensive first-pass hepatic metabolism.
**Distribution:** Widely distributed; concentrates in pituitary.
**Metabolism and Excretion:** Extensively metabolized by the liver; <4% excreted unchanged in urine.
**Protein Binding:** 40–42%.
**Half-life:** 63–69 hr.

TIME/ACTION PROFILE (effect on serum prolactin levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2–3 hr | unknown |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to cabergoline or ergot alkaloids; Uncontrolled hypertension; History of pulmonary, pericardial, valvular, or retroperitoneal fibrotic disorders; Lactation: Has been associated with hypertension, stroke, and seizures. Not to be used for suppression of physiologic lactation.
**Use Cautiously in:** Hepatic impairment; OB: Use in pregnancy only if clearly needed; Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** dizziness, headache, depression, drowsiness, fatigue, nervousness, vertigo, weakness. **Resp:** PULMONARY FIBROSIS, pleural effusion. **EENT:** abnormal vision. **CV:** VALVULAR DISORDERS, postural hypotension, hot flashes. **GI:** constipation, nausea, abdominal pain, dyspepsia, vomiting. **GU:** dysmenorrhea. **Endo:** breast pain. **Neuro:** paresthesia.

### Interactions
**Drug-Drug:** ↑ risk of hypotension with **antihypertensives**. May ↑ the effects of **sibutramine**, **SSRIs**, and other **serotonin agonists** (induces serotonin syndrome). Effectiveness may be ↓ by **phenothiazines**, **butyrophenones** (**haloperidol**), **thioxanthenes**, or **metoclopramide** (avoid concurrent use).

### Route/Dosage
**PO (Adults):** 0.25 mg twice weekly; may be ↑ at 4-wk intervals up to 1 mg twice weekly.

### Availability (generic available)
**Tablets:** 0.5 mg.

## NURSING IMPLICATIONS

### Assessment
- Monitor blood pressure before and frequently during initial therapy. Initial doses >1 mg may cause orthostatic hypotension. Use with caution when administering concurrently with other medications that lower blood pressure. Supervise ambulation and transfer during initial dosing to prevent injury from hypotension.
- Evaluate the cardiac status and consider echocardiography periodically in patients receiving long-term treatment. Monitor for signs or symptoms of valvular disorders (dyspnea, edema, CHF, new cardiac murmur). Use lowest dose and reassess need for therapy periodically.
- **Parkinson's Disease:** Assess symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, masklike face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) before and during therapy.
- ***Lab Test Considerations:*** Monitor serum prolactin concentrations monthly until normalized (<20 mcg/liter in women and <15 mcg/liter in men).

### Potential Nursing Diagnoses
Risk for injury (Side Effects)
Impaired physical mobility (Indications)

### Implementation
- **PO:** May be taken without regard to food.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses as soon as possible within 1 or 2 days. If not remembered until time of next dose, double dose. If nausea occurs, discuss with health care professional.
- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol during therapy.
- Advise women to consult with health care professional regarding a nonhormonal method of birth control. Women should contact health care professional promptly if pregnancy is planned or suspected.
- Instruct patients taking cabergoline for pituitary tumors to inform health care professional immediately if signs of tumor enlargement occur (blurred vision, sudden headache, severe nausea, and vomiting).
- Advise patient to notify health care professional if signs of valvular disorders (shortness of breath, swelling in extremities) occurs.
- Emphasize the importance of regular follow-up exams to determine effectiveness and monitor side effects.

### Evaluation/Desired Outcomes

- Decrease in galactorrhea in patients with hyperprolactinemia.
- After a normal serum prolactin level has been maintained for more than 6 mo, cabergoline may be discontinued. Serum prolactin levels should be monitored periodically to determine necessity of reinstituting cabergoline.
- Decrease in tremor, rigidity, and bradykinesia.
- Improvement in balance and gait in patients with Parkinson's disease.

## caffeine citrate

(ka-**feen si**-trate)

Cafcit

***Classification***

Therapeutic: central nervous system stimulants

Pharmacologic: respiratory stimulants

**Pregnancy Category C**

### Indications

Short-term treatment of idiopathic apnea of prematurity in infants between 28 and <33 wk gestational age.

### Action

Increases levels of cyclic AMP by inhibiting phosphodiesterase. Acts as a bronchial smooth muscle relaxant. Suggested mechanisms of action include: Stimulation of the respiratory center, Increased minute ventilation, Decreased threshold to hypercapnea, Increased response to hypercapnea, Increased skeletal muscle tone, Decreased diaphragmatic fatigue, Increased metabolic rate, Increased oxygen consumption. **Therapeutic Effects:** Decrease in periods of apnea.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability; also absorbed after oral administration.

**Distribution:** Rapidly distributes to the brain; CSF levels in neonates are similar to plasma levels.

**Metabolism and Excretion:** Mostly metabolized by the liver (cytochrome P450 1A2) enzymes; 3–8% converted to theophylline.

**Half-life:** Infants >9 months, Children, and Adults: 5 hr; *Neonates*—3–4 days.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | 24 hr |
| PO | rapid | 30 min–2 hr | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.

**Use Cautiously in:** History of seizure disorders; History of cardiovascular disease; Pedi: Increased risk of toxicity in neonates with impaired hepatic or renal function.

### Adverse Reactions/Side Effects

**CNS:** insomnia, irritability, jitteriness, restlessness. **CV:** tachycardia. **GI:** NECROTIZING ENTEROCOLITIS, feeding intolerance, gastritis, GI bleeding. **GU:** increased urine output. **Derm:** dry skin, rash, skin breakdown. **Endo:** hypoglycemia, hyperglycemia. **MS:** muscle tremors, twitches.

### Interactions

**Drug-Drug: Cimetidine**, **fluconazole**, and **ketoconazole** ↓ metabolism (dose reduction of caffeine may be necessary). **Phenobarbital** and **phenytoin** may ↑ caffeine metabolism (↑ doses of caffeine may be necessary). Because caffeine is a significant metabolite of **theophylline**, concurrent administration is not recommended.

### Route/Dosage

**IV (Neonates):** *Loading dose*—20 mg/kg caffeine citrate (10 mg/kg caffeine base).
**IV, PO (Neonates):** *Maintenance dose*—starting 24 hr after loading dose 5 mg/kg caffeine citrate (2.5 mg/kg caffeine base) q 24 hr.

### Availability (generic available)

**Solution for injection:** 20 mg/mL caffeine citrate (10 mg/mL caffeine base) in 3-mL vials. **Oral solution:** 20 mg/mL caffeine citrate (10 mg/mL caffeine base) in 3-mL vials.

## NURSING IMPLICATIONS

### Assessment

- Assess respiratory status frequently throughout therapy.
- Monitor patient for signs of necrotizing enterocolitis (abdominal distension, vomiting, bloody stools, lethargy). May be fatal.
- ***Lab Test Considerations:*** Monitor serum caffeine levels before and periodically during therapy in infants previously treated with theophylline or in infants whose mothers consumed caffeine before delivery.
- Monitor serum glucose levels. May cause hypoglycemia or hyperglycemia.
- ***Lab Test Considerations:*** Therapeutic range: 8–20 mcg/mL.
- ***Toxicity and Overdose:*** Serum caffeine levels of >50 mcg/mL have been associated with serious toxicity. Monitor serum levels and adjust dose in neonates with impaired hepatic or renal function to avoid toxicity.

### Potential Nursing Diagnoses

Ineffective breathing pattern (Indications)

### Implementation

- **PO:** Maintenance doses may also be administered orally.

**IV Administration**

- **Intermittent Infusion:** Solution should be clear, without particulate matter. ***Rate:*** Initial *loading dose* should be administered over 30 min. *Maintenance doses* may be administered over 10 min every 24 hr beginning 24 hr after loading dose. Syringe pump should be used to ensure accurate delivery.
- **Syringe Compatibility:** alprostadil, amikacin, aminophylline, calcium gluconate, cefotaxime, cimetidine, clindamycin, dexamethasone, dobutamine, dopamine, epinephrine, fentanyl, gentamicin, heparin, isoproterenol, lidocaine, metoclopramide, morphine, nitroprusside, pancuronium, penicillin G, phenobarbital, phenylephrine, sodium bicarbonate, vancomycin.
- **Syringe Incompatibility:** acyclovir, furosemide, lorazepam, nitroglycerin, oxacillin, pantoprazole.
- **Y-Site Compatibility:** doxapram, levofloxacin.
- **Additive Compatibility:** amino acids, calcium gluconate, D5W, D50W, dopamine, fat emulsion, heparin, fentanyl.

### Patient/Family Teaching

- Instruct parent on correct technique for administration. Measure oral dose accurately with a 1-mL syringe. If apnea events continue, consult health care professional; do not increase dose.
- Advise parent to consult health care professional immediately if signs of necrotizing enterocolitis occur.

### Evaluation/Desired Outcomes

- Decrease in apneic episodes in premature infant.

## CALCITONIN

**calcitonin (salmon)**
(kal-si-**toe**-nin)
Miacalcin

**calcitonin (rDNA)**
Fortical

***Classification***
Therapeutic: hypocalcemics
Pharmacologic: hormones

**Pregnancy Category C**

### Indications

**IM, Subcut:** Treatment of Paget's disease of bone. Adjunctive therapy for hypercalcemia. **IM, Subcut, Intranasal:** Management of postmenopausal osteoporosis.

### Action

Inhibits osteoclastic bone resorption and promotes renal excretion of calcium. **Therapeutic Effects:** Decreased rate of bone turnover. Lowering of serum calcium.

### Pharmacokinetics

**Absorption:** Completely absorbed from IM and subcut sites. Rapidly absorbed from nasal mu-

cosa; absorption is 3% compared with parenteral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Rapidly metabolized in kidneys, blood, and tissues.
**Half-life:** 40–90 min.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM, subcut† | Unknown | 2 hr | 6–8 hr |
| Intranasal‡ | rapid | 31–39 min | Unknown |

†Effects on serum calcium; effects on serum alkaline phosphates and urinary hydroxyproline in Paget's disease may require 6–24 months of continuous treatment
‡Serum levels of administered calcitonin

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to calcitonin, salmon protein or gelatin diluent (in some products); OB, Lactation: Use is not recommended.
**Use Cautiously in:** Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** *nasal only*—headaches. **EENT:** *nasal only*—rhinitis, epistaxis, nasal irritation. **GI:** *IM, subcut*—nausea, vomiting. **GU:** *IM, subcut*—urinary frequency. **Derm:** rashes. **Local:** injection site reactions. **MS:** *nasal*—arthralgia, back pain. **Misc:** allergic reactions including ANAPHYLAXIS, facial flushing, swelling.

### Interactions
**Drug-Drug:** Previous bisphosphonate therapy, including **alendronate**, **risedronate**, **etidronate**, **ibandronate** or **pamidronate**, may ↓ response to calcitonin.

### Route/Dosage

#### Postmenopausal osteoporosis
**IM, Subcut (Adults):** 100 IU every other day.
**Intranasal (Adults):** 1 spray (200 IU)/day in alternating nostrils.

#### Paget's disease
**IM, Subcut (Adults):** 100 IU/day initially, after titration, maintenance dose is usually 50 IU/day or every other day.

#### Hypercalcemia
**IM, Subcut (Adults):** 4 IU/kg q 12 hr; if adequate response not achieved, may increase dose after 1–2 days to 8 IU/kg q 12 hr, and if necessary after 2 more days may be increased to 8 IU/kg q 6 hr.

### Availability (generic available)
**Injection :** 200 IU/mL in 2-mL vials. **Cost:** $50.89/vial. **Nasal spray:** 200 IU/actuation in 3.7-mL bottles. **Cost:** *Miacalcin*—$112.22/bottle.

## NURSING IMPLICATIONS

### Assessment
- Observe patient for signs of hypersensitivity (skin rash, fever, hives, anaphylaxis, serum sickness). Keep epinephrine, antihistamines, and oxygen nearby in the event of a reaction.
- Assess patient for signs of hypocalcemic tetany (nervousness, irritability, paresthesia, muscle twitching, tetanic spasms, seizures) during the first several doses of calcitonin. Parenteral calcium, such as calcium gluconate, should be available in case of this event.
- **Intranasal:** Assess nasal mucosa, septum, turbinates, and mucosal blood vessels periodically during therapy. If severe ulceration occurs, drug should be discontinued.
- ***Lab Test Considerations:*** Monitor serum calcium and alkaline phosphatase periodically during therapy. Levels should normalize within a few months of initiation of therapy.
- Urine hydroxyproline (24 hr) may be monitored periodically in patients with Paget's disease.

### Potential Nursing Diagnoses
Acute pain (Indications)
Risk for injury (Indications, Side Effects)

### Implementation
- In patients with suspected sensitivity to calcitonin, skin test should be considered before starting therapy. Test dose is prepared in a dilution of 10 IU/mL by withdrawing 0.05 mL in a tuberculin syringe and filling to 1 mL with 0.9% NaCl for injection. Mix well and discard 0.9 mL. Administer 0.1 mL intradermally on inner aspect on forearm and observe site for 15 min. More than mild erythema or wheal constitutes positive response.
- Store injection and unopened nasal spray bottle in refrigerator. Nasal spray bottle in use can be stored at room temperature.
- **IM, Subcut:** Inspect injection site for the appearance of redness, swelling, or pain. Rotate injection sites. Subcut is the preferred route. Use IM route if dose exceeds 2 mL in volume. Use multiple sites to minimize inflammatory reaction.

### Patient/Family Teaching
- Advise patient to take calcitonin as directed. If dose is missed and medication is scheduled for twice a day, take only if possible within 2 hr of correct time. If scheduled for daily dose, take

only if remembered that day. If scheduled for every other day, take when remembered and restart alternate day schedule. If taking 1 dose 3 times weekly (Mon, Wed, Fri), take missed dose the next day and set each injection back 1 day; resume regular schedule the following week. Do not double doses.

- Instruct patient in the proper method of self-injection and care and disposal of equipment.
- Advise patient to report signs of hypercalcemic relapse (deep bone or flank pain, renal calculi, anorexia, nausea, vomiting, thirst, lethargy) or allergic response promptly.
- Reassure patient that flushing and warmth following injection are transient and usually last about 1 hr.
- Explain that nausea following injection tends to decrease even with continued therapy.
- Instruct patient to follow low-calcium diet if recommended by health care professional (see Appendix M). Women with postmenopausal osteoporosis should adhere to a diet high in calcium and vitamin D.
- **Osteoporosis:** Advise patients receiving calcitonin for the treatment of osteoporosis that exercise has been found to arrest and reverse bone loss. The patient should discuss any exercise limitations with health care professional before beginning program.
- **Intranasal:** Instruct patient on correct use of nasal spray. Demonstrate procedure for use. Before first use, activate pump by holding upright and depressing white side arms down toward bottle 5 times until a full spray is emitted. Following activation, place nozzle firmly in nostril with head in an upright position and depress the pump toward the bottle. The pump should NOT be primed before each daily use. Discard bottle 30 days after first use.
- Advise patient to notify health care professional if significant nasal irritation occurs.

### Evaluation/Desired Outcomes

- Lowered serum calcium levels.
- Decreased bone pain.
- Slowed progression of postmenopausal osteoporosis. Significant increases in bone marrow density may be seen as early as 6 months after initiation of therapy.

**calcitriol, See VITAMIN D COMPOUNDS.**

## CALCIUM SALTS

**calcium acetate (25% Ca or 12.6 mEq/g)**
(**kal**-see-um **ass** -e-tate)
PhosLo

**calcium carbonate (40% Ca or 20 mEq/g)**
(**kal**-see-um **kar**-bo-nate)
Alka-Mints, Amitone, Apo-Cal, BioCal, Calcarb, Calci-Chew, Calciday, Calcilac, Calci-Mix, Calcite, Calglycine, Cal-Plus, Calsan, Caltrate, Chooz, Dicarbosil, Equilet, Gencalc, Liqui-Cal, Liquid Cal-600, Maalox Antacid Caplets, Mallamint, Mylanta Lozenges, Nephro-Calci, Nu-Cal, Os-Cal, Oysco, Oyst-Cal, Oystercal, Rolaids Calcium Rich, Surpass, Surpass Extra Strength, Titralac, Tums, Tums E-X

**calcium chloride (27% Ca or 13.6 mEq/g)**
(**kal**-see-um **kloh**-ride)

**calcium citrate (21% Ca or 12 mEq/g)** (**kal**-see-um **si**-trate)
Cal-Citrate 250, Citrical, Citrical Liquitab

**calcium gluconate (9% Ca or 4.5 mEq/g)**
(**kal**-see-um **gloo**-koh-nate)
Kalcinate

**calcium lactate (13% Ca or 6.5 mEq/g)** (**kal**-see-um **lak**-tate)
Cal-Lac

**tricalcium phosphate (39% Ca or 19.5 mEq/g)**
(tri-**kal**-see-um **foss**-fate)
Posture

***Classification***
Therapeutic: mineral and electrolyte replacements/supplements

**Pregnancy Category C (calcium acetate, calcium chloride, calcium gluconate injections), UK (calcium carbonate, calcium citrate, calcium lactate, tricalcium phosphate)**

## Indications

**PO, IV:** Treatment and prevention of hypocalcemia. **PO:** Adjunct in the prevention of postmenopausal osteoporosis. **IV:** Emergency treatment of hyperkalemia and hypermagnesemia and adjunct in cardiac arrest or calcium channel blocking agent toxicity (calcium chloride, calcium gluconate). **Calcium carbonate:** May be used as an antacid. **Calcium acetate:** Control of hyperphosphatemia in end-stage renal disease.

## Action

Essential for nervous, muscular, and skeletal systems. Maintain cell membrane and capillary permeability. Act as an activator in the transmission of nerve impulses and contraction of cardiac, skeletal, and smooth muscle. Essential for bone formation and blood coagulation. **Therapeutic Effects:** Replacement of calcium in deficiency states. Control of hyperphosphatemia in end-stage renal disease without promoting aluminum absorption (calcium acetate).

## Pharmacokinetics

**Absorption:** Absorption from the GI tract requires vitamin D. IV administration results in complete bioavailability.
**Distribution:** Readily enters extracellular fluid. Crosses the placenta and enters breast milk.
**Metabolism and Excretion:** Excreted mostly in the feces; 20% eliminated by the kidneys.
**Half-life:** Unknown.

TIME/ACTION PROFILE (effects on serum calcium)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | unknown |
| IV | immediate | immediate | 0.5–2 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypercalcemia; Renal calculi; Ventricular fibrillation.
**Use Cautiously in:** Patients receiving digitalis glycosides; Severe respiratory insufficiency; Renal disease; Cardiac disease.

## Adverse Reactions/Side Effects

**CNS:** syncope (IV only), tingling. **CV:** CARDIAC ARREST (IV only), arrhythmias, bradycardia. **GI:** constipation, nausea, vomiting. **GU:** calculi, hypercalciuria. **Local:** phlebitis (IV only).

## Interactions

**Drug-Drug:** Hypercalcemia ↑ the risk of **digoxin** toxicity. Chronic use with **antacids** in renal insufficiency may lead to milk-alkali syndrome. Ingestion by mouth ↓ the absorption of orally administered **tetracyclines**, **fluoroquinolones**, **phenytoin**, and **iron salts**. Excessive amounts may ↓ the effects of **calcium channel blockers**. ↓ absorption of **etidronate** and **risedronate** (do not take within 2 hr of calcium supplements). Concurrent use with **diuretics (thiazide)** may result in hypercalcemia. May ↓ the ability of **sodium polystyrene sulfonate** to decrease serum potassium.
**Drug-Food: Cereals**, **spinach**, or **rhubarb** may ↓ the absorption of calcium supplements. Calcium acetate should not be given concurrently with other calcium supplements.

## Route/Dosage

Doses are expressed in mg, g, or mEq of calcium.
**PO (Adults):** *Prevention of hypocalcemia, treatment of depletion, osteoporosis*—1–2 g/day. *Antacid*—0.5–1.5 g as needed (calcium carbonate only). *Hyperphosphatemia in end-stage renal disease (calcium acetate only)*—Amount necessary to control serum phosphate and calcium.
**PO (Children):** *Supplementation*—45–65 mg/kg/day.
**PO (Infants):** *Neonatal hypocalcemia*—50–150 mg/kg (not to exceed 1 g).
**IV (Adults):** *Emergency treatment of hypocalcemia, cardiac standstill*—7–14 mEq. *Hypocalcemic tetany*—4.5–16 mEq; repeat until symptoms are controlled. *Hyperkalemia with cardiac toxicity*—2.25–14 mEq; may repeat in 1–2 min. *Hypermagnesemia*—7 mEq.
**IV (Children):** *Emergency treatment of hypocalcemia*—1–7 mEq. *Hypocalcemic tetany*—0.5–0.7 mEq/kg 3–4 times daily.
**IV (Infants):** *Emergency treatment of hypocalcemia*—<1 mEq. *Hypocalcemic tetany*—2.4 mEq/kg/day in divided doses.

## Availability (generic available)

### Calcium Acetate

**Tablets:** 250 mg (65 mg Ca)[OTC], 667 mg (169 mg Ca)[OTC], 668 mg (169 mg Ca)[OTC], 1 g (250 mg Ca)[OTC]. **Capsules:** 500 mg (125 mg Ca)[OTC].

### Calcium Carbonate

**Tablets:** 500 mg (200 mg Ca)[OTC], 600 mg (240 mg Ca)[OTC], 650 mg (260 mg Ca)[OTC], 667 mg (266.8 mg Ca)[OTC], 1 g (400 mg Ca)[OTC], 1.25 g (500 mg Ca)[OTC], 1.5 g (600 mg Ca)[OTC]. **Chewable tablets:** 350 mg (300 mg Ca)[OTC], 420 mg (168 mg Ca)[OTC], 450 mg [OTC], 500 mg (200 mg Ca)[OTC], 750 mg (300 mg Ca)[OTC], 1 g (400 mg Ca)[OTC], 1.25 g (500 mg Ca)[OTC]. **Gum tablets:** 300 mg [OTC], 450 mg [OTC], 500 mg (200 mg Ca)[OTC]. **Capsules:** 1.25 g (500 mg Ca)[OTC]. **Lozenges:** 600 mg (240 mg

Ca)OTC. **Oral suspension:** 1.25 g (500 mg Ca)/5 mLOTC. **Powder:** 6.5 g (2400 mg Ca)/packetOTC.

### Calcium Chloride
**Injection:** 10% (1.36 mEq/mL).

### Calcium Citrate
**Tablets:** 250 mgOTC.

### Calcium Gluconate
**Tablets:** 500 mg (45 mg Ca)OTC, 650 mg (58.5 mg Ca)OTC, 975 mg (87.75 mg Ca)OTC, 1 g (90 mg Ca)OTC. **Injection:** 10% (0.45 mEq/mL).

### Calcium Lactate
**Tablets:** 325 mg (42.45 mg Ca)OTC, 500 mg OTC, 650 mg (84.5 mg Ca)OTC.

### Tricalcium Phosphate
**Tablets:** 600 mg (234 mg Ca)OTC.

## NURSING IMPLICATIONS

### Assessment
- **Calcium Supplement/Replacement:** Observe patient closely for symptoms of hypocalcemia (paresthesia, muscle twitching, laryngospasm, colic, cardiac arrhythmias, Chvostek's or Trousseau's sign). Notify health care professional if these occur. Protect symptomatic patients by elevating and padding siderails and keeping bed in low position.
- Monitor blood pressure, pulse, and ECG frequently throughout parenteral therapy. May cause vasodilation with resulting hypotension, bradycardia, arrhythmias, and cardiac arrest. Transient increases in blood pressure may occur during IV administration, especially in geriatric patients or in patients with hypertension.
- Assess IV site for patency. Extravasation may cause cellulitis, necrosis, and sloughing.
- Monitor patient on digoxin for signs of toxicity.
- **Antacid:** When used as an antacid, assess for heartburn, indigestion, and abdominal pain. Inspect abdomen; auscultate bowel sounds.
- ***Lab Test Considerations:*** Monitor serum calcium or ionized calcium, chloride, sodium, potassium, magnesium, albumin, and parathyroid hormone (PTH) concentrations before and periodically during therapy for treatment of hypocalcemia.
- May cause ↓ serum phosphate concentrations with excessive and prolonged use. When used to treat hyperphosphatemia in renal failure patients, monitor phosphate levels.
- ***Toxicity and Overdose:*** Assess patient for nausea, vomiting, anorexia, thirst, severe constipation, paralytic ileus, and bradycardia. Contact health care professional immediately if these signs of hypercalcemia occur.

### Potential Nursing Diagnoses
Imbalanced nutrition: less than body requirements (Indications)
Risk for injury , related to osteoporosis or electrolyte imbalance (Indications)

### Implementation
- ***High Alert:*** Errors with IV calcium gluconate and chloride have occurred secondary to confusion over which salt is ordered. Clarify incomplete orders. Confusion has occurred with milligram doses of calcium chloride and calcium gluconate, which are not equal. Chloride and gluconate forms are routinely available on most hospital crash carts; specify form of calcium desired. Doses should be expressed in mEq.
- Do not confuse Os-Cal (calcium carbonate) with Asacol (mesalamine).
- In arrest situations, the use of calcium chloride is now limited to patients with hyperkalemia, hypocalcemia, and calcium channel blocker toxicity.
- **PO:** Administer calcium carbonate or phosphate 1–1.5 hr after meals and at bedtime. Chewable tablets should be well chewed before swallowing. Dissolve effervescent tablets in glass of water. Follow oral doses with a full glass of water, except when using calcium carbonate as a phosphate binder in renal dialysis. Administer on an empty stomach before meals to optimize effectiveness in patients with hyperphosphatemia.
- **IM:** IM administration of calcium salts can cause severe necrosis and tissue sloughing. Do not administer IM.

#### IV Administration
- **IV:** IV solution should be warmed to body temperature and given through a small-bore needle in a large vein to minimize phlebitis. Do not administer through a scalp vein. May cause cutaneous burning sensation, peripheral vasodilation, and drop in blood pressure. Patient should remain recumbent for 30–60 min after IV administration.
- If infiltration occurs, discontinue IV. May be treated with application of heat, elevation, and local infiltration of normal saline, 1% procaine HCl, or hyaluronidase.

- ***High Alert:*** Administer slowly. High concentrations may cause cardiac arrest. Rapid administration may cause tingling, sensation of warmth, and a metallic taste. Halt infusion if these symptoms occur, and resume infusion at a slower rate when they subside.
- Do not administer solutions that are not clear or that contain a precipitate.

## Calcium Chloride

### IV Administration

- **Direct IV:** May be administered undiluted by IV push.
- **Intermittent/Continuous Infusion:** May be diluted with D5W, D10W, 0.9% NaCl, D5/0.25% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, or D5/LR.
- ***Rate:*** Maximum rate for adults is 0.7–1.4 mEq/min (0.5–1 mL of 10% solution); for children, 0.5 mL/min.
- **Y-Site Compatibility:** acyclovir, alfentanil, amikacin, aminophylline, amiodarone, anidulafungin, ascrobic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, caspofungin, cefonocid, cefotaxime, cefotetan, cefoxitin, ceftizoxime, chloramphenicol, chlorpromazine, cimetidine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxapram, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, inamrinone, insulin, isoproterenol, labetalol, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, multivitamin, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, penicillin G, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, promethazine, propranolol, protamine, pyridoxime, ranitidine, rocuronium, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, urokinase, vancomycin, vasopressin, vencuronium, verapamil, vincristine, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, azathioprine, cefazolin, cefoperazone, ceftazidime, ceftriaxone, cefuroxime, dantrolene, dexamethasone, diazepam, diazoxide, fluorouracil, folic acid, haloperidol, hydrocortisone, indomethacin, ketorolac, magnesium sulfate, methylprednisolone, oxacillin, pantoprazole, pemetrexed, phenytoin, prochlorperazine, propofol, quinupristin/dalfopristin, sodium bicarbonate, trimethoprim/sulfamethoxazole.

## Calcium Gluconate

### IV Administration

- **Direct IV:** Administer slowly by direct IV push. ***Rate:*** Maximum administration rate for adults is 1.5–2 mL/min.
- **Continuous Infusion:** May be further diluted in 1000 mL of D5W, D10W, D20W, D5/0.9% NaCl, 0.9% NaCl, D5/LR, or LR.
- ***Rate:*** Administer at a rate not to exceed 200 mg/min over 12–24 hr.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, carboplatin, caspofungin, cefazolin, cefepime, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxapram, doxorubicin, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanykl, filgrastim, fludar-

abine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepem, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, papaverine, penicillin G, pentamidine, pentaziocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, pyridoxime, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole.

- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, ceftriaxone, dantrolene, dexamethazone, diazepam, diazoxide, inamrinone, indomethacin, methylprednisolone, oxacillin, pemetrexed, phenytoin, quinupristin/dalfopristin, sodium bicarbonate, sodium phosphates, trimethoprim/sulfamethoxazole.

### Patient/Family Teaching

- Instruct patient not to take enteric-coated tablets within 1 hr of calcium carbonate; this will result in premature dissolution of the tablets.
- Do not administer concurrently with foods containing large amounts of oxalic acid (spinach, rhubarb), phytic acid (brans, cereals), or phosphorus (milk or dairy products). Administration with milk products may lead to milk-alkali syndrome (nausea, vomiting, confusion, headache). Do not take within 1–2 hr of other medications if possible.
- Instruct patients on a regular schedule to take missed doses as soon as possible, then go back to regular schedule.
- Advise patient that calcium carbonate may cause constipation. Review methods of preventing constipation (increasing bulk in diet, increasing fluid intake, increasing mobility) and using laxatives. Severe constipation may indicate toxicity.
- Advise patient to avoid excessive use of tobacco or beverages containing alcohol or caffeine.
- **Calcium Supplement:** Encourage patients to maintain a diet adequate in vitamin D (see Appendix M).
- **Osteoporosis:** Advise patients that exercise has been found to arrest and reverse bone loss. Patient should discuss any exercise limitations with health care professional before beginning program.

### Evaluation/Desired Outcomes

- Increase in serum calcium levels.
- Decrease in the signs and symptoms of hypocalcemia.
- Resolution of indigestion.
- Control of hyperphosphatemia in patients with renal failure (calcium acetate only).

**candesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.**

HIGH ALERT

## capecitabine
(kap-pe-**site**-a-been)
Xeloda

***Classification***
Therapeutic: antineoplastics
Pharmacologic: antimetabolites

**Pregnancy Category D**

### Indications

Metastatic colorectal cancer. Adjuvant treatment for Dukes' C colon cancer following primary resection. Metastatic breast cancer that has worsened despite prior therapy with anthracycline (daunorubicin, doxorubicin, idarubicin) (to be used in combination with docetaxel). Metastatic breast cancer that is resistant to both paclitaxel and an anthracycline (daunorubicin, doxorubicin, idarubicin) or is resistant to paclitaxel and further anthracycline therapy is contraindicated.

## Action

Converted in tissue to 5-fluorouracil (5-FU), which inhibits DNA and RNA synthesis by preventing thymidine production. The enzyme responsible for the final step in the conversion to 5-FU may be found in higher concentrations in some tumors. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

## Pharmacokinetics

**Absorption:** Well absorbed after oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Metabolized mostly in tissue and by the liver to 5-FU; 5-FU is metabolized by dihydropyrimidine dehydrogenase to a less toxic compound; inactive metabolites are excreted primarily in urine.
**Half-life:** 45 min.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown† | 1.5 hr (2 hr for 5-FU)‡ | unknown |

†Onset of antineoplastic effect is 6 wk
‡Peak 5-FU levels occur at 2 hr

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to capecitabine or 5-FU; Dihydropyrimidine dehydrogenase deficiency (patients at ↑ risk of 5-FU toxicity); Severe renal impairment (CCr <30 mL/min); OB: Potential for fetal harm or death; Lactation: Potential for serious adverse effects in nursing infants.
**Use Cautiously in:** Mild-moderate renal impairment (↓ starting dose to 75% in patients with CCr 30–50 mL/min); Hepatic dysfunction; Coronary artery disease; Pedi: Safety not established; Geri: ↑ risk of severe diarrhea in patients ≥80 yr.

## Adverse Reactions/Side Effects

**CNS:** fatigue, headache, dizziness, insomnia. **EENT:** eye irritation, epistaxis, rhinorrhea. **CV:** edema, chest pain. **GI:** DIARRHEA, NECROTIZING ENTEROCOLITIS, abdominal pain, anorexia, constipation, dysgeusia, hyperbilirubinemia, nausea, stomatitis, vomiting, dyspepsia, xerostomia. **Derm:** dermatitis, hand-and-foot syndrome, nail disorder, alopecia, erythema, rashes. **F and E:** dehydration. **Hemat:** anemia, leukopenia, thrombocytopenia. **MS:** arthralgia, myalgia. **Neuro:** peripheral neuropathy. **Resp:** cough, dyspnea. **Misc:** fever.

## Interactions

**Drug-Drug:** May ↑ risk of bleeding with **warfarin** (frequent monitoring of PT/INR recommended). Toxicity ↑ by concurrent **leucovorin**. **Antacids** may ↑ absorption. May ↑ blood levels and risk of toxicity from **phenytoin** (may need to ↓ phenytoin dose).
**Drug-Food:** Food ↑ absorption, although capecitabine should be given within 30 min after a meal.

## Route/Dosage

**PO (Adults):** 1250 mg/m² twice daily for 14 days, followed by 7-day rest period; given in 3-wk cycles.

### Renal Impairment

**PO (Adults CCr 30-50 mL/min):** ↓ initial dose to 75% of usual.

## Availability

**Tablets:** 150 mg, 500 mg.

# NURSING IMPLICATIONS

## Assessment

- Assess mucous membranes, number and consistency of stools, and frequency of vomiting. Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, pain in lower back or side, difficult or painful urination). Assess for bleeding (bleeding gums; bruising; petechiae; and guaiac-test stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Notify health care professional if symptoms of toxicity (stomatitis, uncontrollable vomiting, diarrhea, fever) occur; drug may need to be discontinued or dose decreased. Patients with severe diarrhea should be monitored carefully and given fluid and electrolyte replacement if they become dehydrated.
- Assess patient for hand-and-foot syndrome. Symptoms include numbness, dysesthesia or paresthesia, tingling, painless or painful swelling, erythema, desquamation, blistering, and severe pain.
- ***Lab Test Considerations:*** Monitor hepatic (serum alkaline phosphatase, AST, ALT, and bilirubin), renal, and hematologic (hematocrit, hemoglobin, leukocyte, platelet count) function before and periodically during therapy. May cause leukopenia, anemia, and thrombocytopenia. Leukopenia may require discontinuation of therapy. Therapy should be interrupted

if serum bilirubin ↑ to 1.5 times normal or greater; may be reinstituted after bilirubin returns to normal.

- ***Lab Test Considerations:*** Monitor PT or INR frequently in patients receiving warfarin and capecitabine to adjust warfarin dose. May cause ↑ bleeding within a few days of initiation of therapy to 1 mo following discontinuation of therapy. Risk is greater in patients over 60 yr.

### Potential Nursing Diagnoses

Risk for infection (Side Effects)
Imbalanced nutrition: less than body requirements (Side Effects)

### Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations. Do not confuse capecitabine (Xeloda) with orlistat (Xenical).
- Dose modifications are based on degree of toxicity encountered. Once a dose has been reduced because of toxicity, it should not be increased at a later time. See manufacturer's recommendations.
- **PO:** Administer every 12 hr for 2 wk, followed by a 1-wk rest period. Tablets should be taken with water within 30 min after a meal.

### Patient/Family Teaching

- Instruct patient to take medication every 12 hr with water within 30 min after a meal. Missed doses should be omitted; continue regular schedule. Do not double dose.
- Inform patient of the most common side effects. Instruct patient to notify health care provider immediately if any of the following occur: diarrhea (>4 bowel movements in a day or any diarrhea at night), vomiting (more than once in 24 hr), nausea (loss of appetite and significant decrease in daily food intake), stomatitis (pain, redness, swelling, or sore in mouth), hand-and-foot syndrome (pain, swelling, or redness of hands and/or feet), fever or infection (temperature of ≥100.5° F or other signs of infection).
- Instruct patient to notify health care professional if he or she is taking folic acid.
- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; yellowing of skin or eyes; abdominal pain; joint or flank pain; swelling of feet or legs; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Advise patient to rinse mouth with clear water after eating and drinking and to avoid flossing to minimize stomatitis. Viscous lidocaine may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Review with patient the need for contraception during therapy.
- Emphasize the importance of routine follow-up lab tests to monitor progress and to check for side effects.

### Evaluation/Desired Outcomes

- Tumor regression.

## capsaicin (kap-**say**-sin)

Axsam, Capsin, Capzasin-P, Dolorac, No Pain-HP, Pain Doctor, Pain-X, R-Gel, Rid • a • Pain • HP, Zostrix, Zostrix-HP

***Classification***

Therapeutic: nonopioid analgesics (topical)

**Pregnancy Category UK**

### Indications

Temporary management of pain due to rheumatoid arthritis and osteoarthritis. Treatment of pain associated with postherpetic neuralgia or diabetic neuropathy. **Unlabeled Use:** Treatment of postmastectomy pain syndrome. Treatment of complex regional pain syndrome.

### Action

May deplete and prevent the reaccumulation of a chemical (substance P) responsible for transmitting painful impulses from peripheral sites to the CNS. **Therapeutic Effects:** Relief of discomfort associated with painful peripheral syndromes.

### Pharmacokinetics

**Absorption:** Unknown.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** Unknown.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| topical | 1–2 wk | 2–4 wk† | unknown |

†May take up to 6 wk for head and neck neuralgias

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to capsaicin or hot peppers; Not for use near eyes or on open or broken skin.
**Use Cautiously in:** OB, Lactation, Pedi: Safety not established for pregnant women, breastfeeding infants, or children <2 yr.

### Adverse Reactions/Side Effects
**Resp:** cough. **Derm:** transient burning.

### Interactions
**Drug-Drug:** None significant.

### Route/Dosage
**Topical (Adults and Children ≥2 yr):** Apply to affected areas 3–4 times daily.

### Availability
**Cream:** 0.025%[OTC], 0.075%[OTC]. **Gel:** 0.05%[OTC]. **Lotion:** 0.025%[OTC]. **Roll-on:** 0.075%[OTC]. ***In combination with:*** methylsalicylate (Ziks[OTC]). See Appendix B.

## NURSING IMPLICATIONS

### Assessment
- Assess pain intensity and location before and periodically throughout therapy.

### Potential Nursing Diagnoses
Chronic pain (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation
- **Topical:** Apply to affected area not more than 3–4 times daily. Avoid getting medication into eyes or on broken or irritated skin. Do not bandage tightly.
- Topical lidocaine may be applied during the first 1–2 wk of treatment to reduce initial discomfort.

### Patient/Family Teaching
- Instruct patient on the correct method for application of capsaicin. Rub cream into affected area well so that little or no cream is left on the surface. Gloves should be worn during application or hands should be washed immediately after application. If application is to hands for arthritis, do not wash hands for at least 30 min after application.
- Advise patient to apply missed doses as soon as possible unless almost time for next dose. Pain relief lasts only as long as capsaicin is used regularly.
- Advise patient that transient burning may occur with application, especially if applied fewer than 3–4 times daily. Burning usually disappears after the first few days but may continue for 2–4 wk or longer. Burning is increased by heat, sweating, bathing in warm water, humidity, and clothing. Burning usually decreases in frequency and intensity the longer capsaicin is used. Decreasing number of daily doses will not lessen burning but may decrease amount of pain relief and may prolong period of burning.
- Caution patient to flush area with water if capsaicin gets into eyes and to wash with warm, but not hot, soapy water if capsaicin gets on other sensitive areas of the body.
- Instruct patient with herpes zoster (shingles) not to apply capsaicin cream until lesions have healed completely.
- Advise patient to discontinue use and notify health care professional if pain persists longer than 1 month, worsens, or if signs of infection are present.

### Evaluation/Desired Outcomes
- Decrease in discomfort associated with:
- Postherpetic neuropathy.
- Diabetic neuropathy.
- Rheumatoid arthritis.
- Osteoarthritis. Pain relief usually begins within 1–2 wk with arthritis, 2–4 wk with neuralgias, and 4–6 wk with neuralgias of the head and neck.

**captopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.**

## carbamazepine
(kar-ba-**maz**-e-peen)
Apo-Carbamazepine, Carbatrol, Epitol, Equetro, Novo-Carbamaz, Tegretol, Tegretol CR, Tegretol-XR, Teril

***Classification***
Therapeutic: anticonvulsants, mood stabilizers

**Pregnancy Category D**

### Indications
Treatment of tonic-clonic, mixed, and complex-partial seizures. Management of pain in trigeminal neuralgia or diabetic neuropathy. **Equetro only:**

Acute mania and mixed mania. **Unlabeled Use:** Other forms of neurogenic pain.

## Action

Decreases synaptic transmission in the CNS by affecting sodium channels in neurons. **Therapeutic Effects:** Prevention of seizures. Relief of pain in trigeminal neuralgia. Decreased mania.

## Pharmacokinetics

**Absorption:** Absorption is slow but complete. Suspension produces earlier, higher peak, and lower trough levels.
**Distribution:** Widely distributed. Crosses the blood-brain barrier. Crosses the placenta rapidly and enters breast milk in high concentrations.
**Protein Binding:** *Carbamazepine*—75–90%; *epoxide*—50%.
**Metabolism and Excretion:** Extensively metabolized in the liver by cytochrome P450 3A4 to active epoxide metabolite; epoxide metabolite has anticonvulsant and antineuralgic activity.
**Half-life:** *Carbamazapine*—single dose—25–65 hr, chronic dosing—*Children*—8–14 hr; *Adults*—12–17 hr; *epoxide*—34±9 hr.

TIME/ACTION PROFILE (anticonvulsant activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | up to one month† | 4–5 hr‡ | 6–12 hr |
| PO-ER | up to one month† | 2–3–12 hr‡ | 12 hr |

†Onset of antineuralgic activity is 8–72 hr
‡Listed for tablets; peak level occurs 1.5 hr after a chronic dose of suspension

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Bone marrow suppression; Concomitant use or use within 14 days of MAO inhibitors; OB: Use only during pregnancy if potential benefits outweigh risks to the fetus; additional vitamin K during last weeks of pregnancy has been recommended; Lactation: Discontinue drug or bottle feed.
**Use Cautiously in:** All patients (may ↑ risk of suicidal thoughts/behaviors); Cardiac or hepatic disease; Renal failure (dosing adjustment required for ClCr < 10 mL/min; ↑ intraocular pressure; Geri: Older men with prostatic hyperplasia may be at ↑ risk for acute urinary retention or difficulty initiating stream.
**Exercise Extreme Caution in:** Patients positive for HLA-B*1502 allele (unless benefits clearly outweigh the risks).

## Adverse Reactions/Side Effects

**CNS:** SUICIDAL THOUGHTS, ataxia, drowsiness, fatigue, psychosis, sedation, vertigo. **EENT:** blurred vision, nystagmus, corneal opacities. **Resp:** pneumonitis. **CV:** CHF, edema, hypertension, hypotension, syncope. **GI:** hepatitis, pancreatitis, weight gain. **GU:** hesitancy, urinary retention. **Derm:** photosensitivity, rashes, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, urticaria. **Endo:** syndrome of inappropriate antidiuretic hormone (SIADH), hyponatremia. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, THROMBOCYTOPENIA, eosinophilia, leukopenia. **Misc:** chills, fever, lymphadenopathy, ↑ liver enzymes, multiorgan hypersensitivity reactions, hepatic failure (rare).

## Interactions

**Drug-Drug:** May ↑ metabolism of and therefore ↓ levels/ effectiveness of **corticosteroids**, **doxycycline**, **felbamate**, **quinidine**, **warfarin**, **estrogen-containing contraceptives**, **barbiturates**, **cyclosporine**, **benzodiazepines**, **theophylline**, **lamotrigine**, **phenytoin**, **topiramate**, **valproic acid**, **bupropion**, and **haloperidol**. **Danazol** ↑ blood levels (avoid concurrent use if possible). Concurrent use (within 2 wk) of **MAO inhibitors** may result in hyperpyrexia, hypertension, seizures, and death. **Verapamil**, **diltiazem**, **propoxyphene**, **itraconazole**, **ketoconazole**, **erythromycin**, **clarithromycin**, **SSRIs**, **antidepressants**, or **cimetidine** may inhibit the hepatic metabolism of carbamazepine and ↑ levels; may cause toxicity. Enzyme inducers such as **rifampin**, **phenobarbital**, **phenytoin**, **primidone**, and **methosuximide** may ↓ serum concentration of carbamazepine. May ↑ risk of hepatotoxicity from **isoniazid**. **Felbamate** ↓ carbamazepine levels but ↑ levels of active metabolite. May ↓ effectiveness and ↑ risk of toxicity from **acetaminophen**. May ↑ risk of CNS toxicity from **lithium**. May ↓ duration of action of **nondepolarizing neuromuscular blocking agents**.
**Drug-Food: Grapefruit juice** ↑ serum levels and oral bioavailability by 40% and therefore may ↑ effects.

## Route/Dosage

**PO (Adults):** *Anticonvulsant*—200 mg twice daily (tablets) or 100 mg 4 times daily (suspension); increase by 200 mg/day q 7 days until therapeutic levels are achieved (range is 600–1200 mg/day in divided doses q 6–8 hr; not to exceed

1 g/day in 12–15-yr-olds. Extended-release products are given twice daily (XR, CR). *Antineuralgic*—100 mg twice daily or 50 mg 4 times daily (suspension); increase by up to 200 mg/day until pain is relieved, then maintenance dose of 200–1200 mg/day in divided doses (usual range, 400–800 mg/day).
**PO (Children 6–12 yr):** 100 mg twice daily (tablets) or 50 mg 4 times daily (suspension). ↑ by 100 mg weekly until therapeutic levels are obtained (usual range 400–800 mg/day; not to exceed 1 g/day). Extended-release products (XR, CR) are given twice daily.
**PO (Children <6 yr):** 10–20 mg/kg/day in 2–3 divided doses; may be ↑ at weekly intervals until optimal response and therapeutic levels are acheived. Usual maintenance dose is 250–350 mg/day (not to exceed 35 mg/kg/day).

### Availability (generic available)

**Tablets:** 200 mg. **Cost:** *Generic*—$25.97/180. **Chewable tablets:** 100 mg, 200 mg. **Cost:** *Generic*—100 mg $21.98/180. **Extended-release capsules:** 100 mg, 200 mg, 300 mg. **Cost:** 100 mg $235.66/180, 200 mg $226.49/180, 300 mg $216.88/180. **Extended-release tablets:** 100 mg, 200 mg, 400 mg. **Cost:** 100 mg $83.93/180, 200 mg $143.93/180, 400 mg $279.94/180. **Oral suspension (citrus/vanilla flavor):** 100 mg/5 mL. **Cost:** *Generic*—$28.26/450 mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor for changes in skin condition in early therapy. Stevens-Johnson syndrome and toxic epidermal necrolysis are significantly more common in patients with a particular human leukocyte antigen (HLA) allele, HLA-B*1502 (occurs almost exclusively in patients with Asian ancestry, including South Asian Indians). Screen patients of Asian ancestry for the HLA-B*1502 allele before starting treatment with carbamazepine. If positive, carbamazepine should not be started unless the expected benefit outweighs increased risk of serious skin reactions. Patients who have been taking carbamazepine for more than a few months without developing skin reactions are at low risk of these events ever developing.
- **Seizures:** Assess frequency, location, duration, and characteristics of seizure activity.
- **Trigeminal Neuralgia:** Assess for facial pain (location, intensity, duration). Ask patient to identify stimuli that may precipitate facial pain (hot or cold foods, bedclothes, touching face).
- **Bipolar Disorder:** Assess mental status (mood, orientation, behavior) and cognitive abilities before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC, including platelet count, reticulocyte count, and serum iron, weekly during the first 2 mo and yearly thereafter for evidence of potentially fatal blood cell abnormalities. Medication should be discontinued if bone marrow depression occurs.
- Perform genetic testing for the HLA-B*1502 allele in patients of Asian ancestry prior to beginning therapy.
- Liver function tests, urinalysis, and BUN should be routinely performed. May cause ↑ AST, ALT, serum alkaline phosphatase, bilirubin, BUN, urine protein, and urine glucose levels.
- Monitor serum ionized calcium levels every 6 mo or if seizure frequency increases. Thyroid function tests and ionized serum calcium concentrations may be ↓; hypocalcemia ↓ seizure threshold.
- Monitor ECG and serum electrolytes before and periodically during therapy. May cause hyponatremia.
- May occasionally cause ↑ serum cholesterol, high-density lipoprotein, and triglyceride concentrations.
- May cause false-negative pregnancy test results with tests that determine human chorionic gonadotropin.
- ***Toxicity and Overdose:*** Serum blood levels should be routinely monitored during therapy. Therapeutic levels range from 4–12 mcg/mL.

### Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)
Chronic pain (Indications)
Disturbed thought process (Indications)

### Implementation

- Implement seizure precautions as indicated.
- **PO:** Administer medication with food to minimize gastric irritation. May take at bedtime to reduce daytime sedation. Tablets may be crushed if patient has difficulty swallowing. Do not crush or chew extended-release tablets. Extended-release capsules may be opened and the contents sprinkled on applesauce or other similar foods.

- Do not administer suspension simultaneously with other liquid medications or diluents; mixture produces an orange rubbery mass.

### Patient/Family Teaching

- Instruct patient to take carbamazepine around the clock, as directed. Take missed doses as soon as possible but not just before next dose; do not double doses. Notify health care professional if more than one dose is missed. Medication should be gradually discontinued to prevent seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill; changes may occur.
- May cause dizziness or drowsiness. Advise patients to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patients that behavioral changes, skin rash, fever, sore throat, mouth ulcers, easy bruising, petechiae, unusual bleeding, abdominal pain, chills, rash, pale stools, dark urine, or jaundice should be reported to health care professional immediately. Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Inform patient that coating of *Tegretol XR* is not absorbed, but is excreted in feces and may be visible in stool.
- Advise patient not to take alcohol or other CNS depressants concurrently with this medication.
- Caution patients to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may help reduce dry mouth. Saliva substitute may be used. Consult dentist if dry mouth persists >2 wk.
- Advise female patients to use a nonhormonal form of contraception while taking carbamazepine.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up lab tests and eye exams to monitor for side effects.
- Inform patient and family that the Manic-Depressive and Depressive Association can offer support for mania.
- **Seizures:** Advise patients to carry identification describing disease and medication regimen at all times.

### Evaluation/Desired Outcomes

- Absence or reduction of seizure activity.
- Decrease in trigeminal neuralgia pain. Patients with trigeminal neuralgia who are pain-free should be re-evaluated every 3 mo to determine minimum effective dose.
- Decreased mania and depressive symptoms in Bipolar I disorder.

## carbidopa/levodopa

(**kar**-bi-doe-pa/**lee** -voe-doe-pa)

Parcopa, Sinemet, Sinemet CR

***Classification***

Therapeutic: antiparkinson agents

Pharmacologic: dopamine agonists

**Pregnancy Category C (carbidopa/levodopa)**

### Indications

Parkinson's disease. Not useful for drug-induced extrapyramidal reactions.

### Action

Levodopa is converted to dopamine in the CNS, where it serves as a neurotransmitter. Carbidopa, a decarboxylase inhibitor, prevents peripheral destruction of levodopa. **Therapeutic Effects:** Relief of tremor and rigidity in Parkinson's syndrome.

### Pharmacokinetics

**Absorption:** Well absorbed following oral administration.

**Distribution:** Widely distributed. *Levodopa*—enters the CNS in small concentrations. *Carbidopa*—does not cross the blood-brain barrier but does cross the placenta. Both enter breast milk.

**Metabolism and Excretion:** *Levodopa*—mostly metabolized by the GI tract and liver. *Carbidopa*—30% excreted unchanged by the kidneys.

**Half-life:** *Levodopa*—1 hr; *carbidopa*—1–2 hr.

TIME/ACTION PROFILE (antiparkinson effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Carbidopa | unknown | unknown | 5–24 hr |
| Levodopa | 10–15 min | unknown | 5–24 hr or more |
| Carbidopa/levodopa sustained release | unknown | 2 hr | 12 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Angle-closure glaucoma; MAO inhibitor therapy; Malignant melanoma; Undiagnosed skin lesions; Some products contain tartrazine, phenylalanine, or aspartame and should be avoided in patients with known hypersensitivity.

**Use Cautiously in:** History of cardiac, psychiatric, or ulcer disease; OB, Pedi: Safety not established; Lactation: May ↓ serum prolactin.

### Adverse Reactions/Side Effects

**CNS:** involuntary movements, anxiety, dizziness, hallucinations, memory loss, psychiatric problems, urges (gambling, sexual). **EENT:** blurred vision, mydriasis. **GI:** nausea, vomiting, anorexia, dry mouth, hepatotoxicity. **Derm:** melanoma. **Hemat:** hemolytic anemia, leukopenia. **Misc:** darkening of urine or sweat.

### Interactions

**Drug-Drug:** Use with **MAO inhibitors** may result in hypertensive reactions. ↑ risk of arrhythmias with **inhalation hydrocarbon anesthetics** (especially **halothane**; if possible discontinue 6–8 hr before anesthesia). **Phenothiazines**, **haloperidol**, **papaverine**, **phenytoin**, and **reserpine** may ↓ effect of levodopa. Large doses of **pyridoxine** may ↓ beneficial effects of levodopa. Concurrent use with **methyldopa** may alter the effectiveness of levodopa and ↑ risk of CNS side effects. ↑ hypotension may result with concurrent **antihypertensives**. **Anticholinergics** may ↓ absorption of levodopa. ↑ risk of adverse reactions with **selegilene** or **cocaine**.

**Drug-Natural Products: Kava-kava** may ↓ levodopa effectiveness.

**Drug-Food:** Ingestion of foods containing large amounts of **pyridoxine** may ↓ effect of levodopa.

### Route/Dosage

#### Carbidopa/Levodopa

**PO (Adults):** 25 mg carbidopa/100 mg levodopa 3 times daily; may be ↑ every 1–2 days until desired effect is achieved (max = 8 tablets of 25 mg carbidopa/100 mg levodopa/day).

#### Carbidopa/Levodopa Extended-Release

**PO (Adults):** *Patients not currently receiving levodopa*— 50 mg carbidopa/200 mg levodopa twice daily (minimum of 6 hr apart) initially. *Conversion from standard carbidopa/levodopa*— initiate therapy with at least 10% more levodopa content/day (may need up to 30% more) given at 4–8 hr intervals while awake. Allow 3 days between dosage changes; some patients may require larger doses and shorter dosing intervals.

### Availability

#### Carbidopa/Levodopa (generic available)

**Tablets:** 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa. **Orally-disintegrating tablets (mint):** 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa. **Extended-release tablets:** 25 mg carbidopa/100 mg levodopa, 50 mg carbidopa/200 mg levodopa. ***In combination with:*** entacapone (Stalevo); see Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess parkinsonian symptoms (akinesia, rigidity, tremors, pill rolling, shuffling gait, mask-like face, twisting motions, and drooling) during therapy. "On-off phenomenon" may cause symptoms to appear or improve suddenly.
- Assess blood pressure and pulse frequently during period of dose adjustment.
- ***Lab Test Considerations:*** May cause false-positive test results in Coombs' test.
- May cause ↑ serum glucose. Dipstick for urine ketones may reveal false-positive results.
- Monitor hepatic and renal function and CBC periodically in patients on long-term therapy. May cause ↑ AST, ALT, bilirubin, alkaline phosphatase, LDH, and serum protein-bound iodine concentrations. May cause ↓ BUN, creatinine, and uric acid.
- May cause ↓ hemoglobin, ↓ hematocrit, agranulocytosis, hemolytic and nonhemolytic anemia, thrombocytopenia, leukopenia, and ↑ WBC.
- ***Toxicity and Overdose:*** Assess for signs of toxicity (involuntary muscle twitching, facial grimacing, spasmodic eye winking, exaggerated protrusion of tongue, behavioral changes). Consult health care professional if symptoms occur.

### Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications)

### Implementation

- In the carbidopa/levodopa combination, the number following the drug name represents the milligrams of each respective drug.
- In preoperative patients or patients who are NPO, confer with health care professional about continuing medication administration.
- **PO:** Administer on a regular schedule.
- Controlled-release tablets may be administered as whole or half tablets, but they should not be crushed or chewed.
- For *orally disintegrating tablets,* just prior to administration remove tablet from bottle with dry hands. Immediately place tablet on top of tongue. Tablet will dissolve in seconds, then swallow with saliva. Administration with liquid is not necessary.

### Patient/Family Teaching

- Instruct patient to take this medication at regular intervals as directed. Do not change dose regimen or take additional antiparkinson drugs, including more carbidopa/levodopa, without consulting health care professional. Take missed doses as soon as remembered, unless next scheduled dose is within 2 hr; do not double doses.
- Explain that gastric irritation may be decreased by eating food shortly after taking medications but that high-protein meals may impair levodopa's effects. Dividing the daily protein intake among all the meals may help ensure adequate protein intake and drug effectiveness. Do not drastically alter diet during carbidopa/levodopa therapy without consulting health care professional.
- May cause sudden onset of sleep, drowsiness, or dizziness. Advise patient to avoid driving and other activities that require alertness until response to drug is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Health care professional should be notified if orthostatic hypotension occurs.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth.
- Caution patient to monitor skin lesions for any changes. Health care professional should be notified promptly because carbidopa/levodopa may activate malignant melanoma.
- Advise patient to confer with health care professional before taking OTC medications, especially cold remedies. Large amounts of vitamin $B_6$ (pyridoxine) and iron may interfere with the action of levodopa.
- Inform patient that harmless darkening of saliva, urine, or sweat may occur.
- Advise patient to notify health care professional if palpitations, urinary retention, involuntary movements, behavioral changes, severe nausea and vomiting, new skin lesions, or new or increased gambling, sexual, or other intense urges occur. Dose reduction may be required.
- Inform patient that sometimes a "wearing-off" effect may occur at end of dosing interval. Notify health care professional if this poses a problem to lifestyle.

### Evaluation/Desired Outcomes

- Resolution of parkinsonian signs and symptoms. Therapeutic effects usually become evident after 2–3 wk of therapy but may require up to 6 mo. Patients who take this medication for several yr may experience a decrease in the effectiveness of this drug. Effectiveness may sometimes be restored after a "drug holiday."

**carbonyl iron, See IRON SUPPLEMENTS.**

HIGH ALERT

## carboplatin (kar-boe-**pla**-tin)

Paraplatin, Paraplatin-AQ

***Classification***

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

**Pregnancy Category D**

### Indications

Advanced ovarian carcinoma (with other agents). Palliative treatment of ovarian carcinoma unresponsive to other modalities.

### Action

Inhibits DNA synthesis by producing cross-linking of parent DNA strands (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Protein Binding:** Platinum is irreversibly bound to plasma proteins.
**Metabolism and Excretion:** Excreted mostly by the kidneys.
**Half-life:** *Carboplatin*—2.6–5.9 hr (increased in renal impairment); *platinum*—5 days.

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | 21 days | 28 days |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to carboplatin, cisplatin, or mannitol; OB: Pregnancy or lactation.
**Use Cautiously in:** Hearing loss; Electrolyte abnormalities; Renal impairment (dose reduction recommended if creatinine <60 mL/min); Active infections; Diminished bone marrow reserve (dose reduction recommended); Other chronic debilitating illnesses; Geri: ↑ risk of thrombocytopenia, consider renal function in dose determination; Patients with childbearing potential; Pedi: Safe use in children not established.

### Adverse Reactions/Side Effects

**CNS:** weakness. **EENT:** ototoxicity. **GI:** abdominal pain, nausea, vomiting, constipation, diarrhea, hepatitis, stomatitis. **GU:** gonadal suppression, nephrotoxicity. **Derm:** alopecia, rash. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hyponatremia. **Hemat:** ANEMIA, LEUKOPENIA, THROMBOCYTOPENIA. **Metab:** hyperuricemia. **Neuro:** peripheral neuropathy. **Misc:** hypersensitivity reactions including ANAPHYLACTIC-LIKE REACTIONS.

### Interactions

**Drug-Drug:** ↑ nephrotoxicity and ototoxicity with other **nephrotoxic** and **ototoxic drugs (aminoglycosides, loop diuretics)**. ↑ bone marrow depression with other **bone marrow–depressing drugs** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

### Route/Dosage

Other dosing formulas are used.
**IV (Adults):** *Initial treatment*—300 mg/m² with cyclophosphamide at 4-wk intervals. *Treatment of refractory tumors*—360 mg/m² as a single dose; may be repeated at 4-wk intervals, depending on response.

### Renal Impairment

**IV (Adults):** *CCr 41–59 mL/min*—initial dose 250 mg/m²; *CCr 16–40 mL/min*—initial dose 200 mg/m².

### Availability (generic available)

**Lyophilized powder for injection:** 50-mg vials, 150-mg vials, 450-mg vials. **Aqueous solution for injection:** 50-mg/5-ml vial, 150-mg/15-mL vial, 450-mg/45-mL vial, 600-mg/60-mL vial.

## NURSING IMPLICATIONS

### Assessment

- Assess for nausea and vomiting; often occur 6–12 hr after therapy (1–4 hr for aqueous solution) and may persist for 24 hr. Prophylactic antiemetics may be used. Adjust diet as tolerated to maintain fluid and electrolyte balance and ensure adequate nutritional intake. May require discontinuation of therapy.
- Assess patients receiving *Paraplatin-AQ* for neurotoxicity (paresthesias in a stocking—glove distribution, areflexia, loss of proprioception and vibratory sensations). Discontinue therapy when symptoms are first observed. May progress further even after stopping therapy. May be irreversible.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur and may be cumulative; transfusions are frequently required. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor for signs of anaphylaxis (rash, urticaria, pruritus, facial swelling, wheezing, tachycardia, hypotension). Discontinue medication immediately and notify physician if these occur. Epinephrine and resuscitation equipment should be readily available.
- Audiometry is recommended before initiation of therapy and subsequent doses. Ototoxicity manifests as tinnitus and unilateral or bilateral hearing loss in high frequencies and becomes more frequent and severe with repeated doses. Ototoxicity is more pronounced in children.
- ***Lab Test Considerations:*** Monitor CBC, differential, and clotting studies before and weekly during therapy. For *Paraplatin:* The nadirs of thrombocytopenia and leukopenia occur after 21 days and recover by 30 days after a dose. Nadir of granulocyte counts usually occurs after 21–28 days and recovers by day 35.

Withhold subsequent doses until neutrophil count is >2000/mm³ and platelet count is > 100,000/mm³. For *Paraplatin-AQ:* The nadirs of thrombocytopenia and leukopenia occur between days 18 and 23 and recover by day 39. Anemia also occurs with the same frequency and timing as thrombocytopenia and leukopenia.

- Monitor renal function and serum electrolytes before initiation of therapy and before each course of carboplatin. Nephrotoxicity with *Paraplatin-AQ* is cumulative and is potentiated by aminoglycoside antibiotics. Monitor serum creatinine, BUN, creatinine clearance, and magnesium, sodium, potassium, and calcium levels prior to initiating therapy and before each subsequent dose. May cause ↑ BUN and serum creatinine concentrations and ↓ CCr. May cause ↓ serum potassium, calcium, magnesium, and sodium concentrations. Renal function must return to normal before each dose of *Paraplatin-AQ* is given.
- Monitor hepatic function before and periodically during therapy. May cause ↑ serum bilirubin, alkaline phosphatase, and AST concentrations.
- *Paraplatin-AQ* may cause hyperuricemia, usually occurring 3–5 days after therapy. Allopurinol may be used to ↓ uric acid levels.
- *Paraplatin-AQ* may cause ↑ serum amylase levels.

## Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse carboplatin with cisplatin. Do not confuse Paraplatin (carboplatin) with Platinol (cisplatin).
- ***High Alert:*** Carboplatin should be administered in a monitored setting under the supervision of a physician experienced in cancer chemotherapy.

### IV Administration

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- Do not use aluminum needles or equipment during preparation or administration; aluminum reacts with the drug.

### Paraplatin

- **Intermittent Infusion:** Reconstitute to a concentration of 10 mg/mL with sterile water for injection, D5W, or 0.9% NaCl for injection. ***Diluent:*** May be further diluted in D5W or 0.9% NaCl. ***Concentration:*** 0.5 mg/mL. Stable for 8 hr at room temperature.
- May also be administered over 24 hr or by dividing total dose into 5 consecutive pulse doses; may decrease nausea and vomiting but does not decrease nephrotoxicity or ototoxicity. ***Rate:*** Administer over 15–60 min.
- **Y-Site Compatibility:** allopurinol, amifostine, anidlafungin, aztreonam, cefepime, cladribine, doxorubicin liposome, etoposide phosphate, filgrastim, fludarabine, gemcitabine, granisetron, linezolid, melphalan, ondansetron, oxaliplatin, paclitaxel, palonosetron, pemetrexed, piperacillin/tazobactam, propofol, sargramostim, teniposide, thiotepa, topotecan, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl sulfate complex, lansoprazole.

### Paraplatin-AQ

- Hydrate patient with 1–2 liters of fluid infused over 8–12 hr prior to therapy.
- Adequate hydration and urinary output must be maintained for 24 hr following infusion.
- **Intermittent Infusion:** ***Diluent:*** Dilute Paraplatin-AQ with 2 liters of D5/0.45% NaCl containing 37.5 g of mannitol. Do not dilute with D5W. If diluted solution is not to be used within 6 hr, protect solution from light. Do not refrigerate.

## Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; chills; sore throat; signs of infection; lower back or side pain; difficult or painful urination; bleeding gums; bruising; pinpoint red spots on skin; blood in stools, urine, or emesis; increased fatigue, dyspnea, or orthostatic hypotension occurs.
- Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patients not to drink alcoholic

beverages or take medication containing aspirin or NSAIDs because they may precipitate gastric bleeding.
- Instruct patient to promptly report any numbness or tingling in extremities or face, decreased coordination, difficulty with hearing or ringing in the ears, unusual swelling, or weight gain to health care professional.
- Instruct patient not to receive any vaccinations without advice of health care professional and to avoid contact with persons who have received oral polio vaccine within the past several months.
- Advise patient of the need for contraception (if patient is not infertile as a result of surgical or radiation therapy).
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to notify health care professional, rinse mouth with water after eating, and use sponge brush. Mouth pain may require treatment with opioids.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes
- Decrease in size or spread of ovarian carcinoma.

## carisoprodol
(kar-i-**sop**-roe-dole)
Soma, Vanadom

***Classification***
Therapeutic: skeletal muscle relaxants (centrally acting)

**Pregnancy Category UK**

### Indications
Adjunct to rest and physical therapy in the treatment of muscle spasm associated with acute painful musculoskeletal conditions.

### Action
Skeletal muscle relaxation, probably due to CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation.

### Pharmacokinetics
**Absorption:** Well absorbed after oral administration.
**Distribution:** Crosses the placenta; high concentrations in breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 8 hr.

TIME/ACTION PROFILE (skeletal muscle relaxation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | unknown | 4–6 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to carisoprodol or to meprobamate; Porphyria or suspected porphyria.
**Use Cautiously in:** Severe liver or kidney disease; OB, Lactation, Pedi: Safety not established for pregnant women, breastfeeding infants, or children <16 yr; Geri: Poorly tolerated due to anticholinergic effects. Appears on Beers list.

### Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness, agitation, ataxia, depression, headache, insomnia, irritability, syncope. **Resp:** asthma attacks. **CV:** hypotension, tachycardia. **GI:** epigastric distress, hiccups, nausea, vomiting. **Derm:** flushing, rashes. **Hemat:** eosinophilia, leukopenia. **Misc:** ANAPHYLACTIC SHOCK, fever, psychological dependence, severe idiosyncratic reaction.

### Interactions
**Drug-Drug:** Additive CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can increase CNS depression.

### Route/Dosage
**PO (Adults ≥16 yrs):** 250–350 mg 4 times daily for no > 2–3 wk.

### Availability (generic available)
**Tablets:** 250 mg, 350 mg. ***In combination with:*** aspirin (Soma compound) and codeine. See Appendix B.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- Observe patient for idiosyncratic symptoms that may appear within minutes or hours of administration during the first dose. Symptoms include extreme weakness, quadriplegia, dizziness, ataxia, dysarthria, visual disturbances, agitation, euphoria, confusion, and disorientation. Usually subsides over several hours.

- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).

### Potential Nursing Diagnoses

Acute pain (Indications)
Impaired bed mobility (Indications)
Risk for injury (Side Effects)

### Implementation

- Do not confuse Soma with Soma Compound.
- Provide safety measures as indicated. Supervise ambulation and transfer of patients.
- **PO:** Administer with food to minimize GI irritation. Give dose at bedtime.

### Patient/Family Teaching

- Instruct patient to take medication as directed. Missed doses should be taken within 1 hr; if not, omit and return to regular dosing schedule. Do not double doses.
- Encourage patient to comply with additional therapies prescribed for muscle spasm (rest, physical therapy, heat, etc.).
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Instruct patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Instruct patient to notify health care professional if signs of allergy (rash, hives, swelling of tongue or lips, dyspnea) or idiosyncratic reaction occur.

### Evaluation/Desired Outcomes

- Decreased musculoskeletal pain and muscle spasticity.
- Increased range of motion.

HIGH ALERT

## carmustine (kar-mus-teen)

BCNU, BiCNU, Gliadel

***Classification***

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

**Pregnancy Category D**

### Indications

Alone or with other treatments (surgery, radiation) in the management of: Brain tumors, Multiple myeloma, Hodgkin's disease, Other lymphomas.

### Action

Inhibits DNA and RNA synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, especially malignant ones.

### Pharmacokinetics

**Absorption:** Following IV administration, absorption is complete. Following implantation, action is primarily local.
**Distribution:** Highly lipid soluble; readily penetrates CSF. Enters breast milk.
**Metabolism and Excretion:** Rapidly metabolized. Some metabolites have antineoplastic activity.
**Half-life:** *Biologic*—15–30 min; *chemical*—5 min.

TIME/ACTION PROFILE (effect on platelet counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | days | 4–5 wk | 6 wk |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Pregnancy or lactation.
**Use Cautiously in:** Infections; Depressed bone marrow reserve; Geriatric patients (consider age related decrease in body mass, renal/hepatic/cardiovascular function, concurrent medications and chronic illnesses); Impaired pulmonary, hepatic, or renal function; Other chronic debilitating illnesses; Patients with childbearing potential.

### Adverse Reactions/Side Effects

**Resp:** PULMONARY FIBROSIS, pulmonary infiltrates. **GI:** hepatotoxicity, nausea, vomiting, anorexia, diarrhea, esophagitis. **GU:** renal failure. **Derm:** alopecia. **Hemat:** LEUKOPENIA, THROMBOCYTOPENIA, anemia. **Local:** pain at IV site.

### Interactions

**Drug-Drug:** ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. **Smoking** ↑ risk of pulmonary toxicity. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. Myelosuppression may be ↑ by **cimetidine**.

### Route/Dosage

**IV (Adults and Children):** 150–200 mg/m² single dose every 6–8 wk *or* 75–100 mg/m²/day for 2 days q 6 wk *or* 40 mg/m²/day for 5 days q 6 wk.

**Intracavitary** (Adults): Up to 61.6 mg (8 implants) placed in cavity created during surgical resection of brain tumor.

### Availability

**Injection:** 100-mg vial. **Intracavitary wafer:** 7.7 mg in packages of 8.

## NURSING IMPLICATIONS

### Assessment

- Monitor vital signs before and frequently during therapy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur; monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess respiratory status for dyspnea or cough. Pulmonary toxicity usually occurs after high cumulative doses or several courses of therapy but may also occur following 1–2 courses of low doses. Symptoms may be rapid or gradual in onset; damage may be reversible or irreversible. Delayed pulmonary fibrosis may occur yr after therapy. Notify physician promptly if symptoms occur.
- Monitor IV site closely. Carmustine is an irritant. Instruct patient to notify nurse immediately if discomfort occurs at IV site. Discontinue IV immediately if infiltration occurs. Ice may be applied to site. May cause hyperpigmentation of skin along vein.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting, which occur within 2 hr of administration and persist for 4–6 hr. Administration of an antiemetic before and during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and throughout therapy. The nadir of thrombocytopenia occurs in 4–5 wk; the nadir of leukopenia in 5–6 wk. Recovery usually occurs in 6–7 wk but may take 10–12 wk after prolonged therapy. Withhold dose and notify physician if platelet count is $<100{,}000/mm^3$ or leukocyte count is $<4000/mm^3$. Anemia is usually mild.
- Monitor serum bilirubin, AST, ALT, and LDH before and periodically during therapy. May cause mild, reversible ↑ in AST, alkaline phosphatase, and bilirubin.
- Monitor BUN, serum creatinine, and uric acid before and periodically during therapy. Notify physician if BUN is elevated.

### Potential Nursing Diagnoses

Risk for injury (Side Effects)
Disturbed body image (Side Effects)

### Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

**IV Administration**

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers. Contact with skin may cause transient hyperpigmentation.
- **Intermittent Infusion:** Dilute contents of each 100-mg vial with 3 mL of absolute ethyl alcohol provided as a diluent. Dilute this solution with 27 mL of sterile water for injection. ***Concentration:*** 3.3 mg/mL. ***Diluent:*** May be further diluted with 500 mL of D5W or 0.9% NaCl in a glass container.
- Solution is clear and colorless. Do not use vials that contain an oily film, which indicates decomposition. Reconstituted solution is stable for 24 hr when refrigerated and protected from light. Solution contains no preservatives; do not use as a multidose vial.
- IV lines may be flushed with 5–10 mL of 0.9% NaCl before and after carmustine infusion to minimize irritation at the injection site. ***Rate:*** Administer dose over 1–2 hr at rate of <3 mg/mL/min. Rapid infusion rate may cause local pain, burning at site, and flushing. Facial flushing occurs within 2 hr and may persist for 4 hr.
- **Y-Site Compatibility:** amifostine, aztreonam, cefepime, etoposide, filgrastim, fludarabine, gemcitabine, granisetron, melphalan, ondansetron, piperacillin/tazobactam, sargramostim, teniposide, thiotepa, vinorelbine.
- **Additive Incompatibility:** allopurinol, sodium bicarbonate.

### Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; lower back or side pain; difficult or painful urination; bleeding gums; bruising;

petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs.
- Instruct patient to notify health care professional if shortness of breath or increased cough occurs. Encourage patient not to smoke, because smokers are at greater risk for pulmonary toxicity.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient of the need for contraception.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize need for periodic lab tests to monitor for side effects.

## Evaluation/Desired Outcomes

- Decrease in size and spread of tumor.
- Improvement in hematologic parameters in nonsolid cancers.

## carvedilol (kar-**ve**-dil-ole)

Coreg, Coreg CR

***Classification***

Therapeutic: antihypertensives
Pharmacologic: beta blockers

**Pregnancy Category C**

## Indications

Hypertension. CHF (ischemic or cardiomyopathic) with digoxin, diuretics, and ACE inhibitors. Left ventricular dysfunction after myocardial infarction.

## Action

Blocks stimulation of $beta_1$ (myocardial) and $beta_2$ (pulmonary, vascular, and uterine)-adrenergic receptor sites. Also has $alpha_1$ blocking activity, which may result in orthostatic hypotension. **Therapeutic Effects:** Decreased heart rate and blood pressure. Improved cardiac output, slowing of the progression of CHF and decreased risk of death.

## Pharmacokinetics

**Absorption:** Well absorbed but rapidly undergoes extensive first-pass hepatic metabolism, resulting in 25–35% bioavailability. Food slows absorption.
**Distribution:** Unknown.
**Protein Binding:** 98%.
**Metabolism and Excretion:** Extensively metabolized (primarily by CYP2D6 and CYP2C9; the CYP2D6 enzyme system exhibits genetic polymorphism); ~7% of population may be poor metabolizers and may have significantly ↑ carvedilol concentrations and an ↑ risk of adverse effects); excreted in feces via bile, <2% excreted unchanged in urine.
**Half-life:** 7–10 hr.

TIME/ACTION PROFILE (cardiovascular effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 1 hr | 1–2 hr | 12 hr |
| PO-CR | unknown | 5 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** History of serious hypersensitivity reaction (Stevens-Johnson syndrome, angioedema, anaphylaxis); Pulmonary edema; Cardiogenic shock; Bradycardia, heart block or sick sinus syndrome (unless a pacemaker is in place); Uncompensated CHF requiring IV inotropic agents (wean before starting carvedilol); Severe hepatic impairment; Asthma or other bronchospastic disorders.
**Use Cautiously in:** CHF (condition may deteriorate during initial therapy); Renal impairment; Hepatic impairment; Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Peripheral vascular disease; History of severe allergic reactions (intensity of reactions may be increased); OB: Crosses placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression); Lactation, Pedi: Safety not established; Geri: ↑ sensitivity to beta blockers; initial dose reduction recommended.

## Adverse Reactions/Side Effects

**CNS:** dizziness, fatigue, weakness, anxiety, depression, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Resp:** bronchospasm, wheezing. **CV:** BRADYCARDIA, CHF, PULMONARY EDEMA. **GI:** diarrhea, constipation, nausea. **GU:** erectile dysfunction, ↓ li-

bido. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, itching, rashes, urticaria. **Endo:** hyperglycemia, hypoglycemia. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia. **Misc:** ANAPHYLAXIS, ANGIOEDEMA, drug-induced lupus syndrome.

### Interactions

**Drug-Drug: General anesthetics**, **IV phenytoin**, **diltiazem**, and **verapamil** may cause ↑ myocardial depression. ↑ risk of bradycardia with **digoxin**. **Amiodarone** or **fluconazole** may ↑ levels. ↑ hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **clonidine** ↑ hypotension and bradycardia. May ↑ withdrawal phenomenon from **clonidine** (discontinue carvedilol first). Concurrent administration of **thyroid preparations** may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ effectiveness of **theophylline**. May ↓ beneficial $beta_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypotension/bradycardia). **Cimetidine** may ↑ toxicity from carvedilol. Concurrent **NSAIDs** may ↓ antihypertensive action. Effectiveness may be ↓ by **rifampin**. May ↑ serum **digoxin** levels. May ↑ blood levels of **cyclosporine** (monitor blood levels).

### Route/Dosage

**PO (Adults):** *Hypertension*—6.25 mg twice daily, may be ↑ q 7–14 days up to 25 mg twice daily *or extended-release*—20 mg once daily, dose may be doubled every 7–14 days up to 80 mg once daily; *CHF*—3.125 mg twice daily for 2 wk; may be ↑ to 6.25 mg twice daily. Dose may be doubled q 2 wk as tolerated (not to exceed 25 mg twice daily in patients <85 kg or 50 mg twice daily in patients >85 kg) *or extended-release*—10 mg once daily, dose may be doubled every 2 wk as tolerated up to 80 mg once daily; *Left ventricular dysfunction after MI*—6.25 mg twice daily, ↑ after 3–10 days to 12.5 twice daily then to target dose of 25 mg twice daily; some patients may require lower initial doses and slower titration *or extended-release*—20 mg once daily, dose may be doubled every 3–10 days up to 80 mg once daily.

### Availability (generic available)

**Tablets:** 3.125 mg, 6.25 mg, 12.5 mg, 25 mg. **Cost:** *Generic*—3.125 mg $89.95/180, 6.25 mg $79.94/180, 12.5 mg $79.94/180, 25 mg $89.93/180. **Extended-release capsules:** 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** all strengths $333.97/90.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse frequently during dose adjustment period and periodically during therapy. Assess for orthostatic hypotension when assisting patient up from supine position.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention). Patients may experience worsening of symptoms during initiation of therapy for CHF.
- **Hypertension:** Check frequency of refills to determine adherence.
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.

### Potential Nursing Diagnoses

Decreased cardiac output (Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- Do not confuse carvedilol with captopril or carteolol.
- Discontinuation of concurrent clonidine should be gradual, with carvedilol discontinued first over 1-2 wk with limitation of physical activity; then, after several days, discontinue clonidine.
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer with food to minimize orthostatic hypotension.
- Extended-release capsules should be taken in the morning and swallowed whole; do not crush, break, or chew. Extended-release capsules may be opened and sprinkled on cold applesauce and taken immediately; do not store mixture.
- To convert from immediate-release to extended-release product, doses of 3.125 mg

twice daily can be converted to 10 mg daily; doses of 6.25 mg twice daily can be converted to 20 mg daily; doses of 12.5 mg twice daily can be converted to 40 mg daily; and doses of 25 mg twice daily can be converted to 80 mg daily.

### Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well. Do not skip or double up on missed doses. Take missed doses as soon as possible up to 4 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and blood pressure. Instruct them to check pulse daily and blood pressure biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or blood pressure changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask some signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

C

### Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of detrimental side effects.
- Decrease in severity of CHF.

## caspofungin (kas-po-**fun**-gin)

Cancidas

***Classification***

Therapeutic: antifungals (systemic)
Pharmacologic: echinocandins

**Pregnancy Category C**

### Indications

Invasive aspergillosis refractory to, or intolerant of, other therapies. Candidemia and associated serious infections (intra-abdominal abscesses, peritonitis, pleural space infections). Esophageal candidiasis. Suspected fungal infections in febrile neutropenic patients.

### Action

Inhibits the synthesis of $\beta$ (1, 3)-D-glucan, a necessary component of the fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Widely distributed to tissues.
**Protein Binding:** 97%.
**Metabolism and Excretion:** Slowly and extensively metabolized; <1.5% excreted unchanged in urine.
**Half-life:** Polyphasic: $\beta$ *phase*—9–11 hr; $\gamma$ *phase*—40–50 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | end of infusion | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent use with cyclosporine.

**Use Cautiously in:** Moderate hepatic impairment (decreased maintenance dose recommended); Pedi: Children <3 mo (safety not established).

### Adverse Reactions/Side Effects

**CNS:** headache. **GI:** diarrhea, nausea, vomiting. **Derm:** flushing. **Local:** venous irritation at injection site. **Misc:** allergic reactions including ANAPHYLAXIS, fever.

### Interactions

**Drug-Drug:** Concurrent use with **cyclosporine** is not recommended due to ↑ risk of hepatic toxicity. May ↓ blood levels and effects of **tacrolimus**. Blood levels and effectiveness may be ↓ by **rifampin**; maintenance dose should be ↑ to 70 mg (in patients with normal liver function). Blood levels and effectiveness also may be ↓ by **efavirenz**, **nelfinavir**, **nevirapine**, **phenytoin**, **dexamethasone**, or **carbamazepine**; an ↑ in the maintenance dose to 70 mg should be considered in patients who are not clinically responding.

### Route/Dosage

**IV (Adults):** 70 mg initially followed by 50 mg daily, duration determined by clinical situation and response; *Esophageal candidiasis*—50 mg daily, duration determined by clinical situation and response.

**IV (Children ≥3 mo):** 70 mg/m² (max: 70 mg) initially followed by 50 mg/m² daily (max: 70 mg/day), duration determined by clinical situation and response.

### Moderate Hepatic Impairment (Child-Pugh Score 5–6)

**IV (Adults):** 70 mg initially followed by 35 mg daily, duration determined by clinical situation and response.

### Availability

**Powder for injection:** 50 mg/vial, 70 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for signs and symptoms of fungal infections prior to and periodically during therapy.
- Monitor patient for signs of anaphylaxis (rash, dyspnea, stridor) during therapy.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, AST, ALT, eosinophils, and urine protein and RBCs. May also cause ↓ serum potassium, hemoglobin, hematocrit, and WBCs.

### Potential Nursing Diagnoses

Risk for infection (Indications)

### Implementation

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Allow refrigerated vial to reach room temperature. *For 70-mg or 50-mg dose*—Reconstitute vials with 10.8 mL of 0.9% NaCl, sterile water for injection, Bacteriostatic Water for Injection with methylparaben and propylparaben, or Bacteriostatic Water for Injection with 0.9% benzyl alcohol. Do not dilute with dextrose solutions. Reconstituted solution is stable for 1 hr at room temperature. Withdraw 10 mL from vial and add to 250 mL of 0.9% NaCl, 0.45% NaCl, 0.225% NaCl, or LR. The 50-mg dose also can be diluted in 100 mL when volume restriction is necessary. Infusion is stable for 24 hr at room temperature or 48 hr if refrigerated. *For 35-mg dose*—Reconstitute a 50-mg or 70-mg vial as per the directions above. Remove the volume of drug equal to the calculated loading dose or calculated maintenance dose based on a concentration of 7 mg/mL (if reconstituted from the 70-mg vial) or a concentration of 5 mg/mL (if reconstituted from the 50-mg vial). White cake should dissolve completely. Mix gently until a clear solution is obtained. Do not use a solution that is cloudy, discolored, or contains precipitates. ***Concentration:*** 0.14–0.47 mg/mL. ***Rate:*** Infuse over 1 hr.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amiodarone, aztreonam, bumetanide, calcium chloride, calcium gluconate, ceftizoxime, cimetidine, ciprofloxacin, cisatracurium, cyclosporine, daptomycin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, epinephrine, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, ganciclovir, gentamicin, granisetron, haloperidol, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, insulin, isoproterenol, labetalol, levofloxacin, linezolid, magnesium sulfate, meperidine, meropenem, metoclopramide, metoprolol, midazolam, milrinone, morphine, moxifloxacin, nicardipine, nitroglycerin, norepinephrine, ondansetron, palonosetron, phenylephrine, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, tacrolimus, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil.
- **Y-Site Incompatibility:** amphotericin B, ampicillin, ampicillin/sulbactam, azithromycin,

cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dexamethasone sodium phosphate, diazepam, digoxin, enalaprilat, ertapenem, furosemide, heparin, hydralazine, ketorolac, lidocaine, lorazepam, methylprednisolone sodium succinate, metronidazole, nafcillin, nitroprusside, pamidronate, pancuronium, pantoprazole, phenytoin, piperacillin/tazobactam, potassium chloride, potassium phosphate, ranitidine, sodium bicarbonate, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole.

- **Solution Incompatibility:** Solutions containing dextrose.

### Patient/Family Teaching

- Explain the purpose of caspofungin to patient and family.

### Evaluation/Desired Outcomes

- Decrease in signs and symptoms of fungal infections. Duration of therapy is determined based on severity of underlying disease, recovery from immunosuppression, and clinical response.

**cefaclor, See CEPHALOSPORINS—SECOND GENERATION.**

**cefadroxil, See CEPHALOSPORINS—FIRST GENERATION.**

**cefazolin, See CEPHALOSPORINS—FIRST GENERATION.**

**cefdinir, See CEPHALOSPORINS—THIRD GENERATION.**

**cefditoren, See CEPHALOSPORINS—THIRD GENERATION.**

## cefepime (seff-e-peem)

Maxipime

***Classification***

Therapeutic: anti-infectives

Pharmacologic: fourth-generation cephalosporins

**Pregnancy Category B**

C

### Indications

Treatment of the following infections caused by susceptible organisms: Uncomplicated skin and skin structure infections, Bone and joint infections, Uncomplicated and complicated urinary tract infections, Respiratory tract infections, Complicated intra-abdominal infections (with metronidazole), Septicemia. Empiric treatment of febrile neutropenic patients.

### Action

Binds to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of second- and third-generation cephalosporins, but activity against staphylococci is less, whereas activity against gram-negative pathogens is greater, even for organisms resistant to first-, second-, and third-generation agents. Notable is increased action against: *Enterobacter*, *Haemophilus influenzae* (including β-lactamase-producing strains), *Escherichia coli*, *Klebsiella pneumoniae*, *Neisseria*, *Proteus*, *Providencia*, *Pseudomonas aeruginosa*, *Serratia*, *Moraxella catarrhalis* (including β-lactamase-producing strains). Not active against methicillin-resistant staphylococci or enterococci.

### Pharmacokinetics

**Absorption:** Well absorbed after IM administration; IV administration results in complete bioavailability.

**Distribution:** Widely distributed. Crosses the placenta; enters breast milk in low concentrations. Some CSF penetration.

**Metabolism and Excretion:** 85% excreted unchanged in urine.

**Half-life:** 2 hr (increased in renal impairment).

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IM | rapid | 1–2 hr | 12 hr |
| IV | rapid | end of infusion | 12 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.

**Use Cautiously in:** Renal impairment (↓ dosing/↑ dosing interval recommended if CCr ≤60 mL/min); History of GI disease, especially colitis; Patients with hepatic dysfunction or poor nutritional status (may be at increased risk of bleeding); Geriatric patients (dose adjustment due to age-related decrease in renal function may be necessary); OB, Lactation, Pedi: Pregnancy, lactation, and children <2 mo (safety not established).

## Adverse Reactions/Side Effects

**CNS:** SEIZURES (high doses in patients with renal impairment), encephalopathy, headache. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting. **Derm:** rashes, pruritis, urticaria. **Hemat:** bleeding, eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS, superinfection, fever.

## Interactions

**Drug-Drug: Probenecid** ↓ excretion and ↑ blood levels. Concurrent use of **loop diuretics** or **aminoglycosides** may ↑ risk of nephrotoxicity.

## Route/Dosage

**IM (Adults):** *Mild-to-moderate uncomplicated or complicated urinary tract infections due to Escherichia coli*—0.5–1 g every 12 hr.

**IV (Adults):** *Moderate-to-severe pneumonia*—1–2 g every 12 hr. *Mild-to-moderate uncomplicated or complicated urinary tract infections* 0.5–1 g every 12 hr. *Severe uncomplicated or complicated urinary tract infections, moderate-to-severe uncomplicated skin and skin structure infections, complicated intra-abdominal infections*—2 g every 12 hr. *Empiric treatment of febrile neutropenia*—2 g every 8 hr.

**IV (Children 2 mo–16 yr):** *Uncomplicated and complicated urinary tract infections, uncomplicated skin and skin structure infections, pneumonia*—50 mg/kg every 12 hr (not to exceed 2 g/dose). *Febrile neutropenia*—50 mg/kg every 8 hr (not to exceed 2 g/dose).

### Renal Impairment

**IM, IV (Adults):** (See Manufacturer's specific recommendations) *CCr 30–60 mL/min*—0.5–1 g every 24 hr or 2 g every 12–24 hr; *CCr 11–29 mL/min*—0.5–2 g every 24 hr; *CCr <11 mL/min*—250 mg–1 g every 24 hr.

## Availability (generic available)

**Powder for injection:** 500 mg, 1 g, 2 g.

# NURSING IMPLICATIONS

## Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- May cause ↑ serum AST, ALT, bilirubin, BUN, and creatinine.
- May rarely cause leukopenia, neutropenia, thrombocytopenia, and eosinophilia.

## Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

## Implementation

- **IM:** Reconstitute IM doses with sterile or bacteriostatic water for injection, 0.9% NaCl, or D5W. May be diluted with lidocaine to minimize injection discomfort.
- Inject deep into a well-developed muscle mass; massage well.
- IM route should only be used for treatment of mild-to-moderate uncomplicated or complicated urinary tract infections due to *Escherichia coli*.

### IV Administration

- **IV:** Monitor injection site frequently for phlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.

- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.
- **Intermittent Infusion:** Reconstitute with 5 mL sterile water, 0.9% NaCl, or D5W for the 500-mg vial, or 10 mL for the 1-g or 2-g vials. ***Diluent:*** Dilute further in 50–100 mL of D5W, 0.9% NaCl, D10W, D5/0.9% NaCl, or D5/LR. ***Concentration:*** Maximum 18 mg/mL.
- Solution is stable for 24 hr at room temperature and 7 days if refrigerated. ***Rate:*** Administer over 30 min.
- **Y-Site Compatibility:** ampicillin-sulbactam, anidulafungin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cyclophosphamide, cytarabine, dactinomycin, dexamethasone sodium phosphate, dexmedetomidine, docetaxel, doxacurium, doxorubicin liposome, fenoldopam, fluconazole, fludarabine, fluorouracil, furosemide, granisetron, hetastarch, hydrocortisone sodium phosphate, hydrocortisone sodium succinate, hydromorphone, imipenem-cilastatin, insulin, ketamine, leukcovorin, levofloxacin, linezolid, lorazepam, melphalan, mesna, methotrexate, methylprednisolone sodium succinate, metronidazole, milrinone, mycophenolate, octreotide, oxytocin, paclitaxel, palonosetron, piperacillin-tazobactam, ranitidine, remifentanil, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sufentanil, thiotepa, ticarcillin-clavulanate, tigecycline, tirofiban, trimethoprim/sulfamethoxazole, vasopressin, zidovudine.
- **Y-Site Incompatibility:** acyclovir, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, caspofungin, chlorpromazine, cimetidine, ciprofloxacin, cisplatin, dacarbazine, daunorubicin, diazepam, diltiazem, diphenhydramine, doxorubicin hydrochloride, droperidol, enalaprilat, epirubicin, erythromycin, etoposide, etoposide phosphate, famotidine, filgrastim, floxuridine, ganciclovir, gemcitabine, haloperidol, hydroxyzine, idarubicin, ifosfamide, magnesium sulfate, mannitol, mechlorethamine, meperidine, metoclopramide, midazolam, mitomycin, mitoxantrone, nalbuphine, nesiritide, nicardipine, ondansetron, oxaliplatin, pantoprazole, pemetrexed, phenytoin, plicamycin, prochlorperazine, promethazine, quinupristin/dalfopristin, streptozocin, tacrolimus, theophylline, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole.

### Patient/Family Teaching

- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

## celecoxib (sel-e-**kox**-ib)

Celebrex

***Classification***

Therapeutic: antirheumatics, nonsteroidal anti-inflammatory agents
Pharmacologic: COX-2 inhibitors

**Pregnancy Category C**

### Indications

Relief of signs and symptoms of osteoarthritis, rheumatoid arthritis, ankylosing spondylitis and juvenile rheumatoid arthritis. Reduction of the number of adenomatous colorectal polyps in familial adenomatous polyposis (FAP), as an adjunct to usual care (endoscopic surveillance, surgery). Management of acute pain including primary dysmenorrhea.

### Action

Inhibits the enzyme COX-2. This enzyme is required for the synthesis of prostaglandins. Has analgesic, anti-inflammatory, and antipyretic properties. **Therapeutic Effects:** Decreased pain and inflammation caused by arthritis or spondylitis. Decreased number of colorectal polyps. Decreased pain.

### Pharmacokinetics

**Absorption:** Bioavailability unknown.
**Distribution:** 97% bound to plasma proteins; extensive tissue distribution.
**Metabolism and Excretion:** Mostly metabolized by the hepatic CYP2C9 isoenzyme; the CYP2C9 enzyme system exhibits genetic polymorphism; poor metabolizers may have significantly ↑ celecoxib concentrations and an ↑ risk of adverse effects; <3% excreted unchanged in urine and feces.
**Half-life:** 11 hr.

TIME/ACTION PROFILE (pain reduction)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 24–48 hr | unknown | 12–24 hr† |

†After discontinuation.

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity may exist with other NSAIDs, including aspirin; History of allergic-type reactions to sulfonamides; History of asthma, urticaria, or allergic-type reactions to aspirin or other NSAIDs, including the aspirin triad (asthma, nasal polyps, and severe hypersensitivity reactions to aspirin); Advanced renal disease; Severe hepatic dysfunction; Peri-operative pain from coronary artery bypass graft (CABG) surgery; OB: Should not be used in late pregnancy (may cause premature closure of the ductus arteriosus).
**Use Cautiously in:** Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Pre-existing renal disease, heart failure, liver dysfunction, concurrent diuretic or ACE inhibitor therapy (↑ risk of renal impairment); Hypertension or fluid retention; Renal insufficiency (may precipitate acute renal failure); Serious dehydration (correct deficits before administering); Patients who are known or suspected to be poor CYP2C9 metabolizers (↓ initial dose by 50%); Pre-existing asthma; Pedi: Safety not established in children <2 yrs or for longer than 6 mo; Geri: Concurrent therapy with corticosteroids or anticoagulants, long duration of NSAID therapy, history of smoking, alcoholism, geriatric patients, or poor general health status (↑ risk of GI bleeding); Lactation: Lactation.
**Exercise Extreme Caution in:** History of ulcer disease or GI bleeding.

### Adverse Reactions/Side Effects

**CNS:** dizziness, headache, insomnia. **CV:** MYOCARDIAL INFARCTION, STROKE, THROMBOSIS, edema. **GI:** GI BLEEDING, abdominal pain, diarrhea, dyspepsia, flatulence, nausea. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash.

### Interactions

**Drug-Drug:** CYP2C9 inhibitors may ↑ levels. May ↓ effectiveness of **ACE inhibitors**, **thiazide diuretics**, and **furosemide**. **Fluconazole** ↑ levels (use lowest recommended dosage). May ↑ risk of bleeding with **warfarin** and **aspirin**. May ↑ serum **lithium** levels. Does not inhibit the cardioprotective effect of low-dose **aspirin**.

### Route/Dosage

**PO (Adults):** *Osteoarthritis*—200 mg once daily *or* 100 mg twice daily. *Rheumatoid arthritis*—100–200 mg twice daily. *Ankylosing spondylitis*—200 mg once daily *or* 100 mg twice daily; dose may be ↑ after 6 wk to 400 mg daily. *Familial adenomatous polyosis*—400 mg twice daily. *Acute pain, including dysmenorrhea*—400 mg initially, then a 200-mg dose if needed on the first day; then 200 mg twice daily as needed.

### Hepatic Impairment

**PO (Adults):** *Moderate hepatic impairment (Child-Pugh Class B)*—↓ dose by 50%.
**PO (Children ≥2 yrs, ≥10 kg–≤25 kg):** *Juvenile rheumatoid arthritis*—50 mg twice daily.
**PO (Children ≥2 yrs, ≥25 kg):** *Juvenile rheumatoid arthritis*—100 mg twice daily.

### Availability

**Capsules:** 50 mg, 100 mg, 200 mg, 400 mg.
**Cost:** 100 mg $213.29/100, 200 mg $362.17/100, 400 mg $524.26/100.

## NURSING IMPLICATIONS

### Assessment

- Assess range of motion, degree of swelling, and pain in affected joints before and periodically throughout therapy.
- Assess patient for allergy to sulfonamides, aspirin, or NSAIDs. Patients with these allergies should not receive celecoxib.
- Monitor patient for signs of Stevens-Johnson syndrome and toxic epidermal necrolysis. Discontinue celecoxib at first sign of rash.
- ***Lab Test Considerations:*** May cause ↑ AST and ALT levels.
- May cause hypophosphatemia and ↑ BUN.

### Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)

### Implementation

- Do not confuse with Celexa (citalopram) or Cerebyx (fosphenytoin).
- **PO:** May be administered without regard to meals. Capsules may be opened and sprinkled on applesauce and ingested immediately with water. Mixture may be stored in the refrigerator for up to 6 hr.

### Patient/Family Teaching

- Instruct patient to take celecoxib exactly as directed. Do not take more than prescribed dose. Increasing doses does not appear to increase effectiveness. Use lowest effective dose for shortest period of time.
- Advise patient to notify health care professional promptly if sign or symptom of GI toxicity (abdominal pain, black stools), skin rash, unexplained weight gain, edema, or chest pain occurs. Patients should discontinue celecoxib and notify health care professional if signs and symptoms of hepatotoxicity (nausea, fatigue, lethargy, pruritus, jaundice, upper right quadrant tenderness, flu-like symptoms) occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Advise patients with FAP to continue routine surveillance procedures.

### Evaluation/Desired Outcomes

- Reduction in joint pain in patients with osteoarthritis.
- Reduction in joint tenderness, pain, and joint swelling in patients with rheumatoid arthritis and juvenile rheumatoid arthritis.
- Decreased number of colonic polyps in patients with FAP.

**cephalexin, See CEPHALOSPORINS—FIRST GENERATION.**

## CEPHALOSPORINS—FIRST GENERATION

**cefadroxil** (sef-a-**drox**-ill)
Duricef

**cefazolin** (sef-**a**-zoe-lin)
Ancef

**cephalexin** (sef-a-**lex**-in)
Apo-Cephalex, DOM-Cephalexin, Keflex, Nu-Cephalex, Panixine, PMS-Cephalexin

***Classification***
Therapeutic: anti-infectives
Pharmacologic: first-generation cephalosporins

**Pregnancy Category B**

### Indications

Treatment of the following infections caused by susceptible organisms: Skin and skin structure infections (including burn wounds), Pneumonia,

Urinary tract infections, Bone and joint infections, Septicemia. Not suitable for the treatment of meningitis. **Cefadroxil:** Pharyngitis and/or tonsillitis. **Cefazolin:** Perioperative prophylaxis, biliary tract infections, genital infections, bacterial endocarditis prophylaxis for dental and upper respiratory tract procedures. **Cephalexin:** Otitis media.

## Action

Bind to bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against many gram-positive cocci including: *Streptococcus pneumoniae*, Group A beta-hemolytic streptococci, Penicillinase-producing staphylococci. Not active against: Methicillin-resistant staphylococci, *Bacteroides fragilis*, *Enterococcus*. Active against some gram-negative rods including: *Klebsiella pneumoniae*, *Proteus mirabilis*, *Escherichia coli*.

## Pharmacokinetics

**Absorption:** *Cefadroxil* and *cephalexin* are well absorbed following oral administration. *Cefazolin* is well absorbed following IM administration. **Distribution:** Widely distributed. Cefazolin penetrates bone and synovial fluid well. All cross the placenta and enter breast milk in low concentrations. Minimal CSF penetration. **Metabolism and Excretion:** Excreted almost entirely unchanged by the kidneys. **Half-life:** *Cefadroxil*—60–120 min; *cefazolin*—90–150 min; *cephalexin*—50–80 min; (all are ↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Cefadroxil PO | rapid | 1.5–2 hr | 12–24 hr |
| Cefazolin IM | rapid | 0.5–2 hr | 6–12 hr |
| Cefazolin IV | rapid | 5 min | 6–12 hr |
| Cephalexin PO | rapid | 1 hr | 6–12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins. **Use Cautiously in:** Renal impairment (dosage ↓ and/or ↑ dosing interval recommended for: *cefadroxil and cephalexin*, if CCr ≤50 mL/min, and *cefazolin*, if CCr <30 mL/min; History of GI disease, especially colitis; Geri: Dosage adjustment due to age-related ↓ in renal function may be necessary; OB, Lactation: Half-life is shorter and blood levels lower during pregnancy; have been used safely.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting, cramps. **Derm:** STEVENS-JOHNSON SYNDROME, rashes, pruritis, urticaria. **Hemat:** agranulocytosis, eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

## Interactions

**Drug-Drug: Probenecid** ↓ excretion and ↑ blood levels of renally excreted cephalosporins. Concurrent use of **loop diuretics** or **aminoglycosides** may ↑ risk of renal toxicity.

## Route/Dosage

### Cefadroxil

**PO (Adults):** *Pharyngitis and tonsillitis*—500 mg q 12 hr or 1 g q 24 hr for 10 days. *Skin and soft-tissue infections*—500 mg q 12 hr or 1 g q 24 hr. *Urinary tract infections*—500 mg–1 g q 12 hr or 1–2 g q 24 hr.
**PO (Children):** *Pharyngitis, tonsillitis, or impetigo*—15 mg/kg q 12 hr or 30 mg/kg q 24 hr for 10 days. *Skin and soft-tissue infections*—15 mg/kg q 12 hr. *Urinary tract infections*—15 mg/kg q 12 hr .

#### Renal Impairment

**PO (Adults):** *CCr 25–50 mL/min*—500 mg q 12 hr; *CCr 10–25 mL/min*—500 mg q 24 hr; *CCr <10 mL/min*—500 mg q 36 hr.

### Cefazolin

**IM, IV (Adults):** *Moderate to severe infections*—500 mg–2 g q 6–8 hr (maximum 12 g/day). *Mild infections with gram-positive cocci*—250–500 mg q 8 hr. *Uncomplicated urinary tract infections*—1 g q 12 hr. *Pneumococcal pneumonia*—500 mg q 12 hr. *Infective endocarditis or septicemia*—1–1.5 g q 6 hr. *Perioperative prophylaxis*—1 g given 30–60 min prior to incision. Additional 500 mg–1 g should be given for surgeries ≥2 hr. 500 mg–1 g should then be given for all surgeries q 6–8 hr for 24 hr postoperatively.
**IM, IV (Children and Infants >1 mo):** 16.7–33.3 mg/kg q 8 hr (maximum 6 g/day); *Bacterial endocarditis prophylaxis in penicillin-allergic patients:* -25 mg/kg 30 minutes prior to procedure (maximum dose = 1 g).
**IM, IV (Neonates ≤7 days):** 40 mg/kg/day divided q 12 hr.
**IM, IV (Neonates >7 days and ≤2 kg):** 40 mg/kg/day divided q 12 hr.

**IM, IV (Neonates >7 days and >2 kg):** 60 mg/kg/day divided q 8 hr.

### Renal Impairment

**IM, IV (Adults):** *CCr 10–30 mL/min*—Administer q 12 hr; *CCr ≤10 mL/min*—Administer q 24 hr.

### Cephalexin

**PO (Adults):** *Most infections*—250–500 mg q 6 hr. *Uncomplicated cystitis, skin and soft-tissue infections, streptococcal pharyngitis*—500 mg q 12 hr.
**PO (Children):** *Most infections*—25–50 mg/kg/day divided q 6–8 hr (can be administered q 12 hr in skin/skin structure infections or streptococcal pharyngitis). *Otitis media*—18.75–25 mg/kg q 6 hr (maximum = 4 g/day).

### Renal Impairment

**PO (Adults):** *CCr 10–50 mL/min*—500 mg q 8–12 hr; *CCr <10 mL/min*—250–500 mg q 12–24 hr.

### Availability

### Cefadroxil (generic available)

**Capsules:** 500 mg. **Tablets:** 1 g. **Oral suspension (orange-pineapple flavor):** 250 mg/5 mL, 500 mg/5 mL.

### Cefazolin (generic available)

**Powder for injection:** 500 mg, 1 g, 10 g, 20 g. **Premixed containers:** 500 mg/50 mL D5W, 1 g/50 mL D5W.

### Cephalexin (generic available)

**Capsules:** 250 mg, 333 mg, 500 mg, 750 mg. **Tablets:** 250 mg, 500 mg. **Oral suspension:** 100 mg/mL, 125 mg/5 mL, 250 mg/5 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning and during therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- May cause ↑ serum AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, creatinine.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, or eosinophilia.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)

### Implementation

- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering. Refrigerate oral suspensions.

### Cefazolin

- **IM:** Reconstitute IM doses with 2 mL or 2.5 mL of sterile water for injection to achieve a final concentration of 225–330 mg/mL.
- Inject deep into a well-developed muscle mass; massage well.

#### IV Administration

- **IV:** Monitor site frequently for thrombophlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.
- Do not use solutions that are cloudy or contain a precipitate.
- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush line between medications.
- **Direct IV:** ***Diluent:*** 0.9% NaCl, D5W, D10W, dextrose/saline combinations, D5/LR. ***Concentration:*** 100 mg/mL. May use up to 138 mg/mL in fluid-restricted patients. ***Rate:*** May administer over 3–5 min.

- **Intermittent Infusion:** ***Diluent:*** Reconstituted 500-mg or 1-g solution may be diluted in 50–100 mL of 0.9% NaCl, D5W, D10W, dextrose/saline combinations, D5/LR. Solution is stable for 24 hr at room temperature and 10 days if refrigerated. ***Concentration:*** 20 mg/mL. ***Rate:*** Administer over 10–60 min.
- **Syringe Compatibility:** heparin.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, alprostadil, amifostine, aminophylline, amphotericin B liposome, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefonicid, cefoperazone, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, docetaxel, doxacurium, doxapram, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gemcitabine, glycopyrrolate, granisetron, heparin, hydrocortisone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, penicillin G, perphenazine, phenobarbital, phenylephrine, phytonadione, potassium chloride, procainamide, propofol, propranolol, ranitidine, remifentanil, rituximab, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimetaphan, urokinase, vasopressin, vecuronium, verapamil, vincristine, vitamin B complex with C, voriconazole, warfarin.
- **Y-Site Incompatibility:** amphotericin B cholesteryl, azathioprine, calcium chloride, caspofungin, cefotaxime, chlorpromazine, dantrolene, diazepam, diazoxide, diphenhydramine, dobutamine, dopamine, doxorubicin hydrochloride, doxycycline, erythromycin, ganciclovir, haloperidol, hydralazine, hydroxyzine, idarubicin, levofloxacin, mitoxantrone, papaverine, pemetrexed, pentamidine, pentazocine, pentobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, sodium citrate, tobramycin, trimethoprim/sulfamethoxazole, vinorelbine.

### Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish the medication completely as directed, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patient that sharing this medication may be dangerous.
- Pedi: Instruct parents or caregivers to use calibrated measuring device with liquid preparations.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if diarrhea contains blood, mucus, or pus. Advise patient not to treat diarrhea without consulting health care professional.

### Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

## CEPHALOSPORINS—SECOND GENERATION

**cefaclor** (**sef**-a-klor)
Ceclor, Raniclor

**cefotetan** (sef-oh-**tee**-tan)

**cefoxitin** (se-**fox**-i-tin)
Mefoxin

**cefprozil** (sef-**proe**-zil)
Cefzil

**cefuroxime** (se-fyoor-**ox**-eem)
Ceftin, Zinacef

***Classification***
Therapeutic: anti-infectives
Pharmacologic: second-generation cephalosporins

**Pregnancy Category B**

## Indications

Treatment of the following infections caused by susceptible organisms: Respiratory tract infections, Skin and skin structure infections, Bone and joint infections (not cefaclor or cefprozil), Urinary tract infections (not cefprozil). **Cefotetan and cefoxitin:** Intra-abdominal and gynecologic infections. **Cefuroxime:** Meningitis, gynecologic infections, and Lyme disease. **Cefaclor, cefprozil, cefuroxime:** Otitis media. **Cefoxitin and cefuroxime:** Septicemia. **Cefotetan, cefoxitin, cefuroxime:** Perioperative prophylaxis.

## Action

Bind to bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of first-generation cephalosporins but have ↑ activity against several other gram-negative pathogens including: *Haemophilus influenzae*, *Escherichia coli*, *Klebsiella pneumoniae*, *Morganella morganii*, *Neisseria gonorrhoeae* (including penicillinase-producing strains), *Proteus*, *Providencia*, *Serratia marcescens*, *Moraxella catarrhalis*. Not active against methicillin-resistant staphylococci or enterococci. **Cefuroxime:** Active against *Borrelia burgdorferi*. **Cefotetan and cefoxitin:** Active against *Bacteroides fragilis*.

## Pharmacokinetics

**Absorption:** *Cefotetan, cefoxitin,* and *cefuroxime*—well absorbed following IM administration. *Cefaclor, cefprozil,* and *cefuroxime* —well absorbed following oral administration.
**Distribution:** Widely distributed. Penetration into CSF is poor, but adequate for cefuroxime (IV) to be used in treating meningitis. All cross the placenta and enter breast milk in low concentrations.
**Metabolism and Excretion:** Excreted primarily unchanged by the kidneys.
**Half-life:** *Cefaclor*—30–60 min; *cefotetan*—3–4.6 hr; *cefoxitin*—40–60 min; *cefprozil*—90 min; *cefuroxime*—60–120 min; (all are ↑ in renal impairment).

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Cefaclor PO | rapid | 30–60 min | 6–12 hr |
| Cefaclor PO-CD | unknown | unknown | 12 hr |
| Cefotetan IM | rapid | 1–3 hr | 12 hr |
| Cefotetan IV | rapid | end of infusion | 12 hr |
| Cefoxitin IM | rapid | 30 min | 4–8 hr |
| Cefoxitin IV | rapid | end of infusion | 4–8 hr |
| Cefprozil PO | unknown | 1–2 hr | 12–24 hr |
| Cefuroxime PO | unknown | 2–3 hr | 8–12 hr |
| Cefuroxime IM | rapid | 15–60 min | 6–12 hr |
| Cefuroxime IV | rapid | end of infusion | 6–12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins.
**Use Cautiously in:** Renal impairment (↓ dose/↑ dosing interval recommended for: *cefotetan* if CCr ≤30 mL/min, *cefoxitin* if CCr ≤50 mL/min, *cefprozil* if CCr <30 mL/min, *cefuroxime* if CCr ≤20 mL/min); **Cefotetan and cefoxitin:** Patients with hepatic dysfunction, poor nutritional state, or cancer may be at ↑ risk for bleeding; History of GI disease, especially colitis; *Cefprozil (oral suspension)* contains aspartame and should be avoided in patients with phenylketonuria; Geri: Dose adjustment due to age-related ↓ in renal function may be necessary; may also be at ↑ risk for bleeding with *cefotetan* or *cefoxitin*; OB, Lactation: Have been used safely.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES (high doses). **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, cramps, nausea, vomiting. **Derm:** rashes, urticaria. **Hemat:** agranulocytosis, bleeding (↑ with cefotetan and cefoxitin), eosinophilia, hemolytic anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

## Interactions

**Drug-Drug: Probenecid** ↓ excretion and ↑ blood levels. If **alcohol** is ingested within 48–72 hr of cefotetan, a disulfiram-like reaction may occur. Cefotetan may ↑ risk of bleeding with **anticoagulants**, **antiplatelet agents**, **thrombolytics**, and **NSAIDs**. **Antacids** ↓ absorption of

cefaclor. Concurrent use of **aminoglycosides** or **loop diuretics** may ↑ risk of nephrotoxicity.

## Route/Dosage

### Cefaclor

**PO (Adults):** 250–500 mg q 8 hr or 375–500 mg q 12 hr as extended-release tablets.
**PO (Children >1 mo):** 6.7–13.4 mg/kg q 8 hr or 10–20 mg/kg q 12 hr (up to 1 g/day).

### Cefotetan

**IM, IV (Adults):** *Most infections*—1–2 g q 12 hr. *Severe/life-threatening infections*—2–3 g q 12 hr. *Urinary tract infections*—500 mg–2 g q 12 hr *or* 1–2 g q 24 hr. *Perioperative prophylaxis*-1–2 g 30–60 min before initial incision (one-time dose).

#### Renal Impairment

**IM, IV (Adults):** *CCr 10–30 mL/min*—Usual adult dose q 24 hr *or* ½ usual adult dose q 12 hr; *<CCr 10 mL/min*—Usual adult dose q 48 hr *or* ¼ usual adult dose q 12 hr.

### Cefoxitin

**IM, IV (Adults):** *Most infections*—1 g q 6–8 hr. *Severe infections*—1 g q 4 hr *or* 2 g q 6–8 hr. *Life-threatening infections*—2 g q 4 hr *or* 3 g q 6 hr. *Perioperative prophylaxis*—2 g 30–60 min before initial incision, then 2 g q 6 hr for up to 24 hr.
**IM, IV (Children and Infants >3 mo):** *Most infections*—13.3–26.7 mg/kg q 4 hr *or* 20–40 mg/kg q 6 hr. *Perioperative prophylaxis*—30–40 mg/kg within 60 min of initial incision, then 30–40 mg/kg q 6 hr for up to 24 hr.

#### Renal Impairment

**IM, IV (Adults):** *CCr 30–50 mL/min*—1–2 g q 8–12 hr; *CCr 10–29 mL/min*—1–2 g q 12–24 hr; *CCr 5–9 mL/min*—0.5–1 g q 12–24 hr; *CCr <5 mL/min*—0.5–1 g q 24–48 hr.

### Cefprozil

**PO (Adults):** *Most infections*—250–500 mg q 12 hr *or* 500 mg q 24 hr.
**PO (Children 6 mo–12 yr):** *Otitis media*—15 mg/kg q 12 hr. *Acute sinusitis*—7.5–15 mg/kg q 12 hr (higher dose should be used for moderate-to-severe infections).
**PO (Children 2–12 yr):** *Pharyngitis/tonsillitis*—7.5 mg/kg q 12 hr. *Skin/skin structure infections*—20 mg/kg q 24 hr.

#### Renal Impairment

**PO (Adults and Children ≥6 mo):** *CCr <30 mL/min*—½ of usual dose at normal dosing interval.

### Cefuroxime

Cefuroxime oral tablets and oral suspension are not bioequivalent and are not substitutable on a mg-to-mg basis.
**PO (Adults and Children >12 yr):** *Pharyngitis/tonsillitis, maxillary sinusitis, uncomplicated UTIs*—250 mg q 12 hr. *Bronchitis, uncomplicated skin/skin structure infections*—250–500 mg q 12 hr. *Gonorrhea*—1 g (single dose). *Lyme disease*—500 mg q 12 hr for 20 days.
**PO (Children 3 mo–12 yr):** *Otitis media, acute bacterial maxillary sinusitis, impetigo*—15 mg/kg q 12 hr as oral suspension (not to exceed 1 g/day) *or* 250 mg q 12 hr as tablets. *Pharyngitis/tonsillitis*—10 mg/kg q 12 hr as oral suspension (not to exceed 500 mg/day).
**IM, IV (Adults):** *Uncomplicated urinary tract infections, skin/skin structure infections, disseminated gonococcal infections, uncomplicated pneumonia*—750 mg every 8 hr. *Bone/joint infections, severe or complicated infections*—1.5 g every 8 hr. *Life-threatening infections*—1.5 g every 6 hr. *Meningitis*—3 g every 8 hr. *Perioperative prophylaxis*—1.5 g IV 30–60 min before initial incision; 750 mg IM/IV every 8 hr can be given when procedure prolonged. *Prophylaxis during open-heart surgery*—1.5 g IV at induction of anesthesia and then every 12 hr for 3 additional doses. *Gonorrhea*—1.5 g IM (750 mg in two sites) with 1 g probenecid PO.
**IM, IV (Children and Infants >3 mo):** *Most infections*—12.5–25 mg/kg q 6 hr *or* 16.7–33.3 mg/kg q 8 hr (maximum dose = 6 g/day). *Bone and joint infections*—50 mg/kg q 8 hr (maximum dose = 6 g/day). *Bacterial meningitis*—50–60 mg/kg q 6 hr *or* 66.7–80 mg/kg q 8 hr.

#### Renal Impairment

**IM, IV (Adults):** *CCr 10–20 mL/min*—750 mg q 12 hr; *CCr <10 mL/min*—750 mg q 24 hr.

## Availability

### Cefaclor (generic available)

**Capsules:** 250 mg, 500 mg. **Chewable tablets (fruity):** 125 mg, 187 mg, 250 mg, 375 mg. **Extended-release tablets (CD):** 375 mg, 500 mg. **Oral suspension (strawberry):** 125 mg/5 mL, 187 mg/5 mL, 250 mg/5 mL, 375 mg/5 mL.

### Cefotetan (generic available)

**Powder for injection:** 1 g, 2 g, 10 g. **Premixed containers:** 1 g/50 mL, 2 g/50 mL.

### Cefoxitin (generic available)

**Powder for injection:** 1 g, 2 g, 10 g. **Premixed containers:** 1 g/50 mL D5W, 2 g/50 mL D5W.

### Cefprozil (generic available)

**Tablets:** 250 mg, 500 mg. **Oral suspension (bubblegum flavor):** 125 mg/5 mL, 250 mg/5 mL.

### Cefuroxime (generic available)

**Tablets:** 250 mg, 500 mg. **Oral suspension (tutti-frutti flavor):** 125 mg/5 mL, 250 mg/5 mL. **Powder for injection:** 750 mg, 1.5 g, 7.5 g. **Premixed containers:** 750 mg/50 mL, 1.5 g/50 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning and during therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- *Cefotetan*—monitor prothrombin time and assess patient for bleeding (guaiac stools; check for hematuria, bleeding gums, ecchymosis) daily in high-risk patients; may cause hypoprothrombinemia.
- May cause ↑ serum AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, and creatinine.
- *Cefoxitin* may cause falsely ↑ test results for serum and urine creatinine; do not obtain serum samples within 2 hr of administration.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, and eosinophilia.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

- Do not confuse Cefotan (cefotetan) with Ceftin (cefuroxime).
- Do not confuse Ceftin (cefuroxime) with Cefzil (cefprozil).
- Do not confuse cefuroxime with cefotaxime.
- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering.
- Administer cefaclor extended-release tablets with food; do not crush, break, or chew.
- Do not administer *cefaclor* within 1 hr of antacids.
- *Cefuroxime* tablets should be swallowed whole, not crushed; crushed tablets have a strong, persistent bitter taste. Tablets may be taken without regard to meals. Suspension must be taken with food. Shake well each time before using. Tablets and suspension are not interchangeable.
- **IM:** Reconstitute IM doses with sterile or bacteriostatic water for injection or 0.9% NaCl for injection. May be diluted with lidocaine to minimize injection discomfort.
- Inject deep into a well-developed muscle mass; massage well.

#### IV Administration

- **IV:** Change sites every 48–72 hr to prevent phlebitis. Monitor site frequently for thrombophlebitis (pain, redness, swelling).
- If aminoglycosides are administered concurrently, administer in separate sites if possible, at least 1 hr apart. If second site is unavailable, flush line between medications.
- **Direct IV:** Dilute each cephalosporin in at least 1 g/10 mL. Do not use preparations containing benzyl alcohol for neonates. ***Rate:*** Administer slowly over 3–5 min.

### Cefotetan

- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may be further diluted in 50–

100 mL of D5W or 0.9% NaCl. Solution may be colorless or yellow. Solution is stable for 24 hr at room temperature or 96 hr if refrigerated. ***Concentration:*** 10–40 mg/mL. ***Rate:*** Administer over 20–30 min.

- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminophylline, ascorbic acid, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, cafazolin, calcium gluconate, carboplatin, cefonicid, cefoperazone, cefotaxime, cefoxitin, ceftizoxime, ceftriaxone, cefuroximechloramphenicol, cimetidine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidate, digoxin, diltiazem, docetaxel, dopamine, doxacurium, enalaprilat, ephedrine, epinephrine, epoetin alfa, etoposide, etoposide phosphate, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, penicillin G, phenylephrine, phytonadione, potassium chloride, procainamide, propofol, propranolol, pyridoxime, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, trimetaphan, urokinase, vasopressin, vecuronium, verapamil, vincristine, voriconazole.
- **Y-Site Incompatibility:** amphotericin B colloidal, amphotericin B liposome, azathioprine, caspofungin, chlorpromazine, dantrolene, diazepam, diazoxide, diphenhydramine, dobutamine, doxorubicin hydrochloride, doxycycline, epirubicin, erythromycin, esmolol, ganciclovir, gentamicin, haloperidol, hydralazine, hydroxyzine, inamrinone, indomethacin, labetalol, pantoprazole, papaverine, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vinorelbine.

## Cefoxitin

- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may be further diluted in 50–100 mL of D5W, D10W, 0.9% NaCl, dextrose/saline combinations, D5/LR, Ringer's or LR. Stable for 24 hr at room temperature and 1 wk if refrigerated. Darkening of powder does not alter potency. ***Concentration:*** 40 mg/mL. ***Rate:*** Administer over 30–60 min.
- **Continuous Infusion:** May be diluted in 500–1000 mL for continuous infusion.
- **Syringe Compatibility:** heparin.
- **Y-Site Compatibility:** acyclovir, alfentanil, amifostine, aminophylline, amphotericin B cholesteryl, amphotericin B liposome, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefonicid, cefoperazone, cefotaxime, cefotetan, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, docetaxel, dopamine, doxacurium, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, esmolol, etoposide, etoposide phosphate, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, isoproterenol, ketorolac, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, penicillin G, perphenazine, phenylephrine, phytonadione, potassium chloride, procainamide, propofol, propranolol, pyridoxime, ranitidine, remifentanil, rituximab, rocuronium, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trimetaphan, urokinase,

vasopressin, vecuronium, verapamil, vincristine, voriconazole.

- **Y-Site Incompatibility:** ampicillin/sulbactam, azathioprine, caspofungin, ceftizoxime, chlorpromazine, dantrolene, diazepam, diazoxide, diphenhydramine, dobutamine, doxorubiucin hydrochloride, doxycycline, epirubicin, erythromycin, fenoldopam, fligrastim, ganciclovir, haloperidol, hydralazine, hydroxyzine, inamrinone, insulin, labetalol, levofloxacin, methylprednisolone, mitoxantrone, papaverine, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, trastuzumab, trimethoprim/sulfamethoxazole, vinorelbine.

## Cefuroxime

- **Intermittent Infusion:** ***Diluent:*** Solution may be further diluted in 50–100 mL of 0.9% NaCl, D5W, D10W, or dextrose/saline combinations. Stable for 24 hr at room temperature and 48 hr if refrigerated. ***Concentration:*** 10–40 mg/mL. ***Rate:*** Administer over 15–60 min.
- **Continuous Infusion:** May also be diluted in 500–1000 mL for continuous infusion.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefonicid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, chloramphenicol, cimetidine, cisplatin, clindamycin, cyclophosphamide, cyanocobalamin, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, docetaxel, dopamine, doxacurium, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, pemetrexed, penicillin G, perphenazine, phenylephrine, phytonadione, potassium chloride, procainamide, propofol, propranolol, pyridoxine, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimetaphan, urokinase, vasopressin, vecuronium, verapamil, vincristine, voriconazole.
- **Y-Site Incompatibility:** azathioprine, azithromycin, calcium chloride, caspofungin, chlorpromazine, dantrolene, dexamethasone, diazepam, diazoxide, diphenhydramine, dobutamine, doxorubicin hydrochloride, doxycycline, epirubicin, filgrastim, ganciclovir, haloperidol, hydralazine, hydroxyzine, inamrinone, labetalol, magnesium sulfate, midazolam, mitoxantrone, papaverine, pentamidine, penatzocine, pentobarbital, phenobarbital, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, sodium bicarbonate, trimethoprim/sulfamethoxazole, vinorelbine.

## Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish the medication completely, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patient that sharing of this medication may be dangerous.
- Pedi: Instruct parents or caregivers to use calibrated measuring device with liquid preparations.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Caution patients that concurrent use of alcohol with *cefotetan* may cause a disulfiram-like reaction (abdominal cramps, nausea, vomiting, headache, hypotension, palpitations, dyspnea, tachycardia, sweating, flushing). Alcohol and

alcohol-containing medications should be avoided during and for several days after therapy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

### Evaluation/Desired Outcomes
- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

## CEPHALOSPORINS—THIRD GENERATION

**cefdinir** (**sef**-di-nir)
Omnicef

**cefditoren** (sef-dye-**tor**-en)
Spectracef

**cefixime** (sef-**ik**-seem)
Suprax

**cefoperazone** (sef-oh-**per**-a-zone)

**cefotaxime** (sef-oh-**taks**-eem)
Claforan

**cefpodoxime** (sef-poe-**dox**-eem)
Vantin

**ceftazidime** (sef-**tay**-zi-deem)
Fortaz, Tazicef

**ceftibuten** (sef-tye-**byoo**-ten)
Cedax

**ceftizoxime** (sef-ti-**zox**-eem)
Cefizox

**ceftriaxone** (sef-try-**ax**-one)
Rocephin

***Classification***
Therapeutic: anti-infectives
Pharmacologic: third-generation cephalosporins

**Pregnancy Category B**

### Indications
Treatment of the following infections caused by susceptible organisms: Skin and skin structure infections (not cefixime), Urinary and gynecologic infections (not cefdinir, cefditoren, or ceftibuten), Respiratory tract infections (not cefdinir, cefditoren, or ceftibuten). **Cefotaxime, ceftazidime, ceftizoxime, ceftriaxone:** Meningitis and bone/joint infections. **Cefoperazone, cefotaxime, ceftazidime, ceftizoxime, ceftriaxone:** Intra-abdominal infections and septicemia. **Cefdinir, cefixime, cefpodoxime, ceftibuten, ceftriaxone:** Otitis media. **Cefotaxime, ceftriaxone:** Perioperative prophylaxis. **Ceftazidime:** Febrile neutropenia. **Cefotaxime, ceftriaxone:** Lyme disease.

### Action
Bind to the bacterial cell wall membrane, causing cell death. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Similar to that of second-generation cephalosporins, but activity against staphylococci is less, whereas activity against gram-negative pathogens is greater, even for organisms resistant to first- and second-generation agents. Notable is increased action against: *Enterobacter*, *Haemophilus influenzae*, *Escherichia coli*, *Klebsiella pneumoniae*, *Neisseria gonorrhoeae*, *Citrobacter*, *Morganella*, *Proteus*, *Providencia*, *Serratia*, *Moraxella catarrhalis*, *Borrelia burgdorferi*. Some agents have activity against *N. meningitidis* (cefotaxime, ceftazidime, ceftizoxime, ceftriaxone). Some agents have enhanced activity against *Pseudomonas aeruginosa* (ceftazidime, cefoperazone). Not active against methicillin-resistance staphylococci or enterococci. Some agents have activity against anaerobes, including *Bacteroides fragilis* (cefoperazone, cefotaxime, ceftizoxime, ceftriaxone).

### Pharmacokinetics
**Absorption:** *Cefoperazone, cefotaxime, ceftazidime, ceftizoxime,* and *ceftriaxone* are well absorbed after IM administration. *Ceftibuten* is well absorbed after oral administration; *cefixime* 40–50% absorbed after oral administration (oral suspension); *cefdinir* 16–25% absorbed after oral administration. *Cefditoren pivoxil* and *cefpodoxime proxetil* are prodrugs that are converted to their active components in GI tract during absorption (*cefditoren*—14% absorbed [↑ by high-fat meal]; *cefpodoxime*—50% absorbed).
**Distribution:** Widely distributed. Cross the placenta; enter breast milk in low concentrations. CSF penetration better than with first- and second-generation agents.
**Protein Binding:** *Cefoperazone* and *ceftriaxone* ≥90%.
**Metabolism and Excretion:** *Cefdinir*, *ceftazidime*, *cefditoren*, and *ceftizoxime*—>85% excreted in urine. *Cefpodoxime*—30% excreted in

urine. *Cefoperazone*—excreted in the bile. *Ceftibuten, ceftriaxone,* and *cefotaxime*—partly metabolized and partly excreted in the urine. *Cefixime*—50% excreted unchanged in urine, ≥10% in bile.

**Half-life:** *Cefdinir*—1.7 hr; *cefditoren*—1.6 hr; *cefixime*—3–4 hr; *cefoperazone*—2 hr; *cefotaxime*—1–1.5 hr; *cefpodoxime*—2–3 hr; *ceftazidime*—2 hr; *ceftibuten*—2 hr; *ceftizoxime*—1.4–1.9 hr; *ceftriaxone*—6–9 hr (all except *cefoperazone* and *ceftriaxone* are ↑ in renal impairment).

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Cefdinir PO | rapid | 2–4 hr | 12–24 hr |
| Cefditoren PO | rapid | 1.5–3 hr | 12 hr |
| Cefixime PO | rapid | 2–6 hr | 24 hr |
| Cefoperazone IM | rapid | 1–2 hr | 12 hr |
| Cefoperazone IV | rapid | end of infusion | 12 hr |
| Cefotaxime IM | rapid | 0.5 hr | 4–12 hr |
| Cefotaxime IV | rapid | end of infusion | 4–12 hr |
| Cefpodoxime PO | unknown | 2–3 hr | 12 hr |
| Ceftazidime IM | rapid | 1 hr | 6–12 hr |
| Ceftazidime IV | rapid | end of infusion | 6–12 hr |
| Ceftibuten PO | rapid | 3 hr | 24 hr |
| Ceftizoxime IM | rapid | 0.5–1.5 hr | 6–12 hr |
| Ceftizoxime IV | rapid | end of infusion | 6–12 hr |
| Ceftriaxone IM | rapid | 1–2 hr | 12–24 hr |
| Ceftriaxone IV | rapid | end of infusion | 12–24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to cephalosporins; Serious hypersensitivity to penicillins; Pedi: Hyperbilirubinemic neonates (ceftriaxone only; may lead to kernicterus); Pedi: Neonates ≤28 days requiring calcium-containing IV solutions (↑ risk of precipitation formation); Carnitine deficiency or inborn errors of metabolism (cefditoren only); Hypersensitivity to milk protein (ceftidoren only; contains sodium caseinate).

**Use Cautiously in:** Renal impairment (↓ dosing/↑ dosing interval recommended for: *cefdinir* if CCr <30 mL/min, *cefixime* if CCr ≤60 mL/min, *cefotaxime* if CCr <20 mL/min, *cefpodoxime* if CCr <30 mL/min, *ceftazidime* if CCr ≤50 mL/min, *ceftibuten* and *cefditoren* if CCr <50 mL/min, *ceftizoxime* if CCr ≤80 mL/min); Hepatic/biliary impairment or combined hepatic/biliary/renal impairment (dose reduction/↑ dosing interval recommended for *cefoperazone*); Combined severe hepatic and renal impairment (dose reduction/↑ dosing interval recommended for *ceftriaxone*); Diabetes (*ceftibuten* and *cefdinir* suspension contain sucrose); History of GI disease, especially colitis; Patients with poor nutritional status, malabsorption states, or alcoholism may be at ↑ risk for bleeding with *cefoperazone*; Geri: Dose adjustment due to age-related ↓ in renal function may be necessary; OB, Lactation: Have been used safely.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES (high doses), headache. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, vomiting, cholelithiasis (ceftriaxone), cramps. **Derm:** STEVENS-JOHNSON SYNDROME, rashes, urticaria. **Hemat:** agranulocytosis, bleeding (↑ with cefoperazone), eosinophilia, hemolytic anemia, lymphocytosis, neutropenia, thrombocytopenia, thrombocytosis. **GU:** hematuria, vaginal moniliasis. **Local:** pain at IM site, phlebitis at IV site. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

## Interactions

**Drug-Drug: Probenecid** ↓ excretion and ↑ serum levels (cefdinir, cefditoren, cefixime, cefotaxime, cefpodoxime, ceftizoxime, ceftriaxone). Ingestion of **alcohol** within 48–72 hr of cefoperazone may result in a disulfiram-like reaction. Cefoperazone may ↑ risk of bleeding with **anticoagulants**, **antiplatelet agents**, **thrombolytic agents**, and **NSAIDS**. Concurrent use of **loop diuretics** or **nephrotoxic agents** including **aminoglycosides** may ↑ risk of nephrotoxicity. **Antacids** ↓ absorption of cefdinir, cefditoren, and cefpodoxime. **Iron supplements** ↓ absorption of cefdinir. **$H_2$-receptor antagonists** ↓ absorption of cefditoren and cefpodoxime. Cefixime may ↑ **carbamazepine** levels. Ceftriaxone should not be administered concomitantly with any calcium-containing solutions.

## Route/Dosage

### Cefdinir

**PO (Adults ≥13 yr):** 300 mg q 12 hr *or* 600 mg q 24 hr (use q 12 hr dosing only for community-acquired pneumonia or skin and skin structure infections).

**PO (Children 6 mo–12 yr):** 7 mg/kg q 12 hr (use only for skin/skin structure infections) *or* 14 mg/kg q 24 hr; dose should not exceed 600 mg/day.

### Renal Impairment

**PO (Adults and Children ≥13 yr):** *CCr <30 mL/min*—300 mg q 24 hr.

### Renal Impairment

**PO (Children 6 mo–12 yr):** *CCr <30 mL/min*—7 mg/kg q 24 hr.

## Cefditoren

**PO (Adults and Children ≥12 yr):** *Pharyngitis/tonsillitis, skin/skin structure infections*—200 mg twice daily; *Acute bacterial exacerbation of chronic bronchitis or community acquired pneumonia*—400 mg twice daily.

### Renal Impairment

**PO (Adults):** *CCr 30–49 mL/min*—dose should not exceed 200 mg twice daily; *CCr <30 mL/min*—dose should not exceed 200 mg once daily.

## Cefixime

**PO (Adults and Children >12 yr or >50 kg):** *Most infections*—400 mg once daily; *Gonorrhea*—400 mg single dose.
**PO (Children):** 8 mg/kg once daily *or* 4 mg/kg q 12h.

### Renal Impairment

**PO (Adults):** *CCr 21–60 mL/min*—75% of standard dose once daily; *CCr ≤20 mL/min*—50% of standard dose once daily.

## Cefoperazone

**IM, IV (Adults):** *Mild to moderate infections*—1–2 g q 12 hr. *Severe infections*—2–4 g q 8 hr *or* 1.5–3 g q 6 hr.

### Hepatic/Renal Impairment

**IM, IV (Adults):** *Impaired hepatic function/biliary obstruction*—daily dose should not exceed 4 g; *combined hepatic and renal impairment*—daily dose should not exceed 1–2 g.

## Cefotaxime

**IM, IV (Adults and Children >12 yr):** *Most uncomplicated infections*—1 g q 12 hr. *Moderate or severe infections*—1–2 g q 6–8 hr. *Life-threatening infections*—2 g q 4 hr (maximum dose = 12 g/day). *Gonococcal urethritis/cervicitis or rectal gonorrhea in females*—500 mg IM (single dose). *Rectal gonorrhea in males*—1 g IM (single dose). *Perioperative prophylaxis*—1 g 30–90 min before initial incision (one-time dose).
**IM, IV (Children 1 mo–12 yr):** *<50 kg*—100–200 mg/kg/day divided q 6–8 hr. *Meningitis*—200 mg/kg/day divided q 6 hr. *Invasive pneumococcal meningitis*—225–300 mg/kg/day divided q 6–8 hr. *≥50 kg*—see adult dosing.
**IV (Neonates 1–4 wk):** 50 mg/kg q 6–8 hr.
**IV (Neonates ≤1 wk):** 50 mg/kg q 8–12 hr.

### Renal Impairment

(Adults): *CCr <20 mL/min*—↓ dose by 50%.

## Cefpodoxime

**PO (Adults):** *Most infections*—200 mg q 12 hr. *Skin and skin structure infections*—400 mg q 12 hr. *Urinary tract infections/pharyngitis*—100 mg q 12 hr. *Gonorrhea*—200 mg single dose.
**PO (Children 2 mo–12 yr):** *Pharyngitis/tonsillitis/otitis media/acute maxillary sinusitis*—5 mg/kg q 12 hr (not to exceed 200 mg/dose).

### Renal Impairment

**PO (Adults):** *CCr <30 mL/min*—↑ dosing interval to q 24 hr.

## Ceftazidime

**IM, IV (Adults and Children ≥12 yr):** *Pneumonia and skin/skin structure infections*—500 mg–1 g q 8 hr. *Bone and joint infections*—2 g q 12 hr. *Severe and life-threatening infections*—2 g q 8 hr. *Complicated urinary tract infections*—500 mg q 8–12 hr. *Uncomplicated urinary tract infections*—250 mg q 12 hr. *Cystic fibrosis lung infection caused by P. aeruginosa*—30–50 mg/kg q 8 hr (maximum dose = 6 g/day).
**IM, IV (Children 1 mo–12 yr):** 33.3–50 mg/kg q 8 hr (maximum dose = 6 g/day).
**IM, IV (Neonates ≤4 wk):** 50 mg/kg q 8–12 hr.

### Renal Impairment

**IM, IV (Adults):** *CCr 31–50 mL/min*—1 g q 12 hr; *CCr 16–30 mL/min*—1 g q 24 hr; *CCr 6–15 mL/min*—500 mg q 24 hr; *CCr <5 mL/min*—500 mg q 48 hr.

## Ceftibuten

**PO (Adults and Children ≥12 yr):** 400 mg q 24 hr for 10 days.
**PO (Children 6 mo–12 yr):** 9 mg/kg q 24 hr for 10 days (maximum dose = 400 mg/day).

### Renal Impairment

**PO (Adults):** *CCr 30–49 mL/min*—200 mg q 24 hr as capsules *or* 4.5 mg/kg q 24 hr as suspension; *CCr 5–29 mL/min*—100 mg q 24 hr as capsules *or* 2.25 mg/kg q 24 hr as suspension.

### Ceftizoxime

**IM, IV (Adults):** *Severe infections*—1–2 g q 8–12 hr. *Life-threatening infections*—3–4 g q 8 hr. *Uncomplicated urinary tract infections*—500 mg q 12 hr. *Gonococcal urethritis/cervicitis*—1 g IM (single dose).
**IM, IV (Children >6 mo):** 50 mg/kg q 6–8 hr (not to exceed 200 mg/kg/day).

#### Renal Impairment

**IM, IV (Adults):** *CCr 50–79 mL/min*—500 mg–1.5 g q 8 hr; *CCr 5–49 mL/min*—250 mg–1 g q 12 hr; *CCr 0–4 mL/min*—500 mg–1 g q 48 hr *or* 250–500 mg q 24 hr.

### Ceftriaxone

**IM, IV (Adults):** *Most infections*—1–2 g q 12–24 hr. *Gonorrhea*—250 mg IM (single dose). *Meningitis*—2 g q 12 hr. *Perioperative prophylaxis*—1 g 30–120 min before initial incision (single dose).
**IM, IV (Children):** *Most infections*—25–37.5 mg/kg q 12 hr *or* 50–75 mg/kg q 24 hr; dose should not exceed 2 g/day. *Meningitis*—100 mg/kg q 24 hr *or* 50 mg/kg q 12 hr; dose should not exceed 4 g/day. *Acute otitis media*—50 mg/kg IM single dose; dose should not exceed 1 g. *Uncomplicated gonorrhea*—125 mg IM (single dose).

## Availability

### Cefdinir (generic available)

**Oral suspension (strawberry):** 125 mg/5 mL, 250 mg/5 mL. **Cost:** *Generic*—125 mg/5 mL $73.40/100 mL, 250 mg/5 mL $83.87/60 mL.
**Capsules:** 300 mg. **Cost:** $104.99/20.

### Cefditoren

**Tablets:** 200 mg.

### Cefixime

**Oral suspension (strawberry):** 100 mg/5 mL.
**Tablets:** 400 mg.

### Cefoperazone (generic available)

**Powder for injection:** 1 g, 2 g, 10 g. **Premixed containers:** 1 g/50 mL, 2 g/50 mL.

### Cefotaxime (generic available)

**Powder for injection:** 500 mg, 1 g, 2 g, 10 g, 20 g. **Premixed containers:** 1 g/50 mL, 2 g/50 mL.

### Cefpodoxime (generic available)

**Tablets:** 100 mg, 200 mg. **Oral suspension (lemon creme):** 50 mg/5 mL, 100 mg/5 mL.

### Ceftazidime (generic available)

**Powder for injection:** 500 mg, 1 g, 2 g, 6 g.
**Premixed containers:** 1 g/50 mL, 2 g/50 mL.

### Ceftibuten

**Capsules:** 400 mg. **Oral suspension (cherry):** 90 mg/5 mL.

### Ceftizoxime

**Powder for injection:** 1 g, 2 g, 10 g. **Premixed containers:** 1 g/50 mL, 2 g/50 mL.

### Ceftriaxone (generic available)

**Powder for injection:** 250 mg, 500 mg, 1 g, 2 g, 10 g. **Premixed containers:** 1 g/50 mL, 2 g/50 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Before initiating therapy, obtain a history to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- Pedi: Assess newborns for jaundice and hyperbilirubinemia before making decision to use ceftriaxone (should not be used in jaundiced or hyperbilirubinemic neonates).
- ***Lab Test Considerations:*** May cause positive results for Coombs' test in patients receiving high doses or in neonates whose mothers were given cephalosporins before delivery.
- Monitor prothrombin time and assess patient for bleeding (guaiac stools; check for hematuria, bleeding gums, ecchymosis) daily in pa-

tients receiving *cefoperazone* or *cefditoren*, as this agent may cause hypoprothrombinemia.
- May cause ↑ serum AST, ALT, alkaline phosphatase, bilirubin, LDH, BUN, and creatinine.
- May rarely cause leukopenia, neutropenia, agranulocytosis, thrombocytopenia, eosinophilia, lymphocytosis, and thrombocytosis.

## Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Adverse Reactions)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

## Implementation

- Cefditoren is not recommended for prolonged use since other piralate-containing compounds have caused clinical manifestations of carnitine deficiency when used over a period of months.
- **PO:** Administer around the clock. May be administered on full or empty stomach. Administration with food may minimize GI irritation. Shake oral suspension well before administering. Administer *cefditoren* with meals to enhance absorption. Administer *cefpodoxime tablets* with meals to enhance absorption (the suspension may be administered without regard to meals. Administer *ceftibuten* at least 1 hr before or 2 hr after meals.
- *Cefixime oral suspension* should be used to treat otitis media (results in higher peak concentrations than tablets).
- Do not administer *cefdinir* or *cefpodoxime* within 2 hr before or after an antacid. Do not administer *cefpodoxime* within 2 hr before or after an $H_2$ receptor antagonist. Do not administer *cefdinir* within 2 hr before or after iron supplements. Do not administer *cefditoren* concomitantly with antacids.
- **IM:** Reconstitute IM doses with sterile or bacteriostatic water for injection or 0.9% NaCl for injection. May be diluted with lidocaine to minimize injection discomfort.
- Inject deep into a well-developed muscle mass; massage well.

### IV Administration

- **IV:** Monitor injection site frequently for phlebitis (pain, redness, swelling). Change sites every 48–72 hr to prevent phlebitis.
- If aminoglycosides are administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.
- **Direct IV:** Dilute cephalosporins in at least 1 g/10 mL. Avoid direct IV administration of *cefoperazone* and *ceftriaxone*. Do not use preparations containing benzyl alcohol for neonates. ***Rate:*** Administer slowly over 3–5 min.

### Cefoperazone

- **Intermittent Infusion:** Reconstitute each gram with at least 5 mL of sterile or bacteriostatic water for injection or 0.9% NaCl. Shake vigorously and allow to stand for visualization and clarity. Solution may be colorless to straw colored. ***Diluent:*** Dilute each gram in solution in 50–100 mL of 0.9% NaCl, D5W, D10W, dextrose/saline combinations, D5/LR, or LR. ***Concentration:*** 2–50 mg/mL Solution is stable for 24 hr at room temperature and 5 days if refrigerated. ***Rate:*** Administer over 15–30 min.
- **Continuous Infusion:** For continuous infusion, concentration should be 2–25 mg/mL.
- **Syringe Compatibility:** heparin.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, aminophylline, ascorbic acid, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefonicid, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dexamethasone, dexmedetomidine, digoxin, docetaxel, enalaprilat, epinephrine, epoetin alfa, eftifibatide, etoposide, etoposide phosphate, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, lidocaine, linezolid, mannitol, mechlorethamine, melphalan, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, multivitamins, nafcillin, naloxone, nitroglycerin, nitroprusside, norepinephrine, oxacillin, oxytocin, paclitaxel, penicillin G, pentobarbital, phenobarbital, phenylephrine, phytonadione, potassium chloride, procainamide, propofol, propranolol, ranitidine, rituximab, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, urokinase, vasopressin, vincristine.
- **Y-Site Incompatibility:** amifostine, amikacin, amphotericin B cholesteryl, amphotericin B liposome, atracurium, azathioprine, benztropine, calcium chloride, caspofungin, chlorpromazine, cimetidine, cisatracurium, codeine, dantrolene, diazepam, diazoxide, di-

phenhydramine, dobutamine, dopamine, doxacurium, doxorubicin, doxorubicin liposome, doxycycline, epirubicin, filgrastim, ganciclovir, gemcitabine, gentamicin, haloperidol, hydralazine, hydroxyzine, idarubicin, inamrinone, indomethacin, insulin, labetalol, levofloxacin, meperidine, metaraminol, methoxamine, methyldopate, midazolam, mitoxantrone, nalbuphine, nesiritide, nicardipine, ondansetron, oxaliplatin, pantoprazole, papaverine, pentamidine, pentazocine, perphenazine, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxime, quinupristin/dalfopristin, rocuronium, sargramostim, thiamine, tobramycin, tolazoline, trastuzumab, trimetaphan, trimethoprim/sulfamethoxazole, vancomycin, verapamil, vinorelbine.

## Cefotaxime

- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may be further diluted in 50–100 mL of D5W, D10W, LR, dextrose/saline combinations, or 0.9% NaCl. Solution may appear light yellow to amber. Solution is stable for 24 hr at room temperature and 5 days if refrigerated. ***Concentration:*** 20–60 mg/mL. ***Rate:*** Administer over 20–30 min.
- **Syringe Compatibility:** heparin.
- **Y-Site Compatibility:** acyclovir, alfentanil, alprostadin, amifostine, aminophylline, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefonocid, cefoperazone, cefotetan, cefoxitin, ceftriaxone, cefuroxime, cimetidine, cisplain, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, docetaxel, dopamine, doxacurium, doxycyline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, furosemide, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metronidazole, miconazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, penicillin G, perphenazine, phenylephrine, phytonadione, potassium chloride, procainamide, propofol, propranolol, pyridoxime, ranitidine, remifentanil, ritodrine, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trimethaphan, urokinase, vasopressin, verapamil, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** allopurinol, amphotericin B liposome, ampicillin/sulbactam, azathioprine, azithromycin, caspofungin, cefazolin, ceftazidime, ceftizoxime, chloramphenicol, chlorpromazine, dantrolene, diazepam, diazoxide, diphenhydramine, doxorubicin hydrochloride, filgrastim, ganciclovir, gemcitabine, haloperidol, hydralazine, hydroxyzine, inamrinone, labetalol, methylprednisolone, mitoxantrone, pantoprazole, papaverine, pemetrexed, pentamidine, pentazocine, pentobarbital, phenobarbital, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, sodium bicarbonate, trastuzumab, trimethoprim/sulfamethoxazole, vecuronium.

## Ceftazidime

- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may be further diluted in at least 1 g/10 mL of 0.9% NaCl, D5W, D10W, dextrose/saline combinations, or LR. Dilution causes $CO_2$ to form inside vial, resulting in positive pressure; vial may require venting after dissolution to preserve sterility of vial. Not required with L-arginine formulation (Ceptaz). Solution may appear yellow to amber; darkening does not alter potency. Solution is stable for 18 hr at room temperature and 7 days if refrigerated. ***Concentration:*** 40 mg/mL. ***Rate:*** Administer over 15–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminophylline, anidulafungin, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefonicid, ceforperazone, cefotetan, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisplatin, clindamycin, cya-

nocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, docetaxel, dopamine, doxacurium, doxapram, enalaprilat, ephedrine, epinephrine, epoetin alfa, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketamine, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, penicillin G, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, propranolol, pyridoxime, ranitidine, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, sodium citrate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimethaphan, urokinase, vasopressin, vecuronium, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amiodarone, amphotericin B cholesteryl, amphotericin B liposome, amsacrine, ascorbic acid, atracurium, azathioprine, azithromycin, calcium chloride, caspofungin, cefotaxime, chloramphenicol, chlorpromazine, diazepam, diazoxide, diphenhydramine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, epirubicin, ganciclovir, haloperidol, hydralazine, hydroxyzine, idarubicin, inamrinone, midazolam, mitoxantrone, nitroprusside, papaverine, pemetrexed, pentamidine, pentazocine, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, thiamine, trimethoprim/sulfamethoxazole, verapamil, warfarin.

## Ceftizoxime

- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may be further diluted in 50–100 mL of D5W, D10W, 0.9% NaCl, dextrose/saline combinations, or LR. Solution is stable for 8 hr at room temperature and 48 hr if refrigerated. ***Concentration:*** 20 mg/mL. ***Rate:*** Administer over 15–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B liposome, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefoperazone, cefotetan, ceftazidime, ceftriaxone, cefuroxime, cimetidine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dactomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhyrdamine, docetaxel, dopamine, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, enalaprilat, ephedrine, ephinephrnine, epirubicin, epoetin, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxaxin, lidocaine, linezolid, lorazepam, magnesium chloride, mannitol, mechlorethamine, melphalan, meperidine, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, pemetrexed, penicillin G, phenobarbital, phenylephrine, phytonadione, potassium chloride, propofol, propranolol, ranitidine, remifentanil, ritodrine, rituxumab, rocuronium, sargramostim, sodium acetate, sodium bicrabonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, trastuzumab, trimethaphan, vasopressin, verapamil, vincristine, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** amphotericin B colloidal, cefotaxime, cefoxitin, chloramphenicool, chlorpromazine, dantrolene, diazepam, diazoxide, doxycycline, ethromycin, filgrastim, ganciclovir, haloperidol, hydralazine, hydroxyzine, inamrinone, nalbuphine, papaverine, pentamadine, pentazocine, phenytoin, procainamide, prochlorperazine, promethazine, protamine, pyridoxime, quinupristin/dalfopristin, thiamine, trimethoprim/sulfamethoxazole.

## Ceftriaxone

- **Intermittent Infusion:** Reconstitute each 250-mg vial with 2.4 mL, each 500-mg vial with 4.8 mL, each 1-g vial with 9.6 mL, and each 2-g vial with 19.2 mL of sterile water for injection, 0.9% NaCl, or D5W for a concentration of 100 mg/mL. ***Diluent:*** Solution may be further diluted in 50–100 mL of 0.9% NaCl, D5W, D10W, D5/0.45% NaCl, or LR. Solution may appear light yellow to amber. Solution is stable for 3 days at room temperature. ***Concentration:*** 40 mg/mL. ***Rate:*** Administer over 10–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, carboplatin, cefazolin, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, cimetidine, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, docetaxel, dopamine, doxacurium, doxorubicin liposome, doxycycline, drotrecogin, enalaprilat, ephedrine, epinephrine, epoetin alfa, epitifibitide, erythromycin, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gemcitabine, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, indomethacin, insulin, isoproterenol, ketorolac, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, pemetrexed, penicillin G, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, propofol, propranolol, pyridoxime, ranitidine, remifentanil, rituxumab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimethaphan, urokinase, vasopressin, vecuronium, verapamil, vincristine, voriconazole, warfarin, zidovudine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl, amsacrine, ascorbic acid, azathioprine, azithromycin, calcium chloride, calcium gluconate, caspofungin, chloramphenicol, chlorpromazine, clindamycin, dantrolene, diazepam, diazoxide, diphenhydramine, dobutamine, doxorubicin hydrochloride, epirubicin, filgrastim, ganciclovir, haloperidol, hetastarch, hydralazine, hydroxyzine, idarubicin, imipenem/cilastatin, inamrinone, labetalol, lactated ringers, magnesium sulfate, mitoxantrone, pentamidine, pentazocine, pentobarbital, phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin, Ringer's injection, trimethoprim/sulfamethoxazole, tobramycin, vinorelbine. Calcium-containing solutions, including parenteral nutrition, should not be mixed or co-administered, even via different infusion lines at different sites in patients <28 days old. In older patients, flush line thoroughly between infusions.

## Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the medication completely, even if feeling better. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Advise patient that sharing of this medication may be dangerous.
- Pedi: Instruct parents or caregivers to use calibrated measuring device with liquid preparations.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Caution patients that concurrent use of alcohol with *cefoperazone* may cause a disulfiram-like reaction (abdominal cramps, nausea, vomiting, headache, hypotension, palpitations, dyspnea, tachycardia, sweating, flushing). Alcohol and alcohol-containing medications should be avoided during and for several days after therapy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decreased incidence of infection when used for prophylaxis.

## certolizumab pegol

(ser-toe-**liz**-u-mab)

Cimzia

***Classification***

Therapeutic: gastrointestinal anti-inflammatories, antirheumatics

Pharmacologic: tumor necrosis factor blockers, DMARDs, monoclonal antibodies

**Pregnancy Category B**

### Indications

Moderately-to-severely active Crohn's disease when response to conventional therapy has been inadequate. Moderately-to-severely active rheumatoid arthritis.

### Action

Neutralizes tumor necrosis factor (TNF), a prime mediator of inflammation; pegolation provides a long duration of action. **Therapeutic Effects:** Decreased signs/symptoms of Crohn's disease. Decreased pain and swelling, decreased rate of joint destruction and improved physical function in rheumatoid arthritis.

### Pharmacokinetics

**Absorption:** 80% absorbed following SC administration.

**Distribution:** Unknown.

**Metabolism and Excretion:** Unknown.

**Half-life:** 14 days.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | unknown | 50–120 hr | 2–4 wk |

### Contraindications/Precautions

**Contraindicated in:** Active untreated infection; Hepatitis B reactivation; Concurrent use of anakinra.

**Use Cautiously in:** History of recurrent infections, concurrent immunosupressants, medical conditions associated with increased risk of infection, current residence in areas where tuberculosis or histoplasmosis is endemic, history of hepatitis B infection (may reactivate); History of demyelinating disorders (may exacerbate); History of heart failure; Geri: May ↑ risk of infections; OB: Use in pregnancy only if clearly needed; avoid breastfeeding; Pedi: Safety not established; ↑ risk of lymphoma, leukemia, and other malignancies.

### Adverse Reactions/Side Effects

**Derm:** psoriasis, skin reactions (rarely severe). **Hemat:** LEUKEMIA, hematologic reactions. **MS:** arthralgia. **Misc:** allergic reactions including ANAPHYLAXIS, INFECTIONS (including reactivation tuberculosis and invasive fungal infections), MALIGNANCY, lupus-like syndrome.

### Interactions

**Drug-Drug:** Concurrent use with **anakinra** ↑ risk of serious infections (contraindicated). May ↓ antibody response to or ↑ risk of adverse reactions to **live vaccines** (contraindicated).

### Route/Dosage

#### Crohn's Disease

**Subcut (Adults):** 400 mg initially, repeat 2 and 4 wk later; may be followed by maintenance dose of 400 mg every 4 wk.

#### Rheumatoid Arthritis

**Subcut (Adults):** 400 mg initially, repeat 2 and 4 wk later; then maintenance dose of 200 mg every 2 wk (400 mg every 4 wk may be used alternatively).

### Availability

**Lyophilized powder for subcutaneous injection (requires reconstitution):** 200 mg/vial.

**Prefilled syringe:** 200 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- **Crohn's Disease:** Assess abdominal pain and frequency, quantity, and consistency of stools at beginning and during therapy.
- **Arthritis:** Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, sore throat, dyspnea, WBC) prior to and during therapy. Monitor all patients for active TB during therapy, even if initial test was negative. Do not begin certolizumab during an active infection, including chronic or localized infections. If infection develops, monitor closely and discontinue certolizumab if infection becomes serious.
- Evaluate patients at risk for hepatitis B virus (HBV) infection for prior evidence of HBV infection before initiating therapy. Monitor carriers of HBV closely for clinical and lab signs of active HBV infection during and for several

months following discontinuation of therapy. If HBV reactivation occurs, discontinue certolizumab and initiate antiviral therapy.
- Monitor for signs of hypersensitivity reactions (angioedema, dyspnea, hypotension, rash, serum sickness, urticaria). If reactions occur, discontinue certolizumab and treat symptomatically.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dypsnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping certolizumab until the infection has been diagnosed and adequately treated.
- ***Lab Test Considerations:*** May cause anemia, leukopenia, pancytopenia, and thrombocytopenia.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue certolizumab if symptoms of blood dyscrasias (persistent fever) occur.
- May cause ↑ liver enzymes.
- May cause erroneously ↑ aPTT.

### Potential Nursing Diagnoses
Risk for infection (Side Effects)

### Implementation
- Perform test for latent TB. If positive, begin treatment for TB prior to starting certolizumab therapy.
- Bring medication to room temperature prior to reconstituting. Reconstitute 2 vials for each dose by adding 1 mL of Sterile Water for injection to each vial, using a 20-gauge needle, for a concentration of 200 mg/mL. Gently swirl so all powder comes into contact with sterile water; do not shake. Leave vials undisturbed for as long as 30 min to fully reconstitute. Solution is clear and colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter. Do not leave reconstituted solution at room temperature for >2 hr prior to injection. May be refrigerated for up to 24 hr prior to injection; do not freeze.
- **Subcut:** Bring solution to room temperature prior to injection. Using a new 20-gauge needle for each vial, withdraw reconstituted solution into 2 separate syringes each containing 1 mL (200 mg/mL) of certolizumab. Switch each 20-gauge needle to a 23-gauge needle and inject the full contents of each syringe subcut into separate sides of the abdomen or thigh.

### Patient/Family Teaching
- Advise patient of potential benefits and risks of certolizumab. Advise patient to read the *Medication Guide* prior to starting therapy.
- Inform patient of risk of infection. Advise patient to notify health care professional if symptoms of infection (fever, cough, flu-like symptoms, or open cuts or sores), including TB or reactivation of HBV infection, occur.
- Counsel patient about possible risk of lymphoma and other malignancies while receiving certolizumab.
- Advise patient to notify health care professional if signs of hypersensitivity reactions (rash, swollen face, difficulty breathing), or new or worsening medical conditions such as heart or neurological disease or autoimmune disorders occur and to report signs of bone marrow depression (bruising, bleeding, or persistent failure.
- Instruct patient to consult health care professional prior to taking any Rx, OTC, vitamins, or herbal products.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

### Evaluation/Desired Outcomes
- Decrease in signs and symptoms of Crohn's disease.
- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.

## cetirizine (se-ti-ra-zeen)
Zyrtec

***Classification***
Therapeutic: allergy, cold, and cough remedies, antihistamines
Pharmacologic: piperazines (peripherally selective)

**Pregnancy Category B**

## Indications
Relief of allergic symptoms caused by histamine release including: Seasonal and perennial allergic rhinitis, Chronic urticaria.

## Action
Antagonizes the effects of histamine at $H_1$-receptor sites; does not bind to or inactivate histamine. Anticholinergic effects are minimal and sedation is dose related. **Therapeutic Effects:** Decreased symptoms of histamine excess (sneezing, rhinorrhea, ocular tearing and redness, pruritus).

## Pharmacokinetics
**Absorption:** Well absorbed following oral administration.
**Distribution:** Unknown.
**Protein Binding:** 93%.
**Metabolism and Excretion:** Excreted primarily unchanged by the kidneys.
**Half-life:** 7.4–9 hr (decreased in children to 6.2 hr, increased in renal impairment up to 19–21 hr).

TIME/ACTION PROFILE (antihistaminic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | 4–8 hr | 24 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to cetirizine, hydroxyzine or any component; Lactation: Excreted in breast milk; not recommended for use.
**Use Cautiously in:** Patients with hepatic or renal impairment (dosage reduction recommended if CCr ≤31 mL/min or hepatic function is impaired); OB, Pedi: Safety not established for pregnant women or children <6 mo; Geri: Initiate at lower doses.

## Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness (significant with doses >10 mg/day), fatigue. **EENT:** pharyngitis. **GI:** dry mouth.

## Interactions
**Drug-Drug:** Additive CNS depression may occur with **alcohol**, **opioid analgesics**, or **sedative/hypnotics**. **Theophylline** may decrease clearance and increase toxicity.

## Route/Dosage
**PO (Adults and children >6 yr):** 5–10 mg given once or divided twice daily.
**PO (Children 2–5 yr):** 2.5 mg once daily initially, may be increased to 5 mg once daily or 2.5 mg every 12 hr.
**PO (Children 1–2 yr):** 2.5 mg once daily; may be increased to 2.5 mg every 12 hr .
**PO (Children 6–12 mo):** 2.5 once daily.

### Hepatic/Renal Impairment
**PO (Adults and Children >12 yr):** *CCr ≤31 mL/min, hepatic impairment or hemodialysis*—5 mg once daily.
**PO (Children 6–11 yr):** start therapy at <2.5 mg/day.
**PO (Children <6 yr):** use not recommended.

## Availability (generic available)
**Tablets:** 5 mg[OTC], 10 mg[OTC]. **Cost:** 5 mg $76.99/30, 10 mg $75.99/30. **Chewable tablets (grape):** 5 mg[OTC], 10 mg[OTC]. **Cost:** 5 mg $75.99/30, 10 mg $75.99/30. **Syrup (banana-grape and bubblegum flavors):** 1 mg/mL in 120-mL and 480-mL bottles[OTC]. **Cost:** $41.99/120 mL, $145.97/480 mL. ***In combination with:*** pseudoephedrine (Zyrtec-D 12 Hour) (See Appendix B).

# NURSING IMPLICATIONS

## Assessment
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** May cause false-negative result in allergy skin testing.

## Potential Nursing Diagnoses
Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

## Implementation
- Do not confuse Zyrtec (cetirizine) with Zantac (ranitidine) or Zyprexa (olanzapine).
- **PO:** Administer once daily without regard to food.

## Patient/Family Teaching
- Instruct patient to take medication as directed.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.

- Instruct patient to contact health care professional if dizziness occurs or if symptoms persist.

### Evaluation/Desired Outcomes

- Decrease in allergic symptoms.

## cetuximab (se-tux-i-mab)

Erbitux

***Classification***

Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

**Pregnancy Category C**

### Indications

Locally or regionally advanced squamous cell carcinoma of the head and neck with radiation. Recurrent or metastatic squamous cell carcinoma of the head and neck progressing after platinum-based therapy. Epidermal growth factor receptor (EGFR) expressing metastatic colorectal cancer in patients who have not responded to irinotecan and oxaliplatin. Metastatic colorectal cancer (with irinotecan) when tumors express the EGFR and have not responded or are intolerant to irinotecan alone.

### Action

Binds specifically to EGFR, thereby preventing the binding of endogenous epidermal growth factor (EGF). This prevents cell growth and differentiation processes. Combination with irinotecan enhances antitumor effects of irinotecan. **Therapeutic Effects:** Decreased tumor growth and spread.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** 97–114 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to cetuximab or murine (mouse) proteins; Patients whose tumors have KRAS mutations in codon 12 or 13 (not effective); OB, Lactation: Pregnancy or lactation.

**Use Cautiously in:** Exposure to sunlight (may exacerbate dermatologic toxicity); Pedi: Safety not established.

### Adverse Reactions/Side Effects

Most adverse reactions reflect combination therapy with irinotecan.
**CNS:** malaise, depression, headache, insomnia. **EENT:** conjunctivitis. **Resp:** dyspnea, ↑ cough, interstitial lung disease. **CV:** PULMONARY EMBOLISM. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, anorexia, stomatitis. **GU:** renal failure. **Derm:** acneform dermatitis, hypertrichosis, nail disorder, pruritus, skin desquamation, skin infection. **F and E:** dehydration, hypomagnesemia, peripheral edema. **Hemat:** anemia, leukopenia. **MS:** back pain. **Metab:** weight loss. **Misc:** INFUSION REACTIONS, fever, desquamation of mucosal epithelium.

### Interactions

**Drug-Drug:** None noted.

### Route/Dosage

#### Head & Neck Cancer with Radiation

**IV (Adults):** 400 mg/m² administered 1 wk prior to initiation of radiation therapy, followed by weekly maintenance doses of 250 mg/m² for the duration of radiation therapy. Complete infusion 1 hr prior to radiation therapy; dose modification recommended for dermatologic toxicity.

#### Head and Neck Cancer Monotherapy

**IV (Adults):** 400 mg/m² initial loading dose, followed by weekly maintenance doses of 250 mg/m² until disease progression or unacceptable toxicity; dose modification recommended for dermatologic toxicity.

#### Colorectal Cancer

**IV (Adults):** 400 mg/m² initial loading dose, followed by weekly maintenance doses of 250 mg/m²; dose modification recommended for dermatologic toxicity.

### Availability

**Solution for injection:** 2 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Assess for infusion reaction (rapid onset of airway obstruction [bronchospasm, stridor, hoarseness], urticaria, hypotension, loss of consciousness, myocardial infarction, cardiopulmonary arrest) for at least 1 hr following in-

fusion. Longer observation periods may be required for those who experience infusion reactions. Most reactions occur during first dose, but may also occur in later doses. For severe reactions, immediately stop infusion and discontinue cetuximab permanently. Epinephrine, corticosteroids, IV antihistamines, bronchodilators, and oxygen should be available for reactions. Mild to moderate reactions (chills, fever, dyspnea) may be managed by slowing rate of infusion and administration of antihistamines.

- Assess for onset or worsening of pulmonary symptoms. Interrupt therapy to determine nature of symptoms. If interstitial lung disease is confirmed, discontinue cetuximab and treat appropriately.
- Assess for dermatologic toxicities (acneform rash, skin drying and fissuring, inflammatory and infectious sequelae [blepharitis, cheilitis, cellulitis, cyst]). Treat symptomatically. Acneform rash usually occurs within initial 2 wk of therapy and resolves following cessation, but may continue up to 28 days following therapy.
- ***Lab Test Considerations:*** May cause anemia and leukopenia.
- Monitor serum electrolytes periodically during and for at least 8 wk following infusion. May cause hypomagnesemia, hypocalcemia, and hypokalemia; may occur from days to months after initiation of therapy. May require electrolyte replacement.

### Potential Nursing Diagnoses

Ineffective breathing pattern (Adverse Reactions)
Impaired skin integrity (Adverse Reactions)

### Implementation

- Premedicate with histamine$_1$ antagonist (diphenhydramine 50 mg) 30–60 min prior to first dose; base subsequent administration on presence and severity of infusion reactions.
- Administer through a low protein binding 0.22-micrometer in-line filter placed as proximal to patient as possible. Solution should be clear and colorless and may contain a small amount of white amorphous cetuximab particles. Do not shake or dilute.
- Can be administered via infusion pump or syringe pump. Cetuximab should be piggybacked to the patient's infusion line.
- Observe patient for 1 hr following infusion.

**IV Administration**

- **Intermittent Infusion:** *For administration via infusion pump:* Draw up volume of a vial using vented spike needle or other transfer device. Transfer to a sterile evacuated container or bag. Repeat with new needle for each vial until calculated volume is in container. Affix infusion line and prime with cetuximab before starting infusion.
- *For administration via syringe pump:* Draw up volume of a vial using sterile syringe attached to an appropriate vented spike needle. Place syringe into syringe driver of a syringe pump and set rate. Connect infusion line and prime with cetuximab. Use a new needle and filter for each vial. ***Diluent:*** Do not dilute. ***Concentration:*** 2 mg/mL. ***Rate:*** Administer over 2 hr at a rate not to exceed 10 mg/min. Use 0.9% NaCl to flush line at end of infusion.

### Patient/Family Teaching

- Explain purpose of cetuximab and potential side effects to patient.
- Advise patient to report dermatologic changes and signs and symptoms of infusion reactions (fever, chills, or breathing problems) promptly.
- Caution patient to wear sunscreen and hats and limit sun exposure during therapy during and for 2 mo following last dose of cetuximab.
- Advise both female and male patients to use adequate contraception during and for 6 mo following therapy and to avoid breastfeeding during and for 2 mo following therapy.

### Evaluation/Desired Outcomes

- Decreased tumor growth and spread.

HIGH ALERT

## chloral hydrate

(**klor**-al **hye**-drate)

Aquachloral, Novo-Chlorhydrate, PMS-Chloral Hydrate

***Classification***

Therapeutic: sedative/hypnotics

**Schedule IV**

**Pregnancy Category C**

### Indications

Short-term sedative and hypnotic (effectiveness decreases after 2 wk of use). Sedation or reduction of anxiety preoperatively (anesthetic adjunct) or prior to diagnostic procedures.

### Action

Converted to trichloroethanol, which is the active drug. Has generalized CNS depressant properties. **Therapeutic Effects:** Sedation or induction of sleep.

## Pharmacokinetics

**Absorption:** Well absorbed following oral or rectal administration.
**Distribution:** Widely distributed. Crosses the placenta and enters breast milk in low concentrations.
**Metabolism and Excretion:** Converted by liver to trichloroethanol, which is active. Trichloroethanol is, in turn, metabolized by the liver and kidneys to inactive compounds.
**Half-life:** *Chloral hydrate*—Infants: 1 hr. *Trichloroethanol*—Neonates: 8.5–66 hr; Children: 10 hr; Adults: 8–11 hr.

TIME/ACTION PROFILE (sedation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | 1 hr | 4–8 hr |
| Rectal | 0.5–1 hr | 1 hr | 4–8 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe cardiac disease; Severe renal impairment (ClCr <50 mL/min); Coma or pre-existing CNS depression; Uncontrolled severe pain; OB: Crosses placenta; chronic use during pregnancy may cause withdrawal symptoms in the neonate; Lactation: Excreted in human milk, use by nursing mothers may cause sedation in the infant; Esophagitis, gastritis, or ulcer disease; Proctitis (rectal use); Tartrazine hypersensitivity (some rectal products); Impaired respiratory function; Sleep apnea.
**Use Cautiously in:** Hepatic dysfunction; History of suicide attempt or substance abuse; Obstructive sleep apnea; Pedi: May cause direct hyperbilirubinemia in neonates; Geri, Pedi: Dosage reduction recommended.

## Adverse Reactions/Side Effects

**CNS:** excess sedation, disorientation, dizziness, hangover, headache, incoordination, irritability, paradoxical excitation (children). **Resp:** respiratory depression. **GI:** diarrhea, nausea, vomiting, flatulence. **Derm:** rashes. **Misc:** tolerance, physical dependence, psychological dependence.

## Interactions

**Drug-Drug:** Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **sedative/hypnotics**, and **opioid analgesics**. May potentiate **warfarin**. When given within 24 hr of IV **furosemide**, may cause diaphoresis, changes in blood pressure, and flushing. May increase metabolism and decrease effects of **phenytoin**. May increase toxicity of **ifosfamide** and **cyclophosphamide**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can increase CNS depression.

## Route/Dosage

**PO (Adults):** *Hypnotic*—500–1000 mg 15–30 min before bedtime. *Preoperative sedation*—500 mg–1000 mg 30 min before surgery. *Daytime sedation*—250 mg 3 times daily. Single dose/daily dose should not >2 g.
**PO (Geriatric Patients):** *Hypnotic*—250 mg 15–30 min before bedtime.
**Rect (Adults):** *Sedation*—325 mg 3 times daily. *Hypnotic*—500–1000 mg. Single dose/daily dose should not >2 g.
**PO, Rect (Children >1 month):** *Pre-electroencephalogram sedation*—20–25 mg/kg 30–60 min prior. *Sedation prior to dental/medical procedures*—50–75 mg/kg 30–60 min prior; may repeat within 30 min if needed; single dose should not exceed 1 g total for infants or 2 g total for children. *Hypnotic*—50 mg/kg; maximum 2 g/day. *Sedation/anxiety:* 25–50 mg/kg/day divided q 6–8 hr; maximum 500 mg/dose.
**PO, Rect (Neonates):** 25 mg/kg/dose prior to a procedure.

## Availability (generic available)

**Capsules:** 500 mg. **Syrup:** 500 mg/5 mL. **Suppositories:** 325 mg, 500 mg.

# NURSING IMPLICATIONS

## Assessment

- Assess mental status (orientation, mood, behavior) and potential for abuse prior to administering this medication. Prolonged use may lead to physical and psychological dependence. Limit amount of drug available to the patient.
- Assess sleep pattern before and periodically throughout therapy.
- Geri: Assess CNS effects and risk for falls. Institute fall prevention strategies.
- Assess level of consciousness at time of peak effect. Notify physician or other health care professional if desired sedation does not occur or if paradoxical reaction occurs.
- ***Lab Test Considerations:*** Interferes with tests for urinary 17-hydroxycorticosteroids and urinary catecholamines.

## Potential Nursing Diagnoses

Insomnia (Indications)
Anxiety (Indications)

Risk for injury (Side Effects)
Ineffective coping (Indications)
Sleep deprivation (Indications)
Risk for falls (Side Effects)
Acute confusion (Side Effects)

### Implementation

- ***High Alert:*** Pedi: Chloral hydrate overdosage has resulted in fatalities in children. Only accept orders written in milligrams, not volume (teaspoons) or concentration. Chloral hydrate should be administered to children only by trained staff in the health care setting. When administered to children for sedation before outpatient procedures, administer at the facility where procedure is to be performed. Repeated doses should be used with great caution in neonates, as drug and metabolites accumulate and may lead to toxicity. Continue monitoring until level of consciousness is safe for discharge.
- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.
- Refer for psychotherapy if ineffective coping is basis for sleep pattern disturbance.
- Protect patient from injury. Place bed-side rails up. Assist with ambulation. Remove cigarettes from patients receiving hypnotic dose.
- **PO:** Capsules should be swallowed whole with a full glass of water or juice to minimize gastric irritation; do not chew. Dilute syrup in a half glass of water, juice, ginger ale, or formula to mask taste.
- **Rect:** If suppository is too soft for insertion, chill in refrigerator for 30 min or run under cold water before removing foil wrapper.

### Patient/Family Teaching

- Instruct patient to take chloral hydrate exactly as directed. Missed doses should be omitted; do not double doses. If used for 2 wk or longer, abrupt withdrawal may result in CNS excitement, tremor, anxiety, hallucinations, and delirium.
- Chloral hydrate causes drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient that concurrent alcohol use may create an additive effect that results in tachycardia, vasodilation, flushing, headache, hypotension, and pronounced CNS depression. Alcohol and other CNS depressants should be avoided while taking chloral hydrate.
- Advise patient to discontinue use and notify health care professional if skin rash, dizziness, irritability, impaired thought processes, headache, or motor incoordination occurs.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoid nicotine and caffeine).

### Evaluation/Desired Outcomes

- Sedation.
- Improvement in sleep pattern.

## chlordiazepoxide

(klor-dye-az-e-**pox**-ide)

Apo-Chlordiazepoxide, Libritabs, Librium, Mitran, Novopoxide, Poxi

***Classification***

Therapeutic: antianxiety agents, sedative/hypnotics
Pharmacologic: benzodiazepines

**Schedule IV**

**Pregnancy Category D**

### Indications

Adjunct management of anxiety. Treatment of alcohol withdrawal. Adjunct management of anxiety associated with acute myocardial infarction.

### Action

Acts at many levels of the CNS to produce anxiolytic effect. Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter.
**Therapeutic Effects:** Sedation. Relief of anxiety.

### Pharmacokinetics

**Absorption:** Well absorbed from the GI tract. IM absorption may be slow and unpredictable.
**Distribution:** Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk. Recommend to discontinue drug or bottle feed.
**Metabolism and Excretion:** Highly metabolized by the liver. Some products of metabolism are active as CNS depressants.
**Half-life:** 5–30 hr.

TIME/ACTION PROFILE (sedation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–2 hr | 0.5–4 hr | up to 24 hr |
| IM | 15–30 min | unknown | unknown |
| IV | 1–5 min | unknown | 0.25–1 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Some products contain tartrazine and should be avoided in patients with known intolerance;

Cross-sensitivity with other benzodiazepines may occur; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Pulmonary disease; Angle-closure glaucoma; Porphyria; OB, Lactation: May cause CNS depression, flaccidity, feeding difficulties, and weight loss in infants; Pedi: Not for use in children ≤6 yr.
**Use Cautiously in:** Hepatic dysfunction; Severe renal impairment; History of suicide attempt or substance abuse; Geri: Long-acting benzodiazepines cause prolonged sedation in the elderly. Appears on Beers list and is associated with increased risk of falls (↓ dose required or consider short-acting benzodiazepine); Debilitated patients (initial dose reduction required).

### Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, hangover, headache, mental depression, paradoxical excitation, sedation. **EENT:** blurred vision. **GI:** constipation, diarrhea, nausea, vomiting, weight gain. **Derm:** rashes. **Local:** pain at IM site. **Misc:** physical dependence, psychological dependence, tolerance.

### Interactions

**Drug-Drug: Alcohol**, **antidepressants**, **antihistamines**, and **opioid analgesics**—concurrent use results in additive CNS depression. **Cimetidine**, **oral contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propoxyphene**, **propranolol**, or **valproic acid** may enhance effects. May ↓ efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↓ effectiveness of chlordiazepoxide. Sedative effects may be ↓ by **theophylline**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

### Route/Dosage

**PO (Adults):** *Alcohol withdrawal*—50–100 mg, repeated until agitation is controlled (up to 400 mg/day). *Anxiety*—5–25 mg 3–4 times daily.
**PO (Geriatric Patients or Debilitated Patients):** *Anxiety*—5 mg 2–4 times daily initially, increased as needed.
**PO (Children >6 yr):** *Anxiety*—5 mg 2–4 times daily, up to 10 mg 2–3 times daily.
**IM, IV (Adults):** *Alcohol withdrawal*—50–100 mg initially; may be repeated in 2–4 hr. *Anxiety*—50–100 mg initially, then 25–50 mg 3–4 times daily as required (25–50 mg initially in geriatric patients). *Preoperative sedation*—50–100 mg 1 hr preop.
**IM, IV (Geriatric Patients or Debilitated Patients):** *Anxiety/sedation*—25–50 mg/dose.
**IM, IV (Children >12 yr):** *Anxiety/sedation*—25–50 mg/dose.

C

### Availability (generic available)

**Capsules:** 5 mg, 10 mg, 25 mg. **Tablets:** 5 mg, 10 mg, 25 mg. **Injection:** 100-mg ampule. ***In combination with:*** amitriptyline (Limbitrol DS), clidinium (Librax). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess for anxiety and level of sedation (ataxia, dizziness, slurred speech) periodically during therapy.
- Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Monitor blood pressure, heart rate, and respiratory rate frequently when administering parenterally. Report significant changes immediately.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient.
- Geri: Assess risk of falls and institute fall prevention strategies.
- **Alcohol Withdrawal:** Assess for tremors, agitation, delirium, and hallucinations. Protect patient from injury. Institute seizure precautions.
- Geri: Assess risk of falls and institute fall prevention strategies.
- ***Lab Test Considerations:*** Patients on prolonged therapy should have CBC and liver function tests evaluated periodically. May cause ↑ in serum bilirubin, AST, and ALT.
- May alter results of urine 17-ketosteroids and 17-ketogenic steroids. May cause ↓ response on metyrapone tests and decreased thyroidal uptake of $^{123}I$ and $^{131}I$.
- ***Toxicity and Overdose:*** Flumazenil reverses sedation caused by chlordiazepoxide toxicity or overdose. (Flumazenil may induce seizures in patients with a history of seizure disorder or who are on tricyclic antidepressants.)

### Potential Nursing Diagnoses

Anxiety (Indications)
Risk for injury (Side Effects)
Ineffective coping
Dysfunctional family processes: alcoholism

## Implementation

- Do not confuse Librium with Librax.
- IV administration is usually the preferred route for parenteral administration because of the slow, erratic absorption after IM administration.
- After parenteral administration, have patient remain recumbent and observe for 3–8 hr or longer, depending on patient's response.
- Equipment to maintain a patent airway should be immediately available when chlordiazepoxide is administered intravenously.
- Use parenteral solution immediately after reconstitution and discard any unused portion.
- **PO:** Administer after meals or with milk to minimize GI irritation. Tablets may be crushed and taken with food or fluids if patient has difficulty swallowing. Administer greater dose at bedtime to avoid daytime sedation. Do not discontinue abruptly; taper by 10 mg every 3 days to reduce chance of withdrawal effects. Some patients may require longer taper period (months). Monitor patients closely with seizure disorder as abrupt withdrawal may precipitate seizures.
- **IM:** Reconstitute only with 2 mL of diluent provided by manufacturer. Do not use solution if opalescent or hazy. Agitate gently to minimize bubbling. Administer slowly, deep into a well-developed muscle mass to minimize pain at injection site. Solution reconstituted with IM diluent should not be given IV.

### IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute 100 mg in 5 mL of 0.9% NaCl or sterile water for injection. Do not use IM diluent. ***Concentration:*** 20 mg/mL. ***Rate:*** Administer prescribed dose slowly over at least 1 min. Rapid administration may cause apnea, hypotension, bradycardia, or cardiac arrest.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

## Patient/Family Teaching

- Instruct patient to take chlordiazepoxide as directed. If medication is less effective after a few weeks, check with health care professional; do not increase dose. Medication should be tapered at the completion of long-term therapy. Sudden cessation of medication may lead to withdrawal (insomnia, irritability, nervousness, tremors).
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Geri: Instruct patient and family how to reduce falls risk at home.
- Advise patient to avoid the use of alcohol and other CNS depressants concurrently with this medication.
- Instruct patient to consult health care professional before taking OTC medications.
- Instruct patient to notify health care professional if pregnancy is planned or suspected.
- Advise patient that benzodiazepines do not cure underlying problems. Psychotherapy is beneficial in addressing source of anxiety and improving coping skills.
- Teach other methods to decrease anxiety, such as exercise, use of support group (e.g., Alcoholics Anonymous), or relaxation techniques.
- Teach patient not to share medication with anyone.

## Evaluation/Desired Outcomes

- Decreased sense of anxiety.
- Increased ability to cope.
- Decreased delirium tremens and more rational ideation when used for alcohol withdrawal.

**chlorothiazide, See DIURETICS (THIAZIDE).**

# chlorpheniramine

(klor-fen-**ir**-a-meen)

Aller-Chlor, Allergy, Chlo-Amine, Chlorate, Chlor-Trimeton, Chlor-Trimeton Allergy 4 Hour, Chlor-Trimeton Allergy 8 Hour, Chlor-Trimeton Allergy 12 Hour, Chlor-Tripolon, Novo-Pheniram, PediaCare Allergy Formula, Phenetron, Telechlor, Teldrin

***Classification***

Therapeutic: allergy, cold, and cough remedies, antihistamines

**Pregnancy Category B**

## Indications

Relief of allergic symptoms caused by histamine release, including: Nasal allergies, Allergic dermatoses. Management of severe allergic or hypersensitivity reactions, including anaphylaxis and transfusion reactions.

## Action

Antagonizes the effects of histamine at $H_2$-receptor sites; does not bind to or inactivate histamine.

**Therapeutic Effects:** Decreased symptoms of histamine excess (sneezing, rhinorrhea, nasal and ocular pruritus, ocular tearing, and redness).

## Pharmacokinetics

**Absorption:** Well absorbed following oral and parenteral administration.
**Distribution:** Widely distributed. Minimal amounts excreted in breast milk. Crosses the blood-brain barrier.
**Metabolism and Excretion:** Extensively metabolized by the liver.
**Half-life:** 12–15 hr.

TIME/ACTION PROFILE (antihistaminic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15–30 min | 6 hr | 4–12 hr |
| PO–ER | unknown | unknown | 8–24 hr |
| Subcut | unknown | unknown | 4–12 hr |
| IM | unknown | unknown | 4–12 hr |
| IV | rapid | unknown | 4–12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Acute attacks of asthma; Lactation: Avoid use or use alternative feeding method; Known alcohol intolerance (some liquid forms); Pedi: Children <4 yr (OTC cough and cold products containing this medication should be avoided).
**Use Cautiously in:** Angle-closure glaucoma; Liver disease; Geri: Appears on Beers list. Geriatric patients are more susceptible to adverse reactions due to anticholinergic effects; OB: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** drowsiness, dizziness, excitation (in children). **EENT:** blurred vision. **CV:** hypertension, arrhythmias, hypotension, palpitations. **GI:** dry mouth, constipation, obstruction. **GU:** retention, urinary hesitancy.

## Interactions

**Drug-Drug:** ↑ CNS depression with other **CNS depressants**, including **alcohol**, **opioid analgesics**, and **sedative/hypnotics**. **MAO inhibitors** intensify and prolong anticholinergic effects of antihistamines. ↑ anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**.

## Route/Dosage

**PO (Adults):** 4 mg q 4–6 hr *or* 8–12 mg of extended-release formulation q 8–12 hr (not to exceed 24 mg/day).
**PO (Geriatric Patients):** 4 mg twice daily *or* 8 mg of extended-release formulation at bedtime.
**PO (Children 6–12 yr):** 2 mg 3–4 times daily (not to exceed 12 mg/day).

## Injectable formulation is available only in Canada

**Subcut, IM, IV (Adults):** 5–40-mg single dose (not to exceed 40 mg/day).
**Subcut (Children):** 87.5 mcg (0.0875 mg)/kg or 2.5 mg/m² q 6 hr as needed.

## Availability (generic available)

**Tablets:** 4 mg[Rx, OTC], 8 mg[Rx, OTC], 12 mg[Rx, OTC]. **Chewable tablets (orange flavor):** 2 mg[Rx, OTC]. **Timed-release tablets:** 8 mg[Rx, OTC], 12 mg[Rx, OTC]. **Timed-release capsules:** 8 mg[Rx, OTC], 12 mg[Rx, OTC]. **Syrup:** 1 mg/5 mL[Rx, OTC], 2 mg/5 mL[Rx, OTC], 2.5 mg/5 mL[Rx, OTC]. **Injection:** 10 mg/mL, 100 mg/mL. ***In combination with:*** Codeine (Codeprex), pseudoephedrine (Advil), and decongestants[Rx, OTC]. See Appendix B.

# NURSING IMPLICATIONS

## Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) prior to and periodically during therapy.
- Monitor pulse and blood pressure before initiating and throughout IV therapy.
- Caution parents to avoid OTC cough and cold products while breastfeeding or to children <4 yrs.
- Geri: Assess for adverse anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia).
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** May cause false-negative reactions on allergy skin tests; discontinue 4 days prior to testing.

## Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

## Implementation

- **PO:** Administer oral doses with food or milk to decrease GI irritation. Extended-release tablets and capsules should be swallowed whole; do not crush, break, or chew. Chewable tablets should not be swallowed whole; chew well before swallowing.
- **Subcut, IM:** The 100-mg/mL solution is recommended for IM or subcut routes only. The 10-mg/mL solution may be used for IM, subcut, or IV.

### IV Administration

- **Direct IV:** ***Diluent:*** May be given undiluted. Use only the 10 mg/mL strength for IV administration. ***Concentration:*** 10 mg/mL. ***Rate:*** Administer each 10-mg dose over at least 1 min.

## Patient/Family Teaching

- Instruct patient to take chlorpheniramine as directed.
- Geri: Teach patient and family about anticholinergic effects and to contact health care professional if effects persist.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to avoid using alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may help relieve dryness of mouth.
- Instruct patient to contact health care professional if symptoms persist.

## Evaluation/Desired Outcomes

- Decrease in allergic symptoms.

# chlorproMAZINE

(klor-**proe**-ma-zeen)

Chlorpromanyl, Largactil, Novo-Chlorpromazine

***Classification***

Therapeutic: antiemetics, antipsychotics

Pharmacologic: phenothiazines

**Pregnancy Category C**

## Indications

Second-line treatment for schizophrenia and psychoses after failure with atypical antipsychotics. Hyperexcitable, combative behavior in children. Nausea and vomiting. Intractable hiccups. Preoperative sedation. Acute intermittent porphyria. **Unlabeled Use:** Vascular headache. Bipolar disorder.

## Action

Alters the effects of dopamine in the CNS. Has significant anticholinergic/alpha-adrenergic blocking activity. **Therapeutic Effects:** Diminished signs/symptoms of psychosis. Relief of nausea/vomiting/intractable hiccups. Decreased symptoms of porphyria.

## Pharmacokinetics

**Absorption:** Variable absorption from tablets. Well absorbed following IM administration.
**Distribution:** Widely distributed; high CNS concentrations. Crosses the placenta; enters breast milk.
**Protein Binding:** ≥90%.
**Metabolism and Excretion:** Highly metabolized by the liver and GI mucosa. Some metabolites are active.
**Half-life:** 30 hr.

TIME/ACTION PROFILE (antipsychotic activity, antiemetic activity, sedation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–60 min | unknown | 4–6 hr |
| IM | unknown | unknown | 4–8 hr |
| IV | rapid | unknown | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hypersensitivity to sulfites (injectable); Cross-sensitivity with other phenothiazines may occur; Angle-closure glaucoma; Bone marrow depression; Severe liver/cardiovascular disease; Concurrent pimozide use.
**Use Cautiously in:** Diabetes; Respiratory disease; Prostatic hyperplasia; CNS tumors; Epilepsy; Intestinal obstruction; OB, Lactation: Safety not established. Discontinue drug or bottle feed; Pedi: Children with acute illnesses, infections, gastroenteritis, or dehydration (↑ risk of extrapyramidal reactions); Geri: ↑ risk of mortality in elderly patients treated for dementia-related psychosis; Geri: Geriatric/debilitated patients (↓ initial dose).

## Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, sedation, extrapyramidal reactions, tardive dyskinesia. **EENT:** blurred vision, dry eyes, lens opacities. **CV:** hypotension (↑ with IM, IV), tachycardia. **GI:** constipation, dry mouth, anorexia, hepatitis, ileus, priapism. **GU:** urinary retention. **Derm:** photosensitivity, pigment changes, rashes. **Endo:** galactorrhea, amenorrhea. **Hemat:** AGRANULOCYTOSIS, leukopenia. **Metab:** hyperthermia. **Misc:** allergic reactions.

## Interactions

**Drug-Drug:** Concurrent use with **pimozide** ↑ the risk of potentially serious cardiovascular reactions. May alter serum **phenytoin** levels. ↓ pressor effect of **norepinephrine** and eliminates bradycardia. Antagonizes peripheral vasoconstriction from **epinephrine** and may reverse some of its actions. May ↓ elimination and ↑ effects of **valproic acid**. May ↓ the pharmacologic effects of **amphetamine** and **related compounds**. May ↓ the effectiveness of **bromocriptine**. May ↑ blood levels and effects of **tricyclic antidepressants**. **Antacids** or **adsorbent antidiarrheals** may ↓ adsorption; administer 1 hr before or 2 hr after chlorpromazine. ↑ risk of anticholinergic effects with **antihistamines**, **tricyclic antidepressants**, **quinidine**, or **disopyramide**. Premedication with chlorpromazine ↑ the risk of neuromuscular excitation and hypotension when followed by **barbiturate** anesthesia. **Barbiturates** may ↑ metabolism and ↓ effectiveness. Chlorpromazine may ↓ **barbiturate** levels. Additive hypotension with **antihypertensives**. Additive CNS depression with **alcohol**, **antidepressants**, **antihistamines**, **MAO inhibitors**, **opioid analgesics**, **sedative/hypnotics**, or **general anesthetics**. Concurrent use with **lithium** may produce disorientation, unconsciousness, or extrapyramidal symptoms. Concurrent use with **meperidine** may produce excessive sedation and hypotension. Concurrent use with **propranolol** ↑ blood levels of both drugs.

**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression. ↑ anticholinergic effects with **angel's trumpet**, **jimson weed**, and **scopolia**.

## Route/Dosage

**PO (Adults):** *Psychoses*—10–25 mg 2–4 times daily; may ↑ every 3–4 days (usual dose is 200 mg/day; up to 1 g/day) . *Nausea and vomiting*—10–25 mg q 4 hr as needed. *Preoperative sedation*—25–50 mg 2–3 hr before surgery. *Hiccups/porphyria*—25–50 mg 3–4 times daily.

**PO (Children):** *Psychoses/nausea and vomiting*—0.55 mg/kg (15 mg/m²) q 4–6 hr as needed. *Preoperative sedation*—0.55 mg/kg (15 mg/m²) 2–3 hr before surgery.

**IM (Adults):** *Severe psychoses*—25–50 mg initially, may be repeated in 1 hr; ↑ to maximum of 400 mg q 3–12 hr if needed (up to 1 g/day). *Nausea/vomiting*—25 mg initially, may repeat with 25–50 mg q 3–4 hr as needed. *Nausea/vomiting during surgery*—12.5 mg, may be repeated in 30 min as needed. *Preoperative sedation*—12.5–25 mg 1–2 hr prior to surgery. *Hiccups/tetanus*—25–50 mg 3–4 times daily. *Porphyria*—25 mg q 6–8 hr until patient can take PO.

**IM (Children 6 mo):** *Psychoses/nausea and vomiting*—0.55 mg/kg (15 mg/m²) q 6–8 hr (not to exceed 40 mg/day in children 6 mo–5 yr, or 75 mg/day in children 5–12 yr). *Nausea/vomiting during surgery*—0.275 mg/kg, may repeat in 30 min as needed. *Preoperative sedation*—0.55 mg/kg 1–2 hr prior to surgery. *Tetanus*—0.55 mg/kg q 6–8 hr.

**IV (Adults):** *Nausea/vomiting during surgery*—up to 25 mg. *Hiccups/tetanus*—25–50 mg. *Porphyria*—25 mg q 8 hr.

**IV (Children):** *Nausea/vomiting during surgery*—0.275 mg/kg. *Tetanus*—0.55 mg/kg.

## Availability (generic available)

**Tablets:** 10 mg, 25 mg, 50 mg, 100 mg, 200 mg.
**Injection:** 25 mg/mL.

# NURSING IMPLICATIONS

## Assessment

- Assess mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess weight and BMI initially and throughout therapy.
- Assess fasting blood glucose and cholesterol levels initially and periodically throughout therapy. Refer as appropriate for nutritional/weight and medical management.
- Assess positive (hallucinations, delusions, agitation) and negative (social withdrawal) symptoms of schizophrenia.
- Monitor blood pressure (sitting, standing, lying), pulse, and respiratory rate prior to and frequently during the period of dose adjustment.
- Observe patient carefully when administering medication to ensure medication is actually taken and not hoarded.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet may help minimize constipation.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and ex-trapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance con-

trol, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Notify health care professional if these symptoms occur; reduction in dose or discontinuation may be necessary. Trihexyphenidyl, diphenhydramine, or benzotropine may be used to control these symptoms. Benzodiazepines may alleviate symptoms of akathisia.

- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue, excessive eye blinking). Report these symptoms immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, convulsions, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report these symptoms immediately.
- **Preoperative Sedation:** Assess level of anxiety prior to and following administration.
- **Vascular Headache:** Assess type, location, intensity, and duration of pain and accompanying symptoms.
- ***Lab Test Considerations:*** Monitor CBC, liver function tests, and ocular exams periodically throughout therapy. May cause ↓ hematocrit, hemoglobin, leukocytes, granulocytes, platelets. May cause ↑ bilirubin, AST, ALT, and alkaline phosphatase. Agranulocytosis occurs 4–10 wk after initiation of therapy, with recovery 1–2 wk following discontinuation. May recur if medication is restarted. Liver function abnormalities may require discontinuation of therapy. May cause false-positive or false-negative pregnancy tests and false-positive urine bilirubin test results.

## Potential Nursing Diagnoses

Disturbed thought process (Indications)
Imbalanced nutrition: risk for more than body requirements (Side Effects)

## Implementation

- Do not confuse chlorpromazine with chlorpropamide or prochlorperazine.
- Keep patient recumbent for at least 30 min following parenteral administration to minimize hypotensive effects.
- Phenothiazines should be discontinued 48 hr before and not resumed for 24 hr following metrizamide myelography, because they lower the seizure threshold.
- **Hiccups:** Initial treatment is with oral doses. If hiccups persist 2–3 days, IM injection may be used, followed by IV infusion.
- **PO:** Administer oral doses with food, milk, or a full glass of water to minimize gastric irritation. Tablets may be crushed.
- **IM:** Do not inject subcut. Inject slowly into deep, well-developed muscle. May be diluted with 0.9% NaCl or 2% procaine. Lemon-yellow color does not alter potency of solution. Do not administer solution that is markedly discolored or contains a precipitate.

### IV Administration

- **Direct IV:** ***Diluent:*** Dilute with 0.9% NaCl. ***Concentration:*** Do not exceed 1 mg/mL. ***Rate:*** Inject slowly at a rate of at least 1 mg/min for adults and 0.5 mg/min for children.
- **Continuous Infusion:** ***Diluent:*** May further dilute 25–50 mg in 500–1000 mL of D5W, D10W, 0.45% NaCl, 0.9% NaCl, Ringer's or lactated Ringer's injection, dextrose/Ringer's or dextrose/lactated Ringer's combinations.
- **Syringe Compatibility:** atropine , benztropine, butorphanol, diphenhydramine, doxapram, droperidol, fentanyl, glycopyrrolate, hydromorphone, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, pentazocine, scopolamine.
- **Syringe Incompatibility:** cimetidine, heparin, pantoprazole, pentobarbital, thiopental.
- **Y-Site Compatibility:** alfentanyl, amikacin, amsacrine, anidulafungin, ascorbic acid, atracurium, atropine, benztropine, bleomycin, buprenorphine, butorphanol, calcium chloride, calcium gluconate, caspofungin, cimetidine, cisatracurium, cisplatin, cladribine, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, erythromycin, esmolol, etoposide, famotidine, fenoldopam, filgrastim, fluconazole, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, isoproterenol, labetalol, levofloxacin, lidocaine, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins,

nafcillin, nalbuphine, naloxone, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, palonosetron, pancuronium, papaverine, pentamidine, pentazocine, phentolamine, phytonadione, potassium chloride, procainamide, prochlorperazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, rituximab, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, tirofiban, tolazoline, trimetaphan, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole.

- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azathioprine, aztreonam, bivalirudin, bumetanide, carboplatin, cefazolin, cefepime, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, diazoxide, eftifibatide, epoetin alfa, ertapenem, etoposide phosphate, fludarabine, fluorouracil, folic acid, furosemide, gancilovir, hydralazine, imipenem/cilastatin, inamrinone, indomethacin, insulin, ketorolac, linezolid, melphalan, methotrexate, nitroprusside, paclitaxel, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phytonadione, piperacillin/tazobactam, sargramostim, sodium bicarbonate, streptokinase, ticarcillin/clavulante, tigecycline, trastuzumab, trimethoprim/sulfamethoxazole.

### Patient/Family Teaching

- Advise patient to take medication as directed and not to skip doses or double up on missed doses. If a dose is missed, take within 1 hr or omit dose and return to regular schedule. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun. Exposed surfaces may develop a temporary pigment change (ranging from yellow-brown to grayish purple). Extremes of temperature (exercise, hot weather, hot baths or showers) should also be avoided, because this drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth. Consult health care professional if dry mouth continues for 2 wk.
- Advise patient not to take chlorpromazine within 2 hr of antacids or antidiarrheal medication.
- Inform patient that this medication may turn urine a pink-to-reddish-brown color.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools occur.
- Emphasize the importance of routine follow-up exams to monitor response to medication and detect side effects. Encourage continued participation in psychotherapy as indicated.
- Treatment is not a cure since symptoms can recur after discontinuation of medication.

### Evaluation/Desired Outcomes

- Decrease in excitable, manic behavior. Therapeutic effects may not be seen for 7–8 wk.
- Relief of nausea and vomiting.
- Relief of hiccups.
- Preoperative sedation.
- Management of porphyria.
- Relief of vascular headache.
- Decrease in positive (hallucinations, delusions, agitation) symptoms of schizophrenia.

**chlorthalidone (thiazide–like), See DIURETICS (THIAZIDE).**

## chlorzoxazone

(klor-**zox**-a-zohn)

Parafon Forte DSC

***Classification***
Therapeutic: skeletal muscle relaxants (centrally acting)

**Pregnancy Category C**

### Indications
Adjunct to rest and physical therapy in the treatment of muscle spasm associated with acute painful musculoskeletal conditions.

### Action
Skeletal muscle relaxation, probably due to CNS depression. **Therapeutic Effects:** Skeletal muscle relaxation with decreased discomfort.

### Pharmacokinetics
**Absorption:** Readily absorbed after oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver; <1% excreted unchanged in urine.
**Half-life:** 1.1 hr.

TIME/ACTION PROFILE (skeletal muscle effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 1 hr | 1–2 hr | 3–4 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Porphyria.
**Use Cautiously in:** Underlying cardiovascular disease; Impaired renal or hepatic function; OB, Lactation, Pedi: Safety not established; Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects.

### Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness. **GI:** GI BLEEDING, constipation, diarrhea, heartburn, nausea, vomiting. **Derm:** allergic dermatitis. **Hemat:** AGRANULOCYTOSIS, anemia. **Misc:** allergic reactions including ANGIOEDEMA.

### Interactions
**Drug-Drug:** ↑ risk of CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **sedative/hypnotics**, or **opioid analgesics**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

### Route/Dosage
**PO (Adults):** 250–750 mg 3–4 times daily.
**PO (Children):** 20 mg/kg or 600 mg/m²/day in 3–4 divided doses.

### Availability (generic available)
**Tablets:** 250 mg, 500 mg. **Cost:** *250 mg generic*—$29.86/100; *500 mg Parafon Forte DSC*—$126.84/100; *generic*—$102.96/100

## NURSING IMPLICATIONS

### Assessment
- Assess patient for pain, muscle stiffness, and range of motion before and periodically during therapy.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).

### Potential Nursing Diagnoses
Acute pain (Indications)
Impaired physical mobility (Indications)
Risk for injury (Side Effects)

### Implementation
- **PO:** May be administered with meals to minimize gastric irritation. Tablets may be crushed and mixed with food or liquid for ease of administration.

### Patient/Family Teaching
- Instruct patient to take medication as directed; do not take more than the prescribed amount. Missed doses should be taken within 1 hr of time ordered; otherwise, omit and return to normal dosage schedule. Do not double doses.
- Medication may cause drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- If constipation becomes a problem, advise patient that increasing fluid intake and bulk in diet and stool softeners may alleviate this condition.

### Evaluation/Desired Outcomes
- Relief of muscular spasm in acute skeletal muscle conditions.

**cholecalciferol, See VITAMIN D COMPOUNDS.**

## cholestyramine
(koe-less-**tear**-a-meen)
LoCHOLEST, LoCHOLEST Light, Prevalite, Questran, Questran Light

***Classification***
Therapeutic: lipid-lowering agents
Pharmacologic: bile acid sequestrants

**Pregnancy Category C**

## Indications
Management of primary hypercholesterolemia. Pruritus associated with elevated levels of bile acids. **Unlabeled Use:** Diarrhea associated with excess bile acids.

## Action
Bind bile acids in the GI tract, forming an insoluble complex. Result is increased clearance of cholesterol. **Therapeutic Effects:** Decreased plasma cholesterol and low-density lipoproteins (LDLs). Decreased pruritus.

## Pharmacokinetics
**Absorption:** Action takes place in the GI tract. No absorption occurs.
**Distribution:** No distribution.
**Metabolism and Excretion:** After binding bile acids, insoluble complex is eliminated in the feces.
**Half-life:** Unknown.

TIME/ACTION PROFILE (hypocholesterolemic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 24–48 hr | 1–3 wk | 2–4 wk |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Complete biliary obstruction; Some products contain aspartame and should be avoided in patients with phenylketonuria.
**Use Cautiously in:** History of constipation.
**Exercise Extreme Caution in:** Children (may cause intestinal obstruction; deaths have occurred).

## Adverse Reactions/Side Effects
**EENT:** irritation of the tongue. **GI:** abdominal discomfort, constipation, nausea, fecal impaction, flatulence, hemorrhoids, perianal irritation, steatorrhea, vomiting. **Derm:** irritation, rashes. **F and E:** hyperchloremic acidosis. **Metab:** vitamin A, D, and K deficiency.

## Interactions
**Drug-Drug:** May decrease absorption/effects of orally administered **acetaminophen**, **amiodarone**, **clindamycin**, **clofibrate**, **digoxin**, **diuretics**, **gemfibrozil**, **glipizide**, **corticosteroids**, **imipramine**, **mycophenolate**, **methotrexate**, **methyldopa**, **niacin**, **NSAIDs**, **penicillin**, **phenytoin**, **phosphates**, **propranolol**, **tetracyclines**, **tolbutamide**, **thyroid preparations**, **ursodiol**, **warfarin**, and **fat-soluble vitamins (A, D, E,** and **K)**. May decrease absorption of other **orally administered medications**.

## Route/Dosage
**PO (Adults):** 4 g 1–2 times daily (initially, may be increased as needed/tolerated up to 24 g/day in 6 divided doses).
**PO (Children):** 240 mg/kg/day in 2–3 divided doses (not >8 g/day).

## Availability (generic available)
**Powder for suspension with aspartame (strawberry flavor [LoCHOLEST], unflavored [Prevalite, Questran Light]):** 4 g cholestyramine/packet or scoop. **Powder for suspension (strawberry flavor [LoCHOLEST], unflavored [Questran, generic]):** 4 g cholestyramine/packet or scoop.

# NURSING IMPLICATIONS

## Assessment
- **Hypercholesterolemia:** Obtain a diet history, especially in regard to fat consumption.
- **Pruritus:** Assess severity of itching and skin integrity. Dose may be decreased when relief of pruritus occurs.
- **Diarrhea:** Assess frequency, amount, and consistency of stools.
- ***Lab Test Considerations:*** Serum cholesterol and triglyceride levels should be evaluated before initiating, frequently during first few months and periodically throughout therapy. Discontinue medication if paradoxical increase in cholesterol level occurs.
- May cause an increase in AST, ALT, phosphorus, chloride, and alkaline phosphatase and a decrease in serum calcium, sodium, and potassium levels.
- May also cause prolonged prothrombin times.

## Potential Nursing Diagnoses
Constipation (Side Effects)
Noncompliance (Patient/Family Teaching)

## Implementation
- Parenteral or water-miscible forms of fat-soluble vitamins (A, D, and K) and folic acid may be ordered for patients on chronic therapy.
- **PO:** Administer before meals.

- Scoops for powdered preparations may not be exchangable between products.
- Administer other medications 1 hr before or 4–6 hr after the administration of this medication.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed; do not skip doses or double up on missed doses.
- Instruct patient to take medication before meals. Mix cholestyramine with 4–6 oz water, milk, fruit juice, or other noncarbonated beverages. Shake vigorously. Slowly stir in a large glass. Rinse glass with small amount of additional beverage to ensure all medication is taken. May also mix with highly fluid soups, cereals, or pulpy fruits (applesauce, crushed pineapple). Allow powder to sit on fluid and hydrate for 1–2 min before mixing. Do not take dry. Variations in the color of cholestyramine do not alter stability.
- Advise patient that this medication should be used in conjunction with dietary restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Explain that constipation may occur. Increase in fluids and bulk in diet, exercise, stool softeners, and laxatives may be required to minimize the constipating effects. Instruct patient to notify health care professional if constipation, nausea, flatulence, and heartburn persist or if stools become frothy and foul smelling.
- Advise patient to notify health care professional if unusual bleeding or bruising; petechiae; or black, tarry stools occur. Treatment with vitamin K may be necessary.

### Evaluation/Desired Outcomes

- Decrease in serum low-density lipoprotein cholesterol levels. Therapy is usually discontinued if the clinical response remains poor after 3 mo of therapy.
- Decrease in severity of pruritus. Relief usually occurs 1–3 wk after therapy is initiated.
- Decrease in frequency and severity of diarrhea.

**choline and magnesium salicylates, See SALICYLATES.**

**choline salicylate, See SALICYLATES.**

**ciclesonide, See CORTICOSTEROIDS (NASAL).**

**ciclopirox, See ANTIFUNGALS (TOPICAL).**

## cidofovir (sye-doe-**foe**-veer)

Vistide

***Classification***

Therapeutic: antivirals

**Pregnancy Category C**

### Indications

Management of cytomegalovirus (CMV) retinitis in HIV-infected patients (with probenecid).

### Action

Suppresses replication of CMV by inhibiting viral DNA synthesis. **Therapeutic Effects:** Slows progression of CMV retinitis; may not be curative.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Excreted mostly unchanged by the kidneys.
**Half-life:** Unknown.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to cidofovir, probenecid, or sulfonamides; Serum Cr >1.5 mg/dL, CCr ≤55 mL/min, or urine protein ≥100 mg/dL (≥2+ proteinuria); Concurrent use of foscarnet, amphotericin B, aminoglycoside anti-infectives, NSAIDs, or IV pentamidine.
**Use Cautiously in:** Pregnancy or children (safety not established); breastfeeding is not recommended in HIV-positive patients.
**Exercise Extreme Caution in:** Any condition or medication that increases the risk of dehydration.

### Adverse Reactions/Side Effects

**CNS:** headache, weakness. **EENT:** decreased intraocular pressure, hearing loss, iritis, ocular hypotony, uveitis. **Resp:** dyspnea, pneumonia. **GI:** HEPATIC DYSFUNCTION, PANCREATITIS, abdominal pain, nausea, vomiting, anorexia, diarrhea. **GU:** RENAL FAILURE, proteinuria. **Derm:** alopecia, rash. **F and E:** decreased serum bicarbonate. **Hemat:** neutropenia, anemia. **Metab:** METABOLIC ACIDOSIS. **Misc:** chills, fever, infection.

### Interactions

**Drug-Drug:** ↑ risk of nephrotoxicity with **aminoglycosides**, **amphotericin B**, **foscarnet**, and **pentamidine** and should be avoided; wait 7 days after giving other nephrotoxic agents. **Probenecid**, which is required concurrently, may interact with **acetaminophen**, **acyclovir**, **ACE inhibitors**, **barbiturates**, **benzodiazepines**, **bumetanide**, **methotrexate**, **famotidine**, **furosemide**, **NSAIDs**, **theophylline**, and **zidovudine**.

### Route/Dosage

**IV (Adults):** 5 mg/kg once weekly for 2 wk, followed by 5 mg/kg every 2 wk (must be given with probenecid).

### Renal Impairment

**IV (Adults):** *Increase in serum creatinine of 0.3–0.4 mg/dL*—decrease dose to 3 mg/kg; discontinue if serum creatinine increases ≥0.5 mg/dL over baseline.

### Availability

**Solution for injection:** 75 mg/mL in 5-mL ampules.

## NURSING IMPLICATIONS

### Assessment

- Monitor vision for progression of CMV retinitis. Monitor ocular symptoms, intraocular pressure, and visual acuity periodically.
- Antiemetics and administration after a meal may minimize nausea and vomiting associated with probenecid. If allergic reactions occur in association with probenecid, pretreatment with antihistamines or acetaminophen should be considered.
- Monitor vital signs periodically. May cause fever, hypotension, and tachycardia. Monitor patients for early signs and symptoms of infection.
- ***Lab Test Considerations:*** Renal function, measured by serum Cr and urine protein, must be monitored within 48 hr before each dose and throughout cidofovir therapy. In patients with proteinuria, administer IV hydration and repeat urine protein test. If renal function deteriorates, dose modification or temporary discontinuation should be considered.
- Monitor WBC before each dose. Granulocytopenia may occur.
- May cause hyperglycemia, hyperlipemia, hypocalcemia, hypokalemia, and elevated alkaline phosphatase, AST, and ALT.

### Potential Nursing Diagnoses

Risk for infection (Indications)

### Implementation

- Probenecid and saline prehydration must be given with cidofovir to minimize renal toxicity. *Probenecid* must be administered 2 g orally given 3 hr before, then 1 g given 2 hr and 8 hr after completion of cidofovir infusion. *Saline prehydration* with 1 L of 0.9% NaCl must be given over 1–2 hr before cidofovir. A second liter over 1–3 hr is recommended concurrently with or after cidofovir.
- Patients receiving foscarnet, amphotericin B, aminoglycoside, NSAIDs, or IV pentamidine should wait at least 7 days after these agents to begin cidofovir.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute in 100 mL of 0.9% NaCl. Solution is stable for 24 hr if refrigerated. Allow refrigerated solution to return to room temperature before administration. ***Rate:*** Administer over 1 hr.
- **Additive Incompatibility:** Information unavailable. Do not admix with other solutions or medications.

### Patient/Family Teaching

- Inform patient that cidofovir is not a cure for CMV retinitis and that retinitis may continue to progress during and after therapy.
- Inform patient that concurrent antiretroviral therapy may be continued. However, zidovudine therapy should be temporarily discontinued or decreased by 50% on the days of cidofovir therapy because of the effects of probenicid on zidovudine.
- Advise patient of the possibility of renal toxicity from cidofovir. Emphasize the importance of routine lab tests to monitor renal function.
- Inform patient that cidofovir may have teratogenic effects. Women should use contraception during and for 1 mo after therapy. Men should use barrier contraception during and for 3 mo after therapy.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patients to have routine ophthalmologic exams after cidofovir therapy.

### Evaluation/Desired Outcomes

- Decrease in symptoms and arrest of progression of CMV retinitis in HIV-infected patients.

## cilostazol (sil-os-tah-zol)

Pletal

***Classification***

Therapeutic: antiplatelet agents
Pharmacologic: platelet aggregation inhibitors

**Pregnancy Category C**

### Indications

Reduction of the symptoms of intermittent claudication as measured by increased walking distance.

### Action

Inhibits the enzyme cyclic adenosine monophosphate (cAMP) phosphodiesterase III (PDE III), which results in increased cAMP in platelets and blood vessels, producing inhibition of platelet aggregation and vasodilation. **Therapeutic Effects:** Reduced symptoms of intermittent claudication with improved walking distance.

