Disrupts DNA and protein synthesis in susceptible organisms. **Therapeutic Effects:** Bactericidal, trichomonacidal, or amebicidal action. **Spectrum:** Most notable for activity against anaerobic bacteria, including: *Bacteroides*, *Clostridioides difficile*. In addition, is active against: *Trichomonas vaginalis*, *Entamoeba histolytica*, *Giardia lamblia*, *H. pylori*,

Pharmacokinetics

Absorption: 80% absorbed after oral administration. Minimal absorption after topical or vaginal application.

Distribution: Widely distributed into most tissues and fluids, including CSF. Crosses the placenta and enters fetal circulation rapidly; enters breast milk in concentrations equal to plasma levels.

Metabolism and Excretion: Partially metabolized by the liver (30–60%), partially excreted unchanged in the urine, 6–15% eliminated in the feces.

Half-life: Neonates: 25–75 hr; Children and adults: 6–12 hr.

TIME/ACTION PROFILE (PO, IV = blood levels; topical = improvement in rosacea)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–3 hr	8 hr
PO-ER	rapid	unknown	up to 24 hr
IV	rapid	end of infusion	6–8 hr
Topical	3 wk	9 wk	12 hr
Vaginal	unknown	6–12 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens (topical only); OB: First trimester of pregnancy.

Use Cautiously in: History of blood dyscrasias; History of seizures or neurologic problems; Severe hepatic impairment (dose ↓ suggested); Cockayne syndrome (↑ risk of hepatotoxicity and death); Patients receiving corticosteroids or predisposed to edema (injection contains 28 mEq sodium/g metronidazole); OB: Although safety has not been established, has been used to treat trichomoniasis in 2nd- and 3rd-trimester pregnancy—but not as single-dose regimen; Lactation: If needed, use single dose and interrupt nursing for 24 hr thereafter.

Adverse Reactions/Side Effects

Derm: STEVENS-JOHNSON SYNDROME (SJS) rash, urticaria; *topical only*, burning, mild dryness, skin irritation, transient redness. **EENT:** optic neuropathy, tearing (topical only). **GI:** abdominal pain, anorexia, nausea, diarrhea, dry mouth, furry tongue, glossitis, unpleasant taste, vomiting. **Hemat:** leukopenia. **Local:** phlebitis at IV site. **Neuro:** peripheral neuropathy, SEIZURES, dizziness, headache, aseptic meningitis (IV), encephalopathy (IV), psychosis. **Misc:** superinfection.

Interactions

Drug-Drug: Cimetidine may ↑ levels and risk of toxicity. **Phenobarbital** and **rifampin** may ↓ levels and effectiveness. May ↑ levels and the risk of toxicity of **phenytoin**, **lithium**, and **warfarin**. Disulfiram-like reaction may occur with **alcohol** ingestion. May cause acute psychosis and confusion with **disulfiram**. ↑ risk of leukopenia with **fluorouracil** or **azathioprine**. Use with **QT interval prolonging medications** may ↑ risk of QT interval prolongation.

Route/Dosage

PO (Adults): *Anaerobic infections*—7.5 mg/kg every 6 hr (not to exceed 4 g/day). *Trichomoniasis*—250 mg every 8 hr for 7 days *or* single 2-g dose *or* 1 g twice daily for 1 day. *Amebiasis*—500–750 mg every 8 hr for 5–10 days. *H. pylori*—250 mg 4 times daily *or* 500 mg twice daily for 1–2 wk (with other agents). *Antibiotic associated Clostridioides difficile-associated diarrhea (CDAD)*—250–500 mg 3–4 times/day for 10–14 days.

PO (Infants and Children): *Anaerobic infections*—30 mg/kg/day divided every 6 hr, maximum dose: 4 g/day *Trichomoniasis*—15–30 mg/kg/day divided every 8 hr for 7–10 days. *Amebiasis*—35–50 mg/kg/day divided every 8 hr for 5–10 days (not to exceed 750 mg/dose). *Clostridioides difficile-associated diarrhea (CDAD)*—30 mg/kg/day divided every 6 hr for 7–10 days. *H. pylori*—15–20 mg/kg/day divided twice daily for 4 wk.

IV, PO (Neonates 0–4 wk, <1200 g): 7.5 mg/kg every 48 hr. *Postnatal age <7 days, 1200–2000 g*—7.5 mg/kg/day every 24 hr. *Postnatal age <7 days, >2000 g*—15 mg/kg/day divided every 12 hr. *Postnatal age >7 days, 1200–2000 g*—15 mg/kg/day divided every 12 hr. *Postnatal age >7 days, >2000 g*—30 mg/kg/day divided every 12 hr.

IV (Adults): *Anaerobic infections*—Initial dose 15 mg/kg, then 7.5 mg/kg every 6–8 hr *or* 500 mg every 6–8 hr (not to exceed 4 g/day). *Perioperative prophylaxis*—Initial dose 15 mg/kg 1 hr before surgery, then 7.5 mg/kg 6 and 12 hr later. *Amebiasis*—500–750 mg every 8 hr for 5–10 days.

IV (Children): *Anaerobic infections*—30 mg/kg/day divided every 6 hr, maximum dose: 4 g/day.

Topical (Adults): *Acne rosacea*—Apply thin film to affected area bid.

Vag (Adults): *MetroGel Vaginal*—One applicatorful (37.5 mg) of 0.75% gel 1–2 times daily for 5 days; *Nuvessa*—One applicatorful (65 mg) of 1.3% gel as a single dose at bedtime; *Vandazole*—One applicatorful (37.5 mg) of 0.75% gel once daily for 5 days.

Vag (Children ≥12 yr): *Nuvessa*—One applicatorful (65 mg) of 1.3% gel as a single dose at bedtime.

© F.A. Davis Publishing

Vag (Children Post-menarchal): *Vandazole*—One applicatorful (37.5 mg) of 0.75% gel once daily for 5 days.

Availability (generic available)

Tablets: 250 mg, 500 mg. **Capsules:** 375 mg, 500 mg. **Premixed infusion:** 500 mg/100 mL. **Topical cream:** 0.75%, 1%. **Topical gel:** 0.75%, 1%. **Topical lotion:** 0.75%. **Vaginal cream:** 10% (500 mg/applicatorful). **Vaginal gel:** 0.75% (37.5 mg/5 g applicatorful), 1.3% (65 mg/5 g applicatorful). ***In combination with:*** bismuth subcitrate potassium and tetracycline (Pylera). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Monitor neurologic status during and after IV infusions. Inform health care professional if numbness, paresthesia, weakness, ataxia, or seizures occur.
- Monitor intake, output, and daily weight, especially for patients on sodium restriction. Each 500 mg of premixed injection for dilution contains 14 mEq of sodium.
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Giardiasis:** Monitor three stool samples taken several days apart, beginning 3–4 wk after treatment.
- ***Lab Test Considerations:*** May alter results of serum AST, ALT, and LDH tests.

Implementation

- Do not confuse metronidazole with metformin.
- **PO:** Administer on an empty stomach, or may administer with food or milk to minimize GI irritation. Tablets may be crushed for patients with difficulty swallowing. ***DNC:*** Swallow extended-release tablets whole; do not break, crush, or chew.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Administer premixed injection (500 mg/100 mL) undiluted. Do not refrigerate. Once taken out of overwrap, premixed infusion stable for 30 days at room temperature. ***Concentration:*** 5 mg/mL. ***Rate:*** Infuse over 30–60 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, azithromycin, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftozolane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daunorubicin hydrochloride, defibrotide, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, eravacycline, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, meropenem/vaborbactam, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphate, prochlorperazine, promethazine, propranolol, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphate, streptozocin, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acetaminophen, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, aztreonam, blinatumomab, dantrolene, daptomycin, diazepam, filgrastim, ganciclovir, minocycline, pantoprazole, pemetrexed, phenytoin, procainamide, propofol, quinupristin/dalfopristin.
- **Topical:** Cleanse affected area before application. Apply and rub in a thin film twice daily, morning and evening. Avoid contact with eyes.
- **Vag:** Administer once daily dosing at bedtime.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take medication as directed with evenly spaced times between doses, even if feeling better. Do not skip doses or double up on missed doses. Take missed doses as soon as remembered if not almost time for next dose.
- Advise patients treated for trichomoniasis that sexual partners may be asymptomatic sources of reinfection and should be treated concurrently. Patient should also refrain from intercourse or use a condom to prevent reinfection.
- Caution patient to avoid intake of alcoholic beverages or preparations containing alcohol during and for at least 3 days after treatment with metronidazole, including vaginal gel. May cause a disulfiram-like reaction (flushing, nausea, vomiting, headache, abdominal cramps).
- May cause dizziness or light-headedness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional promptly if rash occurs.
- Inform patient that medication may cause an unpleasant metallic taste.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Notify health care professional if dry mouth persists for more than 2 wk.
- Inform patient that medication may cause urine to turn dark.
- Advise patient to consult health care professional if no improvement in a few days or if signs and symptoms of superinfection (black, furry overgrowth on tongue; vaginal itching or discharge; loose or foul-smelling stools) develop.
- Advise females of reproductive potential to inform health care professional if pregnancy is planned or suspected or if breast feeding.
- **Vag:** Instruct patient in correct technique for intravaginal instillation. Advise patient to avoid intercourse during treatment with vaginal gel.
- **Topical:** Instruct patient on correct technique for application of topical gel. Cosmetics may be used after application of gel.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.
- Significant results should be seen within 3 wk of application of topical gel. Application may be continued for 9 wk.

micafungin (my-ka-fun-gin)

Mycamine

Classification

Therapeutic: antifungals
Pharmacologic: echinocandins

Indications

Treatment of esophageal candidiasis. Treatment of candidemia/acute disseminated candidiasis/*Candida* peritonitis and abscesses (in adults and pediatric patients ≥4 mo). Treatment of candidemia/acute disseminated candidiasis/*Candida* peritonitis and abscesses without meningoencephalitis and/or ocular dissemination (in pediatric patients <4 mo). Prophylaxis of *Candida* infections during hematopoetic stem cell transplantation.

Action

Inhibits synthesis of glucan required for the formation of fungal cell wall. **Therapeutic Effects:** Death of susceptible fungi. **Spectrum:** Active against the following *Candida* spp.: *C. albicans*, *C. glabrata*, *C. krusei*, *C. parapsilosis*, *C. tropicalis*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized; 71% fecal elimination.
Half-life: 15 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Severe hepatic impairment; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <4 mo with meningoencephalitis and/or ocular dissemination (safety and effectiveness not established).

Adverse Reactions/Side Effects

GI: worsening hepatic function/hepatitis. **GU:** renal impairment. **Hemat:** hemolysis/hemolytic anemia. **Local:** injection site reactions. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), infusion reactions.

© F.A. Davis Publishing

Interactions

Drug-Drug: ↑ levels and risk of toxicity with **sirolimus** and **nifedipine** (dose adjustments may be necessary).

Route/Dosage

Treatment of Esophageal Candidiasis

IV (Adults): 150 mg once daily for 15 days (range 10–30 days).
IV (Children ≥4 mo and >30 kg): 2.5 mg/kg once daily (max daily dose = 150 mg).
IV (Children ≥4 mo and ≤30 kg): 3 mg/kg once daily.

Treatment of Candidemia/Acute Disseminated Candidiasis/*Candida* Peritonitis and Abscesses

IV (Adults): 100 mg once daily for 15 days (range 10–47 days).
IV (Children ≥4 mo and >30 kg): 2 mg/kg once daily (max daily dose = 100 mg).
IV (Children ≥4 mo and ≤30 kg): 2 mg/kg once daily.

Treatment of Candidemia/Acute Disseminated Candidiasis/*Candida* Peritonitis and Abscesses Without Meningoencephalitis and/or Ocular Dissemination

IV (Children <4 mo): 4 mg/kg once daily.

Prophylaxis of *Candida* Infections During Hematopoetic Stem Cell Transplantation.

IV (Adults): 50 mg once daily (duration range 6–51 days).
IV (Children ≥4 mo and >30 kg): 1 mg/kg once daily (max daily dose = 50 mg).
IV (Children ≥4 mo and ≤30 kg): 1 mg/kg once daily.

Availability (generic available)

Lyophilized powder for injection: 50 mg/vial, 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess symptoms of esophageal candidiasis (dysphagia, odynophagia, retrosternal pain) prior to and during therapy.
- Monitor for signs of anaphylaxis (rash, pruritus, wheezing, laryngeal edema, abdominal pain). Discontinue micafungin and notify health care professional immediately if these occur.
- Monitor for signs and symptoms of histamine-mediated reactions (rash, pruritus, facial swelling, vasodilation) during infusion. If symptoms occur, slow infusion rate.
- Assess for injection site reactions (phlebitis, thrombophlebitis) during therapy. These occur more frequently in patients receiving micafungin via peripheral IV infusion.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, bilirubin, ALT, AST, and LDH levels. If elevations occur, monitor for worsening liver function; may require discontinuation of therapy.
- May cause ↑ BUN and serum creatinine.
- May cause leukopenia, neutropenia, thrombocytopenia, and anemia. Monitor for worsening levels; may require discontinuation of therapy.
- May cause hypokalemia, hypocalcemia, and hypomagnesemia.

Implementation

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** *For Adults:* Reconstitute each 50-mg vial with 5 mL of 0.9% NaCl or D5W to achieve concentration of 10 mg/mL. Reconstitute each 100-mg vial with 5 mL of 0.9% NaCl or D5W to achieve concentration of 20 mg/mL. Dissolve by gently swirling vial; do not shake vigorously. ***Dilution:*** Directions for further dilution based on indication for use. For prophylaxis of *Candida* infections, add 50 mg of micafungin to 100 mL of 0.9% NaCl or D5W. For treatment of esophageal candidiasis, add 150 mg of micafungin to 100 mL of 0.9% NaCl or D5W. Reconstituted vials and infusion are stable for 24 hr at room temperature. Protect diluted solution from light. ***Concentration:*** 0.5–1.5 mg/mL.
- *For Children:* ***Dilution:*** Determine dose and divide by final concentration (10 or 20 mg/mL). Add withdrawn volume to 0.9% NaCl or D5W in IV bag or syringe. ***Concentration:*** 0.5–4 mg/mL. Concentrations >1.5 mg/mL should be administered via central venous catheter to minimize infusion reactions. Discard unused vials. ***Rate:*** Flush line with 0.9% NaCl prior to administration. Infuse over 1 hr. More rapid infusions may result in more frequent histamine mediated reactions.
- **Y-Site Compatibility:** aminophylline, bumetanide, calcium chloride, calcium gluconate, cangrelor, carboplatin, ceftolozane/tazobactam, cyclosporine, dopamine, eptifibatide, esmolol, etoposide, fenoldopam, furosemide, heparin, hydromorphone, lidocaine, lorazepam, magnesium sulfate, meropenem/vaborbactam, mesna, milrinone, nitroglycerin, nitroprusside, norepinephrine, phenylephrine, posaconazole, potassium chloride, potassium phosphates, sodium phosphates, tacrolimus, tedizolid, theophylline, vasopressin.
- **Y-Site Incompatibility:** albumin, human, amiodarone, cisatracurium, diltiazem, dobutamine, epinephrine, eravacycline, insulin regular, isavuconazonium, labetalol, levofloxacin, meperidine, midazolam, morphine, mycophenolate, nicardipine, octreotide, ondansetron, phenytoin, plazomicin, rocuronium, telavancin, vecuronium.

© F.A. Davis Publishing

Patient/Family Teaching

- Inform patient of the purpose of micafungin.
- Advise patient to notify health care professional immediately if signs of anaphylaxis occur. Infusion should be discontinued if symptoms occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of esophageal candidiasis, candidemia, acute disseminated candidiasis, candidal peritonitis, and abscesses.
- Prevention of *Candida* infections during hematopoetic stem cell transplantation.

miconazole, See ANTIFUNGALS (TOPICAL) and ANTIFUNGALS (VAGINAL).

HIGH ALERT

midazolam (mid-ay-zoe-lam)

Nayzilam, Seizalam, ~~Versed~~

Classification

Therapeutic: antianxiety agents, anticonvulsants, sedative/hypnotics

Pharmacologic: benzodiazepines

Schedule IV

Indications

PO: Preprocedural sedation and anxiolysis in pediatric patients. **IM, IV:** Preoperative sedation/anxiolysis/amnesia: Status epilepticus. **IV:** Provides sedation/anxiolysis/amnesia during therapeutic, diagnostic, or radiographic procedures (conscious sedation): Aids in the induction of anesthesia and as part of balanced anesthesia, As a continuous infusion, provides sedation of mechanically ventilated patients during anesthesia or in a critical care setting. **Intranasal:** Acute treatment of intermittent, stereotypic episodes of frequent seizure activity (i.e., seizure clusters, acute repetitive seizures) that are distinct from a patient's usual seizure pattern in patients with epilepsy.

Action

Acts at many levels of the CNS to produce generalized CNS depression. Effects may be mediated by GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Short-term sedation. Postoperative amnesia. Termination of seizure activity.

Pharmacokinetics

Absorption: Rapidly absorbed following oral and nasal administration; undergoes substantial intestinal and first-pass hepatic metabolism. Well absorbed following IM administration; IV administration results in complete bioavailability.

Distribution: Crosses the blood-brain barrier and placenta; excreted in breast milk.

Protein Binding: 97%.

Metabolism and Excretion: Almost exclusively metabolized by the liver by the CYP3A4 isoenzyme, resulting in conversion to hydroxymidazolam, an active metabolite, and 2 other inactive metabolites; metabolites are excreted in urine.

Half-life: Preterm neonates: 2.6–17.7 hr; Neonates: 4–12 hr; Children: 3–7 hr; Adults: 2–6 hr (increased in renal impairment, HF, or cirrhosis).

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
IN	5 min	10 min	30–60 min
IM	15 min	30–60 min	2–6 hr
IV	1.5–5 min	rapid	2–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may occur; Shock; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Acute angle-closure glaucoma; OB: Benzodiazepine drugs may ↑ risk of congenital malformations; use in the last wk of pregnancy has caused CNS depression in the neonate; may affect child's brain development when used during 3rd trimester; Lactation: Lactation; Pedi: Products containing benzyl alcohol should not be used in neonates.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Pulmonary disease; HF; Renal impairment; Severe hepatic impairment; Obese pediatric patients (calculate dose on the basis of ideal body weight); Open-angle glaucoma; Pedi: Rapid injection in neonates has caused severe hypotension and seizures, especially when used with fentanyl; may affect brain development in children <3 yr; safety and effectiveness of nasal spray has not been established in children <12 yr; Geri: Older adults (especially >70 yr) are more susceptible to cardiorespiratory depressant effects; dosage ↓ required.

Adverse Reactions/Side Effects

CV: CARDIAC ARREST, arrhythmias. **Derm:** rash. **EENT:** blurred vision. **GI:** hiccups, nausea, vomiting. **Local:** phlebitis at IV site, pain at IM site. **Neuro:** SUICIDAL THOUGHTS, agitation, drowsiness, excess seda-

© F.A. Davis Publishing

tion, headache. **Resp:** APNEA, LARYNGOSPASM, RESPIRATORY DEPRESSION, bronchospasm, cough.

Interactions

Drug-Drug: ↑ CNS depression with **alcohol**, **antihistamines**, **opioid analgesics**, and other **sedative/hypnotics** (↓ midazolam dose by 30–50% if used concurrently). ↑ risk of hypotension with **antihypertensives**, **opioid analgesics**, acute ingestion of **alcohol**, or **nitrates**. **Moderate CYP3A4 inhibitors** and **strong CYP3A4 inhibitors**, including **clarithromycin**, **diltiazem**, **erythromycin**, **itraconazole**, **ketoconazole**, and **verapamil** may ↑ levels and the risk of toxicity; avoid concurrent use. **Strong CYP3A4 inducers**, including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifampin**, and **rifabutin** may ↓ levels.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. Long-term use of **St. John's wort** may significantly ↓ levels.
Drug-Food: **Grapefruit juice** ↓ metabolism and may ↑ risk of toxicity.

Route/Dosage

Dose must be individualized, taking caution to reduce dose in geriatric patients and in those who are already sedated.

Preoperative Sedation/Anxiolysis/Amnesia

PO (Children 6 mo–16 yr): 0.25–0.5 mg/kg, may require up to 1 mg/kg (dose should not exceed 20 mg); *patients with cardiac/respiratory compromise or concurrent CNS depressants*—0.25 mg/kg.
IM (Adults Otherwise Healthy and <60 yr): 0.07–0.08 mg/kg 1 hr before surgery (usual dose 5 mg).
IM (Adults ≥60 yr, Debilitated or Chronically Ill): 0.02–0.03 mg/kg 1 hr before surgery (usual dose 1–3 mg).
IM (Children): 0.1–0.15 mg/kg up to 0.5 mg/kg 30–60 min prior to procedure; not to exceed 10 mg/dose.

Conscious Sedation for Short Procedures

IV (Adults and Children Otherwise Healthy >12 yr and <60 yr): 1–2.5 mg initially; dosage may be ↑ further as needed. Total doses >5 mg are rarely needed (↓ dose by 50% if other CNS depressants are used). Maintenance doses of 25% of the dose required for initial sedation may be given as necessary.
IV (Children 6–12 yr): 0.025–0.05 mg/kg initially, then titrate dose carefully, may need up to 0.4 mg/kg total, maximum dose 10 mg.
IV (Children 6 mo–5 yr): 0.05 mg/kg initially, then titrate dose carefully, may need up to 0.6 mg/kg total, maximum dose 6 mg.
IV (Geriatric Patients ≥60 yr, Debilitated or Chronically Ill): 1–1.5 mg initially; dose may be ↑ further as needed. Total doses >3.5 mg are rarely needed (↓ dose by 30% if other CNS depressants are used). Maintenance doses of 25% of the dose required for initial sedation may be given as necessary.
Intranasal (Children): 0.2–0.3 mg/kg, may repeat in 5–15 min.

Status Epilepticus

IM (Adults): 10 mg single dose.
IV (Children >2 mo): 0.15 mg/kg load followed by a continuous infusion of 1 mcg/kg/min. Titrate dose upward every 5 min until seizure controlled, range: 1–18 mcg/kg/min.

Seizure Clusters

Intranasal (Adults and Children ≥12 yr): One spray (5 mg) into one nostril initially; if inadequate response after 10 min, administer one spray (5 mg) into other nostril. Not to exceed 2 doses for a single seizure episode. Should not be used to treat more than one episode every 3 days and no more than 5 episodes per mo.

Induction of Anesthesia (Adjunct)

IV (Adults Otherwise Healthy and <55 yr): 300–350 mcg/kg initially (up to 600 mcg/kg total). May give additional dose of 25% of initial dose if needed. If patient is premedicated, initial dose should be further ↓.
IV (Geriatric Patients >55 yr): 150–300 mcg/kg as initial dose. May give additional dose of 25% of initial dose if needed. If patient is premedicated, initial dose should be further ↓.
IV (Adults — Debilitated): 150–250 mcg/kg initial dose. May give additional dose of 25% of initial dose if needed. If patient is premedicated, initial dose should be further ↓.

Sedation in Critical Care Settings

IV (Adults): 0.01–0.05 mg/kg (0.5–4 mg in most adults) initially if a loading dose is required; may repeat every 10–15 min until desired effect is obtained; may be followed by infusion at 0.02–0.1 mg/kg/hr (1–7 mg/hr in most adults).
IV (Children): *Intubated patients only*—0.05–0.2 mg/kg initially as a loading dose; follow with infusion at 0.06–0.12 mg/kg/hr (1–2 mcg/kg/min), titrate to effect, range: 0.4–6 mcg/kg/min.
IV (Neonates >32 wk): *Intubated patients only*—0.06 mg/kg/hr (1 mcg/kg/min).
IV (Neonates <32 wk): *Intubated patients only*—0.03 mg/kg/hr (0.5 mcg/kg/min).

Availability (generic available)

Oral syrup (cherry flavor): 2 mg/mL. **Nasal spray (Nayzilam):** 5 mg/0.01 mL single-dose unit. **Premixed infusion:** 50 mg/50 mL 0.9% NaCl, 100 mg/100 mL 0.9% NaCl. **Solution for injection:** 1 mg/mL, 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess level of sedation and level of consciousness throughout and for 2–6 hr following administration.
- Monitor BP, pulse, and respiration continuously during administration, especially if co-administering opioid analgesics. Oxygen and resuscitative equip-

© F.A. Davis Publishing

ment should be immediately available during IV administration.
- Assess risk for addiction, abuse, or misuse before starting and periodically during therapy.
- ***Toxicity and Overdose:*** If overdose occurs, monitor pulse, respiration, and BP continuously. Maintain patent airway and assist ventilation as needed. If hypotension occurs, treatment includes IV fluids, repositioning, and vasopressors.
- The effects of midazolam can be reversed with flumazenil (Romazicon).

Implementation

- ***High Alert:*** Accidental overdose of oral midazolam syrup in children has resulted in serious harm or death. Do not accept orders prescribed by volume (5 mL or 1 tsp); instead, request dose be expressed in milligrams. Have second practitioner independently check original order and dose calculations. Midazolam syrup should only be administered by health care professionals authorized to administer conscious sedation.
- Supervise ambulation and transfer of patients after administration. Two side rails should be raised and call bell within reach at all times.
- Gradually taper to discontinue or reduce the dose to reduce risk of withdrawal reactions, increased seizure frequency, and status epilepticus. If withdrawal symptoms develop, pause taper or increase dose to previous tapered dose level; decrease dose more slowly. Some patients may require longer tapering period (weeks to >12 mo).
- **PO:** To use the *Press-in Bottle Adaptor (PIBA),* remove the cap and push bottle adaptor into neck of bottle. Close bottle tightly with cap. Solution is a clear red to purplish-red, cherry-flavored syrup. Then remove cap and insert tip of oral dispenser in bottle adaptor. Push the plunger completely down toward tip of oral dispenser and insert firmly into bottle adaptor. Turn entire unit (bottle and oral dispenser) upside down. Pull plunger out slowly until desired amount of medication is withdrawn into oral dispenser. Turn entire unit right side up and slowly remove oral dispenser from the bottle. Tip of dispenser may be covered with tip of cap until time of use. Close bottle with cap after each use.
- Dispense directly into mouth. Do not mix with any liquid prior to dispensing.
- **Intranasal:** Administer 1 spray into one nostril. If no response to initial dose after 10 min, may administer 1 spray into other nostril.
- **IM:** Administer IM doses deep into mid-outer thigh (vastus lateralis muscle), maximum concentration 1 mg/mL. Solution is clear, colorless to light yellow. Do not administer solutions that are discolored or contain particulate matter.

IV Administration

- **IV Push:** ***Dilution:*** Administer undiluted or diluted with D5W or 0.9% NaCl. ***Concentration:*** Undiluted: 1 mg/mL or 5 mg/mL. Diluted: 0.03–3 mg/mL. ***Rate:*** Administer slowly over at least 2–5 min. Titrate dose to patient response. Rapid injection, especially in neonates, has caused severe hypotension.
- **Continuous Infusion:** ***Dilution:*** Dilute with 0.9% NaCl or D5W. ***Concentration:*** 0.5–1 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titrate to desired level of sedation. Assess sedation at regular intervals and adjust rate up or down by 25–50% as needed. Dose should also be decreased by 10–25% every few hrs to find minimum effective infusion rate, which prevents accumulation of midazolam and provides more rapid recovery upon termination.
- **Y-Site Compatibility:** acetaminophen, alemtuzumab, alfentanil, amikacin, amiodarone, anidulafungin, argatroban, arsenic trioxide, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, buprenorphine, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftaroline, ceftolozane/tazobactam, ceftriaxone, ciprofloxacin, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, eravacycline, erythromycin lactobionate, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, folic acid, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin/relebactam, irinotecan, isavuconazonium, isoproterenol, ketamine, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methadone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, plazomicin, potassium chloride, procainamide, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rifampin, rocuronium, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiotepa, tigecycline, tirofiban, to-

© F.A. Davis Publishing

bramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, albumin, human, aminocaproic acid, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, ascorbic acid, azathioprine, azithromycin, cefepime, ceftazidime, cefuroxime, chloramphenicol, dantrolene, dexamethasone, diazepam, epoetin alfa, ertapenem, esomeprazole, fluorouracil, foscarnet, fosphenytoin, ganciclovir, gemtuzumab ozogamicin, hydrocortisone, ibuprofen lysine, indomethacin, ketorolac, meropenem/vaborbactam, methotrexate, micafungin, mitomycin, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium acetate, prochlorperazine, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Inform patient that this medication will decrease mental recall of the procedure.
- Advise patient to avoid grapefruit juice during therapy.
- May cause drowsiness or dizziness. Advise patient to request assistance prior to ambulation and transfer and to avoid driving or other activities requiring alertness for 24 hr following administration.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products, especially blood pressure medicine, antibiotics, and St. John's wort.
- Advise patient to avoid alcohol or other CNS depressants, including opioids, for 24 hr following administration of midazolam.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood, or skin rash occur.
- Advise patient that midazolam is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage pregnant patients to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334; information is available at www.aedpregnancyregistry.org.
- **Nayzilam:** Instruct individual administering *Nayzilam* on how to identify seizure clusters and use product appropriately. Advise patients and caregivers to read *Medication Guide* before starting and with each Rx refill in case of changes. Discuss safe use, risks, and proper storage and disposal of midazolam with patients and caregivers with each Rx refill.
- Advise patient that midazolam is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.

Evaluation/Desired Outcomes

- Sedation during and amnesia following surgical, diagnostic, and radiologic procedures.
- Sedation and amnesia for mechanically ventilated patients in a critical care setting.
- Termination of seizure activity.

REMS

miFEPRIStone (mi-fe-priss-tone)

Korlym, Mifeprex

Classification

Therapeutic: abortifacients, antidiabetics

Pharmacologic: antiprogestational agents

Indications

Mifeprex: Medical termination of intrauterine pregnancy up to day 70 of pregnancy (in combination with misoprostol). **Korlym**: Hyperglycemia secondary to hypercortisolism in patients with endogenous Cushing's syndrome who have type 2 diabetes or glucose intolerance and have failed or are not candidates for surgery.

Action

Antagonizes endometrial and myometrial effects of progesterone. Sensitizes the myometrium to contraction-inducing activity of prostaglandins. Antagonizes the glucocorticoid receptor. **Therapeutic Effects:** Termination of pregnancy. Improved control of blood glucose.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration (69% bioavailability); absorption enhanced with food.

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: Primarily metabolized by the liver via the CYP3A4 isoenzyme; primarily excreted in the feces.

Half-life: 18 hr.

TIME/ACTION PROFILE (termination of pregnancy)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	within 2 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Presence of an intrauterine device (IUD) (Mifeprex); Undiagnosed

© F.A. Davis Publishing

adnexal mass (Mifeprex); Chronic adrenal failure (Mifeprex); Concurrent long-term corticosteroid therapy; Bleeding disorders or concurrent anticoagulant therapy (Mifeprex); Inherited porphyrias (Mifeprex); Severe hepatic impairment (Korlym); Concurrent use with simvastatin, lovastatin, cyclosporine, dihydroergotamine, ergotamine, fentanyl, pimozide, quinidine, sirolimus, or tacrolimus (Korlym); Vaginal bleeding; Endometrial hyperplasia with atypia or endometrial carcinoma (Korlym); OB: Confirmed or suspected ectopic pregnancy (Mifeprex); OB: Pregnancy (Korlym).

Use Cautiously in: Chronic medical conditions such as cardiovascular, hypertensive, hepatic, renal, or respiratory disease (Mifeprex); Women >35 yrs old or who smoke ≥10 cigarettes/day (Mifeprex); Concurrent use with moderate CYP3A4 inhibitors; Bleeding disorders or concurrent anticoagulant therapy (Korlym).

Exercise Extreme Caution in: Concurrent use with strong CYP3A4 inhibitors (Korlym).

Adverse Reactions/Side Effects

CV: peripheral edema (Korlym), hypertension (Korlym), QT interval prolongation (Korlym). **Derm:** rash (Korlym). **Endo:** hypothyroidism (Korlym), adrenal insufficiency (Korlym), ↓ HDL cholesterol (Korlym). **F and E:** hypokalemia (Korlym). **GI:** abdominal pain (Mifeprex), anorexia (Korlym), constipation (Korlym), diarrhea, dry mouth (Korlym), nausea, vomiting. **GU:** uterine bleeding, uterine cramping (Mifeprex), ruptured ectopic pregnancy (Mifeprex), pelvic pain (Mifeprex). **MS:** arthralgia (Korlym), myalgia (Korlym). **Neuro:** anxiety (Korlym), headache, dizziness, fainting (Mifeprex), fatigue (Korlym), weakness (Mifeprex). **Resp:** dyspnea (Korlym), *Pneumocystis jiroveci* pneumonia. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: ↑ blood levels and risk of toxicity from **dihydroergotamine**, **ergotamine**, **lovastatin**, **simvastatin**, **cyclosporine**, **fentanyl**, **pimozide**, **quinidine**, **sirolimus**, or **tacrolimus**; concurrent use with Korlym is contraindicated. **Strong CYP3A4 inhibitors**, including **ketoconazole**, **itraconazole**, **nefazodone**, **ritonavir**, **nelfinavir**, **indinavir**, **atazanavir**, **fosamprenavir**, **clarithromycin**, **conivaptan**, **lopinavir/ritonavir**, **posaconazole**, **saquinavir**, or **voriconazole** may ↑ levels; adjust dose of Korlym. **Moderate CYP3A4 inhibitors**, including **aprepitant**, **diltiazem**, **fluconazole**, **imatinib**, or **verapamil** may ↑ levels; caution with concurrent use of Korlym. Blood levels and effects may be ↓ by **rifampin**, **rifabutin dexamethasone**, **phenytoin**, **phenobarbital**, and **carbamazepine**; avoid concurrent use with Korlym.

Drug-Natural Products: Blood levels and effects may be ↓ by **St. John's wort**; avoid concurrent use with Korlym.

Drug-Food: Blood levels and effects may be ↑ by **grapefruit juice**; caution with concurrent use of Korlym.

Route/Dosage

Mifeprex

PO (Adults): *Day 1*—200 mg as a single dose, followed on *Day 2 or Day 3 (within 24–48 hr of taking Mifeprex)* by misoprostol 800 mcg (given as four 200–mcg tablets) given buccally.

Korlym

PO (Adults): 300 mg once daily; may ↑ by 300 mg/day every 2–4 wk (maximum dose = 1200 mg/day or 20 mg/kg/day); *Initiation of Korlym in patients already being treated with strong CYP3A4 inhibitor*—300 mg once daily; may titrate up to 900 mg once daily, if needed; *Initiation of strong CYP3A4 inhibitor in patients already being treated with Korlym*—Current dose of Korlym = 300 mg once daily: No change; Current dose of Korlym = 600 mg once daily: ↓ dose to 300 mg once daily (may titrate up to 600 mg once daily, if needed); Current dose of Korlym = 900 mg once daily: ↓ dose to 600 mg once daily; Current dose of Korlym = 1200 mg once daily: ↓ dose to 900 mg once daily.

Renal Impairment

PO (Adults): 300 mg once daily; may ↑ by 300 mg/day every 2–4 wk (maximum dose = 600 mg/day).

Hepatic Impairment

PO (Adults): 300 mg once daily; may ↑ by 300 mg/day every 2–4 wk (maximum dose = 600 mg/day).

Availability (generic available)

Tablets (Korlym): 300 mg. **Tablets (Mifeprex):** 200 mg.

NURSING IMPLICATIONS

Assessment

- **Mifeprex**: Determine duration of pregnancy. Pregnancy is dated from the first day of the last menstrual period in a presumed 28-day cycle with ovulation occurring at mid-cycle and can be determined by menstrual history and clinical examination; use ultrasound if duration is uncertain or if ectopic pregnancy is suspected. Assess women who became pregnant with an IUD in place for ectopic pregnancy.
- Assess amount of bleeding and cramping during treatment. Determine if termination is complete on day 14.
- **Korlym:** Monitor for changes in cushingoid appearance (acne, hirsutism, striae, body weight) during therapy.
- Monitor for signs and symptoms of adrenal insufficiency (weakness, nausea, increased fatigue, hypo-

© F.A. Davis Publishing

tension, hypoglycemia) during therapy. If adrenal insufficiency is suspected, discontinue Korlym and administer glucocorticoids immediately.
- ***Lab Test Considerations:*** **Mifeprex:** ↓ hemoglobin, hematocrit, and RBCs may occur in women who bleed heavily.
- Changes in quantitative human chorionic gonadotropin (hCG) levels are not accurate until at least 10 days after mifepristone administration; complete termination of pregnancy must be confirmed by clinical examination.
- **Korlym:** Verify negative pregnancy test in women prior to starting therapy or before restarting therapy if stopped for more than 14 days. Correct hypokalemia prior to initiating therapy. Assess serum potassium 1–2 wk after starting or increasing dose of Korlym and periodically thereafter.
- Monitor A1c periodically during therapy.

Implementation

- Do not confuse mifepristone with misoprostol.
- ***REMS:*** Mifeprex is only available through a restricted program, mifepristone REMS program. Prescribers must be certified by the program, patients must sign an agreement form, and mifepristone is dispensed to patients only in certain healthcare settings.
- **Mifeprex:** Mifepristone should be administered only by health care professionals who have read and understood the prescribing information, are able to assess gestational age of an embryo and diagnose ectopic pregnancies, and who are able to provide surgical intervention in cases of incomplete abortion or severe bleeding.
- Remove any IUD prior to mifepristone administration.
- Measures to prevent rhesus immunization, similar to those of surgical abortion, should be taken.
- **PO:** On *day 1*, after the patient has read the *Medication Guide* and signed the Patient Agreement, administer one 200–mg tablet of mifepristone as a single dose. On *day 2 or 3*, unless abortion has occurred and been confirmed by clinical examination or ultrasound, administer four 200-mcg tablets of misoprostol buccally between 24 and 48 hrs after taking mifepristone. Expulsion of pregnancy usually happens within 2–24 hrs of taking misoprostol. On *day 7–14*, confirm that termination of pregnancy has occurred by clinical examination or ultrasound. If complete expulsion has not occurred, administer another dose of misoprostil 800 mcg buccally.
- **Korlym:** Administer with a meal. ***DNC:*** Swallow tablet whole; do not crush, break, or chew.
- If Korlym therapy is interrupted, reinitiate at lowest dose (300 mg).

Patient/Family Teaching

- **Mifeprex:** Advise patient of the treatment and its effects. Patients must be given a copy of the *Medication Guide and Patient Agreement.* Patient must understand the necessity of completing the treatment schedule of three office visits (day 1, day 2–3, and day 7–14).
- Inform patient that vaginal bleeding and uterine cramping will probably occur and that prolonged or heavy vaginal bleeding is not proof of complete expulsion. Bleeding or spotting occurs for an average of 9–16 days; but may continue for more than 30 days. Advise patient that if the treatment fails, there is a risk of fetal malformation; medical abortion failures are managed by surgical termination.
- Caution patient to notify health care professional immediately if heavy bleeding (soak through 2 thick full-size sanitary pads per hr for 2 consecutive hrs or are concerned about heavy bleeding); abdominal pain or feeling sick (weakness, nausea, vomiting, diarrhea, with or without abdominal pain or fever more than 24 hr after taking mifepristone); or fever (≥100.4°F that lasts >4 hrs, may indicate life-threatening sepsis) occurs.
- Instruct patient in the steps to take in an emergency situation, including precise instructions and a telephone number to call if she has problems or concerns.
- May cause dizziness or fainting. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if she smokes at least 10 cigarettes a day.
- Rep: Caution patient that pregnancy can occur following termination of pregnancy and before resumption of normal menses. Contraception can be initiated as soon as pregnancy termination is confirmed, or before sexual intercourse is resumed.
- **Korlym:** Instruct patient to take Korlym as directed. Advise patient to read *Medication Guide* prior to starting therapy and with each refill in case of changes.
- Caution patient to avoid drinking grapefruit juice during therapy; may increase risk of side effects.
- Instruct patient to notify health care professional if signs and symptoms of adrenal insufficiency, abnormal vaginal bleeding, or low potassium (muscle weakness, aches, cramps, palpitations) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May cause fetal harm. Advise female patient to use a nonhormonal form of contraception during and for at least 1 mo after stopping therapy. Notify health care professional immediately if pregnancy is suspected. Advise female patient to avoid breast feeding during therapy. To minimize exposure to a breast-fed infant, women who discontinue or interrupt Korlym therapy may consider pumping and discarding milk during therapy and for 18–21 days (5–6 half-lives) after last dose, before breast feeding.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- **Mifeprex:** Termination of an intrauterine pregnancy of less than 70 days duration.
- **Korlym:** Improved control of blood glucose.

milnacipran (mil-na-**sip**-ran)

Savella

Classification

Therapeutic: antifibromyalgia agents
Pharmacologic: selective norepinephrine reuptake inhibitors

Indications

Management of fibromyalgia.

Action

Inhibits neuronal reuptake of norepinephrine and serotonin. **Therapeutic Effects:** Decreased pain associated with fibromyalgia.

Pharmacokinetics

Absorption: 85–90% absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly excreted urine as unchanged drug (55%) and inactive metabolites.
Half-life: *D*—isomer 8–10 hr; *L*—isomer 4–6 hr.

TIME/ACTION PROFILE (↓ in pain)

ROUTE	ONSET	PEAK	DURATION
PO	1 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); End-stage renal disease; Significant history of alcohol use/abuse; Chronic liver disease; Lactation: Lactation.
Use Cautiously in: History of suicide risk or attempt; History of seizures; Moderate-to-severe renal impairment (↓ dose if CCr <30 mL/min); Hypertension; Severe hepatic impairment; Obstructive uropathy (↑ risk of adverse genitourinary effects); Angle-closure glaucoma; Geri: Consider age-related ↓ in renal function, chronic disease state and concurrent drug therapy; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: ↑ risk of suicidal thinking and behavior (suicidality) in adolescents and young adults up to 24 yr with major depressive disorder (MDD) and other psychiatric disorders.

Adverse Reactions/Side Effects

CV: hypertension, tachycardia. **Derm:** hot flushes, hyperhidrosis. **F and E:** hyponatremia. **GI:** PANCREATITIS, constipation, dry mouth, ↑ liver enzymes, nausea, vomiting. **GU:** ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, dizziness, headache, insomnia. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of milnacipran. Wait at least 5 days after discontinuing milnacipran before initiation of MAO inhibitor. Concurrent use with **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving milnacipran, immediately discontinue milnacipran and monitor for signs/symptoms of serotonin syndrome for 5 days or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume milnacipran therapy 24 hr after last dose of linezolid or methylene blue). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome. Concurrent use of **NSAIDs**, **aspirin**, or other **drugs that affect coagulation** may ↑ the risk of bleeding. May ↓ antihypertensive effectiveness of **clonidine**. ↑ risk of hypertension and arrhythmias with **epinephrine** or **norepinephrine**. ↑ risk of euphoria and hypotension when switching from **clomipramine**. Concurrent use with **digoxin** may result in adverse hemodynamics, including hypotension and tachycardia; avoid concurrent use with IV digoxin.
Drug-Natural Products: Use with **St. John's wort** ↑ serotonin syndrome.

Route/Dosage

PO (Adults): *Day 1*—12.5 mg; *Day 2–3*—12.5 mg twice daily; *Day 4–7*—25 mg twice daily; *After Day 7*—50 mg twice daily. Some patients may require up to 100 mg twice daily depending on response.

Renal Impairment

PO (Adults): *CCr 5–29 mL/min*—maintenance dose is 25 mg twice daily; some patients may require up to 50 mg twice daily depending on response.

Availability (generic available)

Tablets (contain tartrazine): 12.5 mg, 25 mg, 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess intensity, quality, and location of pain periodically during therapy. May require several wk for effects to be seen.

© F.A. Davis Publishing

- Monitor BP and heart rate before and periodically during therapy. Treat pre-existing hypertension and cardiac disease prior to therapy. Sustained hypertension may be dose related; decrease dose or discontinue therapy if this occurs.
- Monitor closely for changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, convulsions, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report symptoms immediately.
- Assess sexual function before starting milnacipran. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- ***Lab Test Considerations:*** May cause ↑ ALT, AST, and bilirubin.
- May cause hyponatremia.

Implementation

- **PO:** May be administered without regard to meals; may be more tolerable if taken with food.

Patient/Family Teaching

- Instruct patient to take milnacipran as directed at the same time each day. Take missed doses as soon as possible unless time for next dose. Do not stop abruptly; must be decreased gradually. Advise patient to read the *Medication Guide* prior to therapy and with each Rx refill.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. Assess symptoms on a day-to-day basis as changes may be abrupt. If these symptoms occur, notify health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort. Avoid use of aspirin, NSAIDs, and warfarin due to increased risk for bleeding.
- Instruct patient to notify health care professional if signs of liver damage (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained "flu-like" symptoms) or hyponatremia (headache, difficulty concentrating, memory impairment, confusion, weakness, unsteadiness, falls), rash, or serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.
- Advise patient to avoid taking alcohol during milnacipran therapy.
- Inform patient that milnicipran may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Rep: Instruct patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant while taking milnacipran to enroll in the pregnancy registry by calling 1-800-643-3010 or at www.savellapregnancyregistry.com.
- Encourage patient to maintain routine follow-up visits with health care provider to determine effectiveness.

Evaluation/Desired Outcomes

- Reduction in pain and soreness associated with fibromyalgia.

HIGH ALERT

milrinone (mill-ri-none)

~~Primacor~~

Classification

Therapeutic: inotropics

Indications

Short-term treatment of HF unresponsive to conventional therapy with digoxin, diuretics, and vasodilators.

Action

Increases myocardial contractility. Decreases preload and afterload by a direct dilating effect on vascular smooth muscle. **Therapeutic Effects:** Increased cardiac output (inotropic effect).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: 80–90% excreted unchanged by the kidneys.

Half-life: 2.3 hr (↑ in renal impairment).

TIME/ACTION PROFILE (hemodynamic effects)

ROUTE	ONSET	PEAK	DURATION
IV	5–15 min	unknown	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe aortic or pulmonic valvular heart disease; Hypertrophic subaortic stenosis (may ↑ outflow tract obstruction).

© F.A. Davis Publishing

Use Cautiously in: History of arrhythmias, electrolyte abnormalities, abnormal digoxin levels, or insertion of vascular catheters (↑ risk of ventricular arrhythmias); Renal impairment (↓ infusion rate if CCr is <50 mL/min); OB, Lactation: Pregnancy or lactation.

Adverse Reactions/Side Effects

CV: VENTRICULAR ARRHYTHMIAS, angina pectoris, chest pain, hypotension, supraventricular arrhythmias. **CV:** skin rash. **GI:** ↑ liver enzymes. **F and E:** hypokalemia. **Hemat:** thrombocytopenia. **Neuro:** headache, tremor.

Interactions

Drug-Drug: None significant.

Route/Dosage

IV (Adults): *Loading dose*—50 mcg/kg followed by *continuous infusion* at 0.5 mcg/kg/min (range 0.375–0.75 mcg/kg/min).

IV (Infants and Children): *Loading dose*—50 mcg/kg over 10 min followed by *continuous infusion* at 0.5 mcg/kg/min (range 0.25–0.75 mcg/kg/min).

Availability (generic available)

Injection: 1 mg/mL. **Premixed infusion:** 20 mg/100 mL, 40 mg/200 mL.

NURSING IMPLICATIONS

Assessment

- Monitor heart rate and BP continuously during administration. Slow or discontinue if BP drops excessively.
- Monitor intake and output and daily weight. Assess patient for resolution of signs and symptoms of HF (peripheral edema, dyspnea, rales/crackles, weight gain) and improvement in hemodynamic parameters (increase in cardiac output and cardiac index, decrease in pulmonary capillary wedge pressure). Correct effects of previous aggressive diuretic therapy to allow for optimal filling pressure.
- Monitor ECG continuously during infusion. Arrhythmias are common and may be life threatening. The risk of ventricular arrhythmias is increased in patients with a history of arrhythmias, electrolyte abnormalities, abnormal digoxin levels, or insertion of vascular catheters.
- ***Lab Test Considerations:*** Monitor electrolytes and renal function frequently during administration. Correct hypokalemia prior to administration to decrease the risk of arrhythmias.
- Monitor platelet count during therapy.
- ***Toxicity and Overdose: High Alert:*** Overdose manifests as hypotension. Dose should be decreased or discontinued. Supportive measures may be necessary.

Implementation

- ***High Alert:*** Accidental overdose of milrinone can cause patient harm or death. Have second practitioner independently check original order, dose calculations, and infusion pump settings.

IV Administration

- **IV Push:** ***Dilution:*** Loading dose may be administered undiluted. May also be diluted in 0.9% NaCl, 0.45% NaCl, or D5W for ease of administration. ***Concentration:*** 1 mg/mL. ***Rate:*** Administer the loading dose over 10 min.
- **Continuous Infusion:** ***Dilution:*** Milrinone drawn from vials must be diluted. Dilute 10 mg (10 mL) of milrinone in 40 mL of diluent or 20 mg (20 mL) of milrinone in 80 mL of diluent. Compatible diluents include 0.45% NaCl, 0.9% NaCl, and D5W. Premixed infusions are already diluted and ready to use. Admixed solutions are stable for 72 hr at room temperature. Stability of premixed infusions based on manufacturer's expiration date. Do not use solutions that are discolored or contain particulate matter. ***Concentration:*** 200 mcg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titrate according to hemodynamic and clinical response.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B liposome, ampicillin, anidulafungin, argatroban, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, etoposide, etoposide phosphate, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, levofloxacin, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, methohexital, methotrexate, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, mitoxantrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, ni-

troprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, torsemide, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B lipid complex, dantrolene, diazepam, diphenhydramine, esmolol, furosemide, hydroxyzine, imipenem/cilastatin, lidocaine, ondansetron, pantoprazole, phenytoin, procainamide.

Patient/Family Teaching

- Inform patient and family of reasons for administration. Milrinone is not a cure but is a temporary measure to control the symptoms of HF.

Evaluation/Desired Outcomes

- Decrease in the signs and symptoms of HF.
- Improvement in hemodynamic parameters.

minocycline, See TETRACYCLINES.

mirabegron (mye-ra-**beg**-ron)

Myrbetriq

Classification

Therapeutic: urinary tract antispasmodics
Pharmacologic: beta-adrenergic agonists

Indications

Overactive bladder (OAB), including urge urinary incontinence, urgency, and frequency (either as monotherapy or in combination with solifenacin). Pediatric neurogenic detrusor overactivity (NDO).

Action

Acts as a selective beta-3 adrenergic agonist. Increases bladder capacity by relaxing detrusor smooth muscle during storage phase of bladder fill-void cycle. **Therapeutic Effects:** Decreased symptoms of OAB. Improved bladder capacity in NDO.

Pharmacokinetics

Absorption: 29–35% absorbed following oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Extensively metabolized, 6% excreted unchanged in urine (25 mg dose), remainder excreted in urine and feces as metabolites.
Half-life: *Adults*—50 hr; *Children*—26–31 hr.

TIME/ACTION PROFILE (effects on bladder)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr†	24 hr

†Blood level.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe uncontrolled hypertension; End-stage renal disease (eGFR <15 mL/min/1.73 m² or requiring dialysis); Severe hepatic impairment (Child-Pugh Class C).
Use Cautiously in: Hypertension; Bladder outlet obstruction/concurrent antimuscarinics (↑ risk of urinary retention); Concurrent use of antimuscarinics used to treat OAB; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <3 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: ↑ BP, tachycardia. **EENT:** nasopharyngitis. **GI:** constipation, diarrhea, nausea. **GU:** urinary tract infection. **Neuro:** dizziness, headache. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Acts as a moderate inhibitor of the CYP2D6 enzyme system. May ↑ levels and risk of adverse reactions of **drugs metabolized by the CYP2D6 enzyme system** including **desipramine**, **flecainide**, **metoprolol**, **propafenone**, and **thioridazine**. May ↑ levels and risk of toxicity with **digoxin**; use lowest effective level of digoxin/monitor serum levels).

Route/Dosage

The extended-release tablets and extended-release oral suspension are NOT interchangeable and should NOT be combined.

Overactive Bladder

PO (Adults): 25 mg once daily; may ↑ to 50 mg once daily, if needed, after 4–8 wk.

Renal Impairment

PO (Adults): *eGFR 15–29 mL/min/m²*—25 mg once daily (max dose = 25 mg/day).

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh Class B)*—25 mg once daily (max dose = 25 mg/day).

Neurogenic Detrusor Overactivity

PO (Children ≥3 yr and ≥35 kg): *Extended-release tablets*—25 mg once daily; may ↑ to 50 mg once daily, if needed, after 4–8 wk. *Extended-release oral suspension (granules)*—48 mg once daily; may ↑ to 80 mg once daily, if needed after 4–8 wk.
PO (Children ≥3 yr and 22–<35 kg): *Extended-release oral suspension (granules)*—32 mg once

© F.A. Davis Publishing

daily; may ↑ to 64 mg once daily, if needed after 4–8 wk.
PO (Children ≥3 yr and 11–<22 kg): *Extended-release oral suspension (granules)* — 24 mg once daily; may ↑ to 48 mg once daily, if needed after 4–8 wk.

Renal Impairment
PO (Children ≥3 yr and ≥35 kg): *eGFR 15–29 mL/min/m²* — Extended-release tablets: 25 mg once daily (max dose = 25 mg/day); Extended-release oral suspension (granules): 48 mg once daily (max dose = 48 mg/day).

Renal Impairment
PO (Children ≥3 yr and 22–<35 kg): *eGFR 15–29 mL/min/m²* — Extended-release oral suspension (granules): 32 mg once daily (max dose = 32 mg/day).

Renal Impairment
PO (Children ≥3 yr and 11–<22 kg): *eGFR 15–29 mL/min/m²* — Extended-release oral suspension (granules): 24 mg once daily (max dose = 24 mg/day).

Hepatic Impairment
PO (Children ≥3 yr and ≥35 kg): *Moderate hepatic impairment (Child-Pugh Class B)* — Extended-release tablets: 25 mg once daily (max dose = 25 mg/day); Extended-release oral suspension (granules): 48 mg once daily (max dose = 48 mg/day).

Hepatic Impairment
PO (Children ≥3 yr and 22–<35 kg): *Moderate hepatic impairment (Child-Pugh Class B)* — Extended-release oral suspension (granules): 32 mg once daily (max dose = 32 mg/day).

Hepatic Impairment
PO (Children ≥3 yr and 11–<22 kg): *Moderate hepatic impairment (Child-Pugh Class B)* — Extended-release oral suspension (granules): 24 mg once daily (max dose = 24 mg/day).

Availability
Extended-release tablets: 25 mg, 50 mg. **Extended-release oral suspension (granules):** 8 mg/mL.

NURSING IMPLICATIONS

Assessment
- Assess patient for urinary urgency, frequency, and urge incontinence periodically during therapy.
- Monitor BP prior to starting and periodically during therapy; may cause ↑ BP.
- Monitor for signs and symptoms of angioedema (swelling of face, lips, tongue and/or larynx). Discontinue mirabegron and treat symptomatically.

Implementation
- Tablets and granules are different products. Do not interchange, substitute, or combine.

OAB
- **PO:** Administer without regard to food.
- ***DNC:*** Swallow tablets whole with water; do not break, crush, or chew.

NDO
- Pediatric patients weighing ≥35 kg may use tablets or granules. Administer as an extended-release oral suspension once daily.
- ***DNC:*** Swallow tablets whole with water; do not break, crush, or chew.
- Administer granules for patients weighing <35 kg. Granules are prepared as an extended-release oral suspension with a concentration of 8 mg/mL. Shake bottle for 1 min then let stand until foam on top of suspension is gone (about 1–2 min). Administer within 1 hr after preparation with food once daily; do not save dose for later.

Patient/Family Teaching
- Instruct patient to take mirabegron as directed. If a dose is missed, take as soon as remembered unless >12 hrs since missed dose. If >12 hrs since missed dose, omit dose and take next dose at scheduled time. Advise patient to read *Patient Information* sheet prior to starting and with each Rx refill in case of changes.
- Inform patient that mirabegron may cause an increase in BP. Advise patient to have BP checked periodically during therapy.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if difficulty emptying bladder occurs.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Decreased urinary frequency, urgency, and urge incontinence.

mirtazapine (meer-**taz**-a-peen)
Remeron, Remeron RD, Remeron SolTab

Classification
Therapeutic: antidepressants
Pharmacologic: tetracyclic antidepressants

© F.A. Davis Publishing

Indications
Major depressive disorder. **Unlabeled Use:** Panic disorder. Generalized anxiety disorder (GAD). Post-traumatic stress disorder (PTSD).

Action
Potentiates the effects of norepinephrine and serotonin.
Therapeutic Effects: Antidepressant action, which may develop only after several wk.

Pharmacokinetics
Absorption: Well absorbed but rapidly metabolized, resulting in 50% bioavailability.
Distribution: Unknown.
Protein Binding: 85%.
Metabolism and Excretion: Extensively metabolized by the liver by the CYP1A2, CYP2D6, and CYP3A isoenzymes; metabolites excreted in urine (75%) and feces (15%).
Half-life: 20–40 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	6 wk or more	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue).
Use Cautiously in: History of seizures; History of suicide attempt; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; History of mania/hypomania; Patients with hepatic or renal impairment; Angle-closure glaucoma; OB: Other antidepressants are preferred in pregnancy; Lactation: Other antidepressants are preferred when breast feeding; Pedi: Safety and effectiveness in children not established. Suicide risk may be greater in children or adolescents; Geri: Older adults may have ↑ sensitivity to CNS effects and oversedation; begin at lower doses and titrate slowly.

Adverse Reactions/Side Effects
CV: edema, hypotension, vasodilation. **Derm:** pruritus, rash. **EENT:** sinusitis. **F and E:** ↑ thirst. **GI:** constipation, dry mouth, ↑ appetite, abdominal pain, anorexia, ↑ liver enzymes, nausea, vomiting. **GU:** urinary frequency. **Hemat:** AGRANULOCYTOSIS. **Metab:** weight gain, hypercholesterolemia, hyponatremia, ↑ triglycerides. **MS:** arthralgia, back pain, myalgia. **Neuro:** hyperkinesia, hypoesthesia, twitching, NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, drowsiness, abnormal dreams, abnormal thinking, agitation, akathisia, anxiety, apathy, confusion, dizziness, malaise, weakness.. **Resp:** dyspnea, cough. **Misc:** SEROTONIN SYNDROME, flu-like syndrome.

Interactions
Drug-Drug: May cause hypertension, seizures, and death when used with **MAO inhibitors**; do not use within 14 days of MAO inhibitor therapy. Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving mirtazapine, immediately discontinue mirtazapine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume mirtazapine therapy 24 hr after last dose of linezolid or methylene blue). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, and **triptans** ↑ risk of serotonin syndrome. ↑ CNS depression with other **CNS depressants**, including **alcohol** and **benzodiazepines**. **Ketoconazole**, **cimetidine**, **clarithromycin**, **erythromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, or **saquinavir** may ↑ levels. **Phenobarbital**, **phenytoin**, **carbamazepine**, **rifampin**, or **rifabutin** may ↓ levels; may need to ↑ mirtazapine dose. May ↑ the effects and risk of bleeding from **warfarin**.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression. ↑ risk of serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage
PO (Adults): 15 mg/day as a single bedtime dose initially; may be ↑ every 1–2 wk up to 45 mg/day.

Availability (generic available)
Tablets: 7.5 mg, 15 mg, 30 mg, 45 mg. **Cost:** *Generic*— 7.5 mg $158.00/60, 15 mg $81.40/30, 30 mg $83.00/30, 45 mg $85.50/30. **Orally disintegrating tablets (orange flavor):** 15 mg, 30 mg, 45 mg. **Cost:** *Generic*— 15 mg $77.90/30, 30 mg $80.27/30, 45 mg $85.53/30.

NURSING IMPLICATIONS
Assessment
- Assess mental status (orientation, mood, behavior) frequently. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor closely for changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess weight and BMI initially and throughout therapy. For overweight/obese individuals, obtain fasting blood glucose and cholesterol levels. Refer as appropriate for nutritional/weight management and medical management.
- Monitor BP and pulse rate periodically during initial therapy. Report significant changes.
- Monitor for seizure activity in patients with a history of seizures or alcohol abuse. Institute seizure precautions.

© F.A. Davis Publishing

- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue mirtazapine and notify health care professional immediately if these symptoms occur.
- ***Lab Test Considerations:*** Assess CBC and hepatic function before and periodically during therapy.

Implementation

- May be given as a single dose at bedtime to minimize excessive drowsiness or dizziness.
- May be taken without regard to food.
- For *orally disintegrating tablets*, do not attempt to push through foil backing; with dry hands, peal back backing and remove tablet. Immediately place tablet on tongue; tablet will dissolve in sec, then swallow with saliva. Administration with liquid is not necessary.

Patient/Family Teaching

- Instruct patient to take mirtazapine as directed. Take missed doses as soon as remembered; if almost time for next dose, skip missed dose and return to regular schedule. If single bedtime dose regimen is used, do not take missed dose in morning, but consult health care professional. Do not discontinue abruptly; gradual dose reduction may be required. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. Assess symptoms on a day-to-day basis as changes may be abrupt. If these symptoms occur, notify health care professional.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid alcohol or other CNS depressant drugs during and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional of signs and symptoms of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.
- Advise patient to notify health care professional if dry mouth, urinary retention, or constipation occurs. Frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Inform patient of National Pregnancy Registry for Antidepressants that monitors pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patients by calling 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/antidepressants/.
- Therapy for depression may be prolonged. Emphasize the importance of follow-up exam to monitor effectiveness and side effects.

Evaluation/Desired Outcomes

- Resolution of the symptoms of depression.
- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Therapeutic effects may be seen within 1 wk, although several wk are usually necessary before improvement is observed.

miSOPROStol

(mye-soe-**prost**-ole)
Cytotec

Classification
Therapeutic: antiulcer agents, cytoprotective agents
Pharmacologic: prostaglandins

Indications

Prevention of gastric mucosal injury from NSAIDs, including aspirin, in high-risk patients (geriatric patients, debilitated patients, or those with a history of ulcers).

© F.A. Davis Publishing

With mifepristone for termination of pregnancy. **Unlabeled Use:** Treatment of duodenal ulcers. Cervical ripening and labor induction.

Action

Acts as a prostaglandin analogue, decreasing gastric acid secretion (antisecretory effect) and increasing the production of protective mucus (cytoprotective effect). Causes uterine contractions. **Therapeutic Effects:** Prevention of gastric ulceration from NSAIDs. With mifepristone terminates pregnancy of less than 49 days.

Pharmacokinetics

Absorption: Well absorbed following oral administration and rapidly converted to its active form (misoprostol acid).
Distribution: Unknown.
Protein Binding: 85%.
Metabolism and Excretion: Undergoes some metabolism and is then excreted by the kidneys.
Half-life: 20–40 min.

TIME/ACTION PROFILE (effect on gastric acid secretion)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	unknown	3–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to prostaglandins; OB: Should not be used to prevent NSAID-induced gastric injury due to potential for fetal harm or death; Lactation: May cause severe diarrhea in the nursing infant.
Use Cautiously in: OB: Patients with childbearing potential should be counseled to avoid pregnancy during misoprostol therapy for prevention of NSAID-induced gastric injury. Pregnancy status should be determined before initiating therapy; Pedi: Safety not established.
Exercise Extreme Caution in: When used for cervical ripening (unlabeled use) or to induce abortion, may cause uterine rupture (risk factors are late trimester pregnancy, previous Cesarian section or uterine surgery, advanced gestational age, or ≥5 previous pregnancies).

Adverse Reactions/Side Effects

GI: abdominal pain, diarrhea, constipation, dyspepsia, flatulence, nausea, vomiting. **GU:** miscarriage, menstrual disorders. **Neuro:** headache.

Interactions

Drug-Drug: ↑ risk of diarrhea with **magnesium-containing antacids**.

Route/Dosage

PO (Adults): *Antiulcer*—200 mcg 4 times daily with or after meals and at bedtime, *or* 400 mcg twice daily, with the last dose at bedtime. If intolerance occurs, dose may be ↓ to 100 mcg 4 times daily. *Termination of pregnancy*—400 mcg single dose 2 days after mifepristone if abortion has not occurred.
Intravaginally (Adults): 25 mcg (¼ of 100–mcg tablet); may repeat every 3–6 hr, if needed.

Availability (generic available)

Tablets: 100 mcg, 200 mcg. ***In combination with:*** diclofenac (Arthrotec). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in the stool, emesis, or gastric aspirate.
- Assess women of childbearing age for pregnancy. Misoprostol is usually begun on 2nd or 3rd day of menstrual period following a negative pregnancy test result.
- **Termination of pregnancy:** Monitor uterine cramping and bleeding during therapy.
- **Cervical Ripening:** Assess dilation of cervix periodically during therapy.

Implementation

- Do not confuse misoprostol with mifepristone.
- Misoprostol therapy should be started at the onset of treatment with NSAIDs.
- **PO:** Administer medication with meals and at bedtime to reduce severity of diarrhea.
- Antacids may be administered before or after misoprostol for relief of pain. Avoid those containing magnesium, because of increased diarrhea with misoprostol.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as possible unless next dose is due within 2 hr; do not double doses. Emphasize that sharing of this medication may be dangerous.
- Advise patient not to share misoprostol with others, even if they have similar symptoms; may be dangerous.
- Inform patient that misoprostol will cause spontaneous abortion. Women of childbearing age must be informed of this effect through verbal and written information and must use contraception throughout therapy. If pregnancy is suspected, the woman should stop taking misoprostol and immediately notify her health care professional.
- Inform patient that diarrhea may occur. Health care professional should be notified if diarrhea persists for more than 1 wk. Also advise patient to report onset of black, tarry stools or severe abdominal pain.
- Advise patient to avoid alcohol and foods that may cause an increase in GI irritation.

Evaluation/Desired Outcomes

- The prevention of gastric ulcers in patients receiving chronic NSAID therapy.
- Termination of pregnancy.
- Cervical ripening and induction of labor.

© F.A. Davis Publishing

mitoXANTRONE
(mye-toe-**zan**-trone)
~~Novantrone~~

Classification
Therapeutic: antineoplastics, immune modifiers
Pharmacologic: antitumor antibiotics

Indications
Acute nonlymphocytic leukemia (ANLL) in adults (with other antineoplastics). Initial chemotherapy for patients with pain associated with advanced hormone-refractory prostate cancer. Secondary (chronic) progressive, progressive relapsing, or worsening relapsing-remitting multiple sclerosis (MS). **Unlabeled Use:** Breast cancer, liver cancer, and non-Hodgkin's lymphoma.

Action
Inhibits DNA synthesis (cell-cycle phase–nonspecific).
Therapeutic Effects: Death of rapidly replicating cells, particularly malignant ones. Decreased pain in patients with advanced prostate cancer. Decreased disability and slowed progression of MS.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed; limited penetration of CSF.
Metabolism and Excretion: Mostly eliminated by hepatobiliary clearance; <10% excreted unchanged by the kidneys.
Half-life: 5.8 days.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	10 days	21 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB, Lactation: Pregnancy or lactation.
Use Cautiously in: Presence or history of cardiovascular disease (↑ risk of heart failure); Active infection; ↓ bone marrow reserve; Previous mediastinal radiation or use of anthracyclines (↑ risk of heart failure); Impaired hepatobiliary function; Rep: Women of reproductive potential; Geri: May have ↑ sensitivity to drug effects; Pedi: Safety not established.

Adverse Reactions/Side Effects
EENT: blue-green sclera, conjunctivitis. **Neuro:** SEIZURES, headache. **Resp:** cough, dyspnea. **CV:** CARDIOTOXICITY, arrhythmias, ECG changes. **GI:** HEPATOTOXICITY, abdominal pain, diarrhea, nausea, stomatitis, vomiting. **GU:** blue-green urine, gonadal suppression, renal failure. **Derm:** alopecia, rash. **Hemat:** anemia, leukopenia, secondary leukemia, thrombocytopenia. **Metab:** hyperuricemia. **Misc:** HYPERSENSITIVITY REACTIONS, fever.

Interactions
Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. Risk of cardiomyopathy ↑ by previous **anthracycline antineoplastics** (**daunorubicin**, **doxorubicin**, **idarubicin**) or **mediastinal radiation**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Acute Nonlymphatic Leukemia
IV (Adults): *Induction*— 12 mg/m²/day for 3 days (usually given with cytosine arabinoside 100 mg/m²/day for 7 days); if incomplete remission occurs, a 2nd induction may be given. *Consolidation*— 12 mg/m²/day for 2 days (usually given with cytosine arabinoside 100 mg/m²/day for 5 days), given 6 wk after induction with another course 4 wk later.

Advanced Prostate Cancer
IV (Adults): 12–14 mg/m² single dose as a short infusion (with corticosteroids).

Multiple Sclerosis
IV (Adults): 12 mg/m² every 3 mo.

Availability (generic available)
Solution for injection: 2 mg/mL.

NURSING IMPLICATIONS

Assessment
- Monitor for hypersensitivity reaction (rash, urticaria, bronchospasm, tachycardia, hypotension). If these occur, stop infusion and notify physician. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output, appetite, and nutritional intake. Assess patient for nausea and vomiting. Antiemetics may be administered prophylactically. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- Monitor chest x-ray, ECG, echocardiography or MUGA, and radionuclide angiography to determine

© F.A. Davis Publishing

ejection fraction prior to and periodically during therapy. Multiple sclerosis patients with baseline left ventricular ejection fraction (LVEF) <50% should not receive mitoxantrone. May cause cardiotoxicity, especially in patients who have received daunorubicin or doxorubicin. Assess for rales/crackles, dyspnea, edema, jugular vein distention, ECG changes, arrhythmias, and chest pain. Monitor LVEF with echocardiogram or MUGA if signs of HF occur, prior to each dose, and yearly after stopping therapy in patients with multiple sclerosis. Potentially fatal HF may occur during or for mo or years after therapy. Risk is greater in patients receiving a cumulative dose >140 mg/m^2.

- Monitor for symptoms of gout (↑ uric acid levels and joint pain and swelling). Encourage patient to drink at least 2 L of fluid per day. Allopurinol may be given to decrease serum uric acid levels.
- **Multiple sclerosis:** Asses frequency of exacerbations of symptoms of multiple sclerosis periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count prior to and periodically during therapy. The nadir of leukopenia usually occurs within 10 days, and recovery usually occurs within 21 days.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically during therapy to detect hepatotoxicity and nephrotoxicity.
- May cause ↑ uric acid concentrations. Monitor periodically during therapy.

Implementation

- Do not confuse mitoxantrone with mitomycin.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- Avoid contact with skin. Use Luer-Lok tubing to prevent accidental leakage. If contact with skin occurs, immediately wash skin with soap and water.
- Clean all spills with an aqueous solution of calcium hypochlorite. Mix solution by adding 5.5 parts (per weight) of calcium hypochlorite to 13 parts water.

IV Administration

- **IV:** Monitor IV site. If extravasation occurs, discontinue IV and restart at another site. Elevate extremity with extravasation and place ice packs over area. Monitor closely and obtain surgical consultation if local reaction occurs. Mitoxantrone is not a vesicant.
- **IV Push:** ***Dilution:*** Dilute dark blue mitoxantrone solution in at least 50 mL of 0.9% NaCl or D5W. Discard unused solution appropriately. ***Rate:*** Administer slowly over at least 3 min into the tubing of a free-flowing IV of 0.9% NaCl or D5W.
- **Intermittent Infusion:** May be further diluted in D5W, 0.9% NaCl, or D5/0.9% NaCl and used immediately. ***Concentration:*** 0.02–0.5 mg/mL. ***Rate:*** Administer over 15–30 min.
- **Continuous Infusion:** May also be administered over 24 hr.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amikacin, aminophylline, amindarone, anidulafungin, argatroban, atracurium, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, hydralazine, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, metaraminol, methohexital, methotrexate, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, moxifloxacin, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, trimethiprom/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azithromycin, aztreonam, cefazolin, cefepime, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, clindamycin, dantrolene, dexamethasone, diazepam, digoxin, doxorubicin liposome, ertapenem, foscarnet, fosphenytoin, furosemide, heparin, idarubicin, methylprednisolone, nafcillin, nitroprusside, paclitaxel, pantoprazole, pemetrexed, phenytoin, piperacillin/tazobactam, potassium phosphates, propofol, sodium phosphates, voriconazole.

Patient/Family Teaching

- Advise patient to read the *Patient Package Insert* before starting therapy and before each dose in case of changes.

© F.A. Davis Publishing

- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDS; may precipitate gastric bleeding.
- Instruct patient to notify health care professional if abdominal pain, yellow skin, cough, diarrhea, or decreased urine output occurs.
- Inform patient that medication may cause the urine and sclera to turn blue-green.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Topical agents may be used if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Advise patient that, although mitoxantrone may cause infertility, contraception during therapy is necessary because of possible teratogenic effects.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in the production and spread of leukemic cells.
- Decreased pain in patients with prostate cancer.
- Decrease in the frequency of relapse (neurologic dysfunction) in patients with relapsing-remitting multiple sclerosis.

modafinil (mo-daf-i-nil)

Alertec, Provigil

Classification

Therapeutic: central nervous system stimulants

Schedule IV

Indications

To improve wakefulness in patients with excessive daytime drowsiness due to narcolepsy, obstructive sleep apnea, or shift work sleep disorder.

Action

Produces CNS stimulation. **Therapeutic Effects:** Decreased daytime drowsiness in patients with narcolepsy and obstructive sleep apnea. Decreased drowsiness during work in patients with shift work sleep disorder.

Pharmacokinetics

Absorption: Rapidly absorbed; bioavailability unknown.

Distribution: Well distributed; moderately (60%) bound to plasma proteins.

Metabolism and Excretion: Highly (90%) metabolized by the liver; <10% eliminated unchanged.

Half-life: 15 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of left ventricular hypertrophy or ischemic ECG changes, chest pain, arrhythmia, or other significant manifestations of mitral valve prolapse in association with CNS stimulant use.

Use Cautiously in: History of MI or unstable angina; Severe hepatic impairment with or without cirrhosis (dosage ↓ recommended); Concurrent use of MAO inhibitors; OB, Lactation, Pedi: Safety not established; Geri: Lower doses may be necessary due to ↑ sensitivity to drug effects.

Adverse Reactions/Side Effects

CV: arrhythmias, chest pain, hypertension, hypotension, syncope, vasodilation. **Derm:** STEVENS-JOHNSON SYNDROME, dry skin, herpes simplex, rash. **EENT:** rhinitis, abnormal vision, amblyopia, epistaxis, pharyngitis. **Endo:** hyperglycemia. **GI:** ↑ liver enzymes, nausea, anorexia, diarrhea, gingivitis, mouth ulcers, thirst, vomiting. **GU:** abnormal ejaculation, albuminuria, urinary retention. **Hemat:** eosinophilia. **MS:** joint disorder, neck pain. **Neuro:** ataxia, dyskinesia, hypertonia, paresthesia, tremor, SUICIDAL IDEATION, headache, aggression, amnesia, anxiety, cataplexy, confusion, delusions, depression, dizziness, hallucinations, insomnia, mania, nervousness, seizures. **Resp:** dyspnea, lung disorder. **Misc:** infection.

Interactions

Drug-Drug: May ↓ the metabolism and ↑ the effects of **diazepam**, **phenytoin**, **propranolol**, or **tricyclic antidepressants** (dosage adjustments may be necessary). May ↑ the metabolism and ↓ the effects of **hormonal contraceptives**, **cyclosporine**, and **theophylline** (dosage adjustments or additional methods of contraception may be necessary).

Drug-Natural Products: Use with caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) may ↑ stimulant effect.

© F.A. Davis Publishing

Route/Dosage
PO (Adults): 200 mg once daily.

Hepatic Impairment
PO (Adults): *Severe hepatic impairment*— 100 mg once daily.

Availability (generic available)
Tablets: 100 mg, 200 mg.

NURSING IMPLICATIONS

Assessment
- Observe and document frequency of narcoleptic episodes.
- Monitor closely for changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- Monitor for signs and symptoms of angioedema or anaphylaxis (rash, swelling of face, eyes, lips, tongue or larynx; difficulty in swallowing or breathing; hoarseness).
- ***Lab Test Considerations:*** May cause elevated liver enzymes.

Implementation
- **PO:** Administer as a single dose in the morning for patients with narcolepsy or obstructive sleep apnea. Administer 1 hr before the start of work shift for patients with shift work sleep disorder.

Patient/Family Teaching
- Instruct patient to take medication as directed. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill, in case of changes.
- Medication may impair judgment. Advise patient to use caution when driving or during other activities requiring alertness.
- Advise patient that modafinil is a drug with known abuse potential. Advise patient that sharing this medication with others, even those with the same symptoms, is dangerous and illegal. Protect it from theft; store out of sight and reach of children, and in a location not accessible by others.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. Assess symptoms on a day-to-day basis as changes may be abrupt. If these symptoms occur, notify health care professional.
- Advise patient to notify health care professional immediately if rash or symptoms of anaphylaxis occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. If alcohol is used during therapy, intake should be limited to moderate amounts.
- Rep: Advise females of reproductive potential to use effective nonhormonal methods of contraception during and for 1 mo following discontinuation of therapy. Instruct patient to notify health care professional promptly if pregnancy is planned or suspected, or if breast feeding. Encourage women who become pregnant to enroll in the registry by calling 1-866-404-4106. Registry collects information about the safety of modafinil during pregnancy.

Evaluation/Desired Outcomes
- Decrease in narcoleptic symptoms and an enhanced ability to stay awake.

moexipril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

mometasone, See CORTICOSTEROIDS (INHALATION), CORTICOSTEROIDS (NASAL), and CORTICOSTEROIDS (TOPICAL/LOCAL).

montelukast (mon-te-**loo**-kast)
Singulair

Classification
Therapeutic: allergy, cold, and cough remedies, bronchodilators
Pharmacologic: leukotriene antagonists

Indications
Prevention and chronic treatment of asthma. Seasonal or perennial allergic rhinitis (should only be used in patients with inadequate response or intolerance to other therapies). Prevention of exercise-induced bronchoconstriction (EIB).

Action
Antagonizes the effects of leukotrienes, which mediate the following: Airway edema, Smooth muscle constriction, Altered cellular activity. Result is decreased inflammatory process, which is part of asthma and allergic rhinitis. **Therapeutic Effects:** Decreased frequency and severity of acute asthma attacks. Decreased severity of allergic rhinitis. Decreased attacks of EIB.

Pharmacokinetics
Absorption: Rapidly absorbed (63–73%) following oral administration.
Distribution: Unknown.

© F.A. Davis Publishing

Protein Binding: 99%.
Metabolism and Excretion: Mostly metabolized by the liver by the CYP3A4 and CYP2C9 isoenzymes; metabolites eliminated in feces via bile; negligible renal excretion.
Half-life: 2.7–5.5 hr.

TIME/ACTION PROFILE (improved symptoms of asthma)

ROUTE	ONSET	PEAK†	DURATION
PO (swallow)	within 24 hr	3–4 hr	24 hr
PO (chew)	within 24 hr	2–2.5 hr	24 hr

†Blood levels.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attacks of asthma.
Use Cautiously in: Phenylketonuria (chewable tablets contain aspartame); Hepatic impairment (may need ↓ doses); Reduction of corticosteroid therapy (may ↑ the risk of eosinophilic conditions); Pedi: Children <6 yr (EIB), <2 yr (seasonal allergic rhinitis), <12 mo (asthma), <6 mo (perennial allergic rhinitis) (safety and effectiveness not established).

Adverse Reactions/Side Effects

Derm: STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash. **EENT:** nosebleed, otitis (children), sinusitis (children). **GI:** abdominal pain, diarrhea (children), dyspepsia, nausea (children), ↑ liver enzymes. **Neuro:** SUICIDAL BEHAVIORS/THOUGHTS, agitation, aggression, anxiety, attention disturbance, depression, disorientation, dream abnormalities, fatigue, hallucinations, headache, insomnia, irritability, memory impairment, obsessive-compulsive symptoms, restlessness, sleep walking, stuttering, weakness, tics, tremor. **Resp:** cough, rhinorrhea. **Misc:** EOSINOPHILIC CONDITIONS (including Churg-Strauss syndrome), fever.

Interactions

Drug-Drug: Drugs which induce the CYP450 enzyme system (**phenobarbital** and **rifampin**) may ↓ the effects of montelukast.

Route/Dosage

Asthma

PO (Adults and Children ≥15 yr): 10 mg once daily.
PO (Children 6–14 yr): 5 mg once daily (as chewable tablet).
PO (Children 2–5 yr): 4 mg once daily (as chewable tablet or granules).
PO (Children 12–23 mo): 4 mg once daily (as granules).

Exercise-Induced Bronchoconstriction

PO (Adults and Children ≥15 yrs): 10 mg ≥2 hr before exercise. Do not take within 24 hr of another dose; if taking daily doses, do not take dose for EIB.
PO (Children 6–14 yr): 5 mg (as chewable tablet) ≥2 hr before exercise. Do not take within 24 hr of another dose; if taking daily doses, do not take dose for EIB.

Allergic Rhinitis

PO (Adults and Children ≥15 yr): *Seasonal or perennial*— 10 mg once daily.
PO (Children 6–14 yr): *Seasonal or perennial*— 5 mg once daily (as chewable tablet).
PO (Children 2–5 yr): *Seasonal or perennial*— 4 mg once daily (as chewable tablet or granules).
PO (Children 6–23 mo): *Perennial only*— 4 mg once daily (as granules).

Availability (generic available)

Tablets: 10 mg. **Cost:** *Generic*— $169.72/30. **Chewable tablets (cherry flavor):** 4 mg, 5 mg. **Cost:** *Generic*— All strengths $169.72/30. **Oral granules:** 4 mg/pkt. **Cost:** *Generic*— $169.72/30 pkts.

M

NURSING IMPLICATIONS

Assessment

- Assess lung sounds and respiratory function prior to and periodically during therapy.
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Monitor closely for changes in behavior that could indicate the emergence or worsening of depression or suicidal thoughts.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** May cause ↑ AST and ALT concentrations.

Implementation

- Doses of inhaled corticosteroids may be gradually decreased with supervision of health care professional; do not discontinue abruptly.
- **PO:** For asthma, administer once daily in the evening. For allergic rhinitis, may be administered at any time of day.
- Administer granules directly into mouth or mixed in a spoonful of cold or room temperature foods (use only applesauce, mashed carrots, rice, or ice cream). Do not open packet until ready to use. After opening packet, administer full dose within 15 min. Do not store mixture. Discard unused portion. Do not dissolve granules in fluid, but fluid may be taken

© F.A. Davis Publishing

following administration. Granules may be administered without regard to meals.
- *For Exercise Induced Bronchoconstriction:* Administer one tablet at least 2 hrs before exercise; do not take within 24 hr of another dose.

Patient/Family Teaching
- Instruct patient to take medication daily in the evening or at least 2 hr before exercise, even if not experiencing symptoms of asthma. If dose is missed, omit and take next dose at regularly scheduled time; do not double doses. Do not discontinue therapy without consulting health care professional. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Instruct patient not to discontinue or reduce other asthma medications without consulting health care professional.
- Advise patient that montelukast is not used to treat acute asthma attacks, but may be continued during an acute exacerbation. Patient should carry rapid-acting therapy for bronchospasm at all times. Advise patient to notify health care professional if more than the maximum number of short-acting bronchodilator treatments prescribed for a 24-hr period are needed.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any new medications.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. Assess symptoms on a day-to-day basis as changes may be abrupt. If these symptoms or rash occurs, notify health care professional.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes
- Prevention of and reduction in symptoms of asthma.
- Decrease in severity of allergic rhinitis.
- Prevention of exercise-induced bronchoconstriction.

REMS HIGH ALERT

morphine (**mor**-feen)
~~AVINza~~, Doloral, Duramorph, ~~Embeda~~, Infumorph, ~~Kadian~~, M-Ediat, M-Eslon, Mitigo, ~~Morphabond ER~~, Morphine HP, Morphine LP Epidural, MS Contin, MS Contin SRT, ~~Roxanol~~, Statex

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Indications
Severe pain (the 20 mg/mL oral solution concentration should only be used in opioid-tolerant patients). Pain severe enough to require daily, around-the-clock long-term opioid treatment and for which alternative treatment options are inadequate (extended-release). Pulmonary edema. Pain associated with MI.

Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. **Therapeutic Effects:** Decrease in severity of pain.

Pharmacokinetics
Absorption: Variably absorbed (about 30%) following oral administration. More reliably absorbed from rectal, subcut, and IM sites. Following epidural administration, systemic absorption and absorption into the intrathecal space via the meninges occurs.
Distribution: Widely distributed. Crosses the placenta; enters breast milk in small amounts.
Protein Binding: Premature infants: <20%; Adults: 35%.
Metabolism and Excretion: Mostly metabolized by the liver. Active metabolites excreted renally.
Half-life: Premature neonates: 10–20 hr; Neonates: 7.6 hr; Infants 1–3 mo: 6.2 hr; Children 6 mo–2.5 yr: 2.9 hr; Children 3–6 yr: 1–2 hr; Children 6–19 yr with sickle cell disease: 1.3 hr; Adults: 2–4 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	60 min	4–5 hr
PO-ER	unknown	3–4 hr	8–24 hr
IM	10–30 min	30–60 min	4–5 hr
Subcut	20 min	50–90 min	4–5 hr
Rect	unknown	20–60 min	3–7 hr
IV	rapid	20 min	4–5 hr
Epidural	6–30 min	1 hr	up to 24 hr
IT	rapid (min)	unknown	up to 24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Some products contain tartrazine, bisulfites, or alcohol and should be avoided in patients with known hypersensitivity; Acute, mild, intermittent, or postoperative pain (extended/sustained-release); Significant respiratory depression (extended-release); Acute or severe bronchial asthma (extended-release); Paralytic ileus (extended-release).
Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Seizure disorder; Adrenal insufficiency; History of substance abuse; Undiagnosed ab-

© F.A. Davis Publishing

dominal pain; Prostatic hyperplasia; Patients undergoing procedures that rapidly ↓ pain (cordotomy, radiation); long-acting agents should be discontinued 24 hr before and replaced with short-acting agents; Geri: Geriatric or debilitated patients (↑ risk of respiratory depression; dose ↓ suggested); OB, Lactation: Avoid chronic use; has been used during labor but may cause respiratory depression in the newborn; prolonged use of extended-release morphine during pregnancy can result in neonatal opioid withdrawal syndrome; Pedi: Neonates and infants <3 mo (more susceptible to respiratory depression); Pedi: Neonates (oral solution contains sodium benzoate which can cause potentially fatal gasping syndrome).

Adverse Reactions/Side Effects

CV: hypotension, bradycardia. **Derm:** flushing, itching, sweating. **EENT:** blurred vision, diplopia, miosis. **Endo:** adrenal insufficiency. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Neuro:** confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia). **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with **extreme caution** in patients receiving **MAO inhibitors** within 14 days prior (may result in unpredictable, severe reactions—↓ initial dose of morphine to 25% of usual dose). Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **nonbenzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT$_3$ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome. **Mixed agonist/antagonist analgesics**, including **nalbuphine** or **butorphanol** and **partial agonist analgesics**, including **buprenorphine**, may ↓ morphine's analgesic effects and/or precipitate opioid withdrawal in physically dependent patients. May ↑ the anticoagulant effect of **warfarin**. **Cimetidine** ↓ metabolism and may ↑ effects. IV morphine may ↓ levels and antiplatelet effects of **clopidogrel**, **prasugrel**, and **ticagrelor**; consider IV antiplatelet agent as alternative in patients with acute coronary syndrome if morphine concomitantly used.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

Larger doses may be required during chronic therapy.

PO, Rect (Adults ≥50 kg): *Usual starting dose for moderate to severe pain in opioid-naive patients*—30 mg every 3–4 hr initially *or* once 24-hr opioid requirement is determined, convert to extended-release morphine by administering total daily oral morphine dose every 24 hr (as ER capsules), 50% of the total daily oral morphine dose every 12 hr (as *MS Contin*), or 33% of the total daily oral morphine dose every 8 hr (as *MS Contin*). See equianalgesic chart, Appendix I. Dose of ER capsules should not exceed 1600 mg/day because of fumaric acid in formulation.

PO, Rect (Adults and Children <50 kg): *Usual starting dose for moderate to severe pain in opioid-naive patients*—0.3 mg/kg every 3–4 hr initially.

PO (Children >1 mo): *Prompt-release tablets and solution*—0.2–0.5 mg/kg every 4–6 hr as needed. *Controlled-release tablet*—0.3–0.6 mg/kg every 12 hr.

IM, IV, Subcut (Adults ≥50 kg): *Usual starting dose for moderate to severe pain in opioid-naive patients*—4–10 mg every 3–4 hr. *MI*—8–15 mg, for very severe pain additional smaller doses may be given every 3–4 hr.

IM, IV, Subcut (Adults and Children <50 kg): *Usual starting dose for moderate to severe pain in opioid-naive patients*—0.05–0.2 mg/kg every 3–4 hr, maximum: 15 mg/dose.

IM, IV, Subcut (Neonates): 0.05 mg/kg every 4–8 hr, maximum dose: 0.1 mg/kg. Use preservative-free formulation.

IV, Subcut (Adults): *Continuous infusion*—0.8–10 mg/hr; may be preceded by a bolus of 15 mg (infusion rates vary greatly; up to 80 mg/hr have been used).

IV, Subcut (Children >1 mo): *Continuous infusion, postoperative pain*—0.01–0.04 mg/kg/hr. *Continuous infusion, sickle cell or cancer pain*—0.02–2.6 mg/kg/hr.

IV (Neonates): *Continuous infusion*—0.01–0.03 mg/kg/hr.

Epidural (Adults): *Intermittent injection*—5 mg/day (initially); if relief is not obtained at 60 min, 1–2 mg increments may be made (total dose not to exceed 10 mg/day). *Continuous infusion*—2–4 mg/24 hr; may ↑ by 1–2 mg/day (up to 30 mg/day).

Epidural (Children >1 mo): 0.03–0.05 mg/kg, maximum dose: 0.1 mg/kg or 5 mg/24 hr. Use preservative-free formulation.

IT (Adults): 0.2–1 mg. Use preservative-free formulation.

Availability (generic available)

Immediate-release tablets: 15 mg, 30 mg. **Cost:** *Generic*—15 mg $22.17/100, 30 mg $37.77/100. **Extended-release tablets (MS Contin):** 15 mg, 30 mg,

© F.A. Davis Publishing

60 mg, 100 mg, 200 mg. **Cost:** *Generic*—15 mg $167.57/100, 30 mg $317.19/100, 60 mg $532.39/100, 100 mg $763.63/100, 200 mg $1,838.19/100. **Extended-release capsules:** 10 mg, 20 mg, 30 mg, 45 mg, 50 mg, 60 mg, 75 mg, 80 mg, 90 mg, 100 mg, 120 mg. **Cost:** 10 mg $609.60/100, 20 mg $673.20/100, 30 mg $606.31/100, 45 mg $898.99/100, 50 mg $1,224.00/100, 60 mg $1,465.20/100, 75 mg $1,498.31/100, 80 mg $1,951.20/100, 90 mg $1,770.29/100, 100 mg $2,407.20/100, 120 mg $2,088.66/100. **Oral solution:** 1 mg/mL, 10 mg/5 mL, 20 mg/5 mL, 5 mg/mL, 100 mg/5 mL. **Cost:** *Generic*—4 mg/mL $17.51/100 mL, 20 mg/mL $25.20/30 mL. **Rectal suppositories:** 5 mg, 10 mg, 20 mg, 30 mg. **Cost:** *Generic*—5 mg $60.00/12, 10 mg $75.00/12, 20 mg $90.00/12, 30 mg $112.50/12. **Solution for epidural, IV injection (preservative-free):** 0.5 mg/mL, 1 mg/mL. **Solution for epidural or IT use (continuous microinfusion device; preservative-free):** 10 mg/mL, 25 mg/mL. **Solution for IM, subcut, IV injection:** 1 mg/mL, 2 mg/mL, 4 mg/mL, 5 mg/mL, 8 mg/mL, 10 mg/mL, 25 mg/mL, 50 mg/mL. **Solution for IV injection (PCA device):** 1 mg/mL, 2 mg/mL, 3 mg/mL, 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following PO, subcut, IM, and 20 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. When titrating doses of short-acting morphine, a repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients on a continuous infusion should have additional bolus doses provided every 15–30 min, as needed, for breakthrough pain. The bolus dose is usually set to the amount of drug infused each hr by continuous infusion.
- Patients taking extended-release morphine may require additional short-acting opioid doses for breakthrough pain. Doses of short-acting opioids should be equivalent to 10–20% of 24 hr total and given every 2 hr as needed.
- An equianalgesic chart (see Appendix I) should be used when changing routes or when changing from one opioid to another.
- ***High Alert:*** Assess level of consciousness, BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Subsequent doses may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. May cause sleep-related breathing disorders (central sleep apnea [CSA], sleep-related hypoxemia). Geri: Assess geriatric patients frequently; older adults are more sensitive to the effects of opioid analgesics and may experience side effects and respiratory complications more frequently. Pedi: Assess pediatric patient frequently; children are more sensitive to the effects of opioid analgesics and may experience respiratory complications, excitability, and restlessness more frequently.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Patients who receive morphine for pain rarely develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Institute prevention of constipation with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated. Consider drugs for opioid-induced constipation.
- Assess risk for opioid addiction, abuse, or misuse prior to administration. Abuse or misuse of extended-release preparations by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of morphine and can result in overdose and death.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and adults weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Implementation

- ***High Alert:*** Do not confuse MS Contin (morphine sulfate) with Oxycontin (oxycodone). Do not confuse morphine with hydromorphone. Do not confuse morphine (nonconcentrated oral liquid) with morphine (concentrated oral liquid).
- Use only preservative-free formulations for neonates, and for epidural and intrathecal routes in all patients.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- When transferring from other opioids or other forms of morphine to extended-release tablets, administer

© F.A. Davis Publishing

a total daily dose of oral morphine equivalent to previous daily dose (see Appendix I) and divided every 8 hr (MS Contin), every 12 hr (MS Contin), or every 24 hr.

- Morphine should be discontinued gradually to prevent withdrawal symptoms after long-term use. For patients on long-acting agents who are physically opioid-dependent, initiate the taper by a small enough increment (no greater than 10% to 25% of total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2 to 4 wk. Patients who have been taking opioids for briefer periods of time may tolerate a more rapid taper. Monitor frequently to manage pain and withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). If withdrawal symptoms occur, pause the taper for a period of time or raise the dose of opioid analgesic to the previous dose, and then proceed with a slower taper. Also, monitor patients for changes in mood, emergence of suicidal thoughts, or use of other substances. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the opioid analgesic.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.
- **PO:** Doses may be administered with food or milk to minimize GI irritation.
- Administer oral solution with properly calibrated measuring device; may be diluted in a glass of fruit juice just prior to administration to improve taste. Verify correct dose (mg) and correct volume (mL) prior to administration. Use an oral syringe when using 20 mg/mL concentration of oral solution.
- ***DNC:*** Swallow extended-release tablets whole; do not break, crush, dissolve, or chew (could result in rapid release and absorption of a potentially toxic dose).
- Extended release capsules may be opened and the pellets sprinkled onto applesauce immediately prior to administration. Patients should rinse mouth and swallow to assure ingestion of entire dose. ***DNC:*** Pellets should not be chewed, crushed, or dissolved. Capsules may also be opened and sprinkled on approximately 10 mL of water and flushed while swirling through a pre-wetted 16 French gastrostomy tube fitted with a funnel at the port end. Additional water should be used to transfer and flush any remaining pellets. Do not administer extended release capsules via a nasogastric tube.
- **Rect:** *MS Contin* has been administered rectally.
- **IM, Subcut:** Use IM route for repeated doses, because morphine is irritating to subcut tissues.

IV Administration

- **IV:** Solution is colorless; do not administer discolored solution.
- **IV Push:** ***Dilution:*** Do not dilute prior to injection. ***Rate: High Alert:*** Administer slowly at 2.5–15 mg over 5 min. Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Continuous Infusion:** ***Dilution:*** May be added to D5W, D10W, 0.9% NaCl, 0.45% NaCl, Ringer's or LR, dextrose/saline solution, or dextrose/Ringer's or LR. ***Concentration:*** 0.1–1 mg/mL or greater for continuous infusion. ***Rate:*** Administer via infusion pump to control the rate. Dose should be titrated to ensure adequate pain relief without excessive sedation, respiratory depression, or hypotension. May be administered via patient-controlled analgesia (PCA) pump.
- **Y-Site Compatibility:** acetaminophen, aldesleukin, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime,

© F.A. Davis Publishing

chloramphenicol, chlorpromazine, cisatracurium, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, meropenem/vaborbactam, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, posaconazole, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, warfarin, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, azathioprine, dantrolene, doxorubicin liposomal, folic acid, ganciclovir, gemtuzumab ozogamicin, indomethacin, micafungin, minocycline, mitomycin, pentamidine, pentobarbital, phenytoin, sargramostim, trastuzumab.
- **Epidural:** Administer undiluted. Do not use an in-line filter. Do not admix or administer other medications in epidural space for 48 hr after administration. Administer within 4 hr after removing from vial. Store in refrigerator; do not freeze.

Patient/Family Teaching

- ***REMS:*** Instruct patient how and when to ask for pain medication. Do not stop taking without discussing with health care professional; may cause withdrawal symptoms if discontinued abruptly after prolonged use. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. The Patient Counseling Guide (PCG) is available at www.fda.gov/OpioidAnalgesicREMSPCG.
- Instruct patient on how and when to ask for and take pain medication.
- May cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient that morphine is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- Advise patient to notify health care professional if pain control is not adequate or if severe or persistent side effects occur.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Emphasize the importance of aggressive prevention of constipation with the use of morphine.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patients who are immobilized or on prolonged bedrest to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to morphine through breast milk for excess sedation and respiratory depression.

© F.A. Davis Publishing

Chronic use may reduce fertility in females and males.

- **Home Care Issues:** ***High Alert:*** Explain to patient and family how and when to administer morphine and how to care for infusion equipment properly. Pedi: Teach parents or caregivers how to accurately measure liquid medication and to use only the measuring device dispensed with the medication.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Decrease in symptoms of pulmonary edema.

moxifloxacin, See FLUOROQUINOLONES.

mupirocin (myoo-**peer**-oh-sin)

~~Bactroban~~, Centany

Classification

Therapeutic: anti-infectives

Indications

Topical: Treatment of: Impetigo, Secondarily infected traumatic skin lesions (up to 10 cm in length or 100 cm^2 area) caused by *Staphylococcus aureus* and *Streptococcus pyogenes*.

Action

Inhibits bacterial protein synthesis. **Therapeutic Effects:** Inhibition of bacterial growth and reproduction. **Spectrum:** Greatest activity against gram-positive organisms, including: *S. aureus*, Beta-hemolytic streptococci. Resolution of impetigo. Eradication of *S. aureus* carrier state.

Pharmacokinetics

Absorption: Minimal systemic absorption.
Distribution: Remains in the stratum corneum after topical use for prolonged periods of time (72 hr).
Metabolism and Excretion: Metabolized in the skin, removed by desquamation.
Half-life: 17–36 min.

TIME/ACTION PROFILE (anti-infective effect)

ROUTE	ONSET	PEAK	DURATION
Topical†	unknown	3–5 days	72 hr

†Resolution of lesions.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to mupirocin or polyethylene glycol.
Use Cautiously in: Renal impairment; Burn patients; OB, Lactation: Safety not established.

Adverse Reactions/Side Effects

Derm: burning, itching, pain, stinging.

Interactions

Drug-Drug: None reported.

Route/Dosage

Topical (Adults and Children ≥2 mo): Ointment: Apply 3–5 times daily for 5–14 days.
Topical (Adults and Children ≥3 mo): Cream: Apply small amount 3 times/day for 10 days.

Availability (generic available)

Cream: 2%. **Cost:** *Generic*—$69.25/15 g. **Ointment:** 2%. **Cost:** *Generic*—$17.20/22 g.

NURSING IMPLICATIONS

Assessment

- Assess lesions before and daily during therapy.

Implementation

- **Topical:** Wash affected area with soap and water and dry thoroughly. Apply a small amount of mupirocin to the affected area 3 times daily and rub in gently. Treated area may be covered with gauze if desired.

Patient/Family Teaching

- Instruct patient on the correct application of mupirocin. Advise patient to apply medication exactly as directed for the full course of therapy. If a dose is missed, apply as soon as possible unless almost time for next dose. Avoid contact with eyes.
- **Topical:** Teach patient and family appropriate hygienic measures to prevent spread of impetigo.
- Instruct parents to notify school nurse for screening and prevention of transmission.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Patient should consult health care professional if symptoms have not improved in 3–5 days.

Evaluation/Desired Outcomes

- Healing of skin lesions. If no clinical response is seen in 3–5 days, condition should be re-evaluated.

REMS

mycophenolate mofetil (mye-koe-**fee**-noe-late **moe**-fe-til)

CellCept

mycophenolic acid (mye-koe-**fee**-noe-lik)

Myfortic

Classification

Therapeutic: immunosuppressants

© F.A. Davis Publishing

Indications

Mycophenolate mofetil: Prevention of rejection in allogeneic renal, hepatic, and cardiac transplantation (used concurrently with cyclosporine and corticosteroids). **Mycophenolic acid**: Prevention of rejection in allogenic renal transplantation (used concurrently with cyclosporine and corticosteroids). **Unlabeled Use:** Nephrotic syndrome.

Action

Inhibits the enzyme inosine monophosphate dehydrogenase, which is involved in purine synthesis. This inhibition results in suppression of T- and B-lymphocyte proliferation. **Therapeutic Effects:** Prevention of heart, kidney, or liver transplant rejection.

Pharmacokinetics

Absorption: Following oral and IV administration, mycophenolate mofetil is rapidly hydrolyzed to mycophenolic acid (MPA), the active metabolite. Absorption of enteric-coated mycophenolic acid (Myfortic) is delayed compared with mycophenolate mofetil (CellCept).

Distribution: Cross the placenta and enter breast milk.

Protein Binding: *MPA*—97%.

Metabolism and Excretion: MPA is extensively metabolized; <1% excreted unchanged in urine. Some enterohepatic recirculation of MPA occurs.

Half-life: *MPA*—8–18 hr.

TIME/ACTION PROFILE (blood levels of MPA)

ROUTE	ONSET	PEAK	DURATION
mycophenolate mofetil-PO	rapid	0.25–1.25 hr	N/A
mycophenolic acid	rapid	1.5–2.75 hr	N/A

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to polysorbate 80 (for IV mycophenolate mofetil); OB: Pregnancy (↑ risk of congenital anomalies or spontaneous abortion).

Use Cautiously in: Active serious pathology of the GI tract (including history of ulcer disease or GI bleeding); Phenylketonuria (oral suspension contains aspartame); Severe chronic renal impairment (dose not to exceed 1 g twice daily (CellCept) if CCr <25 mL/min/1.73 m^2); careful monitoring recommended; Delayed graft function following transplantation (observe for ↑ toxicity); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Mycophenolate mofetil approved in children ≥3 mo for renal transplant; mycophenolic acid approved in children ≥5 yr for renal transplant; safety not established for other age groups; Geri: ↑ risk of adverse reactions related to immunosuppression in older adults.

Adverse Reactions/Side Effects

CV: edema, hypertension, hypotension, tachycardia. **Derm:** rash. **Endo:** hypercholesterolemia, hyperglycemia, hyperkalemia, hypocalcemia, hypokalemia, hypomagnesemia. **GI:** GI BLEEDING, anorexia, constipation, diarrhea, nausea, vomiting, abdominal pain. **GU:** renal dysfunction. **Hemat:** leukocytosis, leukopenia, thrombocytopenia, anemia, pure red cell aplasia. **Neuro:** tremor, PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), anxiety, confusion, dizziness, headache, insomnia, paresthesia, sedation, tremor. **Resp:** cough, dyspnea. **Misc:** MALIGNANCY, fever, infection (including activation of latent viral infections such as Polyomavirus-associated nephropathy or Hepatitis B/C).

Interactions

Drug-Drug: Combined use with **azathioprine** is not recommended (effects unknown). **Acyclovir** and **ganciclovir** compete with MPA for renal excretion and, in patients with renal dysfunction, may ↑ each other's toxicity. **Magnesium and aluminum hydroxide** antacids ↓ the absorption of MPA (avoid simultaneous administration). **Proton pump inhibitors**, including **dexlansoprazole**, **esomeprazole**, **lansoprazole**, **omeprazole**, **pantoprazole**, and **rabeprazole** may ↓ levels. **Cholestyramine** and **colestipol** ↓ the absorption of MPA (avoid concurrent use). May ↓ the effectiveness of **oral contraceptives** (additional contraceptive method should be used). May ↓ the antibody response to and ↑ risk of adverse reactions from **live attenuated vaccines**. **Amoxicillin/clavulanic acid** or **ciprofloxacin** may ↓ MPA trough levels. **Cyclosporine** may ↓ levels; use caution when discontinuing cyclosporine (may ↑ mycophenolate levels) or when switching from cyclosporine to another immunosuppressant, such as tacrolimus or belatacept. **Telmisartan** may ↓ levels.

Route/Dosage

Mycophenolate Mofetil

Renal Transplantation

PO, IV (Adults): 1 g twice daily; IV should be started ≤24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥14 days). **PO (Children 3 mo–18 yr):** 600 mg/m^2 twice daily (not to exceed 2 g/day).

Hepatic Transplantation

PO, IV (Adults): 1 g twice daily IV, or 1.5 g twice daily PO. IV should be started ≤24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥14 days).

Cardiac Transplantation

PO, IV (Adults): 1.5 g twice daily; IV should be started ≤24 hr after transplantation and switched to PO as soon as possible (IV not recommended for ≥14 days).

© F.A. Davis Publishing

Nephrotic Syndrome
PO (Children): *Frequent relapses*—12.5–18 mg/kg/dose twice daily; maximum: 2 g/day. *Steroid-dependent*—12–18 mg/kg/dose or 600 mg/m² twice daily; maximum: 2 g/day.

Renal Impairment
PO, IV (Adults): *CCr <25 mL/min*—daily dose should not exceed 2 g.

Mycophenolic Acid
Mycophenolate mofetil and mycophenolic acid should not be used interchangeably without the advice of a health care professional.

Renal Transplantation
PO (Adults): 720 mg twice daily.
PO (Children 5–16 yr and ≥1.19 m²): 400–450 mg/m² twice daily (not to exceed 720 mg twice daily).

Availability (generic available)

Mycophenolate Mofetil
Tablets: 500 mg. **Capsules:** 250 mg. **Oral suspension (fruit flavor):** 200 mg/mL. **Powder for injection :** 500 mg/vial.

Mycophenolic Acid
Delayed-release tablets: 180 mg, 360 mg.

NURSING IMPLICATIONS

Assessment
- Assess for symptoms of organ rejection throughout therapy.
- Assess for signs of PML (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) periodically during therapy.
- ***Lab Test Considerations:*** Verify negative urine pregnancy test with a specificity of 25 mIU/mL immediately prior to beginning therapy and again 8–10 days later. Repeat pregnancy tests should be performed during routine follow-up visits.
- Monitor CBC with differential weekly during the 1st mo, twice monthly for the 2nd and 3rd mo of therapy, and then monthly during the 1st yr. Neutropenia occurs most frequently from 31–180 days post-transplant. If ANC is <1000/mm³, dose should be reduced or discontinued.
- Monitor hepatic and renal status and electrolytes periodically during therapy. May cause ↑ alkaline phosphatase, AST, ALT, LDH, BUN, and serum creatinine. May also cause hyperkalemia, hypokalemia, hypocalcemia, hypomagnesemia, hyperglycemia, and hyperlipidemia.

Implementation
- The initial dose of mycophenolate should be given within 24 hr of transplant.
- Mycophenolate mofetil (Cellcept) and mycophenolic acid (Myfortic) are not interchangeable; rate of absorption is different.
- ***REMS:*** Mycophenolate is administered under REMS requirements. Prescribers are encouraged to complete Prescriber Training program and patients are encouraged to complete the Information for Patients to mitigate the risk of embryofetal toxicity associated with the use of mycophenolate during pregnancy.
- **PO:** Administer on an empty stomach, 1 hr before or 2 hr after meals. ***DNC:*** Swallow capsules and delayed-release tablets whole; do not open, crush, or chew. Mycophenolate may be teratogenic; wear gloves and avoid contact with skin or mucous membranes or inhalation of contents of capsules or oral suspension powder. Oral solution can be administered by nasogastric tube (minimum size of 8 French). Oral solution is stable for 60 days if refrigerated.
- Do not administer mycophenolate concurrently with antacids containing magnesium or aluminum.

IV Administration
- **IV:** IV route should only be used for patients unable to take oral medication and should be switched to oral dose form as soon as patient can tolerate capsules or tablets.
- **Intermittent Infusion:** ***Dilution:*** Reconstitute each vial with 14 mL of D5W. Shake gently to dissolve. Solution is slightly yellow; discard if solution is discolored or contains particulate matter. Dilute contents of 2 vials (1-g dose) further with 140 mL of D5W or 3 vials (1.5-g dose) with 210 mL of D5W. ***Concentration:*** 6 mg/mL. Solution is stable for 4 hr. ***Rate:*** Administer via slow IV infusion over at least 2 hr. Do not administer as a bolus or via rapid infusion; increases risk of phlebitis and thrombosis.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, amiodarone, anidulafungin, argatroban, atracurium, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, caspofungin, ceftolozane/tazobactam, chlorpromazine, ciprofloxacin, cisatracurium, daptomycin, dexmedetomidine, dexrazoxane , digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, gentamicin, glycopyrrolate, granisetron, haloperidol, hydralazine, hydromorphone, insulin, regular, isavuconazonium, isoproterenol, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, minocycline, morphine, moxifloxacin, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, 0.9% NaCl, octreotide, ondansetron, oxytocin, pamidronate, pancuronium, pentamidine,

© F.A. Davis Publishing

phentolamine, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, succinylcholine, sufentanil, tacrolimus, theophylline, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azithromycin, aztreonam, calcium gluconate, cangrelor, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, defibrotide, dexamethasone, diazepam, eptifibatide, foscarnet, fosphenytoin, furosemide, ganciclovir, gemtuzumab ozogamicin, heparin, hydrocortisone, imipenem/cilastatin, ketorolac, meropenem, methotrexate, methylprednisolone, micafungin, nafcillin, nitroprusside, pantoprazole, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobacatam, potassium acetate, potassium phosphates, sodium acetate, sodium bicarbonate, sodium phosphates, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. Take missed dose as soon as remembered, but not if within 2 hrs before next dose. Do not skip or double up on missed doses. Do not discontinue without consulting health care professional. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- ***REMS:*** Explain REMS program to patient.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for the transplanted organ, and stress need to notify health care professional immediately if signs of rejection or infection occur.
- May cause somnolence, confusion, dizziness, tremor, or hypotension. Caution patient to avoid driving and other activities requiring alertness until response from medication is known.
- Instruct patient to notify health care professional immediately if signs and symptoms of infection (temperature ≥100.5 F, cold symptoms [runny nose, sore throat], flu symptoms [upset stomach, stomach pain, vomiting, diarrhea], earache or headache, pain during urination, frequent urination, white patches in mouth or throat, unexpected bruising or bleeding, cuts, scrapes, or incisions that are red, warm, and oozing pus) or PML.
- Advise patient to avoid contact with persons with contagious diseases.
- Advise patient to avoid vaccinations with live attenuated virus during therapy.
- Inform patient of the increased risk of lymphoma and other malignancies. Advise patient to use sunscreen and wear protective clothing to decrease risk of skin cancer.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to avoid donating blood during and for at least 6 wk after discontinuation of therapy.
- Rep: Inform females of reproductive potential of the potential for pregnancy loss and fetal harm. Discuss importance of simultaneously using two reliable nonhormonal forms of contraception, unless abstinence is the chosen method, prior to beginning, during, and for 6 wk following discontinuation of therapy and to avoid breast feeding. Discuss acceptable forms of contraception with health care professional. Mycophenolate may decrease effectiveness of hormonal contraceptives. Encourage patients who become pregnant during or within 6 wk after therapy to enroll in the Pregnancy Registry by calling 1-800-617-8191 or www.mycophenolateREMS.com to monitor pregnancy outcomes in women exposed to mycophenolate during pregnancy. Instruct male patients with female partners of reproductive potential to use effective contraception during and for at least 90 days after discontinuing therapy. Advise male patients to avoid semen donation during and for at least 90 days after discontinuing therapy.
- Emphasize the importance of routine follow-up laboratory tests.

Evaluation/Desired Outcomes

- Prevention of rejection of transplanted organs.

© F.A. Davis Publishing

nafarelin (na-**fare**-e-lin)

Synarel

Classification

Therapeutic: hormones

Pharmacologic: gonadotropin-releasing hormones

Indications

Endometriosis. Central precocious puberty (gonadotropin-dependent) in children.

Action

Acts as a synthetic analogue of gonadotropin-releasing hormone (GnRH). Initially increases pituitary production of luteinizing hormone (LH) and follicle-stimulating hormone (FSH), which cause ovarian steroid production. Chronic administration leads to decreased production of gonadotropins. Endometriotic lesions are sensitive to ovarian hormones. **Therapeutic Effects:** Reduction in lesions and associated pain in endometriosis. Arrest and regression of puberty in children with central precocious puberty.

Pharmacokinetics

Absorption: Well absorbed following intranasal administration.

Distribution: Unknown.

Metabolism and Excretion: 20–40% excreted in feces; 3% excreted unchanged by the kidneys.

Half-life: 3 hr.