### Pharmacokinetics

**Absorption:** Slowly absorbed after oral administration.
**Distribution:** Unknown.
**Protein Binding:** 95–98% bound to plasma proteins; one active metabolite is 97.4% bound, the other is 66% bound.
**Metabolism and Excretion:** Extensively metabolized by the liver, two metabolites have platelet aggregation inhibitory activity; metabolites are mostly excreted by the kidneys.
**Half-life:** *Cilostazol and its active metabolites* —11–13 hr.

TIME/ACTION PROFILE (symptom reduction)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 2–4 wk | up to 12 wk | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; CHF; OB: Potential for congenital defects, stillbirth, and low birth weight; Lactation: Potential risk to nursing infants; discontinue or bottle feed.
**Use Cautiously in:** Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** headache, dizziness. **CV:** palpitations, tachycardia. **GI:** diarrhea.

### Interactions

**Drug-Drug:** Concurrent administration of **ketoconazole**, **itraconazole**, **erythromycin**, **diltiazem**, **fluconazole**, **miconazole**, **fluvoxamine**, **fluoxetine**, **nefazodone**, **sertraline**, or **omeprazole** decreases metabolism and increases levels and activity of cilostazol (use lower doses). Concurrent use with **aspirin** has additive effects on platelet function.
**Drug-Food: Grapefruit juice** inhibits metabolism and increases effects; concurrent use should be avoided.

### Route/Dosage

**PO (Adults):** 100 mg twice daily (50 mg twice daily if receiving inhibitors of cilostazol metabolism).

### Availability (generic available)

**Tablets:** 50 mg, 100 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for intermittent claudication before and periodically during therapy.
- ***Lab Test Considerations:*** May occasionally cause anemia, hyperlipemia, hyperuricemia, and albuminuria. May prolong bleeding time.

### Potential Nursing Diagnoses

Activity intolerance (Indications)

### Implementation

- **PO:** Administer on an empty stomach, 1 hr before or 2 hr after meals.
- Do not administer with grapefruit juice. May increase cilostazol levels.

### Patient/Family Teaching

- Instruct patient to take cilostazol on an empty stomach, exactly as directed.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid smoking; nicotine constricts blood vessels.

### Evaluation/Desired Outcomes

- Relief from cramping in calf muscles, buttocks, thighs, and feet during exercise.
- Improvement in walking endurance. Therapeutic effects may be seen in 2–4 wk.

**cimetidine, See HISTAMINE $H_2$ ANTAGONISTS.**

## cinacalcet (sin-a-kal-set)

Sensipar

***Classification***
Therapeutic: hypocalcemics
Pharmacologic: calcimimetic agents

**Pregnancy Category C**

## Indications
Secondary hyperparathyroidism in patients who are being hemodialyzed. Hypercalcemia caused by parathyroid carcinoma.

## Action
Increases sensitivity of calcium-sensing receptors located on the surface of chief cells of parathyroid gland to levels of extracellular calcium. This decreases parathyroid hormone production with resultant decrease in serum calcium. **Therapeutic Effects:** Decreased bone turnover and fibrosis. Decreased serum calcium.

## Pharmacokinetics
**Absorption:** Well absorbed following oral administration, absorption is enhanced by food and further enhanced by a high fat meal.
**Distribution:** Unknown.
**Protein Binding:** 93–97%.
**Metabolism and Excretion:** Highly metabolized by CYP3A4, CYP2D6, and CYP1A2 enzyme systems; 80% excreted in urine as metabolites, 15% in feces.
**Half-life:** 30–40 hr.

TIME/ACTION PROFILE (effect on PTH levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 2–6 hr | 6–12 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Serum calcium <8.4 mg/dL; Lactation: Discontinue drug or bottle-feed.
**Use Cautiously in:** History of seizure disorder; Chronic kidney disease patients who are not being dialyzed (↑ risk of hypocalcemia); Parathyroid hormone level <150 pg/mL (dose reduction or discontinuation may be warranted); Moderate to severe hepatic impairment; OB: Use only if benefits justify risks to fetus; Pedi: Safety not established.

## Adverse Reactions/Side Effects
**GI:** nausea, vomiting. **F and E:** hypocalcemia.
**Metab:** adynamic bone disease.

## Interactions
**Drug-Drug:** Inhibits CYP2D6 and may ↑ levels of **flecainide**, **vinblastine**, **thioridazine**, **metoprolol**, **carvedilol**, and most **tricyclic antidepressants**; dose adjustments may be necessary. Blood levels are ↑ by **strong CYP3A4 inhibitors** including **ketoconazole**, **itraconazole**, and **erythromycin**; monitoring and dose adjustment may be necessary.

## Route/Dosage
**PO (Adults):** 30 mg twice daily, titrate every 2–4 wk up to 90 mg 3–4 times daily in response to serum calcium monitoring.

## Availability
**Tablets:** 30 mg, 60 mg, 90 mg.

# NURSING IMPLICATIONS

## Assessment
- Monitor for signs and symptoms of hypocalcemia (paresthesias, myalgias, cramping, tetany, convulsions) during therapy. If calcium levels decrease to below normal, serum calcium may be increased by adjusting dose (see Lab Test Considerations) and providing supplemental serum calcium, initiating or increasing dose of calcium-based phosphate binder or vitamin D.
- ***Lab Test Considerations:*** Monitor serum calcium and phosphorous levels within 1 wk after initiation of therapy or dose adjustment and monthly for patients with hyperparathyroidism or every 2 mo for patients with parathyroid carcinoma once maintenance dose has been established, especially in patients with a history of seizure disorder. Therapy should not be initiated in patients with serum calcium less than the lower limit of normal (8.4 mg/dL).
- If serum calcium ↓ below 8.4 mg/dL but remains above 7.5 mg/dL, or if symptoms of hypocalcemia occur, use calcium-containing phosphate binders and/or vitamin D sterols to ↑ serum calcium. If serum calcium ↓ below 7.5 mg/dL, or if symptoms of hypocalcemia persist and the dose of vitamin D cannot be ↑, withhold administration of cinacalcet until serum calcium levels reach 8.0 mg/dL, and/or symptoms of hypocalcemia resolve. Re-initiate therapy using next lowest dose of cinacalcet.
- Monitor serum parathyroid hormone (iPTH) levels 1 to 4 wk after initiation of therapy or dose adjustment, and every 1 to 3 mo after maintenance dose has been established. If iPTH levels ↓ below 150–300 pg/mL, reduce dose or discontinue cinacalcet.

- Monitor liver function tests in patients with moderate to severe hepatic impairment during therapy.

### Potential Nursing Diagnoses
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation
- Cinacalcet may be used alone or in combination with vitamin D and/or phosphate binders.
- **PO:** Administer with food or shortly after a meal. Take tablets whole, do not divide.

### Patient/Family Teaching
- Instruct patient to take cinacalcet as directed.
- Advise patient to report signs and symptoms of hypocalcemia to health care professional promptly.

### Evaluation/Desired Outcomes
- Decreased serum calcium levels.

HIGH ALERT

## cisplatin (sis-**pla**-tin)
Platinol, Platinol-AQ

***Classification***
Therapeutic: antineoplastics
Pharmacologic: alkylating agents

**Pregnancy Category D**

### Indications
Metastatic testicular and ovarian carcinoma. Advanced bladder cancer. Head and neck cancer. Cervical cancer. Lung cancer. Other tumors.

### Action
Inhibits DNA synthesis by producing cross-linking of parent DNA strands (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Widely distributed; accumulates for months; enters breast milk.
**Metabolism and Excretion:** Excreted mainly by the kidneys.
**Half-life:** 30–100 hr.

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | 18–23 days | 39 days |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Pregnancy or lactation.
**Use Cautiously in:** Hearing loss; Renal impairment (dosage ↓ recommended); CHF; Electrolyte abnormalities; Active infections; Bone marrow depression; Geriatric patients (↑ risk of nephrotoxicity, peripheral neuropathy); Chronic debilitating illnesses; Patients with childbearing potential.

### Adverse Reactions/Side Effects
**CNS:** SEIZURES, malaise, weakness. **EENT:** ototoxicity, tinnitus. **GI:** severe nausea, vomiting, diarrhea, hepatotoxicity. **GU:** nephrotoxicity, sterility. **Derm:** alopecia. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia. **Hemat:** LEUKOPENIA, THROMBOCYTOPENIA, anemia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Neuro:** peripheral neuropathy. **Misc:** anaphylactoid reactions.

### Interactions
**Drug-Drug:** ↑ nephrotoxicity and ototoxicity with other **nephrotoxic** and **ototoxic drugs (aminoglycosides, loop diuretics)**. ↑ risk of hypokalemia and hypomagnesemia with **loop diuretics** and **amphotericin B**. May ↓ **phenytoin** levels. ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ adverse reactions.

### Route/Dosage
Other regimens are used.
**IV (Adults):** *Metastatic testicular tumors*—20 mg/m² daily for 5 days repeated q 3–4 wk. *Metastatic ovarian cancer*—75–100 mg/m², repeat q 4 wk in combination with cyclophosphamide *or* 100 mg/m² q 3 wk if used as a single agent. *Advanced bladder cancer*—50–70 mg/m² q 3–4 wk as a single agent.

### Availability (generic available)
**Powder for injection:** 10-mg, 50-mg vials. **Injection:** 1 mg/mL in 50- and 100-mg vials.

## NURSING IMPLICATIONS

### Assessment
- Monitor vital signs frequently during administration. Report significant changes.
- Monitor intake and output and specific gravity frequently during therapy. Report discrepancies immediately. To reduce the risk of nephrotoxicity, maintain a urinary output of at least 100 mL/hr for 4 hr before initiating and for at least 24 hr after administration.
- Encourage patient to drink 2000–3000 mL/day to promote excretion of uric acid. Allopuri-

nol and alkalinization of the urine may be used to help prevent uric acid nephropathy.

- Assess patency of IV site frequently during therapy. Cisplatin may cause severe irritation and necrosis of tissue if extravasation occurs. If a large amount of highly concentrated cisplatin solution extravasates, mix 4 mL of 10% sodium thiosulfate with 6 mL of sterile water or 1.6 mL of 25% sodium thiosulfate with 8.4 mL of sterile water and inject 1–4 mL (1 mL for each mL extravasated) through existing line or cannula. Inject subcut if needle has been removed. Sodium thiosulfate inactivates cisplatin.
- Severe and protracted nausea and vomiting usually occur 1–4 hr after a dose; vomiting may last for 24 hr. Administer parenteral antiemetic agents 30–45 min before therapy and routinely around the clock for the next 24 hr. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration. Nausea and anorexia may persist for up to 1 wk.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor for signs of anaphylaxis (facial edema, wheezing, dizziness, fainting, tachycardia, hypotension). Discontinue medication immediately and report symptoms. Epinephrine and resuscitation equipment should be readily available.
- Medication may cause ototoxicity and neurotoxicity. Assess patient frequently for dizziness, tinnitus, hearing loss, loss of coordination, loss of taste, or numbness and tingling of extremities; may be irreversible. Notify health care professional promptly if these occur. Audiometry should be performed before initiation of therapy and before subsequent doses. Hearing loss is more frequent with children and usually occurs first with high frequencies and may be unilateral or bilateral.
- Monitor for inadvertent cisplatin overdose. Doses >100 mg/m$^2$/cycle once every 3–4 wk are rarely used. Differentiate daily doses from total dose/cycle. Symptoms of high cumulative doses include muscle cramps (localized, painful involuntary skeletal muscle contractions of sudden onset and short duration) and are usually associated with advanced stages of peripheral neuropathy.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and routinely throughout therapy. The nadir of leukopenia, thrombocytopenia, and anemia occurs within 18–23 days and recovery 39 days after a dose. Withhold further doses until WBC is >4000/mm$^3$ and platelet count is >100,000/mm$^3$.
- Monitor BUN, serum creatinine, and CCr before initiation of therapy and before each course of cisplatin to detect nephrotoxicity. May cause ↑ BUN and creatinine and ↓ calcium, magnesium, phosphate, sodium, and potassium levels that usually occur the 2nd wk after a dose. Do not administer additional doses until BUN is <25 mg/100 mL and serum creatinine is <1.5 mg/100 mL. May cause ↑ uric acid level, which usually peaks 3–5 days after a dose.
- May cause transiently ↑ serum bilirubin and AST concentrations.
- May cause positive Coombs' test result.

## Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse with carboplatin. To prevent confusion, orders should include generic and brand names. Administer under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers (see Appendix L).
- Hydrate patient with at least 1–2 L of IV fluid 8–12 hr before initiating therapy with cispla-

tin. Amifostine may be administered to minimize nephrotoxicity.
- Do not use aluminum needles or equipment during preparation or administration. Aluminum reacts with this drug, forms a black or brown precipitate, and renders the drug ineffective.
- Unopened vials of powder and constituted solution must not be refrigerated.

**IV Administration**

- **Intermittent Infusion:** Reconstitute 10-mg vials with 10 mL of sterile water for injection and 50-mg vial with 50 mL. Stable for 20 hr if reconstituted with sterile water, for 72 hr with bacteriostatic water. Do not refrigerate, because crystals will form. Solution should be clear and colorless; discard if turbid or if it contains precipitates.
- ***Diluent:*** Dilution in 2 L of 5% dextrose in 0.3% or 0.45% NaCl containing 37.5 g of mannitol is recommended. ***Concentration:*** Keep under 0.5 mg/mL to prevent tissue necrosis. ***Rate:*** Variable. Maximum rate 1 mg/min.
- **Continuous Infusion:** Has been administered as continuous infusion over 24 hr to 5 days with resultant decrease in nausea and vomiting. ***High Alert:*** Clarify dose to ensure cumulative dosage is not confused with daily dose; errors may be fatal.
- **Syringe Compatibility:** bleomycin, cyclophosphamide, doxapram, doxorubicin, droperidol, fluorouracil, furosemide, heparin, leucovorin calcium, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine.
- **Y-Site Compatibility:** allopurinol, aztreonam, bleomycin, chlorpromazine, cimetidine, cladribine, cyclophosphamide, dexamethasone, diphenhydramine, doxorubicin, doxorubicin liposome, droperidol, etoposide, famotidine, filgrastim, fludarabine, fluorouracil, furosemide, ganciclovir, gemcitabine, granisetron, heparin, hydromorphone, leucovorin calcium, linezolid, lorazepam, melphalan, methotrexate, methylprednisolone, metoclopramide, mitomycin, morphine, ondansetron, paclitaxel, palonosetron, pemetrexed, prochlorperazine edisylate, promethazine, propofol, ranitidine, sargramostim, teniposide, topotecan, vinblastine, vincristine, vinorelbine.
- **Y-Site Incompatibility:** amifostine, amphotericin B cholesteryl sulfate, cefepime, lansoprazole, piperacillin/tazobactam, thiotepa.
- **Additive Compatibility:** etoposide, floxuridine, ifosfamide, leucovorin calcium, magnesium sulfate, mannitol, ondansetron, 0.9% NaCl, D5/0.9% NaCl.
- **Additive Incompatibility:** fluorouracil, mesna, thiotepa.

### Patient/Family Teaching

- Instruct patient to report pain at injection site immediately.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to report promptly any numbness or tingling in extremities or face, difficulty with hearing or tinnitus, unusual swelling, or joint pain.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient of the need for contraception, although cisplatin may cause infertility.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies. Therapy should not be administered more frequently than every 3–4 wk, and only if lab values are within acceptable parameters and patient is not exhibiting signs of ototoxicity or other serious adverse effects.

## citalopram (si-tal-oh-pram)

Celexa

***Classification***

Therapeutic: antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

**Pregnancy Category C**

### Indications

Depression. **Unlabeled Use:** Premenstrual dysphoric disorder (PMDD). Obsessive-compulsive disorder (OCD). Panic disorder. Generalized anxiety disorder (GAD). Post-traumatic stress disorder (PTSD). Social anxiety disorder (social phobia).

## Action
Selectively inhibits the reuptake of serotonin in the CNS. **Therapeutic Effects:** Antidepressant action.

## Pharmacokinetics
**Absorption:** 80% absorbed after oral administration.
**Distribution:** Enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver (10% by CYP3A4 and 2C19 enzymes); excreted unchanged in urine.
**Half-life:** 35 hr.

TIME/ACTION PROFILE (antidepressant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–4 wk | unknown | unknown |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Concurrent MAO inhibitor or pimozide therapy.
**Use Cautiously in:** History of mania; History of suicide attempt/ideation (↑ risk during early therapy and during dose adjustment); History of seizure disorder; Illnesses or conditions that are likely to result in altered metabolism or hemodynamic responses; Severe renal or hepatic impairment; OB: Use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; Lactation: Present in breast milk and may result in lethargy with ↓ feeding in infants; weigh risk/benefits; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment in children/adolescents (unlabeled for pediatric use); Geri: ↓ doses recommended.

## Adverse Reactions/Side Effects
**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, apathy, confusion, drowsiness, insomnia, weakness, agitation, amnesia, anxiety, ↓ libido, dizziness, fatigue, impaired concentration, ↑ depression, migraine headache. **EENT:** abnormal accommodation. **Resp:** cough. **CV:** postural hypotension, tachycardia. **GI:** abdominal pain, anorexia, diarrhea, dry mouth, dyspepsia, flatulence, ↑ saliva, nausea, altered taste, ↑ appetite, vomiting. **GU:** amenorrhea, dysmenorrhea, ejaculatory delay, erectile dysfunction, polyuria. **Derm:** sweating, photosensitivity, pruritus, rash. **Metab:** weight loss, weight gain. **F and E:** hyponatremia. **MS:** arthralgia, myalgia. **Neuro:** tremor, paresthesia. **Misc:** SEROTONIN SYNDROME, fever, yawning.

## Interactions
**Drug-Drug:** May cause serious, potentially fatal reactions when used with **MAO inhibitors**; allow at least 14 days between citalopram and **MAO inhibitors**. Concurrent use with **pimozide** may result in prolongation of the QTc interval and is contraindicated. Drugs that affect serotonergic neurotransmitter systems, including **linezolid**, **tramadol**, and **triptans** ↑ risk of serotonin syndrome. Use cautiously with other **centrally acting drugs** (including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**; concurrent use with **alcohol** is not recommended). **Cimetidine** may ↑ levels. Serotonergic effects may be ↑ by **lithium** (concurrent use should be carefully monitored). **Ketoconazole**, **itraconazole**, **erythromycin**, and **omeprazole** may ↑ levels. **Carbamazepine** may ↓ blood levels. May ↑ levels of **metoprolol**. Use cautiously with **tricyclic antidepressants** due to unpredictable effects on serotonin and norepinephrine reuptake. ↑ risk of bleeding with **aspirin**, **NSAIDs**, **clopidogrel**, or **warfarin**.
**Drug-Natural Products:** ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

## Route/Dosage
**PO (Adults):** 20 mg once daily initially, may be ↑ by 20 mg/day at weekly intervals, up to 60 mg/day (usual dose is 40 mg/day).
**PO (Geriatric Patients):** 20 mg once daily initially, may be ↑ to 40 mg/day only in nonresponding patients.

### Hepatic Impairment
**PO (Adults):** 20 mg once daily initially, may be ↑ to 40 mg/day only in nonresponding patients.

## Availability (generic available)
**Tablets:** 10 mg, 20 mg, 40 mg. **Cost:** *Generic*— 10 mg $89.97/90, 20 mg $89.97/90, 40 mg $89.97/90. **Oral solution (peppermint flavor):** 10 mg/5 mL. **Cost:** *Generic*— 10 mg/5 mL $114.00/240 mL.

# NURSING IMPLICATIONS

## Assessment
- Monitor mood changes during therapy.
- Assess for suicidal tendencies, especially during early therapy and dose changes. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and

adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for the next 4 wk, and on advice of health care professional thereafter.
- Assess for sexual dysfunction (erectile dysfunction; decreased libido).
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile blood pressure, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).

### Potential Nursing Diagnoses
Ineffective coping (Indications)
Risk for injury (Side Effects)
Sexual dysfunction (Side Effects)

### Implementation
- Do not confuse with Celebrex (celecoxib), Cerebyx (fosphenytoin), Zyprexa (olanzapine), or Lexapro (escitalopram).
- **PO:** Administer as a single dose in the morning or evening without regard to food.

### Patient/Family Teaching
- Instruct patient to take citalopram as directed.
- May cause drowsiness, dizziness, impaired concentration, and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and to consult health care professional before taking other Rx, OTC, or herbal products.
- Caution patient to change positions slowly to minimize dizziness.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to use sunscreen and wear protective clothing to prevent photosensitivity reactions.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected, or if they plan to breastfeed. If used during pregnancy should be tapered during third trimester to avoid neontal serotinin syndrome.
- Caution patients that citalopram should not be used for at least 14 days after discontinuing MAO inhibitors, and at least 14 days should be allowed after stopping citalopram before starting an MAO inhibitor.
- Emphasize the importance of follow-up exams to monitor progress.

### Evaluation/Desired Outcomes
- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.

HIGH ALERT

## cladribine (klad-ri-been)
Leustatin

***Classification***
Therapeutic: antineoplastics
Pharmacologic: antimetabolites

**Pregnancy Category D**

### Indications
Management of active hairy cell leukemia manifested as anemia, leukopenia, thrombocytopenia, or clinical symptoms. **Unlabeled Use:** chronic lymphocytic leukemia, chronic myelogenous leukemia, non-Hodgkin's lymphomas, progressive multiple sclerosis.

### Action
Inhibits DNA synthesis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Extensively distributed to body tissues; penetrates into cerebrospinal fluid.
**Metabolism and Excretion:** Unknown.
**Half-life:** 3–22 hr.

TIME/ACTION PROFILE (noted as effect on peripheral counts)

| ROUTE | ONSET | PEAK | DURATION† |
|---|---|---|---|
| Platelets | unknown | unknown | 12 days |
| Absolute neutrophil count | unknown | unknown | 5 wk |
| Hemoglobin | unknown | unknown | 8 wk |

†Time to normalization of counts

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Diluent contains benzyl alcohol and should be avoided in patients with known intolerance; OB, Lactation: Pregnant or lactating patients.

**Use Cautiously in:** Patients with active infections; Patients taking medications that cause immunosuppression or bone marrow depression; Impaired hepatic or renal function (↑ risk of toxicity); Patients with childbearing potential; Pedi: Children (safety not established).

## Adverse Reactions/Side Effects

**CNS:** fatigue, headache, dizziness, insomnia, malaise, weakness. **EENT:** epistaxis. **Resp:** abnormal breath sounds, cough, dyspnea. **CV:** edema, tachycardia. **GI:** anorexia, diarrhea, nausea, vomiting, abdominal pain, constipation. **Derm:** rash, erythema, petechiae, pruritis, sweating. **Hemat:** NEUTROPENIA, anemia, thrombocytopenia. **Local:** injection site reactions, phlebitis, thrombosis. **MS:** arthralgia, myalgia. **Misc:** chills, fever, infection, trunk pain.

## Interactions

**Drug-Drug:** Additive bone marrow depression may occur with other **antineoplastics** or **radiation therapy**.

## Route/Dosage

**IV (Adults):** *Hairy cell leukemia*—0.09 mg/kg/day for 7 days.

## Availability

**Injection:** 1 mg/mL.

# NURSING IMPLICATIONS

## Assessment

- Monitor for bone marrow depression. Assess for fever, chills, sore throat, and signs of infection. Monitor platelet count throughout therapy. Assess for bleeding (bleeding gums, bruising, petechiae; test stool, urine, and emesis for blood). Avoid administering IM injections and taking rectal temperatures. Apply pressure to venipuncture site for 10 min. Anemia may occur. Monitor for increased fatigue and dyspnea.
- Monitor IV site for phlebitis.
- Monitor intake and output. Development of uric acid nephropathy in patients with leukemia and lymphoma may be prevented with adequate oral hydration and allopurinol, if needed.
- ***Lab Test Considerations:*** Monitor CD4 T-lymphocyte count and CD8 T-lymphocyte count before initiation of therapy and periodically during and after therapy. Cladribine causes prolonged depression of CD4 and CD8 lymphocyte subset counts, with recovery taking at least 6–12 mo.
- Monitor hemoglobin, hematocrit, leukocyte, and platelet counts before and periodically throughout therapy, especially during the first 4–8 wk after treatment. During the first 2 wk after therapy, platelet counts, absolute neutrophil count (ANC), and hemoglobin decrease. Transfusions of platelets and red blood cells may be required. Platelet count, ANC, and hemoglobin usually return to normal levels by day 12, week 5, and week 8, respectively.
- Monitor renal and hepatic function before and periodically during therapy. May cause nephrotoxicity, resulting in elevated serum creatinine, anuria, and acidosis.
- Monitor serum uric acid concentrations before and periodically during therapy, especially in patients with high tumor burden. May cause elevated serum and uric acid concentrations. May require alkalinization of the urine.
- ***Toxicity and Overdose:*** May cause irreversible neurologic toxicity, resulting in motor weakness progressing to paraparesis or quadriparesis with high doses. If symptoms occur, discontinue cladribine. There is no known antidote.

## Potential Nursing Diagnoses

Risk for infection (Indications)
Risk for injury (Adverse Reactions)

## Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers (see Appendix L).

### IV Administration

- **Continuous Infusion:** ***Diluent:*** Add the daily dose to 500 mL of 0.9% NaCl for injection. Solution is stable for 24 hr at room temperature or 8 days if refrigerated.
- May also be prepared as a 7-day solution with bacteriostatic 0.9% NaCl for infusion via *Pharmacia Deltec* medication cassettes. ***Rate:*** Administer as a continuous infusion over 24 hr.
- **Y-Site Compatibility:** aminophylline, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, chlorproamzine, cimetidine, cisplatin, cyclophosphamide, cytarabine, dexamethasone, diphenhydramine, dobutamine, dopamine, doxorubicin hydrochloride, droperidol, enalaprilat, etoposide, famotidine, furosemide, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, leucovorin, lorazepam, mannitol, meperidine, mesna, methylprednisolone, metoclopramide, mitoxantrone, morphine, nalbuphine, ondansetron, paclitaxel, potassium chloride, prochlorperazine, promethazine, ranitidine, sodium bicarbonate, teniposide, vincristine.
- **Additive Incompatiblity:** D5W. Do not admix with other medications or solutions.

## Patient/Family Teaching

- Instruct patient to notify health care professional promptly in the event of fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; unusual swelling; joint pain; shortness of breath; or confusion. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to be especially careful to avoid falls. Patients should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs because these may precipitate GI hemorrhage.
- Advise patient to use nonhormonal contraceptive measures during and for at least 4 mo after completion of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.

## Evaluation/Desired Outcomes

- Improvement in hematologic status in patients with leukemia.

# clarithromycin

(kla-**rith**-roe-mye-sin)

Biaxin, Biaxin XL

***Classification***

Therapeutic: agents for atypical mycobacterium, anti-infectives, antiulcer agents

Pharmacologic: macrolides

**Pregnancy Category C**

## Indications

Respiratory tract infections including streptococcal pharyngitis, sinusitis, bronchitis and pneumonia. Treatment (with ethambutol) and prevention of disseminated *Mycobacterium avium* complex (MAC). Treatment of following pediatric infections: Otitis media, Sinusitis, Pharyngitis, Skin/skin structure infections. Part of a combination regimen for ulcer disease due to *Helicobacter pylori*. Endocarditis prophylaxis.

## Action

Inhibits protein synthesis at the level of the 50S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action. **Spectrum:** Active against these gram-positive aerobic bacteria: *Staphylococcus aureus*, *Staphylococcus pneumoniae*, *S. pyogenes* (group A strep). Active against these gram-negative aerobic bacteria: *Haemophilus influenzae*, *Moraxella catarrhalis*. Also active against: *Mycoplasma*, *Legionella*, *H. pylori*, *M. avium*.

## Pharmacokinetics

**Absorption:** Rapidly absorbed (50%) after oral administration.

**Distribution:** Widely distributed; tissue levels may exceed those in serum.

**Protein Binding:** 65–70%.

**Metabolism and Excretion:** 10–15% converted by the liver to 14-hydroxyclarithromycin, which has anti-infective activity; 20–30% excreted unchanged in urine. Metabolized by and also inhibits the CYP3A enzyme system.

**Half-life:** Dose-dependent and prolonged with renal dysfunction *250-mg dose*—3–4 hr; *500-mg dose*—5–7 hr.

TIME/ACTION PROFILE (serum levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2 hr | 12 hr |
| PO-XL | unknown | 4 hr | 24 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to clarithromycin, erythromycin, or other macrolide anti-

infectives; Concurrent use of pimozide; OB: Avoid use during pregnancy unless no alternatives are available; Lactation: Not recommend for breast-feeding women.
**Use Cautiously in:** Severe liver or renal impairment (dose adjustment required if CCr <30 mL/min); Myasthenia gravis.

### Adverse Reactions/Side Effects

**CNS:** headache. **Derm:** pruritus, rash, Stevens-Johnson syndrome. **GI:** PSEUDOMEMBRANOUS COLITIS, abdominal pain/discomfort, abnormal taste, diarrhea, dyspepsia, nausea.

### Interactions

**Drug-Drug:** Clarithromycin is an inhibitor of the CYP3A enzyme system. Concurrent use with other agents metabolized by this system can ↑ levels and risk of toxicity. May prolong the QT interval and ↑ risk of arrhythmias with **pimozide**; concurrent use is contraindicated. Similar effects may occur with antiarrhythmics; ECG should be monitored for QTc prolongation and serum levels monitored. May ↑ serum levels and the risk of toxicity from **carbamazepine**, some **benzodiazepines (midazolam, triazolam, alprazolam)**, **cyclosporine**, **buspirone**, **disopyramide**, **ergot alkaloids**, **felodipine**, **omeprazole**, **tacrolimus**, **digoxin**, or **theophylline**. **Ritonavir** ↑ blood levels (↓ clarithromycin dose in patients with CC <60 mL/min). ↑ levels of **HMG-CoA reductase inhibitors** and may ↑ risk of rhabdomyolysis. May ↑ effect of **warfarin** and **sildenafil** (dose reduction may be warranted). May ↑ or ↓ effects of **zidovudine**. Blood levels are ↑ by **delavirdine** and **fluconazole**. Blood levels may be ↓ by **rifampin** and **rifabutin**. ↑ risk of colchicine toxicty when administered with **colchicine**, especially in the elderly.

### Route/Dosage

**PO (Adults):** *Pharyngitis/tonsillitis*—250 mg q 12 hr for 10 days; *Acute maxillary sinusitis*—500 mg q 12 hr for 14 days or 1000 mg once daily for 14 days as XL tablets; *Acute exacerbation of chronic bronchitis*—250–500 mg q 12 hr for 7–14 days or 1000 mg once daily for 7 days as XL tablets; *Community-Acquired pneumonia*—250 mg q 12 hr for 7–14 days or 1000 mg once daily for 7 days as XL tablets; *skin/skin structure infections*—250 mg q 12 hr for 7–14 days; *H. pylori*—500 mg 2–3 times daily with a proton pump inhibitor (lansoprazole or omeprazole) or ranitidine with or without amoxicillin for 10–14 days; *Endocarditis prophylaxis*—500 mg 1 hr before procedure; *MAC prophylaxis/treatment*—500 mg twice daily, for active infection another antimycobacterial is required.
**PO (Children):** *Most infections*—15 mg/kg/day divided q 12 hr for 7–14 days (up to 500 mg/dose for MAC). *Endocarditis prophylaxis*—15 mg/kg 1 hr before procedure.

### Renal Impairment

**PO (Adults):** *CCr <30 mL/min*—250 mg 1-2 times daily, a 500-mg initial dose may be used.
**PO (Children):** *CCr <30 mL/min*—decrease dose by 50% or double dosing interval.

### Availability (generic available)

**Tablets:** 250 mg, 500 mg. **Cost:** *Generic*—250 mg $73.32/20, 500 mg $73.32/20. **Extended-release tablets:** 500 mg. **Cost:** $109.99/20. **Oral suspension (fruit punch and vanilla flavors):** 125 mg/5 mL, 250 mg/5 mL. **Cost:** *Generic*—125 mg/5 mL $39.98/100 mL, 250 mg/5 mL $71.38/100 mL. ***In combination with:*** amoxicillin and lansoprazole as part of a compliance package (Prevpac); See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- **Ulcers:** Assess patient for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** May rarely cause ↑ serum AST, ALT, and alkaline phosphatase concentrations.
- May occasionally cause ↑ BUN.

### Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Administer around the clock, without regard to meals. Food slows but does not decrease the extent of absorption.
- Administer XL tablets with food or milk; do not crush, break or chew.

- Shake suspension well before administration. Store suspension at room temperature; do not refrigerate.
- Do not administer within 4 hr of zidovudine.

### Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Take missed doses as soon as possible, unless almost time for next dose. Do not double doses. Advise patient that sharing of this medication may be dangerous.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools).
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Caution patients taking zidovudine that clarithromycin and zidovudine must be taken at least 4 hr apart.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Instruct the patient to notify health care professional if symptoms do not improve within a few days.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Treatment of ulcers.
- Endocarditis prophylaxis.

## clevidipine (kle-**vi**-di-peen)

Cleviprex

***Classification***

Therapeutic: antihypertensives
Pharmacologic: calcium channel blockers (dihydropyridine)

### Indications

Reduction of blood pressure when oral therapy is not feasible/desirable.

### Action

Inhibits calcium transport into vascular smooth muscle, resulting in inhibition of excitation-contraction coupling and subsequent contraction. Decreases systemic vascular resistance; does not reduce cardiac filling pressure (pre-load). Has no effect on venous capacitance vessels. **Therapeutic Effects:** Decreases blood pressure.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailibility.
**Distribution:** Unknown.
**Protein Binding:** >99.5%.
**Metabolism and Excretion:** Rapidly metabolized by esterases in plasma and tissue to inactive metabolites; metabolites are excreted in urine (63–74%) and feces (7–22%).
**Half-life:** *Initial phase*—1 min; *terminal phase*—15 min.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 2–4 min | 30 min* | end of infusion |

*Time to target blood pressure.

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Allergy to soybeans, eggs/egg products, defective lipid metabolism including pathologic hyperlipidemia, lipoid nephrosis or acute pancreatitis; severe aortic stenosis.
**Use Cautiously in:** Geri: Titrate dose cautiously, initiate therapy at low end of dose range; consider age-related decrease in hepatic, renal or cardiac function, concomitant diseases, or other drug therapy; OB: Use only if maternal benefit outweighs potential risk to fetus; Lactation: Consider possible infant exposure; Pedi: Safety not established for patients <18 yr.

### Adverse Reactions/Side Effects

**CNS:** headache. **CV:** CHF, hypotension, rebound hypertension, reflex tachycardia. **GI:** nausea, vomiting. **MS:** arthralgia.

### Interactions

**Drug-Drug:** ↑ risk of excess hypotension with other **antihypertensives**. Does not protect against effects of abrupt **beta blocker** withdrawal.

### Route/Dosage

**IV (Adults):** *Initial dose:* 1–2 mg/hr; *Dose titration:* Double dose every 90 sec initially; as blood pressure approaches goal, increase dose by less than doubling and lengthen the time between dose adjustments to every 5–10 min. Usual dose required is 4–6 mg/hour. Severe hypertensive patients may require higher doses with a maximum of 16 mg/hr or less. Doses up to 32 mg/hr have been used, but generally should not exceed 21 mg/hr in a 24 hr period due to lipid load.

### Availability

**Emulsion for injection 0.5 mg/mL:** 50 mL vial, 100 mL vial. **Cost:** wholesale cost $145/50-mL vial, $290/100-mL vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and heart rate during infusion, and until vital signs stabilize. Hypotension and reflex tachycardia may occur with rapid upward titration. Monitor patients receiving prolonged clevidipine infusions and who have not been transitioned to other antihypertensive therapies for the possibility of rebound hypertension for at least 8 hr after infusion is stopped; additional adjustments may be needed.

### Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)

### Implementation

- Discontinue clevidipine or titrate downward during initiation of oral therapy; consider time to onset of the oral agent's effect. Continue blood pressure monitoring until desired effect is achieved.

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Do not dilute. Invert vial gently several times before use to ensure emulsion uniformity prior to administration. Solution is milky white; inspect for particulate matter and discoloration. Commercially available standard plastic cannulae may be used to administer the infusion. Administer via central line or peripheral line. Solution is in single-use vials; discard unused portion 4 hr after stopper puncture. Store in refrigerator; once emulsion reaches room temperature, stable for 2 mo, do not re-refrigerate. ***Rate:*** Initiate intravenous infusion at 1-2 mg/hr. Administer using an infusion device allowing calibrated infusion rates.
- **Y-Site Compatibility:** Water for Injection, USP, 0.9% NaCl, D5W, D5/0.9% NaCl, D5/LR, LR, 10% amino acid.
- **Y-Site Incompatibility:** Do not administer in the same line as other medications.

### Patient/Family Teaching

- Inform patient of the rationale for use of clevidipine.
- Advise patients to contact a health care professional immediately if signs of a new hypertensive emergency (neurological symptoms, visual changes, evidence of CHF) occur.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Encourage patients with underlying hypertension to continue follow-up care and to continue taking their oral antihypertensive medication(s) as directed.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.

C

## clindamycin (klin-da-**mye**-sin)

Cleocin, Cleocin T, Clinda-Derm, Clindagel, Clindesse, ClindaMax, Clindets, C/T/S, Dalacin C, Dalacin T, Evoclin

***Classification***

Therapeutic: anti-infectives

**Pregnancy Category B**

### Indications

**PO, IM, IV:** Treatment of: Skin and skin structure infections, Respiratory tract infections, Septicemia, Intra-abdominal infections, Gynecologic infections, Osteomyelitis, Endocarditis prophylaxis. **Topical:** Severe acne. **Vag:** Bacterial vaginosis. **Unlabeled Use: PO, IM, IV:** Treatment of *Pneumocystis carinii* pneumonia, CNS toxoplasmosis, and babesiosis.

### Action

Inhibits protein synthesis in susceptible bacteria at the level of the 50S ribosome. **Therapeutic Effects:** Bactericidal or bacteriostatic, depending on susceptibility and concentration. **Spectrum:** Active against most gram-positive aerobic cocci, including: Staphylococci, *Streptococcus pneumoniae*, other streptococci, but not enterococci. Has good activity against those anaerobic bacteria that cause bacterial vaginosis, including *Bacteroides fragilis*, *Gardnerella vaginalis*, *Mobiluncus* spp, *Mycoplasma hominis*, and *Corynebacterium*. Also active against *P. jirovecii* and *Toxoplasma gondii*.

### Pharmacokinetics

**Absorption:** Well absorbed following PO/IM administration. Minimal absorption following topical/vaginal use.
**Distribution:** Widely distributed. Does not significantly cross blood-brain barrier. Crosses the placenta; enters breast milk.
**Protein Binding:** 94%.
**Metabolism and Excretion:** Mostly metabolized by the liver.

**Half-life:** Neonates: 3.6–8.7 hr; Infants up to 1 yr: 3 hr; Children and adults: 2–3 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 60 min | 6–8 hr |
| IM | rapid | 1–3 hr | 6–8 hr |
| IV | rapid | end of infusion | 6–8 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Previous pseudomembranous colitis; Severe liver impairment; Diarrhea; Known alcohol intolerance (topical solution, suspension).

**Use Cautiously in:** OB: Safety not established for systemic and topical; approved for vaginal use in 3rd trimester of pregnancy; Lactation: Has been used safely but appears in breast milk and exposes infant to drug and its side effects.

## Adverse Reactions/Side Effects

**CNS:** dizziness, headache, vertigo. **CV:** arrhythmias, hypotension. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, bitter taste (IV only), nausea, vomiting. **Derm:** rashes. **Local:** phlebitis at IV site.

## Interactions

**Drug-Drug: Kaolin/pectin** may ↓ GI absorption. May enhance the neuromuscular blocking action of other **neuromuscular blocking agents**. **Topical:** Concurrent use with **irritants**, **abrasives**, or **desquamating agents** may result in additive irritation.

## Route/Dosage

**PO (Adults):** *Most infections*—150–450 mg q 6 hr. P. carinii *pneumonia*—1200–1800 mg/day in divided doses with 15–30 mg Primaquine/day (unlabeled). *CNS toxoplasmosis*—1200–2400 mg/day in divided doses with pyrimethamine 50–100 mg/day (unlabeled); *Bacterial endocarditis prophylaxis*—600 mg 1 hr before procedure.

**PO (Children >1 mo):** 10–30 mg/kg/day divided q 6–8 hr; maximum dose 1.8 g/day. *Bacterial endocarditis prophylaxis*—20 mg/kg 1 hr before procedure.

**IM, IV (Adults):** *Most infections*—300–600 mg q 6–8 hr *or* 900 mg q 8 hr (up to 4.8 g/day IV has been used; single IM doses of >600 mg are not recommended). P. carinii *pneumonia*—2400–2700 mg/day in divided doses with Primaquine (unlabeled). *Toxoplasmosis*—1200–4800 mg/day in divided doses with pyrimethamine. *Bacterial endocarditis prophylaxis*—600 mg 30 min before procedure.

**IM, IV (Children >1 mo):** 25–40 mg/kg/day divided q 6–8 hr; maximum dose: 4.8 g/day. *Bacterial endocarditis prophylaxis*—20 mg/kg 30 min before procedure; maximum dose: 600 mg.

**IM, IV (Infants <1 mo and <2 kg):** 5 mg/kg q 8–12 hr ≥*2 kg*—20–30 mg/kg/day divided q 6–8 hr.

**Vag (Adults and Adolescents):** *Cleocin, Clindamax*—1 applicatorful (5 g) at bedtime for 3 or 7 days (7 days in pregnant patients); *Clindesse*—one applicatorful (5 g) single dose; *or* 1 suppository (100 mg) at bedtime for 3 nights.

**Topical (Adults and Adolescents):** *Solution*—1% solution/suspension applied twice daily (range 1–4 times daily). *Foam, gel*—1% foam or gel applied once daily.

## Availability (generic available)

**Capsules:** 75 mg, 150 mg, 300 mg. **Oral suspension:** 75 mg/5 mL. **Injection:** 150 mg/mL. **Premixed infusion:** 300 mg/50 mL, 600 mg/50 mL, 900 mg/50 mL. **Topical:** 1% lotion, gel, foam, solution, suspension, single-use applicators. ***In combination with:*** benzoyl peroxide (Acanya, BenzaClin, Duac); (see Appendix B). **Vaginal cream:** 2%. **Vaginal suppositories (ovules):** 100 mg. ***In combination with:*** tretinoin (Ziana); (see Appendix B).

# NURSING IMPLICATIONS

## Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Monitor bowel elimination. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. This may begin up to several weeks following the cessation of therapy.
- Assess patient for hypersensitivity (skin rash, urticaria).
- ***Lab Test Considerations:*** Monitor CBC; may cause transient ↓ in leukocytes, eosinophils, and platelets.
- May cause ↑ alkaline phosphatase, bilirubin, CPK, AST, and ALT concentrations.

## Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)
Diarrhea (Side Effects)

## Implementation

- **PO:** Administer with a full glass of water. May be given with or without meals. Shake liquid

preparations well. Do not refrigerate. Stable for 14 days at room temperature.

- **IM:** Do not administer >600 mg in a single IM injection.

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Vials must be diluted before use. Dilute a dose of 300 mg or 600 mg in 50 mL and a dose of 900 mg or 1200 mg in 100 mL. Compatible diluents include D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.45% NaCl, or LR. Admixed solution stable for 16 days at room temperature. Premixed infusion is already diluted and ready to use. ***Concentration:*** Not to exceed 18 mg/mL. ***Rate:*** Not exceed 30 mg/min. Hypotension and cardiopulmonary arrest have been reported following rapid IV administration.
- **Y-Site Compatibility:** acyclovir, alfentanil, amifostine, amikacin, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B liposome, amsacrine, anakinra, anidulafungin, ascorbic acid, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, cefuroxime, chloramphenicol, cimetidine, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alpha, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluoruracil, folic acid, foscarnet, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, metaraminol, methotrexate, methoxamine, methyldopa, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, netilmicin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, pemetrexed, penicillin G, perphenazine, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propofol, propranolol, protamine, pyridoxine, ranitidine, remifentanil, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, azathioprine, azithromycin, caspofungin, ceftriaxone, chlorpromazine, dantrolene, diazepam, filgrastim, ganciclovir, haloperidol, hydroxyzine, idarubicin, inamrinone, minocycline, mitoxantrone, pentamidine, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole, trastuzumab.
- **Vag:** Applicators are supplied for vaginal administration. When treating bacterial vaginosis, concurrent treatment of male partner is not usually necessary.
- **Topical:** Contact with eyes, mucous membranes, and open cuts should be avoided during topical application. If accidental contact occurs, rinse with copious amounts of cool water.
- Wash affected areas with warm water and soap, rinse, and pat dry prior to application. Apply to entire affected area.

## Patient/Family Teaching

- Instruct patient to take medication around the clock at evenly spaced times and to finish the drug completely as directed, even if feeling better. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Advise patient that sharing of this medication may be dangerous.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professional.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal or anal itching or discharge).

- Notify health care professional if no improvement within a few days.
- Patients with a history of rheumatic heart disease or valve replacement need to be taught the importance of antimicrobial prophylaxis before invasive medical or dental procedures.
- **IV:** Inform patient that bitter taste occurring with IV administration is not clinically significant.
- **Vag:** Instruct patient on proper use of vaginal applicator. Insert high into vagina at bedtime. Instruct patient to remain recumbent for at least 30 min following insertion. Advise patient to use sanitary napkin to prevent staining of clothing or bedding. Continue therapy during menstrual period.
- Advise patient to refrain from vaginal sexual intercourse during treatment.
- Caution patient that mineral oil in clindamycin cream may weaken latex or rubber contraceptive devices. Such products should not be used within 72 hr of vaginal cream.
- **Topical:** Caution patient applying topical clindamycin that solution is flammable (vehicle is isopropyl alcohol). Avoid application while smoking or near heat or flame.
- Advise patient to notify health care professional if excessive drying of skin occurs.
- Advise patient to wait 30 min after washing or shaving area before applying.

### Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Endocarditis prophylaxis.
- Improvement in acne vulgaris lesions. Improvement should be seen in 6 wk but may take 8–12 wk for maximum benefit.

**clobetasol, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

**clocortolone, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

## clofarabine (klo-far-a-been)

Clolar

***Classification***

Therapeutic: antineoplastics
Pharmacologic: antimetabolites

**Pregnancy Category D**

### Indications

Refractory/relapsed acute lymphoblastic leukemia in children 1–21 yr.

### Action

Converted intracellularly to the active 5'-triphosphate metabolite which acts as a purine nucleoside antimetabolite; net result is inhibition of DNA synthesis. Produces a rapid reduction of peripheral leukemia cells. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** unknown.
**Metabolism and Excretion:** 46–60% excreted unchanged in urine.
**Half-life:** 5.2 hr.

TIME/ACTION PROFILE (effect on WBCs)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | unknown | 2–6 wk |

### Contraindications/Precautions

**Contraindicated in:** None; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Hepatic or renal impairment; Concurrent use of nephrotoxic or hepatotoxic drugs.

### Adverse Reactions/Side Effects

**CNS:** fatigue. **Resp:** pharyngitis. **CV:** pericardial effusion, tachycardia, edema. **GI:** diarrhea, hepatic toxicity, nausea, abdominal pain, constipation, mucositis, vomiting. **F and E:** dehydration. **Hemat:** NEUTROPENIA, anemia, thrombocytopenia. **Local:** injection site pain. **Misc:** SYSTEMIC INFLAMMATORY RESPONSE SYNDROME, TUMOR LYSIS SYNDROME, infections, fever, chills.

### Interactions

**Drug-Drug:** Concurrent use of **hepato- or nephrotoxoc drugs** ↑ risk of hepato- and nephrotoxicity and should be avoided for the 5-day treatment period.

### Route/Dosage

**IV (Children 1–21 yr):** 52 mg/m$^2$ daily for 5 days; cycle may be repeated every 2–6 wk.

### Availability

**Solution for IV administration:** 20 mg/mL vials.

## NURSING IMPLICATIONS

### Assessment

- Monitor respiratory status and blood pressure during clofabarine infusion.

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor for signs and symptoms of tumor lysis syndrome and cytokine release (tachypnea, tachycardia, hypotension, pulmonary edema) that could develop into systemic inflammatory response syndrome (SIRS), capillary leak syndrome (pleural and pericardial effusions) and organ dysfunction. Administer continuous IV fluids throughout the 5 days of therapy to reduce effects of tumor lysis syndrome and other adverse drug reactions. Administer prophylactic corticosteroids (hydrocortisone 100 mg/m$^2$ of Days 1 and 3) and allopurinol if hyperuricemia is expected. If significant signs or symptoms of SIRS or capillary leak syndrome occur, discontinue clofarabine immediately; diuretics and albumin may be used; may be fatal. Clofarabine may be reinstituted, usually at a lower dose, when the patient is stable.
- Assess for nausea and diarrhea. Prevent dehydration. Discontinue clofarabine administration if hypotension occurs during 5 days of therapy. If hypotension resolves without pharmacological intervention, clofarabine may be reinstituted, usually at a lower dose.
- ***Lab Test Considerations:*** Monitor CBC and platelet counts at regular intervals during therapy and more frequently if levels are abnormal. May cause anemia, leukopenia, thrombocytopenia, neutropenia, febrile neutropenia, and infection.
- Monitor hepatic and renal function frequently during therapy. May cause ↑ AST, ALT, and bilirubin; usually occur within 1 wk of administration and return to baseline within several days. May cause ↑ serum creatinine.

## Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

## Implementation

- Administer under the supervision of a physician experienced in the use of cancer chemotherapeutic agents.

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute with 50 mL of 5% D5W or 0.9% NaCl and filter through a sterile 0.2 micron syringe filter. Solution is clear and practically colorless. ***Concentration:*** 0.4 mg/mL Store at room temperature; use within 24 hr of preparation. ***Rate:*** Administer over 2 hr daily for 5 consecutive days.
- **Y-Site Incompatibility:** Do not administer other medications through same IV line.

## Patient/Family Teaching

- Advise patient to consult health care professional if dizziness, fainting spells, or decreased urine output occur during therapy.
- Advise patient to consult health care professional prior to taking Rx, OTC, or herbal product during clofarabine therapy.

## Evaluation/Desired Outcomes

- Rapid reduction in peripheral leukemia cells.

# clonazepam (kloe-**na**-ze-pam)

Klonopin, Rivotril, Syn-Clonazepam

***Classification***

Therapeutic: anticonvulsants
Pharmacologic: benzodiazepines

**Schedule IV**

**Pregnancy Category C**

## Indications

Prophylaxis of: Petit mal, Petit mal variant, Akinetic, Myoclonic seizures. Panic disorder with or without agoraphobia. **Unlabeled Use:** Uncontrolled leg movements during sleep. Neuralgias. Sedation. Adjunct management of acute mania, acute psychosis, or insomnia.

## Action

Anticonvulsant effects may be due to presynaptic inhibition. Produces sedative effects in the CNS, probably by stimulating inhibitory GABA receptors. **Therapeutic Effects:** Prevention of seizures. Decreased manifestations of panic disorder.

## Pharmacokinetics

**Absorption:** Well absorbed from the GI tract.
**Distribution:** Probably crosses the blood-brain barrier and the placenta.

**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 18–50 hr.

TIME/ACTION PROFILE (anticonvulsant activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 20–60 min | 1–2 hr | 6–12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to clonazepam or other benzodiazepines; Severe liver disease.
**Use Cautiously in:** All patients (may ↑ risk of suicidal thoughts/behaviors); Angle-closure glaucoma; Obstructive sleep apnea; Chronic respiratory disease; History of porphyria; Do not discontinue abruptly; OB: Safety not established; chronic use during pregnancy may result in withdrawal in the neonate; Lactation: May enter breast milk; discontinue drug or bottle feed; Pedi: Safety not established; Geri: May experience excessive sedation at usual doses; decreased dosage recommended.

## Adverse Reactions/Side Effects

**CNS:** SUICIDAL THOUGHTS, behavioral changes, drowsiness, fatigue, slurred speech, ataxia, sedation, abnormal eye movements, diplopia, nystagmus. **Resp:** increased secretions. **CV:** palpitations. **GI:** constipation, diarrhea, hepatitis, weight gain. **GU:** dysuria, nocturia, urinary retention. **Hemat:** anemia, eosinophilia, leukopenia, thrombocytopenia. **Neuro:** ataxia, hypotonia. **Misc:** fever, physical dependence, psychological dependence, tolerance.

## Interactions

**Drug-Drug: Alcohol**, **antidepressants**, **antihistamines**, other **benzodiazepines**, and **opioid analgesics**—concurrent use results in ↑ CNS depression. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propoxyphene**, **propranolol**, or **valproic acid** may ↓ metabolism of clonazepam, ↑ its actions. May ↓ efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↑ metabolism and ↓ effectiveness of clonazepam. Sedative effects may be ↓ by **theophylline**. May ↑ serum **phenytoin** levels. **Phenytoin** may ↓ serum clonazepam levels. **Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

## Route/Dosage

**PO (Adults):** 0.5 mg 3 times daily; may ↑ by 0.5–1 mg q 3 days. Total daily maintenance dose not to exceed 20 mg. *Panic disorder*—0.125 mg twice daily; ↑ after 3 days toward target dose of 1 mg/day (some patients may require up to 4 mg/day).
**PO (Children <10 yr or 30 kg):** Initial daily dose 0.01–0.03 mg/kg/day (not to exceed 0.05 mg/kg/day) given in 2–3 equally divided doses; ↑ by no more than 0.25–0.5 mg q 3 days until therapeutic blood levels are reached (not to exceed 0.2 mg/kg/day).

## Availability (generic available)

**Tablets:** 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.5 mg $29.99/100, 1 mg $29.99/100, 2 mg $26.66/100. **Orally-disintegrating tablets:** 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.125 mg $69.99/60, 0.25 mg $72.99/60, 0.5 mg $70.99/60, 2 mg $100.00/60.

# NURSING IMPLICATIONS

## Assessment

- Observe and record intensity, duration, and location of seizure activity.
- Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess need for continued treatment regularly.
- Assess patient for drowsiness, unsteadiness, and clumsiness. These symptoms are dose related and most severe during initial therapy; may decrease in severity or disappear with continued or long-term therapy.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- ***Lab Test Considerations:*** Patients on prolonged therapy should have CBC and liver function test results evaluated periodically. May cause an ↑ in serum bilirubin, AST, and ALT.
- May cause ↓ thyroidal uptake of sodium iodide, $^{123}I$, and $^{131}I$.
- ***Toxicity and Overdose:*** Therapeutic serum concentrations are 20–80 mg/mL. Flumazenil antagonizes clonazepam toxicity or overdose (may induce seizures in patients with history of seizure disorder or who are on tricyclic antidepressants).

## Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

## Implementation

- Do not confuse clonazepam with clonidine or clorazepate.
- Institute seizure precautions for patients on initial therapy or undergoing dose manipulations.

- **PO:** Administer with food to minimize gastric irritation. Tablets may be crushed if patient has difficulty swallowing. Administer largest dose at bedtime to avoid daytime sedation. Taper by 0.25 mg every 3 days to decrease signs and symptoms of withdrawal. Some patients may require longer taper period (months).

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses within 1 hr or omit; do not double doses. Abrupt withdrawal of clonazepam may cause status epilepticus, tremors, nausea, vomiting, and abdominal and muscle cramps. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- Advise patient to not share medication with others.
- Medication may cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient and family to notify health care professional of unusual tiredness, bleeding, sore throat, fever, clay-colored stools, yellowing of skin, or behavioral changes. Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Patient on anticonvulsant therapy should carry identification at all times describing disease process and medication regimen.
- Emphasize the importance of follow-up exams to determine effectiveness of the medication.
- Advise patient that clonazepam is usually prescribed for short-term use and does not cure underlying problems.

### Evaluation/Desired Outcomes

- Decrease or cessation of seizure activity without undue sedation. Dose adjustments may be required after several months of therapy.
- Decrease in frequency and severity of panic attacks.
- Relief of leg movements during sleep.
- Decrease in pain from neuralgia.

C

## clonidine (klon-i-deen)

Catapres, Catapres-TTS, Dixarit, Duraclon

***Classification***

Therapeutic: antihypertensives
Pharmacologic: adrenergics (centrally acting)

**Pregnancy Category C**

### Indications

**PO, Transdermal:** Management of mild to moderate hypertension. **Epidural:** Management of cancer pain unresponsive to opioids alone. **Unlabeled Use:** Management of opioid withdrawal. Treatment of attention-deficit hyperactivity disorder (ADHD). Adjunctive treatment of neuropathic pain.

### Action

Stimulates alpha-adrenergic receptors in the CNS, which results in decreased sympathetic outflow inhibiting cardioacceleration and vasoconstriction centers. Prevents pain signal transmission to the CNS by stimulating alpha-adrenergic receptors in the spinal cord. **Therapeutic Effects:** Decreased blood pressure. Decreased pain.

### Pharmacokinetics

**Absorption:** Well absorbed from the GI tract and skin. Enters systemic circulation following epidural use. Some absorption follows sublingual administration.
**Distribution:** Widely distributed; enters CNS. Crosses the placenta readily; enters breast milk in high concentrations.
**Metabolism and Excretion:** Mostly metabolized by the liver; 40–50% eliminated unchanged in urine.
**Half-life:** *Neonates*—44–72 hr; *Children*—8–12 hr; *Adults: Plasma*—12–22 hr; *CNS*—1.3 hr.

TIME/ACTION PROFILE (PO, TD = antihypertensive effect; epidural = analgesia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–60 min | 2–4 hr | 8–12 hr |
| Transdermal | 2–3 days | unknown | 7 days† |
| Epidural | unknown | unknown | unknown |

†8 hr following removal of patch

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; *Epidural*—injection site infection, anticoagulant therapy, or bleeding problems.

**Use Cautiously in:** Serious cardiac or cerebrovascular disease; Renal insufficiency; Pedi: Evaluation for cardiac disease should precede initiation of therapy for ADHD in children; Geri: Appear on Beers list due to increased risk of orthostatic hypotension and adverse CNS effects in geriatric patients (↓ dose recommended); OB, Lactation: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** drowsiness, depression, dizziness, nervousness, nightmares. **CV:** bradycardia, hypotension (↑ with epidural), palpitations. **GI:** dry mouth, constipation, nausea, vomiting. **GU:** erectile dysfunction. **Derm:** rash, sweating. **F and E:** sodium retention. **Metab:** weight gain. **Misc:** withdrawal phenomenon.

## Interactions

**Drug-Drug:** Additive sedation with **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive hypotension with other **antihypertensives** and **nitrates**. Additive bradycardia with **beta blockers**, **diltiazem**, **verapamil**, or **digoxin**. **MAO inhibitors**, **amphetamines**, or **tricyclic antidepressants** may ↓ antihypertensive effect. Withdrawal phenomenon may be ↑ by discontinuation of **beta blockers**. Epidural clonidine prolongs the effects of epidurally administered **local anesthetics**. May ↓ effectiveness of **levodopa**.

## Route/Dosage

**PO (Adults and Adolescents ≥12 yrs):** 100 mcg (0.1 mg) bid, ↑ by 100–200 mcg (0.1–0.2 mg)/day q 2–4 days. *Usual maintenance dose* is 200–600 mcg (0.2–0.6 mg)/day in 2–3 divided doses (up to 2.4 mg/day). *Urgent treatment*—200 mcg (0.2 mg) loading dose, then 100 mcg (0.1 mg) q hr until blood pressure is controlled or 800 mcg (0.8 mg) total has been administered; follow with maintenance dosing. *Opioid withdrawal*—300 mcg (0.3 mg)–1.2 mg/day, may be ↓ by 50%/day for 3 days, then discontinued or ↓ by 100–200 mcg (0.1–0.2 mg)/day.

**PO (Geriatric Patients):** 100 mcg (0.1 mg) at bedtime initially, ↑ as needed.

**PO (Children):** *Hypertension*—Initial 5–10 mcg/kg/day divided BID-TID, then increase gradually to 5–25 mcg/kg/day in divided doses q 6 hr; maximum dose: 0.9 mg/day. *ADHD*—0.05 mg/day, then increase q 3–7 days by 0.05 mg/day to 3–5 mcg/kg/day divided TID-QID; maximum dose: 0.5 mg/day. *Neuropathic pain*—2 mcg/kg/dose q 4–6 hr then increase gradually over days up to 4 mcg/kg/dose q 4–6 hr.

**Transdermal (Adults):** *Hypertension*—Transdermal system delivering 100–300 mcg (0.1–0.3 mg)/24 hr applied every 7 days. Initiate with 100 mcg (0.1 mg)/24 hr system; dosage increments may be made q 1–2 wk when system is changed.

**Transdermal (Children):** Once stable oral dose is reached, children may be switched to a transdermal system equivalent closest to the total daily oral dose.

**Epidural (Adults):** 30 mcg/hr initially; titrated according to need.

**Epidural (Children):** 0.5 mcg/kg/hr initially; titrated according to need up to 2 mcg/kg/hr.

## Availability (generic available)

**Tablets:** 🍁 25 mcg (0.025 mg), 100 mcg (0.1 mg), 200 mcg (0.2 mg), 300 mcg (0.3 mg). **Cost:** *Generic*—0.1 mg $21.65/100, 0.2 mg $12.21/100, 0.3 mg $26.65/100. **Transdermal systems:** Catapres-TTS 1, releases 0.1 mg/24 hr, Catapres-TTS 2, releases 0.2 mg/24 hr, Catapres-TTS 3, releases 0.3 mg/24 hr. **Cost:** Catapres-TTS 1 $85.99/4 patches, Catapres-TTS 2 $139.97/4 patches, Catapres-TTS 3 $194.97/4 patches. **Solution for epidural injection:** 100 mcg/mL, 500 mcg/mL. ***In combination with:*** chlorthalidone (Clorpres). See Appendix B.

# NURSING IMPLICATIONS

## Assessment

- Monitor intake and output ratios and daily weight, and assess for edema daily, especially at beginning of therapy.
- Monitor blood pressure and pulse frequently during initial dose adjustment and periodically throughout therapy. Report significant changes.
- **Pain:** Assess location, character, and intensity of pain prior to, frequently during first few days, and routinely throughout administration.
- Monitor for fever as potential sign of catheter infection.

- **Opioid Withdrawal:** Monitor patient for signs and symptoms of opioid withdrawal (tachycardia, fever, runny nose, diarrhea, sweating, nausea, vomiting, irritability, stomach cramps, shivering, unusually large pupils, weakness, difficulty sleeping, gooseflesh).
- ***Lab Test Considerations:*** May cause transient ↑ in blood glucose levels.
- May cause ↓ urinary catecholamine and vanillylmandelic acid (VMA) concentrations; these may ↑ on abrupt withdrawal.
- May cause weakly positive Coombs' test result.

## Potential Nursing Diagnoses

Chronic pain (Indications)
Risk for injury (Side Effects)

## Implementation

- Do not confuse Catapres (clonidine) with Cataflam (diclofenac).
- Do not confuse clonidine with clonazepam (Klonopin).
- In the perioperative setting, continue clonidine up to 4 hr prior to surgery and resume as soon as possible thereafter. Do not interrupt *transdermal clonidine* during surgery. Monitor blood pressure carefully.
- **PO:** Administer last dose of the day at bedtime.
- A 0.1 mg/mL oral suspension may be compounded for pediatric patients.
- **Transdermal:** Transdermal system should be applied once every 7 days. May be applied to any hairless site; avoid cuts or calluses. Absorption is greater when placed on chest or upper arm and decreased when placed on thigh. Rotate sites. Wash area with soap and water; dry thoroughly before application. Apply firm pressure over patch to ensure contact with skin, especially around edges. Remove old system and discard. System includes a protective adhesive overlay to be applied over medication patch to ensure adhesion, should medication patch loosen.
- **Epidural:** Dilute 500 mcg/mL with 0.9% NaCl for a concentration of 100 mcg/mL. Do not administer solutions that are discolored or contain a precipitate. Discard unused portion.

## Patient/Family Teaching

- Instruct patient to take clonidine at the same time each day, even if feeling well. Take missed dosed as soon as remembered. If more than 1 oral dose in a row is missed or if transdermal system is late in being changed by 3 or more days, consult health care professional. All routes of clonidine should be gradually discontinued over 2–4 days to prevent rebound hypertension.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Clonidine may cause drowsiness, which usually diminishes with continued use. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may increase orthostatic hypotension.
- If dry mouth occurs, frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease effect. If dry mouth continues for more than 2 wk, consult health care professional.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Advise patient to consult health care professional before taking other Rx, OTC, or herbal products, especially cough, cold, or allergy remedies.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if itching or redness of skin (with transdermal patch), mental depression, swelling of feet and lower legs, paleness or cold feeling in fingertips or toes, or vivid dreams or nightmares occur. May require discontinuation of therapy, especially with depression.
- **Hypertension:** Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, discontinuation of smoking, moderation of alcohol consumption, regular exercise, and stress management). Medication helps control but does not cure hypertension.
- Instruct patient and family on proper technique for blood pressure monitoring. Advise them to check blood pressure at least weekly and report significant changes.
- **Transdermal:** Instruct patient on proper application of transdermal system. Do not cut or trim unit. Transdermal system can remain in place during bathing or swimming.

- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

## Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in severity of pain.
- Decrease in the signs and symptoms of opioid withdrawal.

## clopidogrel (kloh-**pid**-oh-grel)

Plavix

***Classification***

Therapeutic: antiplatelet agents
Pharmacologic: platelet aggregation inhibitors

**Pregnancy Category B**

## Indications

Reduction of atherosclerotic events (MI, stroke, vascular death) in patients at risk for such events including recent MI, acute coronary syndrome (unstable angina/non–Q-wave MI), stroke, or peripheral vascular disease.

## Action

Inhibits platelet aggregation by irreversibly inhibiting the binding of ATP to platelet receptors.
**Therapeutic Effects:** Decreased occurrence of atherosclerotic events in patients at risk.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration; rapidly metabolized to an active antiplatelet compound. Parent drug has no antiplatelet activity.
**Distribution:** Unknown.
**Protein Binding:** *Clopidogrel*—98%; *active metabolite*—94%.
**Metabolism and Excretion:** Rapidly and extensively converted by the liver (CYP2C19) to its active metabolite, which is then eliminated 50% in urine and 45% in feces; 2% of Whites, 4% of Blacks, and 14% of Asians have CYP2C19 genotype that results in reduced metabolism of clopidogrel (poor metabolizers) into its active metabolite (may result in ↓ antiplatelet effects).
**Half-life:** 8 hr (active metabolite).

TIME/ACTION PROFILE (effects on platelet function)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 24 hr | 3–7 days | 5 days† |

†Following discontinuation

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Pathologic bleeding (peptic ulcer, intracranial hemorrhage); Lactation.
**Use Cautiously in:** Patients at risk for bleeding (trauma, surgery, or other pathologic conditions); History of GI bleeding/ulcer disease; Concurrent use of strong CYP2C19 inhibitors; Severe hepatic impairment; OB, Lactation, Pedi: Safety not established; use in pregnancy only if clearly indicated.

## Adverse Reactions/Side Effects

Incidence of adverse reactions similar to that of aspirin.
**CNS:** depression, dizziness, fatigue, headache. **EENT:** epistaxis. **Resp:** cough, dyspnea. **CV:** chest pain, edema, hypertension. **GI:** GI BLEEDING, abdominal pain, diarrhea, dyspepsia, gastritis. **Derm:** pruritus, purpura, rash. **Hemat:** BLEEDING, NEUTROPENIA, THROMBOTIC THROMBOCYTOPENIC PURPURA. **Metab:** hypercholesterolemia. **MS:** arthralgia, back pain. **Misc:** fever, hypersensitivity reactions.

## Interactions

**Drug-Drug:** Concurrent **abciximab**, **eptifibatide**, **tirofiban**, **aspirin**, **NSAIDs**, **heparin**, **LMWHs**, **thrombolytic agents**, **ticlopidine**, or **warfarin** may ↑ risk of bleeding. May ↓ metabolism and ↑ effects of **phenytoin**, **tolbutamide**, **tamoxifen**, **torsemide**, **fluvastatin**, and many **NSAIDs**. Concurrent use of strong CYP2C19 inhibitors (e.g. **omeprazole**, **esomeprazole**, **cimetidine**, **fluconazole**, **ketoconazole**, **voriconazole**, **etravirine**, **felbamate**, **fluoxetine**, or **fluvoxamine**) may ↓ antiplatelet effects (concurrent use not recommended).
**Drug-Natural Products:** ↑ bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **fenugreek**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

## Route/Dosage

### Recent MI, Stroke, or Peripheral Vascular Disease

**PO (Adults):** 75 mg once daily.

### Acute Coronary Syndrome

**PO (Adults):** 300 mg initially, then 75 mg once daily; aspirin 75–325 mg once daily should be given concurrently.

## Availability

**Tablets:** 75 mg, 300 mg. **Cost:** $389.68/90.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for symptoms of stroke, peripheral vascular disease, or MI periodically during therapy.
- Monitor patient for signs of thrombotic thrombocytic purpura (thrombocytopenia, microangiopathic hemolytic anemia, neurologic findings, renal dysfunction, fever). May rarely occur, even after short exposure (<2 wk). Requires prompt treatment.
- ***Lab Test Considerations:*** Monitor bleeding time during therapy. Prolonged bleeding time, which is time- and dose-dependent, is expected.
- Monitor CBC with differential and platelet count periodically during therapy. Neutropenia and thrombocytopenia may rarely occur.
- May cause ↑ serum bilirubin, hepatic enzymes, total cholesterol, nonprotein nitrogen (NPN), and uric acid concentrations.

### Potential Nursing Diagnoses

Risk for injury (Indications, Side Effects)

### Implementation

- Discontinue clopidogrel 5–7 days before planned surgical procedures.
- **PO:** Administer once daily without regard to food.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses as soon as possible unless almost time for next dose; do not double doses.
- Advise patient to notify health care professional promptly if fever, chills, sore throat, or unusual bleeding or bruising occurs.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products, especially those containing aspirin or NSAIDs or proton pump inhibitors.

### Evaluation/Desired Outcomes

- Prevention of stroke, MI, and vascular death in patients at risk.

## clorazepate (klor-**az**-e-pate)

Apo-Clorazepate, Gen-XENE, Novo-Clopate, Tranxene, Tranxene-SD

C

***Classification***

Therapeutic: anticonvulsants, sedative/hypnotics
Pharmacologic: benzodiazepines

**Schedule IV**

**Pregnancy Category UK**

### Indications

Management of simple partial seizures. Anxiety disorder, symptoms of anxiety. Acute alcohol withdrawl. **Unlabeled Use:** Anxiety associated with acute myocardial infarction.

### Action

Acts at many levels in the CNS to produce anxiolytic effect and CNS depression (by stimulating inhibitory GABA receptors). Produces skeletal muscle relaxation (by inhibiting spinal polysynaptic afferent pathways). Also has anticonvulsant effect (enhances presynaptic inhibition). **Therapeutic Effects:** Relief of anxiety. Sedation. Prevention of seizures.

### Pharmacokinetics

**Absorption:** Well absorbed from the GI tract as desmethyldiazepam.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk.
**Metabolism and Excretion:** Metabolized by the liver; some conversion to active compounds.
**Half-life:** 48 hr.

TIME/ACTION PROFILE (sedation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–2 hr | 1–2 hr | up to 24 hr† |

†May last longer in geriatric patients

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Pre-existing CNS depression; Severe uncontrolled pain; Angle-closure glaucoma; OB, Lactation: May cause CNS depression, flaccidity, feeding difficulties, and seizures in infant. In lactation discontinue drug or bottle-feed.
**Use Cautiously in:** All patients (may ↑ risk of suicidal thoughts/behaviors); Pre-existing hepatic dysfunction; Patients who may be suicidal or have

been addicted to drugs in the past; Debilitated patients (dosage reduction required); Severe pulmonary disease; Geri: Long-acting benzodiazepines cause prolonged sedation in the elderly. Appears on Beers list and is associated with increased risk of falls (↓ dose required or consider short-acting benzodiazepine).

### Adverse Reactions/Side Effects

**CNS:** SUICIDAL THOUGHTS, dizziness, drowsiness, lethargy, hangover, headache, mental depression, slurred speech, ataxia, paradoxical excitation. **EENT:** blurred vision. **Resp:** respiratory depression. **GI:** constipation, diarrhea, nausea, vomiting, weight gain (unusual). **Derm:** rashes. **Misc:** physical dependence, psychological dependence, tolerance.

### Interactions

**Drug-Drug: Alcohol**, **antidepressants**, **antihistamines**, and **opioid analgesics**—concurrent use results in ↑ CNS depression. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propoxyphene**, **propranolol**, or **valproic acid** may ↓ metabolism of clorazepate, ↑ its actions. May ↓ efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↓ metabolism and ↓ effectiveness of clorazepate. Sedative effects may be ↓ by **theophylline**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** ↑ CNS depression.

### Route/Dosage

Prescribe largest dose at bedtime to avoid daytime sedation. Can be used on prn basis for anxiety.
**PO (Adults):** *Anxiety*—7.5–15 mg 2–4 times daily *or* 15 mg at bedtime initially. May also be given in a single dose of 11.25–22.5 mg at bedtime. *Alcohol withdrawal*—30 mg initially, then 15 mg 2–4 times daily on 1st day, then gradually ↓ over subsequent days. *Anticonvulsant*—7.5 mg 3 times daily; can ↑ by no more than 7.5 mg/day at weekly intervals (daily dose not to exceed 90 mg).
**PO (Geriatric Patients or Debilitated Patients):** *Anxiety*—3.75–15 mg/day, may be ↑.
**PO (Children 9–12 yr):** *Anticonvulsant*—7.5 mg twice daily initially, may ↑ by 7.5 mg/wk (not to exceed 60 mg/day).

### Availability (generic available)

**Tablets:** 3.75 mg, 7.5 mg, 11.25 mg, 15 mg, 22.5 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess for drowsiness, unsteadiness, and clumsiness. Symptoms are dose related and most severe during initial therapy; may decrease in severity or disappear with continued or long-term therapy.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient.
- Conduct regular assessment for continued need for treatment.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- **Anxiety:** Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically during therapy.
- **Alcohol Withdrawal:** Assess patient experiencing alcohol withdrawal for tremors, agitation, delirium, and hallucinations. Protect from injury. Institute seizure precautions.
- **Seizures:** Observe and record intensity, duration, and location of seizure activity.
- Geri: Assess risk of falls and institute fall prevention strategies.
- ***Lab Test Considerations:*** Patients on prolonged therapy should have CBC and liver function tests evaluated periodically. May cause an ↑ in serum bilirubin, AST, and ALT.
- May cause ↓ thyroidal uptake of sodium iodide $^{123}I$ and $^{131}I$.
- ***Toxicity and Overdose:*** Flumazenil is the antidote for clorazepate toxicity or overdose (flumazenil may induce seizures in patients with a history of seizures disorder or who are on tricyclic antidepressants).

### Potential Nursing Diagnoses

Anxiety (Indications)
Risk for injury (Indications, Side Effects)
Risk for falls (Side Effects)

### Implementation

- Do not confuse clorazepate with clonazepam.
- **PO:** If gastric irritation is a problem, may be administered with food or fluids. Capsule should be swallowed whole; do not open.
- Avoid administration of antacids within 1 hr of medication, because absorption of clorazepate may be delayed.
- Use lowest effective dose for shortest period of time. Taper by 0.5 mg q 3 days to prevent with-

drawal. Some patients may require longer tapering period (months).

### Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip or double up on missed doses. Abrupt withdrawal may cause status epilepticus, tremors, nausea, vomiting, and abdominal and muscle cramps. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known. Geri: Instruct patient and family how to reduce falls risk at home.
- Caution patient to avoid alcohol or other CNS depressants concurrently with this medication.
- Instruct patient and family to notify health care professional of unusual tiredness, bleeding, sore throat, fever, clay-colored stools, yellowing of skin, or behavioral changes. Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Emphasize the importance of follow-up exams to determine effectiveness of the medication.
- **Seizures:** Patients on anticonvulsant therapy should carry identification describing disease process and medication regimen at all times.

### Evaluation/Desired Outcomes

- Increase in sense of well-being.
- Decrease in subjective feelings of anxiety.
- Control of acute alcohol withdrawal.
- Decrease or cessation of seizure activity without undue sedation.

## clotrimazole, See ANTIFUNGALS (TOPICAL).

## clotrimazole, See ANTIFUNGALS (VAGINAL).

C

## clozapine (kloe-za-peen)

Clozaril, FazaClo

***Classification***

Therapeutic: antipsychotics

**Pregnancy Category B**

### Indications

Schizoprenia unresponsive to or intolerant of standard therapy with other antipsychotics (treatment refractory). To reduce recurrent suicidal behavior in schizophrenic patients.

### Action

Binds to dopamine receptors in the CNS. Also has anticholinergic and alpha-adrenergic blocking activity. Produces fewer extrapyramidal reactions and less tardive dyskinesia than standard antipsychotics but carries high risk of hematologic abnormalities. **Therapeutic Effects:** Diminished schizophrenic behavior. Diminished suicidal behavior.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration.
**Distribution:** Rapid and extensive distribution; crosses blood-brain barrier and placenta.
**Protein Binding:** 95%.
**Metabolism and Excretion:** Mostly metabolized on first pass through the liver (by CYP1A2, CYP2D6, and CYP3A4 isoenzymes); (the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly ↑ clozapine concentrations and an ↑ risk of adverse effects).
**Half-life:** 8–12 hr.

TIME/ACTION PROFILE (antipsychotic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | wk | 4–12 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Bone marrow depression; Severe CNS depression/coma; Uncontrolled epilepsy; Granulocytopenia; Lactation: Discontinue drug or bottle-feed.
**Use Cautiously in:** Prostatic enlargement; Angle-closure glaucoma; Malnourished patients or

patients with cardiovascular, hepatic, or renal disease (use lower initial dose, titrate more slowly); Diabetes; Seizure disorder; Pedi: Children <16 yr (safety not established); Geri: ↑ risk of mortality in elderly patients treated for dementia-related psychosis.

### Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, dizziness, sedation. **EENT:** visual disturbances. **CV:** MYOCARDITIS, hypotension, tachycardia, ECG changes, hypertension. **GI:** constipation, abdominal discomfort, dry mouth, ↑ salivation, nausea, vomiting, weight gain. **Derm:** rash, sweating. **Endo:** hyperglycemia. **Hemat:** AGRANULOCYTOSIS, LEUKOPENIA. **Neuro:** extrapyramidal reactions. **Misc:** fever.

### Interactions

**Drug-Drug:** ↑ anticholinergic effects with other **agents having anticholinergic properties,** including **antihistamines**, **quinidine**, **disopyramide**, and **antidepressants**. Concurrent use with **SSRI antidepressants** (especially **fluvoxamine**), **cimetidine**, **ciprofloxacin**, and **erythromycin** ↑ blood levels and risk of toxicity. ↑ CNS depression with **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, or **sedative/hypnotics**. ↑ hypotension with **nitrates**, acute ingestion of **alcohol**, or **antihypertensives**. ↑ risk of bone marrow suppression with **antihypertensives** or **radiation therapy**. Use with **lithium** ↑ risk of adverse CNS reactions, including seizures. **Phenytoin**, **nicotine**, and **rifampin** may ↓ levels and lead to ↓ efficacy.

**Drug-Natural Products:** Caffeine-containing herbs (**cola nut**, **tea**, **coffee**) may ↑ serum levels and side effects. **St. John's wort** may ↓ blood levels and efficacy.

### Route/Dosage

**PO (Adults):** 25 mg 1–2 times daily initially; ↑ by 25–50 mg/day over a period of 2 wk up to target dose of 300–450 mg/day. May ↑ by up to 100 mg/day once or twice further (not to exceed 900 mg/day). Treatment should be continued for at least 2 yr in patients with suicidal behavior.

### Availability (generic available)

**Tablets:** 25 mg, 100 mg. **Orally-disintegrating tablets (mint):** 25 mg, 100 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy.
- Monitor blood pressure (sitting, standing, lying) and pulse rate before and frequently during initial dose titration.
- Assess weight and BMI initially and throughout therapy.
- Assess fasting blood glucose and cholesterol levels initially and throughout therapy. Refer as appropriate for nutritional/weight management and medical management.
- Observe patient carefully when administering medication to ensure that medication is actually taken and not hoarded or cheeked.
- Monitor for signs of myocarditis (unexplained fatigue, dyspnea, tachypnea, fever, chest pain, palpitations, other signs and symptoms of heart failure, ECG changes, such as ST-T wave abnormalities, arrhythmias, or tachycardia during first month of therapy). If these occur, clozapine should be discontinued and not restarted.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill-rolling motion of hands, mask-like face, shuffling gait, rigidity, tremors and dystonic muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Notify health care professional if these symptoms occur; reduction in dose or discontinuation of medication may be necessary. Trihexyphenidyl or benzotropine may be used to control these symptoms.
- Although not yet reported for clozapine, monitor for possible tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities, lip smacking or puckering, puffing of cheeks, uncontrolled chewing, rapid or worm-like movements of tongue). Report these symptoms immediately; may be irreversible.
- Monitor frequency and consistency of bowel movements. Increasing bulk and fluids in the diet may help to minimize constipation.
- Clozapine lowers the seizure threshold. Institute seizure precautions for patients with history of seizure disorder.
- Transient fevers may occur, especially during first 3 wk of therapy. Fever is usually self-limiting but may require discontinuation of medication. Also, monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.

- ***Lab Test Considerations:*** Monitor WBC, absolute neutrophil count (ANC), and differential count before initiation of therapy and WBC and ANC weekly for the first 6 months, then biweekly during therapy and weekly for 4 wk after discontinuation of clozapine. Because of the risk of agranulocytosis, clozapine is available only in a 1-wk supply through the **Clozaril Patient Management System,** which combines WBC testing, patient monitoring, and controlled distribution through participating pharmacies. If WBC is $<3000$ mm$^3$ or granulocyte count is $<1500$ mm$^3$, withhold clozapine, increase frequency of WBC monitoring according to management system guidelines, and monitor patient for signs and symptoms of infection. If acceptable WBC and ANC levels were maintained during first 6 months of continuous therapy, monitoring may decrease to every 2 wk. If levels are maintained for second 6 months, WBC and ANC may be monitored every 4 wk thereafter.
- ***Toxicity and Overdose:*** Overdose is treated with activated charcoal and supportive therapy. Monitor patient for several days because of risk of delayed effects.
- Avoid use of epinephrine and its derivatives when treating hypotension, and avoid quinidine and procainamide when treating arrhythmias.

## Potential Nursing Diagnoses

Risk for other-directed violence (Indications)
Disturbed thought process (Indications)
Risk for injury (Side Effects)

## Implementation

- **PO:** Administer capsules with food or milk to decrease gastric irritation.
- Leave oral disintegrating tablet in blister until time of use. Do not push tablet through foil. Just before use, peel foil and gently remove disintegrating tablet. Immediately place tablet in mouth and allow to disintegrate and swallow with saliva. If ½ tablet dose used, destroy other half of tablet.

## Patient/Family Teaching

- Instruct patient to take medication as directed. Patients on long-term therapy may need to discontinue gradually over 1–2 wk.
- Explain purpose and procedures for *Clozaril Patient Management System* to patient.
- Inform patient of possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately.
- Inform patient that cigarette smoking can decrease clozapine levels. Risk for relapse increases if patient begins or increases smoking.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- May cause seizures and drowsiness. Caution patient to avoid driving or other activities requiring alertness while taking clozapine.
- Caution patient to avoid concurrent use of alcohol, other CNS depressants, and Rx, OTC, and herbal products without consulting health care professional.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if unexplained fatigue, dyspnea, tachypnea, chest pain, palpitations, sore throat, fever, lethargy, weakness, malaise, or flu-like symptoms occur or if pregnancy is planned or suspected.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast-feeding or planning to breast-feed.
- Advise patient of need for continued medical follow-up for psychotherapy, eye exams, and laboratory tests.

## Evaluation/Desired Outcomes

- Decreased positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunt affect) of schizophrenia.

HIGH ALERT

# codeine (**koe**-deen)

Paveral

***Classification***

Therapeutic: allergy, cold, and cough remedies, antitussives, opioid analgesics
Pharmacologic: opioid agonists

**Schedule II, III, IV, V (depends on content)**

**Pregnancy Category C**

## Indications

Management of mild to moderate pain. Antitussive (in smaller doses). **Unlabeled Use:** Management of diarrhea.

## Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Decreases cough reflex. Decreases GI motility.
**Therapeutic Effects:** Decreased severity of pain. Suppression of the cough reflex. Relief of diarrhea.

## Pharmacokinetics

**Absorption:** 50% absorbed from the GI tract. Completely absorbed from IM sites. Oral and parenteral doses are not equal.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver (primarily via CYP2D6); 10% converted to morphine; the CYP2D6 enzyme system exhibits genetic polymorphism (some patients [1–10% Whites, 3% African Americans, 16–28% North Africans/Ethiopians/Arabs] may be ultra-rapid metabolizers and may have ↑ morphine concentrations and an ↑ risk of adverse effects); 5–15% excreted unchanged in urine.
**Half-life:** 2.5–4 hr.

TIME/ACTION PROFILE (analgesia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–45 min | 60–120 min | 4 hr |
| IM | 10–30 min | 30–60 min | 4 hr |
| Subcut | 10–30 min | unknown | 4 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Head trauma; Increased intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Geri: Geriatric or debilitated patients (dose reduction required; more susceptible to CNS depression, constipation); Undiagnosed abdominal pain; Geri: Prostatic hyperplasia; OB: Has been used during labor; respiratory depression may occur in the newborn; OB, Lactation: Avoid chronic use.

## Adverse Reactions/Side Effects

**CNS:** confusion, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **EENT:** blurred vision, diplopia, miosis. **Resp:** respiratory depression. **CV:** hypotension, bradycardia. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing, sweating. **Misc:** physical dependence, psychological dependence, tolerance.

## Interactions

**Drug-Drug:** Use with extreme caution in patients receiving **MAO inhibitors** ( ↓ initial dose to 25% of usual dose). Additive CNS depression with **alcohol**, **antidepressants**, **antihistamines**, and **sedative/hypnotics**. Administration of **partial antagonists** (**buprenorphine**, **butorphanol**, **nalbuphine**, or **pentazocine**) may precipitate opioid withdrawal in physically dependent patients. **Nalbuphine** or **pentazocine** may ↓ analgesia.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

## Route/Dosage

**PO (Adults):** *Analgesic*—15–60 mg q 3–6 hr as needed. *Antitussive*—10–20 mg q 4–6 hr as needed (not to exceed 120 mg/day). *Antidiarrheal*—30 mg up to 4 times daily.
**PO (Children 6–12 yr):** *Analgesic*—0.5 mg/kg (15 mg/m²) q 4–6 hr (up to 4 times daily) as needed. *Antitussive*—5–10 mg q 4–6 hr as needed (not to exceed 60 mg/day). *Antidiarrheal*—0.5 mg/kg up to 4 times daily.
**PO (Children 2–5 yr):** *Analgesic*—0.5 mg/kg (15 mg/m²) q 4–6 hr (up to 4 times daily) as needed. *Antitussive*—0.25 mg/kg up to 4 times daily. *Antidiarrheal*—0.5 mg/kg up to 4 times daily.
**IM, IV, Subcut (Adults):** *Analgesic*—15–60 mg q 4–6 hr as needed.
**IM, IV, Subcut (Infants and Children):** *Analgesic*—0.5 mg/kg (15 mg/m²) q 4–6 hr as needed.

## Availability (generic available)

**Tablets:** 15 mg, 30 mg, 60 mg. **Oral solution:** 10 mg/5 mL. **Injection:** 30 mg/mL, 60 mg/mL.
***In combination with:*** antihistamines, decongestants, antipyretics, caffeine, butalbital, and nonopioid analgesics. See Appendix B.

# NURSING IMPLICATIONS

## Assessment

- Assess blood pressure, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids, bulk, and laxatives to minimize constipating effects. Stimulant laxa-

tives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated.

- **Pain:** Assess type, location, and intensity of pain before and 1 hr (peak) after administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- An equianalgesic chart (see Appendix K) should be used when changing routes or when changing from one opioid to another.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive codeine for pain do not develop psychological dependence. If progressively higher doses are required, consider conversion to a stronger opioid.
- **Cough:** Assess cough and lung sounds during antitussive use.
- ***Lab Test Considerations:*** May cause ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by direct IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

## Potential Nursing Diagnoses

Acute pain (Indications)
Disturbed sensory perception (visual, auditory) (Side Effects)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check dose calculations and route of administration.
- ***High Alert:*** Do not confuse codeine with Cardene (nicardipine) or Lodine (etodolac).
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower doses.
- Medications should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- When combined with nonopioid analgesics (aspirin, acetaminophen) #2 = 15 mg, #3 = 30 mg, #4 = 60 mg codeine. Codeine as an individual drug is a Schedule II substance. In combination with other drugs, tablet form is Schedule III, and elixir or cough suppressant is Schedule V (see Appendix J).
- **PO:** Oral doses may be administered with food or milk to minimize GI irritation.
- **IM, Subcut:** Do not administer solution that is more than slightly discolored or contains a precipitate.

### IV Administration

- **Direct IV:** Codeine is usually administered IM or subcut, but slow IV injection has been used.
- **Syringe Compatibility:** dimenhydrinate, glycopyrrolate, hydroxyzine.
- **Y-Site Compatibility:** amifostine, amikacin, aminophylline, ammonium chloride, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, busulfan, calcium gluconate, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpormazine, cimetidine, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daunorubicin, dexamethasone, dexrazoxane, digoxin, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, droperidol, enalaprilat, etoposide, etoposide phosphate, famotidine, floxuridine, fluconazole, fludarabine, fluorouracil, gemcitabine, gentanicin, haloperidol, heparin, hydrocortisone, idarubicin, ifosfamide, imipenem/cilastatin, leucovorin, magnesium sulfate, mesna, metoclopramide, metronidazole, mitomycin, mitoxantrone, ondansetron, paclitaxel, plicamycin, potassium chloride, prochlorperazine, promethazine, ranitidine, sodium bicarbonate, streptozocin, teniposide, theophylline, thi-

otepa, tobramycin, topotecan, trimethobenzamide, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** acyclovir, amobarbital, amphotericin B colloidal, ampicillin, cefoperazone, chlorothiazide, furosemide, ganciclovir, lorazepam, mannitol, methotrexate, methylprednisolone, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, thiopental, trimethoprim/sulfamethoxazole.

## Patient/Family Teaching
- Instruct patient on how and when to ask for and take pain medication.
- Codeine may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution ambulatory patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.

## Evaluation/Desired Outcomes
- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of cough.
- Control of diarrhea.

HIGH ALERT

# colchicine (kol-chi-seen)
Colcrys

***Classification***
Therapeutic: antigout agents

**Pregnancy Category D**

## Indications
Acute attacks of gouty arthritis. Familial Mediterranean fever. **Unlabeled Use:** Treatment of hepatic cirrhosis and prevention of recurrences of gout.

## Action
Interferes with the functions of WBCs in initiating and perpetuating the inflammatory response to monosodium urate crystals. **Therapeutic Effects:** Decreased pain and inflammation in acute attacks of gout. Reduced number of attacks of familial Mediterranean fever.

## Pharmacokinetics
**Absorption:** Absorbed from the GI tract, then reenters GI tract from biliary secretions, when more absorption may occur; bioavailability = 45%.
**Distribution:** Concentrates in WBCs.
**Metabolism and Excretion:** Partially metabolized by the liver by CYP3A4; also a substrate for P-glycoprotein. Secreted in bile back into GI tract; eliminated in the feces. 40–65% excreted in the urine as unchanged drug.
**Half-life:** 27–31 hr.

TIME/ACTION PROFILE (anti-inflammatory activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 12 hr | 24–72 hr | unknown |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Use of P-glycoprotein inhibitors or strong CYP3A4 inhibitors in patients with renal or hepatic impairment.
**Use Cautiously in:** Geri: Elderly or debilitated patients (toxicity may be cumulative); Renal impairment (dose ↓ suggested if CCr <80 mL/min); OB, Lactation, Pedi: Safety not established.

## Adverse Reactions/Side Effects
**GI:** diarrhea, nausea, vomiting, abdominal pain. **Derm:** alopecia. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, thrombocytopenia. **Neuro:** peripheral neuritis.

## Interactions
**Drug-Drug:** Additive bone marrow depression may occur with **bone marrow depressants** or **radiation therapy**. Strong **CYP3A4 inhibitors** (e.g., **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, or **telithromycin**) moderate **CYP3A4 inhibitors** (e.g., **aprepitant**, **diltiazem**, **erythromycin**, **fluconazole**, **fosamprenavir**, or **verapamil**) and **P-glycoprotein inhibitors** (e.g., **cyclosporine** or **ranolazine**) may ↑ levels and risk of toxicity (↓ colchicine dose). ↑ risk of rhabdomyolysis with **HMG-CoA reductase inhibitors**, **gemfibrozil**, or **fenofibrate**. Additive adverse GI effects with **NSAIDs**. May cause reversible malabsorption of **vitamin $B_{12}$**.
**Drug-Food: Grapefruit juice** may ↑ levels and risk of toxicity (↓ colchicine dose).

## Route/Dosage

### Acute Gout Attacks

**PO (Adults):** 1.2 mg initially, then 0.6 mg 1 hr later (maximum dose of 1.8 mg in 1 hr); *Concomitant use of strong CYP3A4 inhibitors*—0.6 mg initially, then 0.3 mg 1 hr later (do not repeat treatment course for ≥3 days); *Concomitant use of moderate CYP3A4 inhibitors*—1.2 mg × 1 dose (do not repeat for ≥3 days); *Concomitant use of P-glycoprotein inhibitors*—0.6 mg x 1 dose (do not repeat for ≥3 days).

### Renal Impairment

**PO (Adults):** *CCr <30 mL/min*—1.2 mg initially, then 0.6 mg 1 hr later; do not repeat treatment course for ≥2 wk; *Dialysis*—0.6 mg × 1 dose; do not repeat treatment course for ≥2 wk.

### Prevention of Recurrent Gout Attacks (unlabeled use)

**PO (Adults):** 0.6 mg daily (may be used up to 3 times daily or as little as 1–4 times weekly).

### Familial Mediterranean Fever

**PO (Adults and Children >12 yr):** 1.2–2.4 mg daily (in 1–2 divided doses); may ↑ or ↓ dose in 0.3 mg/day increments based on safety and efficacy; *Concomitant use of strong CYP3A4 inhibitors or P-glycoprotein inhibitors*—Do not exceed 0.6 mg/day (may be given as 0.3 mg twice daily); *Concomitant use of moderate CYP3A4 inhibitors*—Do not exceed 1.2 mg/day (may be given as 0.6 mg twice daily).
**PO (Children 6–12 yr):** 0.9–1.8 mg daily (in 1–2 divided doses).
**PO (Children 4–6 yr):** 0.3–1.8 mg daily (in 1–2 divided doses).

### Renal Impairment

**PO (Adults):** *CCr 30–80 mL/min*—dose reduction may be necessary; *CCr <30 mL/min or dialysis*—0.3 mg/day.

### Availability (generic available)

**Tablets:** 0.6 mg, 🍁 1 mg. **Cost:** *Generic*—$18.12/90.

## NURSING IMPLICATIONS

### Assessment

- ***High Alert:*** Assess patient for toxicity (weakness, abdominal discomfort, nausea, vomiting, diarrhea, delirium, seizures, sense of suffocation, dilated pupils, difficulty swallowing, ascending paralysis, oliguria), withhold drug and report symptoms immediately.
- Monitor intake and output ratios. Fluids should be encouraged to promote a urinary output of at least 2000 mL/day.
- **Gout:** Assess involved joints for pain, mobility, and edema throughout therapy. During initiation of therapy, monitor for drug response every 1–2 hr.
- **Familial Mediterranean fever:** Assess for signs and symptoms of familial Mediterranean fever (abdominal pain, chest pain, fever, chills, recurrent joint pain, red and swollen skin lesions) periodically during therapy.
- ***Lab Test Considerations:*** In patients receiving prolonged therapy, monitor baseline and periodic CBC; report significant ↓ in values. May cause ↓ platelet count, leukopenia, aplastic anemia, and agranulocytosis.
- May cause ↑ in AST and alkaline phosphatase.
- May cause false-positive results for urine hemoglobin.
- May interfere with results of urinary 17-hydroxycorticosteroid concentrations.
- ***Toxicity and Overdose:*** Assess patient for toxicity (weakness, abdominal discomfort, nausea, vomiting, diarrhea). If these symptoms occur, discontinue medication and notify physician or other health care professional. Opioids may be needed to treat diarrhea.

### Potential Nursing Diagnoses

Acute pain (Indications)
Impaired walking (Indications)

### Implementation

- ***High Alert:*** Colchicine overdose can be fatal. Cumulative dose should not exceed 4 mg. Cumulative dose should not exceed 2 mg in geriatric and renal patients. After dosing limit has been reached, do not administer any additional colchicine by any route for 21 days.
- Intermittent therapy with 3 days between courses may be used to decrease risk of toxicity.
- **PO:** Administer oral doses with food to minimize gastric irritation.

### Patient/Family Teaching

- Review medication administration schedule. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- Instruct patients taking prophylactic doses not to increase to therapeutic doses during an acute attack to prevent toxicity. An NSAID or

corticosteroid, preferably via intrasynovial injection, should be used to treat acute attacks.
- Advise patient to avoid grapefruit and grapefruit juice during therapy; may increase risk of toxicity.
- Advise patient to follow recommendations of health care professional regarding weight loss, diet, and alcohol consumption.
- Instruct patient to report nausea, vomiting, abdominal pain, diarrhea, unusual bleeding, bruising, sore throat, fatigue, malaise, or rash promptly. Medication should be withheld if gastric symptoms indicative of toxicity occur.
- Advise patient to notify health care professional before taking any other Rx, OTC, or herbal products.
- Surgery may precipitate an acute attack of gout. Advise patient to confer with health care professional regarding dose 3 days before surgical or dental procedures.

### Evaluation/Desired Outcomes
- Decrease in pain and swelling in affected joints within 12 hr.
- Relief of symptoms within 24–48 hr.
- Prevention of acute gout attacks.
- Reduced number of attacks of familial Mediterranean fever.

## **colesevelam** (koe-le-**sev**-e-lam)
Welchol

***Classification***
Therapeutic: lipid-lowering agents
Pharmacologic: bile acid sequestrants

**Pregnancy Category B**

### Indications
Adjunctive therapy to diet and exercise for the reduction of LDL cholesterol in patients with primary hypercholesterolemia; may be used alone or in combination with hepatic hydroxymethylglutaryl coenzyme A (HMG-CoA) reductase inhibitor. Adjunctive therapy to diet and exercise to improve glycemic control in patients with type 2 diabetes.

### Action
Binds bile acids in the GI tract. Result in increased clearance of cholesterol. Mechanism for lowering blood glucose unknown. **Therapeutic Effects:** Decreased cholesterol and blood glucose.

### Pharmacokinetics
**Absorption:** Not absorbed; action is primarily local in the GI tract.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** Unknown.

TIME/ACTION PROFILE (cholesterol-lowering effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 24–48 hr | 2 wk | unknown |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Bowel obstruction; Triglycerides >500 mg/dL; History of pancreatitis due to hypertriglyceridemia.
**Use Cautiously in:** Triglycerides >300 mg/dL; Dysphagia, swallowing disorders, severe GI motility disorders, or major GI tract surgery; Pregnancy, lactation, or children (safety not established).

### Adverse Reactions/Side Effects
**GI:** constipation, dyspepsia.

### Interactions
**Drug-Drug:** May ↓ absorption of **glyburide**, **levothyroxine**, **phenytoin**, **estrogen-containing oral contraceptives** (give ≥4 hr before colesevelam).

### Route/Dosage
**PO (Adults):** 3 tablets twice daily or 6 tablets once daily.

### Availability
**Tablets:** 625 mg.

## NURSING IMPLICATIONS

### Assessment
- Obtain a diet history, especially in regard to fat consumption.
- ***Lab Test Considerations:*** Monitor serum total cholesterol, LDL, and triglyceride levels before initiating, and periodically during therapy.

### Potential Nursing Diagnoses
Constipation (Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation
- **PO:** Administer once or twice daily with meals. Colesevelam should be taken with a liquid.

### Patient/Family Teaching
- Instruct patient to take medication as directed; do not skip doses or double up on missed doses.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.

### Evaluation/Desired Outcomes

- Decrease in serum total choesterol, LDL cholesterol, apolipoprotein, and blood glucose levels.

## colestipol (koe-les-ti-pole)

Colestid

***Classification***

Therapeutic: lipid-lowering agents
Pharmacologic: bile acid sequestrants

**Pregnancy Category UK**

### Indications

Management of primary hypercholesterolemia. Pruritus associated with elevated levels of bile acids. **Unlabeled Use:** Diarrhea associated with excess bile acids.

### Action

Binds bile acids in the GI tract, forming an insoluble complex. Result is increased clearance of cholesterol. **Therapeutic Effects:** Decreased plasma cholesterol and LDL. Decreased pruritus.

### Pharmacokinetics

**Absorption:** Action takes place in the GI tract. No absorption occurs.
**Distribution:** No distribution.
**Metabolism and Excretion:** After binding bile acids, insoluble complex is eliminated in the feces.
**Half-life:** Unknown.

TIME/ACTION PROFILE (hypocholesterolemic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 24–48 hr | 1 mo | 1 mo |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Complete biliary obstruction; Some products contain aspartame and should be avoided in patients with phenylketonuria.
**Use Cautiously in:** History of constipation.
**Exercise Extreme Caution in:** Pedi: May cause potentially fatal intestinal obstruction in children.

### Adverse Reactions/Side Effects

**EENT:** irritation of the tongue. **GI:** abdominal discomfort, constipation, nausea, fecal impaction, flatulence, hemorrhoids, perianal irritation, steatorrhea, vomiting. **Derm:** irritation, rashes. **F and E:** hyperchloremic acidosis. **Metab:** vitamin A, D, and K deficiency.

### Interactions

**Drug-Drug:** May decrease absorption/effects of orally administered **acetaminophen**, **amiodarone**, **clindamycin**, **clofibrate**, **digoxin**, **diuretics**, **gemfibrozil**, **glipizide**, **corticosteroids**, **imipramine**, **mycophenolate**, **methotrexate**, **methyldopa**, **niacin**, **NSAIDs**, **penicillin**, **phenytoin**, **phosphates**, **propranolol**, **tetracyclines**, **tolbutamide**, **thyroid preparations**, **ursodiol**, **warfarin**, and **fat-soluble vitamins (A, D, E,** and **K)**. May decrease absorption of other **orally administered medications**.

### Route/Dosage

**PO (Adults):** *Granules*—5 g 1–2 times daily, may be increased q 1–2 mo up to 30 g/day in 1–2 doses. *Tablets*—2 g 1–2 times daily, may be increased q 1–2 mo up to 16 g/day in 1–2 doses.

### Availability

**Granules for suspension (unflavored):** 5 g/packet or scoop. **Flavored granules for suspension with aspartame (orange flavor):** 5 g/packet or scoop. **Tablets:** 1 g.

## NURSING IMPLICATIONS

### Assessment

- **Hypercholesterolemia:** Obtain a diet history, especially in regard to fat consumption.
- **Pruritus:** Assess severity of itching and skin integrity. Dose may be decreased when relief of pruritus occurs.
- **Diarrhea:** Assess frequency, amount, and consistency of stools.
- ***Lab Test Considerations:*** Serum cholesterol and triglyceride levels should be evaluated before initiating, frequently during first few months and periodically throughout therapy. Discontinue medication if paradoxical increase in cholesterol level occurs.
- May cause an increase in AST, ALT, phosphorus, chloride, and alkaline phosphatase and a decrease in serum calcium, sodium, and potassium levels.
- May also cause prolonged PT.

### Potential Nursing Diagnoses

Constipation (Side Effects)
Noncompliance (Patient/Family Teaching)

### Implementation

- Parenteral or water-miscible forms of fat-soluble vitamins (A, D, K) and folic acid may be ordered for patients on chronic therapy.

- **PO:** Administer before meals.
- Scoops for powdered preparations may not be exchangable between products.
- Administer other medications 1 hr before or 4–6 hr after the administration of this medication.
- Colestipol tablets should be swallowed whole; do not crush, break, or chew.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed; do not skip doses or double up on missed doses.
- Instruct patient to take medication before meals. Colestipol can be mixed with water, juice, or carbonated beverages. Slowly stir in a large glass. Rinse glass with small amount of additional beverage to ensure all medication is taken. May also mix with highly fluid soups, cereals, or pulpy fruits (applesauce, crushed pineapple). Allow powder to sit on fluid and hydrate for 1–2 min before mixing. Do not take dry.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Explain that constipation may occur. Increase in fluids and bulk in diet, exercise, stool softeners, and laxatives may be required to minimize the constipating effects. Instruct patient to notify health care professional if constipation, nausea, flatulence, and heartburn persist or if stools become frothy and foul smelling.
- Advise patient to notify health care professional if unusual bleeding or bruising; petechiae; or black, tarry stools occur. Treatment with vitamin K may be necessary.

### Evaluation/Desired Outcomes

- Decrease in serum LDL cholesterol levels. Therapy is usually discontinued if the clinical response remains poor after 3 mo of therapy.
- Decrease in severity of pruritus. Relief usually occurs 1–3 wk after therapy is initiated.
- Decrease in frequency and severity of diarrhea.

## CONTRACEPTIVES, HORMONAL

### MONOPHASIC ORAL CONTRACEPTIVES

**ethinyl estradiol/desogestrel**
(**eth**-in-il es-tra-**dye**-ole/dess-oh-**jess**-trel)
Apri 28, Desogen, Ortho-Cept, Reclipsen, Solia

**ethinyl estradiol/drospirenone**
(**eth**-in-il es-tra-**dye**-ole/droe-**spy**-re-nown)
Ocella, Yasmin, Yaz

**ethinyl estradiol/ethynodiol**
(**eth**-in-il es-tra-**dye**-ole/e-thye-noe-**dye**-ole)
Kelnor 1/35, Zovia 1/35, Zovia 1/50

**ethinyl estradiol/levonorgestrel**
(**eth**-in-il es-tra-**dye**-ole/lee-voe-nor-**jess**-trel)
Aviane-28, Lessina-28, Levlen-28, Levora-28, Lutera, Nordette-28, Portia-28, Sronyx

**ethinyl estradiol/norethindrone**
(**eth**-in-il es-tra-**dye**-ole/nor-eth-**in**-drone)
Balziva-28, Brevicon-28, Femcon Fe, Junel 21 1/20, Junel 21 1.5/20, Junel Fe 1/20, Junel Fe 1.5/30, Loestrin 21 1/20, Loestrin 21 1.5/30, Loestrin Fe 1/20, Loestrin Fe 1.5/30, Microgestin, Microgestin Fe 1/20, Modicon, Necon 0.5/35, Necon 1/35, Norethin 1/35E, Norinyl 1+ 35, Nortrel 0.5/35, Nortrel 1/35, Ortho-Novum 1/35, Ovcon 35, Ovcon 50, Zenchant

Aranelle, Leena, Necon 7/7/7, Nortrel 7/7/7, Ortho-Novum 7/7/7, Tilia Fe, Tri-Legest Fe, Tri-Norinyl

**ethinyl estradiol/norgestimate** (**eth**-in-il es-tra-**dye**-ole/nor-**jess**-ti-mate)
Ortho Tri-Cyclen, Ortho Tri-Cyclen Lo, Tri-Lo-Sprintec, Tri-Nessa, Tri-Previfem, Tri-Sprintec

### EXTENDED-CYCLE ORAL CONTRACEPTIVE

**ethinyl estradiol/levonorgestrel** (**eth**-in-il ess-tra-**dye**-ole/lee-voe-nor-**jess**-trel)
Jolessa, LoSeasonique, Lybrel, Quasense, Seasonale, Seasonique

### PROGESTIN-ONLY ORAL CONTRACEPTIVES

**norethindrone** (nor-eth-**in**-drone)
Errin, Camila, Jolivette, Micronor, Nor-Q D

### PROGRESSIVE ESTROGEN ORAL CONTRACEPTIVES

**norethindrone/ethinyl acetate** (nor-eth-**in**-drone/**eth**-in-il **a**-se-tate)
Estrostep, Estrostep Fe

### CONTRACEPTIVE IMPLANT

**etonorgestrel** (e-toe-nor-**jess**-trel)
Implanon

### EMERGENCY CONTRACEPTIVE

**levonorgestrel** (**lee**-voe-nor-**jess**-trel)
Plan B

### INJECTABLE CONTRACEPTIVE

**medroxyprogesterone** (me-**drox**-ee-proe-**jess**-te-rone)
Depo-Provera, Depo-subQ Provera 104

### INTRAUTERINE CONTRACEPTIVE

**levonorgestrel** (**lee**-voe-nor-**jess**-trel)
Mirena

### VAGINAL RING CONTRACEPTIVE

**ethinyl estradiol/etonogestrel** (**eth**-in-il ess-tra-**dye**-ole/e-toe-noe-**jess**-trel)
NuvaRing

### TRANSDERMAL CONTRACEPTIVE

**ethinyl estradiol/norelgestromin** (**eth**-in-il ess-tra-**dye**-ole/nor-el-**jess**-troe-min)
Ortho Evra

***Classification***
Therapeutic: contraceptive hormones

**Pregnancy Category X**

## Indications

Prevention of pregnancy. Regulation of menstrual cycle. Emergency contraception (some products). Treatment of heavy menstrual bleeding in women who choose to use intrauterine contraception as their method of contraception (Mirena). Treatment of premenstrual dysphoric disorder (Yaz, Yasmin). Management of acne in women >14 yr who desire contraception, have no health problems, and have failed topical treatment.