TIME/ACTION PROFILE (↓ ovarian steroid production)

ROUTE	ONSET	PEAK	DURATION
Intranasal	within 4 wk	3–4 wk	3–6 mo†

†Relief of symptoms of endometriosis following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to GnRH, its analogues, or sorbitol; OB, Lactation: Pregnancy or lactation.

Use Cautiously in: Rhinitis; Seizures, cerebrovascular disorders, CNS tumor, or concurrent use of bupropion or selective serotonin reuptake inhibitors.

Adverse Reactions/Side Effects

EENT: nasal irritation. **CV:** MYOCARDIAL INFARCTION, edema. **GU:** vaginal dryness. **Derm:** acne, hirsutism, seborrhea. **Endo:** cessation of menses, impaired fertility, ↓ breast size. **Metab:** hyperglycemia. **MS:** ↓ bone density, myalgia. **Neuro:** SEIZURES, STROKE, headaches, aggression, anger, depression, impatience, irritability, insomnia. **Misc:** ↓ libido, hot flashes, hypersensitivity reactions, weight gain.

Interactions

Drug-Drug: Concurrent **topical nasal decongestants** may ↓ absorption of nafarelin (administer decongestant at least 2 hr after nafarelin). Concurrent use with **bupropion** or **SSRIs** may ↑ risk of seizures.

Route/Dosage

Intranasal (Adults): *Endometriosis*— 1 spray (200 mcg) in one nostril in the morning and 1 spray in the other nostril in the evening (400 mcg/day). May ↑ to 1 spray in each nostril in the morning and evening (800 mcg/day).

Intranasal (Children): *Central precocious puberty*— 2 sprays in each nostril in the morning and in the evening (1600 mcg/day); may ↑ up to 1800 mcg/day (3 sprays in alternating nostrils 3 times daily).

Availability

Nasal spray: 2 mg/mL (200 mcg/spray).

NURSING IMPLICATIONS

Assessment

- **Endometriosis:** Assess patient for endometriotic pain periodically during therapy.
- **Central Precocious Puberty:** Prior to therapy, a complete physical and endocrinologic examination including height, weight, hand and wrist x ray, total sex steroid level (estradiol or testosterone), adrenal steroid level, beta human chorionic gonadotropin level, GnRH stimulation test, pelvic/adrenal/testicular ultrasound, and CT of the head must be performed. These parameters are monitored after 6–8 wk and every 3–6 mo during therapy.
- Assess patient for signs of precocious puberty (menses, breast development, testicular growth) periodically during therapy.
- Nafarelin is discontinued when the onset of normal puberty is desired. Monitor the onset of normal puberty and assess menstrual cycle, reproductive function, and final adult height.

Implementation

- **Endometriosis:** Treatment should be started between days 2 and 4 of the menstrual cycle and continued for up to 6 mo.

Patient/Family Teaching

- Instruct patient on the correct technique for nasal spray: The head should be tilted back slightly; wait 30 sec between sprays.
- Advise patient to consult health care professional if rhinitis occurs during therapy. If a topical decongestant is needed, do not use decongestant until 2 hr after nafarelin dosing. If possible, avoid sneezing during and immediately after nafarelin dose.
- **Endometriosis:** Inform patient that 1 spray should be administered into one nostril in the morning and 1 spray into the other nostril in the evening for the

© F.A. Davis Publishing

400-mcg/day dose. If dose is increased to 800 mcg/day, administer 1 spray to each nostril (2 sprays) morning and evening; 1 bottle should provide a 30-day supply at the 400 mcg/day dose.
- Advise patient to use a form of contraception other than oral contraceptives during therapy. Inform patient that amenorrhea is expected. Instruct patient to notify health care professional if regular menstruation persists or if successive doses are missed.
- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome.
- **Central Precocious Puberty:** Instruct patient on correct timing and number of sprays. The 1600-mcg/day dose is achieved by 2 sprays to each nostril in the morning (4 sprays) and 2 sprays to each nostril in the evening (4 sprays), for a total of 8 sprays. The 1800 mcg/day dose is achieved by 3 sprays into alternating nostrils 3 times per day, for a total of 9 sprays. Inform patient and parents that if doses are not taken as directed pubertal process may be reactivated. One bottle should provide a 7-day supply at the 1600-mcg/day dose.
- Advise patient and parents that during 1st mo of therapy some signs of puberty (vaginal bleeding, breast enlargement) may occur. These should resolve after the 1st mo of therapy. If these signs persist after the 2nd mo of therapy, notify health care professional.

Evaluation/Desired Outcomes
- Reduction in lesions and associated pain in endometriosis.
- Resolution of the signs of precocious puberty.

nafcillin, See PENICILLINS, PENICILLINASE RESISTANT.

naftifine, See ANTIFUNGALS (TOPICAL).

HIGH ALERT

nalbuphine (nal-byoo-feen)
Nubain

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists/analgesics

Indications
Moderate to severe pain. Supplement to balanced anesthesia. Pain control during labor. Sedation before surgery.

Action
Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. In addition, has partial antagonist properties, which may result in opioid withdrawal in physically dependent patients. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics
Absorption: Well absorbed after IM and subcut administration.
Distribution: Probably crosses the placenta and enters breast milk.
Protein Binding: 50%.
Metabolism and Excretion: Mostly metabolized by the liver and eliminated in the feces via biliary excretion. Minimal amounts excreted unchanged by the kidneys.
Half-life: Children 1–8 yrs: 0.9 hr; Adults: 3.5–5 hr.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
IM	<15 min	60 min	3–6 hr
Subcut	<15 min	unknown	3–6 hr
IV	2–3 min	30 min	3–6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to nalbuphine or bisulfites; Patients physically dependent on opioids and who have not been detoxified (may precipitate withdrawal).
Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hyperplasia; Patients who have recently received opioid agonists; OB: Has been used during labor but may cause respiratory depression in the newborn; prolonged use of opioids during pregnancy can result in neonatal opioid withdrawal syndrome; Lactation: May cause respiratory depression and excessive sedation in infant; Pedi: Safety and effectiveness not established in children; Geri: Dose ↓ suggested in older adults.

Adverse Reactions/Side Effects
CV: hypertension, orthostatic hypotension, palpitations. **Derm:** clammy feeling, sweating. **EENT:** blurred vision, diplopia, miosis (high doses). **Endo:** adrenal insufficiency. **GI:** dry mouth, nausea, vomiting, constipation, ileus. **GU:** urinary urgency. **Neuro:** dizziness, headache, sedation, confusion, dysphoria, euphoria, floating feeling, hallucinations, unusual dreams. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia). **Misc:** physical dependence, psychological dependence, tolerance.

Interactions
Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (may result in unpredictable, severe reactions—↓ initial dose of nalbuphine to 25% of usual dose). Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-ben-**

© F.A. Davis Publishing

zodiazepine sedative/hypnotics, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol**; may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. May precipitate withdrawal in patients who are physically dependent on **opioid agonists**. Avoid concurrent use with other **opioid analgesic agonists** (may diminish analgesic effect). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5HT$_3$ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans**, ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

Analgesia

IM, Subcut, IV (Adults): Usual dose is 10 mg every 3–6 hr (maximum: 20 mg/dose or 160 mg/day).

IM, Subcut, IV (Children): 0.1–0.15 mg/kg every 3–6 hr (maximum: 20 mg/dose or 160 mg/day).

Supplement to Balanced Anesthesia

IV (Adults): *Initial*—0.3–3 mg/kg over 10–15 min. *Maintenance*—0.25–0.5 mg/kg as needed.

Availability (generic available)

Solution for injection: 10 mg/mL, 20 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain before and 1 hr after IM or 30 min (peak) after IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal. Patients requiring doses higher than 20 mg should be converted to an opioid agonist. Nalbuphine is not recommended for prolonged use or as first-line therapy for acute or cancer pain.
- An equianalgesic chart (see Appendix I) should be used when changing routes or when changing from one opioid to another.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. May cause sleep-related breathing disorders (central sleep apnea [CSA], sleep-related hypoxemia). Nalbuphine produces respiratory depression, but this does not markedly increase with increased doses.
- Assess previous analgesic history. Antagonistic properties may induce withdrawal symptoms (vomiting, restlessness, abdominal cramps, and increased BP and temperature) in patients physically dependent on opioids.
- Although this drug has a low potential for dependence, prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive nalbuphine for pain do not develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- Assess risk for opioid addiction, abuse, or misuse prior to administration.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Implementation

- ***High Alert:*** Do not confuse nalbuphine with naloxone.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if administered before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive effects and permit lower opioid doses.
- Nalbuphine should be discontinued gradually to prevent withdrawal symptoms after long-term use. Monitor frequently to manage pain and withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). If withdrawal symptoms occur, pause the taper for a period of time or raise the dose of opioid analgesic to the previous dose, and then proceed with a slower taper. Also,

© F.A. Davis Publishing

monitor patients for changes in mood, emergence of suicidal thoughts, or use of other substances. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the opioid analgesic.

- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.
- **IM:** Administer deep into well-developed muscle. Rotate sites of injections.

IV Administration

- **IV Push:** May give IV undiluted.
- ***Concentration:*** 10–20 mg/mL. ***Rate:*** Administer slowly, each 10 mg over 3–5 min.
- **Y-Site Compatibility:** acetaminophen, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, argatroban, arsenic trioxide, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, cisatracurium, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, idarubicin, ifosfamide, insulin regular, irinotecan, isoproterenol, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mesna, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, penicillin G, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, allopurinol, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, azathioprine, cefepime, chloramphenicol, cyclosporine, dantrolene, diazepam, docetaxel, folic acid, furosemide, ganciclovir, gemtuzumab ozogamicin, hydrocortisone, imipenem/cilastatin, indomethacin, ketorolac, methotrexate, methylprednisolone, mitomycin, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, sargramostim, sodium bicarbonate, trastuzumab, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating and to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to notify health care professional if pain control is not adequate or if severe or persistent side effects occur.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dry mouth.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Mon-

© F.A. Davis Publishing

itor infants exposed to nalbuphine through breast milk for excess sedation and respiratory depression. Chronic use may reduce fertility in females and males.

Evaluation/Desired Outcomes

- Decrease in severity of pain without significant alteration in level of consciousness or respiratory status.

naldemedine (nal-**dem**-e-deen)

Symproic

Classification

Therapeutic: laxatives

Pharmacologic: opioid antagonists

Indications

Treatment of opioid-induced constipation (OIC) in patients with chronic noncancer pain, including those with chronic pain related to prior cancer or its treatment who do not require frequent (e.g., weekly) opioid dosage escalation.

Action

Acts peripherally as a mu-opioid receptor antagonist, blocking opioid effects on the GI tract. **Therapeutic Effects:** Blocks constipating effects of opioids on the GI tract without loss of analgesia.

Pharmacokinetics

Absorption: Rapidly absorbed; absorption delayed by high-fat meal by 2 hr.

Distribution: Moderate tissue distribution, does not cross the blood-brain barrier.

Protein Binding: 93–94%.

Metabolism and Excretion: Primarily metabolized by CYP3A to an active metabolite (nor-naldemedine); 57% excreted in urine (16–18% as unchanged drug), 35% excreted in feces.

Half-life: 11 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.75 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Known/suspected mechanical GI obstruction; ↑ risk of recurrent GI obstruction; Severe hepatic impairment; Lactation: Discontinue breast feeding or the naldemedine.

Use Cautiously in: Known/suspected lesions of GI tract (↑ risk for GI perforation); Receiving opioids for <4 wk (may be less responsive to naldemedine); OB: Use only if potential benefit outweighs potential risk to fetus; may cause opioid withdrawal in fetus; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

GI: GI PERFORATION, abdominal pain, diarrhea, gastroenteritis, nausea, vomiting. **Misc:** opioid withdrawal.

Interactions

Drug-Drug: Strong CYP3A inducers, including **carbamazepine**, **phenytoin**, or **rifampin**, may ↓ naldemedine levels and its effectiveness; avoid concurrent use. Other **opioid antagonists** may cause additive effects and ↑ risk of opioid withdrawal. **Moderate CYP3A inhibitors** and **strong CYP3A inhibitors**, including **aprepitant**, **atazanavir**, **clarithromycin**, **diltiazem**, **erythromycin**, **fluconazole**, **itraconazole**, **ketoconazole**, **ritonavir**, or **saquinavir** may ↑ naldemedine levels and risk of toxicity; monitor for potential adverse effects. **P-glycoprotein inhibitors**, including **amiodarone**, **captopril**, **cyclosporine**, **quinidine**, or **verapamil**, may ↑ naldemedine levels and risk of toxicity; monitor for potential adverse effects.

Drug-Natural Products: St. John's wort may ↓ naldemedine levels and its effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults): 0.2 mg once daily.

Availability

Tablets: 0.2 mg.

NURSING IMPLICATIONS

Assessment

- Assess bowel sounds and frequency, quantity, and consistency of stools periodically during therapy.
- Monitor pain intensity during therapy. Naldemedine does not affect pain or effects of opioid analgesics on pain control. Discontinue naldemedine if opioid analgesic is discontinued. Patients receiving opioids for <4 wk may be less responsive to naldemedine.
- Monitor for signs and symptoms of gastrointestinal perforation (severe, persistent, or worsening abdominal pain) periodically during therapy. Discontinue naldemedine if symptoms occur.

Implementation

- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take naldemedine as directed. Advise patient to read *Medication Guide* prior to starting therapy and with each refill in case of changes.
- Advise patient to notify health care professional immediately if stomach pain that does not go away occurs.
- Advise patient to notify health care professional if signs and symptoms of opioid withdrawal (sweating, chills, diarrhea, stomach pain, anxiety, irritability, yawning) occur. Patients taking methadone for pain are at increased risk for stomach pain and diarrhea.

© F.A. Davis Publishing

- Instruct patient to stop taking naldemedine if they stop taking opioid medications.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patients to notify health care professional if pregnancy is planned or suspected and avoid breast feeding during and for 3 days after last dose of therapy.

Evaluation/Desired Outcomes

- Relief of opioid induced constipation, especially if opioid therapy has been for 4 wk or more.

naloxegol (nal-ox-ee-gol)

Movantik

Classification

Therapeutic: laxatives
Pharmacologic: opioid antagonists

Indications

Treatment of opioid-induced constipation (OIC) in patients with chronic noncancer pain, including those with chronic pain related to prior cancer or its treatment who do not require frequent (e.g., weekly) opioid dose escalation.

Action

Acts peripherally as a mu receptor antagonist, blocking opioid receptors in the GI tract. **Therapeutic Effects:** Blocks constipating effects of opioids on the GI tract without loss of analgesia.

Pharmacokinetics

Absorption: Systemic absorption follows oral administration. A high-fat meal ↑ absorption.
Distribution: Does not cross the blood-brain barrier.
Metabolism and Excretion: Metabolized primarily by the CYP3A4 enzyme system; 68% excreted in feces, 16% in urine mostly as metabolites.
Half-life: 6–11 hr.

TIME/ACTION PROFILE (spontaneous bowel movement)

ROUTE	ONSET	PEAK	DURATION
PO	within 24 hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Known/suspected/history of GI obstruction; Severe hepatic impairment; Concurrent use of strong CYP3A4 inhibitors, strong CYP3A4 inducers, or other opioid antagonists; Severe hepatic impairment; Lactation: Lactation (may precipitate opioid withdrawal in infant).
Use Cautiously in: Infiltrative GI tract malignancy, recent GI tract surgery, diverticular disease, ischemic colitis, or concurrent use of bevacizumab (↑ risk of GI perforation); Patients with disruption of the blood-brain barrier (may precipitate opioid withdrawal); OB: Use only if potential maternal benefit justifies potential fetal risk (may precipitate fetal opioid withdrawal); Pedi: Safety and effectiveness not established in children; Geri: Blood levels are ↑ in elderly Japanese patients.

Adverse Reactions/Side Effects

Derm: sweating. **GI:** GASTROINTESTINAL PERFORATION, abdominal pain, diarrhea, flatulence, nausea, vomiting. **Neuro:** headache. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema), opioid withdrawal.

Interactions

Drug-Drug: **Strong CYP3A4 inhibitors**, including **clarithromycin** and **ketoconazole**, may ↑ risk of toxicity/adverse reactions; concurrent use contraindicated. **Strong CYP3A4 inducers**, including **rifampin**, may ↓ blood levels/effectiveness; concurrent use contraindicated. Other **opioid antagonists** may precipitate opioid withdrawal; concurrent use contraindicated. **Moderate CYP3A4 inhibitors**, including **diltiazem**, **erythromycin**, and **verapamil**, may ↑ risk of toxicity/adverse reactions; ↓ dose of methylnaltrexone. Concurrent use of **methadone** for pain ↑ risk of stomach pain and diarrhea. Concurrent use of **bevacizumab** may ↑ risk of GI perforation.
Drug-Food: **Grapefruit/grapefruit juice** may ↑ blood levels and the risk of toxicity/adverse reactions; avoid concurrent use.

Route/Dosage

PO (Adults): 25 mg once daily; if poorly tolerated ↓ dose to 12.5 mg once daily; *Concurrent use of moderate CYP3A4 inhibitors*— 12.5 mg once daily (careful monitoring recommended).

Renal Impairment

PO (Adults): *CCr <60 mL/min*— 12.5 mg once daily initially; may cautiously ↑ to 25 mg once daily, if necessary, with careful monitoring.

Availability

Tablets: 12.5 mg, 25 mg.

NURSING IMPLICATIONS

Assessment

- Assess bowel sounds and frequency, quantity, and consistency of stools periodically during therapy.
- Monitor pain intensity during therapy. Naloxegol does not affect pain or effects of opioid analgesics on pain control. Discontinue naloxegol if opioid analgesic is discontinued.
- Monitor for signs and symptoms of gastrointestinal perforation (severe, persistent, or worsening abdominal pain) periodically during therapy. Discontinue naloxegol if symptoms occur.

Implementation

- Discontinue all maintenance laxative therapy before starting naloxegol. If a suboptimal response occurs with naloxegol, laxatives may be used after 3 days.

© F.A. Davis Publishing

- **PO:** Administer on an empty stomach at least 1 hr before first meal in morning or 2 hrs after meal. Tablet may be crushed to a powder, mixed with 4 oz of water (120 mL) for patients with difficulty swallowing. Drink mixture immediately; refill glass with 120 mL water, stir and drink contents.
- May be administered by NG tube. Flush the NG tube with 1 oz (30 mL) of water using a 60 mL syringe. Crush tablet to a powder and mix with 2 oz (60 mL) of water. Draw up mixture using the 60 mL syringe and administer through the NG tube. Add 2 oz (60 mL) of water to rinse container and administer to flush NG tube and any remaining medicine from NG tube into stomach.
- Avoid grapefruit and grapefruit juice during therapy.

Patient/Family Teaching

- Instruct patient to take naloxegol on an empty stomach as directed. Laxatives should be stopped before starting naloxegol, but may be restarted after 3 days if needed. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- Caution patient to avoid grapefruit and grapefruit juice during therapy.
- Advise patient to notify health care professional immediately if stomach pain that does not go away occurs.
- Advise patient to notify health care professional if signs and symptoms of opioid withdrawal (sweating, chills, diarrhea, stomach pain, anxiety, irritability, yawning) occur. Patients taking methadone for pain are at increased risk for stomach pain and diarrhea.
- Instruct patient to stop taking naloxegol if they stop taking opioid medications.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and avoid breast feeding during therapy; may cause opioid withdrawal in infant.

Evaluation/Desired Outcomes

- Relief of OIC, especially if opioid therapy has been for 4 wk or more.

naloxone (nal-**ox**-one)

~~Evzio~~, Kloxxado, Narcan

Classification

Therapeutic: antidotes (for opioids)
Pharmacologic: opioid antagonists

Indications

Reversal of CNS depression and respiratory depression because of suspected opioid overdose. **Unlabeled Use:** Opioid-induced pruritus (low-dose IV infusion). Management of refractory circulatory shock.

Action

Competitively blocks the effects of opioids, including CNS and respiratory depression, without producing any agonist (opioid-like) effects. **Therapeutic Effects:** Reversal of signs of opioid excess.

Pharmacokinetics

Absorption: Well absorbed after IM or subcut administration. Rapidly absorbed from nasal mucosa.
Distribution: Rapidly distributed to tissues. Crosses the placenta.
Metabolism and Excretion: Metabolized by the liver.
Half-life: 30–90 min (IM, IV, subcut) (up to 3 hr in neonates); 2 hr (intranasal).

TIME/ACTION PROFILE (reversal of opioid effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	unknown	45 min
IM, Subcut	2–5 min	unknown	>45 min
Intranasal	8–13 min	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Cardiovascular disease; Patients physically dependent on opioids (may precipitate severe withdrawal); OB: May cause acute withdrawal syndrome in mother and fetus if mother is opioid dependent; Lactation: Safety not established in breast feeding; Pedi: May cause acute withdrawal syndrome in neonates of opioid-dependent mothers.

Adverse Reactions/Side Effects

CV: VENTRICULAR ARRHYTHMIAS, hypertension, hypotension. **GI:** nausea, vomiting.

Interactions

Drug-Drug: Can precipitate withdrawal in patients physically dependent on **opioid analgesics**. Larger doses may be required to reverse the effects of **buprenorphine**, **butorphanol**, or **nalbuphine**. Antagonizes postoperative **opioid analgesics**.

Route/Dosage

Postoperative Opioid-Induced Respiratory Depression

IV (Adults): 0.02–0.2 mg every 2–3 min until response obtained; repeat every 1–2 hr if needed.
IV (Children): 0.01 mg/kg; may repeat every 2–3 min until response obtained. Additional doses may be given every 1–2 hr if needed.

© F.A. Davis Publishing

IM, IV, Subcut (Neonates): 0.01 mg/kg; may repeat every 2–3 min until response obtained. Additional doses may be given every 1–2 hr if needed.

Opioid-Induced Respiratory Depression During Chronic (>1 wk) Opioid Use

IV, IM, Subcut (Adults >40 kg): 20–40 mcg (0.02–0.04 mg) given as small, frequent (every min) boluses or as an infusion titrated to improve respiratory function without reversing analgesia.

IV, IM, Subcut (Adults and Children <40 kg): 0.005–0.02 mg/dose given as small, frequent (every min) boluses or as an infusion titrated to improve respiratory function without reversing analgesia.

Overdose of Opioids

IV, IM, Subcut (Adults): *Patients not suspected of being opioid dependent*—0.4 mg (10 mcg/kg); may repeat every 2–3 min (IV route is preferred). Some patients may require up to 2 mg. *Patients suspected to be opioid dependent*—Initial dose should be ↓ to 0.1–0.2 mg every 2–3 min. May also be given by IV infusion at rate adjusted to patient's response.

IM, Subcut (Adults and Children): *Evzio*—0.4 mg; may repeat every 2–3 min until emergency medical assistance arrives.

IV, IM, Subcut (Children >5 yr or >20 kg): 2 mg/dose, may repeat every 2–3 min.

IV, IM, Subcut (Infants up to 5 yr or 20 kg): 0.1 mg/kg, may repeat every 2–3 min.

Intranasal (Adults and Children): 1 spray (4 mg or 8 mg) in one nostril; may repeat dose every 2–3 min (with each subsequent dose being administered in alternate nostril).

Opioid-Induced Pruritus

IV (Children): 2 mcg/kg/hr continuous infusion, may ↑ by 0.5 mcg/kg/hr every few hrs if pruritus continues.

Availability (generic available)

Nasal spray: 4 mg/0.1 mL, 8 mg/0.1 mL. **Solution for injection:** 0.4 mg/mL, 2 mg/2 mL (prefilled syringe). ***In combination with:*** buprenorphine (Suboxone, Zubsolv). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor respiratory rate, rhythm, and depth; pulse, ECG, BP; and level of consciousness frequently for 3–4 hr after the expected peak of blood concentrations. After a moderate overdose of a short half-life opioid, physical stimulation may be enough to prevent significant hypoventilation. The effects of some opioids may last longer than the effects of naloxone, and repeat doses may be necessary.
- Patients who have been receiving opioids for >1 wk are extremely sensitive to the effects of naloxone. Dilute and administer in slow increments.
- Assess patient for level of pain after administration when used to treat postoperative respiratory depression. Naloxone decreases respiratory depression but also reverses analgesia.
- Assess patient for signs and symptoms of opioid withdrawal (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). Symptoms may occur within a few min to 2 hr. Severity depends on dose of naloxone, the opioid involved, and degree of physical dependence.
- Lack of significant improvement indicates that symptoms are caused by a disease process or other nonopioid CNS depressants not affected by naloxone.
- ***Toxicity and Overdose:*** Naloxone is a pure antagonist with no agonist properties and minimal toxicity.

Implementation

- Do not confuse naloxone with Lanoxin (digoxin) or nalbuphine. Do not confuse Narcan (naloxone) with Norcuron (vecuronium).
- Larger doses of naloxone may be necessary when used to antagonize the effects of buprenorphine, butorphanol, and nalbuphine.
- Resuscitation equipment, oxygen, vasopressors, and mechanical ventilation should be available to supplement naloxone therapy as needed.
- Doses should be titrated carefully in postoperative patients to avoid interference with control of postoperative pain.
- **Intranasal:** Administer a single spray into one nostril. If patient does not respond or responds and relapses into respiratory depression, additional doses may be given every 2–3 min in alternating nostrils until emergency medical assistance arrives. Naloxone is not a substitute for emergency medical care.

IV Administration

- **IV Push:** ***Dilution:*** Administer undiluted for *suspected opioid overdose*. For *opioid-induced respiratory depression*, dilute with sterile water for injection. For children or adults weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of sterile water or 0.9% NaCl for injection. ***Concentration:*** 0.4 mg/mL, 1 mg/mL, or 10 mcg/mL (depending on preparation used). ***Rate:*** Administer over 30 sec for patients with a *suspected opioid overdose*. For patients who develop *opioid-induced respiratory depression*, administer dilute solution of 0.4 mg/10 mL at a rate of 0.5 mL (0.02 mg) IV push every 2 min. Titrate to avoid withdrawal and severe pain. Excessive dose in postoperative patients may cause excitement, pain, hypotension, hypertension, pulmonary edema, ventricular tachycardia and fibrillation, and seizures. For children and adults weighing <40 kg, administer 10 mcg/mL solution at a rate of 0.5 mcg/kg every 1–2 min.

© F.A. Davis Publishing

- **Continuous Infusion:** ***Dilution:*** Dilute 2 mg of naloxone in 500 mL of 0.9% NaCl or D5W. Infusion is stable for 24 hr. ***Concentration:*** 4 mcg/mL. ***Rate:*** Titrate dose according to patient response.
- **Y-Site Compatibility:** acetylcysteine, alfentanil, amikacin, aminocaproic acid, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, defibrotide, desmopressin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glucagon, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin regular, irinotecan, isavuconazonium, isoproterenol, ketamine, ketorolac, labetalol, lactated Ringer's, levofloxacin, lidocaine, linezolid, mannitol, meperidine, meropenem, meropenem/vaborbactam, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, nicardipine, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiamine, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, amphotericin B lipid complex, amphotericin B liposome, blinatumomab, dantrolene, diazepam, gemtuzumab ozogamicin, leucovorin calcium, mitomycin, pantoprazole, phenytoin, thiopental, thiotepa.
- **Additive Incompatibility:** Incompatible with preparations containing bisulfite, sulfite, and solutions with an alkaline pH.

Patient/Family Teaching

- As medication becomes effective, explain purpose and effects of naloxone to patient.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Monitor mother and fetus for withdrawal syndrome if mother is opioid dependent.
- **Intranasal:** Instruct parents and caregivers in the correct technique for use.

Evaluation/Desired Outcomes

- Adequate ventilation following opioid excess.
- Alertness without significant pain or withdrawal symptoms.

N

BEERS

naproxen (na-**prox**-en)

Aleve, Anaprox, Anaprox DS, Maxidol, EC-Naprosyn, Naprelan, Naprosyn

Classification

Therapeutic: antipyretics, antirheumatics, nonopioid analgesics
Pharmacologic: nonsteroidal anti-inflammatory drugs (NSAIDs)

Indications

Mild to moderate pain. Dysmenorrhea. Fever. Inflammatory disorders, including: Rheumatoid arthritis (adults and children), Osteoarthritis.

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Decreased pain. Reduction of fever. Suppression of inflammation.

Pharmacokinetics

Absorption: Completely absorbed from the GI tract. Sodium salt is more rapidly absorbed.
Distribution: Crosses the placenta; enters breast milk in low concentrations.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: Children <8 yr: 8–17 hr; Children 8–14 yr: 8–10 hr; Adults: 10–20 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	1 hr	unknown	8–12 hr
PO (anti-inflammatory)	14 days	2–4 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Coronary artery bypass graft (CABG) surgery; OB: Avoid use after 30 wk gestation; Lactation: Lactation.

Use Cautiously in: Severe renal or hepatic impairment; Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; History of ulcer disease or any other history of gastrointestinal bleeding (may ↑ risk of GI bleeding); Chronic alcohol use/abuse; OB: Use at or after 20 wk gestation may cause fetal or neonatal renal impairment; if treatment is necessary between 20 wk and 30 wk gestation, limit use to the lowest effective dose and shortest duration possible; Pedi: Children <2 yr (safety and effectiveness not established); Geri: ↑ risk of adverse reactions in older adults.

Adverse Reactions/Side Effects

CV: HF, MYOCARDIAL INFARCTION, STROKE, edema, hypertension, palpitations, tachycardia. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, rash, sweating, pseudoporphyria (12% incidence in children with juvenile rheumatoid arthritis—discontinue therapy if this occurs). **EENT:** tinnitus, visual disturbances. **F and E:** hyperkalemia. **GI:** DRUG-INDUCED HEPATITIS, GI BLEEDING, constipation, dyspepsia, nausea, anorexia, diarrhea, discomfort, flatulence, vomiting. **GU:** cystitis, hematuria, renal failure. **Hemat:** blood dyscrasias, prolonged bleeding time. **Neuro:** dizziness, drowsiness, headache. **Resp:** dyspnea. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: May limit the cardioprotective (antiplatelet) effects of **aspirin**. ↑ risk of bleeding with **anticoagulants**, **aspirin**, **clopidogrel**, **ticagrelor**, **prasugrel**, **corticosteroids**, **fibrinolytics**, **SNRIs**, or **SSRIs**. Additive adverse GI side effects with **aspirin**, **corticosteroids**, **alcohol**, and other **NSAIDs**. **Probenecid** ↑ blood levels and may ↑ toxicity. May ↑ risk of toxicity from **methotrexate**, **antineoplastics**, or **radiation therapy**. May ↑ serum levels and risk of toxicity from **lithium**. ↑ risk of adverse renal effects with **cyclosporine**, **ACE inhibitors**, **angiotensin II antagonists**, or chronic use of **acetaminophen**. May ↓ response to **antihypertensives** or **diuretics**. May ↑ risk of hypoglycemia with **insulin** or **oral hypoglycemic agents**. **Oral potassium supplements** may ↑ GI adverse effects.

Drug-Natural Products: ↑ anticoagulant effect and bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, **licorice**, and others.

Route/Dosage

275 mg naproxen sodium is equivalent to 250 mg naproxen.

Anti-inflammatory/Analgesic/Antidysmenorrheal

PO (Adults): *Naproxen*—250–500 mg twice daily (up to 1.5 g/day). *Delayed-release naproxen*—375–500 mg twice daily. *Naproxen sodium*—275–550 mg twice daily (up to 1.65 g/day).

PO (Children >2 yr): *Analgesia:* 5–7 mg/kg/dose every 8–12 hr. *Inflammatory disease:* 10–15 mg/kg/day divided every 12 hr, maximum: 1000 mg/day.

Antigout

PO (Adults): *Naproxen*—750 mg naproxen initially, then 250 mg every 8 hr. *Naproxen sodium*—825 mg initially, then 275 mg every 8 hr.

OTC Use (naproxen sodium)

PO (Adults): 200 mg every 8–12 hr or 400 mg followed by 200 mg every 12 hr (not to exceed 600 mg/24 hr).

PO (Geriatric Patients >65 yr): Not to exceed 200 mg every 12 hr.

Availability

Naproxen (generic available)

Immediate-release tablets (Naprosyn): 🍁 125 mg, 250 mg, 375 mg, 500 mg. **Delayed-release tablets (EC-Naprosyn):** 375 mg, 500 mg. **Extended-release tablets:** 🍁 750 mg. **Oral suspension (Naprosyn):** 125 mg/5 mL. ***In combination with:*** esomeprazole (Vimovo).

Naproxen Sodium (generic available)

Immediate-release tablets (Aleve, Anaprox DS): 220 mg^{OTC}, 275 mg, 550 mg. **Immediate-release capsules (Maxidol):** 🍁 220 mg^{OTC}. **Extended-release tablets (Naprelan):** 375 mg, 500 mg, 750 mg. ***In combination with:*** pseudoephedrine (Aleve-D Sinus and Cold), sumatriptan (Treximet). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.

© F.A. Davis Publishing

- Monitor BP during initiation and periodically during therapy. May cause fluid retention and edema leading to new onset or worsening hypertension.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, facial swelling) periodically during therapy. Discontinue therapy if symptoms occur.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- **Arthritis:** Assess pain and range of motion prior to and 1–2 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, and liver function tests periodically in patients receiving prolonged therapy.
- May ↑ serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT tests levels. May ↓ blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr.
- Bleeding time may be prolonged up to 4 days following discontinuation of therapy.
- May alter test results for urine 5-HIAA and urine steroid determinations.

Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for the shortest duration possible to minimize risk of cardiovascular thrombotic events.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- Analgesic is more effective if given before pain becomes severe.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids to decrease GI irritation. Food slows but does not reduce the extent of absorption. Do not mix suspension with antacid or other liquid prior to administration. ***DNC:*** Swallow extended-release, delayed-release, and controlled-release tablets whole; do not break, crush, or chew.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses.
- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional. Use of naproxen with 3 or more glasses of alcohol per day may increase risk of GI bleeding.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions (especially in children with juvenile rheumatoid arthritis).
- Instruct patient not to take OTC naproxen preparations for more than 3 days for fever and to consult health care professional if symptoms persist or worsen.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise women to avoid naproxen in the 3rd trimester of pregnancy (after 29 wk); may cause premature closure of the fetal ductus arteriosus. Use of naproxen after 20 wk may cause fetal renal dysfunction leading to oligohydramnios. May cause reversible infertility in women attempting to conceive; may consider discontinuing naproxen.

Evaluation/Desired Outcomes

- Relief of pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 2 wk, but maximum effectiveness may require 2–4 wk of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Reduction of fever.

naratriptan (nar-a-**trip**-tan)

Amerge

Classification

Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Indications

Acute treatment of migraine headache.

© F.A. Davis Publishing

Action
Acts as an agonist at specific 5-HT_1 receptor sites in intracranial blood vessels and sensory trigeminal nerves.
Therapeutic Effects: Cranial vessel vasoconstriction with resultant decrease in migraine headache.

Pharmacokinetics
Absorption: Well absorbed (70%) following oral administration.
Distribution: Unknown.
Metabolism and Excretion: 60% excreted unchanged in urine; 30% metabolized by the liver.
Half-life: 6 hr (↑ in renal impairment).

TIME/ACTION PROFILE (↓ migraine pain)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	2–3 hr†	up to 24 hr

†3–4 hr during migraine attack.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Ischemic heart disease or Prinzmetal's angina; Uncontrolled hypertension; Wolff-Parkinson-White syndrome, or other arrhythmias involving conduction pathways; Hemiplegic or basilar migraine; Stroke or transient ischemic attack; Peripheral vascular disease; Ischemic bowel disease; Severe renal impairment (CCr <15 mL/min); Severe hepatic impairment; Should not be used within 24 hr of other 5-HT_1 agonists or ergot-type compounds (dihydroergotamine); Geri: Age-related ↓ in renal function and ↑ likelihood of CAD greatly ↑ risk of fatal adverse events.
Use Cautiously in: Mild to moderate renal or hepatic impairment (dose should not exceed 2.5 mg/24 hr; initial dose should be ↓); OB, Lactation, Pedi: Safety not established.
Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women, or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision.

Adverse Reactions/Side Effects
CV: CORONARY ARTERY VASOSPASM, MI, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA, myocardial ischemia. **GI:** nausea. **Neuro:** paresthesia, dizziness, drowsiness, malaise/fatigue. **Misc:** pain/pressure sensation in throat/neck.

Interactions
Drug-Drug: ↑ risk of serotonin syndrome when used with **SSRI or SNRI antidepressants**. **Cigarette smoking** ↑ the metabolism of naratriptan. Blood levels and effects are ↑ by **hormonal contraceptives**. Avoid concurrent use (within 24 hr of each other) with **ergot-containing drugs (dihydroergotamine)**; may result in prolonged vasospastic reactions. Avoid concurrent (within 2 wk) use with **MAO inhibitors**; produces ↑ systemic exposure and risk of adverse reactions to naratriptan.
Drug-Natural Products: ↑ risk of serotinergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage
PO (Adults): 1 or 2.5 mg; dose may be repeated in 4 hr if response is inadequate (not to exceed 5 mg/24 hr or treatment of more than 4 headaches/mo).

Availability (generic available)
Tablets: 1 mg, 2.5 mg.

NURSING IMPLICATIONS

Assessment
- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Monitor for serotonin syndrome in patients taking SSRIs or SNRIs concurrently with naratriptan.

Implementation
- **PO:** Tablets may be administered at any time after the headache starts.

Patient/Family Teaching
- Inform patient that naratriptan should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer naratriptan as soon as symptoms of a migraine attack appear, but it may be administered any time during an attack. If migraine symptoms return, a 2nd dose may be used. Allow at least 4 hr between doses, and do not use more than 2 tablets in any 24-hr period. Do not use to treat more than 4 headaches per mo.
- Advise patient that lying down in a darkened room following naratriptan administration may further help relieve headache.
- Advise patient that overuse (use more than 10 days/mo) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of naratriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional prior to next dose of naratriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately and do not take more naratriptan without approval of health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- Instruct patient not to take additional naratriptan if no response is seen with initial dose without consult-

© F.A. Davis Publishing

ing health care professional. There is no evidence that 5 mg provides greater relief than 2.5-mg dose. Additional naratriptan doses are not likely to be effective, and alternative medications, as previously discussed with health care professional, may be used.
- Naratriptan may cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during naratriptan use.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. Patients concurrently taking SSRI or SNRI antidepressants should notify health care professional promptly if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.
- Caution patient not to use naratriptan if pregnancy is planned or suspected or if breast feeding. Adequate contraception should be used during therapy.

Evaluation/Desired Outcomes
- Relief of migraine attack.

nebivolol (ne-**bi**-vi-lole)
Bystolic

Classification
Therapeutic: antihypertensives
Pharmacologic: beta blockers (selective)

Indications
Hypertension (alone or with other antihypertensives).

Action
Blocks stimulation of beta adrenergic receptor sites; selective for $beta_1$ (myocardial) receptors in most patients. In some patients (poor metabolizers, higher blood levels may result in some $beta_2$ [pulmonary, vascular, uterine] adrenergic) blockade. **Therapeutic Effects:** Lowering of BP.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Mostly metabolized by the liver, including the CYP2D6 enzyme system; some metabolites have antihypertensive action; minimal excretion of unchanged drug.
Half-life: *Extensive metabolizers*— 12 hr; *poor metabolizers*— 19 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.5–4 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Severe bradycardia, heart block greater than first degree cardiogenic shock, decompensated heart failure, or sick sinus syndrome (without pacemaker); Severe hepatic impairment; Bronchospastic disease; Lactation: Lactation.
Use Cautiously in: Coronary artery disease (rapid cessation should be avoided); Compensated HF; Major surgery (anesthesia may augment myocardial depression); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Moderate hepatic impairment; Severe renal impairment (↓ initial dose if CCr <30 mL/min); History of severe allergic reactions (↑ intensity of reactions); Pheochromocytoma (alpha blockers required prior to beta blockers); OB: ↑ risk of fetal hypotension, bradycardia, hypoglycemia, and respiratory depression when used during third trimester; use in pregnancy only if potential maternal benefit outweighs potential fetal risk; Pedi: Safety and effectiveness not established in children; Geri: Consider ↑ sensitivity, concurrent chronic diseases, medications and presence of age-related ↓ in clearance in older adults.

Adverse Reactions/Side Effects
Neuro: dizziness, fatigue, headache.

Interactions
Drug-Drug: Drugs that affect the CYP2D6 enzyme system are expected to alter levels and possibly effects of nebivolol; dose alterations may be required. **Fluoxetine**, a known inhibitor of CYP2D6, ↑ levels and effects; similar effects may be expected from **quinidine**, **propafenone**, and **paroxetine**. Blood levels are also ↑ by **cimetidine**. **Anesthetic agents** including **ether**, **trichloroethylene**, and **cyclopropane** as well as **other myocardial depressants** or **inhibitors of AV conduction**, such as **diltiazem** and **verapamil**, may ↑ risk of myocardial depression and bradycardia. Avoid concurrent use with **beta blockers**. If used concurrently with **clonidine**, nebivolol should be tapered and discontinued several days prior to gradual withdrawal of clonidine.

Route/Dosage
PO (Adults): 5 mg once daily initially, may increase at 2 wk intervals up to 40 mg/day.

© F.A. Davis Publishing

Hepatic/Renal Impairment
PO (Adults): 2.5 mg once daily initially; titrate upward cautiously.

Availability (generic available)
Tablets: 2.5, 5 mg, 10 mg, 20 mg.

NURSING IMPLICATIONS
Assessment
- Monitor BP, ECG, and pulse prior to and periodically during therapy.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- ***Lab Test Considerations:*** May cause ↑ BUN, uric acid, triglycerides and ↓ HDL cholesterol and platelet count.

Implementation
- **PO:** May be administered without regard to food.
- When discontinuation is planned, observe patient carefully and advise to minimize physical activity. Taper over 1–2 wk when possible. If angina worsens or acute coronary insufficiency develops, reinstitute nebivolol promptly, at least temporarily.

Patient/Family Teaching
- Instruct patient to take nebivolol as directed, at the same time each day, even if feeling well. If a dose is missed, skip missed dose and take next scheduled dose; do not double doses. Do not discontinue without consulting health care professional. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to ensure that enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in the wallet for emergencies.
- Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly and to report significant changes to health care professional.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of coffee, tea, and cola.
- May mask some signs of hypoglycemia, especially tachycardia. Diabetics should closely monitor blood sugar, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block dizziness or sweating as signs of hypoglycemia.
- May cause dizziness. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if difficulty breathing or signs and symptoms of worsening HF (weight gain, increasing shortness of breath, excessive bradycardia) occur.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Monitor neonates of mothers who used nebivolol during the third trimester for hypotension, bradycardia, hypoglycemia, and respiratory depression.

Evaluation/Desired Outcomes
- Decrease in BP.

neomycin, See AMINOGLYCOSIDES.

neratinib (ne-ra-ti-nib)
Nerlynx

Classification
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors, kinase inhibitors

Indications
Extended adjuvant treatment of early stage human epidermal receptor type 2 (HER2)-overexpressed/amplified breast cancer following adjuvant trastuzumab-based therapy. Advanced or metastatic HER2-positive breast cancer in patients who have received ≥2 prior anti-HER2–based regimens in the metastatic setting (in combination with capecitabine).

Action
Irreversibly binds to epidermal growth factor receptor (EGFR), HER2, and HER4 to inhibit growth of tumors that express HER2 and EGFR. **Therapeutic Effects:** Decreased progression of breast cancer and improved survival.

Pharmacokinetics
Absorption: Blood levels ↑ by high-fat foods.
Distribution: Extensively distributed to tissues.
Protein Binding: >99%.
Metabolism and Excretion: Primarily metabolized in liver via the CYP3A4 isoenzyme into active metabolites (M3, M6, M7, and M11); 97% excreted in feces, <2% excreted by kidneys.
Half-life: 7–17 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–8 hr	24 hr

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Severe hepatic impairment (Child-Pugh C) (↓ dose); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of adverse reactions/side effects in older adults.

Adverse Reactions/Side Effects

CV: hypotension. **Derm:** rash, dry skin, nail disorder. **EENT:** epistaxis. **GI:** DIARRHEA, HEPATOTOXICITY, abdominal pain, ↓ appetite, dyspepsia, nausea, stomatitis, vomiting, abdominal distention, dry mouth. **GU:** renal failure, urinary tract infection. **Metab:** ↓ weight. **MS:** muscle spasms. **Neuro:** fatigue.

Interactions

Drug-Drug: ↓ levels with **proton pump inhibitors**, **H_2 blockers**, and **antacids**; avoid concurrent use with **proton pump inhibitors**; take ≥2 hr before next dose of **H_2 antagonist** or 10 hr after the **H_2 antagonist**; take 3 hr after **antacids**. **Strong or moderate CYP3A4 inhibitors**, including **aprepitant**, **cimetidine**, **ciprofloxacin**, **clarithromycin**, **clotrimazole**, **cobicistat**, **conivaptan**, **crizotinib**, **cyclosporine**, **diltiazem**, **dronedarone**, **erythromycin**, **fluconazole**, **fluvoxamine**, **idelalisib**, **imatinib**, **indinavir**, **itraconazole**, **ketoconazole**, **lopinavir**, **nefazodone**, **nelfinavir**, **posaconazole**, **ritonavir**, **saquinavir**, **tipranavir**, **verapamil**, and **voriconazole**, may ↑ levels/toxicity of neratinib; avoid concurrent use. **Strong or moderate CYP3A4 inducers**, including **bosentan**, **carbamazepine**, **efavirenz**, **enzalutamide**, **mitotane**, **modafanil**, **phenytoin**, and **rifampin**, may ↓ levels of neratinib and its effectiveness; avoid concurrent use. May ↑ **digoxin** levels.

Drug-Natural Products: **St. John's wort** may ↓ levels of neratinib and its effectiveness; avoid concurrent use.

Route/Dosage

Extended Adjuvant Treatment of Early Stage Breast Cancer

PO (Adults): *Non-dose escalation strategy (administer antidiarrheal prophylaxis for the first 56 days of treatment on scheduled basis)* — 240 mg once daily until disease recurrence or for up to 1 yr *OR Dose escalation strategy (use antidiarrheals only as needed for diarrhea)* — 120 mg once daily for 7 days, then 160 mg once daily for 7 days, then 240 mg once daily thereafter until disease recurrence or for up to 1 yr.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment (Child-Pugh C)* — 80 mg once daily until disease recurrence or for up to 1 yr.

Advanced or Metastatic Breast Cancer

PO (Adults): *Non-dose escalation strategy (administer antidiarrheal prophylaxis for the first 56 days of treatment on scheduled basis)* — 240 mg once daily on days 1–21 of a 21-day cycle; continue until disease recurrence or unacceptable toxicity. *OR Dose escalation strategy (use antidiarrheals only as needed for diarrhea)* — 120 mg once daily for 7 days, then 160 mg once daily for 7 days, then 240 mg once daily for 7 days, then 240 mg once daily on days 1–21 of a 21-day cycle; continue until disease recurrence of unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment (Child-Pugh C)* — 80 mg once daily on days 1–21 of a 21-day cycle; continue until disease recurrence or unacceptable toxicity.

Availability

Tablets: 40 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for diarrhea. Use antidiarrheal prophylaxis with first dose and for first 2 cycles (56 days). *If Grade 1 diarrhea (increase of < 4 stools per day over baseline), Grade 2 diarrhea (increase of 4–6 stools per day over baseline) lasting < 5 days, Grade 3 diarrhea (increase of ≥ 7 stools per day over baseline; incontinence; hospitalization indicated; limiting self-care activities of daily living) lasting < 2 days occurs,* modify antidiarrheal therapy, modify diet, and maintain fluid intake of 2 L to avoid dehydration. Once event resolves to ≤ Grade 1 or baseline, start loperamide 4 mg with each subsequent neratinib administration. *If any grade diarrhea with dehydration, fever, hypotension, renal failure, neutropenia, Grade 2 diarrhea lasting ≥ 5 days, Grade 3 diarrhea lasting >2 days despite medical therapy occurs,* hold therapy, modify diet, and maintain fluid intake of 2 L to avoid dehydration. If diarrhea resolves to Grade 0–1 in ≤1 wk, resume therapy at same dose. If diarrhea resolves to Grade 0–1 in >1 wk, resume therapy at reduced dose. Once diarrhea resolves to ≤Grade 1 or baseline, start loperamide 4 mg with each subsequent neratinib administration. *If Grade 4 diarrhea (life-threatening consequences; urgent intervention indicated) occurs,* permanently discontinue neratinib. *If diarrhea recurs to ≥Grade 2 at 120 mg neratinib per day,* permanently discontinue neratinib.

© F.A. Davis Publishing

Obtain stool cultures to determine infectious causes of Grade 3 or 4 or with dehydration, fever, or neutropenia.
- Monitor for signs and symptoms of hepatotoxicity (worsening of fatigue, nausea, vomiting, right upper quadrant tenderness, fever, rash, eosinophilia, Grade 3 diarrhea) periodically during therapy. If symptoms occur, obtain liver function test levels to measure changes.
- ***Lab Test Considerations:*** Verify negative pregnancy test in women of reproductive potential before starting therapy.
- Monitor total bilirubin, AST, ALT, and alkaline phosphatase before starting therapy, monthly for first 3 mo, and every 3 mo during therapy. If evaluating hepatotoxicity, also obtain fractionated bilirubin and prothrombin time. *If Grade 3 ALT (>5–20 × upper limit of normal (ULN)) or Grade 3 bilirubin (>3–10 × ULN),* withhold dose until recovery to ≤ Grade 1, evaluate alternative causes, resume neratinib at next lower dose if recovery to ≤Grade 1 occurs within 3 wk. If Grade 3 ALT or bilirubin occurs again despite one dose reduction, permanently discontinue neratinib. If Grade 4 ALT (>20 × ULN) or Grade 4 bilirubin (>10 × ULN), discontinue neratinib permanently and evaluate alternative causes.

Implementation

- Do not confuse neratinib with nilotinib or niraparib.
- **Premedication for Diarrhea:** When not using dose escalation, use antidiarrheal prophylaxis for first 56 days of therapy, starting with first dose of neratinib. *For weeks 1–2 (days 1–14),* administer loperamide 4 mg three times daily. *For weeks 3–8 (days 15–56),* administer loperamide 4 mg twice daily. *For week 9– discontinuation of neratinib,* administer 4 mg loparamide as needed, not to exceed 16 mg/day; titrate to achieve 1–2 bowel movements/day. If diarrhea occurs despite prophylaxis, treat with additional antidiarrheals, fluids and electrolytes as indicated. Neratinib interruptions and dose reductions may also be required to manage diarrhea.
- **PO:** Administer once daily, at same time each day, with food, continuously for 1 yr; 240-mg dose = 6 tablets. ***DNC:*** Swallow tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take neratinib as directed. If dose is missed, omit and take next scheduled dose next day. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid taking grapefruit or grapefruit juice during therapy.
- Instruct patient to take loperamide according to schedule and titrate to 1–2 bowel movements/day: *For days 1–14 (wk 1–2),* take 4 mg three times daily. *Days 15–56 (wk 3–8),* take 4 mg twice daily. *Days 57–365 (wk 9–52),* take 4 mg as needed up to 16 mg/day. May require additional antidiarrheal agents and dose reduction.
- Caution patient to avoid proton pump inhibitors and H_2 antagonists during therapy and to avoid taking antacids within 3 hr of neratinib.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient to notify health care professional immediately if severe (≥ Grade 3) diarrhea or diarrhea associated with weakness, dizziness, or fever or if signs and symptoms of liver dysfunction occur.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and avoid breast feeding during and for at least 1 mo after last dose. Advise male patients with partners of reproductive potential to use effective contraception during and for 3 mo after last dose.

Evaluation/Desired Outcomes

- Decreased progression of breast cancer.

netupitant/palonosetron (oral)

(ne-**too**-pi-tant/pa-lone-**o**-se-tron)

Akynzeo

fosnetupitant/palonosetron (injection)

(fos-ne-**too**-pi-tant/pa-lone-**o**-se-tron)

Akynzeo

Classification

Therapeutic: antiemetics

Pharmacologic: neurokinin antagonists, 5-HT_3 antagonists

Indications

PO: Prevention of acute and delayed nausea and vomiting associated with initial and repeat courses of cancer chemotherapy, including, but not limited to, highly emetogenic chemotherapy (in combination with dexamethasone). **IV:** Prevention of acute and delayed nausea and vomiting associated with initial and repeat courses of highly emetogenic chemotherapy (in combination with dexamethasone).

Action

Netupitant—Acts as a selective antagonist at substance P/neurokinin 1 (NK1) receptors in the CNS; prevents nausea and vomiting in the acute and delayed phases after chemotherapy. *Palonosetron*—Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zones in the CNS; prevents nausea and vomiting in the acute phase. **Therapeutic Effects:**

© F.A. Davis Publishing

Decreased incidence and severity of nausea and vomiting following emetogenic chemotherapy.

Pharmacokinetics

Absorption: *Netupitant* — Extent of absorption following oral administration unknown; *Fosnetupitant* — Following IV administration, fosnetupitant is rapidly converted to netupitant, the active component. IV administration results in complete bioavailability; *Palonosetron* — 97% absorbed following oral administration.
Distribution: *Netupitant, fosnetupitant, and palonosetron* — Extensively distributed to tissues.
Protein Binding: *Netupitant* — >99.5%; *Fosnetupitant* — 92–95%.
Metabolism and Excretion: *Netupitant* — Primarily metabolized in the liver (mostly by CYP3A4, and to a lesser extent by CYP2C9 and CYP2D6) to three metabolites that have antiemetic activity; <1% excreted unchanged in urine; *Palonosetron* — 50% metabolized (mostly by CYP2D6, and to a lesser extent by CYP3A4 and CYP1A2); 40% excreted unchanged in urine.
Half-life: *Netupitant* — 80 hr; *Palonosetron* — 40 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	5 hr	unknown
IV	rapid	30 min	unknown

Contraindications/Precautions

Contraindicated in: Cross-sensitivity may occur with other 5-HT_3 antagonists; Severe hepatic or renal impairment.
Use Cautiously in: OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Consider age-related ↓ in renal, hepatic, and cardiac function, concurrent disease states and drug therapies.

Adverse Reactions/Side Effects

Derm: erythema. **GI:** constipation, dyspepsia.
Neuro: fatigue, headache, weakness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), SEROTONIN SYNDROME.

Interactions

Drug-Drug: Netupitant is a moderate inhibitor of CYP3A4 and can ↑ levels of drugs that are **CYP3A4 substrates**, including **alprazolam**, **cyclophosphamide**, **dexamethasone**, **docetaxel**, **etoposide**, **ifosfamide**, **imatinib**, **irinotecan**, **midazolam**, **erythromycin**, **paclitaxel**, **triazolam**, **vinorelbine**, **vinblastine**, and **vincristine**; avoid concomitant use for one wk; if avoiding use not feasible, ↓ dose of CYP3A4 substrate. **CYP3A4 inducers** including **rifampin** may ↓ netupitant levels and effectiveness; avoid concurrent use. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans**, ↑ risk of serotonin syndrome.

Route/Dosage

Netupitant/Palonosetron

PO (Adults): *Highly emetogenic chemotherapy (included cisplatin-based)* — One capsule (netupitant 300 mg/palonosetron 0.5 mg) 1 hr before chemotherapy on day 1. *Anthracycline and cyclophosphamide–based chemotherapy and other chemotherapy not considered highly emetogenic* — One capsule (netupitant 300 mg/palonosetron 0.5 mg) 1 hr before chemotherapy on day 1.

Fosnetupitant/Palonosetron

IV (Adults): *Highly emetogenic chemotherapy (included cisplatin-based)* — Fosnetupitant 235 mg/palonosetron 0.25 mg administered 30 min before chemotherapy on day 1.

Availability

Capsules: netupitant 300 mg/palonosetron 0.5 mg. **Lyophilized powder for injection:** netupitant 235 mg/palonosetron 0.25 mg/vial. **Solution for injection:** netupitant 235 mg/palonosetron 0.25 mg/20 mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, delirium, coma], autonomic instability [tachycardia, labile BP, dizziness, diaphoresis, flushing, hyperthermia], neuromuscular aberrations [tremor, rigidity, myoclonus, hyperreflexia, incoordination], seizure, and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- ***Lab Test Considerations:*** May cause transient ↑ in serum bilirubin, AST, and ALT levels.

Implementation

- *For highly emetogenic chemotherapy,* administer with dexamethasone PO 12 mg 30 min prior to chemotherapy on day 1 and 8 mg PO on days 2 and 4. *For chemotherapy not considered highly emetogenic,* administer dexamethasone 30 min prior to chemotherapy on day 1 (day 2 and 4 not needed).
- **PO:** Administer netupitant/palonosetron 1 hr prior to start of chemotherapy without regard to food.

© F.A. Davis Publishing

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute with 20 mL D5W or 0.9% NaCl into vial along vial wall to prevent foaming; swirl gently to mix. Prepare an infusion vial or bag filled with 30 mL D5W or NaCl. Withdraw entire volume of reconstituted solution and transfer it into infusion vial or bag containing 30 mL of D5W or 0.9% NaCl for a total volume of 50 mL. Gently invert bag until complete dissolution. Solution is clear; do not administer solutions that are cloudy, discolored, or contain particulate matter. Total time from reconstitution to the start of infusion should not exceed 24 hr. Store reconstituted solution and final diluted solution at room temperature. Dexamethasone can be given concomitantly or added to solution. ***Rate:*** Infuse over 30 min starting 30 min before chemotherapy. Flush line with 0.9% NaCl at end of infusion.
- **Y-Site Compatibility:** dexamethasone.
- **Y-Site Incompatibility:** solutions containing calcium, solutions containing magnesium, lactated Ringer's solution, Hartmann's solution.

Patient/Family Teaching

- Instruct patient to take netupitant/palonosetron as directed. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional promptly if signs and symptoms of anaphylaxis (shortness of breath, rash, hives, swelling of mouth, throat, and lips) or serotonin syndrome occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decrease in frequency and severity of nausea and vomiting.

NICOTINE (nik-o-teen)

nicotine chewing gum
Nicorette

nicotine inhaler
Nicotrol

nicotine lozenge
Nicorette

nicotine nasal spray
Nicotrol NS

nicotine transdermal patch
Habitrol, Nicoderm CQ

Classification
Therapeutic: smoking deterrents

Indications

Adjunct therapy (with behavior modification) in the management of nicotine withdrawal in patients desiring to give up cigarette smoking.

Action

Provides a source of nicotine during controlled withdrawal from cigarette smoking. **Therapeutic Effects:** Lessened sequelae of nicotine withdrawal (irritability, insomnia, somnolence, headache, and increased appetite).

Pharmacokinetics

Absorption: *Gum, lozenge*—Slowly absorbed from buccal mucosa during chewing/sucking. *Inhaler*—50% of dose is systemically absorbed; most of nicotine released from inhaler is deposited in the mouth; absorption from buccal mucosa is slow. *Nasal spray*—53% absorbed from nasal mucosa. *Transdermal*—70% of nicotine released from the system is absorbed through the skin.
Distribution: Enter breast milk.
Metabolism and Excretion: Mostly metabolized by the liver. Small amounts are metabolized by kidneys and lungs; 10–20% excreted unchanged by kidneys.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Gum	rapid	15–30 min	unknown
Inhaler	slow	within 15 min	unknown
Lozenge	unknown	unknown	unknown
Nasal spray	rapid	4–15 min	unknown
Transdermal	rapid	2–4 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recent history of MI (inhaler or nasal spray); Arrhythmias (inhaler or nasal spray); Severe or worsening angina (inhaler or nasal spray); Severe cardiovascular disease; OB: Pregnancy (may cause fetal harm);.
Use Cautiously in: Cardiovascular disease (including hypertension); Recent history of MI (gum, lozenge, patch); Arrhythmias (gum, lozenge, patch); Severe or worsening angina (gum, lozenge, patch); Diabetes mellitus; Pheochromocytoma; Peripheral vascular diseases; Hyperthyroidism; Continued smoking; Peptic ulcer disease; Seizures; Hepatic disease; Bronchospastic lung disease (inhaler or nasal spray); Allergic reaction to adhesive tape (patch); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; Geri: Begin at lower dosages in older adults.

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: tachycardia, chest pain, hypertension. **Derm:** *transdermal*—burning at patch site, erythema, pruritus, cutaneous hypersensitivity, rash, sweating. **EENT:** sinusitis; *gum*, pharyngitis; *nasal spray*, nasopharyngeal irritation, sneezing, watering eyes, change in smell, earache, epistaxis, eye irritation, hoarseness; *inhaler*, local mouth/throat irritation. **Endo:** dysmenorrhea. **GI:** abdominal pain, abnormal taste, constipation, diarrhea, dry mouth, dyspepsia, hiccups, nausea, vomiting; *gum*, belching, ↑ appetite, ↑ salivation, oral injury, sore mouth. **MS:** arthralgia, back pain, myalgia; *gum*, jaw muscle ache. **Neuro:** paresthesia, headache, insomnia, abnormal dreams, dizziness, drowsiness, impaired concentration, nervousness, seizures, weakness. **Resp:** *Nasal spray, inhaler*—cough, dyspnea.

Interactions

Drug-Drug: Effects of **acetaminophen**, **caffeine**, **imipramine**, **insulin**, **oxazepam**, **propranolol**, or other **beta blockers**, **adrenergic antagonists** (**prazosin**, **labetalol**), and **theophylline** may be ↑ upon smoking cessation; dose ↓ at cessation may be necessary. Effects of adrenergic agonists (e.g., **isoproterenol**, **phenylephrine**) may be ↓ upon smoking cessation; dose ↑ at cessation may be necessary. Concurrent treatment with **bupropion** may cause treatment-emergent hypertension.

Route/Dosage

Gum (Adults): If first cigarette is desired >30 min after awakening, start with 2 mg gum; if first cigarette is desired <30 min after awakening, start with 4 mg gum. Patients should chew one piece of gum every 1–2 hr for 6 wk, then one piece of gum every 2–4 hr for 3 wk, then one piece of gum every 4–8 hr for 3 wk, then discontinue. Should not exceed 24 pieces of gum/day.

Lozenge (Adults): If first cigarette is desired >30 min after awakening, start with 2 mg lozenge; if first cigarette is desired <30 min after awakening, start with 4 mg lozenge. Patients should use one lozenge every 1–2 hr for 6 wk, then one lozenge every 2–4 hr for 3 wk, then one lozenge every 4–8 hr for 3 wk, then discontinue. Should not exceed 20 lozenges/day or more than 5 lozenges in 6 hr.

Intranasal (Adults): One spray in each nostril 1–2 times/hr (up to 5 times/hr); may be ↑ up to maximum of 40 times/day (should not exceed 3 mo of therapy).

Inhaln (Adults): Patients are encouraged to use at least 6 cartridges/day for first 3–6 wk, with additional cartridges as necessary (up to 16/day) for 12 wk. Patients are self-titrated to level of nicotine they require (usual usage 6–16 cartridges/day) followed by gradual withdrawal over 6–12 wk (maximum duration of use = 6 mo).

Transdermal (Adults): *Patients smoking >10 cigarettes/day*—Begin with Step 1 (21 mg/day) for 6 wk, followed by Step 2 (14 mg/day) for 2 wk, and then Step 3 (7 mg/day) for 2 wk, then stop (total of 10 wk) (new patch should be applied every 24 hr); *Patients smoking ≤10 cigarettes/day*—Begin with Step 2 (14 mg/day) for 6 wk, followed by Step 3 (7 mg/day) for 2 wk, then stop (total of 8 wk) (new patch should be applied every 24 hr).

Availability (generic available)

Chewing gum (cinnamon, mint, spearmint, white ice, and fruit chill flavors): 2 mg[OTC], 4 mg[OTC]. **Oral inhalation:** 10 mg/cartridge (delivers 4 mg). **Lozenges (original, mint, cherry, and cappuccino flavors):** 2 mg[OTC], 4 mg[OTC]. **Nasal spray:** 0.5 mg/spray in 10-mL bottles (200 sprays). **Transdermal patch:** 7 mg/day[OTC], 14 mg/day[OTC], 21 mg/day[OTC].

NURSING IMPLICATIONS

Assessment

- Prior to therapy, assess smoking history (number of cigarettes smoked daily, smoking patterns, nicotine content of preferred brand, degree to which patient inhales smoke).
- Assess patient for symptoms of smoking withdrawal (irritability, drowsiness, fatigue, headache, nicotine craving) periodically during nicotine replacement therapy (NRT).
- Evaluate progress in smoking cessation periodically during therapy.
- ***Toxicity and Overdose:*** Monitor for nausea, vomiting, diarrhea, increased salivation, abdominal pain, headache, dizziness, auditory and visual disturbances, weakness, dyspnea, hypotension, and irregular pulse.

Implementation

- **Gum:** Protect gum from light; exposure to light causes gum to turn brown.
- **Lozenge:** Lozenge should be allowed to dissolve slowly in the mouth; it should not be chewed or swallowed.
- **Transdermal:** Patch can be worn for 16 or 24 hr; the patch can be removed before the patient goes to bed (especially if patient has vivid dreams or sleep disturbances) or can remain on while the patient sleeps (especially if patient craves cigarettes upon awakening).
- **Nasal Spray and Inhaler:** Regular use of the spray or inhaler during the first wk of therapy may help patient adjust to irritant effects of the spray.

Patient/Family Teaching

- Encourage patient to participate in a smoking cessation program while using this product.
- Review the patient instruction sheet enclosed in the package.

© F.A. Davis Publishing

- Instruct patient in proper method of disposal of unit. Emphasize need to keep out of the reach of children or pets.
- Rep: Nicotine in any form can be harmful to a pregnant woman and/or the fetus. Assist patient in determining risk/benefit of nicotine replacement therapy (NRT) and harm to the fetus versus the likelihood of stopping smoking without NRT. Maternal smoking and nicotine increase risk of sudden infant death syndrome.
- Emphasize the importance of regular visits to health care professional to monitor progress of smoking cessation.
- **Gum:** Explain purpose of nicotine gum to patient. Patient should chew 1 piece of gum whenever a craving for nicotine occurs or according to a fixed schedule (every 1–2 hr while awake) as directed. Chew gum slowly until a tingling sensation is felt (about 15 chews). Then, patient should stop chewing and store the gum between the cheek and gums until the tingling sensation disappears (about 1 min). Process of stopping, then resuming chewing should be repeated for approximately 30 min until most of the tingle has disappeared. Rapid, vigorous chewing may result in side effects similar to those of smoking too many cigarettes (headache, dizziness, nausea, increased salivation, heartburn, and hiccups). For best chances of quitting, chew at least 9 piece of gum/day during 1st 6 wk.
- Inform patient that the gum has a slight tobacco/pepper-like taste. Many patients initially find it unpleasant and slightly irritating to the mouth. This usually resolves after several days of therapy.
- Advise patient to carry gum at all times during therapy.
- Advise patient to avoid eating or drinking for 15 min before and during chewing of nicotine gum; these interfere with buccal absorption of nicotine.
- The gum usually can be chewed by denture wearers. Contact dentist if the gum adheres to bridgework.
- Inform patient that if they still feel need to use gum after completion of treatment period, advise them to contact a health care professional.
- Instruct patient not to swallow gum.
- Dispose of the gum by wrapping in wrapper to prevent ingestion by children and animals. Call the poison control center, emergency department, or health care professional immediately if a child ingests the gum.
- Emphasize the need to discontinue the gum and to inform health care professional if pregnancy occurs.
- **Transdermal:** Instruct patient in application and use of patch. Apply patch at the same time each day. Keep patch in sealed pouch until ready to apply. Apply to clean, dry skin of upper arm or torso free of oil, hair, scars, cuts, burns, or irritation. Press patch firmly in place with palm for 10 sec, making sure there is good contact, especially around the edges. Keep patch in place during showering, bathing, or swimming; replace patches that have fallen off. Wash hands with soap and water after handling patches. Do not trim or cut patch. No more than 1 patch should be worn at a time. Alternate application sites. Dispose of used patches by folding adhesive sides together and replacing in protective pouch or aluminum foil; keep out of reach of children.
- Advise patient that redness, itching, and burning at application site usually subside within 1 hr. Instruct patient to notify health care professional and not apply new patch if signs of allergic reaction (urticaria, generalized rash, hives) or persistent local skin reactions (severe erythema, pruritus, edema) occur.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **Nasal Spray:** Instruct patient in proper use of spray. Tilt head back slightly. Do not sniff, swallow, or inhale through nose as spray is being administered. Patients who have successfully stopped smoking should continue to use the same dose for up to 8 wk, after which the spray should be discontinued over the next 4–6 wk.
- Discontinue nasal spray by using ½ dose (1 spray at a time), using the spray less frequently, skipping a dose by not using every hr, or setting a planned stop date for use of the spray.
- Treatment should be discontinued in patients who are unable to stop smoking by the 4th wk of therapy (patient is unlikely to quit on that attempt).
- Patients who fail to stop smoking should be given a therapy holiday before another attempt.
- Instruct patient to replace childproof cap after using and before disposal.
- **Inhalation:** Inhalation regimens should consist of frequent, continuous puffing for 20 min.
- Treatment should be discontinued in patients who are unable to stop smoking by the 4th wk of therapy (patient is unlikely to quit on that attempt).
- Patients who fail to stop smoking should be given a therapy holiday before another attempt.
- **Lozenge:** Instruct patient to place lozenge in mouth and allow it to slowly dissolve (20–30 min). Minimize swallowing; advise patient not to chew or swallow lozenge. May cause a warm tingling sensation in mouth. Advise patient to occasionally move lozenge from side to side of mouth until completely dissolved. Instruct patient not to eat or drink 15 min before or while lozenge is in mouth. For best chances of quitting, use at least 9 lozenges/day during 1st 6 wk. Do not use more than 1 lozenge at a time or use continuously one after the another. Lozenge should not be used after 12 wk without consulting health care professional.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Lessened sequelae of nicotine withdrawal (irritability, insomnia, somnolence, headache, and increased appetite) during smoking cessation.

BEERS

NIFEdipine (nye-fed-i-peen)

~~Adalat CC~~, Adalat XL, ~~Afeditab CR~~, ~~Procardia~~, Procardia XL

Classification

Therapeutic: antianginals, antihypertensives
Pharmacologic: calcium channel blockers

Indications

Management of: Hypertension (extended-release only), Angina pectoris, Vasospastic (Prinzmetal's) angina.
Unlabeled Use: Prevention of migraine headache. Management of HF or cardiomyopathy.

Action

Inhibits calcium transport into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction.
Therapeutic Effects: Systemic vasodilation, resulting in decreased BP. Coronary vasodilation, resulting in decreased frequency and severity of attacks of angina.

Pharmacokinetics

Absorption: Well absorbed after oral administration, but large amounts are rapidly metabolized (primarily by CYP3A4 enzyme system), resulting in ↓ bioavailability (45–70%); bioavailability is ↑ (80%) with extended-release forms.
Distribution: Unknown.
Protein Binding: 92–98%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 2–5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	20 min	unknown	6–8 hr
PO–ER	unknown	6 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Systolic BP <90 mm Hg; Coadministration with grapefruit juice, rifampin, rifabutin, phenobarbital, phenytoin, carbamazepine, or St. John's wort.
Use Cautiously in: Severe hepatic impairment (↓ dose recommended); History of porphyria; Severe renal impairment (↓ dose may be necessary); History of serious ventricular arrhythmias or HF; Pedi: Safety and effectiveness not established in children; Geri: Short-acting forms appear on Beers list due to ↑ risk of hypotension and constipation in older adults (↓ dose recommended); also associated with ↑ incidence of falls.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, HF, peripheral edema, bradycardia, chest pain, hypotension, palpitations, syncope, tachycardia. **Derm:** STEVENS-JOHNSON SYNDROME, flushing, dermatitis, erythema multiforme, ↑ sweating, photosensitivity, pruritus/urticaria, rash. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Endo:** gynecomastia, hyperglycemia. **Neuro:** headache, abnormal dreams, anxiety, confusion, dizziness, drowsiness, dysgeusia, jitteriness, nervousness, psychiatric disturbances, weakness. **GI:** ↑ liver enzymes, anorexia, constipation, diarrhea, dry mouth, dyspepsia, GI obstruction, nausea, ulcer, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** paresthesia, tremor. **Resp:** cough, dyspnea, shortness of breath. **Misc:** gingival hyperplasia.

Interactions

Drug-Drug: **Rifampin**, **rifabutin**, **phenobarbital**, **phenytoin**, or **carbamazepine** may significantly ↓ levels and effects; concurrent use is contraindicated. **Ketoconazole**, **fluconazole**, **itraconazole**, **clarithromycin**, **erythromycin**, **nefazodone**, **saquinavir**, **indinavir**, **nelfinavir**, or **ritonavir** may ↑ levels and effects; consider initiating nifedipine at lowest dose. Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. May ↑ serum levels and risk of toxicity from **digoxin**. Concurrent use with **beta blockers**, **digoxin**, or **disopyramide** may result in bradycardia, conduction defects, or HF. **Cimetidine** and **propranolol** may ↓ metabolism and ↑ risk of toxicity. May ↓ metabolism of and ↑ risk of toxicity from **cyclosporine**, **tacrolimus**, **prazosin**, **quinidine**, or **carbamazepine**. ↑ risk of GI obstruction when used concurrently with H_2 **blockers**, **opioids**, **NSAIDs**, **laxatives**, **anticholinergic drugs**, **levothyroxine**, or **neuromuscular blockers**. **Strong CYP3A4 inducers**, including **carbamazepine**, **phenobarbital**, **phenytoin**, and **rifampin**, may ↓ levels and effects; avoid concurrent use.
Drug-Natural Products: **St. John's wort** may significantly ↓ levels and effects; concurrent use is contraindicated.
Drug-Food: **Grapefruit** and **grapefruit juice** ↑ serum levels and effect; avoid concurrent use.

N

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Route/Dosage

PO (Adults): *Immediate-release*—10–30 mg 3 times daily (not to exceed 180 mg/day); *Extended-release*—30–90 mg once daily (not to exceed 90–120 mg/day).

Availability (generic available)

Capsules: 🍁 5 mg, 10 mg, 20 mg. **Extended-release tablets:** 30 mg, 60 mg, 90 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse before therapy, during dose titration, and periodically during therapy. Monitor ECG periodically during prolonged therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of HF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Patients receiving digoxin concurrently with nifedipine should have routine tests of serum digoxin levels and be monitored for signs and symptoms of digoxin toxicity.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia increases risk of arrhythmias; should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. Several days of therapy may cause ↑ hepatic enzymes, which return to normal upon discontinuation of therapy.
- Nifedipine may cause positive ANA and direct Coombs' test results.

Implementation

- Do not confuse with nicardipine or nimodipine.
- **PO:** May be administered without regard to meals. May be administered with meals if GI irritation becomes a problem.
- ***DNC:*** Swallow tablets whole; do not open, break, crush, or chew extended-release tablets. Empty tablets that appear in stool are not significant.
- Avoid administration with grapefruit juice.
- Sublingual use is not recommended due to serious adverse drug reactions.

Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Instruct patient on technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Geri: Teach patient and family about risk for falls and how to reduce risk in the home.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of alcohol or OTC medications and herbal products, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if rash, irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and use SL nitroglycerin as needed for anginal attacks.
- Inform patient that anginal attacks may occur 30 min after administration because of reflex tachycardia. This is usually temporary and is not an indication for discontinuation.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath occurs; or if persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring BP. Advise patient to take BP weekly and to report significant changes to health care professional.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.

nilotinib (ni-lo-ti-nib)

Tasigna

Classification

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors, kinase inhibitors

Indications

Newly diagnosed Philadelphia chromosome positive (Ph+) chronic myelogenous leukemia (CML) in chronic phase. Chronic or accelerated phase Ph+ CML in adult patients who are resistant or intolerant to prior treatment, including imatinib. Chronic or accelerated phase Ph+ CML in pediatric patients ≥1 yr who are resistant or intolerant to prior tyrosine-kinase inhibitor treatment.

Action

Inhibits kinases which may be produced by malignant cell lines. **Therapeutic Effects:** Inhibits production of malignant cells lines with decreased proliferation of leukemic cells.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Blood levels are significantly ↑ by food.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; metabolites are not active.
Half-life: 17 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypokalemia or hypomagnesemia; Long QT syndrome; Concurrent use of QT interval prolonging medications; Concurrent use of strong CYP3A4 inhibitors (e.g., ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, voriconazole, grapefruit juice); Concurrent use of strong CYP3A4 inducers (e.g., dexamethasone, phenytoin, carbamazepine, rifampin, rifabutin, rifapentine, phenobarbital, St. John's wort); Galactose intolerance, severe lactase deficiency, or glucose-galactose malabsorption (capsules contain lactose); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Concurrent use of proton pump inhibitors (may ↓ bioavailability of nilotinib); Electrolyte abnormalities; correct prior to administration to ↓ risk of arrhythmias; Hepatic impairment (↓ dose required for Grade 3 elevated bilirubin, transaminases or lipase); Total gastrectomy (may need to ↑ dose or use alterative therapy); History of pancreatitis; Patients with genetically reduced UGT1A1 activity (presence of UGT1A1*28 allele) (↑ risk of hyperbilirubinemia); Rep: Women of reproductive potential; Pedi: May affect growth and development of children; safety and effectiveness not established in children <1 yr.

Adverse Reactions/Side Effects

CV: MI, STROKE, TORSADES DE POINTES, hypertension, palpitations, pericardial effusion, peripheral arterial disease, QT interval prolongation. **Derm:** pruritus, rash, alopecia, flushing. **EENT:** vertigo. **F and E:** hyperkalemia, hypocalcemia, hypokalemia, hyponatremia, hypophosphatemia. **GI:** HEPATOTOXICITY, ↑ lipase, constipation, diarrhea, nausea, vomiting, abdominal discomfort, anorexia, ascites, dyspepsia, flatulence, hepatitis B virus reactivation. **Hemat:** BLEEDING, MYELOSUPPRESSION. **Metab:** hyperglycemia. **MS:** ↓ growth, musculoskeletal pain. **Neuro:** fatigue, headache, dizziness, paresthesia. **Resp:** pleural effusion, pulmonary edema. **Misc:** fever, night sweats, tumor lysis syndrome.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **ketoconazole**, **itraconazole**, **voriconazole**, **clarithromycin**, **atazanavir**, **indinavir**, **nelfinavir**, **ritonavir**, **saquinavir**, and **nefazodone**, may result in ↑ blood levels and toxicity and should be avoided if possible; if concurrent use is necessary, ↓ nilotinib dose. **Strong CYP3A4 inducers**, including **carbamazepine**, **dexamethasone**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampin**, and **rifapentine**, may ↓ blood levels and effectiveness and should be avoided. May ↑ levels of **CYP3A4 substrates**, including **alfentanil**, **atorvastatin**, **cyclosporine**, **dihydroergotamine**, **ergotamine**, **fentanyl**, **lovastatin**, **midazolam**, **simvastatin**, **sirolimus**, and **tacrolimus**. Concurrent use of other **drugs that prolong QT interval**; may ↑ risk of serious arrhythmias; avoid concomitant use. **Proton pump inhibitors**, **H_2 receptor antagonists**, and **antacids** may ↓ the bioavailability of nilotinib; avoid concurrent use of proton pump inhibitors; doses of H_2 receptor antagonists may be administered 10 hr before or 2 hr after nilotinib; doses of antacids may be administered 2 hr before or after nilotinib.
Drug-Natural Products: St. John's wort may ↓ levels and effectiveness; avoid concurrent use.
Drug-Food: Grapefruit juice may ↑ blood levels and toxicity and should be avoided.

© F.A. Davis Publishing

Route/Dosage

Newly Diagnosed Chronic Phase Ph+ Chronic Myelogenous Leukemia

PO (Adults): 300 mg twice daily; treatment discontinuation may be considered in patients who have received nilotinib for ≥3 yr and achieved a sustained molecular response; if patients lose molecular response after discontinuing therapy, restart nilotinib within 4 wk at the dose level prior to discontinuation; *Concurrent use of strong CYP3A4 inhibitor (ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, voriconazole)* — 200 mg once daily.

PO (Children ≥1 yr): 230 mg/m² twice daily (max single dose = 400 mg) until disease progression or unacceptable toxicity; treatment discontinuation may be considered in patients who have received nilotinib for ≥3 yr and achieved a sustained molecular response; if patients lose molecular response after discontinuing therapy, restart nilotinib within 4 wk at the dose level prior to discontinuation; *Concurrent use of strong CYP3A4 inhibitor (ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, voriconazole)* — 200 mg once daily.

Hepatic Impairment

PO (Adults and Children ≥1 yr): *Mild, moderate or severe hepatic impairment* — 200 mg twice daily; may ↑ to 300 mg twice daily if tolerates.

Resistant or Intolerant Chronic or Accelerated Phase Ph+ Chronic Myelogenous Leukemia

PO (Adults): 400 mg twice daily; treatment discontinuation may be considered in patients who have received nilotinib for ≥3 yr and achieved a sustained molecular response; if patients lose molecular response after discontinuing therapy, restart nilotinib within 4 wk at the dose level prior to discontinuation; *Concurrent use of strong CYP3A4 inhibitor (ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, voriconazole)* — 300 mg once daily.

PO (Children ≥1 yr): 230 mg/m² twice daily (max single dose = 400 mg) until disease progression or unacceptable toxicity; treatment discontinuation may be considered in patients who have received nilotinib for ≥3 yr and achieved a sustained molecular response; if patients lose molecular response after discontinuing therapy, restart nilotinib within 4 wk at the dose level prior to discontinuation; *Concurrent use of strong CYP3A4 inhibitor (ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, voriconazole)* — 200 mg once daily.

Hepatic Impairment

PO (Adults and Children ≥1 yr): *Mild or moderate hepatic impairment* — 300 mg twice daily; may ↑ to 400 mg twice daily if tolerates; *Severe hepatic impairment* — 200 mg twice daily; may ↑ to 300 mg twice daily, and eventually to 400 mg twice daily if tolerates.

Availability

Capsules: 50 mg, 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor ECG to assess the QTc interval at baseline, 7 days after initiation of therapy, after any dose adjustment, and periodically thereafter. For ECGs with QTc >480 msec, withhold nilotinib and check serum potassium and magnesium. If below lower limit of normal, correct to normal with supplements. Review concomitant medications for effects on electrolytes. If QTc returns to <450 msec and within 20 msec of baseline within 2 wk, return to prior dose. If QTc is <480 msec and >450 msec after 2 wk, reduce nilotinib dose to 400 mg once daily. Following dose reduction to 400 mg once daily, if QTc return to >480 msec, discontinue nilotinib. Repeat ECG approximately 7 days after any dose adjustment.
- Monitor for myelosuppression. Assess for bleeding (bleeding gums, bruising, petechiae, blood in stools, urine, emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for at least 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for fatigue, dyspnea, and orthostatic hypotension.
- Monitor for tumor lysis syndrome (malignant disease progression, high WBC counts, hyperuricemia, hyperkalemia, hyperphosphatemia, hypocalcemia, and/or dehydration). Prevent by maintaining adequate hydration and correcting uric acid levels prior to starting nilotinib.
- Monitor for signs of severe fluid retention (unexpected rapid weight gain or swelling) and for symptoms of respiratory or cardiac compromise (shortness of breath) periodically during therapy; evaluate cause and treat patients as needed.
- Monitor growth and development in pediatric patients receiving nilotinib.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor serum electrolytes prior to and periodically during therapy. May cause hypokalemia, hypomagnesemia, hypophosphatemia, hyperkalemia, hypocalcemia, hyperglycemia, and hyponatremia.
- Monitor CBC every 2 wk for first 2 mo and monthly thereafter or as indicated. May cause Grade 3–4 thrombocytopenia, neutropenia, and anemia. If ANC is $<1.0 \times 10^9$/L and/or platelet counts $<50 \times 10^9$/L, stop nilotinib and monitor blood counts. Resume within 2 wk at prior dose if ANC $>1.0 \times 10^9$/L and

© F.A. Davis Publishing

platelets >50 × 10^9/L. If blood counts remain low for >2 wk, reduce dose to 400 mg once daily. Myelosuppression is generally reversible.

- May cause ↑ serum lipase or amylase. If ↑ to ≥Grade 3, withhold nilotinib and monitor serum levels. Resume treatment at 400 mg once daily (230 mg/m² once daily if prior dose was 230 mg/m² twice daily; if serum lipase or amylase return to ≤Grade 1. For pediatric patients, hold nilotinib until serum lipase or amylase return to ≤Grade 1. Resume therapy at 230 mg/m² once daily if prior dose was 230 mg/m² twice daily; discontinue therapy if prior dose was 230 mg/m² once daily.
- Monitor liver function tests monthly. May cause ↑ serum ALT, AST, alkaline phosphatase, and serum bilirubin. If ↑ to ≥Grade 3, withhold nilotinib and monitor bilirubin. Resume treatment at 400 mg once daily if serum lipase or amylase return to ≤Grade 1. For pediatric patients, hold nilotinib until serum bilirubin returns to ≤Grade 1. Resume therapy at 230 mg/m² once daily if prior dose was 230 mg/m² twice daily; discontinue therapy if prior dose was 230 mg/m² once daily, and recovery to ≤Grade 1 takes >28 days.
- Monitor lipid panel and glucose prior to and periodically during first yr of therapy, and then yearly during chronic therapy.
- Upon discontinuation, monitor BCR-ABL transcript levels and CBC with differential monthly for 1 yr, then every 6 wk for 2nd yr, and every 12 wk thereafter.

Implementation

- Do not confuse nilotinib with neratinib or niraparib.
- Correct hypokalemia and hypomagnesemia prior to beginning therapy.
- **PO:** Administer twice daily at 12-hr intervals on an empty stomach, at least 1 hr before and 2 hr after food. ***DNC:*** Swallow capsule whole with water; do not open capsule.
- Patients unable to swallow capsule may open capsule and sprinkle contents of each capsule in 1 teaspoon of applesauce. Swallow mixture within 15 min. Do not use more than 1 teaspoon of applesauce and use only applesauce.
- Avoid antacids less than 2 hr before or after and H_2 antagonists less than 10 hr before or less than 2 hr after administration.

Patient/Family Teaching

- Instruct patient to take nilotinib as directed, approximately 12 hr apart. If a dose is missed, skip dose and resume taking next prescribed dose. Nilotinib is a long-term treatment; do not stop medication or change dose without consulting health care professional. Advise patient to read the *Medication Guide* before starting and with each Rx refill, in case of changes.
- Advise patient to avoid grapefruit, grapefruit juice, or products with grapefruit extract during therapy; may cause toxicity.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort, during therapy.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; signs of fluid retention; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use a soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate bleeding.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Rep: May cause fetal harm. Advise women of reproductive potential to use highly effective contraception during therapy and for at least 14 days following last dose and to avoid breast feeding for at least 14 days following last dose. Advise patient to notify health care professional immediately if pregnancy is suspected.

Evaluation/Desired Outcomes

- Decrease in production of leukemic cells.

niMODipine (nye-**moe**-di-peen)

Nimotop, Nymalize

Classification

Therapeutic: subarachnoid hemorrhage therapy agents

Pharmacologic: calcium channel blockers

Indications

Management of subarachnoid hemorrhage.

Action

Inhibits the transport of calcium into vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. Potent

© F.A. Davis Publishing

peripheral vasodilator. **Therapeutic Effects:** Prevention of vascular spasm after subarachnoid hemorrhage, resulting in decreased neurologic impairment.

Pharmacokinetics

Absorption: Well absorbed following oral administration but extensively metabolized, resulting in ↓ bioavailability.
Distribution: Crosses the blood-brain barrier; remainder of distribution unknown.
Protein Binding: >95%.
Metabolism and Excretion: Mostly metabolized by the liver; ≤10% excreted unchanged by kidneys.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (vasodilation)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Systolic BP <90 mm Hg; Concurrent use of strong CYP3A4 inhibitors (↑ risk of hypotension); Concurrent use of strong CYP3A4 inducers (↓ efficacy).
Use Cautiously in: Severe hepatic impairment (dose ↓ recommended); Severe renal impairment; History of serious ventricular arrhythmias or HF; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Dose ↓ recommended due to↑ risk of hypotension in older adults.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, HF, chest pain, hypotension, palpitations, peripheral edema, syncope, tachycardia. **Derm:** STEVENS-JOHNSON SYNDROME, dermatitis, erythema multiforme, flushing, ↑ sweating, photosensitivity, pruritus/urticaria, rash. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Endo:** gynecomastia, hyperglycemia. **GI:** ↑ liver enzymes, anorexia, constipation, diarrhea, dry mouth, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** abnormal dreams, anxiety, confusion, dizziness, drowsiness, dysgeusia, headache, nervousness, psychiatric disturbances, weakness, paresthesia, tremor. **Resp:** cough, dyspnea. **Misc:** gingival hyperplasia.

Interactions

Drug-Drug: **Strong CYP3A4 inhibitors**, including **clarithromycin**, **indinavir**, **nelfinavir**, **ritonavir**, **saquinavir**, **ketoconazole**, **itraconazole**, **posaconazole**, **voriconazole**, **conivaptan**, and **nefazodone**, may ↑ levels and the risk of hypotension; avoid concurrent use. **Strong CYP3A4 inducers**, including **carbamazepine**, **phenobarbital**, **phenytoin**, and **rifampin**, may ↓ levels and effects; avoid concurrent use. Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**.
Drug-Natural Products: **St. John's wort** may ↓ levels and effect; avoid concurrent use.
Drug-Food: **Grapefruit** and **grapefruit juice** ↑ levels and effect; avoid concurrent use.

Route/Dosage

PO (Adults): 60 mg every 4 hr for 21 days; therapy should be started within 96 hr of subarachnoid hemorrhage.

Hepatic Impairment

PO (Adults): 30 mg every 4 hr for 21 days; therapy should be started within 96 hr of subarachnoid hemorrhage.

Availability (generic available)

Capsules: 30 mg. **Oral solution:** 6 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient's neurologic status (level of consciousness, movement) prior to and periodically following administration.
- Monitor BP and pulse prior to therapy and periodically during therapy.
- Monitor intake and output ratios and daily weight. Assess for signs of HF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ risk of arrhythmias; should be corrected.
- Monitor renal and hepatic functions periodically. Several days of therapy may cause ↑ hepatic enzymes, which return to normal upon discontinuation of therapy.
- May occasionally cause ↓ platelet count.

Implementation

- Do not confuse nimodipine with nicardipine or nifedipine.
- Begin administration within 96 hr of subarachnoid hemorrhage and continue every 4 hr for 21 consecutive days.
- Administer by PO route ONLY; administration via IV or parenterally, may cause serious adverse events, including death.
- **PO:** If patient is unable to swallow capsule, make a hole in both ends of the capsule with a sterile 18-gauge needle and extract the contents into a syringe. Empty contents into water or nasogastric tube and flush with 30 mL normal saline.

© F.A. Davis Publishing

- Administer oral solution 1 hr before or 2 hr after meals. For administration via NG or gastric tube, administer via syringe included, then refill syringe with 20 mL of 0.9% saline water solution; flush remaining contents from NG or gastric tube into stomach.

Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid grapefruit or grapefruit juice during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of alcohol or OTC medications and herbal products, especially cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if rash, irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improvement in neurologic deficits due to vasospasm following subarachnoid hemorrhage.

niraparib (nye-rap-a-rib)

Zejula

Classification

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Indications

Maintenance treatment of recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who are in a complete or partial response to platinum-based chemotherapy. First-line maintenance treatment of advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who are in a complete or partial response to first-line platinum-based chemotherapy. Treatment of advanced ovarian, fallopian tube, or primary peritoneal cancer in patients who have been treated with ≥3 prior chemotherapy regimens and whose cancer is associated with homologous recombination deficiency positive status defined by either a deleterious or suspected deleterious *BRCA* mutation or genomic instability in those who have progressed >6 months after response to the last platinum-based chemotherapy.

Action

Acts as a poly (ADP-ribose) polymerase (PARP-1 and PARP-2) inhibitor; results in DNA damage, apoptosis, and cell death. **Therapeutic Effects:** Decreased progression of ovarian, fallopian tube, or primary peritoneal cancer and improved survival.

Pharmacokinetics

Absorption: 73% absorbed following oral administration.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Primarily metabolized by carboxylesterases to an inactive metabolite; 48% excreted in urine (11% as unchanged drug), 39% in feces (19% as unchanged drug).
Half-life: 36 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 hr	24 hr

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Ischemic heart disease, arrhythmias, or hypertension; Severe renal impairment (CCr <30 mL/min); Moderate or severe hepatic impairment (↓ dose in moderate hepatic impairment); Aspirin hypersensitivity (contains tartrazine); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: palpitations, hypertension. **Derm:** rash. **GI:** abdominal pain/distention, constipation, ↓ appetite, diarrhea, dry mouth, dyspepsia, ↑ liver enzymes, nausea, stomatitis, vomiting. **GU:** urinary tract infection, ↓ fertility (males). **Hemat:** MYELODYSPLASTIC SYNDROME/ACUTE MYELOID LEUKEMIA, NEUTROPENIA, anemia, leukopenia, thrombocytopenia, pancytopenia. **Neuro:** POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), anxiety, dizziness, dysgeusia, fatigue, headache, insomnia. **MS:** arthralgia, myalgia. **Resp:** cough, dyspnea.

Interactions

Drug-Drug: None reported.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Route/Dosage

Maintenance Treatment of Recurrent Epithelial Ovarian, Fallopian Tube, or Primary Peritoneal Cancer

PO (Adults): 300 mg once daily until disease progression or unacceptable toxicity. Treatment should be started within 8 wk after most-recent platinum-containing regimen.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—200 mg once daily until disease progression or unacceptable toxicity. Treatment should be started within 8 wk after most-recent platinum-containing regimen.

First-Line Maintenance Treatment of Advanced Epithelial Ovarian, Fallopian Tube, or Primary Peritoneal Cancer

PO (Adults ≥77 kg AND platelet count ≥150,000/μL): 300 mg once daily until disease progression or unacceptable toxicity. Treatment should be started within 12 wk after most-recent platinum-containing regimen.

PO (Adults <77 kg OR platelet count <150,000/μL): 200 mg once daily until disease progression or unacceptable toxicity. Treatment should be started within 12 wk after most-recent platinum-containing regimen.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—200 mg once daily until disease progression or unacceptable toxicity. Treatment should be started within 12 wk after most-recent platinum-containing regimen.

Treatment of Advanced Ovarian, Fallopian Tube, or Primary Peritoneal Cancer After Receiving ≥3 Prior Chemotherapies

PO (Adults): 300 mg once daily until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—200 mg once daily until disease progression or unacceptable toxicity.

Availability

Capsules (contain tartrazine): 100 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of myelodysplastic syndrome (MDS) or acute myeloid leukemia (AML) (weakness, feeling tired, fever, weight loss, frequent infections, bruising, bleeding easily, breathlessness, blood in urine or stool, and/or low blood cell counts, or need for blood transfusions) periodically during therapy.
- Monitor BP and HR weekly for first 2 mo, then monthly for first year and periodically during therapy. Closely monitor patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension. Manage hypertension with antihypertensive medications and adjustment of niraparib dose, if necessary.
- Monitor for signs and symptoms of PRES (seizure, headache, altered mental status, visual disturbance, cortical blindness, with or without associated hypertension). If symptoms occur, promptly discontinue niraparib.
- ***Lab Test Considerations:*** Patient selection is based on either deleterious or suspected deleterious BRCA mutation and/or genomic instability score. Information on FDA-approved tests for the detection of either deleterious or suspected deleterious BRCA mutation or genomic instability for this indication is available at https://www.fda.gov/companiondiagnostics.
- Verify negative pregnancy test before starting therapy.
- Monitor CBC weekly for first mo, monthly for next 11 mo, and periodically during therapy. Do not start niraparib until recovery of hematological toxicity from previous chemotherapy has recovered. **If platelet count <100,000 mm^3/L:** *First occurrence:* Hold niraparib for a maximum of 28 days and monitor blood counts weekly until platelet counts return to ≥100,000 mm^3/L. Resume at same or reduced dose. If platelet count is <75,000 mm^3/L, resume at a reduced dose. *Second occurrence:* Hold niraparib for a maximum of 28 days and monitor blood counts weekly until platelet counts return to ≥100,000 μL. Resume at a reduced dose. Discontinue niraparib if platelet count has not returned to acceptable levels within 28 days of the dose interruption period, or if dose already reduced to 100 mg once daily. *For platelet count ≤10,000/mm^3/L,* consider platelet transfusion. If other risk factors such as coadministration of anticoagulation or antiplatelet drugs exist, consider interrupting these drugs and/or transfusion. Resume therapy at a reduced dose.
- *If neutrophil <1,000/μL or hemoglobin <8 g/dL:* Hold niraparib for a maximum of 28 days and monitor blood counts weekly until neutrophil counts return to ≥1,500/μL or hemoglobin returns to ≥9 g/dL. Resume at a reduced dose. Discontinue therapy if neutrophils and/or hemoglobin have not returned to acceptable levels within 28 days of dose interruption, or if dose already reduced to 100 mg once daily.
- May cause anemia.
- May cause ↑ AST and ALT.

Implementation

- Do not confuse niraparib with neratinib or nilotinib.
- For the maintenance treatment of advanced ovarian cancer, start therapy with no later than 12 wk after most recent platinum-containing regimen.

© F.A. Davis Publishing

- **Dose Modification Recommendations:** *First dose reduction:* If taking 200 mg, decrease to 100 mg/day. If taking 300 mg, decrease to 200 mg/day. *Second dose reduction:* If taking 200 mg, discontinue niraparib. If taking 300 mg decrease to 100 mg/day. If further dose reduction below 100 mg/day is required, discontinue niraparib.
- For nonhematologic adverse reactions: If nonhematologic CTCAE ≥Grade 3 adverse reaction that persists despite medical management, hold niraparib for a maximum of 28 days or until resolution of adverse reaction. Resume niraparib at a reduced dose. If CTCAE ≥Grade 3 treatment-related adverse reaction lasting >28 days while patient is administered niraparib 100 mg/day, discontinue niraparib.
- **PO:** Administer once daily, at the same time each day, without regard to food. Nausea may be minimized by administering at bedtime. ***DNC:*** Swallow capsules whole; do not open, crush, or chew.

Patient/Family Teaching

- Instruct patient to take niraparib as directed at the same time each day. Do not stop therapy without consulting health care professional. If dose missed or patient vomits after dose, omit and take next dose at scheduled time; do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if symptoms of MDS or AML (weakness, fever, feeling tired, weight loss, shortness of breath, blood in urine or stool, frequent infections, unusual bruising or bleeding) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 6 mo after last dose and to avoid breast feeding during and for 1 mo after last dose of therapy. Inform male patients niraparib may impair fertility.

Evaluation/Desired Outcomes

- Decreased progression of ovarian, fallopian tube, or primary peritoneal cancer and improved survival.

BEERS

nitrofurantoin

(nye-troe-fyoor-**an**-toyn)

Furadantin, Furantoin, Macrobid, Macrodantin

Classification

Therapeutic: anti-infectives

Indications

Prevention and treatment of urinary tract infections caused by susceptible organisms; not effective in systemic bacterial infections.

Action

Interferes with bacterial enzymes. **Therapeutic Effects:** Bactericidal or bacteriostatic action against susceptible organisms. **Spectrum:** Many gram-negative and some gram-positive organisms, specifically: *Citrobacter*, *Corynebacterium*, *Enterobacter*, *Escherichia coli*, *Klebsiella*, *Neisseria*, *Salmonella*, *Shigella*, *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Enterococcus*.

Pharmacokinetics

Absorption: Readily absorbed after oral administration. Absorption is slower but more complete with macrocrystals (Macrodantin).
Distribution: Crosses placenta; enters breast milk.
Protein Binding: 40%.
Metabolism and Excretion: Partially metabolized by the liver; 30–50% excreted unchanged by the kidneys.
Half-life: 20 min (↑ in renal impairment).

TIME/ACTION PROFILE (urine levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	30 min	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens (suspension); Oliguria, anuria, or significant renal impairment (CCr <60 mL/min); History of cholestatic jaundice or hepatic impairment with previous use of nitrofurantoin; Pregnancy near term and infants <1 mo (↑ risk of hemolytic anemia).
Use Cautiously in: Glucose–6–phosphate dehydrogenase (G6PD) deficiency (↑ risk of hemolytic anemia, especially in Blacks and Mediterranean and Near-Eastern ethnic groups); Patients with diabetes or debilitated patients (neuropathy may be more common); OB: Safety not established but has been used safely in pregnant women. Lactation: May cause hemolysis in infants with G6PD deficiency who are breast fed; Geri: Appears on Beers list; ↑ risk for renal, hepatic, and pulmonary reactions.

Adverse Reactions/Side Effects

EENT: nystagmus. **Resp:** PNEUMONITIS, PULMONARY FIBROSIS. **CV:** chest pain. **GI:** HEPATOTOXICITY, CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), anorexia, nausea, vomiting, abdominal pain, diarrhea. **GU:** rust/brown discoloration of urine. **Derm:** photosensitivity. **Hemat:** blood dyscrasias, hemolytic anemia. **Neuro:** peripheral neuropathy, dizziness, drowsiness, headache. **Misc:** hypersensitivity reactions.

© F.A. Davis Publishing

Interactions

Drug-Drug: Probenecid prevents high urinary concentrations; may ↓ effectiveness. **Antacids** may ↓ absorption. ↑ risk of neurotoxicity with **neurotoxic drugs**. ↑ risk of hepatotoxicity with **hepatotoxic drugs**. ↑ risk of pneumonitis with **drugs having pulmonary toxicity**.

Route/Dosage

PO (Adults): *Treatment of active infection*—50–100 mg every 6–8 hr *or* 100 mg every 12 hr as extended-release product. *Chronic suppression*—50–100 mg single evening dose.

PO (Children >1 mo): *Treatment of active infection*—5–7 mg/kg/day divided every 6 hr; maximum dose: 400 mg/day. *Chronic suppression*—1–2 mg/kg/day as a single dose at bedtime; maximum dose: 100 mg/day (unlabeled).

Availability (generic available)

Oral suspension: 25 mg/5 mL. **Cost:** *Generic*—$608.68/230 mL. **Capsules:** 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—50 mg $199.00/100, 100 mg $338.00/100. **Extended-release capsules:** 100 mg. **Cost:** *Generic*—$320.92/100.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of urinary tract infection (frequency, urgency, pain, and burning on urination; fever; cloudy or foul-smelling urine) before and periodically during therapy.
- Obtain specimens for culture and sensitivity before and during drug administration.
- Monitor intake and output ratios. Report significant discrepancies in totals.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Assess for signs and symptoms of pulmonary reactions periodically during therapy. Acute reactions (fever, chills, cough, chest pain, dyspnea, pulmonary infiltration with consolidation or pleural effusion on x ray, eosinophilia) usually occur within first wk of treatment and resolve when therapy is discontinued. Chronic reactions (malaise, dyspnea on exertion, cough, altered pulmonary function) may indicate pneumonitis or pulmonary fibrosis and are more common in patients taking nitrofurantoin for 6 mo or longer.
- ***Lab Test Considerations:*** Monitor CBC routinely with patients on prolonged therapy.
- Monitor liver function tests periodically during therapy. May cause ↑ serum glucose, bilirubin, alkaline phosphatase, BUN, and creatinine. If hepatotoxicity occurs, discontinue therapy.
- Monitor renal function periodically during therapy.

Implementation

- **PO:** Administer with food or milk to minimize GI irritation, to delay and increase absorption, to increase peak concentration, and to prolong duration of therapeutic concentration in the urine.
- ***DNC:*** Do not crush tablets or open capsules.
- Administer liquid preparations with calibrated measuring device. Shake well before administration. Oral suspension may be mixed with water, milk, fruit juices, or infant formula. Rinse mouth with water after administration of oral suspension to avoid staining teeth.

Patient/Family Teaching

- Instruct patient to take medication around the clock, as directed. Take missed doses as soon as remembered and space next dose 2–4 hr apart. Do not skip or double up on missed doses.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that medication may cause a rust-yellow to brown discoloration of urine, which is not significant.
- Advise patient to notify health care professional if fever, chills, cough, chest pain, dyspnea, skin rash, numbness or tingling of the fingers or toes, or intolerable GI upset occurs. Signs of superinfection (milky, foul-smelling urine; perineal irritation; dysuria) should also be reported.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to consult health care professional if no improvement is seen within a few days after initiation of therapy.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Therapy should be continued for a minimum of 7 days and for at least 3 days after the urine has become sterile.
- Decrease in the frequency of infections in chronic suppressive therapy.

NITROGLYCERIN
(nye-tro-**gli**-ser-in)

nitroglycerin extended-release capsules
Nitro-Time

nitroglycerin intravenous
~~Nitro-Bid IV~~, Nitroject, ~~Tridil~~

nitroglycerin sublingual tablets
Nitrostat

© F.A. Davis Publishing

nitroglycerin transdermal ointment
Nitro-Bid

nitroglycerin transdermal patch
Nitro-Dur, Trinipatch

nitroglycerin translingual spray
Nitrolingual, Nitromist, Rho-Nitro

Classification
Therapeutic: antianginals
Pharmacologic: nitrates

Indications
Acute (**translingual, SL, ointment**) and long-term prophylactic (**oral, transdermal**) management of angina pectoris. **PO:** Adjunct treatment of HF. **IV:** Adjunct treatment of acute MI. Production of controlled hypotension during surgical procedures. Treatment of HF.

Action
Increases coronary blood flow by dilating coronary arteries and improving collateral flow to ischemic regions. Produces vasodilation (venous greater than arterial). Decreases left ventricular end-diastolic pressure and left ventricular end-diastolic volume (preload). Reduces myocardial oxygen consumption. **Therapeutic Effects:** Relief or prevention of anginal attacks. Increased cardiac output. Reduction of BP.

Pharmacokinetics
Absorption: Well absorbed after oral, buccal, and sublingual administration. Also absorbed through skin. Orally administered nitroglycerin is rapidly metabolized, leading to ↓ bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Undergoes rapid and almost complete metabolism by the liver; also metabolized by enzymes in bloodstream.
Half-life: 1–4 min.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
SL/Translingual	1–3 min	unknown	30–60 min
PO-ER	40–60 min	unknown	8–12 hr
Oint	20–60 min	unknown	4–8 hr
Patch	40–60 min	unknown	8–24 hr
IV	immediate	unknown	several min

Contraindications/Precautions
Contraindicated in: Hypersensitivity; ↑ intracranial pressure; Severe anemia; Pericardial tamponade; Constrictive pericarditis; Uncorrected hypovolemia; Alcohol intolerance (large IV doses only); Concurrent use of PDE-5 inhibitor (avanafil, sildenafil, tadalafil, vardenafil) or riociguat.

Use Cautiously in: Head trauma or cerebral hemorrhage; Glaucoma; Hypertrophic cardiomyopathy; Severe liver impairment; Malabsorption or hypermotility (PO); Cardioversion (remove transdermal patch before procedure); OB: May compromise maternal/fetal circulation; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
CV: hypotension, tachycardia, syncope. **Derm:** contact dermatitis (transdermal), flushing. **EENT:** blurred vision. **GI:** abdominal pain, nausea, vomiting. **Neuro:** dizziness, headache, apprehension, restlessness, weakness. **Misc:** alcohol intoxication (large IV doses only), tolerance.

Interactions
Drug-Drug: Concurrent use of **avanafil**, **sildenafil**, **tadalafil**, or **vardenafil** may result in severe hypotension (do not use within 24 hr of isosorbide dinitrate or mononitrate); concurrent use contraindicated. Concurrent use of **riociguat** may result in severe hypotension; concurrent use contraindicated. Additive hypotension with **antihypertensives**, acute ingestion of **alcohol**, **beta blockers**, **calcium channel blockers**, **haloperidol**, or **phenothiazines**. Agents having anticholinergic properties (**tricyclic antidepressants**, **antihistamines**, **phenothiazines**) may ↓ absorption of translingual or sublingual nitroglycerin.

Route/Dosage
SL (Adults): *Tablets*—0.3–0.6 mg; may repeat every 5 min for 2 additional doses for acute attack; may also be used prophylactically 5–10 min before activities that may precipitate an acute attack.
Translingual Spray (Adults): 1–2 sprays; may be repeated every 5 min for 2 additional doses for acute attack; may also be used prophylactically 5–10 min before activities that may precipitate an acute attack.
PO (Adults): 2.5–9 mg every 8–12 hr.
IV (Adults): 5 mcg/min; ↑ by 5 mcg/min every 3–5 min to 20 mcg/min; if no response, ↑ by 10–20 mcg/min every 3–5 min (dosing determined by hemodynamic parameters; max: 200 mcg/min).
Transdermal (Adults): *Ointment*—1–2 in. every 6–8 hr. *Transdermal patch*—0.2–0.4 mg/hr initially; may titrate up to 0.4–0.8 mg/hr. Patch should be worn 12–14 hr/day and then taken off for 10–12 hr/day.

Availability (generic available)
Extended-release capsules: 2.5 mg, 6.5 mg, 9 mg. **Sublingual tablets:** 0.3 mg, 0.4 mg, 0.6 mg. **Translingual spray:** 400 mcg/spray in 4.9-g bottle (60 doses) or 14.6-g bottle (200 doses) (Nitrolingual), 400 mcg/spray in 8.5-g bottle (230 doses) (Nitromist). **Transdermal patch:** 0.1 mg/hr, 0.2 mg/hr, 0.3

© F.A. Davis Publishing

mg/hr, 0.4 mg/hr, 0.6 mg/hr, 0.8 mg/hr. **Transdermal ointment:** 2%. **Solution for injection:** 5 mg/mL. **Premixed solution (in D5W):** 25 mg/250 mL, 50 mg/250 mL, 100 mg/250 mL.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- Monitor BP and pulse before and after administration. Patients receiving IV nitroglycerin require continuous ECG and BP monitoring. Additional hemodynamic parameters may be monitored.
- ***Lab Test Considerations:*** May cause ↑ urine catecholamine and urine vanillylmandelic acid concentrations.
- Excessive doses may cause ↑ methemoglobin concentrations.
- May cause falsely ↑ serum cholesterol levels.

Implementation

- **PO:** Administer dose 1 hr before or 2 hr after meals with a full glass of water for faster absorption. ***DNC:*** Sustained-release preparations should be swallowed whole; do not break, crush, or chew.
- **SL:** Tablet should be held under tongue until dissolved. Avoid eating, drinking, or smoking until tablet is dissolved.
- **Translingual spray:** Spray *Nitrolingual* under tongue. Spray *Nitromist* on or under tongue.

IV Administration

- **IV:** Doses must be diluted and administered as an infusion. Standard infusion sets made of polyvinyl chloride (PVC) plastic may absorb up to 80% of the nitroglycerin in solution. Use glass bottles only and special tubing provided by manufacturer.
- **Continuous Infusion:** ***Dilution:*** Vials must be diluted in D5W or 0.9% NaCl. Premixed infusions already diluted in D5W and are ready to be administered (no further dilution needed). Admixed solutions stable for 48 hr at room temperature or 7 days if refrigerated. Stability of premixed solutions based on manufacturer's expiration date. ***Concentration:*** Should not exceed 400 mcg/mL. ***Rate:*** See Route/Dosage section. Administer via infusion pump to ensure accurate rate. Titrate rate according to patient response.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, esomeprazole, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, ganciclovir, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem-cilastatin, indomethacin, insulin regular, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem/vaborbactam, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metronidazole, micafungin, midazolam, milrinone, minocycline, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin-dalfopristin, remifentanil, rocuronium, sodium bicarbonate, sodium citrate, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiamine, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, warfarin, zoledronic acid.
- **Y-Site Incompatibility:** alteplase, dantrolene, daptomycin, diazepam, hydroxycobalamin, levofloxacin, phenytoin, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Manufacturer recommends that nitroglycerin not be admixed with other medications.
- **Topical:** Rotate sites of topical application to prevent skin irritation. Remove patch or ointment from previous site before application.
- Doses may be increased to the highest dose that does not cause symptomatic hypotension.
- Apply ointment by using dose-measuring application papers supplied with ointment. Squeeze ointment onto measuring scale printed on paper. Use paper to spread ointment onto nonhairy area of skin (chest, abdomen, thighs; avoid distal extremities) in a thin, even layer, covering a 2–3-in. area. Do not allow

© F.A. Davis Publishing

ointment to come in contact with hands. Do not massage or rub in ointment; this will increase absorption and interfere with sustained action. Apply occlusive dressing if ordered.

- Transdermal patches may be applied to any hairless site (avoid distal extremities or areas with cuts or calluses). Apply firm pressure over patch to ensure contact with skin, especially around edges. Apply a new dose unit if the first one becomes loose or falls off. Units are waterproof and not affected by showering or bathing. Do not cut or trim system to adjust dosage. Do not alternate between brands of transdermal products; dose may not be equivalent. Remove patches before MRI, cardioversion or defibrillation to prevent patient burns. Patch may be worn for 12–14 hr and removed for 10–12 hr at night to prevent development of tolerance.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless next dose is scheduled within 2 hr (6 hr with extended-release preparations). Do not double doses. Do not discontinue abruptly; gradual dose reduction may be necessary to prevent rebound angina.
- Caution patient to change positions slowly to minimize orthostatic hypotension. First dose should be taken while in a sitting or reclining position, especially in geriatric patients.
- Advise patient to avoid concurrent use of alcohol with this medication. Patient should also consult health care professional before taking OTC medications while taking nitroglycerin.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe.
- Advise patient to notify health care professional if dry mouth or blurred vision occurs.
- **Acute Anginal Attacks:** Advise patient to sit down and use medication at first sign of attack. Relief usually occurs within 5 min. Dose may be repeated if pain is not relieved in 5–10 min. Call health care professional or go to nearest emergency room if anginal pain is not relieved by 3 tablets in 15 min.
- **SL:** Inform patient that tablets should be kept in original glass container or in specially made metal containers, with cotton removed to prevent absorption. Tablets lose potency in containers made of plastic or cardboard or when mixed with other capsules or tablets. Exposure to air, heat, and moisture also causes loss of potency. Instruct patient not to open bottle frequently, handle tablets, or keep bottle of tablets next to body (i.e., shirt pocket) or in automobile glove compartment. Advise patient that tablets should be replaced 6 mo after opening to maintain potency.
- **Lingual Spray:** Instruct patient to lift tongue and spray dose under tongue (*Nitrolingual, NitroMist*) or on tongue (*NitroMist*).

Evaluation/Desired Outcomes

- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance. During long-term therapy, tolerance may be minimized by intermittent administration in 12–14 hr or 10–12 hr off intervals.
- Controlled hypotension during surgical procedures.
- Treatment of HF associated with acute MI.

HIGH ALERT

nitroprusside

(nye-troe-**pruss**-ide)

Nipride, Nipride RTU, Nitropress

Classification

Therapeutic: antihypertensives

Pharmacologic: vasodilators

N

Indications

Hypertensive crises. Controlled hypotension during anesthesia. Cardiac pump failure or cardiogenic shock (alone or with dopamine).

Action

Produces peripheral vasodilation by a direct action on venous and arteriolar smooth muscle. **Therapeutic Effects:** Rapid lowering of BP. Decreased cardiac preload and afterload.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Rapidly metabolized in RBCs and tissues to cyanide and subsequently by the liver to thiocyanate.

Half-life: 2 min.

TIME/ACTION PROFILE (hypotensive effect)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	rapid	1–10 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; ↓ cerebral perfusion.

Use Cautiously in: Renal disease (↑ risk of thiocyanate accumulation); Hepatic disease (↑ risk of cyanide accumulation); Hypothyroidism; Hyponatremia; Vitamin B deficiency; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Geri: Older adults may have ↑ sensitivity to drug effects.

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: dyspnea, hypotension, palpitations. **EENT:** blurred vision, tinnitus. **F and E:** acidosis. **GI:** abdominal pain, nausea, vomiting. **Local:** phlebitis at IV site. **Neuro:** dizziness, headache, restlessness. **Misc:** CYANIDE TOXICITY, thiocyanate toxicity.

Interactions

Drug-Drug: ↑ hypotensive effect with **ganglionic blocking agents**, **general anesthetics**, and other **antihypertensives**. **Estrogens** and **sympathomimetics** may ↓ the response to nitroprusside.

Route/Dosage

IV (Adults and Children): 0.3 mcg/kg/min initially; may be ↑ as needed up to 10 mcg/kg/min (usual dose is 3 mcg/kg/min; not to exceed 10 min of therapy at 10 mcg/kg/min infusion rate).

Availability (generic available)

Premixed infusion: 20 mg/100 mL 0.9% NaCl, 50 mg/100 mL 0.9% NaCl. **Solution for injection:** 25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, heart rate, and ECG frequently throughout therapy; continuous monitoring is preferred. Consult physician for parameters. Monitor for rebound hypertension following discontinuation of nitroprusside.
- Pulmonary capillary wedge pressure (PCWP) may be monitored in patients with MI or HF.
- ***Lab Test Considerations:*** May cause ↓ bicarbonate concentrations, PCO_2, and pH.
- May cause ↑ lactate concentrations.
- May cause ↑ serum cyanide and thiocyanate concentrations.
- Monitor serum methemoglobin concentrations in patients receiving >10 mg/kg and exhibiting signs of impaired oxygen delivery despite adequate cardiac output and arterial PCO_2 (blood is chocolate brown without change on exposure to air). Treatment of methemoglobinemia is 1–2 mg/kg of methylene blue IV administered over several min.
- ***Toxicity and Overdose:*** If severe hypotension occurs, drug effects are quickly reversed, within 1–10 min, by decreasing rate or temporarily discontinuing infusion. May place patient in Trendelenburg position to maximize venous return.
- Monitor plasma thiocyanate levels daily in patients receiving prolonged infusions at a rate >3 mcg/kg/min or 1 mcg/kg/min in patients with anuria. Thiocyanate levels should not exceed 1 mmol/L.
- Signs and symptoms of thiocyanate toxicity include tinnitus, toxic psychoses, hyperreflexia, confusion, weakness, seizures, and coma.
- Cyanide toxicity may manifest as lactic acidosis, hypoxemia, tachycardia, altered consciousness, seizures, and characteristic breath odor similar to almonds.
- Acute treatment of cyanide toxicity includes 4–6 mg/kg of *sodium nitrite* (as a 3% solution) over 2–4 min. This acts as a buffer for cyanide by converting 10% of hemoglobin to methemoglobin. If administration of sodium nitrite is delayed, inhalation of crushed ampule (vaporole, aspirole) of *amyl nitrite* for 15–30 sec of every min should be started until sodium nitrite is running. Following completion of sodium nitrite infusion, administer *sodium thiosulfate* 150–200 mcg/kg (available as 25% and 50% solutions). This will convert cyanide to thiocyanate, which may then be eliminated. If required, entire regimen may be repeated in 2 hr at 50% of the initial doses.

Implementation

- If infusion of 10 mcg/kg/min for 10 min does not produce adequate reduction in BP, manufacturer recommends nitroprusside be discontinued.
- May be administered in left ventricular HF concurrently with an inotropic agent (dopamine, dobutamine) when effective doses of nitroprusside restore pump function and cause excessive hypotension.

IV Administration

- **Continuous Infusion:** ***Dilution:*** Dilute 50 mg of nitroprusside in 250–1000 mL of D5W. Wrap infusion in aluminum foil to protect from light; administration set tubing need not be covered. Amber plastic bags do not offer sufficient protection from light; wrap must be opaque. Freshly prepared solution has a slight brownish tint; discard if solution is dark brown, orange, blue, green, or dark red. Solution must be used within 24 hr of preparation. ***Concentration:*** 50–200 mcg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Administer via infusion pump to ensure accurate dosage rate.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, alprostadil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrro-

late, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, indomethacin, insulin regular, isavuconazonium, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, methadone, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphates, procainamide, propofol, propranolol, protamine, pyridoxine, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, ascorbic acid, azathioprine, caspofungin, ceftazidime, chlorpromazine, dantrolene, daunorubicin hydrochloride, diazepam, diphenhydramine, erythromycin, hydralazine, hydroxyzine, irinotecan, levofloxacin, mesna, mitomycin, mitoxantrone, moxifloxacin, mycophenolate, oritavancin, papaverine, pemetrexed, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, thiotepa, trimethoprim/sulfamethoxazole, vinorelbine, voriconazole.

Patient/Family Teaching

- Explain purpose of nitroprusside to patient.
- Advise patient to report the onset of tinnitus, dyspnea, dizziness, headache, or blurred vision immediately.
- Rep: Prolonged or large doses may cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in BP without the appearance of side effects.
- Treatment of cardiac pump failure or cardiogenic shock.

nivolumab (nye-**vol**-ue-mab)

Opdivo

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies, programmed death-1 inhibitors

Indications

Unresectable/metastatic melanoma (as monotherapy or in combination with ipilimumab). Adjuvant treatment of melanoma in patients that have involvement of lymph nodes or metastatic disease and have undergone complete resection. Metastatic non–small-cell lung cancer (NSCLC) with progression on or after platinum-based chemotherapy. Patients with epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK) genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving nivolumab. First-line treatment of metastatic NSCLC in patients whose tumors express PD-L1 (≥1%) and have no epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK) genomic tumor aberrations (in combination with ipilimumab). First-line treatment of metastatic or recurrent NSCLC in patients whose tumors have no EGFR or ALK genomic tumor aberrations (in combination with ipilimumab and two cycles of platinum-based chemotherapy). Advanced renal cell carcinoma (RCC) in patients who have previously received anti-angiogenic therapy (as monotherapy). Immediate or poor risk, previously untreated advanced RCC (in combination with ipilimumab). First-line treatment of advanced RCC (in combination with cabozantinib). Classic Hodgkin's lymphoma that has relapsed or progressed after either autologous hematopoietic stem cell transplantation (HSCT) and brentuximab or ≥3 lines of systemic therapy that includes autologous HSCT. Recurrent or metastatic squamous cell carcinoma of the head and neck with progression on or after platinum-based therapy. Adjuvant treatment of urothelial carcinoma in patients who are at high risk of recurrence after undergoing radical resection of urothelial carcinoma. Locally advanced or metastatic urothelial carcinoma in patients who either have progression during or following platinum-based therapy or progression within 12 mo of neoadjuvant or adjuvant treatment with platinum-based therapy. Microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) metastatic colorectal cancer (CRC) that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan (as monotherapy or in combination with ipilimumab). Hepatocellular carcinoma (HCC) in patients who have been previously treated with sorafenib (in combination with ipilimumab). Unresectable advanced, recurrent, or metastatic esophageal squamous cell carcinoma after prior fluoropyrimidine- and platinum-based chemotherapy. Adjuvant treatment of completely resected esophageal or gastroesophageal junction cancer with residual pathologic disease in patients who have received neoadjuvant chemoradiotherapy. Advanced or metastatic gastric cancer, gastroesophageal junction cancer, and esophageal adenocarcinoma (in combination with fluoropyrimidine- and platinum-

N

© F.A. Davis Publishing

containing chemotherapy). First-line treatment of unresectable malignant pleural mesothelioma (in combination with ipilimumab).

Action

Programmed death receptor-1 (PD-1) blocking antibody (an IgG4 kappa immunoglobulin) that binds to PD-1 and blocks its interaction with its ligands, PD-L1 and PD-L2, resulting in activation of the immune system and decreased tumor growth. **Therapeutic Effects:** Decreased progression of melanoma, Hodgkin's lymphoma, urothelial carcinoma, colorectal cancer, and HCC. Decreased progression of and improved survival with NSCLC and advanced RCC. Improved survival in squamous cell carcinoma of head and neck, esophageal cancer, gastric cancer, gastroesophageal junction cancer, esophageal adenocarcinoma, and malignant pleural mesothelioma.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 26.7 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Patients undergoing allogeneic HSCT before or after nivolumab therapy (↑ risk of complications); Patients with multiple myeloma receiving a thalidomide analogue and dexamethasone (↑ risk of mortality); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children <12 yr (MSI-H dMMR CRC) or children <18 yr (all other indications).

Adverse Reactions/Side Effects

CV: MYOCARDITIS, pericarditis, peripheral edema, vasculitis. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), rash. **EENT:** iritis, uveitis. **Endo:** ADRENAL INSUFFICIENCY, hypothyroidism, hyperthyroidism, hypoparathyroidism, hypophysitis, type 1 diabetes. **F and E:** hyperkalemia. **GI:** COLITIS, HEPATITIS, gastritis, pancreatitis. **GU:** nephritis. **Hemat:** hemolytic anemia. **MS:** RHABDOMYOLYSIS, myositis. **Neuro:** autoimmune neuropathy, Guillain-Barré syndrome, myasthenic syndrome, myelitis, ENCEPHALITIS, MENINGITIS. **Resp:** PNEUMONITIS, cough. **Misc:** INFUSION-RELATED REACTIONS.

Interactions

Drug-Drug: None noted.

Route/Dosage

Unresectable or Metastatic Melanoma

IV (Adults): *As monotherapy*—240 mg every 2 wk until disease progression or unacceptable toxicity *or* 480 mg every 4 wk until disease progression or unacceptable toxicity; *With ipilimumab*—1 mg/kg followed by ipilimumab on the same day every 3 wk for 4 doses or until unacceptable toxicity (whichever occurs first), then either 240 mg as monotherapy every 2 wk until disease progression or unacceptable toxicity *or* 480 mg as monotherapy every 4 wk until disease progression or unacceptable toxicity.

Hepatocellular Carcinoma

IV (Adults): 1 mg/kg followed by ipilimumab on the same day every 3 wk for 4 doses, then 240 mg as monotherapy every 2 wk *or* 480 mg as monotherapy every 4 wk until disease progression or unacceptable toxicity.

Adjuvant Treatment of Melanoma or Urothelial Carcinoma

IV (Adults): 240 mg every 2 wk until disease progression or unacceptable toxicity for up to 1 yr *or* 480 mg every 4 wk until disease progression or unacceptable toxicity for up to 1 yr.

Classical Hodgkin's Lymphoma, Urothelial Carcinoma, Squamous Cell Carcinoma of Head and Neck, and Esophageal Squamous Cell Carcinoma

IV (Adults): 240 mg every 2 wk until disease progression or unacceptable toxicity *or* 480 mg every 4 wk until disease progression or unacceptable toxicity.

Adjuvant Treatment of Resected Esophageal or Gastroesophageal Junction Cancer

IV (Adults): 240 mg every 2 wk until disease progression or unacceptable toxicity for a total treatment duration of 1 yr *or* 480 mg every 4 wk until disease progression or unacceptable toxicity for a total treatment duration of 1 yr.

Metastatic Non–Small-Cell Lung Cancer

IV (Adults): *As monotherapy*—240 mg every 2 wk until disease progression or unacceptable toxicity *or* 480 mg every 4 wk until disease progression or unacceptable toxicity; *With ipilimumab (for metastatic tumors expressing PD-L1)*—3 mg/kg every 2 wk until disease progression, unacceptable toxicity or for up to 2 yr (if no disease progression) (when given on same day, administer before ipilimumab). *With ipilimumab (for metastatic or recurrent tumors not expressing PD-L1)*—360 mg every 3 wk until disease progression, unacceptable toxicity or for up to 2 yr (if no disease progression) (when given just with platinum-based chemotherapy on same day, administer nivolumab then platinum-based chemotherapy; when

© F.A. Davis Publishing

given with ipilimumab and platinum-based chemotherapy on same day, administer nivolumab, then ipilimumab, then platinum-based chemotherapy).

Advanced Renal Cell Carcinoma

IV (Adults): *As monotherapy*—240 mg every 2 wk until disease progression or unacceptable toxicity *or* 480 mg every 4 wk until disease progression or unacceptable toxicity; *With ipilimumab*—3 mg/kg followed by ipilimumab on the same day every 3 wk for 4 doses, then 240 mg as monotherapy every 2 wk until disease progression or unacceptable toxicity *or* 480 mg as monotherapy every 4 wk until disease progression or unacceptable toxicity. *With cabozantinib*—240 mg every 2 wk until disease progression, unacceptable toxicity, or up to 2 yr *or* 480 mg every 4 wk until disease progression, unacceptable toxicity, or up to 2 yr.

Microsatellite Instability-High or Mismatch Repair Deficient Metastatic Colorectal Cancer

IV (Adults and Children ≥12 yr and ≥40 kg): *As monotherapy*—240 mg every 2 wk until disease progression or unacceptable toxicity *or* 480 mg every 4 wk until disease progression or unacceptable toxicity; *With ipilimumab*—3 mg/kg followed by ipilimumab on the same day every 3 wk for 4 doses, then 240 mg as monotherapy every 2 wk until disease progression or unacceptable toxicity *or* 480 mg as monotherapy every 4 wk until disease progression or unacceptable toxicity.
IV (Children ≥12 yr and <40 kg): *As monotherapy*—3 mg/kg every 2 wk until disease progression or unacceptable toxicity; *With ipilimumab*—3 mg/kg followed by ipilimumab on the same day every 3 wk for 4 doses, then 3 mg/kg as monotherapy every 2 wk until disease progression or unacceptable toxicity.

Gastric Cancer, Gastroesophageal Junction Cancer, and Esophageal Adenocarcinoma

IV (Adults): 240 mg/kg every 2 wk *or* 360 mg every 3 wk until disease progression, unacceptable toxicity or for up to 2 yr (administer before fluoropyrimidine- and platinum-containing chemotherapy on same day).

Malignant Pleural Mesothelioma

IV (Adults): 360 mg/kg every 3 wk until disease progression, unacceptable toxicity or for up to 2 yr (if no disease progression) (administer before ipilimumab on same day).

Availability

Solution for injection: 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of immune-mediated pneumonitis (shortness of breath, chest pain, new or worse cough) periodically during therapy. Treat with corticosteroids 1–2 mg/kg/day prednisone equivalents for ≥Grade 2 pneumonitis followed by corticosteroid taper. *If Grade 2 pneumonitis occurs,* hold nivolumab; resume therapy when recovery to Grade 0–1. *If Grade 3 or 4 pneumonitis occurs,* permanently discontinue nivolumab.
- Assess for signs and symptoms of infusion reactions (chills or shaking, itching or rash, flushing, difficulty breathing, dizziness, fever, feeling faint) periodically during therapy. If Grade 1 or 2 infusion reactions occur, hold or slow infusion. *If Grade 3 or 4 infusion reactions occur,* discontinue therapy.
- Monitor for signs and symptoms of immune-mediated colitis (diarrhea, abdominal pain, mucus or blood in stool, with or without fever). Treat with corticosteroids at doses of 1–2 mg/kg/day of prednisone or equivalents followed by corticosteroid taper for severe (Grade 3) or life-threatening (Grade 4) colitis. *If Grade 2 or 3 colitis occurs,* hold nivolumab. Resume with complete or partial resolution (Grade 0–1) after corticosteroid taper. Permanently discontinue if no complete or partial resolution within 12 wk of last dose or inability to reduce prednisone to ≤10 mg per day (or equivalent) within 12 wk of initiating steroids. *If Grade 4 colitis occurs,* permanently discontinue nivolumab. *If administered with ipilimumab,* hold for Grade 2 colitis. For moderate or severe (Grade 3 or 4) or recurrent colitis, permanently discontinue nivolumab and ipilimumab.
- Monitor for signs and symptoms of hepatitis (yellowing of skin or whites of eyes, severe nausea or vomiting, right-sided abdominal pain, drowsiness, dark urine, unusual bleeding or bruising, anorexia) periodically during therapy.
- Assess for rash periodically during therapy. Topical emollients and/or topical corticosteroids may be adequate to treat mild to moderate nonexfoliative rashes. May cause SJS and TEN. *If rash, itching, blistering, or ulcers in mouth or other mucous membranes occur and SJS, TEN, or DRESS are suspected,* hold dose and refer for assessment and treatment. *If SJS, TEN, or DRESS are confirmed,* permanently discontinue therapy. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia. For immune-mediated rash, administer corticosteroids at doses of 1–2 mg/kg/day of prednisone or equivalents followed by corticosteroid taper for severe (Grade 3) or life-threatening (Grade 4) rash. Withhold for severe rash; permanently discontinue for life-threatening rash.
- Monitor for signs and symptoms of hypophysitis (headaches, photophobia, visual field defects, ex-

© F.A. Davis Publishing

treme tiredness, weight gain or loss, dizziness or fainting, mood changes, hair loss, feeling cold, constipation, deepening voice, excessive thirst and urination) periodically during therapy. Administer hormone replacement and corticosteroids at a dose of 1 mg/kg/day prednisone equivalents followed by corticosteroid taper for moderate or severe hypophysitis. Withhold therapy for moderate or severe hypophysitis. Discontinue for life-threatening Grade 4.

- Monitor for signs and symptoms of adrenal insufficiency. Administer corticosteroids at a dose of 1–2 mg/kg/day prednisone equivalents followed by corticosteroid taper for severe (Grade 3) or life-threatening (Grade 4) symptoms. Withhold for moderate (Grade 2) and permanently discontinue therapy for severe or life-threatening adrenal insufficiency.
- Monitor for signs and symptoms of encephalitis (headache, fever, tiredness or weakness, confusion, memory problems, sleepiness, hallucinations, seizures, stiff neck) periodically during therapy. *If Grade 2 neurological toxicities occur,* hold therapy for patients with new-onset moderate to severe neurologic symptoms during diagnosis. *If Grade 3 or 4 neurological toxicities occur,* permanently discontinue nivolumab and administer corticosteroids at dose of 1–2 mg/kg/day prednisone equivalents for immune-mediated encephalitis, followed by corticosteroid taper.
- Monitor for signs and symptoms of kidney dysfunction (decrease in amount of urine, blood in urine, swelling in ankles, anorexia) periodically during therapy.
- Monitor for signs and symptoms of myocarditis (chest pain, dyspnea) during therapy. If Grade 2, 3 or 4 myocarditis occurs, permanently discontinue nivolumab.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Patient selection for NSCLC in combination with ipilimumab is based on PD-L1 expression. Information on FDA-approved tests for the determination of PD-L1 expression in NSCLC is available at: http://www.fda.gov/CompanionDiagnostics.
- Monitor for abnormal liver tests prior to and periodically during therapy. *For hepatitis with no tumor involvement: If AST/ALT >3 and ≤8 times (or ≤5 if given with ipilimumab) ULN or total bilirubin >1.5 and ≤3 times ULN,* hold nivolumab. Resume with complete or partial resolution (Grade 0–1) after corticosteroid taper. Permanently discontinue if no complete or partial resolution within 12 wk of last dose or inability to reduce prednisone to ≤10 mg per day (or equivalent) within 12 wk of starting steroids. *If AST or ALT >8 times (or >5 if given with ipilimumab) ULN or total bilirubin >3 times ULN,* permanently discontinue nivolumab. For hepatitis with tumor involvement of the liver: *If baseline AST/ALT is >1 and ≤3 times ULN and increases to >5 and ≤10 times ULN or baseline AST/ALT is >3 and ≤5 times ULN and increases to >8 and ≤10 times ULN,* hold nivolumab. *If AST/ALT >10 times ULN or total bilirubin >3 times ULN,* discontinue nivolumab permanently. *If given with cabozantinib and ALT or AST >3 times ULN but ≤10 times ULN with concurrent total bilirubin <2 times ULN,* hold nivolumab and cabozantinib until recovery to Grade 0–1. *If given with cabozantinib and AST or ALT >10 times ULN or >3 times with concurrent bilirubin ≥2 times ULN,* permanently discontinue nivolumab and cabozantinib.
- Monitor for ↑ serum creatinine prior to and periodically during therapy. If Grade 2 or 3 increases in blood creatinine occur, hold nivolumab. Resume in patients with complete or partial resolution (Grade 0–1) after corticosteroid taper. Permanently discontinue if no complete or partial resolution within 12 wk of last dose or inability to reduce prednisone to ≤10 mg per day (or equivalent) within 12 wk of starting steroids. *If Grade 4 increases in blood creatinine occur,* permanently discontinue nivolumab.
- Monitor thyroid function prior to and periodically during therapy. Treat hypothyroidism with replacement therapy. Use medical management for hyperthyroidism. Immune-mediated thyroid dysfunction does not require dose modification of nivolumab.
- Monitor for hyperglycemia. If severe, withhold therapy until metabolic control achieved. If life-threatening, permanently discontinue nivolumab.

Implementation

IV Administration

- **Intermittent Infusion:** ***Dilution:*** 0.9% NaCl or D5W. ***Concentration:*** 1–10 mg/mL. Mix by gentle inversion; do not shake. Solution is clear to slightly opalescent, colorless to slightly yellow; do not administer solution if discolored or contains particulate matter other than translucent to white proteinaceous particles. Solution is stable at room temperature for up to 8 hr and 24 hr if refrigerated. ***Rate:*** Infuse through a sterile, nonpyrogenic, low-protein binding 0.2–1.2 micrometer in-line filter over 30 min. Flush line at end of infusion.
- **Y-Site Incompatibility:** Do not administer other drugs through same infusion line.

Patient/Family Teaching

- Explain purpose of nivolumab to patient.
- Advise patient to notify health care professional immediately if signs and symptoms of pneumonitis, colitis, hepatitis (jaundice, severe nausea or vomiting, pain on right side of abdomen, lethargy, easy bruising or bleeding), kidney problems (decreased urine output, blood in urine, swollen ankles, loss of appetite), hormone gland problems (rapid heartbeat, weight loss, increased sweating, weight gain, hair loss, feeling cold, constipation, deepening of voice, muscle aches, dizziness or fainting, persistent or unusual headache) occur.

© F.A. Davis Publishing

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use highly effective contraception and avoid breast feeding during and for 5 mo after last dose.
- Emphasize importance of keeping scheduled appointments for blood work or other laboratory tests.

Evaluation/Desired Outcomes

- Decreased progression of melanoma, Hodgkin's lymphoma, urothelial carcinoma, colorectal cancer, and HCC.
- Decreased progression of and improved survival with NSCLC and advanced RCC.
- Improved survival in squamous cell carcinoma of head and neck, esophageal cancer, gastric cancer, gastroesophageal junction cancer, esophageal adenocarcinoma, and malignant pleural mesothelioma.

nizatidine, See HISTAMINE H_2 ANTAGONISTS.

HIGH ALERT

norepinephrine

(**nor**-ep-i-nef-rin)

Levophed

Classification

Therapeutic: vasopressors

Indications

Produces vasoconstriction and myocardial stimulation, which may be required after adequate fluid replacement in the treatment of severe hypotension and shock.

Action

Stimulates alpha-adrenergic receptors located mainly in blood vessels, causing constriction of both capacitance and resistance vessels. Also has minor beta-adrenergic activity (myocardial stimulation). **Therapeutic Effects:** Increased BP. Increased cardiac output.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Concentrates in sympathetic nervous tissue. Does not cross the blood-brain barrier but readily crosses the placenta.

Metabolism and Excretion: Taken up and metabolized rapidly by sympathetic nerve endings.

Half-life: Unknown.

TIME/ACTION PROFILE (effects on BP)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	rapid	1–2 min

Contraindications/Precautions

Contraindicated in: Vascular, mesenteric, or peripheral thrombosis; Hypoxia; Hypercarbia; Hypotension secondary to hypovolemia (without appropriate volume replacement); Hypersensitivity to bisulfites.

Use Cautiously in: Hypertension; Concurrent use of MAO inhibitors, tricyclic antidepressants, or cyclopropane or halothane anesthetics; Hyperthyroidism; Cardiovascular disease; OB: May ↓ uterine blood flow; Lactation: Safety not established in breast feeding.

Adverse Reactions/Side Effects

Neuro: anxiety, dizziness, headache, insomnia, restlessness, tremor, weakness. **Resp:** dyspnea. **CV:** arrhythmias, bradycardia, chest pain, hypertension. **GU:** ↓ urine output, renal failure. **Endo:** hyperglycemia. **F and E:** metabolic acidosis. **Local:** phlebitis at IV site. **Misc:** fever.

Interactions

Drug-Drug: Use with **cyclopropane** or **halothane anesthesia**, **cardiac glycosides**, **doxapram**, or local use of **cocaine** may result in ↑ myocardial irritability. Use with **MAO inhibitors**, **doxapram**, or **tricyclic antidepressants** may result in severe hypertension. **Alpha-adrenergic blockers** can prevent pressor response. **Beta blockers** may exaggerate hypertension or block cardiac stimulation. Concurrent use with **ergot alkaloids** (**ergotamine**, **methylergonovine**, or **oxytocin** may result in enhanced vasoconstriction and hypertension.

Route/Dosage

IV (Adults): 0.5–1 mcg/min initially, followed by maintenance infusion of 2–12 mcg/min titrated by BP response (average rate 2–4 mcg/min, up to 30 mcg/min for refractory shock have been used).

IV (Children): 0.1 mcg/kg/min initially; may be followed by infusion titrated to BP response, up to 1 mcg/kg/min.

Availability (generic available)

Premixed infusion: 4 mg/250 mL D5W, 8 mg/250 mL D5W. **Solution for injection:** 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP every 2–3 min until stabilized and every 5 min thereafter. Systolic BP is usually maintained at 80–100 mm Hg or 30–40 mm Hg below the previously existing systolic pressure in previously hypertensive patients. Consult physician for parameters. Continue to monitor BP frequently for hypotension following discontinuation of norepinephrine.

© F.A. Davis Publishing

- ECG should be monitored continuously. CVP, intra-arterial pressure, pulmonary artery diastolic pressure, pulmonary capillary wedge pressure (PCWP), and cardiac output may also be monitored.
- Monitor urine output and notify health care professional if it decreases to <30 mL/hr.
- Assess IV site frequently during infusion. A large vein should be used to minimize risk of extravasation, which may cause tissue necrosis. If prolonged therapy is required or if blanching along the course of the vein occurs, change injection sites to provide relief from vasoconstriction.
- ***Toxicity and Overdose:*** If overdose occurs, discontinue norepinephrine and administer fluid and electrolyte replacement therapy. An alpha-adrenergic blocking agent may be administered intravenously to treat hypertension.

Implementation

- ***High Alert:*** Vasoactive medications are inherently dangerous. Have second practitioner independently check original order, dose calculations, and infusion pump programming. Establish maximum dose limits. Norepinephrine overdose can result in severe peripheral vasoconstriction with resultant ischemia and necrosis of peripheral tissue. Assess peripheral circulation frequently.
- Correct volume depletion, if possible, prior to initiation of norepinephrine.
- Norepinephrine may deplete plasma volume and cause ischemia of vital organs, resulting in hypotension when discontinued, if used for prolonged periods. Prolonged or large doses may also decrease cardiac output.
- Infusion should be discontinued gradually, upon adequate tissue perfusion and maintenance of BP, to prevent hypotension. Do not resume therapy unless BP falls to 70–80 mm Hg.

IV Administration

- **Continuous Infusion:** ***Dilution:*** Dilute 4 mg in 1000 mL of D5W or D5/0.9% NaCl. Do not dilute in 0.9% NaCl without dextrose. ***Concentration:*** 4 mcg/mL. Do not use discolored solutions (pink, yellow, brown) or those containing a precipitate. ***Rate:*** Titrate infusion rate according to patient response, using slowest possible rate to correct hypotension. Administer via infusion pump to ensure accurate dosage.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftazidime/avibactam, ceftozolane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eravacycline, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin/relebactam, imipenem/cilastatin, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, meropenem/vaborbactam, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, octreotide, ondansetron, oritavancin, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, posaconazole, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, remifentanil, succinylcholine, sufentanil, tacrolimus, tedizolid, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, azathioprine, dacarbazine, dantrolene, diazepam, folic acid, foscarnet, ganciclovir, gemtuzumab ozogamicin, indomethacin, mitomycin, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Explain purpose of norepinephrine to patient.
- Instruct patient to report headache, dizziness, dyspnea, chest pain, or pain at infusion site promptly.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Increase in BP to normal range.
- Increased tissue perfusion.

© F.A. Davis Publishing

norethindrone, See CONTRACEPTIVES, HORMONAL.

BEERS

nortriptyline (nor-trip-ti-leen)

Aventyl, Pamelor

Classification

Therapeutic: antidepressants
Pharmacologic: tricyclic antidepressants

Indications

Various forms of depression. **Unlabeled Use:** Management of chronic neurogenic pain.

Action

Potentiates the effect of serotonin and norepinephrine. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action that develops slowly over several wk.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Widely distributed. Enters breast milk in small amounts; probably crosses the placenta.
Protein Binding: 92%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP2D6 isoenzyme); the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly ↑ nortriptyline concentrations and an ↑ risk of adverse effects.
Half-life: 18–28 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 wk	6 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Alcohol intolerance (solution only); Brugada syndrome; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue).
Use Cautiously in: Pre-existing cardiovascular disease; History of seizures; Asthma; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; OB: Use only if clearly needed and maternal benefits outweigh risk to fetus; Lactation: May result in sedation in infant; discontinue drug or bottle-feed; Pedi: Suicide risk may be greater in children or adolescents. Safety not established in children; Geri: More susceptible to adverse reactions; dose ↓ recommended. Geriatric men with prostatic hyperplasia may be more susceptible to urinary retention.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, hypotension, ECG changes. **Derm:** photosensitivity. **EENT:** blurred vision, dry eyes, dry mouth. **Endo:** gynecomastia. **GI:** constipation, nausea, paralytic ileus, unpleasant taste, weight gain. **GU:** urinary retention. **Hemat:** blood dyscrasias. **Neuro:** SUICIDAL THOUGHTS, drowsiness, fatigue, lethargy, agitation, confusion, extrapyramidal reactions, hallucinations, headache, insomnia.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious potentially fatal reactions (MAO inhibitors should be stopped at least 14 days before nortriptyline therapy. Nortriptyline should be stopped at least 14 days before MAO inhibitor therapy). Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue**, may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving nortriptyline, immediately discontinue nortriptyline and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume nortriptyline therapy 24 hr after last dose of linezolid or methylene blue). May prevent the therapeutic response to most **antihypertensives**. Hypertensive crisis may occur with **clonidine**. ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioids**, and **sedative/hypnotics**. Adrenergic effects may be ↑ with other **adrenergic agents**, including **vasoconstrictors** and **decongestants**. ↑ anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**. **Cimetidine**, **fluoxetine**, or **hormonal contraceptives** ↑ blood levels and risk of toxicity. ↑ risk of agranulocytosis with **antithyroid agents**. Drugs that affect serotonergic neurotransmitter systems, including **SSRIs**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, and **triptans**, ↑ risk of serotonin syndrome.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. Use with **St. John's wort** ↑ serotonin syndrome. ↑ anticholinergic effects with **jimson weed** and **scopolia**.

Route/Dosage

PO (Adults): 25 mg 3–4 times daily, up to 150 mg/day.

© F.A. Davis Publishing

PO (Geriatric Patients or Adolescents): 30–50 mg/day in divided doses or as a single dose.

Availability (generic available)

Capsules: 10 mg, 25 mg, 50 mg, 75 mg. **Cost:** *Generic*— 10 mg $40.50/100, 25 mg $80.31/100, 50 mg $145.55/100, 75 mg $221.95/100. **Oral solution:** 10 mg/5 mL. **Cost:** *Generic*— $182.95/473 mL.

NURSING IMPLICATIONS

Assessment

- Monitor mental status (orientation, mood, behavior).
- Assess weight and BMI initially and throughout treatment. For overweight/obese individuals, monitor fasting blood glucose and cholesterol levels.
- Monitor BP and pulse rate before and during initial therapy. Report significant decreases in BP or a sudden increase in pulse rate.
- Monitor baseline and periodic ECGs in geriatric patients or patients with heart disease. May cause prolonged PR and QT intervals and may flatten T waves.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs. After starting therapy, children, adolescents, and young adults should be seen by health care professional face-to-face at least weekly for 4 wk, then every other wk for next 4 wk, then at 12 wk, and then on advice of health care professional thereafter.
- **Pain:** Assess type, location, and severity of pain before and periodically during therapy. Use pain scale to monitor effectiveness of medication.
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts, liver function, and serum glucose periodically. May cause ↑ serum bilirubin and alkaline phosphatase. May cause bone marrow depression. Serum glucose may be ↑ or ↓.
- Serum levels may be monitored in patients who fail to respond to usual therapeutic dose. Therapeutic plasma concentration range is 50–150 ng/mL.
- May cause alterations in blood glucose levels.
- ***Toxicity and Overdose:*** Symptoms of acute overdose include disturbed concentration, confusion, restlessness, agitation, seizures, drowsiness, mydriasis, arrhythmias, fever, hallucinations, vomiting, and dyspnea.
- Treatment of overdose includes gastric lavage, activated charcoal, and a stimulant cathartic. Maintain respiratory and cardiac function (monitor ECG for at least 5 days) and temperature. Medications may include digoxin for HF, antiarrhythmics, and anticonvulsants.

Implementation

- Do not confuse Pamelor (nortriptyline) with Tambocor (flecainide).
- Taper to avoid withdrawal effects. Reduce dose 50% for 3 days, then by 50% for 3 more days, then discontinue.
- **PO:** Administer medication with meals to minimize gastric irritation.
- May be given as a single dose at bedtime to minimize sedation during the day. Dose increases should be made at bedtime because of sedation.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to notify health care professional if visual changes occur. Inform patient that periodic glaucoma testing may be required during long-term therapy.
- Caution patient to make position changes slowly to minimize orthostatic hypotension. (This side effect is less pronounced with this medication than with other tricyclic antidepressants.).
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention occurs or if dry mouth or constipation persists. Sugarless candy or gum may diminish dry mouth, and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Alert patient that urine may turn blue-green in color.
- Inform patient of need to monitor dietary intake. Increase in appetite may lead to undesired weight gain. Refer as appropriate for nutritional, weight, or medical management.

© F.A. Davis Publishing

- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: May have teratogenic effects. Advise females of reproductive potential to use effective contraception during and for at least 5 mo after last dose and to avoid breast feeding during therapy. Advise patient to notify health care professional immediately if pregnancy is planned or suspected.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in severity of chronic neurogenic pain. Patients may require 2–6 wk of therapy before full therapeutic effects of medication are seen.

NPH/regular insulin mixtures, See INSULIN (mixtures).

nystatin, See ANTIFUNGALS (TOPICAL).

nystatin (oral) (nye-stat-in)

~~Mycostatin~~, Nadostine

Classification

Therapeutic: antifungals

For other nystatin dosage forms, see antifungals (topical) and antifungals (vaginal)

Indications

Oral suspension: Local treatment of oropharyngeal candidiasis. **Oral tablet**: Treatment of nonesophageal mucus membrane gastrointestinal candidiasis.

Action

Binds to fungal cell membrane, allowing leakage of cellular contents. **Therapeutic Effects:** Fungistatic or fungicidal action. **Spectrum:** Active against most pathogenic *Candida* species, including *C. albicans*.

Pharmacokinetics

Absorption: Poorly absorbed; action is primarily local.
Distribution: Unknown.
Metabolism and Excretion: Excreted unchanged in the feces after oral administration.
Half-life: Unknown.

TIME/ACTION PROFILE (antifungal effects)

ROUTE	ONSET	PEAK	DURATION
PO	24–72 hr	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products may contain ethyl alcohol or benzyl alcohol—avoid use in patients who may be hypersensitive to or intolerant of these additives.
Use Cautiously in: Denture wearers (dentures require soaking in nystatin suspension).

Adverse Reactions/Side Effects

GI: diarrhea, nausea, stomach pain (large doses), vomiting. **Derm:** contact dermatitis, Stevens-Johnson syndrome.

Interactions

Drug-Drug: None significant.

Route/Dosage

Oropharyngeal Candidiasis

PO (Adults and Children): 400,000–600,000 units 4 times daily as oral suspension.
PO (Infants): 200,000 units 4 times daily or 100,000 units to each side of the mouth 4 times daily.
PO (Neonates , Premature, and Low Birth Weight): 100,000 units 4 times daily or 50,000 units to each side of the mouth 4 times a day.

Gastrointestinal Candidiasis

PO (Adults): 500,000–1,000,000 units 3 times daily. Continue for ≥48 hr after clinical cure to prevent relapse.

Availability (generic available)

Oral suspension: 100,000 units/mL. **Oral tablets:** 500,000 units.

NURSING IMPLICATIONS

Assessment

- Inspect oral mucous membranes before and frequently during therapy. Increased irritation of mucous membranes may indicate need to discontinue medication.

Implementation

- **PO:** Suspension should be administered by placing ½ of dose in each side of mouth. Patient should hold suspension in mouth or swish throughout mouth for several min before swallowing, then gargle and swallow. Use calibrated measuring device for liquid doses. Shake well before administration. Pedi: For neonates and infants, paint suspension into recesses of the mouth.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, take as soon as remembered but not if almost time for next dose. Do not double doses. Therapy should be continued for at least 2 days after symptoms subside.
- Pedi: Instruct parents or caregivers of infants and children on correct dose and administration. Remind them to use only the measuring device dispensed with the product.
- Advise patient to report increased irritation of mucous membranes or lack of therapeutic response to health care professional.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in stomatitis.Treatment of intestinal candidiasis.
- To prevent relapse after oral therapy, therapy should be continued for 48 hr after symptoms have disappeared and cultures are negative.
- Therapy for a period of 2 wk is usually sufficient, but more prolonged therapy may be necessary.

© F.A. Davis Publishing

ocrelizumab (ok-re-liz-ue-mab)

Ocrevus

Classification

Therapeutic: anti-multiple sclerosis agents
Pharmacologic: monoclonal antibodies

Indications

Relapsing forms of multiple sclerosis (MS), including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease. Primary progressive MS.

Action

Binds to the CD20 antigen on pre-B and mature B lymphocytes, which results in antibody-dependent and complement-mediated cell lysis. **Therapeutic Effects:** Reduction in relapse rate and decreased progression toward disability.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Binds specifically to CD20 binding sites on B lymphocytes.
Metabolism and Excretion: Unknown.
Half-life: 26 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Active hepatitis B virus infection (may reactivate infection during and for several mo after treatment); History of life-threatening infusion reaction to ocrelizumab.
Use Cautiously in: Patients who are immunocompromised or receiving other immunosuppressants; OB: Safety not established in pregnancy (may cause fetal B-cell depletion); Lactation: Safety not established in breast feeding; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: peripheral edema. **GI:** HEPATITIS B VIRUS REACTIVATION, diarrhea. **MS:** back pain. **Hemat:** neutropenia. **Neuro:** PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), depression. **Resp:** cough. **Misc:** INFECTION, INFUSION REACTIONS (including anaphylaxis), MALIGNANCY (primarily breast cancer).

Interactions

Drug-Drug: Concurrent use with **immunosuppressive therapies** may ↑ risk of immunosuppression. May ↓ antibody response to or ↑ risk of adverse reactions to **non-live vaccines** and **live vaccines**.

Route/Dosage

IV (Adults): 300 mg initially, then 300 mg in 2 wk, then 600 mg every 6 mo.

Availability

Solution for injection: 30 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for active infection prior to each infusion. Delay infusion until infection resolves.
- Monitor for signs and symptoms of infusion reaction (pruritus, rash, urticaria, erythema, bronchospasm, throat irritation, oropharyngeal pain, dyspnea, pharyngeal or laryngeal edema, flushing, hypotension, pyrexia, fatigue, headache, dizziness, nausea, tachycardia) during and for at least 1 hr after completion of infusion. *If mild to moderate infusion reaction occurs,* reduce infusion rate by half at onset of reaction and for at least 30 min. If rate tolerated, increase rate (see Rate below). Will increase duration of infusion, but not total dose. *If severe reaction occurs,* immediately stop infusion and administer supportive treatment. Restart infusion only after all symptoms resolved. Restart at half rate at time of onset of reaction. If tolerated, increase (see Rate below). Will increase duration of infusion, but not total dose. *If life-threatening infusion reaction occurs,* immediately stop infusion and permanently discontinue ocrelizumab. Provide supportive treatment.
- Assess for signs and symptoms of progressive multifocal leukoencephalopathy (PML) (progressive weakness on one side of body or clumsiness of limbs, disturbance of vision, and changes in thinking, memory, and orientation leading to confusion and personality changes) periodically during therapy. Symptoms are diverse and progress over days to wk. At first sign of PML, suspend ocrelizumab and perform diagnostic evaluation. MRI findings may be apparent before clinical signs or symptoms.
- ***Lab Test Considerations:*** Determine current or prior HBV infection by measuring hepatitis B surface antigen (HBsAg) and hepatitis B core antibody (anti-HBc) before starting therapy. Do not administer to patients with active HBV infection.
- Perform testing for quantitative serum immunoglobulins before starting therapy. May require immunology consult if serum immunoglobulins are low.

Implementation

- Administer all necessary immunizations at least 6 wk before starting therapy. Avoid immunizations during therapy and after discontinuation until B-cell repletion.
- Premedicate to reduce frequency and severity of infusion reactions with methylprednisolone 100 mg IV or equivalent 30 min and an antihistamine, diphenhydra-

© F.A. Davis Publishing

mine, 30–60 min before each infusion. May add an antipyretic, acetaminophen.

- **Intermittent Infusion:** ***Dilution:*** Dilute each dose with 250 mL or 500 mL 0.9% NaCl. Do not use other diluents. Do not shake. Allow infusion bag to come to room temperature before infusion. ***Concentration:*** 1.2 mg/mL. Solution is clear or slightly opalescent, and colorless to pale brown; do not administer solutions that are discolored or contain particulate matter. Solution is stable for 24 hr if refrigerated or up to 8 hr (including infusion time) at room temperature. ***Rate:*** Administer using a dedicated line with a 0.2 or 0.22 micron in-line filter. *For first 2 infusions (300 mg in 250 mL),* begin at 30 mL/hr. Increase by 30 mL/hr every 30 min to 180 mL/hr over 2.5 hr or longer. *For subsequent infusions (600 mg in 500 mL),* begin at 40 mL/hr. Increase by 40 mL/hr every 30 min to 200 mL/hr over 3.5 hr or longer OR start at 100 mL/hr for first 15 min. Increase to 200 mL/hr for next 15 min. Increase to 250 mL/hr for next 30 min. Increase to 300 mL/hr for last 60 min. Duration 2 hr or longer.

Patient/Family Teaching

- Explain purpose of infusions and importance of maintaining schedule to patient. If infusion is missed, administer as soon as possible; do not wait for next scheduled dose. Reset schedule for 6 mo after missed dose is given. Separate doses by at least 5 mo. Advise patient to read *Medication Guide* before starting therapy and with each dose in case of changes.
- Inform patient that infusion reactions may occur up to 24 hr after infusion. Advise patient to notify health care professional immediately if infusion reaction symptoms occur.
- Advise patient to notify health care professional if signs and symptoms of infection (fever, chills, constant cough, cold sore, shingles, genital sores) or PML (problems with thinking, balance, eyesight, weakness on 1 side of body, strength, using arms or legs) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Instruct patient to avoid live vaccines during therapy. Administer any live or live-attenuated vaccines ≥4 wk prior to start of therapy and administer any non-live vaccines ≥2 wk prior to start of therapy. Do not administer live or live-attenuated vaccines to infants born to mothers taking ocrelizumab until recovery of B-cell counts confirmed; may administer non-live vaccines to these infants, but should consider assessing vaccine immune responses to determine whether protective immune response mounted.
- Inform patient of increased risk of malignancy. Advise patient to receive regular breast cancer screening.
- Rep: Advise females of reproductive potential to use effective contraception during and for 6 mo after last infusion and to notify health care professional if breast feeding. Inform patient of pregnancy exposure registry that monitors pregnancy and fetal/neonatal/infant outcomes in women exposed to ocrelizumab during pregnancy. Encourage patient to register themselves by calling 1-833-872-4370 or visiting www.ocrevuspregnancyregistry.com.

Evaluation/Desired Outcomes

- Reduction in relapse rate and decreased progression toward disability in patients with multiple sclerosis.

octreotide (ok-tree-oh-tide)

Bynfezia Pen, Mycapssa, SandoSTATIN, SandoSTATIN LAR, SandoSTATIN LAR Depot

Classification

Therapeutic: antidiarrheals, hormones

Indications

IV, IM, Subcut: Treatment of the following: Symptoms (flushing and diarrhea) associated with metastatic carcinoid tumors; Profuse, watery diarrhea associated with vasoactive intestinal peptide tumors (VIPomas); Acromegaly in patients who have had inadequate response to or cannot be treated with surgical resection, pituitary irradiation, and bromocriptine mesylate at maximally tolerated doses. **PO:** Long-term maintenance treatment of acromegaly in patients who have responded to and tolerated treatment with octreotide or lanreotide. **Unlabeled Use:** Management of diarrhea associated with chemotherapy or graft-versus-host disease. Gastroesophageal variceal hemorrhage.

Action

Suppresses secretion of serotonin and gastroenteropancreatic peptides. Increases absorption of fluid and electrolytes from the GI tract and increases transit time. Decreases levels of serotonin metabolites. Also suppresses growth hormone, insulin, and glucagon. **Therapeutic Effects:** Normalization of growth hormone and insulin-like growth factor 1 levels and maintenance of these levels. Control of severe flushing and diarrhea associated with metastatic carcinoid tumors and VIPomas.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability. Well absorbed following subcut administration and IM administration of depot form. Food reduces rate and extent of oral absorption.

Distribution: Some distribution to extravascular tissues.

Metabolism and Excretion: Extensive hepatic metabolism; 32% excreted unchanged in urine.

Half-life: 1.5 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (control of symptoms)

ROUTE	ONSET	PEAK	DURATION
Subcut, IV	unknown	unknown	up to 12 hr
IM (LAR depot)	unknown	2 wk	up to 4 wk
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Gallbladder disease (↑ risk of stone formation); Renal impairment (dose ↓ may be necessary); Hyperglycemia or hypoglycemia (changes in blood glucose may occur); Fat malabsorption (may be aggravated); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Rep: Premenopausal women (may ↑ fertility and ↑ risk of pregnancy); Pedi: Safety and effectiveness of depot injection and oral formulation not established in children.

Adverse Reactions/Side Effects

CV: edema, atrioventricular block, bradycardia, hypertension, orthostatic hypotension, palpitations, QT interval prolongation. **Derm:** ↑ sweating, flushing. **EENT:** sinusitis, visual disturbances. **Endo:** hyperglycemia, hypoglycemia, hypothyroidism. **GI:** ILEUS, PANCREATITIS, abdominal pain, cholelithiasis, diarrhea, nausea, vomiting, cholecystitis, fat malabsorption, flatulence. **GU:** urinary tract infection. **Local:** injection-site pain. **MS:** arthralgia. **Neuro:** headache, dizziness, drowsiness, fatigue, weakness. **Misc:** ↓ vitamin B_{12} levels.

Interactions

Drug-Drug: May alter requirements for **insulin** or **oral hypoglycemic agents**. May ↓ levels of **cyclosporine** and **digoxin**; closely monitor levels and adjust dose of cyclosporine and digoxin as needed. **Beta blockers**, **digoxin**, **diltiazem**, **ivabradine**, and **verapamil** may ↑ risk of bradycardia. **Proton pump inhibitors**, **H_2 receptor antagonists**, and **antacids** may ↓ absorption and levels of orally administered octreotide; may need to ↑ dosage of oral octreotide. May ↑ levels of **lisinopril**; closely monitor BP. May ↓ levels of **levonorgestrel**; advise patient to use nonhormonal contraceptive or a backup method while receiving octreotide. May ↑ levels of **bromocriptine**; may need to ↓ dose of bromocriptine. May ↓ effectiveness of **lutetium Lu 177 dotatate**; discontinue ≥4 wk prior to each dose of lutetium Lu 177 dotatate.

Route/Dosage

Carcinoid Tumors

Subcut, IV (Adults): 100–600 mcg/day in 2–4 divided doses during first 2 wk of therapy (range 50–1500 mcg/day).

IM (Adults): *Sandostatin LAR*— 20 mg every 4 wk for 2 mo; dose may be further adjusted.

VIPomas

Subcut, IV (Adults): 200–300 mcg/day in 2–4 divided doses during first 2 wk of therapy (range 150–750 mcg/day).

IM (Adults): *Sandostatin LAR*— 20 mg every 2 wk for 2 mo; dose may be further adjusted.

Acromegaly

Subcut, IV (Adults): 50–100 mcg 3 times daily; titrate to achieve growth hormone levels <5 ng/mL or IGF-1 levels <1.9 units/mL (males) or <2.2 units/mL (females) (usual effective dose = 100–200 mcg 3 times daily).

IM (Adults): *Sandostatin LAR*— 20 mg every 4 wk for 3 mo, then adjusted on the basis of growth hormone levels.

PO (Adults): 20 mg twice daily initially; titrate based on IGF-1 levels obtained every 2 wk by 20 mg/day. If maintenance dose = 60 mg/day, administer as 40 mg in AM and 20 mg in PM; if maintenance dose = 80 mg/day, administer as 40 mg twice daily (not to exceed 80 mg/day).

Renal Impairment

PO (Adults): *End-stage renal disease*— 20 mg once daily initially; titrate based on IGF-1 levels obtained every 2 wk by 20 mg/day. If maintenance dose = 40 mg/day, administer as 20 mg twice daily; if maintenance dose = 60 mg/day, administer as 40 mg in AM and 20 mg in PM; if maintenance dose = 80 mg/day, administer as 40 mg twice daily (not to exceed 80 mg/day).

Diarrhea Associated With Chemotherapy (off-label)

Subcut, IV (Adults): 100–150 mcg subcut every 8 hr; may ↑ to 500–1500 mcg subcut or IV every 8 hr for severe diarrhea.

Subcut (Children): 1–10 mcg/kg every 8–12 hr.

Diarrhea Associated With Graft-Versus-Host Disease (off-label)

IV (Adults): 500 mcg every 8 hr; do not continue for longer than 7 days (discontinue within 24 hr of diarrhea resolution).

Subcut (Children): 1–10 mcg/kg every 8–12 hr.

Gastroesophageal Variceal Hemorrhage (off-label)

IV (Adults): 25–100 mcg bolus (may repeat in 1st hr if hemorrhage uncontrolled), followed by continuous infusion of 25–50 mcg/hr for 2–5 days.

IV (Children): 1–2 mcg/kg bolus, followed by continuous infusion of 1–2 mcg/kg/hr; taper dose by 50% every 12 hr when no active bleeding for 24 hr; discontinue when dose is 25% of initial dose.

© F.A. Davis Publishing

Availability (generic available)

Delayed release capsules: 20 mg. **Solution for injection:** 50 mcg/mL, 100 mcg/mL, 200 mcg/mL, 500 mcg/mL, 1000 mcg/mL, 2500 mcg/mL (prefilled pen). **Suspension for injection (depot):** 10 mg/6 mL, 20 mg/6 mL, 30 mg/6 mL.

NURSING IMPLICATIONS

Assessment

- Assess frequency and consistency of stools and bowel sounds throughout therapy.
- Monitor pulse and BP prior to and periodically during therapy.
- Assess patient's fluid and electrolyte balance and skin turgor for dehydration.
- Monitor diabetic patients for signs of hypoglycemia. May require reduction in requirements for insulin and sulfonylureas and treatment with diazoxide.
- Assess for gallbladder disease; assess for pain and monitor ultrasound examinations of gallbladder and bile ducts prior to and periodically during prolonged therapy.
- ***Lab Test Considerations:*** Monitor growth hormone, IGF-1 in patients with acromegaly, 5-HIAA (urinary 5-hydroxyindoleacetic acid), plasma serotonin, and plasma substance P in patients with carcinoid tumors; plasma vasoactive intestinal peptide (VIP) in patients with VIPoma; and free T_4 and serum glucose concentrations prior to and periodically during therapy in all patients taking octreotide. Measure IGF-1 every two wks after starting *Bynfezia Pen* or with dose change.
- Monitor quantitative 72-hr fecal fat and serum carotene determinations periodically for possible drug-induced aggravations of fat malabsorption.
- May cause a slight ↑ in liver enzymes.
- Monitor thyroid function before starting *Bynfezia Pen*. May cause ↓ serum thyroxine (T_4) concentrations.
- Monitor glycemic control for all patients with diabetes and adjust antidiabetic treatment as necessary for hyperglycemia and hypoglycemia.
- Monitor vitamin B_{12} levels during therapy with *Bynfezia Pen*.

Implementation

- Do not confuse Sandostatin (octreotide) with Sandimmune (cyclosporine).
- **PO:** Administer with water on an empty stomach, at least 1 hr before a meal or at least 2 hr after a meal. ***DNC:*** Swallow capsules whole; do not open, crush or chew.
- Solution is clear and colorless; do not use solution that is cloudy, discolored, or contains particulate matter. Ampules should be refrigerated but may be stored at room temperature for the days they will be used. Discard unused solution.
- **Subcut:** Administer the smallest volume needed to achieve required dose to prevent pain at injection site. Rotate injection sites; avoid multiple injections in same site within short periods of time. Preferred injection sites are the hip, thigh, or abdomen.
- Administer injections between meals and at bedtime to avoid GI side effects.
- Allow medication to reach room temperature prior to injection to minimize local reactions at injection site. Rotate injection sites at least 2 in. away from last injection site.
- Withdraw *Bynfezia Pen* yearly for about 4 wk from patients who have received irradiation to assess disease activity. If growth hormone or IGF-1 levels increase and signs and symptoms recur, may resume *Bynfezia Pen* at the dose used at the time of *Bynfezia Pen* discontinuation.
- **IM:** Mix IM solution by adding diluent included in kit. Administer immediately after mixing into the gluteal muscle. Avoid using deltoid site due to pain of injection.
- Patients with carcinoid tumors and VIPomas should continue to receive subcut dose for 2 wk following switch to IM depot form to maintain therapeutic level.

IV Administration

- **IV Push:** ***Dilution:*** May be administered undiluted. ***Rate:*** Administer over 3 min.
- **Intermittent Infusion:** ***Dilution:*** Dilute in 50–200 mL of 0.9% NaCl or D5W. ***Concentration:*** 1.5–250 mcg/mL. ***Rate:*** Infuse over 15–30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftozolane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibitide, eravacycline, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin regular, irinotecan, isavuconazonium,

© F.A. Davis Publishing

isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium hydroxide, mannitol, melphalan, meperidine, meropenem, meropenem/vaborbactam, mesna, methadone, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinapristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** dantrolene, diazepam, micafungin, phenytoin.

Patient/Family Teaching

- Explain purpose of octreotide to patient.
- May cause dizziness, drowsiness, or visual disturbances. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to notify health care professional if signs and symptoms of gallstones, hyperglycemia, hypoglycemia, thyroid function abnormalities, or irregular heartbeat.
- Rep: Inform females of reproductive potential that therapy with octreotide may result in improved fertility. Caution patient to use contraception to prevent unintended pregnancy. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Home Care Issues:** Instruct patient administering octreotide at home on correct technique for injection, storage, and disposal of equipment. Advise patient to read *Instructions for Use* before starting therapy and with each Rx refill in case of changes.
- Instruct patient to administer octreotide exactly as directed. If a dose is missed, administer as soon as possible, then return to regular schedule. Do not double doses.

Evaluation/Desired Outcomes

- Decrease in severity of diarrhea and improvement of electrolyte imbalances in patients with carcinoid or VIP-secreting tumors.
- Relief of symptoms and suppressed tumor growth in patients with pituitary tumors associated with acromegaly.
- Management of diarrhea in patients with AIDS.
- Growth hormone levels <5 ng/mL or IGF-I levels within normal reference ranges for age and sex in patients treated for acromegaly.

ofloxacin, See FLUOROQUINOLONES.

BEERS REMS

OLANZapine (oh-lan-za-peen)

ZyPREXA, ZyPREXA Relprevv, ZyPREXA Zydis

Classification

Therapeutic: antipsychotics, mood stabilizers
Pharmacologic: thienobenzodiazepines

O

Indications

PO, IM: Schizophrenia. **PO:** Management of the following: Acute therapy of manic or mixed episodes associated with bipolar I disorder (as monotherapy [adults and adolescents] or in combination with lithium or valproate [adults only]); Maintenance therapy of bipolar I disorder; Depressive episodes associated with bipolar I disorder (in combination with fluoxetine); Treatment-resistant depression (in combination with fluoxetine). **IM:** Acute agitation due to schizophrenia or bipolar I mania. **Unlabeled Use:** Anorexia nervosa. Treatment of nausea and vomiting related to highly emetogenic chemotherapy.

Action

Antagonizes dopamine and serotonin type 2 in the CNS. Also has anticholinergic, antihistaminic, and anti–alpha$_1$-adrenergic effects. **Therapeutic Effects:** Decreased manifestations of psychoses.

Pharmacokinetics

Absorption: Well absorbed but rapidly metabolized by first-pass effect, resulting in 60% bioavailability. Conventional tablets and orally disintegrating tablets (Zydis) are bioequivalent. IM administration results in significantly higher blood levels (5 times that of oral).
Distribution: Extensively distributed.
Protein Binding: 93%.
Metabolism and Excretion: Highly metabolized (primarily by the CYP1A2 isoenzyme); 7% excreted unchanged in urine.

© F.A. Davis Publishing

Half-life: 21–54 hr.

TIME/ACTION PROFILE (antipsychotic effects)

ROUTE	ONSET	PEAK*	DURATION
PO	unknown	6 hr	unknown
IM	rapid	15–45 min	2–4 hr

*Blood levels.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Phenylketonuria (orally disintegrating tablets contain aspartame).

Use Cautiously in: Hepatic impairment; Patients at risk for aspiration or falls; Cardiovascular or cerebrovascular disease; History of seizures; History of attempted suicide; Diabetes or risk factors for diabetes (may worsen glucose control); Presence/history of constipation, urinary retention, prostatic hypertrophy, or paralytic ileus; Low WBC or ANC or history of drug-induced neutropenia/leukopenia; Angle-closure glaucoma; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; Lactation: Use while breast feeding only if potential maternal benefit justifies potential fetal risk; Pedi: Children <13 yr (safety and effectiveness not established); adolescents at ↑ risk for weight gain and hyperlipidemia; Geri: Older adults may require ↓ doses; ↑ risk of mortality and stroke/transient ischemic attack in older adults treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CV: orthostatic hypotension, bradycardia, chest pain, syncope, tachycardia. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), photosensitivity. **EENT:** amblyopia, rhinitis, ↑ salivation, pharyngitis. **Endo:** galactorrhea, goiter, gynecomastia, hyperglycemia, hyperprolactinemia. **GI:** constipation, dry mouth, ↑ liver enzymes, abdominal pain, dysphagia, nausea, ↑ thirst. **GU:** amenorrhea, ↓ fertility (females), ↓ libido, impotence, urinary incontinence. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **Metab:** weight loss or gain, dyslipidemia, ↑ appetite. **MS:** hypertonia, joint pain. **Neuro:** tremor, NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, agitation, delirium, dizziness, headache, restlessness, sedation, weakness, dystonia, falls, insomnia, mood changes, personality disorder, speech impairment, tardive dyskinesia. **Resp:** cough, dyspnea. **Misc:** aspiration, body temperature dysregulation, fever, flu-like syndrome.

Interactions

Drug-Drug: ↑ anticholinergic effects with other **anticholinergic drugs**, including **antihistamines**, **quinidine**, **disopyramide**, and **antidepressants**; avoid concurrent use. Effects may be ↓ by concurrent **carbamazepine**, **omeprazole**, or **rifampin**. **Antihypertensives** and **CNS depressants** may ↑ risk of orthostatic hypotension. ↑ CNS depression may occur with concurrent use of **alcohol** or other **CNS depressants**; concurrent use of IM olanzapine and parenteral benzodiazepines should be avoided. May antagonize the effects of **levodopa** or other **dopamine agonists**. **Fluvoxamine** may ↑ levels. **Nicotine** can ↓ olanzapine levels.

Route/Dosage

Schizophrenia

PO (Adults — Most Patients): 5–10 mg/day initially; may ↑ at weekly intervals by 5 mg/day (target dose = 10 mg/day; not to exceed 20 mg/day).
PO (Adults — Debilitated or Nonsmoking Female Patients ≥65 yr): Initiate therapy at 5 mg/day.
PO (Children 13–17 yr): 2.5–5 mg/day initially; may ↑ at weekly intervals by 2.5–5 mg/day (target dose = 10 mg/day; not to exceed 20 mg/day).
IM (Adults): *Oral olanzapine dose = 10 mg/day*—210 mg every 2 wk or 410 mg every 4 wk for the first 8 wk, then 150 mg every 2 wk or 300 mg every 4 wk as maintenance therapy; *Oral olanzapine dose = 15 mg/day*—300 mg every 2 wk for the first 8 wk, then 210 mg every 2 wk or 405 mg every 4 wk as maintenance therapy; *Oral olanzapine dose = 20 mg/day*—300 mg every 2 wk for the first 8 wk, then 300 mg every 2 wk as maintenance therapy.
IM (Adults — Debilitated or Nonsmoking Female Patients ≥65 yr): Initiate therapy at 150 mg every 4 wk.

Acute Manic or Mixed Episodes Associated With Bipolar I Disorder

PO (Adults): 10–15 mg/day initially (use 10 mg/day when used with lithium or valproate); may ↑ every 24 hr by 5 mg/day (not to exceed 20 mg/day).
PO (Children 13–17 yr): 2.5–5 mg/day initially; may ↑ by 2.5–5 mg/day (target dose = 10 mg/day; not to exceed 20 mg/day).

Maintenance Treatment of Bipolar I Disorder

PO (Adults): Continue at the dose required to maintain symptom remission (usual dose: 5–20 mg/day).
PO (Children 13–17 yr): Continue at the lowest dose required to maintain symptom remission.

Acute Agitation due to Schizophrenia or Bipolar I Mania

IM (Adults): 10 mg, may repeat in 2 hr, then 4 hr later.
IM (Adults >65 yr): Initiate therapy with 5 mg.

Depressive Episodes Associated With Bipolar I Disorder

PO (Adults): 5 mg/day with fluoxetine 20 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 12.5 mg/day.
PO (Children 10–17 yr): 20 mg/day with olanzapine 2.5 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 12 mg/day.

© F.A. Davis Publishing

Treatment-Resistant Depression

PO (Adults): 5 mg/day with fluoxetine 20 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 20 mg/day.

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg. **Cost:** *Generic*— 2.5 mg $31.23/90, 5 mg $24.47/90, 7.5 mg $30.83/90, 10 mg $37.19/90, 15 mg $53.38/90, 20 mg $71.55/90. **Orally disintegrating tablets (Zydis):** 5 mg, 10 mg, 15 mg, 20 mg. **Cost:** 5 mg $1,298.66/90, 15 mg $2,880.85/90. **Powder for injection:** 10 mg/vial. **Extended-release powder for suspension for injection (Zyprexa Relprevv):** 210 mg/vial, 300 mg/vial, 405 mg/vial. ***In combination with:*** fluoxetine (Symbyax); samidorphan (Lybalvi). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor BP (sitting, standing, lying), ECG, pulse, and respiratory rate before and frequently during dose adjustment.
- Assess weight and BMI initially and throughout therapy.
- Observe patient carefully when administering medication to ensure that medication is taken and not hoarded or cheeked.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet may help minimize constipation.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*— difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*— muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Report these symptoms if they occur, as reduction in dose or discontinuation of medication may be necessary. Trihexyphenidyl or benztropine may be used to control symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue, excessive blinking of eyes). Discontinue olanzapine and report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling), associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- *Zyprexa Relprevv*: Observe for signs and symptoms of Post-injection Delirium/Sedation Syndrome (dizziness, confusion, disorientation, slurred speech, altered gait, difficulty ambulating, weakness, agitation, extrapyramidal symptoms, hypertension, convulsion, reduced level of consciousness ranging from mild sedation to coma) for at least 3 hr after injection.
- ***Lab Test Considerations:*** Evaluate CBC, liver function tests, and ocular examinations periodically during therapy. May cause ↓ platelets. May cause ↑ bilirubin, AST, ALT, GGT, CK, and alkaline phosphatase.
- Monitor blood glucose prior to and periodically during therapy.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.
- May cause hyperlipidemia; monitor serum lipids prior to and periodically during therapy.

Implementation

- Do not confuse Zyprexa (olanzapine) with Celexa (citalopram), Zyrtec (cetirizine), Reprexain (hydrocodone/ibuprofen), Zestril (lisinopril), or Zelapar (selegiline). Do not confuse olanzapine with quetiapine.
- ***REMS:*** *Zyprexa Relprevv* is only prescribed through the *Zyprexa Relprevv Patient Care Program*. Prescribers, pharmacies, and patients must be educated about the program and must comply with the program requirements.
- **PO:** May be administered without regard to meals.
- For orally disintegrating tablets, peel back foil on blister, do not push tablet through foil. Using dry hands, remove from foil and place entire tablet in mouth. Tablet will disintegrate with or without liquid.

© F.A. Davis Publishing

- **IM:** ***Reconstitution:*** Reconstitute with 2.1 mL of sterile water for injection for a concentration of 5 mg/mL. Solution should be clear and yellow; do not administer solutions that are discolored or contain particulate matter.Inject slowly, deep into muscle. Do not administer IV or subcutaneously. Administer within 1 hr of reconstitution. Discard unused solution.
- For *Zyprexa Relprevv*: Use gloves when preparing; solution may be irritating to skin. ***Reconstitution:*** Use only diluent provided by manufacturer. Reconstitute 150-mg or 210-mg dose with 1.3 mL, 300 mg with 1.8 mL, and 405 mg with 2.3 mL of diluent. Loosen powder by tapping vial; inject diluent into powder. Remove needle from vial holding vial upright to prevent loss of solution. Engage needle safety device as explained by manufacturer. Pad a hard surface and tap vial repeatedly until no powder or yellow, dry clumps are visible. Shake vial vigorously until suspension appears smooth and consistent in color and texture. Solution will be yellow and opaque. Allow foam to dissipate. Suspension is stable for 24 hr at room temperature; if not used immediately, shake to resuspend. ***Concentration:*** 150 mg/mL. Replace needle with 19 gauge, 1.5 in. or 2 in. for obese patients. Slowly withdraw desired amount from vial; 150 mg = 1 mL, 210 mg = 1.4 mL, 300 mg = 2 mL, 405 mg = 2.7 mL. Administer immediately deep IM gluteal after withdrawing. Do not massage injection site. Patient must be observed for at least 3 hr after injection for Post-Injection Delirium/Sedation Syndrome.

Patient/Family Teaching

- ***REMS:*** Advise patient to take medication as directed and not to skip doses or double up on missed doses. May need to discontinue gradually. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes. Explain the *Zyprexa Relprevv Patient Care Program* to patient and encourage patient to enroll in the *Zyprexa Relprevv Patient Care Program* registry.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known. Patients receiving *Zyprexa Relprevv* should not drive for 24 hr following injection.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol.
- Advise patient to use sunscreen and protective clothing when exposed to the sun. Extremes of temperature (exercise, hot weather, hot baths, or showers) should also be avoided; this drug impairs body temperature regulation.
- Instruct patient to use saliva substitute, frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth. Consult dentist if dry mouth continues for >2 wk.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, symptoms of Post-Injection Delirium/Sedation Syndrome, or weakness, tremors, visual disturbances, dark-colored urine, clay-colored stools, menstrual abnormalities, galactorrhea, or sexual dysfunction occur.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding. Encourage women who become pregnant while taking olanzapine to enroll in the National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/. Monitor neonates for extrapyramidal and/or withdrawal symptoms and manage symptoms appropriately. Monitor infants exposed through breast feeding for excess sedation, irritability, poor feeding, and extrapyramidal symptoms (tremors and abnormal muscle movements).
- Emphasize the importance of routine follow-up exams and continued participation in psychotherapy.

Evaluation/Desired Outcomes

- Decrease in excitable, manic behavior.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunted affect) of schizophrenia.
- Increased sense of well-being.
- Decreased agitation.

olaparib (oh-lap-a-rib)

Lynparza

Classification

Therapeutic: antineoplastics

Pharmacologic: enzyme inhibitors

Indications

Treatment of deleterious/suspected deleterious germline *BRCA*-mutated advanced ovarian cancer following ≥3 previous lines of chemotherapy. Mainte-

© F.A. Davis Publishing

nance treatment of recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who are in a complete or partial response to platinum-based chemotherapy. ⛓ First-line maintenance treatment of deleterious/suspected deleterious germline or somatic *BRCA*-mutated advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who are in a complete or partial response to first-line platinum-based chemotherapy. ⛓ First-line maintenance treatment of advanced epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who are in a complete or partial response to first-line platinum-based chemotherapy and whose cancer is associated with homologous recombination deficiency (HRD) positive status defined by either a deleterious/suspected deleterious *BRCA* mutation and/or genomic instability (in combination with bevacizumab). ⛓ Treatment of deleterious/suspected deleterious germline *BRCA*-mutated HER2−negative metastatic breast cancer in patients who have been treated with chemotherapy in the neoadjuvant, adjuvant, or metastatic setting (should have been previously treated with or considered intolerant to an endocrine therapy). ⛓ First-line maintenance treatment of deleterious/suspected deleterious germline *BRCA*-mutated metastatic pancreatic adenocarcinoma in patients whose disease has not progressed on ≥16 wks of a first-line platinum-based chemotherapy regimen. ⛓ Deleterious/suspected deleterious germline or somatic homologous recombination repair (HRR) gene-mutated metastatic castration-resistant prostate cancer in patients who have progressed following previous treatment with enzalutamide or abiraterone.

Action

Acts as a poly (ADP-ribose) polymerase (PARP) inhibitor; disrupts DNA transcription, cell cycle regulation, and DNA repair. **Therapeutic Effects:** Improved progression-free survival in ovarian, fallopian tube, primary peritoneal, breast, and pancreatic cancer.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized (mostly by the CYP3A isoenzyme); 15% excreted unchanged in urine, 6% in feces.
Half-life: 14.9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 hr	12 hr

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Concurrent use of strong/moderate CYP3A inhibitors (avoid if possible, if concurrent use is necessary ↓ olaparib dose); Concurrent use of strong/moderate CYP3A inducers (avoid if possible, if concurrent use is necessary effectiveness of olaparib may be ↓); Moderate or severe hepatic impairment; Moderate or severe renal impairment (CCr <50 mL/min) (dose ↓ may be needed); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: DEEP VEIN THROMBOSIS. **Derm:** dermatitis/rash. **GI:** abdominal pain, ↓ appetite, diarrhea, dyspepsia, nausea, vomiting. **Hemat:** MYELODYSPLASTIC SYNDROME/ACUTE MYELOID LEUKEMIA, anemia, lymphopenia, neutropenia, thrombocytopenia. **MS:** arthralgia, back pain, musculoskeletal pain, myalgia. **Neuro:** fatigue, headache, dysgeusia, weakness. **Resp:** PNEUMONITIS, PULMONARY EMBOLISM, cough.

Interactions

Drug-Drug: ↑ risk of prolonged myelosuppression with other **antineoplastics**. Concurrent use with **strong CYP3A4 inhibitors**, including **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **lopinavir/ritonavir**, **nefazodone**, **nelfinavir**, **posaconazole**, **ritonavir**, **saquinavir**, or **voriconazole**, ↑ levels and risk of toxicity; avoid concurrent use if possible but if necessary, ↓ olaparib dose. Concurrent use with **moderate CYP3A4 inhibitors**, including **aprepitant**, **atazanavir**, **ciprofloxacin**, **crizotinib**, **darunavir/ritonavir**, **diltiazem**, **erythromycin**, **fluconazole**, **fosamprenavir**, **imatinib**, or **verapamil** ↑ levels and risk of toxicity; avoid concurrent use if possible but if necessary, ↓ olaparib dose. Concurrent use with **strong CYP3A inducers** including **carbamazepine**, **phenytoin**, and **rifampin** ↓ blood levels and effectiveness and should be avoided. Concurrent use with **moderate CYP3A inducers** including **bosentan**, **efavirenz**, **etravirine**, **modafinil**, and **nafcillin** ↓ blood levels and effectiveness; avoid if possible.
Drug-Natural Products: **St. John's wort** may ↓ blood levels and effectiveness and should be avoided.
Drug-Food: Concurrent ingestion of **grapefruit** and **Seville oranges** may ↑ blood levels and the risk of toxicity and should be avoided.

Route/Dosage

First-Line Maintenance Treatment of *BRCA*-Mutated Advanced Ovarian Cancer or Advanced Ovarian Cancer (in Combination with Bevacizumab)

PO (Adults): 300 mg twice daily until disease progression, unacceptable toxicity, or completion of 2 yr of treatment. If complete response achieved after 2 yr of

© F.A. Davis Publishing

treatment (i.e., no radiological evidence of disease), can stop therapy. If evidence of disease at 2 yr, may continue therapy. *Concurrent use of strong CYP3A4 inhibitor*— 100 mg twice daily until disease progression, unacceptable toxicity, or completion of 2 yr of treatment. If complete response achieved after 2 yr of treatment (i.e., no radiological evidence of disease), can stop therapy. If evidence of disease at 2 yr, may continue therapy. *Concurrent use of moderate CYP3A4 inhibitor*— 150 mg twice daily until disease progression, unacceptable toxicity, or completion of 2 yr of treatment. If complete response achieved after 2 yr of treatment (i.e., no radiological evidence of disease), can stop therapy. If evidence of disease at 2 yr, may continue therapy.

Renal Impairment

PO (Adults): *CCr 31–50 mL/min*— 200 mg twice daily until disease progression, unacceptable toxicity, or completion of 2 yr of treatment. If complete response achieved after 2 yr of treatment (i.e., no radiological evidence of disease), can stop therapy. If evidence of disease at 2 yr, may continue therapy.

Recurrent Ovarian Cancer, Germline *BRCA*-Mutated Advanced Ovarian Cancer, Germline *BRCA*-Mutated HER2–Negative Metastatic Breast Cancer, Germline *BRCA*-Mutated Metastatic Pancreatic Adenocarcinoma, and HRR Gene-mutated Metastatic Castration-Resistant Prostate Cancer

PO (Adults): 300 mg twice daily until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inhibitor*— 100 mg twice daily until disease progression or unacceptable toxicity. *Concurrent use of moderate CYP3A4 inhibitor*— 150 mg twice daily until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *CCr 31–50 mL/min*— 200 mg twice daily until disease progression or unacceptable toxicity.

Availability

Tablets: 100 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of pneumonitis (new or worsening respiratory symptoms, dyspnea, fever, cough, wheezing, radiological abnormality) during therapy. Interrupt therapy; if pneumonitis confirmed, discontinue therapy.
- Monitor for signs and symptoms of venous thrombosis and pulmonary embolism and treat as medically appropriate. May require long-term anticoagulation.
- ***Lab Test Considerations:*** Patient selection is based on the presence of deleterious or suspected deleterious HRR gene mutations, including BRCA mutations, or genomic instability based on the indication, biomarker, and sample type. Information on FDA-approved tests for the detection of genetic mutations is available at http://www.fda.gov/companiondiagnostics.
- Verify negative pregnancy test prior to starting therapy.
- Monitor CBC at baseline and monthly during therapy. Do not start olaparib until patient has recovered from hematological toxicities from previous chemotherapy (≤CTCAE Grade 1). For prolonged hematological toxicities, interrupt olaparib and monitor CBC weekly until recovery. If levels have not recovered to Grade ≤1 after 4 wk, refer to hematologist. Discontinue olaparib if myelodysplastic syndrome or acute myeloid leukemia is confirmed.
- May cause ↓ hemoglobin, neutrophils, platelets, and lymphocytes. May cause ↑ mean corpuscular volume and serum creatinine.

Implementation

- **PO:** Take eight 50 mg capsules twice daily (800 mg/day) without regard to food. ***DNC:*** Swallow capsules whole; do not open, chew, or dissolve capsule; do not take capsules that are deformed or leak.
- If dose reduction is needed, reduce dose to 200 mg (four 50-mg capsules) twice daily or 400 mg/day. If further final dose reduction is needed, reduce to 100 mg (two 50-mg capsules) twice daily or 200 mg.

Patient/Family Teaching

- Instruct patient to take olaparib as directed. If a dose is missed, do not take another to make up; omit dose and take next scheduled dose.
- Inform patient that mild to moderate nausea and/or vomiting is common when taking olaparib. Notify health care professional for antiemetic options if this is problematic.
- Advise patient to avoid grapefruit or Seville oranges during therapy.
- Advise patient to notify health care professional if signs and symptoms of pneumonitis or hematological toxicity (weakness, feeling tired, fever, weight loss, frequent infections, bruising, bleeding easily, shortness of breath, blood in urine or stool, low blood cell counts on laboratory findings, need for blood transfusions) occur. May also be myelodysplastic syndrome (MDS) or acute myeloid leukemia (AML).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for at least 6 mo after last dose and to avoid breast feeding for 1 mo after last dose. Advise patient to notify health care professional if pregnancy is planned or suspected. Advise males with female partners of reproductive potential to use effective

© F.A. Davis Publishing

contraception during and for 3 mo after last dose. Advise male patients not to donate sperm during therapy and for 3 mo following the last dose.
- Emphasize importance of lab test to monitor for side effects.

Evaluation/Desired Outcomes
- Improved progression-free survival in ovarian, fallopian tube, primary peritoneal, breast, and pancreatic cancer.

olmesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

olodaterol (oh-loh-dat-er-ole)
Striverdi Respimat

Classification
Therapeutic: bronchodilators
Pharmacologic: beta-adrenergic agonists

Indications
Maintenance treatment of airflow obstruction in patients with COPD, including chronic bronchitis and emphysema.

Action
A long-acting beta$_2$-adrenergic agonist (LABA) that stimulates adenyl cyclase, resulting in accumulation of cyclic adenosine monophosphate (cAMP) at beta$_2$-adrenergic receptors resulting in bronchodilation. **Therapeutic Effects:** Bronchodilation with decreased airflow obstruction.

Pharmacokinetics
Absorption: 30% absorbed following oral inhalation (from lung surface); swallowed drug is minimally absorbed.
Distribution: Extensive tissue distribution; probably enters breast milk.
Metabolism and Excretion: Extensively metabolized (some by CYP 3A4), only one metabolite binds to B_2 adrenergic receptors. Following inhalation, 5–7% excreted unchanged in urine, remainder in feces as drug and metabolites (84%).
Half-life: 45 hr (following inhalation).

TIME/ACTION PROFILE (improvement in FEV_1)

ROUTE	ONSET	PEAK	DURATION
Inhaln	within 1 hr	1–5 hr	24 hr

Contraindications/Precautions
Contraindicated in: Acutely deteriorating COPD or acute respiratory symptoms; Asthma.
Use Cautiously in: History of seizures; Thyrotoxicosis; History of cardiovascular disorders (coronary insufficiency, arrhythmias, hypertension); Sensitivity to sympathomimetics (adrenergics); Severe hepatic impairment; OB: Use only if potential maternal benefit justifies potential fetal risk; may interfere with uterine contractility during labor; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established.
Exercise Extreme Caution in: Concurrent use with MAOIs, tricyclic antidepressants, or drugs that prolong QTc (↑ risk of adverse cardiovascular reactions).

Adverse Reactions/Side Effects
CV: ↑ BP, ECG changes, tachycardia. **EENT:** nasopharyngitis. **Endo:** hyperglycemia. **F and E:** hypokalemia. **GI:** diarrhea. **MS:** arthralgia, back pain. **Neuro:** dizziness. **Resp:** PARADOXICAL BRONCHOSPASM, cough. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions
Drug-Drug: Concurrent use with **MAOIs**, **tricyclic antidepressants**, or **drugs that prolong QTc** ↑ risk of adverse cardiovascular reactions (use with extreme caution). Concurrent use of other **adrenergics** ↑ risk of adverse adrenergic adverse reactions (tachycardia, ↑ BP). Concurrent use with **corticosteroids**, **non-potassium sparing diuretics**, or **xanthine derivatives** (including **theophylline**) may ↑ risk of hypokalemia and adverse cardiovascular reactions (use cautiously). Concurrent use with **beta blockers** may ↓ effectiveness and cause severe bronchospasm (use cautiously). Should not be used concurrently with any other **long-acting beta$_2$-adrenergic blockers** (LABAs). Blood levels may be ↑ by ketoconazole.

Route/Dosage
Inhaln (Adults): 2 inhalations once daily.

Availability
Inhalation spray: 2.7 mcg (delivers 2.5 mcg) per actuation in cartridges containing 14 doses/cartridge (one actuation lost in priming) for use with Respimat inhaler. ***In combination with:*** tiotropium (Stiolto Respimat). See Appendix N.

NURSING IMPLICATIONS
Assessment
- Assess respiratory status (rate, breath sounds, degree of dyspnea, pulse) before administration and at peak of medication. Consult health care professional about alternative medication if severe bronchospasm is present; onset of action is too slow for patients in acute distress. If paradoxical bronchospasm

© F.A. Davis Publishing

(wheezing) occurs, withhold medication and notify health care professional immediately.
- Monitor for signs and symptoms of allergic reactions (difficulties in breathing or swallowing, swelling of tongue, lips and face, urticaria, skin rash). Discontinue therapy if symptoms occur.
- ***Lab Test Considerations:*** May cause transient hypokalemia and hyperglycemia.

Implementation

- **Inhaln:** Prior to first use, prime the inhaler by actuating toward ground until aerosol cloud is visible, then repeat procedure 3 more times. If not used for 3 days, actuate inhaler once to prepare for use. *Striverdi Respimat* has a slow-moving mist to assist with inhalation. Use once (2 puffs), at the same time daily.
- A rescue inhaler of short-acting beta$_2$-agonists should always be available to treat sudden bronchospasm.

Patient/Family Teaching

- Instruct patient in the correct use of *Striverdi Respimat*. Take missed doses as soon as remembered. Do not take more than 1 dose (2 puffs) in 24 hr. Advise patient not to discontinue without consulting health care professional; symptoms may recur.
- Inform patient that olodaterol is a long-acting bronchodilator and should not be used for treating sudden breathing problems of COPD or asthma.
- Advise patient to notify health care professional if signs and symptoms of allergic reaction, worsening symptoms; decreasing effectiveness of inhaled, short-acting beta$_2$-agonists; need for more inhalations than usual of inhaled, short-acting beta$_2$-agonists; or significant decrease in lung function occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products without consulting health care professional.
- Advise female patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Bronchodilation with decreased airflow obstruction.

olsalazine (ole-**sal**-a-zeen)

Dipentum

Classification

Therapeutic: gastrointestinal anti-inflammatories

Indications

Ulcerative colitis (when patients cannot tolerate sulfasalazine).

Action

Locally acting anti-inflammatory action in the colon, where activity is probably due to inhibition of prostaglandin synthesis. **Therapeutic Effects:** Reduction in the symptoms of inflammatory bowel disease.

Pharmacokinetics

Absorption: Acts locally in colon, where 98–99% is converted to mesalamine (5-aminosalicylic acid).
Distribution: Action is primarily local and remains in the colon.
Metabolism and Excretion: 2% absorbed into systemic circulation is rapidly metabolized; mostly eliminated as mesalamine in the feces.
Half-life: 0.9 hr.

TIME/ACTION PROFILE (levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr; 4–8 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity reactions to salicylates; Cross-sensitivity with furosemide, sulfonylureas, or carbonic anhydrase inhibitors may exist; Glucose-6–phosphate dehydrogenase (G6PD) deficiency; Urinary tract or intestinal obstruction; Porphyria; Lactation: Lactation.
Use Cautiously in: Severe hepatic or renal impairment; Renal impairment (↑ risk of renal tubular damage); OB: Safety not established in pregnancy; Pedi: Children <2 yr (safety and effectiveness not established); Geri: ↑ risk of blood dyscrasias (agranulocytosis, neutropenia, pancytopenia) in older adults. Consider ↓ hepatic/renal/cardiac function, concomitant illnesses, and drug therapies.

Adverse Reactions/Side Effects

Derm: itching, photosensitivity, rash. **GI:** HEPATOTOXICITY, diarrhea, abdominal pain, anorexia, exacerbation of colitis, nausea, vomiting. **GU:** interstitial nephritis, nephrolithiasis, renal failure. **Hemat:** blood dyscrasias. **Neuro:** ataxia, confusion, dizziness, drowsiness, headache, mental depression, psychosis, restlessness. **Misc:** acute intolerance syndrome, hypersensitivity reactions.

Interactions

Drug-Drug: ↑ risk of bleeding after neuraxial anesthesia with **low molecular weight heparins** and **heparinoids**; discontinue olsalazine before initiation of therapy or monitor closely if discontinuation not possible. May ↑ levels of and risk of bleeding from **warfarin**; closely monitor INR. May ↑ myelosuppressive effects of **mercaptopurine** or **azathioprine**; avoid concurrent use, if possible. Concurrent use with **NSAIDs** may ↑ risk of nephrotoxicity. ↑ risk of developing Reye's syndrome; avoid olsalazine during 6 wk after **varicella vaccine**.

Route/Dosage

PO (Adults): 500 mg twice daily.

Availability

Capsules: 250 mg.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and during therapy.
- Assess patient for allergy to sulfonamides and salicylates. Patients allergic to sulfasalazine may take mesalamine or olsalazine without difficulty, but therapy should be discontinued if rash or fever occur.
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- ***Lab Test Considerations:*** Monitor urinalysis, BUN, and serum creatinine prior to and periodically during therapy.
- Olsalazine may cause ↑ AST and ALT levels.
- Monitor CBC prior to and every 3–6 mo during prolonged therapy. Discontinue olsalazine if blood dyscrasias occur.

Implementation

- **PO:** Administer with food in evenly divided doses every 12 hr.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose.
- May cause dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, unusual bleeding or bruising, wheezing, fever, or hives occurs.
- Advise patient to avoid sun exposure, wear sunscreen and protective clothing to minimize risk of photosensitivity reactions.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 mo of therapy.
- Instruct patient to notify health care professional if symptoms worsen or do not improve. If symptoms of acute intolerance (cramping, acute abdominal pain, bloody diarrhea, fever, headache, rash) occur, discontinue therapy and notify health care professional immediately.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Monitor breast-fed infants for diarrhea.
- Inform patient that proctoscopy and sigmoidoscopy may be required periodically during treatment to determine response.

Evaluation/Desired Outcomes

- Decrease in diarrhea and abdominal pain.
- Return to normal bowel pattern in patients with inflammatory bowel disease. Effects may be seen within 3–21 days. The usual course of therapy is 3–6 wk.
- Maintenance of remission in patients with inflammatory bowel disease.

omadacycline

(oh-**mad**-a-**sye**-kleen)

Nuzyra

Classification

Therapeutic: anti-infectives

Pharmacologic: tetracyclines

Indications

Community-acquired bacterial pneumonia (CABP). Acute bacterial skin and skin structure infections (ABSSSI).

Action

Inhibits bacterial protein synthesis by binding to the 30S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action against susceptible bacteria. **Spectrum:** Includes activity against some gram-positive pathogens: *Enterococcus faecalis*, *Staphylococcus aureus* (including methicillin-sensitive and methicillin-resistant strains), *Staphylococcus lugdunensis*, *Streptococcus anginosus*, *Streptococcus constellatus*, *Streptococcus intermedius*, *Streptococcus pneumoniae*, *Streptococcus pyogenes*. Active against some gram-negative pathogens: *Enterobacter cloacae*, *Haemophilus influenzae*, *Haemophilus parainfluenzae*, *Klebsiella pneumoniae*. Also active against several other pathogens, including: *Chlamydophila pneumoniae*, *Legionella pneumophila*, *Mycoplasma pneumoniae*.

Pharmacokinetics

Absorption: 35% absorbed following oral administration (high-fat meal ↓ rate and extent of absorption); IV administration results in complete bioavailability.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Does not undergo metabolism in the liver. Primarily excreted in feces (78–84%), with 14% excreted in urine (27% as unchanged drug).
Half-life: 15–16 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	0.5 hr	24 hr
PO	unknown	2.5 hr	24 hr

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity to omadacycline or other tetracycline derivatives; OB: Pregnancy (may lead to permanent staining of teeth and inhibition of bone growth in fetus if used during 2nd or 3rd trimester); Lactation: Lactation; Pedi: Children <8 yr (may lead to permanent staining of teeth and ↓ growth).

Use Cautiously in: Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of mortality in older adults, especially those with multiple comorbidities.

Adverse Reactions/Side Effects

CV: hypertension. **Derm:** photosensitivity. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), nausea, vomiting, constipation, diarrhea, ↑ liver enzymes. **GU:** ↓ fertility. **Local:** injection site reactions. **Neuro:** headache, insomnia, intracranial hypertension. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: May ↑ effect of **warfarin**. Medications containing **aluminum**, **calcium**, or **magnesium** may ↓ absorption of oral tablets; separate administration by ≥4 hr.

Drug-Food: Dairy products may ↓ absorption of oral tablets; separate administration by ≥4 hr.

Route/Dosage

Community-Acquired Bacterial Pneumonia

IV, PO (Adults): *Loading dose*— 200 mg IV as single dose on Day 1 *or* 100 mg IV twice daily on Day 1 *or* 300 mg orally twice daily on Day 1. *Maintenance dose*— 100 mg IV once daily for additional 6–13 days *or* 300 mg orally once daily for additional 6–13 days.

Acute Bacterial Skin and Skin Structure Infections

IV, PO (Adults): *Loading dose*— 200 mg IV as single dose on Day 1 *or* 100 mg IV twice daily on Day 1 *or* 450 mg orally once daily on Days 1 and 2. *Maintenance dose*— 100 mg IV once daily for additional 6–13 days *or* 300 mg orally once daily for additional 6–13 days.

Availability

Tablets: 150 mg. **Lyophilized powder for injection:** 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy, especially in geriatric patients.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, hives, swelling of face or throat) during therapy.

Implementation

- May cause yellow-brown discoloration and softening of teeth and bones if administered prenatally or during early childhood. Not recommended for children under 8 yr of age or during pregnancy or lactation.
- **PO:** Fast for at least 4 hr and then take with water. After oral dosing, consume no food or drink (except water) for 2 hr and no dairy products, antacids, or multivitamins for 4 hr.

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute each 100-mg vial with 5 mL of sterile water for injection, 0.9% NaCl, or D5W. Gently swirl and let vial stand until cake has completely dissolved and any foam disperses. Do not shake. Solution is yellow to dark orange; do not administer solutions that are discolored or contain particulate matter. ***Dilution:*** Within 1 hr, withdraw 5–10 ml of reconstituted solution and further dilute in 100 mL 0.9% NaCl or D5W. ***Concentration:*** 1 mg/mL or 2 mg/mL. Discard unused solution. Solution is stable for 12 hr at room temperature or 7 days if refrigerated. Allow solution to reach room temperature before administration. ***Rate:*** Infuse through a dedicated line or a Y-site over 60 min for 200-mg dose, or 30 min for a 100-mg dose. If line used for other infusions, flush with 0.9% NaCl or D5W before and after infusion.
- **Y-Site Incompatibility:** Solutions containing calcium and magnesium.

Patient/Family Teaching

- Instruct patient to take medication and to finish the drug completely as directed, even if feeling better. Instruct patient to fast 4 hr before and 2 hr after taking omadacycline and not to consume dairy products, antacids, or multivitamins for 4 hr after taking dose.
- Instruct patient to notify health care professional immediately if rash, diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) to health care professional.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products

© F.A. Davis Publishing

being taken and to consult with health care professional before taking other medications.
- Rep: May cause fetal harm. May permanently turn a baby or child's teeth yellow-gray-brown during tooth development during the second and third trimesters of pregnancy, and from birth to 8 years of age. May also slow bone growth in infants and children. Advise females of reproductive potential to use a nonhormonal method of contraception and avoid breast feeding during and for 4 days after last dose of therapy. Advise patient to notify health care professional promptly if pregnancy is suspected. May impair fertility in females and males.

Evaluation/Desired Outcomes
- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

omega-3-acid ethyl esters
(oh-**me**-ga three **as**-id **eth**-il **es**-ters)
Lovaza

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: fatty acids

Indications
Hypertriglyceridemia (triglycerides ≥500 mg/dL) in adults; used with specific diet.

Action
Inhibits synthesis of triglycerides. **Therapeutic Effects:** Reduction of triglycerides.

Pharmacokinetics
Absorption: Well absorbed.
Distribution: Unknown.
Metabolism and Excretion: Incorporated into phospholipids.
Half-life: Unknown.

TIME/ACTION PROFILE (lowering of triglycerides)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 mo	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Allergy/hypersensitivity to fish; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
Derm: rash. **GI:** altered taste, eructation, ↑ liver enzymes.

Interactions
Drug-Drug: May ↑ risk of bleeding with **aspirin** or **warfarin**.

Route/Dosage
PO (Adults): 4 g once daily *or* 2 g twice daily.

Availability (generic available)
Gelatin capsules (oil-filled): 1 g. **Cost:** $196.69/100.

NURSING IMPLICATIONS

Assessment
- Obtain a diet history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Monitor serum triglyceride levels prior to and periodically during therapy.
- Monitor serum ALT periodically during therapy. May cause ↑ serum ALT without concurrent ↑ in AST levels.
- Monitor serum LDL cholesterol levels periodically during therapy. May cause ↑ in serum LDL levels.

Implementation
- Do not confuse Lovaza (omega-3-acid ethyl esters) with lorazepam.
- An appropriate lipid-lowering diet should be followed before therapy and should continue during therapy.
- **PO:** May be taken as a single 4-g dose or as 2 g twice daily. May be administered with meals. ***DNC:*** Swallow capsules whole; do not break, dissolve, or chew.

Patient/Family Teaching
- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Take missed doses as soon as remembered, but if a day is missed, do not double doses the next day. Medication helps control but does not cure elevated serum triglyceride levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, weight loss in overweight patients, and control of medical problems (such as diabetes mellitus and hypothyroidism) that may contribute to hypertriglyceridemia.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of follow-up exams to determine effectiveness.

Evaluation/Desired Outcomes
- Lowering of serum triglyceride levels. Patients who do not have an adequate response after 2 mo of treatment should be withdrawn from therapy.

© F.A. Davis Publishing

BEERS

omeprazole (o-mep-ra-zole)

Losec, PriLOSEC, PriLOSEC OTC

Classification

Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

Indications

GERD/maintenance of healing in erosive esophagitis. Duodenal ulcers (with or without anti-infectives for *Helicobacter pylori*). Short-term treatment of active benign gastric ulcer. Pathologic hypersecretory conditions, including Zollinger-Ellison syndrome. Reduction of risk of GI bleeding in critically ill patients. **OTC:** Heartburn occurring ≥twice/wk.

Action

Binds to an enzyme on gastric parietal cells in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen with lessened gastroesophageal reflux. Healing of duodenal ulcers.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration; immediate release formulation contains bicarbonate to prevent acid degradation.
Distribution: Good distribution into gastric parietal cells.
Protein Binding: 95%.
Metabolism and Excretion: Mostly metabolized by the liver via the cytochrome P450 (CYP) system (primarily CYP2C19 isoenzyme, but also the CYP3A4 isoenzyme); the CYP2C19 enzyme system exhibits genetic polymorphism (15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ omeprazole concentrations and an ↑ risk of adverse effects); inactive metabolites are excreted in urine (77%) and feces.
Half-life: 0.5–1 hr (↑ in liver disease to 3 hr).

TIME/ACTION PROFILE (antisecretory effects)

ROUTE	ONSET	PEAK	DURATION
PO-delayed release	within 1 hr	within 2 hr	72–96 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to omeprazole or related drugs (benzimidazoles); Concurrent use of rilpivirine.
Use Cautiously in: Hepatic impairment (dose ↓ may be necessary); Patients using high-doses for >1 yr (↑ risk of hip, wrist, or spine fractures and fundic gland polyps); Patients using therapy for >3 yr (↑ risk of vitamin B_{12} deficiency); Lactation: Safety not established in breast feeding; Pedi: Children <1 mo (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: chest pain. **Derm:** cutaneous lupus erythematosus, itching, rash. **F and E:** hypomagnesemia (especially if treatment duration ≥3 mo). **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), abdominal pain, acid regurgitation, constipation, diarrhea, flatulence, fundic gland polyps, nausea, vomiting. **GU:** acute tubulointerstitial nephritis. **Hemat:** vitamin B_{12} deficiency. **MS:** bone fracture. **Neuro:** dizziness, drowsiness, fatigue, headache, weakness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, or tubulointerstitial nephritis), systemic lupus erythematosus.

Interactions

Drug-Drug: Omeprazole is metabolized by the CYP450 enzyme system and may compete with other agents metabolized by this system. May ↑ levels and risk of toxicity of **antifungal agents**, **cilostazol**, **citalopram**, **diazepam**, **flurazepam**, **triazolam**, **cyclosporine**, **phenytoin**, **saquinavir**, **tacrolimus**, and **warfarin**; consider ↓ dose of cilostazol from 100 mg twice daily to 50 mg twice daily. May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **iron salts**, **dasatinib**, **erlotinib**, **nilotinib**, **atazanavir**, **nelfinavir**, **rilpivirine**, and **mycophenolate mofetil**; concurrent use with **rilpivirine** contraindicated; avoid concurrent use with **atazanavir** and **nelfinavir**. Has been used safely with **antacids**. May ↑ levels of **digoxin** and **methotrexate**. **Voriconazole** may ↑ levels. May ↓ the antiplatelet effects of **clopidogrel**; avoid concurrent use. **Rifampin** may ↓ levels and may ↓ response; avoid concurrent use. Hypomagnesemia ↑ risk of **digoxin** toxicity.
Drug-Natural Products: St. John's wort may ↓ levels and may ↓ response; avoid concurrent use.

Route/Dosage

PO (Adults): *GERD/erosive esophagitis and maintenance of healing of erosive esophagitis*—20 mg once daily. *Duodenal ulcers associated with H. pylori*—40 mg once daily in the morning with clarithromycin for 2 wk, then 20 mg once daily for 2 wk *or* 20 mg twice daily with clarithromycin 500 mg twice daily and amoxicillin 1000 mg twice daily for 10 days (if ulcer is present at beginning of therapy, continue omeprazole 20 mg daily for 18 more days); has also been used with clarithromycin and metronidazole. *Gastric ulcer*—40 mg once daily for 4–6 wk. *Reduction of the risk of GI bleeding in critically ill patients*—40 mg initially, then another 40 mg 6–8 hr later, followed by 40 mg once daily for up to 14 days. *Gastric hypersecretory conditions*—60 mg once daily initially; may be increased up to 120 mg 3 times daily (doses >80 mg/day should be given in divided doses); *OTC*—20 mg once daily for up to 14 days.
PO (Children 1–16 yr and ≥20 kg): *GERD/erosive esophagitis*—20 mg once daily for 4–8 wk.
PO (Children 1–16 yr and 10–19 kg): *GERD/erosive esophagitis*—10 mg once daily for 4–8 wk.

© F.A. Davis Publishing

PO (Children 1–16 yr and 5–9 kg): *GERD/erosive esophagitis*—5 mg once daily for 4–8 wk.
PO (Children 1 mo–<1 yr and ≥10 kg): *Erosive esophagitis*—10 mg once daily for up to 6 wk.
PO (Children 1 mo–<1 yr and 5–9 kg): *Erosive esophagitis*—5 mg once daily for up to 6 wk.
PO (Children 1 mo–<1 yr and 3–4 kg): *Erosive esophagitis*—2.5 mg once daily for up to 6 wk.

Availability (generic available)

Delayed-release tablets: 10 mg, 20 mg[OTC]. **Delayed-release capsules:** 10 mg, 20 mg, 40 mg. **Delayed-release powder for oral suspension (peach-mint flavor):** 2.5 mg/packet, 10 mg/packet. ***In combination with:*** metronidazole and clarithromycin in a compliance package (Losec 1-2-3 M); amoxicillin and clarithromycin in a compliance package (Losec 1-2-3-A) (both in Canada only); amoxicillin and rifabutin (Talicia); sodium bicarbonate (Zegerid [OTC]). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** Monitor CBC with differential periodically during therapy.
- May cause ↑ AST, ALT, alkaline phosphatase, and bilirubin.
- May cause serum gastrin concentrations to ↑ during first 1–2 wk of therapy. Levels return to normal after discontinuation of omeprazole.
- Monitor INR and prothrombin time in patients taking warfarin.
- May cause hypomagnesemia. Monitor serum magnesium prior to and periodically during therapy.
- May cause false positive results in diagnostic investigations for neuroendocrine tumors due to ↑ serum chromogranin A (CgA) levels secondary to drug-induced ↓ gastric acidity. Temporarily stop omeprazole at least 14 days before assessing CgA levels and consider repeating test if initial CgA levels are high.

Implementation

- Do not confuse Prilosec (omeprazole) with Prozac (fluoxetine) or Pristiq (desvenlafaxine). Do not confuse omeprazole with fomepizole.
- **PO:** Administer doses before meals, preferably in the morning. ***DNC:*** Capsules and tablets should be swallowed whole; do not crush or chew. Capsules may be opened and sprinkled on cool applesauce, entire mixture should be ingested immediately and followed by a drink of water. Do not store for future use.
- *Powder for oral suspension:* Administer on empty stomach, at least 1 hr before a meal. Empty contents of 2.5-mg packet into 5 mL of water or contents of 10 mg packet into 15 mL of water. Stir. Leave 2–3 min to thicken. Stir and drink within 30 min. If material remains after drinking, add more water, stir and drink immediately. For patients with nasogastric or enteral feeding, suspend feeding for 3 hr before and 1 hr after administration. Empty packet contents into a small cup containing 5 mL of water for 2.5-mg dose or 15 mL water for 10-mg dose using a catheter tipped syringe. **Do not use other liquids or foods.** Immediately shake syringe and leave 2–3 min to thicken. Administer within 30 min. Refill the syringe with an equal amount of water. Shake and flush remaining contents from nasogastric or gastric tube into stomach.
- May be administered concurrently with antacids.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- May cause occasional drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.
- Instruct patient to notify health care professional of onset of black, tarry stools; diarrhea; abdominal pain; persistent headache; or if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy.

© F.A. Davis Publishing

- Decrease in symptoms of GERD and erosive esophagitis. Therapy is continued for 4–8 wk after initial episode.

ondansetron (on-dan-se-tron)

Ondissolve ODF, Zofran, Zofran ODT, ~~Zuplenz~~

Classification
Therapeutic: antiemetics
Pharmacologic: 5-HT_3 antagonists

Indications

IV, PO: Prevention of nausea and vomiting associated with highly or moderately emetogenic chemotherapy. Prevention of postoperative nausea and vomiting. **PO:** Prevention of nausea and vomiting associated with radiation therapy.

Action

Blocks the effects of serotonin at 5-HT_3 receptor sites (selective antagonist) located in vagal nerve terminals and the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following chemotherapy, radiation, or surgery.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability; 100% absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver (primarily by CYP3A4); 5% excreted unchanged by the kidneys.
Half-life: *Adults*—3.5–5.5 hr; *Children 5 mo–12 yr*—2.9 hr.

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO, IV	rapid	15–30 min	4–8 hr
IM	rapid	40 min	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Orally disintegrating tablets contain aspartame and should not be used in patients with phenylketonuria; Congenital long QT syndrome; Concurrent use of apomorphine.
Use Cautiously in: Hepatic impairment; Abdominal surgery (may mask ileus); Phenylketonuria (orally disintegrating tablets contain phenylalanine); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children ≤3 yr (PO) or <1 mo (parenteral).

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, QT interval prolongation.
GI: constipation, diarrhea, abdominal pain, dry mouth, ↑ liver enzymes. **Neuro:** extrapyramidal reactions, SEROTONIN SYNDROME, headache, dizziness, drowsiness, fatigue, weakness. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS.

Interactions

Drug-Drug: Use with **apomorphine** ↑ risk of severe hypotension and loss of consciousness; concurrent use contraindicated. **Carbamazepine**, **phenytoin**, and **rifampin** may ↓ levels. Drugs that affect serotonergic neurotransmitter systems, including **SSRIs**, **SNRIs**, **tricyclic antidepressants**, **MAOIs**, **fentanyl**, **lithium**, **buspirone**, **tramadol**, **methylene blue**, and **triptans**, ↑ risk of serotonin syndrome.

Route/Dosage

Prevention of Nausea/Vomiting Associated With Highly or Moderately Emetogenic Chemotherapy

PO (Adults): *Highly-emetogenic chemotherapy*—24 mg 30 min prior to chemotherapy.
PO (Adults and Children >11 yr): *Moderately emetogenic chemotherapy*—8 mg 30 min prior to chemotherapy and repeated 8 hr later; 8 mg every 12 hr may be given for 1–2 days following chemotherapy.
PO (Children 4–11 yr): *Moderately emetogenic chemotherapy*—4 mg 30 min prior to chemotherapy and repeated 4 and 8 hr later; 4 mg every 8 hr may be given for 1–2 days following chemotherapy.
IV (Adults): 0.15 mg/kg (max dose = 16 mg) 30 min prior to chemotherapy, repeated 4 and 8 hr later.
IV (Children 6 mo–18 yr): 0.15 mg/kg (max dose = 16 mg) 30 min prior to chemotherapy, repeated 4 and 8 hr later.

Hepatic Impairment

PO, IM, IV (Adults): *Severe hepatic impairment*—Not to exceed 8 mg/day.

Prevention of Postoperative Nausea/Vomiting

PO (Adults): 16 mg 1 hr before induction of anesthesia.
IM, IV (Adults and Children >12 yr): 4 mg before induction of anesthesia or postoperatively.
IV (Children 1 mo–12 yr and >40 kg): 4 mg before induction of anesthesia or postoperatively.
IV (Children 1 mo–12 yr and ≤40 kg): 0.1 mg/kg before induction of anesthesia or postoperatively.

Hepatic Impairment

PO, IM, IV (Adults): *Severe hepatic impairment*—Not to exceed 8 mg/day.

Prevention of Nausea/Vomiting Associated With Radiation Therapy

PO (Adults): 8 mg 1–2 hr prior to radiation; may be repeated every 8 hr, depending on type, location, and extent of radiation.

© F.A. Davis Publishing

Hepatic Impairment

PO, IM, IV (Adults): *Severe hepatic impairment*—Not to exceed 8 mg/day.

Availability (generic available)

Tablets: 4 mg, 8 mg, 24 mg. **Cost:** *Generic*—4 mg $735.05/30, 8 mg $1,217.42/30, 24 mg $105.50/1. **Orally disintegrating tablets (contain aspartame) (strawberry flavor):** 4 mg, 8 mg. **Cost:** *Generic*—4 mg $668.78/30, 8 mg $1,113.95/30. **Oral solution (strawberry flavor):** 4 mg/5 mL. **Cost:** $269.74/50 mL. **Solution for injection:** 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- Assess patient for extrapyramidal effects (involuntary movements, facial grimacing, rigidity, shuffling walk, trembling of hands) periodically during therapy.
- Monitor ECG in patients with hypokalemia, hypomagnesemia, HF, bradyarrhythmias, or patients taking concomitant medications that prolong the QT interval.
- Monitor for signs and symptoms of serotonin syndrome (mental status changes [agitation, hallucinations, delirium, coma], autonomic instability [tachycardia, labile BP, dizziness, diaphoresis, flushing, hyperthermia], neuromuscular symptoms [tremor, rigidity, myoclonus, hyperreflexia, incoordination], seizures, gastrointestinal symptoms [nausea, vomiting, diarrhea]). If symptoms occur, discontinue therapy.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** May cause transient ↑ in serum bilirubin, AST, and ALT levels.

Implementation

- First dose is administered prior to emetogenic event.
- **PO:** For orally disintegrating tablets, do not attempt to push through foil backing; with dry hands, peel back backing and remove tablet. Immediately place tablet on tongue; tablet will dissolve in seconds, then swallow with saliva. Administration of liquid is not necessary.

IV Administration

- **IV Push:** Administer undiluted (2 mg/mL) immediately before induction of anesthesia or postoperatively if nausea and vomiting occur shortly after surgery. ***Rate:*** Administer over at least 30 sec and preferably over 2–5 min.
- **Intermittent Infusion:** ***Dilution:*** Dilute doses for prevention of nausea and vomiting associated with chemotherapy in 50 mL of D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.45% NaCl. Solution is clear and colorless. Stable for 7 days at room temperature following dilution. ***Concentration:*** 1 mg/mL. ***Rate:*** Administer each dose over 15 min.
- **Y-Site Compatibility:** acetaminophen, aldesleukin, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, amiodarone, anakinra, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftaroline, ceftazidime, ceftolozane/tazobactam, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, defibrotide, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, floxuridine, fluconazole, fludarabine, folic acid, fosaprepitant, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, isavuconazonium, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methadone, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, papaverine, penicillin G, pentamidine, pentostatin, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, tedizolid, telavancin, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil,

© F.A. Davis Publishing

vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azathioprine, blinatumomab, cefepime, chloramphenicol, dantrolene, ertapenem, foscarnet, furosemide, ganciclovir, gemtuzumab ozogamicin, indomethacin, lorazepam, meropenem/vaborbactam, methohexital, micafungin, milrinone, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenytoin, rituximab, sargramostim, sodium bicarbonate, thiopental, trastuzumab, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take ondansetron as directed.
- Advise patient to notify health care professional immediately if symptoms of irregular heartbeat, serotonin syndrome, or involuntary movement of eyes, face, or limbs occur.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy.
- Prevention of postoperative nausea and vomiting.
- Prevention of nausea and vomiting due to radiation therapy.

oritavancin (oh-rit-a-**van**-sin)

Kimyrsa, Orbactiv

Classification

Therapeutic: anti-infectives

Pharmacologic: lipoglycopeptides

Indications

Acute bacterial skin and skin structure infections caused by or suspected to be caused by susceptible designated Gram-positive bacteria.

Action

Binds to bacterial cell wall resulting in cell death.

Therapeutic Effects: Bactericidal action against susceptible bacteria with resolution of infection. **Spectrum:** Active against *Staphylococcus aureus* (including methicillin-susceptible and resistant strains), *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Streptococcus dysgalactiae*, *Streptococcus anginosus* (including *S. anginosus*, *S. intermidius*, and *S. constellatus*) and *Enterococcus faecalis* (vancomycin-susceptible strains only).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Penetrates skin/skin structures.

Metabolism and Excretion: Slowly excreted unchanged in urine (5% in two wk) and feces (1% in two wk).

Half-life: 245 hr (terminal).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	at least 2 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity (cross-sensitivity with other glycopeptides may occur); Heparin use for 120 hr (5 days) following administration of oritavancin (causes false ↑ aPTT); Concurrent warfarin (↑ risk of bleeding, use only if benefit outweighs bleeding risk); Confirmed/suspected osteomyelitis (alternate treatment required).

Use Cautiously in: Concurrent use of drugs with narrow therapeutic indices that are metabolized by the CYP450 enzyme system (effects may be altered); Severe hepatic/renal impairment; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Older adults may have ↑ sensitivity to drug effects.

Adverse Reactions/Side Effects

CV: tachycardia. **GI:** CLOSTRIDIOIDES DIFFICILE ASSOCIATED DIARRHEA (CDAD), ↑ liver enzymes, nausea, vomiting. **Local:** infusion site reactions. **Neuro:** headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), infusion reactions (including infusion-related reaction resembling vancomycin flushing syndrome), limb/subcutaneous abscess formation.

Interactions

Drug-Drug: ↑ risk of bleeding with **warfarin** (avoid if possible). Affects the activities of several CYP450 enzymes (careful monitoring of other **drugs metabolized by the CYP450 system** that have narrow therapeutic indices to assess for toxicity or ineffectiveness is recommended).

Route/Dosage

IV (Adults): 1200 mg single dose.