## Action

**Monophasic Oral Contraceptives:** Provide a fixed dosage of estrogen/progestin over a 21-day cycle. Ovulation is inhibited by suppression of follicle-stimulating hormone (FSH) and luteinizing

hormone (LH). May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. **Biphasic Oral Contraceptives:** Ovulation is inhibited by suppression of FSH and LH. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. In addition, smaller dose of progestin in phase 1 allows for proliferation of endometrium. Larger amount in phase 2 allows for adequate secretory development. **Triphasic Oral Contraceptives:** Ovulation is inhibited by suppression of FSH and LH. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. Varying doses of estrogen/progestin may more closely mimic natural hormonal fluctuations. **Extended-cycle:** Provides continuous estrogen/progestin for 84 days (365 days for Lybrel), then off for 7 days (low-dose estrogen-only tablet taken during these 7 days with LoSeasonique and Seasonique), resulting in 4 menstrual periods/year (no periods/year for Lybrel). **Progressive Estrogen:** Contains constant amount of progestin with 3 progressive doses of estrogen. **Progestin-Only Contraceptives/Contraceptive Implant/Intrauterine Levonorgestrel/Medroxyprogesterone Injection:** Mechanism not clearly known. May alter cervical mucus and the endometrial environment, preventing penetration by sperm and implantation of the egg. Ovulation may also be suppressed. **Emergency Contraceptive Pills (ECPs):** Inhibit ovulation/fertilization; may also alter tubal transport of sperm/egg and prevent implantation. **Vaginal Ring, Transdermal Patch:** inhibits ovulation, decreases sperm entry into uterus, and decreases likelihood of implantation. **Anti-acne effect:** Combination of estrogen/progestin may increase sex hormone binding globulin (SHBG) resulting in decreased unbound testosterone, which may be a cause of acne.
**Therapeutic Effects:** Prevention of pregnancy. Decreased severity of acne. Decrease in menstrual blood loss. Decrease in premenstrual disphoric disorder.

## Pharmacokinetics

**Absorption:** *Ethinyl estradiol*—rapidly absorbed; *norethindrone*—65% absorbed; *Desogesrtrel and levonorgestrel*—100% absorbed. Others are well absorbed after oral administration. Slowly absorbed from implant, subcutaneous or IM injection. Some absorption follows intrauterine implantation.
**Distribution:** Unknown.
**Protein Binding:** *Ethinyl estradiol*—97–98%. *Drospirenone*—97%.
**Metabolism and Excretion:** *Ethinyl estradiol and norethindrone*—undergo extensive first-pass hepatic metabolism. *Mestranol*—is rapidly converted to ethinyl estradol. *Desogestrel*—is rapidly metabolized to 3-keto-desogestgrel, the active metabolite. Most agents are metabolized by the liver.
**Half-life:** *Ethinyl estradiol*—6–20 hr; *Levonorgestrel*—45 hr; *Norethindrone*—5–14 hr; *Desogestrel (metabolite)*—38 ± 20 hr; *Drospirenone*—30 hr; *Norgestimate (metabolite)*—12–20 hr; *others*—unknown.

TIME/ACTION PROFILE (prevention of pregnancy)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 mo | 1 mo | 1 mo† |
| Implant | 1 mo | 1 mo | 5 yr |
| Intrauterine system | 1 mo | 1 mo | 3 yr |
| IM | 1 mo | 1 mo | 3 mo |
| Subcut | unknown | 1 wk | 3 mo |

†Only during month of taking contraceptive

## Contraindications/Precautions

**Contraindicated in:** OB: Pregnancy; History of thromboembolic disease (e.g., DVT, PE, MI, stroke); Valvular heart disease; Major surgery with extended periods of immobility; Diabetes with vascular involvement; Headache with focal neurological symptoms; Uncontrolled hypertension; History of breast, endometrial, or estrogen-dependent cancer; Abnormal genital bleeding; Liver disease; Hypersensitivity to parabens (injectable only); *Intrauterine levonorgestrel only*—Intrauterine anomaly, postpartum endometriosis, multiple sexual partners, pelvic inflammatory disease, liver disease, genital actinomycosis, immunosuppression, IV drug abuse, untreated genitourinary infection, history of ectopic pregnancy; Some products contain tartrazine and should be avoided in patients with known hypersensitivity intolerance; Lactation: Avoid use.
**Use Cautiously in:** History of cigarette smoking or age >30–35 yr (↑ risk of cardiovascular or thromboembolic phenomenon); Presence of other cardiovascular risk factors (obesity, hyperglycemia, elevated lipids, hypertension); History of diabetes mellitus, bleeding disorders, concurrent anticoagulant therapy or headaches; Pedi: Avoid use before menarche.

## Adverse Reactions/Side Effects

**CNS:** depression, migraine headache. **EENT:** contact lens intolerance, optic neuritis, retinal

thrombosis. **CV:** CEREBRAL HEMORRHAGE, CEREBRAL THROMBOSIS, CORONARY THROMBOSIS, PULMONARY EMBOLISM, edema, hypertension, Raynaud's phenomenon, thromboembolic phenomena, thrombophlebitis. **GI:** abdominal cramps, bloating, cholestatic jaundice, gallbladder disease, liver tumors, nausea, vomiting. **GU:** amenorrhea, breakthrough bleeding, dysmenorrhea, spotting. *Intrauterine levonorgestrel only*—uterine imbedment/uterine rupture. **Derm:** melasma, rash. **Endo:** hyperglycemia. **MS:** *Injectable medroxyprogesterone only*—bone loss. **Misc:** weight change.

## Interactions

**Drug-Drug:** Oral contraceptive efficacy may be ↓ by **penicillins**, **chloramphenicol**, **barbiturates**, chronic **alcohol** use, **carbamazepine**, **oxcarbazepine**, **felbamate**, systemic **corticosteroids**, **phenytoin**, **topiramate**, **primidone**, **modafinil**, **rifampin**, **rifabutin**, some **protease inhibitor antiretrovirals** (including **ritonavir**), or **tetracyclines**. May ↑ effects/risk of toxicity of some **benzodiazepines**, **beta blockers**, **corticosteroids**, **cyclosporine**, and **theophylline**. ↑ risk of hepatic toxicity with **dantrolene** (estrogen only). **Indinavir**, **itraconazole**, **ketoconazole**, **fluconazole**, and **atorvastatin** may ↑ effects/risk of toxicity. **Smoking** ↑ risk of thromboembolic phenomena (estrogen only). May ↓ levels of **acetaminophen**, **temazepam**, **lamotrigine**, **lorazepam**, **oxazepam**, or **morphine**. *Drosperinone-containing products only*—concurrent use with **NSAIDs**, **potassium-sparing diuretics**, **potasssium supplements**, **ACE inhibitors**, or **angiotensin II receptor antagonists** may result in hyperkalemia.

**Drug-Natural Products:** Concomitant use with **St. John's wort** may ↓ contraceptive efficacy and cause breakthrough bleeding and irregular menses.

## Route/Dosage

### Monophasic Oral Contraceptives

**PO (Adults):** On 21-day regimen, take first tablet on first Sunday after menses begins (take on Sunday if menses begins on Sunday) for 21 days, then skip 7 days and begin again. Regimen may also be started on first day of menses, continue for 21 days, then skip 7 days and begin again. Some regimens contain 7 placebo tablets, so that 1 tablet is taken every day for 28 days.

### Biphasic Oral Contraceptives

**PO (Adults):** Given in 2 phases. First phase is 10 days of smaller amount of progestin. Second phase is larger amount of progestin. Amount of estrogen remains constant for same length of time (total of 21 days), then skip 7 days and begin again. Some regimens contain 7 placebo tablets for 28-day regimen.

### Triphasic Oral Contraceptives

**PO (Adults):** Progestin amount varies throughout 21-day cycle. Estrogen component stays the same or may vary. Some regimens contain 7 placebo tablets for 28-day regimen.

### Extended-Cycle Contraceptive

**PO (Adults):** *LoSeasonique, Seasonale and Seasonique*. Start taking first active pill on first Sunday after menses begins (if first day is Sunday, begin then), continue for 84 days of active pill, followed by 7 days of placebo tablets (low-dose estrogen tablets for LoSeasonique and Seasonique), then resume 84/7 cycle again. For *Lybrel*, begin taking the first pill during the first day of the menstrual cycle and start the next pack the day after the previous pack ends.

### Progestin-Only Oral Contraceptives

**PO (Adults):** Start on first day of menses. Taken daily and continuously.

### Progressive Estrogen Oral Contraceptives

**PO (Adults):** Estrogen amount increases q 7 days throughout 21-day cycle. Progestin component stays the same. Some regimens contain 7 placebo tablets for 28-day regimen.

### Emergency Contraceptive

**PO (Adults and Adolescents):** *Plan B*—1 tablet within 72 hr of unprotected intercourse followed by 1 more tablet 12 hr later; *Lo/Ovral*—4 white tablets within 72 hr of unprotected intercourse followed by 4 more white tablets 12 hr later; *Levlen, Nordette*—4 light orange tablets within 72 hr of unprotected intercourse followed by 4 more light orange tablets 12 hr later; *Triphasil, Tri-Levlen*—4 yellow tablets within 72 hr of unprotected intercourse followed by 4 more yellow tablets 12 hr later.

### Injectable Contraceptive

### medroxyprogesterone (Depo-Provera)

**IM (Adults):** 150 mg within first 5 days of menses or within 5 days postpartum, if not breastfeed-

ing. If breastfeeding, give 6 wk postpartum; repeat q 3 mo.

### medroxyprogesterone (Depo-Sub Q Provera 104)

**Subcut (Adults):** 104 mg within first 5 days of menses or within 5 days postpartum, if not breastfeeding. If breastfeeding, give 6 wk postpartum; repeat q 12–14 wk.

### Intrauterine Contraceptive

**Intrauterine** (Adults): Insert one device into uterine cavity within 7 days of menses or immediately after 1st trimester abortion; releases 20 mcg levonorgestrel/day over 5 yr.

### Vaginal Ring Contraceptive

**Vag (Adults):** One ring inserted on or prior to day 5 of menstrual cycle. Ring is left in place for 3 wk, then removed for 1 wk, then a new ring is inserted.

### Transdermal Patch

**Transdermal (Adults):** Patch is applied on day 1 of menstrual cycle (or convenient day in first week), changed weekly thereafter for 3 weeks. Week 4 is patch-free. Cycle is then repeated.

### Acne

**PO (Adults):** Ortho Tri-Cyclen only, taken daily for 21 days, off for 7 days.

### Availability

### Combination Estrogen/Progestin Oral Contraceptives (generic available)

**Oral contraceptive tablets:** Usually in monthly packs with enough (21) active tablets to complete a 28-day cycle. Some contain 7 inert tablets to complete the cycle with or without supplemental iron. **Cost:** *Apri*—$179.93/6 cycles; *Estrostep Fe*—$354.26/6 cycles; *Femcon Fe*—$338.97/6 cycles; *Kariva*—$239.94/6 cycles; *Levora*—$151.94/6 cycles; *Low-Ogestrel*—$151.94/6 cycles; *Necon 0.5/35*—$125.95/6 cycles; *Ovcon 35*—$322.44/6 cycles; *Sprintec*—$143.10/6 cycles; *Tri-Nessa*—$137.94/6 cycles; *Trivora-28*—$139.94/6 cycles; *Yasmin*—$299.90/6 cycles; *Yaz*—$307.96/6 cycles.

### Extended-Cycle Contraceptive

**Tablets:** LoSeasonique—active tablets containing 0.02 mg ethinyl estradiol, 0.1 mg levonorgestrel, and 7 tablets containing 0.01 mg ethinyl estradiol; Seasonale—84 active tablets containing 0.03 mg ethinyl estradiol and 0.15 mg levonorgestrel and 7 inactive tablets; Seasonique—active tablets containing 0.03 mg ethinyl estradiol, 0.15 mg levonorgestrel, and 7 tablets containing 0.01 mg ethinyl estradiol; Lybrel—28 active tablets containing 0.09 mg levonorgestrel and 0.02 mg ethinyl estradiol. **Cost:** *Lybrel*—$49.99/28 tablets; *Seasonale*—$181.98/91 tablets; *Seasonique*—$165.98/91 tablets.

### Levonorgestrel (generic available)

**Emergency contraceptives:** 2 tablets containing 0.75 mg levonorgestrel (Plan B). **Implant:** Rod contains 68 mg etonogestrel. **Intrauterine system:** contains 52 mg levonorgestrel (releases 20 mcg/day).

### Medroxyprogesterone (generic available)

**Injectable IM:** 150 mg/mL. **Injectable Subcutaneous:** 104 mg/0.65 mL (in pre-filled syringes).

### Vaginal Ring Contraceptive

**Ring:** delivers 0.015 mg ethinyl estradiol and 0.120 mg etonogestrel/day. **Cost:** $289.95/6 rings.

### Transdermal Patch

**Patch:** contains 0.75 mg ethinyl estradiol and 6 mg of norelgestromin; releases 20 mg ethinyl estradiol/150 mg norelgestromin per 24 hr. **Cost:** $299.95/18 patches.

## NURSING IMPLICATIONS

### Assessment

- Assess blood pressure before and periodically during therapy.
- **Acne:** Assess skin lesion before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor hepatic function periodically during therapy.
- *Estrogens only*—May cause ↑ serum glucose, sodium, triglyceride, VHDL, total cholesterol, prothrombin, and factors VII, VIII, IX, and X levels. May cause ↓ LDL and antithrombin III levels.
- May cause false interpretations of thyroid function tests.
- *Progestins only*—May cause ↑ LDL concentrations. May cause ↓ serum alkaline phosphatase and HDL concentrations.

### Potential Nursing Diagnoses

Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Oral doses may be administered with or immediately after food to reduce nausea. Chewable tablets may be swallowed whole or chewed; if chewed follow with 8 ounces of liquid.
- For extended-cycle tablets, *Jolessa, Quasense, Seasonale, Seasonique, or LoSeasonique*—

take active tablets for 84 days and followed by the placebo tablets for 7 days; for *Lybrel*—Take 1 pill each day for 28 days, then start the next set of pills daily for the next 28 days.

- For *Emergency Contraception*—Tablets are taken as soon as possible and within 72 hr after unprotected intercourse. Two doses are taken 12 hr apart. Emergency contraception products are available without a prescription to women 17 or older and by prescription for women under 17 yr.
- **Subcut:** Shake vigorously before use to form a uniform suspension. Inject slowly (over 5–7 seconds) at a 45° angle into fatty area of anterior thigh or abdomen every 12 to 14 wk. If more than 14 wk elapse between injections, rule out pregnancy prior to administration. Do not rub area after injection.
- When switching from other hormonal contraceptives, administer within dosing period (7 days after taking last active pill, removing patch or ring, or within the dosing period for IM injection).
- **IM:** Shake vial vigorously just before use to ensure uniform suspension. Administer deep IM into gluteal or deltoid muscle. If period between injections is >14 wk, determine that patient is not pregnant before administering the drug.
- Injectable medroxyprogesterone may lead to bone loss, especially in women younger than 21 yr. Injectable medroxyprogesterone should be used for >2 yr only if other methods of contraception are inadequate. If used long term, women should use supplemental calcium and vitamin D, and monitor bone mineral density.
- **Intrauterine system:** Should be inserted by a trained health care provider. Health care providers are advised to become thoroughly familiar with the insertion instructions before attempting insertion. Following insertion counsel patient on what to expect following insertion. Give patient *Follow-up Reminder Card* provided with product. Discuss expected bleeding patterns during the first months of use. Prescribe analgesics, if indicated. Patients should be reexamined and evaluated 4 to 12 weeks after insertion and once a year thereafter, or more frequently if clinically indicated.

## Patient/Family Teaching

- Instruct patient to take oral medication as directed at the same time each day. Pills should be taken in proper sequence and kept in the original container. Advise patient not to skip pills even if not having sex very often.
- *If single daily dose is missed:* Take as soon as remembered; if not until next day, take 2 tablets and continue on regular dosing schedule. *If 2 days in a row are missed:* Take 2 tablets a day for the next 2 days and continue on regular dosing schedule, using a second method of birth control for the remaining cycle. *If 3 days in a row are missed:* Discontinue medication and use another form of birth control until period begins or pregnancy is ruled out; then begin a new cycle of tablets. *For 28-day dosing schedule:* If schedule is followed for first 21 days and 1 dose is missed of the last 7 tablets, it is important to take the 1st tablet of next month's cycle on the regularly scheduled day.
- Advise patient taking *Jolessa, Quasense, Seasonale, Sesonique,* or *LoSeasonique extended-cycle tablets* that withdrawal bleeding should occur during the 7 days following discontinuation of the active tablets. If withdrawal bleeding does not occur, notify health care professional. Advise patient taking *Lybrel* that no withdrawal bleeding should occur.
- For initial use of *Jolessa, Quasense, Seasonale, Seasonique,* or *LoSeasonique extended cycle tablets*, caution patient to use a nonhormonal method of contraception until she has taken the first 7 days of active tablets. Each 91-day cycle should start on the same day of the week. If started later than the proper day or 2 or more days are missed, a second nonhormonal method of contraception should be used until she has taken the pink tablet for 7 days. Transient spotting or bleeding may occur. If bleeding is persistent or prolonged, notify health care professional.
- Advise patient taking extended cycle tablets that spotting or light bleeding may occur, especially during first 3 months. Continue medication; notify health care professional if bleeding lasts >7 days.
- Advise patient of the need to use another form of contraception for the first 3 wk when beginning to use *oral contraceptives*.
- Advise patient that a second method of birth control should also be used during each cycle in which any of the following are used: *Oral contraceptives*—ampicillin, corticosteroids, antiretroviral protease inhibitors, barbiturates, carbamazepine, chloramphenicol, dihydroergotamine, corticosteroids (systemic), mineral

oil, oral neomycin, oxcarbazapine, penicillin V, phenylbutazone, primidone, rifampin, sulfonamides, tetracyclines, topiramate, or valproic acid.
- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding.
- If nausea becomes a problem, advise patient that eating solid food often provides relief. If nausea persists or vomiting or diarrhea occur, use a nonhormonal method of contraception and notify health care professional.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools), or abnormal vaginal bleeding. Women with a strong family history of breast cancer, fibrocystic breast disease, abnormal mammograms, or cervical dysplasia should be monitored for breast cancer at least yearly.
- Instruct patient to stop taking medication and notify health care professional if pregnancy is suspected.
- Caution patient that cigarette smoking during estrogen therapy may increase risk of serious side effects, especially for women over age 35.
- Caution patients to use sunscreen and protective clothing to prevent increased pigmentation.
- Caution patient that hormonal contraceptives do not protect against HIV or other sexually transmitted diseases.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of routine follow-up physical exams including blood pressure; breast, abdomen, and pelvic examinations; and Papanicolaou smears every 6–12 mo.
- **IM, Subcut:** Advise patient to maintain adequate amounts of dietary calcium and vitamin D to help prevent bone loss.
- **Transdermal:** Instruct patient on application of patch. First patch should be applied within 24 hr of menstrual period. If applied after Day 1 of menstrual period, a nonhormonal method of contraception should be used for the next 7 days. Day of application becomes *Patch Change Day*. Patches are worn for 1 wk and changed on the same day of each wk for 3 wk. Week 4 is patch-free. Withdrawal bleeding is expected during this time.
- Apply patch to clean, dry, intact, healthy skin on buttock, abdomen, upper outer arm, or upper torso in a place where it won't be rubbed by tight clothing. Do not place on skin that is red, irritated, or cut, and do not place on breasts. Do not apply make-up, creams, lotions, powders, or other topical products to area of patch application.
- To apply patch open foil pouch by tearing along edge using fingers. Peel pouch apart and open flat. Grasp a corner of the patch firmly and remove gently from foil pouch. Use fingernail to lift one corner of the patch and peel patch **and** the plastic liner off the foil liner. Do not remove clear liner as patch is removed. Peel away half of the clear liner without touching sticky surface. Apply the sticky surface and remove the rest of the liner. Press down firmly with palm of hand for 10 seconds; make sure the edges stick well.
- On *Patch Change Day* remove patch and apply new one immediately. Used patch still contains some active hormones; fold in half so it sticks to itself and throw away. Apply new patches to a new spot to prevent skin irritation; may be applied in same anatomic area.
- Following patch-free week, apply a new patch on *Patch Change Day*, the day after Day 28, no matter when the menstrual cycle begins.
- If patch becomes partially or completely detached for less than 1 day, reapply patch or apply new patch. If patch is detached for more than 1 day, apply a new patch immediately and use a nonhormonal form of contraception for the next 7 days. Cycle will now start over with a new *Patch Change Day*. If patch is no longer sticky, apply a new patch; do not use tape or wraps to keep patch in place.
- If patch is not changed on *Patch Change Day* in the first week of the cycle, apply new patch immediately upon remembering and use a nonhormonal method of contraception for next 7 days. If patch change is missed in for 1 or 2 days during Week 2 or 3, apply new patch immediately and apply next patch on usual *Patch Change Day*. No backup contraception is needed. If patch change is missed for more than 2 days during Week 2 or 3, stop the cycle and start a new 4-wk contraceptive cycle by applying new patch immediately and using a nonhormonal method of contraception for the next 7 days. If patch is not removed on *Patch Change Day* in Week 4, remove as soon as remembered and start next cycle on usual *Patch Change Day*. No additional contraception is needed.

- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **NuvaRing:** *If a hormonal contraceptive was not used in the past month*, insert *NuvaRing* between Days 1 and 5 of the menstrual cycle (Day 1 = first day of menstrual period), even if bleeding has not finished. Use a nonhormonal method of birth control other than a diaphragm during the first 7 days of ring use. *If switching from a combination estrogen/progesterone oral contraceptive*, insert *NuvaRing* any time during first 7 days after last tablet and no later than the day a new pill cycle would have started. No extra birth control is needed. *If switching from a mini-pill*, start using *NuvaRing* on any day of the month; do not skip days between last pill and first day of *NuvaRing* use. *If switching from an implant*, start using *NuvaRing* on same day implant is removed. *If switching from an injectable contraceptive*, start using *NuvaRing* on the day when next injection is due. *If switching from a progestin-containing IUD*, start using *NuvaRing* on the same day as IUD is removed. A nonhormonal method of contraception, other than the diaphragm, should be used for the first 7 days of *NuvaRing* use when switching from the mini-pill, implant, injectable contraceptive, or IUD.
- *NuvaRing* comes in a reclosable foil pouch. Instruct patient to wash hands, then remove *NuvaRing* from pouch; keep pouch for ring disposal. Using a position of comfort (lying down, squatting, or standing with one leg up), hold *NuvaRing* between thumb and index finger and press opposite sides of the ring together. Gently push folded ring into vagina. Exact position is not important for function of *NuvaRing*. Most women do not feel *NuvaRing* once it is in place. If discomfort is felt, *NuvaRing* may not be inserted far enough into vagina; use finger to push further into vagina. *There is no danger of NuvaRing being pushed in too far or getting lost*. Once inserted, leave *NuvaRing* in place for 3 wk.
- Remove ring 3 wk after insertion on same day and time of insertion. Remove by hooking finger under forward rim or by holding ring between index and middle finger and pulling out. Place ring in foil pouch and dispose; do not throw in toilet. Menstrual period will usually start 2–3 days after ring is removed and may not have finished before next ring is inserted. To continue contraceptive protection, new ring must be inserted 1 wk after last one was removed, even if menstrual period has not stopped.
- If *NuvaRing* slips out of vagina and has been out less than 3 hr, contraceptive protection is still in place. *NuvaRing* can be rinsed in cool to tepid water and should be reinserted as soon as possible. If ring is lost, insert a new ring and continue same schedule as lost ring. If *NuvaRing* has been out of vagina for more than 3 hr, a nonhormonal method of contraception, other than a diaphragm, should be used for the next 7 days.
- *If NuvaRing has been left in for an extra wk or less (4 wk total or less)*, remove and insert a new ring after a 1-wk ring-free break. If *NuvaRing* has been left in place for more than 4 wk, woman should check to be sure she is not pregnant. A nonhormonal method of contraception, other than a diaphragm, must be used for the next 7 days.
- **Intrauterine system:** Advise patient to notify health care professional if pelvic pain or pain during sex, unusual vaginal discharge or genital sores, unexplained fever, exposure to sexually transmitted infections, very severe or migraine headaches, yellowing of skin or whites of the eyes, very severe vaginal bleeding or bleeding that lasts a long time occurs, if a menstrual period is missed, or if *Mirena's* threads cannot be felt.

### Evaluation/Desired Outcomes

- Prevention of pregnancy.
- Regulation of the menstrual cycle.
- Decrease in menstrual blood loss.
- Decrease in acne.
- Decrease in symptoms of premenstrual dysphoric disorder.

## CORTICOSTEROIDS (INHALATION)

**beclomethasone** (be-kloe-**meth**-a-sone)
QVAR

**budesonide** (byoo-**dess**-oh-nide)
Pulmicort Respules, Pulmicort Flexhaler

**flunisolide** (floo-**niss**-oh-lide)
AeroBid, AeroBid-M, Aerospan

**fluticasone** (floo-**ti**-ka-sone)
Flovent Diskus, Flovent HFA

**mometasone** (mo-**met**-a-sone)
Asmanex

***Classification***
Therapeutic: antiasthmatics, anti-inflammatories (steroidal)
Pharmacologic: corticosteroids (inhalation)

**Pregnancy Category B (budesonide), C (all others)**

## Indications
Maintenance treatment of asthma as prophylactic therapy. May decrease the need for or eliminate use of systemic corticosteroids in patients with asthma.

## Action
Potent, locally acting anti-inflammatory and immune modifier. **Therapeutic Effects:** Decreased frequency and severity of asthma attacks. Improves asthma symptoms.

## Pharmacokinetics
**Absorption:** *Beclomethasone*—20%; *budesonide*—6–13% (Flexhaler), 6% (Respules); *flunisolide*—40%; *fluticasone*—<7% (aerosol), 18% (powder); *mometasone*—<1%. Action is primarily local after inhalation.
**Distribution:** 10–25% is deposited in airways if a spacer device is not used. All cross the placenta and enter breast milk in small amounts.
**Metabolism and Excretion:** *Beclomethasone*—after inhalation, beclomethasone dipropionate is converted to beclomethasone monopropionate, an active metabolite that adds to its potency, primarily excreted in feces (<10% excreted in urine; *Budenoside, flunisolide, fluticasone, mometasone*—metabolized by the liver after absorption from lungs; *Budenoside*—60% excreted in urine, 40% in feces; *flunisolide*—50% excreted in urine, 50% in feces; *fluticasone*—primarily excreted in feces (<5% excreted in urine); *mometasone*—75% excreted in feces.
**Half-life:** *Beclomethasone*—2.8 hr; *budesonide*—2–3.6 hr; *flunisolide*—1.8 hr; *fluticasone*—7.8 hr; *mometasone*—5 hr.

TIME/ACTION PROFILE (improvement in symptoms)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Inhalation | within 24 hr‡ | 1–4 wk† | unknown |

†Improvement in pulmonary function; decreased airway responsiveness may take longer.
‡2–8 days for budesonide respule.

## Contraindications/Precautions
**Contraindicated in:** Some products contain alcohol or lactose and should be avoided in patients with known hypersensitivity or intolerance; Acute attack of asthma/status asthmaticus.
**Use Cautiously in:** Active untreated infections; Diabetes or glaucoma; Underlying immunosuppression (due to disease or concurrent therapy); Systemic corticosteroid therapy (should not be abruptly discontinued when inhalation therapy is started; additional corticosteroids needed in stress or trauma); Hepatic dysfunction (fluticasone); OB, Lactation: Safety not established; Pedi: Prolonged or high-dose therapy may lead to complications.

## Adverse Reactions/Side Effects
**CNS:** headache, agitation, depression, dizziness, fatigue, insomnia, restlessness. **EENT:** dysphonia, hoarseness, cataracts, nasal congestion, pharyngitis, sinusitis. **Resp:** bronchospasm, cough, wheezing. **GI:** diarrhea, dry mouth, dyspepsia, esophageal candidiasis, taste disturbances, nausea. **Endo:** adrenal suppression (↑ dose, long-term therapy only), decreased growth (children), ↓ bone mineral density (fluticasone). **MS:** back pain. **Misc:** CHURG-STRAUSS SYNDROME.

## Interactions
**Drug-Drug: Ketoconazole** ↑ levels of budesonide, fluticasone, and mometasone. **Ritonavir** ↑ levels of budesonide and fluticasone; avoid using with fluticasone. **Itraconazole**, **clarithromycin**, and **erythromycin** ↑ levels of budesonide.

## Route/Dosage

### Beclomethasone
**Inhaln (Adults and Children ≥12 yr):** *Previously on bronchodilators alone*—40–80 mcg twice daily (not to exceed 320 mcg twice daily); *Previously on inhaled corticosteroids*—40–160 mcg twice daily (not to exceed 320 mcg twice daily).
**Inhaln (Children 5–11 yr):** *Previously on bronchodilators alone*—40 mcg twice daily (not to exceed 80 mcg twice daily); *Previously on inhaled corticosteroids*—40 mcg twice daily (not to exceed 80 mcg twice daily).

### Budesonide (Pulmicort Flexhaler)

**Inhaln (Adults):** 180–360 mcg twice daily (not to exceed 720 mcg twice daily).
**Inhaln (Children ≥6 yr):** 180–360 mcg twice daily (not to exceed 360 mcg twice daily).

### Budesonide (Pulmicort Respules)

**Inhaln (Children 1–8 yr):** *Previously on bronchodilators alone*—0.5 mg once daily or 0.25 mg twice daily (not to exceed 0.5 mg/day); *Previously on other inhaled corticosteroids*—0.5 mg once daily or 0.25 mg twice daily (not to exceed 1 mg/day); *Previously on oral corticosteroids*—1 mg once daily or 0.5 mg twice daily (not to exceed 1 mg/day).

### Flunisolide

**Aerobid and Aerospan inhalers are not interchangeable; the dosage changes when switching from one product to another**
**Inhaln (Adults and Children >15 yr [Aerobid/Aerobid-M Inhaler]):** 500 mcg (2 inhalations) twice daily (not to exceed 4 inhalations twice daily).
**Inhaln (Adults and Children ≥12 yr [Aerospan Inhaler]):** 160 mcg (2 inhalations) twice daily (not to exceed 4 inhalations twice daily).
**Inhaln (Children 6–15 yr [Aerobid/Aerobid-M Inhaler]):** 500 mcg (2 inhalations) twice daily (not to exceed 2 inhalations twice daily).
**Inhaln (Children 6–11 yr [Aerospan Inhaler]):** 80 mcg (1 inhalation) twice daily (not to exceed 2 inhalations twice daily).

### Fluticasone (Aerosol Inhaler)

**Inhaln (Adults and Children ≥12 yr):** *Previously on bronchodilators alone*—88 mcg twice daily initially, may be ↑ up to 440 mcg twice daily; *Previously on other inhaled corticosteroids*—88–220 mcg twice daily initially, may be ↑ up to 440 mcg twice daily; *Previously on oral corticosteroids*—440 mcg twice daily initially, may be ↑ up to 880 mcg twice daily.
**Inhaln (Children 4–11 yr):** 88 mcg twice daily (not to exceed 88 mcg twice daily).

### Fluticasone (Dry Powder Inhaler)

**Inhaln (Adults and Children ≥12 yr):** *Previously on bronchodilators alone*—100 mcg twice daily initially, may be ↑ up to 500 mcg twice daily; *Previously on other inhaled corticosteroids*—100–250 mcg twice daily initially, may be ↑ up to 500 mcg twice daily; *Previously on oral corticosteroids*—500–1000 mcg twice daily.
**Inhaln (Children 4–11 yr):** *Previously on bronchodilators alone*—50 mcg twice daily initially, may be ↑ up to 100 mcg twice daily; *Previously on other inhaled corticosteroids*—50 mcg twice daily, may be ↑ up to 100 mcg twice daily.

### Mometasone

**Inhaln (Adults and Children >12 yr):** *Previously on bronchodilators or other inhaled corticosteroids*—220 mcg (1 inhalation) once daily, up to 440 mcg/day as a single dose or 2 divided doses; *Previously on oral corticosteroids*—440 mcg (2 inhalations) twice daily (not to exceed 880 mcg/day).

### Availability

#### Beclomethasone

**Inhalation aerosol:** 40 mcg/metered inhalation in 7.3-g canister (delivers 100 metered inhalations), 80 mcg/metered inhalation in 7.3-g canister (delivers 100 metered inhalations). **Cost:** 40 mcg/metered inhalation $41.32/7.3–g canister; 80 mcg metered inhalation $52.04/7.3-g canister.

#### Budesonide

**Inhalation powder (Flexhaler):** 90 mcg/metered inhalation (delivers 60 metered inhalations), 180 mcg/metered inhalation (delivers 120 metered inhalations). **Inhalation suspension (Respules):** 0.25 mg/2 mL in single-dose ampules (5 ampules/envelope), 0.5 mg/2 mL in single-dose ampules (5 ampules/envelope), 1 mg/2 mL in single-dose ampules (5 ampules/envelope). **Cost:** 0.25 mg/2 mL $158.99/20 ampules, 0.5 mg/2 mL $187.00/30 ampules. ***Inhalation with:*** formoterol (Symbicort). See Appendix B.

#### Flunisolide

**Inhalation aerosol (Aerobid):** 250 mcg/metered inhalation in 7-g canisters (delivers 100 metered inhalations). **Inhalation aerosol-menthol (Aerobid-M):** 250 mcg/metered inhalation in 7-g canisters (delivers 100 metered inhalations). **Inhalation aerosol (Aerospan):** 80 mcg/metered inhalation in 5.1-g canisters (delivers 60 metered inhalations) or 8.9-g canisters (delivers 120 metered inhalations).

#### Fluticasone

**Inhalation aerosol (Flovent-HFA):** 44 mcg/metered inhalation in 10.6-g canisters (delivers

120 metered inhalations), 110 mcg/metered inhalation in 12-g canisters (delivers 120 metered inhalations), 220 mcg/metered inhalation in 12-g canisters (delivers 120 metered inhalations). **Cost:** 44 mcg/inhalation $90.00/inhaler, 110 mcg/inhalation $118.99/inhaler, 220 mcg/inhalation $193.52/inhaler. **Powder for inhalation (Flovent Diskus):** 50 mcg, 100 mcg, 250 mcg. ***In combination with:*** salmeterol (Advair). See Appendix B.

### Mometasone

**Powder for inhalation (Twisthaler):** 110 mcg (delivers 100 mcg/metered inhalation; in packages of 7 and 30 inhalation units), 220 mcg (delivers 200 mcg/metered inhalation; in packages of 14, 30, 60, and 120 inhalation units).

## NURSING IMPLICATIONS

### Assessment

- Monitor respiratory status and lung sounds. Assess pulmonary function tests periodically during and for several months after a transfer from systemic to inhalation corticosteroids.
- Assess patients changing from systemic corticosteroids to inhalation corticosteroids for signs of adrenal insufficiency (anorexia, nausea, weakness, fatigue, hypotension, hypoglycemia) during initial therapy and periods of stress. If these signs appear, notify health care professional immediately; condition may be life-threatening.
- Monitor for withdrawal symptoms (joint or muscular pain, lassitude, depression) during withdrawal from oral corticosteroids.
- Monitor growth rate in children receiving chronic therapy; use lowest possible dose.
- May cause decreased bone mineral density during prolonged therapy. Monitor patients with increased risk (prolonged immobilization, family history of osteoporosis, post-menopausal status, tobacco use, advanced age, poor nutrition, chronic use of drugs that can reduce bone mass [anticonvulsants, oral corticosteroids]) for fractures.
- ***Lab Test Considerations:*** Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in chronic therapy. Children and patients using higher than recommended doses are at highest risk for HPA suppression.
- May cause ↑ serum and urine glucose concentrations if significant absorption occurs.

### Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for infection (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

- After the desired clinical effect has been obtained, attempts should be made to decrease dose to lowest amount required to control symptoms. Gradually decrease dose every 2–4 wk as long as desired effect is maintained. If symptoms return, dose may briefly return to starting dose.
- **Inhaln:** Allow at least 1 min between inhalations.

### Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose. Instruct patient to read the *Patient Information and Instructions for Use* before using and with each Rx refill, in case of new information. Advise patient not to discontinue medication without consulting health care professional; gradual decrease is required.
- Advise patients using inhalation corticosteroids and bronchodilator to use bronchodilator first and to allow 5 min to elapse before administering the corticosteroid, unless otherwise directed by health care professional.
- Advise patient that inhalation corticosteroids should not be used to treat an acute asthma attack but should be continued even if other inhalation agents are used.
- Patients using inhalation corticosteroids to control asthma may require systemic corticosteroids for acute attacks. Advise patient to use regular peak flow monitoring to determine respiratory status.
- Caution patient to avoid smoking, known allergens, and other respiratory irritants.
- Advise patient to notify physician if sore throat or sore mouth occurs.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Instruct patient whose systemic corticosteroids have been recently reduced or withdrawn to carry a warning card indicating the need for supplemental systemic corticosteroids in the event of stress or severe asthma attack unresponsive to bronchodilators.
- **Metered-Dose Inhaler:** Instruct patient in the proper use of the metered-dose inhaler. Most inhalers require priming before first use. Shake inhaler well. Exhale completely, and then close lips firmly around mouthpiece. While breathing in deeply and slowly, press

down on canister. Hold breath for as long as possible to ensure deep instillation of medication. Remove inhaler from mouth and breathe out gently. Allow 1–2 min between inhalations. Rinse mouth with water or mouthwash after each use to minimize fungal infections, dry mouth, and hoarseness. Clean the mouthpiece weekly with clean, dry tissue or cloth. Do not place in water (see Appendix D).

- **Pulmicort Flexhaler:** Advise patient to follow instructions supplied. Before first-time use, prime unit by turning cover and lifting off; hold upright with mouthpiece up and twist brown grip fully to right, then fully to left until it clicks. To administer dose, hold upright, twist brown grip fully to right, then fully to left until it clicks. Turn head away from inhaler and exhale (do not blow into inhaler). Do not shake inhaler. Place mouthpiece between lips and inhale deeply and forcefully. Remove inhaler from mouth and exhale (do not exhale into mouthpiece). Repeat procedure if 2nd dose required. Replace cover; rinse mouth with water (do not swallow).
- **Pulmicort Respules:** Administer with a jet nebulizer connected to adequate air flow, equipped with a mouthpiece or face mask. Adjust face mask to avoid exposing eyes to nebulized medication. Wash face after use of face mask. Ultrasonic nebulizers are not adequate for administration and not recommended. Store respules upright, away from heat and protected from light. Do not refrigerate or freeze. Respules are stable for 2 wk at room temperature after opening aluminum foil envelope. Open respules must be used promptly. Unused respules should be returned to aluminum foil envelope.
- **Flovent Diskus:** Do not use with a spacer. Exhale completely and then close lips firmly around mouthpiece. While breathing in deeply and slowly, press down on canister. Hold breath for as long as possible to ensure deep instillation of medication. Remove inhaler from mouth and breathe out gently. Allow 1–2 min between inhalations. After inhalation, rinse mouth with water and spit out (see Appendix D). Never wash the mouthpiece or any part of the Diskus inhaler. Discard Diskus inhaler device 6 wk (50-mcg strength) or 2 mo (100-mcg and 250-mcg strengths) after removal from protective foil overwrap pouch or after all blisters have been used (whichever comes first).
- **Asmanex Twisthaler:** Advise patient to remove cap while device is in upright position. To administer dose, exhale fully, then place mouthpiece between lips and inhale deeply and forcefully. Remove device from mouth and hold breath for 10 sec before exhaling (do not exhale into mouthpiece). Wipe the mouthpiece dry, if necessary, and replace the cap on the device. Rinse mouth with water. Advise patient to discard twisthaler 45 days from opening or when dose counter reads "00", whichever comes first.

### Evaluation/Desired Outcomes

- Management of the symptoms of chronic asthma.
- Improvement in symptoms of asthma.

## CORTICOSTEROIDS (NASAL)

**beclomethasone** (be-kloe-**meth**-a-sone)
Beconase AQ, Rivanase AQ

**budesonide** (byoo-**dess**-oh-nide)
Rhinocort Aqua

**ciclesonide** (sye-**kles**-oh-nide)
Omnaris

**flunisolide** (floo-**niss**-oh-lide)
Nasarel, Rhinalar

**fluticasone** (floo-**ti**-ka-sone)
Flonase, Veramyst

**mometasone** (moe-**met**-a-sone)
Nasonex

**triamcinolone** (trye-am-**sin**-oh-lone)
AllerNaze, Nasacort AQ

***Classification***
Therapeutic: anti-inflammatories (steroidal)
Pharmacologic: corticosteroids (nasal)

**Pregnancy Category B (budesonide), C (all others)**

### Indications

Seasonal or perennial allergic rhinitis. Nonallergic rhinitis (fluticasone). Treatment of nasal polyps.

## Action

Potent, locally acting anti-inflammatory and immune modifier. **Therapeutic Effects:** ↓ in symptoms of allergic or nonallergic rhinitis. ↓ in symptoms of nasal polyps.

## Pharmacokinetics

**Absorption:** *Beclomethasone*—44% absorbed; *budesonide*—34% absorbed; *flunisolide*—50% absorbed; *ciclesonide, fluticasone, mometasone*—negligible absorption. Action of all agents is primarily local following nasal use.
**Distribution:** All agents cross the placenta and enter breast milk in small amounts.
**Metabolism and Excretion:** Following absorption from nasal mucosa, corticosteroids are rapidly and extensively metabolized by the liver.
**Half-life:** *Beclomethasone*—2.7 hr; *budesonide*—2–3 hr; *ciclesonide*—unknown; *flunisolide*—1–2 hr; *fluticasone*—7.8 hr; *mometasone*—5.8 hr; *triamcinolone*—3–5.4 hr.

TIME/ACTION PROFILE (improvement in symptoms)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Beclomethasone | 1–3 days | up to 2 wk | unknown |
| Budesonide | 1–2 days | 2 wk | unknown |
| Ciclesonide | 1–2 days | 2–5 wk | unknown |
| Flunisolide | few days | up to 3 wk | unknown |
| Fluticasone | few days | unknown | unknown |
| Mometasone | within 2 days | 1–2 wk | unknown |
| Triamcinolone | few days | 3–4 days | unknown |

## Contraindications/Precautions

**Contraindicated in:** Some products contain alcohol, propylene, or polyethylene glycol and should be avoided in patients with known hypersensitivity or intolerance.
**Use Cautiously in:** Active untreated infections; Diabetes or glaucoma; Underlying immunosuppression (due to disease or concurrent therapy); Systemic corticosteroid therapy (should not be abruptly discontinued when intranasal therapy is started); Recent nasal trauma, septal ulcers, or surgery (wound healing may be impaired by nasal corticosteroids); OB, Lactation, Pedi: Pregnancy, lactation, or children <12 yr (triamcinolone [AllerNaze]) or <6 yr (beclomethasone, budesonide, ciclesonide, flunisolide) or <4 yr (fluticasone [Flonase]) or <2 yr (fluticasone [Veramyst], mometasone, triamcinolone [Nasacort AQ]) (safety not established; prolonged or high-dose therapy may lead to complications).

## Adverse Reactions/Side Effects

**CNS:** dizziness, headache. **EENT:** epistaxis, nasal burning, nasal irritation, nasal congestion, pharyngitis, rhinorrhea, sneezing, tearing eyes. **GI:** dry mouth, esophageal candidiasis, nausea, vomiting. **Derm:** rash (fluticasone), urticaria (fluticasone). **Endo:** adrenal suppression (high-dose, long-term therapy only), growth suppression (children). **Resp:** bronchospasm, cough. **Misc:** ANAPHYLAXIS, ANGIOEDEMA.

## Interactions

**Drug-Drug: Ketoconazole** ↑ effects of budesonide, ciclesonide, and fluticasone. **Ritonavir** ↑ effects of fluticasone (avoid concurrent use).

## Route/Dosage

### Beclomethasone

**Intranasal (Adults and Children ≥12 yr):** 1–2 sprays in each nostril twice daily (not to exceed 2 sprays in each nostril twice daily).
**Intranasal (Children 6–12 yr):** 1–2 sprays in each nostril twice daily; once adequate control achieved, ↓ dose to 1 spray in each nostril twice daily.

### Budesonide

**Intranasal (Adults and Children ≥12 yr):** 1 spray in each nostril once daily (not to exceed 4 sprays in each nostril once daily).
**Intranasal (Children 6–11 yr):** 1 spray in each nostril once daily (not to exceed 2 sprays in each nostril once daily).

### Ciclesonide

**Intranasal (Adults and Children ≥6 yr):** 2 sprays in each nostril once daily (not to exceed 2 sprays in each nostril/day).

### Flunisolide

**Intranasal (Adults and Children >14 yr):** 2 sprays in each nostril twice daily, may be ↑ to 2 sprays in each nostril 3 times daily if greater effect needed after 4–7 days (not to exceed 8 sprays in each nostril/day).
**Intranasal (Children 6–14 yr):** 1 spray in each nostril 3 times daily or 2 sprays in each nostril twice daily (not to exceed 4 sprays in each nostril/day).

### Fluticasone

**Intranasal (Adults and Children ≥12 yrs):** *Flonase*—2 sprays in each nostril once daily or 1 spray in each nostril twice daily; after several days, attempt to ↓ dose to 1 spray in each nostril once daily. Patients ≥12 yr with seasonal allergic rhinitis may also use 2 sprays in each nostril once

daily on an as-needed basis; *Veramyst*—2 sprays in each nostril once daily or 1 spray in each nostril twice daily; after several days, attempt to ↓ dose to 1 spray in each nostril once daily.
**Intranasal (Children >4 yr):** *Flonase*—1 spray in each nostril once daily (not to exceed 2 sprays in each nostril/day).
**Intranasal (Children 2–11 yrs):** *Veramyst*—1 spray in each nostril daily; may ↑ to 2 sprays if no response. Once symptoms are controlled, attempt to ↓ dose to 1 spray/day.

### Mometasone

**Intranasal (Adults and Children >12 yr):** *Treatment of seasonal and perennial allergic rhinitis*—2 sprays in each nostril once daily (not to exceed 2 sprays in each nostril once daily).
**Intranasal (Adults):** *Nasal polyps*—2 sprays in each nostril twice daily (not to exceed 2 sprays in each nostril twice daily).
**Intranasal (Children 2–11 yr):** *Treatment of seasonal and perennial allergic rhinitis*—1 spray in each nostril once daily.

### Triamcinolone

**Intranasal (Adults and Children >12 yr):** *AllerNaze or Nasacort AQ*—2 sprays in each nostril once daily.
**Intranasal (Children 6–11 yr):** *Nasacort AQ*—1 spray in each nostril once daily (not to exceed 2 sprays in each nostril/day).
**Intranasal (Children 2–5 yr):** *Nasacort AQ*—1 spray in each nostril once daily.

## Availability

### Beclomethasone

**Nasal spray:** 42 mcg/metered spray in 25-g bottles (delivers 180 metered sprays), 🍁 50 mcg/metered spray in 25-g bottles (delivers 200 metered sprays).

### Budesonide

**Nasal spray:** 32 mcg/metered spray in 8.6-g canister (delivers 120 metered sprays). **Cost:** $92.99/bottle.

### Ciclesonide

**Nasal spray:** 50 mcg/metered spray in 12.5-g bottle (delivers 120 metered sprays).

### Flunisolide (generic available)

**Nasal solution:** 25 mcg/metered spray in 25-mL bottle (delivers 200 metered sprays), 29 mcg/metered spray in 25-mL bottle (delivers 200 metered sprays).

### Fluticasone (generic available)

**Nasal spray (Flonase):** 50 mcg/metered spray in 16-g bottle (delivers 120 metered sprays). **Cost:** *Generic*—$59.99/bottle. **Nasal spray (Veramyst):** 27.5 mcg/spray in a 10-g bottle (delivers 120 sprays).

### Mometasone

**Nasal spray (scent-free):** 50 mcg/metered spray in 17-g bottle (delivers 120 metered sprays). **Cost:** $89.24/bottle.

### Triamcinolone

**Nasal spray (AllerNaze):** 50 mcg/metered spray in 15-mL bottle (120 metered sprays). **Nasal spray (Nasacort AQ):** 55 mcg/metered spray in 16.5-g bottle (120 metered sprays). **Cost:** $89.99/16.5-g bottle.

## NURSING IMPLICATIONS

### Assessment

- Monitor degree of nasal stuffiness, amount and color of nasal discharge, and frequency of sneezing.
- Patients on long-term therapy should have periodic otolaryngologic examinations to monitor nasal mucosa and passages for infection or ulceration.
- Monitor growth rate in children receiving chronic therapy; use lowest possible dose.
- ***Lab Test Considerations:*** Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in chronic therapy. Children and patients using higher than recommended doses are at highest risk for HPA suppression.

### Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Risk for infection (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

- After desired clinical effect has been obtained, attempt to decrease dose to lowest amount. Gradually decrease dose every 2–4 wk as long as desired effect is maintained. If symptoms return, dose may briefly return to starting dose.
- **Intranasal:** Patients also using a nasal decongestant should be given decongestant 5–15 min before corticosteroid nasal spray. If patient

is unable to breathe freely through nasal passages, instruct patient to blow nose gently in advance of medication administration.

### Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose.
- Caution patient not to exceed maximal daily dose of nasal spray.
- Instruct patient in correct technique for administering nasal spray (see Appendix D). Most nasal sprays include directions with pictures. Instruct patient to read patient information sheet prior to use. Shake well before use. Warn patient that temporary nasal stinging may occur.
- Instruct patient to gently blow nose to clear nostrils prior to administering dose.
- Instruct patient to stop medication and notify health care professional immediately if signs of anaphylaxis (rash, hives, difficulty breathing, swollen lips or throat) occur.
- Advise patient to consult health care professional before taking other Rx, OTC, or herbal products with fluticasone.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Instruct patient to notify health care professional if symptoms do not improve within 1 month, if symptoms worsen, or if sneezing or nasal irritation occurs.

### Evaluation/Desired Outcomes

- Resolution of nasal stuffiness, discharge, and sneezing in seasonal or perennial allergic rhinitis or nonallergic rhinitis.
- Reduction in symptoms of nasal polyps.

## CORTICOSTEROIDS (SYSTEMIC)

### short-acting corticosteroids

**cortisone** (**kor**-ti-sone)
Cortone

**hydrocortisone**
(hye-droe-**kor**-ti-sone)
Cortef, Cortenema, Solu-Cortef

### intermediate-acting corticosteroids

**methylPREDNISolone**
(meth-ill-pred-**niss**-oh-lone)
A-Methapred, Depo-Medrol, Medrol, Solu-Medrol

**prednisoLONE**
(pred-**niss**-oh-lone)
Orapred, Orapred ODT, Pediapred, Prelone

**predniSONE** (**pred**-ni-sone)
Sterapred

**triamcinolone**
(trye-am-**sin**-oh-lone)
Aristospan, Kenalog, Trivaris

### long-acting corticosteroids

**betamethasone**
(bay-ta-**meth**-a-sone)
Betnelan, Betnesol, Celestone, Selestoject

**budesonide** (byoo-**des**-oh-nide)
Entocort EC

**dexamethasone**
(dex-a-**meth**-a-sone)
DexPak

***Classification***
Therapeutic: antiasthmatics, corticosteroids
Pharmacologic: corticosteroids (systemic)

**Pregnancy Category B (prednisone), C (betamethasone, budesonide, dexamethasone, hydrocortisone, methylprednisolone, prednisolone, triamcinolone), D (cortisone)**

### Indications

**Cortisone, hydrocortisone:** Management of adrenocortical insufficiency. **Betamethasone, dexamethasone, hydrocortisone, prednisolone, prednisone, methylprednisolone, triamcinolone:** Used systemically and locally in a wide variety of chronic diseases including: Inflammatory, Allergic, Hematologic, Neoplastic, Autoimmune disorders. **Methylprednisolone, prednisone:** With other immunosuppressants in the prevention of organ rejection in transplantation surgery. Asthma. **Dexamethasone:** Management of cerebral edema: Diagnostic agent in adrenal disorders. **Budesonide:** Treatment of mild to moderate Crohn's disease. **Unlabeled Use:** Short-term administration to high-risk mothers before delivery to prevent respiratory distress syndrome in the newborn (betamethasone, dexamethasone). Adjunctive therapy of hypercalcemia (prednisone, prednisolone, methylprednisolone). Management of acute spinal cord injury (methylprednisolone). Adjunctive management of nausea and vomiting from chemotherapy (dexamethasone, prednisone, prednisolone, methylpredniso-

lone). Management of croup (dexamethasone). Treatment of airway edema prior to extubation (dexamethasone). Facilitation of ventilator weaning in neonates with bronchopulmonary dysplasia (dexamethasone).

## Action

In pharmacologic doses, all agents suppress inflammation and the normal immune response. All agents have numerous intense metabolic effects (see Adverse Reactions/Side Effects). Suppress adrenal function at chronic doses of *betamethasone*—0.6 mg/day; *cortisone, hydrocortisone*—20 mg/day; *dexamethasone*—0.75 mg/day; *methylprednisolone, triamcinolone*—4 mg/day; *prednisone/prednisolone*—5 mg/day. **Cortisone, hydrocortisone:** Replace endogenous cortisol in deficiency states. **Cortisone, hydrocortisone:** Have potent mineralocorticoid (sodium-retaining) activity. **Prednisolone, prednisone:** Have minimal mineralocorticoid activity. **Betamethasone, dexamethasone, methylprednisolone, triamcinolone:** Have negligible mineralocorticoid activity. **Budesonide:** Local anti-inflammatory activity in the lumen of the GI tract. **Therapeutic Effects:** Suppression of inflammation and modification of the normal immune response. Replacement therapy in adrenal insufficiency. **Budesonide:** Improvement in symptoms/sequelae of Crohn's disease.

## Pharmacokinetics

**Absorption:** Well absorbed after oral administration (except budesonide). Sodium phosphate and sodium succinate salts are rapidly absorbed after IM administration. Acetate and acetonide salts are slowly but completely absorbed after IM administration. Absorption from local sites (intra-articular, intralesional) is slow but complete. Bioavailability of budesonide is 9–21%.
**Distribution:** All are widely distributed, cross the placenta, and probably enter breast milk.
**Metabolism and Excretion:** All are metabolized mostly by the liver to inactive metabolites. *Cortisone* is converted by the liver to hydrocortisone. *Prednisone* is converted by the liver to prednisolone, which is then metabolized by the liver.
**Half-life:** *Betamethasone*—3–5 hr (plasma), 36–54 hr (tissue). *Budesonide*—2.0–3.6 hr. *Cortisone*—0.5 hr (plasma), 8–12 hr (tissue). *Dexamethasone*—3–4.5 hr (plasma), 36–54 hr (tissue). *Hydrocortisone*—1.5–2 hr (plasma), 8–12 hr (tissue). *Methylprednisolone*—>3.5 hr (plasma), 18–36 hr (tissue). *Prednisolone*—2.1–3.5 hr (plasma), 18–36 hr (tissue). *Prednisone*—3.4–3.8 hr (plasma), 18–36 hr (tissue). *Triamcinolone*—2–5 hr (plasma), 18–36 hr (tissue).

TIME/ACTION PROFILE (anti-inflammatory activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Betamethasone PO | unknown | 1–2 hr | 3.25 days |
| Betamethasone IM (acetate/sodium phosphate) | 1–3 hr | unknown | 1 wk |
| Budesonide PO | unknown | unknown | unknown |
| Cortisone PO | rapid | 2 hr | 1.25–1.5 days |
| Dexamethasone PO | unknown | 1–3 hr | 2.75 days |
| Dexamethasone IM, IV (sodium phosphate) | rapid | unknown | 2.75 days |
| Hydrocortisone PO | unknown | 1–2 hr | 1.25–1.5 days |
| Hydrocortisone IM (sodium succinate) | rapid | 1 hr | variable |
| Hydrocortisone IV (sodium succinate) | rapid | unknown | unknown |
| Methylprednisolone PO | unknown | 1–2 hr | 1.25–1.5 days |
| Methylprednisolone IM (acetate) | 6–48 hr | 4–8 days | 1–4 wk |
| Methylprednisolone IM, IV (sodium succinate) | rapid | unknown | unknown |
| Prednisolone PO | unknown | 1–2 hr | 1.25–1.5 days |
| Prednisone PO | unknown | 1–2 hr | 1.25–1.5 days |
| Triamcinolone IM (acetonide) | 24–48 hr | unknown | 1–6 wk |
| Triamcinolone Intralesional (hexacetonide) | slow | unknown | 4 days–4 wk |

## Contraindications/Precautions

**Contraindicated in:** Active untreated infections (may be used in patients being treated for some forms of meningitis); Lactation: Avoid chronic use; Known alcohol, bisulfite, or tartrazine hypersensitivity or intolerance (some products contain these and should be avoided in susceptible patients); Administration of live virus vaccines.

**Use Cautiously in:** Chronic treatment (will lead to adrenal suppression; use lowest possible dose for shortest period of time); Hypothyroidism; Cirrhosis; Pedi: Children (chronic use will result in ↓ growth; use lowest possible dose for shortest period of time); Stress (surgery, infections); supplemental doses may be needed; Potential infections may mask signs (fever, inflammation); OB: Safety not established; Pedi: Neonates (avoid use of benzyl alcohol containing injectable preparations; use preservative-free formulations).

## Adverse Reactions/Side Effects

Adverse reactions/side effects are much more common with high-dose/long-term therapy. **CNS:** depression, euphoria, headache, ↑ intracranial pressure (children only), personality changes, psychoses, restlessness. **EENT:** cataracts, ↑ intraocular pressure. **CV:** hypertension. **GI:** PEPTIC ULCERATION, anorexia, nausea, vomiting. **Derm:** acne, ↓ wound healing, ecchymoses, fragility, hirsutism, petechiae. **Endo:** adrenal suppression, hyperglycemia. **F and E:** fluid retention (long-term high doses), hypokalemia, hypokalemic alkalosis. **Hemat:** THROMBOEMBOLISM, thrombophlebitis. **Metab:** weight gain. **MS:** muscle wasting, osteoporosis, avascular necrosis of joints, muscle pain. **Misc:** cushingoid appearance (moon face, buffalo hump), ↑ susceptibility to infection.

## Interactions

**Drug-Drug:** ↑ risk of hypokalemia with **thiazide** and **loop diuretics**, or **amphotericin B**. Hypokalemia may ↑ risk of **digoxin** toxicity. May increase requirement for **insulin** or **oral hypoglycemic agents**. **Phenytoin**, **phenobarbital**, and **rifampin** ↑ metabolism; may ↓ effectiveness. **Hormonal contraceptives** may ↓ metabolism. ↑ risk of adverse GI effects with **NSAIDs** (including aspirin). At chronic doses that suppress adrenal function, may ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**. May increase serum concentrations of **cyclosporine** and **tacrolimus**. May ↑ risk of tendon rupture from **fluoroquinolones**. **Antacids** ↓ absorption of prednisone and dexamethasone. Known inhibitors of the CYP3A4 enzyme including **ketoconazole**, **itraconazole**, **ritonavir**, **indinavir**, **saquinavir**, and **erythromycin** may ↑ blood levels and effects of budesonide (↓ dose may be necessary). May ↓ **isoniazid** levels and effectiveness. May antagonize the effects of **anticholinergic agents** in myasthenia gravis.

**Drug-Food: Grapefruit juice** ↑ serum levels and effects of budesonide (avoid concurrent use).

## Route/Dosage

### Betamethasone

**PO (Adults):** 0.6–7.2 mg/day as single daily dose or in divided doses.

**PO (Children):** *Adrenocortical insufficiency*—17.5 mcg/kg/day (500 mcg/m²/day) in 3 divided doses. *Other uses*—62.5–250 mcg/kg/day (1.875–7.5 mg/m²/day) in 3 divided doses.

**IM (Adults):** 0.5–9 mg as betamethasone sodium phosphate/acetate suspension. *Prevention of respiratory distress syndrome in newborn*—12 mg daily for 2–3 days before delivery (unlabeled).

**IM (Children):** *Adrenocortical insufficiency*—17.5 mcg/kg/day (500 mcg/m²/day) in 3 divided doses every 3rd day or 5.8–8.75 mcg/kg (166–250 mcg/m²)/day as a single dose.

### Budesonide

**PO (Adults):** *Active Crohn's disease*—9 mg once daily in the morning for ≤8 weeks, may repeat 8 wk course for recurring episodes. *Maintenance of remission*—6 mg once daily for up to 3 months; once symptoms are controlled, taper to complete cessation.

### Cortisone

**PO (Adults):** 25–300 mg/day in divided doses q 12–24 hr.

**PO (Children):** *Adrenocortical insufficiency*—0.7 mg/kg/day (20–25 mg/m²/day) in divided doses q 8 hr. *Other uses*—2.5–10 mg/kg/day (75–300 mg/m²/day) in divided doses q 6–8 hr.

### Dexamethasone

**PO, IM, IV (Adults):** *Anti-inflammatory*—0.75–9 mg daily in divided doses q 6–12 hr. *Airway edema or extubation*—0.5–2 mg/kg/day divided q 6 hr; begin 24 hr prior to extubation and continue for 24 hr post-extubation. *Cerebral edema*—10 mg IV, then 4 mg IM or IV q 6 hr until maximal response achieved, then switch to PO regimen and taper over 5–7 days.

**PO, IM, IV (Children):** *Airway edema or extubation*—0.5–2 mg/kg/day divided q 6 hr; begin

24 hr prior to extubation and continue for 24 hr post-extubation. *Anti-inflammatory*—0.08–0.3 mg/kg/day or 2.5–10 mg/m²/day divided q 6–12 hr. *Physiologic replacement*—0.03–0.15 mg/kg/day or 0.6–0.75 mg/m²/day divided q 6–12 hr.

**PO (Adults):** *Suppression test*—1 mg at 11PM or 0.5 mg q 6 hr for 48 hr.

**IV (Children):** *Chemotherapy-induced emesis*—5–20 mg given 15–30 min before treatment; *Cerebral edema*—Loading dose 1–2 mg/kg followed by 1–1.5 mg/kg/day divided q 4–6 hr for 5 days (not to exceed 16 mg/day); then taper over 1–6 wk; *Bacterial meningitis*—0.6 mg/kg/day divided q 6 hr × 4 days (start at time of first antibiotic dose).

**IV, PO (Adults):** *Chemotherapy-induced emesis*—10–20 mg given 15–30 min before each treatment or 10 mg q 12 hr on each treatment day; *Delayed nausea/vomiting*—4–10 mg PO 1–2 times/day for 2–4 days *or* 8 mg PO q 12 hr for 2 days, then 4 mg PO q 12 hr for 2 days *or* 20 mg PO 1 hr before chemotherapy, then 10 mg PO q 12 hr after chemotherapy, then 8 mg PO q 12 hr for 2 days, then 4 mg PO q 12 hr for 2 days.

**IS (Adults):** 0.4–6 mg/day.

## Hydrocortisone

**PO (Adults):** 20–240 mg/day in 1–4 divided doses.

**PO (Children):** *Adrenocortical insufficiency*—0.56 mg/kg/day (15–20 mg/m²/day) as a single dose or in divided doses. *Other uses*—2–8 mg/kg/day (60–240 mg/m²/day) as a single dose or in divided doses.

**IM, IV (Adults):** 100–500 mg q 2–6 hr (range 100–8000 mg/day).

**IM, IV (Children):** *Adrenocortical insufficiency*—0.186–0.28 mg/kg/day (10–12 mg/m²/day) in 3 divided doses. *Other uses*—0.666–4 mg/kg (20–120 mg/m²) q 12–24 hr.

**Rect (Adults):** *Retention enema*—100 mg nightly for 21 days or until remission occurs.

## Methylprednisolone

**PO (Adults):** *Multiple sclerosis*—160 mg/day for 7 days, then 64 mg every other day for 1 mo. *Other uses*—2–60 mg/day as a single dose or in 2–4 divided doses. *Asthma exacerbations*—120–180 mg/day in divided doses 3–4 times/day for 48 hr, then 60–80 mg/day in 2 divided doses.

**PO (Children):** *Anti-inflammatory/Immunosuppressive*—0.5–1.7 mg/kg/day (5–25 mg/m²/day) in divided doses q 6–12 hr. *Asthma exacerbations*—1 mg/kg q 6 hr for 48 hr, then 1–2 mg/kg/day (maximum: 60 mg/day) divided twice daily.

**IM, IV (Adults):** *Most uses: methylprednisolone sodium succinate*—40–250 mg q 4–6 hr. *High-dose "pulse" therapy: methylprednisolone sodium succinate*—30 mg/kg IV q 4–6 hr for up to 72 hr. *Status asthmaticus: methylprednisolone sodium succinate*—2 mg/kg IV, then 0.5–1 mg/kg IV q 6 hr for up to 5 days. *Multiple sclerosis: methylprednisolone sodium succinate*—160 mg/day for 7 days, then 64 mg every other day for 1 mo. *Adjunctive therapy of* Pneumocystis jirovecii *pneumonia in AIDS patients: methylprednisolone sodium succinate*—30 mg twice daily for 5 days, then 30 mg once daily for 5 days, then 15 mg once daily for 10 days. *Acute spinal cord injury: methylprednisolone sodium succinate*—30 mg/kg IV over 15 min initially, followed in 45 min with a continuous infusion of 5.4 mg/kg/hr for 23 hr (unlabeled).

**IM, IV (Children):** *Anti-inflammatory/Immunosuppressive*—0.5–1.7 mg/kg/day (5–25 mg/m²/day) in divided doses q 6–12 hr. *Acute spinal cord injury: methylprednisolone sodium succinate*—30 mg/kg IV over 15 min initially, followed in 45 min with a continuous infusion of 5.4 mg/kg/hr for 23 hr (unlabeled). *Status asthmaticus*—2 mg/kg IV, then 0.5–1 mg/kg IV q 6 hr. *Lupus nephritis*—30 mg/kg IV every other day for 6 doses.

**IM (Adults):** *Methylprednisolone acetate*—40–120 mg daily, weekly, or every 2 wk.

## Prednisolone

**PO (Adults):** *Most uses*—5–60 mg/day as a single dose or in divided doses. *Multiple sclerosis*—200 mg/day for 7 days, then 80 mg every other day for 1 mo. *Asthma exacerbations*—120–180 mg/day in divided doses 3–4 times/day for 48 hr, then 60–80 mg/day in 2 divided doses.

**PO (Children):** *Anti-inflammatory/Immunosuppressive*—0.1–2 mg/kg/day in 1–4 divided doses; *Nephrotic syndrome*—2 mg/kg/day (60 mg/m²/day) in 1–3 divided doses daily (maximum dose: 80 mg/day) until urine is protein-free for 4–6 weeks, followed by 2 mg/kg/dose (40 mg/m²/dose) every other day in the morning; gradually taper off over 4–6 weeks; *Asthma exacerbations*—1 mg/kg q 6 hr for 48 hr, then 1–2 mg/kg/day (maximum: 60 mg/day) divided twice daily.

### Prednisone

**PO (Adults):** *Most uses*—5–60 mg/day as a single dose or in divided doses. *Multiple sclerosis*—200 mg/day for 1 wk, then 80 mg every other day for 1 mo. *Adjunctive therapy of* P. jirovecii *pneumonia in AIDS patients*—40 mg twice daily for 5 days, then 40 mg once daily for 5 days, then 20 mg once daily for 10 days.
**PO (Children):** *Nephrotic syndrome*—2 mg/kg/day initially given in 1–3 divided doses (maximum 80 mg/day) until urine is protein free for 4–6 weeks. Maintenance dose of 2 mg/kg/day every other day in the morning, gradually taper off after 4–6 weeks. *Asthma exacerbation*—1 mg/kg q 6 hr for 48 hr, then 1–2 mg/kg/day (maximum 60 mg/day) in divided doses twice daily.

### Triamcinolone

**IM (Adults):** *Triamcinolone acetonide*—40–80 mg q 4 wk.
**Intra-articular** (Adults): *Triamcinolone hexacetonide*—2–20 mg q 3–4 wk (dose depends on size of joint to be injected, amount of inflammation, and amount of fluid present).
**IM (Children):** *Triamcinolone acetonide*—40 mg q 4 wk or 30–200 mcg/kg (1–6.25 mg/m$^2$) q 1–7 days.

## Availability

### Betamethasone

**Tablets:** 0.5 mg. **Oral solution (cherry-orange flavor):** 0.6 mg/5 mL. **Effervescent tablets:** 0.5 mg. **Extended-release tablets:** 1 mg. **Suspension for injection (sodium phosphate and acetate):** 6 mg (total)/mL.

### Budesonide

**Capsules (enteric-coated):** 3 mg.

### Cortisone (generic available)

**Tablets:** 25 mg.

### Dexamethasone (generic available)

**Tablets:** 0.5 mg, 0.75 mg, 1 mg, 1.5 mg, 2 mg, 4 mg, 6 mg. **Elixir (raspberry flavor):** 0.5 mg/5 mL. **Oral solution (cherry flavor):** 0.5 mg/5 mL, 1 mg/mL. **Solution for injection (sodium phosphate):** 4 mg/mL, 10 mg/mL.

### Hydrocortisone (generic available)

**Tablets:** 5 mg, 10 mg, 20 mg. **Enema:** 100 mg/60 mL. **Powder for injection (sodium succinate):** 100 mg, 250 mg, 500 mg, 1 g.

### Methylprednisolone (generic available)

**Tablets:** 2 mg, 4 mg, 8 mg, 16 mg, 32 mg. **Powder for injection (sodium succinate):** 40 mg, 125 mg, 500 mg, 1 g, 2 g. **Suspension for injection (acetate):** 20 mg/mL, 40 mg/mL, 80 mg/mL.

### Prednisolone (generic available)

**Tablets:** 5 mg. **Orally disintegrating tablets (grape flavor):** 10 mg, 15 mg, 30 mg. **Oral solution:** 5 mg/5 mL, 10 mg/5 mL, 15 mg/5 mL, 20 mg/5 mL.

### Prednisone (generic available)

**Tablets:** 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg. **Oral solution:** 1 mg/mL, 5 mg/mL.

### Triamcinolone (generic available)

**Suspension for injection (acetonide):** 10 mg/mL, 40 mg/mL, 80 mg/mL. **Suspension for injection (hexacetonide):** 5 mg/mL, 20 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- These drugs are indicated for many conditions. Assess involved systems before and periodically during therapy.
- Assess for signs of adrenal insufficiency (hypotension, weight loss, weakness, nausea, vomiting, anorexia, lethargy, confusion, restlessness) before and periodically during therapy.
- Monitor intake and output ratios and daily weights. Observe patient for peripheral edema, steady weight gain, rales/crackles, or dyspnea. Notify health care professional if these occur.
- Children should have periodic evaluations of growth.
- **Cerebral Edema:** Assess for changes in level of consciousness and headache during therapy.
- **Budesonide:** Assess signs of Crohn's disease (diarrhea, crampy abdominal pain, fever, bleeding from rectum) during therapy.
- **Rect:** Assess symptoms of ulcerative colitis (diarrhea, bleeding, weight loss, anorexia, fever, leukocytosis) periodically during therapy.
- ***Lab Test Considerations:*** Monitor serum electrolytes and glucose. May cause hyperglycemia, especially in persons with diabetes. May cause hypokalemia. Patients on prolonged therapy should routinely have CBC, serum electrolytes, and serum and urine glucose evaluated. May ↓ WBCs. May ↓ serum potassium and calcium and ↑ serum sodium concentrations.
- Guaiac-test stools. Promptly report presence of guaiac-positive stools.
- May ↑ serum cholesterol and lipid values. May ↓ uptake of thyroid $^{123}$I or $^{131}$I.
- Suppress reactions to allergy skin tests.
- Periodic adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-ad-

renal axis suppression in systemic and chronic topical therapy.

- **Dexamethasone Suppression Test: :** To diagnose Cushing's syndrome: Obtain baseline cortisol level; administer dexamethasone at 11 PM and obtain cortisol levels at 8 AM the next day. Normal response is a ↓ cortisol level.
- Alternative method: Obtain baseline 24-hr urine for 17-hydroxycorticosteroid (OHCS) concentrations, then begin 48-hr administration of dexamethasone. Second 24-hr urine for 17-OHCS is obtained after 24 hr of dexamethasone.

## Potential Nursing Diagnoses

Risk for infection (Side Effects)
Disturbed body image (Side Effects)

## Implementation

- Do not confuse prednisone with prednisolone, methylprednisolone, or primidone. Do not confuse hydrocortisone with hydrocodone.
- If dose is ordered daily or every other day, administer in the morning to coincide with the body's normal secretion of cortisol.
- Periods of stress, such as surgery, may require supplemental systemic corticosteroids.
- Patients with mild to moderate Crohn's disease may be switched from oral prednisolone without adrenal insufficiency by gradually decreasing prednisolone doses and adding budesonide.
- **PO:** Administer with meals to minimize GI irritation.
- Tablets may be crushed and administered with food or fluids for patients with difficulty swallowing. Capsules should be swallowed whole; do not crush, break, or chew.
- Use calibrated measuring device to ensure accurate dose of liquid forms.
- For orally disintegrating tablets (ODT), remove tablet from blister just prior to dosing. Peel blister pack open, and place tablet on tongue; may be swallowed whole or allowed to dissolve in mouth, with or without water. Tablets are friable; do not cut, split, or break.
- Avoid consumption of grapefruit juice during therapy with budesonide or methylprednisolone.
- **IM, Subcut:** Shake suspension well before drawing up. IM doses should not be administered when rapid effect is desirable. Do not dilute with other solution or admix. Do not administer suspensions IV.

## Dexamethasone

### IV Administration

- **Direct IV:** ***Diluent:*** May be given undiluted. ***Concentration:*** 4–10 mg/mL. ***Rate:*** Administer over 1–4 min if dose is <10 mg.
- **Intermittent Infusion:** ***Diluent:*** High-dose therapy should be added to D5W or 0.9% NaCl solution. Solution should be clear and colorless to light yellow; use diluted solution within 24 hr. ***Concentration:*** Up to 10 mg/mL. ***Rate:*** Administer infusions over 15–30 min.
- **Syringe Compatibility:** caffeine citrate, dimenhydrate, furosemide, granisetron, ketamine, metoclopramide, octreotide, palonosetron, ranitidine, sufentanil.
- **Syringe Incompatibility:** doxapram, glycopyrrolate, haloperidol, pantoprazole.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B cholesteryl, amphotericin B liposome, amsacrine, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, carboplatin, cefazolin, cefepime, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, chloramphenicol, cimetidine, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, docetaxel, dopamine, doripenem, doxacurium, doxorubicin, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, furosemide, ganciclovir, gemcitabine, glycopyrrolate, granisetron, heparin, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meropenem, metaraminol, methadone, methoxamine, methyldopate, metoclopramide, metoprolol, metronidazole, milrinone, morphine, multivitamin, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin,

oxytocin, paclitaxel, palonosetron, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propofol, propranolol, pyridoxime, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tolazoline, trastuzumab, trimethaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B colloidal, calcium chloride, calcium gluconate, caspofungin, cefuroxime, chlorpormazine, ciprofloxacin, dantrolene, diazepam, diazoxide, diphenhydramine, dobutamine, doxycycline, epirubicin, erythromycin, esmolol, fenoldopam, gentamicin, haloperidol, hydroxyzine, idarubicin, inamrinone, labetalol, magnesium sulfate, midazolam, mitoxantrone, pantoprazole, papaverine, pentamidine, pentazocine, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, quinapristin/dalfopristin, tobramycin, topotecan, trimethoprim/sulfamethoxazole.

## Hydrocortisone

### IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute with provided solution (i.e., Act-O-Vials) or 2 mL of bacteriostatic water or saline for injection. ***Concentration:*** 50 mg/mL. ***Rate:*** Administer each 100 mg over at least 30 sec. Doses 500 mg and larger should be infused over at least 10 min.
- **Intermittent/Continuous Infusion:** ***Diluent:*** May be added to 50–1000 mL of D5W, 0.9% NaCl, or D5/0.9% NaCl. Diluted solutions should be used within 24 hr. ***Concentration:*** 1–5 mg/mL. Concentrations of up to 60 mg/mL have been used in fluid restricted adults. ***Rate:*** Administer over 20–30 min or at prescribed rate.
- **Hydrocortisone sodium succinateY-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B cholesteryl, amphotericin B liposome, amsacrine, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, carboplatin, caspofungin, cefazolin, cefepime, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, docetaxel, dopamine, doripenem, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, droperidol, edrophonium, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin, conjugated estrogens, ethacrynate, etoposide, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gallium nitrate, gemcitabine, glycopyrrolate, granisetron, heparin, hydromorphone, ifosfamide, imiepnem/cilastatin, indomethacin, insulin, isoproterenol, kanamycin, ketorolac, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, metaraminol, methotrexate, methoxamine, methyldopate, methylergonovine, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, naloxone, neostigmine, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, propofol, propranolol, pyridostigmine, ranitidine, remifentanil, rituximab, scopolamine, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, trastuzumab, trimethaphan, trimethobenzamide, urokinase, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** amphotericin B colloidal, azathioprine, calcium chloride, ciprofloxacin, dantrolene, diazepam, diazoxide, dobutamine, doxycycline, ganciclovir, haloperidol, idarubicin, labetalol, lansoprazole, nalbuphine, pentamidine, phenytoin, protamine, pyridoxime, quinapristin/dalfopristin, rocuronium, sargramostim, thiamine, trimethoprim/sulfamethoxazole.

## Methylprednisolone

### IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute with provided solution (Act-O-Vials, Univials) or 2 mL of bacteriostatic water (with benzyl alcohol) for injection. Use preservative-free diluent for use in neonates. Acetate injection is not for IV use. ***Concentration:*** Maximum concentration 125 mg/mL. ***Rate:*** Low dose (<1.8 mg/kg or <125 mg/dose): May be administered direct IV push over 1 to several minutes. Moderate dose (2 mg/kg or 250 mg/dose): give over 15–30 min. High dose (15 mg/kg or 500 mg/dose): give over 30 min. Doses 15 mg/kg or 1 g give over 1 hour.
- **Intermittent/Continuous Infusion:** ***Diluent:*** May be diluted further in D5W, 0.9% NaCl, or D5/0.9% NaCl and administered as intermittent or continuous infusion at the prescribed rate. ***Concentration:*** Maximum 2.5 mg/mL. Solution may form a haze upon dilution.
- **Syringe Compatibility:** granisetron, metoclopramide.
- **Syringe Incompatibility:** pantoprazole.
- **Y-Site Compatibility:** acyclovir, alfentanil, alprostadil, amifostine, amikacin, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B liposome, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, carboplatin, cefazolin, cefepime, cefoperazone, cefotetan, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosproine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, dobutamine, dopamine, doxacurium, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, erythromycin, etoposide, famotidine, fentanyl, fludarabine, fluorouracil, folic acid, furosemide, gentamicin, glycopyrrolate, granisetron, hydromorphone, ifosphamide, imiepnem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, metaraminol, methotrexate, methoxamine, methyldopate, metronidazole, metoprolol, metronidazole, milrinone, morphine, multivitamin, nafcillin, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, procainamide, prochlorperazine, propranolol, ranitidine, remifentanil, rituximab, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, vancomycin, vasopressin, verapamil, vincristine, voriconazole.
- **Y-Site Incompatibility:** allopurinol, amphotericin B colloidal, amphotericin B liposome, ampicillin/sulbactam, amsacrine, calcium chloride, calcium gluconate, caspofungin, cefotaxime, cefoxitin, ciprofloxacin, dantrolene, diazepam, diazoxide, diphenhydramine, docetaxel, doxycycline, epirubicin, etoposide phosphate, fenoldopam, filgrastim, ganciclovir, gemcitabine, haloperidol, hydralazine, ketamine, lansoprazole, magnesium sulfate, mitoxantrone, nalbuphine, paclitaxel, palonosetron, pantoprazole, papaverine, pentamidine, pentazocine, phenytoin, promethazine, propofol, protamine, pyridoxime, quinapristin/dalfopristin, rocuronium, sargramostim, thiamine, trimethoprim/sulfamethoxazole, vecuronium, vinorelbine.
- **Rect:** Position patient on left side and administer nightly for 21 days. Enema should be retained for at least 1 hr and preferably all night. May use sedatives and antidiarrheals to facilitate retention.

### Patient/Family Teaching

- Instruct patient on correct technique of medication administration. Advise patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses. Stopping the medication suddenly may result in adrenal insufficiency (anorexia, nausea, weakness, fatigue, dyspnea, hypotension, hypoglycemia). If these signs appear, notify health care professional immediately. This can be life threatening.
- Corticosteroids cause immunosuppression and may mask symptoms of infection. Instruct patient to avoid people with known contagious illnesses and to report possible infections immediately.

- *Prelone* syrup should not be refrigerated, *Pediapred* solution may be refrigerated, *Orapred* solution should be refrigerated.
- Caution patient to avoid vaccinations without first consulting health care professional.
- Review side effects with patient. Instruct patient to inform health care professional promptly if severe abdominal pain or tarry stools occur. Patient should also report unusual swelling, weight gain, tiredness, bone pain, bruising, nonhealing sores, visual disturbances, or behavior changes.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Discuss possible effects on body image. Explore coping mechanisms.
- Instruct patient to inform health care professional if symptoms of underlying disease return or worsen.
- Advise patient to carry identification describing disease process and medication regimen in the event of emergency in which patient cannot relate medical history.
- Explain need for continued medical follow-up to assess effectiveness and possible side effects of medication. Periodic lab tests and eye exams may be needed.
- **Long-term Therapy:** Encourage patient to eat a diet high in protein, calcium, and potassium, and low in sodium and carbohydrates (see Appendix M). Alcohol should be avoided during therapy; may ↑ risk of GI irritation.
- If rectal dose used 21 days, decrease to every other night for 2–3 weeks to decrease gradually.

### Evaluation/Desired Outcomes

- Decrease in presenting symptoms with minimal systemic side effects.
- Suppression of the inflammatory and immune responses in autoimmune disorders, allergic reactions, and neoplasms.
- Management of symptoms in adrenal insufficiency.
- Improvement of symptoms/sequelae of Crohn's disease (decreased frequency of liquid stools, decreased abdominal complaints, improved sense of well being).
- Improvement in symptoms of ulcerative colitis. Clinical symptoms usually improve in 3–5 days. Mucosal appearance may require 2–3 months to improve.

## CORTICOSTEROIDS (TOPICAL/LOCAL)

**alclometasone** (al-kloe-**met**-a-sone)
Aclovate

**amcinonide** (am-**sin**-oh-nide)
Cyclocort

**betamethasone** (bay-ta-**meth**-a-sone)
Betacort, Betaderm, Beta-Val, Betnovate, Celestoderm, Dermabet, Diprolene, Diprolene AF, Ectosone, Luxiq, Metaderm, Novobetamet, Prevex, Topilene, Topisone, Valnac

**clobetasol** (kloe-**bay**-ta-sol)
Clobex, Cormax, Dermovate, Embeline, Embeline E, Olux, Olux-E, Temovate, Temovate E

**clocortolone** (kloe-**kor**-toe-lone)
Cloderm

**desonide** (**des**-oh-nide)
Desonate, DesOwen, Verdeso

**desoximetasone** (dess-ox-i-**met**-a-sone)
Topicort, Topicort-LP

**diflorasone** (dye-**flor**-a-sone)
Psorcon

**fluocinolone** (floo-oh-**sin**-oh-lone)
Capex, Derma-Smoothe/FS, Fluoderm, Fluolar, Fluonide, Synalar, Synamol

**fluocinonide** (floo-oh-**sin**-oh-nide)
Lidemol, Lidex, Lidex-E, Lyderm, Topsyn, Vanos

**flurandrenolide** (flure-an-**dren**-oh-lide)
Cordran, Cordran-SP, Drenison

**fluticasone** (floo-**tik**-a-sone)
Cutivate

**halcinonide** (hal-**sin**-oh-nide)
Halog

**halobetasol** (hal-oh-**bay**-ta-sol)
Ultravate

**hydrocortisone** (hye-droe-**kor**-ti-sone)
Acticort, Aeroseb-HC, Ala-Cort, Ala-Scalp, Alphaderm, Anusol HC, Bactine, Barriere-HC, CaldeCORT Anti-Itch, Carmol HC, Cetacort, Cortacet, Cortaid, Cortate, Cort-Dome, Cortef Feminine Itch, Corticaine, Corticreme, Cortifair, Cortifoam, Cortizone, Dermacort, DermiCort, Dermtex HC, Emo-Cort, FoilleCort, Gynecort, Hemril-HC, Hi-Cor, Hycort, Hyderm, Hydro-Tex, Hytone, Lacti-Care-HC, Lanacort 9-1-1, Lemoderm, Locoid, Novohydrocort, Nutracort, Orabase-HCA, Pandel, Penecort, Pharma-Cort, Prevex HC, Proctocort, Rhulicort, Synacort, Texacort, Unicort, Westcort

**mometasone** (moe-**met**-a-sone)
Elocom, Elocon

**prednicarbate** (pred-ni-**kar**-bate)
Dermatop

**triamcinolone** (trye-am-**sin**-oh-lone)
Kenalog, Triaderm, Trianide, Triderm

***Classification***
Therapeutic: anti-inflammatories (steroidal)
Pharmacologic: corticosteroids (topical)

**Pregnancy Category C**

## Indications
Management of inflammation and pruritis associated with various allergic/immunologic skin problems.

## Action
Suppress normal immune response and inflammation. **Therapeutic Effects:** Suppression of dermatologic inflammation and immune processes.

## Pharmacokinetics
**Absorption:** Minimal. Prolonged use on large surface areas, application of large amounts, or use of occlusive dressings may ↑ systemic absorption.
**Distribution:** Remain primarily at site of action.
**Metabolism and Excretion:** Usually metabolized in skin; some have been modified to resist local metabolism and have a prolonged local effect.
**Half-life:** *Betamethasone*—3–5 hr (plasma), 36–54 hr (tissue). *Dexamethasone*—3–4.5 hr (plasma), 36–54 hr (tissue). *Hydrocortisone*—1.5–2 hr (plasma), 8–12 hr (tissue). *Triamcinolone*—2–>5 hr (plasma), 18–36 hr (tissue).

TIME/ACTION PROFILE (response depends on condition being treated)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Topical | min–hr | hr–days | hr–days |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity or known intolerance to corticosteroids or components of vehicles (ointment or cream base, preservative, alcohol); Untreated bacterial or viral infections.
**Use Cautiously in:** Hepatic dysfunction; Diabetes mellitus, cataracts, glaucoma, or tuberculosis (use of large amounts of high-potency agents may worsen condition); Patients with pre-existing skin atrophy; OB, Lactation: Chronic use at high dosages may result in adrenal suppression in mother and growth suppression in children; Pedi: Children may be more susceptible to adrenal and growth suppression. Clobetasol not recommended for children <12 yr; desoximetasone not recommended for children <10 yr.

## Adverse Reactions/Side Effects
**Derm:** allergic contact dermatitis, atrophy, burning, dryness, edema, folliculitis, hypersensitivity reactions, hypertrichosis, hypopigmentation, irritation, maceration, miliaria, perioral dermatitis, secondary infection, striae. **Misc:** adrenal suppression ( ↑ dose, long-term therapy).

## Interactions
**Drug-Drug:** None significant.

## Route/Dosage
**Topical (Adults and Children ):** 1–4 times daily (depends on product, preparation, and condition being treated).
**Rect (Adults): hydrocortisone** *Aerosol foam*—90 mg 1–2 times/day for 2–3 wk; then adjusted.

## Availability

### Alclometasone (generic available)
**Cream:** 0.05%. **Ointment:** 0.05%.

### Amcinonide (generic available)
**Cream:** 0.1%. **Lotion:** 0.1%. **Ointment:** 0.1%.

**Cream:** 0.1%, 0.2%, 0.5%$^{Rx, OTC}$, 1%$^{Rx, OTC}$, 2.5%. **Gel:** 1%$^{Rx, OTC}$. **Ointment:** 0.1%, 0.2%, 0.5%$^{Rx, OTC}$, 1%$^{Rx, OTC}$, 2.5%. **Lotion:** 1%$^{Rx, OTC}$, 2.5%. **Solution:** 1%, 2.5%. **Spray:** 0.5%$^{Rx, OTC}$, 1%$^{Rx, OTC}$. **Rectal cream:** 1%. **Rectal aerosol:** 10%. ***In combination with:*** acetic acid, antifungals, anti-infectives, antihistamines, urea, and benzoyl peroxide in various otic and topical preparations; acyclovir (Lipsovir cream). See Appendix B.

### Mometasone (generic available)
**Cream:** 0.1%. **Ointment:** 0.1%. **Lotion:** 0.1%.

### Prednicarbate (generic available)
**Cream:** 0.1%.

### Triamcinolone (generic available)
**Cream:** 0.025%, 0.1%, 05%. **Ointment:** 0.025%, 0.1%, 0.5%. **Lotion:** 0.025%, 0.1%. **Spray:** 0.2 mg/2-sec spray. ***In combination with:*** acetic acid, antifungals, anti-infectives, antihistamines, urea, and benzoyl peroxide in various otic and topical preparations. See Appendix B.

## NURSING IMPLICATIONS

### Assessment
- Assess affected skin before and daily during therapy. Note degree of inflammation and pruritus. Notify health care professional if symptoms of infection (increased pain, erythema, purulent exudate) develop.
- ***Lab Test Considerations:*** Adrenal function tests may be ordered to assess degree of hypothalamic-pituitary-adrenal (HPA) axis suppression in long-term topical therapy. Children and patients with dose applied to a large area, using an occlusive dressing, or using high-potency products are at highest risk for HPA suppression.
- May cause ↑ serum and urine glucose concentrations if significant absorption occurs.

### Potential Nursing Diagnoses
Risk for impaired skin integrity (Indications)
Risk for infection (Side Effects)

### Implementation
- Choice of vehicle depends on site and type of lesion. Ointments are more occlusive and preferred for dry, scaly lesions. Creams should be used on oozing or intertriginous areas, where the occlusive action of ointments might cause folliculitis or maceration. Creams may be preferred for esthetic reasons even though they may dry skin more than ointments. Gels, aerosols, lotions, and solutions are useful in hairy areas.
- **Topical:** Apply *ointments, creams,* or *gels* sparingly as a thin film to clean, slightly moist skin. Wear gloves. Apply occlusive dressing only if specified by health care professional.

- Apply *lotion, solution,* or *gel* to hair by parting hair and applying a small amount to affected area. Rub in gently. Protect area from washing, clothing, or rubbing until medication has dried. Hair may be washed as usual but not right after applying medication.
- Use *aerosols* by shaking well and spraying on affected area, holding container 3–6 in. away. Spray for about 2 seconds to cover an area the size of a hand. Do not inhale. If spraying near face, cover eyes.

### Patient/Family Teaching

- Instruct patient on correct technique of medication administration. Emphasize importance of avoiding the eyes. Apply missed doses as soon as remembered unless almost time for the next dose.
- Caution patient to use only as directed. Avoid using cosmetics, bandages, dressings, or other skin products over the treated area unless directed by health care professional.
- Advise parents of pediatric patients not to apply tight-fitting diapers or plastic pants on a child treated in the diaper area; these garments work as an occlusive dressing and may cause more of the drug to be absorbed.
- Caution women that medication should not be used extensively, in large amounts, or for protracted periods if they are pregnant or planning to become pregnant.
- Advise patient to consult health care professional before using medicine for condition other than indicated.
- Instruct patient to inform health care professional if symptoms of underlying disease return or worsen or if symptoms of infection develop.

### Evaluation/Desired Outcomes

- Resolution of skin inflammation, pruritus, or other dermatologic conditions.

**cortisone, See CORTICOSTEROIDS (SYSTEMIC).**

**cyanocobalamin, See VITAMIN $B_{12}$ PREPARATIONS.**

## cyclobenzaprine

(sye-kloe-**ben**-za-preen)

Amrix, Flexeril

C

***Classification***

Therapeutic: skeletal muscle relaxants (centrally acting)

**Pregnancy Category B**

### Indications

Management of acute painful musculoskeletal conditions associated with muscle spasm. **Unlabeled Use:** Management of fibromyalgia.

### Action

Reduces tonic somatic muscle activity at the level of the brainstem. Structurally similar to tricyclic antidepressants. **Therapeutic Effects:** Reduction in muscle spasm and hyperactivity without loss of function.

### Pharmacokinetics

**Absorption:** Well absorbed from the GI tract.
**Distribution:** Unknown.
**Protein Binding:** 93%.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 1–3 days.

TIME/ACTION PROFILE (skeletal muscle relaxation)

| ROUTE | ONSET | PEAK† | DURATION |
|---|---|---|---|
| PO | within 1 hr | 3–8 hr | 12–24 hr |
| Extended release | unk | unk | 24 hr |

†Full effects may not occur for 1–2 wk

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Should not be used within 14 days of MAO inhibitor therapy; Immediate period after MI; Severe or symptomatic cardiovascular disease; Cardiac conduction disturbances; Hyperthyroidism.
**Use Cautiously in:** Cardiovascular disease; Geri: Appears on Beers list. Poorly tolerated due to anticholinergic effects; OB, Lactation, Pedi: Pregnancy, lactation, and children <15 yr (safety not established).

### Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, confusion, fatigue, headache, nervousness. **EENT:** dry mouth,

blurred vision. **CV:** arrhythmias. **GI:** constipation, dyspepsia, nausea, unpleasant taste. **GU:** urinary retention.

### Interactions

**Drug-Drug:** Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive anticholinergic effects with **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **disopyramide**, **haloperidol**, and **phenothiazines**. Avoid use within 14 days of **MAO inhibitors** (hyperpyretic crisis, seizures, and death may occur).
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

### Route/Dosage

**PO (Adults):** *Acute painful musculoskeletal conditions*—10 mg 3 times daily (range 20–40 mg/day in 2–4 divided doses; not to exceed 60 mg/day) *or* extended-release, 15–30 mg once daily. *Fibromyalgia*—5–40 mg at bedtime (unlabeled).

### Availability (generic available)

**Tablets :** 5 mg, 10 mg. **Cost:** *Generic*—5 mg $18.85/100, 10 mg $18.86/100. **Extended-release capsules (Amrix):** 15 mg, 30 mg. **Cost:** 15 mg $773.97/90.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for pain, muscle stiffness, and range of motion before and periodically throughout therapy.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).

### Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)
Risk for injury (Side Effects)

### Implementation

- Do not confuse cyclobenzaprine with cyproheptadine.
- **PO:** May be administered with meals to minimize gastric irritation.
- Swallow extended-release capsules whole; do not open, crush, or chew.

### Patient/Family Teaching

- Instruct patient to take medication as directed; do not take more than the prescribed amount. Taken missed doses within 1 hr of time ordered; otherwise, return to normal dose schedule. Do not double doses.
- Medication may cause drowsiness, dizziness, and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- If constipation becomes a problem, advise patient that increasing fluid intake and bulk in diet and stool softeners may alleviate this condition.
- Advise patient to notify health care professional if symptoms of urinary retention (distended abdomen, feeling of fullness, overflow incontinence, voiding small amounts) occur.
- Inform patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may help relieve dry mouth.

### Evaluation/Desired Outcomes

- Relief of muscular spasm in acute skeletal muscle conditions. Maximum effects may not be evident for 1–2 wk. Use is usually limited to 2–3 wk; however, has been effective for at least 12 wk in the management of fibromyalgia.

HIGH ALERT

## cyclophosphamide

(sye-kloe-**fos**-fa-mide)
Procytox

***Classification***
Therapeutic: antineoplastics, immunosuppressants
Pharmacologic: alkylating agents

**Pregnancy Category D**

### Indications

Alone or with other modalities in the management of: Hodgkin's disease, Malignant lymphomas, Multiple myeloma, Leukemias, Mycosis fungoides, Neuroblastoma, Ovarian carcinoma, Breast carcinoma, and a variety of other tumors. Minimal change nephrotic syndrome in children. **Unlabeled Use:** Severe active rheumatoid arthritis or Wegener's granulomatosis.

### Action

Interferes with DNA replication and RNA transcription, ultimately disrupting protein synthesis

(cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressant action in smaller doses.

## Pharmacokinetics

**Absorption:** Inactive parent drug is well absorbed from the GI tract. Converted to active drug by the liver.
**Distribution:** Widely distributed. Limited penetration of the blood-brain barrier. Crosses the placenta; enters breast milk.
**Metabolism and Excretion:** Converted to active drug by the liver; 30% eliminated unchanged by the kidneys.
**Half-life:** 4–6.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO, IV | 7 days | 7–15 days | 21 days |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Active infections; Bone marrow depression; Other chronic debilitating illnesses; OB: Patients with childbearing potential.

## Adverse Reactions/Side Effects

**Resp:** PULMONARY FIBROSIS. **CV:** MYOCARDIAL FIBROSIS, hypotension. **GI:** anorexia, nausea, vomiting. **GU:** HEMORRHAGIC CYSTITIS, hematuria. **Derm:** alopecia. **Endo:** gonadal suppression, syndrome of inappropriate antidiuretic hormone (SIADH). **Hemat:** LEUKOPENIA, thrombocytopenia, anemia. **Metab:** hyperuricemia. **Misc:** secondary neoplasms.

## Interactions

**Drug-Drug: Phenobarbital** or **rifampin** may ↑ toxicity of cyclophosphamide. Concurrent **allopurinol** or **thiazide diuretics** may exaggerate bone marrow depression. May prolong neuromuscular blockade from **succinylcholine**. Cardiotoxicity may be additive with other **cardiotoxic agents** (e.g., **cytarabine**, **daunorubicin**, **doxorubicin**). May ↓ serum **digoxin** levels. Additive bone marrow depression with other **antineoplastics** or **radiation therapy**. May potentiate the effects of **warfarin**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. Prolongs the effects of **cocaine**.

## Route/Dosage

Many regimens are used.
**PO (Adults):** 1–5 mg/kg/day.
**PO (Children):** *Induction*—2–8 mg/kg/day (60–250 mg/m²/day) in divided doses for 6 days or longer. *Maintenance*—2–5 mg/kg (50–150 mg/m²/day) twice weekly.
**IV (Adults):** 40–50 mg/kg in divided doses over 2–5 days *or* 10–15 mg/kg q 7–10 days *or* 3–5 mg/kg twice weekly *or* 1.5–3 mg/kg/day. Other regimens may use larger doses.
**IV (Children):** *Induction*—2–8 mg/kg/day (60–250 mg/m²/day) in divided doses for 6 days or longer. Total dose for 7 days may be given as a single weekly dose. *Maintenance*—10–15 mg/kg every 7–10 days or 30 mg/kg q 3–4 wk.

## Availability (generic available)

**Tablets:** 25 mg, 50 mg. **Injection:** 500 mg, 750 mg, 1 g, 2 g.

# NURSING IMPLICATIONS

## Assessment

- Monitor blood pressure, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor urinary output frequently during therapy. To reduce the risk of hemorrhagic cystitis, fluid intake should be at least 3000 mL/day for adults and 1000–2000 mL/day for children. May be administered with mesna.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess nausea, vomiting, and appetite. Weigh weekly. Antiemetics may be given 30 min before administration of medication to minimize GI effects. Anorexia and weight loss can be minimized by feeding frequent light meals.
- Encourage patient to drink 2000–3000 mL/day to promote excretion of uric acid. Alkalinization of the urine may be used to help prevent uric acid nephropathy.
- Assess cardiac and respiratory status for dyspnea, rales/crackles, weight gain, edema. Pulmonary toxicity may occur after prolonged therapy. Cardiotoxicity may occur early in therapy and is characterized by symptoms of CHF.

- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before and periodically during therapy. The nadir of leukopenia occurs in 7–12 days (recovery in 17–21 days). Leukocytes should be maintained at 2500–4000/mm$^3$. May also cause thrombocytopenia (nadir 10–15 days), and rarely causes anemia.
- Monitor BUN, creatinine, and uric acid before and frequently during therapy to detect nephrotoxicity.
- Monitor ALT, AST, LDH, and serum bilirubin before and frequently during therapy to detect hepatotoxicity.
- Urinalysis should be evaluated before initiating therapy and frequently during therapy to detect hematuria or change in specific gravity indicative of SIADH.
- May suppress positive reactions to skin tests for *Candida*, mumps, *Trichophyton*, and tuberculin purified-protein derivative (PPD). May also produce false-positive results in Papanicolaou smears.

## Potential Nursing Diagnoses

Risk for infection (Side Effects)
Disturbed body image (Side Effects)

## Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse cyclophosphamide with cyclosporine. Do not confuse Cytoxan (cyclophosphamide) with Cytozar (cytarabine) or Cytotec (misoprostol).
- **PO:** Administer medication on an empty stomach. If severe gastric irritation develops, medication may be given with food.
- Oral solution can be formed by diluting powder for injection in aromatic elixir to a concentration of 1–5 mg of cyclophosphamide/mL. Reconstituted preparations should be refrigerated and used within 2 wk.
- **IV:** Prepare solution for IV administration in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- Prepare IV solution by diluting each 100 mg with 5 mL of sterile water or bacteriostatic water for injection containing parabens. Shake solution gently and allow to stand until clear. Use solution without bacteriostatic water within 6 hr. Solution prepared with bacteriostatic water is stable for 24 hr at room temperature, 6 days if refrigerated.

### IV Administration

- **Direct IV:** Administer reconstituted solution undiluted. ***Concentration:*** 20 mg/mL. ***Rate:*** Administer at a rate of 100 mg/min.
- **Intermittent Infusion:** ***Diluent:*** May be further diluted in up to 250 mL of D5W, 0.9% NaCl, 0.45% NaCl, dextrose/saline combinations, LR, or dextrose/Ringer's solution. ***Concentration:*** 20–25 mg/mL. ***Rate:*** Administer over 30–60 min..
- **Syringe Compatibility:** bleomycin, cisplatin, doxapram, doxorubicin, droperidol, fluorouracil, furosemide, heparin, leucovorin calcium, methotrexate, metoclopramide, mitomycin, vinblastine, vincristine.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefepime, cefoperazone, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, codeine, cyclosporine, cytarabine, dactinomycin, dapotomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxacurium, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, inamrinone, insulin, isoproterenol, kanamycin, ketorolac, labetalol, leucovorin calcium, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprus-

side, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, paclitaxel, palonosetron, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trastuzumjab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B colloidal, diazepam, phenytoin.

## Patient/Family Teaching

- Instruct patient to take dose in early morning. Emphasize need for adequate fluid intake for 72 hr after therapy. Patient should void frequently to decrease bladder irritation from metabolites excreted by the kidneys. Report hematuria immediately. If a dose is missed, contact health care professional.
- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; lower back or side pain; difficult or painful urination; sores in the mouth or on the lips; yellow discoloration of skin or eyes; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; unusual swelling; joint pain; shortness of breath; or confusion occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs; may precipitate GI hemorrhage.
- Advise patient that this medication may cause sterility and menstrual irregularities or cessation of menses. This drug is also teratogenic, and contraceptive measures should continue for at least 4 mo after completion of therapy.
- Discuss with patient the possibility of hair loss. Explore methods of coping. May also cause darkening of skin and fingernails.
- Instruct patient not to receive any vaccinations without advice of health care professional.

## Evaluation/Desired Outcomes

- Decrease in size or spread of malignant tumors.
- Improvement of hematologic status in patients with leukemia. Maintenance therapy is instituted if leukocyte count remains between 2500 and 4000/mm$^3$ and if patient does not demonstrate serious side effects.
- Management of minimal change nephrotic syndrome in children.

# cycloSPORINE†

(**sye**-kloe-spor-een)

Neoral, Sandimmune, Gengraf

***Classification***

Therapeutic: immunosuppressants, antirheumatics (DMARD)

Pharmacologic: polypeptides (cyclic)

**Pregnancy Category C**

†See Appendix C for ophthalmic use

## Indications

**PO, IV:** Prevention and treatment of rejection in renal, cardiac, and hepatic transplantation (with corticosteroids). **PO:** Treatment of severe active rheumatoid arthritis (Neoral only). Treatment of severe recalcitrant psoriasis in adult nonimmunocompromised patients (Neoral only). **Unlabeled Use:** Management of recalcitrant ulcerative colitis. Treatment of steroid resistant nephrotic syndrome. Treatment of severe steroid resistant autoimmune disease. Prevention and treatment of graft vs. host disease in bone marrow transplant patients.

## Action

Inhibits normal immune responses (cellular and humoral) by inhibiting interleukin-2, a factor necessary for initiation of T-cell activity. **Therapeutic Effects:** Prevention of rejection reactions. Slowed progression of rheumatoid arthritis or psoriasis.

## Pharmacokinetics

**Absorption:** Erratically absorbed (range 10–60%) after oral administration, with significant

first-pass metabolism by the liver. Microemulsion (Neoral) has better bioavailability.
**Distribution:** Widely distributed, mainly into extracellular fluid and blood cells. Crosses the placenta; enters breast milk.
**Protein Binding:** 90–98%.
**Metabolism and Excretion:** Extensively metabolized by the liver (first pass); excreted in bile, small amounts excreted unchanged in urine.
**Half-life:** Children—7 hr; adults—19 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown† | 2–6 hr | unknown |
| IV | unknown | end of infusion | unknown |

†Onset of action in rheumatoid arthritis is 4–8 wk and may last 4 wk after discontinuation; for psoriasis, onset is 2–6 wk and lasts 6 wk following discontinuation

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to cyclosporine or polyoxyethylated castor oil (vehicle for IV form); OB, Lactation: Should not be given unless benefits outweigh risks; Disulfiram therapy or known alcohol intolerance (IV and oral liquid dose forms contain alcohol); Psoriasis patients receiving immunosuppressants or radiation; Uncontrolled hypertension.
**Use Cautiously in:** Severe hepatic impairment (dose ↓ recommended); Renal impairment (frequent dose changes may be necessary); Active infection; Pedi: Larger or more frequent doses may be required.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, tremor, confusion, flushing, headache, psychiatric problems. **CV:** hypertension. **GI:** diarrhea, hepatotoxicity, nausea, vomiting, abdominal discomfort, anorexia, pancreatitis. **GU:** nephrotoxicity. **Derm:** hirsutism, acne. **F and E:** hyperkalemia, hypomagnesemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** hyperlipidemia, hyperuricemia. **Neuro:** hyperesthesia, paresthesia. **Misc:** gingival hyperplasia, hypersensitivity reactions, infections (including activation of latent viral infections such as BK virus-associated nephropathy).