Availability

Lyophilized powder for injection (Orbactiv): 400 mg/vial. **Lyophilized powder for injection (Kimyrsa):** 1200 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.

© F.A. Davis Publishing

- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to 2 mo following cessation of therapy.
- Monitor for infusion-related reaction (resembling vancomycin flushing syndrome—flushing of upper body, urticaria, pruritus, rash; chest pain, back pain, chills, tremor). May resolve with stopping or slowing infusion.
- ***Lab Test Considerations:*** Monitor hepatic function tests. May cause ↑ ALT, AST, and bilirubin.
- May cause hyperuricemia and hypoglycemia.
- Causes falsely ↑ aPTT for 120 hrs after infusion. Avoid heparin administration during this time. Use a nonphospholipid dependent coagulation test such as Factor Xa assay if needed.
- Artificially prolongs PT and INR for up to 12 hr. May increase risk of bleeding with warfarin.

Implementation

- The two oritavancin products (*Orabactiv* and *Kimyrsa*) are different products. Directions for use are not interchangeable.

Orabactiv

- ***Reconstitution:*** Using three 400-mg vials, add 40 mL of sterile water for injection to each vial for a 10-mg/mL solution/vial. Swirl gently to avoid foaming and ensure powder is completely reconstituted. Solution is clear and colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter. ***Dilution:*** Withdraw and discard 120 mL from 1000-mL bag of D5W. Withdraw 40 mL from each vial and add to D5W bag. Do not use 0.9% NaCl; may cause precipitation. ***Concentration:*** 1.2 mg/mL. Use within 6 hr at room temperature or 12 hr if refrigerated, including 3 hr infusion. ***Rate:*** Infuse over 3 hr.
- **Y-Site Incompatibility:** Do not mix with other solutions or medications. Flush line before and after infusion.

Kimyrsa

- Use of intravenous unfractionated heparin is contraindicated for 120 hours (5 days) after *Kimyrsa* administration because the activated partial thromboplastin time (aPTT) test results may remain falsely elevated for up to 120 hours (5 days) after *Kimyrsa* administration.
- ***Reconstitution:*** Add 40 mL sterile water for injection to 1200-mg vial. Swirl gently to avoid foaming. Solution is clear, colorless to pink; do not use solutions that are cloudy, discolored, or contain particulate matter. ***Concentration:*** 30 mg/mL. ***Dilution:*** Withdraw and discard 40 mL from a 250-mL IV bag of 0.9% NaCl or D5W. Withdraw 40 mL of the reconstituted vial and add to IV bag of 0.9% NaCl or D5W to bring volume to 250 mL. ***Concentration:*** 4.8 mg/mL. Discard unused portion of reconstituted solution. Solution is stable for 4 hr at room temperature or 12 hr if refrigerated. Combined storage and infusion times should be within the stability times. ***Rate:*** Infuse over 1 hr.
- **Y-Site Compatibility:** 0.9% NaCl D5W.
- **Y-Site Incompatibility:** Drugs formulated at a basic or neutral pH. Do not use with other drugs. If same IV line must be used, flush line before and after infusion with 0.9% NaCl or D5W.

Patient/Family Teaching

- Explain purpose of oritavancin to patient.
- Instruct patient to notify health care professional if signs and symptoms of hypersensitivity reactions (rash, hives, dyspnea, facial swelling) occur.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct the patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

oseltamivir (o-sel-**tam**-i-vir)

Tamiflu

Classification

Therapeutic: antivirals

Pharmacologic: neuraminidase inhibitors

Indications

Treatment of uncomplicated acute illness due to influenza infection in adults and children ≥2 wk who have had symptoms for ≤2 days. Prevention of influenza in patients ≥1 yr.

Action

Inhibits the enzyme neuraminidase, which may alter virus particle aggregation and release. **Therapeutic Effects:** Reduced duration or prevention of flu-related symptoms.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract and converted by the liver to the active form, oseltamivir carboxylate. 75% reaches systemic circulation as the active drug.
Distribution: Unknown.
Protein Binding: oseltamivir phosphate: 42%; oseltamivir carboxylate: 3%.
Metabolism and Excretion: Rapidly metabolized by the liver to oseltamivir carboxylate, the active drug. >99% excreted unchanged in urine.
Half-life: *Oseltamivir carboxylate*—6–10 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; End stage renal disease and not receiving dialysis.
Use Cautiously in: Renal impairment (↓ dose if CCr ≤60 mL/min); Hereditary fructose intolerance (75 mg of oral suspension contains 2 g of sorbitol); OB: Use during pregnancy only if benefit to patient outweighs potential fetal risk; Lactation: Use during breast feeding only if benefit to patient outweighs potential risk to infant; Pedi: Children <2 wk (safety and efficacy not established for treatment); children <1 yr (safety and efficacy not established for prevention). Oral suspension contains sodium benzoate; avoid use in neonates.

Adverse Reactions/Side Effects

GI: nausea, vomiting. **Neuro:** SEIZURES, abnormal behavior, agitation, confusion, delirium, hallucinations, insomnia, nightmares, vertigo. **Resp:** bronchitis.

Interactions

Drug-Drug: May ↓ the therapeutic effect of **influenza virus vaccine**; avoid use 2 days prior to and 2 wk after vaccine administration.

Route/Dosage

Treatment of Influenza

PO (Adults and Children ≥13 yr): 75 mg twice daily for 5 days.
PO (Children 1–12 yr and >40 kg): 75 mg twice daily for 5 days.
PO (Children 1–12 yr and 23.1–40 kg): 60 mg twice daily for 5 days.
PO (Children 1–12 yr and 15.1–23 kg): 45 mg twice daily for 5 days.
PO (Children 1–12 yr and ≤15 kg): 30 mg twice daily for 5 days.
PO (Infants 2 wk–<1 yr): 3 mg/kg/dose twice daily for 5 days.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—30 mg twice daily for 5 days; *CCr 10–30 mL/min*—30 mg once daily for 5 days; *CCr ≥10 mL/min and on HD*—30 mg after each HD session (not to exceed 5 days); *CCr ≥10 mL/min and on PD*—30-mg single dose immediately after a dialysis exchange; *CCr <10 mL/min and not on dialysis*—Not recommended.

Influenza Prevention

PO (Adults and Children ≥13 yr): 75 mg once daily for ≥10 days.
PO (Children 1–12 yr and >40 k g): 75 mg once daily for 10 days.
PO (Children 1–12 yr and 23.1–40 kg): 60 mg once daily for 10 days.
PO (Children 1–12 yr and 15.1–23 kg): 45 mg once daily for 10 days.
PO (Children 1–12 yr and ≤15 kg): 30 mg once daily for 10 days.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—30 mg once daily for ≥10 days; *CCr 10–30 mL/min*—30 mg every other day for ≥10 days; *CCr ≥10 mL/min and on HD*—30 mg after alternate HD sessions (treatment duration ≥10 days); *CCr ≥10 mL/min and on PD*—30 mg once weekly immediately after a dialysis exchange (treatment duration ≥10 days); *CCr <10 mL/min and not on dialysis*—Not recommended.

Availability (generic available)

Capsules: 30 mg, 45 mg, 75 mg. **Oral suspension (tutti-frutti flavor):** 6 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor influenza symptoms (sudden onset of fever, cough, headache, fatigue, muscular weakness, sore throat). Additional supportive treatment may be indicated to treat symptoms.

Implementation

- Treatment with oseltamivir should be started as soon as possible from the first sign of flu symptoms within 2 days of exposure.
- Consider available information on influenza drug susceptibility patterns and treatment effects before using oseltamivir for prophylaxis.
- **PO:** May be administered with food or milk to minimize GI irritation.
- Use correct oral dosing device for measuring oral solution. Dosing errors have occurred due to oseltamivir dosing in mg and solution in mL. Make sure units of measure on prescription instructions match dosing device provided with the drug.
- If oral suspension is not available, capsules can be opened and mixed with flavored foods (regular or sugar-free chocolate syrup, corn syrup, caramel topping, light brown sugar dissolved in water). If correct dose and oral suspension are not available, pharmacist may compound emergency supply of oral suspension from 75 mg capsules.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take oseltamivir as soon as influenza symptoms appear and to continue to take it as directed, for the full course of therapy, even if feeling better. Take missed doses as soon as remembered unless within 2 hr of next dose. Do not double doses.
- Caution patient that oseltamivir should not be shared with anyone, even if they have the same symptoms.
- Advise patient that oseltamivir is not a substitute for a flu shot. Patients should receive annual flu shot according to immunization guidelines.
- Advise patients to report behavioral changes (hallucinations, delirium, and abnormal behavior) to health care professional immediately.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Reduced duration or prevention of flu-related symptoms.

osimertinib (oh-si-**mer**-ti-nib)

Tagrisso

Classification

Therapeutic: antineoplastics
Pharmacologic: epidermal growth factor receptor (EGFR) inhibitors

Indications

Treatment of metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non–small-cell lung cancer (NSCLC) in patients who have progressed on or after EGFR tyrosine kinase inhibitor therapy. First-line treatment of metastatic NSCLC in patients whose tumors have EGFR exon 19 deletions or exon 21 L858R mutations. Adjuvant therapy after tumor resection of NSCLC in patients whose tumors have EGFR exon 19 deletions or exon 21 L858R mutations.

Action

Irreversibly binds to select mutant forms of EGFR (including T790M), resulting in inactivation of kinases that regulate proliferation and transformation; the T790M mutation is the most common mechanism of resistance to EGFR tyrosine kinase inhibitors. **Therapeutic Effects:** Decreased spread of NSCLC.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Extensively distributed to tissues.
Protein Binding: 95%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system) to 2 active metabolites; 68% excreted in feces (2% as unchanged drug); 14% excreted in urine (2% as unchanged drug).
Half-life: 48 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Oral	unknown	6 hr	24 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of strong CYP3A4 inhibitors or inducers; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Congenital long QT syndrome, HF, electrolyte abnormalities, or taking QT interval prolonging medications; End stage renal disease (CCr <15 mL/min); Severe hepatic impairment; Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: CARDIOMYOPATHY, VENOUS THROMBOEMBOLISM, cutaneous vasculitis, QT interval prolongation. **Derm:** ERYTHEMA MULTIFORME (EM), STEVENS-JOHNSON SYNDROME (SJS), dry skin, nail disorders, pruritus, rash, urticaria. **EENT:** blepharitis, blurred vision, cataracts, dry eye, eye pain, ↑ lacrimation, keratitis. **F and E:** hypermagnesemia, hyponatremia. **GI:** constipation, ↓ appetite, diarrhea, nausea, stomatitis. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA, anemia, lymphopenia. **MS:** back pain. **Neuro:** STROKE, fatigue, headache. **Resp:** INTERSTITIAL LUNG DISEASE, cough.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **itraconazole**, **nefazodone**, and **ritonavir**, may ↑ levels and the risk of toxicity; avoid concurrent use. **Strong CYP3A4 inducers**, including **carbamazepine**, **rifampin**, and **phenytoin**, may ↓ levels and its effectiveness; avoid concurrent use. May ↑ or ↓ **carbamazepine**, **cyclosporine**, **ergot derivatives**, **fentanyl**, **phenytoin**, or **quinidine**; avoid concurrent use. **QT interval prolonging drugs** may ↑ risk of torsades de pointes; avoid concurrent use. May ↑ levels of **P-gp substrates**, including **fexofenadine**. May ↑ levels of **breast cancer resistant protein (BCRP) substrates**, including **rosuvastatin**.
Drug-Natural Products: St. John's wort may ↓ levels and its effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults): 80 mg once daily. In patients with metastatic disease, continue until disease progression or unacceptable toxicity. In adjuvant setting, continue until disease progression, unacceptable toxicity, or for up to 3 yr.

© F.A. Davis Publishing

Availability
Tablets: 40 mg, 80 mg.

NURSING IMPLICATIONS
Assessment
- Assess for worsening respiratory symptoms (dyspnea, coughing, fever) during therapy; may indicate interstitial lung disease (ILD) or pneumonitis. If signs and symptoms occur, hold medication. If ILD confirmed, permanently discontinue osimertinib.
- Monitor cardiac status (ECG, electrolytes) periodically during therapy, especially in patients with congenital long QTc syndrome, HF, electrolyte abnormalities, or taking medications that prolong QTc interval. *If QTc interval >500 msec on at least 2 separate ECGs,* hold therapy until QTc interval is <481 msec or recovery to baseline if baseline is ≥481 msec, resume at 40-mg dose. *If QTc interval prolongation occurs with signs and symptoms of life-threatening arrhythmia,* permanently discontinue therapy.
- Assess for signs and symptoms of cardiomyopathy (cardiac failure, pulmonary edema, ejection fraction decreased, stress cardiomyopathy) by echo cardiogram, multigated acquisition (MUGA) scan prior to starting therapy and every 3 mo during therapy. *If asymptomatic and absolute decrease in left ventricular ejection fraction (LVEF) of 10% from baseline and below 50%,* withhold therapy for up to 4 wk. If improved to baseline, resume. If not improved to baseline, permanently discontinue. *If symptomatic HF develops,* permanently discontinue therapy.
- Monitor for symptoms of keratitis (eye inflammation, lacrimation, light sensitivity, blurred vision, eye pain, red eye) during therapy. If symptoms occur, refer to an ophthalmologist.
- Assess for skin rash during therapy. Hold osimertinib if SJS or EM are suspected. Discontinue osimertinib if SJS or EM are confirmed.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Patient selection is based on presence of EGFR exon mutations in tumor specimens. Information on FDA-approved tests for the detection of EGFR mutations is available at http://www.fda.gov/companiondiagnostics.
- Monitor CBC with differential periodically during therapy. May cause lymphopenia, thrombocytopenia, anemia, and neutropenia. *If ≥Grade 3 reaction occurs,* withhold osimertinib for up to 3 wk. *If improved to Grade 0–2,* resume at 80 mg or 40 mg daily. *If no improvement in 3 wk,* permanently discontinue osimertinib.
- May cause hyponatremia and hypermagnesemia.

Implementation
- **PO:** Administer once daily without regard to food.
- For patients with difficulty swallowing, disperse tablet in 60 mL (2 oz) of only non-carbonated water. Stir until tablet is completely dispersed and swallow immediately; do not crush, heat, or ultrasonicate during preparation. Rinse container with 4–8 oz of water and drink or administer through NG tube immediately. If administered via NG tube, disperse tablet in 15 mL of noncarbonated water, then use an additional 15 mL of water to transfer any residues in syringe. Administer 30 mL of solution via NG tube with 30 mL of water flushes.

Patient/Family Teaching
- Instruct patient to take osimertinib as directed. If dose missed, omit and take next dose as scheduled. Advise patient to read *Patient Information* prior to starting therapy and with each Rx dose refill in case of changes.
- Advise patient to notify health care professional if signs and symptoms of lung problems (worsening lung symptoms, trouble breathing, shortness of breath, cough, fever) or heart problems (pounding or racing heart, shortness of breath, swollen ankles or feet, lightheadedness, fainting), eye symptoms, rash (target lesions, severe blistering or peeling of skin), or cutaneous vasculitis (multiple, nonblanching red papules on forearms, lower legs, or buttocks or large hives on trunk that do not go away within 24 hr and develop a bruised appearance) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Caution females of reproductive potential to use effective contraception during and for 6 wk after final dose. Advise males with female partners of reproductive potential to use effective contraception during and for 4 mo after final dose. Advise females to avoid breast feeding during and for 2 wk after final dose. May impair fertility in females and males.

Evaluation/Desired Outcomes
- Decreased spread of NSCLC.

ospemifene (os-**pem**-i-feen)
Osphena

Classification
Therapeutic: hormones
Pharmacologic: estrogen agonists/antagonists

Indications
Moderate to severe dyspareunia due to menopausal vulvar/vaginal atrophy. Moderate to severe vaginal dryness due to menopausal vulvar/vaginal atrophy.

Action
Has agonist (estrogen-like) effects on the endometrium of the uterus; effects are tissue-specific. **Therapeutic**

© F.A. Davis Publishing

Effects: Decreased dyspareunuia. Decreased vaginal dryness.

Pharmacokinetics

Absorption: Well absorbed following oral administration; food enhances absorption 2–3 fold.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 and CYP2C9 enzyme systems); 75% excreted in feces, 7% in urine as metabolites; minimal amounts excreted unchanged in urine.
Half-life: 26 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
PO	within 12 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Undiagnosed abnormal genital bleeding; History/ suspicion of estrogen-dependent cancer; History of/current thromboembolic disorder, including DVT, PE, MI, or stroke; Concurrent use of estrogens, estrogen agonists/antagonists, fluconazole, or rifampin; Severe hepatic impairment; OB: Known/suspected pregnancy (may cause fetal harm); Lactation: Breast feeding should be avoided.
Use Cautiously in: Patients with risk factors for cardiovascular disease, arterial vascular disease, or venous thromboembolism (including hypertension, obesity, family history, tobacco use, diabetes mellitus, history of DVT/PE, or systemic lupus erythematosus); Women with a uterus (estrogen use without a progestin ↑ risk of endometrial cancer); Known or suspected breast cancer.

Adverse Reactions/Side Effects

CV: DEEP VEIN THROMBOSIS/PE, MI, STROKE. **Derm:** hot flush, hyperhydrosis. **GU:** ENDOMETRIAL CANCER, genital/vaginal discharge. **MS:** muscle spasms. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions

Drug-Drug: Fluconazole may ↑ levels and risk of toxicity; avoid concurrent use. **Ketoconazole** or other **CYP3A4 or CYP2C9 inhibitors** may ↑ levels and risk of toxicity. **Rifampin** may ↓ levels and effectiveness; avoid concurrent use. Avoid concurrent use of other **estrogens** or **estrogen agonist/antagonists** due to ↑ estrogen effects. May displace or be displaced by other **drugs that are highly protein bound**.

Route/Dosage

PO (Adults): 60 mg once daily.

Availability

Tablets: 60 mg.

NURSING IMPLICATIONS

Assessment

- Assess amount of pain during intercourse and vaginal dryness prior to and periodically during therapy.
- Determine methods previously used to treat dyspareunia.
- Assess BP before and periodically during therapy.
- Monitor for hypersensitivity reactions (angioedema, urticaria, rash, pruritus). If symptoms occur, discontinue ospemifene and treat symptomatically.

Implementation

- **PO:** Administer once daily with food.

Patient/Family Teaching

- Instruct patient to take ospemifene as directed. Advise patient to read *Patient Information* sheet before starting therapy and with each Rx refill in case of changes.
- Advise patient to report signs and symptoms of unusual vaginal bleeding, changes in vision or speech, sudden new severe headaches, severe pains in chest or legs with or without shortness of breath, weakness, or fatigue promptly to health care professional immediately.
- Inform patient that ospemifene may cause hot flashes, vaginal discharge, muscle spasm, and increased sweating.
- Patients who still have a uterus should discuss addition of progestin with health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise women to follow yearly exams (pelvic exam, breast exam, mammogram) to monitor for breast and uterine cancer.
- Caution patient that cigarette smoking, high BP, high cholesterol, diabetes, and being overweight during estrogen therapy may increase risk of heart disease.
- Ospemifene should not be taken during pregnancy or breast feeding. Instruct patient to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding.
- Advise patient to discuss dose and need for ospemifene every 3–6 mo.

Evaluation/Desired Outcomes

- Decrease in pain during intercourse.
- Decreased vaginal dryness.

oxacillin, See PENICILLINS, PENICILLINASE RESISTANT.

© F.A. Davis Publishing

oxaliplatin (ox-a-li-pla-tin)
Eloxatin

Classification
Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Indications
Adjuvant treatment of stage III colon cancer in patients who have undergone complete resection of the primary tumor (in combination with 5-fluorouracil and leucovorin). Treatment of advanced colorectal cancer (in combination with 5-fluorouracil and leucovorin). **Unlabeled Use:** Treatment of ovarian cancer that has progressed despite treatment with other agents.

Action
Inhibits DNA replication and transcription by incorporating platinum into normal cross-linking (cell-cycle nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Extensive tissue distribution.
Protein Binding: >90% (platinum).
Metabolism and Excretion: Undergoes rapid and extensive nonenzymatic biotransformation; excreted mostly by the kidneys.
Half-life: 391 hrs.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Hypersensitivity to other platinum compounds; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Renal impairment; HF, bradycardia, concomitant use of QT interval prolonging medications, hypokalemia, and hypomagnesemia; Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of adverse reactions in older adults.

Adverse Reactions/Side Effects
Adverse reactions are noted for the combination of oxaliplatin, 5-fluorouracil and leucovorin.
CV: QT INTERVAL PROLONGATION, TORSADES DE POINTES, chest pain, edema, thromboembolism. **EENT:** visual abnormalities. **F and E:** dehydration, hypokalemia. **GI:** diarrhea, nausea, vomiting, abdominal pain, anorexia, gastroesophageal reflux, stomatitis. **Hemat:** leukopenia, NEUTROPENIA, THROMBOCYTOPENIA, anemia. **Local:** injection site reactions. **MS:** RHABDOMYOLYSIS, back pain. **Neuro:** neurotoxicity, REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME, fatigue. **Resp:** PULMONARY FIBROSIS, cough, dyspnea. **Misc:** ANAPHYLAXIS/ANAPHYLACTOID REACTIONS, fever.

Interactions
Drug-Drug: Concurrent use of **nephrotoxic agents** may ↑ toxicity. Concurrent use of QT interval prolonging medications, including **Class Ia antiarrhythmics** and **Class III antiarrhythimics** may ↑ risk of torsades de pointes.

Route/Dosage
IV (Adults): *Day 1*—85 mg/m² with leucovorin 200 mg/m² at the same time over 2 hr, followed by 5-fluorouracil 400 mg/m² bolus over 2–4 min, then 5-fluorouracil 600 mg/m² as a 22-hr infusion. *Day 2*—leucovorin 200 mg/m² over 2 hr, followed by 5-fluorouracil 400 mg/m² bolus over 2–4 min, then 5-fluorouracil 600 mg/m² as a 22-hr infusion. Cycle is repeated every 2 wk. Dosage reduction/alteration may be required for neurotoxicity or other serious adverse effects.

Renal Impairment
IV (Adults): *CCr <30 mL/min*—↓ dose on Day 1 to 65 mg/m².

Availability (generic available)
Solution for injection: 5 mg/mL.

NURSING IMPLICATIONS
Assessment
- Assess for peripheral sensory neuropathy. *Acute onset* occurs within hr to 1–2 days of dosing, resolves within 14 days, and frequently recurs with further dosing (transient paresthesia, dysesthesia, and hypoesthesia of hands, feet, perioral area, or throat). Symptoms may be precipitated or exacerbated by exposure to cold or cold objects; avoid ice during symptoms. May also cause jaw spasm, abnormal tongue sensation, dysarthria, eye pain, and a feeling of chest pressure. *Persistent* (>14 days) causes paresthesias, dysethesias, and hypoesthesias, but may also include deficits in proprioception that may interfere with daily activities (walking, writing, swallowing). Persistent neuropathy may occur without prior acute neuropathy and may improve upon discontinuation of oxaliplatin. **Adjuvant Therapy:** *For persistent Grade 2 neurosensory events that do not resolve,* reduce dose of oxaliplatin to 75 mg/m². *For patients with persistent Grade 3 neurosensory events,* consider discontinuing therapy. Do not alter infusional 5-fluorouracil/leucovorin regimen. *For Grade 4 neuropathy,* discontinue oxaliplatin. **Advanced Colorectal Cancer:** *For persistent Grade 2 neurosensory events that do not resolve, reduce dose to 65 mg/m². For patients with persistent Grade 3 neurosensory events,* consider discontinuing therapy. Do not alter infusional 5-fluorouracil/leucovorin regimen. *For Grade 4 neuropathy,* discontinue oxaliplatin.

© F.A. Davis Publishing

- Assess for signs of pulmonary fibrosis (nonproductive cough, dyspnea, crackles, radiological; infiltrates). May be fatal. Discontinue oxaliplatin if pulmonary fibrosis occurs.
- Monitor for signs of anaphylaxis (rash, hives, swelling of lips or tongue, sudden cough). Epinephrine, corticosteroids, and antihistamines should be readily available.
- Monitor for signs and symptoms of reversible posterior leukoencephalopathy syndrome (headache, altered mental functioning, seizures, abnormal vision from blurriness to blindness, associated or not with hypertension).
- Monitor ECG in patients with HF, bradyarrhythmias, and electrolyte abnormalities and in patients taking drugs known to prolong the QT interval, including Class Ia and III antiarrhythmics.
- Monitor for signs and symptoms of GI adverse reactions (nausea, vomiting, diarrhea) during therapy. *If Grade 3 or 4 GI adverse reactions occur,* after recovery, reduce oxaliplatin dose to 75 mg/m^2 along with dose reduction of fluorouracil to 300 mg/m^2 as an IV bolus and 500 mg/m^2 as a 22-hr continuous infusion.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor WBC with differential, hemoglobin, platelet count, and blood chemistries (ALT, AST, bilirubin, and serum creatinine) at baseline and before each oxaliplatin cycle. **Adjuvant Therapy:** *For Grade 4 neutropenia or febrile neutropenia, or Grade 3 or 4 thrombocytopenia,* hold next dose until neutrophils $\geq 1.5 \times 10^9$/L and platelets $\geq 75 \times 10^9$/L. Reduce dose of oxaliplatin to 75 mg/m^2 and infusional 5-fluorouracil to 300 mg/m^2 bolus and 500 mg/m^2 22-hr infusion. **Advanced Colorectal Cancer:** *After recovery from grade 3/4 gastrointestinal (despite prophylactic treatment), or grade 4 neutropenia, or febrile neutropenia, or grade 3/4 thrombocytopenia:* reduce dose of oxaliplatin to 65 mg/m^2 and 5-fluorouracil by 20% (300 mg/m^2 bolus and 500 mg/m^2 22-hr infusion). Delay next dose until neutrophils $\geq 1.5 \times 10^9$/L and platelets $\geq 75 \times 10^9$/L.
- Monitor and correct electrolytes before starting therapy and periodically during therapy.

Implementation

- Extravasation may result in local pain and inflammation that may be severe and lead to necrosis.
- Premedicate patient with antiemetics with or without dexamethasone. Prehydration is not required.

IV Administration

- **Intermittent Infusion:** Protect concentrated solution from light; do not freeze. ***Dilution:*** Must be further diluted with 250–500 mL of D5W. **Do not use 0.9% NaCl or any other chloride-containing solution for final solution.** Do not use aluminum needles or administration sets containing aluminum parts; aluminum may cause degradation of platinum compounds. May be stored in refrigerator for 24 hr or 6 hr at room temperature. Diluted solution is not light-sensitive. Do not administer solutions that are discolored or contain particulate matter. ***Concentration:*** 0.2–0.6 mg/mL. ***Rate:*** Administer oxaliplatin simultaneously with leucovorin in separate bags via Y-line over 120 min. Prolonging infusion time to 6 hr may decrease acute toxicities. Infusion times for fluorouracil and leucovorin do not need to change.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, caspofungin, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levoleucovorin calcium, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methadone, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, paclitaxel, palonosetron, pancuronium, pemetrexed, pentamidine, phentolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, the-

© F.A. Davis Publishing

ophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** calcium chloride, cefepime, dantrolene, diazepam, sodium chloride. Alkaline solutions, chloride-containing solutions. Infusion line should be flushed with D5W prior to administration of other solutions or medications.

Patient/Family Teaching

- Explain purpose of oxaliplatin to patient. Advise patient to read *Patient Information* before starting therapy and periodically during therapy in case of changes.
- Inform patients and caregivers of potential for peripheral neuropathy and potentiation by exposure to cold or cold objects. Advise patient to avoid cold drinks, use of ice in drinks or as ice packs, and to cover exposed skin prior to exposure to cold temperature or cold objects. Caution patients to cover themselves with a blanket during infusion, do not breathe deeply when exposed to cold air, wear warm clothing, and cover mouth and nose with a scarf or pull-down ski cap to warm the air that goes to their lungs, do not take things from the freezer or refrigerator without wearing gloves, drink fluids warm or at room temperature, always drink through a straw, do not use ice chips for nausea, be aware that most metals (car doors, mailbox) are cold; wear gloves to touch, do not run air conditioning at high levels in house or car, if hands get cold wash them with warm water. Advise health care professional of how you did since last treatment before next infusion.
- Instruct patient to notify health care professional immediately if signs of reversible posterior leukoencephalopathy syndrome, low blood cell counts (fever, persistent diarrhea, infection) or if persistent vomiting, signs of dehydration, cough or breathing difficulty, thirst, dry mouth, dizziness, decreased urination, signs of infection (fever, temperature of ≥100.5° F, cough that brings up mucus, chills or shivering, burning or pain on urination, pain on swallowing, sore throat, redness or swelling at intravenous site) or signs of allergic reactions occur.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during therapy and for at least 9 mo after final dose and to avoid breast feeding during and for 3 mo after final dose. Advise males with female partners of reproductive potential to use effective contraception for 6 mo after final dose. May impair female and male fertility.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignancies.

BEERS

oxazepam (ox-az-e-pam)

Oxpam, ~~Serax~~

Classification

Therapeutic: antianxiety agents, sedative/hypnotics

Pharmacologic: benzodiazepines

Schedule IV

Indications

Management of anxiety, anxiety associated with depression. Symptomatic treatment of alcohol withdrawal.

Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Decreased anxiety. Diminished symptoms of alcohol withdrawal.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Absorption is slower than with other benzodiazepines.

Distribution: Widely distributed. Crosses the blood-brain barrier. May cross the placenta and enter breast milk.

Metabolism and Excretion: Metabolized by the liver to inactive compounds.

Protein Binding: 97%.

Half-life: 5–15 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	45–90 min	unknown	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Some products contain tartrazine and should be avoided in patients with known intolerance.

Use Cautiously in: Hepatic dysfunction (may be preferred over some benzodiazepines due to short half-life); History of suicide attempt or substance use disorder; Debilitated patients (initial dosage ↓ recommended); Severe chronic obstructive pulmonary disease; Myasthenia gravis; OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <6 yr (safety and effectiveness not established); Geri: Appears on Beers list (associated with ↑ risk of falls in older adults; ↓ dose required).

Adverse Reactions/Side Effects

EENT: blurred vision. **Neuro:** dizziness, drowsiness, confusion, hangover, headache, impaired memory, mental depression, paradoxical excitation, slurred

© F.A. Davis Publishing

speech. **Resp:** respiratory depression. **CV:** tachycardia. **GI:** constipation, diarrhea, drug-induced hepatitis, nausea, vomiting, weight gain (unusual). **GU:** urinary problems. **Derm:** rashes. **Hemat:** leukopenia. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioid analgesics**, and other **sedative/hypnotics** (including other **benzodiazepines**). May ↓ the therapeutic effectiveness of **levodopa**. **Hormonal contraceptives** or **phenytoin** may ↓ effectiveness. **Theophylline** may ↓ sedative effects.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

PO (Adults): *Antianxiety agent*—10–30 mg 3–4 times daily. *Sedative/hypnotic/management of alcohol withdrawal*—15–30 mg 3–4 times daily.
PO (Geriatric Patients): 5 mg 1–2 times daily initially or 10 mg 3 times daily; may be ↑ as needed.

Availability (generic available)

Capsules: 10 mg, 15 mg, 30 mg. **Tablets:** 10 mg, 15 mg, 30 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for anxiety and orientation, mood and behavior.
- Assess level of sedation (ataxia, dizziness, slurred speech) periodically throughout therapy.
- Assess regularly for continued need for treatment.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict the amount of drug available to patient.
- Assess risk for addiction, abuse, or misuse prior to administration and periodically during therapy.
- Geri: Assess CNS effects and risk of falls. Institute falls prevention strategies.
- ***Lab Test Considerations:*** Monitor CBC and liver function tests periodically during prolonged therapy.
- May cause decreased thyroidal uptake of ^{123}I and ^{131}I.

Implementation

- Medication should be tapered at the completion of therapy (taper by 0.5 mg every 3 days). Sudden cessation of medication may lead to withdrawal (insomnia, irritability, nervousness, tremors).
- **PO:** Administer with food if GI irritation becomes a problem.

Patient/Family Teaching

- Instruct patient to take oxazepam exactly as directed. Missed doses should be taken within 1 hr; if remembered later, omit and return to regular dosing schedule. Do not double or increase doses. If dose is less effective after a few wk, notify health care professional.
- Inform patient that oxazepam is usually prescribed for short-term use; do not take more than prescribed or for a longer period than prescribed.
- Advise patient that oxazepam is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Teach other methods to decrease anxiety, such as increased exercise, support group, relaxation techniques.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid the use of alcohol, other CNS depressants, or opioids and to consult health care professional prior to the use of OTC preparations that contain antihistamines or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: May cause fetal harm. Advise females of reproductive potential to use a nonhormonal method of contraception during use. Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Monitor infants exposed to oxazepam during 2nd and 3rd trimester or immediately prior to or during childbirth for decreased fetal movement and/or fetal heart rate variability, "floppy infant syndrome," dependence, and symptoms of withdrawal (hypertonia, hyperreflexia, hypoventilation, irritability, tremors, diarrhea, vomiting); may occur shortly after delivery up to 3 wk after birth. Monitor breast-fed infants for sedation and poor sucking. Encourage pregnant patients to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334; information is available at www.aedpregnancyregistry.org.
- Emphasize the importance of follow-up exams to monitor effectiveness of medication.
- Geri: Instruct patient and family how to reduce falls risk at home.

Evaluation/Desired Outcomes

- Decreased sense of anxiety.
- Increased ability to cope.
- Prevention or relief of acute agitation, tremor, and hallucinations during alcohol withdrawal.

© F.A. Davis Publishing

OXcarbazepine

(ox-kar-**baz**-e-peen)

Oxtellar XR, Trileptal

Classification

Therapeutic: anticonvulsants

Pharmacologic: carbamazepine analogues

Indications

Monotherapy or adjunctive therapy of partial seizures.

Unlabeled Use: Management of trigeminal neuralgia.

Action

Blocks sodium channels in neural membranes, stabilizing hyperexcitable states, inhibiting repetitive neuronal firing, and decreasing propagation of synaptic impulses. **Therapeutic Effects:** Decreased incidence of seizures.

Pharmacokinetics

Absorption: Rapidly absorbed after oral administration and rapidly converted to the active 10-hydroxy metabolite (MHD).

Distribution: Enters breast milk in significant amounts.

Metabolism and Excretion: Extensively converted to MHD, which is then primarily excreted by the kidneys.

Half-life: *Oxcarbazepine*—2 hr; *MHD*—9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO 12 hr	PO	rapid	4.5 hr†

†Steady-state levels of MHD are reached after 2–3 days during twice-daily dosing.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to oxcarbazepine, carbamazepine, or eslicarbazepine.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (dose ↓ recommended if CCr <30 mL/min); Severe hepatic impairment; OB: May be teratogenic (associated with oral clefts and cardiac abnormalities); levels of active metabolites may gradually ↓ during pregnancy which may ↑ seizure risk; use during pregnancy only if maternal benefit outweighs potential risk to fetus; Lactation: Use while breast feeding only if maternal benefit outweighs potential risk to infant; Rep: Women of reproductive potential; Pedi: Children <2 yr (immediate-release) and <6 yr (extended-release) (safety not established).

Exercise Extreme Caution in: Patients positive for HLA-B*1502 alleles (unless benefits clearly outweigh the risks) (↑ risk of serious skin reactions).

Adverse Reactions/Side Effects

Derm: DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, acne, rash, urticaria. **EENT:** abnormal vision, diplopia, nystagmus. **Endo:** hypothyroidism. **F and E:** hyponatremia. **GI:** abdominal pain, dyspepsia, nausea, vomiting, thirst. **Neuro:** ataxia, gait disturbances, tremor, SEIZURES, SUICIDAL THOUGHTS, dizziness/vertigo, drowsiness/fatigue, headache, cognitive symptoms. **Misc:** hypersensitivity reactions, lymphadenopathy.

Interactions

Drug-Drug: May ↑ levels and risk of toxicity of **CYP2C19 substrates**, including **phenytoin** when used at doses greater than 1200 mg/day; may need to ↓ dose of phenytoin. May ↓ levels and effectiveness of **CYP3A4 substrates**, including **hormonal contraceptives**. **Carbamazepine**, **phenobarbital**, **phenytoin**, and **rifampin** may ↓ levels; monitor MHD levels during titration period; may need to adjust dose of oxcarbazepine.

Route/Dosage

(Immediate-release tablets and oral suspension can be interchanged at equal doses.).

PO (Adults): *Adjunctive therapy (immediate-release)*—300 mg twice daily, may ↑ by up to 600 mg/day at weekly intervals up to 1200 mg/day (up to 2400 mg/day may be needed); *Conversion to monotherapy (immediate-release)*—300 mg twice daily; may ↑ by 600 mg/day at weekly intervals, while other antiepileptic drugs are tapered over 3–6 wk; dose of oxcarbazepine should be ↑ up to 2400 mg/day over a period of 2–4 wk; *Initiation of monotherapy (immediate-release)*—300 mg twice daily, ↑ by 300 mg/day every 3rd day, up to 1200 mg/day. Maximum maintenance dose should be achieved over 2–4 wk; *Adjunctive therapy or monotherapy (extended-release)*—600 mg once daily for 1 wk; may ↑ by 600 mg/day at weekly intervals up to 1200–2400 mg once daily; *Concurrent use of strong CYP3A4 inducer (carbamazepine, phenobarbital, phenytoin, rifampin) (extended-release)*—consider initiating therapy with 900 mg once daily.

PO (Children 2–16 yr): *Adjunctive therapy (immediate-release)*—4–5 mg/kg twice daily (up to 600 mg/day), ↑ over 2 wk to achieve 900 mg/day in patients 20–29 kg, 1200 mg/day in patients 29.1–39 kg and 1800 mg/day in patients >39 kg (range 6–51 mg/kg/day). In patients <20 kg, initial dose of 16–20 mg/kg/day may be used not to exceed 60 mg/kg/day. *Conversion to monotherapy (immediate-release)*—8–10 mg/kg/day given twice daily; may ↑ by 10 mg/kg/day at weekly intervals, whereas other antiepileptic drugs are tapered over 3–6 wk; dose of oxcarbazepine should be ↑ up to 600–900 mg/day in patients ≤20 kg, 900–1200 mg/day in patients 25–30 kg, 900–1500 mg/day in patients 35–40 kg. 1200–1500 mg/day in patients 45 kg, 1200–1800 mg/day in patients 50–55 kg, 1200–2100 mg/day in patients 60–65 kg, and 1500–2100 mg/day in patients 70 kg. Maximum maintenance dose should be achieved over 2–4 wk.

© F.A. Davis Publishing

PO (Children 6–17 yr): *Adjunctive therapy or monotherapy (extended-release)* — 8–10 mg/kg once daily (up to 600 mg/day) for 1 wk; may ↑ by 8–10 mg/kg/day at weekly intervals over 2–3 wk to achieve 900 mg/day in patients 20–29 kg, 1200 mg/day in patients 29.1–39 kg and 1800 mg/day in patients >39 kg; *Concurrent use of strong CYP3A4 inducer (carbamazepine, phenobarbital, phenytoin, rifampin) (extended-release)* — consider initiating therapy with 12–15 mg/kg (max dose = 900 mg) once daily.

Renal Impairment

PO (Adults): *CCr<30 mL/min (immediate- and extended-release)*. Initiate therapy at 300 mg/day and ↑ slowly to achieve desired response.

Availability (generic available)

Extended-release tablets: 150 mg, 300 mg, 600 mg. **Cost:** 150 mg $357.60/100, 300 mg $496.80/100, 600 mg $909.60/100. **Oral suspension (lemon-flavor):** 300 mg/5 mL. **Cost:** *Generic* — $206.80/250 mL. **Tablets:** 150 mg, 300 mg, 600 mg. **Cost:** *Generic* — 150 mg $145.36/100, 300 mg $264.46/100, 600 mg $487.92/100.

NURSING IMPLICATIONS

Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- **Seizures:** Assess frequency, location, duration, and characteristics of seizure activity. Hyponatremia may increase frequency and severity of seizures.
- Monitor patient for CNS changes. May manifest as cognitive symptoms (psychomotor slowing, difficulty with concentration, speech or language problems), somnolence or fatigue, or coordination abnormalities (ataxia, gait disturbances).
- Monitor for skin reactions (rash, erythema, urticaria, pruritus, fever, blistering). Patients with HLA-B*1502 alleles are at increased risk for Stevens-Johnson syndrome and toxic epidermal necrolysis. Discontinue oxcarbazepine if symptoms occur.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling), associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- ***Lab Test Considerations:*** Monitor ECG and serum electrolytes before and periodically during therapy. May cause hyponatremia. Usually occurs during the first 3 mo of therapy. May require dose reduction, fluid restriction, or discontinuation of therapy. Sodium levels return to normal within a few days of discontinuation.

Implementation

- Do not confuse oxcarbazepine with carbamazepine or oxaprozin.
- Implement seizure precautions as indicated.
- **PO:** Administer twice daily with or without food.
- Administer extended-release tablets on an empty stomach, at least 1 hr before or 2 hr after meals; giving with food increases risks of adverse effects. Swallow extended-release tablets whole, do not crush, break, or chew.
- Shake oral suspension well and prepare dose immediately after. Withdraw using oral dosing syringe supplied by manufacturer. May be mixed in a small glass of water just prior to administration or swallowed directly from syringe. Rinse syringe with warm water and allow to dry.

Patient/Family Teaching

- Instruct patient to take oxcarbazepine in equally spaced doses, as directed. Take missed doses as soon as possible but not just before next dose; do not double dose. Notify health care professional if more than 1 dose is missed. Medication should be gradually discontinued to prevent seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- May cause dizziness, drowsiness, or CNS changes. Advise patients to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. Advise patient not to take alcohol or other CNS depressants concurrently with this medication.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery. Rep: Advise females of reproductive potential to use an additional nonhormonal method of contraception during therapy and until next menstrual period. Instruct patient to notify health care professional if pregnancy is planned or suspected. Encourage patients who become pregnant to enroll in the North

© F.A. Davis Publishing

American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org. Enrollment must be done by patients themselves.
- Advise patients to carry identification describing disease and medication regimen at all times.

Evaluation/Desired Outcomes
- Absence or reduction of seizure activity.

oxiconazole, See ANTIFUNGALS (TOPICAL).

OXYBUTYNIN (ox-i-**byoo**-ti-nin)

oxybutynin (oral)
~~Ditropan~~, Ditropan XL

oxybutynin (transdermal gel)
Gelnique

oxybutynin (transdermal patch)
Oxytrol, Oxytrol for Women

Classification
Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

Indications
Urinary symptoms that may be associated with neurogenic bladder including: Frequent urination, Urgency, Nocturia, Urge incontinence. Overactive bladder with symptoms of urge incontinence, urgency, and frequency.

Action
Inhibits the action of acetylcholine at postganglionic receptors. Has direct spasmolytic action on smooth muscle, including smooth muscle lining the GU tract, without affecting vascular smooth muscle. **Therapeutic Effects:** Increased bladder capacity. Delayed desire to void. Decreased urge incontinence, urinary urgency, and frequency and decreased number of urinary accidents associated with overactive bladder.

Pharmacokinetics
Absorption: Rapidly absorbed following oral administration, but undergoes extensive first-pass metabolism; XL tablets provide extended release. Transdermal absorption occurs by passive diffusion through intact skin and bypasses the first-pass effect.
Distribution: Highly bound (>99%) to plasma proteins. Widely distributed.
Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 enzyme system); 1 metabolite is pharmacologically active; metabolites are renally excreted with negligible (<0.1%) excretion of unchanged drug.
Half-life: 7–8 hr (oral and patch); 30–64 hr (gel).

TIME/ACTION PROFILE (urinary spasmolytic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	3–6 hr	6–10 hr (up to 24 hr with XL tablet)
TD-patch	within 24 hr	36 hr	3–4 days
TD-gel	unknown	unknown	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Uncontrolled angle-closure glaucoma; Intestinal obstruction or atony; Urinary retention.
Use Cautiously in: Hepatic/renal impairment; Bladder outflow obstruction; Ulcerative colitis; Benign prostatic hyperplasia; Cardiovascular disease; Reflux esophagitis or gastrointestinal obstructive disorders; Patients with dementia receiving acetylcholinesterase inhibitors; Myasthenia gravis; Parkinson's disease (may worsen symptoms); Autonomic neuropathy (may worsen ↓ GI motility); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety not established in children <18 yr (patch and gel) or <5 yr (oral); Geri: Poorly tolerated in older adults due to anticholinergic effects. Initiate treatment at lower doses.

Adverse Reactions/Side Effects
CV: chest pain, edema, tachycardia. **Derm:** ↓ sweating, hot flushes, *transdermal only:* application site reactions, pruritus. **EENT:** blurred vision, hoarseness. **GI:** constipation, dry mouth, nausea, abdominal pain, anorexia, diarrhea, dysphagia. **GU:** ↑ thirst, urinary retention. **Metab:** hyperthermia. **Neuro:** dizziness, drowsiness, agitation, confusion, hallucinations, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions
Drug-Drug: ↑ anticholinergic effects with other **agents having anticholinergic properties**, including **amantadine**, **antidepressants**, **phenothiazines**, **disopyramide**, and **haloperidol**. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioids**, and **sedative/hypnotics**. **Ketoconazole**, **itraconazole**, **erythromycin**, and **clarithromycin** may ↑ effects. May ↓ the GI promotility effects of **metoclopramide**.

Route/Dosage
PO (Adults): *Immediate-release tablets*—5 mg 2–3 times daily (not to exceed 5 mg 4 times daily) (may start with 2.5 mg 2–3 times daily in elderly). *Extended-release tablets*—5–10 mg once daily; may ↑, as needed (in 5-mg increments) up to maximum dose of 30 mg/day.
PO (Children >5 yr): *Immediate-release tablets*—5 mg 2–3 times daily (not to exceed 15 mg/day). *Ex-*

© F.A. Davis Publishing

tended-release tablets (children ≥6 yr)—5 mg once daily; may ↑, as needed, (in 5-mg increments) up to maximum dose of 20 mg/day.
PO (Children 1–5 yr): 0.2 mg/kg/dose 2–3 times daily.
Transdermal (Adults): *Patch*—Apply one 3.9-mg system twice weekly (every 3–4 days); *Gel*—Apply contents of one sachet once daily.

Availability (generic available)

Immediate-release tablets: 5 mg. **Cost:** *Generic*—$52.94/100. **Extended-release tablets:** 5 mg, 10 mg, 15 mg. **Cost:** *Generic*—5 mg $105.23/100, 10 mg $106.08/100, 15 mg $117.04/100. **Syrup:** 5 mg/5 mL. **Cost:** *Generic*—$38.95/473 mL. **Transdermal gel:** 10%. **Cost:** $30.12/3 g. **Transdermal patch:** 3.9 mg/24 hr[OTC].

NURSING IMPLICATIONS

Assessment

- Monitor voiding pattern and intake and output ratios, and assess abdomen for bladder distention prior to and periodically during therapy. Catheterization may be used to assess postvoid residual. Cystometry is usually performed to diagnose type of bladder dysfunction prior to prescription of oxybutynin.
- Geri: Assess geriatric patients for anticholinergic effects (sedation and weakness).

Implementation

- Do not confuse Ditropan XL (oxybutynin) with Diprivan (propofol). Do not confuse oxybutynin with oxycodone.
- **PO:** Immediate release tabs should be administered on an empty stomach; XL tablets may be given with or without food. ***DNC:*** XL tablets should be swallowed whole; do not break, crush, or chew.
- **Transdermal patch:** Apply patch on same two days each wk (Sunday/Wednesday, Monday/Thursday) to hip, abdomen, or buttock in an area that is clean, dry, and without irritation. Patch should be worn continuously.
- **Transdermal gel:** Apply clear, colorless gel once daily to intact skin on abdomen (avoid area around navel), upper arms/shoulders, or thighs until dry. Rotate sites; do not use same site on consecutive days.

Patient/Family Teaching

- Instruct patient to take oxybutinin as directed. Take missed doses as soon as remembered unless almost time for next dose. Advise patient to read *Information for the Patient* prior to beginning therapy and with each Rx refill in case of new information.
- May cause drowsiness or blurred vision. Advise patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Instruct patient that frequent rinsing of mouth, good oral hygiene, and sugarless gum or candy may decrease dry mouth. Health care professional should be notified if mouth dryness persists >2 wk.
- Advise patient to stop taking oxybutinin and notify health care professional immediately if signs of angioedema and/or anaphylaxis (swelling of face, tongue, or throat; rash; dyspnea) occur.
- Inform patient that oxybutynin decreases the body's ability to perspire. Avoid strenuous activity in a warm environment because overheating may occur.
- Advise patient to notify health care professional if urinary retention occurs or if constipation persists. Discuss methods of preventing constipation, such as increasing dietary bulk, increasing fluid intake, and increasing mobility.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Discuss need for continued medical follow-up. Periodic cystometry may be used to evaluate effectiveness. Ophthalmic exams should be performed periodically to detect glaucoma, especially in patients over 40 yr of age.
- **Transdermal patch:** Instruct patient on correct application and disposal of patch. Open pouch by tearing along arrows; apply immediately. Apply ½ patch to skin by removing ½ protective cover and applying firmly to skin. Apply 2nd half by bending in half and rolling patch onto skin while removing protective liner. Press patch firmly in place.
- Remove slowly; fold in half, sticky sides together, and discard. Wash site with mild soap and water or a small amount of baby oil.
- Advise patient referred for MRI to remove patch prior to test and give directions for replacing patch.
- **Transdermal gel:** Instruct patient on correct application of oxybutynin gel. Do not apply to recently shaved skin, skin with rashes, or areas treated with lotions, oils, or powders; may be used with sunscreen. Wash area with mild soap and water and dry completely before applying. Tear packet open just before use and squeeze entire contents into hand or directly onto application site of abdomen, arms/shoulders, or thighs. Amount of gel will be size of a nickel on the skin. Gently rub into skin until dry. Wash hands immediately following application. Avoid application near open fire or when smoking; medication is flammable. Do not shower, bathe,

© F.A. Davis Publishing

swim, exercise, or immerse the application site in water within 1 hr after application. Cover application site with clothing if close skin-to-skin contact at application site is anticipated.

Evaluation/Desired Outcomes

- Relief of bladder spasm and associated symptoms (frequency, urgency, nocturia, and incontinence) in patients with a neurogenic or overactive bladder.

REMS HIGH ALERT

oxyCODONE (ox-i-**koe**-done)
Oxaydo, OxyCONTIN, Oxy IR, OxyNEO, Roxicodone, Xtampza ER, Supeudol

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists, opioid agonists/nonopioid analgesic combinations

Schedule II

Indications

Moderate to severe pain. Pain severe enough to require daily, around-the-clock long-term opioid treatment and for which alternative treatment options are inadequate (extended-release) (children ≥11 yr should be tolerating a minimum opioid dose of ≥20 mg of oxycodone or equivalent for ≥5 days before initiating extended-release oxycodone therapy).

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Protein Binding: 38–45%.
Metabolism and Excretion: Mostly metabolized by the liver by the CYP3A4 isoenzyme; also metabolized by the CYP2D6 to a minor extent.
Half-life: 2–3 hr.

TIME/ACTION PROFILE (analgesic effects)

ROUTE	ONSET	PEAK	DURATION
PO	10–15 min	60–90 min	3–6 hr
PO-ER†	10–15 min	3 hr	12 hr

†Extended-release.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain alcohol or bisulfites and should be avoided in patients with known intolerance or hypersensitivity; Significant respiratory depression; Paralytic ileus; Acute or severe bronchial asthma; Acute, mild, intermittent, or postoperative pain (extended-release).

Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe renal or hepatic disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Seizure disorders; Undiagnosed abdominal pain; Prostatic hyperplasia; Difficulty swallowing or GI disorders that may predispose patient to obstruction (↑ risk for GI obstruction); OB, Lactation: Avoid chronic use; prolonged use of opioids during pregnancy can result in neonatal opioid withdrawal syndrome; Geri: ↑ risk of respiratory depression in older adults; initial dose ↓ recommended; Pedi: Children <11 yr (safety and effectiveness of extended-release products not established).

Adverse Reactions/Side Effects

CV: orthostatic hypotension. **Derm:** flushing, sweating. **EENT:** blurred vision, diplopia, miosis. **Endo:** adrenal insufficiency. **GI:** constipation, dry mouth, choking, GI obstruction, nausea, vomiting. **GU:** urinary retention. **Neuro:** confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia). **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with caution in patients receiving **MAO inhibitors** (may result in unpredictable reactions— ↓ initial dose of oxycodone to 25% of usual dose). Additive CNS depression with **alcohol**, **antihistamines**, and **sedative/hypnotics**. **Mixed agonist/antagonist analgesics**, including **nalbuphine** or **butorphanol** and **partial agonist analgesics**, including **buprenorphine**, may ↓ oxycodone's analgesic effects and/or precipitate opioid withdrawal in physically dependent patients. Concurrent use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **fluconazole**, **clarithromycin**, **erythromycin**, **nefazodone**, **diltiazem**, **verapamil**, **nelfinavir**, and **fosamprenavir** ↑ levels and risk of opioid toxicity; careful monitoring during initiation, dose changes, or discontinuation of the inhibitor is recommended. Concurrent use with **CYP3A4 inducers** including **barbiturates**, **carbamazepine**, **efavirenz**, **corticosteroids**, **modafinil**, **nevirapine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, or **rifampin** may ↓ fentanyl levels and analgesia; if inducers are discontinued or dosage ↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. **CYP2D6 inhibitors** may ↑ levels. Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**,

© F.A. Davis Publishing

SNRIs, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT$_3$ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans**, ↑ risk of serotonin syndrome.

Route/Dosage

Larger doses may be required during chronic therapy. ER capsules are NOT bioequivalent to ER tablets.

PO (Adults ≥50 kg): *Opioid-naive patients*—5–10 mg every 3–4 hr initially, as needed. Once optimal analgesia is obtained, patients with chronic pain may be converted to an equivalent 24-hr dose given in 2 divided doses as extended-release tablets every 12 hr.

PO (Adults <50 kg): *Opioid-naive patients*—0.2 mg/kg every 3–4 hr initially, as needed. Once optimal analgesia is obtained, patients with chronic pain may be converted to an equivalent 24-hr dose given in 2 divided doses as extended-release tablets every 12 hr.

PO (Children ≥11 yr): 0.05–0.15 mg/kg every 4–6 hr as needed, as immediate-release product. Once optimal analgesia is obtained, patients with chronic pain may be converted to an equivalent 24-hr dose given in 2 divided doses as extended-release tablets every 12 hr.

Rect (Adults): 10–40 mg 3–4 times daily initially, as needed.

Hepatic Impairment

PO (Adults): ↓ initial dose by 50–66%.

Availability (generic available)

Immediate-release capsules: 5 mg. **Cost:** *Generic*—$79.59/100. **Immediate-release tablets (Roxicodone):** 5 mg, 10 mg, 15 mg, 20 mg, 30 mg. **Cost:** *Generic*—5 mg $47.99/100, 10 mg $62.50/100, 15 mg $75.90/100, 20 mg $110.30/100, 30 mg $145.47/100. **Immediate-release tablets (abuse-deterrent) (Oxaydo):** 5 mg, 7.5 mg. **Oral solution:** 5 mg/5 mL, 100 mg/5 mL (concentrated). **Cost:** *Generic*—$142.50/500 mL. **Extended-release capsules (abuse deterrent) (Xtampza ER):** 9 mg, 13.5 mg, 18 mg, 27 mg, 36 mg. **Extended-release tablets (abuse deterrent) (Oxycontin):** 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 60 mg, 80 mg. **Cost:** 10 mg $52.54/20, 15 mg $78.60/20, 20 mg $100.42/20, 30 mg $142.16/20, 40 mg $178.10/20, 60 mg $259.32/20, 80 mg $335.08/20. **Rectal suppositories:** 10 mg, 20 mg. ***In combination with:*** aspirin (Endodan, Percodan), acetaminophen (Endocet, Magnacet, Oxycet, Percocet, Roxicet, Xartemis XR); see Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr (peak) after administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analog scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients taking extended-release tablets may also be given supplemental short-acting opioid doses for breakthrough pain.
- An equianalgesic chart (see Appendix I) should be used when changing routes or when changing from one opioid to another.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. May cause sleep-related breathing disorders (central sleep apnea [CSA], sleep-related hypoxemia).
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Patients who receive oxycodone for pain rarely develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated. Consider drugs for opioid induced constipation.
- Assess risk for opioid addiction, abuse, or misuse prior to administration. Abuse or misuse of extended-release preparations by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of oxycodone and can result in overdose and death.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

© F.A. Davis Publishing

Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders.
- Do not confuse short-acting oxycodone with long-acting *Oxycontin*. Do not confuse oxycodone with hydrocodone, oxybutynin, or oxymorphone. Do not confuse *Oxycontin* with MS Contin or oxymorphone.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect. Abuse deterrent: *Oxaydo*, *Xtampza ER*, and *Oxycontin* are abuse deterrent formulations that are difficult to crush, and if crushed result in a gel.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Oxycodone should be discontinued gradually after long-term use to prevent withdrawal symptoms. For patients on long-acting agents who are physically opioid-dependent, initiate the taper by a small enough increment (no greater than 10–25% of total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2–4 wk. Patients who have been taking opioids for briefer periods of time may tolerate a more rapid taper. Monitor frequently to manage pain and withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). If withdrawal symptoms occur, pause the taper for a period of time or raise the dose of opioid analgesic to the previous dose, and then proceed with a slower taper. Also, monitor patients for changes in mood, emergence of suicidal thoughts, or use of other substances. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the opioid analgesic.
- **PO:** May be administered with food or milk to minimize GI irritation.
- Administer solution with properly calibrated measuring device.
- **Extended-Release:** ***DNC:*** Take 1 tablet at a time. Swallow extended-release tablet whole; do not crush, break, or chew. Taking broken, chewed, crushed, or dissolved extended-release tablets may lead to rapid release and absorption of a potentially fatal dose of oxycodone. Advise patients not to presoak, lick, or wet controlled-release tablets prior to placing in the mouth. Take each tablet with enough water to ensure complete swallowing immediately after placing in mouth. Dose of extended-release preparations should be based on 24-hr opioid requirement determined with short-acting opioids then converted to extended-release form.
- Do not use *Oxaydo* for administration via nasogastric, gastric, or other feeding tubes as it may cause obstruction of feeding tubes.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.

Patient/Family Teaching

- ***REMS:*** Instruct patient on how and when to ask for and take pain medication. Do not stop taking without discussing with health care professional; may cause withdrawal symptoms if discontinued abruptly after prolonged use. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. The Patient Counseling Guide (PCG) is available at www.fda.gov/OpioidAnalgesicREMSPCG.
- Advise patient that oxycodone is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- Advise patient to notify health care professional if pain control is not adequate or if severe or persistent side effects occur.
- Medication may cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving and other

© F.A. Davis Publishing

activities requiring alertness until response to medication is known.
- Advise patients taking *Oxycontin* tablets that empty matrix tablets may appear in stool.
- Advise patient to make position changes slowly to minimize orthostatic hypotension.
- Emphasize the importance of aggressive prevention of constipation with the use of oxycodone.
- Advise patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to oxycodone through breast milk for excess sedation and respiratory depression. Chronic use may reduce fertility in females and males.

Evaluation/Desired Outcomes
- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

HIGH ALERT

oxytocin (ox-i-**toe**-sin)
Pitocin

Classification
Therapeutic: hormones
Pharmacologic: oxytocics

Indications
IV: Induction of labor at term. **IV:** Facilitation of threatened abortion. **IV, IM:** Postpartum control of bleeding after expulsion of the placenta.

Action
Stimulates uterine smooth muscle, producing uterine contractions similar to those in spontaneous labor. Has vasopressor and antidiuretic effects. **Therapeutic Effects:** Induction of labor. Control of postpartum bleeding.

Pharmacokinetics
Absorption: IV administration results in 100% bioavailability.
Distribution: Widely distributed in extracellular fluid. Small amounts reach fetal circulation.
Metabolism and Excretion: Rapidly metabolized by liver and kidneys.
Half-life: 3–9 min.

TIME/ACTION PROFILE (reduction in uterine contractions)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	1 hr
IM	3–5 min	unknown	30–60 min

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Anticipated nonvaginal delivery.
Use Cautiously in: OB: 1st and 2nd stages of labor; slow infusion over 24 hr has caused water intoxication with seizure and coma or maternal death due to oxytocin's antidiuretic effect.

Adverse Reactions/Side Effects
Maternal adverse reactions are noted for IV use only.
Neuro: *maternal*—COMA, SEIZURES; *fetal*, INTRACRANIAL HEMORRHAGE. **Resp:** *fetal*—ASPHYXIA, hypoxia. **CV:** *maternal*—hypotension; *fetal*, arrhythmias. **F and E:** *maternal*—hypochloremia, hyponatremia, water intoxication. **Misc:** *maternal*—↑ uterine motility, painful contractions, abruptio placentae, ↓ uterine blood flow, hypersensitivity.

Interactions
Drug-Drug: Severe hypertension may occur if oxytocin follows administration of **vasopressors**.

Route/Dosage

Induction/Stimulation of Labor
IV (Adults): 0.5–1 mU/min; ↑ by 1–2 mU/min every 30–60 min until desired contraction pattern established; dose may be ↓ after desired frequency of contractions is reached and labor has progressed to 5–6 cm dilation.

Postpartum Hemorrhage
IV (Adults): 10 units infused at 20–40 mU/min.
IM (Adults): 10 units after delivery of placenta.

Incomplete/Inevitable Abortion
IV (Adults): 10 units at a rate of 20–40 mU/min.

Availability (generic available)
Solution for injection: 10 units/mL.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Fetal maturity, presentation, and pelvic adequacy should be assessed prior to administration of oxytocin for induction of labor.
- Assess character, frequency, and duration of uterine contractions; resting uterine tone; and fetal heart rate frequently throughout administration. If contractions occur <2 min apart and are >50–65 mm Hg on monitor, if they last 60–90 sec or longer, or if a significant change in fetal heart rate develops, stop infusion and turn patient on her left side to prevent fetal anoxia. Notify health care professional immediately.
- Monitor maternal BP and pulse frequently and fetal heart rate continuously throughout administration.
- This drug occasionally causes water intoxication. Monitor patient for signs and symptoms (drowsiness, listlessness, confusion, headache, anuria) and notify physician or other health care professional if they occur.
- ***Lab Test Considerations:*** Monitor maternal electrolytes. Water retention may result in hypochloremia or hyponatremia.

Implementation

- Do not administer oxytocin simultaneously by more than one route.

IV Administration

- **Continuous Infusion:** Rotate infusion container to ensure thorough mixing. Store solution in refrigerator, but do not freeze.
- Infuse via infusion pump for accurate dose. Oxytocin should be connected via Y-site injection to an IV of 0.9% NaCl for use during adverse reactions.
- Magnesium sulfate should be available if needed for relaxation of myometrium.
- **Induction of Labor:** ***Dilution:*** Dilute 1 mL (10 units) in 1 L of compatible infusion fluid (0.9% NaCl, D5W, or LR). ***Concentration:*** 10 mU/mL. ***Rate:*** Begin infusion at 0.5–2 mU/min (0.05–0.2 mL); increase in increments of 1–2 mU/min at 15–30-min intervals until contractions simulate normal labor.
- **Postpartum Bleeding:** ***Dilution:*** For control of postpartum bleeding, dilute 1–4 mL (10–40 units) in 1 L of compatible infusion fluid. ***Concentration:*** 10–40 mU/mL. ***Rate:*** Begin infusion at a rate of 20–40 mU/min to control uterine atony. Adjust rate as indicated.
- **Incomplete or Inevitable Abortion:** ***Dilution:*** For incomplete or inevitable abortion, dilute 1 mL (10 units) in 500 mL of 0.9% NaCl or D5W. ***Concentration:*** 20 mU/mL. ***Rate:*** Infuse at a rate of 20–40 mU/min.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, capreomycin, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, clindamycin, cyanocobalamin, cyclosporine, daptomycin, dexamethasone, dexmedetomidine, digoxin, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, metaraminol, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, palonosetron, pamidronate, papaverine, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, tigecycline, tirofiban, tobramycin, tolazoline, vancomycin, vasopressin, verapamil, vitamin B complex with C, voriconazole, warfarin, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** dantrolene, diazepam, diazoxide, indomethacin, methohexital, phenytoin, remifentanil, trimethoprim/sulfamethoxazole.
- **Solution Compatibility:** dextrose/Ringer's or lactated Ringer's combinations, dextrose/saline combinations, Ringer's or lactated Ringer's injection, D5W, D10W, 0.45% NaCl, 0.9% NaCl.

Patient/Family Teaching

- Advise patient to expect contractions similar to menstrual cramps after administration has started.

Evaluation/Desired Outcomes

- Onset of effective contractions.
- Increase in uterine tone.
- Reduction in postpartum bleeding.

© F.A. Davis Publishing

PACLitaxel (pak-li-tax-el)
~~Taxol~~

PACLitaxel protein-bound particles (albumin-bound)
Abraxane

Classification
Therapeutic: antineoplastics
Pharmacologic: taxoids

Indications
Paclitaxel: Advanced ovarian cancer (with cisplatin). Non–small-cell lung cancer (NSCLC) when potentially curative surgery and/or radiation therapy is not an option. Metastatic breast cancer unresponsive to other therapy. Node-positive breast cancer when administered sequentially to standard combination chemotherapy that includes doxorubicin. Treatment of AIDS-related Kaposi's sarcoma. **Paclitaxel (albumin-bound):** Metastatic breast cancer after treatment failure or relapse where therapy included an anthracycline. Locally advanced or metastatic NSCLC when potentially curative surgery or radiation therapy is not an option (with carboplatin). Metastatic pancreatic adenocarcinoma (with gemcitabine).

Action
Interferes with the normal cellular microtubule function that is required for interphase and mitosis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Cross the placenta.
Protein Binding: 89–98%.
Metabolism and Excretion: Highly metabolized by the liver (primarily by CYP2C8 and CYP3A4), <10% excreted unchanged in urine.
Half-life: *Paclitaxel*—13–52 hr; *Paclitaxel protein-bound particles (albumin-bound)*—27 hr.

TIME/ACTION PROFILE (effect on WBCs)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	11 days	3 wk

Contraindications/Precautions
Contraindicated in: Hypersensitivity to paclitaxel, other taxanes, or castor oil (paclitaxel); Severe hypersensitivity to paclitaxel protein-bound particles (paclitaxel protein-bound particles); AST >10× ULN or total bilirubin >5× ULN (paclitaxel protein-bound particles); Moderate or severe hepatic impairment (pancreatic adenocarcinoma only for paclitaxel protein-bound particles); Known alcohol intolerance; Neutrophil count ≤1500/mm³ (for patients with ovarian, lung, breast, or pancreatic cancer) or ≤1000/mm³ (for patients with AIDS-related Kaposi's sarcoma); ANC ≤1000/mm³ in patients with AIDS-related Kaposi's sarcoma; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Moderate or severe hepatic impairment (↓ dose); Active infection; ↓ bone marrow reserve; Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: Older adults may have ↑ risk of adverse reactions.

Adverse Reactions/Side Effects
CV: ECG changes, edema, hypotension, bradycardia. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, alopecia. **GI:** diarrhea, ↑ liver enzymes, mucositis, nausea, vomiting, pancreatitis. **Hemat:** NEUTROPENIA, anemia, thrombocytopenia. **Local:** injection site reactions. **MS:** arthralgia, myalgia. **GU:** renal failure. **Neuro:** peripheral neuropathy, dizziness, headache, seizures. **Resp:** PULMONARY EMBOLISM, PULMONARY FIBROSIS, cough, dyspnea, interstitial pneumonia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), SEPSIS.

Interactions
Drug-Drug: CYP3A4 inhibitors including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, and **saquinavir** may ↑ levels and risk of toxicity; concurrent use should be undertaken with caution. **CYP3A4 inducers** including **carbamazepine**, **rifampin**, and **phenytoin** may ↓ levels and ↑ risk of treatment failure; concurrent use should be undertaken with caution. **Gemfibrozil** may ↑ levels and risk of toxicity; concurrent use should be undertaken with caution. ↑ risk of myelosuppression with other **antineoplastics** or **radiation therapy**. Myelosuppression ↑ when given after **cisplatin**. May ↑ levels and toxicity of **doxorubicin**. May ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.

Route/Dosage
Many other regimens are used.

Paclitaxel

Ovarian Cancer
IV (Adults): *Previously untreated patients*—175 mg/m² over 3 hr every 3 wk *or* 135 mg/m² over 24 hr every 3 wk, followed by cisplatin; *Previously treated patients*—135 mg/m² *or* 175 mg/m² over 3 hr every 3 wk.

Breast Cancer
IV (Adults): *Adjuvant treatment of node-positive breast cancer*—175 mg/m² over 3 hr every 3 wk for 4 courses administered sequentially to doxorubicin-

© F.A. Davis Publishing

containing combination chemotherapy; *Failure of initial therapy for metastatic disease or relapse within 6 mo of adjuvant therapy* — 175 mg/m² over 3 hr every 3 wk.

NSCLC

IV (Adults): 135 mg/m² over 24 hr every 3 wk, followed by cisplatin.

AIDS-Related Kaposi's Sarcoma

IV (Adults): 135 mg/m² over 3 hr every 3 wk *or* 100 mg/m² over 3 hr every 2 wk (dose ↓/adjustment may be necessary in patients with advanced HIV infection).

Paclitaxel Protein-Bound Particles (albumin-bound)

Breast Cancer

IV (Adults): 260 mg/m² over 30 min every 3 wk.

Hepatic Impairment

IV (Adults): *Moderate hepatic impairment (AST levels <10 × ULN and bilirubin levels 1.51–3 × ULN)* — 200 mg/m² over 30 min every 3 wk; dose may be ↑ to 260 mg/m² for the 3rd course based on individual tolerance; *Severe hepatic impairment (AST levels <10 × ULN and bilirubin levels 3.01–5× ULN)* — 200 mg/m² over 30 min every 3 wk; dose may be ↑ to 260 mg/m² for the 3rd course based on individual tolerance; *Severe hepatic impairment (AST levels >10 × ULN or bilirubin levels >5 × ULN)* — Avoid use.

NSCLC

IV (Adults): 100 mg/m² over 30 min on Days 1, 8, and 15 of each 21-day cycle.

Hepatic Impairment

IV (Adults): *Moderate hepatic impairment (AST levels <10 × ULN and bilirubin levels 1.51–3 × ULN)* — 80 mg/m² over 30 min on Days 1, 8, and 15 of each 21-day cycle; dose may be ↑ to 100 mg/m² for the 3rd course based on individual tolerance; *Severe hepatic impairment (AST levels <10 × ULN and bilirubin levels 3.01–5 × ULN)* — 80 mg/m² over 30 min on Days 1, 8, and 15 of each 21-day cycle; dose may be ↑ to 100 mg/m² for the 3rd course based on individual tolerance; *Severe hepatic impairment (AST levels >10 × ULN or bilirubin levels >5 × ULN)* — Avoid use.

Pancreatic Adenocarcinoma

IV (Adults): 125 mg/m² over 30–40 min on Days 1, 8, and 15 of each 28-day cycle.

Hepatic Impairment

IV (Adults): *Moderate or severe hepatic impairment* — Avoid use.

Availability

Paclitaxel (generic available)

Solution for injection: 6 mg/mL.

Paclitaxel Protein-Bound Particles (albumin-bound)

Lyophilized powder for injection: 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently, especially during first hr of the infusion.
- Monitor cardiovascular status especially during first 3 hr of infusion. Hypotension and bradycardia are common but usually do not require treatment. Continuous ECG monitoring is recommended only for patients with serious underlying conduction abnormalities or those concurrently taking doxorubicin.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for dyspnea and orthostatic hypotension. Granulocyte-colony stimulating factor (G-CSF) may be used if necessary.
- Monitor intake and output, appetite, and nutritional intake. Paclitaxel causes nausea and vomiting in 50% of patients. Prophylactic antiemetics may be used. Adjust diet as tolerated to help maintain fluid and electrolyte balance and nutritional status.
- Assess patient for arthralgia and myalgia, which usually begin 2–3 days after therapy and resolve within 5 days. Pain is usually relieved by nonopioid analgesics but may be severe enough to require treatment with opioid analgesics.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome and toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Paclitaxel:** Monitor for hypersensitivity reactions continuously during the first 30 min and frequently thereafter. These occur frequently (19%), usually during the first 10 min of paclitaxel infusion, after the 1st or 2nd dose. Pretreatment is recommended for **all** patients and should include dexamethasone 20 mg PO (10 mg for patients with advanced HIV disease) 12 and 6 hr prior to paclitaxel, diphenhydramine 50 mg IV 30–60 min prior to paclitaxel. Most common manifestations are dyspnea, flushing, tachycardia, rash, hypotension, and chest pain. If these occur, stop infusion and notify health care professional. Treatment may include bronchodilators, epinephrine, antihistamines, and corticosteroids. Keep these agents and resuscitative equipment close by in the event of an anaphylactic reaction. Other manifestations of hypersensitivity reactions include flushing and rash.
- Assess for development of peripheral neuropathy. If severe symptoms occur, subsequent dose should be reduced by 20%.
- **Paclitaxel protein-bound (albumin-bound)**: Consider premedication in patients who have had prior hypersensitivity reactions to paclitaxel protein-

© F.A. Davis Publishing

bound (albumin-bound). Do not re-challenge patients who experience a severe hypersensitivity reaction.
- Sensory neuropathy is dose- and schedule-dependent. *If ≥Grade 3 sensory neuropathy occurs,* withhold paclitaxel protein-bound (albumin-bound) until resolution to Grade 1 or 2 for metastatic breast cancer or until resolution to ≤Grade 1 for NSCLC and pancreatic cancer followed by a dose reduction for all subsequent courses of therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- **Paclitaxel:** Monitor CBC and differential prior to and periodically during therapy. The nadir of leukopenia occurs in 11 days, with recovery by days 15–21. *If neutrophil counts less than 500/mm³ for ≥1 wk,* reduce dose by 20% for subsequent courses.
- **Paclitaxel Protein-Bound Particles (albumin-bound):** Monitor CBC and differential frequently, including before starting therapy and prior to dosing on Day 1 (for breast cancer), 8, and 15 (for NSCLC and pancreatic cancer). For NSCLC: *If neutropenic fever (ANC <500/mm³ with fever >38°C) OR delay of next cycle by more than 7 days for ANC <1500/mm³ OR ANC <500/mm³ for >7 days,* reduce dose on 1st occurrence to 75 mg/m² and on 2nd occurrence, reduce dose to 50 mg/m². For 3rd occurrence, discontinue therapy. Do not administer if neutrophil count is <1500/mm³. If severe neutropenia (neutrophils <500 cells/mm³ for seven days or more), reduce dose in subsequent courses. *If platelet count <50,000/mm³,* for 1st occurrence, reduce dose to 75 mg/m². Discontinue therapy at 2nd occurrence. For Pancreatic Cancer: *On Day 1, if ANC <1500 cells/mm³OR platelet count <100,000 cells/mm³,* hold next dose until recovery. *On Day 8, if ANC 500 to <1000 cells/mm³ OR platelet count 50,000 to <75,000 cells/mm³,* reduce dose one level; *On Day 8, if ANC <500 cells/mm³ OR <50,000 cells/mm³,* hold dose. *On Day 15, if Day 8 doses were reduced or given without modification, and ANC 500 to <1000 cells/mm³ OR platelet count 50,000 to <75,000 cells/mm³,* reduce dose 1 level from Day 8. *On Day 15, if Day 8 doses were reduced or given without modification, and ANC <500 cells/mm³OR platelet count <50,000 cells/mm³,* hold doses. *On Day 15, if Day 8 doses were held and ANC ≥1000 cells/mm³OR platelet count ≥75,000 cells/mm³,* reduce dose 1 level from Day 1. *On Day 15, if Day 8 doses were held and ANC 500 to <1000 cells/mm³OR platelet count 50,000 to <75,000 cells/mm³,* reduce dose 2 levels from Day 1. On Day 15, if Day 8 doses were held and ANC <500 cells/mm³OR platelet count <50,000 cells/mm³, hold doses. Monitor liver function studies (AST, ALT, LDH, bilirubin) prior to and periodically during therapy to detect hepatotoxicity.

Implementation

- Do not confuse paclitaxel with docetaxel or paclitaxel protein-bound particles.

Paclitaxel

IV Administration

- **Continuous Infusion:** Paclitaxel must be diluted prior to injection. ***Dilution:*** Dilute contents of 5-mL (30-mg) vials with the following diluents: 0.9% NaCl, D5W, D5/0.9% NaCl, or dextrose in Ringer's solution. ***Concentration:*** 0.3–1.2 mg/mL. Although haziness in solution is normal, inspect for particulate matter or discoloration before use. Use an in-line filter of not >0.22-micron pore size. Solutions are stable for 27 hr at room temperature and lighting. Do not use PVC containers or administration sets. ***Rate:*** Dose for *breast cancer, ovarian cancer, or AIDS-related Kaposi's sarcoma* is administered over 3 hr. Dose for *ovarian cancer* can also be administered as a 24-hr infusion.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, dopamine, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, ketorolac, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methadone, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, moxifloxacin, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital,

P

© F.A. Davis Publishing

pentostatin, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, quinupristin/dalfopristin, remifentanil, rituximab, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, amphotericin B deoxycholate, amphotericin B liposome, chlorpromazine, diazepam, digoxin, doxorubicin liposomal, gemtuzumab ozogamicin, hydroxyzine, idarubicin, indomethacin, labetalol, methylprednisolone, mitoxantrone, phenytoin, propranolol.

Paclitaxel Protein-Bound Particles (albumin-bound)

- **Dose Reduction for Pancreatic Cancer**: Full dose — 125 mm/m². 1st dose reduction — 100 mm/m². 2nd dose reduction — 75 mm/m². If additional dose reduction required — discontinue therapy.

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute by slowly adding 20 mL to each vial over at least 1 min for a concentration of 5 mg/mL. Direct solution to inside wall of vial to prevent foaming. Allow vial to sit for at least 5 min to ensure proper wetting of cake/powder. Gently swirl or invert vial for at least 2 min until powder is completely dissolved; avoid foaming. If foaming or clumping occurs, allow vial to stand for 15 min until foaming dissolves. Solution should be milky and homogenous without visible particles. If particles or settling are visible, gently invert vial to resuspend. Inject appropriate amount into sterile PVC IV bag. Do not use an in-line filter during administration. Do not administer solutions that are discolored or contain particulate matter. Reconstituted solution should be administered immediately but is stable for 8 hr if refrigerated. Discard unused portion. ***Rate:*** Administer over 30 min. Monitor infusion site closely for infiltration.
- **Y-Site Compatibility:** carboplatin, dexamethasone, gemcitabine, granisetron, palonosetron.

Patient/Family Teaching

- Explain purpose of paclitaxel to patient. Advise patient to read *Patient Information* before starting therapy and periodically during therapy in case of changes.
- Advise patient to notify health care professional immediately of rash, difficulty breathing, or symptoms of hypersensitivity reaction occurs.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or to take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional if abdominal pain, yellow skin, weakness, paresthesia, gait disturbances, or joint or muscle aches occur.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis usually resolves in 5–7 days.
- Discuss with patient the possibility of hair loss. Complete hair loss usually occurs between days 14 and 21 and is reversible after discontinuation of therapy. Explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Rep: Advise females of reproductive potential to use a nonhormonal method of contraception during and for at least 6 mo after last dose of therapy and to avoid breast feeding during and for 2 wk after last dose. Advise male patients with female partners of reproductive potential to use effective contraception during and for at least 3 mo after last dose. May impair fertility in females and males.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancy.

palbociclib (pal-**bo**-si-klib)

Ibrance

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Indications

Advanced or metastatic hormone receptor (HR)-positive, human epidermal growth factor 2 (HER2)-negative breast cancer in post-menopausal women or in men as initial endocrine-based therapy (in combination with an aromatase inhibitor). Advanced or metastatic HR-positive, HER2-negative breast cancer in women or men with disease progression following endocrine therapy (in combination with fulvestrant).

Action

Inhibits kinases (cyclin-dependent kinases 4 and 6) that are part of the signaling pathway for cell prolifera-

© F.A. Davis Publishing

tion. **Therapeutic Effects:** Improved survival and decreased spread of breast cancer.

Pharmacokinetics

Absorption: 46% absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized (by CYP3A and sulfontransferase [SULT]); also acts as an inhibitor of CYP3A; 6.9% excreted unchanged in urine, 2.3% in feces.
Half-life: 29 hr.

TIME/ACTION PROFILE (improvement in progression-free survival)

ROUTE	ONSET	PEAK	DURATION
PO	within 4 mo	unknown	maintained throughout treatment

Contraindications/Precautions

Contraindicated in: Concurrent use of strong/moderate CYP3A inhibitors; Concurrent use of CYP3A inducers; OB: Pregnancy (may cause fetal harm); Lactation: Discontinue palbociclib or discontinue breast feeding.
Use Cautiously in: Concurrent use of sensitive CYP3A substrates (narrow therapeutic indices); Severe renal impairment; Severe hepatic impairment; Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

Derm: alopecia. **EENT:** epistaxis. **GI:** ↓ appetite, diarrhea, nausea, stomatitis, vomiting. **GU:** ↓ fertility. **Hemat:** NEUTROPENIA, anemia, leukopenia, thrombocytopenia. **Neuro:** peripheral neuropathy, weakness. **Resp:** INTERSTITIAL LUNG DISEASE.

Interactions

Drug-Drug: Concurrent use with **CYP3A inhibitors** including **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **lopinavir/ritonavir**, **nefazodone**, **nelfinavir**, **posaconazole**, **ritonavir**, **saquinavir**, **verapamil**, and **voriconazole** ↑ levels and the risk of toxicity; avoid, if possible (if unavoidable, ↓ dose of palbociclib [resume original dose after 3–5 half-lives of offending drug have passed following discontinuation]). **Strong CYP3A inducers** including **carbamazepine**, **phenytoin**, **rifampin** can ↓ levels and effectiveness; concurrent use should be avoided. Moderate CYP inducers including **bosentan**, **efavirenz**, **etravirine**, **modafinil**, and **nafcillin** may also ↓ levels and effectiveness; avoid concurrent use. ↑ levels and effects/toxicity of **alfentanil**, **cyclosporine**, **dihydroergotamine**, **ergotamine**, **everolimus**, **fentanyl**, **midazolam**, **pimozide**, **quinidine**, **sirolimus**, and **tacrolimus**; if concurrent use is required dose ↓ may be necessary.
Drug-Natural Products: **St. John's wort** may ↓ levels and effectiveness; avoid concurrent use.
Drug-Food: **Grapefruit/grapefruit juice** ↑ levels and the risk of toxicity, avoid ingestion.

Route/Dosage

PO (Adults): 125 mg once daily for 21 days, followed by 7 days off; *Concurrent use of strong CYP3A4 inhibitor*— 75 mg once daily for 21 days, followed by 7 days off.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment (Child-Pugh C)* — 75 mg once daily for 21 days, followed by 7 days off.

Availability

Capsules: 75 mg, 100 mg, 125 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of infection (fever, chills, dizziness, shortness of breath, weakness, increased bleeding or bruising) during therapy. Treat as medically appropriate. No dose adjustment is needed for Grade 1 or 2 non-hematologic toxicities. *For Grade ≥3 (if persisting despite medical treatment),* withhold palbociclib until symptoms resolve to Grade ≤1; Grade ≤2 (if not considered a safety risk for patient). Resume at next lower dose.
- Monitor for signs and symptoms of interstitial lung disease or pneumonitis (hypoxia, cough, dyspnea) during therapy. If symptoms are severe, permanently discontinue therapy.
- ***Lab Test Considerations:*** Obtain a negative pregnancy test before starting therapy.
- Monitor CBC prior to and at beginning of each cycle, on Day 15 of first 2 cycles, and as clinically indicated. May cause ↓ neutrophil counts; median time to first episode is 15 days (13–117 days) and median duration of Grade ≥3 neutropenia was 7 days. May cause febrile neutropenia.
- No dose adjustment is needed for Grade 1 or 2 hematologic toxicities. *For Grade 3 Day 1 of cycle:* withhold palbociclib, repeat CBC monitoring within 1 wk. When recovered to Grade ≤2, start next cycle at same dose. *For Grade 3 Day 15 of first 2 cycles:* If Grade 3 on Day 15, continue palbociclib at current dose to complete cycle and repeat CBC on Day 22. *If Grade 4 on Day 22,* withhold palbociclib until recovery to Grade ≤2. Resume at next lower dose. Consider dose reduction in cases of prolonged (>1 wk) recovery from Grade 3 neutropenia or recurrent Grade 3 neutropenia on Day 1 of subsequent cy-

© F.A. Davis Publishing

cles. *For Grade 3 ANC (500– <1000/mm³) plus fever ≥38.5°C and/or infection,* withhold palbociclib until recovery to Grade ≤2. Resume at next lower dose. *For Grade 4,* withhold palbociclib until recovery to Grade ≤2. Resume at next lower dose.
- May cause ↓ WBC, lymphocytes, hemoglobin, and platelets.

Implementation
- **PO:** Administer once daily at the same time each day, for 21 consecutive days followed by 7 days off treatment, with food in combination with letrozole once daily given throughout 28-day cycle. Swallow capsules whole; do not open, crush, or chew; do not swallow capsules that are broken, cracked, or not intact.
- If dose reduction needed for adverse reactions starting dose is 125 mg/day. 1st dose reduction is to 100 mg/day, 2nd dose reduction is to 75 mg/day; if further dose reduction needed, discontinue therapy.

Patient/Family Teaching
- Instruct patient to take palbociclib as directed. If a dose is vomited or missed, omit dose and take next dose at usual time; do not take an additional dose that day. Do not change dose or stop taking without consulting health care professional. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid grapefruit or grapefruit products during therapy; may increase amount of palbociclib in blood.
- Advise patient to notify health care professional if signs and symptoms of infection occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Rep: Advise females of reproductive potential to use effective contraception and avoid breast feeding during and for at least 3 wk after last dose. Advise patient to notify health care professional if pregnancy is planned or suspected. Advise males with female partners of reproductive potential to use effective contraception during and for at least 3 wk after last dose. Inform male patient that palbociclib may impair fertility.

Evaluation/Desired Outcomes
- Decrease in the spread of breast cancer.

palifermin (pa-liff-er-min)
Kepivance

Classification
Therapeutic: cytoprotective agents
Pharmacologic: keratinocyte growth factors (rDNA)

Indications
Severe oral mucositis (≥WHO grade 3) associated with myelotoxic therapy in patients requiring autologous hematopoietic stem cell support for hematologic malignancies.

Action
Enhances proliferation of epithelial cells. **Therapeutic Effects:** Decreased incidence/duration of mucositis.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Distributes into extravascular space.
Metabolism and Excretion: Unknown.
Half-life: 4.5 hr.

TIME/ACTION PROFILE (levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of dose	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to palifermin or other *E. coli*-derived proteins; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Allogeneic hematopoietic stem cell support (↑ risk of exacerbated mucositis); Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects
Derm: erythema, pruritus, rash. **GI:** taste disturbance, tongue thickening/discoloration. **GU:** ↓ fertility. **Metab:** ↑ amylase, ↑ lipase. **MS:** arthralgia. **Neuro:** dysesthesia.

Interactions
Drug-Drug: Unfractionated heparin and **low-molecular weight heparin** ↑ levels (flush tubing with saline between use). Administration within 24 hr after **myelotoxic therapy (chemotherapy/radiation)** ↑ severity and duration of mucositis.

Route/Dosage
IV (Adults): 60 mcg/kg/day for 3 days before and 3 days after myelotoxic therapy.

Availability
Powder for injection: 6.25 mg/vial.

NURSING IMPLICATIONS

Assessment
- Assess level of oral mucositis prior to and periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ serum lipase and amylase; usually reversible.
- May cause proteinuria.

Implementation
- Do not administer palifermin within 24 hr before, during infusion, or 24 hr after infusion of myelotoxic chemotherapy.

© F.A. Davis Publishing

- Administer doses for 3 consecutive days before (3rd dose 24–48 hr prior to chemotherapy) and 3 consecutive days after myelotoxic chemotherapy (4th dose on same day as hematopoietic stem cells infusion after infusion is completed and at least 4 days after most recent palifermin administration) for a total of 7 doses.

IV Administration

- **IV Push:** ***Reconstitution:*** Reconstitute palifermin powder by slowly injecting 1.2 mL of sterile water for injection aseptically. ***Concentration:*** 5 mg/mL. Swirl gently; do not shake or vigorously agitate. Solution should be clear and colorless; do not administer solution that is discolored or contains particulate matter. Dissolution usually takes less than 3 min. Administer immediately after reconstitution or refrigerate and administer within 24 hr. Do not freeze. Allow to reach room temperature for up to 1 hr. Protect from light. Discard palifermin after expiration date or if left at room temperature for more than 1 hr. ***Rate:*** Administer via bolus injection. Do not use a filter.
- **Y-Site Incompatibility:** heparin. If heparin solution is used to maintain IV line, flush with 0.9% NaCl prior to and after use of palifermin.

Patient/Family Teaching

- Explain the purpose of palifermin to patient.
- Inform patient of evidence of tumor growth and stimulation in cell culture and animal models.
- Advise patient to notify health care professional if rash, erythema, edema, pruritus, oral/perioral dysesthesia (tongue discoloration, tongue thickening, alteration of taste) occur.
- Rep: May cause fetal harm. Advise female patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy and for at least 2 wk after last dose. May impair female and male fertility.

Evaluation/Desired Outcomes

- Decrease in incidence and duration of oral mucositis in patients receiving myelotoxic therapy requiring hematopoietic stem cell support.

BEERS

paliperidone (pa-li-**per**-i-done)

Invega, Invega Hafyera, Invega Sustenna, Invega Trinza

Classification

Therapeutic: antipsychotics
Pharmacologic: benzisoxazoles

Indications

PO, IM: Acute and maintenance treatment of schizophrenia (Invega and Invega Sustenna). **IM:** Maintenance treatment of schizophrenia after patients have been adequately treated with Invega Sustenna for at least 4 mo (Invega Trinza). **IM:** Maintenance treatment of schizophrenia after patients have been adequately treated with either Invega Sustenna for at least 4 mo or Invega Trinza for at least one 3-mo cycle (Invega Hafyera). **PO, IM:** Acute treatment of schizoaffective disorder (as monotherapy or as adjunct to mood stabilizers and/or antidepressants) (Invega and Invega Sustenna).

Action

May act by antagonizing dopamine and serotonin in the CNS. Paliperidone is the active metabolite of risperidone. **Therapeutic Effects:** Decreased manifestations of schizophrenia. Decreased manifestations of schizoaffective disorder.

Pharmacokinetics

Absorption: 28% absorbed following oral administration, food ↑ absorption; slowly absorbed after IM administration (concentrations higher and more rapidly achieved with administration into deltoid muscle).
Distribution: Unknown.
Metabolism and Excretion: 59% excreted unchanged in urine; 32% excreted in urine as metabolites.
Half-life: 23 hr (PO); 25–49 days (IM — Sustenna); 84–139 days (IM — Trinza); 148–159 days (IM — Hafyera).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	24 hr	24 hr
IM — Sustenna	unknown	13 days	1 mo
IM — Trinza	unknown	30–33 days	3 mo
IM — Hafyera	unknown	29–32 days	6 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity to paliperidone or risperidone; Concurrent use of drugs known to cause QTc prolongation (including quinidine, procainamide, sotalol, amiodarone, chlorpromazine, thioridazine, moxifloxacin); History of congenital QTc prolongation or other cardiac arrhythmias; Bradycardia, hypokalemia, hypomagnesemia (↑ risk of QTc prolongation); Pre-existing severe GI narrowing (due to nature of tablet formulation); CCr <50 mL/min (for IM).
Use Cautiously in: Patients with Parkinson's disease or dementia with Lewy Bodies (↑ sensitivity to effects of antipsychotics); History of suicide attempt; History of HF, MI, conduction abnormalities, stroke, TIA (↑ risk of orthostatic hypotension and syncope); Patients at risk for aspiration pneumonia or falls; History of seizures; Conditions which may ↑ body temperature (strenuous exercise, exposure to extreme heat, concur-

© F.A. Davis Publishing

rent anticholinergics or risk of dehydration); ↓ GI transit time (may ↑ blood levels); May mask symptoms of some drug overdoses, intestinal obstruction, Reye's Syndrome, or brain tumor (due to antiemetic effect); Diabetes mellitus; Severe hepatic impairment; Renal impairment (dose ↓ recommended if CCr <80 mL/min); Low white blood cell count/absolute neutrophil count or history of drug-induced leukopenia/neutropenia (↑ risk of leukopenia/neutropenia); OB: Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if maternal benefit outweighs fetal risk; Lactation: Use while breast feeding only if potential maternal benefit outweighs potential risk to infant; Pedi: Children <12 yr (safety and effectiveness not established); Geri: ↑ risk of mortality and stroke/TIA in older adults treated for dementia-related psychosis; consider age-related ↓ in renal function.

Adverse Reactions/Side Effects

CV: palpitations, tachycardia (dose related), bradycardia, orthostatic hypotension, QT interval prolongation. **EENT:** blurred vision. **Endo:** amenorrhea, dyslipidemia, galactorrhea, gynecomastia, hyperglycemia, weight gain. **GI:** abdominal pain, dry mouth, dyspepsia, nausea, swollen tongue. **GU:** ↓ fertility (females), impotence, priapism. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **MS:** back pain, dystonia (dose related). **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, drowsiness, extrapyramidal disorders (dose related), headache, insomnia, akathisia, anxiety, confusion, dizziness, dysarthria, fatigue, syncope, tardive dyskinesia, tremor (dose related), weakness. **Resp:** dyspnea, cough. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), fever.

Interactions

Drug-Drug: ↑ risk of CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **sedative/hypnotics**, or **opioid analgesics**. May antagonize the effects of **levodopa** or other **dopamine agonists**. ↑ risk of orthostatic hypotension with **antihypertensives**, **nitrates**, or other **agents that lower BP**. **Strong CYP3A4 inducers** or **strong P-glycoprotein inducers**, including **carbamazepine** or **rifampin** may ↓ levels/effects; avoid concurrent use with Invega Sustenna (if use of strong CYP3A4 or P-glycoprotein inducer necessary, consider using paliperidone ER tablets). **Valproic acid** may ↑ levels (may need to ↓ dose of paliperidone).

Drug-Natural Products: St. John's wort may ↓ levels/effects; avoid concurrent use with Invega Sustenna.

Route/Dosage

Schizophrenia

PO (Adults): 6 mg once daily; may titrate by 3 mg/day at intervals of at least 5 days (range 3–12 mg/day).

PO (Children 12–17 yr): 3 mg once daily; may titrate by 3 mg/day at intervals of at least 5 days (not to exceed 6 mg if <51 kg or 12 mg if ≥51 kg).

IM (Adults): *Invega Sustenna*—234 mg initially, then 156 mg 1 wk later; continue with monthly maintenance dose of 117 mg (range of 39–234 mg based on efficacy and/or tolerability); *Invega Trinza*—Dose should be based on dose of previous 1-mo injection dose of Invega Sustenna. If last dose of Invega Sustenna was 78 mg: Administer 273 mg of Invega Trinza every 3 mo. If last dose of Invega Sustenna was 117 mg: Administer 410 mg of Invega Trinza every 3 mo. If last dose of Invega Sustenna was 156 mg: Administer 546 mg of Invega Trinza every 3 mo. If last dose of Invega Sustenna was 234 mg: Administer 819 mg of Invega Trinza every 3 mo. May adjust dose based on efficacy and/or tolerability (range: 273–819 mg). *Invega Hafyera*—Dose should be based on dose of previous 1-mo injection dose of Invega Sustenna or previous every 3-mo dose of Invega Trinza. If last dose of Invega Sustenna was 156 mg: Administer 1,092 mg of Invega Hafyera every 6 mo. If last dose of Invega Sustenna was 234 mg: Administer 1,560 mg of Invega Hafyera every 6 mo. If last dose of Invega Trinza was 546 mg: Administer 1,092 mg of Invega Hafyera every 6 mo. If last dose of Invega Trinza was 819 mg: Administer 1,560 mg of Invega Hafyera every 6 mo.

Renal Impairment

PO (Adults): *CCr 50–79 mL/min*—3 mg/day initially; dose may be ↑ to maximum of 6 mg/day; *CCr 10–<50 mL/min*—1.5 mg/day initially; dose may be ↑ to maximum of 3 mg/day.

Renal Impairment

IM (Adults): *CCr 50–79 mL/min*—Invega Sustenna: 156 mg initially, then 117 mg 1 wk later; continue with monthly maintenance dose of 78 mg; Invega Trinza: once stabilized on Invega Sustenna, can then transition to appropriate dose of Invega Trinza (see above) *CCr <50 mL/min*—Contraindicated.

Schizoaffective Disorder

PO (Adults): 6 mg/day; may titrate by 3 mg/day at intervals of at least 4 days (range 3–12 mg/day).

Renal Impairment

PO (Adults): *CCr 50–79 mL/min*—3 mg/day initially; dose may be ↑ to maximum of 6 mg/day; *CCr 10–<50 mL/min*—1.5 mg/day initially; dose may be ↑ to maximum of 3 mg/day.

Availability (generic available)

Extended-release tablets (Invega): 1.5 mg, 3 mg, 6 mg, 9 mg. **Extended-release intramuscular injection (Invega Sustenna):** 39 mg/0.25 mL, 50 mg/0.5 mL, 75 mg/0.75 mL, 78 mg/0.5 mL, 100 mg/mL, 117 mg/0.75 mL, 150 mg/1.5 mL, 156 mg/mL, 234 mg/1.5 mL. **Extended-release intramuscular injection (Invega Trinza):** 175 mg/0.875 mL, 263 mg/1.315 mL, 273 mg/0.875 mL, 350 mg/1.75

© F.A. Davis Publishing

mL, 410 mg/1.315 mL, 525 mg/2.625 mL, 546 mg/1.75 mL, 819 mg/2.625 mL. **Extended-release intramuscular injection (Invega Hafyera):** 1,092 mg/3.5 mL, 1,560 mg/5 mL.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression, especially during early therapy. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout therapy.
- Monitor BP (sitting, standing, lying down) and pulse before and periodically during therapy. May cause prolonged QT interval, tachycardia, and orthostatic hypotension.
- Observe patient when administering medication to ensure that medication is actually swallowed and not hoarded or cheeked.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation of medication may be necessary.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, delirium, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, cardiac arrhythmia, pallor, tiredness). Discontinue paliperidone and notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- ***Lab Test Considerations:*** Monitor fasting blood glucose and cholesterol levels before and periodically during therapy.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.

Implementation

- ***High Alert:*** Do not confuse *Invega Sustenna* with *Invega Trinza*.
- **PO:** Administer once daily in the morning without regard to food. ***DNC:*** Tablets should be swallowed whole; do not crush, break, or chew.
- **IM:** *Invega Sustenna:* Administer initial and 2nd doses in deltoid using a 1½-inch, 22 gauge needle for patients ≥90 kg (≥200 lb) or 1-inch 23 gauge needle for patients <90 kg (<200 lb). Monthly maintenance doses can be administered in either deltoid or gluteal sites. For gluteal injection, use 1½-inch, 22 gauge needle regardless of patient weight. To avoid missed dose, may give 2nd dose 4 days before or after the 1-wk timepoint. Monthly doses may be given up to 7 days before or after the monthly timepoint. *After 1st mo, if missed dose is within 4 wk of scheduled dose*, administer 2nd dose of 156 mg as soon as possible. Give 3rd dose of 117 mg in either deltoid or gluteal muscle 5 wk after 1st injection (regardless of timing of 2nd injection). Then return to normal monthly injections in either deltoid or gluteal muscle. *If >4 wk and <7 wk since 1st injection,* resume by administering 156 mg dose in deltoid as soon as possible, a 2nd 156 mg dose in deltoid in 1 wk, followed by monthly doses in deltoid or gluteal sites. *If >7 mo since scheduled dose,* administer using initial dosing schedule. During regular monthly dose schedule, *if <6 wk since last injection*, administer previously stabilized dose as soon as possible, then monthly. *If >6 wk since last injection*, resume dose previously stabilized on, unless stabilized on 234 mg (then 1st two injections should be 156 mg). Administer 1 dose in deltoid as soon as possible, then another deltoid injection of same dose 1 wk later, then resume regular monthly schedule. *If >6 mo since last injection*, administer using initial dosing schedule.
- **IM:** *Invega Trinza:* Use only after at least 4 mo of monthly *Invega Sustenna* therapy. Prior to administration, shake the prefilled syringe vigorously for at least 15 sec within 5 min prior to administration to ensure a homogeneous suspension. *Deltoid injection:* For patients weighing <90 kg, use the 1-inch 22 gauge thin wall needle. For patients weighing ≥90 kg, use the 1½-inch 22 gauge thin wall needle. *Gluteal injection:* Regardless of patient weight, use 1½-inch 22 gauge thin wall needle. Initiate *Invega Trinza* when next 1-mo paliperidone dose is scheduled. *Avoid missed doses;* dose may be given 2 wk before or after 3 mo scheduled dose. *If more than 3½ mo (up to but <4 mo) since last dose,* administer previously administered dose as soon as possible, then continue with 3-mo injections. *If 4 mo up to and including 9 mo since last dose,* do NOT administer next dose. *If last dose was 273 mg,* admin-

P

© F.A. Davis Publishing

ister 2 doses of 78 mg of *Invega Sustenna* one wk apart into deltoid muscle, then one dose of *Invega Trinza* 273 mg 1 mo after 2nd dose of *Invega Sustenna*. *If last dose was 410 mg,* administer 2 doses of 117 mg of *Invega Sustenna* 1 wk apart into deltoid muscle, then one dose of *Invega Trinza* 410 mg 1 mo after 2nd dose of *Invega Sustenna*. *If last dose was 819 mg,* administer 2 doses of 156 mg of *Invega Sustenna* 1 wk apart into deltoid muscle, then one dose of *Invega Trinza* 819 mg 1 mo after 2nd dose of *Invega Sustenna*. If >9 mo have elapsed since last injection of *Invega Trinza*, reinitiate treatment with *Invega Sustenna*. Then resume *Invega Trinza* after at least 4 mo of *Invega Sustenna*.

- **IM:** *Invega Hafyera* must be administered as a gluteal IM injection by a health care professional once every 6 mo. After shaking, solution is uniform, thick, and milky white; do not inject is discolored or contains particulate matter. Do not use needles from *Invega Sustenna* or *Invega Trinza*; may develop blockage. Begin *Invega Hafyera* only after therapy has been established with either once-a-month *Invega Sustenna* for at least 4 mo OR every-3-mo *Invega Trinza* for at least 1 3-mo injection cycle. Begin within 1 wk before or after next scheduled dose for *Invega Sustenna* or 2 wk before of after *Invega Trinza* dose. May give *Invega Hafyera* injection up to 2 wk before or 3 wk after the scheduled 6-mo dose to avoid a missed dose. If >6 mo and 3 wk but <8 mo since last dose of *Invega Hafyera*, restart with *Invega Sustenna*. *If last dose of Invega Hafyera was 1092 mg,* administer *Invega Sustenna* 156 mg into deltoid muscle on Day 1. Then 1 mo after Day 1, administer *Invega Hafyera* 1092 mg into gluteal muscle. *If last dose of Invega Hafyera was 1560 mg,* administer *Invega Sustenna* 234 mg into deltoid muscle on Day 1. Then 1 mo after Day 1, administer *Invega Hafyera* 1560 mg into gluteal muscle. If 8 mo up to and including 11 mo since last dose of *Invega Hafyera*, restart with *Invega Sustenna*. *If last dose of Invega Hafyera was 1092 mg,* administer *Invega Sustenna* 156 mg into deltoid muscle on Day 1 and 156 mg on Day 8. Then 1 mo after Day 8, administer *Invega Hafyera* 1092 mg into gluteal muscle. *If last dose of Invega Hafyera was 1560 mg,* administer *Invega Sustenna* 156 mg into deltoid muscle on Day 1 and 156 mg on Day 8. Then 1 mo after Day 1, administer *Invega Hafyera* 1560 mg into gluteal muscle. If >11 mo since the last dose of *Invega Hafyera*, restart therapy with *Invega Sustenna*. *Invega Hafyera* can be resumed after therapy with *Invega Sustenna* for at least 4 mo.

Patient/Family Teaching

- Instruct patient to take medication as directed. Advise patient that appearance of tablets in stool is normal and not of concern.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- May cause drowsiness and dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Advise patient that extremes in temperature should also be avoided; this drug impairs body temperature regulation.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort and alcohol.
- Advise patient to seek nutritional, weight, or medical management as needed for weight gain or cholesterol elevation.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, tremors, menstrual abnormalities, galactorrhea, or sexual dysfunction occur.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding. Encourage women who become pregnant while taking paliperidone to enroll in the National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/. Monitor neonates for extrapyramidal and/or withdrawal symptoms (agitation, hypertonia, hypotonia, tremor, somnolence, respiratory distress, feeding disorder) and manage symptoms appropriately. Monitor infants exposed to paliperidone through breast milk for excess sedation, failure to thrive, jitteriness, and extrapyramidal symptoms (tremors and abnormal muscle movements). May temporarily cause female infertility.
- Emphasize the importance of routine follow-up exams to monitor side effects and continued participation in psychotherapy to improve coping skills.

Evaluation/Desired Outcomes

- Decrease in excited, manic behavior.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunted affect) of schizophrenia.

© F.A. Davis Publishing

palonosetron
(pa-lone-**o**-se-tron)
~~Aloxi~~

Classification
Therapeutic: antiemetics
Pharmacologic: 5-HT_3 antagonists

Indications
Prevention of acute and delayed nausea and vomiting caused by initial or repeat courses of moderately or highly emetogenic chemotherapy (moderately emetogenic chemotherapy for adults only). Prevention of postoperative nausea and vomiting (PONV) for up to 24 hr after surgery.

Action
Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zones in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following emetogenic chemotherapy or surgery.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: 50% metabolized; 40% excreted unchanged in urine.
Half-life: 40 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	within 30 min	unknown	7 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; cross sensitivity with other 5-HT_3 antagonists may occur.
Use Cautiously in: OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Neonates <1 mo (safety and effectiveness not established).

Adverse Reactions/Side Effects
GI: constipation, diarrhea. **Neuro:** dizziness, headache. **Misc:** SEROTONIN SYNDROME.

Interactions
Drug-Drug: Drugs that affect serotonergic neurotransmitter systems, including **SSRIs**, **SNRIs**, **tricyclic antidepressants**, **MAOIs**, **fentanyl**, **lithium**, **buspirone**, **tramadol**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Route/Dosage

Prevention of Chemotherapy-Induced Nausea/Vomiting
IV (Adults): 0.25 mg given 30 min before start of chemotherapy.
IV (Children 1 mo–<17 yr): 20 mcg/kg (max = 1.5 mg) given 30 min before start of chemotherapy.

Prevention of PONV
IV (Adults): 0.075 mg given immediately before induction of anesthesia.

Availability (generic available)
Solution for injection: 0.05 mg/mL. ***In combination with:*** fosnetupitant (Akynzeo); netupitant (Akynzeo); see Appendix N.

NURSING IMPLICATIONS

Assessment
- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- ***Lab Test Considerations:*** May cause transient ↑ in serum bilirubin, AST, and ALT levels.

Implementation
- 1st dose is administered prior to emetogenic event.
- Repeated dose within a 7-day period is not recommended.

IV Administration
- **IV Push:** Administer dose undiluted 30 min prior to chemotherapy or immediately prior to the induction of anesthesia. Flush line prior to and after administration with 0.9% NaCl. Do not administer solutions that are discolored or contain particulate matter.
- ***Concentration:*** 0.05 mg/mL. ***Rate:*** Administer over 30 sec in adults and 15 sec in children 30 min before starting chemotherapy and over 10 sec for postoperative nausea and vomiting.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine,

© F.A. Davis Publishing

doxorubicin hydrochloride, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, fosaprepitant, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, insulin regular, irinotecan, isoproterenol, ketorolac, labetalol, lactated ringers, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna$_{methadone}$, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, neostigmine, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, paclitaxel, paclitaxel protein bound, pamidronate, pancuronium, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine.

- **Y-Site Incompatibility:** acyclovir, allopurinol, amphotericin B deoxycholate, diazepam, doxycycline, ganciclovir, gemtuzumab ozogamicin, imipenem/cilastatin, methylprednisolone, minocycline, nafcillin, pantoprazole, pentamidine, pentobarbital, phenytoin, thiopental.

Patient/Family Teaching

- Inform patient of purpose of medication.
- Advise patient to notify health care professional if nausea or vomiting occur.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with initial and repeat courses of emetogenic cancer chemotherapy or surgery.

pamidronate (pa-mid-roe-nate)

Aredia

Classification

Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates, hypocalcemics

Indications

Moderate to severe hypercalcemia associated with malignancy. Osteolytic bone lesions associated with multiple myeloma or breast cancer. Moderate to severe Paget's disease.

Action

Inhibits resorption of bone. **Therapeutic Effects:** Decreased serum calcium. Decreased skeletal destruction in multiple myeloma or breast cancer. Decreased skeletal complications in Paget's disease.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Rapidly absorbed by bone. Reaches high concentrations in bone, liver, spleen, teeth, and tracheal cartilage. Approximately 50% of a dose is retained by bone and then slowly released.
Metabolism and Excretion: 50% is excreted unchanged in the urine.
Half-life: Elimination half-life from plasma is biphasic—1st phase 1.6 hr, 2nd phase 27.2 hr. Elimination half-life from bone is 300 days.

TIME/ACTION PROFILE (effect on serum calcium)

ROUTE	ONSET	PEAK	DURATION
IV	24 hr	7 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to pamidronate, other biphosphonates, or mannitol; OB, Lactation: Pregnancy or lactation.
Use Cautiously in: Underlying cardiovascular disease, especially HF (initiate saline hydration cautiously); Invasive dental procedures, cancer, receiving chemotherapy or corticosteroids, poor oral hygiene, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (may ↑ risk of jaw osteonecrosis); History of thyroid surgery (may be at ↑ risk for hypocalcemia); Renal impairment (dose ↓ recommended); Pedi: Safety not established.

Adverse Reactions/Side Effects

EENT: conjunctivitis, blurred vision, eye pain/inflammation, rhinitis. **Neuro:** fatigue. **Resp:** rales. **CV:** arrhythmias, hypertension, syncope, tachycardia. **GI:** nausea, abdominal pain, anorexia, constipation, vomiting. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hypophosphatemia, fluid overload. **GU:** nephrotoxicity. **Hemat:** leukopenia, anemia. **Local:** phlebitis at injection site. **Metab:** hypothyroidism. **MS:** muscle stiffness, musculoskeletal pain, femur fractures, osteonecrosis (primarily of jaw). **Misc:** fever, generalized pain.

Interactions

Drug-Drug: Hypokalemia and hypomagnesemia may ↑ risk of **digoxin** toxicity. **Calcium** and **vitamin D** will

© F.A. Davis Publishing

antagonize the beneficial effects of pamidronate. Concurrent use of **thalidomide** may ↑ risk of renal dysfunction.

Route/Dosage

Single doses should not exceed 90 mg.

Hypercalcemia of Malignancy

IV (Adults): *Moderate hypercalcemia*—30–90 mg; may be repeated after 7 days.

Osteolytic Lesions from Multiple Myeloma

IV (Adults): 90 mg monthly.

Osteolytic Lesions from Metastatic Breast Cancer

IV (Adults): 90 mg q 3–4 wk.

Paget's Disease

IV (Adults): 90–180 mg/treatment; may be given as 30 mg daily for 3 days up to 30 mg/wk for 6 wk. Single doses of 60–90 mg may also be effective.

Availability (generic available)

Powder for injection: 30 mg/vial, 90 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor intake/output ratios and BP frequently during therapy. Assess for signs of fluid overload (edema, rales/crackles).
- Monitor symptoms of hypercalcemia (nausea, vomiting, anorexia, weakness, constipation, thirst, and cardiac arrhythmias).
- Observe for evidence of hypocalcemia (paresthesia, muscle twitching, laryngospasm, and Chvostek's or Trousseau's sign). Protect symptomatic patients by elevating and padding side rails; keep bed in low position.
- Monitor IV site for phlebitis (pain, redness, swelling). Symptomatic treatment should be used if this occurs.
- Assess for bone pain. Treatment with nonopioid or opioid analgesics may be necessary.
- ***Lab Test Considerations:*** Assess serum creatinine prior to each treatment. Withhold dose if renal function has deteriorated in patients treated for bone metastases.
- Monitor serum electrolytes (including calcium, phosphate, potassium, and magnesium), hemoglobin, and creatinine closely. Monitor CBC and platelet count during the first 2 wk of therapy. May cause hyperkalemia or hypokalemia, hypernatremia, and hematuria.
- Monitor renal function periodically during therapy.

Implementation

- Initiate a vigorous saline hydration, maintaining a urine output of 2000 mL/24 hr, concurrently with pamidronate therapy. Patients should be adequately hydrated, but avoid overhydration. Use caution in patients with underlying cardiovascular disease, especially HF. Do not use diuretics prior to treatment of hypovolemia.
- Patients with severe hypercalcemia should be started at the 90-mg dose.
- **IV:** Reconstitute by adding 10 mL of sterile water for injection to each vial. ***Concentration:*** 30 mg/10 mL or 90 mg/10 mL. Allow drug to dissolve before withdrawing. Solution is stable for 24 hr if refrigerated.
- **Hypercalcemia:** ***Dilution:*** Dilute further in 1000 mL of 0.45% NaCl, 0.9% NaCl, or D5W. Solution is stable for 24 hr at room temperature. ***Rate:*** Administer 60-mg infusion over at least 4 hr and 90-mg infusion over 24 hr.
- **Multiple Myeloma:** ***Dilution:*** Dilute reconstituted solution in 500 mL of 0.45% NaCl, 0.9% NaCl, or D5W. ***Rate:*** Administer over 4 hr.
- **Paget's Disease:** Dilute reconstituted solution in 500 mL of 0.45% NaCl, 0.9% NaCl, or D5W.
- ***Rate:*** Administer over 4 hr.
- **Y-Site Compatibility:** acyclovir alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampillicin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, metaraminol, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin,

© F.A. Davis Publishing

paclitaxel, palonosetron, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** amphotericin B deoxycholate, caspofungin, dantrolene, diazepam, leucovorin, phenytoin.
- **Additive Incompatibility:** Calcium-containing solutions, such as Ringer's solution.

Patient/Family Teaching

- Advise patient to report signs of hypercalcemic relapse (bone pain, anorexia, nausea, vomiting, thirst, lethargy) or eye problems (pain, inflammation, blurred vision, conjunctivitis) to health care professional promptly.
- Advise patient to notify nurse of pain at the infusion site.
- Encourage patient to comply with dietary recommendations. Diet should contain adequate amounts of calcium and vitamin D.
- Advise patient to notify health care professional if bone pain is severe or persistent.
- Advise patient to maintain good oral hygiene and have regular dental examinations. Instruct patient to inform health care professional of pamidronate therapy prior to dental surgery.
- Emphasize the need for keeping follow-up exams to monitor progress, even after medication is discontinued, to detect relapse.

Evaluation/Desired Outcomes

- Lowered serum calcium levels.
- Decreased pain from lytic lesions.

pancrelipase (pan-kre-li-pase)

Cotazym, Creon, Pancrease MT, Pancreaze, Pertyze, Viokace, Zenpep

Classification

Therapeutic: digestive agent
Pharmacologic: pancreatic enzymes

Indications

Pancreatic insufficiency associated with: Chronic pancreatitis, Pancreatectomy, Cystic fibrosis, GI bypass surgery, Ductal obstruction secondary to tumor.

Action

Contains lipolytic, amylolytic, and proteolytic activity.
Therapeutic Effects: Increased digestion of fats, carbohydrates, and proteins in the GI tract.

Pharmacokinetics

Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (digestant effects)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to hog proteins.
Use Cautiously in: Gout, renal impairment, or hyperuricemia (may ↑ uric acid levels); OB: Systemic absorption during pregnancy expected to be minimal; significant fetal exposure not expected; Lactation: Systemic absorption expected to be minimal; significant exposure to breast-fed infant not expected.

Adverse Reactions/Side Effects

EENT: nasal stuffiness. **Resp:** dyspnea, shortness of breath, wheezing. **GI:** FIBROSING COLONOPATHY (high doses only), abdominal pain (high doses only), diarrhea, nausea, stomach cramps, oral irritation. **GU:** hematuria. **Derm:** hives, rash. **Metab:** hyperuricemia. **Misc:** allergic reactions.

Interactions

Drug-Drug: Antacids (**calcium carbonate** or **magnesium hydroxide**) may ↓ effectiveness of pancrelipase. May ↓ the absorption of concurrently administered **iron supplements**.
Drug-Food: Alkaline foods destroy coating on enteric-coated products.

Route/Dosage

PO (Adults and Children ≥4 yr): Initiate with 500 lipase units/kg/meal; dose should be adjusted based on weight, clinical symptoms, and stool fat content; maximum dose = 2500 lipase units/kg/meal (or 10,000 lipase units/kg/day).
PO (Children >1 yr and <4 yr): Initiate with 1000 lipase units/kg/meal; dose should be adjusted based on weight, clinical symptoms, and stool fat content; maximum dose = 2500 lipase units/kg/meal (or 10,000 lipase units/kg/day).
PO (Children ≤1 yr): 2000–4000 lipase units per 120 mL of formula or breast milk.

Availability (generic available)

Delayed-release capsules: 2600 units lipase/6200 units protease/10,850 units amylase, 3000 units lipase/9500 units protease/15,000 units amylase, 3000 units lipase/10,000 units protease/16,000 units amylase, 4000 units lipase/14,375 units protease/15,125 units

© F.A. Davis Publishing

amylase, 4200 units lipase/14,200 units protease/24,600 units amylase, 5000 units lipase/17,000 units protease/27,000 units amylase, 6000 units lipase/19,000 units protease/30,000 units amylase, 8000 units lipase/28,750 units protease/30,250 units amylase, 8000 units lipase/30,000 units protease/30,000 units amylase, 10,000 units lipase/34,000 units protease/55,000 units amylase, 10,500 units lipase/35,500 units protease/61,500 units amylase, 12,000 units lipase/38,000 units protease/60,000 units amylase, 13,800 units lipase/27,600 units protease/27,600 units amylase, 15,000 units lipase/51,000 units protease/82,000 units amylase, 16,000 units lipase/57,500 units protease/60,500 units amylase, 16,800 units lipase/56,800 units protease/98,400 units amylase, 20,000 units lipase/55,000 units protease/55,000 units amylase, 20,000 units lipase/68,000 units protease/109,000 units amylase, 20,700 units lipase/41,400 units protease/41,400 units amylase, 21,000 units lipase/54,700 units protease/83,900 units amylase, 23,000 units lipase/46,000 units protease/46,000 units amylase, 24,000 units lipase/76,000 units protease/120,000 units amylase, 25,000 units lipase/85,000 units protease/136,000 units amylase, 36,000 units lipase/114,000 units protease/180,000 units amylase, 40,000 units lipase/136,000 units protease/218,000 units amylase. **Tablets:** 10,440 units lipase/39,150 units protease/39,150 units amylase, 20,880 units lipase/78,300 units protease/78,300 units amylase.

NURSING IMPLICATIONS

Assessment

- Assess patient's nutritional status (height, weight, skin-fold thickness, arm muscle circumference, and lab values) prior to and periodically throughout therapy.
- Monitor stools for high fat content (steatorrhea). Stools will be foul-smelling and frothy.
- Assess patient for allergy to pork; sensitivity to pancrelipase may exist.
- ***Lab Test Considerations:*** May cause ↑ serum and urine uric acid concentrations.

Implementation

Pancreaze is not interchangeable with any other pancrelipase product.

- **PO:** Administer immediately before or with meals and snacks.
- ***DNC:*** Swallow tablets whole; do not crush, break, or chew.
- Swallow capsules whole. If unable to swallow, capsules may be opened and sprinkled on foods. Delayed-release capsules filled should not be chewed (sprinkle on soft, acidic foods that can be swallowed without chewing, such as applesauce or Jell-O) and followed immediately by water or juice to ensure complete ingestion. These medications should not be chewed or mixed with alkaline foods prior to ingestion or coating will be destroyed.
- Half of the prescribed *Pancreaze* and *Pertyze* dose for an individualized full meal should be given with each snack. The total daily dose should reflect approximately three meals plus two or three snacks per day.
- Do not mix contents of *Pancreaze*, *Pertyze,* or *Creon* capsules directly into breast milk or formula. Capsule contents may be sprinkled on small amounts of acidic soft food with a pH of 4.5 or less (applesauce) and given to the infant within 15 min. Contents of the capsule may also be administered directly to the mouth. Follow administration with breast milk or formula. Applesauce mixture of *Pertyze* can also be administered via G-tube.
- Do not mix *Zenpep* capsule contents directly into formula or breast milk prior to administration. Administer with applesauce, bananas, or pears (commercially prepared) and follow with breast milk or formula.
- Do not chew or retain *Ultressa* capsule in mouth.

Patient/Family Teaching

- Encourage patients to comply with diet recommendations of health care professional (generally high-calorie, high-protein, low-fat). Dose should be adjusted for fat content of diet. Usually 300 mg of pancrelipase is necessary to digest every 17 g of dietary fat. If a dose is missed, it should be omitted and next dose taken with next snack, as directed. Do not increase dose without consulting health care professional. Several days may be required to determine correct dose. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill; information may be updated.
- Instruct patient not to chew tablets and to swallow them quickly with plenty of liquid to prevent mouth and throat irritation. Sit upright to enhance swallowing. Eating immediately after taking medication helps further ensure that the medication is swallowed and does not remain in contact with mouth and esophagus for a prolonged period. Patient should avoid sniffing powdered contents of capsules, as sensitization of nose and throat may occur (nasal stuffiness or respiratory distress).
- Advise patients and caregivers to notify health care professional if symptoms of fibrosing colonopathy (abdominal pain, distention, vomiting, constipation) occur. Occur more frequently with doses exceeding 6000 lipase units/kg of body weight per meal (10,000 lipase units/kg of body weight/day) and have been associated with colonic strictures in children below the age of 12 yr.

P

© F.A. Davis Publishing

- Instruct patient to notify health care professional if joint pain, swelling of legs, gastric distress, or rash occurs.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Improved nutritional status in patients with pancreatic insufficiency.
- Normalization of stools in patients with steatorrhea.

HIGH ALERT

pancuronium

(pan-cure-**oh**-nee-yum)

~~Pavulon~~

Classification

Therapeutic: neuromuscular blocking agents—nondepolarizing

Indications

Induction of skeletal muscle paralysis and facilitation of intubation after induction of anesthesia in surgical procedures. Facilitation of compliance during mechanical ventilation.

Action

Prevents neuromuscular transmission by blocking the effect of acetylcholine at the myoneural junction. Has no analgesic or anxiolytic properties. **Therapeutic Effects:** Skeletal muscle paralysis.

Pharmacokinetics

Absorption: Following IV administration, absorption is essentially complete.

Distribution: Rapidly distributes into extracellular fluid; small amounts cross the placenta.

Metabolism and Excretion: Excreted mostly unchanged by the kidneys; small amounts are eliminated in bile.

Half-life: 2 hr.

TIME/ACTION PROFILE (neuromuscular blockade)

ROUTE	ONSET	PEAK	DURATION
IV	30–45 sec	3–4.5 min	40–60 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to bromides; Pedi: Products containing benzyl alcohol should be avoided in neonates.

Use Cautiously in: Underlying cardiovascular disease (↑ risk of arrhythmias); Dehydration or electrolyte abnormalities (should be corrected); Situations in which histamine release would be problematic; Fractures or muscle spasm; Renal impairment (↓ elimination); Hyperthermia (↑ duration/intensity of paralysis); Hepatic impairment (altered response); Shock; Extensive burns (may be more resistant to effects); Low plasma pseudocholinesterase levels (may be seen in association with anemia, dehydration, cholinesterase inhibitors/insecticides, severe liver disease, pregnancy, or hereditary predisposition); Obese patients; OB, Lactation: Safety not established; may be used during caesarian section; Pedi: Contains benzyl alcohol, which can cause potentially fatal gasping syndrome in neonates; Geri: Age-related ↓ in renal function may result in prolonged effects.

Exercise Extreme Caution in: Patients with neuromuscular diseases such as myasthenia gravis (small test dose may be used to assess response).

Adverse Reactions/Side Effects

Resp: bronchospasm. **CV:** hypertension, tachycardia. **GI:** excessive salivation. **Derm:** rash. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Intensity and duration of paralysis may be prolonged by pretreatment with **succinylcholine**, **general anesthesia** (inhalation), **aminoglycosides**, **vancomycin**, **tetracyclines**, **polymyxin B**, **colistin**, **cyclosporine**, **calcium channel blockers**, **clindamycin**, **lidocaine**, and other **local anesthetics**, **lithium**, **quinidine**, **procainamide**, **beta blockers**, **potassium-losing diuretics**, or **magnesium**. **Inhalation anesthetics** including **enflurane**, **isoflurane**, **halothane**, **desflurane**, **sevoflurane** may enhance effects. Higher infusion rates may be required and duration of action may be shortened in patients receiving long-term **carbamazepine**, **steroids (chronic)**, **azathioprine**, or **phenytoin**.

Route/Dosage

IV (Adults and Children >1 mo): *Initial intubating dose*—0.06–0.1 mg/kg initially; additional doses of 0.01 mg/kg may be given every 25–60 min to maintain paralysis. *Continuous infusion*—1–2 mcg/kg/min.

Availability (generic available)

Injection: 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess respiratory status continuously throughout therapy with neuromuscular blocking agents. These medications should be used only to facilitate intubation or in patients already intubated.
- Neuromuscular response should be monitored with a peripheral nerve stimulator intraoperatively. Paralysis is initially selective and usually occurs sequentially in the following muscles: levator muscles of eyelids, muscles of mastication, limb muscles, abdominal muscles, muscles of the glottis, intercostal muscles, and the diaphragm. Recovery of muscle function usually occurs in reverse order.
- Monitor ECG, heart rate, and BP throughout administration.

© F.A. Davis Publishing

- Observe the patient for residual muscle weakness and respiratory distress during the recovery period.
- Monitor infusion site frequently. If signs of tissue irritation or extravasation occur, discontinue and restart in another vein.
- ***Toxicity and Overdose:*** If overdose occurs, use peripheral nerve stimulator to determine the degree of neuromuscular blockade. Maintain airway patency and ventilation until recovery of normal respirations occurs.
- Administration of anticholinesterase agents (neostigmine, pyridostigmine) may be used to antagonize the action of neuromuscular blocking agents once the patient has demonstrated some spontaneous recovery from neuromuscular block. Atropine is usually administered prior to or concurrently with anticholinesterase agents to counteract the muscarinic effects.
- Administration of fluids and vasopressors may be necessary to treat severe hypotension or shock.

Implementation

- ***High Alert:*** Unintended administration of a neuromuscular blocking agent instead of administration of the intended medication or administration of a neuromuscular blocking agent in the absence of ventilatory support has resulted in serious harm or death. Confusing similarities in packaging and insufficiently controlled access to these medications are often implicated in these medication errors. Store these products in a separate, locked container.
- Dose is titrated to patient response.
- Neuromuscular blocking agents have *no* effect on consciousness or pain threshold. Adequate anesthesia/analgesia should *always* be used when neuromuscular blocking agents are used as an adjunct to surgical procedures or when painful procedures are performed. Benzodiazepines and/or analgesics should be administered concurrently when prolonged neuromuscular blocker therapy is used for ventilator patients, because patient is awake and able to feel all sensations.
- If eyes remain open throughout prolonged administration, protect corneas with artificial tears.
- Store pancuronium in refrigerator. To prevent absorption by plastic, pancuronium should not be stored in plastic syringes. May be administered in plastic syringes.
- Most neuromuscular blocking agents are incompatible with barbiturates and sodium bicarbonate. Do not admix.

IV Administration

- **IV Push:** ***Dilution:*** May be administered undiluted. ***Concentration:*** 1 mg/mL (10-mL vial); 2 mg/mL (2-mL or 5-mL vial). ***Rate:*** Administer over 1–2 min.
- **Intermittent Infusion:** ***Dilution:*** Add 100 mg of pancuroniuum to 250 mL of D5W, 0.9% NaCl, D5/0.9% NaCl, or LR. ***Concentration:*** 0.4 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem-cilastatin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, methohexital, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** allopurinol, amphotericin B deoxycholate, amphotericin B lipid complex, caspofungin, dantrolene, diazepam, furosemide, pantoprazole, phenytoin, thiopental.

P

© F.A. Davis Publishing

Patient/Family Teaching

- Explain all procedures to patient receiving neuromuscular blocker therapy without general anesthesia, because consciousness is not affected by neuromuscular blocking agents alone.
- Reassure patient that communication abilities will return as the medication wears off.

Evaluation/Desired Outcomes

- Adequate suppression of the twitch response when tested with peripheral nerve stimulation and subsequent muscle paralysis.
- Improved compliance during mechanical ventilation.

panitumumab

(pan-i-**tu**-mu-mab)

Vectibix

Classification

Therapeutic: antineoplastics

Pharmacologic: kinase inhibitors

Indications

Treatment of wild-type *RAS* (wild type in *KRAS* and *NRAS*) metastatic colorectal cancer that has failed fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy (to be used as monotherapy). Treatment of wild-type *RAS* (wild type in *KRAS* and *NRAS*) metastatic colorectal cancer (as first-line therapy with FOLFOX).

Action

Binds to EGFR resulting in inactivation of kinases that regulate proliferation and transformation. **Therapeutic Effects:** Decreased progression of colorectal cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Monoclonal antibodies cross the placenta and enter breast milk.

Metabolism and Excretion: Unknown.

Half-life: 7.5 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Concurrent leucovorin; *RAS*—mutant metastatic colorectal cancer or unknown *RAS* mutation status (↑ mortality and tumor progression); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Derm: NECROTIZING FASCIITIS, acneiform dermatitis, dry skin, erythema, paronychia, pruritus, rash, skin exfoliation, skin fissures, abscesses, photosensitivity. **EENT:** corneal perforation, keratitis, eyelash growth, ulcerative keratitis. **F and E:** edema, hypocalcemia, hypomagnesemia. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, stomatitis. **GU:** acute renal failure. **Neuro:** fatigue. **Resp:** INTERSTITIAL LUNG DISEASE, PULMONARY FIBROSIS, cough. **Misc:** INFUSION REACTIONS, SEPSIS.

Interactions

Drug-Drug: None reported.

Route/Dosage

IV (Adults): 6 mg/kg every 14 days.

Availability

Solution for injection: 20 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for dermatologic toxicity (dermatitis acneiform, pruritus, erythema, rash, skin exfoliation, paronychia, dry skin, skin fissures). If severe, may lead to infection (sepsis, septic death, abscesses requiring incision and drainage). With severe reactions, hold panitumumab and monitor for inflammatory or infectious sequelae. *If severe dermatologic toxicities (Grade 3 or higher) or those considered intolerable occur,* hold panitumumab. *Upon 1st occurrence of a grade 3 dermatologic toxicity,* hold 1–2 doses; if skin improves to <Grade 3, reinitiate at original dose. *For 2nd occurrence of a grade 3 dermatologic toxicity,* hold 1–2 doses; if skin improves to <Grade 3, reinitiate at 80% of original dose. *For 3rd occurrence of a grade 3 dermatologic toxicity,* hold 1–2 doses; if skin improves to <Grade 3, reinitiate at 60% of original dose. *For 4th occurrence of a grade 3 dermatologic toxicity,* permanently discontinue panitumumab.
- Monitor for severe infusion reactions (anaphylactic reaction, bronchospasm, fever, chills, hypotension). If severe reaction occurs, stop panitumumab; may require permanent discontinuation.
- Assess for pulmonary fibrosis (cough, wheezing, exertional dyspnea, interstitial lung disease, pneumonitis, lung infiltrates). Permanently discontinue panitumumab if these signs occur.
- Monitor for diarrhea and dehydration during therapy.
- Monitor for signs and symptoms of interstitial lung disease (persistent or recurrent coughing, wheezing, dyspnea) during therapy; discontinue panitumumab if symptoms occur.
- Monitor for evidence of keratitis, ulcerative keratitis, or corneal perforation. Interrupt or discontinue panitumumab for acute or worsening keratitis, ulcerative keratitis, or corneal perforation.

© F.A. Davis Publishing

- ***Lab Test Considerations:*** Patient selection is based on RAS status. Prior to administration, assess RAS mutational status in colorectal tumors and confirm the absence of a RAS mutation. Information on FDA-approved tests for the detection of RAS mutations in patients with metastatic colorectal cancer is available at: http://www.fda.gov/Companion-Diagnostics.
- Monitor electrolyte levels periodically during and for 8 wk after completion of therapy. May cause hypomagnesemia, hypocalcemia, and hypokalemia. Replace electrolytes as needed.

Implementation

- **Intermittent Infusion:** ***Dilution:*** Withdraw necessary amount of panitumumab. Dilute to a volume of 100 mL with 0.9% NaCl; dilute doses >1000 mg with 150 mL. ***Concentration:*** 10 mg/mL. Mix by inverting gently; do not shake. Administer via infusion pump using a low-protein binding 0.2 mcg or 0.22 mcg in-line filter. Solution is colorless and may contain a small amount of visible translucent to white, amorphous, proteinaceous particles. Do not administer solutions that are discolored or contain particulate matter. Store in refrigerator; do not freeze. Use diluted solution within 6 hr of preparation if stored at room temperature or within 24 hr if refrigerated. ***Rate:*** Administer over 60 min every 14 days. If 1st infusion is tolerated, subsequent infusions may be infused over 30–60 min. Administer doses >1000 mg over 90 min.
- *If mild to moderate infusion reaction (Grade 1 or 2) occurs,* decrease infusion rate by 50%. *If severe reaction (Grade 3 or 4) occurs,* immediately and permanently discontinue panitumumab.
- **Y-Site Incompatibility:** Flush line before and after administration with 0.9% NaCl. Do not mix with other medications or solutions.

Patient/Family Teaching

- Explain purpose of panitumumab to patient.
- May cause photosensitivity. Caution patient to wear sunscreen and hats and to limit sun exposure.
- Advise patient to notify health care professional if signs and symptoms of dermatologic toxicity, infusion reactions, pulmonary fibrosis, or ocular changes occur.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and to avoid breast feeding during and for 2 months after last dose. May impair fertility in females.
- Emphasize the need for periodic blood tests to monitor electrolyte levels.

Evaluation/Desired Outcomes

- Decreased progression of colorectal cancer.

BEERS

pantoprazole

(pan-**toe**-pra-zole)

Pantoloc, Protonix, Protonix IV, Tecta

Classification

Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

Indications

Erosive esophagitis associated with GERD. Maintenance of healing of erosive esophagitis. Pathologic gastric hypersecretory conditions. **Unlabeled Use:** Adjunctive treatment of duodenal ulcers associated with *Helicobacter pylori*.

Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis. Decreased acid secretion in hypersecretory conditions.

Pharmacokinetics

Absorption: Tablet is enteric-coated; absorption occurs only after tablet leaves the stomach.
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Primarily metabolized by the CYP2C19 and CYP3A4 isoenzymes in the liver; the CYP2C19 enzyme system exhibits genetic polymorphism (15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ pantoprazole concentrations and an ↑ risk of adverse effects); inactive metabolites are excreted in urine (71%) and feces (18%).
Half-life: 1 hr.

TIME/ACTION PROFILE (effect on acid secretion)

ROUTE	ONSET†	PEAK	DURATION†
PO	2.5 hr	unknown	1 wk
IV	15–30 min	2 hr	unknown

†Onset = 51% inhibition; duration = return to normal following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to pantoprazole or related drugs (benzimidazoles).
Use Cautiously in: Patients using high doses for >1 yr (↑ risk of hip, wrist, or spine fractures and fundic gland polyps); Patients using therapy for >3 yr (↑ risk of vitamin B_{12} deficiency); OB: Use only if potential ma-

© F.A. Davis Publishing

ternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Derm: cutaneous lupus erythematosus. **Endo:** hyperglycemia. **F and E:** hypomagnesemia (especially if treatment duration ≥3 mo). **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), abdominal pain, diarrhea, eructation, flatulence, fundic gland polyps. **GU:** acute tubulointerstitial nephritis. **Hemat:** vitamin B_{12} deficiency. **MS:** bone fracture. **Neuro:** headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, or tubulointerstitial nephritis, systemic lupus erythematosis.

Interactions

Drug-Drug: May ↓ levels of **atazanavir** and **nelfinavir**; avoid concurrent use with either of these antiretrovirals. May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **ampicillin esters**, **iron salts**, **erlotinib**, and **mycophenolate mofetil**; concomitant use with **atazanavir** not recommended. May ↑ risk of bleeding with **warfarin** (monitor INR/PT). Hypomagnesemia ↑ risk of **digoxin** toxicity. May ↑ **methotrexate** levels.

Route/Dosage

GERD

PO (Adults): *Short-term treatment of erosive esophagitis associated with GERD*—40 mg once daily for up to 8 wk; *Maintenance of healing of erosive esophagitis*—40 mg once daily.
PO (Children ≥5 yr): *15–39 kg*—20 mg once daily for up to 8 wk; *≥40 kg*—40 mg once daily for up to 8 wk.
IV (Adults): 40 mg once daily for 7–10 days.

Gastric Hypersecretory Conditions

PO (Adults): 40 mg twice daily, up to 120 mg twice daily.
IV (Adults): 80 mg every 12 hr (up to 240 mg/day).

Availability (generic available)

Delayed-release tablets: 20 mg, 40 mg. **Cost:** *Generic*—All strengths $368.22/90. **Delayed-release oral suspension:** 40 mg/packet. **Cost:** $7.60/1 pkt. **Powder for injection:** 40 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** May cause abnormal liver function tests, including ↑ AST, ALT, alkaline phosphatase, and bilirubin.
- May cause hypomagnesemia. Monitor serum magnesium prior to and periodically during therapy.

Implementation

- Do not confuse Protonix (pantoprazole) with Lotronex (alosetron) or protamine.
- Patients receiving pantoprazole IV should be converted to PO dosing as soon as possible.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- **PO:** ***DNC:*** May be administered with or without food. Do not break, crush, or chew tablets.
- Antacids may be used concurrently.

IV Administration

- **IV:** ***Reconstitution:*** Reconstitute each vial with 10 mL of 0.9% NaCl. Reconstituted solution is stable for 6 hr at room temperature.
- **IV Push:** ***Dilution:*** Administer undiluted. ***Concentration:*** 4 mg/mL. ***Rate:*** Administer over at least 2 min.
- **Intermittent Infusion:** ***Dilution:*** Dilute further with D5W, 0.9% NaCl, or LR. ***Concentration:*** 0.4–0.8 mg/mL. Diluted solution is stable for 24 hr at room temperature. ***Rate:*** Administer over 15 min at a rate of <3 mg/min.
- **Y-Site Compatibility:** acetazolamide, allopurinol, alprostadil, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, azithromycin, bleomycin, bumetanide, cangrelor, carboplatin, carmustine, ceftaroline, ceftolozane/tazobactam, ceftriaxone, cyclophosphamide, cytarabine, docetaxel, doxorubicin liposomal, doxycycline, eravacycline, ertapenem, fluorouracil, foscarnet, fosphenytoin, ganciclovir, granisetron, hetastarch, imipenem/cilastatin, irinotecan, isavuconazonium, meropenem/vaborbactam, mesna, methadone, methohexital, nafcillin, paclitaxel, penicillin G sodium, pentobarbital, phentolamine, phenylephrine, plazomicin, potassium chloride, procainamide, rifampin, succinylcholine, sufentanil, telavancin, theophylline, tigecycline, tirofiban, vasopressin, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, alfentanil, atropine, aztreonam, blinatumomab, buprenorphine, butorphanol, calcium acetate, calcium chloride, cefepime, cefotaxime, cefotetan, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, diltiazem, diphenhydramine, dobutamine, doxorubicin hydrochloride, droperidol, ephedrine, epirubicin, esmolol, estrogens,conjugated, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, gemcitabine, gemtuzumab ozogamicin, glycopyrrolate, haloperidol, hydralazine, hydromor-

© F.A. Davis Publishing

phone, hydroxyzine, idarubicin, ifosfamide, indomethacin, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, melphalan, meperidine, meropenem, methotrexate, methylprednisolone, metoprolol, metronidazole, milrinone, mitomycin, mitoxantrone, moxifloxacin, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, ondansetron, palonosetron, pancuronium, pemetrexed, pentamidine, phenytoin, potassium acetate, potassium phosphates, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium phosphates, streptozocin, thiotepa, topotecan, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, solutions containing zinc.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly. Instruct patient to notify health care professional immediately if rash, diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain, heartburn, gastric irritation, and bleeding in patients with GERD; may require up to 4 wk of therapy.
- Healing in patients with erosive esophagitis. Therapy is continued for up to 8 wk.

paricalcitol, See VITAMIN D COMPOUNDS.

BEERS

PAROxetine

PAROxetine hydrochloride
(par-**ox**-e-teen)
Paxil, Paxil CR

PAROxetine mesylate
Brisdelle, Pexeva

Classification
Therapeutic: antianxiety agents, antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Indications

Paxil, Paxil CR, Pexeva: Major depressive disorder, panic disorder. **Paxil, Pexeva**: Obsessive compulsive disorder (OCD), generalized anxiety disorder (GAD). **Paxil, Paxil CR**: Social anxiety disorder. **Paxil**: Posttraumatic stress disorder (PTSD). **Paxil CR**: Premenstrual dysphoric disorder (PMDD). **Brisdelle**: Moderate to severe vasomotor symptoms associated with menopause.

Action

Inhibits neuronal reuptake of serotonin in the CNS, thus potentiating the activity of serotonin; has little effect on norepinephrine or dopamine; mechanism for benefit in treating vasomotor symptoms unknown. **Therapeutic Effects:** Antidepressant action. Decreased frequency of panic attacks, OCD, or anxiety. Improvement in manifestations of post-traumatic stress disorder. Decreased dysphoria prior to menses. Decreased vasomotor symptoms in postmenopausal women.

Pharmacokinetics

Absorption: Completely absorbed following oral administration. Controlled-release tablets are enteric-coated and control medication release over 4–5 hr.
Distribution: Widely distributed throughout body fluids and tissues, including the CNS; cross the placenta and enter breast milk.
Protein Binding: 95%.
Metabolism and Excretion: Highly metabolized by the liver (partly by P450 2D6 enzyme system); the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly ↑ paroxetine concentrations and an ↑ risk of adverse effects. 2% excreted unchanged in urine.
Half-life: 21 hr.

TIME/ACTION PROFILE (antidepressant action)

ROUTE	ONSET	PEAK	DURATION
PO	1–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of thioridazine or pimozide; Lactation: Lactation.

© F.A. Davis Publishing

Use Cautiously in: Risk of suicide (may ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment); History of mania; History of seizures; History of bipolar disorder; Angle-closure glaucoma; Severe renal/hepatic impairment; OB: Use during the 1st trimester may be associated with an ↑ risk of cardiac malformations—consider fetal risk/maternal benefit; use during the 3rd trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; may be greater in children and adolescents (safety and effectiveness in children/adolescents not established); Geri: ↑ risk of hyponatremia in older adults; daily dose should not exceed 40 mg.

Adverse Reactions/Side Effects

CV: chest pain, edema, hypertension, palpitations, postural hypotension, tachycardia, vasodilation. **Derm:** STEVENS-JOHNSON SYNDROME (SJS), sweating, photosensitivity, pruritus, rash. **EENT:** blurred vision, rhinitis. **F and E:** hyponatremia. **GI:** constipation, diarrhea, dry mouth, nausea, abdominal pain, ↓/↑ appetite, dyspepsia, flatulence, taste disturbances, vomiting. **GU:** ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction, genital disorders, infertility, urinary disorders, urinary frequency. **Metab:** weight gain/loss. **MS:** back pain, bone fracture, myalgia, myopathy. **Neuro:** paresthesia, tremor, NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, anxiety, dizziness, drowsiness, headache, insomnia, weakness, agitation, amnesia, confusion, emotional lability, hangover, impaired concentration, malaise, mental depression, syncope. **Resp:** cough, pharyngitis, respiratory disorders, yawning. **Misc:** SEROTONIN SYNDROME, chills, fever.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions (wait at least 2 wk after stopping MAO inhibitor before initiating paroxetine; wait at least 2 wk after stopping paroxetine before starting MAO inhibitors). Concurrent use with **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving paroxetine, immediately discontinue paroxetine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume paroxetine therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **pimozide** or **thioridazine** may ↑ risk of QT interval prolongation and torsades de pointes; concurrent use contraindicated. May ↓ metabolism and ↑ effects of certain **drugs that are metabolized by the liver**, including other **antidepressants**, **phenothiazines**, **class IC antiarrhythmics**, **risperidone**, **atomoxetine**, **theophylline**, and **quinidine**. Concurrent use should be undertaken with caution. **Cimetidine** ↑ blood levels. **Phenobarbital** and **phenytoin** may ↓ effectiveness. Concurrent use with **alcohol** is not recommended. May ↓ the effectiveness of **digoxin** and **tamoxifen**. May ↑ risk of bleeding with **warfarin**, **aspirin**, or **NSAIDs**. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort**, **SAMe**, and **tryptophan**.

Route/Dosage

Depression

PO (Adults): 20 mg as a single dose in the morning; may ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day). *Controlled-release tablets*—25 mg once daily initially. May ↑ at weekly intervals by 12.5 mg (not to exceed 62.5 mg/day).

PO (Geriatric Patients or Debilitated Patients): 10 mg/day initially; may be slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*—12.5 mg once daily initially; may be slowly ↑ (not to exceed 50 mg/day).

Obsessive Compulsive Disorder

PO (Adults): 20 mg/day initially; ↑ by 10 mg/day at weekly intervals up to 40 mg (not to exceed 60 mg/day).

Panic Disorder

PO (Adults): 10 mg/day initially; ↑ by 10 mg/day at weekly intervals up to 40 mg (not to exceed 60 mg/day). *Controlled-release tablets*—12.5 mg/day initially; ↑ by 12.5 mg/day at weekly intervals (not to exceed 75 mg/day).

Social Anxiety Disorder

PO (Adults): 20 mg/day. *Controlled-release tablets*—12.5 mg/day initially; may ↑ by 12.5 mg/day weekly intervals (not to exceed 37.5 mg/day).

Generalized Anxiety Disorder

PO (Adults): 20 mg once daily initially; ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day).

Post-Traumatic Stress Disorder

PO (Adults): 20 mg/day initially; may ↑ by 10 mg/day at weekly intervals (not to exceed 50 mg/day).

Premenstrual Dysphoric Disorder

PO (Adults): *Controlled-release tablets*—12.5 mg once daily throughout menstrual cycle or during luteal phase of menstrual cycle only; may ↑ to 25 mg/day after 1 wk.

© F.A. Davis Publishing

Menopausal Vasomotor Symptoms

PO (Adults): 7.5 mg once daily at bedtime.

Hepatic Impairment

PO (Adults): Paxil, Paxil CR, or Pexeva: *Severe hepatic impairment*—10 mg/day initially; may slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*—12.5 mg once daily initially; may slowly ↑ (not to exceed 50 mg/day).

Renal Impairment

PO (Adults): Paxil, Paxil CR, or Pexeva: *Severe renal impairment*—10 mg/day initially; may slowly ↑ (not to exceed 40 mg/day). *Controlled-release tablets*—12.5 mg once daily initially; may slowly ↑ (not to exceed 50 mg/day).

Availability (generic available)

Paroxetine hydrochloride tablets: 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Generic*—10 mg $9.93/90, 20 mg $9.93/90, 30 mg $18.82/90, 40 mg $14.88/90. **Paroxetine hydrochloride controlled-release tablets:** 12.5 mg, 25 mg, 37.5 mg. **Cost:** *Generic*—12.5 mg $263.62/90, 25 mg $254.13/90, 37.5 mg $270.06/90. **Paroxetine hydrochloride oral suspension (orange flavor):** 10 mg/5 mL. **Cost:** $268.35/250 mL. **Paroxetine mesylate capsules (Brisdelle):** 7.5 mg. **Cost:** $161.64/30. **Paroxetine mesylate tablets (Pexeva):** 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** 10 mg $235.38/30, 20 mg $244.69/30, 30 mg $253.99/30, 40 mg $263.33/30.

NURSING IMPLICATIONS

Assessment

- Monitor appetite and nutritional intake. Weigh weekly. Notify health care professional of continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue paroxetine and notify health care professional immediately if these symptoms occur.
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Assess sexual function before starting paroxetine. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- **Depression:** Monitor mental status (orientation, mood, behavior). Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- **OCD:** Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning.
- **Panic Attacks:** Assess frequency and severity of panic attacks.
- **Social Anxiety Disorder:** Assess frequency and severity of episodes of anxiety.
- **Post-Traumatic Stress Disorder:** Assess manifestations of post-traumatic stress disorder periodically during therapy.
- **Premenstrual Dysphoria:** Assess symptoms of premenstrual distress prior to and during therapy.
- ***Lab Test Considerations:*** Monitor CBC and differential periodically during therapy. Report leukopenia or anemia.

Implementation

- Do not confuse paroxetine with fluoxetine, duloxetine, or piroxicam. Do not confuse Paxil (paroxetine) with Doxil (doxorubicin liposomal) or Plavix (clopidogrel). Do not confuse Pexeva (paroxetine mesylate) with Lexiva (fosamprenavir).
- Paroxetine mesylate (Pexeva) cannot be substituted with paroxetine (Paxil or Paxil CR) or generic paroxetine.
- Periodically reassess dose and continued need for therapy.
- **PO:** Administer as a single dose in the morning. May administer with food to minimize GI irritation.
- Swallow tablets whole. Do not crush, break, or chew. Shake suspension before administering.
- Taper to avoid potential withdrawal reactions.

Patient/Family Teaching

- Instruct patient to take paroxetine as directed. Take missed doses as soon as possible and return to regular dosing schedule. Do not double doses. Caution patient to consult health care professional before discontinuing paroxetine. Daily doses should be decreased slowly. Abrupt withdrawal may cause dizziness, sensory disturbances, agitation, anxiety, nausea, and sweating. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.

© F.A. Davis Publishing

- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior, or if symptoms of serotonin syndrome or neuroleptic malignant syndrome occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications and to avoid alcohol or other CNS-depressant drugs during therapy.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Saliva substitute may be used. Consult dentist if dry mouth persists for more than 2 wk.
- Advise patient to notify health care professional if headache, weakness, nausea, anorexia, anxiety, or insomnia persists.
- Inform patient that paroxetine may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Rep: Advise females of reproductive potential to notify health care professional immediately if pregnancy is planned or suspected and to avoid breast feeding during therapy. Infants exposed to paroxetine during 1st trimester have increased risk of congenital malformations, particularly cardiovascular malformations. If used during pregnancy, should be tapered during 3rd trimester to avoid neonatal serotonin syndrome. Monitor infants exposed to paroxetine for excess sedation, restlessness, agitation, poor feeding, poor weight gain, respiratory distress; may ↑ risk of persistent pulmonary hypertension of the newborn. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patients by calling the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clnical-and-researchprograms/pregnancyregistry/antidepressants/ .
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy to improve coping skills.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.
- Decrease in obsessive-compulsive behaviors.
- Decrease in frequency and severity of panic attacks.
- Decrease in frequency and severity of episodes of anxiety.
- Improvement in manifestations of post-traumatic stress disorder.
- Decreased dysphoria prior to menses.

patiromer (pa-tir-oh-mer)

Veltassa

Classification

Therapeutic: electrolyte modifiers, hypokalemic

Pharmacologic: cationic exchange resins

Indications

Mild to moderate hyperkalemia (if severe, more immediate measures such as calcium IV or insulin/glucose IV should be instituted).

Action

Contains calcium-sorbitol counterion and ↑ fecal potassium excretion through binding of potassium in the lumen of the GI tract. **Therapeutic Effects:** Reduced serum potassium concentrations.

Pharmacokinetics

Absorption: Not systemically absorbed.

Distribution: Not distributed.

Metabolism and Excretion: Eliminated in the feces.

Half-life: Unknown.

TIME/ACTION PROFILE (↓ in serum potassium concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	7–12 hr	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of bowel impaction, bowel obstruction, or severe constipation (may be ineffective and worsen condition).

Use Cautiously in: Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

F and E: hypokalemia, hypomagnesemia. **GI:** constipation, diarrhea, flatulence, nausea.

Interactions

Drug-Drug: May ↓ absorption of any other orally administered medication; administer other oral medications ≥6 hr before or after patiromer.

Route/Dosage

PO (Adults): 8.4 g once daily; titrate dose at ≥1 wk intervals by 8.4 g once daily as needed to achieve desired serum potassium concentration (max = 25.2 g once daily).

Availability

Powder for oral suspension: 8.4 g/pkt, 16.8 g/pkt, 25.2 g/pkt.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Monitor for bowel sounds and frequency and consistency of stools periodically during therapy. May cause constipation.
- ***Lab Test Considerations:*** Monitor serum potassium and magnesium periodically during therapy. May cause hypokalemia and hypomagnesemia. Consider magnesium supplements if hypomagnesemia occurs.

Implementation

- Due to delayed action, do not use patiromer as an emergency treatment of life-threatening hyperkalemia.
- **PO:** Prepare dose by measuring 1/3 cup of water, add half of water, apple, or cranberry juice into glass, then add patiromer and stir. Add remaining water and stir thoroughly. Powder will not dissolve, mixture will look cloudy; add more water to mixture for desired consistency. Administer immediately at least 3 hr before or 3 hr after other PO medications. If powder remains in glass after drinking, add more water, stir and drink immediately. Repeat as necessary for entire dose. Do not heat (microwave) or add to heated foods or liquids. Do not take in dry form. Stable for 3 mo at room temperature or until the package expiration date if refrigerated.

Patient/Family Teaching

- Instruct patient to take patiromer as directed and adhere to prescribed diet.
- Advise patient to take patiromer ≥3 hrs before or 3 hrs after other medications.

Evaluation/Desired Outcomes

- Reduced serum potassium concentrations.

PAZOPanib (pah-zoe-puh-nib)

Votrient

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Advanced renal cell carcinoma. Advanced soft tissue sarcoma in patients who have previously received chemotherapy.

Action

Acts as a tyrosine kinase inhibitor of several vascular endothelial growth factor (VEGF) receptors, platelet-derived growth factor receptor, fibroblast growth factor receptor, cytokine receptor, interleukin-2 receptor inducible T-cell kinase, leukocyte-specific protein tyrosine kinase, and transmembrane glycoprotein receptor tyrosine kinase. Overall effect is decreased angiogenesis in tumors. **Therapeutic Effects:** Decreased growth and spread of renal cell carcinoma. Improvement in progression-free survival.

Pharmacokinetics

Absorption: Well absorbed following oral administration; crushing tablet and ingesting food ↑ absorption.
Distribution: unknown.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized by the liver (primarily by the CYP3A4 enzyme system, minor amounts by CYP1A2 and CYP2C8) followed by elimination in feces; <4% excreted by the kidneys.
Half-life: 30.9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	PO	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment; History of hemoptysis, cerebral or GI bleeding in preceding 6 mo; Risk/history of arterial thrombotic events, including MI, angina or ischemic stroke within preceding 6 mo; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Congenital prolonged QTc interval or concurrent medications/diseases that prolong QTc (may ↑ risk of torsades de pointes); Electrolyte abnormalities (correct prior to use; may ↑ risk of potentially serious arrhythmia); Patients at risk for gastrointestinal perforation/fistula; Surgery; interruption of therapy recommended; Hypertension; control before therapy is initiated; Hypothyroidism (may worsen condition); Moderate hepatic impairment (dose ↓ recommended); Patients of East-Asian descent (↑ risk of neutropenia, thrombocytopenia, and palmar-plantar erythrodysesthesia); Rapidly growing tumors, high tumor burden, renal impairment, or dehydration (↑ risk of tumor lysis syndrome); Patients with genetically reduced UGT1A1 activity (presence of UGT1A1*28/*28 allele) (↑ risk of hyperbilirubinemia); Patients positive for HLA-B*5701 allele (↑ risk of hepatotoxicity); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of hepatotoxicity in older adults.

Adverse Reactions/Side Effects

CV: HF, MI, DEEP VEIN THROMBOSIS, bradycardia, hypertension, chest pain, QT interval prolongation. **GI:** GI PERFORATION/FISTULA, HEPATOTOXICITY, PANCREATITIS, abdominal pain, anorexia, diarrhea, nausea, vomiting, dyspepsia. **GU:** HEMOLYTIC UREMIC SYNDROME, ↓ fertility, proteinuria. **Derm:** hair color changes (depig-

© F.A. Davis Publishing

mentation), alopecia, facial edema, impaired wound healing, palmar-plantar erythrodysesthesia (hand-foot syndrome), rash, skin depigmentation. **Endo:** hypothyroidism. **Hemat:** BLEEDING, THROMBOTIC THROMBOCYTOPENIC PURPURA, neutropenia, thrombocytopenia. **Metab:** ↑ lipase, weight loss. **MS:** arthralgia, muscle spasms. **Neuro:** POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), STROKE, fatigue, weakness, altered taste. **Resp:** INTERSTITIAL LUNG DISEASE, PULMONARY EMBOLISM. **Misc:** TUMOR LYSIS SYNDROME.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **ketoconazole**, **ritonavir**, and **clarithromycin** may ↑ levels and risk of toxicity; avoid concurrent use; if concurrent use unavoidable, ↓ pazopanib dose. **Strong CYP3A4 inducers**, including **rifampin**, may ↓ levels and effectiveness; avoid concurrent use. May ↑ levels and risk of toxicity of **CYP3A4 substrates**, **CYP2D6 substrates**, or **CYP2C8 substrates** that have narrow therapeutic windows; concurrent use is not recommended. ↑ risk of hepatotoxicity with **simvastatin**. **Proton pump inhibitors** and **H_2 receptor antagonists** may ↓ levels; avoid concurrent use; use short-acting antacid instead. **Antacids** may ↓ levels; separate doses by several hrs. **QT interval prolonging drugs** may ↑ risk of QT interval prolongation; avoid concurrent use.

Drug-Food: Grapefruit juice may ↑ levels; avoid concurrent use.

Route/Dosage

PO (Adults): 800 mg once daily until disease progression or unacceptable toxicity; *Concurrent use of strong CYP3A4 inhibitors*— 400 mg once daily until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*— 200 mg once daily until disease progression or unacceptable toxicity.

Availability

Tablets: 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP during frequent therapy; may cause hypertension. BP should be well controlled prior to initiating therapy. If Grade 2 or 3 hypertension occurs, reduce dose and start or adjust antihypertensive therapy. Permanently discontinue pazopanib if hypertension remains Grade 3 despite dose reduction(s) and adjustment of antihypertensive therapy. *If Grade 4 hypertension or hypertensive crisis occurs,* permanently discontinue pazopanib. Baseline and periodic evaluation of LVEF is recommended in patients at risk of cardiac dysfunction. *If LVEF is symptomatic or Grade 3,* hold pazopanib until improved to Grade <3. Resume therapy based on medical judgment. *If LVEF is Grade 4,* permanently discontinue pazopanib.
- Obtain baseline ECG and monitor periodically during therapy. Maintain serum calcium, magnesium, and potassium within normal range during therapy. Monitor patients who are at risk of developing QTc prolongation (patients with a history of QT interval prolongation, patients taking antiarrhythmics or other medications that may prolong QT interval, those with relevant preexisting cardiac disease). Monitor ECG and electrolytes (calcium, magnesium, potassium) at baseline and as indicated. Correct hypokalemia, hypomagnesemia, and hypocalcemia prior to starting and during therapy.
- Monitor for signs and symptoms of GI perforation and fistula (abdominal pain; swelling in stomach area; vomiting blood; black sticky stools; GI bleeding) during therapy. *If Grade 2 or 3 GI fistula occurs,* hold pazopanib and resume based on medical judgment. If Grade 4 fistula occurs, permanently discontinue pazopanib.
- Monitor for signs and symptoms of bleeding. *If Grade 2 symptoms occur,* hold pazopanib until improvement to Grade ≤1. Resume at reduced dose. *If Grade 2 symptoms recur after dose interruption and reduction or Grade 3 or 4 symptoms occur,* permanently discontinue pazopanib.
- Monitor for signs and symptoms of arterial thromboembolic events (MI, stroke, TIA). If symptoms occur, permanently discontinue pazopanib.
- Monitor for signs and symptoms on venous thromboembolic events (venous thrombosis, pulmonary embolism). *If Grade 3 symptoms occur,* hold pazopanib and resume at same dose if managed with appropriate therapy for at least 1 wk. *If Grade 4 symptoms occur,* permanently discontinue pazopanib.
- Monitor for pulmonary symptoms indicative of interstitial lung disease/pneumonitis. Permanently discontinue pazopanib in patients who develop ILD or pneumonitis.
- Monitor for signs and symptoms of PRES (headache, seizure, lethargy, confusion, blindness, mild hypertension). Diagnosis is confirmed by MRI. Discontinue pazopanib permanently if PRES occurs.
- ***Lab Test Considerations:*** Verify negative pregnancy status prior to starting therapy.
- Monitor serum liver tests before initiation and wk 3, 5, 7, and 9, then at mo 3 and mo 4 if symptoms occur. Monitor periodically after mo 4. *If isolated ALT ↑ between 3 and 8 times the upper limit of normal,* therapy may continue with weekly monitoring of liver function until ALT returns to Grade 1 or baseline. *If isolated ALT ↑ >8 times the upper limit of normal,* stop therapy until ALT returns to Grade 1 or baseline. If benefit outweighs risk, may reintroduce at reduced dose of 400 mg/day with weekly serum liver tests for 8 wk. Following reintroduction, if ALT ↑ >3 times the upper limit of normal recurs, permanently discontinue pazopanib. *If ALT ↑ occurs concurrently with ↑ serum bilirubin >2 times the upper limit of normal*, discontinue pazopanib permanently. Monitor

© F.A. Davis Publishing

liver function tests until return to baseline. *Patients with only mild indirect hyperbilirubinemia (Gilbert's syndrome) and ↑ ALT >3 times the upper limit of normal* should be managed as per recommendations for ↑ ALT.

- Monitor thyroid function periodically during therapy. May cause hypothyroidism.
- Obtain baseline urinalysis and monitor periodically with follow-up with 24-hour urine protein as indicated. *If 24-hr urine protein ≥ 3 g,* hold pazopanib until improvement to Grade ≤ 1. Resume at a reduced dose. Permanently discontinue if 24-hr urine protein ≥ 3 g does not improve or recurs despite dose reductions or if nephrotic syndrome is confirmed. May cause proteinuria. Discontinue therapy if Grade 4 proteinuria develops.
- May cause leukopenia, neutropenia, thrombocytopenia, and lymphocytopenia.
- May cause ↑ AST and ↓ serum phosphorous, sodium, and magnesium. May cause ↑ or ↓ serum glucose.

Implementation

- Do not confuse pazopanib with ponatinib.
- May impair wound healing. Hold pazopanib at least 1 wk prior to elective surgery. Do not administer for at least 2 wk following major surgery and until adequate wound healing.
- **Recommended Dose Reductions:** *For Renal Carcinoma,* 1st reduction: 400 mg once daily; 2nd reduction: 200 mg once daily. *For Soft Tissue Sarcoma,* 1st reduction: 600 mg once daily; 2nd reduction: 400 mg once daily.
- **PO:** Administer at least 1 hr before or 2 hr after a meal. ***DNC:*** Swallow tablets whole; do not crush tablets.

Patient/Family Teaching

- Instruct patient to take pazopanib on an empty stomach as directed. Take missed doses as soon as remembered; if less than 12 hr before next dose, omit dose. Advise patient to read the *Medication Guide* prior to taking pazopanib and with each Rx refill; new information may be available.
- Advise patient to avoid drinking grapefruit juice or eating grapefruit during therapy; may increase amounts of pazopanib absorbed.
- Advise patient to notify health care professional immediately if signs and symptoms of liver problems (yellowing of skin or whites of eyes, unusual darkening of urine, unusual tiredness, pain in the right upper stomach area), heart failure (shortness of breath), heart attack or stroke (chest pain or pressure; pain in arms, back, neck or jaw; shortness of breath; numbness or weakness on one side of body; trouble talking; headache; dizziness), blood clots (new chest pain, trouble breathing or shortness of breath that starts suddenly; leg pain; swelling of arms and hands, or legs and feet; cool or pale arm or leg), bleeding problems (unusual bleeding, bruising, wounds that do not heal), GI perforation or fistula, PRES (headaches, seizures, lack of energy, confusion, high BP, loss of speech, blindness or changes in vision, and problems thinking), severe increase in BP (severe chest pain, severe head ache, blurred vision, confusion, nausea and vomiting, severe anxiety, shortness of breath, seizures, unconsciousness), interstitial lung disease (persistent cough, shortness of breath), tumor lysis syndrome (irregular heartbeat, seizures, confusion, muscle cramps or spasms, decrease in urine output) or severe infections (fever; cold symptoms such as runny nose or sore throat that do not go away; flu symptoms such as cough, tiredness, and body aches; pain when urinating; cuts, scrapes or wounds that are red, warm, swollen or painful) occur.
- Inform patient that diarrhea frequently occurs. Instruct patient on ways to manage diarrhea and to notify health care professional if moderate to severe diarrhea occurs.
- Inform patient that loss of color (depigmentation) of skin or hair may occur during therapy. Explore methods of coping.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional of any impending surgery. Pazopanib must be stopped for at least 7 days prior to surgery due to the effects on healing and held for at least 2 wk after major surgery or until adequate healing.
- Rep: Advise females of reproductive potential and male patients with partners of reproductive potential to use effective contraception during therapy and for at least 2 wk after discontinuing therapy, and to notify health care professional immediately if pregnancy is suspected. Advise patient to avoid breast feeding during therapy and for 2 wk after final dose. Inform patients that pazopanib may impair fertility for both men and women during therapy.

Evaluation/Desired Outcomes

- Decreased growth and spread of renal cell carcinoma.
- Improvement in spread of sarcoma.

pegaspargase

(peg-ass-**par**-jase)

Oncaspar

Classification

Therapeutic: antineoplastics

Pharmacologic: enzymes

© F.A. Davis Publishing

Indications

First-line treatment of acute lymphoblastic leukemia (ALL) (in combination with other chemotherapy agents). Treatment of ALL in patients who have had a previous hypersensitivity reaction to native L-asparaginase (in combination with other chemotherapy agents).

Action

Consists of L-asparaginase bound to polyethylene glycol (PEG). This compound depletes asparagine, which leukemic cells cannot synthesize. Normal cells are able to produce their own asparagine and are less susceptible to the effects of asparaginase. Binding to PEG renders asparaginase less antigenic and therefore less likely to induce hypersensitivity reactions. **Therapeutic Effects:** Death of leukemic cells.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Metabolized by serum proteases and in the reticuloendothelial system.
Half-life: 5.7 days (less in patients with previous hypersensitivity to native L-asparaginase).

TIME/ACTION PROFILE (hematologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	14 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to pegaspargase; History of serious thrombosis with previous L-asparaginase therapy; History of pancreatitis, including pancreatitis association with previous L-asparaginase therapy; History of serious hemorrhagic events to previous L-asparaginase therapy; Severe hepatic impairment; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: History of previous hypersensitivity reaction to L-asparaginase (↑ risk of hypersensitivity reaction); Rep: Women of reproductive potential.

Adverse Reactions/Side Effects

Endo: hypercholesterolemia, hyperglycemia, hypertriglyceridemia. **CV:** peripheral edema. **GI:** HEPATOTOXICITY, PANCREATITIS, abdominal pain, anorexia, diarrhea, nausea, vomiting. **Hemat:** HEMORRHAGE, THROMBOSIS, neutropenia. **Local:** injection site reactions. **MS:** arthralgia, myalgia. **Neuro:** paresthesia, SEIZURES, headache, malaise. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), chills, night sweats.

Interactions

Drug-Drug: May alter response to **anticoagulants** or **antiplatelet agents**.

Route/Dosage

IM, IV (Adults >21 yr): 2500 units/m² no more frequently than every 14 days.
IM, IV (Adults and Children ≤21 yr): 2000 units/m² no more frequently than every 14 days.

Availability

Solution for injection: 750 units/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for previous hypersensitivity reactions to native L-asparaginase. Monitor for infusion and hypersensitivity reaction (urticaria, diaphoresis, facial swelling, joint pain, hypotension, bronchospasm) for at least 1 hr following administration. *If Grade 1 reaction occurs,* reduce infusion rate by 50%. *If Grade 2 reaction occurs,* hold infusion and treat symptoms. When symptoms resolve, resume infusion and reduce infusion rate by 50%. *If Grade 3 to 4 reaction occurs,* permanently discontinue infusion. Epinephrine and resuscitation equipment should be readily available. Reaction may occur up to 2 hr after administration.
- Monitor for development of bone marrow depression. Assess for fever, sore throat, and signs of infection. Monitor platelet count throughout therapy. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac test stools, urine, and emesis). Avoid giving IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min. *If Grade 3 to 4 hemorrhage occurs,* hold infusion. Evaluate for coagulopathy and consider clotting factor replacement as needed. Resume pegaspargase with next scheduled dose if bleeding is controlled. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor patient frequently for signs of pancreatitis (nausea, vomiting, abdominal pain). *If Grade 3 to 4 pancreatitis occurs,* hold pegaspargase for elevations in lipase or amylase >3 times upper limit of normal (ULN) until enzyme levels stabilize or are declining. Discontinue pegaspargase permanently if pancreatitis is confirmed.
- Monitor for signs and symptoms of thromboembolism (headache, arm or leg swelling, shortness of breath, chest pain) during therapy. *If uncomplicated deep vein thrombosis occurs,* hold infusion and treat with antithrombotic therapy. Upon resolution of symptoms consider resuming pegaspargase, while continuing antithrombotic therapy. *If severe or life-threatening thrombosis occurs,* discontinue pegaspargase permanently. Treat with antithrombotic therapy.
- Assess nausea, vomiting, and appetite. Weigh patient weekly. Prophylactic antiemetics may be used prior to administration.
- ***Lab Test Considerations:*** Obtain negative pregnancy test before starting therapy.
- Monitor CBC prior to and periodically throughout therapy. May alter coagulation studies. Fibrinogen may be decreased; PT and partial thromboplastin time (PTT) may be ↑.

© F.A. Davis Publishing

- Monitor serum amylase frequently to detect pancreatitis.
- Monitor blood glucose; may cause hyperglycemia.
- May cause elevated BUN and serum creatinine.
- Hepatotoxicity may be manifested by increased AST, ALT, alkaline phosphatase, or bilirubin. Liver function tests usually return to normal after therapy. *If total bilirubin >3 times to <10 times UNL,* hold infusion until total bilirubin is ≤1.5 times ULN. *If total bilirubin >10 times ULN,* discontinue pegaspargase and do not make up for missed doses.
- May cause ↓ serum calcium.
- May cause elevated serum and urine uric acid and hyponatremia.
- May cause hypercholesterolemia and hypertriglyceridemia.

Implementation

- IM is the preferred route because of a lower incidence of adverse reactions.
- Solutions should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- **IM:** Limit single injection volume to 2 mL. If volume of injection is >2 mL, use multiple injection sites.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute each dose in 100 mL of 0.9% NaCl or D5W. Do not shake or agitate. Do not use if solution is cloudy or has formed a precipitate.
- Use only 1 dose per vial; do not re-enter the vial. Discard unused portions.
- Keep refrigerated but do not freeze. Freezing destroys activity but does not change the appearance of pegaspargase. ***Rate:*** Administer over 1–2 hr via Y-site through an infusion that is already running.
- **Additive Incompatibility:** Information unavailable. Do not admix with other medications or solutions.

Patient/Family Teaching

- Inform patient of the possibility of hypersensitivity reactions, including anaphylaxis.
- Advise patient that concurrent use of other medications may increase the risk of bleeding and the toxicity of pegaspargase. Consult health care professional before taking any other medications, including OTC drugs.
- Instruct patient to notify health care professional if abdominal pain, severe nausea and vomiting, jaundice, fever, chills, sore throat, bleeding or bruising, excess thirst or urination, or mouth sores occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush, electric razor, and to be especially careful to avoid falls. Patients should also be cautioned not to drink alcoholic beverages or take medications containing aspirin or NSAIDs because these may precipitate gastric bleeding.
- Instruct patient not to receive any vaccinations without advice of health care professional. Advise parents that this may alter child's immunization schedule.
- Rep: Advise females of reproductive potential to use 2 methods of effective contraception, including a barrier method, and avoid breast feeding during therapy and for at least 3 mo after last dose. Pegaspargase may decrease effectiveness of oral contraceptives; oral contraceptives are not recommended.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Improvement of hematologic status in patients with leukemia.

pegfilgrastim (peg-fil-**gra**-stim)

Fulphila, Lapelga, Neulasta, Neulasta Onpro, Nyvepria, Udenyca, Ziextenzo

Classification

Therapeutic: colony-stimulating factors

P

Indications

To decrease the incidence of infection (febrile neutropenia) in patients with nonmyeloid malignancies receiving myelosuppressive antineoplastics associated with a high risk of febrile neutropenia.

Action

Filgrastim is a glycoprotein that binds to and stimulates neutrophils to divide and differentiate. Also activates mature neutrophils. Binding to a polyethylene glycol molecule prolongs its effects. **Therapeutic Effects:** Decreased incidence of infection in patients who are neutropenic from chemotherapy.

Pharmacokinetics

Absorption: Well absorbed following subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 15–80 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to filgrastim or *Escherichia coli*–derived proteins.
Use Cautiously in: Patients with breast or lung cancer receiving chemotherapy and/or radiotherapy (↑ risk of myelodysplastic syndrome or acute myeloid leukemia); Patients with sickle cell disease (↑ risk of

© F.A. Davis Publishing

sickle cell crisis); Concurrent use of lithium; Malignancy with myeloid characteristics; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects

CV: aortitis. **GI:** SPLENIC RUPTURE. **GU:** glomerulonephritis. **Hemat:** ACUTE MYELOID LEUKEMIA, MYELODYSPLASTIC SYNDROME, SICKLE CELL CRISIS, leukocytosis, thrombocytopenia. **MS:** medullary bone pain. **Resp:** ADULT RESPIRATORY DISTRESS SYNDROME (ARDS). **Misc:** CAPILLARY LEAK SYNDROME, HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Simultaneous use with **antineoplastics** may have adverse effects on rapidly proliferating neutrophils; avoid use for 24 hr before and 24 hr following chemotherapy. **Lithium** may potentiate the release of neutrophils; concurrent use should be undertaken cautiously.

Route/Dosage

Subcut (Adults and Children ≥45 kg): 6 mg per chemotherapy cycle.
Subcut (Children 31–44 kg): 4 mg per chemotherapy cycle.
Subcut (Children 21–30 kg): 2.5 mg per chemotherapy cycle.
Subcut (Children 10–20 kg): 1.5 mg per chemotherapy cycle.
Subcut (Children <10 kg): 0.1 mg/kg per chemotherapy cycle.

Availability

Solution for injection (prefilled syringes): 6 mg/0.6 mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for bone pain throughout therapy. Pain is usually mild to moderate and usually controllable with nonopioid analgesics, but may require opioid analgesics.
- Assess patient periodically for signs of ARDS (fever, lung infiltration, respiratory distress). If ARDS occurs, treat condition and discontinue pegfilgrastim and/or withhold until symptoms resolve.
- Monitor for signs and symptoms of splenic rupture (left upper abdominal or shoulder pain) during therapy.
- Monitor for signs and symptoms of capillary leak syndrome (hypotension, hypoalbuminemia, edema, hemoconcentration). Treat symptomatically.
- Assess for signs and symptoms of aortitis (fever, abdominal pain, malaise, back pain, increased inflammatory markers [C-reactive protein, white blood cell count]). Discontinue pegfilgrastim if aortitis is suspected.
- May cause transient positive nuclear bone imaging changes.
- ***Lab Test Considerations:*** Obtain CBC and platelet count before chemotherapy. Monitor hematocrit, WBC, and platelet count regularly. May cause thrombocytopenia.
- May cause elevated LDH, alkaline phosphatase, and uric acid.

Implementation

- Do not confuse Neulasta (pegfilgrastim) with Lunesta (eszopiclone).
- Pegfilgrastim should not be administered between 14 days before and 24 hrs after administration of cytotoxic chemotherapy.
- Keep patients with sickle cell disease receiving pegfilgrastim well hydrated and monitor for sickle cell crisis. Discontinue therapy if sickle cell crisis occurs.
- **Subcut:** Administer subcut once per chemotherapy cycle. Do not administer solutions that are discolored or contain particulate matter. Do not shake. Store refrigerated; may be allowed to reach room temperature for at least 30 min and maximum of 48 hr, but protect from light.
- **On-body Injector**: Small, one-time use, lightweight, battery-powered, and waterproof up to 8 feet for 1 hr. Fill by health care professional with a prefilled syringe before application. The prefilled syringe with *Neulasta* and the *On-body Injector* are part of *Neulasta Onpro kit*. The *On-body Injector* is applied directly to skin using a self-adhesive backing. The *On-body Injector* uses sounds and lights to inform its status. The prefilled syringe gray needle cap contains dry natural rubber, derived from latex; do not use if allergic to latex. Apply to intact, nonirritated skin on abdomen or back of arm. Back of arm may only be used if there is a caregiver available to monitor the status of the *On-body Injector*. Approximately 27 hrs after the *On-body Injector* is applied, *Neulasta* will be delivered over approximately 45 min. Follow manufacturer's instructions for monitoring and removal. Instruct patients using the *On-body Injector* to notify health care professional immediately if they suspect the device may not have performed as intended in order to determine need for a replacement dose.

Patient/Family Teaching

- Instruct patient in technique for injection, care of medication, and disposal of equipment. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional immediately if signs of allergic reaction (shortness of breath, hives, rash, pruritus, laryngeal edema), ARDS (shortness of breath with or without a fever, trouble breathing, fast rate of breathing), kidney injury (swelling of face or ankles, blood in urine or dark-colored urine, urinate less than usual), capillary leak syndrome (swelling or puffiness and urinating less than usual, trouble breathing, swelling of abdomen and feeling of fullness, dizziness or feeling

© F.A. Davis Publishing

faint, general feeling of tiredness), myelodysplastic syndrome or acute myeloid leukemia (tiredness, fever, and easy bruising or bleeding), inflammation of the aorta (fever, abdominal pain, feeling tired, back pain), or signs of splenic rupture (left upper abdominal or shoulder tip pain) occur.

- Advise patients with sickle cell disease to maintain hydration and to notify health care professional promptly if symptoms of sickle cell crisis occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of adherence with therapy and regular monitoring of blood counts.
- **Home Care Issues:** Instruct patient on correct disposal technique for home administration. Caution patient not to reuse needle, syringe, or drug product. Provide patient with a puncture-proof container for disposal of prefilled syringe.

Evaluation/Desired Outcomes

- Decreased incidence of infection in patients who are neutropenic from chemotherapy.

peginterferon beta-1a

(peg-in-ter-**feer**-on **bay**-ta)
Plegridy

Classification
Therapeutic: immune modifiers
Pharmacologic: interferons

Indications

Relapsing forms of multiple sclerosis, including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease.

Action

Antiviral and immunoregulatory properties produced by interacting with specific receptor sites on cell surfaces may explain beneficial effects. Produced by recombinant DNA technology. Pegylation prolongs duration of action. **Therapeutic Effects:** Reduced incidence of relapse (neurologic dysfunction) and slowed physical disability.

Pharmacokinetics

Absorption: Extent of absorption following subcut or IM administration unknown.
Distribution: Unknown.
Metabolism and Excretion: Undergoes catabolism; excretion is mainly renal.
Half-life: 78 hr.

TIME/ACTION PROFILE (reduction in relapse rate)

ROUTE	ONSET	PEAK	DURATION
subcut	within one mo	24–36 wk	unknown
IM	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to natural or recombinant interferon beta or peginterferon.
Use Cautiously in: History of depression or suicidal ideation; Latex allergy; History of seizures; Renal impairment (risk of adverse reactions may be ↑); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; Geri: Safety and effectiveness not established in older adults.

Adverse Reactions/Side Effects

CV: HF. **Derm:** pruritus. **GI:** HEPATOTOXICITY, nausea, vomiting. **Hemat:** THROMBOTIC THROMBOCYTOPENIC PURPURA, HEMOLYTIC UREMIC SYNDROME, ↓ peripheral blood counts. **Local:** injection site reactions. **MS:** arthralgia, myalgia. **Neuro:** SEIZURES, SUICIDAL IDEATION, headache, depression, weakness. **Misc:** AUTOIMMUNE DISORDERS, HYPERSENSITIVITY REACTIONS (including anaphylaxis), chills, fever, flu-like symptoms.

Interactions

Drug-Drug: ↑ myelosuppression may occur with other **myelosuppressives** including **antineoplastics**. Concurrent use of **hepatotoxic agents** may ↑ the risk of hepatotoxicity (↑ liver enzymes).
Drug-Natural Products: Avoid concomitant use with **immunomodulating natural products** such as **astragalus**, **echinacea**, and **melatonin**.

Route/Dosage

IM, Subcut (Adults): 63 mcg on Day 1, then 94 mcg on Day 15, then 125 mcg every 14 days.

Availability

Solution for injection (prefilled pens and prefilled syringes): 63 mcg/0.5 mL, 94 mcg/0.5 mL, 125 mcg/0.5 mL.

NURSING IMPLICATIONS

Assessment

- Assess frequency of exacerbations of symptoms of multiple sclerosis periodically during therapy.
- Monitor patient for signs of depression during therapy. If depression occurs, notify health care professional immediately.
- Monitor for injection site reactions (erythema, pain, pruritus, edema, bruising, drainage, necrosis). Avoid injecting near area of reaction.

© F.A. Davis Publishing

- Monitor patient with significant cardiac disease for worsening symptoms during initiation and periodically during therapy.
- ***Lab Test Considerations:*** Monitor serum AST, ALT, and bilirubin periodically during therapy.
- Monitor CBC with differential and platelet counts periodically during therapy. May cause anemia, ↓ lymphocyte, ↓ neutrophil, and ↓ platelet counts.

Implementation

- Administer prophylactic analgesics and/or antipyretics to prevent or minimize flu-like symptoms. Incidence of injection site reactions may be less with IM than with subcut dosing.
- Remove syringe from refrigerator and allow to warm to room temperature for 30 min before injection. Do not use warm water to warm. Solution is clear to slightly opalescent and colorless to slightly yellow. Do not administer solutions that are cloudy, discolored, or contain particulate matter.
- **Subcut:** Inject subcut in abdomen, back of upper arm, and thigh every 14 days; rotate sites. Prefilled pens are for single dose; discard after use.
- For patients using subcut dosing for the first time, titrate using the *Plegridy Starter Pack* for use with the prefilled syringe. Kit is supplied separately and contains two titration devices (*Dose 1 for Day 1:* 63 mcg, orange clip; *Dose 2 for Day 15:* 94 mcg, blue clip; *Dose 3 for Day 29 and every 14 days after:* 125 mcg, gray clip) to be used only with prefilled syringes for subcut use.
- **IM:** Rotate injection sites between left and right thighs.
- Protective cover of prefilled syringe for IM use contains latex. Avoid handling by latex-sensitive individuals. Monitor for allergic reactions.
- For patients using IM dosing for the first time, titrate using the *Plegridy Titration Kit* for use with the prefilled syringe. Kit is supplied separately and contains two titration devices (*Dose 1 for Day 1:* 63 mcg, yellow clip; *Dose 2 for Day 15:* 94 mcg, purple clip; *Dose 3 for Day 29 and every 14 days after:* 125 mcg, no clip) to be used only with prefilled syringes for IM use.

Patient/Family Teaching

- Instruct patient in correct technique for injection and care and disposal of equipment. Avoid injecting into areas of skin irritation, redness, bruising, infection, or scarring. Check injection site 2 hr after injection for redness, swelling, and tenderness. Notify health care professional if skin reaction does not clear in a few days. Caution patient not to reuse needles or syringes and provide patient with a puncture-resistant container for disposal.
- Instruct patient to take medication as directed; do not change dose or schedule without consulting health care professional. Advise patient to read *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- Inform patient that flu-like symptoms (headache, fever, chills, myalgia, sweating, malaise, tiredness) may occur during therapy. Acetaminophen may be used for relief of fever and myalgias. Flu-like symptoms are not contagious.
- Advise patient to notify health care professional immediately if signs and symptoms of liver disease (yellowing of skin or whites of eyes, nausea, loss of appetite, tiredness, bleeding easily, confusion, sleepiness, dark-colored urine, pale stools), depression, suicidal thoughts, seizures, allergic reactions (itching; swelling of face, eyes, lips, tongue, throat; trouble breathing; feeling faint; anxiousness; rash; hives) or autoimmune diseases (easy bleeding or bruising, thyroid gland problems, autoimmune hepatitis) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in the frequency of relapse (neurologic dysfunction) in patients with relapsing-remitting multiple sclerosis.

pegloticase (peg-**loe**-ti-kase)

Krystexxa

Classification

Therapeutic: antigout agents
Pharmacologic: enzymes

Indications

Treatment of chronic gout in adults who have not responded to/cannot tolerate xanthine oxidase inhibitors, including allopurinol.

Action

Consists of recombinant uricase covalently bonded to monomethoxypoly(ethylene glycol) [mPEG]; uricase catalyzes the oxidation of uric acid to allantoin, a water soluble byproduct that is readily excreted in urine.
Therapeutic Effects: ↓ serum uric acid levels with resultant ↓ in attacks of gout and its sequelae.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (effects on serum uric acid)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	within 24 hr	>300 hr

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Glucose-6–phosphate dehydrogenase (G6–PD) deficiency (↑ risk of hemolysis and methemoglobinemia); Lactation: Breast feeding is not recommended.

Use Cautiously in: HF (may ↑ risk of exacerbation); Retreatment after a drug-free interval (↑ risk of allergic reactions, monitor carefully); Geri: May be more sensitive to drug effects; OB: Use during pregnancy only if clearly needed; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: chest pain. **EENT:** nasopharyngitis. **GI:** nausea, constipation, vomiting. **Derm:** contusion/ecchymoses. **Hemat:** HEMOLYSIS, METHEMOGLOBINEMIA. **Metab:** gout flare. **Misc:** allergic reactions including ANAPHYLAXIS, INFUSION REACTIONS.

Interactions

Drug-Drug: May interfere with the action of other **PEG-containing therapies**.

Route/Dosage

IV (Adults): 8 mg every 2 wk.

Availability

Solution for injection: 8 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for joint pain and swelling. Gout flares frequently occur upon initiation of therapy, but do not require discontinuation. Administer prophylactic doses of colchicine or an NSAID at least 1 wk before and concurrently during the first 6 mo of therapy.
- Monitor for signs and symptoms of anaphylaxis (wheezing, peri-oral or lingual edema, hemodynamic instability, rash, urticaria) during and following infusion. May occur with any infusion, including initial infusion; usually occurs with 2 hr of infusion. Delayed reactions have also been reported. Risk is higher in patients with uric acid level >6 m g/dL.
- Monitor for infusion reactions (rash, redness of skin, dyspnea, flushing, chest discomfort, chest pain) during and periodically after infusion. If infusion reaction occurs, slow or stop infusion; restart at slower rate. If severe reaction occurs, discontinue infusion and treat as needed. Risk is greater in patients who have lost therapeutic response. Monitor patient for at least 1 hr following infusion.
- ***Lab Test Considerations:*** Screen patients at risk for G6PD deficiency prior to starting therapy. Patients of African, Mediterranean (including Southern European and Middle Eastern), and Southern Asian ancestry are at increased risk for G6PD deficiency. Do not administer pegloticase to patients with G6PD deficiency.
- Monitor serum uric acid levels prior to infusion. Consider discontinuing therapy if levels ↑ to >6 mg/dL, especially if 2 consecutive levels are >6 mg/dL.

Implementation

- Premedicate patient with antihistamines and corticosteroids prior to infusion to minimize risk of anaphylaxis and infusion reaction. Administer in a setting with professionals prepared to manage anaphylaxis and infusion reactions.
- Discontinue all oral urate-lowering medications prior to and during therapy.

IV Administration

- **Intermittent Infusion:** Withdraw 1 mL of pegloticase from vial and inject into 250 mL bag of NaCl; discard unused portion. Invert bag several times to mix; do not shake. Solution is clear and colorless; do not administer solutions that are discolored or contain a precipitate. Solution is stable for 4 hr if refrigerated or at room temperature. Store in refrigerator and protect from light; do not freeze. Allow solution to reach room temperature before administering; do not use artificial heating. ***Rate:*** Infuse over 120 min. Do not administer via IV push or bolus.
- **Additive Incompatibility:** Do not mix with other medications.

Patient/Family Teaching

- Explain purpose of pegloticase to patient. Instruct patient to read *Medication Guide* before starting therapy before each infusion.
- Advise patient to notify health care professional immediately if signs of anaphylaxis or infusion reaction occur.
- Advise patient not to take pegloticase if they have G6PD deficiency.
- Inform patient that gout flares may initially ↑ at the start of pegloticase. Advise patient to not to stop therapy but to take medication (colchicine, NSAID) to reduce flares regularly for the first few mo of pegloticase therapy.
- Instruct patient not to take oral urate-lowering medications before or during therapy.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- ↓ in uric acid levels with resultant improvement in gout symptoms in patients with chronic gout.

pembrolizumab

(pem-broe-**li**-zoo-mab)

Keytruda

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies, programmed death-1 inhibitors

© F.A. Davis Publishing

Indications

Unresectable or metastatic melanoma. Adjuvant treatment of melanoma with involvement of lymph node(s) following complete resection. ⛓ First-line treatment of patients with stage III non–small-cell lung cancer (NSCLC), who are not candidates for surgical resection or definitive chemoradiation, or metastatic NSCLC and whose tumors express PD-L1 (tumor proportion score [TPS] ≥1%) and have no epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK) genomic tumor aberrations (as monotherapy). ⛓ Metastatic NSCLC expressing PD-L1 (TPS ≥1%) that has progressed on or after platinum-containing chemotherapy (as monotherapy). Patients with EGFR or ALK genomic tumor aberrations should have disease progression on FDA-approved therapy for these aberrations prior to receiving pembrolizumab. ⛓ First-line treatment of metastatic non-squamous NSCLC with no EGFR or ALK genomic tumor aberrations (in combination with pemetrexed and platinum chemotherapy). First-line treatment of metastatic non-squamous NSCLC (in combination with carboplatin and either paclitaxel or nab-paclitaxel [albumin-bound]). Recurrent or metastatic head and neck squamous cell carcinoma (HNSCC) that has progressed on or after platinum-containing chemotherapy. First-line treatment of metastatic or unresectable, recurrent HNSCC (in combination with platinum and fluorouracil). ⛓ First-line treatment of metastatic or unresectable, recurrent HNSCC expressing PD-L1 (combined positive score [CPS] ≥1). Adults with relapsed or refractory classical Hodgkin lymphoma (cHL). Children with refractory cHL or cHL that has relapsed after ≥2 lines of therapy. Primary mediastinal large B-cell lymphoma that is refractory or that has relapsed after ≥2 prior lines of therapy (should not be used in patients who require urgent cytoreductive therapy). ⛓ Locally advanced or metastatic urothelial carcinoma in patients who are not eligible for any platinum-containing chemotherapy. Locally advanced or metastatic urothelial carcinoma in patients who have disease progression during or following platinum-containing chemotherapy or within 12 mo of neoadjuvant or adjuvant treatment with platinum-containing chemotherapy. Bacillus Calmette-Guerin (BCG)-unresponsive, high-risk, non-muscle invasive bladder cancer with carcinoma in situ with or without papillary tumors in patients who are not eligible for or have elected not to undergo cystectomy. ⛓ Unresectable or metastatic, microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) solid tumors that have progressed following prior treatment and have no satisfactory alternative treatment options. ⛓ First-line treatment of unresectable or metastatic MSI-H or dMMR colorectal cancer (CRC). ⛓ Recurrent locally advanced or metastatic gastric or gastroesophageal junction adenocarcinoma expressing PD-L1 (CPS ≥1) that has progressed on or after ≥2 prior lines of therapy including fluoropyrimidine- and platinum-containing chemotherapy and if appropriate, HER2/neu-targeted therapy. ⛓ First-line treatment of locally advanced unresectable or metastatic HER2-positive gastric or gastroesophageal junction adenocarcinoma (in combination with trastuzumab, fluoropyrimidine- and platinum-containing chemotherapy). ⛓ Locally advanced or metastatic esophageal or gastroesophageal junction (tumors with epicenter 1–5 cm above the gastroesophageal junction) carcinoma that is not amenable to surgical resection or definitive chemoradiation either as monotherapy after ≥1 prior line of systemic therapy for patients with tumors of squamous cell histology that express PD-L1 (CPS ≥10) or in combination with platinum- and fluoropyrimidine-based chemotherapy. ⛓ Recurrent or metastatic cervical cancer expressing PD-L1 (CPS ≥1) that has progressed on or after chemotherapy. Hepatocellular carcinoma (HCC) in patients previously treated with sorafenib. Recurrent locally advanced or metastatic Merkel cell carcinoma (MCC). First-line treatment of advanced renal cell carcinoma (RCC) (in combination with axitinib or lenvatinib). ⛓ Advanced endometrial carcinoma that is not MSI-H or dMMR in patients who have disease progression following prior systemic therapy in any setting and are not candidates for curative surgery or radiation (in combination with lenvatinib). ⛓ Unresectable or metastatic tumor mutational burden-high (TMB-H) [≥10 mutations/megabase] solid tumors that have progressed following prior treatment and have no satisfactory alternative treatment options. Recurrent or metastatic cutaneous squamous cell carcinoma (cSCC) that is not curable by surgery or radiation. ⛓ Locally recurrent unresectable or metastatic triple-negative breast cancer (TNBC) in patients whose tumors express PD-L1 (CPS ≥10) (in combination with chemotherapy). High-risk early-stage TNBC (in combination with chemotherapy as neoadjuvant treatment, and then continued as a single agent as adjuvant treatment after surgery).

Action

Programmed death receptor-1 (PD-1) blocking antibody (an IgG4 kappa immunoglobulin) that binds to PD-1 and blocks its interaction with its ligands, PD-L1 and PD-L2, resulting in activation of the immune system and decreased tumor growth. **Therapeutic Effects:** Decreased spread of melanoma, NSCLC, HNSCC, cHL, urothelial carcinoma, MSI-H or dMMR solid tumors, MSI-H or dMMR CRC, gastric tumors, cervical cancer, endometrial cancer, esophageal cancer, primary mediastinal large B-cell lymphoma, HCC, MCC, RCC, TMB-H solid tumors, cSCC, and TNBC.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 26 days.

© F.A. Davis Publishing

TIME/ACTION PROFILE (response)

ROUTE	ONSET	PEAK	DURATION
IV	within 3 mo	unknown	may persist for >8.8 mo

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Moderate to severe hepatic impairment; Solid organ transplant recipients (↑ risk of rejection); Allogeneic hematopoietic stem cell transplant recipients (↑ risk of transplantation complications); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children <2 yr (cHL, MSI-H cancer, primary mediastinal large B-Cell lymphoma, and MCC) or children <18 yr (all other indications).

Adverse Reactions/Side Effects

CV: MYOCARDITIS, pericarditis, vasculitis. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), pruritus, rash. **EENT:** iritis, uveitis. **Endo:** ADRENAL INSUFFICIENCY, hypothyroidism, hyperthyroidism, hypoparathyroidism, hypophysitis, type 1 diabetes. **GI:** COLITIS, HEPATITIS, ↓ appetite, constipation, diarrhea, nausea, gastritis, pancreatitis. **GU:** nephritis. **Hemat:** anemia, hemolytic anemia. **MS:** RHABDOMYOLYSIS, arthralgia, back pain, extremity pain, myalgia, myositis. **Neuro:** autoimmune neuropathy, Guillain-Barré syndrome, myasthenic syndrome, myelitis, ENCEPHALITIS, MENINGITIS, dizziness, fatigue, headache, insomnia. **Resp:** PNEUMONITIS. **Misc:** INFUSION-RELATED REACTIONS, SEPSIS.

Interactions

Drug-Drug: None noted.

Route/Dosage

Melanoma

IV (Adults): 200 mg every 3 wk until disease progression or unacceptable toxicity *or* 400 mg every 6 wk until disease progression or unacceptable toxicity; *Adjuvant treatment*— 200 mg every 3 wk until disease recurrence, unacceptable toxicity, or up to 12 mo *or* 400 mg every 6 wk until disease recurrence, unacceptable toxicity, or up to 12 mo.

Non-Small Cell Lung Cancer, Head and Neck Squamous Cell Carcinoma, Esophageal Cancer, or Locally Recurrent Unresectable or Metastatic Triple Negative Breast Cancer

IV (Adults): 200 mg every 3 wk until disease progression, unacceptable toxicity, or up to 24 mo *or* 400 mg every 6 wk until disease progression, unacceptable toxicity, or up to 24 mo. If being administered in combination with chemotherapy, should be administered prior to chemotherapy when given on the same day.

Urothelial Carcinoma, Gastric Cancer, Cervical Cancer, Endometrial Carcinoma, Hepatocellular Cancer, Renal Cell Carcinoma, Cutaneous Squamous Cell Carcinoma, or Microsatellite Instability-High/Mismatch Repair Deficient Colorectal Cancer

IV (Adults): 200 mg every 3 wk until disease progression, unacceptable toxicity, or up to 24 mo *or* 400 mg every 6 wk until disease progression, unacceptable toxicity, or up to 24 mo. If being administered in combination with chemotherapy or trastuzumab, should be administered prior to these medications when given on the same day.

Bacillus Calmette-Guerin-Unresponsive, High-Risk Non-Muscle Invasive Bladder Cancer

IV (Adults): 200 mg every 3 wk until persistent or recurrent high-risk non-muscle invasive bladder cancer, disease progression, unacceptable toxicity, or up to 24 mo *or* 400 mg every 6 wk until persistent or recurrent high-risk non-muscle invasive bladder cancer, disease progression, unacceptable toxicity, or up to 24 mo.

Classical Hodgkin Lymphoma, Microsatellite Instability-High/Mismatch Repair Deficient Cancer, Primary Mediastinal Large B-Cell Lymphoma, Merkel Cell Carcinoma, or Tumor Mutational Burden-High Cancer

IV (Adults): 200 mg every 3 wk until disease progression, unacceptable toxicity, or up to 24 mo *or* 400 mg every 6 wk until disease progression, unacceptable toxicity, or up to 24 mo.

IV (Children ≥2 yr): 2 mg/kg (max = 200 mg) every 3 wk until disease progression, unacceptable toxicity, or up to 24 mo.

High-Risk, Early-Stage Triple Negative Breast Cancer

IV (Adults): 200 mg every 3 wk for 24 wk (8 doses) (as neoadjuvant treatment in combination with chemotherapy) or until disease progression or unacceptable toxicity followed by 200 mg every 3 wk for up to 27 wk (9 doses) (as monotherapy as adjuvant treatment after surgery) *or* 400 mg every 6 wk for 24 wk (4 doses) (as neoadjuvant treatment in combination with chemotherapy) or until disease progression or unacceptable toxicity followed by 400 mg every 6 wk for up to 27 wk (5 doses) (as monotherapy as adjuvant treatment after surgery). If being administered in combination with

P

© F.A. Davis Publishing

chemotherapy, should be administered prior to chemotherapy when given on the same day.

Availability

Solution for injection: 25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of immune-mediated pneumonitis (shortness of breath, chest pain, new or worse cough) periodically during therapy. Evaluate with x-ray. Treat with corticosteroids for ≥Grade 2 pneumonitis. *If Grade 2 immune-mediated pneumonitis occurs,* hold pembrolizumab. Resume therapy in patients with complete or partial resolution (Grades 0 to 1) after corticosteroid taper. *If Grades 3 or 4 or recurrent Grade 2 occur,* permanently discontinue therapy.
- Monitor for signs and symptoms of colitis (diarrhea, abdominal pain, mucus or blood in stool, with or without fever). *If Grades 2 or 3 immune-mediated colitis occur,* hold dose. Resume therapy in patients with complete or partial resolution (Grades 0 to 1) after corticosteroid taper. *If Grade 4 occurs,* permanently discontinue pembrolizumab.
- Assess for signs and symptoms of immune-mediated hepatitis (yellowing of skin or whites of eyes, unusual darkening of urine, unusual tiredness, pain in right upper stomach) before each dose.
- Monitor for signs and symptoms of infusion-related reactions (rigors, chills, wheezing, pruritus, flushing, rash, hypotension, hypoxemia, fever). *If Grades 1 or 2 infusion-related reactions occur,* hold or slow rate of infusion. *If Grades 3 or 4 reactions occur,* stop infusion and permanently discontinue therapy.
- Monitor for clinical signs and symptoms of hypophysitis (persistent or unusual headache, extreme weakness, dizziness or fainting, vision changes) during therapy. *If Grade 3 or 4 immune-mediated endocrinopathies occur,* hold dose until clinically stable.
- Assess for rash periodically during therapy. Topical emollients and/or topical corticosteroids may be adequate to treat mild to moderate non-exfoliative rashes. May cause SJS, TEN, and DRESS. *If rash, itching, blistering, or ulcers in mouth or other mucous membranes occur and SJS, TEN, or DRESS are suspected,* hold dose and refer for assessment and treatment. *If SJS, TEN, or DRESS are confirmed,* permanently discontinue therapy.
- Monitor for signs and symptoms of encephalitis (headache, fever, tiredness or weakness, confusion, memory problems, sleepiness, hallucinations, seizures, stiff neck) periodically during therapy. *If Grade 2 neurological toxicities occur,* hold therapy for patients with new-onset moderate to severe neurologic symptoms during diagnosis. *If Grade 3 or 4 neurological toxicities occur,* permanently discontinue pembrolizumab and administer corticosteroids at dose of 1–2 mg/kg/day prednisone equivalents for immune-mediated encephalitis, followed by corticosteroid taper.
- Monitor for signs and symptoms of myocarditis (chest pain, dyspnea) during therapy. If Grade 2, 3 or 4 myocarditis occurs, permanently discontinue pembrolizumab.
- ***Lab Test Considerations:*** Verify negative pregnancy test prior to starting therapy.
- Patient selection is based on presence of positive PD-L1 expression in stage III NSCLC who are not candidates for surgical resection or definitive chemoradiation, metastatic NSCLC, first-line treatment of metastatic or unresectable, recurrent HNSCC, metastatic gastric cancer (if PD-L1 expression is not detected in an archival gastric cancer specimen, evaluate feasibility of obtaining a tumor biopsy for PD-L1 testing), previously treated recurrent locally advanced or metastatic esophageal cancer, and recurrent or metastatic cervical cancer. For MSI-H/dMMR indications, select patients for pembrolizumab as a single agent based on MSI-H/dMMR status in tumor specimens. For TMB-H, select patients for pembrolizumab as a single agent based on TMB-H status in tumor specimens. For combination therapy for non-MSI-H/dMMR advanced endometrial carcinoma, select patients for pembrolizumab in combination with lenvatinib based on MSI or MMR status in tumor specimens. For use of pembrolizumab in combination with chemotherapy, select patients based on the presence of positive PD-L1 expression in locally recurrent unresectable or metastatic TNBC. Information on FDA-approved tests used for patient selection is available at http://www.fda.gov/CcompanionDiagnostics. An FDA -approved test for detection of MSI-H or dMMR is not currently available.
- Monitor for ↑ serum creatinine prior to and periodically during therapy. If Grade 2 or 3 increases in blood creatinine occur, hold pembrolizumab. Resume in patients with complete or partial resolution (Grade 0 to 1) after corticosteroid taper. Permanently discontinue if no complete or partial resolution within 12 wk of last dose or inability to reduce prednisone to ≤10 mg per day (or equivalent) within 12 wk of starting steroids. *If Grade 4 increases in blood creatinine occur,* permanently discontinue pembrolizumab.
- Monitor for abnormal liver tests prior to and periodically during therapy. For hepatitis with no tumor involvement: *If AST/ALT >3 and ≤8 times ULN or total bilirubin >1.5 and ≤3 times ULN,* hold pembrolizumab. Resume with complete or partial resolution (Grade 0 to 1) after corticosteroid taper. Permanently discontinue if no complete or partial resolution within 12 wk of last dose or inability to reduce prednisone to ≤10 mg per day (or equivalent) within 12 wk of starting steroids. *If AST or ALT >8 times ULN or total bilirubin >3 times ULN,* permanently discontinue pembrolizumab. For hepa-

© F.A. Davis Publishing

titis with tumor involvement of the liver: *If baseline AST/ALT is >1 and ≤3 times ULN and increases to >5 and ≤10 times ULN or baseline AST/ALT is >3 and ≤5 times ULN and increases to >8 and ≤10 times ULN,* hold pembrolizumab. *If AST/ALT >10 times ULN or total bilirubin >3 times ULN,* discontinue pembrolizumab permanently.

- Monitor for changes in thyroid function at start of and periodically during therapy, and as indicated based on clinical evaluation. Administer corticosteroids for ≥Grade 3 hyperthyroidism, withhold pembrolizumab for severe (Grade 3) hyperthyroidism and resume therapy when recovery to Grade 0 to 1. Permanently discontinue for life-threatening (Grade 4) hyperthyroidism. Manage hypothyroidism with thyroid replacement without interruption of therapy or corticosteroids.
- Monitor serum blood glucose. May cause hyperglycemia or other signs and symptoms of diabetes.

Implementation

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Withdraw required volume of pembrolizumab and transfer to IV bag of 0.9% NaCl or D5W. Mix using gently inversion. Solution is clear to slightly opalescent, colorless to slightly yellow; do not administer solution if discolored or contains particulate matter other than translucent to white proteinaceous particles. Solution is stable at room temperature for up to 6 hr including infusion time and 96 hr if refrigerated. ***Concentration:*** 1 mg/mL to 10 mg/mL. ***Rate:*** Infuse through a sterile, non-pyrogenic, low-protein binding 0.2 micron to 5 micron in-line or add-on filter over 30 min.
- **Y-Site Incompatibility:** Do not administer other drugs through same infusion line.

Patient/Family Teaching

- Explain purpose of pembrolizumab to patient.
- Advise patient to notify health care professional immediately if signs and symptoms of pneumonitis, colitis, hepatitis, kidney problems (change in amount or color of urine), hormone gland problems (rapid heart beat, weight loss, increased sweating, weight gain, hair loss, feeling cold, constipation, deepening of voice, muscle aches, dizziness or fainting, persistent or unusual headache) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May cause fetal harm. Advise female patient of reproductive potential to use highly effective contraception and avoid breast feeding during and for ≥4 mo after last dose.
- Emphasize importance of keeping scheduled appointments for blood work or other laboratory tests.

Evaluation/Desired Outcomes

- Decreased spread of melanoma, NSCLC, HNSCC, cHL, urothelial carcinoma, MSI-H, gastric tumors, cervical cancer, endometrial cancer, esophageal cancer, primary mediastinal large B-cell lymphoma, HCC, MCC, and RCC.

PEMEtrexed (pe-me-**trex**-ed)

Alimta, Pemfexy

Classification

Therapeutic: antineoplastics

Pharmacologic: antimetabolites, folate antagonists

Indications

Malignant pleural mesothelioma as initial therapy when tumor is unresectable or patient is not a candidate for surgery (in combination with cisplatin). Metastatic non-squamous non–small-cell lung cancer (NSCLC) as initial therapy in patients without EGFR or ALK genomic tumor aberrations (in combination with platinum-based therapy and pembrolizumab). Locally advanced or metastatic non-squamous NSCLC as initial therapy (in combination with cisplatin). Locally advanced or metastatic non-squamous NSCLC as maintenance treatment in patients whose disease has not progressed after 4 cycles of platinum-based first-line chemotherapy (as monotherapy). Recurrent, metastatic non-squamous NSCLC after previous chemotherapy (as monotherapy).

Action

Disrupts folate dependent metabolic processes involved in thymidine and purine synthesis. Converted intracellularly to polyglutamate form which increases duration of action. **Therapeutic Effects:** Decreases growth and spread of mesothelioma. Improved survival in patients with non-squamous NSCLC.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Minimal metabolism; 70–90% excreted unchanged in urine.

Half-life: 3.5 hr (normal renal function).

TIME/ACTION PROFILE (hematologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	8–15 days	21 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; CCr <45 mL/min; OB: Pregnancy (may cause fetal harm); Lactation:

© F.A. Davis Publishing

Lactation.

Use Cautiously in: Concurrent use of NSAIDs in patients with CCr 45–79 mL/min (avoid those with short half-lives); 3rd space fluid accumulation (ascites, pleural effusions); consider drainage prior to therapy; Hepatic impairment (dose alteration recommended); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: chest pain. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, desquamation, rash, radiation recall. **GI:** constipation, nausea, stomatitis, vomiting, anorexia, diarrhea, esophagitis, mouth pain. **GU:** ↓ fertility (men). **Hemat:** anemia, hemolytic anemia, leukopenia, thrombocytopenia. **Neuro:** neuropathy. **Resp:** INTERSTITIAL PNEUMONITIS, pharyngitis. **Misc:** fever, infection.

Interactions

Drug-Drug: NSAIDs, especially those with short half-lives, ↑ levels and risk of toxicity; avoid for 2 days before, day of, and 2 days after treatment. **Probenecid** ↑ levels. Concurrent use of **nephrotoxic agents** ↑ risk of nephrotoxicity.

Route/Dosage

Non-Squamous Non–Small-Cell Lung Cancer

IV (Adults): *Initial therapy (with cisplatin)* — 500 mg/m² on Day 1 of each 21-day cycle for up to 6 cycles (administer before cisplatin); *Initial therapy (with platinum-based therapy and pembrolizumab)* — 500 mg/m² on Day 1 of each 21-day cycle for 4 cycles (administer before carboplatin or cisplatin and after pembrolizumab). Following completion of platinum-based therapy, pemetrexed may be administered as monotherapy or with pembrolizumab as maintenance therapy until disease progression or unacceptable toxicity; *Maintenance treatment (as monotherapy) or disease recurrence (as monotherapy)* — 500 mg/m² on Day 1 of each 21-day cycle until disease progression or unacceptable toxicity.

Mesothelioma

IV (Adults): 500 mg/m² on Day 1 of each 21-day cycle until disease progression or unacceptable toxicity.

Availability (generic available)

Lyophilized powder for injection: 100 mg/vial, 500 mg/vial, 1 g/vial. **Solution for injection:** 25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for rash during therapy. Pretreatment with dexamethasone 4 mg orally twice daily the day before, the day of, and the day after administration reduces incidence and severity or reaction.
- Monitor for hematologic and GI (mucositis, diarrhea) toxicities. *If any Grade 3 or 4 toxicities, except mucositis or diarrhea, requiring hospitalization occur,* decrease doses of pemetrexed and cisplatin by 75%. *If Grade 3 or 4 mucositis occurs,* decrease pemetrexed dose by 50% and cisplatin by 100% of previous dose.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur; monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess for neurotoxicity during therapy. *If Grade 0–1 neurotoxicity occurs,* decrease pemetrexed and cisplatin doses by 100% of previous dose. *If Grade 2 neurotoxicity occurs,* decrease pemetrexed dose by 100% and cisplatin dose by 50% of previous dose. *If Grade 3 or 4 neurotoxicity occurs,* discontinue therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor CBC and platelet counts for nadir and recovery and renal function, before each dose and on days 8 and 15 of each cycle and chemistry for renal and liver functions periodically. May cause neutropenia, thrombocytopenia, leukopenia, and anemia. A new cycle should not be started unless the ANC is at least 1500 cells/mm³, platelet count is at least 100,000 cells/mm³, and CCr is ≥45 mL/min. *If nadir of ANC is <500/mm³ and nadir of platelets are at least 50,000/mm³,* decrease doses of pemetrexed and cisplatin by 75%. *If nadir of platelets is <50,000/mm³ regardless of ANC nadir,* decrease pemetrexed and cisplatin doses by 50%.

Implementation

- Do not confuse pemetrexed with pralatrexate.
- Pemetrexed should be administered under supervision of a physician experienced in the use of chemotherapeutic agents.
- To reduce toxicity, 0.4–1 mg of folic acid must be taken daily for 7 days preceding 1st dose of pemetrexed and should continue during and for 21 days after last dose. Patients must also receive an injection of vitamin B_{12} 1 mg IM during the wk preceding 1st dose of pemetrexed and every 3 cycles thereafter. Subsequent doses of vitamin B_{12} may be given on same day as pemetrexed. Also administer dexamethasone 4 mg twice daily the day before, the day of, and the day after pemetrexed administration.

IV Administration

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in designated containers.
- **Intermittent Infusion:** ***Reconstitution:*** Calculate number of pemetrexed 500-mg vials needed; vials contain excess to facilitate delivery. Reconstitute 500 mg with 20 mL of preservative-free 0.9% NaCl.

© F.A. Davis Publishing

Concentration: 25 mg/mL. Swirl gently until powder is completely dissolved. Solution is clear and colorless to yellow or green-yellow. Do not administer if discolored or containing particulate matter. ***Dilution:*** Dilute further to 100 mL with preservative-free 0.9% NaCl. Solution is stable at room temperature or if refrigerated for up to 24 hr. ***Rate:*** Administer over 10 min.

- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, ceftriaxone, cefuroxime, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, regular, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methylprednisolone sodium succinate, metoclopramide, metoprolol, midazolam, milrinone, mitomycin, morphine, moxifloxacin, nafcillin, naloxone, nitroglycerin, norepinephrine, octreotide, oxaliplatin, paclitaxel, pamidronate, pancuronium, pentobarbital, phenobarbital, phentolamine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, promethazine, propranolol, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** anidulafungin, calcium acetate, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, chloramphenicol, chlorpromazine, ciprofloxacin, D5W, dacarbazine, dantrolene, daunorubicin hydrochloride, diazepam, dobutamine, doxorubicin hydrochloride, doxycycline, droperidol, epirubicin, erythromycin, gemcitabine, gentamicin, hydralazine, idarubicin, irinotecan, metronidazole, minocycline, mitoxantrone, nalbuphine, nicardipine, nitroprusside, ondansetron, pantoprazole, pentamidine, phenytoin, prochlorperazine, quinupristin/dalfopristin, tobramycin, topotecan, vasopressin.
- **Additive Incompatibility:** Solutions containing calcium, including lactated Ringer's and Ringer's solution.

Patient/Family Teaching

- Explain purpose of pemetrexed to patient.
- Emphasize the importance of taking prophylactic folic acid and vitamin B_{12} to reduce treatment-related hematologic and GI toxicity.
- Advise patient to notify health care professional immediately if signs and symptoms of infection (fever, sore throat), anemia, or neurotoxicity occur.
- Instruct patients to notify health care professional if persistent vomiting, diarrhea, or signs of dehydration appear.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially NSAIDs, and to avoid alcohol during therapy.
- Rep: Advise females of reproductive potential to use effective contraception during and for at least 6 mo after last dose of pemetrexed and to avoid breast feeding for at least 1 wk after last dose. Advise males with female partners of reproductive potential to use effective contraception during and for at least 3 mo after last dose. If pregnancy is planned or suspected, notify health care professional promptly. May impair fertility in males.

Evaluation/Desired Outcomes

- Decreased growth and spread of mesothelioma or non–small-cell lung cancer.

PENICILLINS (pen-i-**sill**-ins)

penicillin G aqueous
~~Pfizerpen~~

penicillin G benzathine
Bicillin L-A

penicillin G procaine
~~Wycillin~~

penicillin V
Pen-VK

Classification
Therapeutic: anti-infectives
Pharmacologic: penicillins

Indications

Treatment of a wide variety of infections including: Pneumococcal pneumonia, Streptococcal pharyngitis, Syphilis,

© F.A. Davis Publishing

Gonorrhea strains. Treatment of enterococcal infections (requires the addition of an aminoglycoside). Prevention of rheumatic fever. Should not be used as a single agent to treat anthrax. **Unlabeled Use:** Treatment of Lyme disease. Prevention of recurrent *Streptococcal pneumoniae* septicemia in children with sickle-cell disease.

Action

Bind to bacterial cell wall, resulting in cell death.

Therapeutic Effects: Bactericidal action against susceptible bacteria. **Spectrum:** Active against: Most gram-positive organisms, including many streptococci (*Streptococcus pneumoniae*, group A beta-hemolytic streptococci), staphylococci (non–penicillinase-producing strains), and *Bacillus anthracis*; Some gram-negative organisms, such as *Neisseria meningitidis* and *Neisseria gonorrhoeae* (only penicillin susceptible strains); Some anaerobic bacteria and spirochetes including *Borellia burgdorferi*.

Pharmacokinetics

Absorption: Variably absorbed from the GI tract. *Penicillin V*— resists acid degradation in the GI tract. *Procaine and benzathine penicillin*— IM absorption is delayed and prolonged and results in sustained therapeutic blood levels.

Distribution: Widely distributed, although CNS penetration is poor in the presence of uninflamed meninges. Crosses the placenta and enters breast milk.

Metabolism and Excretion: Minimally metabolized by the liver, excreted mainly unchanged by the kidneys.

Half-life: 30–60 min.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Penicillin V PO	rapid	0.5–1 hr	4–6 hr
Penicillin G IM	rapid	0.25–0.5 hr	4–6 hr
Penicillin G IV	rapid	end of infusion	4–6 hr
Benzathine penicillin IM	delayed	12–24 hr	3 wk
Procaine penicillin IM	delayed	1–4 hr	12 hr

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity to penicillins (cross-sensitivity may exist with cephalosporins and other beta-lactams); Hypersensitivity to procaine or benzathine (procaine and benzathine preparations only); Some products may contain tartrazine and should be avoided in patients with known hypersensitivity.

Use Cautiously in: Severe renal impairment (dose ↓ recommended); OB: Although safety not established in pregnancy, has been used safely; Lactation: Safety not established in breast feeding; Geri: Consider ↓ body mass, age-related ↓ in renal, hepatic, and cardiac function, comorbidities, and concurrent drug therapy when prescribing and dosing.

Adverse Reactions/Side Effects

Derm: ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, urticaria. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, epigastric distress, nausea, vomiting. **GU:** interstitial nephritis. **Hemat:** eosinophilia, hemolytic anemia, leukopenia. **Local:** pain at IM site, phlebitis at IV site. **Neuro:** SEIZURES. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and serum sickness), superinfection.

Interactions

Drug-Drug: May ↓ effectiveness of oral contraceptive agents. **Probenecid** ↓ renal excretion and ↑ blood levels of penicillin (therapy may be combined for this purpose). **Neomycin** may ↓ absorption of penicillin V. ↓ elimination of **methotrexate** and ↑ risk of serious toxicity.

Route/Dosage

Penicillin G

IM, IV (Adults): *Most infections*— 1–5 million units every 4–6 hr.

IM, IV (Children): 8333–16,667 units/kg every 4 hr; 12,550–25,000 units/kg every 6 hr; up to 250,000 units/kg/day in divided doses, some infections may require up to 300,000 units/kg/day.

IV (Infants >7 days): 25,000 units/kg every 8 hr; *Meningitis*— 50,000–75,000 units/kg every 6 hr.

IV (Infants <7 days): 25,000 units/kg every 12 hr; *Streptococcus B meningitis*— 100,000–150,000 units/kg/day in divided doses.

Penicillin G Benzathine

IM (Adults): *Streptococcal infections/erysipeloid*— 1.2 million units single dose. *Primary, secondary, and early latent syphilis*— 2.4 million units single dose. *Tertiary and late latent syphilis (not neurosyphilis)*— 2.4 million units once weekly for 3 wk. *Prevention of rheumatic fever*— 1.2 million units every 3–4 wk.

IM (Children >27 kg): *Streptococcal infections/erysipeloid*— 900,000–1.2 million units (single dose). *Primary, secondary, and early latent syphilis*— up to 2.4 million units single dose. *Late latent or latent syphilis of undetermined duration*— 50,000 units/kg weekly for 3 wk. *Prevention of rheumatic fever*— 1.2 million units every 2–3 wk.

IM (Children <27 kg): *Streptococcal infections/erysipeloid*— 300,000–600,000 units single dose. *Primary, secondary, and early latent syphilis*— up to 2.4 million units single dose. *Late latent or latent syphilis of undetermined duration*— 50,000 units/kg weekly for 3 wk. *Prevention of rheumatic fever*— 1.2 million units every 2–3 wk.

Penicillin G Procaine

IM (Adults): *Moderate or severe infections*— 600,000–1.2 million units/day as a single dose or in 2 divided

© F.A. Davis Publishing

doses. *Neurosyphilis*—2.4 million units/day with 500 mg probenecid PO 4 times daily for 10–14 days.
IM (Children): *Congenital syphilis*—50,000 units/kg/day for 10–14 days.

Penicillin V Potassium

PO (Adults and Children ≥12 yr): *Most infections*—125–500 mg every 6–8 hr. *Rheumatic fever prevention*—125–250 mg every 12 hr.
PO (Children <12 yr): *Lyme disease*—12.5 mg/kg every 6 hr (unlabeled); prevention of *Streptococcus pneumoniae* sepsis in children with sickle cell disease—125 mg twice daily.

Availability

Penicillin G Potassium Aqueous (generic available)

Powder for injection : 1 million units/vial, 5 million units/vial, 20 million units/vial. **Premixed solution for injection:** 1 million units/50 mL, 2 million units/50 mL, 3 million units/50 mL.

Penicillin G Sodium Aqueous (generic available)

Powder for injection: 5 million units/vial.

Penicillin G Benzathine

Suspension for IM injection: 600,000 units/mL.

Penicillin G Procaine (generic available)

Suspension for IM injection: 300,000 units/mL, 600,000 units/mL.

Penicillin V Potassium (generic available)

Oral solution: 125 mg/5 mL, 250 mg/5 mL. **Cost:** *Generic*—125 mg/5 mL $3.84/100 mL, 250 mg/5 mL $4.31/100 mL. **Tablets:** 250 mg, 🍁 300 mg, 500 mg. **Cost:** *Generic*—250 mg $45.75/100, 500 mg $77.77/100.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history to determine previous use of and reactions to penicillins, cephalosporins, or other beta-lactam antibiotics. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. 1st dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause positive direct Coombs' test results. Hyperkalemia may develop after large doses of penicillin G potassium. Monitor serum sodium concentrations in patient with hypertension or HF. Hypernatremia may develop after large doses of penicillin sodium. May cause ↑ AST, ALT, LDH, and serum alkaline phosphatase concentrations. May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.

Implementation

- Do not confuse penicillin with penicillamine. Do not confuse penicillin G aqueous (potassium or sodium salt) with penicillin G procaine.
- **PO:** Administer around the clock. Penicillin V may be administered without regard for meals.
- Use calibrated measuring device for liquid preparations. Solution is stable for 14 days if refrigerated.
- **IM:** Reconstitute according to manufacturer's directions with sterile water for injection, D5W, or 0.9% NaCl.
- **IM:** Shake medication well before injection. Inject penicillin deep into a well-developed muscle mass at a slow, consistent rate to prevent blockage of the needle. Massage well. Accidental injury near or into a nerve can result in severe pain and dysfunction.
- Penicillin G potassium or sodium may be diluted with lidocaine (without epinephrine) 1% or 2% to minimize pain from IM injection.
- Never give penicillin G benzathine or penicillin G procaine suspensions IV. May cause embolism or toxic reactions.

IV Administration

- **IV:** Change IV sites every 48 hr to prevent phlebitis.
- Administer slowly and observe patient closely for signs of hypersensitivity.
- **Intermittent Infusion:** ***Dilution:*** Doses of 3 million units or less should be diluted in at least 50 mL of D5W or 0.9% NaCl; doses of more than 3 million units should be diluted with 100 mL. ***Concentration:*** 100,000–500,000 units/mL (50,000 units/mL in neonates). ***Rate:*** Infuse over 1–2 hr in adults or 15–30 min in children.
- **Continuous Infusion:** Doses of 10 million units or more may be diluted in 1 or 2 L.
- ***Rate:*** Infuse over 24 hr.

© F.A. Davis Publishing

Penicillin G Potassium

- **Y-Site Compatibility:** acyclovir, alfentanil, amiodarone, ascorbic acid, atropine, azathioprine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefotetan, ceftazidime, ceftozolane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, dexamethasone, digoxin, diltiazem, diphenhydramine, dopamine, enalaprilat, ephedrine, epinephrine, epoetin alfa, esmolol, famotidine, fentanyl, fluconazole, folic acid, foscarnet, furosemide, glycopyrrolate, heparin, hydrocortisone, hydromorphone, imipenem/cilastatin, indomethacin, insulin, regular, isoproterenol, ketamine, ketorolac, lactated Ringer's, lidocaine, magnesium sulfate, mannitol, meperidine, meropenem/vaborbactam, methylprednisolone, metoclopramide, metoprolol, midazolam, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, penicillin G sodium, phenylephrine, phytonadione, plazomicin, potassium chloride, procainamide, prochlorperazine, propranolol, pyridoxine, sodium bicarbonate, sufentanil, tacrolimus, theophylline, thiamine, tobramycin, vasopressin, verapamil, vitamin B complex with C.
- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart, dantrolene, diazepam, dobutamine, doxycycline, ganciclovir, haloperidol, minocycline, papaverine, pentamidine, pentobarbital, phenytoin, protamine, tranexamic acid, trimethoprim/sulfamethoxazole.

Penicillin G Sodium

- **Y-Site Compatibility:** alfentanil, ascorbic acid, atropine, azathioprine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, dexamethasone, digoxin, diphenhydramine, dopamine, enalaprilat, ephedrine, epinephrine, epoetin alfa, esmolol, famotidine, fentanyl, fluconazole, folic acid, furosemide, glycopyrrolate, heparin, hydrocortisone, imipenem/cilastatin, indomethacin, insulin, regular, isoproterenol, ketamine, ketorolac, lactated Ringer's, levofloxacin, lidocaine, magnesium sulfate, mannitol, meperidine, methylprednisolone, metoclopramide, metoprolol, midazolam, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, pantoprazole, penicillin G potassium, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, propranolol, pyridoxine, sodium bicarbonate, sodium citrate, sufentanil, theophylline, thiamine, vasopressin, verapamil.
- **Y-Site Incompatibility:** If aminoglycosides and penicillins must be administered concurrently, administer in separate sites at least 1 hr apart, aminophylline, amphotericin B deoxycholate, dantrolene, diazepam, dobutamine, doxycycline, ganciclovir, haloperidol, labetalol, minocycline, papaverine, pentamidine, pentobarbital, phenytoin, protamine, tranexamic acid, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Incompatible with aminoglycosides; do not admix.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish drug completely as directed, even if feeling better. Advise patient that sharing this medication may be dangerous.
- Advise patient to report signs of superinfection (black, furry overgrowth on tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise patient taking oral contraceptives to use an additional nonhormonal method of contraception during therapy with penicillin and until next menstrual period.
- Patient with an allergy to penicillin should be instructed to always carry an identification card with this information.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

PENICILLINS, PENICILLINASE RESISTANT

dicloxacillin (dye-klox-a-**sill**-in)
nafcillin (naf-**sill**-in)
oxacillin (ox-a-**sill**-in)

Classification
Therapeutic: anti-infectives
Pharmacologic: penicillinase resistant penicillins

Indications

Treatment of the following infections due to penicillinase-producing staphylococci: Respiratory tract infec-

© F.A. Davis Publishing

tions, Sinusitis, Skin and skin structure infections. **Dicloxacillin:** Osteomyelitis. **Nafcillin, oxacillin:** Are also used to treat: Bone and joint infections, Urinary tract infections, Endocarditis, Septicemia, Meningitis.