## Interactions

**Drug-Drug:** ↑ blood levels and/or risk of toxicity with **azithromycin,clarithomycin, amphotericin B**, **aminoglycosides**, **amiodarone**, **anabolic steroids**, some **calcium channel blockers**, **cimetidine**, **colchicine**, **danazol**, **erythromycin**, **fluconazole**, **fluoroquinolones**, **ketoconazole**, **itraconazole**, **metoclopramide**, **methotrexate, miconazole**, **nefazodone NSAIDs**, **melphalan**, **protease inhibitors quinupristin/dalfopristin**, or **hormonal contraceptives**. ↑ nephrotoxicity with **acyclovir, amphotericin B, aminoglycosides, NSAIDs**, **trimethoprim, ciprofloxacin**, and **vancomycin**. ↑ immunosuppression with other **immunosuppressants** (cyclophosphamide, azathioprine, corticosteroids). **Barbiturates**, **phenytoin**, **rifampin**, **rifabutin, carbamazepine**, **oxcarbamazepine** or **sulfonamides** may ↓ effect of cyclosporine. ↑ risk of hyperkalemia with **potassium-sparing diuretics**, **potassium supplements**, or **ACE inhibitors**. ↑ serum levels/risk of toxicity from **digoxin** (↓ digoxin dose by 50%). Prolongs the action of **neuromuscular blocking agents**. ↑ risk of seizures with **imipenem/cilastatin**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. ↑ risk of rhabdomyolysis with **HMG-CoA reductase inhibitors**. May ↑ levels and risk of toxicity from **etoposide**. Concurrent use with **tacrolimus** should be avoided. **Orlistat** ↓ absorption; avoid concurrent use. May ↑ levels and the risk of hypoglycemia from **repaglinide**.
**Drug-Natural Products:** Concomitant use with **echinacea** and **melatonin** may interfere with immunosuppression. Use with **St. John's wort** may cause ↓ serum levels and organ rejection for transplant patients.
**Drug-Food:** Concurrent ingestion of **grapefruit or grapefruit juice** ↑ absorption and should be avoided. **Food** ↓ absorption of microemulsion products (Neoral).

## Route/Dosage

Doses are adjusted on the basis of serum level monitoring.

## Prevention of Transplant Rejection (Sandimmune)

**PO (Adults and Children):** 14–18 mg/kg/dose 4–12 hr before transplant then 5–15 mg/kg/day divided q 12–24 hr postoperatively, taper by 5% weekly to maintenance dose of 3–10 mg/kg/day.
**IV (Adults and Children):** 5–6 mg/kg/dose 4–12 hr before transplant, then 2–10 mg/kg/day in divided doses q 8–24 hr; change to PO as soon as possible.

## Prevention of Transplant Rejection (Neoral)

**PO (Adults and Children):** 4–12 mg/kg/day divided q 12 hr (dose varies depending on organ transplanted).

### Rheumatoid Arthritis (Neoral only)

**PO (Adults and Children):** 2.5 mg/kg/day given in 2 divided doses; may ↑ by 0.5–0.75 mg/kg/day after 8 and 12 weeks, up to 4 mg/kg/day. ↓ dose by 25–50% if adverse reactions occur.

### Severe Psoriasis (Neoral only)

**PO (Adults):** 2.5 mg/kg/day given in 2 divided doses, for at least 4 wk; then may ↑ by 0.5 mg/kg/day q 2 wk, up to 4 mg/kg/day. ↓ dose by 25–50% if adverse reactions occur.

### Autoimmune Diseases (Neoral only)

**PO (Adults and Children):** 1–3 mg/kg/day.

### Availability (generic available)

**Microemulsion soft gelatin capsules (Gengraf, Neoral):** 25 mg, 100 mg. **Cost:** *Gengraf*—25 mg $227.97/180, 100 mg $949.52/180; *Neoral*—25 mg $239.96/180, 100 mg $956.36/180. **Microemulsion oral solution (Gengraf, Neoral):** 100 mg/mL. **Cost:** *Neoral*—$301.71/50 mL. **Soft gelatin capsules (Sandimmune):** 25 mg, 100 mg. **Cost:** 25 mg $337.25/180, 100 mg $1,280.00/180. **Oral solution (Sandimmune):** 100 mg/mL. **Cost:** *Neoral*—$363.18/50 mL. **Injection (Sandimmune):** 50 mg/mL in 5-mL ampules.

## NURSING IMPLICATIONS

### Assessment

- Monitor serum creatinine level, intake and output ratios, daily weight, and blood pressure during therapy. Report significant changes.
- **Prevention of Transplant Rejection:** Assess for symptoms of organ rejection throughout therapy.
- **IV:** Monitor patient for signs and symptoms of hypersensitivity (wheezing, dyspnea, flushing of face or neck) continuously during at least the first 30 min of each treatment and frequently thereafter. Oxygen, epinephrine, and equipment for treatment of anaphylaxis should be available with each IV dose.
- **Arthritis:** Assess pain and limitation of movement prior to and during administration.
- Prior to initiating therapy, perform a physical exam including blood pressure on 2 occasions to determine baseline. Monitor blood pressure every 2 wk during initial 3 mo, then monthly if stable. If hypertension occurs, dose should be reduced.
- **Psoriasis:** Assess skin lesions prior to and during therapy.
- ***Lab Test Considerations:*** Measure serum creatinine, BUN, CBC, magnesium, potassium, uric acid, and lipids at baseline, every 2 wk during initial therapy, and then monthly if stable. Nephrotoxicity may occur; report significant increases.
- May cause hepatotoxicity; monitor for ↑ AST, ALT, alkaline phosphatase, amylase, and bilirubin.
- May cause ↑ serum potassium and uric acid levels and ↓ serum magnesium levels.
- Serum lipid levels may be ↑.
- ***Toxicity and Overdose:*** Evaluate serum cyclosporine levels periodically during therapy. Dose may be adjusted daily, in response to levels, during initiation of therapy. Guidelines for desired serum levels will vary among institutions.

### Potential Nursing Diagnoses

Chronic pain (Indications)
Risk for infection (Side Effects)

### Implementation

- Do not confuse cyclosporine with cyclophosphamide or cycloserine.
- Given with other immunosuppressive agents. Protect transplant patients from staff and visitors who may carry infection. Maintain protective isolation as indicated.
- Microemulsion products (Neoral) and other products (Sandimmune) are not interchangeable.
- **PO:** Draw up oral solution in the pipette provided with the medication. Mix oral solution with milk, chocolate milk, apple juice or orange juice, preferably at room temperature. Stir well and drink at once. Use a glass container and rinse with more diluent to ensure that total dose is taken. Administer oral doses with meals. Wipe pipette dry; do not wash after use.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute each 1 mL (50 mg) of IV concentrate immediately before use with 20–100 mL of D5W or 0.9% NaCl for injection. Solution is stable for 24 hr in D5W. In 0.9% NaCl, it is stable for 6 hr in a polyvinylchloride container and 12 hr in a glass container at room temperature. ***Concentration:*** 2.5 mg/mL. ***Rate:*** Infuse slowly over 2–6 hr via infusion pump.
- **Continuous Infusion:** May be administered over 24 hr.

- **Y-Site Compatibility:** acyclovir, alfentanil, amikacin, aminophylline, anidulafungin, ascorbic acid, atracurium, atropine, azathioprine, azotreonam, bivalirudin, bumetanide, buprenorphine, butorpohanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefonicid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxarubicin hydrochloride, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, meperidine, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thimine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine.
- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B liposome, cyanocobalamin, dantrolene, diazepam, diazoxide, drotrecogin, pentobarbital, phenobarbital, phenytoin, rituximab, trastuzumab, trimethoprim/sulfamethoxazole, voriconazole.

### Patient/Family Teaching

- Instruct patient to take medication at the same time each day and with regard to food, as directed. Do not skip doses or double up on missed doses. Take missed doses as soon as remembered within 12 hr. Do not discontinue medication without advice of health care professional.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ, and stress need to notify health care professional immediately if they occur.
- Instruct patients and/or parents to notify health care professional if diarrhea develops; decreases absoption of cyclosporine and can result in rejection.
- Instruct patient to avoid grapefruit and grapefruit juice to prevent interaction with cyclosporine.
- Advise patient of common side effects (nephrotoxicity, increased blood pressure, hand tremors, increased facial and body hair, gingival hyperplasia). Advise patients that if hair growth is excessive, depilatories, or waxing, can be used.
- Teach patient the correct method for monitoring blood pressure. Instruct patient to notify health care professional of significant changes in blood pressure or if hematuria, increased frequency, cloudy urine, decreased urine output, fever, sore throat, tiredness, or unusual bruising occurs.
- Instruct patient on proper oral hygiene. Meticulous oral hygiene and dental examinations for teeth cleaning and plaque control every 3 mo will help decrease gingival inflammation and hyperplasia.
- Instruct patient to consult health care professional before taking any OTC medications or receiving any vaccinations while taking this medication.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of follow-up exams and lab tests.

### Evaluation/Desired Outcomes

- Prevention of rejection of transplanted tissues.
- Decrease in severity of pain.
- Increased ease of joint movement.
- Decrease in progression of psoriasis.

## cyproheptadine

(si-proe-**hep**-ta-deen)

Periactin, PMS-Cyproheptadine

***Classification***
Therapeutic: allergy, cold, and cough remedies, antihistamines

**Pregnancy Category B**

## Indications
Relief of allergic symptoms caused by histamine release including: Seasonal and perennial allergic rhinitis, Chronic urticaria, Cold urticaria. **Unlabeled Use:** Stimulation of appetite.

## Action
Antagonizes the effects of histamine at H-receptor sites; does not bind to or inactivate histamine. Also blocks the effects of serotonin, which may result in increased appetite. **Therapeutic Effects:** Decreased symptoms of histamine excess (sneezing, rhinorrhea, nasal and ocular pruritus, ocular tearing and redness). Decreased cold urticaria.

## Pharmacokinetics
**Absorption:** Apparently well absorbed after oral dosing.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** Unknown.

TIME/ACTION PROFILE (antihistaminic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15–60 min | 1–2 hr | 8 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Acute attacks of asthma; Lactation; Known alcohol intolerance (syrup only).
**Use Cautiously in:** Geri: Appears on Beers list. Geriatric patients are sensitive to anticholinergic effects and have increased risk for side effects; Angle-closure glaucoma; Liver disease; Pregnancy (safety not established).

## Adverse Reactions/Side Effects
**CNS:** drowsiness, excitation (increased in children). **EENT:** blurred vision. **CV:** arrhythmias, hypotension, palpitations. **GI:** dry mouth, constipation. **GU:** hesitancy, retention. **Derm:** photosensitivity, rashes. **Misc:** weight gain.

## Interactions
**Drug-Drug:** Additive CNS depression with other **CNS depressants**, including **alcohol**, **opioid analgesics**, and **sedative/hypnotics**. **MAO inhibitors** may intensify and prolong the anticholinergic effects of **antihistamines**.

## Route/Dosage
**PO (Adults):** 4 mg q 8 hr (range 4–20 mg/day in 3 divided doses; up to 0.5 mg/kg/day).
**PO (Children 6–14 yr):** 2–4 mg q 8–12 hr (not to exceed 16 mg/day).
**PO (Children 2–6 yr):** 2 mg q 8–12 hr (not to exceed 12 mg/day).

## Availability (generic available)
**Tablets:** 4 mg, 4 mg[OTC]. **Syrup:** 2 mg/5 mL, 2 mg/5 mL[OTC].

# NURSING IMPLICATIONS

## Assessment
- Geri: Assess for adverse anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia).
- **Allergy:** Assess symptoms (rhinitis, conjunctivitis, hives) prior to and periodically throughout therapy.
- Assess lung sounds and respiratory function prior to and periodically throughout therapy. May cause thickening of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- **Appetite Stimulant:** Monitor food intake and weight routinely.
- ***Lab Test Considerations:*** May cause false-negative reactions on allergy skin tests; discontinue 72 hr prior to testing.
- Increased serum amylase and prolactin concentrations may occur when cyproheptadine is administered with a thyrotropin-releasing hormone.

## Potential Nursing Diagnoses
Ineffective airway clearance (Indications)
Risk for injury (Side Effects)

## Implementation
- Do not confuse cyproheptadine with cyclobenzaprine.
- **PO:** Administer with food, water, or milk to minimize gastric irritation.

## Patient/Family Teaching
- Instruct patient to take cyproheptadine exactly as directed. Missed dose should be taken as soon as remembered. Do not double doses. Syrup should be accurately measured using calibrated medication cup or measuring device.

- Medication may cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Advise patient to use sunscreen and protective clothing to prevent a photosensitivity reaction.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Patient should notify dentist if dry mouth persists for >2 wk.
- Geri: Teach patient and family about anticholinergic effects and to contact a health care provider if such effects persist.

### Evaluation/Desired Outcomes

- Alleviation of allergic symptoms.
- Alleviation of cold urticaria.
- Improvement of appetite.

HIGH ALERT

## cytarabine (sye-tare-a-been)

Ara-C, cytosine arabinoside,
Cytosar, Cytosar-U, DepoCyt

***Classification***
Therapeutic: antineoplastics
Pharmacologic: antimetabolites

**Pregnancy Category D**

### Indications

**IV:** Used mainly in combination chemotherapeutic regimens for the treatment of leukemias and non-Hodgkin's lymphomas. **IT:** Treatment of lymphomatous meningitis.

### Action

Inhibits DNA synthesis by inhibiting DNA polymerase (cell-cycle S-phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** Absorption occurs from subcut sites, but blood levels are lower than with IV administration; IT administration results in negligible systemic exposure.
**Distribution:** Widely distributed; IV- and subcut-administered cytarabine crosses the blood-brain barrier but not in sufficient quantities. Crosses the placenta.
**Metabolism and Excretion:** Metabolized mostly by the liver; <10% excreted unchanged by the kidneys. Metabolism to inactive drug in the CSF is negligible because the enzyme that metabolizes it is present in very low concentrations in the CSF.
**Half-life:** *IV, subcut*—1–3 hr; *IT*—100–236 hr.

TIME/ACTION PROFILE (IV, subcut—effects on WBCs; IT—levels in CSF)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut, IV (1st phase) | 24 hr | 7–9 days | 12 days |
| Subcut, IV (2nd phase) | 15–24 days | 15–24 days | 25–34 days |
| IT | rapid | 5 hr | 14–28 days |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB: Pregnancy or lactation; Active meningeal infection (IT only).
**Use Cautiously in:** Active infections; Decreased bone marrow reserve; Renal/hepatic disease; Other chronic debilitating illnesses; OB: Patients with childbearing potential.

### Adverse Reactions/Side Effects

**CNS:** CNS dysfunction (high dose), confusion, drowsiness, headache. **EENT:** corneal toxicity (high dose), hemorrhagic conjunctivitis (high dose). **Resp:** PULMONARY EDEMA (high dose). **CV:** edema. **GI:** nausea, vomiting, hepatitis, hepatotoxicity, severe GI ulceration (high dose), stomatitis. **GU:** urinary incontinence. **Derm:** alopecia, rash. **Endo:** sterility. **Hemat:** *(less with IT use)*—anemia, leukopenia, thrombocytopenia. **Metab:** hyperuricemia. **Neuro:** *Intrathecal only*—CHEMICAL ARACHNOIDITIS, abnormal gait. **Misc:** cytarabine syndrome, fever.

### Interactions

**Drug-Drug:** ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. ↑ risk of cardiomyopathy when used in high-dose regimens with **cyclophosphamide**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. May ↓ absorption of **digoxin** tablets. May ↓ the efficacy of **gentamicin** when used to treat *Klebsiella pneumoniae* infections. Recent treatment with **asparaginase** may ↑ risk of pancreatitis. ↑ neurotoxicity with concurrently administered **IT antineoplastics** (IT only).

### Route/Dosage

Dose regimens vary widely.
**IV (Adults):** *Induction dose*—200 mg/m²/day for 5 days q 2 wk as a single agent *or* 2–6 mg/kg/day (100–200 mg/m²/day) as a single daily dose

*or* in 2–3 divided doses for 5–10 days or until remission occurs as part of combination chemotherapy. *Maintenance*—70–200 mg/m²/day for 2–5 days monthly. *Refractory leukemias/lymphomas*—3 g/m² q 12 hr for up to 12 doses.
**Subcut, IM (Adults):** *Maintenance*—1–1.5 mg/kg q 1–4 wk.
**IT (Adults):** *Depo Cyt Induction*—50 mg (intraventricular or lumbar puncture) every 14 days for 2 doses (weeks 1 and 3); *consolidation*—50 mg (intraventricular or lumbar puncture) every 14 days for 3 doses (weeks 5, 7, and 9), followed by one additional dose at week 13; *maintenance*—50 mg (intraventricular or lumbar puncture) every 28 days for 4 doses (weeks 17, 21, 25, and 29). If drug-related neurotoxicity occurs, dose should be reduced to 25 mg or discontinued (dexamethasone 4 mg PO/IV twice daily for 5 days should be started concurrently with IT cytarabine).

### Availability (generic available)

**Powder for injection:** 100 mg, 500 mg, 1 g, 2 g.
**Sustained-release liposome injection for IT use:** 50 mL/5-mL vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol may decrease uric acid levels. Alkalinization of urine may increase excretion of uric acid.
- Assess nutritional status. Nausea and vomiting may occur within 1 hr of administration, especially if IV dose is administered rapidly, less severe if medication is infused slowly. Administering an antiemetic prior to and periodically throughout therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- Monitor patient for development of *cytarabine* or *ara-C syndrome* (fever, myalgia, bone pain, chest pain, maculopapular rash, conjunctivitis, malaise), which usually occurs 6–12 hr following administration. Corticosteroids may be used for treatment or prevention. If patient responds to corticosteroids, continue cytarabine and corticosteroids.
- Assess patient for respiratory distress and pulmonary edema. Occurs with high doses rarely; may be fatal.
- Monitor patient for signs of anaphylaxis (rash, dyspnea, swelling). Epinephrine, corticosteroids, and resuscitation equipment should be readily available.
- **IT:** Chemical arachnoiditis (nausea, vomiting, headache, fever, back pain, CSF pleocytosis and neck rigidity, neck pain, or meningism) is an expected side effect of IT cytarabine. Incidence and severity of symptoms may be decreased with coadministration of dexamethasone.
- Monitor patients receiving IT therapy continuously for the development of neurotoxicity (myelopathy, personality changes, dysarthria, ataxia, confusion, somnolence, coma). If neurotoxicity develops, decrease amount of subsequent doses and discontinue if neurotoxicity persists. Risk may be increased if cytarabine is administered intrathecally and IV within a few days.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count prior to and frequently during therapy. Leukocyte counts begin to drop within 24 hr of administration. The initial nadir occurs in 7–9 days. After a small ↑ in the count, the second, deeper nadir occurs 15–24 days after administration. Platelet counts begin to ↓ 5 days after a dose, with a nadir at 12–15 days. Leukocyte and thrombocyte counts usually begin to ↑ 10 days after the nadirs. Therapy is usually withdrawn if leukocyte count is <1000/mm³ or platelet count is <50,000/mm³. Bone marrow aspirations are recommended every 2 wk until remission occurs.
- Monitor renal (BUN and creatinine) and hepatic function (AST, ALT, bilirubin, alkaline phosphatase, and LDH) prior to and routinely during therapy.
- May cause ↑ uric acid concentrations.

### Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Side Effects)

## Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse cytarabine with Cytoxan (cyclophosphamide). Do not confuse Cytosar (cytarabine) with Cytovene (ganciclovir) or Cytoxan. Do not confuse high-dose and regular therapy. Fatalities have occurred with high-dose therapy.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers (see Appendix L).
- May be given subcut, direct IV, intermittent IV, continuous IV, or IT.
- **IV, Subcut:** Reconstitute 100-mg vials with 5 mL of bacteriostatic water for injection with benzyl alcohol 0.9% for a concentration of 20 mg/mL. Reconstitute 500-mg vials with 10 mL for a concentration of 50 mg/mL, 1-g vials with 10 mL, and 2-g vials with 20 mL for a concentration of 100 mg/mL. Reconstituted solution is stable for 48 hr. Do not administer a cloudy or hazy solution.

### IV Administration

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 100 mg/mL. ***Rate:*** Administer each 100 mg over 1–3 min.
- **Intermittent Infusion:** ***Diluent:*** May be further diluted in 0.9% NaCl, D5W, D10W, D5/0.9% NaCl, Ringer's solution, LR, or D5/LR. ***Concentration:*** Dilute doses in 100 mL of diluent. ***Rate:*** Infuse over 15–30 min.
- **Continuous Infusion:** Rate and concentration for IV infusion are ordered individually.
- **Syringe Compatibility:** metoclopramide.
- **Y-Site Compatibility:** amifostine, amsacrine, aztreonam, cefepime, chlorpromazine, cimetidine, cladribine, dexamethasone phosphate, diphenhydramine, doxorubicin liposome, droperidol, etoposide phosphate, famotidine, filgrastim, fludarabine, furosemide, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, linezolid, lorazepam, melphalan, methotrexate, methylprednisolone, metoclopramide, morphine, ondansetron, paclitaxel, pemetrexed, piperacillin/tazobactam, prochlorperazine, promethazine, propofol, ranitidine, sargramostim, sodium bicarbonate, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B cholesteryl sulfate complex, ganciclovir, lansoprazole.
- **Additive Compatibility:** methotrexate, mitoxantrone, ondansetron, potassium chloride, sodium bicarbonate, vincristine.
- **Additive Incompatibility:** fluorouracil, heparin, regular insulin, nafcillin, oxacillin, penicillin G sodium.
- **IT:** Patients receiving *liposomal cytarabine* should be started on dexamethasone 4 mg twice daily PO or IV for 5 days beginning on the day of liposomal cytarabine injection.
- Allow vial to warm to room temperature. Gently agitate or invert vial to resuspend particles immediately before withdrawal from vial. No further reconstitution or dilution is required with *liposomal cytarabine*. Reconstitute *conventional cytarabine* with preservative-free 0.9% NaCl or autologous spinal fluid. Use immediately to prevent bacterial contamination.
- Liposomal cytarabine must be used within 4 hr of withdrawal from the vial. Discard unused portions. Inject directly into CSF via intraventricular reservoir or by direct injection into lumbar sac. Do not use in-line filters.
- Instruct patient to lie flat for 1 hr following IT injection. Monitor for immediate toxic reactions.

## Patient/Family Teaching

- Caution patient to avoid crowds and persons with known infections. Report symptoms of infection (fever, chills, cough, hoarseness, sore throat, lower back or side pain, painful or difficult urination) immediately.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions (use soft toothbrush and electric razor, avoid falls, do not drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding).
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis may require treatment with opioid analgesics.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 4 mo after therapy is concluded.
- Instruct patient not to receive any vaccinations without advice of health care professional.

- Emphasize the need for periodic lab tests to monitor for side effects.
- **IT:** Inform patient about the expected side effects (headache, nausea, vomiting, fever) and about early signs of neurotoxicity. Instruct patient to notify health care professional if these signs occur.
- Emphasize the importance of taking dexamethasone with lyposomal cytarabine.

## Evaluation/Desired Outcomes

- Improvement of hematopoietic values in leukemias.
- Decrease in size and spread of the tumor in non-Hodgkin's lymphomas. Therapy is continued every 2 wk until patient is in complete remission or thrombocyte count or leukocyte count falls below acceptable levels.
- Treatment of lymphomatous meningitis.

HIGH ALERT

# dacarbazine (da-kar-ba-zeen)

DTIC, DTIC-Dome

***Classification***

Therapeutic: antineoplastics
Pharmacologic: alkylating agents

**Pregnancy Category C**

## Indications

Treatment of metastatic malignant melanoma (single agent). Treatment of Hodgkin's disease as second-line therapy (with other agents).

## Action

Disrupts DNA and RNA synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly growing tissue cells, especially malignant ones.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Large volume of distribution; probably concentrates in liver; some CNS penetration.
**Metabolism and Excretion:** 50% metabolized by the liver, 50% excreted unchanged by the kidneys.
**Half-life:** 5 hr (↑ in renal and hepatic dysfunction).

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV (WBCs) | 16–20 days | 21–25 days | 3–5 days |
| IV (platelets) | unknown | 16 days | 3–5 days |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB, Lactation: Pregnancy or lactation.
**Use Cautiously in:** Active infections; Bone marrow depression; Pedi: Children (safety not established); Renal dysfunction; Hepatic dysfunction.

## Adverse Reactions/Side Effects

**GI:** HEPATIC NECROSIS, anorexia, nausea, vomiting, diarrhea, hepatic vein thrombosis. **Derm:** alopecia, facial flushing, photosensitivity, rash. **Endo:** gonadal suppression. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** pain at IV site, phlebitis at IV site, tissue necrosis. **MS:** myalgia. **Neuro:** facial paresthesia. **Misc:** ANAPHYLAXIS, fever, flu-like syndrome, malaise.

## Interactions

**Drug-Drug:** Additive bone marrow depression with other **antineoplastics**. **Carbamazepine**, **phenobarbital**, **rifampin**, and **aminoglutethimide** may ↑ metabolism and decrease effectiveness. Blood levels may be ↑ with **amiodarone**, **ciprofloxacin**, **fluvoxamine**, **ketoconazole**, **norfloxacin**, **ofloxacin**, **isoniazid**, or **miconazole**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

## Route/Dosage

Other regimens are used.
**IV (Adults):** *Malignant melanoma*—2–4.5 mg/kg/day for 10 days administered every 4 wk *or* 250 mg/m²/day for 5 days administered every 3 wk. *Hodgkin's disease*—150 mg/m²/day for 5 days (in combination with other agents) administered every 4 wk *or* 375 mg/m² (in combination with other agents) administered every 15 days.

## Availability

**Powder for injection:** 200 mg.

# NURSING IMPLICATIONS

## Assessment

- Monitor vital signs prior to and frequently during therapy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor IV site closely. Dacarbazine is an irritant. Instruct patient to notify health care professional immediately if discomfort at IV site occurs. Discontinue IV immediately if infiltration occurs. Applications of hot packs may relieve pain, burning sensation, and irritation at injection site.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting, which may be severe and last 1–12 hr. Administration of an antiemetic prior to and periodically during therapy, restricting oral intake for 4–6 hr prior to administration, and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status. Nausea usually decreases on subsequent doses.

- ***Lab Test Considerations:*** Monitor CBC and differential prior to and periodically throughout therapy. The nadir of thrombocytopenia occurs in 16 days. The nadir of leukopenia occurs in 3–4 wk. Recovery begins in 5 days. Withhold dose and notify physician if platelet count is $<100{,}000/mm^3$ or leukocyte count is $<4000/mm^3$.
- Monitor for increased AST, ALT, BUN, and serum creatinine. May cause hepatic necrosis.

### Potential Nursing Diagnoses

Risk for infection (Side Effects)
Risk for injury (Side Effects)

### Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

**IV Administration**

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers (see Appendix L).
- Reconstitute each 200-mg vial with 19.7 mL of sterile water for injection. Solution is colorless or clear yellow. Do not use solution that has turned pink. ***Concentration:*** 10 mg/mL solution is stable for 8 hr at room temperature and for 72 hr if refrigerated.
- **Intermittent Infusion:** ***Diluent:*** Further dilute with up to 250 mL of D5W or 0.9% NaCl. Stable for 24 hr if refrigerated or 8 hr at room temperature. ***Rate:*** Administer over 30–60 min.
- **Y-Site Compatibility:** amifostine, aztreonam, bivalirudin, caspofungin, daptomycin, dexmedetomidine, docetaxel, doxorubicin liposome, ertapenem, etoposide phosphate, fenoldopam, filgrastim, fludarabine, granisetron, hetastarch, levofloxacin, mechlorethamine, melphalan, nesiritide, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, quinupristin/dalfopristin, sargramostim, teniposide, thiotepa, tigecycline, tirofiban, vinorelbine, voriconazole.
- **Y-Site Incompatibility:** allopurinol, amphotericin B liposome, cefepime, pantoprazole, pemetrexed, piperacillin/tazobactam.

### Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; abdominal pain; yellowing of eyes; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs; may increase GI irritation.
- May cause photosensitivity. Instruct patient to avoid sunlight or wear protective clothing and use sunscreen for 2 days after therapy.
- Instruct patient to inform health care professional if flu-like syndrome occurs. Symptoms include fever, myalgia, and general malaise. May occur after several courses of therapy. Usually occurs 1 wk after administration. May persist for 1–3 wk. Acetaminophen may be used for relief of symptoms.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Advise patient of the need for a nonhormonal method of contraception.
- Instruct patient not to receive any vaccinations without advice of health care professional.

### Evaluation/Desired Outcomes

- Decrease in size and spread of malignant melanoma or Hodgkin's lymphoma.

**dalteparin, See HEPARINS (LOW MOLECULAR WEIGHT).**

## dantrolene (dan-troe-leen)

Dantrium

***Classification***

Therapeutic: skeletal muscle relaxants (direct acting)

**Pregnancy Category C**

### Indications

**PO:** Treatment of spasticity associated with: Spinal cord injury, Stroke, Cerebral palsy, Multiple sclerosis. Prophylaxis of malignant hyperthermia. **IV:** Emergency treatment of malignant hyperthermia. **Unlabeled Use:** Management of neuroleptic malignant syndrome.

### Action

Acts directly on skeletal muscle, causing relaxation by decreasing calcium release from sarcoplasmic reticulum in muscle cells. Prevents intense catabolic process associated with malignant hyperthermia. **Therapeutic Effects:** Reduction

of muscle spasticity. Prevention of malignant hyperthermia.

### Pharmacokinetics

**Absorption:** 35% absorbed after oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Almost entirely metabolized by the liver.
**Half-life:** 8.7 hr.

TIME/ACTION PROFILE (effects on spasticity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 wk | unknown | 6–12 hr |
| IV | rapid | rapid | unknown |

### Contraindications/Precautions

**Contraindicated in:** No contraindications to IV form in treatment of hyperthermia; OB, Lactation: Pregnancy and lactation; Situations in which spasticity is used to maintain posture or balance.
**Use Cautiously in:** Cardiac, pulmonary, or previous liver disease; Women, patients >35 yr (↑ risk of hepatotoxicity).

### Adverse Reactions/Side Effects

**CNS:** drowsiness, muscle weakness, confusion, dizziness, headache, insomnia, malaise, nervousness. **EENT:** excessive lacrimation, visual disturbances. **Resp:** pleural effusions. **CV:** changes in BP, tachycardia. **GI:** HEPATOTOXICITY, diarrhea, anorexia, cramps, dysphagia, GI bleeding, vomiting. **GU:** crystalluria, dysuria, frequency, erectile dysfunction, incontinence, nocturia. **Derm:** pruritus, sweating, urticaria. **Hemat:** eosinophilia. **Local:** irritation at IV site, phlebitis. **MS:** myalgia. **Misc:** chills, drooling, fever.

### Interactions

**Drug-Drug:** Additive CNS depression with **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, **sedative/hypnotics**, and parenteral **magnesium sulfate**. ↑ risk of hepatotoxicity with other **hepatotoxic agents** or **estrogens**. ↑ risk of arrhythmias with **verapamil**. ↑ neuromuscular blocking effects of **vecuronium**.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can increase CNS depression.

### Route/Dosage

**PO (Adults):** *Spasticity*—25 mg/day initially; ↑ by 25 mg/day q 4–7 days until desired response or total of 100 mg 4 times daily is reached. *Prevention of malignant hyperthermia*—4–8 mg/kg/day in 3–4 divided doses for 1–2 days before procedure, last dose 3–4 hr preop. *Post-hyperthermic crisis follow-up*—4–8 mg/kg/day in 3–4 divided doses for 1–3 days after IV treatment.
**PO (Children >5 yr):** *Spasticity*—0.5 mg/kg twice daily; ↑ by 0.5 mg/kg/day q 4–7 days until desired response is obtained or dosage of 3 mg/kg 4 times daily is reached (not to exceed 400 mg/day). *Prevention of malignant hyperthermia*—4–8 mg/kg/day in 3–4 divided doses for 1–2 days before procedure, last dose 3–4 hr preop. *Post-hyperthermic crisis follow-up*—4–8 mg/kg/day in 3–4 divided doses for 1–3 days after IV treatment.
**IV (Adults and Children):** *Treatment of malignant hyperthermia*—at least 1 mg/kg (up to 3 mg/kg), continued until symptoms decrease or a cumulative dose of 10 mg/kg has been given. If symptoms reappear, dose may be repeated. *Prevention of malignant hyperthermia*—2.5 mg/kg before anesthesia.

### Availability (generic available)

**Capsules:** 25 mg, 50 mg, 100 mg. **Powder for injection:** 20 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Assess bowel function periodically. Persistent diarrhea may warrant discontinuation of therapy.
- **Muscle Spasticity:** Assess neuromuscular status and muscle spasticity before initiating therapy and periodically during its course to determine response to therapy.
- **Malignant Hyperthermia:** Assess previous anesthesia history of all surgical patients. Also assess for family history of reactions to anesthesia (malignant hyperthermia or perioperative death).
- Monitor ECG, vital signs, electrolytes, and urine output continuously when administering IV for malignant hyperthermia.
- Monitor patient for difficulty swallowing and choking during meals on the day of administration.
- ***Lab Test Considerations:*** Monitor liver function frequently during therapy. Liver function abnormalities (↑ AST, ALT, alkaline phosphatase, bilirubin, GGTP) may require discontinuation of therapy.

- Evaluate renal function and CBC before and periodically during therapy in patients receiving prolonged therapy.

## Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Acute pain (Indications)
Risk for injury (Side Effects)

## Implementation

- Do not confuse Dantrium (dantrolene) with danazol.
- **PO:** If gastric irritation becomes a problem, may be administered with food. Oral suspensions may be made by opening capsules and adding them to fruit juices or other liquid. Drink immediately after mixing.
- Oral dose for spasticity should be divided into 4 doses/day.

### IV Administration

- **Direct IV:** ***Diluent:*** Reconstitute each 20 mg with 60 mL of sterile water for injection (without a bacteriostatic agent) . Shake until solution is clear. Solution must be used within 6 hr. Administer without further dilution. Protect diluted solution from direct light. ***Concentration:*** 0.333 mg/mL. ***Rate:*** Administer each single dose by rapid continuous IV push through Y-tubing or 3-way stopcock. Follow immediately with subsequent doses as indicated. Medication is very irritating to tissues; observe infusion site frequently to avoid extravasation.
- **Intermittent Infusion:** Prophylactic dose has been administered as an infusion. ***Rate:*** Administer over 1 hr before anesthesia.
- **Y-Site Compatibility:** acyclovir, paclitaxel, palonosetron.
- **Y-Site Incompatibility:** alfentanil, amikacin, aminophylline, amphotericin B colloidal, ampicillin, ampicillin/sulbactam, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, caclium chloride, calcium gluconate, caspofungin, cefazolin, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisplatin, clindamycin, cyanocobalamin, cyclosporine, dactinomycin, daptomycin, dexamethasone, diazepam, diazoxide, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, hydroxyzine, imipenem/cilastatin, inamrinone, indomethacin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phenytoin, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, proimethazine, propranolol, protamine, pyridoxime, ranitidine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethoprim/sulfamethoxazole, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vinorelbine, voriconazole.

## Patient/Family Teaching

- Advise patient not to take more medication than the amount prescribed to minimize risk of hepatotoxicity and other side effects. If a dose is missed, do not take unless remembered within 1 hr. Do not double doses.
- May cause dizziness, drowsiness, visual disturbances, and muscle weakness. Advise patient to avoid driving and other activities requiring alertness until response to drug is known. After IV dose for surgery, patients may experience decreased grip strength, leg weakness, lightheadedness, and difficulty swallowing for up to 48 hr. Caution patients to avoid activities requiring alertness and to use caution when walking down stairs and eating during this period.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Instruct patient to notify health care professional if rash; itching; yellow eyes or skin; dark urine; or clay-colored, bloody, or black, tarry stools occur or if nausea, weakness, malaise,

fatigue, or diarrhea persists. May require discontinuation of therapy.
- Advise patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the importance of follow-up exams to check progress in long-term therapy and blood tests to monitor for side effects.
- **Malignant Hyperthermia:** Patients with malignant hyperthemia should carry identification describing disease process at all times.

### Evaluation/Desired Outcomes
- Relief of muscle spasm in musculoskeletal conditions. One wk or more may be required to see improvement; if there is no observed improvement in 45 days, the medication is usually discontinued.
- Prevention of or decrease in temperature and skeletal rigidity in malignant hyperthermia.

## **daptomycin** (dap-to-**mye**-sin)
Cubicin

***Classification***
Therapeutic: anti-infectives
Pharmacologic: cyclic lipopeptide antibacterial agents

**Pregnancy Category B**

### Indications
Complicated skin and skin structure infections caused by aerobic Gram-positive bacteria.

### Action
Causes rapid depolarization of membrane potential following binding to bacterial membrane; this results in inhibition of protein, DNA, and RNA synthesis. **Therapeutic Effects:** Death of bacteria with resolution of infection. **Spectrum:** Active against *Staphylococcus aureus* (including methicillin-resistant strains), *Streptococcus pyogenes*, *S. pyogenes agalactiae*, some *S. dysgalactiae*, and *Enterococcus faecalis* (vancomycin-susceptible strains).

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Protein Binding:** 92%.
**Metabolism and Excretion:** Metabolism not known; mostly excreted by kidneys.
**Half-life:** 8.1 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** CCr <30 mL/min (dose reduction required); Geri: May have ↓ clinical response with ↑ risk of adverse reactions; OB: Use only if clearly needed; Lactation: Lactation; Pedi: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** dizziness. **Resp:** dyspnea. **CV:** hypertension, hypotension. **GI:** PSEUDOMEMBRANOUS COLITIS, constipation, diarrhea, nausea, vomiting, ↑ liver function tests. **GU:** renal failure. **Derm:** pruritus, rash. **Hemat:** anemia. **Local:** injection site reactions. **MS:** ↑ CPK. **Misc:** fever.

### Interactions
**Drug-Drug: Tobramycin** ↑ blood levels. Concurrent **HMG-CoA reductase inhibitors** may ↑ the risk of myopathy.

### Route/Dosage
**IV (Adults):** 4 mg/kg every 24 hr.

### Renal Impairment
**IV (Adults):** *CCr <30 mL/min*—4 mg/kg every 48 hr.

### Availability
**Powder for injection:** 500 mg/vial.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of pseudomembranous colitis. May begin up to several weeks following cessation of therapy.
- Monitor patient for development of muscle pain or weakness, particularly of distal extremities. Discontinue daptomycin in patients with unexplained signs and symptoms of myopathy in conjunction with CPK elevation >1000 U/L, or in patients without reported symptoms who have marked elevations in CPK >2000 U/L. Consider temporarily suspending agents asso-

ciated with rhabdomyolysis, (HMG-CoA reductase inhibitors) in patients receiving daptomycin.

- ***Lab Test Considerations:*** Monitor CPK weekly, more frequently in patients with unexplained ↑. Discontinue daptomycin if CPK >1000 units/L and signs and symptoms of myopathy occur. In patients with renal insufficiency, monitor both renal function and CPK more frequently.
- May cause false prolongation of PT and ↑ INR.

## Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

## Implementation

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute 500-mg vial with 10 mL of 0.9% NaCl inserted toward wall of vial. Rotate vial gently to wet powder. Allow to stand for 10 min undisturbed. Swirl vial gently to completely reconstitute solution. Reconstituted vials are stable for 12 hr at room temperature or 48 hr if refrigerated. Dilute further in 50 mL of 0.9% NaCl. Solution is stable for 12 hr at room temperature or 48 hr if refrigerated. Do not administer solutions that are cloudy or contain a precipitate. ***Rate:*** Infuse over 30 min. Do not infuse daptomycin with ReadyMED® elastomeric infusion pumps due to incompatibility.
- **Y-Site Compatibility:** alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, argatroban, atenolol, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, dacarbazine, dactinomycin, daunorubicin hydrochloride, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, diazepam, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, mesna, metaraminol, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate mofetil, nafcillin, nalbuphine, naloxone, nicardipine, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, phentolamine, phenylephrine, phenyobarbital, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trimethobenzamide, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, amphotericin B colloidal, amphotericin B lipid complex, cytarabine, dantrolene, gemcitabine, imipenem/cilastatin, methotrexate, metronidazole, minocycline, mitomycin, nesiritide, nitroglycerin, pantoprazole, pentazocine, pentobarbital, phenytoin, remifentanil, streptozocin, sufentanil, thiopental, vancomycin.
- **Solution Incompatibility:** D5W.

## Patient/Family Teaching

- Inform patient of purpose of medication.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

## Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

# darbepoetin (dar-be-poh-e-tin)

Aranesp

***Classification***

Therapeutic: antianemics
Pharmacologic: hormones (rDNA)

**Pregnancy Category C**

## Indications

Anemia associated with chronic renal failure. Chemotherapy-induced anemia in patients with non-myeloid malignancies.

## Action

Stimulates erythropoiesis (production of red blood cells). **Therapeutic Effects:** Maintains and may elevate red blood cell counts, decreasing the need for transfusions.

## Pharmacokinetics

**Absorption:** 30–50% following subcut administration; IV administration results in complete bioavailability.
**Distribution:** Confined to the intravascular space.
**Metabolism and Excretion:** Unknown.
**Half-life:** *Subcut*—49 hr; *IV*—21 hr.

TIME/ACTION PROFILE (increase in RBCs)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV, subcut | 2–6 wk | unknown | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Uncontrolled hypertension; Patients receiving chemotherapy when anticipated outcome is cure.
**Use Cautiously in:** History of hypertension; Underlying hematologic diseases, including hemolytic anemia, sickle-cell anemia, thalassemia and porphyria (safety not established); OB, Lactation, Pedi: Safety not established.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, dizziness, fatigue, headache, weakness. **Resp:** cough, dyspnea, bronchitis. **CV:** CHF, MI, STROKE, THROMBOTIC EVENTS (especially with hemoglobin >12 g/dL), edema, hypertension, hypotension, chest pain. **GI:** abdominal pain, nausea, diarrhea, vomiting, constipation. **Derm:** pruritus. **Hemat:** pure red cell aplasia. **MS:** myalgia, arthralgia, back pain, limb pain. **Misc:** fever, allergic reactions, flu-like syndrome, sepsis, ↑ mortality and ↑ tumor growth (with hemoglobin ≥12 g/dL).

## Interactions

**Drug-Drug:** None reported.

## Route/Dosage

### Anemia due to Chronic Renal Failure

(Use lowest dose that will gradually increase hemoglobin level and avoid RBC transfusion).
**IV, Subcut (Adults):** *Starting treatment with darbepoetin (no previous epoetin)*—0.45 mcg/kg once weekly (may start with 0.75 mcg/kg q 2 wk in patients not on dialysis); adjust dose to attain target Hgb of 10–12 g/dL; if Hgb ↑ by >1.0 g/dL in 2 wk or if the Hgb is ↑ and nearing 12 g/dL, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL after 4 wk of therapy (with adequate iron stores), ↑ dose by 25%; do not ↑ dose more frequently than q 4 wk. *Conversion from epoetin to darbepoetin*—weekly epoetin dose <2500 units = 6.25 mcg/week darbepoetin, weekly epoetin dose 2500–4999 units = 12.5 mcg/week darbepoetin, weekly epoetin dose 5000–10,999 units = 25 mcg/week darbepoetin, weekly epoetin dose 11,000–17,999 units = 40 mcg/week darbepoetin, weekly epoetin dose 18,000–33,999 units = 60 mcg/week darbepoetin, weekly epoetin dose 34,000–89,999 units = 100 mcg/week darbepoetin, weekly epoetin dose >90,000 units = 200 mcg/week darbepoetin.

### Anemia due to Chemotherapy

(Use only for chemotherapy-related anemia and discontinue when chemotherapy course is completed; do not initiate if hemoglobin ≥10 g/dL.)
**Subcut (Adults):** 2.25 mcg/kg weekly or 500 mcg q 3 wk; target Hgb should not exceed 12 g/dL. If Hgb ↑ by >1.0 g/dL in 2 wk or if the Hgb >12 g/dL or Hgb reaches level to avoid transfusion, ↓ dose by 40%; if Hgb ↑ by <1.0 g/dL after 6 wk of therapy, ↑ dose to 4.5 mcg/kg .

## Availability

**Albumin solution for injection:** 25 mcg/mL 1-mL vial, 40 mcg/mL 1-mL vial, 60 mcg/mL 1-mL vial, 100 mcg/mL 1-mL vial, 150 mcg/mL 0.75-mL vial, 200 mcg/mL 1-mL vial, 300 mcg/mL 1-mL vial, 500 mcg/mL 1-mL vial. **Pre-filled syringes:** 60 mcg/0.3 mL, 100 mcg/0.5 mL, 200 mcg/0.4 mL.

# NURSING IMPLICATIONS

## Assessment

- Monitor blood pressure before and during therapy. Inform health care professional if severe hypertension is present or if blood pres-

sure begins to increase. Additional antihypertensive therapy may be required during initiation of therapy.
- Monitor response for symptoms of anemia (fatigue, dyspnea, pallor).
- Monitor dialysis shunts (thrill and bruit) and status of artificial kidney during hemodialysis. May need to increase heparin dose to prevent clotting. Monitor patients with underlying vascular disease for impaired circulation.
- Monitor for allergic reactions (rash, utricaria). Discontinue darbepoetin if signs of anaphylaxis (dyspnea, laryngeal swelling) occur.
- **Lab Test Considerations:** May cause ↑ in WBCs and platelets. May ↓ bleeding times.
- Monitor serum ferritin, transferrin, and iron levels prior to and during therapy to assess need for concurrent iron therapy. Transferrin saturation should be at least 20% and ferritin should be at least 100 ng/mL.
- Monitor hemoglobin before and weekly during initial therapy, for 4 wk after a change in dose, and regularly after target range has been reached and maintenance dose is determined. Monitor other hematopoietic parameters (CBC with differential and platelet count) before and periodically during therapy. Hemoglobin increases of more than 1.0 g/dL in any 2-week period or hemoglobin >12 g/dL increases the likelihood of life-threatening cardiovascular complications, cardiac arrest, neurologic events (seizures, stroke), hypertensive reactions, CHF, vascular thrombosis/ischemia/infarction, acute MI, and fluid overload/edema.
- If increase in hemoglobin is less than 1 g/dL over 4 wk and iron stores are adequate, dose may be increased by 25% of previous dose.
- Monitor renal function studies and electrolytes closely; resulting increased sense of well-being may lead to decreased compliance with other therapies for renal failure.

## Potential Nursing Diagnoses

Activity intolerance (Indications)

## Implementation

- Transfusions are still required for severe symptomatic anemia. Supplemental iron should be initiated with darbepoetin and continued during therapy. Correct deficiencies of folic acid or vitamin $B_{12}$ prior to therapy.
- Institute seizure precautions in patients who experience greater than a 1.0 g/dL increase in hemoglobin in a 2-wk period or exhibit any change in neurologic status.
- *For conversion from epoetin alfa to darbepoetin,* if epoetin was administered 2–3 times/wk administer darbepoetin once a week. If patient was receiving epoetin once/wk, darbepoetin may be administered once every 2 wk. Route of administration should remain consistent.
- Dose adjustments should not be more frequent than once/month.
- Do not shake vial; inactivation of medication may occur. Do not administer vials containing solution that is discolored or contains particulate matter. Discard vial immediately after withdrawing dose. Do not pool unused portions.
- **Subcut:** This route is often used for patients not requiring dialysis.

### IV Administration

- **Direct IV:** Administer undiluted. ***Rate:*** May be administered as direct injection or bolus over 1–3 min into IV tubing or via venous line at end of dialysis session.
- **Y-Site Incompatibility:** Do not administer in conjunction with other drugs or solutions.

## Patient/Family Teaching

- Explain rationale for concurrent iron therapy (increased red blood cell production requires iron).
- Discuss possible return of menses and fertility in women of childbearing age. Patient should discuss contraceptive options with health care professional.
- Discuss ways of preventing self-injury in patients at risk for seizures. Driving and activities requiring continuous alertness should be avoided.
- Inform patient that use of darbepoetin may result in shortened overall survival and/or ↓ time to tumor progression.
- **Anemia of Chronic Renal Failure**: Stress importance of compliance with dietary restrictions, medications, and dialysis. Foods high in iron and low in potassium include liver, pork, veal, beef, mustard and turnip greens, peas, eggs, broccoli, kale, blackberries, strawberries, apple juice, watermelon, oatmeal, and enriched bread. Darbepoetin will result in increased sense of well-being, but it does not cure underlying disease.
- **Home Care Issues:** Home dialysis patients determined to be able to safely and effectively administer darbepoetin should be taught proper dosage, administration technique with syringe, auto-injector or IV use, and disposal of equipment. *Information for Patients and Caregivers* should be provided to patient along with medication.

### Evaluation/Desired Outcomes

- Increase in hemoglobin not to exceed 12 g/dL with improvement in symptoms of anemia in patients with chronic renal failure or with chemotherapy-induced anemia.

## darifenacin (dar-i-fen-a-sin)

Enablex

***Classification***

Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

**Pregnancy Category C**

### Indications

Overactive bladder with symptoms (urge incontinence, urgency, frequency).

### Action

Acts as a muscarinic (cholinergic) receptor antagonist; antagonizes bladder smooth muscle contraction. **Therapeutic Effects:** Decreased symptoms of overactive bladder.

### Pharmacokinetics

**Absorption:** 15–19% absorbed.
**Distribution:** Unknown.
**Protein Binding:** 98%.
**Metabolism and Excretion:** Extensively metabolized by the CYP2D6 enzyme system in most individuals; poor metabolizers (7% of Caucasians, 2% of African Americans) have less CYP2D6 activity with less metabolism occurring. Some metabolism via CYP3A4 enzyme system. 60% excreted renally as metabolites, 40% in feces as metabolites.
**Half-life:** 13–19 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 7 hr | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Urinary retention; Gastric retention; Uncontrolled angle-closure glaucoma; Severe hepatic impairment.
**Use Cautiously in:** Concurrent use of CYP3A4 inhibitors (use lower dose/clinical monitoring may be necessary); Moderate hepatic impairment (lower dose recommended); Bladder outflow obstruction; GI obstructive disorders, ↓ GI motility, severe constipation or ulcerative colitis; Myasthenia gravis; Angle-closure glaucoma; Lactation, Pedi: Safety not established; OB: Use only if maternal benefit outweighs fetal risk.

### Adverse Reactions/Side Effects

**CNS:** dizziness. **EENT:** blurred vision. **GI:** constipation, dry mouth, dyspepsia, nausea. **Metab:** heat intolerance. **Misc:** ANGIOEDEMA.

### Interactions

**Drug-Drug:** Blood levels and risk of toxicity are ↑ by concurrent use of strong CYP3A4 inhibitors including **ketoconazole**, **itraconazole**, **ritonavir**, **nelfinavir**, **clarithromycin**, and **nefazodone**; daily dose should not exceed 7.5 mg. Concurrent use of moderate inhibitors of CYP3A4, especially those with narrow therapeutic indices, including **flecainide**, **thioridazine**, and **tricyclic antidepressants**, should be undertaken with caution.

### Route/Dosage

**PO (Adults):** 7.5 mg once daily, may be ↑ after 2 wk to 15 mg once daily.

### Availability

**Extended-release tablets:** 7.5 mg, 15 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor voiding pattern and assess symptoms of overactive bladder (urinary urgency, urinary incontinence, urinary frequency) to and periodically during therapy.

### Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

### Implementation

- **PO:** Administer once daily without regard to food. Extended-release tablets must be swallowed whole; do not break, crush, or chew.

### Patient/Family Teaching

- Instruct patient to take darifenacin as directed. Advise patient to read the *Patient Information* before starting therapy and with each prescription refill. If a dose is missed, skip dose and take next day; do not take 2 doses in same day.
- Do not share darifenacin with others; may be dangerous.
- Inform patient of potential anticholinergic side effects (constipation, urinary retention, blurred vision, heat prostration in a hot environment).
- May cause dizziness and blurred vision. Caution patient to avoid driving and other activities that require alertness until response to medication is known.
- Advise patient to consult health care professional prior to taking Rx, OTC, or herbal products with darifenacin.

### Evaluation/Desired Outcomes

- Decrease in symptoms of overactive bladder (urge urinary incontinence, urgency, frequency).

## darunavir (da-ru-na-veer)

Prezista

***Classification***

Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors

**Pregnancy Category C**

### Indications

HIV infection (must be used with ritonavir and with other antiretrovirals).

### Action

Inhibits HIV-1 protease, selectively inhibiting the cleavage of HIV-encoded specific polyproteins in infected cells. This prevents the formation of mature virus particles. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV infection and its sequelae.

### Pharmacokinetics

**Absorption:** *Without ritonavir*—37% absorbed following oral administration; *with ritonavir*—82%. Food ↑ absorption by 30%.
**Distribution:** Unknown.
**Protein Binding:** 95% bound to plasma proteins.
**Metabolism and Excretion:** Extensively metabolized by CYP3A enzyme system. 41% eliminated unchanged in feces, 8% in urine.
**Half-life:** 15 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 2.5–4 hr | 12 hr |

### Contraindications/Precautions

**Contraindicated in:** Concurrent dihydroergotamine, ergonovine, ergotamine, methylergonovine, midazolam, pimozide, triazolam, lovastatin, simvastatin, rifampin, or St. John's wort; Lactation: HIV may be transmitted in human milk; Pedi: Children <3 yr.
**Use Cautiously in:** Hepatic impairment; Sulfa allergy; Geri: Consider age-related impairment in hepatic function, concurrent chronic disease states and drug therapy; OB: Use in pregnancy only if maternal benefit outweighs fetal risk; Pedi: Children 3–6 yr (safety not established).

### Adverse Reactions/Side Effects

Based on concurrent use with ritonavir.
**GI:** HEPATOTOXICITY, constipation, diarrhea, nausea, vomiting. **Endo:** hyperglycemia. **Metab:** body fat redistribution. **Derm:** rash.

### Interactions

**Drug-Drug:** Darunavir and ritonavir are both inhibitors of CYP3A and are metabolized by CYP3A. Multiple drug-drug interactions can be expected with drugs that share, inhibit, or induce these pathways. Consult product information for more specific details. **Rifampin** ↑ metabolism and may ↓ antiretroviral effectiveness, concurrent use is contraindicated. ↓ metabolism of and may ↑ risk of ergot toxicity with **dihydroergotamine**, **ergonovine**, **ergotamine**, or **methylergonovine**; concurrent use is contraindicated. ↓ metabolism of and may ↑ risk of myopathy with **lovastatin** and **simvastatin**; concurrent use is contraindicated. ↑ levels and risk of cardiotoxicity with **pimozide**; concurrent use is contraindicated. ↑ levels and risk of excess CNS depression with **midazolam** or **triazolam**; concurrent use is contraindicated. Concurrent use with **indinavir** may ↑ darunavir and indinavir levels. ↑ levels and risk of myopathy from **atorvastatin**, **rosuvastatin**, or **pravastatin** (use lowest dose of these agents or consider fluvastatin). Concurrent use with **efavirenz** results in ↓ darunavir levels and ↑ efavirenz levels; use combination cautiously. **Lopivavir/ritonavir** may ↓ levels; although concurrent use is not recommended, additional ritonavir may be required. **Saquinavir** may ↓ levels; concurrent use is not recommended. ↑ levels of **lidocaine**, **quinidine**, **propafenone**, **flecainide**, and **amiodarone**; use cautiously and with available blood level monitoring. ↑ **digoxin** levels; blood level monitoring recommended. May ↑ **carbamazepine** levels; blood level monitoring recommended. May ↓ **phenytoin** or **phenobarbital** levels; blood level monitoring recommended. ↓ levels of **warfarin**; monitor INR. ↑ levels of **trazodone** and **desipramine**; use cautiously and ↓ dose if necessary. ↑ levels of **clarithromycin**; ↓ dose of clarithromycin if CCr ≤60 mL/min. **Ketoconazole** and **itraconazole** may levels. ↑ levels of **ketoconazole** and **itraconazole**; daily dose of itraconazole or ketoconazole should not be >200 mg. ↓ levels of **voriconazole**; concurrent use not recommended. Concurrent use with **rifabutin** ↑ rifabutin levels and ↓ darunavir levels; (may be due to ritonavir); ↓ rifabutin dose to 150 mg every other day. ↑ levels of **beta-blockers**; may need to ↓ dose. ↑ levels of **felodi-**

**pine**, **nifedipine**, or **nicardipine**; monitor clinical response carefully. **Dexamethasone** ↓ levels. May ↑ levels of **inhaled fluticasone**; choose alternative inhaled corticosteroid. ↑ levels of **cyclosporine**, **tacrolimus**, or **sirolimus**; blood level monitoring recommended. ↓ levels of **methadone**. ↑ **risperidone** and **thioridazine** levels; may need to ↓ dose. May ↑ levels of **sildenafil**, **vardenafil** or **tadalafil**; may result in hypotension, syncope, visual changes, and prolonged erection ( ↓ dose of sildenafil to 25 mg q 48 hr, vardenafil to 2.5 mg q 72 hr, and tadalafil to 10 mg q 72 hr recommended). ↓ levels of **sertraline** and **paroxetine**; adjust dose by clinical response. May ↓ levels and contraceptive efficacy of some estrogen-based **hormonal contraceptives** including **ethinyl estradiol** (alternative or additional methods of contraception recommended).

**Drug-Natural Products: St. John's wort** ↑ metabolism and may ↓ antiretroviral effectiveness; concurrent use is contraindicated.

### Route/Dosage

**PO (Adults):** *Therapy-naive*—800 mg (two 400-mg tablets) with ritonavir 100 mg once daily; *Therapy-experienced*—600 mg (one 600-mg tablet or two 300-mg tablets) with ritonavir 100 mg twice daily.

**PO (Children ≥6 yr):** *20–29 kg*—375 mg with ritonavir 50 mg twice daily; *30–39 kg*—450 mg with ritonavir 60 mg twice daily; *≥40 kg*—600 mg with ritonavir 100 mg twice daily.

### Availability

**Tablets:** 75 mg, 150 mg, 300 mg, 400 mg, 600 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess for allergy to sulfonamides.
- Monitor patient for development of rash; usually maculopapular and self-limited. Discontinue therapy if severe.
- ***Lab Test Considerations:*** Monitor viral load and CD4 counts regularly during therapy.
- May cause ↑ serum AST, ALT, GGT, total bilirubin, alkaline phosphatase, pancreatic amylase, pancreatic lipase, triglycerides, total cholesterol, and uric acid concentrations. Monitor hepatic function prior to and periodically during therapy. Hepatotoxicity may require interruption or discontinuation of therapy.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Must be administered with a meal or light snack along with ritonavir 100 mg to be effective. The type of food is not important. Tablets should be swallowed whole with water or milk; do not chew.

### Patient/Family Teaching

- Emphasize the importance of taking darunavir with ritonavir exactly as directed, at evenly spaced times throughout day. Do not take more than prescribed amount and do not stop taking without consulting health care professional. If a dose of darunavir or ritonavir is missed by more than 6 hr, wait and take next dose at regularly scheduled time. If missed by less than 6 hr, take darunavir and ritonavir immediately and then take next dose at regularly scheduled time. If a dose is skipped, do not double doses. Advise patient to read the *Patient Information* sheet before starting therapy and with each Rx renewal in case changes have been made.
- Instruct patient that darunavir should not be shared with others.
- Advise patient to avoid taking other Rx, OTC, or herbal products without consulting health care professional. These medications interact with many other drugs.
- Inform patient that darunavir does not cure AIDS or prevent associated or opportunistic infections. Darunavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of darunavir are unknown at this time.
- Inform patient that darunavir may cause hyperglycemia and hepatotoxicity. Advise patient to notify health care professional if signs of hyperglycemia (increased thirst or hunger; unexplained weight loss; increased urination; fatigue; or dry, itchy skin) or hepatotoxicity (unexplained fatigue, anorexia, nausea, jaundice, abdominal pain or dark urine) occur.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control

during darunavir therapy. Advise female patients to avoid breastfeeding during therapy with darunavir.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

HIGH ALERT

## DAUNOrubicin hydrochloride
(daw-noe-**roo**-bi-sin **hye**-dro-**klor**-ide)
Cerubidine

***Classification***
Therapeutic: antineoplastics
Pharmacologic: anthracyclines

**Pregnancy Category D**

### Indications
In combination with other antineoplastics in the treatment of leukemias.

### Action
Forms a complex with DNA, which subsequently inhibits DNA and RNA synthesis (cell-cycle phase-nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressive properties.

### Pharmacokinetics
**Absorption:** Administered IV only, resulting in complete bioavailability.
**Distribution:** Widely distributed. Crosses the placenta.
**Metabolism and Excretion:** Extensively metabolized by the liver. Converted partially to a compound that also has antineoplastic activity (daunorubicinol); 40% eliminated by biliary excretion.
**Half-life:** *Daunorubicin* — 18.5 hr. *Daunorubicinol*— 26.7 hr.

TIME/ACTION PROFILE (effects on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 7–10 days | 10–14 days | 21 days |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to daunorubicin or any other components in the formulation; Symptomatic CHF/arrhythmias; Pregnant or lactating women.
**Use Cautiously in:** Active infections or decreased bone marrow reserve; Geriatric patients or patients with other chronic debilitating illnesses (dosage reduction recommended for patients ≥60 yr); May reactivate skin lesions produced by previous radiation therapy; Hepatic or renal impairment (dosage reduction recommended if serum creatinine >3 mg/dL or serum bilirubin >1.2 mg/dL); Patients who have received previous anthracycline therapy or who have underlying cardiovascular disease (increased risk of cardiotoxicity); Patients with childbearing potential.

### Adverse Reactions/Side Effects
**EENT:** rhinitis, abnormal vision, sinusitis. **CV:** CARDIOTOXICITY, arrhythmias. **GI:** nausea, vomiting, esophagitis, hepatoxicity, stomatitis. **GU:** red urine, gonadal suppression. **Derm:** alopecia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Misc:** chills, fever.

### Interactions
**Drug-Drug:** Additive myelosuppression with other **antineoplastics**. May decrease antibody response to **live-virus vaccines** and increase risk of adverse reactions. **Cyclophosphamide** increases the risk of cardiotoxicity. Increased risk of hepatic toxicity with other **hepatotoxic agents**.

### Route/Dosage
Other dose regimens are used. In adults, cumulative dose should not exceed 550 mg/m² (450 mg/m² if previous chest radiation).
**IV (Adults <60 yr):** 45 mg/m²/day for 3 days in first course, then for 2 days of second course (as part of combination regimen).
**IV (Adults ≥60 yr):** 30 mg/m²/day for 3 days in first course, then for 2 days of second course (as part of combination regimen).
**IV (Children >2 yr):** 25 mg/m² once weekly (as part of combination regimen). In children <2 yr or BSA <0.5 m², dosage should be determined on a mg/kg basis.

### Availability (generic available)

**Powder for injection:** 20 mg/vial. **Solution for injection:** 5 mg/mL in 4-mL vials (20 mg).

## NURSING IMPLICATIONS

### Assessment

- Monitor vital signs before and frequently during therapy.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums; bruising; petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess IV site frequently for inflammation or infiltration. Instruct patient to notify nurse immediately if pain or irritation at injection site occurs. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Notify physician immediately. Daunorubicin is a vesicant. Standard treatments include local injections of steroids and application of ice compresses.
- Monitor intake and output, appetite, and nutritional intake. Assess for nausea and vomiting, which, although mild, may persist for 24–48 hr. Administration of an antiemetic before and periodically during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status. Encourage fluid intake of 2000–3000 mL/day. Allopurinol and alkalinization of the urine may be used to help prevent urate stone formation.
- Assess patient for evidence of cardiotoxicity, which manifests as CHF (peripheral edema, dyspnea, rales/crackles, weight gain, jugular venous distention) and usually occurs 1–6 mo after initiation of therapy. Chest x-ray, echocardiography, ECGs, and radionuclide angiography determination of ejection fraction may be ordered before and periodically throughout therapy. A 30% decrease in QRS voltage and decrease in systolic ejection fraction are early signs of cardiotoxicity. Patients who receive total cumulative doses >550/mm$^2$, who have a history of cardiac disease, or who have received mediastinal radiation are at greater risk of developing cardiotoxicity. May be irreversible and fatal, but usually responds to early treatment.
- ***Lab Test Considerations:*** Monitor uric acid levels.
- *Daunorubicin hydrochloride:* Monitor CBC and differential before and periodically throughout therapy. The leukocyte count nadir occurs 10–14 days after administration. Recovery usually occurs within 21 days after administration of daunorubicin.
- Monitor AST, ALT, LDH, and serum bilirubin. May cause transient ↑ serum alkaline phosphatase, bilirubin, and AST concentrations.

### Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Decreased cardiac output (Side Effects)

### Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse daunorubicin hydrochloride (Cerubidine) with daunorubicin citrate liposome (DaunoXome) or with doxorubicin (Adriamycin, Rubex) or doxorubicin hydrochloride liposome (Doxil). To prevent confusion, orders should include generic and brand name.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **IV:** Reconstitute each 20 mg with 4 mL of sterile water for injection for a concentration of 5 mg/mL. Shake gently to dissolve. Reconstituted medication is stable for 24 hr at room temperature, 48 hr if refrigerated. Protect from sunlight.
- Do not use aluminum needles when reconstituting or injecting daunorubicin, as aluminum darkens the solution.

#### IV Administration

- **Direct IV:** ***Diluent:*** Dilute further in 10–15 mL of 0.9% NaCl. Administer direct IV push through Y-site into free-flowing infusion of 0.9% NaCl or D5W. ***Rate:*** Administer over at least 2–3 min. Rapid administration rate may cause facial flushing or erythema along the vein.
- **Intermittent Infusion:** ***Diluent:*** May also be diluted in 50–100 mL of 0.9% NaCl. ***Rate:***

Administer 50 mL over 10–15 min or 100 mL over 30–45 min.
- **Y-Site Compatibility:** amifostine , etoposide, filgrastim, gemcitabine, granisetron, melphalan, methotrexate, ondansetron, sodium bicarbonate, teniposide, thiotepa, vinorelbine.
- **Y-Site Incompatibility:** allopurinol, aztreonam, cefepime, fludarabine, lansoprazole, piperacillin/tazobactam.
- **Additive Incompatibility:** Manufacturer does not recommend admixing daunorubicin hydrochloride.

## Patient/Family Teaching
- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis pain may require management with opioid analgesics. Period of highest risk is 3–7 days after administration of dose.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, or swelling of lower extremities occurs.
- Discuss with patient possibility of hair loss. Explore methods of coping. Regrowth of hair usually begins within 5 wk after discontinuing therapy.
- Inform patient that medication may turn urine reddish color for 1–2 days after administration.
- Inform patient that this medication may cause irreversible gonadal suppression. Advise patient that this medication may have teratogenic effects. Contraception should be used during therapy and for at least 4 mo after therapy is concluded.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

## Evaluation/Desired Outcomes
- Improvement of hematologic status in patients with leukemia.

HIGH ALERT

# decitabine (de-sit-a-been)
Dacogen

***Classification***
Therapeutic: antineoplastics

**Pregnancy Category D**

## Indications
Treatment of various myelodysplastic syndromes (MDS).

## Action
Inhibits DNA methyltransferase, causing apoptosis. Has more effect on rapidly replicating cells.
**Therapeutic Effects:** Improved hematologic and clinical manifestations of MDS.

## Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** 0.5 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | end of infusion | unknown |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; OB: Pregnancy or lactation.
**Use Cautiously in:** Patients with child-bearing potential (males and females); Impaired hepatic/renal function; Geri: Elderly patients may be more sensitive to effects; Pedi: Safety in children not established.

## Adverse Reactions/Side Effects
**CNS:** confusion, fatigue, insomnia, depression, lethargy. **EENT:** blurred vision. **Resp:** cough. **CV:** atrial fibrillation, pulmonary edema, tachycardia. **GI:** abdominal pain, constipation, diarrhea, stomatitis, vomiting, abnormal liver function tests. **Derm:** petechiae, rash. **F and E:** edema, hypokalemia, hypomagnesemia, ascites. **Hemat:** BLEEDING, anemia, neutropenia, thrombocytopenia. **Local:** injection site irritation. **Metab:** hyperglycemia. **MS:** arthralgia, myalgia. **Misc:** INFECTION, fever, lymphadenopathy.

## Interactions
**Drug-Drug:** ↑ risk of myelosuppression with other **antineoplastics**, **immunosuppressants**, or **radiation therapy**. May ↓ antibody re-

sponse to and ↑ risk of adverse reactions from **live virus vaccines**.

### Route/Dosage

**IV (Adults):** *First treatment cycle*—15 mg/m² as a continuous infusion over 3 hours repeated every 8 hours for 3 days. *Subsequent cycles*—cycle should be repeated every 6 wk for a minimum of 4 cycles; treatment may be continued as long as the patient continues to benefit. Dose adjustment/delay may be required for hematologic toxicity, renal or hepatic impairment, or infection.

### Availability

**Lyophilized powder for injection (requires reconstitution):** 50 mg/vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- ***Lab Test Considerations:*** Monitor CBC prior to each dosing cycle and periodically as needed. May cause neutropenia, thrombocytopenia, and anemia; occur more frequently in 1st or 2nd cycle. Use early institution of growth factors and antimicrobial agents to prevent infections.
- Obtain liver chemistries and serum creatinine prior to initiation of treatment. May cause hyperbilirubinemia and hypoalbuminemia.
- May cause hyperglycemia, hypomagnesemia, hyponatremia, hypokalemia, and hyperkalemia.

### Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)

### Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers (see Appendix L).
- Pre-medicate patient with standard anti-emetic therapy.
- If hematologic recovery (ANC ≥1,000 cells/mm³ and platelets ≥50,000 cells/mm³) from previous treatment cycle requires more than 6, but less than 8 wk—delay dosing for up to 2 wk and temporarily reduce dose to 11 mg/m² (33 mg/m²/day, 99 mg/m²/cycle) upon restarting therapy.
- If hematologic recovery requires more than 8, but less than 10 wk—Patient should be assessed for disease progression (by bone marrow aspirates); in the absence of progression, delay dose for up to 2 more wk and reduce dose as above upon restarting, then maintain or increase in subsequent cycles as clinically indicated.
- **Intermittent Infusion:** Reconstitute with 10 mL of Sterile Water for injection for a concentration of 5 mg/mL. Immediately after reconstitution, dilute further with 0.9% NaCl, D5W, or LR for a final concentration of 0.1–1.0 mg/mL. Unless used within 15 min of reconstitution, dilute solution must be prepared using cold infusion fluids and refrigerated until administration (maximum of 7 hr). ***Rate:*** Administer over 3 hr.

### Patient/Family Teaching

- Caution patient to avoid crowds and persons with known infections. Report symptoms of infection (fever, chills, cough, hoarseness, sore throat, lower back or side pain, painful or difficult urination) immediately.
- Instruct patient to report unusual bleeding. Advise patient of thrombocytopenia precautions (use soft toothbrush and electric razor, avoid falls, do not drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding).
- Inform patient that this medication may have teratogenic effects. Advise women to avoid becoming pregnant during treatment and advise men not to father a child during or for 2 months after treatment.

### Evaluation/Desired Outcomes

- Improved hematologic and clinical manifestations of MDS.

# deferoxamine

(de-fer-**ox**-a-meen)
Desferal

***Classification***
Therapeutic: antidotes
Pharmacologic: heavy metal antagonists

**Pregnancy Category C**

## Indications

Acute toxic iron ingestion. Secondary iron overload syndromes associated with multiple transfusion therapy.

## Action

Chelates unbound iron, forming a water-soluble complex (ferrioxamine) in plasma that is easily excreted by the kidneys. **Therapeutic Effects:** Removal of excess iron. Also chelates aluminum.

## Pharmacokinetics

**Absorption:** Poorly absorbed after oral administration. Well absorbed after IM administration and subcut administration.
**Distribution:** Appears to be widely distributed.
**Metabolism and Excretion:** Metabolized by tissues and plasma enzymes. Unchanged drug and chelated form excreted by the kidneys; 33% of iron removed is eliminated in the feces via biliary excretion.
**Half-life:** 1 hr.

TIME/ACTION PROFILE (effects on hematologic parameters)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | unknown | unknown |
| IM | unknown | unknown | unknown |
| Subcut | unknown | unknown | unknown |

## Contraindications/Precautions

**Contraindicated in:** Severe renal disease; Anuria; OB: Early pregnancy or childbearing potential (however, may be used safely in pregnant patients with moderate-to-severe acute iron intoxication).
**Use Cautiously in:** Pedi: Children <3 yr (safety not established).

## Adverse Reactions/Side Effects

**EENT:** blurred vision, cataracts, ototoxicity. **CV:** hypotension, tachycardia. **GI:** abdominal pain, diarrhea. **GU:** red urine. **Derm:** erythema, flushing, urticaria. **Local:** induration at injection site, pain at injection site. **MS:** leg cramps. **Misc:** allergic reactions, fever, shock after rapid IV administration.

## Interactions

**Drug-Drug: Ascorbic acid** may ↑ effectiveness of deferoxamine but may also ↑ cardiac iron toxicity.

## Route/Dosage

### Acute Iron Ingestion

**IM, IV (Adults and Children ≥3 yr):** 1 g, then 500 mg q 4 hr for 2 doses. Additional doses of 500 mg q 4–12 hr may be needed (not to exceed 6 g/24 hr).

### Chronic Iron Overload

**IM, IV (Adults and Children ≥3 yr):** 500 mg–1 g daily IM; additional doses of 2 g should be given IV for each unit of blood transfused (not to exceed 1 g/day in absence of transfusions; 6 g/day if patient receives transfusions).
**Subcut (Adults and Children ≥3 yr):** 1–2 g/day (20–40 mg/kg/day) infused over 8–24 hr.

## Availability (generic available)

**Powder for injection:** 500 mg/vial, 2 g/vial.

# NURSING IMPLICATIONS

## Assessment

- In acute poisoning, assess time, amount, and type of iron preparation ingested.
- Monitor signs of iron toxicity: early acute (abdominal pain, bloody diarrhea, emesis), late acute (decreased level of consciousness, shock, metabolic acidosis).
- Monitor vital signs closely, especially during IV administration. Report hypotension, erythema, urticaria, or signs of allergic reaction. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- May cause oculotoxicity or ototoxicity. Report decreased visual acuity or hearing loss. Audiovisual exams should be performed every 3 mo in patients with chronic iron overload.
- Monitor intake and output and urine color. Inform health care professional if patient is anuric. Chelated iron is excreted primarily by the kidneys; urine may turn red.
- ***Lab Test Considerations:*** Monitor serum iron, total iron binding capacity (TIBC), ferritin levels, and urinary iron excretion before and periodically during therapy.
- Monitor liver function studies to assess damage from iron poisoning.

## Potential Nursing Diagnoses

Risk for injury poisoning (Indications)

### Implementation

- IM route is preferred in acute iron intoxication unless patient is in shock.
- Reconstitute 500-mg vial with 2 mL and 2-g vial with 8 mL of sterile water for injection for a concentration of 213 mg/mL. Dissolve powder completely before administration. Solution is yellow and is stable for 1 wk after reconstitution if protected from light. Discard unused portion.
- Used in conjunction with induction of emesis or gastric aspiration and lavage with sodium bicarbonate, and supportive measures for shock and metabolic acidosis in acute poisoning.
- **IM:** Administer deep IM and massage well. Rotate sites. IM administration may cause transient severe pain.
- **Subcut:** Reconstitute 500-mg vial with 5 mL and 2-g vial with 20 mL of sterile water for injection. ***Concentration:*** 95 mg/mL. Subcut route used to treat chronically elevated iron therapy is administered into abdominal subcut tissue via infusion pump for 8–24 hr per treatment.
- **IV:** Reconstitute 500-mg vial with 5 mL and 2-g vial with 20 mL of sterile water for injection. ***Concentration:*** 95 mg/mL. ***Diluent:*** D5W, 0.9% NaCl, 0.45% NaCl, or LR. Dissolve powder completely before administration. Solution is clear and colorless to slightly yellow. Administer within 3 hr of reconstitution; 24 hr if prepared under laminar flow hood. Discard unused portion. ***Rate:*** Maximum infusion rate is 15 mg/kg/hr for first 1000 mg. May be followed by 500 mg infused over 4 hr at a slower rate not to exceed 125 mg/hr. Rapid infusion rate may cause hypotension, erythema, urticaria, wheezing, convulsions, tachycardia, or shock.
- May be administered at the same time as blood transfusion in persons with chronically elevated serum iron levels. Use separate site for administration.

### Patient/Family Teaching

- Reinforce need to keep iron preparations, all medications, and hazardous substances out of the reach of children.
- Reassure patient that red coloration of urine is expected and reflects excretion of excess iron.
- May cause dizziness or impairment of vision or hearing. Caution patient to avoid driving or other activities requiring alertness until response from medication is known.
- Advise patient not to take vitamin C preparations without consulting health care professional, because tissue toxicity may increase.
- Encourage patients requiring chronic therapy to keep follow-up appointments for lab tests. Eye and hearing exams may be monitored every 3 mo.

### Evaluation/Desired Outcomes

- Return of serum iron concentrations to a normal level (50–150 mcg/100 mL).

## desipramine (dess-**ip**-ra-meen)

Norpramin, Pertofrane

***Classification***

Therapeutic: antidepressants
Pharmacologic: tricyclic antidepressants

**Pregnancy Category C**

### Indications

Depression. **Unlabeled Use:** Chronic pain syndromes. Anxiety. Insomnia.

### Action

Potentiates the effect of serotonin and norepinephrine in the CNS. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action (may develop only over several weeks).

### Pharmacokinetics

**Absorption:** Well absorbed from the GI tract.
**Distribution:** Widely distributed.
**Protein Binding:** 90–92%.
**Metabolism and Excretion:** Extensively metabolized by the liver. One metabolite is pharmacologically active (2-hydroxydesipramine). Undergoes enterohepatic recirculation and secretion into gastric juices. Small amounts enter breast milk.
**Half-life:** 12–27 hr.

TIME/ACTION PROFILE (antidepressant effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 2–3 wk | 2–6 wk | days–wk |

### Contraindications/Precautions

**Contraindicated in:** Angle-closure glaucoma; Recent MI, heart failure, known history of QTc prolongation.
**Use Cautiously in:** Patients with pre-existing cardiovascular disease; Prostatic hyperplasia (↑ susceptibility to urinary retention); History of sei-

zures (threshold may be ↓); May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents; OB: Use during pregnancy only if potential maternal benefit outweighs risks to fetus; use during lactation may result in neonatal sedation; Pedi: Safety not established in children <12 yr; Geri: ↑ sensitivity to effects.

### Adverse Reactions/Side Effects

**CNS:** drowsiness, fatigue. **EENT:** blurred vision, dry eyes, dry mouth. **CV:** ARRHYTHMIAS, hypotension, ECG changes. **GI:** constipation, drug-induced hepatitis, paralytic ileus, increased appetite, weight gain. **GU:** urinary retention, decreased libido. **Derm:** photosensitivity. **Endo:** changes in blood glucose, gynecomastia. **Hemat:** blood dyscrasias.

### Interactions

**Drug-Drug:** Desipramine is metabolized in the liver by the cytochrome P450 2D6 enzyme and its action may be affected by drugs which compete for metabolism by or alter the activity of this enzyme including other **antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrthythmics** (**propafenone**, **flecainide**, **encainide**); when used concurrently dose reduction of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects. May cause hypotension, tachycardia, and potentially fatal reactions when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk prior to). Concurrent use with **SSRI antidepressants** may result in ↑ toxicity and should be avoided (fluoxetine should be stopped 5 wk before). Concurrent use with **clonidine** may result in hypertensive crisis and should be avoided. **Phenytoin** may ↓ levels and effectiveness; ↑ doses of desipramine may be required to treat depression. Concurrent use with **levodopa** may result in delayed/↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by **rifamycins**, **carbamazepine**, and **barbiturates**. Concurrent use with **moxifloxacin** ↑ risk of adverse cardiovascular reactions. ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioid analgesics**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other **agents having these properties**. **Hormonal contraceptives** ↑ levels and may cause toxicity. **Cigarette smoking** may ↑ metabolism and alter effects.

**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. ↑ anticholinergic effects with **jimson weed** and **scopolia**.

### Route/Dosage

**PO (Adults):** 100–200 mg/day as a single dose or in divided doses (up to 300 mg/day).
**PO (Geriatric Patients):** 25–50 mg/day in divided doses (up to 150 mg/day).
**PO (Children >12 yr):** 25–50 mg/day in divided doses, increased as needed up to 100 mg/day.
**PO (Children 6–12 yr):** 10–30 mg/day (1–5 mg/kg/day) in divided doses.

### Availability (generic available)

**Tablets:** 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg.

## NURSING IMPLICATIONS

### Assessment

- Obtain weight and BMI initially and periodically throughout therapy.
- Assess FBS and cholesterol levels for overweight/obese individuals.
- Refer as appropriate for nutrition/weight management and medical management.
- Monitor blood pressure and pulse prior to and during initial therapy. Notify physician or other health care professional of decreases in blood pressure (10–20 mm Hg) or sudden increase in pulse rate. Patients taking high doses or with a history of cardiovascular disease should have ECG monitored prior to and periodically during therapy.
- **Depression:** Monitor mental status (orientation, mood, behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Pain:** Assess intensity, quality, and location of pain periodically throughout therapy. Use pain scale to monitor effectiveness of medication.
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts, liver function, and serum glucose periodically. May cause an ↑ serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be ↑ or ↓.
- ***Lab Test Considerations:*** Serum levels may be monitored in patients who fail to respond to usual therapeutic dose.

### Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)

Impaired oral mucous membrane (Side Effects)
Impaired urinary elimination (Side Effects)
Chronic pain (Indications)
Risk for constipation (Side Effects)
Sexual dysfunction (Side Effects)

### Implementation

- Do not confuse despiramine with clomipramine, imipramine, or nortriptyline.
- Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take weeks to months. May give entire dose at bedtime.
- Taper to avoid withdrawal effects. Reduce dose by half for 3 days then reduce again by half for 3 days, then discontinue.
- **PO:** Administer medication with or immediately after a meal to minimize gastric upset. Tablet may be crushed and given with food or fluids.

### Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea; vomiting; diarrhea; headache; trouble sleeping, with vivid dreams; and irritability.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Orthostatic hypotension, sedation, and confusion are common during early therapy, especially in the elderly. Protect patient from falls. Institute fall precautions. Advise patient to make position changes slowly.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluids or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Alert patient that medication may turn urine blue-green in color.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams to monitor effectiveness and side effects and to improve coping skills.
- Refer to local support group.

### Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in chronic pain symptoms.
- Full therapeutic effects may be seen 2–6 wk after initiating therapy.

## **desirudin** (des-i-**rude**-in)

Iprivask

***Classification***

Therapeutic: anticoagulants
Pharmacologic: thrombin inhibitors

**Pregnancy Category C**

### Indications

Prevention of deep-vein thrombosis (DVT) after hip-replacement surgery.

### Action

Selectively inhibits free and clot-bound thrombin. Inhibition of thrombin prevents activation of factors V, VIII, and XII; conversion of fibrinogen to fibrin; platelet adhesion and aggregation. **Therapeutic Effects:** Decreased incidence of DVT and subsequent pulmonary embolism after hip-replacement surgery.

### Pharmacokinetics

**Absorption:** Completely absorbed following subcutaneous administration.
**Distribution:** Binds specifically and directly to thrombin.
**Metabolism and Excretion:** 40–50% excreted unchanged by kidneys; some metabolism in kidneys and pancreas.
**Half-life:** 2 hr.

TIME/ACTION PROFILE (effect on aPTT)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Subcut | rapid | 1–3 hr | 12 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to natural or recombinant hirudins; Active bleeding; Coagulation disorders.

**Use Cautiously in:** Renal impairment (dosage change recommended if CCr ≤60 mL/min); Geriatric patients (due to age-related renal impairment); Hepatic impairment; Pregnancy (use only if benefits to mother outweigh fetal risk); Lactation, children (safety not established).

**Exercise Extreme Caution in:** Spinal/epidural anesthesia (increased risk of spinal/epidural hematomas and their sequelae, especially when used with NSAIDs, platelet inhibitors, or other anticoagulants).

## Adverse Reactions/Side Effects

**GI:** nausea. **Hemat:** BLEEDING, anemia. **Local:** injection site reactions, wound secretion.

## Interactions

**Drug-Drug: Dextran 40**, **systemic corticosteroids**, **thrombolytics**, and other **anticoagulants** ↑ risk of bleeding (discontinue if possible; if not, monitor laboratory and clinical status closely). Agents altering platelet function including **salicylates**, **NSAIDs**, **clopidogrel**, **ticlopidine**, **dipyridamole**, and **glycoprotein IIb/IIIa antagonists** also ↑ risk of bleeding.

## Route/Dosage

**Subcut (Adults):** 15 mg every 12 hr, start 5–15 min prior to surgery, but after regional block (if used), for up to 12 days.

### Renal Impairment

**Subcut (Adults):** *CCr 31–60 mL/min*—start with 5 mg every 12 hr; further doses determined by daily aPTT; *CCr <31 mL/min*—start with 1.7 mg every 12 hr; further doses determined by daily aPTT.

## Availability

**Lyophilized powder for injection (requires reconstitution with specific diluent):** 15.75 mg/vial with 0.6 mL ampule of diluent (contains mannitol, delivers 15 mg dose).

# NURSING IMPLICATIONS

## Assessment

- Assess for signs of bleeding (bleeding gums, nosebleed, unusual bruising; black, tarry stools; hematuria; fall in hematocrit or blood pressure; guaiac-positive stools; bleeding from surgical site). Notify physician if these occur.
- Assess patient for evidence of thrombosis. Symptoms depend on area of involvement. Notify physician immediately; may require urgent treatment.
- Monitor patients with epidural catheters frequently for signs of neurological impairment (midline back pain, numbness or weakness in lower limbs, bowel and/or bladder dysfunction). Notify physician immediately if these occur.
- Observe injection sites for hematomas, ecchymosis, or inflammation.
- ***Lab Test Considerations:*** Monitor activated partial thromboplastin time (aPTT) daily in patients with increased risk of bleeding and/or renal impairment. Monitor serum creatinine daily in patients with renal impairment. Peak aPTT should not exceed two times control. Reduce dose or discontinue desirudin until aPTT is <2 times control; resume at a lower dose.
- If a patient is switched from oral anticoagulants to desirudin or from desirudin to oral anticoagulants, measure anticoagulant activity closely.
- Thrombin time is not suitable for monitoring desirudin.
- Monitor CBC. If hematocrit ↓ unexpectedly, assess patient for potential bleeding sites.

## Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Adverse Reactions)

## Implementation

- Reconstitute each vial with 0.5 mL of diluent provided for a concentration of 15.75 mg of desirudin/0.5 mL. Shake vial gently until fully reconstituted to a clear colorless solution. Do not administer solutions that are discolored, cloudy, or contain a particulate matter. Reconstituted solution should be used immediately, but is stable for 24 hr at room temperature and protected from light. Discard unused solution.
- **Subcut:** Withdraw all reconstituted solution into syringe with a 26- or 27-gauge, 1/2-inch length needle. Inject entire contents subcutaneously which will deliver 15 mg. Patient should be sitting or lying down during administration. Rotate sites between left and right anterolateral and left and right posterolateral thigh or abdominal wall. Inject entire length of needle while pinching skin between thumb and forefinger; continue to pinch skin throughout injection. Do not rub injection site following injection to prevent bruising.

- **Syringe Incompatibility:** Do not mix with other diluents or medications.

### Patient/Family Teaching

- Advise patient to report symptoms of unusual bleeding or bruising to health care professional immediately.
- Instruct patient not to take aspirin, NSAIDs, or herbal products during therapy without consulting health care professional.

### Evaluation/Desired Outcomes

- Decreased incidence of DVT and subsequent pulmonary embolism after hip-replacement surgery.

## desloratadine

(dess-lor-**a**-ta-deen)
Clarinex

***Classification***
Therapeutic: allergy, cold, and cough remedies, antihistamines
Pharmacologic: piperidines

**Pregnancy Category C**

### Indications

Symptoms of allergic rhinitis (seasonal and perennial). Chronic idiopathic urticaria.

### Action

Blocks peripheral effects of histamine released during allergic reactions. **Therapeutic Effects:** Decreased symptoms of allergic reactions (nasal stuffiness, red swollen eyes). Decreased pruritus, reduction in number and size of hives in chronic idiopathic urticaria.

### Pharmacokinetics

**Absorption:** Well absorbed; absorption for orally-disintegrating tablets and oral tablets is identical.
**Distribution:** Enters breast milk.
**Metabolism and Excretion:** Extensively metabolized to 3-hydroxydesloratadine, an active metabolite; small percentage of patients may be slow metabolizers.
**Half-life:** 27 hr.

TIME/ACTION PROFILE (antihistaminic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 3 hr | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB: Lactation.
**Use Cautiously in:** Patients with hepatic or renal impairment (↓ dose to 5 mg every other day); Geri: Dosing for the elderly should consider ↓ hepatic, renal, or cardiac function, concomitant diseases, other drug therapy and ↑ risk of adverse reactions; Pedi: Children <6 mo (safety not established).

### Adverse Reactions/Side Effects

**CNS:** drowsiness (rare). **EENT:** pharyngitis. **GI:** dry mouth. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

**Drug-Drug:** The following interactions may occur, but are less likely to occur with desloratidine than with more sedating antihistamines. **MAO inhibitors** may ↑ and prolong effects of antihistamines. ↑ CNS depression may occur with other **CNS depressants** including **alcohol**, **antidepressants**, **opioids**, and **sedative/hypnotics**.

### Route/Dosage

**PO (Adults and Children ≥12 yr):** 5 mg once daily.

#### Hepatic Impairment

#### Renal Impairment

**PO (Adults and Children ≥12 yr):** 5 mg every other day.
**PO (Children 6–11 yr):** 2.5 mg once daily.
**PO (Children 12 mo–5 yr):** 1.25 mg once daily.
**PO (Children 6–12 mo):** 1 mg once daily.

### Availability

**Tablets:** 5 mg. **Cost:** $292.91/90. **Orally-disintegrating tablets (RediTabs) (tutti frutti):** 2.5 mg, 5 mg. **Cost:** 2.5 mg $319.29/90, 5 mg $307.89/90. **Syrup (bubblegum):** 0.5 mg/mL. **Cost:** $168.58/473 mL. ***In combination with:*** pseudoephedrine (Clarinex-D 12 Hour, Clarinex-D 24 Hour; see Appendix B).

## NURSING IMPLICATIONS

### Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–

2000 mL/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** May cause false-negative result on allergy skin testing.

### Potential Nursing Diagnoses
Ineffective airway clearance (Indications)
Risk for injury (Adverse Reactions)

### Implementation
- **PO:** May be administered without regard to meals.
- Pedi: Use calibrated measuring device to ensure accurate dose of syrup for children.
- *For rapidly disintegrating tablets (Reditabs):* Place on tongue. Tablet disintegrates rapidly. May be taken with or without water. Administer immediately after opening the blister.

### Patient/Family Teaching
- Instruct patients to take desloratidine as directed. Do not increase dose or frequency; does not increase effectiveness and may increase side effects.
- May rarely cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.

### Evaluation/Desired Outcomes
- Decrease in allergic symptoms.

## desmopressin
(des-moe-**press**-in)
DDAVP, DDAVP Rhinal Tube, DDAVP Rhinyle Drops, Stimate

***Classification***
Therapeutic: hormones
Pharmacologic: antidiuretic hormones

**Pregnancy Category B**

### Indications
**PO, Subcut, IV, Intranasal:** Treatment of central diabetes insipidus caused by a deficiency of vasopressin. **IV, Intranasal:** Controls bleeding in certain types of hemophilia and von Willebrand's disease. **PO:** Primary nocturnal enuresis.

### Action
An analogue of naturally occurring vasopressin (antidiuretic hormone). Primary action is enhanced reabsorption of water in the kidneys.
**Therapeutic Effects:** Prevention of nocturnal enuresis. Maintenance of appropriate body water content in diabetes insipidus. Control of bleeding in certain types of hemophilia or von Willebrand's disease.

### Pharmacokinetics
**Absorption:** 5% absorbed following oral administration; some 10–20% absorbed from nasal mucosa.
**Distribution:** Distribution not fully known. Enters breast milk.
**Metabolism and Excretion:** Unknown.
**Half-life:** 75 min.

TIME/ACTION PROFILE (PO, intranasal = antidiuretic effect; IV = effect on factor VIII activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1 hr | 4–7 hr | unknown |
| Intranasal | 1 hr | 1–5 hr | 8–20 hr |
| IV | within min | 15–30 min | 3 hr† |

†4–24 hr in mild hemophilia A

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Hypersensitivity to chlorobutanol; Patients with type IIB or platelet-type (pseudo) von Willebrand's disease; Hyponatremia.
**Use Cautiously in:** Angina pectoris; Hypertension; Patients at risk for hyponatremia; OB, Lactation: Safety not established.

### Adverse Reactions/Side Effects
**CNS:** SEIZURES, drowsiness, headache, listlessness. **EENT:** *intranasal*—nasal congestion, rhinitis. **Resp:** dyspnea. **CV:** hypertension, hypotension, tachycardia (large IV doses only). **GI:** mild abdominal cramps, nausea. **GU:** vulval pain. **Derm:** flushing. **F and E:** water intoxication/hyponatremia. **Local:** phlebitis at IV site.

### Interactions
**Drug-Drug: Chlorpropamide**, **clofibrate**, or **carbamazepine** may enhance the antidiuretic response to desmopressin. **Demeclocycline**, **lithium**, or **norepinephrine** may diminish the antidiuretic response to desmopressin. Large doses may enhance the effects of **vasopressors**.

### Route/Dosage

### Primary Nocturnal Enuresis
**PO (Adults and Children ≥6 yr):** 0.2 mg at bedtime; may be titrated up to 0.6 mg at bedtime to achieve desired response.

### Diabetes Insipidus

**PO (Adults and Children):** 0.05 mg twice daily; adjusted as needed (usual range: 0.1–1.2 mg/day in 2–3 divided doses).
**Intranasal (Adults):** *DDAVP*–0.1–0.4 mL/day in 1–3 divided doses.
**Intranasal (Children 3 mo–12 yr):** *DDAVP*–0.05–0.3 mL/day in 1–2 divided doses.
**Subcut, IV (Adults):** 2–4 mcg/day in 2 divided doses.

### Hemophilia A/von Willebrand's disease

**Intranasal (Adults and Children ≥50 kg):** *Stimate*—1 spray (150 mcg) in each nostril.
**Intranasal (Adults and Children <50 kg):** *Stimate*—1 spray (150 mcg) in one nostril.
**IV (Adults and Children >3 mo):** 0.3 mcg/kg, repeated as needed.

### Availability (generic available)

**Tablets:** 0.1 mg, 0.2 mg. **Nasal spray (DDAVP):** 10 mcg/spray—5-mL bottle (0.1 mg/mL) contains 50 doses ). **Nasal spray (Stimate):** 150 mcg/spray. **Rhinal tube delivery system-nasal solution:** 2.5-mL vials with applicator tubes (0.1 mg/mL). **Injection:** 4 mcg/mL.

## NURSING IMPLICATIONS

### Assessment

- Chronic intranasal use may cause tolerance or if administered more frequently than every 24–48 hr IV tachyphylaxis (short-term tolerance) may develop.
- **Nocturnal Enuresis:** Monitor frequency of enuresis throughout therapy. Use cautiously in patients at risk for water intoxication with hyponatremia.
- **Diabetes Insipidus:** Monitor urine and plasma osmolality and urine volume frequently. Assess patient for symptoms of dehydration (excessive thirst, dry skin and mucous membranes, tachycardia, poor skin turgor). Weigh patient daily and assess for edema.
- **Hemophilia:** Monitor plasma factor VIII coagulant, factor VIII antigen, and ristocetin cofactor. May also assess activated partial thromboplastin time (aPTT) for hemophilia A and skin bleeding time for von Willebrand's disease. Assess patient for signs of bleeding.
- Monitor blood pressure and pulse during IV infusion.
- Monitor intake and output and adjust fluid intake (especially in children and elderly) to avoid overhydration in patients receiving desmopressin for hemophilia.
- ***Toxicity and Overdose:*** Signs and symptoms of water intoxication include confusion, drowsiness, headache, weight gain, difficulty urinating, seizures, and coma.
- Treatment of overdose includes decreasing dose and, if symptoms are severe, administration of furosemide.

### Potential Nursing Diagnoses

Deficient fluid volume (Indications)
Excess fluid volume (Adverse Reactions)

### Implementation

- IV desmopressin has 10 times the antidiuretic effect of intranasal desmopressin.
- **PO:** Begin oral doses 12 hr after last intranasal dose. Monitor response closely.
- **Diabetes Insipidus:** Parenteral dose for antidiuretic effect is administered direct IV or subcut.
- **Hemophilia:** Parenteral dose for control of bleeding is administered via IV infusion. If used preoperatively, administer 30 min prior to procedure.

#### IV Administration

- **Direct IV:** (for diabetes insipidus) ***Diluent:*** Administer undiluted. ***Concentration:*** 4 mcg/mL. ***Rate:*** Administer over 1 min.
- **Intermittent Infusion (for hemophilia and von Willebrand's disease):** ***Diluent:*** Dilute each dose in 50 mL of 0.9% NaCl for adults and children >10 kg and in 10 mL in children weighing <10 kg. ***Rate:*** Infuse slowly over 15–30 min.
- **Y-Site Compatibility:** No information available.
- **Intranasal:** If intranasal dose is used preoperatively, administer 2 hr before procedure.

### Patient/Family Teaching

- Advise patient to notify health care professional if bleeding is not controlled or if headache, dyspnea, heartburn, nausea, abdominal cramps, vulval pain, or severe nasal congestion or irritation occurs.
- Caution patient to avoid concurrent use of alcohol with this medication.
- **Diabetes Insipidus:** Instruct patient on intranasal administration. Medication is supplied with a flexible calibrated catheter (rhinyle). Draw solution into rhinyle. Insert one end of tube into nostril, blow on the other end to de-

posit solution deep into nasal cavity. An air-filled syringe may be attached to the plastic catheter for children, infants, or obtunded patients. Tube should be rinsed under water after each use.
- If nasal spray is used, prime pump prior to first use by pressing down 4 times. Caution patient that nasal spray should not be used beyond the labeled number of sprays; subsequent sprays may not deliver accurate dose. Do not attempt to transfer remaining solution to another bottle.
- Instruct patient to take missed doses as soon as remembered but not if it is almost time for the next dose. Do not double doses.
- Advise patient that rhinitis or upper respiratory infection may decrease effectiveness of this therapy. If increased urine output occurs, patient should contact health care professional for dosage adjustment.
- Patients with diabetes insipidus should carry identification at all times describing disease process and medication regimen.

### Evaluation/Desired Outcomes
- Decreased frequency of nocturnal enuresis.
- Decrease in urine volume.
- Relief of polydipsia.
- Increased urine osmolality.
- Control of bleeding in hemophilia.

**desonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

**desoximetasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

## desvenlafaxine
(**des**-ven-la-**fax**-een)
Pristiq

***Classification***
Therapeutic: antidepressants
Pharmacologic: selective serotonin/norepinephrine reuptake inhibitors

**Pregnancy Category C**

### Indications
Major depressive disorder.

### Action
Inhibits serotonin and norepinephrine reuptake in the CNS. **Therapeutic Effects:** Decrease in depressive symptomatology, with fewer relapses/recurrences.

### Pharmacokinetics
**Absorption:** 80% absorbed following oral administration.
**Distribution:** Enters breast milk.
**Metabolism and Excretion:** 55% metabolized by the liver, 45% excreted unchanged in urine.
**Half-life:** 10 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 7.5 hr | 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to venlafaxine or desvenlafaxine; Concurrent MAO inhibitors or within 14 days of stopping an MAO inhibitor; after desvenlafaxine is stopped wait 7 days until starting an MAO inhibitor; Should not be used concurrently with venlafaxine.
**Use Cautiously in:** Untreated cerebrovascular or cardiovascular disease, including untreated hypertension (control blood pressure before initiating therapy); Bipolar disorder (may activate mania/hypomania); History of ↑ intraocular pressure/angle-closure glaucoma; Renal impairment (consider modifications, dose should not exceed 50 mg/day, especially in moderate to severe renal impairment); History of seizures or neurologic impairment; Hepatic impairment (dose should not exceed 100 mg/day); Geri: Consider age-related decrease in renal function, decreased body mass, concurrent disease states, and medications; OB, Lactation: Use in pregnancy or lactation only if maternal benefit outweighs fetal/infant risk; Pedi: ↑ risk of suicidal thinking and behavior (suicidality) in children and adolescents with major depressive disorder and other psychiatric disorders. Observe closely for suicidality and behavior changes.

### Adverse Reactions/Side Effects
**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, anxiety, dizziness, drowsiness, insomnia, headache. **EENT:** ↑ intraocular pressure, mydriasis. **Resp:** eosinophilic pneumonia, interstitial lung disease. **CV:** hypertension. **GI:** ↓ appetite, constipation, nausea. **GU:** male sexual dysfunction. **Derm:** sweating. **F and E:** hyponatremia. **Hemat:** ↑ risk of bleeding. **Metab:** hypercholesterolema, hyperlipidemia. **Misc:** SEROTONIN SYNDROME.

## Interactions

**Drug-Drug:** Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions (wait at least 2 wk after stopping MAO inhibitor before initiating desvenlafaxine; wait at least 1 wk after stopping desvenlafaxine before starting an MAO inhibitor). ↑ risk of bleeding with other **drugs that ↑ bleeding risk** including **anticoagulants**, **antithrombotics**, **platelet aggregation inhibitors**, and **NSAIDs**. Use cautiously with other **CNS-active drugs**, including **alcohol** or **sedative/hypnotics**; effects of combination are unknown. Drugs that affect serotonergic neurotransmitter systems, including **linezolid**, **tramadol**, and **triptans** ↑ risk of serotonin syndrome. **Ketoconazole** may ↑ the effects of desvenlafaxine.

## Route/Dosage

**PO (Adults):** 50 mg once daily.

### Renal Impairment

**PO (Adults):** *CCr 30–50 mL/min*—50 mg/day; *CCr <30 mL/min*—50 mg every other day.

## Availability

**Extended-release tablets:** 50 mg, 100 mg.

# NURSING IMPLICATIONS

## Assessment

- Assess mental status and mood changes, especially during initial few months of therapy and during dose changes. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, significant change in weight and/or appetite, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings or guilt or worthlessness, slowed thinking or impaired concentration, suicide attempt or suicidal ideation).
- Assess suicidal tendencies, especially in early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr.
- Monitor blood pressure before and periodically during therapy. Sustained hypertension may be dose related; decrease dose or discontinue therapy if this occurs.
- Monitor appetite and nutritional intake; weigh weekly. Report continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile blood pressure, hyperthermia], neuromuscular aberrations [hyper reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- ***Lab Test Considerations:*** May cause ↑ fasting serum total cholesterol, LDL, cholesterol, and triglycerides.
- May cause transient proteinuria, not usually associated with ↑ BUN or creatinine.
- May cause hyponatremia.

## Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)

## Implementation

- **PO:** Administer at the same time each day, with or without food. Tablets should be swallowed whole; do not crush, break, chew, or dissolve.

## Patient/Family Teaching

- Instruct patient to take medication exactly as directed at the same time each day. Take missed doses as soon as possible unless almost time for next dose. Do not double doses or discontinue abruptly; gradually decrease before discontinuation.
- Advise patient, family and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Caution patient to avoid taking alcohol or other CNS-depressant drugs during therapy and not to take other Rx, OTC, or herbal products without consulting health care professional.
- Instruct female patients to inform health care professional if pregnancy is planned or suspected or if breastfeeding.
- Instruct patient to notify health care professional if signs of allergy (rash, hives, swelling, difficulty breathing) occur.

- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy.

### Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Therapy is usually continued for several mo.

**dexamethasone, See CORTICOSTEROIDS (SYSTEMIC).**

## dexlansoprazole

(dex-lan-**soe**-pra-zole)
Dexilant

***Classification***
Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

**Pregnancy Category B**

### Indications

Healing/maintenance of healing of erosive esophagitis (EE). Tretment of heartburn from non-erosive gastroesopahageal reflux disease (GERD).

### Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux.

### Pharmacokinetics

**Absorption:** Well absorbed following oral administration.
**Distribution:** Unknown.
**Protein Binding:** 96–99%.
**Metabolism and Excretion:** Extensively metabolized by the liver (CYP2C19 and CYP3A4 enzyme systems are involved); patients who are poor metabolizers may have higher blood levels; no active metabolites. No renal elimination.
**Half-life:** 1–2 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK* | DURATION |
|---|---|---|---|
| PO | unknown | 1–2 hr (1st); 4–5 hr (2nd) | 24 hr |

*Reflects effects of delayed release capsule.

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe hepatic impairment; Lactation: Lactation.

**Use Cautiously in:** Moderate hepatic impairment (daily dose should not exceed 30 mg); Pedi: Safety not established.

### Adverse Reactions/Side Effects

**GI:** abdominal pain, diarrhea, flatulence, nausea, vomiting.

### Interactions

**Drug-Drug:** ↓ levels of **atazanavir**; do not administer concurrently. May ↓ absorption of drugs requiring acid pH for absorption, including **amipcillin**, **iron salts**, and **ketoconazole**. May increase effect of **warfarin**. May ↓ the antiplatelet effects of **clopidogrel**.

### Route/Dosage

**PO (Adults):** *Healing of EE*—60 mg once daily for up to 8 wk; *maintenance of healing of EE*—30 mg once daily for up to 6 mo; *GERD*—30 mg once daily for 4 wk.

### Hepatic Impairment

**PO (Adults):** *Moderate hepatic impairment*—daily dose should not exceed 30 mg.

### Availability

**Delayed release capsules:** 30 mg, 60 mg.

## NURSING IMPLICATIONS

### Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** May cause abnormal liver function tests, including ↑ AST, ALT, and ↑ or ↓ serum bilirubin.
- May cause ↑ serum creatinine and BUN, ↑ blood glucose, and ↑ serum potassium levels.
- May cause ↓ platelet levels.
- May also cause ↑ gastrin and total protein levels.
- Monitor INR and prothrombin time in patients taking warfarin.

### Potential Nursing Diagnoses

Acute pain (Indications)

### Implementation

- **PO:** May be administered without regard to food. Swallow capsules whole or may be opened and sprinkled on 1 tbsp of applesauce and swallowed immediately for patients with difficulty swallowing.

### Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered. Brand name was formerly Kapidex.

- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Instruct patient to consult health care professional prior to taking other Rx, OTC, or herbal products.

### Evaluation/Desired Outcomes

- Decrease in abdominal pain heartburn, gastric irritation and bleeding in patients with GERD; may require up to 4 wk of therapy.
- Healing in patients with erosive esophagitis; may require up to 8 wk of therapy for healing and 6 mo of therapy for maintenance.

## dexmedetomidine

(dex-me-de-**to**-mi-deen)
Precedex

***Classification***
Therapeutic: sedative/hypnotics

**Pregnancy Category C**

### Indications

Sedation of initially intubated and mechanically ventilated patients during treatment in an intensive care setting; should not be used for >24 hr. Sedation of non-intubated patients before and/or during surgical and other procedures.