Action

Bind to bacterial cell wall, leading to cell death. Not inactivated by penicillinase enzymes. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Active against most gram-positive aerobic cocci but less so than penicillin. Spectrum is notable for activity against: Penicillinase-producing strains of *Staphylococcus aureus*, *Staphylococcus epidermidis*. Not active against methicillin-resistant staphylococci.

Pharmacokinetics

Absorption: *Dicloxacillin*—Rapidly but incompletely (35–76%) absorbed from the GI tract. *Nafcillin and oxacillin*—Completely absorbed following IV administration; well absorbed from IM sites.
Distribution: Widely distributed; penetration into CSF is minimal, but sufficient in the presence of inflamed meninges; cross the placenta and enter breast milk.
Metabolism and Excretion: *Dicloxacillin*—Some metabolism by the liver (6–10%) and some renal excretion of unchanged drug (60%); small amounts eliminated in the feces via the bile. *Nafcillin, oxacillin*—Partially metabolized by the liver (nafcillin 60%, oxacillin 49%), partially excreted unchanged by the kidneys.
Half-life: *Dicloxacillin*—0.5–1.1 hr (↑ in severe hepatic and renal dysfunction); *Nafcillin*—Neonates: 1–5 hr; Children 1 mo – 14 yr: 0.75–1.9 hr; Adults: 0.5–1.5 hr (↑ in renal impairment); *Oxacillin*—Neonates: 1.6 hr; Children up to 2 yr: 0.9–1.8 hr; Adults: 0.3–0.8 hr (↑ in severe hepatic impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Dicloxacillin	30 min	30–120 min	6 hr
Nafcillin IM	30 min	60–120 min	4–6 hr
Nafcillin IV	rapid	end of infusion	4–6 hr
Oxacillin IM	rapid	30 min	4–6 hr
Oxacillin IV	rapid	end of infusion	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins (cross-sensitivity with cephalosporins may exist).
Use Cautiously in: Severe renal or hepatic impairment; OB, Lactation: Safety not established.

Adverse Reactions/Side Effects

Derm: rash, urticaria. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting, ↑ liver enzymes. **GU:** acute kidney injury, hematuria, interstitial nephritis, proteinuria. **Hemat:** eosinophilia, leukopenia. **Local:** pain at IM sites, phlebitis at IV sites. **Neuro:** SEIZURES (high doses). **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and serum sickness), superinfection.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ blood levels (treatment may be combined for this purpose). May ↓ effectiveness of **oral contraceptive agents**. May ↓ elimination of **methotrexate** and ↑ risk of serious toxicity.

Route/Dosage

Dicloxacillin

PO (Adults and Children ≥40 kg): 125–250 mg every 6 hr (max dose = 2 g/day).
PO (Children <40 kg): 6.25–12.5 mg/kg every 6 hr; (up to 12.25 mg/kg every 6 hr has been used for osteomyelitis) (max dose = 2 g/day).

Nafcillin

IV (Adults): 500–2000 mg every 4–6 hr.
IM (Adults): 500 mg every 4–6 hr.
IM, IV (Children and Infants): 50–200 mg/kg/day divided every 4–6 hr (max dose = 12 g/day).
IM, IV (Neonates >2 kg): 25 mg/kg every 8 hr for the 1st 7 days of life, then 25 mg/kg every 6 hr.
IM, IV (Neonates 1.2–2 kg): 25 mg/kg every 12 hr for the 1st 7 days of life, then 25 mg/kg every 8 hr.
IM, IV (Neonates 0–4 wk, <1.2 kg): 25 mg/kg every 12 hr.

Oxacillin

IM, IV (Adults and Children ≥40 kg): 250–2000 mg every 4–6 hr (max dose = 12 g/day).
IM, IV (Children <40 kg): 100–200 mg/kg/day divided every 4–6 hr (max dose = 12 g/day).
IM, IV (Neonates ≥2 kg): 25 mg/kg every 8 hr for the 1st 7 days of life, then 25 mg/kg every 6 hr.
IM, IV (Neonates 1.2–2 kg): 25 mg/kg every 12 hr for the 1st 7 days of life, then 25 mg/kg every 8 hr.
IM, IV (Neonates <1.2 kg): 25 mg/kg every 12 hr.

Availability

Dicloxacillin (generic available)

Capsules: 250 mg, 500 mg.

Nafcillin (generic available)

Powder for injection (requires reconstitution and dilution): 1 g/vial, 2 g/vial, 10 g/vial. **Premixed infusion:** 1 g/50 mL D5W, 2 g/100 mL D5W.

Oxacillin (generic available)

Powder for injection (requires reconstitution and dilution): 1 g/vial, 2 g/vial, 10 g/vial. **Premixed infusion:** 1 g/50 mL D5W, 2 g/50 mL D5W.

P

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins, cephalosporins, or other beta-lactam antibiotics. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. 1st dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing, abdominal pain). Discontinue the drug and notify health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Assess vein for signs of irritation and phlebitis. Change IV site every 48 hr to prevent phlebitis.
- ***Lab Test Considerations:*** May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.
- May cause positive direct Coombs' test result.
- May cause ↑ AST, ALT, LDH, and serum alkaline phosphatase concentrations.

Implementation

- **PO:** Administer around the clock on an empty stomach at least 1 hr before or 2 hr after meals. Take with a full glass of water; acidic juices may decrease absorption of penicillins.
- Use calibrated measuring device for liquid preparations. Shake well. Solution is stable for 14 days if refrigerated.

Nafcillin

IV Administration

- **IV, IM:** To reconstitute, add 3.4 mL to each 1-g vial or 6.8 mL to each 2-g vial, for a concentration of 250 mg/mL. Stable for 2–7 days if refrigerated.
- **IV Push:** ***Dilution:*** Dilute reconstituted solution with 15–30 mL of sterile water, 0.45% NaCl, or 0.9% NaCl for injection. ***Concentration:*** 100 mg/mL. ***Rate:*** Administer over 5–10 min.
- **Intermittent Infusion:** ***Dilution:*** Dilute with sterile water for injection, 0.9% NaCl, D5W, D10W, D5/0.25% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, D5/LR, Ringer's or LR. Stable for 24 hr at room temperature, 96 hr if refrigerated. ***Concentration:*** 2–40 mg/mL. ***Rate:*** Infuse over at least 30–60 min to avoid vein irritation.
- **Y-Site Compatibility:** acyclovir, alfentanil, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, dactinomycin, daptomycin, dexamethasone, digoxin, dobutamine, docetaxel, dopamine, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, furosemide, ganciclovir, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, imipenem/cilastatin, indomethacin, isoproterenol, ketorolac, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, multivitamins, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxytocin, paclitaxel, pamidronate, pnacuronium, pantoprazole, pemetrexed, penicillin G, pentobarbital, perphenazine, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, propofol, propranolol, sodium bicarbonate, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tolazoline, trimetaphan, vasopressin, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, ampicillin, azathioprine, caspofungin, chloramphenicol, dantrolene, diazoxide, doxycycline, droperidol, epirubicin, folic acid, gemcitabine, haloperidol, hydralazine, hydroxyzine, idarubicin, irinotecan, meperidine, metaraminol, mitoxantrone, mycophenolate, palonosetron, pentamidine, phenytoin, promethazine, protamine, pyridoxime, succinylcholine, trimethoprim/sulfamethoxazole, vecuronium, vincristine, vinrelbine. If penicillins and aminoglycosides must be administered concurrently, administer at separate sites.

Oxacillin

IV Administration

- **IV, IM:** To reconstitute for IM or IV use, add 1.4 mL of sterile water for injection to each 250-mg vial, 2.7 mL to each 500-mg vial, 5.7 mL to each 1-g vial, 11.5 mL to each 2-g vial, and 23 mL to each 4-g vial, for a concentration of 250 mg/1.5 mL. Stable for 3 days at room temperature or 7 days if refrigerated.
- **IV Push:** ***Dilution:*** Further dilute each reconstituted 250-mg or 500-mg vial with 5 mL of sterile water or 0.9% NaCl for injection, 10 mL for each 1-g vial, 20 mL for each 2-g vial, and 40 mL for each 4-g vial. ***Concentration:*** 100 mg/mL. ***Rate:*** Administer slowly over 10 min.
- **Intermittent Infusion:** ***Dilution:*** Dilute with 0.9% NaCl, D5W, D5/0.9% NaCl, or LR. ***Concentration:*** 0.5–40 mg/mL. ***Rate:*** May be infused for up to 6 hr.
- **Y-Site Compatibility:** acyclovir, alfentanil, aminophylline, ascorbic acid, atracurium, atropine, az-

© F.A. Davis Publishing

treonam, benztropine, bumetanide, buprenorphine, butorphanol, chloramphenicol, chlorpromazine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, dexamethasone, digoxin, diltiazem, dopamine, doxapram, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, famotidine, fentanil, fluconazole, folic acid, foscarnet, furosemide, glycopyrrolate, heparin, hydrocortisone sodium succinate, hydromorphone, imipenem/cilastatin, insulin, regular, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, mannitol, methotrexate, methoxamine, methyldopate, metoclopramide, metoprolol, midazolam, milrinone, morphine, multivitamins, nafcillin, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxytocin, papaverine, penicillin G, pentobarbital, perphenazine, phenobarbital, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, propranolol, sufentanil, tacrolimus, theophylline, thiamine, tolazoline, trimetaphan, vancomycin, vasopressin, vitamin B complex with C, zidovudine.

- **Y-Site Incompatibility:** calcium chloride, calcium gluconate, dantrolene, diazepam, diazoxide, dobutamine, doxycycline, esmolol, haloperidol, hydralazine, metaraminol, pentamidine, phenytoin, promethazine, pyridoxime, succinylcholine, trimethoprim/sulfamethoazole. If penicillins and aminoglycosides must be administered concurrently, administer at separate sites.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Missed doses should be taken as soon as remembered. Advise patient that sharing of this medication may be dangerous.
- Advise patient to report signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

perindopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

pertuzumab (per-tue-zue-mab)

Perjeta

Classification

Therapeutic: antineoplastics
Pharmacologic: HER2/neu receptor antagonists, monoclonal antibodies

Indications

HER2-positive metastatic breast cancer in patients who have not yet been treated with anti-HER2 agents or chemotherapy (in combination with docetaxel and trastuzumab [or trastuzumab hyaluronidase]). Neoadjuvant treatment of HER2-positive locally advanced, inflammatory, or early stage breast cancer (either >2 cm in diameter or node-positive) (in combination with trastuzumab [or trastuzumab hyaluronidase] and chemotherapy). Adjuvant treatment of HER2−positive early breast cancer at high risk of recurrence (in combination with trastuzumab [or trastuzumab hyaluronidase] and chemotherapy).

Action

A monoclonal antibody that attaches to and blocks the human epidermal growth factor receptor 2 protein (HER2), resulting in cell growth arrest and apoptosis.
Therapeutic Effects: Decreased spread of breast cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 18 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	20 mo†

†Median duration of response.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy (may cause fetal harm).
Use Cautiously in: HER2 testing is required prior to treatment; Asian patients (↑ incidence of febrile neutropenia); Lactation: Safety not established in breast feeding; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

May reflect combination treatment with docetaxel and trastuzumab.
CV: HF, peripheral edema. **Derm:** alopecia, rash, dry skin, itching, nail disorder. **EENT:** ↑ lacrimation. **GI:** ↓ appetite, diarrhea, nausea, vomiting. **Hemat:** ANEMIA, LEUKOPENIA, NEUTROPENIA. **MS:** arthralgia, myalgia. **Neuro:** peripheral neuropathy, dizziness, dysgeusia, fa-

© F.A. Davis Publishing

tigue, headache, insomnia, weakness. **Resp:** dyspnea. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), INFUSION REACTIONS, chills, fever.

Interactions

Drug-Drug: ↑ risk of bone marrow depression/immunosuppression with other **bone marrow depressants/immunosuppressants** or **radiation therapy**.

Route/Dosage

Metastatic Breast Cancer

IV (Adults): 840 mg initially, then 420 mg every 3 wk.

Neoadjuvant Treatment of Breast Cancer

IV (Adults): 840 mg initially, then 420 mg every 3 wk for 3–6 cycles given preoperatively. Following surgery, administer 420 mg every 3 wk to complete 1 yr of treatment (up to 18 cycles).

Adjuvant Treatment of Breast Cancer

IV (Adults): 840 mg initially, then 420 mg every 3 wk for 1 yr (up to 18 cycles) or until disease recurrence or unacceptable toxicity.

Availability

Solution for injection: 30 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess left ventricular ejection fraction (LVEF) before starting pertuzumab and at regular intervals during therapy. Metastatic Breast Cancer: *If pretreatment left ventricular ejection fraction (LVEF) ≥50%,* monitor prior to and about every 12 wk. *If LVEF ↓ to <40% or 40–45% with a fall of ≥10% points below pretreatment value,* hold pertuzumab and trastuzumab or trastuzumab hyaluronidase for at least 3 wk. *If after 3 wk LVEF recovered to >45% or 40–45% with a fall of <10% points below pretreatment value,* resume pertuzumab and trastuzumab or trastuzumab hyaluronidase. Early Breast Cancer: *If pretreatment left ventricular ejection fraction (LVEF) ≥55%,* monitor prior to and about every 12 wk or once neoadjuvant therapy. *If LVEF ↓ to <50% with a fall of ≥10% points below pretreatment value,* hold pertuzumab and trastuzumab or trastuzumab hyaluronidase for at least 3 wk. *If after 3 wk LVEF recovered to >50% with a fall of <10% points below pretreatment value,* resume pertuzumab and trastuzumab or trastuzumab hyaluronidase. For patients receiving anthracycline-based chemotherapy, a LVEF of ≥ 50% is required after completion of anthracyclines, before starting pertuzumab and trastuzumab.
- If trastuzumab is withheld or discontinued, withhold or discontinue pertuzumab. If docetaxel is discontinued, pertuzumab and trastuzumab therapy may continue. Dose reductions are not recommended for pertuzumab.
- Assess patient closely for 60 min after initial infusion and 30 min after subsequent infusions for signs and symptoms of infusion-associated reactions (pyrexia, chills, fatigue, headache, asthenia, hypersensitivity, vomiting). If a significant infusion-associated reaction occurs, slow or interrupt infusion and administer appropriate medical therapies. Monitor until complete resolution of signs and symptoms. If severe infusion reactions occur, consider discontinuation of pertuzumab.
- Monitor patient for signs and symptoms of hypersensitivity reactions (rash, hives, itching, dyspnea, swelling of throat, lips, tongue) occurs.
- ***Lab Test Considerations:*** Verify negative pregnancy status before starting therapy.
- Determine HER protein overexpression prior to therapy.
- Verify pregnancy status prior to initiation of pertuzumab.
- Monitor CBC with differential periodically during therapy.

Implementation

IV Administration

- When administered with pertuzumab, initial dose of trastuzumab is 8 mg/kg infused over 90 min, followed every 3 wk by 6 mg/kg infused over 30–90 min.
- When administered with pertuzumab, initial dose of trastuzumab hyaluronidase is 600 mg/10,000 units administered subcut over 2–5 min once every 3 wk.
- When administered with pertuzumab, initial dose of docetaxel is 75 mg/m^2 as an IV infusion. Dose of docetaxel may be ↑ to 100 mg/m^2 every 3 wk if initial dose is tolerated.
- Administer pertuzumab, trastuzumab or trastuzumab hyaluronidase and docetaxel sequentially. Administer pertuzumab and trastuzumab or trastuzumab hyaluronidase in any order. Administer docetaxel after pertuzumab and trastuzumab or trastuzumab hyaluronidase. Observe patient for 30 to 60 min after pertuzumab infusion and before any subsequent infusion of trastuzumab or docetaxel.
- **Intermittent Infusion:** ***Dilution:*** 0.9% NaCl; do not use D5W. Withdraw appropriate volume of pertuzumab and dilute in 250 mL using a PVC or non-PVC polyolefin infusion bag. Gently invert to mix; do not shake. If not administered immediately, may be refrigerated for 24 hr; do not freeze. ***Rate:*** Infuse initial 840 mg over 60 min, followed every 3 wk by 420 mg over 30–60 min.
- For delayed or missed doses, if time between 2 sequential infusions is <6 wk, administer 420 mg dose of pertuzumab; do not wait until next planned dose. If time between 2 sequential infusions ≥6 wk, readminister initial 840 mg dose over 60 min, followed every 3 wk by 420 mg dose over 30–60 min.

Patient/Family Teaching

- Explain purpose of medication to patient.
- Advise patient to report signs and symptoms of infusion-associated reactions immediately.

© F.A. Davis Publishing

- Advise patient to notify health care professional immediately if signs and symptoms of left ventricular dysfunction (new onset or worsening shortness of breath, cough, swelling of the ankles/legs, swelling of the face, palpitations, weight gain of more than 5 pounds in 24 hrs, dizziness or loss of consciousness) occur.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding. Caution patient to use effective contraception during and for 7 mo following the last dose. Inform patients who become pregnant while receiving pertuzumab of pregnancy pharmacovigilance program to monitor infant outcomes. Encourage pregnant females who may be exposed to pertuzumab during pregnancy to report exposure to the Genentech Adverse Event Line at 1-888-835-2555. Monitor females who become pregnant for oligohydramnios.

Evaluation/Desired Outcomes

- Decreased spread of metastatic breast cancer.

pertuzumab/trastuzumab/hyaluronidase

(per-**tue**-zue-mab/traz-**too**-zoo-mab/hye-al-yoor-**on**-i-dase)

Phesgo

Classification

Therapeutic: antineoplastics

Pharmacologic: HER2/neu receptor antagonists, monoclonal antibodies

Indications

Neoadjuvant treatment of human epidermal growth factor receptor 2 protein (HER2)-positive locally advanced, inflammatory, or early stage breast cancer (either >2 cm in diameter or node-positive) (in combination with chemotherapy). Adjuvant treatment of HER2–positive early breast cancer at high risk of recurrence (in combination with chemotherapy). HER2-positive metastatic breast cancer in patients who have not yet been treated with anti-HER2 agents or chemotherapy (in combination with docetaxel).

Action

Pertuzumab and trastuzumab—monoclonal antibody that binds to HER2 sites in breast cancer tissue and inhibits proliferation of cells that overexpress HER2; *Hyaluronidase*—Acts locally by depolymerizing hyaluronan, which increases permeability of the subcutaneous tissue. **Therapeutic Effects:** Regression of breast cancer and metastases.

Pharmacokinetics

Pertuzumab

Absorption: 70% absorbed following subcutaneous administration.

Distribution: Not widely distributed.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

Trastuzumab

Absorption: 80% absorbed following subcutaneous administration.

Distribution: Not widely distributed.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Pertuzumab—subcut	unknown	4 days	unknown
Trastuzumab—subcut	unknown	4 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy (may cause fetal harm).

Use Cautiously in: HF, uncontrolled hypertension, recent MI, arrhythmias, prior anthracycline exposure (equivalent to >360 mg/m² of doxorubicin); Pulmonary disease or extensive tumor involvement of lungs (↑ risk of pulmonary toxicity); Dyspnea at rest (↑ risk of hypersensitivity reaction); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: HF, arrhythmias, hypertension, peripheral edema. **Derm:** alopecia, dry skin, rash, dermatitis, erythema, nail discoloration, palmar-plantar erythrodysesthesia syndrome. **EENT:** epistaxis, dry eye, ↑ lacrimation, rhinorrhea. **Endo:** hypoglycemia. **F and E:** hyperkalemia, hyponatremia, hypernatremia, hypokalemia. **GI:**

© F.A. Davis Publishing

constipation, diarrhea, dyspepsia, hypoalbuminemia, ↑ liver enzymes, nausea, stomatitis, vomiting, abdominal pain, hemorrhoids, hyperbilirubinemia. **GU:** ↑ serum creatinine, urinary tract infection. **Hemat:** anemia, leukopenia, lymphocytopenia, neutropenia, thrombocytopenia. **Local:** injection site pain, injection site reaction. **Metab:** ↓ appetite, ↓ weight. **MS:** arthralgia, myalgia, muscle spasm, pain. **Neuro:** paresthesia, peripheral neuropathy, dizziness, dysgeusia, headache, insomnia. **Resp:** ACUTE RESPIRATORY DISTRESS SYNDROME, INTERSTITIAL PNEUMONITIS, PULMONARY EDEMA, PULMONARY FIBROSIS, cough, dyspnea, upper respiratory tract infection, pleural effusion. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), fatigue, fever.

Interactions

Drug-Drug: Use of an **anthracycline** (**daunorubicin**, **doxorubicin**, or **idarubicin**) following therapy may ↑ risk of cardiotoxicity; if possible, avoid anthracycline-based therapy for up to 7 mo following completion of therapy.

Route/Dosage

Do not substitute Phesgo with or for pertuzumab, trastuzumab, ado-trastuzumab emtansine, or fam-trastuzumab deruxtecan.

Neoadjuvant Treatment of Breast Cancer

Subcut (Adults): *Initial dose*—Pertuzumab 1,200 mg/trastuzumab 600 mg/hyaluronidase 10,000 units followed by maintenance dose in 3 wk; *Maintenance dose*—Pertuzumab 600 mg/trastuzumab 600 mg/hyaluronidase 20,000 units every 3 wk for 3 to 6 cycles as part of a treatment regimen for early breast cancer. Following surgery, continue pertuzumab/trastuzumab/hyaluronidase to complete 1 year of treatment (up to 18 cycles) or until disease recurrence or unmanageable toxicity, whichever occurs first, as a part of a complete regimen for early breast cancer. In patients receiving an anthracycline-based regimen for early breast cancer, administer pertuzumab/trastuzumab/hyaluronidase following completion of the anthracycline. In patients receiving docetaxel or paclitaxel, administer docetaxel or paclitaxel after pertuzumab/trastuzumab/hyaluronidase.

Adjuvant Treatment of Breast Cancer

Subcut (Adults): *Initial dose*—Pertuzumab 1,200 mg/trastuzumab 600 mg/hyaluronidase 10,000 units followed by maintenance dose in 3 wk; *Maintenance dose*—Pertuzumab 600 mg/trastuzumab 600 mg/hyaluronidase 20,000 units every 3 wk for a total of 1 year (up to 18 cycles) or until disease recurrence or unmanageable toxicity, whichever occurs first, as part of a complete regimen for early breast cancer. In patients receiving an anthracycline-based regimen for early breast cancer, administer pertuzumab/trastuzumab/hyaluronidase following completion of the anthracycline. In patients receiving docetaxel or paclitaxel, administer docetaxel or paclitaxel after pertuzumab/trastuzumab/hyaluronidase.

Metastatic Breast Cancer

Subcut (Adults): *Initial dose*—Pertuzumab 1,200 mg/trastuzumab 600 mg/hyaluronidase 10,000 units followed by maintenance dose in 3 wk; *Maintenance dose*—Pertuzumab 600 mg/trastuzumab 600 mg/hyaluronidase 20,000 units every 3 wk until disease recurrence or unmanageable toxicity. Administer docetaxel after pertuzumab/trastuzumab/hyaluronidase.

Availability

Solution for injection: pertuzumab 60 mg, trastuzumab 60 mg, and hyaluronidase 2,000 units/mL in 15–mL vial, pertuzumab 80 mg, trastuzumab 40 mg, and hyaluronidase 2,000 units/mL in 10–mL vial.

NURSING IMPLICATIONS

Assessment

- Conduct a cardiac assessment, including history, physical examination, and determination of LVEF by echocardiogram or MUGA scan before starting therapy. Assess LVEF at regular intervals. May cause hypertension, arrhythmias, left ventricular cardiac dysfunction, HF, cardiomyopathy and death. *For early breast cancer: with LVEF ≥55%,* monitor LVEF every 12 wk. Hold *Phesgo* for at least 3 wk for LVEF decrease to <50% with a fall of ≥10% points below pretreatment value. Resume *Phesgo* after 3 wk if LVEF recovered to ≥50% or <10% points below pretreatment value. *For metastatic breast cancer with LVEF ≥50%,* monitor LVEF every 12 wk. Hold *Phesgo* for 3 wk for LVEF decrease to either <40% or 40–45% with a fall of ≥10% points below pretreatment value. Resume *Phesgo* after 3 wk if LVEF has recovered to either >45% or 40–45% with a fall of <10% points below pretreatment value. After repeat assessment within 3 wk, if LVEF has not improved, has declined further, and/or patient is symptomatic, permanently discontinue *Phesgo*. After completion of therapy, continue to monitor for cardiomyopathy and assess LVEF measurements every 6 mo for at least 2 years.
- Monitor for at least 30 min after initial dose of *Phesgo* and 15 min after each maintenance dose for signs of hypersensitivity symptoms or administration-related reactions. If significant injection-related reaction occurs, slow or pause injection and administer symptomatic therapy. Have medications and emergency equipment available. For Grade 1 or 2 hypersensitivity reactions, premedicate with an analgesic, antipyretic, or antihistamine. Permanently discontinue *Phesgo* if anaphylaxis or severe injection-related reactions.
- Monitor for signs and symptoms of pulmonary toxicity (dyspnea, interstitial pneumonitis, pulmonary infiltrates, pleural effusions, non-cardiogenic pulmonary edema, pulmonary insufficiency and hypoxia, acute respiratory distress syndrome, pulmonary fibrosis) periodically during therapy.
- ***Lab Test Considerations:*** Patient selection is based on HER2 protein overexpression or HER2

© F.A. Davis Publishing

gene amplification in tumor specimens using FDA-approved tests specific for breast cancer. Information on FDA-approved tests is available at http://www.fda.gov/CompanionDiagnostics.
- Obtain a negative pregnancy test before starting therapy.
- May exacerbate chemotherapy-induced neutropenia. May cause anemia, neutropenia, leukopenia, and febrile neutropenia.
- May cause ↑ serum creatinine, AST, ALT, bilirubin and ↓ albumin.
- May cause ↓ potassium and glucose and ↑ sodium and potassium.

Implementation
- *Phesgo* has different dose and administration instructions than pertuzumab IV, trastuzumab IV, and subcut trastuzumab when administered alone. Do not use other drugs in place of *Phesgo*. Must always be administered by health care professional.
- *In patients receiving anthracycline-based regimen for early breast cancer,* administer *Phesgo* following completion of the anthracycline. *In patients receiving Phesgo for early breast cancer with docetaxel or paclitaxel,* administer docetaxel or paclitaxel after *Phesgo*. *In patients receiving Phesgo for metastatic breast cancer with docetaxel,* administer docetaxel after *Phesgo*.
- **Subcut:** Check label to make sure vial contains *Phesgo* and not IV pertuzumab, or IV trastuzumab, or subcut trastuzumab. Solution is clear to opalescent, and colorless to slightly brownish; do not administer solutions that are cloudy, discolored, or contain particulate matter. Do not dilute; do not shake. Attach 25–27 gauge 3/8–5/8 inch needle to syringe just before injection. Solution is stable for up to 4 hr at room temperature or 24 hr if refrigerated. Inject into thighs only; alternate between right and left thigh with each dose. Inject initial dose of 15 mL over 8 min. Inject maintenance dose of 10 mL over 5 min. Inject at least 1 inch from previous site and avoid areas where skin is red, bruised, tender, or hard. Inject other subcut medications in different sites.

Patient/Family Teaching
- Explain purpose of *Phesgo* and regimen to patient.
- Advise patient to notify health care professional immediately if signs and symptoms of cardiomyopathy (new onset or worsening shortness of breath, cough, swelling of ankles or legs, swelling of face, palpitations, weight gain >5 pounds in 24 hrs, dizziness, loss of consciousness) or hypersensitivity and administration-related reactions (dizziness, nausea, chills, fever, vomiting, diarrhea, urticaria, swelling of face or neck, breathing problems, chest pain) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May be teratogenic. Advise females of reproductive potential to use effective contraception and to avoid breast feeding for 7 mo after last dose. If *Phesgo* is administered during pregnancy, or if a patient becomes pregnant while receiving *Phesgo*or within 7 mo following last dose of *Phesgo*, health care providers and patients should immediately report *Phesgo* exposure to pharmacovigilance program at Genentech at 1-888-835-2555.

Evaluation/Desired Outcomes
- Regression of breast cancer and metastases.

phenazopyridine
(fen-az-oh-**peer**-i-deen)
Baridium, Phenazo, Pyridium, Pyridium Plus

Classification
Therapeutic: nonopioid analgesics
Pharmacologic: urinary tract analgesics

P

Indications
Provides relief from the following urinary tract symptoms, which may occur in association with infection or following urologic procedures: Pain, Itching, Burning, Urgency, Frequency.

Action
Acts locally on the urinary tract mucosa to produce analgesic or local anesthetic effects. Has no antimicrobial activity. **Therapeutic Effects:** Diminished urinary tract discomfort.

Pharmacokinetics
Absorption: Appears to be well absorbed following oral administration.
Distribution: Unknown. Small amounts cross the placenta.
Metabolism and Excretion: Rapidly excreted unchanged in the urine.
Half-life: Unknown.

TIME/ACTION PROFILE (urinary analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	5–6 hr	6–8 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Glomerulonephritis; Severe hepatitis, uremia, or renal failure; Renal insufficiency; Glucose-6–phosphate dehydrogenase (G6PD) deficiency.

© F.A. Davis Publishing

Use Cautiously in: Hepatitis; OB, Lactation: Safety not established.

Adverse Reactions/Side Effects

GI: hepatotoxicity, nausea. **GU:** bright-orange urine, renal failure. **Derm:** rash. **Hemat:** hemolytic anemia, methemoglobinemia. **Neuro:** headache, vertigo.

Interactions

Drug-Drug: None significant.

Route/Dosage

PO (Adults): 200 mg 3 times daily for 2 days.
PO (Children): 4 mg/kg 3 times daily for 2 days.

Availability (generic available)

Tablets: 95 mg[OTC], 100 mg, 100 mg[OTC], 200 mg[OTC], 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for urgency, frequency, and pain on urination prior to and throughout therapy.
- ***Lab Test Considerations:*** Renal function should be monitored periodically during course of therapy.
- Interferes with urine tests based on color reactions (glucose, ketones, bilirubin, steroids, protein).

Implementation

- ***High Alert:*** Do not confuse Pyridium (phenazopyridine) with pyridoxine.
- Medication should be discontinued after pain or discomfort is relieved (usually 2 days for treatment of urinary tract infection). Concurrent antibiotic therapy should continue for full prescribed duration.
- **PO:** Administer medication with or following meals to decrease GI irritation. Do not crush, break, or chew tablet.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If a dose is missed, take as soon as remembered unless almost time for next dose.
- Advise patient that while phenazopyridine administration is stopped once pain or discomfort is relieved, concurrent antibiotic therapy must be continued for full duration of therapy. Do not save unused portion of phenazopyridine without consulting health care professional.
- Inform patient that drug causes reddish-orange discoloration of urine that may stain clothing or bedding. Sanitary napkin may be worn to avoid clothing stains. May also cause staining of soft contact lenses.
- Instruct patient to notify health care professional if rash, skin discoloration, or unusual tiredness occurs.

Evaluation/Desired Outcomes

- Decrease in pain and burning on urination.

BEERS

PHENobarbital

(fee-noe-**bar**-bi-tal)
Ancalixir, ~~Luminal~~

Classification
Therapeutic: anticonvulsants, sedative/hypnotics
Pharmacologic: barbiturates

Schedule IV

Indications

Anticonvulsant in tonic-clonic (grand mal), partial, and febrile seizures in children. Preoperative sedative and in other situations in which sedation may be required. Hypnotic (short-term). **Unlabeled Use:** Prevention/treatment of hyperbilirubinemia in neonates.

Action

Produces all levels of CNS depression. Depresses the sensory cortex, decreases motor activity, and alters cerebellar function. Inhibits transmission in the nervous system and raises the seizure threshold. Capable of inducing (speeding up) enzymes in the liver that metabolize drugs, bilirubin, and other compounds. **Therapeutic Effects:** Anticonvulsant activity. Sedation.

Pharmacokinetics

Absorption: Absorption is slow but relatively complete (70–90%).
Distribution: Unknown.
Metabolism and Excretion: 75% metabolized by the liver, 25% excreted unchanged by the kidneys.
Half-life: Neonates: 1.8–8.3 days; Infants: 0.8–5.5 days; Children: 1.5–3 days; Adults: 2–6 days.

TIME/ACTION PROFILE (sedation†)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	unknown	>6 hr
IM, subcut	10–30 min	unknown	4–6 hr
IV	5 min	30 min	4–6 hr

†Full anticonvulsant effects occur after 2–3 wk of chronic dosing unless a loading dose has been used.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Comatose patients or those with pre-existing CNS depression; Severe respiratory disease with dyspnea or obstruction; Uncontrolled severe pain; Known alcohol intolerance (elixir only); Lactation: Discontinue drug or bottle feed.
Use Cautiously in: Hepatic dysfunction; Severe renal impairment; History of suicide attempt or drug abuse; Hypnotic use should be short-term. Chronic use may lead to dependence; OB: Chronic use during pregnancy results in drug dependency in the infant; may result in coagulation defects and fetal malformation; acute use at term may result in respiratory depression in the newborn; Geri: Initial dose ↓ recommended.

© F.A. Davis Publishing

Adverse Reactions/Side Effects

Neuro: hangover, delirium, depression, drowsiness, excitation, lethargy, vertigo. **Resp:** respiratory depression; *IV*, LARYNGOSPASM, bronchospasm. **CV:** *IV*—hypotension. **GI:** constipation, diarrhea, nausea, vomiting. **Derm:** photosensitivity, rashes, urticaria. **Local:** phlebitis at IV site. **MS:** arthralgia, myalgia, neuralgia. **Misc:** hypersensitivity reactions including ANGIOEDEMA and SERUM SICKNESS, physical dependence, psychological dependence.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and other **sedative/hypnotics**. May induce hepatic enzymes that metabolize other drugs, ↓ their effectiveness, including **hormonal contraceptives**, **warfarin**, **chloramphenicol**, **cyclosporine**, **dacarbazine**, **corticosteroids**, **tricyclic antidepressants**, **felodipine**, **clonazepam**, **carbamazepine**, **verapamil**, **theophylline**, **metronidazole**, and **quinidine**. May ↑ risk of hepatic toxicity of **acetaminophen**. **MAO inhibitors**, **valproic acid**, or **divalproex** may ↓ metabolism of phenobarbital, ↑ sedation. **Rifampin** may ↑ metabolism of and ↓ effects of phenobarbital. May ↑ risk of hematologic toxicity with **cyclophosphamide**.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression. **St. John's wort** may ↓ effects.

Route/Dosage

Status Epilepticus

IV (Adults and Children >1 mo): 15–18 mg/kg in a single or divided dose, maximum loading dose 20 mg/kg.
IV (Neonates): 15–20 mg/kg in a single or divided dose.

Maintenance Anticonvulsant

IV, PO (Adults and Children >12 yr): 1–3 mg/kg/day as a single dose or 2 divided doses.
IV, PO (Children 5–12 yr): 4–6 mg/kg/day in 1–2 divided doses.
IV, PO (Children 1–5 yr): 6–8 mg/kg/day in 1–2 divided doses.
IV, PO (Infants): 5–6 mg/kg/day in 1–2 divided doses.
IV, PO (Neonates): 3–4 mg/kg/day once daily, may need to increase up to 5 mg/kg/day by 2nd wk of therapy.

Sedation

PO, IM (Adults): 30–120 mg/day in 2–3 divided doses. *Preoperative sedation*—100–200 mg IM 1–1.5 hr before the procedure.
PO (Children): 2 mg/kg 3 times daily. *Preoperative sedation*—1–3 mg/kg PO/IM/IV 1–1.5 hr before the procedure.

Hypnotic

PO, Subcut, IV, IM (Adults): 100–320 mg at bedtime.
IV, IM, Subcut (Children): 3–5 mg/kg at bedtime.

Hyperbilirubinemia

PO (Adults): 90–180 mg/day in 2–3 divided doses.
PO (Children <12 yr): 3–8 mg/kg/day in 2–3 divided doses, doses up to 12 mg/kg/day have been used.

Availability (generic available)

Tablets: 15 mg, 30 mg, 60 mg, 100 mg. **Elixir:** 20 mg/5 mL. **Injection:** 65 mg/mL, 130 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor respiratory status, pulse, and BP, and signs and symptoms of angioedema (swelling of lips, face, throat, dyspnea) frequently in patients receiving phenobarbital IV. Equipment for resuscitation and artificial ventilation should be readily available. Respiratory depression is dose-dependent.
- Prolonged therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient, especially if depressed, suicidal, or with a history of addiction.
- Geri: Elderly patients may react to phenobarbital with marked excitement, depression, and confusion. Monitor for these adverse reactions.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Sedation:** Assess level of consciousness and anxiety when used as a preoperative sedative.
- Assess postoperative patients for pain with a pain scale. Phenobarbital may increase sensitivity to painful stimuli.
- ***Lab Test Considerations:*** Patients on prolonged therapy should have hepatic and renal function and CBC evaluated periodically.
- Monitor serum folate concentrations periodically during therapy because of increased folate requirements of patients on long-term anticonvulsant therapy with phenobarbital.
- May cause ↓ serum bilirubin concentrations in neonates, in patients with congenital nonhemolytic unconjugated hyperbilirubinemia, and in epileptics.
- ***Toxicity and Overdose:*** Serum phenobarbital levels may be monitored when used as an anticonvulsant. Therapeutic blood levels are 10–40 mcg/mL. Symptoms of toxicity include confusion, drowsiness, dyspnea, slurred speech, and staggering.

Implementation

- Do not confuse phenobarbital with pentobarbital.
- Supervise ambulation and transfer of patients following administration. Two side rails should be raised and call bell within reach at all times. Keep bed in low position. Institute seizure and fall precautions.

© F.A. Davis Publishing

- When changing from phenobarbital to another anticonvulsant, gradually decrease phenobarbital dose while concurrently increasing dose of replacement medication to maintain anticonvulsant effects.
- **PO:** Tablets may be crushed and mixed with food or fluids (do not administer dry) for patients with difficulty swallowing. Oral solution may be taken undiluted or mixed with water, milk, or fruit juice. Use calibrated measuring device for accurate measurement of liquid doses.
- **IM:** Injections should be given deep into the gluteal muscle to minimize tissue irritation. Do not inject >5 mL into any one site, because of tissue irritation.

IV Administration

- **IV:** Doses may require 15–30 min to reach peak concentrations in the brain. Administer minimal dose and wait for effectiveness before administering 2nd dose to prevent cumulative barbiturate-induced depression.
- **IV Push:** ***Dilution:*** Reconstitute sterile powder for IV dose with a minimum of 3 mL of sterile water for injection. Dilute further with 10 mL of sterile water. Do not use solution that is not absolutely clear within 5 min after reconstitution or that contains a precipitate. Discard powder or solution that has been exposed to air for longer than 30 min.
- Solution is highly alkaline; avoid extravasation, which may cause tissue damage and necrosis. If extravasation occurs, injection of 5% procaine solution into affected area and application of moist heat may be ordered.
- ***Concentration:*** 130 mg/mL (undiluted). ***Rate:*** Do not inject IV faster than 1 mg/kg/min with a maximum of 30 mg over 1 min in infants and children and 60 mg over 1 min in adults. Titrate slowly for desired response. Rapid administration may result in respiratory depression.
- **Y-Site Compatibility:** acyclovir, alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, butorphanol, calcium chloride, calcium gluconate, carboplatin, cefazolin, ceftazidime, ceftriaxone, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, docetaxel, dopamine, doxacurium, doxapram, enalaprilat, ephedrine, epoetin alfa, eptifibatide, ertapenem, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, ifosfamide, indomethacin, insulin, irinotecan, ketorolac, labetalol, linezolid, lorazepam, magnesium sulfate, mannitol, meropenem, metaraminol, methadone, methotrexate, methoxamine, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, morphine, multivitamins, nafcillin, naloxone, nitroglycerin, nitroprusside, octreotide, oxacillin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, propofol, propranolol, rocuronium, sodium acetate, sodium bicarbonate, sufentanil, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, vecuronium, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, amphotericin B cholesteryl, ampicillin, atracurium, buprenorphine, carmustine, caspofungin, cefotaxime, cefotetan, cefoxitin, cefuroxime, chlorpromazine, cyclophosphamide, dantrolene, diazepam, diazoxide, diltiazem, diphenhydramine, dobutamine, doxorubicin, doxycycline, epinephrine, erythromycin, esmolol, haloperidol, hydroxyzine, idarubicin, isoproterenol, lidocaine, meperidine, methyldopate, midazolam, mycophenolate, nalbuphine, norepinephrine, ondansetron, papaverine, penicillin G, pentamidine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxime, quinupristin/dalfopristin, succinylcholine, thiamine, trimethoprim/sulfamethoxazole, verapamil, vinorelbine.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered if not almost time for next dose; do not double doses.
- Advise patients on prolonged therapy not to discontinue medication without consulting health care professional. Abrupt withdrawal may precipitate seizures or status epilepticus.
- Medication may cause daytime drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to notify health care professional if signs and symptoms of angioedema, fever, sore throat, mouth sores, unusual bleeding or bruising, nosebleeds, or petechiae occur.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoid nicotine and caffeine).
- Advise female patients using oral contraceptives to use an additional nonhormonal contraceptive during therapy and until next menstrual period. Instruct patient to contact health care professional immediately if pregnancy is planned or suspected.
- Pedi: Advise parents or caregivers that child may experience irritability, hyperactivity, and/or sleep dis-

© F.A. Davis Publishing

turbances, which may diminish in a few days to a few wk or may persist until drug is stopped. An alternative medication can be considered. Instruct parents to monitor for skin rash occurring 7–20 days after treatment begins and to contact a health care provider if rash occurs. Teach family about symptoms of toxicity (staggering, drowsiness, slurred speech).

Evaluation/Desired Outcomes

- Decrease or cessation of seizure activity without excessive sedation. Several wk may be required to achieve maximum anticonvulsant effects.
- Preoperative sedation.
- Improvement in sleep patterns.
- Decrease in serum bilirubin levels.

REMS

phentermine/topiramate

(**fen**-ter-meen/toe-**pyre**-a-mate)

Qsymia

Classification

Therapeutic: weight control agents

Pharmacologic: appetite suppressants

Schedule IV

Indications

Weight management as part of a program including caloric restriction and increased exercise in patients with an initial body mass index (BMI) of ≥30 kg/m² or a BMI of ≥27 kg/m² with at least one other risk factor (hypertension, type 2 diabetes mellitus, or dyslipidemia).

Action

Phentermine—↓ appetite and food consumption; *Topiramate*—↓ appetite and enhances satiety. **Therapeutic Effects:** Weight loss.

Pharmacokinetics

Absorption: *Phentermine*—Unknown; *Topiramate*—80% absorbed following oral administration.

Distribution: *Phentermine*—Unknown; *Topiramate*—Unknown.

Metabolism and Excretion: *Phentermine*—metabolized by the liver; *Topiramate*—70% excreted unchanged in urine.

Half-life: *Phentermine*—19–24 hr; *Topiramate*—21 hr.

TIME/ACTION PROFILE (phentermine—appetite suppression, topiramate—blood levels)

ROUTE	ONSET	PEAK	DURATION
PO (weight loss)	within 8 wk	16–32 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity/idiosyncracy to sympathomimetics; Glaucoma; Hyperthyroidism; During/within 14 days of MAO inhibitors; Severe renal impairment (CCr <30 mL/min); Severe hepatic impairment; History of suicidal thought/active suicidal ideation; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Diabetes (weight loss may ↑ risk of hypoglycemia); History of substance abuse; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of adverse effects in older adults (consider age-related ↓ in cardiac, renal, and hepatic function, concurrent chronic disease states and medications).

Adverse Reactions/Side Effects

CV: tachycardia, hypotension, palpitations. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, alopecia, oligohydrosis (↓ sweating). **EENT:** acute myopia, blurred vision, eye pain, secondary angle closure glaucoma. **Endo:** hypoglycemia. **F and E:** metabolic acidosis, hypokalemia. **GI:** HEPATOTOXICITY, altered taste, constipation, dry mouth. **GU:** ↑ serum creatinine, kidney stones. **Neuro:** paresthesia, SEIZURES (FOLLOWING ABRUPT DISCONTINUATION), headache, insomnia, cognitive impairment, dizziness, mood disorders, suicidal ideation. **Misc:** hyperthermia.

Interactions

Drug-Drug: ↑ risk of hypokalemia with **non-potassium sparing diuretics**. ↑ risk of CNS depression with **other CNS depressants** including **alcohol**, some **antihistamines**, **sedative/hypnotics**, **antipsychotics**, and **opioid analgesics**; avoid concurrent use of alcohol. Altered exposure to **oral contraceptives** may ↑ risk of irregular bleeding. Blood levels of topiramate may be ↓ by **carbamazepine** or **phenytoin**. Concurrent use of topiramate with **valproic acid** may ↑ risk of hyperammonemia. Concurrent use of topiramate with **carbonic anhydrase inhibitors** may ↑ risk of metabolic acidosis and kidney stones. ↑ risk of hypotension with **antihypertensive** and **diuretics**. May ↓ **pioglitazone** levels.

Route/Dosage

PO (Adults): *Initial dose*—one phentermine 3.75 mg/topiramate 23 mg capsule once daily for 14 days, then ↑ to one phentermine 7.5 mg/topiramate 46 mg capsule once daily for 12 wk, then assess weight loss. If weight loss has not exceeded 3% of baseline, discontinue or ↑ dose to one phentermine 11.25 mg/topiramate 69 mg capsule once daily for 14 days, then one phentermine 15 mg/topiramate 92 mg capsule once daily for 12 wk, if weight loss has not exceeded 5% of baseline, discontinue as success is unlikely. Discontinu-

© F.A. Davis Publishing

ation should proceed by taking the phentermine 15 mg/topiramate 92 mg capsule every other day for 1 wk.

Renal Impairment

PO (Adults): *CCr ≥30 mL/min– <50 mL/min*— daily dose should not exceed one phentermine 7.5 mg/topiramate 46 mg capsule once daily.

Hepatic Impairment

PO (Adults): *Child-Pugh score 7–9*— daily dose should not exceed one phentermine 7.5 mg/topiramate 46 mg capsule once daily.

Availability

Capsules (contain tartrazine): phentermine 3.75 mg (immediate-release)/topiramate 23 mg (extended-release) (for titration only), phentermine 7.5 mg (immediate-release)/topiramate 46 mg (extended-release), phentermine 11.25 mg (immediate-release)/topiramate 69 mg (extended-release) (for titration only), phentermine 15 mg (immediate-release)/topiramate 92 mg (extended-release). **Cost:** 3.75 mg/23 mg $163.24/30, 7.5 mg/46 mg $184.49/30, 11.25 mg/69 mg $221.38/30, 15 mg/92 mg $239.40/30.

NURSING IMPLICATIONS

Assessment

- Monitor patients for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed. Evaluate weight loss after each 12 wk of therapy.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression. Discontinue phentermine/topiramate if these occur.
- Monitor BP and heart rate periodically during therapy; may cause increase in resting heart rate. May cause hypotension in patients treated with antihypertensives.
- ***Lab Test Considerations:*** Verify negative pregnancy test prior to starting therapy and monthly during therapy.
- May cause hypoglycemia; monitor blood glucose closely in diabetic patients.
- May cause metabolic acidosis; monitor serum bicarbonate, prior to starting and periodically during therapy.
- May cause ↑ serum creatinine; peak increases observed after 4–8 wk of therapy. Monitor serum creatinine prior to and periodically during therapy; if persistent elevations occur, decrease dose or discontinue therapy.
- May cause hypokalemia; monitor serum potassium periodically during therapy.

Implementation

- ***REMS:*** Qsymia is only available through certified pharmacies that are enrolled in the Qsymia certified pharmacy network. Information can be obtained at www.QsymiaREMS.com or by calling 1-888-998-4887.
- **PO:** Administer once daily in the morning without regard to food. Avoid dosing in the evening; may cause insomnia.

Patient/Family Teaching

- Instruct patient to take phentermine/topiramate as directed. Do not stop taking without consulting health care professional. Discontinue gradually taking 1 dose every other day for at least 1 wk before stopping to prevent seizures. ***REMS:*** Explain Qsymia REMS requirements to patient.
- Advise patient to notify health care professional if sustained periods of heart pounding or racing while at rest; severe and persistent eye pain or significant changes in vision; changes in attention, concentration, memory, and/or difficulty finding words; factors that can increase risk of acidosis (prolonged diarrhea, surgery, high-protein/low-carbohydrate diet, and/or concomitant medications).
- Inform patients and families of risk of suicidal thoughts and behavior (behavioral changes, emerging or worsening signs and symptoms of depression, unusual changes in mood, or emergence of suicidal thoughts, behavior, or thoughts of self-harm). Advise that these should be reported to health care professional immediately.
- May cause changes in mental performance, motor performance, and/or vision. Caution patients to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to increase fluid intake to increase urinary output and decrease risk of kidney stones.
- Advise patient to monitor for decreased sweating and increased body temperature during physical activity, especially in hot weather.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Advise patient to avoid taking other CNS depressants, opioids, or alcohol.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and avoid breast feeding during therapy. Advise female patients to notify health care professional if pregnancy is planned or suspected. For patients taking combined oral contraceptives, may cause irregular bleeding and spotting; advise patient to continue oral contraceptive and notify health care professional if spotting is concerning.

Evaluation/Desired Outcomes

- Decrease in weight and BMI. If 3% of baseline body weight is not lost by Week 12, increase dose or discontinue phentermine/topiramate. Evaluate after second 12 wk of therapy. If 5% of baseline body weight is not lost by second 12 wk of therapy, as it is unlikely patient will achieve and sustain clinically meaningful weight loss with continued treatment.

© F.A. Davis Publishing

HIGH ALERT

phenylephrine (fen-il-**eff**-rin)

Biorphen, Neo-Synephrine, Vazculep

Classification

Therapeutic: vasopressors
Pharmacologic: adrenergics, alpha adrenergic agonists, vasopressors

For ophthalmic use see Appendix B

Indications

Management of hypotension associated with shock that may persist after adequate fluid replacement. Management of hypotension associated with anesthesia. **Anesthesia adjunct**. Prolongation of the duration of spinal anesthesia. Localization of the effect of regional anesthesia.

Action

Constricts blood vessels by stimulating alpha-adrenergic receptors. **Therapeutic Effects:** Increased BP.

Pharmacokinetics

Absorption: Well absorbed from IM sites. IV administration results in complete bioavailability.
Distribution: Highly distributed into organs and tissues.
Metabolism and Excretion: Metabolized by the liver into inactive metabolites.
Half-life: 2.5 hr.

TIME/ACTION PROFILE (vasopressor effects)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	15–20 min
IM	10–15 min	unknown	0.5–2 hr
Subcut	10–15 min	unknown	50–60 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity to bisulfites.
Use Cautiously in: HF, coronary artery disease, or peripheral arterial disease; OB: Has been used safely during Cesarean section procedure; safety of use during first or second trimester not established; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Neuro: blurred vision, headache, insomnia, nervousness, tremor. **Resp:** dyspnea. **CV:** ARRHYTHMIAS, bradycardia, chest pain, hypertension, ischemia, tachycardia. **Derm:** pruritus. **GI:** epigastric pain, nausea, vomiting. **Local:** phlebitis, sloughing at IV sites.

Interactions

Drug-Drug: Use with **general anesthetics** may result in myocardial irritability; use with extreme caution. Use with **MAO inhibitors**, **ergot alkaloids (methylergonovine)**, **oxytocics**, **tricyclic antidepressants**, **atropine**, **corticosteroids**, or **atomoxetine** results in severe hypertension. **Alpha-adrenergic blockers**, **phosphodiesterase-5 inhibitors**, **calcium channel blockers**, **benzodiazepines**, **ACE inhibitors**, or **guanfacine** may antagonize vasopressor effects.

Route/Dosage

Hypotension

Subcut, IM (Adults): 2–5 mg.
Subcut, IM (Children): 0.1 mg/kg/dose every 1–2 hr as needed, maximum dose 5 mg.
IV (Adults): 0.2 mg (range 0.1–0.5 mg), may be repeated every 10–15 min *or* as an infusion at 100–180 mcg/min initially, 40–60 mcg/min maintenance.
IV (Children): 5–20 mcg/kg/dose every 10–15 min as needed or 0.1–0.5 mcg/kg/min infusion, titrate to effect.

Hypotension During Anesthesia

Subcut, IM (Adults): 2–3 mg has been used 3–4 min before spinal anesthesia to prevent hypotension.
IM, Subcut (Children): —0.5–1 mg/25 lb body weight.
IV (Adults): 40–100 mcg; may repeat every 1–2 min as needed (not to exceed total dose of 200 mcg); if BP remains low, initiate continuous infusion at 10–35 mcg/min (not to exceed 200 mcg/min).

Vasoconstrictor for Regional Anesthesia

Local (Adults): Add 1 mg to every 20 mL of local anesthetic (yields a 1:20,000 solution).

Prolongation of Spinal Anesthesia

Spinal (Adults): 2–5 mg added to anesthetic solution.

Availability (generic available)

Solution for injection: 0.1 mg/mL, 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP every 2–3 min until stabilized and every 5 min thereafter during IV administration.
- Monitor ECG continuously for arrhythmias during IV administration.
- Assess IV site frequently throughout infusion. Antecubital or other large vein should be used to minimize risk of extravasation, which may cause tissue necrosis.

Implementation

- ***High Alert:*** Patient harm and fatalities have occurred from medication errors with phenylephrine. Prior to administration, have second practitioner independently check original order, dose calculations, concentration, route of administration, and infusion pump settings.

P

© F.A. Davis Publishing

IV Administration

- **IV:** Blood volume depletion should be corrected, if possible, before initiation of IV phenylephrine.
- **IV Push:** ***Dilution:*** Dilute each 1 mg with 9 mL of sterile water for injection or D5W.
- For *Biorphen*, the **0.1 mg/mL** solution must NOT be diluted prior to administration.
- For *Biorphen* **10 mg/mL** solution, ***Dilution:*** dilute 1 mL (10 mg) with 99 mL of D5W or 0.9% NaCl before bolus or continuous infusion. ***Concentration:*** 100 mcg/mL. Solution is stable for 4 hr at room temperature or 24 hr if refrigerated. ***Rate:*** Administer each single dose over 1 min.
- **Continuous Infusion:** ***Dilution:*** Dilute 10 mg in 250 or 500 mL of D5W or 0.9% NaCl. For *Biorphen*, dilute 10 mg in 500 mL of D5W or 0.9% NaCl. ***Concentration:*** 20 or 40 mcg/mL. ***Rate:*** Titrate rate according to patient response. Infuse via infusion pump to ensure accurate dose rate.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftazidime/avibactam, ceftozolane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, eravacycline, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin/relebactam, imipenem/cilastatin, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem/vaborbactam, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, penicillin G, pentobarbital, phenobarbital, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amphotericin B deoxycholate, amphotericin B lipid complex, azathioprine, dantrolene, diazepam, ganciclovir, indomethacin, insulin, regular, minocycline, mitomycin, pentamidine, phenytoin, thiopental, trimethoprim/sulfamethoxazole.
- **Anesthesia:** Phenylephrine 2–5 mg may be added to spinal anesthetic solution to prolong anesthesia.
- Phenylephrine 1 mg may be added to each 20 mL of local anesthetic to produce vasoconstriction.

Patient/Family Teaching

- Explain purpose of phenylephrine to patient.
- **IV:** Instruct patient to report headache, dizziness, dyspnea, or pain at IV infusion site promptly.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Increase in BP to normal range.
- Prolonged duration of spinal anesthesia.
- Localization of regional anesthesia.

phenytoin (fen-i-toyn)

Dilantin, Phenytek, Tremytoine

Classification

Therapeutic: antiarrhythmics (group IB), anticonvulsants
Pharmacologic: hydantoins

Indications

Treatment/prevention of tonic-clonic (grand mal) seizures and complex partial seizures. **Unlabeled Use:** As an antiarrhythmic, particularly for ventricular arrhythmias associated with digoxin toxicity, prolonged QT interval, and surgical repair of congenital heart diseases in children. Management of neuropathic pain, including trigeminal neuralgia.

Action

Limits seizure propagation by altering ion transport. May also decrease synaptic transmission. Antiarrhythmic properties as a result of shortening the action potential and decreasing automaticity. **Therapeutic Effects:** Diminished seizure activity. Termination of ventricular arrhythmias.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Absorbed slowly from the GI tract. Bioavailability differs among products; the Dilantin and Phenytek preparations are considered to be "extended" products. Other products are considered to be prompt release.

Distribution: Distributes into CSF and other body tissues and fluids. Enters breast milk; crosses the placenta, achieving similar maternal/fetal levels. Preferentially distributes into fatty tissue.

Protein Binding: Adults 90–95%; ↓ protein binding in neonates (up to 20% free fraction available), infants (up to 15% free), and patients with hyperbilirubinemia, hypoalbuminemia, severe renal dysfunction or uremia.

Metabolism and Excretion: Mostly metabolized by the liver via the CYP2C9 isoenzyme, and to a lesser extent by the CYP2C19 isoenzyme; ⚷ the CYP2C9 isoenzyme exhibits genetic polymorphism (intermediate or poor metabolizers may have significantly ↑ phenytoin concentrations and an ↑ risk of adverse reactions); minimal amounts excreted in the urine.

Half-life: 22 hr (range 7–42 hr).

TIME/ACTION PROFILE (anticonvulsant effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–24 hr (1 wk)*	1.5–3 hr	6–12 hr
PO-ER	2–24 hr (1 wk)	4–12 hr	12–36 hr
IV	0.5–1 hr (1 wk)	rapid	12–24 hr

*() = time required for onset of action without a loading dose.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to propylene glycol (phenytoin injection only); History of hepatotoxicity related to phenytoin; Alcohol intolerance (phenytoin injection and liquid only); Sinus bradycardia, sinoatrial block, 2nd- or 3rd-degree heart block, or Stokes-Adams syndrome (phenytoin injection only); OB: Pregnancy (may cause fetal harm) (↑ risk of congenital anomalies; ↑ risk of hemorrhage in newborn if used at term).

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Hepatic or renal disease (↑ risk of adverse reactions; dose reduction recommended for hepatic impairment); Severe cardiac or respiratory disease (use of IV phenytoin may result in an ↑ risk of serious adverse reactions); Cardiac disease (↑ risk of cardiac arrest or bradycardia); ⚷ CYP2C9 intermediate or poor metabolizers (↑ risk of phenytoin toxicity); Lactation: Use while breast feeding only if potential maternal benefit justifies potential harm to infant; Pedi: Suspension contains sodium benzoate, a metabolite of benzyl alcohol that can cause potentially fatal gasping syndrome in neonates; Geri: Use of IV phenytoin may result in an ↑ risk of serious adverse reactions in older adults.

Exercise Extreme Caution in: ⚷ Patients positive for HLA-B*1502 allele or carriers of CYP2C9*3 variant (unless benefits clearly outweigh the risks) (↑ risk of serious skin reactions).

Adverse Reactions/Side Effects

Most listed are for chronic use of phenytoin.

CV: CARDIAC ARREST, hypotension (↑ with IV phenytoin), bradycardia, tachycardia. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, hypertrichosis, rash, exfoliative dermatitis, pruritus, purple glove syndrome. **EENT:** diplopia, nystagmus. **GI:** ACUTE HEPATIC FAILURE, gingival hyperplasia, nausea, constipation, drug-induced hepatitis, vomiting. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, megaloblastic anemia, thrombocytopenia. **MS:** osteomalacia, osteoporosis. **Neuro:** SUICIDAL THOUGHTS, ataxia, agitation, confusion, dizziness, drowsiness, dysarthria, dyskinesia, extrapyramidal syndrome, headache, insomnia, vertigo, weakness. **Misc:** ANGIOEDEMA, fever, lymphadenopathy.

Interactions

Drug-Drug: Acute ingestion of **alcohol**, **amiodarone**, **benzodiazepines**, **capecitabine**, **chloramphenicol**, **chlordiazepoxide**, **cimetidine**, **disulfiram**, **estrogens**, **ethosuximide**, **felbamate**, **fluconazole**, **fluorouracil**, **fluoxetine**, **fluvastatin**, **fluvoxamine**, **halothane**, **isoniazid**, **itraconazole**, **ketoconazole**, **methylphenidate**, **miconazole**, **oxcarbazepine**, **omeprazole**, **phenothiazines**, **salicylates**, **sertraline**, **sulfonamides**, **trazodone**, **voriconazole**, and **warfarin** may ↑ levels. Chronic ingestion of **alcohol**, **barbiturates**, **carbamazepine**, **diazepam**, **diazoxide**, **fosamprenavir**, **nelfinavir**, **rifampin**, **ritonavir**, **sucralfate**, **theophylline**, and **vigabatrin** may ↓ levels. May ↓ the effects of **albendazole**, **amiodarone**, **atorvastatin**, **benzodiazepines**, **carbamazepine**, **clozapine**, **cyclosporine**, **digoxin**, **efavirenz**, **estrogens**, **felbamate**, **fluvastatin**, **indinavir**, **lamotrigine**, **lopinavir/ritonavir**, **methadone**, **mexiletine**, **nelfinavir**, **nifedipine**, **nimodipine**, **nisoldipine**, **oxcarbazepine**, **oral contraceptives**, **quetiapine**, **quinidine**, **rifampin**, **ritonavir**, **saquinavir**, **simvastatin**, **tacrolimus**, **theophylline**, **topiramate**, **verapamil**, and **warfarin**. IV phenytoin and **dopamine** may cause additive hypotension. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioids**, and **sedative/hypnotics**. **Antacids** may ↓ absorption of orally administered phe-

P

© F.A. Davis Publishing

nytoin. ↑ systemic clearance of antileukemic drug **methotrexate**, which has been associated with a worse event free survival; phenytoin use is not recommended in children undergoing chemotherapy for acute lymphocytic leukemia.

Drug-Natural Products: St. John's wort may ↓ levels.

Drug-Food: Phenytoin may ↓ absorption of **folic acid**. Concurrent administration of **enteral tube feedings** may ↓ phenytoin absorption. **Folic acid** may ↓ levels.

Route/Dosage

IM administration is not recommended due to erratic absorption and pain on injection. Oral route should be used whenever possible.

Anticonvulsant

PO (Adults): Loading dose of 15–20 mg/kg as extended capsules in 3 divided doses given every 2–4 hr; maintenance dose 5–6 mg/kg/day given in 1–3 divided doses; usual dosing range = 200–1200 mg/day.
PO (Children 10–16 yr): 6–7 mg/kg/day in 2–3 divided doses.
PO (Children 7–9 yr): 7–8 mg/kg/day in 2–3 divided doses.
PO (Children 4–6 yr): 7.5–9 mg/kg/day in 2–3 divided doses.
PO (Children 0.5–3 yr): 8–10 mg/kg/day in 2–3 divided doses.
PO (Neonates up to 6 mo): 5–8 mg/kg/day in 2 divided doses, may require every 8 hr dosing.
IV (Adults): *Status epilepticus loading dose*—15–20 mg/kg. Rate not to exceed 25–50 mg/min. *Maintenance dose*—same as PO dosing above.
IV (Children): *Status epilepticus loading dose*—15–20 mg/kg at 1–3 mg/kg/min. *Maintenance dose*—same as PO dosing above.

Antiarrhythmic

IV (Adults): 50–100 mg every 10–15 min until arrhythmia is abolished, or a total of 15 mg/kg has been given, or toxicity occurs.
PO (Adults): Loading dose: 250 mg 4 times daily for 1 day, then 250 mg twice daily for 2 days, then maintenance at 300–400 mg/day in divided doses 1–4 times/day.
IV (Children): 1.25 mg/kg every 5 min, may repeat up to total loading dose of 15 mg/kg. *Maintenance dose*—5–10 mg/kg/day in 2–3 divided doses IV or PO.

Availability (generic available)

Capsules: 30 mg, 100 mg, 200 mg, 300 mg. **Cost:** *Generic*—100 mg $33.90/100, 200 mg $24.00/30, 300 mg $34.94/30. **Chewable tablets:** 50 mg. **Cost:** *Generic*—$52.63/100. **Oral suspension:** 30 mg/5 mL, 125 mg/5 mL. **Cost:** $36.97/237 mL. **Solution for injection:** 50 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess oral hygiene. Vigorous cleaning beginning within 10 days of initiation of phenytoin therapy may help control gingival hyperplasia.
- Assess patient for phenytoin hypersensitivity syndrome (fever, skin rash, lymphadenopathy, angioedema). Rash usually occurs within the first 2 wk of therapy. Hypersensitivity syndrome usually occurs at 3–8 wk but may occur up to 12 wk after initiation of therapy. May lead to renal failure, rhabdomyolysis, or hepatic necrosis; may be fatal.
- Observe patient for development of rash. Discontinue phenytoin at the first sign of skin reactions. Serious adverse reactions such as exfoliative, purpuric, or bullous rashes or the development of lupus erythematosus, Stevens-Johnson syndrome, or toxic epidermal necrolysis preclude further use of phenytoin or fosphenytoin. Stevens-Johnson syndrome and toxic epidermal necrolysis are significantly more common in patients with a particular human leukocyte antigen (HLA) allele, HLA-B*1502 (occurs almost exclusively in patients with Asian ancestry, including Han Chinese, Filipinos, Malaysians, South Asian Indians, and Thais). Avoid using phenytoin or fosphenytoin as alternatives to carbamazepine for patients who test positive. If less serious skin eruptions (measles-like or scarlatiniform) occur, phenytoin may be resumed after complete clearing of the rash. If rash reappears, further use of fosphenytoin or phenytoin should be avoided.
- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling), associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- **Seizures:** Assess location, duration, frequency, and characteristics of seizure activity. EEG may be monitored periodically throughout therapy.
- Monitor BP, ECG, and respiratory function continuously during administration of IV phenytoin and throughout period when peak serum phenytoin levels occur (15–30 min after administration).
- **Arrhythmias:** Monitor ECG continuously during treatment of arrhythmias.
- ***Lab Test Considerations:*** Monitor CBC, serum calcium, albumin, and hepatic function tests prior to and monthly for the first several mo, then periodically during therapy.

© F.A. Davis Publishing

- May cause ↑ serum alkaline phosphatase, GGT, and glucose levels.
- Monitor serum folate concentrations periodically during prolonged therapy.
- ***Toxicity and Overdose:*** Monitor serum phenytoin levels routinely. Therapeutic blood levels are 10–20 mcg/mL (8–15 mcg/mL in neonates) in patients with normal serum albumin and renal function. In patients with altered protein binding (neonates, patients with renal failure, hypoalbuminemia, acute trauma), free phenytoin serum concentrations should be monitored. Therapeutic serum free phenytoin levels are 1–2 mcg/mL.
- Progressive signs and symptoms of phenytoin toxicity include nystagmus, ataxia, confusion, nausea, slurred speech, and dizziness.

Implementation

- Implement seizure precautions.
- When transferring from phenytoin to another anticonvulsant, dosage adjustments are made gradually over several wk.
- When substituting *fosphenytoin* for oral *phenytoin* therapy, the same total daily dose may be given as a single dose. Unlike parenteral phenytoin, fosphenytoin may be given safely by the IM route.
- Administer vitamin K just before delivery to women taking phenytoin during pregnancy to prevent potentially life-threatening bleeding disorder related to decreased levels of vitamin K–dependent clotting factors which may occur in newborns exposed to phenytoin in utero.
- **PO:** Administer with or immediately after meals to minimize GI irritation. Shake liquid preparations well before pouring. Use a calibrated measuring device for accurate dose. Chewable tablets must be crushed or chewed well before swallowing. Capsules may be opened and mixed with food or fluids for patients with difficulty swallowing. To prevent direct contact of alkaline drug with mucosa, have patient swallow a liquid first, follow with mixture of medication, then follow with a full glass of water or milk or with food.
- If patient is receiving enteral tube feedings, 2 hr should elapse between feeding and phenytoin administration. If phenytoin is administered via nasogastric tube, flush tube with 2–4 oz water before and after administration.
- Do not interchange chewable phenytoin tablets with phenytoin sodium capsules, because they are not bioequivalent.
- Capsules labeled "extended" may be used for once-a-day dose; those labeled "prompt" may result in toxic serum levels if used for once-a-day dose.

IV Administration

- **IV:** Slight yellow color will not alter solution potency. If refrigerated, may form precipitate, which dissolves after warming to room temperature. Discard solution that is not clear.
- To prevent precipitation and minimize local venous irritation, follow infusion with 0.9% NaCl through the same needle or catheter. Avoid extravasation; phenytoin is caustic to tissues; may lead to purple glove syndrome. Monitor infusion site closely.
- **IV Push:** Administer undiluted. ***Rate:*** Administer at a rate not to exceed 50 mg over 1 min in adults or 1–3 mg/kg/min in neonates. Rapid administration may result in severe hypotension, cardiovascular collapse, or CNS depression.
- **Intermittent Infusion:** ***Dilution:*** Administer by mixing with no more than 50 mL of 0.9% NaCl. ***Concentration:*** 1–10 mg/mL. Administer immediately following admixture. Use tubing with a 0.45- to 0.22-micron in-line filter. ***Rate:*** Complete infusion within 1 hr at a rate not to exceed 50 mg/min. In patients who may develop hypotension, patients with cardiovascular disease, or geriatric patients maximum rate of 25 mg/min [may be as low as 5–10 mg/min]. Maximum rate in neonates is 1–3 mg/kg/min. Monitor cardiac function and BP throughout infusion.
- **Y-Site Compatibility:** cisplatin.
- **Y-Site Incompatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, dantrolene, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, etoposide, etoposide phosphate, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, fosphenytoin, furosemide, ganciclovir, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, hydroxyzine, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketamine, ketorolac, labet-

© F.A. Davis Publishing

alol, lactated Ringer's , leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem/vaborbactam, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamin infusion, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxacillin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Additive Incompatibility:** Do not admix with other solutions or medications, especially dextrose, because precipitation will occur.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. If a dose is missed from a once-a-day schedule, take as soon as possible and return to regular dosing schedule. If taking several doses a day, take missed dose as soon as possible within 4 hr of next scheduled dose; do not double doses. Consult health care professional if doses are missed for 2 consecutive days. Abrupt withdrawal may lead to status epilepticus. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Caution patient to avoid alcohol and CNS depressants. Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia. Institution of oral hygiene program within 10 days of initiation of phenytoin therapy may minimize growth rate and severity of gingival enlargement. Patients under 23 yr of age and those taking doses >500 mg/day are at increased risk for gingival hyperplasia.
- Advise patient that brands of phenytoin may not be equivalent. Check with health care professional if brand or dose form is changed.
- Advise diabetic patients to monitor blood glucose carefully and to notify health care professional of significant changes.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient not to take phenytoin within 2–3 hr of antacids.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Instruct patients that behavioral changes, skin rash, facial or perioral, swelling, shortness of breath, fever, sore throat, mouth ulcers, easy bruising, petechiae, unusual bleeding, abdominal pain, chills, pale stools, dark urine, jaundice, severe nausea or vomiting, drowsiness, slurred speech, unsteady gait, swollen glands, or persistent headache should be reported to health care professional immediately. Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Rep: May cause fetal harm. Advise female patients to use an additional nonhormonal method of contraception during therapy and until next menstrual period. Instruct patient to notify health care professional if pregnancy is planned or suspected. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry that monitors pregnancy outcomes in women exposed to antiepileptic drugs (AEDs), such as phenytoin, during pregnancy by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org. Enrollment must be done by patients themselves. Monitor serum phenytoin concentrations periodically during pregnancy to determine need for dose adjustments. May cause depletion of vitamin K–dependent clotting factors in newborns. Administer vitamin K to mother before delivery and to neonate after birth to prevent bleeding.
- Emphasize the importance of routine exams to monitor progress. Patient should have routine physical exams, especially monitoring skin and lymph nodes, and EEG testing.

Evaluation/Desired Outcomes

- Decrease or cessation of seizures without excessive sedation.
- Suppression of arrhythmias.
- Relief of neuropathic pain.

© F.A. Davis Publishing

phytonadione

(fye-toe-na-**dye**-one)
Mephyton, vitamin K

Classification
Therapeutic: antidotes, vitamins
Pharmacologic: fat-soluble vitamins

Indications

Prevention and treatment of hypoprothrombinemia, which may be associated with: Excessive doses of oral anticoagulants, Salicylates, Certain anti-infective agents, Nutritional deficiencies, Prolonged total parenteral nutrition. Prevention and treatment of vitamin K-deficiency bleeding in neonates.

Action

Required for hepatic synthesis of blood coagulation factors II (prothrombin), VII, IX, and X. **Therapeutic Effects:** Prevention of bleeding due to hypoprothrombinemia.

Pharmacokinetics

Absorption: Well absorbed following oral or subcut administration. Oral absorption requires presence of bile salts. Some vitamin K is produced by bacteria in the GI tract.
Distribution: Crosses the placenta; does not enter breast milk.
Metabolism and Excretion: Rapidly metabolized by the liver.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK†	DURATION‡
PO	6–12 hr	unknown	unknown
Subcut	1–2 hr	3–6 hr	12–14 hr
IV	1–2 hr	3–6 hr	12 hr

†Control of hemorrhage.
‡Normal PT achieved.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity or intolerance to benzyl alcohol (injection only).
Use Cautiously in: Hepatic impairment; Pedi: Use of injection formulations containing benzyl alcohol may lead to "gasping syndrome" in neonates and infants.
Exercise Extreme Caution in: Severe life-threatening reactions have occurred following IV administration, use other routes unless risk is justified.

Adverse Reactions/Side Effects

GI: gastric upset, unusual taste. **Derm:** eczematous reactions, flushing, kernicterus, rash, scleroderma-like lesions, urticaria. **GI:** hyperbilirubinemia (large doses in very premature infants). **Hemat:** hemolytic anemia. **Local:** erythema, pain at injection site, swelling. **Misc:** HYPERSENSITIVITY REACTIONS.

Interactions

Drug-Drug: Large doses will counteract the effect of **warfarin**. Large doses of **salicylates** or broad-spectrum **anti-infectives** may ↑ vitamin K requirements. **Bile acid sequestrants**, **mineral oil**, and **sucralfate** may ↓ vitamin K absorption from the GI tract.

Route/Dosage

IV use of phytonadione should be reserved for patients with serious or life-threatening bleeding and elevated INR. Oral route is preferred in patients with elevated INRs and no serious or life-threatening bleeding. IM route should generally be avoided because of risk of hematoma formation.

Treatment of Hypoprothrombinemia due to Vitamin K Deficiency (from factors other than warfarin)

Subcut, IV (Adults): 10 mg.
PO (Adults): 2.5–25 mg/day.
Subcut, IV (Children >1 mo): 1–2 mg single dose.
PO (Children >1 mo): 2.5–5 mg/day.

Vitamin K Deficiency (Supratherapeutic INR) Secondary to Warfarin

PO (Adults): *INR ≥5 and <9 (no significant bleeding)* — Hold warfarin and give 1–2.5 mg vitamin K; if more rapid reversal required, give ≤5 mg vitamin K; *INR >9 (no significant bleeding)* — Hold warfarin and give 2.5–5 mg vitamin K.
IV (Adults): *Elevated INR with serious or life-threatening bleeding* — 10 mg slow infusion.

Prevention of Hypoprothrombinemia during Total Parenteral Nutrition

IV (Adults): 5–10 mg once weekly.
IV (Children): 2–5 mg once weekly.

Prevention of Vitamin K-Deficiency Bleeding in Neonates

IM (Neonates): 0.5–1 mg, within 1 hr of birth, may repeat in 6–8 hr if needed. May be repeated in 2–3 wk if mother received previous anticonvulsant/anticoagulant/anti-infective/antitubercular therapy. 1–5 mg may be given IM to mother 12–24 hr before delivery.

Treatment of Vitamin K-Deficiency Bleeding in Neonates

IM, Subcut (Neonates): 1–2 mg/day.

Availability (generic available)

Tablets: 5 mg. **Solution for injection:** 1 mg/0.5 mL, 10 mg/mL.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Monitor for frank and occult bleeding (guaiac stools, Hematest urine, and emesis). Monitor pulse and BP frequently; notify health care professional immediately if symptoms of internal bleeding or hypovolemic shock develop. Inform all personnel of patient's bleeding tendency to prevent further trauma. Apply pressure to all venipuncture sites for at least 5 min; avoid unnecessary IM injections.
- Pedi: Monitor for side effects and adverse reactions. Children may be especially sensitive to the effects and side effects of vitamin K. Neonates, especially premature neonates, may be more sensitive than older children.
- ***Lab Test Considerations:*** Monitor INR prior to and throughout vitamin K therapy to determine response to and need for further therapy.

Implementation

- Do not confuse Mephyton (phytonadione) with methadone.
- The parenteral route is preferred for phytonadione therapy but, because of severe, potentially fatal hypersensitivity reactions, IV vitamin K is not recommended.
- Administration of whole blood or plasma may also be required in severe bleeding because of the delayed onset of this medication.
- Phytonadione is an antidote for warfarin overdose but does not counteract the anticoagulant activity of heparin.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute in 0.9% NaCl, D5W, or D5/0.9% NaCl. ***Rate:*** Administer over 30–60 min. Rate should not exceed 1 mg/min.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, dexamethasone sodium phosphate, digoxin, diphenhydramine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, esmolol, famotidine, fentanyl, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, heparin, hydrocortisone sodium succinate, imipenem/cilastatin, indomethacin, insulin, isoproterenol, ketorolac, labetalol, lidocaine, mannitol, meperidine, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, papaverine, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, potassium chloride, procainamide, prochlorperazine, propranolol, pyridoxine, sodium bicarbonate, succinylcholine, sufentanil, theophylline, thiamine, tobramycin, vancomycin, vasopressin, verapamil, vitamin B complex with C.
- **Y-Site Incompatibility:** dantrolene, diazepam, diazoxide, magnesium sulfate, phenytoin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take phytonadione as directed. Take missed doses as soon as remembered unless almost time for next dose. Notify health care professional of missed doses.
- Cooking does not destroy substantial amounts of vitamin K. Patient should not drastically alter diet while taking vitamin K. See Appendix J for foods high in vitamin K.
- Caution patient to avoid IM injections and activities leading to injury. Use a soft toothbrush, do not floss, and shave with an electric razor until coagulation defect is corrected.
- Advise patient to report any symptoms of unusual bleeding or bruising (bleeding gums; nosebleed; black, tarry stools; hematuria; excessive menstrual flow).
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry identification at all times describing disease process.
- Emphasize the importance of frequent lab tests to monitor coagulation factors.

Evaluation/Desired Outcomes

- Prevention of spontaneous bleeding or cessation of bleeding in patients with hypoprothrombinemia secondary to impaired intestinal absorption or oral anticoagulant, salicylate, or anti-infective therapy.
- Prevention of hemorrhagic disease in the newborn.

pimavanserin (pim-a-**van**-ser-in)

Nuplazid

Classification

Therapeutic: antipsychotics

Indications

Hallucinations and delusions associated with Parkinson's disease psychosis.

Action

Exact mechanism is unknown. May work by acting as an inverse agonist and antagonist primarily at 5-HT_{2A} receptors and less at 5–HT_{2C} receptors. **Therapeutic Effects:** Reduced frequency and/or severity of hallucinations and delusions in patients with Parkinson's disease psychosis.

© F.A. Davis Publishing

Pharmacokinetics
Absorption: Unknown.
Distribution: Extensively distributed to tissues.
Protein Binding: 95%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 and CYP3A5 isoenzymes) to an active metabolite. Primarily excreted in feces.
Half-life: 57 hr (pimavanserin); 200 hr (active metabolite).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; QT interval prolongation; Concurrent use of agents that prolong the QT interval, including sotalol, quinidine, disopyramide, procainamide, amiodarone, thioridazine, chlorpromazine, moxifloxacin, and ziprasidone (↑ risk of serious arrhythmias); History of arrhythmias, including bradycardia; Hypokalemia or hypomagnesemia (↑ risk of serious arrhythmias); Congenital long QT syndrome (↑ risk of serious arrhythmias); Severe renal impairment (CCr <30 mL/min).
Use Cautiously in: OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of mortality in older adults treated for psychosis related to dementia/neurocognitive disorders.

Adverse Reactions/Side Effects
CV: TORSADES DE POINTES, peripheral edema, QT interval prolongation. **GI:** constipation, nausea. **Neuro:** gait disturbance, confusion, hallucinations. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions
Drug-Drug: Concurrent use of **amiodarone**, **sotalol**, **quinidine**, **disopyramide**, **procainamide**, **thioridazine**, **chlorpromazine**, **moxifloxacin**, and **ziprasidone** ↑ the risk of serious ventricular arrhythmias and should be avoided. **Strong CYP3A4 inhibitors**, including **clarithromycin**, **indinavir**, **itraconazole**, and **ketoconazole**, may ↑ levels; ↓ dose of pimavanserin. **Strong CYP3A4 inducers**, including **carbamazepine**, **phenytoin**, and **rifampin** as well as **moderate CYP3A4 inducers**, including **efavirenz**, **modafinil**, **nafcillin**, and **thioridazine** may ↓ levels; avoid concurrent use.
Drug-Natural Products: **St. John's wort** may ↓ levels; avoid concurrent use.

Route/Dosage
PO (Adults): 34 mg once daily. *Concurrent use of strong CYP3A4 inhibitors*— 10 mg once daily.

Availability
Capsules: 34 mg. **Tablets:** 10 mg.

NURSING IMPLICATIONS
Assessment
- Assess mental status (orientation, mood, behavior) before and periodically during therapy.

Implementation
- **PO:** Administer 2 tablets once daily without regard to food.
- Capsules can be taken whole, or opened and entire contents sprinkled over a tablespoon (15 mL) of applesauce, yogurt, pudding, or a liquid nutritional supplement. Consume immediately without chewing; do not store for future use.

Patient/Family Teaching
- Instruct patient to take pimavanserin as directed.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Reduced frequency and/or severity of hallucinations and delusions in patients with Parkinson's disease psychosis.

pimecrolimus
(pi-me-**cro**-li-mus)
Elidel

Classification
Therapeutic: immunosuppressants (topical)

Indications
Short-term and intermittent long-term management of mild to moderate atopic dermatitis unresponsive to or in patients intolerant of conventional treatment.

Action
Inhibits T-cell and mast cell activation by interfering with production of inflammatory cytokines. **Therapeutic Effects:** Decreased severity of atopic dermatitis.

Pharmacokinetics
Absorption: Minimally absorbed through intact skin.
Distribution: Local distribution after topical administration.
Metabolism and Excretion: Systemic metabolism and excretion are negligible with local application.
Half-life: Not applicable.

© F.A. Davis Publishing

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
topical	within 6 days	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Should not be applied to areas of active cutaneous viral infections (↑ risk of dissemination); Concurrent use of occlusive dressings; Netherton's syndrome (↑ absorption of pimecrolimus); Lactation: Discontinue breast feeding.

Use Cautiously in: Possible risk of cancer. Do not use as first-line therapy; Clinical infection at treatment site (infection should be treated/cleared prior to use); Skin papillomas (warts); allow treatment/resolution prior to use; Natural/artificial sunlight (minimize exposure); OB: Use only if maternal benefit outweighs potential risk to fetus; Pedi: Children <2 yr (safety not established); use only if other treatments have failed.

Adverse Reactions/Side Effects

Local: burning. **Misc:** ↑ risk of lymphoma/skin cancer.

Interactions

Drug-Drug: None significant as systemic absorption is negligible.

Route/Dosage

Topical (Adults and Children ≥2 yr): Apply thin film twice daily; rub in gently and completely.

Availability (generic available)

Cream: 1%.

NURSING IMPLICATIONS

Assessment

- Assess skin lesions prior to and periodically during therapy. Discontinue therapy after signs and symptoms of atopic dermatitis have resolved. Resume treatment at the first signs and symptoms of recurrence.

Implementation

- **Topical:** Apply a thin layer to affected area twice daily and rub in gently and completely. May be used on all skin areas including head, neck, and intertriginous areas. Do not use with occlusive dressings.

Patient/Family Teaching

- Instruct patient on correct technique for application. Apply only as directed to external areas. Wash hands following application, unless hands are areas of application. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Caution patient to avoid exposure to natural or artificial sunlight, including tanning beds, while using cream.
- Advise patient that pimecrolimus may cause skin burning. This occurs most commonly during 1st few days of application, is of mild to moderate severity, and improves within 5 days or as atopic dermatitis resolves.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Advise patient to notify health care provider if no improvement is seen following 6 wk of treatment or at any time if condition worsens.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of atopic dermatitis.

pioglitazone (pi-o-**glit**-a-zone)
Actos

Classification
Therapeutic: antidiabetics (oral)
Pharmacologic: thiazolidinediones

Indications

Type 2 diabetes mellitus (with diet and exercise); may be used with metformin, sulfonylureas, or insulin.

Action

Improves sensitivity to insulin by acting as an agonist at receptor sites involved in insulin responsiveness and subsequent glucose production and utilization. Requires insulin for activity. **Therapeutic Effects:** Decreased insulin resistance, resulting in glycemic control without hypoglycemia.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: >99% bound to plasma proteins. Active metabolites are also highly (>99%) bound.

Metabolism and Excretion: Extensively metabolized by the liver (primarily by CYP2C8); at least two metabolites have pharmacologic activity. Minimal renal excretion of unchanged drug.

Half-life: *Pioglitazone*—3–7 hr; *total pioglitazone (pioglitazone plus metabolites)*—16–24 hr.

TIME/ACTION PROFILE (effects on blood glucose)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Type 1 diabetes; Diabetic ketoacidosis; Clinical evidence of active liver disease or ↑ ALT (>2.5 times upper limit of normal); Active bladder cancer; Pedi: Children.

Use Cautiously in: Edema; HF (avoid use in moderate to severe HF); Hepatic impairment; History of bladder cancer; Women (may ↑ distal upper and lower

© F.A. Davis Publishing

limb fractures); Rep: Women of reproductive potential (may restore ovulation and ↑ risk of pregnancy); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding.

Adverse Reactions/Side Effects

CV: HF, edema. **EENT:** macular edema. **GI:** LIVER FAILURE, ↑ liver enzymes. **GU:** BLADDER CANCER. **Hemat:** anemia. **MS:** RHABDOMYOLYSIS, fractures (arm, hand, foot) (females).

Interactions

Drug-Drug: May ↓ efficacy of **hormonal contraceptives**. Strong **CYP2C8 inhibitors**, including **gemfibrozil** may ↑ levels. **Ketoconazole** may ↑ levels. Concurrent use with **insulin** may ↑ risk of fluid retention and worsening HF. **Topiramate** may ↓ levels.
Drug-Natural Products: Glucosamine may worsen blood glucose control. **Chromium** and **coenzyme Q-10** may produce ↑ hypoglycemic effects.

Route/Dosage

PO (Adults): *No HF*—15–30 mg once daily, may be ↑ in increments of 15 mg/day to 45 mg/day if needed; *NYHA class I-II HF*—15 mg once daily; may be ↑ in increments of 15 mg/day to 45 mg/day if needed; *Concurrent use of gemfibrozil*—do not exceed 15 mg once daily.

Availability (generic available)

Tablets: 15 mg, 30 mg, 45 mg. **Cost:** *Generic*—15 mg $25.49/90, 30 mg $22.75/90, 45 mg $38.12/90. ***In combination with:*** metformin (Actoplus Met), glimepiride (Duetact), alogliptin (Oseni); see Appendix N.

NURSING IMPLICATIONS

Assessment

- Observe patient taking concurrent insulin for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- Assess for signs and symptoms of heart failure (edema, dyspnea, rapid weight gain, unusual tiredness) after initiation and with dose increases.
- ***Lab Test Considerations:*** Monitor serum glucose and A_{1c} periodically during therapy to evaluate effectiveness.
- Monitor CBC with differential periodically during therapy. May cause ↓ in hemoglobin and hematocrit, usually during the first 4–12 wk of therapy; then levels stabilize.
- Monitor serum AST, ALT, alkaline phosphatase, and total bilirubin levels before starting therapy and periodically thereafter or if jaundice or symptoms of hepatic dysfunction occur. Pioglitazone should not be started in patients with active liver disease or ALT levels >2.5 times the upper limit of normal. Patients with mild ALT ↑ should have more frequent monitoring. If ALT ↑ to >3 times the upper limit of normal, recheck ALT promptly. Discontinue pioglitazone if ALT remains >3 times normal.
- May cause transient ↑ in CK levels.

Implementation

- Do not confuse Actos (pioglitazone) with Actonel (risedronate).
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered with or without meals.

Patient/Family Teaching

- Instruct patient to take medication as directed. If dose for 1 day is missed, do not double dose the next day. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness, and health care professional should be notified if significant changes occur.
- Advise patient to notify health care professional immediately if signs of hepatic dysfunction (nausea, vomiting, upper right abdominal pain, fatigue, anorexia, dark urine, jaundice), bladder cancer (hematuria, dysuria, urinary urgency), or HF (edema, shortness of breath, rapid weight gain, tiredness) occur.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Rep: Insulin is the preferred method of controlling blood glucose during pregnancy. May cause ovulation in anovulatory women, counsel females of reproductive potential that higher doses of oral contraceptives or a form of contraception other than oral contraceptives may be required. Advise patient to notify health care professional promptly if pregnancy is planned or suspected or if breast feeding.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.

© F.A. Davis Publishing

- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Control of blood glucose levels.

piperacillin/tazobactam

(pi-**per**-a-sill-in/tay-zoe-**bak**-tam)

Zosyn

Classification

Therapeutic: anti-infectives

Pharmacologic: extended spectrum penicillins

Indications

Appendicitis and peritonitis. Skin and skin structure infections. Gynecologic infections. Community-acquired and nosocomial pneumonia.

Action

Piperacillin: Binds to bacterial cell wall membrane, causing cell death. Spectrum is extended compared with other penicillins. **Tazobactam:** Inhibits beta-lactamase, an enzyme that can destroy penicillins.

Therapeutic Effects: Death of susceptible bacteria.

Spectrum: Active against piperacillin-resistant, beta-lactamase–producing: *Bacteroides fragilis*, *E. coli*, *Acinetobacter baumanii*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Staphylococcus aureus*, *Haemophilus influenzae*.

Pharmacokinetics

Absorption: Piperacillin is well absorbed (80%) from IM sites. IV administration results in complete bioavailability.

Distribution: Widely distributed. Enters CSF well only when meninges are inflamed. Crosses the placenta and enters breast milk in low concentrations.

Metabolism and Excretion: Piperacillin (68%) and tazobactam (80%) are mostly excreted unchanged by the kidneys.

Half-life: Adults: 0.7–1.2 hr; Children 6 mo–12 yr: 0.7–0.9 hr; Infants 2–5 mo: 1.4 hr.

TIME/ACTION PROFILE (piperacillin blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to penicillins, beta-lactams, cephalosporins, or tazobactam (cross-sensitivity may occur).

Use Cautiously in: Renal impairment (↑ risk of seizures) (dosage ↓ or increased interval recommended if CCr <40 mL/min); Seizure disorders; Sodium restriction; Critically ill patients (↑ risk of renal failure; use alternative antibiotic, if possible); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <2 mo (safety and effectiveness not established).

Adverse Reactions/Side Effects

Derm: ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash (↑ in patients with cystic fibrosis), urticaria. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, constipation, drug-induced hepatitis, nausea, vomiting. **GU:** interstitial nephritis, renal failure. **Hemat:** bleeding, leukopenia, neutropenia, thrombocytopenia. **Local:** pain, phlebitis at IV site. **Neuro:** SEIZURES (higher doses), confusion, dizziness, headache, insomnia, lethargy. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and serum sickness), fever (↑ in cystic fibrosis patients), superinfection.

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ blood levels. May alter excretion of **lithium**. **Potassium-losing diuretics**, **corticosteroids**, or **amphotericin B** may ↑ risk of hypokalemia. ↑ risk of hepatotoxicity with other **hepatotoxic agents**. May ↓ levels/effects of **aminoglycosides** in patients with renal impairment. May ↑ levels and risk of toxicity from **methotrexate**. ↑ risk of acute kidney injury when concomitantly administered with **vancomycin**. May prolong the neuromuscular blockade associated with **vecuronium**.

Route/Dosage

Contains 2.84 mEq (65 mg) sodium/g of piperacillin; adult doses below expressed as combined piperacillin/tazobactam content.

Appendicitis/Peritonitis

IV (Adults and Children ≥2 mo and >40 kg): 3.375 g every 6 hr.

IV (Children ≥9 mo and ≤40 kg and normal renal function): 112.5 mg (100 mg piperacillin/12.5 mg tazobactam)/kg every 8 hr.

IV (Infants 2–9 mo and ≤40 kg and normal renal function): 90 mg (80 mg piperacillin/10 mg tazobactam)/kg every 8 hr.

Renal Impairment

IV (Adults): *CCr 20–40 mL/min*—2.25 g every 6 hr; *CCr <20 mL/min*—2.25 g every 8 hr; *Hemodialysis*—2.25 g every 12 hr + 0.75 g following hemodialysis on hemodialysis days; *Continuous ambulatory peritoneal dialysis*—2.25 g every 12 hr.

Nosocomial Pneumonia

IV (Adults and Children ≥2 mo and >40 kg): 4.5 g every 6 hr.

IV (Children ≥9 mo and ≤40 kg and normal renal function): 112.5 mg (100 mg piperacillin/12.5 mg tazobactam)/kg every 6 hr.

© F.A. Davis Publishing

IV (Infants 2–9 mo and ≤40 kg and normal renal function): 90 mg (80 mg piperacillin/10 mg tazobactam)/kg every 6 hr.

Renal Impairment

IV (Adults): *CCr 20–40 mL/min*—3.375 g every 6 hr; *CCr <20 mL/min*—2.25 g every 6 hr; *Hemodialysis*—2.25 g every 8 hr + 0.75 g following hemodialysis on hemodialysis days; *Continuous ambulatory peritoneal dialysis*—2.25 g every 8 hr.

Skin and Skin Structure Infections, Gynecologic Infections, and Community-Acquired Pneumonia

IV (Adults): 3.375 g every 6 hr.

Renal Impairment

IV (Adults): *CCr 20–40 mL/min*—2.25 g every 6 hr; *CCr <20 mL/min*—2.25 g every 8 hr; *Hemodialysis*—2.25 g every 12 hr + 0.75 g following hemodialysis on hemodialysis days; *Continuous ambulatory peritoneal dialysis*—2.25 g every 12 hr.

Availability (generic available)

Powder for injection: 2.25 g (2 g piperacillin/0.25 g tazobactam)/vial, 3.375 g (3 g piperacillin/0.375 g tazobactam)/vial, 4.5 g (4 g piperacillin/0.5 g tazobactam)/vial, 40.5 g (36 g piperacillin/4.5 g tazobactam)/vial. **Premixed infusion:** 2.25 g (2 g piperacillin/0.25 g tazobactam) in 50 mL, 3.375 g (3 g piperacillin/0.375 g tazobactam) in 50 mL, 4.5 g (4 g piperacillin/0.5 g tazobactam) in 100 mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins or cephalosporins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. 1st dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of CDAD. May begin up to several wk following cessation of therapy.
- Assess for skin reactions (rash, fever, edema, mucosal erosions or ulcerations, red or inflamed eyes). Monitor patient with mild to moderate rash for progression. If rash becomes severe or systemic symptoms occur, discontinue piperacillin/tazobactam.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling), associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- ***Lab Test Considerations:*** Evaluate renal and hepatic function, CBC, serum potassium, and bleeding times prior to and routinely during therapy.
- May cause positive direct Coombs' test result.
- May cause ↑ BUN, serum creatinine, AST, ALT, serum bilirubin, alkaline phosphatase, and LDH.
- May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.
- May cause prolonged prothrombin and partial thromboplastin time.
- May cause ↓ hemoglobin and hematocrit and thrombocytopenia, eosinophilia, leukopenia, and neutropenia. It also may cause proteinuria; hematuria; pyuria; hyperglycemia; ↓ total protein or albumin; and abnormalities in sodium, potassium, and calcium levels.

Implementation

IV Administration

- If a dose of piperacillin/tazobactam is required that does not equal 2.25 g, 3.375 g, or 4.5 g, premixed infusion should not be used.
- **Intermittent Infusion:** For patients weighing >40 kg: ***Reconstitution:*** Reconstitute 2.25 g, 3.375 g, and 4.5 g single-dose vials with 10 mL, 15 mL, and 20 mL, respectively of 0.9% NaCl, Sterile Water for Injection, or D5W. Swirl until dissolved. ***Concentration:*** 202.5 mg/mL (180 mg/mL of piperacillin and 22.5 mg/mL of tazobactam). ***Dilution:*** Dilute further in 50–150 mL of 0.9% NaCl, D5W, D6/0.9% NaCl, or LR. For patients weighing up to 40 kg: dilute to a concentration of 20 mg/mL to 80 mg/mL. Reconstituted vials stable for 24 hr at room temperature or 48 hr if refrigerated. Infusion stable for 24 hr at room temperature or 7 days if refrigerated. Premixed bags are stable for 24 hr at room temperature of 14 days if refrigerated. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** acetaminophen, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposomal, anidulafungin, argatroban, arsenic trioxide, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, cal-

cium acetate, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefepime, ceftolozane/tazobactam, chloramphenicol, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diphenhydramine, docetaxel, dopamine, enalaprilat, ephedrine, epinephrine, eptifibatide, eravacycline, erythromycin, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, isoproterenol, ketamine, ketorolac, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem/vaborbactam, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxytocin, paclitaxel, palonosetron, pancuronium, pemetrexed, pentobarbital, phenobarbital, phentolamine, phenylephrine, plazomicin, potassium acetate, potassium chloride, potassium phosphate, procainamide, remifentanil, rituximab, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, tedizolid, telavancin, theophylline, thiotepa, tigecycline, tirofiban, trimethoprim/sulfamethoxazole, vasopressin, vinblastine, vincristine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, alemtuzumab, amiodarone, amphotericin B deoxycholate, caspofungin, chlorpromazine, ciprofloxacin, cisplatin, dacarbazine, dantrolene, daunorubicin hydrochloride, diltiazem, dobutamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, epirubicin, famotidine, ganciclovir, gemcitabine, gemtuzumab ozogamicin, glycopyrrolate, haloperidol, hydralazine, hydroxyzine, idarubicin, insulin, regular, irinotecan, labetalol, levofloxacin, methadone, midazolam, minocycline, mitomycin, mitoxantrone, mycophenolate, nalbuphine, nicardipine, pentamidine, phenytoin, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, rocuronium, streptozocin, thiopental, tobramycin, topotecan, tranexamic acid, trastuzumab, vecuronium, verapamil, vinorelbine.

Patient/Family Teaching

- Explain purpose of piperacillin/tazobactam to patient.
- Advise patient to report rash and signs of superinfection (black furry overgrowth on tongue, vaginal itching or discharge, loose or foul-smelling stools) and allergy.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

pitavastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

plecanatide (ple-**kan**-a-tide)

Trulance

Classification

Therapeutic: laxatives

Pharmacologic: guanylate cyclase-C agonists

Indications

Chronic idiopathic constipation (CIC). Irritable bowel syndrome with constipation (IBS-C).

Action

Locally ↑ cyclic guanosine monophosphate (cGMP) concentrations which ↑ intestinal fluid and accelerates transit time. **Therapeutic Effects:** Increased frequency of complete spontaneous bowel movements.

Pharmacokinetics

Absorption: Minimally absorbed, action is primarily local.

Distribution: Stays within the GI tract with minimal distribution.

Metabolism and Excretion: Converted to its principal active metabolite within the GI tract. Plecanatide and active metabolite then degrade in intestinal lumen to smaller peptides and amino acids. Excretion information unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (improvement in CIC symptoms)

ROUTE	ONSET	PEAK	DURATION
PO	1 wk	2–12 wk	2 wk†

†Following discontinuation.

Contraindications/Precautions

Contraindicated in: Known/suspected mechanical GI obstruction; Pedi: Children <6 yr (↑ risk of dehydration) and 6–18 yr (safety and effectiveness not established).

Use Cautiously in: OB: Safety not established in pregnancy; fetal exposure to plecanatide or its active

© F.A. Davis Publishing

metabolite unlikely; Lactation: Excretion of plecanatide or its active metabolites into breast milk negligible.

Adverse Reactions/Side Effects
GI: abdominal distention, diarrhea, flatulence, ↑ liver enzymes.

Interactions
Drug-Drug: None known.

Route/Dosage
PO (Adults): 3 mg once daily.

Availability
Tablets: 3 mg.

NURSING IMPLICATIONS
Assessment
- Monitor bowel function (frequency, consistency) periodically during therapy. If severe diarrhea occurs, withhold plecanatide and rehydrate patient.
- ***Lab Test Considerations:*** May cause ↑ ALT, and AST.

Implementation
- **PO:** Administer once daily without regard to food. Swallow tablet whole. Tablets can be crushed and mixed in applesauce or water and administered orally or with water in a nasogastric or gastric feeding tube. Do not mix with other foods or liquids.

Patient/Family Teaching
- Instruct patient to take plecanatide as directed. If a dose is missed, omit and take next dose at regular time; do not double doses.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Increased frequency of complete spontaneous bowel movements.

polyethylene glycol 3350
(po-lee-**eth**-e-leen **glye**-kole)
Canada ClearLax, Canada Comfilax, Canada Emolax, GlycoLax, Canada Hydralax, Canada Lax-a-Day, MiraLax, Canada PegaLax, Canada Relaxa, Canada RestoraLax

Classification
Therapeutic: laxatives
Pharmacologic: osmotics

Indications
Treatment of occasional constipation.

Action
Polyethylene glycol (PEG) in solution acts as an osmotic agent, drawing water into the lumen of the GI tract. **Therapeutic Effects:** Evacuation of the GI tract without water or electrolyte imbalance.

Pharmacokinetics
Absorption: Nonabsorbable.
Distribution: Unknown.
Metabolism and Excretion: Excreted in fecal contents.
Half-life: Unknown.

TIME/ACTION PROFILE (bowel movement)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 days	unknown

Contraindications/Precautions
Contraindicated in: GI obstruction; Gastric retention; Toxic colitis; Megacolon; Bowel perforation.
Use Cautiously in: Abdominal pain of uncertain cause, particularly if accompanied by fever; OB: Minimal systemic absorption; may be used during pregnancy when osmotic laxative needed; Lactation: Minimal systemic absorption; probably compatible with breast feeding; Pedi: May be associated with metabolic acidosis and neuropsychiatric events in children.

Adverse Reactions/Side Effects
Derm: urticaria. **GI:** abdominal bloating, cramping, flatulence, nausea.

Interactions
Drug-Drug: None significant.

Route/Dosage
PO (Adults): 17 g (heaping tablespoon) in 8 oz of water once daily; may be used for up to 2 wk.
PO (Children >6 mo): 0.2–0.8 g/kg once daily, titrate to effect (max = 17 g/day).

Availability (generic available)
Powder: 14-oz, 24-oz, and 26-oz containers.

NURSING IMPLICATIONS
Assessment
- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Implementation
- Do not confuse Miralax (polyethylene glycol) with Mirapex (pramipexole). Do not confuse polyethylene glycol with propylene glycol.
- **PO:** Dissolve powder in 8 oz of any beverage (hot or cold) prior to administration. Do not mix in starch-

© F.A. Davis Publishing

based thickeners used for patients with difficulty swallowing.

Patient/Family Teaching

- Inform patient that 2–4 days may be required to produce a bowel movement; best results require 1–2 wk of use. PEG should not be used for more than 2 wk. Prolonged, frequent, or excessive use may result in electrolyte imbalance and laxative dependence.
- Advise patient to notify health care professional if nausea, vomiting or abdominal pain, unusual cramps, bloating, diarrhea or a sudden change in bowel habits for >2 wk occurs. Advise patient to discontinue use and consult health care professional if severe diarrhea, rectal bleeding, abdominal pain, bloating, cramping, or nausea gets worse, or if they need to use for >1 wk.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- A soft, formed bowel movement.

posaconazole (po-sa-kon-a-zole)

Noxafil, Noxafil Powdermix, Posanol

Classification

Therapeutic: antifungals
Pharmacologic: triazoles

Indications

PO, IV: Treatment of invasive aspergillosis (tablets and injection). **PO, IV:** Prevention of invasive *Aspergillus* and *Candida* infections in patients who are severely immunocompromised, such as hematopoietic stem cell transplant (HSCT) recipients with graft-versus-host disease (GVHD) or those with hematologic malignancies with prolonged neutropenia from chemotherapy (tablets, oral suspension, delayed-release oral suspension, and injection). **PO:** Treatment of oropharyngeal candidiasis (including candidiasis unresponsive to itraconazole or fluconazole) (oral suspension).

Action

Blocks ergosterol synthesis, a major component of fungal plasma membrane. **Therapeutic Effects:** Fungistatic/fungicidal action against susceptible fungi. **Spectrum:** *Aspergillus* spp. *Candida* spp.

Pharmacokinetics

Absorption: Well absorbed following oral administration; absorption is optimized by food; IV administration results in complete bioavailability.
Distribution: Extensive extravascular distribution and penetration into body tissues.
Protein Binding: >98%.
Metabolism and Excretion: Some metabolism via UDP glucuronidation; 66% eliminated unchanged in feces, 13% in urine (mostly as metabolites).
Half-life: 35 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO (suspension)	unknown	3–5 hr	8 hr
PO-ER	unknown	4–5 hr	24 hr
IV	unknown	2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to posaconazole or other azole antifungals; Concurrent use of atorvastatin, ergot alkaloids, lovastatin, pimozide, quinidine, simvastatin, or sirolimus; Hereditary fructose intolerance (for delayed-release oral suspension only).
Use Cautiously in: History of/predisposition to QTc prolongation including congenital QTc prolongation, concurrent medications that prolong QTc, or electrolyte abnormalities (hypokalemia, hypomagnesemia); correct pre-existing abnormalities prior to administration; Moderate-severe renal impairment (CCr <50 mL/min); use only if justified by risk/benefit assessment (IV form should be avoided, use oral form only); Severe diarrhea, vomiting, or renal impairment (monitor for breakthrough fungal infections); OB: May cause fetal harm (based on animal data); use only if potential maternal benefit outweighs potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit outweighs potential risk to infant; Pedi: Children <18 yr (IV) or <13 yr (oral) (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, QT interval prolongation. **Endo:** adrenal insufficiency. **F and E:** hypokalemia, hypomagnesemia, hypocalcemia. **GI:** HEPATOCELLULAR DAMAGE, PANCREATITIS, diarrhea, nausea, vomiting. **Neuro:** headache. **Resp:** cough. **Misc:** HYPERSENSITIVITY REACTIONS, fever.

Interactions

Drug-Drug: May ↑ **cyclosporine**, **sirolimus**, and **tacrolimus** levels and risk of toxicity; use with sirolimus contraindicated; for cyclosporine and tacrolimus, ↓ dose initially and monitor levels frequently. May ↑ **quinidine** and **pimozide** levels and the risk for arrhythmias; concurrent use contraindicated. May ↑ levels and risk of toxicity from **ergot alkaloids**, including **ergotamine** and **dihydroergotamine**; concurrent use contraindicated. May ↑ levels of **simvastatin**, **atorvastatin**, or **lovastatin** and the risk for rhabdomyolysis; concurrent use contraindicated. **Rifabutin**, **phenytoin**, **cimetidine**, and **efavirenz** may ↓ levels and may ↓ effectiveness; avoid concurrent use. **Esomeprazole** and **metoclopramide** may ↓ levels and effectiveness. May ↑ **rifabutin** levels and risk of toxicity; avoid concurrent use. **QT interval prolonging drugs** may ↑ risk for QT interval prolongation and torsades de pointes; avoid concurrent use. May ↑ **digoxin** levels and risk of toxicity; monitor levels frequently. May ↑

© F.A. Davis Publishing

phenytoin, **midazolam**, **ritonavir**, and **atazanavir** levels and risk of toxicity; monitor for excess clinical effect. May ↑ levels of and risk of neurotoxicity, SIADH, and paralytic ileus with concurrent use of **vinca alkaloids**, including **vincristine** and **vinblastine**; consider using an alternative non-azole antifungal. May ↑ levels and risk of adverse cardiovascular reactions to **calcium channel blockers**; consider dosage reduction.

Route/Dosage

The oral suspension is NOT interchangeable with delayed-release tablets or delayed-release oral suspension.

Treatment of Invasive Aspergillosis

May switch between use of IV and delayed-release tablets (another loading dose is not needed when switching between formulations).

PO (Adults and Children ≥13 yr): *Delayed-release tablets*— 300 mg twice daily on Day 1, then 300 mg once daily starting on Day 2 for a total of 6–12 wk.
IV (Adults and Children ≥13 yr): 300 mg twice daily on Day 1, then 300 mg once daily starting on Day 2 for a total of 6–12 wk.

Prophylaxis of Invasive *Aspergillus* and *Candida* Infections

PO (Adults and Children ≥13 yr): *Oral suspension*— 200 mg 3 times daily. Duration of therapy is based on recovery from neutropenia or immunosuppression.
PO (Adults and Children ≥2 yr and >40 kg): *Delayed-release tablets*— 300 mg twice daily on Day 1, then 300 mg once daily starting on Day 2. Duration of therapy is based on recovery from neutropenia or immunosuppression.
PO (Children ≥2 yr and 36–40 kg): *Delayed-release oral suspension*— 240 mg twice daily on Day 1, then 240 mg once daily starting on Day 2. Duration of therapy is based on recovery from neutropenia or immunosuppression.
PO (Children ≥2 yr and 26–<36 kg): *Delayed-release oral suspension*— 210 mg twice daily on Day 1, then 210 mg once daily starting on Day 2. Duration of therapy is based on recovery from neutropenia or immunosuppression.
PO (Children ≥2 yr and 21–<26 kg): *Delayed-release oral suspension*— 180 mg twice daily on Day 1, then 180 mg once daily starting on Day 2. Duration of therapy is based on recovery from neutropenia or immunosuppression.
PO (Children ≥2 yr and 17–<21 kg): *Delayed-release oral suspension*— 150 mg twice daily on Day 1, then 150 mg once daily starting on Day 2. Duration of therapy is based on recovery from neutropenia or immunosuppression.
PO (Children ≥2 yr and 12–<17 kg): *Delayed-release oral suspension*— 120 mg twice daily on Day 1, then 120 mg once daily starting on Day 2. Duration of therapy is based on recovery from neutropenia or immunosuppression.
PO (Children ≥2 yr and 10–<12 kg): *Delayed-release oral suspension*— 90 mg twice daily on Day 1, then 90 mg once daily starting on Day 2. Duration of therapy is based on recovery from neutropenia or immunosuppression.
IV (Adults): 300 mg twice daily on Day 1, then 300 mg once daily starting on Day 2. Duration of therapy is based on recovery from neutropenia or immunosuppression.
IV (Children ≥2 yr): 6 mg/kg (max = 300 mg) twice daily on Day 1, then 6 mg/kg (max = 300 mg) once daily starting on Day 2. Duration of therapy is based on recovery from neutropenia or immunosuppression.

Treatment of Oropharyngeal Candidiasis

PO (Adults and Children ≥13 yr): *Oral suspension*— 100 mg twice daily on Day 1, then 100 mg once daily for the next 13 days. For refractory oropharyngeal candidiasis, give 400 mg twice daily; duration of therapy is based on the severity of the patient's underlying disease and clinical response.

Availability (generic available)

Delayed-release tablets: 100 mg. **Delayed-release oral suspension (berry-flavor) (contains sorbitol):** 300 mg/pkt. **Oral suspension (cherry-flavor):** 40 mg/mL. **Solution for injection:** 18 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of fungal infection. If severe diarrhea or vomiting occurs, monitor closely for breakthrough fungal infection.
- ***Lab Test Considerations:*** Monitor liver function tests prior to and periodically during therapy. May cause ↑ ALT, ↑ AST, ↑ alkaline phosphatase, and ↑ total bilirubin levels; generally reversible on discontinuation. Discontinue posaconazole if clinical signs and symptoms of liver disease develop.
- Monitor electrolyte levels (potassium, magnesium, calcium) before starting and during therapy. Correct as necessary before and during therapy.
- If administered with tacrolimus or cyclosporine, monitor tacrolimus or cyclosporine whole blood trough concentrations frequently during and at discontinuation of posaconazole; adjust tacrolimus or cyclosporine dose accordingly.

Implementation

- Delayed-release tablet and oral suspension are not interchangeable. Tablets are the preferred oral for-

© F.A. Davis Publishing

mulation for prophylaxis because they achieve higher plasma concentrations of drug.
- **PO:** Administer delayed-release tablets with food. ***DNC:*** Swallow tablets whole; do not divide, crush, or chew.
- Shake suspension well before use. Use spoon provided to ensure accurate dose. Administer during or within 20 min of a full meal, liquid nutritional supplement, or an acidic carbonated beverage (ginger ale) to enhance absorption. Rinse spoon for administration with water after each use. Alternative therapy or close monitoring for breakthrough fungal infections should be considered for patients unable to eat a full meal or tolerate a nutritional supplement.
- Mix *Noxafil PowderMix* immediately before use. Remove cap from mixing liquid and push bottle adapter into neck of bottle. Once in place, bottle adapter stays in the bottle. Remove 9 mL of mixing liquid using the provided BLUE syringe. Put cap back on the bottle. Only use mixing liquid in the kit to prepare *Noxafil PowderMix* for delayed-release oral suspension. Using mixing cup provided, combine 9 mL of mixing liquid and entire contents of one packet in the Noxafil PowderMix kit and mix. Final concentration of approximately 30 mg/mL. Shake mixing cup vigorously for 45 sec to mix powder and mixing liquid. Mixture should look cloudy and free of clumps. Use reconstituted suspension within 1 hr; discard unused portion. Administer using GREEN syringe for doses ≤3 mL; use BLUE syringe if dose >3 mL. Not all mixture in cup will be used. Use only the provided notched tip syringes To ensure delivery of the correct dose. Design of notched tip syringe prevents aggregation of the suspension during preparation and administration. *Noxafil PowderMix* is not recommended for patients weighing >40 kg; dose cannot be achieved with this formulation.

IV Administration
- **Intermittent Infusion:** Allow solution to reach room temperature before administering. ***Dilution:*** Dilute in D5W, D5/0.45% NaCl, D5/0.9% NaCl, D5/20 mEq potassium, 0.45% NaCl or 0.9% NaCl. ***Concentration:*** 1–2 mg/mL. Do not dilute with other solutions. Use immediately; stable for 24 hrs if refrigerated. Discard unused solution. Solution is clear, colorless to yellow; do not administer solutions that are discolored or contain particulate matter. Administer through a 0.22 micron polyethersulfone (PES) or polyvinylidene difluoride (PVDF) filter via central venous line, including a central venous catheter or peripherally inserted central catheter (PICC) line. If no central catheter available, may be administered through a peripheral venous catheter by slow intravenous infusion over 30 min only as a single dose in advance of central venous line placement or to bridge the period during which a central venous line is replaced or is in use for other intravenous treatment. ***Rate:*** Infuse slowly over 90 min. Do not give as a bolus.
- **Y-Site Compatibility:** amikacin, caspofungin, ciprofloxacin, daptomycin, dobutamine, famotidine, filgrastim, gentamicin, hydromorphone, levofloxacin, lorazepam, meropenem, micafungin, morphine, norepinephrine, potassium chloride, vancomycin.

Patient/Family Teaching
- Instruct patient to take posaconazole during or immediately (within 20 min) following a full meal or liquid nutritional supplement in order to enhance absorption. Take missed doses as soon as remembered. Instruct patient to read the *Patient Information* before taking posaconazole and with each Rx refill in case of changes.
- Advise patient to notify health care professional if severe diarrhea or vomiting occurs; may decrease posaconazole blood levels and allow breakthrough fungal infections or if signs and symptoms of liver injury (itching, yellow eyes or skin, fatigue, flu-like symptoms) or change in heart rate or rhythm occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes
- Resolution of clinical and laboratory indications of fungal infections. Duration of therapy is based on recovery from infection or neutropenia or immunosuppression.

potassium and sodium phosphates
(po-**tas**-e-um/**soe**-dee-um **foss**-fates)
K-Phos M.F, K-Phos Neutral, K-Phos No. 2, Neutra-Phos, Uro-KP Neutral

Classification
Therapeutic: antiurolithics, mineral and electrolyte replacements/supplements

Indications
Treatment and prevention of phosphate depletion in patients who are unable to ingest adequate dietary phosphate. Adjunct therapy of urinary tract infections with methenamine hippurate or mandelate. Prevention of calcium urinary stones. Phosphate salts of potassium may be used in hypokalemic patients with metabolic acidosis or coexisting phosphorus deficiency.

Action
Phosphate is present in bone and is involved in energy transfer and carbohydrate metabolism. Serves as a buffer for the excretion of hydrogen ions by the kidneys.

© F.A. Davis Publishing

Dibasic potassium phosphate is converted in renal tubule to monobasic salt, resulting in urinary acidification, which is required for methenamine hippurate or mandelate to be active as urinary anti-infectives. Acidification of urine increases solubility of calcium, decreasing calcium stone formation. **Therapeutic Effects:** Replacement of phosphorus in deficiency states. Urinary acidification. Increased efficacy of methenamine. Decreased formation of calcium urinary tract stones.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Vitamin D promotes GI absorption of phosphates.
Distribution: Phosphates enter extracellular fluids and are then actively transported to sites of action.
Metabolism and Excretion: Excreted mainly (>90%) by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (effects on serum phosphate levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hyperkalemia (potassium salts); Hyperphosphatemia; Hypocalcemia; Severe renal impairment; Untreated Addison's disease (potassium salts).
Use Cautiously in: Hyperparathyroidism; Cardiac disease; Hypernatremia (sodium phosphate only); Hypertension (sodium phosphate only); Renal impairment.

Adverse Reactions/Side Effects

Related to hyperphosphatemia, unless otherwise indicated.
CV: ARRHYTHMIAS, CARDIAC ARREST, bradycardia, ECG changes (absent P waves, widening of the QRS complex with biphasic curve, peaked T waves), edema. **GI:** diarrhea, abdominal pain, nausea, vomiting. **F and E:** hyperkalemia, hypernatremia, hyperphosphatemia, hypocalcemia, hypomagnesemia. **MS:** *hypocalcemia, hyperkalemia*—muscle cramps. **Neuro:** flaccid paralysis, heaviness of legs, paresthesias, tremors, confusion, dizziness, headache, weakness.

Interactions

Drug-Drug: Concurrent use of **potassium-sparing, diuretics, ACE inhibitors**, or **angiotensin II receptor blockers** with potassium phosphates may result in hyperkalemia. Concurrent use of **corticosteroids** with sodium phosphate may result in hypernatremia. Concurrent administration of **calcium-, magnesium-**, or **aluminum-containing compounds** ↓ absorption of phosphates by formation of insoluble complexes. **Vitamin D** enhances the absorption of phosphates.
Drug-Food: Oxalates (in spinach and rhubarb) and **phytates** (in bran and whole grains) may ↓ absorption of phosphates by binding them in the GI tract.

Route/Dosage

Phosphorous Supplementation

PO (Adults and Children >4 yr): 250–500 mg (8–16 mmol) phosphorus (1–2 packets) 4 times daily.
PO (Children <4 yr): 250 mg (8 mmol) phosphorus (1 packet) 4 times daily.

Urinary Acidification

PO (Adults): 2 tablets 4 times/day.

Maintenance Phosphorus

PO (Adults): 50–150 mmol/day in divided doses.
PO (Children): 2–3 mmol/kg/day in divided doses.

Availability

Potassium and Sodium Phosphates

Tablets (K-Phos MF): elemental phosphorus 125.6 mg (4 mmol), sodium 67 mg (2.9 mEq), and potassium 44.5 mg (1.1 mEq). **Tablets (K-Phos Neutral):** elemental phosphorus 250 mg (8 mmol), sodium 298 mg (13 mEq), and potassium 45 mg (1.1 mEq). **Tablets (K-Phos No.2):** elemental phosphorus 250 mg (8 mmol), sodium 134 mg (5.8 mEq), and potassium 88 mg (2.3 mEq). **Tablets (Uro-KP Neutral):** elemental phosphorus 258 mg, sodium 262.4 mg (10.8 mEq), and potassium 49.4 mg (1.3 mEq). **Powder for oral solution (Neutra-Phos):** elemental phosphorus 250 mg (8 mmol), sodium 164 mg (7.1 mEq), and potassium 278 mg (7.1 mEq)/packet.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of hypokalemia (weakness, fatigue, arrhythmias, presence of U waves on ECG, polyuria, polydipsia) and hypophosphatemia (anorexia, weakness, decreased reflexes, bone pain, confusion, blood dyscrasias) throughout therapy.
- Monitor intake and output ratios and daily weight. Report significant discrepancies.
- ***Lab Test Considerations:*** Monitor serum phosphate, potassium, sodium, and calcium levels prior to and periodically throughout therapy. Increased phosphate may cause hypocalcemia.
- Monitor renal function studies prior to and periodically throughout therapy.
- Monitor urinary pH in patients receiving potassium and sodium phosphate as a urinary acidifier.

Implementation

- **PO:** Tablets should be dissolved in a full glass of water. Allow mixture to stand for 2–5 min to ensure it

© F.A. Davis Publishing

is fully dissolved. Solutions prepared by pharmacy should not be further diluted.
- Medication should be administered after meals to minimize gastric irritation and laxative effect.
- Do not administer simultaneously with antacids containing aluminum, magnesium, or calcium.

Patient/Family Teaching

- Explain to the patient the purpose of the medication and the need to take as directed. Take missed doses as soon as remembered unless within 1 or 2 hr of the next dose. Explain that the tablets should not be swallowed whole. Tablets should be dissolved in water.
- Instruct patients in low-sodium diet (see Appendix J).
- Advise patient of the importance of maintaining a high fluid intake (drinking at least one 8-oz glass of water each hr) to prevent kidney stones.
- Instruct the patient to promptly report diarrhea, weakness, fatigue, muscle cramps, unexplained weight gain, swelling of lower extremities, shortness of breath, unusual thirst, or tremors.

Evaluation/Desired Outcomes

- Prevention and correction of serum phosphate and potassium deficiencies.
- Maintenance of acid urine.
- Decreased urine calcium, which prevents formation of renal calculi.

HIGH ALERT

POTASSIUM SUPPLEMENTS

(poe-**tass**-ee-um)

potassium acetate

potassium bicarbonate/potassium chloride

potassium bicarbonate/potassium citrate

Effer-K, K-Lyte DS

potassium chloride

Klor-Con, Klor-Con M10, Klor-Con M15, Klor-Con M20, K-Tab, Micro-K, Micro-K 10

potassium gluconate

Classification

Therapeutic: mineral and electrolyte replacements/supplements

Indications

PO, IV: Treatment/prevention of potassium depletion.
IV: Arrhythmias due to digoxin toxicity.

Action

Maintain acid-base balance, isotonicity, and electrophysiologic balance of the cell. Activator in many enzymatic reactions; essential to transmission of nerve impulses; contraction of cardiac, skeletal, and smooth muscle; gastric secretion; renal function; tissue synthesis; and carbohydrate metabolism. **Therapeutic Effects:** Replacement. Prevention of deficiency.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Enters extracellular fluid; then actively transported into cells.
Metabolism and Excretion: Excreted by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (↑ in serum potassium levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	unknown
IV	rapid	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Hyperkalemia; Severe renal impairment; Untreated Addison's disease; Severe tissue trauma; Hyperkalemic familial periodic paralysis; Some products may contain tartrazine (FDC yellow dye #5) or alcohol; avoid using in patients with known hypersensitivity or intolerance; Potassium acetate injection contains aluminum, which may become toxic with prolonged use to high-risk groups (renal impairment, premature neonates).
Use Cautiously in: Cardiac disease; Renal impairment; Diabetes mellitus (liquids may contain sugar); Hypomagnesemia (may make correction of hypokalemia more difficult); GI hypomotility including dysphagia or esophageal compression from left atrial enlargement (tablets, capsules); Patients receiving potassium-sparing drugs.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, ECG changes. **GI:** abdominal pain, diarrhea, flatulence, nausea, vomiting; *tablets, capsules only*, GI ulceration, stenotic lesions. **Local:** irritation at IV site. **Neuro:** paralysis, paresthesia, confusion, restlessness, weakness.

Interactions

Drug-Drug: Use with **potassium-sparing diuretics** or **ACE inhibitors** or **angiotensin II receptor antagonists** may lead to hyperkalemia. **Anticholinergics** may ↑ GI mucosal lesions in patients taking wax-matrix potassium chloride preparations.

Route/Dosage

Expressed as mEq of potassium. Potassium acetate contains 10.2 mEq/g; potassium bicarbonate contains 10 mEq potassium/g; potassium chloride contains 13.4 mEq potassium/g; potassium gluconate contains 4.3 mEq/g.

© F.A. Davis Publishing

Normal Daily Requirements

PO, IV (Adults): 40–80 mEq/day.
PO, IV (Children): 2–3 mEq/kg/day.
PO, IV (Neonates): 2–6 mEq/kg/day.

Prevention of Hypokalemia during Diuretic Therapy

PO (Adults): 20–40 mEq/day in 1–2 divided doses; single dose should not exceed 20 mEq.
PO (Neonates , Infants, and Children): 1–2 mEq/kg/day in 1–2 divided doses.

Treatment of Hypokalemia

PO (Adults): 40–100 mEq/day in divided doses.
PO (Neonates , Infants, and Children): 2–5 mEq/kg/day in divided doses.
IV (Adults): *Serum potassium >2.5 mEq/L*—Up to 20 mEq/day as an infusion (not to exceed 10 mEq/hr) or a concentration of 40 mEq/L via peripheral line (up to 100 mEq/L have been used via central line [unlabeled]). *Serum potassium <2 mEq/L with symptoms*—Up to 40 mEq/day as an infusion (rate should generally not exceed 20 mEq/hr).
IV (Neonates , Infants, and Children): 0.5–1 mEq/kg/dose (maximum 30 mEq/dose) as an infusion to infuse at 0.3–0.5 mEq/kg/hr (maximum infusion rate 1 mEq/kg/hr).

Availability

Potassium Acetate (generic available)

Concentrate for injection (contains aluminum): 2 mEq/mL, 4 mEq/mL.

Potassium Bicarbonate/Potassium Chloride (generic available)

Tablets for effervescent oral solution: 12 mEq, 25 mEq.

Potassium Bicarbonate/Potassium Citrate (generic available)

Tablets for effervescent oral solution: 10 mEq, 20 mEq, 25 mEq, 50 mEq.

Potassium Chloride (generic available)

Extended-release tablets: 8 mEq, 10 mEq, 15 mEq, 20 mEq. **Cost:** *Generic*—8 mEq $53.64/100, 10 mEq $45.97/100, 20 mEq $45.97/100. **Extended-release capsules:** 8 mEq, 10 mEq. **Cost:** *Generic*—8 mEq $70.40/100, 10 mEq $72.62/100. **Oral solution:** 20 mEq/15 mL, 40 mEq/15 mL. **Cost:** *Generic*—20 mEq/15 mL $14.51/473 mL, 40 mEq/15 mL $27.11/473 mL. **Powder/packets for oral solution:** 20-mEq/packet, 25-mEq/packet. **Cost:** 20 mEq $58.21/30 pkts, 25 mEq $69.20/30 pkts. **Concentrate for injection:** 0.1 mEq/mL in 10-mEq ampules and vials, 0.2 mEq/mL in 10- and 20-mEq ampules and vials, 0.3 mEq/mL in 30-mEq ampules and vials, 0.4 mEq/mL in 20- and 40-mEq ampules and vials, 1.5 mEq/mL, 2 mEq/mL, 3 mEq/mL.
Solution for IV infusion: 10 mEq/L in various dextrose and saline solutions in 250-, 500-, and 100-mL containers, 20 mEq/L in dextrose/saline/LRs in 250-, 500-, and 100-mL containers, 30 mEq/L in various dextrose and saline solutions in 250-, 500-, and 100-mL containers, 40 mEq/L in various dextrose and saline solutions in 250-, 500-, and 100-mL containers.

Potassium Gluconate (generic available)

Tablets: 2 mEq, 5 mEq. **Elixir:** 20 mEq/15 mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of hypokalemia (weakness, fatigue, U wave on ECG, arrhythmias, polyuria, polydipsia) and hyperkalemia (see Toxicity and Overdose).
- Monitor pulse, BP, and ECG periodically during IV therapy.
- ***Lab Test Considerations:*** Monitor serum potassium before and periodically during therapy. Monitor renal function, serum bicarbonate, and pH. Determine serum magnesium level if patient has refractory hypokalemia; hypomagnesemia should be corrected to facilitate effectiveness of potassium replacement. Monitor serum chloride because hypochloremia may occur if replacing potassium without concurrent chloride.
- ***Toxicity and Overdose:*** Symptoms of toxicity are those of hyperkalemia (slow, irregular heartbeat; fatigue; muscle weakness; paresthesia; confusion; dyspnea; peaked T waves; depressed ST segments; prolonged QT segments; widened QRS complexes; loss of P waves; and cardiac arrhythmias).
- Treatment includes discontinuation of potassium, administration of sodium bicarbonate to correct acidosis, dextrose and insulin to facilitate passage of potassium into cells, calcium salts to reverse ECG effects (in patients who are not receiving digoxin), sodium polystyrene used as an exchange resin, and/or dialysis for patient with impaired renal function.

Implementation

- ***High Alert:*** Medication errors involving too rapid infusion or bolus IV administration of potassium chloride have resulted in fatalities. See IV administration guidelines below.
- For most purposes, potassium chloride should be used, except for renal tubular acidoses (hyperchloremic acidosis), in which other salts are more appropriate (potassium bicarbonate, potassium citrate, or potassium gluconate).
- If hypokalemia is secondary to diuretic therapy, consideration should be given to decreasing the dose of diuretic, unless there is a history of significant arrhythmias or concurrent digitalis glycoside therapy.

P

© F.A. Davis Publishing

- **PO:** Administer with or after meals to decrease GI irritation.
- Use of tablets and capsules should be reserved for patients who cannot tolerate liquid preparations.
- Dissolve effervescent tablets in 3–8 oz of cold water. Ensure that effervescent tablet is fully dissolved. Powders and solutions should be diluted in 3–8 oz of cold water or juice (do not use tomato juice if patient is on sodium restriction). Instruct patient to drink slowly over 5–10 min.
- Tablets and capsules should be taken with a meal and full glass of water. Do not chew or crush enteric-coated or extended-release tablets or capsules. Micro-K ExtenCaps capsules can be opened and sprinkled on soft food (pudding, applesauce) and swallowed immediately with a glass of cool water or juice.
- **IV:** Assess for extravasation; severe pain and tissue necrosis may occur. ***High Alert:*** Never administer potassium IV push or bolus.

Potassium Acetate

- **Continuous Infusion:** ***High Alert:*** Do not administer undiluted. Each single dose *must* be diluted and thoroughly mixed in 100–1000 mL of dextrose, saline, Ringer's or LR, dextrose/saline, dextrose/Ringer's, or LR combinations. Usually limited to 80 mEq/L via peripheral line (200 mEq/L via central line).
- ***Rate: High Alert:*** Infuse slowly, at a rate up to 10 mEq/hr in adults or 0.5 mEq/kg/hr in children on general care areas. Check hospital policy for maximum infusion rates (maximum rate in monitored setting 40 mEq/hr in adults or 1 mEq/kg/hr in children).
- **Y-Site Compatibility:** ciprofloxacin.

Potassium Chloride

- **Continuous Infusion:** ***High Alert:*** Do not administer concentrations of ≥1.5 mEq/mL undiluted; fatalities have occurred. Concentrated products have black caps on vials or black stripes above constriction on ampules and are labeled with a warning about dilution requirement. Each single dose must be diluted and thoroughly mixed in 100–1000 mL of IV solution. Usually limited to 80 mEq/L via peripheral line (200 mEq/L via central line).
- Concentrations of 0.1 and 0.4 mEq/mL are intended for administration via calibrated infusion device and do not require dilution.
- ***Rate: High Alert:*** Infuse slowly, at a rate up to 10 mEq/hr in adults or 0.5 mEq/kg/hr in children in general care areas. Check hospital policy for maximum infusion rates (maximum rate in monitored setting 40 mEq/hr in adults or 1 mEq/kg/hr in children). Use an infusion pump.
- **Solution Compatibility:** May be diluted in dextrose, saline, Ringer's solution, LR, dextrose/saline, dextrose/Ringer's solution, and dextrose/LR combinations. Commercially available premixed with many of the above IV solutions.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, aztreonam, benztropine, betamethasone, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, conjugated estrogens, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, irinotecan, isoproterenol, ketamine, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, methotrexate, methoxamine, methyldopate, methylergonovine, meticlopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, neostigmine, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, papaverine, pemetrexed, penicillin G, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, procainamide, prochlorperazine, propofol, propranolol, protamine, pyridostigmine, pyridoxime, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, scopolamine, sodium acetate, sodium bicarbonate, succinylcholine, tacrolimus, telavancin, theophylline, thiamine, thiotepa, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, vancomycin, vasopressin, verapamil, vincristine, vinorelbine, voriconazole, warfarin, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B cholesteryl, amphotericin B deoxycholate, azithromycin, dantrolene, diazepam, diazoxide, haloperidol, hydralazine, pentamidine, phenytoin, trimethoprim/sulfamethoxazole.

© F.A. Davis Publishing

Patient/Family Teaching

- Explain to patient purpose of the medication and the need to take as directed, especially when concurrent digoxin or diuretics are taken. Take missed doses as soon as remembered within 2 hr; if not, return to regular dose schedule. Do not double dose.
- Emphasize correct method of administration. GI irritation or ulceration may result from chewing enteric-coated tablets or insufficient dilution of liquid or powder forms.
- Some extended-release tablets are contained in a wax matrix that may be expelled in the stool. This occurrence is not significant.
- Instruct patient to avoid salt substitutes or low-salt milk or food unless approved by health care professional. Patient should be advised to read all labels to prevent excess potassium intake.
- Advise patient regarding sources of dietary potassium (see Appendix J). Encourage compliance with recommended diet.
- Instruct patient to report dark, tarry, or bloody stools; weakness; unusual fatigue; or tingling of extremities. Notify health care professional if nausea, vomiting, diarrhea, or stomach discomfort persists. Dosage may require adjustment.
- Emphasize the importance of regular follow-up exams to monitor serum levels and progress.

Evaluation/Desired Outcomes

- Prevention and correction of serum potassium depletion.
- Cessation of arrhythmias caused by digoxin toxicity.

pramipexole (pra-mi-pex-ole)

Mirapex, Mirapex ER

Classification

Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Indications

Management of Parkinson's disease. Restless leg syndrome (immediate-release only).

Action

Stimulates dopamine receptors in the striatum of the brain. **Therapeutic Effects:** Decreased tremor and rigidity in Parkinson's disease. Decreased leg restlessness.

Pharmacokinetics

Absorption: >90% absorbed following oral administration.

Distribution: Widely distributed.

Metabolism and Excretion: 90% excreted unchanged in urine.

Half-life: 8 hr (↑ in geriatric patients and patients with renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	8 hr
PO-ER	unknown	6 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Major psychotic disorder; Impulsive control/compulsive behaviors.

Use Cautiously in: Renal impairment (↑ dosing interval recommended if CCr <60 mL/min [immediate-release] or CCr <50 mL/min [extended-release]); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; may inhibit lactation; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects

CV: orthostatic hypotension. **Derm:** pruritus. **Endo:** SIADH. **GI:** constipation, dry mouth, dyspepsia, nausea, tooth disease. **GU:** urinary frequency. **MS:** RHABDOMYOLYSIS, leg cramps, muscle pain, postural deformities. **Neuro:** hypertonia, unsteadiness/falling, SLEEP ATTACKS, amnesia, dizziness, drowsiness, hallucinations, weakness, abnormal dreams, aggression, agitation, confusion, delirium, delusions, disorientation, dyskinesia, extrapyramidal syndrome, headache, impulse control disorders (gambling, sexual, uncontrolled spending, binge/compulsive eating), insomnia, paranoid ideation, psychosis.

Interactions

Drug-Drug: Concurrent **levodopa** ↑ risk of hallucinations and dyskinesia. **Cimetidine**, **diltiazem**, **triamterene**, **verapamil**, **quinidine**, **quinine**, and **cisplatin** may ↑ levels. Effectiveness may be ↓ by **dopamine antagonists**, including **butyrophenones**, **metoclopramide**, **phenothiazines**, or **thioxanthenes**.

Route/Dosage

When switching from immediate-release to extended-release product, the same total daily dose can be used.

Parkinson's Disease

PO (Adults): *Immediate-release*—0.125 mg 3 times daily initially; may be ↑ every 5–7 days (range 1.5–4.5 mg/day in 3 divided doses); *Extended-release*—0.375 mg once daily; may be ↑ to 0.75 mg once daily in 5–7 days, and then ↑ every 5–7 days by 0.75 mg/day (max dose = 4.5 mg/day).

Renal Impairment

PO (Adults Immediate-release): *CCr 35–59 mL/min*—0.125 mg twice daily initially, may be ↑ every

© F.A. Davis Publishing

5–7 days up to 1.5 mg twice daily; *CCr 15–34 mL/min*—0.125 mg daily initially, may be ↑ every 5–7 days up to 1.5 mg daily.

Renal Impairment

PO (Adults Extended-release): *CCr 30–50 mL/min*—0.375 mg every other day; may consider ↑ dose to 0.375 mg once daily after 1 wk based on response and tolerability; may ↑ in 0.375 mg increments after 1 wk (max dose = 2.25 mg/day).

Restless Leg Syndrome

PO (Adults): 0.125 mg daily 1–3 hr before bedtime. May be ↑ at 4–7 day intervals to 0.25 mg daily, then up to 0.5 mg daily.

Renal Impairment

PO (Adults Immediate-release): *CCr 20–60 mL/min*—0.125 mg daily 1–3 hr before bedtime. May be ↑ at 14-day intervals to 0.25 mg daily, then up to 0.5 mg daily.

Availability (generic available)

Immediate-release tablets: 0.125 mg, 0.25 mg, 0.5 mg, 0.75 mg, 1 mg, 1.5 mg. **Cost:** *Generic*—0.125 mg $265.47/90, 0.25 mg $277.55/90, 0.5 mg $265.47/90, 0.75 mg $265.47/90, 1 mg $277.55/90, 1.5 mg $277.55/90. **Extended-release tablets:** 0.375 mg, 0.75 mg, 1.5 mg, 2.25 mg, 3 mg, 3.75 mg, 4.5 mg. **Cost:** 0.375 mg $103.92/7, 0.75 mg $103.92/7, 1.5 mg $103.92/7, 2.25 mg $445.40/30, 3 mg $445.40/30, 3.75 mg $445.40/30, 4.5 mg $445.40/30.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of psychotic-like behavior (confusion, paranoid ideation, delusions, hallucinations, psychotic-like behavior, disorientation, aggressive behavior, agitation, delirium, hallucinations). Risk of symptoms increases with age. Notify health care professional if these occur.
- Monitor ECG and BP frequently during dose adjustment and periodically throughout therapy.
- Assess patient for drowsiness and sleep attacks. Drowsiness is a common side effect of pramipexole, but sleep attacks or episodes of falling asleep during activities that require active participation may occur without warning. Assess patient for concomitant medications that have sedating effects or may increase serum pramipexole levels (see Interactions). May require discontinuation of therapy.
- **Parkinson's Disease:** Assess patient for signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxia) before and throughout therapy.
- **Restless Leg Syndrome:** Assess sleep patterns and frequency of restless leg disturbances.

Implementation

- Do not confuse Mirapex (pramipexole) with Miralax (polyethylene glycol).
- An attempt to reduce the dose of levodopa/carbidopa may be made cautiously during pramipexole therapy.
- Taper or discontinuation may cause withdrawal symptoms (apathy, anxiety, depression, fatigue, insomnia, sweating, pain); symptoms do not respond to levodopa. Trial readministration of pramipexole at lowest dose may be considered.
- **PO:** Administer with meals to minimize nausea; usually resolves with continued therapy. ***DNC:*** Swallow extended-release tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses or immediate-release product as soon as remembered if it is not almost time for next dose. If extended release tablets are missed, skip dose and take next regular dose. Do not double doses. Consult health care professional before reducing dose or discontinuing medication; may cause withdrawal symptoms, fever, confusion, or severe muscle stiffness. Advise patient to read the *Patient Information* sheet before taking and with each Rx refill, as changes may occur.
- May cause drowsiness and unexpected episodes of falling asleep. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Advise patient to notify health care professional if episodes of falling asleep occur.
- Advise patient to change position slowly to minimize orthostatic hypotension. May occur more frequently during initial therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to have periodic skin exams to check for lesions that may be melanoma.
- Advise patient to notify health care professional if new or increased gambling, sexual, or other intense urges or psychotic-like behaviors occur.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Pramipexole may inhibit lactation.

Evaluation/Desired Outcomes

- Decreased tremor and rigidity in Parkinson's disease.
- Decrease in restless legs and improved sleep.

prasterone (pras-ter-one)

Intrarosa

Classification

Therapeutic: none assigned
Pharmacologic: steroids

© F.A. Davis Publishing

Indications
Moderate to severe dyspareunia.

Action
Inactive steroid that is converted into active androgens and/or estrogens. Exact mechanism in treatment of vulvar and vaginal atrophy in menopausal women not fully established. **Therapeutic Effects:** Reduced severity of dyspareunia.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Metabolized via dehydrogenase, reductase, and aromatase to estradiol and testosterone.
Half-life: Unknown.

TIME/ACTION PROFILE (improvement in dyspareunia severity)

ROUTE	ONSET	PEAK	DURATION
Vag	unknown	12 wk	unknown

Contraindications/Precautions
Contraindicated in: Undiagnosed abnormal genital bleeding; Current or history of breast cancer; OB, Lactation, Pedi: Only indicated in postmenopausal women.
Use Cautiously in: None noted.

Adverse Reactions/Side Effects
GU: vaginal discharge.

Interactions
Drug-Drug: None noted.

Route/Dosage
Vag (Adults): Insert one vaginal insert at bedtime.

Availability
Vaginal insert: 6.5 mg.

NURSING IMPLICATIONS

Assessment
- Assess for pain during intercourse periodically during therapy.

Implementation
- **Vag:** Insert vaginal insert at bedtime using applicator provided. Vaginal inserts can be stored at room temperature or refrigerated.

Patient/Family Teaching
- Explain purpose of prasterone to patient. Instruct patient to read *Instructions for Use* before inserting prasterone.
- Inform patient that vaginal discharge and abnormal PAP smear findings may occur with prasterone.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications during therapy.

Evaluation/Desired Outcomes
- Decreased pain during intercourse.

prasugrel (pra-soo-grel)
Effient

Classification
Therapeutic: antiplatelet agents
Pharmacologic: thienopyridines

Indications
Reduction of thrombotic cardiovascular events (including stent thrombosis) in patients with acute coronary syndrome who will be managed with percutaneous coronary intervention (PCI) including patients with unstable angina or non-ST-elevation myocardial infarction (NSTEMI). Reduction of thrombotic cardiovascular events (including stent thrombosis) in patients with ST-elevation myocardial infarction (STEMI) when managed with either primary/delayed PCI.

Action
Acts by irreversibly binding its active metabolite to the $P2Y_{12}$ class of ADP receptors on platelets; inhibiting platelet activation and aggregation. **Therapeutic Effects:** Decreased thrombotic events including cardiovascular death, nonfatal myocardial infarction (MI), and nonfatal stroke.

Pharmacokinetics
Absorption: Well absorbed following oral administration (79%), then rapidly converted to an active metabolite.
Distribution: Unknown.
Protein Binding: *Active metabolite*—98%.
Metabolism and Excretion: Active metabolite is metabolized to two inactive compounds; 68% excreted in the urine and 27% in feces as inactive metabolites.
Half-life: *Active metabolite*—7 hr (range 2–15 hr).

TIME/ACTION PROFILE (effect on platelet function)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	2 hr	5–9 days†

†Following discontinuation.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Active pathological bleeding; History of transient ischemic attack or stroke.
Use Cautiously in: Patients about to undergo coronary artery bypass grafting (CABG) (↑ risk of bleeding; discontinue at least 7 days prior to surgery); Premature

© F.A. Davis Publishing

discontinuation (↑ risk of stent thrombosis, MI, and death); Body weight <60 kg, propensity to bleed, severe hepatic impairment, concurrent use of medications that ↑ the risk of bleeding (↑ risk of bleeding); Hypotension in the setting of recent coronary angiography, PCI, CABG, or other surgical procedure (suspect bleeding but do not discontinue prasugrel); Geri: Use in patients ≥75 yr of age generally not recommended (↑ risk of fatal/intracranial bleeding and questionable benefit, except in high-risk patients such as diabetes or prior MI); OB: Use only if potential benefit to mother justifies potential risk to fetus; Lactation: Use only if potential benefit to the mother justifies potential risk to nursing infant; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

Neuro: dizziness, fatigue, headache. **Resp:** cough, dyspnea. **CV:** atrial fibrillation, bradycardia, hypertension, hypotension, peripheral edema. **GI:** diarrhea, nausea. **Derm:** rash. **Hemat:** BLEEDING, THROMBOTIC THROMBOCYTOPENIC PURPURA, leukopenia. **Metab:** hyperlipidemia. **MS:** back pain, extremity pain. **Misc:** allergic reactions including ANGIOEDEMA, fever, noncardiac chest pain.

Interactions

Drug-Drug: ↑ risk of bleeding with **warfarin** and **NSAIDs**. **Opioids** may ↓ absorption of active metabolite and ↓ antiplatelet effects; consider using parenteral antiplatelet in patients with acute coronary syndrome if concurrent use of opioids needed.

Route/Dosage

Aspirin 75–325 mg/daily should be taken concurrently.

PO (Adults ≥60 kg): 60 mg initially as a loading dose, then 10 mg once daily.

PO (Adults <60 kg): Consider maintenance dose of 5 mg once daily.

Availability (generic available)

Tablets: 5 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of stroke, peripheral vascular disease, or MI periodically during therapy.
- Monitor patient for signs of thrombotic thrombocytopenic purpura (thrombocytopenia, microangiopathic hemolytic anemia, neurologic findings, renal dysfunction, fever). May rarely occur, even after short exposure (<2 wk). Requires prompt treatment.
- ***Lab Test Considerations:*** Monitor bleeding time during therapy. Prolonged bleeding time, which is time- and dose-dependent, is expected.
- Monitor CBC with differential and platelet count periodically during therapy. Thrombocytopenia and anemia may rarely occur.

Implementation

- Discontinue prasugrel 7 days before planned surgical procedures.
- Patients should take aspirin 75–325 mg daily with prasugrel.
- *In patients with unstable angina (UA) or NSTEMI,* dose is usually administered at time of diagnosis or at time of PCI.
- *In patients with STEMI* presenting within 12 hrs of symptom onset, loading dose is usually administered at time of diagnosis or at time of PCI.
- **PO:** Administer once daily without regard to food. Swallow tablets whole; do not break.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Do not discontinue without consulting health care professional. Advise patient to read *Medication Guide* before taking and with each Rx refill; in case of changes. Instruct patient to keep prasugrel in original container with dessicant, and keep tightly capped to protect from moisture.
- Advise patient to notify health care professional promptly if fever, weakness, skin paleness, purple skin patches, yellowing of skin or eyes, chills, sore throat, neurological changes, or unusual bleeding or bruising, swelling of lips, difficulty breathing, rash, or hives occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially NSAIDs.
- Advise female patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Prevention of stroke, MI, and vascular death in patients at risk.

pravastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

BEERS

prazosin (**pra**-zoe-sin)
Minipress

Classification
Therapeutic: antihypertensives
Pharmacologic: peripherally acting antiadrenergics

© F.A. Davis Publishing

Indications
Mild to moderate hypertension. **Unlabeled Use:** Management of urinary outflow obstruction in patients with benign prostatic hyperplasia.

Action
Dilates both arteries and veins by blocking postsynaptic alpha$_1$-adrenergic receptors. Decreases contractions in smooth muscle of prostatic capsule. **Therapeutic Effects:** Lowering of BP. Decreased cardiac preload and afterload. Decreased symptoms of prostatic hyperplasia (urinary urgency, urinary hesitancy, nocturia).

Pharmacokinetics
Absorption: 60% absorbed following oral administration.
Distribution: Widely distributed.
Protein Binding: 97%.
Metabolism and Excretion: Extensively metabolized by the liver. Minimal (5–10%) renal excretion of unchanged drug.
Half-life: 2–3 hr.

TIME/ACTION PROFILE (antihypertensive effects)

ROUTE	ONSET	PEAK	DURATION
PO	2 hr	2–4 hr†	10 hr

†Following single dose; maximal antihypertensive effects occur after 3–4 wk of chronic dosing.

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Renal insufficiency (↑ sensitivity to effects; dose ↓ may be required); OB, Lactation, Pedi: Safety not established; Angina pectoris; When adding diuretics (↓ dose of prazosin); Patients undergoing cataract surgery (↑ risk of intraoperative floppy iris syndrome).

Adverse Reactions/Side Effects
EENT: blurred vision, intraoperative floppy iris syndrome. **CV:** first-dose orthostatic hypotension, palpitations, angina, edema. **GI:** abdominal cramps, diarrhea, dry mouth, nausea, vomiting. **GU:** erectile dysfunction, priapism. **Neuro:** dizziness, headache, weakness, drowsiness, mental depression, syncope.

Interactions
Drug-Drug: Additive hypotension with acute ingestion of **alcohol**, other **antihypertensives**, or **nitrates**. Antihypertensive effects may be ↓ by **NSAIDs**.

Route/Dosage

Hypertension
PO (Adults): 1 mg 2–3 times daily (give 1st dose at bedtime) for initial 3 days of therapy, then ↑ gradually to maintenance dose of 6–15 mg/day in 2–3 divided doses (not to exceed 20–40 mg/day).
PO (Children): 50–400 mcg (0.05–0.4 mg)/kg/day in 2–3 divided doses (not to exceed 7 mg/dose or 15 mg/day).

Benign Prostatic Hyperplasia
PO (Adults): 1–5 mg twice daily.

Availability (generic available)
Capsules: 1 mg, 2 mg, 5 mg. **Tablets:** 1 mg, 2 mg, 5 mg.

NURSING IMPLICATIONS

Assessment
- Assess for first-dose orthostatic reaction (dizziness, weakness) and syncope. May occur 30 min–2 hr after initial dose and occasionally thereafter. Incidence may be dose related. Volume-depleted or sodium-restricted patients may be more sensitive. Observe patient closely during this period; take precautions to prevent injury. 1st dose may be given at bedtime to minimize this reaction.
- Monitor intake and output ratios and daily weight; assess for edema daily, especially at beginning of therapy.
- **Hypertension:** Monitor BP and pulse frequently during initial dosage adjustment and periodically throughout therapy. Report significant changes.
- Monitor frequency of prescription refills to determine adherence.
- **Benign Prostatic Hyperplasia:** Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Rule out prostatic carcinoma before therapy; symptoms are similar.

Implementation
- May be used in combination with diuretics or beta blockers to minimize sodium and water retention. If these are added to prazosin therapy, reduce dose of prazosin initially and titrate to effect.
- **PO:** Administer daily dose at bedtime. If necessary, dose may be increased to twice daily.

Patient/Family Teaching
- Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered. If not remembered until next day, omit; do not double doses.
- Advise patient to weigh self twice weekly and assess feet and ankles for fluid retention.
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Alcohol, CNS

© F.A. Davis Publishing

depressants, standing for long periods, hot showers, and exercising in hot weather should be avoided because of enhanced orthostatic effects.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially NSAIDs and cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication regimen before any surgery.
- Advise patient to notify health care professional immediately if erection lasts for 4 hr or longer or if frequent dizziness, fainting, or swelling of feet or lower legs occurs.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Hypertension:** Emphasize the importance of continuing to take this medication as directed, even if feeling well. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management).
- Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and to report significant changes.

Evaluation/Desired Outcomes
- Decrease in BP without appearance of side effects.
- Decrease in symptoms of prostatic hyperplasia.

prednicarbate, See CORTICOSTEROIDS (TOPICAL/LOCAL).

prednisoLONE, See CORTICOSTEROIDS (SYSTEMIC).

predniSONE, See CORTICOSTEROIDS (SYSTEMIC).

pregabalin (pre-gab-a-lin)
Lyrica, Lyrica CR

Classification
Therapeutic: analgesics, anticonvulsants
Pharmacologic: gamma aminobutyric acid (GABA) analogues, nonopioid analgesics

Schedule V

Indications
Immediate-release and extended-release: Treatment of the following conditions: Neuropathic pain associated with diabetic peripheral neuropathy, Postherpetic neuralgia. **Immediate-release:** Treatment of the following conditions: Fibromyalgia, Neuropathic pain associated with spinal cord injury, Partial-onset seizures (adjunctive therapy).

Action
Binds to calcium channels in CNS tissues which regulate neurotransmitter release. Does not bind to opioid receptors. **Therapeutic Effects:** Decreased neuropathic or postherpetic pain. Decreased partial-onset seizures.

Pharmacokinetics
Absorption: Well absorbed (>90%) following oral administration.
Distribution: Probably crosses the blood-brain barrier.
Metabolism and Excretion: Minimally metabolized; 90% excreted unchanged in urine.
Half-life: 6 hr.

TIME/ACTION PROFILE (↓ post–herpetic pain)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Myopathy (known/suspected); Severe renal impairment (CCr <30 mL/min) (extended-release only); Lactation: Lactation.
Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (dose alteration recommended for CCr <60 mL/min); HF; History of drug dependence/drug-seeking behavior; Respiratory impairment (↑ risk of respiratory depression); OB: Safety not established in pregnancy; Pedi: Children <1 mo (safety and effectiveness not established); Geri: Consider age-related ↓ in renal function when determining dose in older adults.

Adverse Reactions/Side Effects
CV: peripheral edema, PR interval prolongation. **Derm:** STEVENS-JOHNSON SYNDROME, bullous pemphigoid. **EENT:** blurred vision, double vision, vertigo. **GI:** dry mouth, abdominal pain, constipation, diarrhea, ↑

© F.A. Davis Publishing

appetite, nausea, vomiting. **Hemat:** thrombocytopenia. **Metab:** weight gain. **MS:** ↑ creatine kinase. **Neuro:** SUICIDAL THOUGHTS/BEHAVIORS, dizziness, drowsiness, headache, impaired attention/concentration/thinking. **Resp:** RESPIRATORY DEPRESSION. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema), fever.

Interactions

Drug-Drug: Concurrent use with **thiazolidinediones** (**pioglitazone**, **rosiglitazone**) may ↑ risk of fluid retention. ↑ risk of CNS and respiratory depression with other **CNS depressants** including **opioids**, **alcohol**, **benzodiazepines**, or other **sedatives/hypnotics**.

Route/Dosage

Diabetic Neuropathic Pain

PO (Adults): *Immediate-release*—50 mg 3 times daily, ↑ over 7 days up to 100 mg 3 times daily. *Extended-release*—165 mg once daily after an evening meal; ↑ to 330 mg once daily after an evening meal within 1 wk.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—Immediate-release: 75–300 mg/day in 2–3 divided doses; Extended-release: 82.5–330 mg once daily after an evening meal; *CCr 15–30 mL/min*—Immediate-release: 25–150 mg/day in 1–2 divided doses; *CCr <15 mL/min*—Immediate-release: 25–75 mg/day as a single daily dose.

Postherpetic Neuralgia

PO (Adults): *Immediate-release*—75 mg twice daily or 50 mg 3 times daily initially, may ↑ over 7 days to 300 mg/day in 2–3 divided doses; after 2–4 wk may ↑ to 600 mg/day in 2–3 divided doses. *Extended-release*—165 mg once daily after an evening meal; ↑ to 330 mg once daily after an evening meal within 1 wk; if pain is persistent after 2–4 wk, may then ↑ dose of up to 660 mg once daily after an evening meal.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—Immediate-release: 75–300 mg/day in 2–3 divided doses; Extended-release: 82.5–330 mg once daily after an evening meal; *CCr 15–30 mL/min*—Immediate-release: 25–150 mg/day in 1–2 divided doses; *CCr <15 mL/min*—Immediate-release: 25–75 mg/day as a single daily dose.

Fibromyalgia

PO (Adults): *Immediate-release*—75 mg twice daily initially, may ↑ to 150 mg twice daily within 1 wk based on efficacy and tolerability. May ↑ to 225 twice daily.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—Immediate-release: 75–300 mg/day in 2–3 divided doses *CCr 15–30 mL/min*—Immediate-release: 25–150 mg/day in 1–2 divided doses; *CCr <15 mL/min*—Immediate-release: 25–75 mg/day as a single daily dose.

Spinal Cord Injury Neuropathic Pain

PO (Adults): *Immediate-release*—75 mg twice daily initially, may be ↑ to 150 mg twice daily within 1 wk based on efficacy and tolerability; if insufficient pain relief after 2–3 wk, may ↑ to 300 twice daily.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—Immediate-release: 75–300 mg/day in 2–3 divided doses; *CCr 15–30 mL/min*—Immediate-release: 25–150 mg/day in 1–2 divided doses; *CCr <15 mL/min*—Immediate-release: 25–75 mg/day as a single daily dose.

Partial Onset Seizures

PO (Adults): *Immediate-release*—75 mg twice daily or 50 mg 3 times daily initially; may gradually ↑ on a weekly basis up to a max dose of 600 mg/day (in 2–3 divided doses).
PO (Children ≥1 mo and ≥30 kg): *Immediate-release*—2.5 mg/kg/day in 2–3 divided doses; may gradually ↑ on a weekly basis up to a max dose of 10 mg/kg/day in 2–3 divided doses (max = 600 mg/day).
PO (Children ≥1 mo and <30 kg): *Immediate-release*—3.5 mg/kg/day in 2–3 divided doses for patients ≥4 yr old or in 3 divided doses for patients 1 mo–<4 yr old; may gradually ↑ on a weekly basis up to a max dose of 14 mg/kg/day in 2–3 divided doses for patients ≥4 yr old or in 3 divided doses for patients 1 mo–<4 yr old.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—Immediate-release: 75–300 mg/day in 2–3 divided doses; *CCr 15–30 mL/min*—Immediate-release: 25–150 mg/day in 1–2 divided doses; *CCr <15 mL/min*—Immediate-release: 25–75 mg/day as a single daily dose.

Availability (generic available)

Immediate-release capsules: 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg. **Cost:** 25 mg $411.71/100, 50 mg $409.80/100, 75 mg $409.80/100, 100 mg $409.80/100, 150 mg $409.80/100, 200 mg $411.71/100, 225 mg $411.71/100. **Extended-release tablets:** 82.5 mg, 165 mg, 330 mg. **Oral solution:** 20 mg/mL. **Cost:** $553.82/473 mL.

NURSING IMPLICATIONS

Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior, or depression.

© F.A. Davis Publishing

- **Diabetic Peripheral Neuropathy, Postherpetic Neuralgia, Fibromyalgia, and Spinal Cord Injury Pain:** Assess location, characteristics, and intensity of pain periodically during therapy.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- ***Lab Test Considerations:*** May cause ↑ creatine kinase levels.
- May cause ↓ platelet count.

Implementation

- Do not confuse Lyrica (pregabalin) with Lopressor (metoprolol). Do not confuse Lyrica with Hydrea (hydroxyurea).
- Pregabalin should be discontinued gradually over at least 1 wk. Abrupt discontinuation may cause insomnia, nausea, headache, anxiety, sweating, and diarrhea when used for pain and may cause increase in seizure frequency when treating seizures.
- **PO:** May be administered without regard to meals. Oral solution may be stored at room temperature.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Do not discontinue abruptly. Advise patient to read the *Patient Information Leaflet* prior to taking pregabalin and with each Rx refill in case of changes.
- May cause dizziness, drowsiness, and blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Advise patient to notify health care professional if changes in vision occur. Patients with seizures should not resume driving until health care professional gives clearance based on control of seizure disorder.
- Instruct patient to promptly report unexplained muscle pain, tenderness, or weakness, especially if accompanied by malaise or fever. Discontinue therapy if myopathy is diagnosed or suspected or if markedly elevated creatine kinase levels occur.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Inform patient that pregabalin may cause edema and weight gain.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Caution patient to avoid alcohol or other CNS depressants, including opioids, with pregabalin.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. May impair male fertility. Encourage patients who become pregnant to enroll in the NAAED Pregnancy Registry by calling 1-800-233-2334.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease in intensity of chronic pain.
- Decrease in the frequency or cessation of seizures.

BEERS

prochlorperazine

(proe-klor-**pair**-a-zeen)

~~Compazine~~, Compro, Prochlorazine

Classification

Therapeutic: antiemetics, antipsychotics

Pharmacologic: phenothiazines

Indications

Management of nausea and vomiting. Treatment of psychoses. Treatment of anxiety.

Action

Alters the effects of dopamine in the CNS. Possesses significant anticholinergic and alpha-adrenergic blocking activity. Depresses the chemoreceptor trigger zone (CTZ) in the CNS. **Therapeutic Effects:** Diminished nausea and vomiting. Diminished signs and symptoms of psychoses or anxiety.

Pharmacokinetics

Absorption: Absorption from tablet is variable; may be better with oral liquid formulations. Well absorbed after IM administration.

Distribution: Widely distributed, high concentrations in the CNS. Crosses the placenta and probably enters breast milk.

Protein Binding: ≥90%.

Metabolism and Excretion: Highly metabolized by the liver and GI mucosa. Converted to some compounds with antipsychotic activity.

Half-life: Unknown.

TIME/ACTION PROFILE (antiemetic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–40 min	unknown	3–4 hr
Rect	60 min	unknown	3–4 hr
IM	10–20 min	10–30 min	3–4 hr
IV	rapid (min)	10–30 min	3–4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other phenothiazines may exist; Angle-closure glaucoma; Bone marrow depression; Severe liver or

© F.A. Davis Publishing

cardiovascular disease; Hypersensitivity to bisulfites or benzyl alcohol (some parenteral products); Pedi: Children <2 yr or <9.1 kg.
Use Cautiously in: Diabetes mellitus; Respiratory disease; Prostatic hypertrophy; CNS tumors; Epilepsy; Intestinal obstruction; Patients at risk for falls; OB, Lactation: Safety not established; Geri: Dose ↓ recommended; ↑ risk of mortality in elderly patients treated for dementia-related psychosis.

Adverse Reactions/Side Effects

EENT: blurred vision, dry eyes, lens opacities. **CV:** ECG changes, hypotension, tachycardia. **GI:** constipation, dry mouth, anorexia, drug-induced hepatitis, ileus. **GU:** pink or reddish-brown discoloration of urine, urinary retention. **Derm:** photosensitivity, pigment changes, rashes. **Endo:** galactorrhea. **Hemat:** AGRANULOCYTOSIS, leukopenia. **Metab:** hyperthermia. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, extrapyramidal reactions, sedation, tardive dyskinesia. **Misc:** allergic reactions.

Interactions

Drug-Drug: Additive hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, **sedative/hypnotics**, or **general anesthetics**. Additive anticholinergic effects with other **drugs possessing anticholinergic properties**, including **antihistamines**, some **antidepressants**, **atropine**, **haloperidol**, and other **phenothiazines**. **Lithium** ↑ risk of extrapyramidal reactions. May mask early signs of **lithium** toxicity. ↑ risk of agranulocytosis with **antithyroid agents**. ↓ beneficial effects of **levodopa**. **Antacids** may ↓ absorption.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression. ↑ anticholinergic effects with **angel's trumpet**, **jimson weed**, and **scopolia**.

Route/Dosage

Pediatric dose should not exceed 10 mg on the 1st day and then should not exceed 20 mg/day in children 2–5 yr or 25 mg/day in children 6–12 yr.

Antiemetic

PO (Adults and Children ≥12 yr): 5–10 mg 3–4 times daily (not to exceed 40 mg/day).
PO (Children 18–39 kg): 2.5 mg 3 times daily *or* 5 mg twice daily (not to exceed 15 mg/day).
PO (Children 14–17 kg): 2.5 mg 2–3 times daily (not to exceed 10 mg/day).
PO (Children 9–13 kg): 2.5 mg 1–2 times daily (not to exceed 7.5 mg/day).
IM (Adults and Children ≥12 yr): 5–10 mg every 3–4 hr as needed. *Nausea/vomiting associated with surgery*—5–10 mg; may be repeated once.
IM (Children 2–12 yr): 132 mcg (0.132 mg)/kg; usually only 1 dose is required.
IV (Adults and Children ≥12 yr): 2.5–10 mg (not to exceed 40 mg/day). *Nausea/vomiting associated with surgery*—5–10 mg; may be repeated once.
Rect (Adults): 25 mg twice daily.
Rect (Children 18–39 kg): 2.5 mg 3 times daily or 5 mg twice daily (not to exceed 15 mg/day).
Rect (Children 14–17 kg): 2.5 mg 2–3 times daily (not to exceed 10 mg/day).
Rect (Children 9–13 kg): 2.5 mg 1–2 times daily (not to exceed 7.5 mg/day).

Antipsychotic

PO (Adults and Children ≥12 yr): 5–10 mg 3–4 times daily; may be ↑ every 2–3 days (up to 150 mg/day).
PO (Children 2–12 yr): 2.5 mg 2–3 times daily.
IM (Adults): 10–20 mg every 2–4 hr for up to 4 doses, then 10–20 mg every 4–6 hr (up to 200 mg/day).
IM (Children 2–12 yr): 132 mcg (0.132 mg)/kg (not to exceed 10 mg/dose).
IV (Adults and Children ≥12 yr): 2.5–10 mg (up to 40 mg/day).
Rect (Adults): 10 mg 3–4 times daily; may be ↑ by 5–10 mg every 2–3 days as needed.

Antianxiety

PO (Adults and Children ≥12 yr): 5 mg 3–4 times daily (not to exceed 20 mg/day or longer than 12 wk).
IM (Adults and Children ≥12 yr): 5–10 mg every 3–4 hr as needed (up to 40 mg/day).
IM (Children 2–12 yr): 132 mcg (0.132 mg)/kg.
IV (Adults): 2.5–10 mg (up to 40 mg/day).

Availability (generic available)

Tablets: 5 mg, 10 mg. **Cost:** *Generic*—5 mg $59.35/100, 10 mg $89.25/100. **Solution for injection:** 5 mg/mL (edisylate), 5 mg/mL (mesylate). **Suppositories:** 10 mg, 25 mg. **Cost:** *Generic*—$160.77/12.

NURSING IMPLICATIONS

Assessment

- Monitor BP (sitting, standing, lying down), ECG, pulse, and respiratory rate before and frequently during the period of dosage adjustment. May cause Q-wave and T-wave changes in ECG.
- Assess patient for level of sedation after administration.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swal-

© F.A. Davis Publishing

lowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Report these symptoms; reduction in dose or discontinuation may be necessary. Trihexyphenidyl or diphenhydramine may be used to control these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Notify health care professional immediately if these symptoms occur.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- **Antiemetic:** Assess patient for nausea and vomiting before and 30–60 min after administration.
- **Antipsychotic:** Monitor patient's mental status (orientation to reality and behavior) before and periodically during therapy.
- Observe patient carefully when administering oral medication to ensure that medication is actually taken and not hoarded.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet may help minimize constipation.
- **Anxiety:** Assess degree and manifestations of anxiety and mental status before and periodically during therapy.
- ***Lab Test Considerations:*** CBC and liver function tests should be evaluated periodically during therapy. May cause blood dyscrasias, especially between wk 4 and 10 of therapy. Hepatotoxicity is more likely to occur between wk 2 and 4 of therapy. May recur if medication is restarted. Liver function abnormalities may require discontinuation of therapy.
- May cause false-positive or false-negative pregnancy test results and false-positive urine bilirubin test results.
- May cause ↑ serum prolactin levels.

Implementation

- To prevent contact dermatitis, avoid getting solution on hands.
- Phenothiazines should be discontinued 48 hr before and not resumed for 24 hr after myelography; they lower seizure threshold.
- **PO:** Administer with food, milk, or a full glass of water to minimize gastric irritation.
- **IM:** Do not inject subcut. Inject slowly, deep into well-developed muscle. Keep patient recumbent for at least 30 min after injection to minimize hypotensive effects. Slight yellow color will not alter potency. Do not administer solution that is markedly discolored or that contains a precipitate.

IV Administration

- **IV Push:** ***Concentration:*** Dilute to a concentration of 1 mg/mL. ***Rate:*** Administer at a rate of 1 mg/min; not to exceed 5 mg/min.
- **Intermittent Infusion:** ***Dilution:*** Dilute 20 mg in up to 1 L dextrose, saline, Ringer's or LR, dextrose/saline, dextrose/Ringer's, or lactated Ringer's combinations.
- **Continuous Infusion:** Has been used as infusion with 20 mg/L of compatible solution.
- **Y-Site Compatibility:** acetaminophen, alemtuzumab, alfentanil, amikacin, amsacrine, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, benztropine, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, caspofungin, chlorpromazine, cisatracurium, cisplatin, cladribine, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxacurium, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fentanyl, fluconazole, gentamicin, glycopyrrolate, granisetron, hetastarch, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, irinotecan, isoproterenol, labetalol, leucovorin calcium, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, penicillin G, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, pyridoxime, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, aldesleukin, allopurinol, amifostine, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azathioprine, aztreonam, bivalirudin, calcium chloride, cefazolin, cefepime, cefotaxime,

© F.A. Davis Publishing

cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazoxide, epoetin alfa, ertapenem, etoposide phosphate, fenoldopam, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, ganciclovir, gemcitabine, imipenem/cilastatin, indomethacin, insulin, ketorolac, levofloxacin, midazolam, nitroprusside, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, sodium bicarbonate, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for next dose. If more than 2 doses are scheduled each day, missed dose should be taken within about 1 hr of the ordered time. Abrupt withdrawal may lead to gastritis, nausea, vomiting, dizziness, headache, tachycardia, and insomnia.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid alcohol and CNS depressants. Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes in temperature should also be avoided, because this drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth. Consult health care professional if dry mouth continues for >2 wk.
- Advise patient not to take prochlorperazine within 2 hr of antacids or antidiarrheal medication.
- Advise patient that increasing bulk and fluids in the diet and exercise may help minimize the constipating effects of this medication.
- Inform patient that this medication may turn urine pink to reddish-brown.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, skin rashes, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools are noted.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of routine follow-up exams to monitor response to medication and detect side effects. Periodic ocular exams are indicated. Encourage continued participation in psychotherapy as ordered by health care professional.

Evaluation/Desired Outcomes

- Relief of nausea and vomiting.
- Decrease in excitable, paranoic, or withdrawn behavior when used as an antipsychotic.
- Decrease in feelings of anxiety.

progesterone

(proe-**jess**-te-rone)

Crinone, Endometrin, Prometrium

Classification

Therapeutic: hormones

Pharmacologic: progestins

P

Indications

Crinone, Prometrium, and Oil for Injection: Secondary amenorrhea. **Oil for injection:** Abnormal uterine bleeding. **Prometrium:** Prevention of endometrial hyperplasia in postmenopausal women who have not had a hysterectomy (with estrogen). **Crinone and Endometrin:** Part of assisted reproductive technology (ART) in the management of infertility.

Action

Produces: Secretory changes in the endometrium, Increase in basal body temperature, Histologic changes in vaginal epithelium, Relaxation of uterine smooth muscle, Mammary alveolar tissue growth, Pituitary inhibition, Withdrawal bleeding in the presence of estrogen.

Therapeutic Effects: Restoration of hormonal balance with control of uterine bleeding. Successful outcome in assisted reproduction.

Pharmacokinetics

Absorption: Micronization increases oral and vaginal absorption.

Distribution: Enters breast milk.

Protein Binding: ≥90%.

Metabolism and Excretion: Metabolized by the liver; 50–60% eliminated by kidneys; 10% eliminated in feces.

Half-life: Several min.

© F.A. Davis Publishing

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	unknown
Vaginal	unknown	34.8–55 hr	unknown
IM	unknown	19.6–28 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens or sesame oil/seeds (IM suspension only); Hypersensitivity to peanuts (Prometrium only); Undiagnosed vaginal bleeding; Thromboembolic disease; Cerebrovascular disease; Severe hepatic impairment; Breast or genital cancer; Missed abortion; OB: Pregnancy.

Use Cautiously in: History of hepatic impairment; Cardiovascular disease; Depression; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects

CV: MI, thrombophlebitis. **Derm:** chloasma, melasma, rash. **EENT:** retinal thrombosis. **Endo:** amenorrhea, breakthrough bleeding, breast tenderness, changes in menstrual flow, galactorrhea, spotting. **F and E:** edema. **GI:** constipation, gingival bleeding, hepatitis, nausea. **GU:** cervical erosions, pelvic pain, vaginal discharge. **Hemat:** THROMBOEMBOLISM. **Local:** irritation or pain at IM injection site. **Metab:** weight gain, weight loss. **Neuro:** STROKE, depression, headache. **Resp:** PULMONARY EMBOLISM. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: May ↓ effectiveness of **bromocriptine** when used concurrently for galactorrhea and amenorrhea.

Route/Dosage

Secondary Amenorrhea

PO (Adults): 400 mg once daily in the evening for 10 days.

Vag (Adults): 45 mg (1 applicatorful of 4% gel) once every other day for up to 6 doses; may be ↑ to 90 mg (1 applicatorful of 8% gel) once every other day for up to 6 doses.

IM (Adults): 100–150 mg (single dose) or 5–10 mg once daily for 6–8 days given 8–10 days before expected menstrual period.

Abnormal Uterine Bleeding

IM (Adults): 5–10 mg once daily for 6 days.

Prevention of Endometrial Hyperplasia

PO (Adults): 200 mg once daily at bedtime for 12 days sequentially per 28-day cycle.

Assisted Reproductive Technology

Vag (Adults): *Patients who require progesterone supplementation*—90 mg (1 applicatorful of 8% gel) once daily; if pregnancy occurs, may continue for up to 10–12 wk *or* 100 mg insert 2 or 3 times daily starting the day after oocyte retrieval and continuing for up to 10 wk total duration; *Patients with partial or complete ovarian failure who require progesterone replacement (intravaginal gel)*—90 mg (1 applicatorful of 8% gel) twice daily; if pregnancy occurs, may continue for up to 10–12 wk.

Availability (generic available)

Capsules (Prometrium): 100 mg, 200 mg. **Oil for injection:** 50 mg/mL. **Vaginal gel (Crinone):** 4%, 8%. **Vaginal insert (Endometrin):** 100 mg. ***In combination with:*** estradiol (Bijuva). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor BP periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Amenorrhea:** Assess patient's usual menstrual history. Administration of drug usually begins 8–10 days before anticipated menstruation. Withdrawal bleeding usually occurs 48–72 hr after course of therapy. Therapy should be discontinued if menses occur during injection series.
- **Dysfunctional Bleeding:** Monitor pattern and amount of vaginal bleeding (pad count). Bleeding should end by 6th day of therapy. Therapy should be discontinued if menses occur during injection series.
- ***Lab Test Considerations:*** Monitor hepatic function before and periodically during therapy.
- May cause ↑ plasma amino acid and alkaline phosphatase levels.
- May ↓ pregnanediol excretion concentrations.
- May cause ↑ serum concentrations of LDL and ↓ concentrations of HDL.
- High doses may ↑ sodium and chloride excretion.
- May alter thyroid function test results.

Implementation

- **PO:** Administer at bedtime. For patients who experience difficulty swallowing the capsules, take with a full glass of water while in the standing position.
- **IM:** Shake vial before preparing IM dose. Administer deep IM. Rotate sites.
- **Vag:** Vaginal gel and insert are administered with disposable applicator provided by manufacturer.
- If dose increase is required from 4% gel to 8% gel, doubling the volume of the 4% gel will not accomplish dose increase; changing to 8% gel is required.

Patient/Family Teaching

- Explain purpose of progesterone to patient.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, or hepatic dysfunction

© F.A. Davis Publishing

(yellowed skin or eyes, pruritus, dark urine, light-colored stools) to health care professional.
- Instruct patient to notify health care professional if change in vaginal bleeding pattern or spotting occurs.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional immediately if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of routine follow-up physical exams, including BP; breast, abdomen, and pelvic examinations; and Pap smears.
- **Vag:** Instruct patient not to use vaginal gel concurrently with other vaginal agents. If these agents must be used concurrently, administer at least 6 hr before or after vaginal gel. Small, white globules may appear as a vaginal discharge possibly due to gel accumulation, even several days after use.

Evaluation/Desired Outcomes
- Reduction of uterine bleeding.
- Successful outcome in assisted reproduction.

HIGH ALERT

propofol (proe-poe-fol)
Diprivan

Classification
Therapeutic: general anesthetics

Indications
Induction of general anesthesia in children >3 yr and adults. Maintenance of balanced anesthesia when used with other agents in children >2 mo and adults. Initiation and maintenance of monitored anesthesia care (MAC). Sedation of intubated, mechanically ventilated patients in intensive care units (ICUs).

Action
Short-acting hypnotic. Mechanism of action is unknown. Produces amnesia. Has no analgesic properties. **Therapeutic Effects:** Induction and maintenance of anesthesia.

Pharmacokinetics
Absorption: Administered IV only, resulting in complete absorption.
Distribution: Rapidly and widely distributed. Crosses the blood-brain barrier well; rapidly redistributed to other tissues. Crosses the placenta and enters breast milk.
Protein Binding: 95–99%.
Metabolism and Excretion: Rapidly metabolized by the liver.
Half-life: 3–12 hr (blood-brain equilibration half-life 2.9 min).

TIME/ACTION PROFILE (loss of consciousness)

ROUTE	ONSET	PEAK	DURATION†
IV	40 sec	unknown	3–5 min

†Time to recovery is 8 min (up to 19 min if opioid analgesics have been used).

Contraindications/Precautions
Contraindicated in: Hypersensitivity to propofol, soybean oil, egg lecithin, or glycerol; OB: Crosses placenta; may cause neonatal depression; may affect child's brain development when used during 3rd trimester; Lactation: Enters breast milk; effects on newborn unknown.
Use Cautiously in: Cardiovascular disease; Lipid disorders (emulsion may have detrimental effect); ↑ intracranial pressure; Cerebrovascular disorders; Hypovolemic patients (lower induction and maintenance dosage ↓ recommended); Pedi: Not recommended for induction of anesthesia in children <3 yr, or for maintenance of anesthesia in infants <2 mo; not for ICU or pre-procedure sedation; may affect brain development in children <3 yr; Geri: Lower induction and maintenance dose ↓ recommended.

Adverse Reactions/Side Effects
Neuro: dizziness, headache. **Resp:** APNEA, cough. **CV:** bradycardia, hypotension, hypertension. **GI:** abdominal cramping, hiccups, nausea, vomiting. **Derm:** flushing. **Local:** burning, pain, stinging, coldness, numbness, tingling at IV site. **MS:** involuntary muscle movements, perioperative myoclonia. **GU:** discoloration of urine (green). **Misc:** PROPOFOL INFUSION SYNDROME, fever.

Interactions
Drug-Drug: Additive CNS and respiratory depression with **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics** (dose ↓ may be required). **Theophylline** may antagonize the CNS effects of propofol. Propofol may ↑ levels of **alfentanil**. Cardiorespiratory instability can occur when used with **acetazolamide**. Serious bradycardia can occur with concurrent use of **fentanyl** in children. ↑ risk of hypertriglyceridemia with **intravenous fat emulsion**.

Route/Dosage

General Anesthesia
IV (Adults <55 yr): *Induction*—40 mg every 10 sec until induction achieved (2–2.5 mg/kg total). *Maintenance*—100–200 mcg/kg/min. Rates of 150–200 mcg/kg/min are usually required during first 10–15 min after induction, then ↓ by 30–50% during first 30 min of maintenance. Rates of 50–100 mcg/kg/min are

© F.A. Davis Publishing

associated with optimal recovery time. May also be given intermittently in increments of 25–50 mg.
IV (Geriatric Patients , Cardiac patients, Debilitated Patients, or Hypovolemic Patients): *Induction*—20 mg every 10 sec until induction achieved (1–1.5 mg/kg total). *Maintenance*—50–100 mcg/kg/min (dose in cardiac anesthesia ranges from 50–150 mcg/kg/min depending on concurrent use of opioid).
IV (Adults Undergoing Neurosurgical Procedures): *Induction*—20 mg every 10 sec until induction achieved (1–2 mg/kg total). *Maintenance*—100–200 mcg/kg/min.
IV (Children ≥3 yr–16 yr): *Induction*—2.5–3.5 mg/kg, use lower dose for children ASA III or IV.
IV (Children 2 mo–16 yr): *Maintenance*—125–300 mcg/kg/min (following first 30 min of maintenance, rate should be ↓ if possible), younger children may require larger infusion rates compared to older children.

Monitored Anesthesia Care (MAC) Sedation

IV (Adults <55 yr): *Initiation*—100–150 mcg/kg/min infusion *or* 0.5 mg/kg as slow injection. *Maintenance*—25–75 mcg/kg/min infusion or incremental boluses of 10–20 mg.
IV (Geriatric Patients , Debilitated Patients, or ASA III/IV Patients): *Initiation*—Use slower infusion or injection rates. *Maintenance*—20% less than the usual adult infusion dose; rapid/repeated bolus dosing should be avoided.

ICU Sedation

IV (Adults): 5 mcg/kg/min for a minimum of 5 min. Additional increments of 5–10 mcg/kg/min over 5–10 min may be given until desired response is obtained. (Range 5–50 mcg/kg/min.) Dose should be reassessed every 24 hr.

Availability (generic available)

Solution for injection: 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess respiratory status, pulse, and BP continuously throughout propofol therapy. Frequently causes apnea lasting ≥60 sec. Maintain patent airway and adequate ventilation. Propofol should be used only by individuals experienced in endotracheal intubation, and equipment for this procedure should be readily available.
- Assess level of sedation and level of consciousness throughout and following administration.
- When using for ICU sedation, wake-up and assessment of CNS function should be done daily during maintenance to determine minimum dose required for sedation. Maintain a light level of sedation during these assessments; do not discontinue. Abrupt discontinuation may cause rapid awakening with anxiety, agitation, and resistance to mechanical ventilation.
- Monitor for propofol infusion syndrome (severe metabolic acidosis, hyperkalemia, lipemia, rhabdomyolysis, hepatomegaly, cardiac and renal failure). Most frequent with prolonged, high-dose infusions (>5 mg/kg/hr for >48 hr) but has also been reported following large-dose, short-term infusions during surgical anesthesia. If prolonged sedation or increasing dose is required, or metabolic acidosis occurs, consider alternative means of sedation.
- ***Toxicity and Overdose:*** If overdose occurs, monitor pulse, respiration, and BP continuously. Maintain patent airway and assist ventilation as needed. If hypotension occurs, treatment includes IV fluids, repositioning, and vasopressors.

Implementation

- Do not confuse Diprivan (propofol) with Diflucan (fluconazole) or Ditropan (oxybutynin).
- Dose is titrated to patient response.
- Propofol has no effect on the pain threshold. Adequate analgesia should *always* be used when propofol is used as an adjunct to surgical procedures.

IV Administration

- **IV Push:** ***Dilution:*** Usually administered undiluted. If dilution is necessary, use only D5W. Shake well before use. Solution is opaque, making detection of contaminants difficult. Do not use if separation of the emulsion is evident. Contains no preservatives; maintain sterile technique and administer immediately after preparation. ***Concentration:*** Undiluted: 10 mg/mL. If dilution is necessary, dilute to concentration ≥2 mg/mL.
- Discard unused portions and IV lines at the end of anesthetic procedure or within 6 hr. For ICU sedation, discard after 12 hr if administered directly from vial or after 6 hr if transferred to a syringe or other container. Do not administer via filter <5–micron pore size.
- Aseptic technique is essential. Solution is capable of rapid growth of bacterial contaminants. Infections and subsequent deaths have been reported. ***Rate:*** Administer over 3–5 min. Titrate to desired level of sedation. Frequently causes pain, burning, and stinging at injection site; use larger veins of the forearm, antecubital fossa, or a dedicated IV catheter. Lidocaine 10–20 mg IV may be administered prior to injection to minimize pain. Pedi: Induction doses may be administered over 20–30 sec.
- **Intermittent/Continuous Infusion:** ***Dilution:*** Administer undiluted. Allow 3 to 5 min between dose adjustments to allow for and assess the clinical effects. ***Concentration:*** 10 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Solution Compatibility:** D5W, LR, D5/LR, D5/0.45% NaCl, D5/0.2% NaCl.
- **Y-Site Compatibility:** acyclovir, alfentanil, aminophylline, ampicillin, aztreonam, bumetanide, bu-

© F.A. Davis Publishing

prenorphine, butorphanol, calcium gluconate, carboplatin, cefazolin, cefepime, cefotaxime, cefoxitin, ceftriaxone, cefuroxime, chlorpromazine, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dexamethasone, dexmedetomidine, diphenhydramine, dobutamine, dopamine, doxycycline, droperidol, enalaprilat, epinephrine, esmolol, famotidine, fenoldopam, fentanyl, fluconazole, fluorouracil, furosemide, ganciclovir, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketamine, labetalol, levorphanol, lidocaine, lorazepam, magnesium sulfate, mannitol, meperidine, milrinone, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, paclitaxel, pentobarbital, phenobarbital, potassium chloride, prochlorperazine, propranolol, scopolamine, sodium bicarbonate, succinylcholine, sufentanil, thiopental, vecuronium.

- **Y-Site Incompatibility:** amikacin, amphotericin B deoxycholate, calcium chloride, ciprofloxacin, diazepam, digoxin, doxorubicin, gentamicin, levofloxacin, methotrexate, methylprednisolone sodium succinate, metoclopramide, mitoxantrone, phenytoin, tobramycin, verapamil.

Patient/Family Teaching

- Inform patient that this medication will decrease mental recall of the procedure.
- May cause drowsiness or dizziness. Advise patient to request assistance prior to ambulation and transfer and to avoid driving or other activities requiring alertness for 24 hr following administration.
- Advise patient to avoid alcohol or other CNS depressants without the advice of a health care professional for 24 hr following administration.

Evaluation/Desired Outcomes

- Induction and maintenance of anesthesia.
- Amnesia.
- Sedation in mechanically ventilated patients in an intensive care setting.

HIGH ALERT

propranolol

(proe-**pran**-oh-lole)

Hemangeol, ~~Inderal~~, Inderal LA, Inno-Pran XL

Classification

Therapeutic: antianginals, antiarrhythmics (Class II), antihypertensives, vascular headache suppressants

Pharmacologic: beta blockers

Indications

Management of hypertension, angina, arrhythmias, hypertrophic cardiomyopathy, thyrotoxicosis, essential tremors, pheochromocytoma (all but Hemangeol). Also used in the prevention and management of MI, and the prevention of vascular headaches (all but Hemangeol). Proliferating infantile hemangioma requiring systemic therapy (Hemangeol only). **Unlabeled Use:** Also used to manage alcohol withdrawal, aggressive behavior, antipsychotic-associated akathisia, situational anxiety, and esophageal varices. Post-traumatic stress disorder (PTSD).

Action

Blocks stimulation of $beta_1$ (myocardial) and $beta_2$ (pulmonary, vascular, and uterine)-adrenergic receptor sites; its mechanism for the treatment of infantile hemangiomas is unknown. **Therapeutic Effects:** Decreased heart rate and BP. Suppression of arrhythmias. Prevention of MI. Hemangioma resolution.

Pharmacokinetics

Absorption: Well absorbed but undergoes extensive first-pass hepatic metabolism.

Distribution: Moderate CNS penetration. Crosses the placenta; enters breast milk.

Protein Binding: 93%.

Metabolism and Excretion: Almost completely metabolized by the liver (primarily for CYP2D6 isoenzyme) (the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly ↑ propranolol concentrations and an ↑ risk of adverse effects).

Half-life: 3.4–6 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	60–90 min†	6–12 hr
PO–ER	unknown	6 hr	24 hr
IV	immediate	1 min	4–6 hr

†Following single dose, full effect not seen until several wk of therapy.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia, sick sinus syndrome, or heart block (unless pacemaker present); Premature infants with corrected age <5 wk (Hemangeol only); Infants <2 kg (Hemangeol only); Asthma or history of bronchospasm (Hemangeol only); BP <50/30 mmHg (Hemangeol only); Pheochromocytoma (Hemangeol only).

Use Cautiously in: Renal or hepatic impairment; Pulmonary disease (including asthma); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); History of severe allergic reac-

© F.A. Davis Publishing

tions (may ↑ intensity of response); Skeletal muscle disease (may exacerbate myopathy); OB: Crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression. May also ↓ blood supply to the placenta, ↑ the risk for premature birth or fetal death, and cause intrauterine growth retardation. May ↑ risk of cardiac and pulmonary complications in the infant during the neonatal time frame. Lactation: Safety and effectiveness not established in breast feeding; Pedi: ↑ risk of hypoglycemia in children, especially during periods of fasting such as before surgery, during prolonged exertion, or with coexisting renal insufficiency; Geri: Older adults may have ↑ sensitivity to all beta blockers; initial dose reduction and careful titration recommended.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, BRADYCARDIA, HF, PULMONARY EDEMA, orthostatic hypotension, peripheral vasoconstriction. **Derm:** ERYTHEMA MULTIFORME, EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS, itching, rash. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Endo:** hyperglycemia, hypoglycemia (↑ in children). **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, ↓ libido. **MS:** arthralgia, back pain, muscle cramps, myopathy. **Neuro:** paresthesia, fatigue, weakness, anxiety, dizziness, drowsiness, insomnia, memory loss, mental depression, mental status changes, nervousness, nightmares. **Resp:** bronchospasm, wheezing. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthesia, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Levels may be ↓ with chronic **alcohol** use. Concurrent use with **amphetamines**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulin** or **oral hypoglycemics** (dose adjustments may be necessary). May ↓ effectiveness of **beta-adrenergic bronchodilators** and **theophylline**. May ↓ beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension). **Cimetidine** may ↑ blood levels and toxicity. Concurrent **NSAIDs** may ↓ antihypertensive action. **Smoking** ↑ metabolism and ↓ effects; smoking cessation may ↑ effects. May ↑ levels of **lidocaine** and **bupivacaine**.

Route/Dosage

PO (Adults): *Antianginal*—80–320 mg/day in 2–4 divided doses or once daily as extended/sustained-release capsules. *Antihypertensive*—40 mg twice daily initially; may be ↑ as needed (usual range 120–240 mg/day; doses up to 1 g/day have been used); *or* 80 mg once daily as extended/sustained-release capsules, ↑ as needed up to 120 mg. *InnoPran XL* dosing form is designed to be given once daily at bedtime. *Antiarrhythmic*—10–30 mg 3–4 times daily. *Prevention of MI*—180–240 mg/day in divided doses. *Hypertrophic cardiomyopathy*—20–40 mg 3–4 times daily. *Adjunct therapy of pheochromocytoma*—20 mg 3 times daily to 40 mg 3–4 times daily concurrently with alpha-blocking therapy, started 3 days before surgery is planned. *Vascular headache prevention*—20 mg 4 times daily *or* 80 mg/day as extended/sustained-release capsules; may be ↑ as needed up to 240 mg/day. *Management of tremor*—40 mg twice daily; may be ↑ up to 120 mg/day (up to 320 mg have been used).
PO (Children): *Antihypertensive/antiarrhythmic*—0.5–1 mg/kg/day in 2–4 divided doses; may be ↑ as needed (usual range for maintenance dose is 2–4 mg/kg/day in 2 divided doses).
PO (Children 5 wk–5 mo): *Infantile hemangioma*—0.6 mg/kg twice daily (at least 9 hr apart); after 1 wk, ↑ to 1.1 mg/kg twice daily; after another wk, ↑ to 1.7 mg/kg twice daily and maintain for 6 mo.
IV (Adults): *Antiarrhythmic*—1–3 mg; may be repeated after 2 min and again in 4 hr if needed.
IV (Children): *Antiarrhythmic*—10–100 mcg (0.01–0.1 mg)/kg (up to 1 mg/dose); may be repeated every 6–8 hr if needed.

Availability (generic available)

Immediate-release tablets: 10 mg, 20 mg, 40 mg, 60 mg, 80 mg. **Extended-release capsules:** 60 mg, 80 mg, 120 mg, 160 mg. **Oral solution:** 20 mg/5 mL, 40 mg/5 mL. **Oral solution (Hemangeol):** 4.28 mg/mL. **Solution for injection:** 1 mg/mL. ***In combination with:*** hydrochlorothiazide (generic only).

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during dose adjustment period and periodically during therapy.
- Abrupt withdrawal of propranolol may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia. Drug should be tapered over a 2-wk period before discontinuation. Assess patient carefully during tapering and after medication is discontinued. Consider that patients taking propranolol for non-cardiac indications may have undiagnosed cardiac disease. Abrupt discontinuation or withdrawal over too-short a period of time (less than 9 days) should be avoided.
- Pedi: Assess pediatric patients for signs and symptoms of hypoglycemia, particularly when oral foods and fluids are restricted.
- Patients receiving **propranolol IV** must have continuous ECG monitoring and may have pulmonary capillary wedge pressure (PCWP) or central venous

© F.A. Davis Publishing

pressure (CVP) monitoring during and for several hrs after administration.
- Assess for orthostatic hypotension when assisting patient up from supine position.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Angina:** Assess frequency and characteristics of anginal attacks periodically during therapy.
- **Vascular Headache Prophylaxis:** Assess frequency, severity, characteristics, and location of vascular headaches periodically during therapy.
- **PTSD:** Assess frequency of symptoms (flashbacks, nightmares, efforts to avoid thoughts or activities that may trigger memories of the trauma, and hypervigilance) periodically throughout therapy.
- **Infantile Hemangioma:** Monitor heart rate and BP for 2 hr after propranolol initiation or dose increases. May worsen bradycardia or hypotension. Discontinue if severe (<80 beats per min) or symptomatic bradycardia or hypotension (systolic BP <50 mmHg) occurs.
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↓ or ↑ in blood glucose levels. In labile diabetic patients, hypoglycemia may be accompanied by precipitous ↑ of BP.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.
- Hypotension may be treated with modified Trendelenburg position and IV fluids unless contraindicated. Vasopressors (epinephrine, norepinephrine, dopamine, dobutamine) may also be used. Hypotension does not respond to beta agonists.
- Glucagon has been used to treat bradycardia and hypotension.

Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous. Before administering intravenously, have second practitioner independently check the original order, dose calculations, and infusion pump settings. Also, patient harm or fatalities have occurred when switching from oral to IV *propranolol*; oral and parenteral doses are not interchangeable. IV dose is 1/10 of the oral dose. Change to oral therapy as soon as possible.
- ***High Alert:*** Do not confuse propranolol with Pravachol. Do not confuse Inderal (propranolol) with Adderall (an amphetamine/dextroamphetamine combination drug).
- **PO:** Take apical pulse prior to administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify physician or other health care professional.
- Administer with meals or directly after eating to enhance absorption.
- Swallow extended release tablets whole; do not crush, break, or chew. *Propranolol tablets* may be crushed and mixed with food.
- Administer *Innopran XL* tablets at bedtime and take consistently either on an empty stomach for with food. Avoid discontinuing abruptly, especially in patients with ischemic heart disease. Gradually decrease dose over 1–2 wk. If angina markedly worsens or acute coronary insufficiency develops, promptly resume therapy, at least temporarily and take other measures for management of unstable angina.
- Mix propranolol oral solution with liquid or semi-solid food (water, juices, applesauce, puddings). To ensure entire dose is taken, rinse glass with more liquid or have patient consume all of the applesauce or pudding. Do not store after mixing.
- Administer *Hemangeol* during or right after a feeding to prevent hypoglycemia. Skip dose if child is not eating or vomiting. Administer using oral syringe provided; if necessary may be diluted in small amount of milk or fruit juice and given in baby's bottle.

IV Administration

- **IV Push:** ***Dilution:*** Administer undiluted or dilute each 1 mg in 10 mL of D5W for injection. ***Concentration:*** Undiluted: 1 mg/mL. Diluted in 10 mL of D5W: 0.1 mg/mL. ***Rate:*** Administer at 0.5 mg/ min for adults to avoid hypotension and cardiac arrest; do not exceed 1 mg/min. Pedi: Administer over 10 min.
- **Intermittent Infusion:** ***Dilution:*** May be diluted in 50 mL of 0.9% NaCl, D5W, D5/0.45% NaCl, D5/0.9% NaCl, or lactated Ringer's injection. ***Concentration:*** Depends on dose. ***Rate:*** Infuse over 10–15 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, alteplase, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cis-

© F.A. Davis Publishing

platin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methadone, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, dantrolene, diazepam, indomethacin, insulin, regular, mitomycin, paclitaxel, pantoprazole, phenytoin, piperacillin/tazobactam, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 4 hr before next dose (8 hr with extended-release propranolol). Inform patient that abrupt withdrawal can cause life-threatening arrhythmias, hypertension, or myocardial ischemia. Advise parent to read medication guide prior to starting and with each Rx refill in case of changes in *Hemangeol*.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse daily and BP biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or BP changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially NSAIDs and cold preparations, concurrently with this medication.
- Advise diabetic patients to closely monitor blood sugar, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask some signs of hypoglycemia, but dizziness and sweating may still occur. Acute hypertension may occur following insulin-induced hypoglycemia in patients receiving propranolol. Instruct parents/caregivers of children receiving *Hemangeol* how to recognize signs of hypoglycemia, and to notify health care professional and take child to nearest emergency department if hypoglycemia is suspected.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Monitor neonates exposed to propranolol during pregnancy for bradycardia, hypoglycemia, and respiratory depression. May cause erectile dysfunction in males.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.
- **Angina:** Caution patient to avoid overexertion with decrease in chest pain.
- **Vascular Headache Prophylaxis:** Caution patient that sharing this medication may be dangerous.
- **PTSD:** Advise patient that medication may relieve distressing symptoms but that psychotherapy is the

© F.A. Davis Publishing

primary treatment for the disorder. Refer patient and family to a PTSD support group.

Evaluation/Desired Outcomes

- Decrease in BP.
- Control of arrhythmias without appearance of detrimental side effects.
- Reduction in frequency of anginal attacks.
- Increase in activity tolerance.
- Prevention of MI.
- Prevention of vascular headaches.
- Management of thyrotoxicosis.
- Management of pheochromocytoma.
- Decrease in tremors.
- Management of hypertrophic cardiomyopathy.
- Decrease in symptoms associated with PTSD.
- Resolution of Infantile hemangioma (propranolol only).

propylthiouracil

(proe-pill-thye-oh-**yoor**-a-sill)

Propyl-Thyracil

Classification

Therapeutic: antithyroid agents

Pharmacologic: thioamides

Indications

Patients with Graves' disease with hyperthyroidism or toxic multinodular goiter who are intolerant to methimazole and for whom surgery or radioactive iodine therapy is not appropriate. Adjunct in the control of hyperthyroidism in preparation for thyroidectomy or radioactive iodine therapy in patients who are intolerant to methimazole.

Action

Inhibits the synthesis of thyroid hormones. **Therapeutic Effects:** Decreased signs and symptoms of hyperthyroidism.

Pharmacokinetics

Absorption: Rapidly absorbed from the GI tract.
Distribution: Concentrates in the thyroid gland; crosses the placenta and enters breast milk in low concentrations.
Metabolism and Excretion: Metabolized by the liver.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (effects on clinical thyroid status)

ROUTE	ONSET	PEAK	DURATION
PO	10–21 days†	6–10 wk	wk

†Effects on serum thyroid hormone concentration may occur within 60 min of a single dose.

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: ↓ bone marrow reserve; OB: May be used during 1st trimester (consider using methimazole during 2nd and 3rd trimesters); however, fetus may develop thyroid problems; mother and fetus may be at ↑ risk for hepatotoxicity; Lactation: Enters breast milk (safety not established); Geri: May have ↑ sensitivity; should initiate therapy with lowest dose; Pedi: Children <6 yr (safety not established); not recommended unless methimazole not tolerated and surgery or radioactive iodine therapy not appropriate.

Adverse Reactions/Side Effects

CV: edema, vasculitis. **GI:** HEPATOTOXICITY, nausea, vomiting, diarrhea, loss of taste. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, exfoliative dermatitis, hair loss, skin discoloration, urticaria. **Endo:** hypothyroidism. **GU:** glomerulonephritis. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, BLEEDING, leukopenia, thrombocytopenia. **MS:** arthralgia, myalgia. **Neuro:** drowsiness, headache, paresthesia, vertigo. **Resp:** interstitial pneumonitis. **Misc:** fever, lymphadenopathy, parotitis, splenomegaly.

Interactions

Drug-Drug: Additive bone marrow depression with **antineoplastics** or **radiation therapy**. Additive antithyroid effects with **lithium**, or **potassium iodide**. ↑ risk of agranulocytosis with **phenothiazines**.

Route/Dosage

PO (Adults): 100 mg every 8 hr; may be ↑ to 400 mg/day (occasional patient may require 600–900 mg/day); usual maintenance dose = 100–150 mg/day.
PO (Children >10 yr): 50–300 mg/day given once daily or in 2–4 divided doses.
PO (Children 6–10 yr): 50–150 mg/day given once daily or in 2–4 divided doses.

Availability (generic available)

Tablets: 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Monitor response of symptoms of hyperthyroidism or thyrotoxicosis (tachycardia, palpitations, nervousness, insomnia, fever, diaphoresis, heat intolerance, tremors, weight loss, diarrhea).
- Assess patient for development of hypothyroidism (intolerance to cold, constipation, dry skin, headache, listlessness, tiredness, or weakness). Dose adjustment may be required.
- Assess patient for skin rash or swelling of cervical lymph nodes. Treatment may be discontinued if this occurs.

© F.A. Davis Publishing

- ***Lab Test Considerations:*** Thyroid function studies should be monitored prior to therapy, monthly during initial therapy, and every 2–3 mo throughout therapy.
- WBC and differential counts should be monitored periodically throughout therapy. Agranulocytosis may develop rapidly and usually occurs during first 2 mo. This necessitates discontinuation of therapy.
- May cause increased AST, ALT, LDH, alkaline phosphatase, serum bilirubin, and prothrombin time.

Implementation

- Do not confuse propylthiouracil with Purinethol (mercaptopurine).
- Can be compounded by pharmacist into enema or suppository.
- **PO:** Administer at same time in relation to meals every day. Food may either increase or decrease absorption.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed, around the clock. If a dose is missed, take as soon as remembered; take both doses together if almost time for next dose; check with health care professional if more than 1 dose is missed. Consult health care professional prior to discontinuing medication.
- Instruct patient to monitor weight 2–3 times weekly. Report significant changes.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional regarding dietary sources of iodine (iodized salt, shellfish).
- Advise patient to report sore throat, fever, chills, headache, malaise, weakness, yellowing of eyes or skin, unusual bleeding or bruising, symptoms of hyperthyroidism or hypothyroidism, or rash to health care professional promptly.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to carry identification describing medication regimen at all times and to notify health care professional of medication regimen prior to treatment or surgery.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of routine exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Decrease in severity of symptoms of hyperthyroidism (lowered pulse rate and weight gain).
- Return of thyroid function studies to normal.
- May be used as short-term adjunctive therapy to prepare patient for thyroidectomy or radiation therapy or may be used in treatment of hyperthyroidism. Treatment of 6 mo to several yr may be necessary, usually averaging 1 yr.

protamine sulfate
(**proe**-ta-meen)

Classification
Therapeutic: antidotes
Pharmacologic: antiheparins

Indications

Acute management of severe heparin overdosage. Used to neutralize heparin received during dialysis, cardiopulmonary bypass, and other procedures. **Unlabeled Use:** Management of overdose of heparin-like compounds.

Action

A strong base that forms a complex with heparin (an acid). **Therapeutic Effects:** Inactivation of heparin.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Metabolic fate not known. Protamine-heparin complex eventually degrades.
Half-life: Unknown.

TIME/ACTION PROFILE (reversal of heparin effect)

ROUTE	ONSET	PEAK	DURATION
IV	30 sec–1 min	unknown	2 hr†

†Depends on body temperature.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to protamine or fish.
Use Cautiously in: Patients who have received previous protamine-containing insulin or vasectomized men (↑ risk of hypersensitivity reactions); OB, Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects

Resp: dyspnea. **CV:** bradycardia, hypertension, hypotension, pulmonary hypertension. **GI:** nausea, vomiting. **Derm:** flushing, warmth. **Hemat:** bleeding. **MS:** back pain. **Misc:** hypersensitivity reactions, including ANAPHYLAXIS, ANGIOEDEMA , and PULMONARY EDEMA.

Interactions

Drug-Drug: None significant.

Route/Dosage

IV (Adults and Children): *Heparin overdose*— 1 mg/100 units of heparin. If given >30 min after heparin, give 0.5 mg/100 units of heparin (not to exceed 100 mg/2 hr). Further doses should be determined by

© F.A. Davis Publishing

coagulation tests. If heparin was administered subcutaneously, use 1–1.5 mg protamine per 100 units of heparin, give 25–50 mg of the protamine dose slowly followed by a continuous infusion over 8–16 hr. *Enoxaparin overdose*— 1 mg/each mg of enoxaparin to be neutralized (unlabeled). *Dalteparin overdose*— 1 mg/100 anti-Xa IU of dalteparin. If required, a 2nd dose of 0.5 mg/100 anti-Xa IU of dalteparin may be given 2–4 hr later if laboratory assessment indicates need (unlabeled).

Availability (generic available)

Injection: 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for bleeding and hemorrhage throughout therapy. Hemorrhage may recur 8–9 hr after therapy because of rebound effects of heparin. Rebound may occur as late as 18 hr after therapy in patients heparinized for cardiopulmonary bypass.
- Assess for allergy to fish (salmon), previous reaction to or use of protamine insulin or protamine sulfate. Vasectomized and infertile men also have higher risk of hypersensitivity reaction.
- Observe patient for signs and symptoms of hypersensitivity reaction (hives, edema, coughing, wheezing). Keep epinephrine, an antihistamine, and resuscitative equipment close by in the event of anaphylaxis.
- Assess for hypovolemia before initiation of therapy. Failure to correct hypovolemia may result in cardiovascular collapse from peripheral vasodilating effects of protamine sulfate.
- ***Lab Test Considerations:*** Monitor clotting factors, activated clotting time (ACT), activated partial thromboplastin time (aPTT), and thrombin time (TT) 5–15 min after therapy and again as necessary.

Implementation

- Do not confuse protamine with Protonix (pantoprazole).
- Discontinue heparin infusion. In milder cases, overdosage may be treated by heparin withdrawal alone.
- In severe cases, fresh frozen plasma or whole blood may also be required to control bleeding.
- Dose varies with type of heparin, route of heparin therapy, and amount of time elapsed since discontinuation of heparin.
- Do not administer >100 mg in 2 hr without rechecking clotting studies, as protamine sulfate has its own anticoagulant properties.

IV Administration

- **IV Push:** ***Dilution:*** May be administered undiluted. If further dilution is desired, D5W or 0.9% NaCl may be used. ***Concentration:*** 10 mg/mL. ***Rate:*** Administer by slow IV push over 1–3 min. Rapid infusion rate may result in hypotension, bradycardia, flushing, or feeling of warmth. If these symptoms occur, stop infusion and notify physician. No more than 50 mg should be administered within a 10-min period.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, ascorbic acid, atropine, azathioprine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, ceftazidime, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, erythromycin, esmolol, famotidine, fentanyl, fluconazole, ganciclovir, gentamicin, glycopyrrolate, imipenem/cilastatin, isoproterenol, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine, metaraminol, methoxamine, methyldopate, metoclopramide, metoprolol, midazolam, morphine, multivitamins, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxytocin, papaverine, phentolamine, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, pyridoxime, sodium bicarbonate, succinylcholine, sufentanil, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, verapamil.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, ampicillin, ampicillin/sulbactam, cefazolin, cefotaxime, cefoxitin, ceftazidime, cefuroxime, chloramphenicol, dantrolene, dexamethasone sodium phosphate, diazepam, diazoxide, folic acid, furosemide, heparin, hydrocortisone sodium succinate, indomethacin, insulin, ketorolac, methylprednisolone sodium succinate, nafcillin, oxacillin, penicillin G, pentamidine, pentobarbital, phenobarbital, phenytoin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Explain purpose of the medication to patient. Instruct patient to report recurrent bleeding immediately.
- Advise patient to avoid activities that may result in bleeding (shaving, brushing teeth, receiving injections or rectal temperatures, or ambulating) until risk of hemorrhage has passed.

Evaluation/Desired Outcomes

- Control of bleeding.
- Normalization of clotting factors in heparinized patients.

prucalopride (proo-kal-oh-pride)

Motegrity, Resotran

Classification

Therapeutic: prokinetic agents
Pharmacologic: 5-HT_4 agonists

© F.A. Davis Publishing

Indications
Treatment of chronic idiopathic constipation (CIC).

Action
Acts as a selective serotonin type 4 ($5\text{-}HT_4$) receptor agonist, which stimulates colonic peristalsis and leads to increased bowel motility. **Therapeutic Effects:** Increased frequency of complete spontaneous bowel movements.

Pharmacokinetics
Absorption: >90% absorbed following oral administration.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Primarily excreted by the kidneys, with 60–65% being excreted unchanged in the urine, and 5% in feces.
Half-life: 24 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Intestinal perforation or obstruction, obstructive ileus, Crohn's disease, ulcerative colitis, or toxic megacolon/megarectum; End-stage renal disease requiring dialysis.
Use Cautiously in: Depression; Severe renal impairment (CCr <30 mL/min) (↓ dose); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; Geri: May need to ↓ dose in older adults due to age-related ↓ in renal function.

Adverse Reactions/Side Effects
GI: abdominal pain, diarrhea, nausea, abdominal distension, flatulence, vomiting. **Neuro:** SUICIDAL THOUGHTS/BEHAVIOR, headache, depression, dizziness, fatigue.

Interactions
Drug-Drug: None reported.

Route/Dosage
PO (Adults): 2 mg once daily.

Renal Impairment
PO (Adults): *CCr <30 mL/min*— 1 mg once daily.

Availability
Tablets: 1 mg, 2 mg.

NURSING IMPLICATIONS
Assessment
- Assess bowel sounds and frequency, quantity, and consistency of stools periodically during therapy.
- Monitor for signs and symptoms of persistent worsening of depression or the emergence of suicidal thoughts and behaviors.

Implementation
- **PO:** Administer once daily without regard to food.

Patient/Family Teaching
- Instruct patient to take prucalopride as directed. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient and family members to discontinue prucalopride and notify health care professional immediately if suicidal ideation and behavior (unusual changes in mood or behavior, persistent worsening of depression, feeling sad or hopeless, thoughts or attempts at self harm, emergence of suicidal thoughts or behavior) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to prucalopride during pregnancy. Register patients by contacting MotherToBaby Pregnancy Studies conducted by the Organization of Teratology Information Specialists (OTIS) at 1-877-311-8972 or visiting https://mothertobaby.org/pregnancy-studies/.

Evaluation/Desired Outcomes
- Increased frequency of complete spontaneous bowel movements.

pseudoephedrine
(soo-doe-e-**fed**-rin)
Silfedrine Children's, Sudafed 12 Hour, Sudafed 24 Hour, Sudafed Children's, SudoGest, SudoGest 12 Hour

Classification
Therapeutic: allergy, cold, and cough remedies, nasal drying agents/decongestants
Pharmacologic: adrenergics, alpha adrenergic agonists

Indications
Symptomatic management of nasal congestion associated with acute viral upper respiratory tract infections. Used in combination with antihistamines in the management of allergic conditions. Used to open obstructed eustachian tubes in chronic otic inflammation or infection.

Action
Stimulates alpha- and beta-adrenergic receptors. Produces vasoconstriction in the respiratory tract mucosa (alpha-adrenergic stimulation) and possibly bronchodilation ($beta_2$-adrenergic stimulation). **Therapeutic Effects:** Reduction of nasal congestion, hyperemia, and swelling in nasal passages.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Appears to enter the CSF; probably crosses the placenta and enters breast milk.
Metabolism and Excretion: Partially metabolized by the liver. 55–75% excreted unchanged by the kidneys (depends on urine pH).
Half-life: Children: 3.1 hr; Adults: 9–16 hr (depends on urine pH).

TIME/ACTION PROFILE (decongestant effects)

ROUTE	ONSET	PEAK	DURATION
PO	15–30 min	unknown	4–6 hr
PO-ER	60 min	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to sympathomimetic amines; Hypertension, severe coronary artery disease; Concurrent MAO inhibitor therapy; Known alcohol intolerance (some liquid products).
Use Cautiously in: Hyperthyroidism; Diabetes mellitus; Prostatic hyperplasia; Ischemic heart disease; Glaucoma; OB, Lactation: Safety not established; Pedi: Avoid OTC cough and cold products containing this medication in children <4 yr.

Adverse Reactions/Side Effects

Neuro: SEIZURES, anxiety, nervousness, dizziness, drowsiness, excitability, fear, hallucinations, headache, insomnia, restlessness, weakness. **Resp:** respiratory difficulty. **CV:** CARDIOVASCULAR COLLAPSE, palpitations, hypertension, tachycardia. **GI:** anorexia, dry mouth. **GU:** dysuria. **Misc:** diaphoresis.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may cause hypertensive crisis. Additive adrenergic effects with other **adrenergics**. Concurrent use with **beta blockers** may result in hypertension or bradycardia. **Drugs that acidify the urine** may ↓ effectiveness. **Phenothiazines** and **tricyclic antidepressants** potentiate pressor effects. **Drugs that alkalinize the urine (sodium bicarbonate, high-dose antacid therapy)** may intensify effectiveness.
Drug-Food: Foods that acidify the urine may ↓ effectiveness. **Foods that alkalinize the urine** may intensify effectiveness (see lists in Appendix J).

Route/Dosage

PO (Adults and Children >12 yr): 60 mg every 6 hr as needed (not to exceed 240 mg/day) *or* 120 mg extended-release preparation every 12 hr *or* 240 mg extended-release preparation every 24 hr.
PO (Children 6–12 yr): 30 mg every 6 hr as needed (not to exceed 120 mg/day).
PO (Children 4–5 yr): 15 mg every 6 hr (not to exceed 60 mg/day).

Availability (generic available)

Tablets: 30 mg[OTC], 60 mg[OTC]. **Extended-release tablets:** 120 mg[OTC], 240 mg[OTC]. **Capsules:** 🍁 60 mg[OTC]. **Extended-release capsules:** 🍁 240 mg[OTC]. **Liquid (grape and others):** 15 mg/5 mL[OTC], 30 mg/5 mL[OTC]. ***In combination with:*** antihistamines, acetaminophen, cough suppressants, and expectorants[OTC]. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess congestion (nasal, sinus, eustachian tube) before and periodically during therapy.
- Monitor pulse and BP before beginning therapy and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.

Implementation

- Do not confuse Sudafed with sotalol or Sudafed PE. Do not confuse Sudafed 12 Hour with Sudafed 12 Hour Pressure + Pain.
- Administer pseudoephedrine at least 2 hr before bedtime to minimize insomnia.
- **PO:** Extended-release tablets and capsules should be swallowed whole; do not crush, break, or chew. Contents of the capsule can be mixed with jam or jelly and swallowed without chewing for patients with difficulty swallowing.

Patient/Family Teaching

- Instruct patient to take medication as directed and not to take more than recommended. Take missed doses within 1 hr; if remembered later, omit. Do not double doses. Caution parents to avoid OTC cough and cold products while breast feeding or to children <4 yr.
- Instruct patient to notify health care professional if nervousness, slow or fast heart rate, breathing difficulties, hallucinations, or seizures occur, because these symptoms may indicate overdose.
- Instruct patient to contact health care professional if symptoms do not improve within 7 days or if fever is present.

Evaluation/Desired Outcomes

- Decreased nasal, sinus, or eustachian tube congestion.

pyrazinamide
(peer-a-**zin**-a-mide)
🍁 Tebrazid

Classification
Therapeutic: antituberculars

© F.A. Davis Publishing

Indications
Used in combination with other agents in the treatment of active tuberculosis.

Action
Converted to pyrazinoic acid in susceptible strains of Mycobacterium which lowers the pH of the environment. **Therapeutic Effects:** Bacteriostatic action against susceptible mycobacteria. **Spectrum:** Active against mycobacteria only.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Widely distributed. Reaches high concentrations in the CNS (same as plasma). Excreted in breast milk.
Protein Binding: 50%.
Metabolism and Excretion: Mostly metabolized by the liver. Metabolite (pyrazinoic acid) has antimycobacterial activity; 3–4% excreted unchanged by the kidneys.
Half-life: *Pyrazinamide*—9.5 hr. *Pyrazinoic acid*—12 hr. Both are ↑ in renal impairment.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr (4–5 hr†)	24 hr

†For pyrazinoic acid.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Cross-sensitivity with ethionamide, isoniazid, niacin, or nicotinic acid may exist; Severe liver impairment.
Use Cautiously in: Gout; Renal failure; Diabetes mellitus; Acute intermittent porphyria; OB: Use during pregnancy only if clearly needed; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects
GI: HEPATOTOXICITY, anorexia, diarrhea, nausea, vomiting. **GU:** dysuria. **Derm:** acne, itching, photosensitivity, rash. **Hemat:** anemia, thrombocytopenia. **Metab:** hyperuricemia. **MS:** arthralgia, gouty arthritis.

Interactions
Drug-Drug: Concurrent use with **rifampin** may result in life-threatening hepatotoxicity and should be avoided. May ↓ blood levels and effectiveness of **cyclosporine**. May ↓ effectiveness of **antigout agents**.

Route/Dosage
PO (Adults and Children): 15–30 mg/kg/day as a single dose. Up to 60 mg/kg/day has been used in isoniazid-resistant tuberculosis (not to exceed 2 g/day as a single dose or 3 g/day in divided doses). May also be given as 50–70 mg/kg 2–3 times weekly (not to exceed 2 g/dose on daily regimen, 3 g/dose for 3-times-weekly regimen, or 4 g/dose for twice-weekly regimen). *Patients with HIV*—20–40 mg/kg/day for first 2 mo of therapy (maximum: 2 g/day); further dosing depends on regimen employed.

Availability (generic available)
Tablets: 500 mg.

NURSING IMPLICATIONS

Assessment
- Perform mycobacterial studies and susceptibility tests before and periodically during therapy to detect possible resistance.
- ***Lab Test Considerations:*** Evaluate hepatic function before and every 2–4 wk during therapy. Increased AST and ALT may not be predictive of clinical hepatitis and may return to normal levels during treatment. Patients with impaired liver function should receive pyrazinamide therapy only if crucial to treatment.
- Monitor serum uric acid concentrations during therapy. May cause ↑ resulting in precipitation of acute gout.
- May interfere with urine ketone determinations.

Implementation
- **PO:** May be given concurrently with isoniazid.

Patient/Family Teaching
- Advise patient to take medication as directed and not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for next dose. Emphasize the importance of continuing therapy even after symptoms have subsided. Length of therapy depends on regimen being used and underlying disease states.
- Inform diabetic patients that pyrazinamide may interfere with urine ketone measurements.
- Advise patients to notify health care professional if no improvement is noticed after 2–3 wk of therapy or if fever, anorexia, malaise, nausea, vomiting, darkened urine, yellowish discoloration of the skin and eyes, pain, or swelling of the joints occurs.
- Advise patients to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Monitor infants exposed to pyrazinamide via breast milk for jaundice.
- Emphasize the importance of regular follow-up exams to monitor progress and check for side effects.

Evaluation/Desired Outcomes
- Resolution of signs and symptoms of tuberculosis.
- Negative sputum cultures.

© F.A. Davis Publishing

BEERS

QUEtiapine (kwet-eye-a-peen)

SEROquel, SEROquel XR

Classification

Therapeutic: antipsychotics, mood stabilizers

Indications

Schizophrenia. Depressive episodes with bipolar disorder. Acute manic episodes associated with bipolar I disorder (as monotherapy [for adults or adolescents] or with lithium or divalproex [adults only]). Maintenance treatment of bipolar I disorder (with lithium or divalproex). Adjunctive treatment of depression.

Action

Probably acts by serving as an antagonist of dopamine and serotonin. Also antagonizes histamine H_1 receptors and alpha$_1$-adrenergic receptors. **Therapeutic Effects:** Decreased manifestations of psychoses, depression, or acute mania.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Extensively metabolized by the liver (mostly by P450 CYP3A4 enzyme system) to norquetiapine (active metabolite with anticholinergic properties); <1% excreted unchanged in the urine.
Half-life: 6 hr.

TIME/ACTION PROFILE (antipsychotic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	8–12 hr
PO-XR	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of agents that prolong the QT interval, including dofetilide, sotalol, quinidine, disopyramide, amiodarone, dronedarone, thioridazine, chlorpromazine, droperidol, moxifloxacin, mefloquine, pentamidine, arsenic trioxide, tacrolimus, ziprasidone, erythromycin, citalopram, escitalopram, and clarithromycin (↑ risk of serious arrhythmias); History of arrhythmias, including bradycardia; Hypokalemia or hypomagnesemia (↑ risk of serious arrhythmias); Congenital long QT syndrome (↑ risk of serious arrhythmias).

Use Cautiously in: Cardiovascular disease, cerebrovascular disease, dehydration or hypovolemia (↑ risk of hypotension); History of seizures or Alzheimer's dementia; Diabetes (may ↑ risk of hyperglycemia); Patients at risk for aspiration pneumonia or falls; Hepatic impairment (dose ↓ may be necessary); Hypothyroidism (may be exacerbated); History of suicide attempt; Low white blood cell count or history of drug-induced leukopenia/neutropenia (↑ risk of leukopenia/neutropenia); Urinary retention, prostatic hypertrophy, constipation, or ↑ intraocular pressure; OB: Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents; Geri: Older adults may require ↓ doses; ↑ risk of mortality and stroke in older adults treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CV: ↑ BP (children), palpitations, peripheral edema, postural hypotension. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, sweating. **EENT:** ear pain, rhinitis, pharyngitis. **Endo:** weight gain, hyperglycemia, hyperlipidemia, hyperprolactinemia, hypertriglyceridemia, hypothyroidism. **GI:** GI OBSTRUCTION, PANCREATITIS, anorexia, constipation, dry mouth, dyspepsia. **GU:** ↓ fertility (females). **Hemat:** AGRANULOCYTOSIS, ↓ hemoglobin, leukopenia, neutropenia. **MS:** rhabdomyolysis. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, dizziness, cognitive impairment, extrapyramidal symptoms, sedation, tardive dyskinesia. **Resp:** cough, dyspnea. **Misc:** flu-like syndrome.

Interactions

Drug-Drug: Concurrent use of **macrolide antibiotics (erythromycin, clarithromycin), dofetilide, sotalol, quinidine, disopyramide, procainamide, thioridazine, chlorpromazine, droperidol, gemifloxacin, moxifloxacin, mefloquine, pentamidine, arsenic trioxide, citalopram, escitalopram, tacrolimus,** and **ziprasidone** ↑ the risk of serious ventricular arrhythmias and should be avoided. ↑ CNS depression may occur with **alcohol, antihistamines, opioid analgesics,** and **sedative/hypnotics**. ↑ risk of hypotension with acute ingestion of **alcohol** or **antihypertensives**. **Phenytoin** and **thioridazine** ↑ clearance and ↓ effectiveness of quetiapine (dose change may be necessary); similar effects may occur with **carbamazepine, barbiturates, rifampin,** or **corticosteroids**. Effects may be ↑ by **ketoconazole, itraconazole, fluconazole, protease inhibitors,** or **erythromycin**, as well as by other **agents that inhibit the cytochrome P450 CYP3A4 enzyme**. Concurrent use of **anticholinergic medications** may ↑ risk of anticholinergic adverse reactions.

© F.A. Davis Publishing

Route/Dosage

Schizophrenia

PO (Adults): *Immediate-release*—25 mg twice daily on Day 1, ↑ by 25–50 mg 2–3 times daily on Days 2 and 3, up to 300–400 mg/day in 2–3 divided doses by Day 4 (not to exceed 800 mg/day); *Extended-release*—300 mg once daily, ↑ by 300 mg/day (not to exceed 800 mg/day); elderly patients or patients with hepatic impairment should be started on immediate-release product and converted to extended-release product once effective dose is reached.
PO (Children 13–17 yr): *Immediate-release*—25 mg twice daily on Day 1, ↑ to 50 mg twice daily on Day 2, then ↑ to 100 mg twice daily on Day 3, then ↑ to 150 mg twice daily on Day 4, then ↑ to 200 mg twice daily on Day 5; may then ↑ by no more than 100 mg/day (not to exceed 800 mg/day).

Acute Manic Episodes Associated With Bipolar I Disorder

PO (Adults): *Immediate-release*—50 mg twice daily on Day 1, then ↑ to 100 mg twice daily on Day 2, then ↑ to 150 mg twice daily on Day 3, then ↑ to 200 mg twice daily on Day 4; may then ↑ by no more than 200 mg/day up to 400 mg twice daily on Day 6 if needed; *Extended-release*—300 mg once daily on Day 1, then 600 mg once daily on Day 2, then 400–800 mg once daily starting on Day 3.
PO (Children 10–17 yr): *Immediate-release*—25 mg twice daily on Day 1, then ↑ to 50 mg twice daily on Day 2, then ↑ to 100 mg twice daily on Day 3, then ↑ to 150 mg twice daily on Day 4, then ↑ to 200 mg twice daily on Day 5; may then ↑ by no more than 100 mg/day (not to exceed 600 mg/day).

Acute Depressive Episodes Associated With Bipolar Disorder

PO (Adults): *Immediate-release or extended-release*—50 mg once daily at bedtime on Day 1, then ↑ to 100 mg daily at bedtime on Day 2, then ↑ to 200 mg daily at bedtime on Day 3, then ↑ to 300 mg daily at bedtime thereafter.

Maintenance Treatment of Bipolar I Disorder

PO (Adults): Continue at the dose required to maintain symptom remission (usual dosage: 400–800 mg/day given as once daily dose [extended-release] or in two divided doses [immediate-release]).
PO (Children 10–17 yr): Continue at the lowest dose required to maintain symptom remission.

Depression

PO (Adults): *Extended-release*—50 mg once daily on Days 1 and 2, then ↑ to 150 mg once daily starting on Day 3 (not to exceed 300 mg/day).

Availability (generic available)

Immediate-release tablets: 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg. **Cost:** *Generic*—25 mg $17.59/100, 100 mg $26.94/100, 200 mg $39.30/100. **Extended-release tablets:** 50 mg, 150 mg, 200 mg, 300 mg, 400 mg. **Cost:** 50 mg $460.84/60, 150 mg $827.50/60, 200 mg $910.78/60, 300 mg $1,194.14/60, 400 mg $1,403.42/60.