### Action

Acts as a relatively selective alpha-adrenergic agonist with sedative properties. **Therapeutic Effects:** Sedation.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Protein Binding:** 94%.
**Metabolism and Excretion:** Mostly metabolized by the liver, some metabolism by P450 enzyme system. Metabolites are mostly excreted in urine.
**Half-life:** 2 hr.

TIME/ACTION PROFILE (sedation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Hepatic impairment (lower doses may be required); Advanced heart block; Geri: ↑ risk of bradycardia and hypotension; OB, Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**Resp:** hypoxia. **CV:** BRADYCARDIA, SINUS ARREST, hypotension, transient hypertension. **GI:** nausea, vomiting. **Hemat:** anemia. **Misc:** fever.

### Interactions

**Drug-Drug:** Sedation is enhanced by **anesthetics**, other **sedative/hypnotics**, and **opioid analgesics**.
**Drug-Natural Products:** Concomitant use of **kava-kava, valerian, skullcap, chamomile,** or **hops**can ↑ CNS depression.

### Route/Dosage

### ICU Sedation

**IV (Adults):** *Loading infusion*—1 mcg/kg over 10 min followed by *maintenance infusion* of 0.2–0.7 mcg/kg/hr for maximum of 24 hr; rate is adjusted to achieve desired level of sedation.

### Procedural Sedation

**IV (Adults):** *Loading infusion*—1 mcg/kg (0.5 mcg/kg for ophthalmic surgery or patients >65 yr) over 10 min followed by *maintenance infusion* of 0.6 mcg/kg/hr; rate is adjusted to achieve desired level of sedation (usual range 0.2–1 mcg/kg/hr) (maintenance infusion of 0.7 mcg/kg/hr recommended for fiberoptic intubation until endotracheal tube secured).

### Availability

**Injection:** 100 mcg/mL in 2-mL ampules and vials.

## NURSING IMPLICATIONS

### Assessment

- Assess level of sedation throughout therapy. Dose is adjusted based on level of sedation.
- Monitor ECG and blood pressure continuously throughout therapy. May cause hypotension, bradycardia, and sinus arrest.
- ***Toxicity and Overdose:*** Atropine IV may be used to modify the vagal tone.

## Potential Nursing Diagnoses

Anxiety (Indications)

## Implementation

- Dexmedetomidine should be administered only in intensive care settings with continuous monitoring.

### IV Administration

- **Continuous Infusion:** ***Diluent:*** To prepare infusion, withdraw 2 mL of dexmedetomidine and add to 48 mL of 0.9 NaCl for a total of 50 mL. ***Concentration:*** 4 mcg/mL. Shake gently. Solution should be clear; do not administer solutions that are discolored or contain particulate matter. Ampules and vials are for single use only. ***Rate:*** Administer *loading infusion* over 10 minutes, followed by *maintenance infusion* of 0.2–0.7 mcg/kg/hr for ICU sedation and 0.2–1.0 mcg/kg/hr for procedural sedation. Adjust dose to achieve desired level of sedation. Administer via infusion pump to ensure accurate rate.
- **Y-Site Compatibility:** 0.9% NaCl, 20% mannitol, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, D5W, dexamethasone, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doxacurium, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gancyclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, mesna, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, minocycline, mitomycin, mitoxantrone, morphine, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, plasma substitute, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinapristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiopental, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** amphotericin B colloidal, diazepam, pantoprazole, phenytoin.

## Patient/Family Teaching

- Explain to patient and family the purpose of the medication.

## Evaluation/Desired Outcomes

- Sedation for up to 24 hr.

# dexmethylphenidate

(dex-meth-ill-**fen**-i-date)

Focalin, Focalin XR

***Classification***

Therapeutic: central nervous system stimulants

**Schedule II**

**Pregnancy Category C**

## Indications

Adjunctive treatment of ADHD.

## Action

Produces CNS and respiratory stimulation with weak sympathomimetic activity. **Therapeutic Effects:** Increased attention span in ADHD.

## Pharmacokinetics

**Absorption:** Readily absorbed following oral administration.

**Distribution:** Unknown.

**Metabolism and Excretion:** Mostly metabolized by the liver; inactive metabolites are renally excreted.
**Half-life:** 2.2 hr.

TIME/ACTION PROFILE (improvement in symptoms)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 7 days | 1 mo | unknown |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hyperexcitable states (marked anxiety, agitation, or tension); Hyperthyroidism; Psychotic personalities, suicidal or homicidal tendencies; Glaucoma; Motor tics, family history or diagnosis of Tourette's syndrome; Concurrent use of MAO inhibitors; Should not be used to treat depression or prevent/treat normal fatigue; Psychoses (may exacerbate symptoms).
**Use Cautiously in:** Cardiovascular disease (sudden death has occurred in children with structural cardiac abnormalities or other serious heart problems); Hyperthyroidism; Hypertension; Diabetes mellitus; Geri: Geriatric/debilitated patients; Continual use (may result in psychological or physical dependence); Seizure disorders (may lower seizure threshold); OB, Lactation, Pedi: Pregnancy, lactation, or children <6 yr (safety not established; use in pregnancy only if clearly needed).

## Adverse Reactions/Side Effects

**CNS:** behavioral disturbances, hallucinations, insomnia, mania, nervousness, thought disorder. **EENT:** visual disturbances. **CV:** SUDDEN DEATH, tachycardia. **GI:** abdominal pain, anorexia, nausea. **Metab:** growth suppression, weight loss (may occur with prolonged use). **Neuro:** twitching. **Misc:** fever.

## Interactions

**Drug-Drug:** Concurrent use with or use within 14 days following discontinuation of **MAO inhibitors** may result in hypertensive crisis and is contraindicated. May ↓ effects of **antihypertensives**. May ↑ effects of **vasopressors**. May cause serious adverse reactions with **clonidine**. May ↑ effects of **warfarin**, **phenobarbital**, **phenytoin**, some **antidepressants**; dose adjustments may be necessary.

## Route/Dosage

### Tablets

**PO (Adults and Children ≥6 yr):** *Patients not previously taking methylphenidate*—2.5 mg twice daily, may be ↑ weekly as needed up to 10 mg twice daily; *Patients currently taking methylphenidate*—starting dose is 1/2 of the methylphenidate dose, up to 10 mg twice daily.

### Extended-release capsules

**PO (Adults):** *Patients not previously taking methylphenidate*—10 mg once daily, may be ↑ by 10 mg after 1 wk to 20 mg/day; *Patients currently taking methylphenidate*—starting dose is 1/2 of the methylphenidate dose, up to 20 mg/day given as a single daily dose; *Patients currently taking dexmethylphenidate*—give same daily dose as a single dose.
**PO (Children ≥6 yr):** *Patients not previously taking methylphenidate*—5 mg once daily, may be ↑ by 5 mg weekly up to 20 mg/day; *Patients currently taking methylphenidate*—starting dose is 1/2 of the methylphenidate dose, up to 20 mg/day, given as a single daily dose; *Patients currently taking dexmethylphenidate*—give same daily dose as a single dose.

## Availability (generic available)

**Tablets:** 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic*—2.5 mg $69.90/100, 5 mg $89.90/100, 10 mg $129.90/100. **Extended-release capsules:** 5 mg, 10 mg, 15 mg, 20 mg.

# NURSING IMPLICATIONS

## Assessment

- Assess child's attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- Monitor blood pressure, pulse, and respiration before administering and periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- Monitor weight biweekly and inform health care professional of significant loss. Pedi: Monitor height periodically in children; report growth inhibition.
- Monitor closely for behavior change.

- Dexmethylphenidate has the potential for dependence and abuse. Prolonged use may result in tolerance.
- ***Lab Test Considerations:*** Monitor CBC, differential, and platelet count periodically in patients receiving prolonged therapy.

### Potential Nursing Diagnoses
Disturbed thought process (Side Effects)

### Implementation
- **PO:** Administer twice daily at least 4 hr apart without regard to meals.
- Administer XR tablets once daily in the morning. Capsules should be swallowed whole. For patients with difficulty swallowing, capsules can be opened and sprinkled on a spoonful of applesauce. Mixture should be consumed immediately; do not store for future use.

### Patient/Family Teaching
- Instruct patient to take medication as directed. If more than prescribed amount is taken, notify health care professional immediately. If a dose is missed, take the remaining doses for that day at regularly spaced intervals; do not double doses. Take the last dose before 6PM to minimize the risk of insomnia. Instruct patient not to alter dose without consulting health care professional. Abrupt cessation with high doses may cause extreme fatigue and mental depression. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill.
- Inform patient that sharing this medication may be dangerous.
- Advise patient to check weight 2–3 times weekly and report weight loss to health care professional.
- Advise patient to consult with health care professional prior to taking other prescription, OTC, or herbal products concurrently with dexmethylphenidate.
- May rarely cause dizziness or drowsiness. Caution patient to avoid driving or activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if nervousness, restlessness, insomnia, dizziness, anorexia, or dry mouth becomes severe. Pedi: If reduced appetite and weight loss are a problem, advise parents to provide high calorie meals when drug levels are low (at breakfast and or bedtime).
- Advise patient and/or parents to notify health care professional of behavioral changes.
- Inform patient that health care professional may order periodic holidays from the drug to assess progress and to decrease dependence.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breastfeeding.
- Caution patients to inform health care professional if they have ever abused or been dependent on alcohol or drugs, or if they are now abusing or dependent on alcohol or drugs.
- Emphasize the importance of routine follow-up exams to monitor progress.
- **Home Care Issues:** Advise parents to notify school nurse of medication regimen.

### Evaluation/Desired Outcomes
- Improved attention span, decreased impulsiveness and hyperactivity in ADHD. If improvement is not seen within 1 month, discontinue dexmethylphenidate.

## dexrazoxane (dex-ra-**zox**-ane)
Totect, Zinecard

***Classification***
Therapeutic: cardioprotective agents

**Pregnancy Category C**

### Indications
Reducing incidence and severity of cardiomyopathy from doxorubicin in women with metastatic breast cancer who have already received a cumulative dose of doxorubicin >300 mg/m². Treatment of extravasation resulting from IV anthracycline chemotherapy.

### Action
Acts as an intracellular chelating agent. **Therapeutic Effects:** Diminishes the cardiotoxic effects of doxorubicin. Decreased damage from extravasation of anthracyclines.

### Pharmacokinetics
**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Some metabolism occurs; 42% eliminated in urine.
**Half-life:** 2.1–2.5 hr.

TIME/ACTION PROFILE (cardioprotective effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Any other type of chemotherapy except other anthracyclines (doxorubicin-like agents).
**Use Cautiously in:** CCr <40 mL/min (dose reduction required); OB: Pregnancy, lactation, or children (safety not established).

### Adverse Reactions/Side Effects

**Hemat:** myelosuppression. **Local:** pain at injection site.

### Interactions

**Drug-Drug:** Myelosuppression may be ↑ by **antineoplastics** or **radiation therapy**. Antitumor effects of concurrent combination chemotherapy with **fluorouracil** and **cyclophosphamide** may be ↓ by dexrazoxane.

### Route/Dosage

### Cardioprotective

**IV (Adults):** 10 mg of dexrazoxane/1 mg doxorubicin.

#### Renal Impairment

**IV (Adults):** decrease dose by 50%.

### Extravasation protection

**IV (Adults):** 1000 mg/m² (maximum 2000 mg) given on days 1 and 2, and followed by a dose of 500 mg/m² (maximum 1000 mg) on day 3.

#### Renal Impairment

**IV (Adults CCr <40 mL/min):** decrease dose by 50%.

### Availability (generic available)

**Injection (Zinecard):** 250-mg vial, 500-mg vial.
**Injection (Totect):** 500-mg vial.

## NURSING IMPLICATIONS

### Assessment

- **Cardioprotective:** Assess extent of cardiomyopathy (cardiomegaly on x-ray, basilar rales, S gallop, dyspnea, decline in left ventricular ejection fraction) prior to and periodically during therapy.
- **Extravasation protection:** Assess site of extravasation for pain, burning, swelling, and redness.
- ***Lab Test Considerations:*** Monitor CBC and platelet count frequently during therapy. Thrombocytopenia, leukopenia, neutropenia, and granulocytopenia from chemotherapy may be more severe at nadir with dexrazoxane therapy.
- Monitor liver function tests periodically during therapy. May cause reversible ↑ of liver enzymes.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Risk for impaired skin integrity (Indications)

### Implementation

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers (see Appendix L).
- Do not administer solutions that are discolored or contain particulate matter. Reconstituted solution and diluted solution are stable in an IV bag for 6 hr at room temperature or if refrigerated. Discard unused solutions.

#### IV Administration

- **Cardioprotective:** Doxorubicin should be administered within 30 min following dexrazoxane administration.
- **Direct IV:** ***Diluent:*** Reconstitute dexrazoxane with 0.167 molar (M/6) sodium lactate injection. ***Concentration:*** 10 mg/mL. ***Rate:*** Administer via slow IV push.
- **Intermittent Infusion:** ***Diluent:*** Reconstituted solution may also be diluted with 0.9% NaCl or D5W. Solution is stable for 6 hr at room temperature or refrigerated. ***Concentration:*** 1.3–5 mg/mL. ***Rate:*** May also be administered via rapid IV infusion over 15–30 min.
- **Additive Incompatibility:** Do not mix with other medications.
- **Extravasation Protection:** Administer as soon as possible within 6 hr of extravasation. Remove cooling procedures, such as ice packs, at least 15 min before administration to allow sufficient blood flow to area of extravasation.
- **Intermittent Infusion:** ***Diluent:*** Dilute each vial in 50 mL of diluent provided by manufacturer. Add contents of all vials into 1000 mL of 0.9% NaCl for further dilution. Solution is slightly yellow. Use diluted solutions within 2 hr of dilution. Store at room temperature. ***Rate:*** Administer over 1–2 hr.

### Patient/Family Teaching

- Explain the purpose of the medication to the patient.
- Emphasize the need for continued monitoring of cardiac function.

- Advise patient to notify health care professional if pregnancy is suspected or planned. Dexrazoxane may be teratogenic.

### Evaluation/Desired Outcomes

- Reduction of incidence and severity of cardiomyopathy associated with doxorubicin administration in women with metastatic breast cancer.
- Decrease in late sequalae (site pain, fibrosis, atrophy, and local sensory disturbance) following extravasation of anthracycline chemotherapeutic agents.

## dextroamphetamine

(dex-troe-am-**fet**-a-meen)
Dexedrine

***Classification***
Therapeutic: central nervous system stimulants
Pharmacologic: amphetamines

**Schedule II**

**Pregnancy Category C**

### Indications

Adjunct management of ADHD. Narcolepsy. **Unlabeled Use:** Exogenous obesity.

### Action

Produces CNS stimulation by releasing norepinephrine from nerve endings. Pharmacologic effects: CNS and respiratory stimulation, Vasoconstriction, Mydriasis (pupillary dilation), Contraction of the urinary bladder sphincter.
**Therapeutic Effects:** Increased motor activity and mental alertness and decreased fatigue in narcoleptic patients. Increased attention span in ADHD.

### Pharmacokinetics

**Absorption:** Well absorbed.
**Distribution:** Widely distributed; high concentrations in brain and CSF. Crosses the placenta; enters breast milk; potentially embryotoxic.
**Metabolism and Excretion:** Some metabolism by the liver. Urinary excretion is pH-dependent. Alkaline urine promotes reabsorption and prolongs action.
**Half-life:** 10–12 hr (6.8 hr in children).

TIME/ACTION PROFILE (CNS stimulation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–2 hr | 3 hr | 2–10 hr |
| PO-ER | unknown | unknown | up to 24 hr |

### Contraindications/Precautions

**Contraindicated in:** OB, Lactation: Pregnancy or lactation; Hyperexcitable states, including hyperthyroidism; Psychotic personalities; Suicidal or homicidal tendencies; Glaucoma; Some products contain tartrazine; avoid in patients with known hypersensitivity.
**Use Cautiously in:** Cardiovascular disease (sudden death has occurred in children with structural cardiac abnormalities or other serious heart problems); Hypertension; Diabetes mellitus; History of substance abuse; Debilitated patients; Continual use (may produce psychological dependence or physical addiction); Geri: Appears on Beers list. Elderly are at ↑ risk for cardiovascular side effects.

### Adverse Reactions/Side Effects

**CNS:** hyperactivity, insomnia, restlessness, tremor, behavioral disturbances, depression, dizziness, hallucinations, headache, irritability, mania, thought disorder. **CV:** SUDDEN DEATH, palpitations, tachycardia, arrhythmias, hypertension. **GI:** anorexia, constipation, cramps, diarrhea, dry mouth, metallic taste, nausea, vomiting. **GU:** erectile dysfunction, ↑ libido. **Derm:** urticaria. **Misc:** physical dependence, psychological dependence.

### Interactions

**Drug-Drug:** ↑ adrenergic effects with other **adrenergics**. Use with **MAO inhibitors** can result in hypertensive crisis. Alkalinizing the urine (**sodium bicarbonate**, **acetazolamide**) prolongs effect. Acidification of urine (**ammonium chloride**, large doses of **ascorbic acid**) ↓ effect. **Phenothiazines** may ↓ effect of dextroamphetamine. May antagonize the response to **antihypertensives**. ↑ risk of cardiovascular side effects with **beta blockers** or **tricyclic antidepressants**.
**Drug-Natural Products: St. John's wort** may ↑ serious side effects, concurrent use is not recommended. Use with caffeine-containing herbs (**guarana**, **tea**, **coffee**) ↑ stimulant effect. **St. John's wort** may ↑ serious side effects, concurrent use is not recommended.

### Route/Dosage

#### Attention-Deficit Hyperactivity Disorder

**PO (Adults):** 5–40 mg/day in divided doses. Sustained-release capsules should not be used as initial therapy.
**PO (Children ≥ 6 yr):** 5 mg 1–2 times daily, ↑ by 5 mg daily at weekly intervals (maximum: 40 mg/day). Sustained-release capsules should not be used as initial therapy.

**PO (Children 3–5 yr):** 2.5 mg/day, ↑ by 2.5 mg daily at weekly intervals (maximum: 40 mg/day).

### Narcolepsy

**PO (Adults):** 5–60 mg/day single dose or in divided doses. Sustained-release capsules should not be used as initial therapy.
**PO (Children ≥12 yr):** 10 mg/day, ↑ by 10 mg/day at weekly intervals until response is obtained or 60 mg is reached.
**PO (Children 6–12 yr):** 5 mg/day, ↑ by 5 mg/day at weekly intervals until response is obtained or 60 mg is reached.

### Exogenous obesity

**PO (Adults and Children >12 yr):** 5–30 mg/day in divided doses of 5–10 mg given 30–60 min before meals.

### Availability (generic available)

**Tablets:** 5 mg, 10 mg. **Sustained-release capsules:** 5 mg, 10 mg, 15 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, pulse, and respiration before administering and periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- Has high dependence and abuse potential. Tolerance to medication occurs rapidly; do not increase dose.
- Monitor closely for behavior change.
- Geri: Not recommended for use in elderly secondary to risk for hypertension, angina, and MI.
- **ADHD:** Monitor weight biweekly and inform health care professional of significant loss. Pedi: Monitor height periodically in children; report growth inhibition.
- Assess child's attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- **Narcolepsy:** Observe and document frequency of narcoleptic episodes.
- May produce a false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- ***Lab Test Considerations:*** May interfere with urinary steroid determinations.
- May cause ↑ plasma corticosteroid concentrations; greatest in evening.

### Potential Nursing Diagnoses

Disturbed thought process (Side Effects)

### Implementation

- Do not confuse Adderall (dextroamphetamine/amphetamine) with Inderal (propranolol).
- Therapy should utilize the lowest effective dose.
- **PO:** Sustained-release capsules should be swallowed whole; do not break, crush, or chew.
- **ADHD:** Pedi: When symptoms are controlled, dose reduction or interruption of therapy may be possible during summer months or may be given on each of the 5 school days with medication-free weekends and holidays.

### Patient/Family Teaching

- Instruct patient to take medication at least 6 hr before bedtime to avoid sleep disturbances. Take missed doses as soon as remembered up to 6 hr before bedtime. Do not double doses. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill. Instruct patient not to alter dose without consulting health care professional. Abrupt cessation of high doses may cause extreme fatigue and mental depression.
- Inform patient that sharing this medication may be dangerous.
- Inform patient that the effects of drug-induced dry mouth can be minimized by rinsing frequently with water or chewing sugarless gum or candies.
- Advise patient to avoid the intake of large amounts of caffeine.
- Medication may impair judgment. Advise patients to use caution when driving or during other activities requiring alertness.
- Advise patient to notify health care professional if nervousness, restlessness, insomnia, dizziness, anorexia, or dry mouth becomes severe. Pedi: If reduced appetite and weight loss are a problem, advise parents to provide high calorie meals when drug levels are low (at breakfast and/or bedtime).
- Advise patient and/or parents to notify health care professional of behavioral changes.

- Inform patient that periodic holiday from the drug may be ordered to assess progress and decrease dependence.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breastfeeding.
- Caution patients to inform health care professional if they have ever abused or been dependent on alcohol or drugs, or if they are now abusing or dependent on alcohol or drugs.
- Emphasize the importance of routine follow-up exams to monitor progress.
- **Home Care Issues:** Advise parents to notify school nurse of medication regimen.

### Evaluation/Desired Outcomes

- Improved attention span. Therapy should be interrupted and reassessed periodically.
- Decrease in narcoleptic symptoms.

## dextromethorphan

(dex-troe-meth-**or**-fan)

Balminil DM, Benylin Adult, Benylin Pediatric, Broncho-Grippol-DM, Calmylin #1, Children's Hold, Creo-Terpin, Delsym, DexAlone, DM Syrup, Drixoral Liquid Cough Caps, ElixSure Children's Cough Syrup, Hold, Koffex, Little Colds Cough Formula Drops, Mediquell, Neo-DM, Ornex • DM, PediCare Infant's Long Acting Cough Drops, Pertussin Cough Suppressant, Pertussin CS, Pertussin ES, Robidex, Robitussin Cough Calmers, Robitussine CoughGels, Robitussin Maximum Strength Cough Suppressant, Robitussin Pediatric, Sedatuss, Simply Cough, Sucrets Cough Control Formula, TheraFlu Thin Strips Long Acting Cough, Triaminic Thin Strips Long Acting Cough, Vicks 44 Cough Relief, Vicks Formula 44 Pediatric Formula

***Classification***

Therapeutic: allergy, cold, and cough remedies, antitussives

**Pregnancy Category C**

### Indications

Symptomatic relief of coughs caused by minor viral upper respiratory tract infections or inhaled irritants. Most effective for chronic nonproductive cough. A common ingredient in nonprescription cough and cold preparations.

### Action

Suppresses the cough reflex by a direct effect on the cough center in the medulla. Related to opioids structurally but has no analgesic properties. **Therapeutic Effects:** Relief of irritating nonproductive cough.

### Pharmacokinetics

**Absorption:** Rapidly absorbed from the GI tract. Extended-release product is slowly absorbed.
**Distribution:** Unknown. Probably crosses the placenta and enters breast milk.
**Metabolism and Excretion:** Metabolized to dextrorphan, an active metabolite. Dextromethorphan and dextrorphan are renally excreted.
**Half-life:** Unknown.

TIME/ACTION PROFILE (cough suppression)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15–30 min | unknown | 3–6 hr† |
| PO-ER | unknown | unknown | 9–12 hr |

†Up to 8 hr for gelcaps

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Patients taking MAO inhibitors or SSRIs; Should not be used for chronic productive coughs; Some products contain alcohol and should be avoided in patients with known intolerance.
**Use Cautiously in:** Cough that lasts more than 1 wk or is accompanied by fever, rash, or headache—health care professional should be consulted; History of drug abuse or drug-seeking behavior (capsules have been abused resulting in deaths); Diabetes (some products contain sucrose); OB: Pregnancy (has been used safely); Lactation: Lactation; Pedi: Children <4 yr (OTC cough and cold products containing this medication should be avoided).

### Adverse Reactions/Side Effects

**CNS:** *high dose*—dizziness, sedation. **GI:** nausea.

### Interactions

**Drug-Drug:** Use with **MAO inhibitors** may result in serotonin syndrome (nausea, confusion, changes in blood pressure); concurrent use should be avoided. ↑ CNS depression with **antihistamines**, **alcohol**, **antidepressants**, **sedative/hypnotics**, or **opioids**. **Amiodarone**, **fluoxetine**, or **quinidine** may ↑ blood levels and adverse reactions from dextromethorphan.

### Route/Dosage

**PO (Adults and Children >12 yr):** 10–20 mg q 4 hr *or* 30 mg q 6–8 hr *or* 60 mg of extended-release preparation bid (not to exceed 120 mg/day).

**PO (Children 6–12 yr):** 5–10 mg q 4 hr *or* 15 mg q 6–8 hr *or* 30 mg of extended-release preparation q 12 hr (not to exceed 60 mg/day).
**PO (Children 4–6 yr):** 2.5–5 mg q 4 hr *or* 7.5 mg q 6–8 hr *or* 15 mg of extended-release preparation q 12 hr (not to exceed 30 mg/day).

### Availability

**Gelcaps:** 30 mg[OTC]. **Lozenges (cherry):** 2.5 mg[OTC], 5 mg[OTC]. **Liquid (cherry, grape):** 3.5 mg/5 mL[OTC], 5 mg/5 mL, 7.5 mg/5 mL[OTC], 15 mg/5 mL[OTC], 30 mg/5 mL[OTC]. **Syrup (cherry, cherry bubblegum):** 7.5 mg/5 mL[OTC], 15 mg/15 mL[OTC], 10 mg/5 mL[OTC]. **Extended-release suspension (orange):** 30 mg/5 mL[OTC]. **Drops (Grape):** 7.5 mg/0.8 mL[OTC], 7.5 mg/1 mL[OTC]. **Orally-disintegrating strips (cherry, grape):** 7.5 mg[OTC], 15 mg[OTC]. ***In combination with:*** antihistamines, decongestants, and expectorants in cough and cold preparations[OTC]. See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess frequency and nature of cough, lung sounds, and amount and type of sputum produced. Unless contraindicated, maintain fluid intake of 1500–2000 mL to decrease viscosity of bronchial secretions.

### Potential Nursing Diagnoses

Ineffective airway clearance (Indications)

### Implementation

- Dextromethorphan 15–30 mg is equivalent in cough suppression to codeine 8–15 mg.
- **PO:** Do not give fluids immediately after administering to prevent dilution of vehicle. Shake oral suspension well before administration.

### Patient/Family Teaching

- Instruct patient to cough effectively: Sit upright and take several deep breaths before attempting to cough.
- Advise patient to minimize cough by avoiding irritants, such as cigarette smoke, fumes, and dust. Humidification of environmental air, frequent sips of water, and sugarless hard candy may also decrease the frequency of dry, irritating cough.
- Caution patient to avoid taking more than the recommended dose or taking alcohol or other CNS depressants concurrently with this medication; fatalities have occurred. Caution parents to avoid OTC cough and cold products while breastfeeding or to children <4 yrs.
- May occasionally cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient that any cough lasting over 1 wk or accompanied by fever, chest pain, persistent headache, or skin rash warrants medical attention.

### Evaluation/Desired Outcomes

- Decrease in frequency and intensity of cough without eliminating patient's cough reflex.

## diazepam (dye-az-e-pam)

Apo-Diazepam, Diastat, Diazemuls, Novodipam, PMS-Diazepam, Valium, Vivol

***Classification***

Therapeutic: antianxiety agents, anticonvulsants, sedative/hypnotics, skeletal muscle relaxants (centrally acting)
Pharmacologic: benzodiazepines

**Schedule IV**

**Pregnancy Category D**

### Indications

Adjunct in the management of: Anxiety Disorder, Athetosis, Anxiety relief prior to cardioversion (injection), Stiffman Syndrome, Preoperative sedation, Conscious sedation (provides light anesthesia and anterograde amnesia). Treatment of status epilepticus/uncontrolled seizures (injection). Skeletal muscle relaxant. Management of the symptoms of alcohol withdrawal. **Unlabeled Use:** Anxiety associated with acute myocardial infarction, insomnia.

### Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. Produces skeletal muscle relaxation by inhibiting spinal polysynaptic afferent pathways. Has anticonvulsant properties due to enhanced presynaptic inhibition. **Therapeutic Effects:** Relief of anxiety. Sedation. Amnesia. Skeletal muscle relaxation. Decreased seizure activity.

### Pharmacokinetics

**Absorption:** Rapidly absorbed from the GI tract. Absorption from IM sites may be slow and unpredictable. Well absorbed (90%) from rectal mucosa.

**Distribution:** Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk.
**Metabolism and Excretion:** Highly metabolized by the hepatic P450 enzymes (CYP2C19 and CYP3A4); the CYP2C19 enzyme system exhibits genetic polymorphism; ⛓ 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ diazepam concentrations and an ↑ risk of adverse effects. Some products of metabolism are active as CNS depressants.
**Half-life:** Neonates: 50–95 hr; Infants 1 month–2 yr: 40–50 hr; Children 2–12 yr: 15–21 hr; Children 12–16 yr: 18–20 hr; Adults: 20–50 hr (up to 100 hr for metabolites).

TIME/ACTION PROFILE (sedation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30–60 min | 1–2 hr | up to 24 hr |
| IM | within 20 min | 0.5–1.5 hr | unknown |
| IV | 1–5 min | 15–30 min | 15–60 min† |
| Rectal | 2–10 min | 1–2 hr | 4–12 hr |

†In status epilepticus, anticonvulsant duration is 15–20 min

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Comatose patients; Myasthenia gravis; Severe pulmonary impairment; Sleep apnea; Severe hepatic dysfunction; Pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Some products contain alcohol, propylene glycol, or tartrazine and should be avoided in patients with known hypersensitivity or intolerance; OB: ↑ risk of congenital malformations; Pedi: Children <6 mo (for oral; safety not established); Lactation: Recommend to discontinue drug or bottle-feed.
**Use Cautiously in:** Severe renal impairment; History of suicide attempt or drug dependence; Debilitated patients (dose reduction required); Patients with low albumin; Pedi: Metabolites can accumulate in neonates. Injection contains benzyl alcohol which can cause potentially fatal gasping syndrome in neonates; Geri: Long-acting benzodiazepines cause prolonged sedation in the elderly. Appears on *Beers list* and is associated with ↑ risk of falls (↓ dose required or consider short-acting benzodiazepine).

## Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, lethargy, depression, hangover, ataxia, slurred speech, headache, paradoxical excitation. **EENT:** blurred vision. **Resp:** respiratory depression. **CV:** hypotension (IV only). **GI:** constipation, diarrhea (may be caused by propylene glycol content in oral solution), nausea, vomiting, weight gain. **Derm:** rashes. **Local:** pain (IM), phlebitis (IV), venous thrombosis. **Misc:** physical dependence, psychological dependence, tolerance.

## Interactions

**Drug-Drug: Alcohol**, **antidepressants**, **antihistamines**, and **opioid analgesics**—concurrent use results in additive CNS depression. **Cimetidine**, **hormonal contraceptives**, **disulfiram**, **fluoxetine**, **isoniazid**, **ketoconazole**, **metoprolol**, **propoxyphene**, **propranolol**, or **valproic acid** may ↓ the metabolism of diazepam, enhancing its actions. May ↓ the efficacy of **levodopa**. **Rifampin** or **barbiturates** may ↑ the metabolism and ↓ effectiveness of diazepam. Sedative effects may be ↓ by **theophylline**. Concurrent use of **ritonavir** is not recommended.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

## Route/Dosage

### Antianxiety

**PO (Adults):** 2–10 mg 2–4 times daily.
**IM, IV (Adults):** 2–10 mg, may repeat in 3–4 hr as needed.
**PO (Children >6 mo):** 1–2.5 mg 3–4 times daily.
**IM, IV (Children >1 mo):** 0.04–0.3 mg/kg/dose q 2–4 hr to a maximum of 0.6 mg/kg within an 8 hr period if necessary.

### Precardioversion

**IV (Adults):** 5–15 mg 5–10 min precardioversion.

### Pre-endoscopy

**IV (Adults):** 2.5–20 mg.
**IM (Adults):** 5–10 mg 30 min pre-endoscopy.

### Pediatric Conscious Sedation for Procedures

**PO (Children >6 mo):** 0.2–0.3 mg/kg (not to exceed 10 mg/dose) 45–60 min prior to procedure.

### Status Epilepticus/Acute Seizure Activity

**IV (Adults):** 5–10 mg, may repeat q 10–15 min to a total of 30 mg, may repeat regimen again in 2–4 hr (IM route may be used if IV route unavailable); larger doses may be required.
**IM, IV (Children ≥5 yr):** 0.05–0.3 mg/kg/dose given over 3–5 min q 15–30 min to a total dose of 10 mg, repeat q 2–4 hr.

**IM, IV (Children 1 mo–5 yr ):** 0.05–0.3 mg/kg/dose given over 3–5 min q 15–30 min to maximum dose of 5 mg, repeat in 2–4 hr if needed.
**IV (Neonates):** 0.1–0.3 mg/kg/dose given over 3–5 min q 15–30 min to maximum dose of 2 mg.
**Rect (Adults and Children >12 yr):** 0.2 mg/kg; may repeat 4–12 hr later.
**Rect (Children 6–11 yr):** 0.3 mg/kg; may repeat 4–12 hr later.
**Rect (Children 2–5 yr):** 0.5 mg/kg; may repeat 4–12 hr later.

### Febrile Seizure Prophylaxis

**PO (Children >1 mo):** 1 mg/kg/day divided q 8 hr at first sign of fever and continue for 24 hr after fever is gone.

### Skeletal Muscle Relaxation

**PO (Adults):** 2–10 mg 3–4 times daily.
**PO (Geriatric Patients or Debilitated Patients):** 2–2.5 mg 1–2 times daily initially.
**PO (Children >6 mo):** 1–2.5 mg 3–4 times daily.
**IM, IV (Adults):** 5–10 mg; may repeat in 2–4 hr (larger doses may be required for tetanus).
**IM, IV (Geriatric Patients or Debilitated Patients):** 2–5 mg; may repeat in 2–4 hr (larger doses may be required for tetanus).
**IM, IV (Children ≥5 yr):** *Tetanus*—5–10 mg q 3–4 hr.
**IM, IV (Children >1 mo):** *Tetanus*—1–2 mg q 3–4 hr.

### Alcohol Withdrawal

**PO (Adults):** 10 mg 3–4 times in first 24 hr, decrease to 5 mg 3–4 times daily.
**IM, IV (Adults):** 10 mg initially, then 5–10 mg in 3–4 hr as needed; larger or more frequent doses have been used.

### Psychoneurotic Reactions

**IM, IV (Adults):** 2–10 mg, may be repeated in 3–4 hr.

### Availability (generic available)

**Tablets:** 2 mg, 5 mg, 10 mg. **Cost:** *Generic*—2 mg $7.99/30, 5 mg $7.99/30, 10 mg $7.99/30.
**Oral solution:** 1 mg/mL, 5 mg/mL (Intensol).
**Solution for injection:** 5 mg/mL (contains 10% alcohol and 40% propylene glycol). **Rectal gel delivery system:** 2.5 mg, 10 mg, 20 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, pulse, and respiratory rate prior to and periodically throughout therapy and frequently during IV therapy.
- Assess IV site frequently during administration; diazepam may cause phlebitis and venous thrombosis.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient. Observe depressed patients closely for suicidal tendencies.
- Conduct regular assessment of continued need for treatment.
- Geri: Assess risk of falls and institute fall prevention strategies.
- **Anxiety:** Assess mental status (orientation, mood, behavior) and degree of anxiety.
- Assess level of sedation (ataxia, dizziness, slurred speech) prior to and periodically throughout therapy.
- **Seizures:** Observe and record intensity, duration, and location of seizure activity. The initial dose of diazepam offers seizure control for 15–20 min after administration. Institute seizure precautions.
- **Muscle Spasms:** Assess muscle spasm, associated pain, and limitation of movement prior to and during therapy.
- **Alcohol Withdrawal:** Assess patient experiencing alcohol withdrawal for tremors, agitation, delirium, and hallucinations. Protect patient from injury.
- ***Lab Test Considerations:*** Evaluate hepatic and renal function and CBC periodically during prolonged therapy.
- ***Toxicity and Overdose:*** Flumazenil is an adjunct in the management of toxicity or overdose. (Flumazenil may induce seizures in patients with a history of seizures disorder or who are on tricyclic antidepressants.)

### Potential Nursing Diagnoses

Anxiety (Indications)
Impaired physical mobility (Indications)
Risk for injury (Side Effects)

### Implementation

- Do not confuse diazepam with lorazepam or ditropan.
- Patient should be kept on bedrest and observed for at least 3 hr following parenteral administration.

- If opioid analgesics are used concurrently with parenteral diazepam, decrease opioid dose by ⅓ and titrate dose to effect.
- Use lowest effective dose. Taper by 2 mg every 3 days to decrease withdrawal symptoms. Some patients may require longer taper periods (mos).
- **PO:** Tablets may be crushed and taken with food or water if patient has difficulty swallowing.
- Mix Intensol preparation with liquid or semisolid food such as water, juices, soda, applesauce, or pudding. Administer entire amount immediately. Do not store.
- **IM:** IM injections are painful and erratically absorbed. If IM route is used, inject deeply into deltoid muscle for maximum absorption.

### IV Administration

- **IV:** Resuscitation equipment should be available when diazepam is administered IV.
- **Direct IV:** ***Diluent:*** For IV administration do not dilute or mix with any other drug. If direct IV push is not feasible, administer IV push into tubing as close to insertion site as possible. Continuous infusion is not recommended due to precipitation in IV fluids and absorption of diazepam into infusion bags and tubing. Injection may cause burning and venous irritation; avoid small veins. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer slowly at a rate of 5 mg/min in adults. Infants and children should receive 1–2 mg/min. Rapid injection may cause apnea, hypotension, bradycardia, or cardiac arrest.
- **Y-Site Compatibility:** daptomycin, docetaxel, fentanyl, methadone, piperacillin/tazobactam, teniposide.
- **Y-Site Incompatibility:** acyclovir, alfentanil, amikacin, aminophylline, amphotericin B cholesteryl sulfate, amphotericin B colloidal, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefepime, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, dantrolene, dexamethasone, dexmedetomidine, diazoxide, digoxin, diltiazem, diphenhydramine, dopamine, doripenem, doxacurium, doxorubicin, doxycycline, eftifibatide, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydroxyzine, idarubicin, ifosfamide, imipenem/cilastatin, inamrinone, indomethacin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, magnesium chloride, mannitol, mechlorethamine, meperidine, meropenem, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, multivitamin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phenytoin, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, tacrolimus, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, trimethoprim/sulfamethoxazole, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole.
- **Rect:** Do not repeat *Diastat* rectal dose more than 5 times/mo or 1 episode every 5 days. Round dose up to next available dose unit.
- Diazepam injection has been used for rectal administration. Instill via catheter or cannula fitted to the syringe or directly from a 1-mL syringe inserted 4–5 cm into the rectum. A dilution of diazepam injection with propylene glycol containing 1 mg/mL has also been used.
- Do not dilute with other solutions, IV fluids, or medications.

### Patient/Family Teaching

- Instruct patient to take medication as directed and not to take more than prescribed or increase dose if less effective after a few weeks without checking with health care professional. Review package insert for Diastat rectal gel with patient/caregiver prior to administration.

Abrupt withdrawal of diazepam may cause insomnia, unusual irritability or nervousness, and seizures. Advise patient that sharing of this medication may be dangerous.
- Medication may cause drowsiness, clumsiness, or unsteadiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known. ***Geri:*** Advise geriatric patients of increased risk for CNS effects and potential for falls.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of follow-up examinations to determine effectiveness of the medication.
- **Seizures:** Patients on anticonvulsant therapy should carry identification describing disease process and medication regimen at all times.

## Evaluation/Desired Outcomes
- Decrease in anxiety level. Full therapeutic antianxiety effects occur after 1–2 wk of therapy.
- Decreased recall of surgical or diagnostic procedures.
- Control of seizures.
- Decrease in muscle spasms.
- Decreased tremulousness and more rational ideation when used for alcohol withdrawal.

# DICLOFENAC† (dye-**kloe**-fen-ak)

**diclofenac potassium (oral)**
Cambia, Cataflam, Zipsor

**diclofenac sodium (oral)**
Apo-Diclo, Voltaren, Voltaren XR

**diclofenac sodium (topical gel)**
Solaraze, Voltaren Gel

**diclofenac epolamine (topical patch)**
Flector

***Classification***
Therapeutic: nonopioid analgesics, nonsteroidal anti-inflammatory agents

**Pregnancy Category B (3% gel), C (oral, 1% gel, patch)**

†For ophthalmic use see Appendix C

## Indications
**PO:** Management of inflammatory disorders including: Rheumatoid arthritis, Osteoarthritis, Ankylosing spondylitis. Primary dysmenorrhea. Relief of mild to moderate pain. Acute treatment of migraines (powder for oral solution). **Topical:** Management of: Actinic keratoses (Solaraze), Osteoarthritis (Voltaren Gel). **Transdermal:** Acute pain due to minor strains, sprains, and contusions.

## Action
Inhibits prostaglandin synthesis. **Therapeutic Effects:** Suppression of pain and inflammation. Relief of acute migraine attacks. **Topical**: Clearance of actinic keratosis lesions.

## Pharmacokinetics
**Absorption:** Undergoes first-pass metabolism by liver which results in 50% bioavailability. Oral diclofenac sodium is a delayed-release dose form. Diclofenac potassium is an immediate-release dose form. 6–10% of topical gel is systemically absorbed.
**Distribution:** Crosses the placenta.
**Protein Binding:** >99%.
**Metabolism and Excretion:** Metabolized by the liver to several metabolites; 65% excreted in urine, 35% in bile.
**Half-life:** 2 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO (inflammation) | few days-1 wk | ≥2 wk | unknown |
| PO (pain) | 30 min | unknown | up to 8 hr |
| Top (gel and patch) | unknown | 10–20 hr | unknown |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to diclofenac or other components of formulation; Cross-sensitivity may occur with other NSAIDs including aspirin; Active GI bleeding/ulcer disease; Patients undergoing coronary artery bypass graft surgery.
**Use Cautiously in:** Severe renal/hepatic disease; Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use); Heart failure; History of porphyria; History of peptic ulcer disease and/or GI bleeding; Geri: Dose reduction recommended; more susceptible to adverse reactions, including GI bleeding; Bleeding tendency or concurrent anticoagulant therapy;

OB, Lactation: Not recommended for use during second half of pregnancy; Pedi: Safety not established.

### Adverse Reactions/Side Effects

For oral diclofenac unless noted.
**CNS:** dizziness, headache. **CV:** hypertension. **EENT:** tinnitus. **GI:** GI BLEEDING, abdominal pain, constipation, diarrhea, dyspepsia, flatulence, heartburn, ↑ liver enzymes, nausea, vomiting. **GU:** acute renal failure, hematuria. **Derm:** EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritis, rashes, eczema, photosensitivity. **F and E:** edema. **Hemat:** anemia, prolonged bleeding time. **Local:** *Topical only*—contact dermatitis, dry skin, exfoliation. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions

Primarily noted for oral administration.
**Drug-Drug:** ↑ adverse GI effects with **aspirin**, other **NSAIDs**, or **corticosteroids**. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ levels/risk of toxicity from **cyclosporine**, **lithium**, or **methotrexate**. ↑ risk of bleeding with some **cephalosporins**, **thrombolytic agents**, **antiplatelet agents**, or **warfarin**. Concurrent use of oral **NSAIDs** during topical diclofenac therapy should be minimized.
**Drug-Natural Products:** ↑ bleeding risk with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

### Route/Dosage

Different formulations of oral diclofenac (diclofenac sodium enteric-coated tablets, diclofenac sodium extended-release tablets, and diclofenac potassium immediate-release tablets) are not bioequivalent and should not be substituted on a mg-to-mg basis.

### Diclofenac Potassium

**PO (Adults):** *Analgesic/antidysmenorrheal (Cataflam)*—100 mg initially, then 50 mg 3 times daily as needed; *Analgesic (Zipsor)*—25 mg 4 times daily ; *Rheumatoid arthritis (Cataflam)*—50 mg 3–4 times daily; *Osteoarthritis (Cataflam)*—50 mg 2–3 times daily; *Osteoarthritis (Cambria)*—one packet (50 mg) given as a single dose.

### Diclofenac Sodium

**PO (Adults):** *Rheumatoid arthritis (delayed-release [enteric-coated] tablets)*—50 mg 3–4 times daily *or* 75 mg twice daily (usual maintenance dose 25 mg 3 times daily). *Rheumatoid arthritis (extended-release tablets)*—100 mg once daily; if unsatisfactory response, dose may be ↑ to 100 mg twice daily. *Osteoarthritis (delayed-release [enteric-coated] tablets)*—50 mg 2–3 times daily *or* 75 mg twice daily. *Osteoarthritis (extended-release tablets)*—100 mg once daily. *Ankylosing spondylitis (delayed-release [enteric-coated] tablets)*—25 mg 4 times daily, with an additional 25 mg given at bedtime, if necessary.
**Topical (Adults):** *Solaraze*—Apply to lesions twice daily for 60–90 days; *Voltaren gel*—Lower extremities (knees, ankles, feet): Apply 4 g to affected area 4 times daily (maximum of 16 g per joint/day); Upper extremities (elbows, wrists, hands): Apply 2 g to affected area 4 times daily (maximum of 8 g per joint/day); Maximum total body dose should not exceed 32 g/day.

### Diclofenac Epolamine

**Topical (Adults):** *Flector*—Apply 1 patch to most painful area twice daily.

### Availability (generic available)

**Diclofenac potassium immediate-release tablets (Cataflam):** 50 mg. **Cost:** *Generic*—$59.98/100. **Diclofenac potassium liquid-filled capsules (Zipsor):** 50 mg. **Diclofenac potassium powder for oral solution (Cambria):** 50 mg/packet. **Diclofenac sodium delayed-release (enteric-coated) tablets (Voltaren):** 25 mg, 50 mg, 75 mg. **Cost:** *Generic*—50 mg $37.08/100, 75 mg $44.98/100. **Diclofenac sodium extended-release tablets (Voltaren XR):** 75 mg, 100 mg. **Cost:** *Generic*—100 mg $208.78/90. **Diclofenac sodium gel:** 1% (Voltaren gel), 3% (Solaraze). **Diclofenac epolamine topical patch:** 180 mg/patch. ***In combination with:*** 200 mcg misoprostol (Arthrotec). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at ↑ risk for developing hypersensitivity reactions.
- Monitor blood pressure closely during initiation of treatment and periodically during therapy in patients with hypertension.
- **Pain:** Assess pain and limitation of movement; note type, location, and intensity before and 30–60 min after administration.
- **Arthritis:** Assess arthritic pain (note type, location, intensity) and limitation of movement before and periodically during therapy.
- **Actinic Keratosis:** Assess lesions prior to and periodically during therapy.

- ***Lab Test Considerations:*** Diclofenac has minimal effect on bleeding time and platelet aggregation.
- May cause ↓ in hemoglobin and hematocrit.
- Monitor CBC and liver function tests within 8 wk of initiating diclofenac therapy and periodically during therapy. May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT concentrations.
- Monitor BUN and serum creatinine periodically during therapy. May cause ↑ BUN and serum creatinine.

## Potential Nursing Diagnoses

Acute pain (Indications)
Impaired physical mobility (Indications)

## Implementation

- Do not confuse Cataflam (diclofenac) with Catapres (clonidine).
- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time.
- **PO:** Take with food or milk to minimize gastric irritation. May take first 1–2 doses on an empty stomach for more rapid onset. Do not crush or chew enteric-coated or extended-release tablets.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.
- **Topical:** Gel should be applied to intact skin; do not use on open wounds. An adequate amount of gel should be applied to cover the entire lesion.
- **Transdermal:** Apply patch to the most painful area twice a day. Do not apply to non-intact or damaged skin resulting from any etiology (exudative dermatitis, eczema, infected lesion, burns, wounds). Avoid contact with eyes; wash hands after applying, handling, or removing patch.

## Patient/Family Teaching

- Caution patient to avoid concurrent use of alcohol, aspirin, acetaminophen, other NSAIDs, or other OTC medications without consulting health care professional.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct female patients to inform health care professional if they plan or suspect pregnancy. Caution female patient to avoid use of diclofenac in last trimester of pregnancy and to notify health care professional if breastfeeding.
- May cause serious side effects: CV (MI or stroke), GI (ulcers, bleeding), skin (exfoliative dermatitis, Stevens-Johnson Syndrome, toxic epidermal necrolysis) and hypersensitivity (anaphylaxis). May occur without warning symptoms. Advise patient to stop medication and notify health care professional immediately if symptoms of CV side effects (chest pain, shortness of breath, weakness, slurring of speech), GI side effects (epigastric pain, dyspepsia, melana, hematemesis), skin side effects (skin rash, blisters, fever, itching) or hypersensitivity reactions (difficulty breathing or swelling of face or throat) occur. Inform patient that risk for heart attack or stroke that can lead to death increases with longer use of NSAID medications and in people who have heart disease and that risk of ulcer increases with concurrent use of corticosteroids and anticoagulants, longer use, smoking, drinking alcohol, older age, and having poor health.
- Advise patient to notify health care professional promptly if unexplained weight gain, swelling of arms and legs or hands and feet, nausea, fatigue, lethargy, pruritis, yellowing of skin or eyes, itching, stomach pain, vomiting blood, bloody or tarry stools, or flu-like symptoms occur.
- **PO:** Instruct patient to take diclofenac with a full glass of water and to remain in an upright position for 15–30 min after administration. Take missed doses as soon as possible within 1–2 hr if taking once or twice a day or unless almost time for next dose if taking more than twice a day. Do not double doses.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- **Topical:** Advise patient to minimize use of concurrent NSAIDs during topical therapy.
- Instruct patient to avoid covering lesion with occlusive dressing and to avoid applying sunscreen or cosmetics to the affected area.
- Advise patient that it may take up to 1 mo for complete healing of the lesion to occur.
- **Transdermal:** Instruct patient on correct application procedure for patch. Apply patch to

most painful area. Change patch every 12 hr. Remove patch if irritation occurs. Fold used patches so adhesive sticks to itself and discard where children and pets cannot get them. Encourage patient to read the *NSAID Medication Guide* that accompanies the prescription.
- Instruct patients if patch begins to peel off to tape the edges. Do not wear patch during bathing or showering. Bathing should take place between scheduled patch removal and application.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

### Evaluation/Desired Outcomes
- Decrease in severity of mild-to-moderate pain.
- Increased ease of joint movement. Patients who do not respond to one NSAID may respond to another. May require 2 wk or more for maximum effects.
- Decrease in or healing of lesions in actinic keratosis. Optimal effect may not be seen until 30 days after discontinuation of therapy. Lesions that do not heal should be re-evaluated.

**dicloxacillin, See PENICILLINS, PENICILLINASE RESISTANT.**

## dicyclomine
(dye-**sye**-kloe-meen)
Bentyl, Bentylol, Formulex, Spasmoban

***Classification***
Therapeutic: antispasmodics
Pharmacologic: anticholinergics

**Pregnancy Category UK**

### Indications
Management of irritable bowel syndrome in patients who do not respond to usual interventions (sedation/change in diet).

### Action
May have a direct and local effect on GI smooth muscle, reducing motility and tone. **Therapeutic Effects:** Decreased GI motility.

### Pharmacokinetics
**Absorption:** Well absorbed after oral and IM administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** 80% eliminated in urine, 10% in feces.
**Half-life:** 1.8 hr (initial phase), 9–10 hr (terminal phase).

TIME/ACTION PROFILE (antispasmodic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO, IM | unknown | unknown | unknown |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Obstruction of the GI or GU tract; Reflux esophagitis; Severe ulcerative colitis (risk of paralytic ileus); Unstable cardiovascular status; Glaucoma; Myasthenia gravis; Infants <6 mo; Lactation.
**Use Cautiously in:** High environmental temperatures (risk of heat prostration); Hepatic/renal impairment; Autonomic neuropathy; Cardiovascular disease; Prostatic hyperplasia; Geri: Appears on Beers list. Geriatric patients have increased sensitivity to anticholinergics; Pregnancy (safety not established).

### Adverse Reactions/Side Effects
**CNS:** confusion (increased in geriatric patients), drowsiness, light-headedness (IM only). **EENT:** blurred vision, increased intraocular pressure. **CV:** palpitations, tachycardia. **GI:** PARALYTIC ILEUS, constipation, heartburn, decreased salivation, dry mouth, nausea, vomiting. **GU:** erectile dysfunction, urinary hesitancy, urinary retention. **Derm:** decreased sweating. **Endo:** decreased lactation. **Local:** pain/redness at IM site. **Misc:** allergic reactions including ANAPHYLAXIS.

### Interactions
**Drug-Drug:** Additive anticholinergic effects with other **anticholinergics**, including **antihistamines**, **quinidine**, and **disopyramide**. May alter the absorption of **other orally administered drugs** by slowing motility of the GI tract. **Antacids** or **adsorbent antidiarrheals** decrease the absorption of anticholinergics. May increase GI mucosal lesions in patients taking oral **potassium chloride** tablets. Increased risk of adverse cardiovascular reactions with **cyclopropane** anesthesia.

### Route/Dosage
**PO (Adults):** 10–20 mg 3–4 times daily (up to 160 mg/day).
**PO (Children ≥2 yr):** 10 mg 3–4 times daily, adjusted as tolerated.
**PO (Children 6 mo–2 yr):** 5–10 mg 3–4 times daily, adjusted as tolerated.
**IM (Adults):** 20 mg q 4–6 hr, adjusted as tolerated.

### Availability
**Tablets:** 10 mg, 20 mg. **Capsules:** 10 mg, 20 mg. **Syrup:** 10 mg/5 mL. **Solution for injection:** 10 mg/mL.

## NURSING IMPLICATIONS

### Assessment
- Assess patient for symptoms of irritable bowel syndrome (abdominal cramping, alternating constipation and diarrhea, mucus in stools) before and periodically during therapy.
- Assess patient routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate the constipating effects of the drug.
- Monitor intake and output ratios; may cause urinary retention.
- ***Lab Test Considerations:*** Antagonizes effects of pentagastrin and histamine during the gastric acid secretion test. Avoid administration for 24 hr preceding the test.
- ***Toxicity and Overdose:*** Severe anticholinergic symptoms may be reversed with physostigmine or neostigmine.

### Potential Nursing Diagnoses
Acute pain (Indications)
Diarrhea (Indications)

### Implementation
- **PO:** Administer dicyclomine 30 min–1 hr before meals.
- **IM:** Monitor patient after administration; may cause light-headedness and irritation at injection site.

### Patient/Family Teaching
- Instruct patient to take dicyclomine exactly as directed and not to take more than the prescribed amount. Missed doses should be taken as soon as remembered if not just before next dose.
- Medication may cause drowsiness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Inform patient that frequent oral rinses, sugarless gum or candy, and good oral hygiene may help relieve dry mouth. Consult health care professional regarding use of saliva substitute if dry mouth persists for more than 2 wk.
- Advise patient receiving dicyclomine to make position changes slowly to minimize the effects of drug-induced orthostatic hypotension.
- Caution patient to avoid extremes of temperature. This medication decreases the ability to sweat and may increase the risk of heat stroke.
- Advise patient to consult health care professional before taking any OTC medications concurrently with this therapy.
- Advise patient to notify health care professional immediately if eye pain or increased sensitivity to light occurs. Emphasize the importance of routine eye exams throughout therapy.

### Evaluation/Desired Outcomes
- A decrease in the symptoms of irritable bowel syndrome.

**diflorasone, See CORTICOSTEROIDS (TOPICAL/LOCAL).**

HIGH ALERT

## digoxin (di-**jox**-in)
Lanoxicaps, Lanoxin

***Classification***
Therapeutic: antiarrhythmics, inotropics
Pharmacologic: digitalis glycosides

**Pregnancy Category C**

### Indications
Heart failure. Atrial fibrillation and atrial flutter (slows ventricular rate). Paroxysmal atrial tachycardia.

### Action
Increases the force of myocardial contraction. Prolongs refractory period of the AV node. Decreases conduction through the SA and AV nodes. **Therapeutic Effects:** Increased cardiac output (positive inotropic effect) and slowing of the heart rate (negative chronotropic effect).

### Pharmacokinetics
**Absorption:** 60–80% absorbed after oral administration of tablets; 70-85% absorbed after administration of elixir. Absorption from liquid-filled capsules is 90–100%; 80% absorbed from IM sites (IM route not recommended due to pain/irritation).
**Distribution:** Widely distributed; crosses placenta and enters breast milk.
**Metabolism and Excretion:** Excreted almost entirely unchanged by the kidneys.
**Half-life:** 36–48 hr (increased in renal impairment).

TIME/ACTION PROFILE (antiarrhythmic or inotropic effects, provided that a loading dose has been given)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Digoxin–PO | 30–120 min | 2–8 hr | 2–4 days† |
| Digoxin–IM | 30 min | 4–6 hr | 2–4 days† |
| Digoxin–IV | 5–30 min | 1–4 hr | 2–4 days† |

†Duration listed is that for normal renal function; in impaired renal function, duration will be longer

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Uncontrolled ventricular arrhythmias; AV block (in absence of pacemaker); Idiopathic hypertrophic subaortic stenosis; Constrictive pericarditis; Known alcohol intolerance (elixir only).
**Use Cautiously in:** Hypokalemia (greatly ↑ risk of digoxin toxicity); Hypercalcemia (↑ risk of toxicity, especially with mild hypokalemia); Hypomagnesemia (may ↑ risk of digoxin toxicity); Diuretic use (may cause electrolyte abnormalities including hypokalemia and hypomagnesemia); Hypothyroidism; Geri: Very sensitive to toxic effects; dose adjustments required for age-related ↓ in renal function and body weight; Myocardial infarction; Renal impairment (dose ↓ required); Obesity (dose should be based on ideal body weight); OB: Although safety has not been established, has been used during pregnancy without adverse effects on the fetus; Lactation: Similar concentrations in serum and breast milk result in subtherapeutic levels in infant, use with caution.

## Adverse Reactions/Side Effects

**CNS:** fatigue, headache, weakness. **EENT:** blurred vision, yellow or green vision. **CV:** ARRHYTHMIAS, bradycardia, ECG changes, AV block, SA block. **GI:** anorexia, nausea, vomiting, diarrhea. **Hemat:** thrombocytopenia. **Metab:** electrolyte imbalances with acute digoxin toxicity.

## Interactions

**Drug-Drug: Thiazide** and **loop diuretics**, **piperacillin**, **ticarcillin**, **amphotericin B**, **corticosteroids**, and excessive use of **laxatives** may cause hypokalemia which may ↑ risk of toxicity. **Amiodarone**, some **benzodiazepines**, **cyclosporine**, **diphenoxylate**, **indomethacin**, **itraconazole**, **propafenone**, **quinidine**, **quinine**, **spironolactone**, and **verapamil** may ↑ levels and lead to toxicity (serum level monitoring/dose reduction may be required). Levels may be ↓ by some **antineoplastics** (**bleomycin**, **carmustine**, **cyclophosphamide**, **cytarabine**, **doxorubicin**, **methotrexate**, **procarbazine**, **vincristine**), **activated charcoal**, **cholestyramine**, **colestipol**, **kaolin/pectin**, **metoclopramide**, **penicillamine**, **rifampin**, or **sulfasalazine**. In a small percentage (10%) of patients gut bacteria metabolize digoxin to inactive compounds; **macrolide anti-infectives** (**erythromycin**, **azithromycin**, **clarithromycin**) and **tetracyclines**, by killing these bacteria, will cause ↑ levels and toxicity; dose may need to be ↓ for up to 9 weeks. Additive bradycardia may occur with **beta blockers**, **diltiazem**, **verapamil**, **clonidine**, and other **antiarrhythmics** (**quinidine**, **disopyramide**). Concurrent use of **sympathomimetics** may ↑ risk of arrthythmias. **Thyroid hormones** may ↓ therapeutic effects.
**Drug-Natural Products: Licorice** and stimulant natural products (**aloe**) may ↑ risk of potassium depletion. **St. John's wort** may ↓ levels and effect.
**Drug-Food:** Concurrent ingestion of a **high-fiber meal** may ↓ absorption. Administer digoxin 1 hour before or 2 hours after such a meal.

## Route/Dosage

For rapid effect, a larger initial loading/digitalizing dose should be given in several divided doses over 12–24 hr. Maintenance doses are determined for digoxin by renal function. All dosing must be evaluated by individual response. In general, doses required for atrial arrhythmias are higher than those for inotropic effect. When determining dose, consider that bioavailability of gelatin capsules (Lanoxicaps) is greater than that of tablets.
**IV (Adults):** *Digitalizing dose*—0.5–1 mg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.
**IV (Children >10 yr):** *Digitalizing dose*—8–12 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.
**IV (Children 5–10 yr):** *Digitalizing dose*—15–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.
**IV (Children 2–5 yr):** *Digitalizing dose*—25–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.
**IV (Children 1–24 mo):** *Digitalizing dose*—30–50 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.
**IV (Infants–full term):** 20–30 mcg/kg given as 50% of the dose initially and one quarter of the

initial dose in each of 2 subsequent doses at 6-12 hr intervals.
**IV (Infants–premature):** *Digitalizing dose*—15–25 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals.
**PO (Adults):** *Digitalizing dose*—0.75–1.5 mg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6–12 hr intervals. *Maintenance dose*—0.125–0.5 mg/day as tablets or 0.350–0.5 mg/day as gelatin capsules, depending on patient's lean body weight, renal function, and serum level.
**PO (Geriatric Patients):** Initial daily dosage should not exceed 0.125 mg.
**PO (Children >10 yr):** *Digitalizing dose*—10–15 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—2.5–5 mcg/kg given daily as a single dose.
**PO (Children 5–10 yr):** *Digitalizing dose*—20–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—5–10 mcg/kg given daily in 2 divided doses.
**PO (Children 2–5 yr):** *Digitalizing dose*—30–40 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—7.5–10 mcg/kg given daily in 2 divided doses.
**PO (Children 1–24 mo):** *Digitalizing dose*—35–60 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—10–15 mcg/kg given daily in 2 divided doses.
**PO (Infants–full term):** *Digitalizing dose*—25–35 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—6–10 mcg/kg given daily in 2 divided doses.
**PO (Infants–premature):** *Digitalizing dose*—20–30 mcg/kg given as 50% of the dose initially and one quarter of the initial dose in each of 2 subsequent doses at 6-12 hr intervals. *Maintenance dose*—5–7.5 mcg/kg given daily in 2 divided doses.

## Availability (generic available)

**Tablets:** 0.125 mg, 0.25 mg. **Cost:** *Lanoxin*—0.125 mg $24.97/90, 0.25 mg $29.97/90; *Generic*—0.125 mg $21.97/90, 0.25 mg $21.97/90. **Capsules:** 0.05 mg, 0.1 mg, 0.2 mg. **Cost:** 0.05 mg $25.99/100, 0.1 mg $33.56/100, 0.2 mg $39.57/100. **Elixir (lime flavor):** 0.05 mg/mL. **Injection:** 0.25 mg/mL. **Pediatric injection:** 0.1 mg/mL.

# NURSING IMPLICATIONS

## Assessment

- Monitor apical pulse for 1 full min before administering. Withhold dose and notify physician if pulse rate is <60 bpm in an adult, <70 bpm in a child, or <90 bpm in an infant. Also notify health care professional promptly of any significant changes in rate, rhythm, or quality of pulse.
- Pedi: Heart rate varies in children depending on age, ask physician to specify at what heart rates digoxin should be withheld.
- Monitor blood pressure periodically in patients receiving IV digoxin.
- Monitor ECG throughout IV administration and 6 hr after each dose. Notify health care professional if bradycardia or new arrhythmias occur.
- Observe IV site for redness or infiltration; extravasation can lead to tissue irritation and sloughing.
- Monitor intake and output ratios and daily weights. Assess for peripheral edema, and auscultate lungs for rales/crackles throughout therapy.
- Before administering initial loading dose, determine whether patient has taken any digitalis preparations in the preceding 2–3 wk.
- Geri: Digoxin has been associated with an increased risk of falls in the elderly. Assess for falls risk and implement prevention strategies per facility protocol.
- ***Lab Test Considerations:*** Evaluate serum electrolyte levels (especially potassium, magnesium, and calcium) and renal and hepatic functions periodically during therapy. Notify health care professional before giving dose if patient is hypokalemic. Hypokalemia, hypomagnesemia, or hypercalcemia may make the patient more susceptible to digitalis toxicity. Pedi: Neonates may have falsely elevated serum digoxin concentrations due to a naturally occurring substance chemically similar to di-

goxin. Geri: Older adults may be toxic even when serum concentrations are within normal range; assess for clinical symptoms of toxicity even when serum levels are normal.

- ***Toxicity and Overdose:*** Therapeutic serum digoxin levels range from 0.5–2 ng/mL. Serum levels may be drawn 6–8 hr after a dose is administered, although they are usually drawn immediately before the next dose. Bacteria in the GI tract can metabolize a substantial amount of digoxin before it is absorbed. Patients receiving erythromycin or tetracycline, which kill gut bacteria, can develop toxicity on their usual doses of digoxin. Geri: Older adults are at increased risk for toxic effects of digoxin (appears on Beers list) due to age-related decreased renal clearance, which can exist even when serum creatinine levels are normal. Digoxin requirements in the older adult may change and a formerly therapeutic dose can become toxic.
- Observe for signs and symptoms of toxicity. In adults and older children, the first signs of toxicity usually include abdominal pain, anorexia, nausea, vomiting, visual disturbances, bradycardia, and other arrhythmias. In infants and small children, the first symptoms of overdose are usually cardiac arrhythmias. If these appear, withhold drug and notify health care professional immediately.
- If signs of toxicity occur and are not severe, discontinuation of digitalis glycoside may be all that is required.
- If hypokalemia is present and renal function is adequate, potassium salts may be administered. Do not administer if hyperkalemia or heart block exists. **Correct any other electrolyte abnormalities.**
- Correction of arrhythmias resulting from digitalis toxicity may be attempted with lidocaine, procainamide, quinidine, propranolol, or phenytoin. Temporary ventricular pacing may be useful in advanced heart block.
- Treatment of life-threatening arrhythmias may include administration of digoxin immune Fab *(Digibind)*, which binds to the digitalis glycoside molecule in the blood and is excreted by the kidneys.

## Potential Nursing Diagnoses

Decreased cardiac output (Indications)

## Implementation

- ***High Alert:*** Digoxin has a narrow therapeutic range. Medication errors associated with digoxin include miscalculation of pediatric doses and insufficient monitoring of digoxin levels. Have second practitioner independently check original order and dose calculations. Monitor therapeutic drug levels.
- For rapid digitalization, the initial dose is higher than the maintenance dose; 50% of the total digitalizing dose is given initially. The remainder of the dose will be administered in 25% increments at 4–8 hr intervals.
- When changing from parenteral to oral dose forms, dose adjustments may be necessary because of pharmacokinetic variations in percentage of digoxin absorbed: 100 mcg (0.1 mg) digoxin injection or 100 mcg (0.1 mg) liquid-filled capsule = 125 mcg (0.125 mg) tablet or 125 mcg (0.125 mg) of elixir.
- **PO:** Administer oral preparations consistently with regard to meals. Tablets can be crushed and administered with food or fluids if patient has difficulty swallowing. Use calibrated measuring device for liquid preparations; calibrated dropper is not accurate for doses of less than 0.2 mL or 10 mcg. Do not alternate between dose forms; bioavailability of capsules is greater than that of tablets or elixir.
- **IM:** Administer deep into gluteal muscle and massage well to reduce painful local reactions. Do not administer more than 2 mL of digoxin in each IM site. IM administration is not generally recommended.

### IV Administration

- **Direct IV:** ***Diluent:*** May be administered undiluted. May also dilute 1 mL of digoxin in 4 mL of sterile water for injection, D5W, or 0.9% NaCl. Less diluent will cause precipitation. Use diluted solution immediately. ***Rate:*** Administer over at least 5 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, amikacin, aminophylline, anidulafungin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, cefonocid, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, codeine, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, eto-

poside phosphate, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, meropenem, metaraminol, methotrexate, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nesiritide, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentazocine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, ranitidine, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole.

- **Y-Site Incompatibility:** amiodarone, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, caspofungin, dantrolene, diazepam, diazoxide, doxorubicin, foscarnet, idarubicin, mitoxantrone, paclitaxel, pentamidine, phenytoin, propofol, quinupristin/dalfopristin, trimethoprim/sulfamethoxazole.

## Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. Teach parents or caregivers of infants and children how to accurately measure medication. Take missed doses within 12 hr of scheduled dose or omit. Do not double doses. Consult health care professional if doses for 2 or more days are missed. Do not discontinue medication without consulting health care professional.
- Teach patient to take pulse and to contact health care professional before taking medication if pulse rate is <60 or >100.
- Pedi: Teach parents or caregivers that changes in heart rate, especially bradycardia, are among the first signs of digoxin toxicity in infants and children. Instruct parents or caregivers in apical heart rate assessment and ask them to notify a health care professional if heart rate is outside of range set by health care professional before administering the next scheduled dose.
- Review signs and symptoms of digitalis toxicity with patient and family. Advise patient to notify health care professional immediately if these or symptoms of CHF occur. Inform patient that these symptoms may be mistaken for those of colds or flu.
- Instruct patient to keep digoxin tablets in their original container and not to mix in pill boxes with other medications; they may look similar to and may be mistaken for other medications.
- Advise patient that sharing of this medication can be dangerous.
- Caution patient to avoid concurrent use of other Rx, OTC, and herbal products without consulting health care professional. Advise patient to avoid taking antacids or antidiarrheals within 2 hr of digoxin.
- Advise patient to notify health care professional of this medication regimen before treatment.
- Patients taking digoxin should carry identification describing disease process and medication regimen at all times.
- Geri: Review fall prevention strategies with older adults and their families.
- Emphasize the importance of routine follow-up exams to determine effectiveness and to monitor for toxicity.

## Evaluation/Desired Outcomes

- Decrease in severity of CHF.
- Increase in cardiac output.
- Decrease in ventricular response in atrial tachyarrhythmias.
- Termination of paroxysmal atrial tachycardia.

**digoxin immune Fab**
(di-**jox**-in im-**myoon** fab)
Digibind, DigiFab

***Classification***
Therapeutic: antidotes
Pharmacologic: antibody fragments

**Pregnancy Category C**

## Indications
Serious life-threatening overdosage with digoxin.

## Action
An antibody produced in sheep that binds antigenically to unbound digoxin in serum. **Therapeutic Effects:** Binding and subsequent removal of digoxin, preventing toxic effects in overdose.

## Pharmacokinetics
**Absorption:** Administered IV only, resulting in complete bioavailability.
**Distribution:** Widely distributed throughout extracellular space.
**Metabolism and Excretion:** Excreted by the kidneys as the bound complex (digoxin immune Fab plus digoxin).
**Half-life:** 14–20 hr.

TIME/ACTION PROFILE (reversal of arrhythmias and hyperkalemia; reversal of inotropic effect may take several hr)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 30 min (variable) | unknown | 2–6 hr |

## Contraindications/Precautions
**Contraindicated in:** No known contraindications.
**Use Cautiously in:** Known hypersensitivity to sheep proteins or products; Children, pregnancy, or lactation (safety not established).

## Adverse Reactions/Side Effects
**CV:** re-emergence of atrial fibrillation, re-emergence of CHF. **F and E:** HYPOKALEMIA.

## Interactions
**Drug-Drug:** Prevents therapeutic response to **digoxin**.

## Route/Dosage
*Digibind*—38 mg of digoxin immune Fab will bind 0.5 mg of digoxin. Each vial contains 38 mg of digoxin immune Fab; *DigiFab*—40 mg of digoxin immune Fab will bind 0.5 mg of digoxin. Each vial contains 40 mg of digoxin immune Fab.

### Known Amount of Digoxin Ingested (Administered)
**IV (Adults and Children):** *For digitalis glycoside toxicity due to digoxin tablets, oral solution, or IM digoxin*—dose of digoxin ingested (mg) × 0.8/1000 × 38. *For digitalis glycoside toxicity due to digoxin capsules, IV digoxin*—dose of digoxin ingested (mg)/0.5 × 38.

### Known Serum Digoxin Concentrations (SDCs)
**IV (Adults and Children):** *Digibind*—Dose (mg) = SDC (nanograms/mL) × body weight (kg)/100 × 38; *DigiFab*—SDC (nanograms/mL) × body weight (kg)/100 × 40.

### Unknown Amount Ingested/SDCs Unavailable
**IV (Adults and Children):** *Digibind*—760 mg (20 vials); *DigiFab*—800 mg (20 vials).

### Toxicity during chronic digoxin therapy
**IV (Adults and Children):** *Digibind*—228 mg (6 vials); *DigiFab*—240 mg (6 vials).

## Availability
**Powder for injection, lyophilized (Digibind):** 38 mg/vial. **Powder for injection, lyophilized (DigiFab):** 40 mg/vial.

# NURSING IMPLICATIONS

## Assessment
- Monitor ECG, pulse, blood pressure, and body temperature before and during treatment. Patients with atrial fibrillation may develop a rapid ventricular response as a result of decreased digoxin levels.
- Assess patient for increase in signs of CHF (peripheral edema, dyspnea, rales/crackles, weight gain).
- ***Lab Test Considerations:*** Monitor serum digoxin levels before administration.
- Monitor serum potassium levels frequently during treatment. Before treatment, hyperkalemia usually coexists with toxicity. Levels may decrease rapidly; hypokalemia should be treated promptly.
- Free serum digoxin levels fall rapidly after administration. Total serum concentrations rise suddenly after administration but are bound to the Fab molecule and are inactive. Total serum concentrations will decrease to undetectable levels within several days. Serum digoxin levels are not valid for 5–7 days after administration.

## Potential Nursing Diagnoses
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

## Implementation
- Cardiopulmonary resuscitation equipment and medications should be available during administration.

- Delay redigitalization for several days until the elimination of digoxin immune Fab from the body is complete.

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Reconstitute each vial in 4 mL of sterile water for injection and mix gently. Solution will contain a concentration of 9.5 mg/mL (*Digibind*) or 10 mg/mL (*DigiFab*). May be further diluted with 0.9% NaCl to achieve the concentration below. Reconstituted solution should be used immediately but is stable for 4 hr if refrigerated. For small doses in infants and children, a reconstituted 38-mg vial can be diluted with 34 mL of 0.9% NaCl (*Digibind*) or 36 mL of 0.9% NaCl (*DigiFab*) for a concentration of 1 mg/mL. ***Concentration:*** 1 mg/mL. ***Rate:*** Infuse over 30 min through a 0.22-micron membrane filter. If cardiac arrest is imminent, rapid direct IV injection may be used. Do not use rapid direct injection in other patients because of increased risk of adverse reactions. Small doses in infants and children may be administered with a tuberculin syringe.
- **Incompatibility:** Information unavailable. Do not mix with other drugs or solutions.

### Patient/Family Teaching

- Explain the procedure and purpose of the treatment to the patient.
- Instruct patient to notify health care provider immediately if signs of delayed allergic reaction (rash, pruritus, urticaria) occur after hospital discharge.

### Evaluation/Desired Outcomes

- Resolution of signs and symptoms of digoxin toxicity.
- Decreased digoxin or level without major side effects.

**dihydroergotamine, See ergotamine.**

## diltiazem (dil-**tye**-a-zem)

Apo-Diltiaz, Cardizem, Cardiazem CD, Cardizem LA, Cardizem SR, Cartia XT, Dilacor XR, Diltia XT, Novo-Diltazem, Nu-Diltiaz, Ratio-Diltiazem CD, Syn-Diltiazem, Taztia XT, Tiazac

***Classification***
Therapeutic: antianginals, antiarrhythmics (class IV), antihypertensives
Pharmacologic: calcium channel blockers

**Pregnancy Category C**

D

### Indications

Hypertension. Angina pectoris and vasospastic (Prinzmetal's) angina. Supraventricular tachyarrhythmias and rapid ventricular rates in atrial flutter or fibrillation.

### Action

Inhibits transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. **Therapeutic Effects:** Systemic vasodilation resulting in decreased blood pressure. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina. Reduction of ventricular rate in atrial fibrillation or flutter.

### Pharmacokinetics

**Absorption:** Well absorbed, but rapidly metabolized after oral administration.
**Distribution:** Unknown.
**Protein Binding:** 70–80%.
**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A4 enzyme system).
**Half-life:** 3.5–9 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 30 min | 2–3 hr | 6–8 hr |
| PO–SR | unknown | unknown | 12 hr |
| PO–CD, XR, LA | unknown | 14 days† | up to 24 hr |
| IV | 2–5 min | 2–4 hr | unknown |

†Maximum antihypertensive effect with chronic therapy

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Systolic blood pressure <90 mm Hg; Recent MI or pulmonary congestion; Concurrent use of rifampin.
**Use Cautiously in:** Severe hepatic impairment (↓ dose recommended); Geri: ↓ dose; slower IV infusion rate recommended; ↑ risk of hypotension; consider age-related decrease in body mass, ↓ hepatic/renal/cardiac function, concurrent drug therapy and other disease states); Severe renal impairment; Serious ventricular ar-

rhythmias or CHF; OB, Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** abnormal dreams, anxiety, confusion, dizziness, drowsiness, headache, nervousness, psychiatric disturbances, weakness. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Resp:** cough, dyspnea. **CV:** ARRHYTHMIAS, CHF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **GI:** ↑ liver enzymes, anorexia, constipation, diarrhea, dry mouth, dysgeusia, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Derm:** dermatitis, erythema multiforme, flushing, sweating, photosensitivity, pruritus/urticaria, rash. **Endo:** gynecomastia, hyperglycemia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Misc:** STEVENS-JOHNSON SYNDROME, gingival hyperplasia.

### Interactions

**Drug-Drug:** ↑ hypotension may occur when used with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by **NSAIDs**. May ↑ **digoxin** levels. Concurrent use with **beta blockers**, **digoxin**, **disopyramide**, or **phenytoin** may result in bradycardia, conduction defects, or CHF. **Phenobarbital** and **phenytoin** may ↑ metabolism and ↓ effectiveness. May ↓ metabolism of and ↑ risk of toxicity from **cyclosporine**, **quinidine**, or **carbamazepine**. **Cimetidine** and **ranitidine** ↑ levels and effects. May ↑ or ↓ the effects of **lithium** or **theophylline**.

**Drug-Food: Grapefruit juice** ↑ levels and effect.

### Route/Dosage

**PO (Adults):** 30–120 mg 3–4 times daily or 60–120 mg twice daily as SR capsules or 180–240 mg once daily as CD or XR capsules or LA tablets (up to 360 mg/day).

**IV (Adults):** 0.25 mg/kg; may repeat in 15 min with a dose of 0.35 mg/kg. May follow with continuous infusion at 10 mg/hr (range 5–15 mg/hr) for up to 24 hr.

### Availability (generic available)

**Tablets:** 30 mg, 60 mg, 90 mg, 120 mg. **Cost:** *Generic*— 30 mg $12.99/90, 60 mg $14.99/90, 90 mg $15.99/90, 120 mg $19.99/90. **Sustained-release capsules:** 60 mg, 90 mg, 120 mg. **Cost:** *Generic*— 60 mg $80.30/180, 90 mg $124.76/180, 120 mg $199.13/180. **Extended-release capsules (Cardizem CD, Dilacor XR, Tiazac, Cartia XT, Taztia XT):** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg. **Cost:** *Generic*— 120 mg $69.98/90, 180 mg $79.97/90, 240 mg $106.97/90, 300 mg $126.97/90, 360 mg $128.97/90, 420 mg $120.99/90. **Extended-release tablets (Cardizem LA):** 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg. **Cost:** 120 mg $183.90/90, 180 mg $189.97/90, 240 mg $225.98/90, 300 mg $330.86/90, 360 mg $339.98/90, 420 mg $363.18/90. **Injection:** 5 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse prior to therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy. May cause prolonged PR interval.
- Monitor intake and output ratios and daily weight. Assess for signs of CHF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Monitor frequency of prescription refills to determine adherence.
- Patients receiving digoxin concurrently with calcium channel blockers should have routine serum digoxin levels checked and be monitored for signs and symptoms of digoxin toxicity.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- **Arrhythmias:** Monitor ECG continuously during administration. Report bradycardia or prolonged hypotension promptly. Emergency equipment and medication should be available. Monitor blood pressure and pulse before and frequently during administration.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ the risk of arrhythmias and should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. May cause ↑ in hepatic enzymes after several days of therapy, which return to normal on discontinuation of therapy.

### Potential Nursing Diagnoses

Acute pain (Indications)
Decreased cardiac output (Adverse Reactions)

## Implementation

- Do not confuse Cardizem (diltiazem) with Cardene (nicardipine). Do not confuse Cardizem LA with Cardene SR. Do not confuse Tiazac (diltiazem) with Ziac (bisprolol/hydrochlorothiazide).
- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- Do not open, crush, break, or chew sustained-release capsules or tablets. Empty tablets that appear in stool are not significant. Crush and mix diltiazem with food or fluids for patients having difficulty swallowing.

### IV Administration

- **Direct IV:** ***Diluent:*** Administer bolus dose undiluted. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer over 2 min.
- **Continuous Infusion:** ***Diluent:*** Dilute 125 mg in 100 mL, 250 mg in 250 mL, or 250 mg in 500 mL of 0.9% NaCl, D5W, or D5/0.45% NaCl. Infusion is stable for 24 hr at room temperature or if refrigerated. ***Concentration:*** 125 mg/125 mL (1 mg/mL), 250 mg/300 mL (0.83 mg/mL), 250 mg/550 mL (0.45 mg/mL). ***Rate:*** See Route/Dosage section. Titrate to patient's heart rate and blood pressure response.
- **Y-Site Compatibility:** albumin, alfentanil, amifostine, amikacin, amiodarone, amphotericin B colloidal, argatroban, atracurium, aztreonam, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, diphenhydramine, dobutamine, docetaxel, dopamine, doripenem, doxacurium, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephendrine, epinephrine, epirubicin, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hetastarch, hydralazine, hydromorphone, ifosfamide, imipenem/cilastatin, inamrinone, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, metaraminol, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pemetrexed, penicillin G potassium, pentamidine, phentolamine, phenylephrine, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, streptozocin, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, trimethobenzamide, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** allopurinol, amphotericin B liposome, cefepime, chloramphenicol, dantrolene, diazepam, fluorouracil, furosemide, ganciclovir, ketorolac, methotrexate, micafungin, pantroprazole, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, rifampin, thiopental.

## Patient/Family Teaching

- Advise patient to take medication as directed at the same time each day, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid large amounts (6–8 glasses of grapefruit juice/day) during therapy.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).

- Instruct patient to avoid concurrent use of alcohol or OTC medications, especially cough and cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if irregular heartbeats, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath occurs; or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring blood pressure. Advise patient to take blood pressure weekly and to report significant changes to health care professional.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.
- Suppression and prevention of tachyarrhythmias.

## dinoprostone

(dye-noe-**prost**-one)

Cervidil Vaginal Insert, Prepidil Endocervical Gel, Prostin E Vaginal Suppository

***Classification***

Therapeutic: cervical ripening agent
Pharmacologic: oxytocics, prostaglandins

**Pregnancy Category C**

### Indications

Endocervical Gel, Vaginal Insert: Used to "ripen" the cervix in pregnancy at or near term when induction of labor is indicated. Vaginal Suppository: Induction of midtrimester abortion, Management of missed abortion up to 28 wk, Management of nonmetastatic gestational trophoblastic disease (benign hydatidiform mole).

### Action

Produces contractions similar to those occurring during labor at term by stimulating the myometrium (oxytocic effect). Initiates softening, effacement, and dilation of the cervix ("ripening"). Also stimulates GI smooth muscle. **Therapeutic Effects:** Initiation of labor. Expulsion of fetus.

### Pharmacokinetics

**Absorption:** Rapidly absorbed.
**Distribution:** Unknown. Action is mostly local.
**Metabolism and Excretion:** Metabolized by enzymes in lung, kidneys, spleen, and liver tissue.
**Half-life:** Unknown.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Cervical ripening (gel) | rapid | 30–45 min | unknown |
| Cervical ripening (insert) | rapid | unknown | 12 hr |
| Abortion time (suppository) | 10 min | 12–24 hr | 2–3 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to prostaglandins or additives in the gel or suppository; The gel/insert should be avoided in situations in which prolonged uterine contractions should be avoided, including: Previous cesarean section or uterine surgery, Cephalopelvic disproportion, Traumatic delivery or difficult labor, Multiparity (≥6 term pregnancies) , Hyperactive or hypertonic uterus, Fetal distress (if delivery is not imminent), Unexplained vaginal bleeding, Placenta previa, Vasa previa, Active herpes genitalis, Obstetric emergency requiring surgical intervention, Situations in which vaginal delivery is contraindicated; Presence of acute pelvic inflammatory disease or ruptured membranes; Concurrent oxytocic therapy (wait for 30 min after removing insert before using oxytocin).
**Use Cautiously in:** Uterine scarring; Asthma; Hypotension; Cardiac disease; Adrenal disorders; Anemia; Jaundice; Diabetes mellitus; Epilepsy; Glaucoma; Pulmonary, renal, or hepatic disease; Multiparity (up to 5 previous term pregnancies).

### Adverse Reactions/Side Effects

Endocervical Gel, Vaginal Insert.

**GU:** uterine contractile abnormalities, warm feeling in vagina. **MS:** back pain. **Misc:** fever.

### Suppository

**CNS:** headache, drowsiness, syncope. **Resp:** coughing, dyspnea, wheezing. **CV:** hypotension, hypertension. **GI:** diarrhea, nausea, vomiting. **GU:** *UTERINE RUPTURE*, urinary tract infection, uterine hyperstimulation, vaginal/uterine pain. **Misc:** allergic reactions including *ANAPHYLAXIS*, chills, fever.

### Interactions

**Drug-Drug:** Augments the effects of other **oxytocics**.

### Route/Dosage

### Cervical Ripening

**Vag (Adults, Cervical):** *Endocervical gel*—0.5 mg; if response is unfavorable, may repeat in 6 hr (not to exceed 1.5 mg/24 hr). *Vaginal insert*—one 10-mg insert.

### Abortifacient

**Vag (Adults):** One 20-mg suppository, repeat q 3–5 hr (not to exceed 240 mg total or longer than 48 hr).

### Availability

**Endocervical gel (Prepidil):** 0.5 mg dinoprostone in 3 g of gel vehicle in a prefilled syringe with catheters. **Vaginal insert (Cervidil):** 10 mg. **Vaginal suppository (Prostin E Vaginal):** 20 mg.

## NURSING IMPLICATIONS

### Assessment

- **Abortifacient:** Monitor frequency, duration, and force of contractions and uterine resting tone. Opioid analgesics may be administered for uterine pain.
- Monitor temperature, pulse, and blood pressure periodically throughout therapy. Dinoprostone-induced fever (elevation >1.1°C or 2°F) usually occurs within 15–45 min after insertion of suppository. This returns to normal 2–6 hr after discontinuation or removal of suppository from vagina.
- Auscultate breath sounds. Wheezing and sensation of chest tightness may indicate hypersensitivity reaction.
- Assess for nausea, vomiting, and diarrhea in patients receiving suppository. Vomiting and diarrhea occur frequently. Patient should be premedicated with antiemetic and antidiarrheal.
- Monitor amount and type of vaginal discharge. Notify physician or other health care professional immediately if symptoms of hemorrhage (increased bleeding, hypotension, pallor, tachycardia) occur.
- **Cervical Ripening:** Monitor uterine activity, fetal status, and dilation and effacement of cervix continuously throughout therapy. Assess for hypertonus, sustained uterine contractility, and fetal distress. Insert should be removed at the onset of active labor.

### Potential Nursing Diagnoses

Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

- **Abortifacient:** Warm the suppository to room temperature just before use.
- Wear gloves when handling unwrapped suppository to prevent absorption through skin.
- Patient should remain supine for 10 min after insertion of suppository; then she may be ambulatory.
- **Vaginal Insert:** Place vaginal insert transversely in the posterior vaginal fornix immediately after removing from foil package. Warming of insert and sterile conditions are not required. Use vaginal insert only with a retrieval system. Use minimal amount of water-soluble lubricant during insertion; avoid excess because it may hamper release of dinoprostone from insert. Patient should remain supine for 2 hr after insertion, then may ambulate.
- Vaginal insert delivers dinoprostone 0.3 mg/hr over 12 hr. Remove insert at the onset of active labor, before amniotomy, or after 12 hr.
- Oxytocin should not be used during or less than 30 min after removal of insert.
- **Endocervical Gel:** Determine degree of effacement before insertion of the endocervical catheter. Do not administer above the level of the internal os. Use a 20-mm endocervical catheter if no effacement is present and a 10-mm catheter if the cervix is 50% effaced.
- Use caution to prevent contact of dinoprostone gel with skin. Wash hands thoroughly with soap and water after administration.
- Bring gel to room temperature just before administration. Do not force warming with external sources (water bath, microwave). Remove

peel-off seal from end of syringe; then remove the protective end cap and insert end cap into plunger stopper assembly in barrel of syringe. Aseptically remove catheter from package. Firmly attach catheter hub to syringe tip; click is evidence of attachment. Fill catheter with sterile gel by pushing plunger to expel air from catheter before administration to patient. Gel is stable for 24 mo if refrigerated.

- Patient should be in dorsal position with cervix visualized using a speculum. Introduce gel with catheter into cervical canal using sterile technique. Administer gel by gentle expulsion from syringe and then remove catheter. Do not attempt to administer small amount of gel remaining in syringe. Use syringe for only 1 patient; discard syringe, catheter, and unused package contents after using.
- Patient should remain supine for 15–30 min after administration to minimize leakage from cervical canal.
- Oxytocin may be administered 6–12 hr after desired response from dinoprostone gel. If no cervical/uterine response to initial dose of dinoprostone is obtained, repeat dose may be administered in 6 hr.

### Patient/Family Teaching

- Explain purpose of medication and vaginal exams.
- **Abortifacient:** Instruct patient to notify health care professional immediately if fever and chills, foul-smelling vaginal discharge, lower abdominal pain, or increased bleeding occurs.
- Provide emotional support throughout therapy.
- **Cervical Ripening:** Inform patient that she may experience a warm feeling in her vagina during administration.
- Advise patient to notify health care professional if contractions become prolonged.

### Evaluation/Desired Outcomes

- Complete abortion. Continuous administration for more than 2 days is not usually recommended.
- Cervical ripening and induction of labor.

## diphenhydrAMINE (oral, parenteral)

(dye-fen-**hye**-dra-meen)

Allerdryl, Allergy Medication, AllerMax, Banophen, Benadryl Dye-Free Allergy, Benadryl Allergy, Benadryl, Compoz, Compoz Nighttime Sleep Aid, Diphen AF, Diphen Cough, Diphenhist, Dormin, Genahist, 40 Winks, Hyrexin-50, Insomnal, Maximum Strength Nytol, Maximum Strength Sleepinal, Midol PM, Miles Nervine, Nighttime Sleep Aid, Nytol, Scot-Tussin Allergy DM, Siladril, Silphen, Sleep-Eze 3, Sleepwell 2-night, Sominex, Snooze Fast, Sominex, Tusstat, Twilite, Unisom Nighttime Sleep-Aid

***Classification***

Therapeutic: allergy, cold, and cough remedies, antihistamines, antitussives

**Pregnancy Category B**

### Indications

Relief of allergic symptoms caused by histamine release including: Anaphylaxis, Seasonal and perennial allergic rhinitis, Allergic dermatoses. Parkinson's disease and dystonic reactions from medications. Mild nighttime sedation. Prevention of motion sickness. Antitussive (syrup only).

### Action

Antagonizes the effects of histamine at $H_1$-receptor sites; does not bind to or inactivate histamine. Significant CNS depressant and anticholinergic properties. **Therapeutic Effects:** Decreased symptoms of histamine excess (sneezing, rhinorrhea, nasal and ocular pruritus, ocular tearing and redness, urticaria). Relief of acute dystonic reactions. Prevention of motion sickness. Suppression of cough.

### Pharmacokinetics

**Absorption:** Well absorbed after oral or IM administration but 40–60% of an oral dose reaches systemic circulation due to first-pass metabolism.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk.
**Metabolism and Excretion:** 95% metabolized by the liver.
**Half-life:** 2.4–7 hr.

TIME/ACTION PROFILE (antihistaminic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 15–60 min | 2–4 hr | 4–8 hr |
| IM | 20–30 min | 2–4 hr | 4–8 hr |
| IV | rapid | unknown | 4–8 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Acute attacks of asthma; Lactation: Lactation; Known alcohol intolerance (some liquid products).
**Use Cautiously in:** Severe liver disease; Angle-closure glaucoma; Seizure disorders; Prostatic hyperplasia; Peptic ulcer; May cause paradoxical ex-

citation in young children; Hyperthyroidism; OB: Safety not established; Geri: Appears on *Beers list*. Geriatric patients are more susceptible to adverse drug reactions and anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia); dose reduction or non-anticholinergic antihistamine recommended.

### Adverse Reactions/Side Effects

**CNS:** drowsiness, dizziness, headache, paradoxical excitation (increased in children). **EENT:** blurred vision, tinnitus. **CV:** hypotension, palpitations. **GI:** anorexia, dry mouth, constipation, nausea. **GU:** dysuria, frequency, urinary retention. **Derm:** photosensitivity. **Resp:** chest tightness, thickened bronchial secretions, wheezing. **Local:** pain at IM site.

### Interactions

**Drug-Drug:** ↑ risk of CNS depression with other **antihistamines**, **alcohol**, **opioid analgesics**, and **sedative/hypnotics**. ↑ anticholinergic effects with **tricyclic antidepressants**, **quinidine**, or **disopyramide**. **MAO inhibitors** intensify and prolong the anticholinergic effects of antihistamines.

**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

### Route/Dosage

**PO (Adults and Children >12 yr):** *Antihistaminic/antiemetic/antivertiginic*—25–50 mg q 4–6 hr, not to exceed 300 mg/day. *Antitussive*—25 mg q 4 hr as needed, not to exceed 150 mg/day. *Antidyskinetic*—25–50 mg q 4 hr (not to exceed 400 mg/day). *Sedative/hypnotic*—50 mg 20–30 min before bedtime.

**PO (Children 6–12 yr):** *Antihistaminic/antiemetic/antivertiginic*—12.5–25 mg q 4–6 hr (not to exceed 150 mg/day). *Antidyskinetic*—1–1.5 mg/kg q 6–8 hr as needed (not to exceed 300 mg/day). *Antitussive*—12.5 mg q 4 hr (not to exceed 75 mg/day). *Sedative/hypnotic*—1 mg/kg/dose 20–30 min before bedtime (not to exceed 50 mg).

**PO (Children 2–6 yr):** *Antihistaminic/antiemetic/antivertiginic*—6.25–12.5 mg q 4–6 hr (not to exceed 37.5 mg/day). *Antidyskinetic*—1–1.5 mg/kg q 4–6 hr as needed (not to exceed 300 mg/day). *Antitussive*—6.25 mg q 4 hr (not to exceed 37.5 mg/24 hr). *Sedative/hypnotic*—1 mg/kg/dose 20–30 min before bedtime (not to exceed 50 mg).

**IM, IV (Adults):** 25–50 mg q 4 hr as needed (may need up to 100-mg dose, not to exceed 400 mg/day).

**IM, IV (Children):** 1.25 mg/kg (37.5 mg/m$^2$) 4 times daily (not to exceed 300 mg/day).

### Availability (generic available)

**Capsules:** 25 mg$^{Rx, OTC}$, 50 mg$^{Rx, OTC}$. **Tablets:** 25 mg$^{Rx, OTC}$, 50 mg$^{Rx, OTC}$. **Chewable tablets (grape flavor):** 25 mg$^{Rx, OTC}$. **Elixir (cherry and other flavors):** 12.5 mg/5 mL$^{Rx, OTC}$. **Syrup (cherry and raspberry flavor):** 12.5 mg/5 mL$^{Rx, OTC}$. **Injection:** 10 mg/mL, 50 mg/mL. ***In combination with:*** analgesics, decongestants, and expectorants, in OTC pain, sleep, cough, and cold preparations. See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Diphenhydramine has multiple uses. Determine why the medication was ordered and assess symptoms that apply to the individual patient. Geri: Appears in the *Beers list.* May cause sedation and confusion due to increased sensitivity to anticholinergic effects. Monitor carefully, assess for confusion, delirium, other anticholinergic side effects and fall risk. Institute measures to prevent falls.
- **Prevention and Treatment of Anaphylaxis:** Assess for urticaria and for patency of airway.
- **Allergic Rhinitis:** Assess degree of nasal stuffiness, rhinorrhea, and sneezing.
- **Parkinsonism and Extrapyramidal Reactions:** Assess movement disorder before and after administration.
- **Insomnia:** Assess sleep patterns.
- **Motion Sickness:** Assess nausea, vomiting, bowel sounds, and abdominal pain.
- **Cough Suppressant:** Assess frequency and nature of cough, lung sounds, and amount and type of sputum produced. Unless contraindicated, maintain fluid intake of 1500–2000 mL daily to decrease viscosity of bronchial secretions.
- **Pruritus:** Assess degree of itching, skin rash, and inflammation.
- ***Lab Test Considerations:*** May ↓ skin response to allergy tests. Discontinue 4 days before skin testing.

### Potential Nursing Diagnoses

Insomnia (Indications)
Risk for deficient fluid volume (Indications)
Risk for injury (Side Effects)

## Implementation

- Do not confuse Benadryl (diphenhydramine) with Benylin (dextromethorphan), desipramine (Norpramin), or with dimenhydrinate (Dramamine).
- When used for insomnia, administer 20 min before bedtime and schedule activities to minimize interruption of sleep.
- When used for prophylaxis of motion sickness, administer at least 30 min and preferably 1–2 hr before exposure to conditions that may precipitate motion sickness.
- **PO:** Administer with meals or milk to minimize GI irritation. Capsule may be emptied and contents taken with water or food.
- **IM:** Administer 50 mg/mL into well-developed muscle. Avoid subcut injections.

### IV Administration

- **Direct IV:** ***Diluent:*** May be further diluted in 0.9% NaCl, 0.45% NaCl, D5W, D10W, dextrose/saline combinations, Ringer's solution, LR, and dextrose/Ringer's combinations. ***Concentration:*** 25 mg/mL. ***Rate:*** Infuse at a rate not to exceed 25 mg/min.
- **Syringe Compatibility:** atropine, butorphanol, chlorpromazine, cimetidine, droperidol, fentanyl, fluphenazine, glycopyrrolate, hydromorphone, hydroxyzine, meperidine, metoclopramide, midazolam, morphine, nalbuphine, pentazocine, perphenazine, prochlorperazine, promethazine, ranitidine, scopolamine, sufentanil.
- **Syringe Incompatibility:** haloperidol, pantoprazole, pentobarbital, phenobarbital, phenytoin, thiopental.
- **Y-Site Compatibility:** abciximab, acyclovir, aldesleukin, alfentanil, amifostine, amikacin, amphotericin B liposome, amsacrine, argatroban, ascorbic acid, atropine, azithromycin, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, ceftizoxime, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexmedetomidine, digoxin, diltiazem, dobutamine, docetaxel, dopamine, doripenem, doxorubicin, doxorubicin liposome, doxycycline, enalaprilat, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, folic acid, gemcitabine, gentamicin, glycopyrrolate, granisetron, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, melphalan, meperidine, meropenem, methadone, methicillin, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, minocycline, mitomycin, morphine, multiple viitamins, nalbuphine, naloxone, nesiritide, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pemetrexed, penicillin G, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinipristin/dalfopristin, ranitidine, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimethophan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole.
- **Y-Site Incompatibility:** allopurinol, aminophylline, amphotericin B cholesteryl , amphotericin B colloidal, ampicillin, azathioprine, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, dantrolene, dexamethasone, diazepam, diazoxide, fluorouracil, foscarnet, furosemide, ganciclovir, indomethacin, insulin, ketorolac, methylprednisolone, milrinone, nitroprusside, pantoprazole, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, trimethoprim/sulfamethoxazole.

## Patient/Family Teaching

- Instruct patient to take medication as directed; do not exceed recommended amount. Caution patient not to use oral OTC diphenhydramine products with any other product containing diphenhydramine, including products used topically.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- May cause dry mouth. Inform patient that frequent oral rinses, good oral hygiene, and sugarless gum or candy may minimize this effect. Notify health care professional if dry mouth persists for more than 2 wk.

- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoidance of nicotine and caffeine) to patients taking diphenhydramine to aid sleep.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Caution patient to avoid use of alcohol and other CNS depressants concurrently with this medication.
- Pedi: Can cause excitation in children. Caution parents or caregivers about proper dose calculation; overdosage, especially in infants and children, can cause hallucinations, seizures, or death. Caution parents to avoid OTC cough and cold products while breastfeeding or to children <4 yr.
- Geri: Instruct older adults to avoid OTC products that contain diphenhydramine due to increased sensitivity to anticholinergic effects and potential for adverse reactions related to these effects.
- Advise patients taking diphenhydramine in OTC preparations to notify health care professional if symptoms worsen or persist for more than 7 days.

## Evaluation/Desired Outcomes

- Prevention of, or decreased urticaria in, anaphylaxis or other allergic reactions.
- Decreased dyskinesia in parkinsonism and extrapyramidal reactions.
- Sedation when used as a sedative/hypnotic.
- Prevention of or decrease in nausea and vomiting caused by motion sickness.
- Decrease in frequency and intensity of cough without eliminating cough reflex.

# diphenoxylate/atropine

(dye-fen-**ox**-i-late/**a**-troe-peen)

Logen, Lomanate, Lomotil, Lonox

# difenoxin/atropine

(dye-fen-**ox**-in/**a**-troe-peen)

Motofen

***Classification***

Therapeutic: antidiarrheals

Pharmacologic: anticholinergics

**Schedule V (diphenoxylate/atropine), IV (difenoxin/atropine)**

**Pregnancy Category C**

## Indications

Adjunctive therapy in the treatment of diarrhea.

## Action

Inhibits excess GI motility. Structurally related to opioid analgesics but has no analgesic properties. Atropine added to discourage abuse. **Therapeutic Effects:** Decreased GI motility with subsequent decrease in diarrhea.

## Pharmacokinetics

**Absorption:** Well absorbed from the GI tract.
**Distribution:** Enters breast milk.
**Metabolism and Excretion:** *Diphenoxylate*—mostly metabolized by the liver with some conversion to an active antidiarrheal compound (difenoxin). *Difenoxin*—metabolized by the liver. Minimal excretion in urine.
**Half-life:** *Diphenoxylate*—2.5 hr; *difenoxin*—4.5 hr.

TIME/ACTION PROFILE (antidiarrheal action)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Difenoxin–PO | 45–60 min | 2 hr | 3–4 hr |
| Diphenoxylate–PO | 45–60 min | 2 hr | 3–4 hr |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Severe liver disease; Infectious diarrhea (due to *Escherichia coli*, *Salmonella*, or *Shigella*); Diarrhea associated with pseudomembranous colitis; Dehydrated patients; Angle-closure glaucoma; Children <2 yr; Known alcohol intolerance (some liquid diphenoxylate/atropine products only).
**Use Cautiously in:** Patients physically dependent on opioids; Inflammatory bowel disease; Geriatric patients (more sensitive to effects); Children (more sensitive to effects, especially Down syndrome patients); Prostatic hyperplasia; Pregnancy, lactation, or children <12 yr (safety not established for difenoxin/atropine in children <12 yr; diphenoxylate/atropine should not be used in children <2 yr).

## Adverse Reactions/Side Effects

**CNS:** dizziness, confusion, drowsiness, headache, insomnia, nervousness. **EENT:** blurred vision, dry eyes. **CV:** tachycardia. **GI:** constipation, dry mouth, epigastric distress, ileus, nausea, vomiting. **GU:** urinary retention. **Derm:** flushing.

## Interactions

**Drug-Drug:** Additive CNS depression with other **CNS depressants** including **alcohol**, **antihista-**

**mines**, **opioid analgesics**, and **sedative/hypnotics**. Additive anticholinergic properties with other **drugs having anticholinergic properties**, including **tricyclic antidepressants** and **disopyramide**. Use with **MAO inhibitors** may result in hypertensive crisis.
**Drug-Natural Products:** Increased anticholinergic effects with **angel's trumpet**, **jimson weed**, and **scopolia**.

### Route/Dosage

#### Difenoxin/Atropine

Doses given are in terms of difenoxin—each tablet contains 1 mg difenoxin with 0.025 mg of atropine.
**PO (Adults):** 2 tablets initially, then 1 tablet after each loose stool or every 3–4 hr as needed (not to exceed 8 tablets/day).

#### Diphenoxylate/Atropine

Adult doses given are in terms of diphenoxylate—each tablet contains 2.5 mg diphenoxylate with 0.025 mg of atropine; pediatric doses are given in mg of diphenoxylate and in mL of diphenoxylate/atropine liquid; each 5 mL of liquid contains 2.5 mg diphenoxylate with 0.025 mg of atropine.
**PO (Adults):** 5 mg 3–4 times daily initially, then 5 mg once daily as needed (not to exceed 20 mg/day).
**PO (Children):** *use liquid only*—0.3–0.4 mg/kg/day in 4 divided doses.

### Availability

#### Difenoxin/Atropine

**Tablets:** 1 mg difenoxin/0.025 mg atropine.

#### Diphenoxylate/Atropine (generic available)

**Tablets:** 2.5 mg diphenoxylate/0.025 mg atropine. **Liquid (cherry flavor):** 2.5 mg diphenoxylate/0.025 mg atropine per 5 mL.

## NURSING IMPLICATIONS

### Assessment

- Assess the frequency and consistency of stools and bowel sounds prior to and throughout therapy.
- Assess patient's fluid and electrolyte balance and skin turgor for dehydration.
- ***Lab Test Considerations:*** Liver function tests should be evaluated periodically during prolonged therapy.
- Diphenoxylate/atropine may cause increased serum amylase concentrations.

### Potential Nursing Diagnoses

Diarrhea (Indications)
Constipation (Side Effects)

### Implementation

- Do not confuse Lomotil with Lamictal (lamotrigine) or Lamisil (terbinafine).
- Risk of dependence increases with high-dose, long-term use. Atropine has been added to discourage abuse.
- **PO:** Diphenoxylate/atropine tablets may be administered with food if GI irritation occurs. Tablets may be crushed and administered with patient's fluid of choice. Use calibrated measuring device for liquid preparations.

### Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Do not take more than the prescribed amount because of the habit-forming potential and risk of overdose in children. If on a scheduled dosing regimen, missed doses should be taken as soon as possible unless almost time for next dose. Do not double doses.
- Medication may cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may relieve dry mouth.
- Caution patient to avoid alcohol and other CNS depressants concurrently with this medication.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional if diarrhea persists or if fever, abdominal pain, or palpitations occur.

### Evaluation/Desired Outcomes

- Decrease in diarrhea. Treatment of acute diarrhea should be continued for 24–36 hr before it is considered ineffective.

## dipyridamole

(dye-peer-**id**-a-mole)
Apo-Dipyridamole, Dipridacot, Novodipiradol, Persantine, Persantine IV

***Classification***
Therapeutic: antiplatelet agents, diagnostic agents (coronary vasodilators)
Pharmacologic: platelet adhesion inhibitors

**Pregnancy Category B**

### Indications

**PO:** Prevention of thromboembolism in patients with prosthetic heart valves (with warfarin). Maintains patency after surgical grafting proce-

dures, including coronary artery bypass (with aspirin). **IV:** As an alternative to exercise in myocardial perfusion scintigraphy (cardiac stress testing with radiotracer imaging).

### Action

**PO:** Decreases platelet aggregation by inhibiting the enzyme phosphodiesterase. **IV:** Produces coronary vasodilation by inhibiting adenosine uptake. **Therapeutic Effects: PO:** Inhibition of platelet aggregation and subsequent thromboembolic events. **IV:** In diagnostic thallium imaging, dipyridamole dilates normal coronary arteries, reducing flow to vessels that are narrowed and causing abnormal thallium distribution.

### Pharmacokinetics

**Absorption:** Moderately absorbed (30–60%) after oral administration.
**Distribution:** Widely distributed. Crosses the placenta; enters breast milk.
**Metabolism and Excretion:** Metabolized by the liver; excreted in the bile.
**Half-life:** 10 hr.

TIME/ACTION PROFILE (PO = antiplatelet activity, IV = coronary vasodilation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | unknown |
| IV | unknown | 6.5 min† | 30 min |

†From start of infusion

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Hypotensive patients; Geri: Appears on Beers list. Geriatric patients may be more susceptible to orthostatic hypotension; Patients with platelet defects; Pregnancy (although safety not established, has been used without harm during pregnancy); Lactation or children <12 yr (safety not established).

### Adverse Reactions/Side Effects

**CNS:** dizziness, headache, syncope; *IV only*, transient cerebral ischemia, weakness. **Resp:** *IV only*—bronchospasm. **CV:** *IV only*—MI, hypotension, arrhythmias, flushing. **GI:** nausea, diarrhea, GI upset, vomiting. **Derm:** rash.

### Interactions

**Drug-Drug:** Additive effects with **aspirin** on platelet aggregation. Risk of bleeding may be ↑ when used with **anticoagulants**, **thrombolytic agents**, **NSAIDs**, **cefoperazone**, **cefotetan**, **valproic acid**, or **sulfinpyrazone**. ↑ risk of hypotension with **alcohol**. **Theophylline** may negate the effects of dipyridamole during diagnostic thallium imaging.

### Route/Dosage

**PO (Adults):** 225–400 mg/day in 3–4 divided doses.
**IV (Adults):** 570 mcg/kg; maximum dose 60 mg.

### Availability (generic available)

**Tablets:** 25 mg, 50 mg, 75 mg, 100 mg. **Injection:** 5 mg/mL in 2-mL and 10-ml vials. ***In combination with:*** aspirin (Aggrenox). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- **PO:** Monitor blood pressure and pulse before instituting therapy and regularly during period of dosage adjustment. Geri: Assess geriatric patients for orthostatic hypotension.
- **IV:** Monitor vital signs during and for 10–15 min after infusion. Obtain ECG in at least 1 lead. If severe chest pain or bronchospasm occurs, administer IV aminophylline 50–250 mg at a rate of 50–100 mg over 30–60 sec. If hypotension is severe, place patient in a supine position with head tilting down. If chest pain is unrelieved with aminophylline 250 mg, administer nitroglycerin SL. If chest pain is still unrelieved, treat as myocardial infarction.
- ***Lab Test Considerations:*** Bleeding time should be monitored periodically throughout therapy.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Acute pain (Indications)

### Implementation

- **PO:** Administer with a full glass of water at least 1 hr before or 2 hr after meals for faster absorption. If GI irritation occurs, may be administered with or immediately after meals. Tablets may be crushed and mixed with food if patient has difficulty swallowing. Pharmacist may make a suspension.

**IV Administration**

- **Intermittent Infusion:** ***Diluent:*** Dilute in at least a 1:2 ratio of 0.45% NaCl, 0.9% NaCl, or D5W for a total volume of 20–50 mL. Undiluted dipyridamole may cause venous irritation. ***Rate:*** Infuse over 4 min.
- **Y-Site Compatibility:** No information available.

## Patient/Family Teaching

- **PO:** Instruct patient to take medication at evenly spaced intervals as directed. Take missed doses as soon as remembered unless the next scheduled dose is within 4 hr. Do not double doses. Benefit of medication may not be apparent to patient; encourage patient to continue taking medication as directed.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid the use of alcohol, as it may potentiate the hypotensive effects. Tobacco products should also be avoided because nicotine causes vasoconstriction.
- Advise patient to consult health care professional before taking OTC medications concurrently with this medication. Aspirin should be taken only if directed and only in dose prescribed. Advise patient to discuss alternatives for pain relief or fever.
- Instruct patient to notify health care professional if unusual bleeding or bruising occurs. Concurrent use of aspirin or warfarin may increase risk of bleeding but is commonly used with specific indications.
- Advise patient to notify health care professional of medication regimen and whether using concurrent aspirin or warfarin therapy.
- **IV:** Instruct patient to notify health care professional immediately if dyspnea or chest pain occurs.

## Evaluation/Desired Outcomes

- Prevention of postoperative thromboembolic complications associated with prosthetic heart valves.
- Maintenance of patency after surgical graft procedures.
- Coronary vasodilation in thallium myocardial perfusion imaging.

# DIURETICS (POTASSIUM-SPARING)

**amiloride** (a-**mill**-oh-ride)
Apo-Amiloride, Midamor

**spironolactone**
(speer-oh-no-**lak**-tone)
Aldactone, Novospiroton

**triamterene** (trye-**am**-ter-een)
Dyrenium

***Classification***
Therapeutic: diuretics
Pharmacologic: potassium-sparing diuretics

**Pregnancy Category B (amiloride), C (spironolactone, triamterene)**

## Indications

Counteract potassium loss caused by other diuretics. Used with other agents (thiazides) to treat edema or hypertension. Primary hyperaldosteronism (spironolactone only). **Unlabeled Use: Spironolactone:** Management of CHF (low doses).

## Action

Inhibition of sodium reabsorption in the kidney while saving potassium and hydrogen ions (spironolactone achieves this effect by antagonizing aldosterone receptors). **Therapeutic Effects:** Weak diuretic and antihypertensive response when compared with other diuretics. Conservation of potassium.

## Pharmacokinetics

**Absorption:** *Amiloride*—30–90% absorbed; *spironolactone*—>90% absorbed; *triamterene*—30–70% absorbed.
**Distribution:** *Amiloride* and *triamterene*—widely distributed; all cross the placenta and enter breast milk.
**Protein Binding:** *Spironolactone* >90%.
**Metabolism and Excretion:** *Amiloride*—50% eliminated unchanged in urine, 40% excreted in the feces; *spironolactone*—converted by the liver to its active diuretic compound (canrenone); *triamterene*—80% metabolized by the liver, some excretion of unchanged drug.
**Half-life:** *Amiloride*—6–9 hr; *spironolactone*—78–84 min (spironolactone); 13–24 hr (canrenone); *triamterene*—1.7–2.5 hr.

TIME/ACTION PROFILE (diuretic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Amiloride | 2 hr† | 6–10 hr† | 24 hr† |
| Spironolactone | unknown | 2–3 days‡ | 2–3 days‡ |
| Triamterene | 2–4 hr† | 1–several days‡ | 7–9 hr† |

†Single dose
‡Multiple doses

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hyperkalemia; Anuria; Acute renal insufficiency; Significant renal dysfunction (CCr ≤30 mL/min or SCr >2.5 mg/dL).

**Use Cautiously in:** Hepatic dysfunction; Geri: Presence of age-related renal dysfunction may lead to ↑ risk of hyperkalemia; Diabetes (↑ risk of hyperkalemia); History of gout or kidney stones (triamterene only); Concurrent use of potassium supplements or potassium-containing salt substitutes; OB, Lactation, Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** dizziness; *spironolactone only*, clumsiness, headache. **CV:** arrhythmias. **GI:** *amiloride*—constipation, nausea, vomiting. **GU:** *spironolactone*—erectile dysfunction; *triamterene*—nephrolithiasis. **Derm:** *triamterene*—photosensitivity. **Endo:** *spironolactone*—breast tenderness, gynecomastia, irregular menses, voice deepening. **F and E:** hyperkalemia, hyponatremia. **Hemat:** *spironolactone*—agranulocytosis; *triamterene*—hemolytic anemia, thrombocytopenia. **MS:** muscle cramps. **Misc:** allergic reactions.

### Interactions

**Drug-Drug:** ↑ hypotension with acute ingestion of **alcohol**, other **antihypertensives**, or **nitrates**. Use with **ACE inhibitors**, **angiotensin II receptor antagonists**, **NSAIDS**, **potassium supplements**, **cyclosporine**, or **tacrolimus** ↑ risk of hyperkalemia. May ↑ levels/risk of toxicity from **lithium**. Effectiveness may be ↓ by **NSAIDs**. Spironolactone may ↑ effects of **digoxin**.

### Route/Dosage

#### Amiloride

**PO (Adults):** *HTN*—5–10 mg/day (up to 20 mg).
**PO (Children 1–17 yr):** 0.4–0.625 mg/kg/day (maximum = 20 mg/day) (unlabeled use).

#### Spironolactone

**PO (Adults):** *Edema*—25–200 mg/day in 1–2 divided doses. *HTN*—50–100 mg/day in 1–2 divided doses. *Diuretic-induced hypokalemia*—25–100 mg/day in 1–2 divided doses. *Diagnosis of primary hyperaldosteronism*—100–400 mg/day in 1–2 divided doses. *CHF*—12.5–25 mg/day (unlabeled use).
**PO (Children 1–17 yr):** *Diuretic, HTN*—1 mg/kg/day in 1–2 divided doses (should not exceed 3.3 mg/kg/day or 100 mg/day) (unlabeled use). *Diagnosis of primary hyperaldosteronism*—125–375 mg/m²/day in 1–2 divided doses (unlabeled use).
**PO (Neonates):** 1–3 mg/kg/day in 1–2 divided doses.

#### Triamterene

**PO (Adults):** *HTN*—100 mg twice daily (not to exceed 300 mg/day; lower doses in combination products).
**PO (Children):** *HTN*—1–2 mg/kg/day in 2 divided doses; should not exceed 4 mg/kg/day or 300 mg/day.

### Availability

#### Amiloride (generic available)

**Tablets:** 5 mg. ***In combination with:*** hydrochlorothiazide ({Moduret}). See Appendix B.

#### Spironolactone (generic available)

**Tablets:** 25 mg, 50 mg, 100 mg. ***In combination with:*** hydrochlorothiazide (Aldactazide, {Apo-Spirozide}). See Appendix B.

#### Triamterene

**Capsules:** 50 mg, 100 mg. ***In combination with:*** hydrochlorothiazide ({Apo-Triazide}, Dyazide, Maxzide, {Novo-Triamzide}, {Nu-Triazide}, {Pro-Triazide}, {Riva-Zide}). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor intake and output ratios and daily weight during therapy.
- If medication is given as an adjunct to antihypertensive therapy, monitor blood pressure before administering.
- Monitor response of signs and symptoms of hypokalemia (weakness, fatigue, U wave on ECG, arrhythmias, polyuria, polydipsia). Assess patient frequently for development of hyperkalemia (fatigue, muscle weakness, paresthesia, confusion, dyspnea, ECG changes, cardiac arrhythmias). Patients who have diabetes mellitus or kidney disease and geriatric patients are at increased risk of developing these symptoms.
- Periodic ECGs are recommended in patients receiving prolonged therapy.
- ***Lab Test Considerations:*** Serum potassium levels should be evaluated before and routinely during therapy. Withhold drug and notify physician or other health care professional if patient becomes hyperkalemic.
- Monitor BUN, serum creatinine, and electrolytes before and periodically during therapy. May cause ↑ serum magnesium, BUN, creati-

nine, potassium, and urinary calcium excretion levels. May also cause ↓ sodium levels.
- Discontinue potassium-sparing diuretics 3 days before a glucose tolerance test because of risk of severe hyperkalemia.
- *Spironolactone* may cause false ↑ of plasma cortisol concentrations. Spironolactone should be withdrawn 4–7 days before test.
- Monitor platelet count and total and differential leukocyte count periodically during therapy in patients taking *triamterene*.

### Potential Nursing Diagnoses
Excess fluid volume (Indications)

### Implementation
- **PO:** Administer in AM to avoid interrupting sleep pattern.
- Administer with food or milk to minimize gastric irritation and to increase bioavailability.
- *Triamterene* capsules may be opened and contents mixed with food or fluids for patients with difficulty swallowing.

### Patient/Family Teaching
- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- Caution patient to avoid salt substitutes and foods that contain high levels of potassium or sodium unless prescribed by health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult with health care professional before taking any OTC decongestants, cough or cold preparations, or appetite suppressants concurrently with this medication because of potential for increased blood pressure.
- Advise patients taking *triamterene* to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to notify health care professional if muscle weakness or cramps; fatigue; or severe nausea, vomiting, or diarrhea occurs.
- Emphasize the need for follow-up exams to monitor progress.
- **Hypertension:** Reinforce need to continue additional therapies for hypertension (weight loss, restricted sodium intake, stress reduction, moderation of alcohol intake, regular exercise, and cessation of smoking). Medication helps control but does not cure hypertension.
- Teach patient and family the correct technique for checking blood pressure weekly.

### Evaluation/Desired Outcomes
- Increase in diuresis and decrease in edema while maintaining serum potassium level in an acceptable range.
- Decrease in blood pressure.
- Prevention of hypokalemia in patients taking diuretics.
- Treatment of hyperaldosteronism.

## DIURETICS (THIAZIDE)

**chlorothiazide**
(klor-oh-**thye**-a-zide)
Diuril, Sodium Diuril

**chlorthalidone (thiazide–like)**
(klor-**thal**-i-doan)
Apo-Chlorthalidone, Thalitone

**hydrochlorothiazide**
(hye-droe-klor-oh-**thye**-a-zide)
Apo-Hydro, Bio-Hydrochlorothiazide, DOM-Hydrochlorothiazide, Esedrix, Microzide, Novo-Hydrazide, Nu-Hydro, Oretic, PHL-Hydrochlorothiazide, PMS-Hydrochlorothiazide, Urozide

***Classification***
Therapeutic: antihypertensives, diuretics
Pharmacologic: thiazide diuretics

**Pregnancy Category B (chlorthalidone, hydrochlorothiazide), C (chlorothiazide)**

### Indications
Management of mild to moderate hypertension. Treatment of edema associated with: CHF, Renal dysfunction, Cirrhosis, Glucocorticoid therapy, Estrogen therapy.

### Action
Increases excretion of sodium and water by inhibiting sodium reabsorption in the distal tubule. Promotes excretion of chloride, potassium, magnesium, and bicarbonate. May produce arteriolar dilation. **Therapeutic Effects:** Lowering of blood pressure in hypertensive patients and diuresis with mobilization of edema.

## Pharmacokinetics

**Absorption:** All are rapidly absorbed after oral administration.
**Distribution:** All cross the placenta and enter breast milk.
**Metabolism and Excretion:** All are excreted mainly unchanged by the kidneys.
**Half-life:** *Chlorothiazide*—1–2 hr; *chlorthalidone*—35–50 hr; *hydrochlorothiazide*—6–15 hr.

TIME/ACTION PROFILE (diuretic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Chlorothiazide PO | 2 hr | 4 hr | 6–12 hr |
| Chlorothiazide IV | 15 min | 30 min | 2 hr |
| Chlorthalidone | 2 hr | 2 hr | 48–72 hr |
| Hydrochlorothiazide† | 2 hr | 3–6 hr | 6–12 hr |

†Onset of antihypertensive effect is 3–4 days and does not become maximal for 7–14 days of dosing

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity (cross-sensitivity with other thiazides or sulfonamides may exist); Some products contain tartrazine and should be avoided in patients with known intolerance; Anuria; Lactation.
**Use Cautiously in:** Renal or hepatic impairment; OB: Pregnancy (jaundice or thrombocytopenia may be seen in the newborn); Pedi: Avoid use of hydrochlorothiazide oral solution in neonates (contains sodium benzoate, a metabolite of benzyl alcohol, which causes fetal gasping syndrome).

## Adverse Reactions/Side Effects

**CNS:** dizziness, drowsiness, lethargy, weakness. **CV:** hypotension. **GI:** anorexia, cramping, hepatitis, nausea, pancreatitis, vomiting. **Derm:** photosensitivity, rashes. **Endo:** hyperglycemia. **F and E:** hypokalemia, dehydration, hypercalcemia, hypochloremic alkalosis, hypomagnesemia, hyponatremia, hypophosphatemia, hypovolemia. **Hemat:** thrombocytopenia. **Metab:** hypercholesterolemia, hyperuricemia. **MS:** muscle cramps.

## Interactions

**Drug-Drug:** Additive hypotension with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Additive hypokalemia with **corticosteroids**, **amphotericin B**, **piperacillin**, or **ticarcillin**. ↓ excretion of **lithium**. **Cholestyramine** or **colestipol** ↓ absorption. Hypokalemia ↑ risk of **digoxin** toxicity. **NSAIDs** may ↓ effectiveness.

## Route/Dosage

When used as a diuretic in adults, generally given daily, but may be given every other day or 2–3 days/week.

### Chlorothiazide

**PO (Adults):** 125 mg–2 g/day in 1–2 divided doses.
**PO (Children >6 mos):** 20 mg/kg/day in 1–2 divided doses (maximum dose = 1 g/day).
**PO (Neonates ≤6 mo):** 10–20 mg/kg q 12 hr (maximum dose = 375 mg/day).
**IV (Adults):** 500 mg–1 g/day in 1–2 divided doses.
**IV (Children >6 mos):** 4 mg/kg/day in 1–2 divided doses (maximum dose = 20 mg/kg/day) (unlabeled use).
**IV (Neonates ≤6 mo):** 1–4 mg/kg q 12 hr (maximum dose = 20 mg/kg/day) (unlabeled use).

### Chlorthalidone

**PO (Adults):** 12.5–100 mg once daily (daily doses above 25 mg are associated with greater likelihood of electrolyte abnormalities).

### Hydrochlorothiazide

**PO (Adults):** 12.5–100 mg/day in 1–2 divided doses (up to 200 mg/day); not to exceed 50 mg/day for hypertension; daily doses above 25 mg are associated with greater likelihood of electrolyte abnormalities.
**PO (Children >6 mo):** 1–3 mg/kg/day in 2 divided doses (not to exceed 37.5 mg/day).
**PO (Children <6 mo):** 1–3 mg/kg/day in 2 divided doses.

## Availability

### Chlorothiazide (generic available)

**Tablets:** 250 mg, 500 mg. **Oral suspension:** 250 mg/5 mL. **Powder for injection:** 500 mg.

### Chlorthalidone (generic available)

**Tablets:** 25 mg, 50 mg, 100 mg. ***In combination with:*** atenolol (Tenoretic), clonidine (Clorpres). See Appendix B.

### Hydrochlorothiazide (generic available)

**Tablets:** 25 mg, 50 mg. **Capsules:** 12.5 mg. **Oral solution:** 10 mg/mL, 100 mg/mL

***In combination with:*** numerous antihypertensive agents. See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, intake, output, and daily weight and assess feet, legs, and sacral area for edema daily.
- Assess patient, especially if taking digoxin, for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Notify health care professional if these signs of electrolyte imbalance occur. Patients taking digoxin are at risk of digoxin toxicity because of the potassium-depleting effect of the diuretic.
- If hypokalemia occurs, consideration may be given to potassium supplements or ↓ dose of diuretic.
- Assess patient for allergy to sulfonamides.
- **Hypertension:** Monitor blood pressure before and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- ***Lab Test Considerations:*** Monitor electrolytes (especially potassium), blood glucose, BUN, serum creatinine, and uric acid levels before and periodically throughout therapy.
- May cause ↑ in serum and urine glucose in diabetic patients.
- May cause ↑ in serum bilirubin, calcium, creatinine, and uric acid, and ↓ in serum magnesium, potassium, sodium, and urinary calcium concentrations.
- May cause ↑ serum cholesterol, low-density lipoprotein, and triglyceride concentrations.

### Potential Nursing Diagnoses

Excess fluid volume (Indications)
Risk for deficient fluid volume (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

- Administer in the morning to prevent disruption of sleep cycle.
- Intermittent dose schedule may be used for continued control of edema.
- **PO:** May give with food or milk to minimize GI irritation. Tablets may be crushed and mixed with fluid to facilitate swallowing.

#### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Reconstitute chlorothiazide with at least 18 mL of sterile water for injection. Shake to dissolve. Stable for 24 hr at room temperature. May be given undiluted or may be diluted further with D5W or 0.9% NaCl. ***Concentration:*** Up to 28 mg/mL. ***Rate:*** If administered undiluted may give by direct IV over 3–5 min. If diluted, may run over 30 min.

### Patient/Family Teaching

- Instruct patient to take this medication at the same time each day. If a dose is missed, take as soon as remembered but not just before next dose is due. Do not double doses.
- Instruct patient on use of calibrated dropper for measuring hydrochlorothiazide concentrated oral solution.
- Instruct patient to monitor weight biweekly and notify health care professional of significant changes.
- Caution patient to change positions slowly to minimize orthostatic hypotension. This may be potentiated by alcohol.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patient to discuss dietary potassium requirements with health care professional (see Appendix M).
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to report muscle weakness, cramps, nausea, vomiting, diarrhea, or dizziness to health care professional.
- Emphasize the importance of routine follow-up exams.
- **Hypertension:** Advise patients to continue taking the medication even if feeling better. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).
- Instruct patient and family in correct technique for monitoring weekly blood pressure.
- Advise patient to consult health care professional before taking OTC medication, especially cough or cold preparations, concurrently with this therapy.

### Evaluation/Desired Outcomes

- Decrease in blood pressure.
- Increase in urine output.
- Decrease in edema.

**divalproex sodium, See VALPROATES.**

HIGH ALERT

# DOBUTamine

(doe-**byoo**-ta-meen)
Dobutrex

***Classification***
Therapeutic: inotropics
Pharmacologic: adrenergics

**Pregnancy Category B**

## Indications
Short-term (<48 hr) management of heart failure caused by depressed contractility from organic heart disease or surgical procedures.

## Action
Stimulates beta$_1$ (myocardial)-adrenergic receptors with relatively minor effect on heart rate or peripheral blood vessels. **Therapeutic Effects:** Increased cardiac output without significantly increased heart rate.

## Pharmacokinetics
**Absorption:** Administered by IV infusion only, resulting in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Metabolized by the liver and other tissues.
**Half-life:** 2 min.

TIME/ACTION PROFILE (inotropic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 1–2 min | 10 min | brief (min) |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity to dobutamine or bisulfites; Idiopathic hypertrophic subaortic stenosis.
**Use Cautiously in:** History of hypertension (increased risk of exaggerated pressor response); MI; Atrial fibrillation (pretreatment with digitalis glycosides recommended); History of ventricular atopic activity (may be exacerbated); Hypovolemia (correct before administration); Pregnancy or lactation (safety not established).

## Adverse Reactions/Side Effects
**CNS:** headache. **Resp:** shortness of breath. **CV:** hypertension, increased heart rate, premature ventricular contractions, angina pectoris, arrhythmias, hypotension, palpitations. **GI:** nausea, vomiting. **Local:** phlebitis. **Misc:** hypersensitivity reactions including skin rash, fever, bronchospasm or eosinophilia, nonanginal chest pain.

## Interactions
**Drug-Drug:** Use with **nitroprusside** may have a synergistic effect on ↑ cardiac output. **Beta blockers** may negate the effect of dobutamine. ↑ risk of arrhythmias or hypertension with some **anesthetics** (**cyclopropane**, **halothane**), **MAO inhibitors**, **oxytocics**, or **tricyclic antidepressants**.

## Route/Dosage
**IV (Adults and Children):** 2.5–15 mcg/kg/min titrate to response (up to 40 mcg/kg/min).
**IV (Neonates):** 2–15 mcg/kg/min.

## Availability
**Injection:** 12.5 mg/mL in 20-, 40-, and 100-mL vials. **Premixed infusion:** 250 mg/250 mL, 500 mg/500 mL, 500 mg/250 mL, 1000 mg/250 mL.

# NURSING IMPLICATIONS

## Assessment
- Monitor blood pressure, heart rate, ECG, pulmonary capillary wedge pressure (PCWP), cardiac output, CVP, and urinary output continuously during the administration. Report significant changes in vital signs or arrhythmias. Consult physician for parameters for pulse, blood pressure, or ECG changes for adjusting dose or discontinuing medication.
- Palpate peripheral pulses and assess appearance of extremities routinely throughout dobutamine administration. Notify physician if quality of pulse deteriorates or if extremities become cold or mottled.
- ***Lab Test Considerations:*** Monitor potassium concentrations during therapy; may cause hypokalemia.
- Monitor electrolytes, BUN, creatinine, and prothrombin time weekly during prolonged therapy.
- ***Toxicity and Overdose:*** If overdose occurs, reduction or discontinuation of therapy is the only treatment necessary because of the short duration of dobutamine.

## Potential Nursing Diagnoses
Decreased cardiac output (Indications)
Ineffective tissue perfusion (Indications)

## Implementation
- ***High Alert:*** IV vasoactive medications are potentially dangerous. Have second practitioner independently check original order, dosage calculations, and infusion pump settings. Do not

confuse dobutamine with dopamine. If available as floor stock, store in separate areas.
- Correct hypovolemia with volume expanders before initiating dobutamine therapy.
- Administer into a large vein and assess administration site frequently. Extravasation may cause pain and inflammation.

**IV Administration**

- **Continuous Infusion:** ***Diluent:*** Vials must be diluted before use. Dilute 250–1000 mg in 250–500 mL of D5W, 0.9% NaCl, 0.45% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, or LR. Admixed infusions stable for 48 hr at room temperature and 7 days if refrigerated. Premixed infusions are already diluted and ready to use. ***Concentration:*** 0.25–5 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Administer via infusion pump to ensure precise amount delivered. Titrate to patient response (heart rate, presence of ectopic activity, blood pressure, urine output, CVP, PCWP, cardiac index). Dose should be titrated so heart rate does not increase by >10% of baseline.
- **Y-Site Compatibility:** amifostine, amikacin, amiodarone, anidulafungin, argatroban, atracurium, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cimetidine, ciprofloxacin, cisatracurium, cyclosporine, cladribine, dexmeditomidine, diazepam, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin liposome, doxycycline, enalaprilat, epinephrine, eptifibatide, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, gemcitabine, gentamicin, granisetron, haloperidol, hydromorphone, inamrinone, insulin, isoproterenol, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, norepinephrine, ondansetron, oxaliplatin, palonosetron, pancuronium, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, ranitidine, remifentanil, streptokinase, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, vecuronium, verapamil, voriconazole, zidovudine.
- **Y-Site Incompatibility:** acyclovir, alteplase, aminophylline, amphotericin B cholesteryl sulfate, ampicillin, ampicillin/sulbactam, amphotericin B, cefazolin, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, ertapenem, foscarnet, ganciclovir, hydrocortisone sodium succinate, indomethacin, ketorolac, lansoprazole, micafungin, pantoprazole, pemetrexed, penicillin G potassium, phenytoin, phytonadione, piperacillin/tazobactam, sodium bicarbonate, thiopental, ticarcillin/clavulanate, trimethoprim/sulfamethoxazole, warfarin.

### Patient/Family Teaching

- Explain to patient the rationale for instituting this medication and the need for frequent monitoring.
- Advise patient to inform nurse immediately if chest pain; dyspnea; or numbness, tingling, or burning of extremities occurs.
- Instruct patient to notify nurse immediately of pain or discomfort at the site of administration.
- **Home Care Issues:** Instruct caregiver on proper care of IV equipment.
- Instruct caregiver to report signs of worsening CHF (shortness of breath, orthopnea, decreased exercise tolerance), abdominal pain, and nausea or vomiting to health care professional promptly.

### Evaluation/Desired Outcomes

- Increase in cardiac output.
- Improved hemodynamic parameters.
- Increased urine output.

HIGH ALERT

## docetaxel (doe-se-**tax**-el)

Taxotere

***Classification***

Therapeutic: antineoplastics
Pharmacologic: taxoids

**Pregnancy Category D**

### Indications

Breast cancer (locally advanced/metastatic breast cancer or with doxorubicin and cyclophosphamide as adjuvant treatment of node-positive disease). Non–small-cell lung cancer (locally advanced/ metastatic) after failure on platinum regimen or with platinum as initial therapy). Advanced metastatic hormone-refractory prostate cancer (with prednisone). Squamous cell carcinoma of the head and neck (inoperable, locally advanced) with cisplatin and fluorouracil.

### Action

Interferes with normal cellular microtubule function required for interphase and mitosis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Extensively metabolized by the liver; metabolites undergo fecal elimination.
**Half-life:** 11.1 hr.

TIME/ACTION PROFILE (effect on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | rapid | 5–9 days | 7 days |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Hypersensitivity to polysorbate 80; Known alcohol intolerance; Neutrophil count <1500/mm$^3$; Liver impairment (serum bilirubin > upper limit of normal, ALT and/or AST >1.5 times upper limit of normal, with alkaline phosphatase >2.5 times upper limit of normal); OB: Pregnancy or lactation.
**Use Cautiously in:** OB: Patients with childbearing potential.

## Adverse Reactions/Side Effects

**CNS:** fatigue, weakness. **Resp:** bronchospasm. **CV:** ASCITES, CARDIAC TAMPONADE, PERICARDIAL EFFUSION, PULMONARY EDEMA, peripheral edema. **GI:** diarrhea, nausea, stomatitis, vomiting. **Derm:** alopecia, rashes, dermatitis, desquamation, edema, erythema, nail disorders. **Hemat:** anemia, thrombocytopenia, leukopenia. **Local:** injection site reactions. **MS:** myalgia, arthralgia. **Neuro:** neurosensory deficits, peripheral neuropathy. **Misc:** hypersensitivity reactions, including ANAPHYLAXIS.

## Interactions

**Drug-Drug:** ↑ bone marrow depression may occur with other **antineoplastics** or **radiation therapy**. **Cyclosporine**, **ketoconazole**, **erythromycin**, or **troleandomycin** may significantly alter the effects of docetaxel.

## Route/Dosage

**IV (Adults):** *Breast cancer*—60–100 mg/m$^2$ every 3 wk; *Breast cancer adjuvant therapy*—75 mg/m$^2$ every 3 wk for 6 cycles (with doxorubicin and cyclophosphamide); *Non–small-cell lung cancer*—75 mg/m$^2$ every 3 wk (alone or with platinum); *Prostate cancer*—75 mg/m$^2$ every 3 wk (with oral prednisone); *Squamous cell cancer*—75 mg/m$^2$ every 3 wk for 4 cycles (with cisplatin and fluorouracil).

## Availability

**Injection concentrate:** 20 mg/0.5 mL polysorbate 80 with diluent (13% ethanol), 80 mg/2 mL polysorbate 80 with diluent (13% ethanol).

# NURSING IMPLICATIONS

D

## Assessment

- Monitor vital signs before and after administration.
- Assess infusion site for patency. Docetaxel is not a vesicant. If extravasation occurs, discontinue docetaxel immediately and aspirate the IV needle. Apply cold compresses to the site for 24 hr.
- Monitor for hypersensitivity reactions continuously during infusion. These are most common after the first and second doses of docetaxel. Reactions may consist of bronchospasm, hypotension, and/or erythema. Mild to moderate reactions may be treated symptomatically and infusion slowed or stopped until reaction subsides. Severe reactions require discontinuation of therapy and symptomatic treatment. Do not readminister docetaxel to patients with previous severe reactions. Severe edema may also occur. Weigh patients before each treatment. Fluid accumulation may result in edema, ascites, and pleural or pericardial effusions. Pretreatment with corticosteroids (such as dexamethasone 8 mg PO twice daily for 5 days, starting 1 day before docetaxel) is recommended to minimize edema and hypersensitivity reactions. PO furosemide may be used to treat edema.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess patient for rash. May occur on feet or hands but may also occur on arms, face, or thorax, usually with pruritus. Rash usually occurs within 1 wk after infusion and resolves before next infusion.
- Assess for development of neurosensory deficit (paresthesia, dysesthesia, pain, burning). May also cause weakness. Pyridoxine may be used to minimize symptoms. Severe symptoms may require dose reduction or discontinuation.

- Assess patient for arthralgia and myalgia, which are usually relieved by nonopioid analgesics but may be severe enough to require treatment with opioid analgesics.
- ***Lab Test Considerations:*** Monitor CBC and differential before each treatment. Frequently causes neutropenia (<2000 neutrophils/$mm^3$); may require dose adjustment. If the neutrophil count is less than 1500/$mm^3$, dose should be held. Neutropenia is reversible and not cumulative. The nadir is 8 days, with a duration of 7 days. May also cause thrombocytopenia and anemia.
- Monitor liver function studies (AST, ALT, alkaline phosphatase, bilirubin) before each cycle. Doses are usually held if levels are elevated.

## Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Risk for injury (Adverse Reactions)

## Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. Do not confuse Taxotere (docetaxel) with Taxol (paclitaxel).
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.

### IV Administration

- **Continuous Infusion:** ***Diluent:*** Before dilution, allow vials to stand at room temperature for 5 min. Withdraw entire contents of diluent vial and transfer to vial of docetaxel. Rotate vial gently for 15 sec to mix. Do not shake. Solution should be clear but may contain foam at top. Allow to stand for a few minutes to allow foam to dissipate. All foam need not dissipate before continuing preparation. ***Concentration:*** To prepare the solution for infusion, withdraw the required amount of 10 mg/mL solution into syringe and inject into 250 mL of 0.9% NaCl or D5W for a concentration of 0.3–0.9 mg/mL. Rotate infusion container to mix infusion thoroughly. Do not administer solutions that are cloudy or contain a precipitate. Solution does not require an in-line filter. Dilute solutions are stable for 8 hr if refrigerated or at room temperature. ***Rate:*** Administer over 1 hr.
- **Y-Site Compatibility:** acyclovir, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bumetanide, buprenorphine, butorphanol, calcium gluconate, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chlorpromazine, cimetidine, ciprofloxacin, clindamycin, dexamethasone sodium phosphate, diphenhyrdamine, dobutamine, dopamine, doxycycline, droperidol, enalaprilat, famotidine, fluconazole, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, imipenem/cilastatin, leucovorin, lorazepam, LR, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metoclopramide, metronidazole, minocycline, morphine, ondansetron, oxaliplatin, palonosetron, pemetrexed, piperacillin, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, ranitidine, sodium bicarbonate, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, zidovudine.
- **Y-Site Incompatibility:** amphotericin B, doxorubicin liposome, methylprednisolone, nalbuphine.
- **Additive Incompatibility:** Information unavailable. Do not admix with other drugs or solutions.

## Patient/Family Teaching

- Advise patient to notify health care professional if fever >101°F; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor.
- Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Fatigue is a frequent side effect of docetaxel. Advise patient that frequent rest periods and pacing of activities may minimize fatigue.
- Instruct patient to notify health care professional if abdominal pain, yellow skin, weakness, paresthesia, gait disturbances, swelling of the feet, or joint or muscle aches occur.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking.
- Discuss with patient the possibility of hair loss. Complete hair loss usually begins after 1 or 2 treatments and is reversible after discontinuation of therapy. Explore coping strategies.

- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Decrease in size or spread of malignancy in women with advanced breast cancer.
- Decrease in size or spread of malignancy in locally advanced or metastatic non–small-cell lung cancer.
- Decreased size or spread of advanced metastatic hormone-refractory prostate cancer.

## **docosanol** (doe-**koe**-sa-nole)

Abreva

***Classification***

Therapeutic: antivirals (topical)

**Pregnancy Category B**

### Indications

Treatment of recurrent oral-facial herpes simplex (cold sores, fever blisters).

### Action

Prevents herpes simplex virus from entering cells by preventing viral particles from fusing with cell membranes. **Therapeutic Effects:** Reduced healing time. Decreased duration of symptoms (pain, burning, itching, tingling).

### Pharmacokinetics

**Absorption:** Unknown.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** Unknown.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Topical | unknown | unknown | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to docosanol or any other components of the formulation (benzyl alcohol, mineral oil, propylene glycol, or sucrose).
**Use Cautiously in:** Children <12 yr (safety not established); Pregnancy (use only if clearly needed).

### Adverse Reactions/Side Effects

All local reactions occured at site of application.
**Local:** acne, skin, itching, rash.

### Interactions

**Drug-Drug:** None significant.

### Route/Dosage

**Topical (Adults and Children ≥12 yr):** Apply small amount 5 times daily to sores on lips or face until healed.

### Availability

**Cream:** 10% cream in 2 g tubes[OTC].

## NURSING IMPLICATIONS

### Assessment

- Assess skin lesions prior to and periodically throughout therapy.

### Potential Nursing Diagnoses

Impaired skin integrity, impaired (Indications)
Risk for infection, high risk for (Indications)
Deficient knowledge, related to disease process and medication regimen (Patient/Family Teaching)

### Implementation

- **Topical:** Cream should be applied to lesions 5 times daily starting at the first sign of a sore or blister.

### Patient/Family Teaching

- Instruct patient on correct technique for application of docosanol. Cream should only be applied to lips and face. Avoid application in or near eyes. Emphasize handwashing following application, or touching lesions to prevent spread to others or to other areas of the body.
- Advise patient to begin application of docosanol at the first sign of a sore or blister, even during prodromal stage (feeling of burning, itching, tingling, or numbness).
- Inform patient that docosanol reduces duration of herpes simplex virus episodes but does not cure virus. Viral reactivation may be triggered by ultraviolet radiation or sun exposure, stress, fatigue, chilling, and windburn. Other possible triggers include fever, injury, menstruation, dental work, and infectious diseases (cold, flu).
- Advise patient to notify health care professional if lesions do not heal in 14 days or if fever, rash, or swollen lymph nodes occur.

### Evaluation/Desired Outcomes

- Reduction in duration of symptoms (pain, burning, itching, tingling) of herpes simplex virus episodes.

# DOCUSATE (dok-yoo-sate)

**docusate calcium**
DC Softgels, Dioctocal, Pro-Cal-Sof, Sulfolax, Surfak

**docusate sodium**
Colace, Correctol Stool Softener Soft Gels, Diocto, Docu, Docusoft S, DOK, DOS Softgels, DOS, DOSS, DSS, Dulcolax Stool Softener, Ex-Lax Stool Softener, Fleet Sof-Lax, Modane Soft, Phillips Liqui-Gels, Regulax-SS, Regulex, Silace, Soflax, Stool Softener, Therevac SB

***Classification***
Therapeutic: laxatives
Pharmacologic: stool softeners

**Pregnancy Category C**

## Indications
**PO:** Prevention of constipation (in patients who should avoid straining, such as after MI or rectal surgery). **Rect:** Used as enema to soften fecal impaction.

## Action
Promotes incorporation of water into stool, resulting in softer fecal mass. May also promote electrolyte and water secretion into the colon.
**Therapeutic Effects:** Softening and passage of stool.

## Pharmacokinetics
**Absorption:** Small amounts may be absorbed from the small intestine after oral administration. Absorption from the rectum is not known.
**Distribution:** Unknown.
**Metabolism and Excretion:** Amounts absorbed after oral administration are eliminated in bile.
**Half-life:** Unknown.

TIME/ACTION PROFILE (softening of stool)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 24–48 hr (up to 3–5 days) | unknown | unknown |
| Rectal | 2–15 min | unknown | unknown |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Abdominal pain, nausea, or vomiting, especially when associated with fever or other signs of an acute abdomen.
**Use Cautiously in:** Excessive or prolonged use may lead to dependence; Should not be used if prompt results are desired; OB, Lactation: Has been used safely.

## Adverse Reactions/Side Effects
**EENT:** throat irritation. **GI:** mild cramps. **Derm:** rashes.

## Interactions
**Drug-Drug:** None significant.

## Route/Dosage

### Docusate Calcium
**PO (Adults):** 240 mg once daily.

### Docusate Sodium
**PO (Adults and Children >12 yr):** 50–400 mg in 1–4 divided doses.
**PO (Children 6–12 yr):** 40–150 mg in 1–4 divided doses.
**PO (Children 3–6 yr):** 20–60 mg in 1–4 divided doses.
**PO (Children <3 yr):** 10–40 mg in 1–4 divided doses.
**Rect (Adults):** 50–100 mg or 1 unit containing 283 mg docusate sodium, soft soap, and glycerin.

## Availability (generic available)

### Docusate Calcium
**Capsules:** 240 mg[OTC].

### Docusate Sodium (generic available)
**Tablets:** 100 mg[OTC]. **Capsules:** 50 mg[OTC], 100 mg[OTC], 120 mg[OTC], 240 mg[OTC], 250 mg[OTC]. **Syrup:** 20 mg/5 mL[OTC]. **Liquid:** 150 mg/15 mL[OTC]. **Enema:** 283 mg/5 mL[OTC]. ***In combination with:*** stimulant laxatives[OTC]. See Appendix B.

# NURSING IMPLICATIONS

## Assessment
- Assess for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

## Potential Nursing Diagnoses
Constipation (Indications)

## Implementation
- This medication does not stimulate intestinal peristalsis.
- **PO:** Administer with a full glass of water or juice. May be administered on an empty stomach for more rapid results.
- Oral solution may be diluted in milk or fruit juice to decrease bitter taste.
- Do not administer within 2 hr of other laxatives, especially mineral oil. May cause increased absorption.

## Patient/Family Teaching

- Advise patients that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Encourage patients to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake (6–8 full glasses/day), and increasing mobility. Normal bowel habits are variable and may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient not to use laxatives when abdominal pain, nausea, vomiting, or fever is present.
- Advise patient not to take docusate within 2 hr of other laxatives.

## Evaluation/Desired Outcomes

- A soft, formed bowel movement, usually within 24–48 hr. Therapy may take 3–5 days for results. Rectal dose forms produce results within 2–15 min.

# dofetilide (doe-fet-il-ide)

Tikosyn

***Classification***

Therapeutic: antiarrhythmics (class III)

**Pregnancy Category C**

## Indications

Maintenance of normal sinus rhythm (delay in time to recurrence of atrial fibrillation/atrial flutter [AF/AFl]) in patients with AF/AFl lasting more than one week, and who have been converted to normal sinus rhythm. For the conversion of atrial fibrillation and atrial flutter to normal sinus rhythm.

## Action

Blocks cardiac ion channels responsible for transport of potassium. Increases monophasic action potential duration. Increases effective refractory period. **Therapeutic Effects:** Prevention of recurrent AF/AFl. Conversion of AF/AFl to normal sinus rhythm.

## Pharmacokinetics

**Absorption:** Well absorbed (>90%) following oral administration.

**Distribution:** Unknown.

**Metabolism and Excretion:** 80% excreted by kidneys via cationic renal secretion, mostly as unchanged drug; 20% excreted as inactive metabolites; some metabolism in the liver via cytochrome P450 system (CYP3A4 isoenzyme).

**Half-life:** 10 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within hours | 2-3 hr† | 12-24 hr |

†Steady state levels are achieved after 2–3 days

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Congenital or acquired prolonged QT syndromes; Baseline QT interval or QTc of >440 msec (500 msec in patients with ventricular conduction abnormalities); Creatinine clearance (CCr) <20 mL/min; Concurrent use of verapamil or agents which inhibit the renal cation transport system including cimetidine, ketoconazole, trimethoprim, megestrol or prochlorperazine; Concurrent use of hydrochlorothiazide; OB: Lactation (use should be avoided).

**Use Cautiously in:** Underlying electrolyte abnormalities (increased risk of serious arrhythmias; correct prior to administration); CCr 20–60 mL/min (dosage reduction recommended); Severe hepatic impairment; OB: Pregnancy (use only when benefit to patient outweighs potential risk to fetus); Pedi: Children <18 yr (safety not established).

## Adverse Reactions/Side Effects

**CNS:** dizziness, headache. **CV:** VENTRICULAR ARRHYTHMIAS, chest pain, QT interval prolongation.

## Interactions

**Drug-Drug: Hydrochlorothiazide** ↑ dofetilide levels and the risk of QT prolongation with arrhythmias; concurrent use is contraindicated. Concurrent use of renal cation transport inhibitors including **cimetidine**, **trimethoprim**, and **ketoconazole** increases blood levels and the risk of serious arrhythmias and is contraindicated. **Amiloride**, **metformin**, **megestrol**, **prochlorperazine**, and **triamterene** may have similar effects. **Phenothiazines**, **tricyclic antidepressants**, some **macrolides** (including **erythromcyin** and **telithromycin**, and **fluoroquinolones** may prolong QT interval and ↑ risk of arrhythmias; concurrent use is not recommended. Blood levels and risk of arrhythmias is also ↑ by **verapamil**; concurrent use is contra-

indicated and a 2-day washout period is recommended). Inhibitors of the cytochrome P450 system (CY P450 3A4 isoenzyme) including **macrolide anti-infectives**, **azole antifungals**, **protease inhibitor antiretrovirals**, **SSRI antidepressants**, **amiodarone**, **cannabinoids**, **diltiazem**, **nefazodone**, **quinine**, and **zafirlukast** may also ↑ blood levels and the risk of arrhythmias and concurrent use should be undertaken with caution. Should not be used concurrently with other **class I or III antiarrhythmics** due to increased risk of arrhythmias. **Phenothiazines** and **tricyclic antidepressants** also prolong QT interval and should not be used concurrently with dofetilide. Hypokalemia or hypomagnesemia from **potassium-depleting diuretics** increases the risk of arrhythmias; correct abnormalities prior to administration. Concurrent use of **digoxin** may also increase the risk of arrhythmias.
**Drug-Food: Grapefruit juice** may ↑ levels; avoid concurrent use.

### Route/Dosage
Dosing should be adjusted according to renal function and assessment of QT interval.
**PO (Adults):** *Starting dose*—500 mcg twice daily; *maintenance dose*—250 mcg twice daily (not to exceed 500 mcg twice daily).

### Renal Impairment
**PO (Adults):** *CCr 40–60 mL/min Starting dose*—250 mcg twice daily; *maintenance dose*—125 mcg twice daily; *CCr 20– 40 mL/min Starting dose*—125 mcg twice daily; *maintenance dose*—125 mcg once daily.

### Availability
**Capsules:** 125 mcg, 250 mcg, 500 mcg.

## NURSING IMPLICATIONS

### Assessment
- Monitor ECG, pulse, and blood pressure continuously during initiation of therapy and for at least 3 days, then periodically during therapy. Evaluate QTc prior to initiation of therapy and every 3 months during therapy. If QTc exceeds 440 msec (500 msec in patients with ventricular conduction abnormalities), discontinue dofetilide and monitor patient until QTc returns to baseline.
- Assess the patient's medication history including OTC, Rx, and natural/herbal products, with emphasis on those that interact with dofetilide (see Interactions).
- ***Lab Test Considerations:*** Creatinine clearance must be calculated for all patients prior to administration and every 3 months during therapy.

### Potential Nursing Diagnoses
Decreased cardiac output (Indications)

### Implementation
- Dolfetilide must be initiated or reinitiated in a setting that provides continuous ECG monitoring and has personnel trained in the management of serious ventricular arrhythmias. Due to the potential for life-threatening ventricular arrhythmias, dofetilide is usually used for patients with highly symptomatic AF/AFl.
- Patients with AF should be anticoagulated according to usual protocol prior to electrical or pharmacological cardioversion.
- Make sure patient has an adequate supply of dofetilide prior to discharge to prevent interruption of therapy.
- Patients should not be discharged from the hospital within 12 hr of electrical or pharmacological conversion to normal sinus rhythm.
- **PO:** Administer at the same time each day without regard to food.

### Patient/Family Teaching
- Instruct patient to take medication as directed, even if feeling well. If a dose is missed, do not double next dose. Take next dose at usual time.
- Patient should read the patient package insert prior to initiation of therapy and reread it each time therapy is renewed. Emphasize the need for compliance with therapy, the potential for drug interactions, and the need for periodic monitoring to minimize the risk of serious arrhythmias.
- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patient not to take OTC medications with dofetilide without consulting health care professional.
- Advise patient to consult health care professional immediately if they faint, become dizzy, or have fast heartbeats. If health care professional is unavailable instruct patient to go to nearest hospital emergency department, take remaining dofetilide capsules, and show them to the doctor or nurse. If symptoms associated

with altered electrolyte balance such as excessive or prolonged diarrhea, sweating, or vomiting or loss of appetite or thirst occur health care professional should also be notified immediately.
- Emphasize the importance of routine follow-up exams to monitor progress.

### Evaluation/Desired Outcomes
- Prevention of recurrent AF/AFl.
- Conversion of AF/AFl to normal sinus rhythm.
- If patients do not convert to normal sinus rhythm within 24 hr of initiation of therapy, electrical conversion should be considered.

## dolasetron (dol-a-se-tron)
Anzemet

***Classification***
Therapeutic: antiemetics
Pharmacologic: 5-$HT_3$ antagonists

**Pregnancy Category B**

### Indications
Prevention of nausea and vomiting associated with emetogenic chemotherapy. Prevention and treatment of postoperative nausea/vomiting.

### Action
Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea/vomiting associated with emetogenic chemotherapy or surgery.

### Pharmacokinetics
**Absorption:** Well absorbed but rapidly metabolized to hydrodolasetron, the active metabolite.
**Distribution:** Unknown.
**Metabolism and Excretion:** 61% of hydrodolasetron is excreted unchanged by the kidneys.
**Half-life:** *Hydrodolasetron*—8.1 hr (shorter in children).

TIME/ACTION PROFILE (antiemetic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1–2 hr | up to 24 hr |
| IV | unknown | 15–30 min | up to 24 hr |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Patients with risk factors for prolongation of cardiac conduction intervals (hypokalemia, hypomagnesemia, concurrent diuretic or antiarrhythmic therapy, congenital QT syndrome, cumulative high-dose anthracycline therapy); Pregnancy or lactation (safety not established).

### Adverse Reactions/Side Effects
**CNS:** headache (increased in cancer patients), dizziness, fatigue, syncope. **CV:** bradycardia, ECG changes, hypertension, hypotension, tachycardia. **GI:** diarrhea, dyspepsia. **GU:** oliguria. **Derm:** pruritus. **Misc:** chills, fever, pain.

### Interactions
**Drug-Drug:** Concurrent **diuretic** or **antiarrhythmic** therapy or cumulative **high-dose anthracycline therapy** may ↑ risk of conduction abnormalities. Blood levels and effects of hydrodolasteron are ↑ by **atenolol** and **cimetidine**. Blood levels and effects of hydrodolasetron are ↓ by **rifampin**.

### Route/Dosage

### Prevention of Chemotherapy-Induced Nausea/Vomiting
**PO (Adults):** 100 mg given within 1 hr before chemotherapy.
**PO (Children 2–16 yr):** 1.8 mg/kg given within 1 hr before chemotherapy (not to exceed 100 mg).
**IV (Adults and Children ≥2 yr):** 1.8 mg/kg given 30 min before chemotherapy (usual dose in adults is 100 mg; not to exceed 100 mg in children).

### Prevention/Treatment of Postoperative Nausea/Vomiting
**PO (Adults):** 100 mg given within 2 hr before surgery.
**PO (Children 2–16 yr):** 1.2 mg/kg (up to 100 mg/dose) given within 2 hr before surgery.
**IV (Adults):** 12.5 mg given 15 min before cessation of anesthesia (prevention) or as soon as nausea or vomiting begins (treatment).
**IV (Children 2–16 yr):** 0.35 mg/kg (up to 12.5 mg) given 15 min before cessation of anesthesia (prevention) or as soon as nausea or vomiting begins (treatment).

### Availability
**Tablets:** 50 mg, 100 mg. **Injection:** 12.5 mg/0.625 mL ampules, 20 mg/mL in 5-mL vials.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds before and after administration.
- Monitor vital signs after administration. IV administration may be followed by severe hypotension, bradycardia, and syncope.

### Potential Nursing Diagnoses

Imbalanced nutrition: less than body requirements (Indications)

### Implementation

- **PO:** Administer within 1 hr before chemotherapy or 2 hr before surgery.
- Injectable dolasetron may be mixed in apple or apple-grape juice for oral dosing for pediatric patients. May be stored at room temperature for 2 hr before use.

#### IV Administration

- **IV:** Administer 30 min before chemotherapy, 15 min before cessation of anesthesia, or postoperatively if nausea and vomiting occur shortly after surgery.
- **Direct IV:** ***Diluent:*** May be administered undiluted. ***Concentration:*** 20 mg/mL. ***Rate:*** Administer over at least 30 sec.
- **Intermittent Infusion:** ***Diluent:*** May be diluted in 0.9% NaCl, D5W, dextrose/saline combinations, D5/LR, LR, or 10% mannitol solution. Solution is clear and colorless. Stable for 24 hr at room temperature or 48 hr if refrigerated after dilution. ***Concentration:*** Dilute doses in 50 mL diluent. ***Rate:*** Administer each dose as an IV infusion over up to 15 min.
- **Y-Site Compatibility:** azithromycin, dexmeditomidine, fenoldopam, oxaliplatin.
- **Y-Site Incompatibility:** Manufacturer recommends not admixing with other medications.

### Patient/Family Teaching

- Advise patient to notify health care professional if nausea or vomiting occurs.

### Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy.
- Prevention and treatment of postoperative nausea and vomiting.

## donepezil (doe-**nep**-i-zill)

Aricept, Aricept ODT

***Classification***

Therapeutic: anti-Alzheimer's agents
Pharmacologic: cholinergics (cholinesterase inhibitors)

**Pregnancy Category C**

### Indications

Mild to moderate dementia associated with Alzheimer's disease.

### Action

Inhibits acetylcholinesterase thus improving cholinergic function by making more acetylcholine available. **Therapeutic Effects:** May temporarily lessen some of the dementia associated with Alzheimer's disease. Enhances cognition. Does not cure the disease.

### Pharmacokinetics

**Absorption:** Well absorbed after oral administration.
**Distribution:** Unknown.
**Protein Binding:** 96%.
**Metabolism and Excretion:** Partially metabolized by the liver (CYP2D6 and CYP3A4 enyzmes) and partially excreted by kidneys (17% unchanged). Two metabolites are pharmacologically active.
**Half-life:** 70 hr.

TIME/ACTION PROFILE (improvement in symptoms)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | several wk | 6 wk† |

†Return to baseline after discontinuation

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to donepezil or piperidine derivatives.
**Use Cautiously in:** Patients with underlying cardiac disease, especially sick sinus syndrome or supraventricular conduction defects; Patients with a history of ulcer disease or those currently taking NSAIDs; Patients with a history of seizures; Patients with a history of asthma or obstructive pulmonary disease; OB, Lactation, Pedi: Safety not established; assumed to be secreted in breast milk. Discontinue drug or bottle-feed.

### Adverse Reactions/Side Effects

**CNS:** headache, abnormal dreams, depression, dizziness, drowsiness, fatigue, insomnia, syncope, sedation (unusual). **CV:** atrial fibrillation, hypertension, hypotension, vasodilation. **GI:** diarrhea, nausea, anorexia, vomiting, weight gain (unusual). **GU:** frequent urination. **Derm:** ecchymoses. **Metab:** hot flashes, weight loss. **MS:** arthritis, muscle cramps.

### Interactions

**Drug-Drug:** Exaggerates muscle relaxation from **succinylcholine**. Interferes with the action of **anticholinergics**. ↑ cholinergic effects of **bethanechol**. May ↑ risk of GI bleeding from **NSAIDs**. **Quinidine** and **ketoconazole** ↓ metabolism of donepezil. **Rifampin**, **carbamazepine**, **dexamethasone**, **phenobarbital**, and **phenytoin** induce the enzymes that metabolize donepezil and may ↓ its effects.
**Drug-Natural Products: Jimson weed** and **scopolia** may antagonize cholinergic effects.

### Route/Dosage

#### Mild to Moderate Alzheimer's Disease

**PO (Adults):** 5 mg once daily; after 4–6 wk may increase to 10 mg once daily (dose should not exceed 5 mg/day in frail, elderly females).

#### Severe Alzheimer's Disease

**PO (Adults):** 10 mg once daily (dose should not exceed 10 mg/day).

### Availability

**Tablets:** 5 mg, 10 mg. **Cost:** 5 mg $464.97/90, 10 mg $455.97/90. **Orally-disintegrating tablets:** 5 mg, 10 mg. **Cost:** 5 mg $174.65/30, 10 mg $166.85/30.

## NURSING IMPLICATIONS

### Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- Administer Mini-Mental Status Exam (MMSE) initially and periodically as a screening tool to rate cognitive functioning.
- Administer Clock Drawing Test initially and periodically as a screening tool to measure severity of dementia.
- Monitor heart rate periodically during therapy. May cause bradycardia.

### Potential Nursing Diagnoses

Disturbed thought process (Indications)
Impaired environmental interpretation syndrome (Indications)
Risk for injury (Indications)

### Implementation

- **PO:** Administer in the evening just before going to bed. May be taken without regard to food.
- *Oral disintegrating tablets* should be allowed to dissolve on tongue; follow with water.

### Patient/Family Teaching

- Emphasize the importance of taking donepezil daily, as directed. Missed doses should be skipped and regular schedule returned to the following day. Do not take more than prescribed; higher doses do not increase effects but may increase side effects.
- Inform patient/family that it may take weeks before improvement in baseline behavior is observed.
- Caution patient and caregiver that donepezil may cause dizziness.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, diarrhea, or changes in color of stool occur or if new symptoms occur or previously noted symptoms increase in severity.
- Advise patient and caregiver to notify health care professional of medication regimen before treatment or surgery.
- Emphasize the importance of follow-up exams to monitor progress; atypical antipsychotics may be used as an adjunct to improve behavior.

### Evaluation/Desired Outcomes

- Improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

HIGH ALERT

## DOPamine (dope-a-meen)

Intropin, Revimine

***Classification***
Therapeutic: inotropics, vasopressors
Pharmacologic: adrenergics

**Pregnancy Category C**

### Indications

Adjunct to standard measures to improve: Blood pressure, Cardiac output, Urine output in treatment of shock unresponsive to fluid replacement. Increase renal perfusion (low doses).

### Action

Small doses (0.5–3 mcg/kg/min) stimulate dopaminergic receptors, producing renal vasodilation. Larger doses (2–10 mcg/kg/min) stimulate dopaminergic and beta$_1$-adrenergic receptors, producing cardiac stimulation and renal vasodilation. Doses greater than 10 mcg/kg/min stimulate al-

pha-adrenergic receptors and may cause renal vasoconstriction. **Therapeutic Effects:** Increased cardiac output, increased blood pressure, and improved renal blood flow.

### Pharmacokinetics

**Absorption:** Administered IV only, resulting in complete bioavailability.
**Distribution:** Widely distributed but does not cross the blood-brain barrier.
**Metabolism and Excretion:** Metabolized in liver, kidneys, and plasma.
**Half-life:** 2 min.

TIME/ACTION PROFILE (hemodynamic effects)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 1–2 min | up to 10 min | <10 min |

### Contraindications/Precautions

**Contraindicated in:** Tachyarrhythmias; Pheochromocytoma; Hypersensitivity to bisulfites (some products).
**Use Cautiously in:** Hypovolemia; Myocardial infarction; Occlusive vascular diseases; Geri: Older patients may be more susceptible to adverse effects; OB: Pregnancy and lactation (safety not established).

### Adverse Reactions/Side Effects

**CNS:** headache. **EENT:** mydriasis (high dose). **Resp:** dyspnea. **CV:** arrhythmias, hypotension, angina, ECG change, palpitations, vasoconstriction. **GI:** nausea, vomiting. **Derm:** piloerection. **Local:** irritation at IV site.

### Interactions

**Drug-Drug:** Use with **MAO inhibitors**, **ergot alkaloids** (**ergotamine**), **doxapram**, **guanadrel**, or some **antidepressants** results in severe hypertension. Use with IV **phenytoin** may cause hypotension and bradycardia. Use with **general anesthetics** may result in arrhythmias. **Beta blockers** may antagonize cardiac effects.

### Route/Dosage

**IV (Adults):** *Dopaminergic (renal vasodilation) effects*—1–5 mcg/kg/min. *Beta-adrenergic (cardiac stimulation) effects*—5–15 mcg/kg/min. *Alpha-adrenergic (increased peripheral vascular resistance) effects*—>15 mcg/kg/min; infusion rate may be increased as needed.
**IV (Children and Infants):** 1–20 mcg/kg/min, depending on desired response (1–5 mcg/kg/min has been used to improve renal blood flow).
**IV (Neonates):** 1–20 mcg/kg/min.

### Availability (generic available)

**Injection for dilution:** 40 mg/mL, 80 mg/mL, 160 mg/mL. **Premixed injection:** 200 mg/250 mL, 400 mg/250 mL, 800 mg/250 mL, 800 mg/500 mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, heart rate, pulse pressure, ECG, pulmonary capillary wedge pressure (PCWP), cardiac output, CVP, and urinary output continuously during administration. Report significant changes in vital signs or arrhythmias. Consult physician for parameters for pulse, blood pressure, or ECG changes for adjusting dose or discontinuing medication.
- Monitor urine output frequently throughout administration. Report decreases in urine output promptly.
- Palpate peripheral pulses and assess appearance of extremities routinely during dopamine administration. Notify physician if quality of pulse deteriorates or if extremities become cold or mottled.
- If hypotension occurs, administration rate should be increased. If hypotension continues, more potent vasoconstrictors (norepinephrine) may be administered.
- ***Toxicity and Overdose:*** If excessive hypertension occurs, rate of infusion should be decreased or temporarily discontinued until blood pressure is decreased. Although additional measures are usually not necessary because of short duration of dopamine, phentolamine may be administered if hypertension continues.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Ineffective tissue perfusion (Indications)

### Implementation

- ***High Alert:*** IV vasoactive medications are potentially dangerous. Have second practitioner independently check original order, dose calculations, and infusion pump settings. Do not confuse dopamine with dobutamine. If both are available as floor stock, store in separate areas.
- Correct hypovolemia with volume expanders before initiating dopamine therapy.
- Extravasation may cause severe irritation, necrosis, and sloughing of tissue. Administer into a large vein and assess administration site frequently. If extravasation occurs, affected area should be infiltrated liberally with 10–15 mL

of 0.9% NaCl containing 5–10 mg of phentolamine. For pediatric patients, use 1 mL of phentolamine dilution to infiltrate (do not exceed 5 mg total). Infiltration within 12 hr of extravasation produces immediate hyperemic changes.

### IV Administration

- **Continuous Infusion:** ***Diluent:*** Dopamine vials must be diluted before use. Dilute 200–800 mg of dopamine in 250–500 mL of 0.9% NaCl, D5W, D5/LR, D5/0.45% NaCl, D5/0.9% NaCl, or LR. Admixed solution is stable for 24 hr. Discard solutions that are cloudy, discolored, or contain a precipitate. Premixed infusions are already diluted and ready to use. ***Concentration:*** 0.8–3.2 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Infusion must be administered via infusion pump to ensure precise amount delivered. Titrate to response (blood pressure, heart rate, urine output, peripheral perfusion, presence of ectopic activity, cardiac index). Decrease rate gradually when discontinuing to prevent marked decreases in blood pressure.
- **Y-Site Compatibility:** amifostine, amikacin, aminophylline, amiodarone, anidulafungin, argatroban, atracurium, atropine, aztreonam, bivalirudin, bumetanide, calcium chloride, calcium gluconate, caspofungin, cefotaxime, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, cimetidine, ciprofloxacin, cisatracurium, cladribine, clindamycin, cyclosporine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, doxorubicin liposome, doxycycline, droperidol, enalaprilat, epinephrine, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, foscarnet, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, nafcillin, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, palonosetron, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, ranitidine, remifentanil, sargramostim, streptokinase, tacrolimus, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, vecuronium, verapamil, vitamin B complex with C, voriconazole, warfarin, zidovudine.
- **Y-Site Incompatibility:** acyclovir, alteplase, amphotericin B cholesteryl sulfate, ampicillin, cefazolin, chloramphenicol, diazepam, ganciclovir, indomethacin, insulin, lansoprazole, phenytoin, thiopental, trimethoprim/sulfamethoxazole.

### Patient/Family Teaching

- Explain to patient the rationale for instituting this medication and the need for frequent monitoring.
- Advise patient to inform nurse immediately if chest pain; dyspnea; numbness, tingling, or burning of extremities occurs.
- Instruct patient to inform nurse immediately of pain or discomfort at the site of administration.

### Evaluation/Desired Outcomes

- Increase in blood pressure.
- Increase in peripheral circulation.
- Increase in urine output.

## doripenem (do-ri-**pen**-em)

Doribax

***Classification***

Therapeutic: anti-infectives
Pharmacologic: carbapenems

**Pregnancy Category B**

### Indications

Infections caused by susceptible organisms including: complicated intra-abdominal infections, complicated urinary tract infections, including pyelonephritis.

### Action

Inhibits bacterial cell wall formation. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following gram-negative organisms: *Acinetobacter baumanii*, *Escherichia coli*, *Klebsiella pneumoniae*, *Proteus mirabilis*, and *Pseudomonas aeruginosa*. Also active against the following gram-

positive organisms: *Streptococcus constellatus* and *S. intermedius*. Anaerobic spectrum includes *Bacteroides caccae*, *B. fragilis*, *B. thetaiotaomicron*, *B.uniformis*, *B. vulgatus*, and *Peptostreptococcus micros*.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Penetrates renal and peritoneal and retroperitoneal tissues and fluids.
**Metabolism and Excretion:** Mostly excreted unchanged in urine; minimal metabolism.
**Half-life:** 1 hr .

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | end of infusion | 8 hr* |

*Normal renal function

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to doripenem, other carbapenems, or beta-lactams.
**Use Cautiously in:** Geri: Consider age-related decrease in renal function when choosing dose; Lactation: Use cautiously during lactation; Pedi: Safe use in children has not been established.

## Adverse Reactions/Side Effects

**CV:** headache. **GI:** PSEUDOMEMBRANOUS COLITIS, diarrhea, nausea, ↑ liver enzymes. **Hemat:** anemia. **Local:** phlebitis. **Misc:** allergic reactions including ANAPHYLAXIS, infection with resistant organisms, superinfection.

## Interactions

**Drug-Drug:** May ↓ serum **valproate** levels (↑ risk of seizures).
**Drug-Natural Products:** May ↓ blood levels of **valproic acid**; this may result in loss of seizure control. **Probenecid** ↓ renal clearance and ↑ blood levels.

## Route/Dosage

**IV (Adults):** 500 mg every 8 hr.

### Renal Impairment

**IV (Adults):** *CCr 30–50 mL/min*—250 mg every 8 hr; *CCr >10–<30 mL/min*—250 mg every 12 hr.

## Availability

**Powder for injection (requires reconstitution:** 500 mg/vial.

# NURSING IMPLICATIONS

## Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins, cephalosporins, or carbapenems. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician immediately if these occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause ↑ AST, ALT, serum alkaline phosphatase levels.
- May cause anemia.

## Potential Nursing Diagnoses

Risk for infection (Indications, Side Effects)

## Implementation

- May switch to appropriate oral therapy after at least 3 days of parenteral therapy, once clinical improvement has been demonstrated.

### IV Administration

- **Intermittent Infusion:** Reconstitute 500-mg vial with 10 mL of sterile injection or 0.9% NaCl and shake gently to form a suspension of 50 mg/mL. ***Diluent:*** Withdraw the resulting solution using a 21-gauge needle and add it to 100 mL of 0.9% NaCl or D5W; gently shake until clear. *For moderate or severe renal impairment, withdraw 55 mL of this solution from the bag and discard.* Solution should be clear and colorless to slightly yellow. ***Concentration:*** Final concentration is 4.5 mg/mL. Suspension is stable for 1 hr prior to dilution in infusion bag. Administer within 8 hr of reconstitution with 0.9% NaCl or 4 hr of reconstitution with D5W at room temperature or 24 hr if refrigerated; do not freeze. ***Rate:*** Administer over 1 hr. Do not administer direct IV.
- **Y-Site Compatibility:** acyclovir, amikacin, aminophylline, amiodarone, anidulafungin, atropine, azithromycin, bumetanide, calcium gluconate, carboplatin, caspofungin, cimetidine, ciprofloxacin, cisplatin, cyclophosphamide, cyclosporine, daptomycin, dexametha-

sone, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, enalaprilat, esmolol, esomeprazole, etoposide phosphate, famotidine, fentanyl, fluconazole, fluorouracil, foscarnet, fucosemide, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, insulin, labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, methotrexate, methylprednisolone, metoclopramide, metronidazole, micafungin, midazolam, milrinone, morphine, moxifloxacin, norepinephrine, ondansetron, paclitaxel, pantoprazole, phenobarbital, phenylephrine, potassium chloride, ranitidine, sodium bicarbonate, sodium phosphate, tacrolimus, tigecycline, tobramycin, vancomycin, voriconazole, zidovudine.

- **Y-Site Incompatibility:** Do not mix with or physically add to solutions containing other medications, diazepam, potassium phosphate, propofol.

## Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy. Consult health care professional before treating with antidiarrheals.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several weeks after discontinuation of medication.

## Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection. Duration may be extended up to 14 days for patients with concurrent bacteremia.

# **doxazosin** (dox-**ay**-zoe-sin)

Cardura, Cardura XL

***Classification***

Therapeutic: antihypertensives
Pharmacologic: peripherally acting antiadrenergics

**Pregnancy Category C**

## Indications

Hypertension (alone or with other agents) (immediate-release only). Symptomatic benign prostatic hyperplasia (BPH).

## Action

Dilates both arteries and veins by blocking postsynaptic alpha$_1$-adrenergic receptors. **Therapeutic Effects:** Lowering of blood pressure. Increased urine flow and decreased symptoms of BPH.

## Pharmacokinetics

**Absorption:** Well absorbed following oral administration.
**Distribution:** Probably enters breast milk; rest of distribution unknown.
**Protein Binding:** 98–99%.
**Metabolism and Excretion:** Extensively metabolized by the liver.
**Half-life:** 22 hr.

TIME/ACTION PROFILE

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO† | 1–2 hr | 2–6 hr | 24 hr |
| PO-XL‡ | 5 wk | unknown | unknown |

† Antihypertensive effect
‡ Improved urinary flow and BPH symptoms

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity.
**Use Cautiously in:** Hepatic dysfunction; Gastrointestinal narrowing (XL only); Geri: Appears on Beers list. Geriatric patients are at ↑ risk for hypotension; OB, Lactation, Pedi: Safety not established; Patients undergoing cataract surgery (↑ risk of intraoperative floppy iris syndrome).

## Adverse Reactions/Side Effects

**CNS:** dizziness, headache, depression, drowsiness, fatigue, nervousness, weakness. **EENT:** abnormal vision, blurred vision, conjunctivitis, epistaxis, intraoperative floppy iris syndrome. **Resp:** dyspnea. **CV:** first-dose orthostatic hypotension, arrhythmias, chest pain, edema, palpitations. **GI:** abdominal discomfort, constipation, diarrhea, dry mouth, flatulence, nausea, vomiting. **GU:** ↓ libido, sexual dysfunction. **Derm:** flushing, rash, urticaria. **MS:** arthralgia, arthritis, gout, myalgia.

## Interactions

**Drug-Drug:** ↑ risk of hypotension with **sildenafil**, **tadalafil**, **vardenafil**, other **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. **NSAIDs**, **sympathomimetics**, or **estrogens** may ↓ effects of antihypertensive therapy.

### Route/Dosage

#### Hypertension

**PO (Adults):** — 1 mg once daily, may be gradually ↑ at 2-wk intervals to 2–16 mg/day; incidence of postural hypotension greatly ↑ at doses >4 mg/day. *BPH* — 1 mg once daily, may be gradually increased to 8 mg/day.

#### Benign Prostatic Hyperplasia

**PO (Adults):** *Immediate release* — 1 mg once daily, may be ↑ every 1–2 wk up to 8 mg/day; *Extended release* — 4 mg once daily (with breakfast), may be ↑ in 3–4 wk to 8 mg/day.

### Availability (generic available)

**Tablets:** 1 mg, 2 mg, 4 mg, 8 mg. **Cost:** *Generic* — 1 mg $49.97/90, 2 mg $43.97/90, 4 mg $59.97/90, 8 mg $62.99/90. **Extended-release tablets:** 4 mg, 8 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse 2–6 hr after first dose, with each increase in dose, and periodically during therapy. Report significant changes.
- Assess for first-dose orthostatic hypotension and syncope. Incidence may be dose related. Observe patient closely during this period and take precautions to prevent injury.
- Monitor intake and output ratios and daily weight, and assess for edema daily, especially at beginning of therapy. Report weight gain or edema.
- **BPH:** Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) prior to and periodically during therapy.

### Potential Nursing Diagnoses

Impaired urinary elimination (Indications)
Risk for injury (Side Effects)

### Implementation

- Do not confuse Cardura (doxazosin) with Cardene (nicardipine) or Ridaura (auranofin).
- **PO:** Administer daily dose at bedtime.
- XL tablets should be swallowed whole; do not break, crush, or chew.
- **Hypertension:** May be administered concurrently with a diuretic or other antihypertensive.

### Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to decrease orthostatic hypotension.
- Advise patient to consult health care professional before taking any cough, cold, or allergy remedies or herbal products.
- Emphasize the importance of follow-up visits to determine effectiveness of therapy.
- **Hypertension:** Instruct patient and family on proper technique for blood pressure monitoring. Advise them to check blood pressure at least weekly and report significant changes.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management).

### Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of side effects.
- Decrease in urinary symptoms of BPH.

## doxepin (dox-e-pin)

Sinequan, Triadapin, Zonalon

***Classification***

Therapeutic: antianxiety agents, antidepressants, antihistamines (topical)
Pharmacologic: tricyclic antidepressants

**Pregnancy Category C**

### Indications

**PO:** Depression. **Topical:** Short-term control of pruritus associated with: Eczematous dermatitis, Lichen simplex chronicus. **Unlabeled Use: PO:** Chronic pain syndromes: Pruritus, Dermatitis, Anxiety, Insomnia.

### Action

**PO:** Prevents the reuptake of norepinephrine and serotonin by presynaptic neurons; resultant accumulation of neurotransmitters potentiates their activity. Also possesses significant anticholinergic properties. **Topical:** Antipruritic action due to antihistaminic properties. **Therapeutic Effects: PO:** Relief of depression. Decreased anxiety. **Topical:** Decreased pruritus.

## Pharmacokinetics

**Absorption:** Well absorbed from the GI tract, although much is metabolized on first pass through the liver. Some systemic absorption follows topical application.
**Distribution:** Widely distributed. Enters breast milk; probably crosses the placenta.
**Metabolism and Excretion:** Metabolized by the liver. Some conversion to active antidepressant compound. May re-enter gastric juice via secretion from enterohepatic circulation, where more absorption may occur.
**Half-life:** 8–25 hr.

TIME/ACTION PROFILE (antidepressant activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 2–3 wk | up to 6 wk | days–weeks |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Some products contain bisulfites and should be avoided in patients with known intolerance; Untreated angle-closure glaucoma; Period immediately after myocardial infarction; history of QTc prolongation, heart failure, cardiac arrhythmia.
**Use Cautiously in:** Geri: Pre-existing cardiovascular disease (increased risk of adverse reactions); Prostatic enlargement (more susceptible to urinary retention); Seizures; OB: Use during pregnancy only if potential maternal benefit outweighs risks to fetus; use during lactation may result in neonatal sedation. Recommend discontinue drug or bottle-feed; Pedi: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents; Pedi: Safety not established in children <12 yr); Geri: Appears on *Beers list* and is associated with increased falls risk secondary to anticholinergic and sedative effects. Geriatric patients should have initial dosage reduction .

## Adverse Reactions/Side Effects

**CNS:** fatigue, sedation, agitation, confusion, hallucinations. **EENT:** blurred vision, increased intraocular pressure. **CV:** hypotension, arrhythmias, ECG abnormalities. **GI:** constipation, dry mouth, hepatitis, increased appetite, weight gain, nausea, paralytic ileus. **GU:** urinary retention, decreased libido. **Derm:** photosensitivity, rashes. **Hemat:** blood dyscrasias. **Misc:** hypersensitivity reactions.

## Interactions

Apply to both topical and oral use.

**Drug-Drug:** Doxepin is metabolized in the liver by the cytochrome P450 2D6 enzyme and its action may be affected by drugs that compete for metabolism by this enzyme including other **antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrhythmics** (**propafenone**, **flecainide**); when used concurrently, dosage ↓ of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects of doxepin. May cause hypotension, tachycardia, and potentially fatal reactions when used with **MAO inhibitors** (avoid concurrent use—discontinue 2 wk prior to doxepin). Concurrent use with **SSRI antidepressants** may result in ↑ toxicity and should be avoided (fluoxetine should be stopped 5 wk before). Concurrent use with **clonidine** may result in hypertensive crisis and should be avoided. Concurrent use with **levodopa** may result in delayed/↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by **rifamycins**. ↑ CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioid analgesics**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other **agents having these properties**. **Phenothiazines** or **hormonal contraceptives** ↑ levels and may cause toxicity. **Smoking** may increase metabolism and alter effects.
**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, or **chamomile** can increase CNS depression. Increased anticholinergic effects with **jimson weed** and **scopolia**.

## Route/Dosage

**PO (Adults):** *Antidepressant/antianxiety*—25 mg 3 times daily, may be increased as needed (up to 150 mg/day in outpatients or 300 mg/day in inpatients; some patients may require only 25–50 mg/day). Once stabilized, entire daily dose may be given at bedtime. *Antipruritic*—10 mg at bedtime initially, may be increased up to 25 mg.
**PO (Geriatric Patients):** *Antidepressant*—25–50 mg/day initially, may be increased as needed.
**Topical (Adults):** Apply 4 times daily (wait 3–4 hr between applications) for up to 8 days.

### Availability (generic available)

**Capsules:** 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Oral concentrate:** 10 mg/mL. **Topical cream:** 5%.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and pulse rate prior to and during initial therapy. Patients taking high doses or with a history of cardiovascular disease should have ECG monitored prior to and periodically during therapy.
- Assess for sexual dysfunction (decreased libido; erectile dysfunction).
- Assess weight and BMI initially and throughout treatment. Obtain FBS and cholesterol levels in overweight/obese individuals.
- Geri: Assess falls risk and institute fall prevention strategies. Assess for anticholinergic effects.
- **Depression:** Assess mental status (orientation, mood, behavior) frequently. Confusion, agitation, and hallucinations may occur during initiation of therapy and may require dosage reduction. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Anxiety:** Assess degree and manifestations of anxiety prior to and during therapy.
- **Pain:** Assess the type, location, and severity of pain prior to and periodically during therapy. Use pain scale to assess effectiveness of therapy.
- **Topical:** Assess pruritic area prior to and periodically during therapy.
- ***Lab Test Considerations:*** Monitor WBC and differential blood counts, hepatic function, and serum glucose periodically. May cause ↑ serum bilirubin and alkaline phosphatase levels. May cause bone marrow depression. Serum glucose may be ↑ or ↓.

### Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for injury (Side Effects)
Sexual dysfunction (Side Effects)

### Implementation

- Do not confuse doxepin with doxycycline.
- May be given as a single dose at bedtime to minimize sedation during the day. Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take weeks to months.
- To avoid withdrawal, taper by 50% for 3 days, then 50% again for 3 days, then discontinue.
- **PO:** Administer medication with or immediately following a meal to minimize gastric irritation. Capsules may be opened and mixed with foods or fluids if patient has difficulty swallowing.
- Oral concentrate must be diluted in at least 120 mL of water, milk, or fruit juice. Do not mix with carbonated beverages or grape juice. Use calibrated measuring device to ensure accurate amount.
- **Topical:** Apply thin film of doxepin cream only to affected areas, and rub in gently. Apply only to affected skin; not for ophthalmic, oral, or intravaginal use.

### Patient/Family Teaching

- Inform patient that systemic side effects may occur with oral or topical use.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to the medication is known.
- Orthostatic hypotension, sedation, and confusion are common during early therapy, especially in geriatric patients. Protect patient from falls. Institute fall precautions. Advise patient to change positions slowly.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention occurs or if dry mouth or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- **PO:** Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- Refer appropriate individuals for weight management.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.

- Inform patient that urine may turn blue-green in color.
- Inform patient of need to monitor dietary intake. Increase in appetite is possible and may lead to undesired weight gain.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams to monitor effectiveness and side effects.
- Refer patient to psychotherapy to improve coping skills and to local support group.
- **Topical:** Instruct patient to apply a thin film of medication exactly as directed; do not use more medication than directed, apply to a larger area than directed, use more often than directed, or use longer than 8 days.
- Inform patient that topical preparation may cause burning, stinging, swelling, increased itching, or worsening of eczema. Notify health care professional if these symptoms become bothersome.
- Caution patient not to use occlusive dressings; may increase systemic absorption.
- Advise patient to notify health care professional if excessive drowsiness occurs with topical application. Number of applications per day, amount of cream applied, or area of application may be reduced. May require discontinuation of therapy.

### Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite .
- Improved energy level.
- Improved sleep.
- Decrease in anxiety.
- Decrease in chronic pain. Patients may require 2–6 wk of oral therapy before full therapeutic effects of medication are evident.
- Decrease in pruritus associated with eczema.

**doxercalciferol, See VITAMIN D COMPOUNDS.**

HIGH ALERT

## DOXOrubicin

(dox-oh-**roo**-bi-sin)

Adriamycin PFS, Adriamycin RDF, Rubex

***Classification***

Therapeutic: antineoplastics

Pharmacologic: anthracyclines

**Pregnancy Category D**

D

### Indications

Alone or with other modalities in the treatment of various solid tumors including: Breast, Ovarian, Bladder, Bronchogenic carcinoma, Malignant lymphomas and leukemias.

### Action

Inhibits DNA and RNA synthesis by forming a complex with DNA; action is cell-cycle S-phase–specific. Also has immunosuppressive properties.

**Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** Administered IV only, resulting in complete bioavailability.

**Distribution:** Widely distributed; does not cross the blood-brain barrier; extensively bound to tissues.

**Metabolism and Excretion:** Mostly metabolized by the liver. Converted by liver to an active compound. Excreted predominantly in the bile, 50% as unchanged drug. Less than 5% eliminated unchanged in the urine.

**Half-life:** 16.7 hr.

TIME/ACTION PROFILE (effect on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 10 days | 14 days | 21–24 days |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB, Lactation: Pregnancy or lactation.

**Use Cautiously in:** History of cardiac disease or high cumulative doses of anthracyclines; Depressed bone marrow reserve; Liver impairment (reduce dose if serum bilirubin >1.2 mg/dL); Children, geriatric patients, mediastinal radiation, concurrent cyclophosphamide (risk of cardiotoxicity); OB: Patients with childbearing potential.

### Adverse Reactions/Side Effects

**Resp:** recall pneumonitis. **CV:** CARDIOMYOPATHY, ECG changes. **GI:** diarrhea, esophagitis, nausea, stomatitis, vomiting. **GU:** red urine. **Derm:** alopecia, photosensitivity. **Endo:** sterility, prepubertal growth failure with temporary gonadal impairment (children only). **Hemat:** anemia, leuko-

penia, thrombocytopenia. **Local:** phlebitis at IV site, tissue necrosis. **Metab:** hyperuricemia. **Misc:** hypersensitivity reactions.

### Interactions

**Drug-Drug:** ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. Pediatric patients who have received concurrent doxorubicin and **dactinomycin** have an ↑ risk of recall pneumonitis at variable times following local radiation therapy. May ↑ skin reactions at previous **radiation therapy** sites. If **paclitaxel** is administered first, clearance of doxorubicin is ↓ and the incidence and severity of neutropenia and stomatitis are ↑ (problem is diminished if doxorubicin is administered first). Hematologic toxicity is ↑ and prolonged by concurrent use of **cyclosporine**; risk of coma and seizures is also ↑. Incidence and severity of neutropenia and thrombocytopenia are ↑ by concurrent **progesterone**. **Phenobarbital** may ↑ clearance and decrease effects of doxorubicin. Doxorubicin may ↓ metabolism and ↑ effects of **phenytoin**. **Streptozocin** may ↑ the half-life of doxorubicin (dosage ↓ of doxorubicin recommended). May ↑ risk of hemorrhagic cystitis from **cyclophosphamide** or hepatitis from **mercaptopurine**. Cardiac toxicity may be ↑ by **radiation therapy** or **cyclophosphamide**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

### Route/Dosage

Other regimens are used.

**IV (Adults):** 60–75 mg/m² daily, repeat q 21 days; or 25–30 mg/m² daily for 2–3 days, repeat q 3–4 wk or 20 mg/m²/wk. Total cumulative dose should not exceed 550 mg/m² without monitoring of cardiac function or 400 mg/m² in patients with previous chest radiation or other cardiotoxic chemotherapy.

**IV (Children):** 30 mg/m²/day for 3 days every 4 wk.

### Hepatic Impairment

**IV (Adults):** Serum bilirubin 1.2–3mg/dL—50% of usual dose; serum bilirubin 3.1–5 mg/dL—25% of usual dose.

### Availability (generic available)

**Powder for injection:** 10-mg, 20-mg, 50-mg, 100-mg, 150-mg vials. **Injection:** 2 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, and report occurrence of significant discrepancies. Encourage fluid intake of 2000–3000 mL/day. Allopurinol and alkalinization of the urine may be used to decrease serum uric acid levels and to help prevent urate stone formation.
- Severe and protracted nausea and vomiting may occur as early as 1 hr after therapy and may last 24 hr. Administer parenteral antiemetics 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis and notify physician or other health care professional if emesis exceeds guidelines to prevent dehydration.
- Monitor for development of signs of cardiac toxicity, which may be either acute and transient (ST segment depression, flattened T wave, sinus tachycardia, and extrasystoles) or late onset (usually occurs 1–6 mo after initiation of therapy) and characterized by intractable CHF (peripheral edema, dyspnea, rales/crackles, weight gain). Chest x-ray, echocardiography, ECGs, and radionuclide angiography may be ordered prior to and periodically during therapy. Cardiotoxicity is more prevalent in children younger than 2 yr and geriatric patients. Dexrazoxane may be used to prevent cardiotoxicity in patients receiving cumulative doses of >300 mg/m².
- Assess injection site frequently for redness, irritation, or inflammation. Doxorubicin is a vesicant but may infiltrate painlessly even if blood returns on aspiration of infusion needle. Severe tissue damage may occur if doxorubicin extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein. Local infiltration of antidote is not recommended. Apply ice packs and elevate and rest extremity for 24–48 hr to reduce swelling, then resume normal activity as tolerated. If swelling, redness, and/or pain persists beyond 48 hr, immediate consultation for possible debridement is indicated.
- Assess oral mucosa frequently for development of stomatitis. Increased dosing interval and/or

decreased dosing is recommended if lesions are painful or interfere with nutrition.

- ***Lab Test Considerations:*** Monitor CBC and differential prior to and periodically during therapy. The WBC nadir occurs 10–14 days after administration, and recovery usually occurs by the 21st day. Thrombocytopenia and anemia may also occur. Increased dosing interval and/or decreased dose is recommended if ANC is <1000 cells/mm$^3$ and/or platelet count is <50,000 cells/mm$^3$.
- Monitor renal (BUN and creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to and periodically during therapy. Dose reduction is required for bilirubin >1.2 mg/dL or serum creatinine >3 mg/dL.
- May cause ↑ serum and urine uric acid concentrations.

## Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Decreased cardiac output (Adverse Reactions)

## Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations and infusion pump settings. Do not confuse doxorubicin hydrochloride (Adriamycin, Rubex) with doxorubicin hydrochloride liposome (Doxil) or with daunorubicin hydrochloride (Cerubidine) or daunorubicin citrate liposome (DaunoXome) or with idarubicin.. Do not confuse adriamycin with idamycin. Clarify orders that do not include generic and brand names.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers (see Appendix L).
- Aluminum needles may be used to administer doxorubicin but should not be used during storage, because prolonged contact results in discoloration of solution and formation of a dark precipitate. Solution is red.

### IV Administration

- **Direct IV:** ***Diluent:*** Dilute each 10 mg with 5 mL of 0.9% NaCl (nonbacteriostatic) for injection. Shake to dissolve completely. Do not add to IV solution. Reconstituted medication is stable for 24 hr at room temperature and 48 hr if refrigerated. Protect from sunlight. ***Concentration:*** 2 mg/mL. ***Rate:*** Administer each dose over 3–5 minutes through Y-site of a free-flowing infusion of 0.9% NaCl or D5W. Facial flushing and erythema along involved vein frequently occur when administration is too rapid.
- **Y-Site Compatibility:** alfentanil, amifostine, anidulafungin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, ceftizoxime, chlorpromazine, cimetidine, ciprofloxacin, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dolasetron, dopamine, doripenem, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, hydromorphone, ifosfamide, imipenem cilastatin, inamrinone, isoproterenol, ketorolac, labetalol, leucovorin calcium, levorphanol, lidocaine, linezolid, lorazepam, mannitol, mechlorethamine, melphalan, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, octreotide, ofloxacin, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, ranitidine, sargramostim, sodium acetate, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethobenzamide, vancomycin, vasopression, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B colloidal, amphotericin B liposome, ampicillin, ampicillin/sulbactam, cefazolin, cefepime, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, diazepam, digoxin, er-

tapenem, foscarnet, fosphenytoin, ganciclovir, magnesium sulfate, meropenem, methohexital, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium phosphates, propofol, rituximab, sodium phosphates, thiopental, trimethoprim/sufamethoxazole, voriconazole.

### Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, because these may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. The risk of developing stomatitis is greatest 5–10 days after a dose; the usual duration is 3–7 days.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 4 mo after therapy is concluded. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, swelling of lower extremities, or skin irritation (swelling, pain, or redness of feet or hands) occurs.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy.
- Advise family and/or caregivers to take precautions (i.e., latex gloves) in handling body fluids for at least 5 days posttreatment.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies in solid tumors.
- Improvement of hematologic status in leukemias.

HIGH ALERT

## DOXOrubicin, liposomal

(dox-oh-**roo**-bi-sin **lye**-poe-sohm-al)

Doxil

***Classification***

Therapeutic: antineoplastics

Pharmacologic: anthracyclines

**Pregnancy Category D**

### Indications

AIDS-related Kaposi's sarcoma (KS) in patients who cannot tolerate or fail conventional therapy. Ovarian carcinoma. Multiple myeloma with bortezomib in patients who have not previously received bortezomib and have received at least one prior therapy.

### Action

Inhibits DNA and RNA synthesis by forming a complex with DNA; action is cell-cycle S-phase–specific. Also has immunosuppressive properties. Encapsulation in a liposome increases uptake by tumors, prolongs action, and may decrease some toxicity. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

### Pharmacokinetics

**Absorption:** Administered IV only, resulting in complete bioavailability.

**Distribution:** Widely distributed; does not cross the blood-brain barrier; extensively bound to tissues ( ↑ concentrations delivered to KS lesions due to liposomal carrier).

**Metabolism and Excretion:** Mostly metabolized by the liver with conversion to an active compound. Excreted mostly in bile, 50% as unchanged drug. <5% eliminated unchanged in the urine.

**Half-life:** 55 hr.

TIME/ACTION PROFILE (effect on blood counts)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | 10 days | 14 days | 21–24 days |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; OB: Pregnancy or lactation.

**Use Cautiously in:** Pre-existing cardiac disease or ↑ cumulative doses of anthracyclines; Depressed bone marrow reserve; Liver impairment (dose reduction required if serum bilirubin >1.2 mg/dL); Geri, Pedi: Children, geriatric patients, prior mediastinal radiation, concurrent cyclophosphamide (increased risk of cardiotoxicity); OB: Patients with childbearing potential.

## Adverse Reactions/Side Effects

**CNS:** weakness. **CV:** CARDIOMYOPATHY. **GI:** nausea, diarrhea, increased alkaline phosphatase, moniliasis, stomatitis, vomiting. **Derm:** alopecia, palmar-plantar erythrodysesthesia. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** injection site reactions. **Misc:** ANAPHYLACTOID ALLERGIC REACTIONS, acute infusion-related reactions, fever.

## Interactions

**Drug-Drug:** ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. Pediatric patients who have received concurrent doxorubicin and **dactinomycin** have ↑ risk of recall pneumonitis following local radiation therapy. May ↑ skin reactions at previous **radiation therapy** sites. If **paclitaxel** is administered first, clearance of doxorubicin is ↓ and incidence and severity of neutropenia and stomatitis are ↑ (problem is less if doxorubicin is administered first). Hematologic toxicity is ↑ by concurrent use of **cyclosporine**; risk of coma and seizures is also ↑. Incidence and severity of neutropenia and thrombocytopenia are ↑ by concurrent **progesterone**. **Phenobarbital** may ↑ clearance and ↓ effects of doxorubicin. Doxorubicin may ↓ metabolism and ↑ effects of **phenytoin**. **Streptozocin** may ↑ the half-life of doxorubicin (dose reduction of doxorubicin recommended). May ↑ risk of hemorrhagic cystitis from **cyclophosphamide** or hepatitis from **mercaptopurine**. Cardiac toxicity may be ↑ by **radiation therapy** or **cyclophosphamide**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

## Route/Dosage

Other regimens are used.

**IV (Adults):** *AIDS-related KS*—20 mg/m² every 3 wk; *Metastatic ovarian cancer*—40–50 mg/m² every 4 wk; *Multiple myeloma*—30 mg/m²on day 4 after following borezomib for up to 8 cycles.

## Availability

**Liposomal dispersion for injection:** 20 mg/10 mL in 10-mL and 25-mL vials.

# NURSING IMPLICATIONS

## Assessment

- Monitor blood pressure, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor for acute infusion-related reactions consisting of flushing, shortness of breath, facial swelling, headache, chills, chest pain, back pain, chest or throat tightness, fever, tachycardia, pruritus, rash, cyanosis, syncope, bronchospasm, asthma, apnea, which may be accompanied by hypotension. Reactions usually resolve over 1 day and are usually limited to first dose. Slowing infusion rate may minimize this reaction. Reaction is thought to be due to liposome.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue doxorubicin and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, and report occurrence of significant discrepancies. Encourage fluid intake of 2000–3000 mL/day. Allopurinol and alkalinization of the urine may be used to decrease serum uric acid levels and to help prevent urate stone formation.
- Severe and protracted nausea and vomiting may occur as early as 1 hr after therapy and may last 24 hr. Administer parenteral antiemetics 30–45 min prior to therapy and routinely

around the clock for the next 24 hr as indicated. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration.

- Monitor for development of signs of cardiac toxicity, which may be either acute and transient (ST segment depression, flattened T wave, sinus tachycardia, and extrasystoles) or late onset (usually occurs 1–6 mo after initiation of therapy) and characterized by intractable CHF (peripheral edema, dyspnea, rales/crackles, weight gain); occurs more frequently in patients receiving a cumulative dose of ≥550 mg/m$^2$. Chest x-ray, echocardiography, ECGs, and radionuclide angiography may be ordered prior to and periodically during therapy. Cardiotoxicity is more prevalent in children younger than 2 yr and geriatric patients. Dexrazoxane may be used to prevent cardiotoxicity in patients receiving cumulative doses of >300 mg/m$^2$.
- Assess injection site frequently for redness, irritation, or inflammation. Doxorubicin is a vesicant but may infiltrate painlessly even if blood returns on aspiration of infusion needle. Severe tissue damage may occur if doxorubicin extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein. Local infiltration of antidote is not recommended. Apply ice packs and elevate and rest extremity for 24–48 hr to reduce swelling, then resume normal activity as tolerated. If swelling, redness, and/or pain persists beyond 48 hr, immediate consultation for possible debridement is indicated.
- Assess oral mucosa frequently for development of stomatitis. Increased dosing interval and/or decreased dose is recommended if lesions are painful or interfere with nutrition.
- Monitor for skin toxicity with prolonged use; palmar-plantar erythrodysesthesia usually occurs after 6 wk of treatment and consists of swelling, pain, and erythema of the hands and feet. This may progress to desquamation but usually regresses after 2 wk. In severe cases, modification and delay of future doses of doxorubicin liposome may be necessary.
- ***Lab Test Considerations:*** Monitor CBC and differential prior to and periodically during therapy. The WBC nadir occurs 10–14 days after administration, and recovery usually occurs by the 21st day. Thrombocytopenia and anemia may also occur. ↑ dosing interval and/or ↓ dose is recommended if ANC is <1000 cells/mm$^3$ and/or platelet count is <50,000 cells/mm$^3$.
- Monitor renal (BUN and creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to and periodically during therapy. Dose reduction is required for bilirubin >1.2 mg/dL or serum creatinine >3 mg/dL.
- May cause ↑ serum and urine uric acid concentrations.

## Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Decreased cardiac output (Adverse Reactions)

## Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations, and infusion pump settings. Do not confuse doxorubicin hydrochloride liposome (Doxil) with doxorubicin hydrochloride (Adriamycin, Rubex) or with daunorubicin hydrochloride (Cerubidine) or daunorubicin citrate liposome (DaunoXome). Clarify orders that do not include generic and brand names.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Aluminum needles may be used to administer doxorubicin but should not be used during storage, because prolonged contact results in discoloration of solution and formation of a dark precipitate. Solution is red.

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Dilute dose, up to 90 mg, in 250 mL of D5W. Do not dilute with other diluents or diluents containing a bacteriostatic agent. Solution is not clear, but a translucent red liposomal dispersion. Do not use in-line filters. Refrigerate diluted solutions and administer within 24 hr of dilution. ***Concentration:*** 0.36 mg/mL. ***Rate:*** Initial rate of infusion should be 1 mg/min to minimize risk of infusion reactions. If no reactions occur, increase rate to complete administration within 1 hr. Do not administer as a bolus or undiluted solution. Rapid infusion may increase infusion-related reactions.
- **Y-Site Compatibility:** acyclovir, allopurinol, aminophylline, ampicillin, aztreonam, bleomycin, butorphanol, calcium gluconate, carboplatin, cefazolin, cefepime, cefoxitin, ceftizoxime, ceftriaxone, chlorpromazine, cimetidine, cip-

rofloxacin, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dexamethasone sodium phosphate, diphenhydramine, dobutamine, dopamine, droperidol, enalaprilat, etoposide, famotidine, fluconazole, fluorouracil, furosemide, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, leucovorin, lorazepam, magnesium sulfate, mesna, methotrexate, methylprednisolone sodium succinate, metronidazole, ondansetron, piperacillin, potassium chloride, prochlorperazine, ranitidine, ticarcillin/clavulanate, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.

- **Y-Site Incompatibility:** amphotericin B, amphotericin B cholesteryl sulfate complex, buprenorphine, cefoperazone, ceftazidime, docetaxel, mannitol, meperidine, metoclopramide, mitoxantrone, morphine, ofloxacin, paclitaxel, piperacillin/tazobactam, promethazine, sodium bicarbonate.
- **Additive Incompatibility:** Do not admix with other solutions or medications.

### Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. The risk of developing stomatitis is greatest 5–10 days after a dose; the usual duration is 3–7 days.
- Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 4 mo after therapy is concluded. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, swelling of lower extremities, or skin irritation (swelling, pain, or redness of feet or hands) occurs.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy.
- Advise family and/or caregivers to take precautions (i.e., latex gloves) in handling body fluids for at least 5 days posttreatment.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies.
- Arrested progression of KS in patients with HIV infection.

## doxycycline, See TETRACYCLINES.

## dronedarone (dro-**ned**-a-rone)

Multaq

***Classification***

Therapeutic: antiarrhythmics
Pharmacologic: benzofurans

**Pregnancy Category X**

### Indications

Reduces the risk of hospitalization in patients with paroxysmal or persistent atrial fibrillation (AF) or atrial flutter (AFL), who have had a recent episode of AF/AFL and have other cardiovascular risk factors and are currently in sinus rhythm or plan to be cardioverted.

### Action

Has several antiarrhythmic properties; prolongs PR and QTc intervals. **Therapeutic Effects:** Suppression of AF/AFL.

## Pharmacokinetics

**Absorption:** Poor bioavailability (4%) due to extensive first pass hepatic metabolism (4%) food increases bioavailability (15%).
**Distribution:** Unknown.
**Protein Binding:** >98%.
**Metabolism and Excretion:** Undergoes extensive first pass hepatic metabolism; mostly by the CYP3A enzyme system. 6% excreted in urine as metabolites, 84% was excreted in feces as metabolites. Minimal elimination as unchanged drug.
**Half-life:** 13–19 hr.

TIME/ACTION PROFILE (antiarrhythmic effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown† | 3–6 hr‡ | 12 hr |

† Steady state blood levels are attained at 4–8 days
‡ Peak levels after individual doses

## Contraindications/Precautions

**Contraindicated in:** Class IV heart failure or Class II–III heart failure with recent decompensation; Second- or third-degree atrioventricular (AV) block or sick sinus syndrome (unless a pacemaker is present); Heart rate <50 bpm; Concurrent use of strong CYP3A inhibitors or drugs/herbal products that prolong the QT interval; QTc interval ≥500 ms; Concurrent use of Class I or III antiarrhythmics including amiodarone, flecainide, propafenone, quinidine, disopyramide, dofetilide and sotalol; must be discontinued prior to treatment; Severe hepatic impairment; OB: Pregnancy (may cause fetal harm); Lactation: Avoid use during lactation.
**Use Cautiously in:** New/worsening heart failure; Hypokalemia or hypomagnesemia (may ↑ risk of arrhythmias); Mild or moderate hepatic impairment; OB: Women with childbearing potential; contraception should be used; Pedi: Safey and effectiveness in patients <18 yr not established.

## Adverse Reactions/Side Effects

**CNS:** weakness. **CV:** CHF, QTc prolongation. **GI:** abdominal pain, diarrhea, nausea, taste abnormality, vomiting. **Derm:** photosensitivity.

## Interactions

**Drug-Drug:** Dronedarone is metabolized by CYP-3A and is a moderate inhibitor of CYP3A and CYP2D6 enzyme systems; interactions may occur with other drugs that are substrates for or are metabolized by theses systems. Dronedarone also inhibits P-gP, which can result in ↑ absorption of certain drugs. Concurrent use of **strong CYP3A inhibitors** including **ketoconazole**, **itraconazole**, **voriconazole**, **cyclosporine**, **telithromycin**, **clarithromycin**, **nefazodone**, and **ritonavir** or **drugs that prolong the QT interval** including **phenothiazine antipsychotics**, **tricyclic antidepressants**, some oral **macrolide antibiotics** and other **Class I and III antiarrhythmics** ↑ risk of serious adverse cardiovascular reactions and should be avoided. Concurrent use of CYP3A4 inducers including **rifampin**, **phenobarbital**, **carbamazepine**, or **phenytoin** ↓ blood levels and effectiveness and should be avoided. ↑ **digoxin** levels and the risk of toxicity (discontinue or ↓ dose by 50% before treatment and monitor carefully). Avoid concurrent use of other **antiarrhythmics**, including **amiodarone**, **flecainide**, **propafenone**, **quinidine**, **disopyramide**, **dofetilide**, and **sotalol** due to ↑ risk of adverse cardiovascular reactions; discontinue prior to dronedarone therapy (concurrent use is contraindicated). Concurrent use of **calcium channel blockers** ↑ risk of adverse cardiovascular reactions (initiate at lower dose and increase only after ECG evaluation). Concurrent use of **betablockers** ↑ risk of bradycardia (initiate at lower dose and increase only after ECG evaluation). May also ↑ levels and effects of**tricyclic antidepressants**, and **selective serotonin reuptake inhibitors (SSRIs)**. May ↑ levels and risk of toxicity of some **HMG-CoA reductase inhibitors (statins)**, see recommendations for specific agents. Concurrent use with **CYP 3A substrates** including **sirolimus** and **tacrolimus** may ↑ risk of serious adverse reactions; monitor and adjust dosage carefully.
**Drug-Natural Products: St. John's wort** ↓ blood levels and may ↓ effectiveness; avoid concurrent use.
**Drug-Food: Grapefruit juice** may ↑ levels and the risk of toxicity; avoid concurrent ingestion.

## Route/Dosage

**PO (Adults):** 400 mg twice daily.

## Availability

**Tablets:** 400 mg.

# NURSING IMPLICATIONS

## Assessment

- Assess for signs and symptoms of atrial fibrillation or atrial flutter (palpitations, abnormal ECG) periodically during therapy.
- Monitor ECG periodically during therapy. If QTc ≥500 ms discontinue therapy.
- ***Lab Test Considerations:*** Monitor serum potassium and magnesium levels during therapy and maintain within normal range. May cause hypokalemia and hypomagnesemia.

- Serum creatinine levels increase by about 0.1 mg/dL following initiation of therapy with a rapid onset and plateau after 7 days; reversible with discontinuation. If increase and plateau occurs, use increased value as new baseline.

### Potential Nursing Diagnoses
Decreased cardiac output (Indications)

### Implementation
- **PO:** Administer twice daily with morning and evening meals.

### Patient/Family Teaching
- Instruct patient to take dronederone as directed. Do not stop taking dronederone, even if feeling better without consulting health care professional. If a dose is missed, omit and take next dose at regularly scheduled time; do not double dose. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill; there may be new information.
- Advise patient to avoid grapefruit juice during therapy.
- Advise patient to notify health care professional if signs and symptoms of heart failure (weight gain, dependent edema, increasing shortness of breath) occur.
- Advise patient to consult health care professional before taking other Rx, OTC, or herbal products, especially St. John's wort.
- May be teratogenic. Caution female patients of childbearing yr to use effective contraception during therapy and to notify health care professional if pregnancy is planned or suspected or if breastfeeding.

### Evaluation/Desired Outcomes
- Reduction in hospitalization of patients with paroxysmal or persistent atrial fibrillation or atrial flutter.

## **droperidol** (droe-**per**-i-dole)
Inapsine

***Classification***
Therapeutic: sedative/hypnotics
Pharmacologic: butyrophenones

**Pregnancy Category C**

### Indications
Used to produce tranquilization and as an adjunct to general and regional anesthesia. **Unlabeled Use:** Useful in decreasing postoperative or postprocedure nausea and vomiting.

### Action
Similar to haloperidol—alters the action of dopamine in the CNS. **Therapeutic Effects:** Tranquilization. Suppression of nausea and vomiting in selected situations.

### Pharmacokinetics
**Absorption:** Well absorbed following IM administration.
**Distribution:** Appears to cross the blood-brain barrier and placenta.
**Metabolism and Excretion:** Mainly metabolized by the liver. Only 10% excreted unchanged by the kidneys.
**Half-life:** 2.2 hr.

TIME/ACTION PROFILE (sedation)

| ROUTE | ONSET | PEAK | DURATION* |
|---|---|---|---|
| IM, IV | 3–10 min | 30 min | 2–4 hr |

*Listed as duration of tranquilization; alterations in consciousness may last up to 12 hr

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Known intolerance; Angle-closure glaucoma; Bone marrow depression; CNS depression; Severe liver or cardiac disease; Known or suspected QT prolongation.
**Use Cautiously in:** Geriatric, debilitated, or severely ill patients (smaller doses should be used); Diabetic patients; Respiratory insufficiency; Prostatic hyperplasia; CNS tumors; Intestinal obstruction; Seizures (may lower seizure threshold); Severe liver disease; Pregnancy, lactation, and children <2 yr (although safety not established, droperidol has been used during cesarean section without respiratory depression in the newborn); Age >65 yr, concurrent benzodiazepines, volatile anesthetics, IV opioids (may increase risk of serious arrhythmias); use lower initial doses.
**Exercise Extreme Caution in:** Patients with risk factors for prolonged QT syndrome (CHF, bradycardia, diuretic use, cardiac hypertrophy, hypokalemia, hypomagnesema) or other drugs known to prolong QT interval.

### Adverse Reactions/Side Effects
**CNS:** SEIZURES, extrapyramidal reactions, abnormal EEG, anxiety, confusion, dizziness, excessive sedation, hallucinations, hyperactivity, mental depression, nightmares, restlessness, tardive dyskinesia. **CV:** ARRHYTHMIAS (including torsades de pointes), QT prolongation. **EENT:** blurred vision, dry eyes. **Resp:** bronchospasm, laryngospasm.

**CV:** hypotension, tachycardia. **GI:** constipation, dry mouth. **Misc:** chills, facial sweating, shivering.

### Interactions

**Drug-Drug:** Additive hypotension with **antihypertensives** or **nitrates**. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioid analgesics**, and other **sedatives**. Concurrent use of **drugs known to prolong QT interval** (↑ risk of potentially life-threatening arrhythmias).

**Drug-Natural Products:** Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

### Route/Dosage

### Premedication/Use Without Premedication in Diagnostic Procedures

**IV, IM (Adults):** 2.5–initially, 30–60 min prior to induction of anesthesia; additional doses of 1.25 mg IV may be needed, but should be undertaken with caution.

**IM, IV (Children 2–12 yr):** 0.1 mg/kg maximum initial dose.

### Adjunct to General Anesthesia

**IV (Adults):** 2.5 mg additional doses of 1.25 mg IV may be needed, but should be undertaken with caution.

**IM, IV (Children 2–12 yr):** 0.1 mg/kg maximum initial dose.

### Adjunct in Regional Anesthesia

**IM, IV (Adults):** 2.5 mg.

### Antiemetic

**IV (Adults):** 0.5–1.25 mg q 4 hr as needed (unlabeled).

### Availability (generic available)

**Injection:** 2.5 mg/mL.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure and heart rate frequently during therapy. Report significant changes immediately. Hypotension may be treated with parenteral fluids if hypovolemia is a causal factor. Vasopressors (norepinephrine, phenylephrine) may be needed. Avoid use of epinephrine, because droperidol reverses its pressor effects and may cause paradoxical hypotension.
- Assess 12-lead ECG in all patients prior to administration to determine if prolonged QT interval is present. Do not administer to patients with a prolonged QT interval. Monitor ECG prior to, during, and for 2–3 hr after treatment to monitor for arrhythmias.
- Assess patient for level of sedation following administration.
- Observe patient for extrapyramidal symptoms (dystonia, oculogyric crisis, extended neck, flexed arms, tremor, restlessness, hyperactivity, anxiety) throughout therapy. Notify physician or other health care professional should these occur. An anticholinergic antiparkinsonian agent may be used to treat these symptoms.
- **Nausea and Vomiting:** Assess nausea, vomiting, hydration status, bowel sounds, and abdominal pain prior to and following administration.

### Potential Nursing Diagnoses

Risk for injury (Side Effects)

### Implementation

**IV Administration**

- **Direct IV:** ***Diluent:*** Administer undiluted. ***Concentration:*** 2.5 mg/mL. ***Rate:*** Administer each dose slowly over 30–60 sec.
- **Intermittent Infusion:** ***Diluent:*** May be added to D5W, 0.9% NaCl, or LR. ***Rate:*** Administer by slow IV infusion. Titrate according to patient response.
- **Syringe Compatibility:** atropine, bleomycin, butorphanol, chlorpromazine, cimetidine, cisplatin, cyclophosphamide, dimenhydrinate, diphenhydramine, doxorubicin, fentanyl, glycopyrrolate, hydroxyzine, meperidine, metoclopramide, midazolam, mitomycin, morphine, nalbuphine, pentazocine, perphenazine, prochlorperazine, promethazine, scopolamine, vinblastine, vincristine.
- **Syringe Incompatibility:** fluorouracil, furosemide, heparin, leucovorin calcium, methotrexate, ondansetron , pentobarbital.
- **Y-Site Compatibility:** amifostine, azithromycin, aztreonam, bivalirudin, bleomycin, buprenorphine, cisatracurium, cladribine, cisplatin, cyclophosphamide, cytarabine, dexmedetomidine, docetaxel, doxorubicin, doxorubicin liposome, etoposide, famotidine, fenoldopam, filgrastim, fluconazole, fludarabine, gemcitabine, granisetron, hydrocortisone sodium succinate, idarubicin, linezolid, melphalan, meperidine, metoclopramide, mitomycin, ondansetron, oxaliplatin, paclitaxel, potassium chloride, propofol, remifentanil, sargramostim, teniposide, thiotepa, vinblastine, vincristine, vinorelbine, vitamin B complex with C.

- **Y-Site Incompatibility:** allopurinol sodium, amphotericin B cholesteryl sulfate complex, cefepime, fluorouracil, foscarnet, furosemide, lansoprazole, leucovorin calcium, nafcillin, pemetrexed, piperacillin/tazobactam.
- **Additive Incompatibility:** barbiturates.

### Patient/Family Teaching

- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Medication causes drowsiness. Advise patient to call for assistance during ambulation and transfer.

### Evaluation/Desired Outcomes

- General quiescence and reduced motor activity.
- Decreased nausea and vomiting.

## drotrecogin (dro-tre-**coe**-gin)

Xigris

***Classification***

Therapeutic: anti-infectives
Pharmacologic: activated protein C, human

**Pregnancy Category C**

### Indications

To reduce mortality in adult patients with sepsis.

### Action

Probably acts by suppressing widespread inflammation associated with sepsis. **Therapeutic Effects:** Decrease mortality due to sepsis.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.
**Half-life:** Unknown.

TIME/ACTION PROFILE (activity)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | end of infusion | unknown |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Patients with a high risk of bleeding, including those with: active internal bleeding, recent (within 3 months) stroke, recent (within 2 months) intracranial or intraspinal injury or severe head trauma, any trauma associated with an increased risk of life-threatening bleeding, presence of an epidural catheter, intracranial neoplasm/mass lesion/cerebral herniation; Patients not expected to survive due to pre-existing medical condition(s); HIV-positive patients with CD-4 cell counts ≤50/mm$^3$; Chronic dialysis patients; Patients who have undergone bone marrow, lung, liver, pancreas or small bowel transplantation; OB: Lactation.
**Use Cautiously in:** Concurrent therapeutic heparin therapy (≥15 units/kg/hr), recent (within 3 days) thrombolytic therapy, recent (within 7 days) oral anticoagulants or glycoprotein IIb/IIIa inhibitors, recent (within 7 days) aspirin therapy > 650 mg/day or other platelet inhibitors; Platelet count <30,000 x 10$^6$/L; Prothrombin time—INR >3.0; Recent (within 6 wk) GI bleeding; Recent (within 3 mos) ischemic stroke; Intracranial arteriovenous malformation or aneurysm; Known bleeding diathesis; Chronic severe hepatic disease; Any other serious bleeding risk; Surgical procedures (discontinue 2 hr before; resume 12 hr after if hemostasis is achieved); OB: Pregnancy (use only if clearly needed); Pedi: Children (safety not established).

### Adverse Reactions/Side Effects

**Hemat:** BLEEDING.

### Interactions

**Drug-Drug:** Risk of serious bleeding may be ↑ by **antiplatelet agents**, **anticoagulants**, **thrombolytic agents**, or **other agents that may affect coagulation**.
**Drug-Natural Products:** Risk of bleeding may be ↑ by **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **gingko**, **Panax ginseng**, and others.

### Route/Dosage

**IV (Adults):** 24 mcg/kg/hr for 96 hr.

### Availability

**Powder for intravenous infusion (requires reconstitution):** 5-mg vial, 20-mg vial.

## NURSING IMPLICATIONS

### Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; tarry, black stools; hematuria; fall in hematocrit or blood pressure; guaiac-positive stools, urine, or nasogastric aspirate) throughout therapy. If clinically important bleeding occurs, stop drotrecogin infusion immediately. Assess other agents used that may affect coagulation.

Once hemostasis is achieved, reinstitution of drotrecogin may be reconsidered.

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- ***Lab Test Considerations:*** Most patients with severe sepsis have coagulopathy prolonging activated partial thromboplastin time (aPTT) and prothrombin time (PT). Drotrecogin may also affect aPTT, but has minimal effect on PT. Use PT to monitor coagulation status of patients receiving drotrecogin.

### Potential Nursing Diagnoses

Ineffective tissue perfusion, impaired (Indications)

### Implementation

- Drotrecogin should be discontinued 2 hr prior to invasive surgical procedures or procedures with a risk of bleeding. Once hemostasis is achieved, drotrecogin may be started 12 hr after the procedure.

**IV Administration**

- **Intermittent Infusion:** Calculate dose and number of 5-mg or 20-mg vials needed (vials contain excess to facilitate delivery). Reconstitute 5-mg vials with 2.5 mL and 20-mg vials with 10 mL sterile water for injection for a concentration of 2 mg/mL. Add sterile water slowly to vial; avoid inverting or shaking. Gently swirl until powder is completely dissolved. ***Diluent:*** Reconstituted solution must be diluted further with 0.9% NaCl . Withdraw amount of reconstituted solution needed from vial and add to infusion bag of 0.9% NaCl; direct stream to side of the bag to avoid agitating solution. Gently invert bag to mix. Reconstituted solution must be used within 3 hr and IV administration must be completed within 14 hr of preparation of IV solution. Do not administer if discolored or contains particulate matter. If infusion is interrupted, restart at initial infusion rate and continue to complete recommended infusion. ***Concentration:*** 100–1000 mcg/mL. When using low concentrations (<200 mcg/mL) at low flow rates (<5 mL/hr), prime infusion set for approximately 15 min at a flow rate of 5 mL/hr. ***Rate:*** Administer at a rate of 24 mcg/kg/hr for 96 hr. Do not use bolus dosing or dose escalation.
- **Y-Site Incompatibility:** Administer via a dedicated IV line or a dedicated lumen of a multilumen central venous catheter.
- **Solution Compatibility:** May be administered only with 0.9% NaCl, LR, dextrose or dextrose/ saline combinations.

### Patient/Family Teaching

- Explain purpose of medication to patient.

### Evaluation/Desired Outcomes

- Reduction of mortality in adult patients with severe sepsis.

## duloxetine (do-lox-e-teen)

Cymbalta

***Classification***

Therapeutic: antidepressants
Pharmacologic: selective serotonin/norepinephrine reuptake inhibitors

**Pregnancy Category C**

### Indications

Major depressive disorder. Diabetic peripheral neuropathic pain. Generalized anxiety disorder. Fibromyalgia. **Unlabeled Use:** Stress urinary incontinence.

### Action

Inhibits serotonin and norepinephrine reuptake in the CNS. Both antidepressant and pain inhibition are centrally mediated. **Therapeutic Effects:** Decreased depressive symptomatology. Decreased neuropathic pain. Decreased symptoms of anxiety. Decreased pain.

### Pharmacokinetics

**Absorption:** Well absorbed following oral administration.
**Distribution:** Unknown.
**Protein Binding:** Highly (> 90%) protein-bound.
**Metabolism and Excretion:** Mostly metabolized, primarily by the CYP2D6 and CYP1A2 enzyme pathways.
**Half-life:** 12 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 6 hr | 12 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent MAO inhibitor therapy; Uncontrolled angle-closure glaucoma; End-stage renal disease; Chronic hepatic impairment or substantial alcohol use (increased risk of hepatitis); Lactation: May enter breast milk; discontinue or bottle-feed.
**Use Cautiously in:** History of suicide attempt or ideation; History of mania (may activate mania/hypomania); Concurrent use of other centrally acting drugs (↑ risk of adverse reactions); History of seizure disorder; Controlled angle-closure

glaucoma; Diabetic patients and those with renal impairment (consider lower initial dose with gradual increase); OB: Use during 3rd trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; Pedi: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents (safe use in children/adolescents not established).

### Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, fatigue, drowsiness, insomnia, activation of mania, dizziness, nightmares. **EENT:** blurred vision, ↑ intraocular pressure. **CV:** ↑ blood pressure. **GI:** HEPATOTOXICITY, ↓ appetite, constipation, dry mouth, nausea, diarrhea, ↑ liver enzymes, gastritis, vomiting. **F and E:** hyponatremia. **GU:** dysuria, abnormal orgasm, erectile dysfunction, ↓ libido, urinary retention. **Derm:** ↑ sweating, pruritus, rash. **Neuro:** tremor. **Misc:** SEROTONIN SYNDROME.

### Interactions

**Drug-Drug:** Concurrent use with **MAO inhibitors** may result in serious potentially fatal reactions (do not use within 14 days of discontinuing MAOI. Wait at least 5 days after stopping duloxetine to start MAOI). ↑ risk of hepatotoxicity with chronic **alcohol** abuse. Drugs that affect serotonergic neurotransmitter systems, including **linezolid**, **tramadol**, and **triptans** ↑ risk of serotonin syndrome. **Drugs that inhibit CYP1A2**, including **fluvoxamine** and some **fluoroquinolones** ↑ levels of duloxetine and should be avoided. **Drugs that inhibit CYP2D6**, including **paroxetine**, **fluoxetine** and **quinidine** ↑ levels of duloxetine and may increase the risk of adverse reactions. Duloxetine also inhibits CYP2D6 and may ↑ levels of drugs metabolized by CYP2D6, including **tricyclic antidepressants**, **phenothiazines** and **class 1C antiarrhythmics** (**propafenone** and **flecainide**); concurrent use should be undertaken with caution. ↑ risk of serious arrhythmias with **thioridazine**; avoid concurrent use. ↑ risk of bleeding with **aspirin**, **NSAIDs**, or **warfarin**.

**Drug-Natural Products:** Use with **St. John's wort** ↑ of serotonin syndrome.

### Route/Dosage

**PO (Adults):** *Antidepressant*—20–30 mg twice daily; *Neuropathic pain or generalized anxiety disorder*—60 mg once daily; *Fibromyalgia*-30 mg once daily for 1 wk, then ↑ to 60 mg once daily.

#### Renal Impairment

**PO (Adults):** start with lower dose and ↑ gradually.

### Availability

**Capsules:** 20 mg, 30 mg, 60 mg. **Cost:** 20 mg $320.96/90, 30 mg $345.99/90, 60 mg $347.98/90.

## NURSING IMPLICATIONS

### Assessment

- Assess for sexual dysfunction (erectile dysfunction; decreased libido).
- Monitor blood pressure before and periodically during therapy. Sustained hypertension may be dose related; decrease dose or discontinue therapy if this occurs.
- Monitor appetite and nutritional intake. Weigh weekly. Report continued weight loss. Adjust diet as tolerated to support nutritional status.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression. Risk may be increased in children, adolescents, and adults ≤24 yr.
- **Depression:** Assess mental status (orientation, mood, and behavior). Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess suicidal tendencies in both adults and children, especially in early therapy or during dose changes. Restrict amount of drug available to patient.
- **Pain and Fibromyalgia:** Assess intensity, quality, and location of pain periodically during therapy. Use pain scale. May require several weeks for effects to be seen.
- ***Lab Test Considerations:*** May cause ↑ ALT, AST, bilirubin, CPK, and alkaline phosphatase.

### Potential Nursing Diagnoses

Ineffective coping (Indications)
Risk for suicide (Adverse Reactions)
Chronic pain (Indications)

### Implementation

- **PO:** May be administered without regard to meals. Capsules should be swallowed whole. Do not crush, chew, or open and sprinkle con-

tents on food or liquids; may affect enteric coating.

### Patient/Family Teaching

- Instruct patient to take duloxetine as directed at the same time each day. Take missed doses as soon as possible unless time for next dose. Do not stop abruptly; must be decreased gradually.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. If these symptoms occur, notify health care professional.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional prior to taking any Rx, OTC, or herbal products.
- Instruct patient to notify health care professional if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile blood pressure, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) or liver damage (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained "flu-like" symptoms) occur.
- Advise patient to avoid taking alcohol during duloxetine therapy.
- Instruct patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Refer patient/family to local support group.

### Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Patients may notice improvement within 1–4 wk, but should be advised to continue therapy as directed. Therapy is usually continued for several months.
- Decrease in neuropathic pain associated with diabetic peripheral neuropathy.
- Decrease in pain and soreness associated with fibromyalgia.

## **dutasteride** (doo-**tas**-te-ride)

Avodart

***Classification***

Therapeutic: benign prostatic hyperplasia (BPH) agents

Pharmacologic: androgen inhibitors

**Pregnancy Category X**

### Indications

Management of the symptoms of benign prostatic hyperplasia (BPH) in men with an enlarged prostate gland (alone or with tamsulosin).

### Action

Inhibits the enzyme 5-alpha-reductase, which is responsible for converting testosterone to its potent metabolite 5-alpha-dihydrotestosterone in the prostate gland and other tissues. 5-Alpha-dihydrotestosterone is partly responsible for prostatic hyperplasia. **Therapeutic Effects:** Reduced prostate size with associated decrease in urinary symptoms.

### Pharmacokinetics

**Absorption:** Well absorbed (60%) following oral administration; also absorbed through skin.
**Distribution:** 11.5% of serum concentration partitions into semen.
**Protein Binding:** 99% bound to albumin; 96.6% bound to alpha-1 glycoprotein.
**Metabolism and Excretion:** Mostly metabolized by the liver via the CYP3A4 metabolic pathway; metabolites are excreted in feces.
**Half-life:** 5 wk.

TIME/ACTION PROFILE (reduction in dihydrotestosterone levels†)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | 1-2 wk | unknown |

†Symptoms may only improve over 3–12 mo

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Cross-sensitivity with other 5-alpha-reductase inhibitors may occur; Women; Pedi: Children.
**Use Cautiously in:** Hepatic impairment.

### Adverse Reactions/Side Effects

**GU:** decreased libido, ejaculation disorders, erectile dysfunction. **Endo:** gynecomastia. **Derm:** rash, urticaria. **Misc:** ALLERGIC REACTIONS, ANGIOEDEMA.

### Interactions

**Drug-Drug:** Blood levels and effects may be increased by **ritonavir**, **ketoconazole**, **verapamil**, **diltiazem**, **cimetidine**, **ciprofloxacin**, or other **CYP3A4 enzyme inhibitors**.

### Route/Dosage

**PO (Adults):** 0.5 mg once daily (with or without tamsulosin).

### Availability

**Soft gelatin capsules:** 0.5 mg. **Cost:** $269.97/90.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Digital rectal examinations should be performed before and periodically during therapy for BPH.
- ***Lab Test Considerations:*** Serum prostate-specific antigen (PSA) concentrations, which are used to screen for prostate cancer, decrease by about 20% within the 1st mo of therapy and stabilize at about 50% of the pretreatment level within 6 mo. New baseline PSA concentrations should be established at 3 and 6 mo of therapy and evaluated periodically during therapy.

### Potential Nursing Diagnoses

Impaired urinary elimination (Indications)

### Implementation

- **PO:** Administer once daily with or without meals. Do not break, crush, or chew capsule.

### Patient/Family Teaching

- Instruct patient to take dutasteride at the same time each day as directed, even if symptoms improve or are unchanged. Take missed doses as soon as remembered later in the day or omit dose. Do not make up by taking double doses the next day.
- Caution patient that sharing of dutasteride may be dangerous.
- Inform patient that the volume of ejaculate may be decreased during therapy but that this will not interfere with normal sexual function.
- Caution patient that dutasteride poses a potential risk to a male fetus. Women who are pregnant or may become pregnant should avoid exposure to semen of a partner taking dutasteride and should not handle dutasteride because of the potential for absorption.
- Advise patient to avoid donating blood for at least 6 mo after last dose of dutasteride to prevent a pregnant female from receiving dutasteride through a blood transfusion.
- Emphasize the importance of periodic follow-up exams to determine whether a clinical response has occurred.

### Evaluation/Desired Outcomes

- Decrease in urinary symptoms of BPH.

**econazole, See ANTIFUNGALS (TOPICAL).**

## efavirenz (e-fa-veer-enz)

Sustiva

***Classification***

Therapeutic: antiretrovirals
Pharmacologic: non-nucleoside reverse transcriptase inhibitors

**Pregnancy Category D**

### Indications

HIV infection (incombination with one or more other antiretroviral agents).

### Action

Inhibits HIV reverse transcriptase, which results in disruption of DNA synthesis. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae. Increases CD4 cell counts and decreases viral load.

### Pharmacokinetics

**Absorption:** 50% absorbed when ingested following a high-fat meal.
**Distribution:** 99.5–99.75% bound to plasma proteins; enters CSF.
**Metabolism and Excretion:** Mostly metabolized by the liver.
**Half-life:** *Following single dose*—52–76 hr. *Following multiple doses*—40–55 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 3–5 hr | 24 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent pimozide, midazolam, triazolam, voriconazole (standard doses), St. John's wort, or ergot derivatives.
**Use Cautiously in:** History of mental illness or substance abuse (↑ risk of psychiatric symptomatology); History of hepatic impairment (including hepatitis B or C infection or concurrent therapy with hepatotoxic agents); History of seizure disorders (↑ risk of seizures); OB: Use in pregnancy only if other options have been exhausted; Lactation: Breastfeeding not recommended for HIV-infected mothers; Pedi: ↑ incidence of rash; Geri: Cautious initial dosing due to ↑ incidence of renal or cardiac dysfunction.

### Adverse Reactions/Side Effects

**CNS:** abnormal dreams, depression, dizziness, drowsiness, fatigue, headache, impaired concentration, insomnia, nervousness, psychiatric symptomatology. **GI:** nausea, abdominal pain, anorexia, diarrhea, dyspepsia, flatulence. **GU:** hematuria, renal calculi. **Derm:** RASH, sweating, pruritus. **Endo:** hypercholesterolemia, hypertriglyceridemia. **Neuro:** hypoesthesia. **Misc:** fat redistribution.

### Interactions

**Drug-Drug:** ↑ levels of **pimozide**, **midazolam, triazolam,** or **ergot alkaloids** when used concurrently; may result in potentially serious adverse reactions including arrhythmias, CNS, and respiratory depression (concurrent use contraindicated). Induces (stimulates) the hepatic cytochrome P450 3A4 enzyme system and would be expected to influence the effects of other drugs that are metabolized by this system; efavirenz itself is also metabolized by this system. ↑ risk of CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, and **opioid analgesics**. Concurrent use with **ritonavir** ↑ levels of both agents and the likelihood of adverse reactions, especially hepatotoxicity. May alter the effectiveness of **hormonal contraceptives**. Use with **voriconazole** significantly ↓ voriconazole levels and ↑ efavirenz levels; concurrent use with standard doses of voriconazole is contraindicated; if used together, ↑ dose of voriconazole to 400 mg q 12 hr and ↓ dose of efavirenz to 300 mg daily. ↓ **indinavir** blood levels (indinavir dose ↑ recommended). ↓ **saquinavir** blood levels (avoid using saquinavir as the only protease inhibitor with efavirenz). May alter the effects of **warfarin**.
**Drug-Natural Products:** Use with **St. John's wort** may cause ↓ levels and effectiveness, including development of drug resistance (concurrent use contraindicated).
**Drug-Food:** Ingestion following a high-fat meal ↑ absorption by 50%.

### Route/Dosage

**PO (Adults and Children >40 kg):** 600 mg once daily.
**PO (Children 32.5–40 kg):** 400 mg once daily.
**PO (Children 25–32.5 kg):** 350 mg once daily.
**PO (Children 20–25 kg):** 300 mg once daily.
**PO (Children 15–20 kg):** 250 mg once daily.

**PO (Children 10–15 kg):** 200 mg once daily.

### Availability

**Capsules:** 50 mg, 200 mg. **Tablets:** 600 mg. ***In combination with:*** emtricitabine and tenofovir (Atripla) (See Appendix B).

## NURSING IMPLICATIONS

### Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess for rash, especially during 1st mo of therapy. Onset is usually within 2 wk and resolves with continued therapy within 1 mo. May range from mild maculopapular with erythema and pruritus to exfoliative dermatitis and Stevens-Johnson syndrome. Occurs more often and may be more severe in children. If rash is severe or accompanied by blistering, desquamation, mucosal involvement, or fever, therapy must be discontinued immediately. Efavirenz may be reinstated concurrently with antihistamines or corticosteroids in patients discontinuing due to rash.
- Assess patient for CNS and psychiatric symptoms (dizziness, impaired concentration, somnolence, abnormal dreams, insomnia) during therapy. Symptoms usually begin during 1st or 2nd day of therapy and resolve after 2–4 wk. Administration at bedtime may minimize symptoms. Concurrent use with alcohol or psychoactive agents may cause additive CNS symptoms.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- Monitor liver function tests in patients with a history of hepatitis B or C. May cause ↑ serum AST, ALT, and GGT concentrations. If moderate to severe liver function test abnormalities occur, efavirenz doses should be held until levels return to normal. Discontinue if liver function abnormalities recur when therapy is resumed.
- May cause ↑ in total cholesterol and serum triglyceride levels.
- May cause false-positive urine cannabinoid results.

### Potential Nursing Diagnoses

Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Administer on an empty stomach, preferably at bedtime to minimize nervous system side effects Avoid taking with a high-fat meal. Do not break tablets.

### Patient/Family Teaching

- Emphasize the importance of taking efavirenz as directed. It must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount, and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Instruct patient that efavirenz should not be shared with others.
- May cause dizziness, impaired concentration, or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional immediately if rash occurs.
- Inform patient that efavirenz does not cure AIDS or prevent associated or opportunistic infections. Efavirenz does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of efavirenz are unknown at this time.
- Advise patient to avoid taking other Rx, OTC, or herbal products without consulting health care professional.
- Advise patients taking oral contraceptives to use a nonhormonal method of birth control during efavirenz therapy and for at least 12 wk following discontinuation and to notify health care professional if they become pregnant while taking efavirenz.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

## **eletriptan** (e-le-**trip**-tan)

Relpax

***Classification***
Therapeutic: vascular headache suppressants
Pharmacologic: 5-$HT_1$ agonists

**Pregnancy Category C**

## Indications
Acute treatment of migraine headache.

## Action
Acts as an agonist at specific 5-hydroxy-tryptamine receptor sites in intracranial blood vessels and sensory trigeminal nerves. **Therapeutic Effects:** Cranial vessel vasoconstriction with resultant decrease in migraine headache.

## Pharmacokinetics
**Absorption:** 50% absorbed after oral administration.
**Distribution:** Enters breast milk.
**Metabolism and Excretion:** Mostly metabolized by the liver via the CYP3A4 enzyme system.
**Half-life:** 4 hr.

TIME/ACTION PROFILE (decreased migraine pain)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | within 2 hr | 2 hr | up to 24 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Hemiplegic or basilar migraine; Ischemic cardiovascular, cerebrovascular, or peripheral vascular syndromes (including ischemic bowel disease); History of significant cardiovascular disease; Uncontrolled hypertension; Severe hepatic impairment; Should not be used within 24 hr of other 5-$HT_1$ agonists or ergot-type compounds (dihydroergotamine); Should not be used within 72 hr of potent CYP3A4 inhibitors including ketoconazole, itraconazole, nefazodone, clarithromycin, ritonavir, and nelfinavir.
**Use Cautiously in:** OB: Use during pregnancy only if potential benefits justify potential risk to fetus; Lactation: Doses up to 80 mg daily not expected to cause adverse effects in breastfed infants >2 mo (NIH); Pedi: Children <18 yr (safety not established); Geri: ↑ risk of ↑ blood pressure.
**Exercise Extreme Caution in:** Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision.

## Adverse Reactions/Side Effects
**CNS:** dizziness, drowsiness, weakness. **CV:** chest tightness/pressure. **GI:** abdominal pain, dry mouth, dysphagia, nausea. **Neuro:** paresthesia.

## Interactions
**Drug-Drug:** Blood levels and risk of adverse reactions are increased by potent **CYP3A4 inhibitors** (including **ketoconazole**, **itraconazole**, **nefazodone**, **clarithromycin**, **ritonavir**, and **nelfinavir**); use within 72 hr is contraindicated. Concurrent use (within 24 hr of each other) with ergot-containing drugs (**dihydroergotamine**) may result in prolonged vasospastic reactions and should be avoided.

## Route/Dosage
**PO (Adults):** 20 or 40 mg; may be repeated in 2 hr if initial response is inadequate (not to exceed 80 mg/24 hr or treatment of 3 headaches/mo).

## Availability
**Tablets:** 20 mg, 40 mg. **Cost:** 20 mg $113.61/6, 40 mg $113.99/6.

# NURSING IMPLICATIONS

## Assessment
- Assess pain location, intensity, character, duration and associated symptoms (photophonia, phonophobia, nausea, vomiting) during migraine attack.

## Potential Nursing Diagnoses
Acute pain (Indications)

## Implementation
- **PO:** Administer at the first sign of a headache. If after the initial dose, headache improves but then returns, dose may be repeated at least 2 hr after initial dose. If initial dose is ineffective, second dose is unlikely to be effective.

## Patient/Family Teaching
- Instruct patient that eletriptan should only be used during a migraine attack. Eletriptan is used for treatment of a migraine attack, not for prevention.
- Instruct patient to take eletriptan at the first sign of a migraine, but may be administered at any time during attack. Allow at least 2 hr between doses and do not use more than 80 mg/day or 3 attacks/mo.
- Caution patient not to take eletriptan within 24 hr of other vascular headache suppressants.

- Advise patient that lying down in a darkened room after eletriptan administration may further help relieve headache.
- Advise patient to notify health care professional if she plans or suspects pregnancy, or if breastfeeding.
- Advise patient to notify health care professional before next dose of eletriptan if pain or tightness in the chest occurs. If chest pain is severe or does not subside, notify health care professional immediately. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care provider at next visit.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during therapy.

### Evaluation/Desired Outcomes

- Relief of migraine attack.

## emtricitabine

(em-tri-**si**-ti-been)

Emtriva

***Classification***

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors

**Pregnancy Category B**

### Indications

HIV infection (with other antiretrovirals).

### Action

Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in viral DNA chain termination. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae. Increases CD4 cell counts and decreases viral load.

### Pharmacokinetics

**Absorption:** Rapidly and extensively absorbed; 93% bioavailable.

**Distribution:** Unknown.

**Metabolism and Excretion:** Some metabolism, 86% renally excreted, 14% fecal excretion.

**Half-life:** 10 hr.

TIME/ACTION PROFILE (blood levels*)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 1–2 hr | 24 hr |

*Normal renal function

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Lactation: Breastfeeding not recommended in HIV-infected patients.

**Use Cautiously in:** Hepatitis B infection (may exacerbate following discontinuation); Renal impairment; OB: Use only if clearly needed; Geri: May be at ↑ risk for adverse effects.

### Adverse Reactions/Side Effects

**CNS:** dizziness, headache, insomnia, weakness, depression, nightmares. **GI:** abdominal pain, diarrhea, nausea, SEVERE HEPATOMEGALY WITH STEATOSIS, dyspepsia,, vomiting. **Derm:** rash, skin discoloration. **F and E:** LACTIC ACIDOSIS. **MS:** arthralgia, myalgia. **Neuro:** neuropathy, paresthesia. **Resp:** cough, rhinitis. **Misc:** fat redistribution.

### Interactions

**Drug-Drug:** None noted.

### Route/Dosage

**PO (Adults ≥18 yr):** 200 mg once daily.

### Renal Impairment

**PO (Adults ≥18 yr):** *CCr 30–49 mL/min*—200 mg every 48 hr; *CCr 15–29 mL/min*—200 mg every 72 hr; *CCr <15 mL/min*—200 mg every 96 hr.

### Availability

**Capsules:** 200 mg. **Oral solution (cotton candy flavor):** 10 mg/mL. ***In combination with:*** efavirenz and tenofovir (Atripla); tenofovir (Truvada). See Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- May cause lactic acidosis and severe hepatomegaly with steatosis. These events are more likely to occur if patients are female, obese, or receiving nucleoside analogue medications for extended periods of time. Monitor patient for signs (increased serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- Test patients for chronic hepatitis B virus (HBV) before initiating therapy. Emtricitabine is not indicated for treatment of HBV. Exacerbations of HBV have occurred upon discontinuation of emtricitabine.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.

- May cause ↑ AST, ALT, bilirubin, creatine kinase, serum amylase, serum lipase, and triglycerides. May cause ↑ or ↓ serum glucose. May cause ↓ neutrophil count.

### Potential Nursing Diagnoses
Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation
- **PO:** May be administered with or without food.

### Patient/Family Teaching
- Emphasize the importance of taking emtricitabine as directed. It must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered, but not if almost time for next dose; do not double doses.
- Instruct patient that emtricitabine should not be shared with others.
- Inform patient that emtricitabine does not cure AIDS or prevent associated or opportunistic infections. Emtricitabine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of emtricitabine are unknown at this time.
- Instruct patient to notify health care professional immediately if symptoms of lactic acidosis (tiredness or weakness, unusual muscle pain, trouble breathing, stomach pain with nausea and vomiting, cold especially in arms or legs, dizziness, fast or irregular heartbeat) or if signs of hepatotoxicity (yellow skin or whites of eyes, dark urine, light colored stools, lack of appetite for several days or longer, nausea, abdominal pain) occur. These symptoms may occur more frequently in patients that are female, obese, or have been taking medications like emtricitabine for a long time.
- Inform patient that redistribution of body fat (central obesity, dorsocervical fat enlargement or buffalo hump, peripheral and facial wasting, breast enlargement, cushingoid appearance) and skin discoloration (hyperpigmentation on palms and soles) may occur.
- Advise patient to notify health care professional if she plans or suspects pregnancy or is breastfeeding.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

## enalapril/enalaprilat, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

## enoxaparin, See HEPARINS (LOW MOLECULAR WEIGHT).

## entacapone (en-tak-a-pone)
Comtan

***Classification***
Therapeutic: antiparkinson agents
Pharmacologic: catechol-*O*-methyltransferase inhibitors

**Pregnancy Category C**

### Indications
With levodopa/carbidopa to treat idiopathic Parkinson's disease when signs and symptoms of end-of-dose "wearing-off" (so-called fluctuating patients) occur.

### Action
Acts as a selective and reversible inhibitor of the enzyme catechol *O*-methyltransferase (COMT). Inhibition of this enzyme prevents the breakdown of levodopa, increasing availability to the CNS.
**Therapeutic Effects:** Prolongs duration of response to levodopa with end-of-dose motor fluctuations. Decreased signs and symptoms of Parkinson's disease.

### Pharmacokinetics
**Absorption:** 35% absorbed following oral administration; absorption is rapid.
**Distribution:** Unknown.
**Protein Binding:** 98%.
**Metabolism and Excretion:** Minimal amounts excreted unchanged; highly metabolized followed by biliary excretion.
**Half-life:** *Initial phase*—0.4–0.7 hr; *second phase*—2.4 hr.

TIME/ACTION PROFILE (inhibition of COMT)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | unknown | unknown | up to 8 hr |

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Concurrent nonselective MAO inhibitor therapy.
**Use Cautiously in:** Hepatic impairment; Concurrent use of drugs that are metabolized by COMT; OB, Lactation: Safety not established; Pedi: No identified use in children.

### Adverse Reactions/Side Effects

**CNS:** NEUROLEPTIC MALIGNANT SYNDROME, dizziness, hallucinations, syncope, urges (gambling, sexual). **Resp:** pulmonary infiltrates, pleural effusion, pleural thickening. **CV:** hypotension. **Derm:** melanoma. **GI:** abdominal pain, diarrhea, nausea (during initiation), retroperitoneal fibrosis. **GU:** brownish-orange discoloration of urine. **MS:** RHABDOMYOLYSIS. **Neuro:** dyskinesia.

### Interactions

**Drug-Drug:** Concurrent use with selective **MAO inhibitors** is not recommended; both agents inhibit the metabolic pathways of catecholamines. Concurrent use of drugs that are metabolized by COMT such as **isoproterenol**, **epinephrine**, **norepinephrine**, **dopamine**, **dobutamine**, and **methyldopa** may ↑ risk of tachycardia, ↑ blood pressure, and arrhythmias. **Probenecid**, **cholestyramine**, **erythromycin**, **rifampin**, **ampicillin**, and **chloramphenicol** may interfere with biliary elimination of entacapone; use concurrently with caution.

### Route/Dosage

**PO (Adults):** 200 mg with each dose of levodopa/carbidopa up to a maximum of 8 times daily.

### Availability

**Tablets:** 200 mg. ***In combination with:*** levodopa/carbidopa (Stalevo), see Appendix B.

## NURSING IMPLICATIONS

### Assessment

- Assess parkinsonian and extrapyramidal symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, mask-like face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) prior to and during therapy. Dyskinesia may increase with therapy.
- Monitor patient for development of diarrhea. Usually occurs within 4 to 12 wk of start of therapy, but may occur as early as the first week and as late as months after initiation of therapy.
- Monitor patient for signs similar to neuroleptic malignant syndrome (elevated temperature, muscular rigidity, altered consciousness, elevated CPK). Symptoms have been associated with rapid dose reduction or withdrawal of other dopaminergic drugs. Withdrawal should be gradual.

### Potential Nursing Diagnoses

Impaired physical mobility (Indications)
Risk for injury (Indications)

### Implementation

- **PO:** Always administer entacapone with levodopa/carbidopa. Entacapone has no antiparkinsonism effects of its own.

### Patient/Family Teaching

- Encourage patient to take entacapone as directed. Take missed doses as soon as possible, up to 2 hr before the next dose. Taper gradually when discontinuing or a withdrawal reaction may occur.
- May cause dizziness or hallucinations. Advise patient to avoid driving or other activities that require alertness until response to the drug is known.
- Inform patient that nausea may occur, especially at initiation of therapy. Therapy may cause change in urine color to brownish orange.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to notify health care professional if suspicious or unusual skin changes, hallucinations, or new or increased gambling, sexual, or other intense urges occur.
- Instruct patient to notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of routine follow-up exams.

### Evaluation/Desired Outcomes

- Decreased signs and symptoms of Parkinson's disease.

## **entecavir** (en-**tek**-aveer)

Baraclude

***Classification***

Therapeutic: antivirals
Pharmacologic: nucleoside analogues

**Pregnancy Category C**

## Indications
Chronic hepatitis B infection with evidence of active disease.

## Action
Phosphorylated intracellularly to active form which acts as an analogue of guanosine, interfering with viral DNA synthesis. **Therapeutic Effects:** Decreased hepatic damage due to chronic hepatitis B infection.

## Pharmacokinetics
**Absorption:** Well absorbed following oral administration.
**Distribution:** Extensive tissue distribution.
**Metabolism and Excretion:** 62–73% excreted unchanged by kidneys.
**Half-life:** Plasma—128–149 hr; intracellular—15 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | rapid | 0.5–1 hr | 24 hr |

## Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Lactation: Potential for serious adverse effects in infant.
**Use Cautiously in:** Renal impairment (dose reduction recommended if CCr <50 mL/min; Liver transplant recipients (careful monitoring of renal function recommended); Patients co-infected with HIV (unless receiving highly active antiretroviral therapy; at ↑ risk for resistance); OB: Use only if clearly needed, considering benefits and risks; Pedi: Safety not established in children <16 yr; Geri: ↑ risk of toxicity due to age-related ↓ in renal function.

## Adverse Reactions/Side Effects
**CNS:** dizziness, fatigue, headache. **GI:** HEPATOMEGALY (WITH STEATOSIS), dyspepsia, nausea. **F and E:** LACTIC ACIDOSIS. **Derm:** alopecia, rash.

## Interactions
**Drug-Drug:** Concurrent use of drugs which may impair renal function may ↑ blood levels and risk of toxicity.

## Route/Dosage
**PO (Adults and Children >16 yr):** 0.5 mg once daily; *history of lamivudine resistance*—1 mg once daily.

### Renal Impairment
**PO (Adults and Children >16 yr):** *CCr 30–50 mL/min*—0.25 mg once daily, *history of lamivudine resistance*—0.5 mg once daily; *CCr 10–<30 mL/min*—0.15 mg once daily, *history of lamivudine resistance*—0.3 mg once daily; *CCr <10 mL/min*—0.05 mg once daily, *history of lamivudine resistance*—0.1 mg once daily.

## Availability
**Tablets:** 0.5 mg, 1 mg. **Oral solution (orange):** 0.05 mg/mL.

# NURSING IMPLICATIONS

## Assessment
- Monitor signs of hepatitis (jaundice, fatigue, anorexia, pruritus) during and for several months following discontinuation of therapy. Exacerbations may occur when therapy is discontinued.
- May cause lactic acidosis and severe hepatomegaly with steatosis. Monitor patient for signs (increased serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- ***Lab Test Considerations:*** Monitor liver function closely during and for several months following discontinuation of therapy. May cause ↑ AST, ALT, bilirubin, amylase, lipase, creatinine and serum glucose. May cause ↓ serum albumin.

## Potential Nursing Diagnoses
Risk for infection (Indications)
Noncompliance (Patient/Family Teaching)

## Implementation
- **PO:** Administer on an empty stomach at least 2 hr before or after a meal. Oral solution is ready to use and should not be diluted or mixed with water or any other liquid. Hold spoon in a vertical position and fill gradually to mark corresponding to the prescribed dose. Rinse dosing spoon with water after each daily dose. Store in outer carton at room temperature. After opening, solution can be used until expiration date on bottle.

## Patient/Family Teaching
- Instruct patient to read the *Patient Information* with each refill and to take entecavir as directed. Take missed doses as soon as possible unless almost time for next dose. Do not run out of entecavir, get more when supply runs low. Do not double doses. Emphasize the importance of compliance with full course of therapy, not taking more than the prescribed

amount, and not discontinuing without consulting health care professional. Inform patient that hepatitis exacerbation may occur upon discontinuation of therapy. Caution patient not to share medication with others.
- Inform patient that entecavir does not cure HBV disease, but may lower the amount of HBV in the body, lower the ability of HBV to multiply and infect new liver cells, and may improve the condition of the liver. Entecavir does not reduce the risk of transmission of HBV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and avoid sharing needles or donating blood to prevent spreading HBV to others.
- Advise patient to notify health care professional promptly if signs of lactic acidosis (weakness or tiredness; unusual muscle pain; trouble breathing; stomach pain with nausea and vomiting; feeling cold, especially in arms or legs; dizziness, fast or irregular heartbeat) or hepatotoxicity (jaundice, dark urine, light-colored bowel movements, anorexia, nausea, lower stomach pain) occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional before taking other Rx, OTC, or herbal products with entecavir.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breastfeeding.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress and monitor for side effects.

### Evaluation/Desired Outcomes
- Decreased hepatic damage due to chronic hepatitis B infection.

## EPIDURAL LOCAL ANESTHETICS

**bupivacaine** (byoo-**pi**-vi-kane)
Marcaine, Sensorcaine

**ropivacaine** (**roe**-pi-vi-kane)
Naropin

***Classification***
Therapeutic: epidural local anesthetics, anesthetics (topical/local)

**Pregnancy Category B (ropivacaine), C (bupivacaine)**

### Indications
Local or regional anesthesia or analgesia for surgical, obstetric, or diagnostic procedures.

### Action
Local anesthetics inhibit initiation and conduction of sensory nerve impulses by altering the influx of sodium and efflux of potassium in neurons, slowing or stopping pain transmission. Epidural administration allows action to take place at the level of the spinal nerve roots immediately adjacent to the site of administration. The catheter is placed as close as possible to the dermatomes (skin surface areas innervated by a single spinal nerve or group of spinal nerves) that, when blocked, will produce the most effective spread of analgesia for the site of injury. **Therapeutic Effects:** Decreased pain or induction of anesthesia; low doses have minimal effect on sensory or motor function; higher doses may produce complete motor blockade.

### Pharmacokinetics
**Absorption:** Systemic absorption follows epidural administration, but amount absorbed depends on dose.
**Distribution:** Agents are lipid soluble, which selectively keeps them in the epidural space and limits systemic absorption. If systemic absorption occurs, these agents are widely distributed and cross the placenta.
**Metabolism and Excretion:** Small amounts that may reach systemic circulation are mostly metabolized by the liver. Very little excreted unchanged in the urine.
**Half-life:** *Bupivacaine*—1.5–5 hr (after epidural use); *ropivacaine*—4.2 hr (after epidural use).

TIME/ACTION PROFILE (analgesia)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Epidural | 10–30 min | unknown | 2-8 hr† |

†Duration of anesthetic block

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; cross-sensitivity with other amide local anesthetics may occur (lidocaine, mepivacaine, prilocaine); Bupivacaine contains bisulfites and should be avoided in patients with known intolerance; OB: Bupivacaine

only—Do not use 0.75% concentration. Only 0.5% and 0.25% concentrations should be used for obstetrical anesthesia due to reports of cardiac arrest and difficult resuscitation with the 0.75% concentration ; Lactation: Discontinue nursing.

**Use Cautiously in:** Concurrent use of other local anesthetics; Liver disease; Concurrent use of anticoagulants (including low-dose heparin and low-molecular-weight heparins/heparinoids); ↑ the risk of spinal/epidural hematomas; OB: Bupivacaine and ropivacaine—both agents rapidly cross the placenta with obstetrical paracervical block anesthesia and can result in maternal, fetal, or neonatal toxicity with cardiac, central nervous system, or vascular tone abnormalities. May cause maternal hypotension. ; Pedi: Bupivacaine—safety not established in children <12 yr. Ropivacaine—safety not established in chlidren <18 yr; Geri: May require lower doses due to ↑ risk of hypotension and/or ↑ risk of toxicity due to age-related decline in renal function.

### Adverse Reactions/Side Effects

**CNS:** SEIZURES, anxiety, dizziness, headache, irritability. **EENT:** blurred vision, tinnitus. **CV:** CARDIOVASCULAR COLLAPSE, arrhythmias, bradycardia, hypotension, tachycardia. **GI:** nausea, vomiting. **GU:** urinary retention. **Derm:** pruritus. **F and E:** metabolic acidosis. **Neuro:** circumoral tingling/numbness, tremor. **Misc:** allergic reactions, fever.

### Interactions

**Drug-Drug:** Additive toxicity may occur with concurrent use of other **amide local anesthetics** (including **lidocaine**, **mepivacaine**, and **prilocaine**). Use of bupivacaine solution containing epinephrine with **MAO inhibitors** may cause hypertension. **Fluvoxamine**, **amiodarone**, **ciprofloxacin**, and **propofol** may ↑ effects of ropivacaine.

### Route/Dosage

Solutions containing preservatives should not be used for caudal or epidural blocks.

### Bupivacaine

**Epidural (Adults and Children > 12 yr):** 10–20 mL of 0.25% (partial to moderate block), 0.5% (moderate to complete block), or 0.75% (complete block) solution. Administer in increments of 3–5 mL allowing sufficient time to detect toxic signs/symptoms of inadvertent IV or IT administration. A test dose of 2–3 mL of 0.5% with epinephrine solution is recommended prior to epidural blocks.

### Ropivacaine

### Surgical Anesthesia

**Epidural (Adults):** *Lumbar epidural*-15–30 mL of 0.5% solution or 15–25 mL of 0.75% solution or 15–20 mL of 1% solution; *Lumbar epidural for cesarean section*-20–30 mL of 0.5% solution or 15–20 mL of 0.75% solution; *Thoracic epidural*-5–15 mL of 0.5–0.75% solution.

### Labor Pain

**Epidural (Adults):** *Lumbar epidural*-10–20 mL of 0.2% solution initially, then continuous infusion of 6–14 mL/hr of 0.2% solution with incremental injection of 10–15 mL/hr of 0.2% solution.

### Postoperative Pain

**Epidural (Adults):** *Lumbar or thoracic epidural*-Continuous infusion of 6–14 mL/hr of 0.2% solution.

### Availability (generic available)

### Bupivacaine

**Solution for injection (preservative-free):** 0.25%, 0.5%, 0.75%. ***In combination with:*** epinephrine 1:200,000.

### Ropivacaine

**Solution for injection (preservative-free):** 0.2%, 0.5%, 0.75%, 1%.

## NURSING IMPLICATIONS

### Assessment

- Monitor for sensation during procedure and return of sensation after procedure.
- **Systemic Toxicity:** Assess for systemic toxicity (circumoral tingling and numbness, ringing in ears, metallic taste, dizziness, blurred vision, tremors, slow speech, irritability, twitching, seizures, cardiac dysrhythmias) each shift. Report to physician or other health care professional.
- **Orthostatic Hypotension:** Monitor blood pressure, heart rate, and respiratory rate continuously while patient is receiving this medication. Mild hypotension is common because of the effect of local anesthetic block of nerve fibers on the sympathetic nervous system, causing vasodilation. Significant hypotension and bradycardia may occur, especially when rising from a prone position or following large dose increases or boluses. Treatment of unresolved

hypotension may include hydration, decreasing the epidural infusion rate, and/or removal of local anesthetic from analgesic solution.

- **Unwanted Motor and Sensory Deficit:** The goal of adding low-dose local anesthetics to epidural opioids for pain management is to provide analgesia, not to produce anesthesia. Patients should be able to ambulate if their condition allows, and epidural analgesic should not hamper this important recovery activity. However, many factors, including location of the epidural catheter, local anesthetic dose, and variability in patient response, can result in patients experiencing unwanted motor and sensory deficits. Pain is the first sensation lost, followed by temperature, touch, proprioception, and skeletal muscle tone.
- Assess for sensory deficit every shift. Ask patient to point to numb and tingling skin areas (numbness and tingling at the incision site is common and usually normal). Notify physician or other health care professional of unwanted motor and sensory deficits.
- Unwanted motor and sensory deficits often can be corrected with simple treatment. For example, a change in position may relieve temporary sensory loss in an extremity. Minor extremity muscle weakness is often treated by decreasing the epidural infusion rate and keeping the patient in bed until the weakness resolves. Sometimes removing the local anesthetic from the analgesic solution is necessary, such as when signs of local anesthetic toxicity are detected or when simple treatment of motor and sensory deficits has been unsuccessful.

### Potential Nursing Diagnoses

Acute pain, acute (Indications)
Impaired physical mobility (Side Effects)

### Implementation

- See Route and Dosage section.

### Patient/Family Teaching

- Instruct patient to notify nurse if signs or symptoms of systemic toxicity occur.
- Advise patient to request assistance during ambulation until orthostatic hypotension and motor deficits are ruled out.

### Evaluation/Desired Outcomes

- Decrease in postoperative pain without unwanted sensory or motor deficits.

HIGH ALERT

## **epinephrine** (e-pi-**nef**-rin)

Adrenalin, Ana-Guard, AsthmaHaler Mist, AsthmaNefrin (racepinephrine), EpiPen, microNefrin, Nephron, Primatene, Sus-Phrine, S-2

***Classification***

Therapeutic: antiasthmatics, bronchodilators, vasopressors
Pharmacologic: adrenergics

**Pregnancy Category C**

See Appendix C for ophthalmic use

### Indications

**Subcut, IV, Inhaln:** Management of reversible airway disease due to asthma or COPD. **Subcut, IM, IV:** Management of severe allergic reactions. **IV, Intracardiac, Intratracheal, Intraosseous (part of advanced cardiac life support [ACLS] and pediatric advanced life support [PALS] guidelines):** Management of cardiac arrest (unlabeled). **Inhaln:** Management of upper airway obstruction and croup (racemic epinephrine). **Local/Spinal:** Adjunct in the localization/prolongation of anesthesia.

### Action

Results in the accumulation of cyclic adenosine monophosphate (cAMP) at beta-adrenergic receptors. Affects both $beta_1$(cardiac)-adrenergic receptors and $beta_2$(pulmonary)-adrenergic receptor sites. Produces bronchodilation. Also has alpha-adrenergic agonist properties, which result in vasoconstriction. Inhibits the release of mediators of immediate hypersensitivity reactions from mast cells. **Therapeutic Effects:** Bronchodilation. Maintenance of heart rate and blood pressure. Localization/prolongation of local/spinal anesthetic.

### Pharmacokinetics

**Absorption:** Well absorbed following subcut administration; some absorption may occur following repeated inhalation of large doses.
**Distribution:** Does not cross the blood-brain barrier; crosses the placenta and enters breast milk.
**Metabolism and Excretion:** Action is rapidly terminated by metabolism and uptake by nerve endings.
**Half-life:** Unknown.

TIME/ACTION PROFILE (bronchodilation)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| Inhaln | 1 min | unknown | 1–3 hr |
| Subcut | 5–10 min | 20 min | <1–4 hr |
| IM | 6–12 min | unknown | <1–4 hr |
| IV | rapid | 20 min | 20–30 min |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to adrenergic amines; Cardiac arrhythmias; Some products may contain bisulfites or fluorocarbons (in some inhalers) and should be avoided in patients with known hypersensitivity or intolerance.

**Use Cautiously in:** Cardiac disease (angina, tachycardia, MI); Hypertension; Hyperthyroidism; Diabetes; Cerebral arteriosclerosis; Glaucoma (except for ophthalmic use); Excessive use may lead to tolerance and paradoxical bronchospasm (inhaler); OB: Use only if potential maternal benefit outweighs potential risks to fetus; Lactation: High intravenous doses of epinephrine might ↓ milk production or letdown. Low-dose epidural, topical, inhaled or ophthalmic epinephrine are unlikely to interfere with breastfeeding (NIH); Geri: More susceptible to adverse reactions; may require ↓ dose.

## Adverse Reactions/Side Effects

**CNS:** nervousness, restlessness, tremor, headache, insomnia. **Resp:** paradoxical bronchospasm (excessive use of inhalers). **CV:** angina, arrhythmias, hypertension, tachycardia. **GI:** nausea, vomiting. **Endo:** hyperglycemia.

## Interactions

**Drug-Drug:** Concurrent use with other **adrenergic agents** will have additive adrenergic side effects. Use with **MAO inhibitors** may lead to hypertensive crisis. **Beta blockers:** may negate therapeutic effect. **Tricyclic antidepressants** enhance pressor response to epinephrine.

**Drug-Natural Products:** Use with caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) ↑ stimulant effect.

## Route/Dosage

**Subcut, IM (Adults):** *Anaphylactic reactions/asthma*—0.1–0.5 mg (single dose not to exceed 1 mg); may repeat q 10–15 min for anaphylactic shock or q 20 min–4 hr for asthma.

**Subcut (Children > 1 month):** *Anaphylactic reactions/asthma*—0.01 mg/kg (not to exceed 0.5 mg/dose) q 15 min for 2 doses, then q 4 hr.

**IV (Adults):** *Severe anaphylaxis*—0.1–0.25 mg q 5–15 min; may be followed by 1–4 mcg/min continuous infusion; *cardiopulmonary resuscitation (ACLS guidelines)*—1 mg q 3–5 min; *bradycardia (ACLS guidelines)*—2–10 mcg/min).

**IV (Children):** *Severe anaphylaxis*—0.1 mg (less in younger children); may be followed by 0.1 mcg/kg/min continuous infusion (may be increased up to 1.5 mcg/kg/min); *symptomatic bradycardia/pulseless arrest (PALS guidelines)*—0.01 mg/kg, may be repeated q 3–5 min higher doses (up to 0.1–0.2 mg/kg) may be considered; may also be given by the intraosseous route. May also be given by the endotracheal route in doses of 0.1—0.2 mg/kg diluted to a volume of 3–5 mL with normal saline followed by several positive pressure ventilations.

**Inhaln (Adults):** *Metered-dose inhaler*—1 inhalation (160–250 mcg), may be repeated after 1–2 min; additional doses may be repeated q 3 hr; *inhalation solution*—1 inhalation of 1% solution; may be repeated after 1–2 min; additional doses may be given q 3 hr; *racepinephrine*—Via hand nebulizer, 2–3 inhalations of 2.25% solution; may repeat in 5 min with 2–3 more inhalations, up to 4–6 times daily.

**Inhaln (Children > 1 month):** 0.25–0.5 mL of 2.25% racemic epinephrine solution diluted in 3 mL normal saline.

**IV, Intratracheal (Neonates):** 0.01–0.03 mg/kg q 3–5 min as needed.

**IM (Children > 1 month < 30 kg):** 0.15 mg (EpiPen Jr); > 30 kg: 0.3 mg (EpiPen).

**Intracardiac (Adults):** 0.3–0.5 mg.

**Endotracheal** (Adults): *Cardiopulmonary resuscitation (ACLS guidelines)*—2–2.5 mg.

**Topical (Adults and Children ≥6 yr):** *Nasal decongestant*—Apply 1% solution as drops, spray, or with a swab.

**Intraspinal** (Adults and Children): 0.2–0.4 mL of 1:1000 solution.

**With Local Anesthetics** (Adults and Children): Use 1:200,000 solution with local anesthetic.

## Availability (generic available)

**Inhalation aerosol:** 0.125% (≥300 inhalations/15 mL)[OTC], 0.5% (≥300 inhalations/15 mL)[OTC], 300 mcg/spray (≥300 inhalations/15 mL)[OTC]. **Inhalation solution:** 1%[OTC]. **Injection:** 0.1 mg/mL (1:10,000), 1 mg/mL (1:1000). **Autoinjector (EpiPen) :** 0.15 mg/0.3 mL (1:2000), 0.3 mg/0.3 mL (1:1000). **Cost:** 0.15 mg $56.48/syringe, 0.3 mg $58.99/syringe. **Topical solution:** 0.1%.

# NURSING IMPLICATIONS

## Assessment

- **Bronchodilator:** Assess lung sounds, respiratory pattern, pulse, and blood pressure before administration and during peak of medication. Note amount, color, and character of sputum

produced, and notify health care professional of abnormal findings.
- Monitor pulmonary function tests before and periodically during therapy.
- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify health care professional immediately.
- Observe patient for drug tolerance and rebound bronchospasm. Patients requiring more than 3 inhalation treatments in 24 hr should be under close supervision. If minimal or no relief is seen after 3–5 inhalation treatments within 6–12 hr, further treatment with aerosol alone is not recommended.
- Assess for hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). If condition occurs, withhold medication and notify health care professional immediately.
- **Vasopressor:** Monitor blood pressure, pulse, ECG, and respiratory rate frequently during IV administration. Continuous ECG, hemodynamic parameters, and urine output should be monitored continuously during IV administration.
- Monitor for chest pain, arrhythmias, heart rate > 110 bpm, and hypertension. Consult physician for parameters of pulse, blood pressure, and ECG changes for adjusting dosage or discontinuing medication.
- **Shock:** Assess volume status. Hypovolemia should be corrected prior to administering epinephrine IV.
- **Nasal Decongestant:** Assess patient for nasal and sinus congestion prior to and periodically during therapy.
- ***Lab Test Considerations:*** May cause transient ↓ in serum potassium concentrations with nebulization or at higher than recommended doses.
- May cause an ↑ in blood glucose and serum lactic acid concentrations.
- ***Toxicity and Overdose:*** Symptoms of overdose include persistent agitation, chest pain or discomfort, decreased blood pressure, dizziness, hyperglycemia, hypokalemia, seizures, tachyarrhythmias, persistent trembling, and vomiting.
- Treatment includes discontinuing adrenergic bronchodilator and other beta-adrenergic agonists and symptomatic, supportive therapy. Cardioselective beta blockers are used cautiously-because they may induce bronchospasm.

## Potential Nursing Diagnoses

Ineffective airway clearance (Indications)
Ineffective tissue perfusion (Indications)

## Implementation

- ***High Alert:*** Patient harm or fatalities have occurred from medication errors with epinephrine. Epinephrine is available in various concentrations, strengths, and percentages and used for different purposes. Packaging labels may be easily confused or products incorrectly diluted. Dilutions should be prepared by a pharmacist. IV doses should be expressed in milligrams not ampules, concentration or volume. Prior to administration, have second practitioner independently check original order, dose calculations, concentration, route of administration, and infusion pump settings.
- Medication should be administered promptly at the onset of bronchospasm.
- Use a tuberculin syringe with a 26-gauge ½-in. needle for subcut injection to ensure that correct amount of medication is administered.
- Tolerance may develop with prolonged or excessive use. Effectiveness may be restored by discontinuing for a few days and then readministering.
- Do not use solutions that are pinkish or brownish or that contain a precipitate.
- For anaphylactic shock, volume replacement should be administered concurrently with epinephrine. Antihistamines and corticosteroids may be used in conjunction with epinephrine.
- **IM, Subcut:** Medication can cause irritation of tissue. Rotate injection sites to prevent tissue necrosis. Massage injection sites well after administration to enhance absorption and to decrease local vasoconstriction. Avoid IM administration in gluteal muscle.

### IV Administration

- **Direct IV:** ***Diluent:*** The 1:10,000 solution can be administered undiluted. Dilute 1 mg (1 mL) of a 1:1000 solution in 9 mL of 0.9% NaCl to prepare a 1:10,000 solution. ***Concentration:*** 0.1 mg/mL (1:10,000). ***Rate:*** Administer each 1 mg (10 mL) of a 1:10,000 solution over at least 1 min; more rapid administration may be used during cardiac resuscitation. Follow each dose with 20 mL IV saline flush.
- **Continuous Infusion:** ***Diluent:*** Dilute 1 mg (1 mL) of a 1:1000 solution in 250 mL of D5W or 0.9% NaCl. Protect from light. Infusion stable for 24 hr. ***Concentration:*** 4 mcg/mL. ***Rate:*** See Route/Dosage section. Titrate to response (blood pressure, heart rate, respiratory rate).
- **Y-Site Compatibility:** alfentanil, amikacin, amiodarone, amphotericin B liposome, anidulafungin, ascorbic acid, atropine, aztreonam,

benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefoperazone, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftizoxime, ceftriaxone, cefuroxime, chloramphenicol , chlorpromazine, cimetidine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, enalaprilat, epirubicin, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, folic acid, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, mechlorethamine, meperidine, metaraminol, methicillin, methotrexate, methoxamine, methyldopa, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, minocycline, mitoxantrone, morphine, multiple vitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, pentamidine, pentazocine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, ranitidine, remifentanil, ritodrine, rocuronium, sodium acetate, streptokinase, streptomycin, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiamine, thiotepa, ticarcillin/clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trimethophan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, vitamin B complex with C, voriconazole, warfarin.

- **Y-Site Incompatibility:** acyclovir, aminophylline, azathioprine, dantrolene, diazepam, diazoxide, fluorouracil, ganciclovir, indomethacin, micafungin, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole.
- **Inhaln:** When using epinephrine inhalation solution, 10 drops of 1% base solution should be placed in the reservoir of the nebulizer.
- The 2.25% inhalation solution of racepinephrine must be diluted for use in the combination nebulizer/respirator.
- Allow 1–2 min to elapse between inhalations of epinephrine inhalation solution, epinephrine inhalation aerosol, or epinephrine bitartrate inhalation aerosol to make certain the second inhalation is necessary.
- When epinephrine is used concurrently with corticosteroid or ipratropium inhalations, administer bronchodilator first and other medications 5 min apart to prevent toxicity from inhaled fluorocarbon propellants.
- **Endotracheal:** Epinephrine can be injected directly into the bronchial tree via the endotracheal tube if the patient has been intubated. Perform 5 rapid insufflations; forcefully administer 10 mL containing 2–2.5 mg epinephrine (1 mg/mL) directly into tube; follow with 5 quick insufflations.

## Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If on a scheduled dosing regimen, take a missed dose as soon as possible; space remaining doses at regular intervals. Do not double doses. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Advise patient to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- **Inhaln:** Review correct administration technique (aerosolization, IPPB, metered-dose inhaler) with patient. See Appendix D for administration with metered-dose inhaler. Wait 1–5 min before administering next dose. Mouthpiece should be washed after each use.
- Do not spray inhaler near eyes.
- Instruct patient to save inhaler; refill canisters may be available.

- Advise patients to use bronchodilator first if using other inhalation medications, and allow 5 min to elapse before administering other inhalant medications, unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth.
- Advise patient to maintain adequate fluid intake (2000–3000 mL/day) to help liquefy tenacious secretions.
- Advise patient to consult health care professional if respiratory symptoms are not relieved or worsen after treatment or if chest pain, headache, severe dizziness, palpitations, nervousness, or weakness occurs.
- Instruct patient to notify health care professional if contents of one canister are used up in less than 2 wk.
- **Autoinjector:** Instruct patients using auto-injector for anaphylactic reactions to remove gray safety cap, placing black tip on thigh at right angle to leg. Press hard into thigh until auto-injector functions, hold in place for 10 seconds, remove, and discard properly. Massage injected area for 10 sec. Pedi: Teach parents or caregivers signs and symptoms of anaphlyaxis, how to use auto-injector safely, and to get the child to a hospital as soon as possible. Instruct parents or caregivers to teach child how to manage his or her allergy, how to self-inject, and what to do in an emergency. For children too young to self-inject and who will be separated from parent, tell parents to always discuss allergy and use of auto-injector with responsible adult.

## Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.
- Increase in ease of breathing.
- Prevention of bronchospasm or reduction of frequency of acute asthma attacks in patients with chronic asthma.
- Prevention of exercise-induced asthma.
- Reversal of signs and symptoms of anaphylaxis.
- Increase in cardiac rate and output, when used in cardiac resuscitation.
- Increase in blood pressure, when used as a vasopressor.
- Localization of local anesthetic.
- Decrease in sinus and nasal congestion.

HIGH ALERT

# epirubicin (ep-i-roo-bi-sin)

Ellence

***Classification***
Therapeutic: antineoplastics
Pharmacologic: anthracyclines

**Pregnancy Category D**

## Indications

A component of adjuvant therapy for evidence of axillary tumor involvement following resection of primary breast cancer.

## Action

Inhibits DNA and RNA synthesis by forming a complex with DNA. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

## Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Rapidly and widely distributed; concentrates in RBCs.
**Metabolism and Excretion:** Extensively and rapidly metabolized by the liver and other tissues.
**Half-life:** 35 hr.

TIME/ACTION PROFILE (effect on WBCs)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | unknown | 10–14 days | 21 days |

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to epirubicin, other anthracyclines, or related compounds; Baseline neutrophil count <1500 cells/mm$^3$; Severe myocardial insufficiency or recent MI; Previous anthracyclines up to the maximum cumulative dose; Severe hepatic dysfunction; Concurrent cimetidine therapy; OB, Lactation: Significant risk for fetal or infant harm.
**Use Cautiously in:** Severe renal impairment (serum creatinine >5 mg/dL); consider ↓ dose; Hepatic impairment (dose ↓ recommended for bilirubin >1.2 mg/dL or AST >2–4 times upper limit of normal); Depressed bone marrow reserve; OB: Warn patients with childbearing potential to avoid pregnancy during treatment; Pedi: Safety not established; ↑ risk of acute cardiotoxicity and chronic CHF; Geri: ↑ risk of toxicity in female patients ≥70 yr.

## Adverse Reactions/Side Effects

**CNS:** lethargy. **CV:** CARDIOTOXICITY (dose-related). **GI:** nausea, vomiting, anorexia, diarrhea, mucositis. **Derm:** alopecia, flushing, itching, photosensitivity, radiation-recall reaction, rash, skin/nail hyperpigmentation. **Endo:** gonadal suppression. **Hemat:** LEUKOPENIA, anemia, thrombocytopenia, treatment-related leukemia/myelodysplas-

tic syndromes. **Local:** injection site reactions, phlebitis at IV site, tissue necrosis. **Metab:** hot flashes, hyperuricemia. **Misc:** ANAPHYLAXIS, INFECTION.

### Interactions

**Drug-Drug: Cimetidine** ↑ blood levels and risk of serious toxicity; avoid concurrent use. Additive hematologic and gastrointestinal toxicity with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

### Route/Dosage

**IV (Adults):** 100–120 mg/m² repeated in 3–4 wk cycles (total dose may be given on day 1 or split and given in equally divided doses on day 1 and day 8 of each cycle (combination regimens may employ concurrent 5-fluorouracil and cyclophosphamide).

### Hepatic Impairment

**IV (Adults):** *Bilirubin 1.2–3 mg/dL or AST 2–4 times upper limit of normal*—use 50% of recommended starting dose; *bilirubin >3 mg/dL or AST >4 times upper limit of normal*—use 25% of recommended starting dose.

### Availability (generic available)

**Solution for injection (red):** 50-mg/25-mL single-use vial, 200-mg/100-mL single-use vial.

## NURSING IMPLICATIONS

### Assessment

- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Severe nausea and vomiting may occur. Administer parenteral antiemetic agents 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration.
- Measure cardiac function, using ECG and a multigated radionuclide angiography (MUGA) scan or an ECHO, prior to therapy. Perform repeated evaluations of left ventricular ejection fraction during therapy. Monitor for development of signs of cardiac toxicity, which may occur early (ST-T wave changes, sinus tachycardia, and extrasystoles) or late (may occur months to yr after termination of therapy). Delayed cardiac toxicity is characterized by cardiomyopathy, tachycardia, peripheral edema, dyspnea, rales/crackles, weight gain, hepatomegaly, ascites, pleural effusion. Toxicity is usually dependent on cumulative dose.
- Assess injection site frequently for redness, irritation, or inflammation. Burning or stinging during infusion may indicate infiltration and infusion should be discontinued and restarted in another vein. Epirubicin is a vesicant but may infiltrate painlessly even if blood returns on aspiration of infusion needle. Severe tissue damage may occur if epirubicin extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein.
- Assess oral mucosa frequently for development of stomatitis (pain, burning, erythema, ulcerations, bleeding, infection). Increased dosing interval and/or decreased dosing is recommended if lesions are painful or interfere with nutrition.
- ***Lab Test Considerations:*** Monitor CBC and differential before and during each cycle of therapy. Epirubicin should not be administered to patients with a baseline neutrophil count <1500 cells/mm³. The WBC nadir occurs 10–14 days after administration, and recovery usually occurs by the 21st day. Severe thrombocytopenia and anemia may also occur.
- Monitor renal (BUN and creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to and periodically during therapy. Dose reduction is required for bilirubin >1.2 mg/dL, AST 2–4 times the upper limit of normal, or serum creatinine >5 mg/dL.

### Potential Nursing Diagnoses

Risk for infection (Adverse Reactions)
Decreased cardiac output (Adverse Reactions)

### Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, calculations and infusion pump settings. Epirubicin should be administered only under the supervision of a physician experi-

enced in the use of cancer chemotherapeutic agents.

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Administer prophylactic anti-infective therapy with trimethoprim/sulfamethoxazole or a fluoroquinolone and antiemetic therapy prior to administration of epirubicin.
- Do not administer subcut or IM.

### IV Administration

- **Intermittent Infusion:** ***Diluent:*** Administer undiluted. Solution is clear red. Use epirubicin within 24 hr of penetration of rubber stopper. Discard unused solution. ***Concentration:*** 2 mg/mL. ***Rate:*** Administer initial dose of 100–120 mg/m$^2$ over 15–20 min through Y-site of a free-flowing infusion of 0.9% NaCl or D5W. Lower doses may be infused for shorter periods, but not less than over 3 min. Do not administer via direct IV push. Facial flushing and erythema along involved vein frequently occur when administration is too rapid. Venous sclerosis may result from injection into a small vein or repeated injections into the same vein. Avoid veins over joints or in extremities with compromised venous or lymphatic drainage.
- **Syringe Incompatibility:** Do not mix in syringe with other drugs or with alkaline solutions, fluorouracil, heparin, ifosfamide.
- **Y-Site Compatibility:** alfentanil, amifostine, amikacin, aminocaproic acid, atracurium, aztreonam, bivalirudin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefotaxime, ceftizoxime, chlorpromazine, cimetidine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, daptomycin, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dolasetron, dopamine, doxacurium, doxacycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem cilastatin, inamrinone, insulin, isoproterenol, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, mannitol, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, monocycline, mitomycin, mivacurium, morphine, nalbuphine, naloxone, nesiritide, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pentamidine, pentazocine, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinapristin/dalfopristin, ranitidine, remifentanil, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, tirofiban, tobramycin, trimethobenzamide, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B colloidal, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azithromycin, cefepime, cefoperazone, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, dexamethasone sodium phosphate, diazepam, ertapenem, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, heparin, hydrocortisone sodium phosphate, ketorolac, leucovorin, magnesium sulfate, meropenem, methohexital, methylprednisolone, nafcillin, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium phosphates, sodium bicarbonate, sodium phosphates, thiopental, ticarcillin/clavulanate, tigecycline, trimethoprim/sulfamethoxazole.

## Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should be cautioned not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, because these may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. Patients usually recover by the third week of therapy.

- Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 4 mo after therapy is concluded. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression.
- Instruct patient to avoid taking cimetidine, OTC or Rx, during therapy, and to consult health care professional prior to taking other Rx, OTC, or herbal products.
- Instruct patient to notify health care professional immediately if vomiting, dehydration, fever, evidence of infection, symptoms of CHF, or pain at injection site occurs. Patients should be informed of the risk of irreversible cardiac damage and treatment-related leukemia.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy. May cause hyperpigmentation of the skin and nails. Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Emphasize the need for periodic lab tests to monitor for side effects.

### Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies in patients with axillary node tumor involvement following resection of primary breast cancer.

## eplerenone (e-ple-re-none)

Inspra

***Classification***

Therapeutic: antihypertensives
Pharmacologic: aldosterone antagonists

**Pregnancy Category B**

### Indications

Hypertension (alone, or with other agents). LV systolic dysfunction and evidence of HF post-MI.

### Action

Blocks the effects of aldosterone by attaching to mineralocorticoid receptors. **Therapeutic Effects:** Lowering of blood pressure. Improves survival in patients with evidence of HF post-MI.

### Pharmacokinetics

**Absorption:** Well absorbed following oral administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A4 enzyme system); <5% excreted unchanged by the kidneys.
**Half-life:** 4–6 hr.

TIME/ACTION PROFILE (antihypertensive effect)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | Unknown | 4 wk | Unknown |

### Contraindications/Precautions

**Contraindicated in:** Serum potassium >5.5 mEq/L; Type 2 diabetes with microalbuminuria (for patients with HTN; ↑ risk of hyperkalemia); Serum creatinine >2 mg/dL in males or > 1.8 mg/dL in females (for patients with HTN); CCr ≤30 mL/min (for all patients); CCr <50 mL/min (for patients with HTN); Concurrent use of potassium supplements or potassium-sparing diuretics (for patients with HTN); Concurrent use of strong inhibitors of the CYP3A4 enzyme system (ketoconazole, itraconazole, nefazodone, clarithromycin, ritonavir, or nelfinavir); Lactation: Lactation.
**Use Cautiously in:** Severe hepatic impairment; OB: Use only if clearly needed; Pedi: Safety not established.

### Adverse Reactions/Side Effects

**CNS:** dizziness, fatigue. **GI:** abnormal liver function tests, abdominal pain, diarrhea. **GU:** albuminuria. **Endo:** abnormal vaginal bleeding, gynecomastia. **F and E:** HYPERKALEMIA. **Metab:** hypercholesterolemia, hypertriglyceridemia. **Misc:** flu-like symptoms.

### Interactions

**Drug-Drug:** Concurrent use of strong inhibitors of the CYP3A4 enzyme system (**ketoconazole**, **itraconazole**, **nefazodone**, **clarithromycin**, **ritonavir**, or **nelfinavir**) significantly ↑ effects of eplenerone; concurrent use contraindicated. Concurrent use of weak inhibitors of the CYP3A4 enzyme system (**erythromycin**, **saquinavir**, **fluconazole**, **verapamil**) may ↑ effects of eplerenone; initial dose of eplerenone should be ↓ by 50%. **NSAIDs** may ↓ antihypertensive effects. Concurrent use of **ACE inhibitors** or **Angioten-**

**sin II receptor blockers** may ↑ risk of hyperkalemia.

### Route/Dosage

### Hypertension

**PO (Adults):** 50 mg daily initially; may be increased to 50 mg twice daily; *Patients receiving concurrent moderate CYP3A4 inhibitors (erythromycin, saquinavir, verapamil, fluconazole)* — 25 mg once daily initially.

### HF Post-MI

**PO (Adults):** 25 mg daily initially; increase in 4 wk to 50 mg daily; subsequent dose adjustments may need to be made based on serum potassium concentrations.

### Availability

**Tablets:** 25 mg, 50 mg.

## NURSING IMPLICATIONS

### Assessment

- Monitor blood pressure periodically during therapy.
- Monitor prescription refills to determine adherence.
- ***Lab Test Considerations:*** May cause hyperkalemia. Monitor serum potassium levels prior to starting therapy, within the first wk, at 1 month following start of therapy or dose adjustmentand periodically thereafter. Monitor serum potassium and serum creatinine in 3-7 days in patients who start taking a moderate CYP3A4 inhibitor.
- May cause ↓ serum sodium and ↑ serum triglyceride, cholesterol, ALT, GGT, creatinine, and uric acid levels.

### Potential Nursing Diagnoses

Decreased cardiac output (Indications)
Noncompliance (Patient/Family Teaching)

### Implementation

- **PO:** Administer once daily. May be increased to twice daily if response is inadequate.

### Patient/Family Teaching

- Instruct patient to take medication as directed at the same time each day, even if feeling well.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, discontinuation of smoking, moderation of alcohol consumption, regular exercise, stress management). Medication controls, but does not cure, hypertension.
- Instruct patient and family on correct technique for monitoring blood pressure. Advise them to monitor blood pressure at least weekly, and notify health care professional of significant changes.
- Inform patient not to use potassium supplements, salt substitutes containing potassium, or other Rx, OTC, or herbal products without consulting health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if dizziness, diarrhea, vomiting, rapid or irregular heartbeat, lower extremity edema, or difficulty breathing occur.
- Advise patient to inform health care professional of treatment regimen prior to treatment or surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected. Advise patient to avoid breastfeeding during therapy.
- Emphasize the importance of follow-up exams to check serum potassium.

### Evaluation/Desired Outcomes

- Decrease in blood pressure without appearance of side effects.
- Improvement in survival in patients with evidence of HF post-MI.

## epoetin (e-poe-e-tin)

Epogen, EPO, Eprex, erythropoietin, Procrit

***Classification***
Therapeutic: antianemics
Pharmacologic: hormones

**Pregnancy Category C**

### Indications

Anemia associated with chronic renal failure. Anemia secondary to zidovudine (AZT) therapy in HIV-infected patients. Anemia from chemotherapy in patients with nonmyeloid malignancies. Reduction of need for transfusions after surgery. **Unlabeled Use:** Anemia of prematurity.

### Action

Stimulates erythropoiesis (production of red blood cells). **Therapeutic Effects:** Maintains and may elevate RBCs, decreasing the need for transfusions.

### Pharmacokinetics

**Absorption:** Well absorbed after subcut administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown.

**Half-life:** *Children and Adults*—4–13 hr; *Neonates*—11–17 hr.

TIME/ACTION PROFILE (increase in RBCs)

| ROUTE | ONSET† | PEAK | DURATION |
|---|---|---|---|
| IV, subcut | 7–10 days | within 2 mos | 2 wk‡ |

†Increase in reticulocytes
‡After discontinuation

## Contraindications/Precautions

**Contraindicated in:** Hypersensitivity to albumin or mammalian cell-derived products; Uncontrolled hypertension; Patients with erythropoietin levels >200 mUnits/mL; Patients receiving chemotherapy when anticipated outcome is cure; Neutropenia in newborns.

**Use Cautiously in:** History of seizures; History of porphyria; OB: Evidence of fetal harm in animal studies—use only if potential benefit outweighs potential risk to fetus; OB, Lactation: Little published information, however, erythropoetin alfa is a normal constituent of breastmilk; Pedi: Multidose vials contain benzyl alcohol, which can cause potentially fatal gasping syndrome in neonates.

## Adverse Reactions/Side Effects

**CNS:** SEIZURES, headache. **CV:** CHF, MI, STROKE, THROMBOTIC EVENTS (especially with hemoglobin >12 g/dL), hypertension. **Derm:** transient rashes. **Endo:** restored fertility, resumption of menses. **Misc:** ↑ mortality and ↑ tumor growth (with hemoglobin ≥12 g/dL).

## Interactions

**Drug-Drug:** May ↑ requirement for **heparin** anticoagulation during hemodialysis.

## Route/Dosage

(Use lowest dose that will gradually increase hemoglobin level and avoid RBC transfusion).

### Anemia of Chronic Renal Failure

**Subcut, IV (Adults):** 50–100 units/kg 3 times weekly initially; adjust dose to attain target hemoglobin of 10–12 g/dL.

**Subcut, IV (Children):** 50 units/kg 3 times weekly initially; adjust dose to attain target hemoglobin of 10–12 g/dL.

### Anemia Secondary to AZT Therapy

**Subcut, IV (Adults):** 100 units/kg 3 times weekly for 8 wk; if inadequate response, may increase by 50–100 units/kg every 4–8 wk (max: 300 units/kg 3 times weekly).

**Subcut, IV (Children 8 mo-17 yr):** 50–400 units/kg 2–3 times weekly.

### Anemia from Chemotherapy

(Use only for chemotherapy-related anemia and discontinue when chemotherapy course is completed; do not initiate if hemoglobin ≥10 g/dL).

**Subcut (Adults):** 150 units/kg 3 times weekly or 40,000 units weekly; adjust dose to maintain lowest hemoglobin level sufficient to avoid blood transfusions (do not exceed hemoglobin of 12 g/dL).

**IV (Children 6 mo—18 yr):** 600 units/kg 3 times weekly; adjust dose to maintain lowest hemoglobin level sufficient to avoid blood transfusions (do not exceed hemoglobin of 12 g/dL).

### Surgery

**Subcut (Adults):** 300 units/kg/day for 10 days before surgery, day of surgery, and 4 days after *or* 600 units/kg 21, 14, and 7 days before surgery and on day of surgery.

### Anemia of Prematurity

**IV, Subcut (Neonates):** 25–100 units/kg/dose 3 times weekly or 100 units/kg/dose 5 times weekly or 200 units/kg/dose every other day for 10 doses.

## Availability

**Injection:** 2000 units/mL, 3000 units/mL, 4000 units/mL, 10,000 units/mL, 20,000 units/mL, 40,000 units/mL.

# NURSING IMPLICATIONS

## Assessment

- Monitor blood pressure before and during therapy. Inform health care professional if severe hypertension is present or if blood pressure begins to increase. Additional antihypertensive therapy may be required during initiation of therapy.
- Monitor for symptoms of anemia (fatigue, dyspnea, pallor).
- Monitor dialysis shunts (thrill and bruit) and status of artificial kidney during hemodialysis. Heparin dose may need to be increased to prevent clotting. Patients with underlying vascular disease should be monitored for impaired circulation.
- **Lab Test Considerations:** May cause ↑ in WBCs and platelets. May ↓ bleeding times.
- Serum ferritin, transferrin, and iron levels should also be monitored to assess need for concurrent iron therapy. Transferrin saturation should be at least 20% and ferritin should be at least 100 ng/mL.

- **Anemia of Chronic Renal Failure:** Monitor hematocrit before and twice weekly during initial therapy, for 2–6 wk after a change in dose, and regularly after target range (30–36%) has been reached and maintenance dose is determined. Monitor other hematopoietic parameters (CBC with differential and platelet count) before and periodically during therapy. If hemoglobin ↑ and approached 12 g/dL or ↑ by more than 1 g/dL in a 2-wk period, ↓ dose by 25% and monitor hemoglobin twice weekly for 2–6 wk. If ↑ in hemoglobin continues and exceeds 12 g/dL, dose should be withheld until hemoglobin begins to ↓; epoetin is then reinitiated at a dose 25% lower than previous dose. If hemoglobin ↑ by <1 g/dL over 4 wk (and iron stores are adequate), ↑ dose by 25%; monitor hemoglobin twice weekly for 2–6 wk; further dose ↑ may be made at 4–wk intervals until desired response attained.
- Monitor renal function studies and electrolytes closely; resulting increased sense of well-being may lead to decreased compliance with other therapies for renal failure. Increases in BUN, creatinine, uric acid, phosphorus, and potassium may occur.
- **Anemia Secondary to Zidovudine Therapy:** Before initiating therapy, determine serum erythropoietin level before transfusion. Patients receiving zidovudine with endogenous serum erythropoietin levels >500 mUnits/mL may not respond to therapy. Monitor hemoglobin weekly during dosage adjustment. If response does not reduce transfusion requirements or increase hemoglobin effectively after 8 wk of therapy, dose may be ↑ by 50–100 units/kg 3 times weekly. Evaluate response and adjust dose by 50–100 units/kg every 4–8 wk thereafter. If a satisfactory response is not obtained with a dose of 300 units/kg 3 times weekly, it is unlikely that a higher dose will produce a response. Once the desired response is attained, maintenance dose is titrated based on variations of zidovudine dose and intercurrent infections. If hemoglobin exceeds 12 g/dL, discontinue dose until hemoglobin drops to <11 g/dL, then ↓ dose by 25%.
- **Anemia from Chemotherapy:** Monitor hemoglobin weekly until stable. Do not initiate if hemoglobin ≥10 g/dL. Patients with lower baseline serum erythropoietin levels may respond more rapidly; not recommended if levels >200 mUnits/mL. If hemoglobin exceeds 12 g/dL, withhold dose until hemoglobin approaches level where transfusions may be required and then reinitiate at a dose 25% lower than previous dose. If hemoglobin ↑ by >1 g/dL in any 2–wk period, ↓ dose by 25%. For 3 times weekly dosing regimens, if response is not adequate (no ↓ in transfusion requirements or no ↑ in hemoglobin) after 8 wk of therapy, dose may be ↑ up to 300 units/kg 3 times weekly. If no response is obtained to this dose, it is unlikely that higher doses will produce a response. For weekly dosing regimens, if response is not adequate (no ↑ in hemoglobin by ≥1 g/dL after 4 wk in absence of RBC transfusion), ↑ dose to 60,000 units weekly (adults) or 900 units/kg (max: 60,000 units) (children).
- **Surgery:** Determine that hemoglobin is >10 to ≤13 g/dL before therapy.

## Potential Nursing Diagnoses

Activity intolerance (Indications)
Noncompliance (Patient/Family Teaching)

## Implementation

### IV Administration

- Transfusions are still required for severe symptomatic anemia. Supplemental iron should be initiated with epoetin and continued throughout therapy.
- Institute seizure precautions in patients who experience greater than a 4-point increase in hematocrit in a 2-wk period or exhibit any change in neurologic status. Risk of seizures is greatest during the first 90 days of therapy.
- Do not shake vial; inactivation of medication may occur. Discard vial immediately after withdrawing dose from single-use 1-mL vial. Refrigerate multidose 2-mL vial; stable for 21 days after initial entry.
- **Subcut:** This route is often used for patients not requiring dialysis.
- May be admixed in syringe immediately before administration with 0.9% NaCl with benzyl alcohol 0.9% in a 1:1 ratio to prevent injection site discomfort.
- **Direct IV:** ***Diluent:*** Administer undiluted or dilute with an equal amount of 0.9% NaCl. ***Concentration:*** 1000–40000 units/mL. ***Rate:*** May be administered as direct injection or bolus over 1–3 minutes into IV tubing or via venous line at end of dialysis session.

## Patient/Family Teaching

- Advise patient to read the *Medication Guide* prior to initiating therapy and with each Rx refill.
- Explain rationale for concurrent iron therapy (increased red blood cell production requires iron).

- Discuss possible return of menses and fertility in women of childbearing age. Patient should discuss contraceptive options with health care professional.
- Discuss ways of preventing self-injury in patients at risk for seizures. Driving and activities requiring continuous alertness should be avoided.
- Inform patient that use of epoetin may result in shortened overall survival and/or ↓ time to tumor progression.
- Advise patient to notify health care professional immediately if signs of blood clots (chest pain, trouble breathing or shortness of breath, pain in the legs, with or without swelling; a cool or pale arm or leg, sudden confusion, trouble speaking or trouble understanding others' speech, sudden numbness or weakness in the face, arm, or leg, especially on one side of the body, sudden trouble seeing, sudden trouble walking, dizziness, loss of balance or coordination, loss of consciousness or fainting, hemodialysis vascular access stops working) occur.
- Advise patient to inform health care professional of medication prior to treatment or surgery.
- **Anemia of Chronic Renal Failure:** Stress importance of compliance with dietary restrictions, medications, and dialysis. Foods high in iron and low in potassium include liver, pork, veal, beef, mustard and turnip greens, peas, eggs, broccoli, kale, blackberries, strawberries, apple juice, watermelon, oatmeal, and enriched bread. Epoetin will result in increased sense of well-being, but it does not cure underlying disease.
- **Home Care Issues:** Home dialysis patients determined to be able to safely and effectively administer epoetin should be taught proper dosage, administration technique, and disposal of equipment. *Information for Home Dialysis Patients* should be provided to patient along with medication.

### Evaluation/Desired Outcomes

- Increase in hematocrit to 30–36% with improvement in symptoms of anemia in patients with chronic renal failure.
- Increase in hematocrit in anemia secondary to zidovudine therapy.
- Increase in hematocrit in patients with anemia resulting from chemotherapy.
- Reduction of need for transfusions after surgery.

## eprosartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

HIGH ALERT

E

## eptifibatide (ep-ti-**fib**-a-tide)

Integrilin

***Classification***

Therapeutic: antiplatelet agents
Pharmacologic: glycoprotein IIb/IIIa inhibitors

**Pregnancy Category B**

### Indications

Acute coronary syndrome (unstable angina/non–Q-wave MI), including patients who will be managed medically and those who will undergo percutaneous coronary intervention (PCI) that may consist of percutaneous transluminal angioplasty (PCTA) or atherectomy. Treatment of patients undergoing PCI. Usually used concurrently with aspirin and heparin.

### Action

Decreases platelet aggregation by reversibly antagonizing the binding of fibrinogen to the glycoprotein IIb/IIIa binding site on platelet surfaces.
**Therapeutic Effects:** Inhibition of platelet aggregation resulting in decreased incidence of new MI, death, or refractory ischemia, reducing the need for repeat urgent cardiac intervention.

### Pharmacokinetics

**Absorption:** IV administration results in complete bioavailability.
**Distribution:** Unknown.
**Metabolism and Excretion:** 50% excreted by the kidneys.
**Half-life:** 2.5 hr.

TIME/ACTION PROFILE (effects on platelet function)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| IV | immediate | following bolus | brief† |

†Inhibition is reversible following cessation of infusion

### Contraindications/Precautions

**Contraindicated in:** Hypersensitivity; Active internal bleeding or history of bleeding within previous 30 days; Severe uncontrolled hypertension (systolic BP >200 mm Hg and/or diastolic BP

>110 mm Hg); Major surgical procedure within 6 wk; History of hemorrhagic stroke or other stroke within 30 days; Concurrent use of other glycoprotein IIb/IIIa receptor antagonists; Platelet count <100,000/mm$^3$; Severe renal insufficiency (serum creatinine ≥4 mg/dL) or dependency on renal dialysis.
**Use Cautiously in:** Geri: ↑ risk of bleeding ; Renal insufficiency ( ↓ infusion rate if CCr < 50 mL/min); OB, Pedi: Pregnancy, lactation, or children (safety not established; use in pregnancy only if clearly needed).

### Adverse Reactions/Side Effects
Noted for patients receiving heparin and aspirin in addition to eptifibatide.
**CV:** hypotension. **Hemat:** BLEEDING (including GI and intracranial bleeding, hematuria, and hematomas).

### Interactions
**Drug-Drug:** ↑ risk of bleeding with other drugs that affect hemostasis (**heparins**, **warfarin**, **NSAIDs**, **thrombolytic agents**, **abciximab**, **dipyridamole**, **ticlopidine**, **clopidogrel**, some **cephalosporins**, **valproates**).
**Drug-Natural Products:** ↑ bleeding risk with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, and **Panax ginseng**.

### Route/Dosage

#### Acute Coronary Syndrome
**IV (Adults ≤121 kg):** 180 mcg/kg as a bolus dose, followed by 2 mcg/kg/min until hospital discharge or surgical intervention (up to 72 hr).

#### Percutaneous Coronary Intervention
**IV (Adults):** 180 mcg/kg as a bolus dose, immediately before PCI, followed by 2 mcg/kg/min infusion; a second bolus of 180 mcg/kg is given 10 min after first bolus; infusion should continue for 18–24 or hospital discharge (minimum of 12 hr).

#### Renal Impairment
(Adults CCr <50 mL/min): 180 mcg/kg bolus followed by 1 mcg/kg/min infusion; second bolus of 180 mcg/kg is given 10 min after first bolus for patients undergoing PCI.

### Availability
**Solution for injection:** 20 mg/10 mL, 75 mg/100 mL, 200 mg/100 mL.

## NURSING IMPLICATIONS

### Assessment
- Assess for bleeding. Most common sites are arterial access site for cardiac catheterization or GI or GU tract. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and NG tubes should be minimized. Noncompressible sites for IV access should be avoided. If bleeding cannot be controlled with pressure, discontinue eptifibatide and heparin immediately.
- ***Lab Test Considerations:*** Prior to eptifibatide therapy, assess hemoglobin or hematocrit, platelet count, serum creatinine, and PT/aPTT. Activated clotting time (ACT) should also be measured in patients undergoing PCI.
- Maintain the aPTT between 50 and 70 sec unless PCI is to be performed. Maintain ACT between 300 and 350 sec during PCI.
- Arterial sheath should not be removed unless aPTT <45 sec.
- If platelet count decreases to <100,000 and is confirmed, eptifibatide and heparin should be discontinued and condition monitored and treated.

### Potential Nursing Diagnoses
Ineffective tissue perfusion (Indications)

### Implementation
- ***High Alert:*** Accidental overdose of antiplatelet medications has resulted in patient harm or death from internal hemorrhage or intracranial bleeding. Have second practitioner independently check original order, dose calculations, and infusion pump settings.
- Most patients receive heparin and aspirin concurrently with eptifibatide.
- After PCI, femoral artery sheath may be removed during eptifibatide treatment only after heparin has been discontinued and its effects mostly reversed.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused portion.

#### IV Administration
- **Direct IV:** ***High Alert: Diluent:*** Withdraw appropriate loading dose from bolus vial (20 mg/10-mL vial) into a syringe. Administer undiluted. ***Concentration:*** 2 mg/mL. ***Rate:*** Administer over 1–2 min.
- **Continuous Infusion:** ***Diluent:*** Administer undiluted directly from the 100-mL vial via an infusion pump. ***Concentration:*** 0.75 mg/mL or 2 mg/mL (depends on vial used). ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** alteplase, amiodarone, argatroban, atropine, bivalirudin, daptomycin, dobutamine, ertapenem, heparin, lidocaine,

meperidine, metoprolol, micafungin, midazolam, morphine, nitroglycerin, palonosetron, potassium chloride, verapamil.
- **Y-Site Incompatibility:** furosemide.
- **Solution Compatibility:** 0.9% NaCl, D5/0.9% NaCl.

### Patient/Family Teaching
- Inform patient of the purpose of eptifibatide.
- Instruct patient to notify health care professional immediately if any bleeding is noted.

### Evaluation/Desired Outcomes
- Inhibition of platelet aggregation, resulting in decreased incidence of new MI, death, or refractory ischemia with the need for repeat urgent cardiac intervention.

**ergocalciferol, See VITAMIN D COMPOUNDS.**

## ergonovine (er-goe-noe-veen)
ergometrine, Ergotrate

***Classification***
Therapeutic: none assigned
Pharmacologic: oxytocics

**Pregnancy Category UK**

### Indications
Prevention and treatment of postpartum or postabortion hemorrhage caused by uterine atony or involution. **Unlabeled Use:** As a diagnostic agent to provoke coronary artery spasm.

### Action
Directly stimulates uterine and vascular smooth muscle. **Therapeutic Effects:** Uterine contraction.

### Pharmacokinetics
**Absorption:** Well absorbed after oral or IM administration.
**Distribution:** Unknown.
**Metabolism and Excretion:** Unknown. Probably metabolized by the liver.
**Half-life:** Unknown.

TIME/ACTION PROFILE (uterine contractions)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 5–15 min | unknown | ≥3 hr |
| IM | 2–5 min | unknown | ≥3 hr |
| IV | immediate | unknown | 45 min |

### Contraindications/Precautions
**Contraindicated in:** Hypersensitivity; Avoid chronic use; Should not be used to induce labor.
**Use Cautiously in:** Hypertensive or eclamptic patients (increased susceptibility to hypertensive and arrhythmogenic side effects); Severe hepatic or renal disease; Sepsis; Third stage of labor.

### Adverse Reactions/Side Effects
**CNS:** dizziness, headache. **EENT:** tinnitus. **Resp:** dyspnea. **CV:** arrhythmias, chest pain, hypertension, palpitations. **GI:** nausea, vomiting. **Derm:** sweating. **Misc:** allergic reactions.

### Interactions
**Drug-Drug:** Excessive vasoconstriction may result when used with other **vasopressors**, such as **dopamine** or **nicotine**. May ↑ the risk of adverse reactions with **bromocriptine**.

### Route/Dosage

#### Oxytocic
**PO, SL (Adults):** 0.2–0.4 mg q 6–12 hr (usual course is 48 hr).
**IM, IV (Adults):** 200 mcg (0.2 mg) q 2–4 hr for up to 5 doses.

#### Provocative Agent for Coronary Artery Spasm
**IV (Adults):** 50 mcg (0.05 mg) q 5 min until chest pain occurs or a total dose of 400 mcg (0.4 mg) has been given (unlabeled).

### Availability
**Tablets:** 0.2 mg. **Injection:** 0.2 mg/mL, 0.25 mg/mL.

## NURSING IMPLICATIONS

### Assessment
- Monitor blood pressure, pulse, and respirations every 15–30 min until transfer to the postpartum unit, then every 1–2 hr. Report hypertension, chest pain, arrhythmias, headache, or change in neurologic status.
- Monitor amount and type of vaginal discharge. Report symptoms of hemorrhage (increased bleeding, hypotension, pallor, tachycardia) immediately.

- Palpate uterine fundus; note position and consistency. Notify physician or other health care professional if fundus fails to contract in response to ergonovine. Assess patient for severe cramping; dose may be decreased.
- Assess for signs of ergotism (cold, numb fingers and toes; nausea; vomiting; diarrhea; headache; muscle pain; weakness).
- If patient fails to respond to ergonovine, check serum calcium level. Correction of hypocalcemia may restore responsiveness.
- ***Lab Test Considerations:*** May cause ↓ serum prolactin level, which inhibits synthesis of breast milk.
- ***Toxicity and Overdose:*** Toxicity, initially manifested as ergotism, may cause seizures and gangrene. Seizures are treated with anticonvulsants. Vasodilators and heparin may be ordered to improve circulation to extremities.

## Potential Nursing Diagnoses

Ineffective tissue perfusion (Indications)
Risk for injury (Side Effects)

## Implementation

- Do not administer solution that is discolored or contains a precipitate.
- **PO:** Administration is usually limited to 48 hr postpartum, by which time the danger of hemorrhage from uterine atony has passed.
- Tablets may be administered SL.
- **IM:** The preferred route is IM. Firm uterine contractions are produced within a few minutes. Dose may need to be repeated every 2–4 hr for full therapeutic effect.

### IV Administration

- **Direct IV:** The IV route is reserved for severe uterine bleeding. ***Diluent:*** Dilute with 5 mL of 0.9% NaCl. ***Rate:*** Administer slow IV push over at least 1 min through Y-site injection of an IV of D5W or 0.9% NaCl.

## Patient/Family Teaching

- Review symptoms of toxicity with patient. Instruct the patient to report occurrence of these immediately.
- Inform patient that uterine cramping demonstrates effectiveness of therapy.
- Explain need for pad count to determine degree of bleeding. Instruct patient to report immediately an increase in degree of bleeding or passage of clots.
- Instruct patient to report breastfeeding difficulties.
- Caution patient not to smoke while receiving ergonovine; nicotine is also a vasoconstrictor.

## Evaluation/Desired Outcomes

- Uterine contraction and cramping in the prevention or cessation of uterine hemorrhage after delivery or abortion.
- Vasoconstriction of the coronary arteries when used as a diagnostic agent.

# **ergotamine** (er-**got**-a-meen)

Ergomar

# **dihydroergotamine** (dye-hye-droe-er-**got**-a-meen)

D.H.E. 45, Migranal

***Classification***

Therapeutic: vascular headache suppressants
Pharmacologic: ergot alkaloids

**Pregnancy Category X**

## Indications

Treatment of vascular headaches including: Migraine with or without aura, Cluster headaches.

## Action

Vasoconstriction of dilated blood vessels by stimulating alpha-adrenergic and serotonergic (5-HT) receptors. Larger doses may produce alpha-adrenergic blockade and vasodilation. **Therapeutic Effects:** Constriction of dilated carotid artery bed with resolution of vascular headache.

## Pharmacokinetics

**Absorption:** *Ergotamine*—Unpredictably absorbed (60%) from the GI tract (may be enhanced by caffeine). Sublingual absorption is very poor. *Dihydroergotamine*—rapidly absorbed after IM and subcut administration, 32% absorbed from nasal mucosa.
**Distribution:** Ergotamine crosses the blood-brain barrier and enters breast milk.
**Protein Binding:** *Dihydroergotamine*—90%; *ergotamine*—93–98%.
**Metabolism and Excretion:** Both ergotamine and dihydroergotamine are 90% metabolized by the liver (CYP3A4 enzyme system). Some metabolites are active.
**Half-life:** *Ergotamine*—1.5–2.5 hr. *Dihydroergotamine*—9–10 hr.

TIME/ACTION PROFILE (relief of headache)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
| PO | 1–2 hr (variable) | 1–5 hr | unknown |
| Nasal | within 30 min | unknown | unknown |
| SL | unknown | unknown | unknown |

| | | | |
|---|---|---|---|
| IM, subcut | 15–30 min | 15 min–2 hr | 8 hr |
| IV | <5 min | 15 min–2 hr | 8 hr |

## Contraindications/Precautions

**Contraindicated in:** Peripheral vascular disease; Ischemic heart disease; Uncontrolled hypertension; Severe renal or liver disease; Malnutrition; Known alcohol intolerance (dihydroergotamine injection only); OB, Lactation: Pregnancy and lacation; Concurrent use of CYP3A4 inhibitors (protease inhibitors and macrolide anti-infectives).

**Use Cautiously in:** Illnesses associated with peripheral vascular pathology such as diabetes mellitus; Concurrent administration of other vasconstrictor agents; Pedi: Children (safety not established).

## Adverse Reactions/Side Effects

**CNS:** dizziness. **EENT:** rhinitis (nasal). **CV:** MI, hypertension, angina pectoris, arterial spasm, intermittent claudication. **GI:** abdominal pain, nausea, vomiting, altered taste *(nasal)*, diarrhea, polydipsia. **MS:** extremity stiffness, muscle pain, stiff neck, stiff shoulders. **Neuro:** leg weakness, numbness or tingling in fingers or toes. **Misc:** fatigue.

## Interactions

**Drug-Drug:** Concurrent use of potent inhibitors of the CYP3A4 enzyme system, including protease inhibitors (**ritonavir**, **nelfinavir**, and **indinavir**) some macrolide anti-infectives (**erythromycin**, **clarithromycin**, and **troleandomycin**) and some azole antifungals (**ketoconazole**, **itraconazole**) may produce serious life-threatening peripheral ischemia and is contraindicated. Concurrent use with **beta blockers**, **hormonal contraceptives**, or **nicotine** (heavy smoking) may ↑ risk of peripheral vasoconstriction. Dihydroergotamine antagonizes the antianginal effects of **nitrates**. Concurrent use with **vasoconstrictors** may have ↑ effects (avoid concurrent use). Concurrent use with **almotriptan**, **frovatriptan**, **naratriptan**, **rizatriptan**, **sumatriptan**, and **zolmitriptan** may result in prolonged vasoconstriction (allow 24 hr between use).

## Route/Dosage

### Ergotamine

**PO, SL (Adults):** 1–2 mg initially, then 1–2 mg q 30 min until attack subsides or a total of 6 mg has been given. Should not be used more than twice weekly, with at least 5 days between courses; 1–2 mg PO at bedtime daily for 10–14 days have been used to terminate series of cluster headaches.

### Dihydroergotamine

**IM, Subcut (Adults):** 1 mg; may repeat in 1 hr to a total of 3 mg (not to exceed 3 mg/day or 6 mg/wk).

**IV (Adults):** 0.5 mg; may repeat in 1 hr (not to exceed 2 mg/day or 6 mg/wk). For chronic intractable headache, 0.5–1 mg q 8 hr may be given until relief is obtained (not to exceed 6 mg/wk).

**Intranasal (Adults):** 1 spray (0.5 mg) in each nostril, repeat after 15 min (2 mg total dose); not to exceed 3 mg/24 hr or 4 mg/wk.

## Availability

### Ergotamine

**Sublingual tablets:** 2 mg. ***In combination with:*** caffeine, barbiturates, and belladonna alkaloids in preparations for vascular headaches. See Appendix B.

### Dihydroergotamine

**Injection:** 1 mg/mL (contains alcohol). **Nasal spray:** 4 mg/1 mL in 1-mL ampules with nasal spray applicator. ***In combination with:*** *Ergotamine*—caffeine, barbiturates, and belladonna alkaloids in preparations for vascular headaches. See Appendix B.

# NURSING IMPLICATIONS

## Assessment

- Assess frequency, location, duration, and characteristics (pain, nausea, vomiting, visual disturbances) of chronic headaches. During acute attack, assess type, location, and intensity of pain before and 60 min after administration.
- Monitor blood pressure and peripheral pulses periodically during therapy. Report any increases in blood pressure.
- Assess for signs of ergotism (cold, numb fingers and toes; nausea; vomiting; headache; muscle pain; weakness).
- Assess for nausea and vomiting. Ergotamine stimulates the chemoreceptor trigger zone. Metoclopramide or a phenothiazine antiemetic may be given orally as prophylaxis 1 hr before administration of dihydroergotamine IV. Oral administration may decrease risk of extrapyramidal reactions and other side effects encountered with IV administration.

- ***Toxicity and Overdose:*** Toxicity is manifested by severe ergotism (chest pain, abdominal pain, persistent paresthesia in the extremities) and gangrene. Vasodilators, dextran, or heparin may be ordered to improve circulation.

### Potential Nursing Diagnoses

Acute pain (Indications)
Risk for injury (Side Effects)
Deficient knowledge, related to medication regimen (Patient/Family Teaching)

### Implementation

- Do not confuse Cafergot (ergotamine/caffeine) with Carafate (sucralfate).
- Administer as soon as patient reports prodromal symptoms or headache.
- **SL:** Allow tablet to dissolve under tongue. Do not allow patient to eat, drink, or smoke while tablet is dissolving.

**IV Administration**

- **Direct IV:** ***Diluent:*** Dihydroergotamine may be administered undiluted. ***Concentration:*** 1 mg/mL. ***Rate:*** Administer over 1 min.

### Patient/Family Teaching

- Instruct patient to take ergotamine at the first sign of an impending headache and not to exceed the maximum dose prescribed.
- Encourage patient to rest in a quiet, dark room after taking ergotamine.
- Review symptoms of toxicity. Instruct patient to report these promptly.
- Caution patient not to smoke and to avoid exposure to cold; these vasoconstrictors may further impair peripheral circulation.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient to avoid alcohol, which may precipitate vascular headaches.
- Instruct female patients to inform health care professional if they plan or suspect pregnancy. Ergotamine should not be taken during pregnancy.
- **Subcut, IM:** Inject at the first sign of a headache and repeat at 1-hr intervals up to 3 doses. Once minimal effective dose is determined, adjust dose for subsequent attacks.
- **Intranasal:** Instruct patient in proper use of nasal spray. Prime nasal sprayer 4 times before dose. Administer 1 spray to each nostril followed in 15 min by an additional spray in each nostril for a total of 4 sprays. Do not tilt head or sniff after spray. Do not use more than amount instructed. Discard ampule within 8 hr of opening. Do not refrigerate. Assembly may be used for 4 treatments; then discard.
- Advise patient not to use *Migranal* to prevent a headache if there are no symptoms or if headache is different from typical migraine.
- Instruct patient to notify health care professional if numbness or tingling in fingers or toes; pain, tightness, or discomfort in chest; muscle pain or cramps in arms or legs; weakness in legs; temporary speeding or slowing of heart rate; or swelling or itching occurs.

### Evaluation/Desired Outcomes

- Relief of pain from vascular headaches.

## erlotinib (er-lo-ti-nib)

Tarceva

***Classification***
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

**Pregnancy Category D**

### Indications

Locally advanced/metastatic non-small cell lung cancer, which has not responded to previous chemotherapy. First-line therapy for locally advanced, surgically unresectable, or metastatic pancreatic cancer (with gemcitabine).

### Action

Inhibits the enzyme tyrosine kinase, which is associated with human epidermal growth factor receptor (EGFR); blocks growth stimulation signals in cancer cells. **Therapeutic Effects:** Decreased spread of lung or pancreatic cancer with increased survival.

### Pharmacokinetics

**Absorption:** 60% absorbed; bioavailability ↑ to 100% with food.
**Distribution:** Unknown.
**Protein Binding:** 93% protein bound.
**Metabolism and Excretion:** Mostly metabolized by the liver (CYP3A4 enzyme system).
**Half-life:** 36 hr.

TIME/ACTION PROFILE (blood levels)

| ROUTE | ONSET | PEAK | DURATION |
|---|---|---|---|