NURSING IMPLICATIONS

Assessment

- Monitor mental status (mood, orientation, behavior) before and periodically during therapy.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr.
- Assess weight and BMI initially and during therapy.
- Monitor BP (sitting, standing, lying) and pulse before and frequently during initial dose titration. If hypotension occurs during dose titration, return to the previous dose.
- Observe patient carefully to ensure medication is swallowed and not hoarded or cheeked.
- Monitor for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like faces, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation may be necessary. Trihexyphenidyl or benztropine may be used to control these symptoms.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Monitor for signs of pancreatitis (nausea, vomiting, anorexia, persistent severe abdominal pain, sometimes radiating to the back) during therapy.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling), associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.

© F.A. Davis Publishing

- ***Lab Test Considerations:*** May cause asymptomatic ↑ in AST and ALT.
- May also cause anemia, thrombocytopenia, leukocytosis, and leukopenia.
- May cause ↑ total cholesterol and triglycerides.
- Obtain fasting blood glucose and cholesterol levels initially and throughout therapy.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Implementation

- Do not confuse quetiapine with olanzapine. Do not confuse Seroquel with Seroquel XR, Serzone (nefazodone), or Sinequan (doxepin).
- If therapy is reinstituted after an interval of ≥1 wk off, follow initial titration schedule.
- **PO:** May be administered without regard to food. Extended-release tablets should be swallowed whole, do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Consult health care professional prior to stopping quetiapine; should be discontinued gradually. Stopping abruptly may cause insomnia, nausea, and vomiting.
- Advise patient and caregiver that quetiapine should not be given to elderly patients with dementia-related psychosis; may ↑ risk of death.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid extremes in temperature; this drug impairs body temperature regulation.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications and alcohol, especially other CNS depressants.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Refer patient for nutritional, weight, or medical management of dyslipidemia as indicated.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly of sore throat, fever, unusual bleeding or bruising, constipation, or rash.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding. Encourage women who become pregnant while taking quetiapine to enroll in the National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/. Monitor neonates for extrapyramidal and/or withdrawal symptoms and manage symptoms appropriately. May lead to temporary, reversible infertility in females.
- Emphasize importance of routine follow-up exams to monitor side effects and continued participation in psychotherapy as indicated to improve coping skills. Ophthalmologic exams should be performed before and every 6 mo during therapy.

Evaluation/Desired Outcomes

- Decrease in excited, manic, behavior.
- Decrease in signs of depression in patients with bipolar disorder.
- Decrease in manic episodes in patients with bipolar I disorder.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decrease in negative symptoms (social withdrawal, flat, blunt affect) of schizophrenia.

quinapril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

© F.A. Davis Publishing

© F.A. Davis Publishing

BEERS

RABEprazole (ra-bep-ra-zole)

Aciphex, ~~Aciphex Sprinkle~~, Pariet

Classification

Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

Indications

Gastroesophageal reflux disease (GERD). Duodenal ulcers (including combination therapy with clarithromycin and amoxicillin to eradicate *Helicobacter pylori* and prevent recurrence). Pathological hypersecretory conditions, including Zollinger-Ellison syndrome.

Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis. Decreased acid secretion in hypersecretory conditions.

Pharmacokinetics

Absorption: Delayed-release tablet is designed to allow rabeprazole, which is not stable in gastric acid, to pass through the stomach intact. Subsequently 52% is absorbed after oral administration.
Distribution: Unknown.
Protein Binding: 96.3%.
Metabolism and Excretion: Mostly metabolized by the CYP3A4 and CYP2C19 isoenzymes in the liver; (the CYP2C19 enzyme system exhibits genetic polymorphism; 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ rabeprazole concentrations and an ↑ risk of adverse effects); 10% excreted in feces; remainder excreted in urine as inactive metabolites.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (acid suppression)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	unknown	24 hr†

†Suppression continues to increase over the first wk of therapy.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to rabeprazole or related drugs (benzimidazoles); Concurrent use of rilpivirine.
Use Cautiously in: Severe hepatic impairment (dose reduction may be necessary); Patients using high-doses for >1 yr (↑ risk of hip, wrist, or spine fractures and fundic gland polyps); Patients using therapy for >3 yr (↑ risk of vitamin B_{12} deficiency); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

Derm: cutaneous lupus erythematosus, photosensitivity, rash. **F and E:** hypomagnesemia (especially if treatment duration ≥3 mo). **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), abdominal pain, constipation, diarrhea, fundic gland polyps, nausea. **GU:** acute tubulointerstitial nephritis. **Hemat:** vitamin B_{12} deficiency. **MS:** bone fracture, neck pain. **Neuro:** dizziness, headache, malaise. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, or tubulointerstitial nephritis), chills, fever, systemic lupus erythematosus.

Interactions

Drug-Drug: Rabeprazole is metabolized by the CYP450 enzyme system and may interact with other drugs metabolized by this system. May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **atazanavir**, **iron salts**, **erlotinib**, **dasatinib**, **nelfinavir**, **nilotinib**, **rilpivirine**, and **mycophenolate mofetil**; concurrent use with **rilpivirine** contraindicated; avoid concurrent use with **nelfinavir**. May ↑ levels of **digoxin**, **methotrexate**, **saquinavir**, and **tacrolimus**. Hypomagnesemia ↑ risk of **digoxin** toxicity. May ↑ the risk of bleeding with **warfarin** (monitor INR/PT).

Route/Dosage

Gastroesophageal Reflux Disease

PO (Adults): *Healing of erosive or ulcerative GERD*—20 mg once daily for 4–8 wk; *Maintenance of healing of erosive or ulcerative GERD*—20 mg once daily; *Symptomatic GERD*—20 mg once daily for 4 wk (additional 4 wk may be considered for non-responders).
PO (Children ≥12 yr): *Short-term treatment of symptomatic GERD*—20 mg once daily for up to 8 wk.
PO (Children 1–11 yr): *≥15 kg*—10 mg once daily for up to 12 wk (given as sprinkle); *<15 kg*—5 mg once daily for up to 12 wk (given as sprinkle); may ↑ up to 10 mg once daily if inadequate response.

Duodenal Ulcers

PO (Adults): *Healing of duodenal ulcers*—20 mg once daily for up to 4 wk.

H. pylori Eradication to Reduce the Risk of Duodenal Ulcer Recurrence (Triple Therapy)

PO (Adults): 20 mg twice daily for 7 days, with amoxicillin 1000 mg twice daily for 7 days and clarithromycin 500 mg twice daily for 7 days.

R

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Pathological Hypersecretory Conditions Including Zollinger-Ellison Syndrome

PO (Adults): 60 mg once daily initially, may be adjusted as needed and continued as necessary; doses up to 100 mg daily or 60 mg twice daily have been used.

Availability (generic available)

Delayed-release capsules (sprinkle): 10 mg. **Delayed-release tablets:** 10 mg, 20 mg.

NURSING IMPLICATIONS

Assessment

- Assess routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** Monitor CBC with differential periodically during therapy.
- May cause hypomagnesemia. Monitor serum magnesium prior to and periodically during therapy.

Implementation

- ***High Alert:*** Do not confuse rabeprazole with aripiprazole. Do not confuse Aciphex with Accupril or Aricept.
- **PO:** Administer doses before meals, preferably in the morning. Tablets should be swallowed whole; do not break, crush, or chew.
- Capsules may be opened and sprinkled on a small amount of soft food (apple sauce, fruit, or vegetable-based baby food, yogurt) or empty contents into small amount of liquid (infant formula, apple juice, pediatric electrolyte solution). Food or liquid should be at or below room temperature. Whole dose should be taken within 15 min of being sprinkled. Granules should not be chewed or crushed. Dose should be taken 30 min before a meal. Do not store mixture for future use.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- May cause occasional drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Caution patients to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Instruct patient to notify health care professional of onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache or if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy.
- Decrease in symptoms of GERD. Therapy is continued for 4–8 wk after initial episode.

raloxifene (ra-lox-i-feen)

Evista

Classification

Therapeutic: bone resorption inhibitors
Pharmacologic: selective estrogen receptor modulators

Indications

Treatment and prevention of osteoporosis in postmenopausal women. Reduction of the risk of breast cancer in postmenopausal women with osteoporosis and those at high risk for invasive breast cancer.

Action

Binds to estrogen receptors, producing estrogen-like effects on bone, resulting in reduced resorption of bone and decreased bone turnover. **Therapeutic Effects:** Prevention of osteoporosis in patients at risk. Decreased risk of breast cancer.

Pharmacokinetics

Absorption: Although well absorbed (>60%), after oral administration, extensive first-pass metabolism results in 2% bioavailability.
Distribution: Highly bound to plasma proteins; remainder of distribution unknown.
Protein Binding: Highly bound to plasma proteins.
Metabolism and Excretion: Extensively metabolized by the liver; undergoes enterohepatic cycling; excreted primarily in feces.
Half-life: 27.7 hr.

TIME/ACTION PROFILE (effects on bone turnover)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 mo	unknown

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of thromboembolic events; OB: May cause fetal harm (not indicated for women of reproductive potential; avoid use in pregnancy); Lactation: Not indicated for women of reproductive potential (avoid use during breast feeding); Pedi: Safety not established.

Use Cautiously in: Potential immobilization (↑ risk of thromboembolic events); History of stroke or transient ischemic attack; Atrial fibrillation; Hypertension; Cigarette smoking.

Adverse Reactions/Side Effects

CV: THROMBOEMBOLISM. **EENT:** retinal vein thrombosis. **MS:** leg cramps. **Neuro:** STROKE. **Misc:** hot flashes.

Interactions

Drug-Drug: Cholestyramine ↓ absorption (avoid concurrent use). May alter effects of **warfarin** and other **highly protein-bound drugs**. Concurrent systemic **estrogen** therapy is not recommended.

Route/Dosage

PO (Adults): 60 mg once daily.

Availability (generic available)

Tablets: 60 mg. **Cost:** $630.76/100.

NURSING IMPLICATIONS

Assessment

- Assess patient for bone mineral density with x-ray, serum, and urine bone turnover markers (bone-specific alkaline phosphatase, osteocalcin, and collagen breakdown products) before and periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ apolipoprotein A-I and reduced serum total cholesterol, LDL cholesterol, fibrinogen, apolipoprotein B, and lipoprotein.
- May cause ↑ hormone-binding globulin (sex steroid-binding globulin, thyroxine-binding globulin, corticosteroid-binding globulin) with ↑ total hormone concentrations.
- May cause small ↓ in serum total calcium, inorganic phosphate, total protein, and albumin.
- May also cause slight decrease in platelet count.

Implementation

- **PO:** May be administered without regard to meals.
- Calcium supplementation should be added to diet if daily intake is inadequate.

Patient/Family Teaching

- Instruct patient to take raloxifene as directed. Discuss the importance of adequate calcium and vitamin D intake or supplementation. Instruct patient to read the *Medication Guide* when initiating therapy and again with each prescription refill in case of changes.
- Advise patient to discontinue smoking and alcohol consumption.
- Emphasize the importance of regular weight-bearing exercise. Advise patient that raloxifene should be discontinued at least 72 hr before and during prolonged immobilization (recovery from surgery, prolonged bedrest). Instruct patient to avoid prolonged restrictions of movement during travel because of the increased risk of venous thrombosis.
- Advise patient that raloxifene will not reduce hot flashes or flushes associated with estrogen deficiency and may cause hot flashes.
- Instruct patient to notify health care professional immediately if leg pain or a feeling of warmth in the lower leg (calf); swelling of the legs, hands, or feet; sudden chest pain; shortness of breath or coughing up blood; or sudden change in vision, such as loss of vision or blurred vision occur. Being still for a long time (sitting still during a long car or airplane trip, being in bed after surgery) can increase risk of blood clots.
- Advise patient that raloxifene may have teratogenic effects. Instruct patient to notify health care provider immediately if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Prevention of osteoporosis in postmenopausal women.
- Reduced risk of breast cancer in postmenopausal women with osteoporosis and those at high risk for invasive breast cancer.

R

raltegravir (ral-**teg**-ra-veer)

Isentress, Isentress HD

Classification

Therapeutic: antiretrovirals

Pharmacologic: integrase strand transfer inhibitors (INSTIs)

Indications

HIV-1 infection (with other antiretrovirals).

Action

Inhibits HIV-1 integrase, which is required for viral replication. **Therapeutic Effects:** Evidence of decreased viral replication and reduced viral load with slowed progression of HIV and its sequelae.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the uridine diphosphate glucuronosyltransferase (UGT) A1A enzyme system; 23% excreted in urine as parent drug and metabolite.

© F.A. Davis Publishing

Half-life: 9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 hr	12 hr

Contraindications/Precautions

Contraindicated in: Lactation: Breast feeding not recommended in patients with HIV.

Use Cautiously in: Concurrent use of medications associated with rhabdomyolysis/myopathy (may ↑ risk); Phenylketonuria (chewable tablets contain phenylalanine); OB: Considered a preferred integrase strand transfer inhibitor for pregnant patients living with HIV who are antiretroviral-naïve, who have had antiretroviral therapy in the past but are restarting or who require a new antiretroviral therapy regimen; Pedi: Preterm neonates (safety and effectiveness not established); Geri: Choose dose carefully, considering concurrent disease states, drug therapy, and age-related ↓ in hepatic and renal function.

Adverse Reactions/Side Effects

CV: MYOCARDIAL INFARCTION. **Derm:** STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), rash. **GI:** diarrhea, abdominal pain, gastritis, hepatitis, nausea, vomiting. **GU:** renal failure/impairment. **Hemat:** anemia, neutropenia. **Metab:** lipodystrophy. **MS:** RHABDOMYOLYSIS, ↑ creatine kinase, myopathy. **Neuro:** SUICIDAL THOUGHTS, headache, depression, dizziness, fatigue, insomnia, weakness. **Misc:** fever, hypersensitivity reactions, immune reconstitution syndrome.

Interactions

Drug-Drug: Concurrent use with **strong inducers of the UGT A1A enzyme system** including **rifampin** may ↓ blood levels and effectiveness. Concurrent use with **strong inhibitors of the UGT A1A enzyme system** including **atazanavir** may ↑ blood levels. ↑ risk of rhabomyolysis/myopathy **HMG-CoA reductase inhibitors**. **Proton pump inhibitors** may ↑ levels. **Efavirenz**, **etravirine**, and **tipranavir/ritonavir** may ↓ levels. Administration with **antacids**, containing **magnesium** or **aluminum** ↓ absorption of raltegravir; separate administration of raltegravir and magnesium- or aluminum-containing antacids by ≥6 hr.

Route/Dosage

Do not substitute the chewable tablets or oral suspension for the film-coated tablets.

PO (Adults): *Treatment-naïve patients or patients who are virologically suppressed on an initial regimen of raltegravir 400 mg twice daily* — Two 600-mg tablets (1200 mg) once daily or 400 mg twice daily; *Treatment-experienced patients* — 400 mg twice daily; *Concurrent use of rifampin (either treatment-naïve or treatment-experienced patients)* — 800 mg twice daily.

PO (Children ≥40 kg and either treatment-naïve or virologically suppressed on an initial regimen of raltegravir 400 mg twice daily): *Tablet* — Two 600-mg tablets (1200 mg) once daily or 400 mg twice daily; *Chewable tablets* — 300 mg twice daily.

PO (Children 28–39 kg): *Tablet* — 400 mg twice daily; *Chewable tablets (if unable to swallow tablet)* — 200 mg twice daily.

PO (Children 25–27 kg): *Tablet* — 400 mg twice daily; *Chewable tablets (if unable to swallow tablet)* — 150 mg twice daily.

PO (Children ≥4 wk and 20–<25 kg): *Chewable tablets* — 150 mg twice daily.

PO (Children ≥4 wk and 14–19 kg): *Oral suspension* — 100 mg twice daily; *Chewable tablets* — 100 mg twice daily.

PO (Children ≥4 wk and 10–13 kg): *Oral suspension* — 80 mg twice daily; *Chewable tablets* — 75 mg twice daily.

PO (Children ≥4 wk and 8–9 kg): *Oral suspension* — 60 mg twice daily; *Chewable tablets* — 50 mg twice daily.

PO (Children ≥4 wk and 6–7 kg): *Oral suspension* — 40 mg twice daily; *Chewable tablets* — 50 mg twice daily.

PO (Children ≥4 wk and 4–5 kg): *Oral suspension* — 30 mg twice daily; *Chewable tablets* — 25 mg twice daily.

PO (Children ≥4 wk and 3–<4 kg): *Oral suspension* — 25 mg twice daily; *Chewable tablets* — 25 mg twice daily.

PO (Neonates 1–4 wk and 4–<5 kg): *Oral suspension* — 15 mg twice daily.

PO (Neonates 1–4 wk and 3–<4 kg): *Oral suspension* — 10 mg twice daily.

PO (Neonates 1–4 wk and 2–<3 kg): *Oral suspension* — 8 mg twice daily.

PO (Neonates 0–1 wk and 4–<5 kg): *Oral suspension* — 7 mg once daily.

PO (Neonates 0–1 wk and 3–<4 kg): *Oral suspension* — 5 mg once daily.

PO (Neonates 0–1 wk and 2–<3 kg): *Oral suspension* — 4 mg once daily.

Availability

Tablets: 400 mg, 600 mg. **Chewable tablets (orange-banana):** 25 mg, 100 mg. **Packet for oral suspension (banana-flavor):** 100 mg/pkt.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Monitor for anxiety, depression (especially in patients with a history of psychiatric illness), suicidal ideation, and paranoia during therapy.
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accom-

© F.A. Davis Publishing

panied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** Monitor viral load and CD4 counts regularly during therapy.
- May cause ↓ ANC, hemoglobin, and platelet counts.
- May cause ↑ serum glucose, AST, ALT, GGT, total bilirubin, alkaline phosphatase, pancreatic amylase, serum lipase, and CK concentrations.

Implementation
- Tablets are not interchangeable with chewable tablets or packets for oral suspension.
- **PO:** May be administered without regard to meals.
- Swallow tablets whole; do not break, crush, or chew.
- Chewable tablets may be chewed or swallowed. For children with difficulty chewing the 25 mg chewable tablet, tablet may be crushed. Place the tablet(s) in a small, clean cup. For each tablet, add a teaspoonful (5 mL) of liquid (water, juice, breast milk). Within 2 min, tablet(s) will absorb liquid and fall apart. Using a spoon, crush any remaining pieces of the tablet(s). Immediately administer the entire dose orally. If any portion of dose is left in the cup, add another teaspoonful (5 mL) of liquid, swirl and administer immediately.
- *Oral suspension:* Pour packet for oral solution into 10 mL of water and mix in provided mixing cup. Gently swirl for 45 sec until mix is uniform; do not shake. Once mixed, administer with syringe orally within 30 min of mixing. Discard unused solution.

Patient/Family Teaching
- Emphasize the importance of taking raltegravir as directed, at evenly spaced times throughout day. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses. Advise patient to read *Patient Information* sheet before starting therapy and with each Rx renewal in case of changes.
- Instruct patient that raltegravir should not be shared with others.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient that raltegravir does not cure AIDS or prevent associated or opportunistic infections. Raltegravir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of raltegravir are unknown at this time.
- Advise patient to notify health care professional if they develop any unusual symptoms, if any known symptom persists or worsen, or if signs and symptoms of rhabdomyolysis (unexplained muscle pain, tenderness, weakness), rash, or depression or suicidal thoughts occur.
- Immune reconstitution syndrome may trigger opportunistic infections or autoimmune disorders. Notify health care professional if symptoms occur.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected. Inform pregnant women about the pregnancy exposure registry to monitor pregnancy outcomes. Enroll patient in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263. Advise female patient to avoid breast feeding during therapy.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

ramipril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

R

ramucirumab
(ra-mue-**sir**-ue-mab)
Cyramza

Classification
Therapeutic: antineoplastics
Pharmacologic: vascular endothelial growth factor antagonists

Indications
Advanced gastric cancer or gastroesophageal junction adenocarcinoma following unsuccessful combination treatment that included a fluoropyrimidine or platinum compound (as monotherapy or in combination with paclitaxel). First-line treatment of metastatic non–small-cell lung cancer (NSCLC) in patients whose tumors have epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 (L858R) substitution mutations (in combination with erlotinib). Metastatic NSCLC with disease progression on or after platinum-based chemotherapy (in combination with docetaxel). Metastatic colorectal cancer (CRC) with disease progression on or after treatment with bevacizumab, oxaliplatin, and a fluoropyrimidine (in combination with iri-

© F.A. Davis Publishing

notecan, folinic acid, and 5–fluorouracil [FOLFIRI]). Hepatocellular carcinoma (HCC) in patients with an alpha fetoprotein of ≥400 ng/mL who have been previously treated with sorafenib.

Action

A monoclonal antibody that binds to vascular endothelial growth factor receptor 2 (VEGFR 2), antagonizing its effects, resulting in decreased angiogenesis. **Therapeutic Effects:** Decreased growth and spread of gastric cancer, gastroesophageal junction adenocarcinoma, NSCLC, CRC, and HCC.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (improved survival)

ROUTE	ONSET	PEAK	DURATION
IV	within 1 mo	7–8 mo	24 mo

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Child-Pugh Class B or C cirrhosis (use only if benefits outweigh risk of further deterioration); Surgery (discontinue prior to surgery, reinstate when healing is complete); Serious or non-healing wounds; Hypertension (must be controlled prior to treatment); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: CARDIAC ARREST, MI, hypertension. **Derm:** impaired wound healing. **Endo:** hypothyroidism. **F and E:** hyponatremia. **GI:** GASTROINTESTINAL OBSTRUCTION/PERFORATION, diarrhea, worsened cirrhosis/hepatorenal syndrome, diarrhea. **GU:** ↓ fertility (females), nephrotic syndrome, proteinuria. **Hemat:** BLEEDING, neutropenia. **Neuro:** POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), STROKE, encephalopathy, headache. **Misc:** INFUSION-RELATED REACTIONS, impaired wound healing.

Interactions

Drug-Drug: ↑ risk of bleeding with **anticoagulants**, **antiplatelet agents** and **NSAIDs**.

Route/Dosage

Gastric Cancer or Hepatocellular Carcinoma

IV (Adults): 8 mg/kg every 2 wk until disease progression or unacceptable toxicity.

Non–Small-Cell Lung Cancer

IV (Adults): *First-line treatment in tumors with EGFR exon 19 deletions or exon 21 (L858R) substitution mutations*— 10 mg/kg every 2 wk until disease progression or unacceptable toxicity; *Disease progression on or after platinum-based therapy*— 10 mg/kg on Day 1 of a 21-day cycle prior to docetaxel; continued until disease progression or unacceptable toxicity.

Colorectal Cancer

IV (Adults): 8 mg/kg every 2 wk prior to FOLFIRI administration; continued until disease progression or unacceptable toxicity.

Availability

Solution for injection (requires dilution): 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for infusion-related reactions (rigors/tremors, back pain/spasms, chest pain and/or tightness, chills, flushing, dyspnea, wheezing, hypoxia, paresthesia, bronchospasm, supraventricular tachycardia, hypotension) during infusion. Reduce infusion rate by 50% for Grade 1 or 2 reactions, and immediately and permanently discontinue ramucirumab if Grade 3 or 4 reactions occur.
- Monitor BP prior to and at least every 2 wk during therapy. Hold therapy for severe hypertension until BP is under control. Permanently discontinue if unable to control hypertension.
- Avoid administration for at least 28 days prior to and 28 days after surgery or until wound is healed.
- If arterial thromboembolic events (myocardial infarction, cardiac arrest, cerebrovascular accident, cerebral ischemia), permanently discontinue.
- Monitor for signs and symptoms of bleeding (bleeding, lightheadedness) during therapy. *If Grade 3 or 4 bleeding occurs,* permanently discontinue medication.
- Monitor for signs and symptoms of gastrointestinal perforation (severe diarrhea, vomiting, severe abdominal pain) during therapy. Discontinue medication permanently if perforation occurs.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor urinary protein periodically during therapy. Hold ramucirumab for urine protein ≥2 g/24 hr. Reinitiate therapy at reduced dose (reduce 8 mg dose to 6 mg/kg and 10 mg to 8 mg) every 2 wk once urinary protein levels <2 g/24 hr. If protein level returns to ≥2 g/24 hr hold therapy until urine protein <2 g per 24 hr and reduce dose (reduce 6 mg to 5 mg/kg and 8 mg to 6 mg) every 2 wk once urinary protein levels return to <2 g/24 hr. Discontinue therapy permanently if urine protein level >3 g/24 hr or if nephrotic syndrome occurs.

Implementation

- Hold ramucirumab therapy for at least 4 wk before elective surgery and for at least 2 wk after major surgery until adequate wound healing occurs.
- Prior to each dose, premedicate all patients with IV histamine H_1 antagonist (diphenhydramine). Preme-

© F.A. Davis Publishing

dicate patients who have experienced a Grade 1 or 2 infusion reaction with dexamethasone and acetaminophen prior to each infusion.

IV Administration

- **Intermittent Infusion:** Withdraw required volume from vial. ***Dilution:*** Dilute with 0.9% NaCl for a final volume of 250 mL. Do not use dextrose-containing solutions. Gently invert to ensure adequate mixing. Solution is clear to slightly opalescent and colorless to slightly yellow; do not administer solutions that are discolored or contain particulate material. Solution is stable for 24 hr if refrigerated or 4 hr at room temperature. Discard unused solution. ***Rate:*** Infuse over 60 min via infusion pump through a separate infusion line using a 0.22 micron filter; do not administer as IV push or bolus. Flush line with 0.9% NaCl at end of infusion. If 1st infusion is tolerated, administer all subsequent infusions over 30 min.
- **Y-Site Incompatibility:** Do not dilute with other solutions or infuse with other electrolyte solutions or medications.

Patient/Family Teaching

- Explain purpose of ramucirumab to patient.
- Advise patient to notify health care professional if bleeding or lightheadedness occur.
- Instruct patient in self BP monitoring and advise patient to notify health care professional if signs and symptoms of hypertension (elevated BP, severe headache, lightheadedness, neurologic symptoms) or if severe diarrhea, vomiting, or severe abdominal pain occur.
- Advise patient to notify health care professional of medication regimen prior to surgery; must be stopped for at least 4 wk before elective surgery and for at least 2 wk after major surgery until adequate wound healing occurs; may impair wound healing.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for at least 3 mo after last dose and avoid breast feeding for 2 mo after last dose. Notify health care professional if pregnancy is suspected. Advise patient that ramucirumab may impair fertility in females.

Evaluation/Desired Outcomes

- Decreased growth and spread of cancer.

ranolazine (ra-**nole**-a-zeen)

Ranexa

Classification

Therapeutic: antianginals

Indications

Chronic angina pectoris.

Action

Does not ↓ BP or heart rate; remainder of mechanism is not known. **Therapeutic Effects:** Decreased frequency of angina.

Pharmacokinetics

Absorption: Highly variable.
Distribution: Unknown.
Metabolism and Excretion: Metabolized in the gut (P-glycoprotein) and by the liver (primarily CYP3A and less by CYP2D6); <5% excreted unchanged in urine and feces.
Half-life: 7 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–5 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of potent inhibitors of CYP3A; Concurrent use of inducers of CYP3A; Hepatic impairment; Lactation: Lactation.
Use Cautiously in: Renal impairment; OB: Use only when potential benefit outweighs risk to fetus; Pedi: Safety and effectiveness not established; Geri: ↑ risk of adverse reactions in patients >75 yr.

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, palpitations, QTc prolongation. **EENT:** tinnitus. **GI:** abdominal pain, constipation, dry mouth, nausea, vomiting. **GU:** acute renal failure. **Neuro:** dizziness, headache.

Interactions

Drug-Drug: **Ketoconazole**, **itraconazole**, **clarithromycin**, **nefazodone**, **nelfinavir**, **ritonavir**, **indinavir**, and **saquinavir** significantly ↑ levels; concurrent use contraindicated. **Rifampin**, **rifabutin**, **rifapentin**, **phenobarbital**, **phenytoin**, and **carbamazepine** significantly ↓ levels; concurrent use contraindicated. **Verapamil**, **diltiazem**, **aprepitant**, **erythromycin**, and **fluconazole** ↑ levels (do not exceed ranolazine dose of 500 mg twice daily). **Cyclosporine** may ↑ levels. **Paroxetine** may ↑ levels. May ↑ levels of **simvastatin**. May ↓ metabolism and ↑ effects of **metoprolol**, **tricyclic antidepressants**, and **antipsychotics**; dosage adjustments may be necessary. May ↑ **digoxin** levels; dose adjustment may be required.
Drug-Natural Products: **St. John's wort** significantly ↓ levels (contraindicated).
Drug-Food: **Grapefruit juice** ↑ levels (do not exceed ranolazine dose of 500 mg twice daily).

Route/Dosage

PO (Adults): 500 mg twice daily initially, may be ↑ to 1000 mg twice daily.

Availability (generic available)

Extended-release tablets: 500 mg, 1000 mg.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess location, duration, intensity, and precipitating factors of anginal pain.
- Monitor ECG at baseline and periodically during therapy to evaluate effects on QT interval.
- ***Lab Test Considerations:*** Monitor renal function after starting and periodically during therapy in patients with moderate to severe renal impairment (CCr <60 mL/min) for ↑ serum creatinine accompanied by ↑ BUN. Usually has a rapid onset, but does not progress during therapy and is reversible with discontinuation of ranolazine. If acute renal failure develops, discontinue ranolazine.
- May cause transient eosinophilia.
- May cause small mean ↓ in hematocrit.

Implementation

- Ranolazine should be used in combination with amlodipine, beta blockers, or nitrates.
- Do not administer with grapefruit juice or grapefruit products.
- **PO:** May be administered without regard to food. Tablets should be swallowed whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take ranolazine as directed. If a dose is missed, take the usual dose at the next scheduled time; do not double doses. Explain to patient that ranolazine is used for chronic therapy and will not help an acute angina episode.
- Advise patient to avoid grapefruit juice and grapefruit products when taking ranolazine.
- May cause dizziness and light-headedness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if fainting occurs.
- Inform patient that ranolazine may cause changes in the ECG. Patient should inform health care professional if they have a personal or family history of QTc prolongation, congenital long QT syndrome, or proarrhythmic conditions such as hypokalemia.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in frequency of angina attacks.

rasagiline (ra-za-ji-leen)

Azilect

Classification

Therapeutic: antiparkinson agents
Pharmacologic: monoamine oxidase type B inhibitors

Indications

Parkinson's disease.

Action

Irreversibly inactivates monoamine oxidase (MAO) by binding to it at type B (brain sites); inactivation of MAO leads to increased amounts of dopamine available in the CNS. Differs from selegiline by its nonamphetamine characteristics. **Therapeutic Effects:** Improvement in symptoms of Parkinson's disease, allowing increase in function.

Pharmacokinetics

Absorption: 36% absorbed following oral administration.
Distribution: Readily crosses the blood-brain barrier.
Metabolism and Excretion: Extensively metabolized by the liver (CYP1A2 enzyme) to an inactive metabolite; less than 1% excreted in urine.
Half-life: 1.3 hr; does not correlate with duration of MAO-B inhibition.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1 hr	40 days*

*Recovery of MAO-B function.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent meperidine, tramadol, methadone, sympathomimetic amines, dextromethorphan, mirtazapine, cyclobenzaprine, cocaine, St. John's wort, or another MAO inhibitor; Moderate to severe hepatic impairment; Elective surgery requiring general anesthesia; allow 14 days after discontinuation; Pheochromocytoma; Psychotic disorder.

Use Cautiously in: Mild hepatic impairment (↑ blood levels); OB: Safety not established; Lactation: Use during breast feeding only if benefit to patient outweighs potential risk to infant; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: orthostatic hypotension (may ↑ levodopa-induced hypotension), ↑ BP, chest pain, syncope. **Derm:** alopecia, ecchymosis, ↑ melanoma risk, rash. **EENT:** conjunctivitis, rhinitis. **Endo:** weight loss. **GI:** anorexia, dizziness, dyspepsia, gastroenteritis, vomiting. **GU:** albuminuria, ↓ libido. **Hemat:** leukopenia. **MS:** arthralgia, arthritis, neck pain. **Neuro:** dyskinesia (may ↑ levodopa-induced dyskinesia), paresthesia, depression, dizziness, drowsiness, hallucinations, impulse control disorders (gambling, sexual), malaise, sleep driving, vertigo. **Resp:** asthma. **Misc:** fever, flu-like syndrome, ↑ fall risk.

Interactions

Drug-Drug: Concurrent use of **meperidine**, **tramadol**, **methadone**, or other **MAO inhibitors** may ↑ risk of serotonin syndrome; concurrent use contraindi-

© F.A. Davis Publishing

cated. **Ciprofloxacin** and other **inhibitors of the CYP1A2 enzyme** ↑ rasagiline levels; dose adjustment is recommended. Concurrent use with **dextromethorphan** may result in psychosis/bizarre behavior and should be avoided. ↑ risk of adverse reactions with **mirtazapine** and **cyclobenzapine**; concurrent use should be avoided. Hypertensive crisis may occur with **sympathomimetic amines** including **amphetamines**, **cold products**, and some **weight loss products** containing **vasoconstrictors** such as **pseudoephedrine**, **phenylephrine**, or **ephedrine**; avoid concurrent use. ↑ risk of serotonin syndrome with **tricyclic antidepressants**, **SSRIs**, and **SNRIs**; rasagiline should be discontinued ≥14 days prior to initiation of antidepressants (**fluoxetine** should be discontinued ≥5 wk prior to rasagiline therapy).

Drug-Natural Products: Risk of toxicity is ↑ with **St. John's wort**.

Drug-Food: Ingestion of foods containing high amounts of **tyramine** (>150 mg) (e.g., cheese) may result in life-threatening hypertensive crisis.

Route/Dosage

PO (Adults): *Monotherapy or as adjunct therapy in patients not taking levodopa*—1 mg once daily; *Concurrent levodopa therapy*—0.5 mg once daily, may ↑ to 1 mg once daily; *Concurrent ciprofloxacin or other CYP1A2 inhibitors*—0.5 mg once daily.

Hepatic Impairment

PO (Adults): *Mild hepatic impairment*—0.5 mg once daily.

Availability (generic available)

Tablets: 0.5 mg, 1 mg.

NURSING IMPLICATIONS

Assessment

- Assess signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxic gait) prior to and during therapy.
- Monitor BP periodically during therapy.
- Assess skin for melanomas periodically during therapy.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- ***Lab Test Considerations:*** May cause albuminuria, leukopenia, and abnormal liver function tests.
- ***Toxicity and Overdose:*** Concurrent ingestion of tyramine-rich foods and many medications may result in a life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, tachycardia or bradycardia, severe headache, neck stiffness or soreness, nausea and vomiting, sweating, photosensitivity, and enlarged pupils.

Implementation

- Do not confuse Azilect (rasagiline) with Aricept (donepezil).
- If used in combination with levodopa, a reduction in levodopa dose may be considered based on individual results.
- **PO:** Administer once daily.

Patient/Family Teaching

- Instruct patient to take rasagiline as directed. Missed doses should be omitted and next dose taken at usual time the following day. Do not double doses. Do not discontinue abruptly; may cause elevated temperature, muscular rigidity, altered consciousness, and autonomic instability.
- Caution patient to avoid alcohol, CNS depressants, and foods or beverages containing tyramine (see Appendix J) during and for at least 2 wk after therapy has been discontinued; they may precipitate a hypertensive crisis. Contact health care professional immediately if symptoms of hypertensive crisis or serotonin syndrome develop.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Caution patient to avoid use of St. John's wort and analgesics meperidine, tramadol, or methadone during therapy.
- Caution patient to avoid elective surgery requiring general anesthesia, cocaine, or local anesthesia containing sympathomimetic vasoconstrictors within 14 days of discontinuing rasagiline. If surgery is necessary sooner, benzodiazepines, rapacuronium, fentanyl, morphine, and codeine may be used cautiously.
- May cause dizziness or drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Geriatric patients are at increased risk for this side effect.
- Advise patient to monitor for melanomas frequently and on a regular basis.
- Caution patient to notify health care professional if new skin lesions, agitation, aggression, delirium, hallucinations, sleep driving, or new or increased gambling, sexual, or other intense urges occur.
- Advise patient to notify health care professional immediately if severe headache, neck stiffness, heart racing, or palpitations occur.
- Advise female patients to notify health care professionals if pregnancy is planned or suspected, or if breast feeding.

R

© F.A. Davis Publishing

Evaluation/Desired Outcomes
- Improvement in symptoms of Parkinson's disease, allowing increase in function.

rasburicase (ras-byoor-i-case)
Elitek, Fasturtec

Classification
Therapeutic: antigout agents, antihyperuricemics
Pharmacologic: enzymes

Indications
Initial management of increased uric acid levels in patients with leukemia, lymphoma, or other malignancies who are being treated with antineoplastics, which are expected to produce hyperuricemia.

Action
An enzyme that promotes the conversion of uric acid to allantoin, an inactive, water-soluble compound. Produced by recombinant DNA technology. **Therapeutic Effects:** Decreased sequelae of hyperuricemia (nephropathy, arthropathy).

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 18 hr.

TIME/ACTION PROFILE (↓ in uric acid)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	unknown	4–24 hr

Contraindications/Precautions
Contraindicated in: G6PD deficiency (↑ risk of severe hemolysis); Previous allergic reaction, hemolysis, or methemoglobinemia from rasburicase; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: None reported.

Adverse Reactions/Side Effects
Derm: rash. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, mucositis. **Hemat:** HEMOLYSIS, METHEMOGLOBINEMIA, neutropenia. **Neuro:** headache. **Resp:** respiratory distress. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever, sepsis.

Interactions
Drug-Drug: None known.

Route/Dosage
IV (Adults and Children): 0.2 mg/kg daily as a single dose for 5 days.

Availability
Lyophilized powder for injection: 1.5 mg/vial, 7.5 mg/vial.

NURSING IMPLICATIONS

Assessment
- Monitor patients for signs of allergic reactions and anaphylaxis (chest pain, dyspnea, hypotension, urticaria). If these signs occur, rasburicase should be immediately and permanently discontinued.
- ***Lab Test Considerations:*** Monitor patients for hemolysis. Screen patients at higher risk for G6PD deficiency (patients of African American or Mediterranean ancestry) prior to therapy. If hemolysis occurs, discontinue and do not restart rasburicase.
- Monitor patients for methemoglobinemia. Discontinue rasburicase and do not restart in patients who develop methemoglobinemia.
- May cause spuriously low uric acid levels in blood samples left at room temperature. Collect blood for uric acid levels in pre-chilled tubes containing heparin and immediately immerse and maintain in an ice water bath. Uric acid must be analyzed in plasma. Plasma samples must be assayed within 4 hr of collection.

Implementation
- Chemotherapy is initiated 4–24 hr after 1st dose of rasburicase.

IV Administration
- **Intermittent Infusion:** Determine number of vials of rasburicase needed based on patient's weight and dose/kg. ***Reconstitution:*** Reconstitute in diluent provided. Add 1 mL of diluent provided to each vial and mix by swirling very gently. Do not shake or vortex. Reconstitute 7.5 mg vial with 5 mL of diluent.Solution should be clear and colorless. Do not use solutions that are discolored or contain particulate matter. ***Dilution:*** Remove dose from reconstituted vials and inject into infusion bag of 0.9% NaCl for a final total volume of 50 mL. Administer within 24 hr of reconstitution. Store reconstituted or diluted solution in refrigerator for up to 24 hr. ***Rate:*** Administer over 30 min. Do not administer as a bolus.
- **Y-Site Incompatibility:** Infuse through a separate line. Do not use a filter with infusion. If separate line is not possible, flush line with at least 15 mL of 0.9% NaCl prior to rasburicase infusion.

Patient/Family Teaching
- Inform patient and family of purpose of rasburicase infusion.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during and for 2 wk after last dose.

Evaluation/Desired Outcomes
- Decrease in plasma uric acid levels in pediatric patients receiving antineoplastics expected to result in tumor lysis and subsequent elevation of plasma uric acid levels. More than 1 course of therapy or administration beyond 5 days is not recommended.

© F.A. Davis Publishing

regorafenib (re-goe-raf-e-nib)
Stivarga

Classification
Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications
Metastatic colorectal cancer (CRC) that has failed previous treatment that included a fluoropyrimidine, oxaliplatin, irinotecan, an anti-VEGF therapy, and additional anti-EGFR therapy if tumor is of the RAS wild type. Locally advanced, unresectable, or metastatic gastrointestinal stromal tumor (GIST) in patients who have previously been treated with imatinib and sunitinib. Hepatocellular carcinoma (HCC) in patients who have previously been treated with sorafenib.

Action
Inhibits kinases, which are responsible for many phases of cell function and proliferation. **Therapeutic Effects:** Decreased progression of HCC and metastatic CRC with improved survival. Decreased progression of GIST.

Pharmacokinetics
Absorption: Well absorbed following oral administration (69–83%).
Distribution: Unknown.
Protein Binding: *Regorafenib*—>99.5%, *M-2 metabolite*—99.8%, *M-5 metabolite*—99.95%.
Metabolism and Excretion: Highly metabolized (by CYP3A4 and UGT1A9), 2 metabolites (M-2 and M-5) have antineoplastic activity. Undergoes enterohepatic circulation.
Half-life: *Regorafenib*—28 hr (range 14–58 hr), *M-2 metabolite*—25 hr (range 14–32 hr), *M-5 metabolite*—51 hr (range 32–70 hr). 47% excreted in feces as parent compound, 24% as metabolites; 19% excreted in urine (mostly as inactive metabolites).

TIME/ACTION PROFILE (improved survival)

ROUTE	ONSET	PEAK	DURATION
PO	3 mo	3 mo	up to 10 mo

Contraindications/Precautions
Contraindicated in: Avoid strong CYP3A4 inducers/inhibitors; Severe hepatic impairment (Child-Pugh Class C); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: History of hypertension/cardiovascular disease (BP should be controlled prior to treatment); Elective surgical procedures (discontinue 2 wk prior to surgery); Asian patients (↑ risk of palmar-plantar erythrodysesthesia); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
CV: HYPERTENSION, MYOCARDIAL ISCHEMIA/INFARCTION. **Derm:** ERYTHEMA MULTIFORME (EM), PALMAR-PLANTAR ERYTHRODYSESTHESIA, STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), alopecia, impaired wound healing, rash. **EENT:** dysphonia. **Endo:** hypothyroidism. **F and E:** hypocalcemia, hypokalemia, hypophosphatemia, hyponatremia. **GI:** GASTROINTESTINAL FISTULA/PERFORATION, HEPATOTOXICITY, ↓ appetite, diarrhea, mucositis, altered taste, dry mouth, gastrointestinal reflux, ↑ transaminases. **GU:** proteinuria, ↓ fertility. **Hemat:** BLEEDING, THROMBOCYTOPENIA, anemia, lymphopenia. **Metab:** ↓ weight, ↑ lipase, ↑ amylase. **MS:** pain, musculoskeletal stiffness. **Neuro:** tremor, POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), fatigue, headache. **Misc:** INFECTION, HYPERSENSITIVITY REACTIONS, fever.

Interactions
Drug-Drug: Strong CYP3A4 inhibitors including **clarithromycin**, **itraconazole**, **ketoconazole**, **posaconazole**, and **voriconazole** ↑ levels and the risk of toxicity, avoid concurrent use. **Strong CYP3A4 inducers** including **carbamazepine**, **phenobarbital**, **phenytoin**, and **rifampin** ↓ levels and effectiveness, avoid concurrent use. May ↑ risk of bleeding with **warfarin**. May ↑ levels and risk of toxicity of **breast cancer resistance protein (BCRP) substrates**, including **methotrexate**, **fluvastatin**, or **atorvastatin**.
Drug-Natural Products: St. John's wort ↓ blood levels and effectiveness, avoid concurrent use.
Drug-Food: Grapefruit juice ↑ blood levels and the risk of toxicity, avoid concurrent use.

Route/Dosage
PO (Adults): 160 mg daily on days 1–21 of a 28-day cycle. Continue treatment until disease progression or unacceptable toxicity.

Availability
Tablets: 40 mg.

NURSING IMPLICATIONS
Assessment
- Monitor BP prior to and weekly during the first 6 wk, then every cycle of therapy. Do not initiate regorafenib until BP is well controlled.
- Assess for cardiac ischemia or infarction during therapy.
- Assess for bleeding during therapy. Interrupt therapy if severe hemorrhage occurs.
- Assess for rash periodically during therapy. May cause SJS or TEN. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue,

© F.A. Davis Publishing

muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (PRES) (seizures, headache, visual disturbances, confusion, altered mental function) during therapy. Diagnosis via MRI. Discontinue regorafenib in patients who develop PRES.
- ***Lab Test Considerations:*** Obtain liver function test (ALT, AST, bilirubin) before starting, at least every 2 wk during first 2 mo of therapy, and monthly thereafter. Monitor liver function tests weekly in patients with ↑ liver function tests until improvement to <3× the upper limit of normal or baseline.
- May cause anemia, thrombocytopenia, neutropenia, and lymphopenia.
- May cause hypocalcemia, hypokalemia, hyponatremia, and hypophosphatemia.
- May cause proteinuria, ↑ serum lipase, and ↑ serum amylase.
- May cause ↑ INR. Monitor INR levels more frequently in patients receiving warfarin.

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits. Therapy should be initiated by physician experienced in the treatment of patients with colorectal cancer.
- May impair wound healing. Hold therapy for at least 2 wk before elective surgery and for at least 2 wk after major surgery until adequate wound healing occurs.
- **PO:** Administer four 40 mg tablets once daily at same time of day with a whole glass of water for the first 21 days of each 28-day cycle. ***DNC:*** Swallow tablets whole with a low-fat meal that contains <30% fat and <600 calories.
- **Dose modifications:** *Interrupt therapy for* Grade 2 hand-foot skin reaction (HFSR) that is recurrent or does not improve in 7 days despite dose reduction; interrupt therapy for a minimum of 7 days for Grade 3 (HFSR), symptomatic Grade 2 hypertension, any Grade 3 or 4 adverse reactions.
- *Reduce dose to 120 mg daily for* 1st occurrence of Grade 2 HFSR of any duration, after 1st recovery of any Grade 3 or 4 adverse reaction, for Grade 3 ↑ AST or ALT; only resume if potential benefit outweighs risk of hepatotoxicity.
- *Reduce dose to 80 mg daily for* reoccurrence of Grade 2 HFSR at 120 mg dose, after recovery of any Grade 3 or 4 adverse reaction at 120 mg dose (except hepatotoxicity).
- *Discontinue regorafenib permanently for* failure to tolerate 80 mg dose, any occurrence of ↑ AST or ALT >20 × upper limit of normal, any occurrence of ↑ AST or ALT >3 × upper limit of normal with concurrent bilirubin >2 × upper limit of normal, reoccurrence of ↑ AST or ALT >5 × upper limit of normal despite reduction to 120 mg dose, any Grade 4 adverse reaction; only resume if the potential benefits outweigh the risks.

Patient/Family Teaching

- Instruct patient to take tablets at the same time each day with a low-fat meal. Take missed doses on the same day as soon as remembered; do not take 2 doses on the same day to make up for a missed dose. Store medicine in original container; do not place in daily or weekly pill boxes. Discard remaining tablets 28 days after opening bottle. Tightly close bottle after each opening and keep desiccant in bottle. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid drinking grapefruit juice or eating grapefruit during regorafenib therapy.
- Advise patient to notify health care professional immediately if signs and symptoms of liver problems (yellowing of skin or white part of eyes, nausea, vomiting, dark tea-colored urine, change in sleep pattern), bleeding, skin changes (redness, pain, blisters, bleeding, swelling), hypertension (severe headache, lightheadedness, neurologic symptoms), myocardial ischemia or infarction (chest pain, shortness of breath, dizziness, fainting), or GI perforation or fistula (severe abdominal pain, persistent swelling of abdomen, high fever, chills, nausea, vomiting, severe diarrhea, dehydration) occur.
- Advise patient to notify health care provider of therapy prior to surgery or if had recent surgery.
- Advise patient to maintain adequate hydration to minimize risk and to notify health care professional promptly if signs and symptoms of PRES (headache, seizures, weakness, confusion, high BP, blindness or change in vision, problems thinking) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Rep: May cause fetal harm. Advise women of reproductive potential and men of the need for effective contraception during and for at least 2 mo after completion of therapy. Notify health care provider immediately if pregnancy is planned or suspected and to avoid breast feeding during therapy.
- Emphasize importance of monitoring lab values to monitor for adverse reactions.

Evaluation/Desired Outcomes

- Decreased progression of HCC and metastatic CRC.
- Decreased progression of GIST.

remdesivir (rem-**de**-si-vir)
Veklury

Classification
Therapeutic: antivirals
Pharmacologic: nucleoside analogues

© F.A. Davis Publishing

Indications
Treatment of coronavirus 2019 (COVID-19) infection in patients requiring hospitalization.

Action
As an adenosine nucleotide prodrug, remdesivir is metabolized to an active nucleoside triphosphate metabolite, after being distributed into cells. Remdesivir triphosphate acts as an adenosine triphosphate (ATP) analog and competes with ATP for incorporation into RNA chains by the SARS-CoV-2 RNA-dependent RNA polymerase, which results in delayed chain termination during viral RNA replication. **Therapeutic Effects:** Reduced time to recovery (hospital discharge, hospitalized but not requiring supplemental oxygen and no longer requiring ongoing care) from COVID-19 infection.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Remdesivir is a prodrug that is metabolized intracellularly to the active metabolite, remdesivir triphosphate. Primarily excreted in urine (74%, 10% as unchanged drug), with 18% of drug being excreted in feces.
Half-life: *Nucleoside triphosphate metabolite*— 20 hr.

TIME/ACTION PROFILE (median time to recovery)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	11 days	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Severe renal impairment (eGFR<30 mL/min) (vehicle in both lyophilized powder and solution for injection formulations can accumulate resulting in toxicity).
Use Cautiously in: Hepatic impairment; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <12 yr or weighing <40 kg (safety and effectiveness not established).

Adverse Reactions/Side Effects
Endo: hyperglycemia. **GI:** nausea, constipation, ↑ liver enzymes. **GU:** acute kidney injury. **Hemat:** anemia. **Resp:** RESPIRATORY FAILURE. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever, infusion reactions.

Interactions
Drug-Drug: Chloroquine or **hydroxychloroquine** may ↓ antiviral effects; avoid concurrent use.

Route/Dosage
IV (Adults and Children ≥12 yr and ≥40 kg): 200 mg on Day 1, then 100 mg once daily starting on Day 2. Treatment duration = 10 days (patients requiring invasive mechanical ventilation and/or ECMO); 5 days (patients not requiring invasive mechanical ventilation and/or ECMO) (if these patients are not improving after 5 days, treatment may be continued for another 5 days).

Availability
Lyophilized powder for injection: 100 mg/vial. **Solution for injection:** 5 mg/mL.

NURSING IMPLICATIONS

Assessment
- Monitor for signs and symptoms of COVID-19 infection (fever, cough, shortness of breath) before and periodically during therapy.
- Monitor for signs and symptoms of hypersensitivity reactions (hypotension, tachycardia, bradycardia, dyspnea, wheezing, angioedema, rash, nausea, vomiting, diaphoresis, shivering) during therapy. Slowing infusion rate to maximum time of 120 min may prevent reactions. If clinically significant symptoms occur, immediately discontinue infusion and begin symptomatic treatment.
- ***Lab Test Considerations:*** Determine eGFR before starting therapy, Monitor renal function during therapy. Monitor hepatic function before starting and daily during remdesivir therapy. *If ALT ≥5 × ULN,* do not start remdesivir therapy. *If ALT ≥5 × ULN during therapy or ALT elevation accompanied by signs or symptoms of liver inflammation or increasing conjugated bilirubin, alkaline phosphatase, or INR,* hold dose. Resume when ALT <5 × ULN. Monitor prothrombin time before starting and during therapy.

Implementation
- Do not administer with chloroquine or hydroxychloroquine; may decrease antiviral activity.

IV Administration
- **Intermittent Infusion: Remdesivir powder for Injection, 100 mg:** ***Reconstitution:*** Reconstitute lyophilized powder with 19 mL of Sterile Water for Injection. Discard vial if vacuum does not pull Sterile Water for Injection into vial. Shake vial for 30 sec. Allow contents to settle for 2–3 min for a clear solution. If contents not completely dissolved, shake for 30 sec and allow to settle for 2–3 min. Repeat until solution is clear. ***Concentration:*** 5 mg/mL. Reconstituted solution is stable for 4 hr at room temperature or 24 hr if refrigerated. ***Dilution:*** Dilute with 100 mL or 250 mL of 0.9% NaCl. *For 200 mg dose,* withdraw and discard 40 mL from the 250 mL or 100 mL 0.9% NaCl infusion bag. Withdraw 40 mL of reconstituted solution and inject into infusion bag. *For 100 mg dose,* withdraw and discard 20 mL from the 250 mL or 100 mL 0.9% NaCl infusion bag. Withdraw 20 mL of reconstituted solution and inject into infusion bag. Gently invert bag 20 times to mix; do

R

© F.A. Davis Publishing

not shake. Solution is stable for 24 hr at room temperature or 48 hr if refrigerated. **Remdesivir solution for Injection, 100 mg/20 mL (5 mg/mL):** Allow vials to reach room temperature; stable for 12 hr at room temperature before dilution. Solution is clear and colorless to yellow; do not use solutions that are cloudy, discolored, or contain particulate matter. ***Dilution:*** *For 200 mg dose,* withdraw and discard 40 ml from 250 mL infusion bag of 0.9% NaCl. Inject 5 mL air into vial and withdraw 40 mL remdesivir solution; last 5 mL may require force to withdraw. Inject remdesivir solution into infusion bag. *For 100 mg dose,* withdraw and discard 20 ml from 250 mL infusion bag of 0.9% NaCl. Inject 10 mL air into vial and withdraw 20 mL remdesivir solution; last 5 mL may require force to withdraw. Inject remdesivir solution into infusion bag. Gently invert bag 20 times to mix; do not shake. Solution is stable for 24 hr at room temperature or 48 hr if refrigerated. ***Rate:*** *Infuse 250 mL* over 30 min for rate of 8.33 mL/min, over 60 min for rate of 4.17 mL/min, or over 120 min for rate of 2.08 mL/min. *Infuse 100 mL* over 30 min for rate of 3.33 mL/min, over 60 min for rate of 1.67 mL/min, or over 120 min for rate of 0.83 mL/min.

Patient/Family Teaching

- Explain purpose of remdesivir to patient.
- Advise patient to notify health care professional immediately if signs and symptoms of hypersensitivity reactions (low blood pressure, changes in heartbeat, shortness of breath, wheezing, swelling of lips, face, or throat, rash, nausea, vomiting, sweating, shivering) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially chloroquine or hydroxychloroquine.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding during therapy.

Evaluation/Desired Outcomes

- Reduced time to recovery (hospital discharge, hospitalized but not requiring supplemental oxygen and no longer requiring ongoing care) from SARS-CoV-2 infection.

reteplase, See THROMBOLYTIC AGENTS.

revefenacin (rev-e-fen-a-sin)

Yupelri

Classification

Therapeutic: bronchodilators
Pharmacologic: anticholinergics

Indications

Maintenance treatment of COPD (not for acute [rescue] use).

Action

Acts as an anticholinergic by inhibiting the M_3 receptor in bronchial smooth muscle, which leads to bronchodilation. **Therapeutic Effects:** Bronchodilation with lessened symptoms of COPD.

Pharmacokinetics

Absorption: 3% systemically absorbed following oral inhalation.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Rapidly hydrolyzed to an active metabolite. Primarily eliminated in feces (88%) with less than 5% excreted in urine.
Half-life: 22–70 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Nebulization	rapid	14–41 min	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hepatic impairment.
Use Cautiously in: Narrow-angle glaucoma; Prostatic hyperplasia or bladder neck obstruction; OB: Safety not established; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

Neuro: headache. **Resp:** cough, paradoxical bronchospasm. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: May ↑ risk of anticholinergic effects with other **anticholingerics**. **Rifampin** or **cyclosporine** may ↑ levels of active metabolite; concurrent use not recommended.

Route/Dosage

Inhaln (Adults): 175 mcg via nebulization once daily.

Availability

Inhalation solution: 175 mcg/3 mL.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced. Closely monitor patients on higher dose for adverse effects.
- Monitor pulmonary function tests before initiating and periodically during therapy to determine effectiveness.
- Observe for paradoxical bronchospasm (wheezing, dyspnea, tightness in chest) during therapy. If condi-

© F.A. Davis Publishing

tion occurs, hold medication and notify health care professional immediately.
- Monitor patient for signs of hypersensitivity reactions (rash, hives, severe itching, swelling of face, mouth, and tongue, difficulty breathing or swallowing) during therapy. Discontinue therapy and consider alternative if reaction occurs.

Implementation
- **Inhaln:** Administer once daily by oral inhalation via a standard jet nebulizer connected to an air compressor.

Patient/Family Teaching
- Instruct patient to use medication as directed. Do not discontinue therapy without discussing with health care professional, even if feeling better. Use a rapid-acting bronchodilator if symptoms occur before next dose is due. Caution patient not to use more than once a day; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication. Instruct patient to review *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Caution patient not to use medication to treat acute symptoms. Use a rapid-acting inhaled beta-adrenergic bronchodilator for relief of acute asthma attacks. Notify health care professional immediately if symptoms get worse or more inhalations than usual are needed from rescue inhaler.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or nausea, vomiting, shakiness, headache, fast or irregular heartbeat, sleeplessness, or signs and symptoms of narrow angle glaucoma (eye pain or discomfort, blurred vision, visual halos or colored images, red eyes) or urinary retention (difficulty passing urine, painful urination) occur.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products or alcohol concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes
- Bronchodilation with decreased airflow obstruction.

Rh_o(D) IMMUNE GLOBULIN
(arr aych oh dee im-**yoon glob** -yoo-lin)

Rh_o(D) immune globulin standard dose IM
HyperRHO S/D Full Dose, RhoGAM

Rh_o(D) immune globulin microdose IM
HyperRHO S/D Mini-Dose, MICRhoGAM, Mini-Gamulin R

Rh_o(D) immune globulin IV
WinRho SDF

Rh_o(D) immune globulin microdose IM, IV
Rhophylac

Classification
Therapeutic: vaccines/immunizing agents
Pharmacologic: immune globulins

Indications
IM, IV: Administered to Rh_o(D)-negative patients who have been exposed to Rh_o(D)-positive blood by: Pregnancy or delivery of a Rh_o(D)-positive infant, Abortion of a Rh_o(D)-positive fetus, Fetal-maternal hemorrhage due to amniocentesis, other obstetrical manipulative procedure, or intra-abdominal trauma while carrying a Rh_o(D)-positive fetus, Transfusion of Rh_o(D)-positive blood or blood products to a Rh_o(D)-negative patient. **IV:** Management of immune thrombocytopenic purpura (ITP).

Action
Prevent production of anti-Rh_o(D) antibodies in Rh_o(D)-negative patients who were exposed to Rh_o(D)-positive blood. Increase platelet counts in patients with ITP. **Therapeutic Effects:** Prevention of antibody response and hemolytic disease of the newborn (erythroblastosis fetalis) in future pregnancies of women who have conceived a Rh_o(D)-positive fetus. Prevention of Rh_o(D) sensitization following transfusion accident. Decreased bleeding in patients with ITP.

Pharmacokinetics
Absorption: Completely absorbed with IV administration. Well absorbed from IM sites.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Approximately 25–30 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	5–10 days	unknown
IV†	unknown	2 hr	unknown

†When given for ITP, platelet counts start to rise in 1–2 days, peak after 5–7 days, and last for 30 days.

Contraindications/Precautions
Contraindicated in: Prior hypersensitivity reaction to human immune globulin; Rh_o(D)- or Du-positive patients.

© F.A. Davis Publishing

Use Cautiously in: ITP patients with pre-existing anemia (decrease dose if Hgb <10 g/dL). May also cause disseminated intravascular coagulation in ITP patients.

Adverse Reactions/Side Effects

CV: hypertension, hypotension. **Derm:** rash. **GI:** diarrhea, nausea, vomiting. **GU:** acute renal failure. **Hemat:** *ITP*—DISSEMINATED INTRAVASCULAR COAGULATION, INTRAVASCULAR HEMOLYSIS, anemia. **MS:** arthralgia, myalgia. **Local:** pain at injection site. **Neuro:** dizziness, headache. **Misc:** fever.

Interactions

Drug-Drug: May ↓ antibody response to some **live-virus vaccines** (**measles**, **mumps**, **rubella**).

Route/Dosage

$Rh_o(D)$ Immune Globulin (for IM use only)

Following Delivery

IM (Adults): *HyperRHO S/D Full Dose, RhoGAM*—1 vial standard dose (300 mcg) within 72 hr of delivery.

Before Delivery

IM (Adults): *HyperRHO S/D Full Dose, RhoGAM*—1 vial standard dose (300 mcg) at 26–28 wk.

Termination of Pregnancy (<13 wk Gestation)

IM (Adults): *HyperRHO S/D Mini-Dose, MICRhoGAM*—1 vial of microdose (50 mcg) within 72 hr.

Termination of Pregnancy (>13 wk Gestation)

IM (Adults): *RhoGAM*—1 vial standard dose (300 mcg) within 72 hr.

Large Fetal-Maternal Hemorrhage (>15 mL)

IM (Adults): *RhoGAM*—20 mcg/mL of $Rh_o(D)$-positive fetal RBCs.

Transfusion Accident

IM (Adults): *HyperRHO S/D Full Dose, RhoGAM*—(Volume of Rh-positive blood administered × Hct of donor blood)/15 = number of vials of standard dose (300 mcg) preparation (round to next whole number of vials).

$Rh_o(D)$ Immune Globulin IV (for IM or IV Use)

Following Delivery

IM, IV (Adults): *WinRho SDF*—600 IU (120 mcg) within 72 hr of delivery. *Rhophylac*—1500 IU (300 mcg) within 72 hr of delivery.

Prior to Delivery

IM, IV (Adults): *WinRho SDF, Rhophylac*—1500 IU (300 mcg) at 28 wk; if initiated earlier in pregnancy, repeat every 12 wk.

Following Amniocentesis or Chorionic Villus Sampling

IM, IV (Adults): *WinRho SDF (before 34 wk gestation)*—1500 IU (300 mcg) immediately; repeat every 12 wk during pregnancy. *Rhophylac*—1500 IU (300 mcg) within 72 hr of procedure.

Termination of Pregnancy, Amniocentesis, or Any Other Manipulation

IM, IV (Adults): *WinRho SDF*—600 IU (120 mcg) within 72 hr after event.

Large Fetal-Maternal Hemorrhage/Transfusion Accident

IM (Adults): *WinRho SDF*—6000 IU (1200 mcg) every 12 hr until total dose is given (total dose determined by amount of blood loss/hemorrhage).
IV (Adults): 3000 IU (600 mcg) every 8 hr until total dose is given (total dose determined by amount of blood loss/hemorrhage).

Immune Thrombocytopenic Purpura

IV (Adults and Children): *WinRho SDF, Rhophylac*—50 mcg (250 IU)/kg initially (if Hgb <10 g/dL, ↓ dose to 25–40 mcg [125–200 IU]/kg); further dosing/frequency determined by clinical response (range 25–60 mcg [125–300 IU]/kg). Each dose may be given as a single dose or in 2 divided doses on separate days.

Availability

$Rh_o(D)$ Immune Globulin (for IM Use)

Injection: 50 mcg/vial (microdose—MICRhoGAM, HyperRHO S/D Mini-Dose), 300 mcg/vial (standard dose—RhoGAM, HyperRHO S/D Full Dose).

$Rh_o(D)$ Immune Globulin Intravenous (for IM or IV Use)

Injection: 600 IU (120 mcg)/vial, 1500 IU (300 mcg)/vial, 2500 IU (500 mcg)/vial, 5000 IU (1000 mcg)/vial, 15,000 IU (3000 mcg)/vial. **Prefilled syringes:** 1500 IU (300 mcg/2 mL).

NURSING IMPLICATIONS

Assessment

- **IV:** Assess vital signs periodically during therapy in patients receiving IV $Rh_o(D)$ immune globulin.
- **ITP:** Monitor patient for signs and symptoms of intravascular hemolysis (IVH) (back pain, shaking chills, fever, hemoglobinuria), anemia, and renal insufficiency. If transfusions are required, use $Rh_o(D)$-negative packed red blood cells to prevent exacerbation of IVH.
- ***Lab Test Considerations:*** *Pregnancy:* Type and crossmatch of mother and newborn's cord blood must be performed to determine need for medication. Mother must be $Rh_o(D)$-negative and Du-negative. Infant must be $Rh_o(D)$-positive. If there is doubt regarding infant's blood type or if father is $Rh_o(D)$-positive, medication should be given.

© F.A. Davis Publishing

- An infant born to a woman treated with $Rh_o(D)$ immune globulin antepartum may have a weakly positive direct Coombs' test result on cord or infant blood.
- *ITP:* Monitor platelet counts, RBC counts, hemoglobin, and reticulocyte levels to determine effectiveness of therapy.

Implementation

- Do not give to infant, to $Rh_o(D)$-positive individual, or to $Rh_o(D)$-negative individual previously sensitized to the $Rh_o(D)$ antigen. However, there is no more risk than when given to a woman who is not sensitized. When in doubt, administer $Rh_o(D)$ immune globulin.
- Do not confuse IM and IV formulations. Rh immune globulin for IV administration is labeled "Rh Immune Globulin Intravenous." Rh Immune Globulin Intravenous may be given IM; however, Rh Immune Globulin (microdose and standard dose) is for IM use only and cannot be given IV.
- When using prefilled syringes, allow solution to reach room temperature before administration.
- **IM:** Reconstitute $Rh_o(D)$ immune globulin IV for IM use immediately before use with 1.25 mL of 0.9% NaCl. Inject diluent onto inside wall of vial and wet pellet by gently swirling until dissolved. Do not shake.
- Administer into the deltoid muscle. Dose should be given within 3 hr but may be given up to 72 hr after delivery, miscarriage, abortion, or transfusion.

IV Administration

- **IV Push:** Reconstitute $Rh_o(D)$ immune globulin IV for IV administration immediately before use with 2.5 mL of 0.9% NaCl. Inject diluent onto inside wall of vial and wet pellet by gently swirling until dissolved. Do not shake. ***Rate:*** Administer over 3–5 min.

Patient/Family Teaching

- **Pregnancy:** Explain to patient that the purpose of this medication is to protect future $Rh_o(D)$-positive infants.
- **ITP:** Explain purpose of medication to patient.

Evaluation/Desired Outcomes

- Prevention of erythroblastosis fetalis in future $Rh_o(D)$-positive infants.
- Prevention of $Rh_o(D)$ sensitization following incompatible transfusion.
- Decreased bleeding episodes in patients with ITP.

ribociclib (rye-boe-**sye**-klib)

Kisqali

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Advanced or metastatic hormone receptor (HR)-positive, human epidermal growth factor 2 (HER2)-negative breast cancer in pre-/perimenopausal or postmenopausal women (as initial endocrine-based therapy) (in combination with an aromatase inhibitor). Advanced or metastatic HR-positive, HER2-negative breast cancer in postmenopausal women (as initial endocrine-based therapy or following disease progression on endocrine therapy) (in combination with fulvestrant).

Action

Inhibits kinases (cyclin-dependent kinases 4 and 6) that are part of the signaling pathway for cell proliferation. **Therapeutic Effects:** Improved survival and decreased spread of breast cancer.

Pharmacokinetics

Absorption: Unknown.
Distribution: Extensively distributed to the tissues.
Metabolism and Excretion: Mostly metabolized by the CYP3A4 isoenzyme; 17% excreted unchanged in feces, 12% in urine.
Half-life: 32 hr.

TIME/ACTION PROFILE (plasma levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–4 hr	unknown

R

Contraindications/Precautions

Contraindicated in: QT interval prolongation (QT interval ≥450 msec); Uncorrected hypokalemia or hypomagnesemia; Recent MI, HF, unstable angina, or bradycardia; Concurrent use of QT interval prolonging medications or strong CYP3A4 inhibitors; CYP3A inducers (may ↓ effectiveness); OB: May cause fetal harm; Lactation: Avoid breast feeding.

Use Cautiously in: Concurrent use of sensitive CYP3A substrates (narrow therapeutic indices), dose of substrate may need to be ↓ Severe renal impairment (↓ dose); Moderate or severe hepatic impairment (↓ dose); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, peripheral edema, QT interval prolongation, syncope. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), alopecia, pruritus, rash. **F and E:** hypokalemia, hypophosphatemia. **GI:** abdominal pain, constipation, ↓ appetite, diarrhea, nausea, ↑ liver enzymes, stomatitis, vomiting, hyperbilirubinemia. **GU:** ↑ serum creatinine, ↓ fertility (males). **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA, anemia. **MS:** back pain. **Neuro:** fatigue, headache, insomnia. **Resp:** INTERSTITIAL LUNG DISEASE, dyspnea. **Misc:** fever.

© F.A. Davis Publishing

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **clarithromycin**, **conivaptan**, **indinavir**, **itraconazole**, **ketoconazole**, **lopinavir/ritonavir**, **nefazodone**, **nelfinavir**, **posaconazole**, **ritonavir**, **saquinavir**, or **voriconazole** may ↑ levels and the risk of toxicity; avoid concurrent use, if possible (if unavoidable, ↓ dose of ribociclib). **Strong CYP3A4 inducers**, including **carbamazepine**, **phenytoin**, or **rifampin** can ↓ levels and effectiveness; avoid concurrent use. May ↑ levels and effects/toxicity of **alfentanil**, **cyclosporine**, **dihydroergotamine**, **ergotamine**, **everolimus**, **fentanyl**, **midazolam**, **pimozide**, **quinidine**, **sirolimus** and **tacrolimus**; if concurrent use is required dose ↓ may be necessary. **QT-interval-prolonging medications**, including **amiodarone**, **chloroquine**, **clarithromycin**, **disopyramide**, **haloperidol**, **methadone**, **moxifloxacin**, **ondansetron**, **pimozide**, **procainamide**, **quinidine**, **sotalol**, and **tamoxifen** may ↑ risk of QT interval prolongation; avoid concurrent use.

Drug-Natural Products: St. John's wort may ↓ levels and effectiveness; avoid concurrent use.

Drug-Food: Grapefruit/grapefruit juice or **pomegranate/pomegranate juice** may ↑ levels and the risk of toxicity; avoid ingestion.

Route/Dosage

PO (Adults): 600 mg once daily for 21 days, followed by 7 days off to complete a 28-day treatment cycle; continue treatment cycles until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inhibitor*— 400 mg once daily for 21 days, followed by 7 days off to complete a 28-day treatment cycle; continue treatment cycles until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *Severe renal impairment*— 200 mg once daily for 21 days, followed by 7 days off to complete a 28-day treatment cycle; continue treatment cycles until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Moderate or severe hepatic impairment*— 400 mg once daily for 21 days, followed by 7 days off to complete a 28-day treatment cycle; continue treatment cycles until disease progression or unacceptable toxicity.

Availability

Tablets: 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor ECG prior to starting therapy. Avoid administering ribociclib to patient with QT interval >450 msec. Repeat ECG on Day 14 of first cycle, beginning of 2nd cycle, and as indicated. *If QT interval >480 msec,* suspend therapy. *If QT interval prolongation resolves to <481 msec,* resume therapy at same dose level. *If QT ≥481 msec recurs,* interrupt dose until QT interval resolves to <481 msec; then resume ribociclib at next lower dose level. *If QT interval >500 msec,* withhold therapy if >500 msec on at least 2 separate ECGs (within same visit). *If QT interval prolongation resolves to <481 msec,* resume therapy at next lower dose. *If QT interval prolongation is either >500 msec or >60 msec change from baseline AND associated with any of the following: Torsades de Pointes, polymorphic ventricular tachycardia, unexplained syncope, or signs and symptoms of serious arrhythmia,* permanently discontinue ribociclib.
- Monitor for signs and symptoms of ILD/pneumonitis (hypoxia, cough, dyspnea) during therapy. *If Grade 1 symptoms (asymptomatic) occur,* continue dose and treat symptoms. *If Grade 2 symptoms (symptomatic) occur,* hold therapy until ≤Grade 1. Resume at next lower dose. *If Grade 2 recurs,* discontinue ribociclib permanently. *If Grade 3 (severe symptomatic) or Grade 4 symptoms (life-threatening) occur,* permanently discontinue therapy.
- Monitor for signs and symptoms of cutaneous reactions (rash, erythema, purpura) during therapy. *If reactions are Grade 1 (< 10% body surface area [BSA] with active skin toxicity, no signs of systemic involvement) or Grade 2 (10–30% BSA with active skin toxicity, no signs of systemic involvement),* continue at same dose and initiate medical therapy and monitor as clinically indicated. *If Grade 3 reaction (severe rash not responsive to medical management; >30% BSA with active skin toxicity, signs of systemic involvement present; SJS) occurs,* hold ribociclib until the cause of the reaction has been determined. If the cause is SJS, TEN, or DRESS, permanently discontinue therapy. If cause is not SJS, TEN, DRESS, hold dose until recovery to Grade ≤ 1, then resume ribociclib at same dose level. If the cutaneous adverse reaction still recurs at Grade 3, resume ribociclib at the next lower dose level. *If Grade 4 reaction (any % BSA associated with extensive superinfection, with IV antibiotics indicated; life-threatening consequences; TEN) occurs,* permanently discontinue ribociclib.
- ***Lab Test Considerations:*** Verify negative pregnancy test prior to starting therapy.
- Monitor serum electrolytes (potassium, calcium, phosphorous, magnesium) prior to starting therapy, at beginning of first 6 cycles, and as indicated. Correct abnormalities before starting therapy.
- Monitor liver function before starting therapy, every 2 wk for first 2 cycles, at beginning of each subsequent 4 cycles, and as indicated. **For AST and/or ALT ↑ from baseline, WITHOUT ↑ total bilirubin >2 × upper limit of normal (ULN):** *Grade 1 (>ULN to 3 × ULN),* No dose adjustment. *Grade 2 (>3 to 5 × ULN),* Baseline at <Grade 2: Hold dose until recovery to ≤baseline grade, then resume at same dose. *If Grade 2 recurs,* resume ribociclib at next lower dose.

© F.A. Davis Publishing

Do not interrupt dose for Grade 2 at baseline. *Grade 3 (>5 to 20 × ULN),* withhold dose until recovery to ≤baseline grade, then resume at next lower dose. *If Grade 3 recurs,* discontinue ribociclib. *Grade 4 (>20 × ULN),* discontinue ribociclib. **Combined ↑ in AST and/or ALT WITH total bilirubin ↑, in absence of cholestasis:** *If ALT and/or AST >3 × ULN along with total bilirubin >2 × ULN irrespective of baseline grade,* discontinue ribociclib.

- Monitor CBC before starting therapy, every 2 wk for first 2 cycles, at beginning of each subsequent 4 cycles, and as indicated. *If Grade 1 or 2 (ANC 1000/mm³ to <lower limit of normal [LLN]) occurs,* no dose adjustment required. *If Grade 3 (ANC 500–1000/mm³) occurs,* interrupt dose until recovery to Grade ≤2. Resume therapy at same dose. *If toxicity recurs at Grade 3,* hold dose until recovery, then resume ribociclib at next lower dose. *If Grade 3 febrile neutropenia occurs,* suspend therapy until recovery of neutropenia to Grade ≤2. Resume therapy at next lower dose. *If Grade 4 (ANC <500/mm³) occurs,* withhold therapy until recovery to Grade ≤2. Resume ribociclib at next lower dose.

Implementation

- **PO:** Administer once daily, at the same time each day, preferably in the morning, without regard to food. Swallow tablets whole; do not crush, break, or chew. Do not administer tablets that are broken, cracked, or not intact.
- Pre/perimenopausal women taking ribociclib and an aromatase inhibitor or fulvestrant should also be treated with a luteinizing hormone-releasing hormone (LHRH) agonist.

Patient/Family Teaching

- Instruct patient to take ribociclib as directed. If patient vomits after taking dose or misses dose, do not take more that day. Take next dose next day at usual time. Advise patient to read *Patient Information* prior to starting and with each Rx refill in case of changes.
- Advise patient to avoid eating pomegranate or grapefruit and to avoid drinking pomegranate or grapefruit juice during therapy.
- Advise patient to notify health care professional if signs and symptoms of heart rhythm problems (change in heartbeat [fast or irregular], dizziness, feeling faint), low white blood cell counts (fever and chills), or liver problems (yellowing of skin or whites of eyes, jaundice, dark or brown, tea-colored urine, feeling very tired, loss of appetite, pain on upper right side of abdomen, unusual bleeding or bruising) or skin reactions occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May cause fetal harm. Advise female patient of reproductive potential to use effective contraception to avoid breast feeding during and for at least 3 wk after last dose of therapy. Inform male patients that ribociclib may impair fertility.

Evaluation/Desired Outcomes

- Improved survival and decreased spread of breast cancer.

rifabutin (riff-a-**byoo**-tin)

Mycobutin

Classification

Therapeutic: agents for atypical mycobacterium

Indications

Prevention of disseminated *Mycobacterium avium* complex (MAC) disease in patients with advanced HIV infection.

Action

Appears to inhibit DNA-dependent RNA polymerase in susceptible organisms. **Therapeutic Effects:** Antimycobacterial action against susceptible organisms.

Spectrum: Active against *M. avium* and most strains of *M. tuberculosis*.

Pharmacokinetics

Absorption: Well absorbed following oral administration (50–85%). Absorption ↓ in HIV-positive patients (20%).

Distribution: Widely distributed to body tissues and fluids.

Metabolism and Excretion: Mostly metabolized by the liver; <5% excreted unchanged by the kidneys.

Half-life: 45 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity. Cross-sensitivity with other rifamycins (rifampin) may occur; Active tuberculosis; Concurrent use of ritonavir; Lactation: Lactation.

Use Cautiously in: OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: chest pain, chest pressure. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS

© F.A. Davis Publishing

(TEN), rash, skin discoloration. **EENT:** ocular disturbances. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), altered taste, drug-induced hepatitis. **Hemat:** hemolysis, neutropenia, thrombocytopenia. **MS:** arthralgia, myositis. **Resp:** dyspnea. **Misc:** brown-orange discoloration of body fluids (urine, tears, saliva), flu-like syndrome.

Interactions

Drug-Drug: **Ritonavir** may significantly ↑ levels; concurrent use contraindicated. May ↓ levels and effectiveness of **efavirenz**, **indinavir**, **nelfinavir**, **nevirapine**, **saquinavir** (dosage adjustment may be necessary), **corticosteroids**, **disopyramide**, **quinidine**, **opioid analgesics**, **oral hypoglycemic agents**, **warfarin**, **estrogens**, **estrogen-containing contraceptives**, **phenytoin**, **verapamil**, **fluconazole**, **quinidine**, **theophylline**, **zidovudine**, and **chloramphenicol**. **Efavirenz** and **nevirapine** may ↑ levels.

Route/Dosage

PO (Adults): 300 mg once daily. If GI upset occurs, may give as 150 mg twice daily with food.

Availability (generic available)

Capsules: 150 mg. ***In combination with:*** amoxicillin and omeprazole (Talicia). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor patient for signs of active tuberculosis (purified protein derivative [PPD], chest x-ray, sputum culture, blood culture, urine culture, biopsy of suspicious lymph nodes) prior to and during therapy. Rifabutin must not be administered to patients with active tuberculosis.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of CDAD. May begin up to several wk following cessation of therapy.
- Assess patient for skin rash frequently during therapy. Discontinue rifabutin at first sign of rash; may be life-threatening. SJS, TEN, or DRESS may develop. Treat symptomatically; may recur once treatment is stopped.
- ***Lab Test Considerations:*** Monitor CBC periodically during therapy. May cause neutropenia and thrombocytopenia.

Implementation

- Do not confuse rifabutin with rifapentine.
- **PO:** May be administered without regard to meals. High-fat meals slow rate but not extent of absorption. May be mixed with foods such as applesauce. If GI upset occurs, administer with food.

Patient/Family Teaching

- Advise patient to take medication as directed. Do not skip doses or double up on missed doses. Emphasize the importance of continuing therapy even if asymptomatic.
- Advise patient to notify health care professional promptly if signs and symptoms of neutropenia (sore throat, fever, signs of infection), thrombocytopenia (unusual bleeding or bruising), or hepatitis (yellow eyes and skin, nausea, vomiting, anorexia, unusual tiredness, weakness) occur.
- Caution patient to avoid the use of alcohol during this therapy, because this may increase the risk of hepatotoxicity.
- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Instruct patient to report symptoms of myositis (myalgia, arthralgia) or uveitis (intraocular inflammation) to health care professional promptly.
- Inform patient that skin, saliva, sputum, sweat, tears, urine, and feces may become brown-orange and that soft contact lenses may become permanently discolored.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.
- Emphasize the importance of regular follow-up exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Prevention of disseminated MAC in patients with advanced HIV infection.

rifAMPin (rif-am-pin)

~~Rifadin~~, Rimactane, Rofact

Classification

Therapeutic: antituberculars
Pharmacologic: rifamycins

Indications

Active tuberculosis (with other agents). Elimination of meningococcal carriers. **Unlabeled Use:** Prevention of disease caused by *Haemophilus influenzae* type B in close contacts. Synergy with other antimicrobial agents for *S. aureus* infections.

Action

Inhibits RNA synthesis by blocking RNA transcription in susceptible organisms. **Therapeutic Effects:** Bactericidal action against susceptible organisms. **Spectrum:** Broad spectrum notable for activity against: *Mycobacterium* spp., *Staphylococcus aureus*, *H. influenzae*, *Legionella pneumophila*, *Neisseria meningitidis*.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Widely distributed; enters CSF. Crosses placenta; enters breast milk.
Protein Binding: 80%.

© F.A. Davis Publishing

Metabolism and Excretion: Mostly metabolized by the liver; 60% eliminated in feces via biliary elimination.
Half-life: 3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	12–24 hr
IV	rapid	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of atazanavir, darunavir, fosamprenavir, praziquantel, saquinavir, tipranavir, or ritonavir-boosted saquinavir.
Use Cautiously in: History of liver disease (↑ risk of hepatotoxicity); Chronic liver disease, poor nutritional status, or prolonged use of antibacterial drugs or anticoagulants (↑ risk of vitamin K deficiency and subsequent coagulation disorders); Diabetes; Concurrent use of other hepatotoxic agents; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding.

Adverse Reactions/Side Effects

Derm: ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, pruritus. **EENT:** red discoloration of tears. **GI:** HEPATOTOXICITY, abdominal pain, diarrhea, flatulence, heartburn, nausea, vomiting, red discoloration of saliva and teeth. **GU:** red discoloration of urine. **Hemat:** bleeding, hemolytic anemia, thrombocytopenia. **MS:** arthralgia, muscle weakness, myalgia. **Neuro:** ataxia, confusion, drowsiness, fatigue, headache, weakness. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema), flu-like syndrome.

Interactions

Drug-Drug: Significantly ↓ levels and effectiveness of **atazanavir**, **darunavir**, **fosamprenavir**, **praziquantel**, **saquinavir**, and **tipranavir**; concurrent use contraindicated. Significantly ↓ levels and effectiveness of **efavirenz**, **indinavir**, **quinine**, **sofosbuvir**, **ticagrelor**, and **zidovudine**; avoid concomitant use. Significantly ↓ levels and effectiveness of **hormonal contraceptives**; use nonhormonal birth control during rifampin therapy. May ↓ levels and effectiveness of numerous drugs, including **chloramphenicol**, **clarithromycin**, **cyclosporine**, **dapsone**, **diazepam**, **diltiazem**, **disopyramide**, **doxycycline**, **fluconazole**, **glipizide**, **glyburide**, **haloperidol**, **ketoconazole**, **levothyroxine**, **losartan**, **lovastatin**, **metoprolol**, **mexiletine**, **morphine**, **moxifloxacin**, **nifedipine**, **nortriptyline**, **ondansetron**, **oxycodone**, **phenytoin**, **prednisolone**, **propafenone**, **propranolol**, **rosiglitazone**, **quinidine**, **simvastatin**, **tamoxifen**, **theophylline**, **toremifene**, **verapamil**, and **zolpidem**. May ↑ levels of active metabolite of **clopidogrel**, which may ↑ risk of bleeding; avoid concomitant use. May ↓ levels and effectiveness of **warfarin**; monitor INR regularly during concurrent therapy. May significantly ↓ levels and effectiveness of **itraconazole**; avoid use 2 wk before and during itraconazole therapy. May significantly ↓ levels and effectiveness of **irinotecan**; avoid use 2 wk before and during irinotecan therapy. May ↓ levels and effectiveness of **digoxin**; closely monitor serum digoxin concentrations and ↑ digoxin dose by 20–40%, if needed. May significantly ↓ levels and effectiveness of **tacrolimus**; monitor tacrolimus whole blood concentrations regularly and ↑ tacrolimus dose as necessary. May ↓ levels and effectiveness of **methadone**, which may ↑ risk of withdrawal symptoms. Absorption may be ↓ by **antacids**; administer rifampin ≥1 hr prior to antacids. **Probenecid** and **trimethoprim/sulfamethoxazole** may ↑ levels and risk of toxicity. Concurrent use with **atovaquone** may ↓ atovaquone levels and effectiveness and ↑ levels and risk of toxicity of rifampin; avoid concomitant use.

Route/Dosage

Tuberculosis

PO, IV (Adults): 600 mg/day or 10 mg/kg/day (up to 600 mg/day) single dose; may also be given twice weekly.
PO, IV (Children and Infants): 10–20 mg/kg/day single dose or divided every 12 hr (not to exceed 600 mg/day); may also be given twice weekly.

Asymptomatic Carriers of Meningococcus

PO, IV (Adults): 600 mg every 12 hr for 2 days.
PO, IV (Children ≥1 mo): 10 mg/kg every 12 hr for 2 days (max: 600 mg/dose).
PO (Infants <1 mo): 5 mg/kg every 12 hr for 2 days.

H. influenzae Prophylaxis

PO (Adults): 600 mg/day for 4 days.
PO (Children): 20 mg/kg/day for 4 days (max: 600 mg/dose).
PO (Neonates): 10 mg/kg/day for 4 days.

Synergy for *S. aureus* infections

PO (Adults): 300–600 mg twice daily.
PO (Children and Neonates): 5–20 mg/kg/day divided every 12 hr (max: 600 mg/dose).

Availability (generic available)

Capsules: 150 mg, 300 mg. **Powder for injection:** 600 mg/vial.

NURSING IMPLICATIONS

Assessment

- Perform mycobacterial studies and susceptibility tests prior to and periodically during therapy to detect possible resistance.

© F.A. Davis Publishing

- Assess lung sounds and character and amount of sputum periodically during therapy.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling), associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- ***Lab Test Considerations:*** Evaluate renal function, CBC, and urinalysis periodically and during therapy.
- Monitor hepatic function at least monthly during therapy. May cause ↑ BUN, AST, ALT, and serum alkaline phosphatase, bilirubin, and uric acid concentrations.
- May cause false-positive direct Coombs' test results. May interfere with folic acid and vitamin B assays.
- May interfere with dexamethasone suppression test results; discontinue rifampin 15 days prior to test.
- May interfere with methods for determining serum folate and vitamin B levels and with urine tests based on color reaction.
- Monitor coagulation tests (PT, INR, aPTT) during therapy in patients at risk for vitamin K deficiency.

Implementation

- Do not confuse rifampin with rifaximin or Rifamate (isoniazid/rifampin).
- May use vitamin K supplementation in patients at risk for vitamin K deficiency.
- **PO:** Administer medication on an empty stomach at least 1 hr before or 2 hr after meals with a full glass (240 mL) of water. If GI irritation becomes a problem, may be administered with food. Antacids may also be taken 1 hr prior to administration. Capsules may be opened and contents mixed with applesauce or jelly for patients with difficulty swallowing.
- Pharmacist can compound a syrup for patients unable to swallow solids.

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute each 600-mg vial with 10 mL of sterile water for injection for a concentration of 60 mg/mL. ***Dilution:*** Dilute further in 100 mL or 500 mL of D5W or 0.9% NaCl. Reconstituted vials are stable for 24 hr at room temperature. Infusion is stable at room temperature for 4 hr (in D5W) or 24 hr (in 0.9% NaCl). ***Concentration:*** Not to exceed 6 mg/mL. ***Rate:*** Administer solutions diluted in 100 mL over 30 min and solutions diluted in 500 mL over 3 hr.
- **Y-Site Compatibility:** amiodarone, bumetanide, ciprofloxacin, daptomycin, midazolam, pantoprazole, tigecycline, vancomycin.
- **Y-Site Incompatibility:** diltiazem.

Patient/Family Teaching

- Advise patient to take medication once daily (unless biweekly regimens are used), as directed, and not to skip doses or double up on missed doses. Emphasize the importance of continuing therapy even after symptoms have subsided. Length of therapy for tuberculosis depends on regimen being used and underlying disease states. Patients on short-term prophylactic therapy should also be advised of the importance of compliance with therapy.
- Advise patient to notify health care professional promptly if signs and symptoms of hepatitis (yellow eyes and skin, nausea, vomiting, anorexia, unusual tiredness, weakness) or of thrombocytopenia (unusual bleeding or bruising) occur.
- Caution patient to avoid the use of alcohol during this therapy, because this may increase the risk of hepatotoxicity.
- Instruct patient to report the occurrence of flu-like symptoms (fever, chills, myalgia, headache) promptly.
- Rifampin may occasionally cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that saliva, sputum, teeth, sweat, tears, urine, and feces may become red-orange to red-brown and that soft contact lenses may become permanently discolored.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.
- Emphasize the importance of regular follow-up exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Decreased fever and night sweats.
- Diminished cough and sputum production.
- Negative sputum cultures.
- Increased appetite.
- Weight gain.
- Reduced fatigue.
- Sense of well-being in patients with tuberculosis.
- Prevention of meningococcal meningitis.
- Prevention of *H. influenzae* type B infection. Prophylactic course is usually short term.

rifAXIMin (ri-**fax**-i-min)

Xifaxan, Zaxine

Classification

Therapeutic: anti-infectives

Pharmacologic: rifamycins

Indications

Travelers' diarrhea due to noninvasive strains of *Escherichia coli*. Reduction in risk of overt hepatic encephalopathy recurrence. Treatment of irritable bowel syndrome (IBS) with diarrhea.

© F.A. Davis Publishing

Action
Inhibits bacterial RNA synthesis by binding to bacterial DNA-dependent RNA polymerase. **Therapeutic Effects:** Decreased severity of travelers' diarrhea. Decreased episodes of overt hepatic encephalopathy. Decreased signs/symptoms of IBS. **Spectrum:** *Escherichia coli* (enterotoxigenic and enteroaggregative strains).

Pharmacokinetics
Absorption: Poorly absorbed (<0.4%), action is primarily in GI tract.
Distribution: 80–90% concentrated in gut.
Metabolism and Excretion: Almost exclusively excreted unchanged in feces.
Half-life: 6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to rifaximin or other rifamycins; Diarrhea with fever or bloody stools; Diarrhea caused by other infectious agents; Lactation: Potential for adverse effects in the infant. Switch to formula for duration of treatment.
Use Cautiously in: OB: Use only if benefit to mother outweighs risk to fetus; Pedi: Safety not established in children <18 yr (hepatic encephalopathy) or <12 yr (travelers' diarrhea).

Adverse Reactions/Side Effects
CV: peripheral edema. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD). **Neuro:** dizziness.

Interactions
Drug-Drug: P-glycoprotein inhibitors, including **cyclosporine**, may ↑ levels. May cause fluctuations in INR when used with **warfarin**; closely monitor INR.

Route/Dosage
Travelers' Diarrhea
PO (Adults and Children ≥12 yr): 200 mg 3 times daily for 3 days.
Hepatic Encephalopathy
PO (Adults): 550 mg twice daily.
IBS with Diarrhea
PO (Adults): 550 mg 3 times daily for 14 days; if recurrence of symptoms, may treat up to an additional 2 times.

Availability
Tablets: 200 mg, 550 mg.

NURSING IMPLICATIONS
Assessment
- **Traveler's Diarrhea:** Assess frequency and consistency of stools and bowel sounds prior to and during therapy.
- Assess fluid and electrolyte balance and skin turgor for dehydration.
- **Hepatic Encephalopathy:** Assess mental status periodically during therapy.
- **IBS With Diarrhea:** Assess frequency and consistency of stools and other IBS symptoms (bloating, cramping) daily.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause lymphocytosis, monocytosis, and neutropenia.

Implementation
- Do not confuse rifaximin with rifampin.
- **PO:** Administer with or without food.

Patient/Family Teaching
- Instruct patient to take rifaximin as directed and to complete therapy, even if feeling better. Caution patient to stop taking rifaximin if diarrhea symptoms get worse, persist more than 24–48 hr, or are accompanied by fever or blood in the stool. Consult health care professional if these occur. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise female patients to notify health care professional if pregnant or if pregnancy is suspected, or if breast feeding.

Evaluation/Desired Outcomes
- Decreased severity of travelers' diarrhea.
- Reduction in risk of overt hepatic encephalopathy recurrence.
- Reduction in symptoms of IBS with diarrhea.

rilpivirine (ril-pi-vir-een)
Edurant

Classification
Therapeutic: antiretrovirals
Pharmacologic: non-nucleoside reverse transcriptase inhibitors

Indications
Treatment-naïve patients with HIV infection with HIV-1 RNA ≤100,000 copies/mL at start of therapy. Short-term treatment of HIV infection in patients with an HIV-1 RNA <50 copies/mL who are on a stable antiretroviral regimen with no history of treatment failure and with no

© F.A. Davis Publishing

known or suspected resistance to either cabotegravir or rilpivirine (in combination with cabotegravir) (to be used as either oral lead-in to assess the tolerability of rilpivirine prior to administration of cabotegravir/rilpivirine extended-release injection or oral therapy for patients who will miss planned injection dosing with cabotegravir/rilpivirine extended-release injection).

Action

Inhibits HIV-replication by non-competitively inhibiting HIV reverse transcriptase. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae. Increases CD4 cell counts and decreases viral load.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: 99.7%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A enzyme system); 25% excreted in feces unchanged, <1% excreted unchanged in urine.
Half-life: 50 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of drugs that induce the CYP3A enzyme system or ↑ gastric pH (↓ blood levels and effectiveness, ↑ resistance); Lactation: Breast feeding not recommended in patients with HIV.
Use Cautiously in: Concurrent use of drugs that ↑ risk of torsades de pointes (may ↑ risk of arrhythmias); History of depression or suicide attempt; Hepatitis B or C; Concurrent use of antacids or H_2 antagonists (↓ levels and effectiveness); Pedi: Children <12 yr (safety and effectiveness not established); Geri: Consider ↓ hepatic/renal/cardiac function, concurrent diseases, and drug therapy.

Adverse Reactions/Side Effects

Derm: DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), rash. **Endo:** fat redistribution, Grave's disease. **GI:** autoimmune hepatitis, hepatotoxicity. **MS:** polymyositis. **Neuro:** Guillain-Barré syndrome, depression (↑ in children), dizziness, headache, insomnia. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: **Drugs that induce the CYP3A enzyme system** including **carbamazepine**, **dexamethasone** (more than a single dose), **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifampin**, or **rifapentine** ↓ levels and effectiveness and promote virologic resistance; concurrent use contraindicated. **Proton pump inhibitors** including **esomeprazole**, **lansoprazole**, **omeprazole**, **pantoprazole**, and **rabeprazole** ↓ levels and effectiveness and may ↑ resistance; concurrent use contraindicated. Concurrent use with **antacids** may ↓ levels and effectiveness; use with caution, administer at least 2 hr before or 4 hr after rilpivirine. Concurrent use with **H_2 antagonists** may ↓ levels and effectiveness; use with caution, administer at least 12 hr before or 4 hr after rilpivirine. **Rifabutin** may ↓ levels; ↑ rilpivirine dose during concurrent use. **Efavirenz**, **etravirine**, and **nevirapine** may ↓ levels; avoid concurrent use. **Darunavir/ritonavir**, **lopinavir/ritonavir**, **atazanavir/ritonavir**, **fosamprenavir/ritonavir**, **saquinavir/ritonavir**, **tipranavir/ritonavir**, **atazanavir**, **fosamprenavir**, **indinavir**, and **nelfinavir** may ↑ levels. **Clarithromyin** or **erythromycin** may ↑ levels; consider using azithromycin. **Fluconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, and **voriconazole** may ↑ levels; rilpivirine may ↓ **ketoconazole** levels. Concurrent use with **drugs that ↑ risk of torsades de pointes** may ↑ risk of serious arrhythmias. May ↓ levels of **methadone**; monitor clinical effects.
Drug-Natural Products: Concurrent use of **St. John's wort** ↓ blood levels and effectiveness and promote virologic resistance; concurrent use contraindicated.

Route/Dosage

Treatment-Naïve Patients With HIV Infection

PO (Adults and Children ≥12 yr and ≥35 kg): 25 mg once daily; *Pregnant patients on stable rilpivirine regimen prior to pregnancy and virologically suppressed (HIV RNA <50 copies/mL)* — 25 mg once daily; *Concurrent rifabutin therapy* — 50 mg once daily (↓ dose to 25 mg once daily when rifabutin discontinued).

Combination Therapy With Cabotegravir for HIV Infection

PO (Adults): *Oral lead-in therapy to assess tolerability of rilpivirine* — 25 mg once daily (with oral cabotegravir) for 28 days, then switch to cabotegravir/rilpivirine extended-release injection. *To replace planned missed cabotegravir/rilpivirine extended-release injections (up to 2 consecutive monthly injections)* — 25 mg once daily (with oral cabotegravir) initiated approximately 1 mo after last injection of cabotegravir/rilpivirine and then continued until day the cabotegravir/rilpivirine extended-release injection is restarted.

Availability

Tablets: 25 mg. ***In combination with:*** dolutegravir (Juluca); emtricitabine and tenofovir (Complera). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.

© F.A. Davis Publishing

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess for rash periodically during therapy. May cause DRESS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- Monitor liver function tests before and periodically during therapy in patients with underlying liver disease, hepatitis B or C, or marked ↑ transaminase. May cause ↑ serum creatinine, AST, ALT, total bilirubin, total cholesterol, LDL, and triglycerides.

Implementation

- **PO:** Administer once daily with a meal.
- When administered with cabotegravir, administer rilpivirine with cabotegravir once daily at same time with a meal. Take last PO dose on same day as cabotegravir injection is started. If patient plans to miss a scheduled cabotegravir injection by >7 days, take daily PO therapy to replace up to 2 consecutive monthly injection visits. Take 1st PO dose 1 mo after last injection.

Patient/Family Teaching

- Emphasize the importance of taking rilpivirine as directed, at the same time each day. It must always be used in combination with other antiretroviral drugs. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses with a meal if remembered <12 hr of the time it is usually taken, then return to regular schedule. If more than 12 hr from time dose is usually taken, omit dose and resume dosing schedule; do not double doses. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes.
- Advise patient to take antacids 2 hr before or 4 hr after and H_2 antagonists 12 hr before or 4 hr after rilpivirine.
- Instruct patient that rilpivirine should not be shared with others.
- Inform patient that rilpivirine does not cure AIDS or prevent associated or opportunistic infections. Rilpivirine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of rilpivirine are unknown at this time.
- Inform patients and families of risk of suicidal thoughts and behavior and advise that behavioral changes, emergency or worsening signs and symptoms of depression, unusual changes in mood, or emergence of suicidal thoughts, behavior, or thoughts of self-harm should be reported to health care professional immediately.
- Immune reconstitution syndrome may trigger opportunistic infections or autoimmune disorders. Notify health care professional if symptoms or rash occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Inform patient that changes in body fat (increased fat in upper back and neck, breast, and around back, chest, and stomach area; loss of fats from legs, arms, and face) may occur.
- Rep: Advise patient taking oral contraceptives to use a nonhormonal method of birth control during rilpivirine therapy. If pregnancy is suspected notify health care professional promptly. Encourage pregnant women to enroll in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263. Advise female patient to avoid breast feeding.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

rimegepant (ri-**meg**-je-pant)

Nurtec ODT

Classification

Therapeutic: vascular headache suppressants
Pharmacologic: calcitonin gene-related peptide receptor antagonists

Indications

Acute treatment of migraine with or without aura. Preventive treatment of episodic migraines.

Action

Binds to and inhibits the calcitonin gene-related peptide (CGRP) receptor, which reduces the neuroinflammatory and vasodilatory effects of CGRP. **Therapeutic Effects:** Reduction in pain and other bothersome symptoms associated with migraine. Reduction in number of monthly migraine days.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: 64% absorbed following oral administration. High-fat foods may delay and reduce extent of absorption.
Distribution: Extensively distributed to tissues.
Protein Binding: 96%.
Metabolism and Excretion: Primarily metabolized in liver via CYP3A4 isoenzyme, and to a lesser extent by CYP2C9 isoenzyme. Primarily excreted as unchanged drug in feces (42%) and urine (51%).
Half-life: 11 hr.

TIME/ACTION PROFILE (relief of migraine pain)

ROUTE	ONSET	PEAK	DURATION
PO	0.5 hr	2 hr	up to 48 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic impairment; End-stage renal disease (CCr <15 mL/min).
Use Cautiously in: OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

GI: nausea. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **itraconazole** may significantly ↑ levels and risk of toxicity; avoid concurrent use. **Moderate CYP3A4 inhibitors** may ↑ levels and risk of toxicity; avoid another dose of rimegepant within 48 hr during concurrent use. **Strong CYP3A4 inducers**, including **rifampin** or **moderate CYP3A4 inducers**, may ↓ levels and effectiveness; avoid concurrent use. **P-glycoprotein inhibitors** or **breast cancer resistance protein (BCRP) inhibitors**, including **itraconazole**, may significantly ↑ levels and risk of toxicity; avoid concurrent use.

Route/Dosage

Acute Migraine Treatment

PO (Adults): 75 mg as single dose (max dose = 75 mg/24 hr). Should not be used to treat >18 migraines in 30-day period.

Preventive Treatment of Episodic Migraines

PO (Adults): 75 mg every other day.

Availability

Orally disintegrating tablets (menthol-flavor): 75 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, character, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Monitor frequency of migraine headaches in patients using rimegepant for prophylaxis.

Implementation

- Use dry hands when opening blister pack. Peel back foil covering of one blister and gently remove the orally disintegrating tablet (ODT). Do not push ODT through foil. As soon as blister is opened, remove ODT and place on tongue; ODT may also be placed under tongue. ODT will disintegrate in saliva so that it can be swallowed without additional liquid. Take ODT immediately after opening blister pack. Do not store ODT outside the blister pack for future use.
- **PO: Treatment**: Administer ODT once daily as needed for migraine attacks. Limit dose to one ODT/day and no more than 18 doses in a 30-day period.
- **Prophylaxis**: Administer one ODT every other day for prevention of migraine headaches.

Patient/Family Teaching

- Instruct patient to take rimegepant as soon as symptoms of a migraine attack appear, but it may be administered any time during an attack. Do not use more than 75 mg in any 24-hr period.
- Instruct patient using rimegepant for prevention to take as directed.
- Advise patient to avoid alcohol, which aggravates headaches, during rimegepant use.
- Advise patient that lying down in a darkened room following rimegepant administration may further help relieve headache.
- Inform patients of potential for hypersensitivity reaction and that these reactions can occur days after administration of rimegepant. Advise patients to notify health care professional immediately if signs or symptoms of hypersensitivity reactions (shortness of breath, rash) occur. Rimegepant should be discontinued if hypersensitivity reaction occurs.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Relief of migraine attack.
- Reduction in frequency of migraine headaches.

risankizumab

(**ris**-an-**kiz**-ue-mab)
Skyrizi

Classification
Therapeutic: antipsoriatics
Pharmacologic: interleukin antagonists, monoclonal antibodies

© F.A. Davis Publishing

Indications
Moderate-to-severe plaque psoriasis in patients who are candidates for phototherapy or systemic therapy.

Action
Binds to the p19 protein subunit of the interleukin (IL)-23 cytokine to prevent its interaction with the IL-23 receptor. This cytokine is normally involved in inflammatory and immune responses. Binding to interleukins antagonizes their effects, inhibiting the release of proinflammatory cytokines and chemokines. **Therapeutic Effects:** Decrease in area and severity of psoriatic lesions.

Pharmacokinetics
Absorption: 89% absorbed following subcutaneous administration.
Distribution: Well distributed to tissues.
Metabolism and Excretion: Broken down by catabolic processes into peptides and amino acids.
Half-life: 28 days.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	3–14 days	12 wk

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Active, untreated infection.
Use Cautiously in: History of tuberculosis (possibility of reactivation); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children.
Exercise Extreme Caution in: Chronic infection or history of recurrent infection.

Adverse Reactions/Side Effects
Local: injection site reactions. **Neuro:** headache.
Misc: infection, fatigue.

Interactions
Drug-Drug: May ↓ antibody response to and ↑ risk of adverse reactions from **live vaccines**; avoid use during therapy.

Route/Dosage
Subcut (Adults): 150 mg initially and 4 wk later, then 150 mg every 12 wk.

Availability
Solution for injection (prefilled pens): 150 mg/mL. **Solution for injection (prefilled syringes):** 75 mg/0.83 mL, 150 mg/mL.

NURSING IMPLICATIONS

Assessment
- Assess patient for tuberculosis (TB) before starting, during, and after therapy. Do not administer risankizumab to patient with active TB. Consider anti-TB therapy before starting therapy in patients with a past history of latent or active TB in whom an adequate course of treatment cannot be confirmed.
- Assess skin lesions before and periodically during therapy.
- Monitor for signs and symptoms of infection (fever, chills, cough, dyspnea, skin infections) periodically during therapy.

Implementation
- Complete all age-appropriate vaccinations as recommended by current immunization guidelines before starting therapy.
- Before injecting, remove carton from refrigerator and without removing prefilled pen or prefilled syringe(s) from the carton, allow risankizumab to reach room temperature out of direct sunlight: 30–90 min for prefilled pen and 15–30 min for the prefilled syringe(s). Solution is colorless to slightly yellow and clear to slightly opalescent; may contain a few translucent to white particles. Do not use if solution is cloudy, discolored, or contains large particles. Do not freeze or shake.
- **Subcut:** Inject into abdomen or thigh; may inject in upper, outer arm if administered by health care professional or caregiver. Do not inject into areas where skin is tender, bruised, erythematous, indurated or affected by psoriasis. If using 75 mg/0.83 mL syringes, 150 mg dose requires two syringes. Inject in different locations.

Patient/Family Teaching
- Instruct patient caregiver in correct injection technique and disposal of equipment. Administer at Week 0, Week 4, and every 12 wk thereafter. If a dose is missed, administer as soon as possible, then resume dosing at the regular scheduled time.
- Advise patient to notify health care professional if signs and symptoms of infection (fever, sweats, chills, cough, shortness of breath, blood in mucus [phlegm], muscle aches, warm, red, or painful skin or sores different from psoriasis, weight loss, diarrhea or stomach pain, burning on urination, urinating more often than usual) occur.
- Advise patient to avoid live vaccines during therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Inform patient of

R

© F.A. Davis Publishing

pregnancy exposure registry that monitors outcomes in women with plaque psoriasis who become pregnant while treated with risankizumab. Encourage patient to enroll by calling 1-877-302-2161.

Evaluation/Desired Outcomes

- Decrease in area and severity of psoriatic lesions.

risedronate (riss-**ed**-roe-nate)
Actonel, Actonel DR, Atelvia

Classification
Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates

Indications

Prevention and treatment of postmenopausal and corticosteroid-induced osteoporosis. Treatment of Paget's disease in men and women. Treatment of osteoporosis in men.

Action

Inhibits bone resorption by binding to bone hydroxyapatite, which inhibits osteoclast activity. **Therapeutic Effects:** Reversal of the progression of osteoporosis with decreased fractures and other sequelae. Reduced bone turnover and resorption; normalization of serum alkaline phosphatase with reduced complications of Paget's disease.

Pharmacokinetics

Absorption: Rapidly but poorly absorbed following oral administration (0.63% bioavailability).
Distribution: 60% of absorbed dose distributes to bone.
Metabolism and Excretion: 40% of absorbed dose is excreted unchanged by kidneys; unabsorbed drug is excreted in feces.
Half-life: *Initial*—1.5 hr; *terminal*—220 hr (reflects dissociation from bone).

TIME/ACTION PROFILE (effects on serum alkaline phosphatase)

ROUTE	ONSET	PEAK	DURATION
PO	within days	30 days	up to 16 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe renal impairment (CCr <30 mL/min); Hypocalcemia; Abnormalities of the esophagus, which delay esophageal emptying (i.e., strictures, achalasia); Inability to stand/sit upright for at least 30 min; OB: Pregnancy (may cause fetal harm).
Use Cautiously in: History of upper GI disorders; Other disturbances of bone or mineral metabolism (correct abnormalities before initiating therapy); Dietary deficiencies (supplemental vitamin D and calcium may be required); Invasive dental procedures, cancer, receiving chemotherapy, corticosteroids, or angiogenesis inhibitors, poor oral hygeine, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly fitting dentures (may ↑ risk of jaw osteonecrosis); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects

CV: chest pain, edema. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash. **EENT:** amblyopia, conjunctivitis, dry eyes, eye pain/inflammation, tinnitus. **GI:** abdominal pain, diarrhea, belching, colitis, constipation, dysphagia, esophagitis, esophageal cancer, esophageal ulcer, gastric ulcer, nausea. **MS:** arthralgia, musculoskeletal pain, femur fractures, osteonecrosis (primarily of jaw). **Neuro:** weakness. **Resp:** asthma exacerbation. **Misc:** flu-like syndrome.

Interactions

Drug-Drug: Concurrent use with **NSAIDs** or **aspirin** ↑ risk of GI irritation. Absorption is ↓ by **calcium supplements** or **antacids**. **Proton pump inhibitors** and **H_2 antagonists** may cause a faster release of drug from the delayed-release product that can ↑ drug levels; concurrent use not recommended.
Drug-Food: Food ↓ absorption (administer at least 30 min before breakfast).

Route/Dosage

Prevention and Treatment of Postmenopausal Osteoporosis

PO (Adults): 5 mg once daily (immediate-release tablets) *or* 35 mg once weekly (immediate- or delayed-release tablets) *or* 75 mg taken on 2 consecutive days for a total of 2 tablets each mo (immediate-release tablets) *or* 150 mg once monthly (immediate-release tablets).

Prevention and Treatment of Glucocorticoid-Induced Osteoporosis

PO (Adults): 5 mg once daily (immediate-release tablets).

Treatment of Osteoporosis in Men

PO (Adults): 35 mg once weekly (immediate-release tablets).

Treatment of Paget's Disease

PO (Adults): 30 mg once daily for 2 mo (immediate-release tablets); retreatment may be considered after 2 mo off therapy.

Availability (generic available)

Immediate-release tablets: 5 mg, 30 mg, 35 mg, 150 mg. **Delayed-release tablets (Atelvia):** 35 mg.

NURSING IMPLICATIONS

Assessment

- Perform a routine oral exam prior to initiation of therapy. Dental exam with appropriate preventative dentistry should be considered prior to therapy. Patients with history of tooth extraction, poor oral hy-

© F.A. Davis Publishing

giene, gingival infections, diabetes, or use of a dental appliance or those taking immunosuppressive therapy, angiogenesis inhibitors, or systemic corticosteroids are at greater risk for osteonecrosis of the jaw.
- **Osteoporosis:** Assess patients via bone density study for low bone mass before and periodically during therapy.
- **Paget's disease:** Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size).
- ***Lab Test Considerations:*** *Osteoporosis:* Assess serum calcium before and periodically during therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating alendronate therapy. May cause mild, transient ↑ of calcium and phosphate.
- *Paget's disease:* Monitor alkaline phosphatase prior to and periodically during therapy to monitor effectiveness of therapy.

Implementation

- Do not confuse Actonel (risedronate) with Actos (pioglitazone).
- **PO:** Administer *Actonel* first thing in the morning with 6–8 oz of water, 30 min prior to other medications, beverages, or food. Waiting longer than 30 min will improve absorption. Administer *Atelvia* right after breakfast with at least 4 oz of water. ***DNC:*** Swallow tablet whole; do not crush, break, or chew.
- Calcium-, magnesium-, or aluminum-containing agents may interfere with absorption of risedronate and should be taken at a different time of day with food.
- Avoid administering delayed-release product with proton pump inhibitors or H_2 antagonists; may allow a faster release and increased drug level.

Patient/Family Teaching

- Instruct patient on the importance of taking as directed. Risedronate should be taken with 6–8 oz of water (mineral water, orange juice, coffee, and other beverages decrease absorption). *If a dose of Actonel 35 is missed*, take 1 tablet the morning remembered, then return to the 1 tablet/wk on the originally scheduled day; do not take 2 pills at once. *If 1 or both tablets of Actonel 75 are missed and the next month's scheduled doses are more than 7 days away*: if both Actonel 75 are missed take 1 the morning remembered and 1 the next morning. If only 1 Actonel 75 tablet is missed: take the missed tablet on the morning of the day after you remember, then return to original schedule. Do not take more than two 75 mg tablets within 7 days. *If 1 or both tablets of Actonel 75 are missed and the next month's scheduled doses are within 7 days,* omit and return to schedule next mo. *If 1 or both tablets of Actonel 150 are missed and the next month's scheduled doses are more than 7 days away,* take the missed tablet on the morning of the day after you remember, then return to original schedule. Do not take more than two 150-mg tablets within 7 days. *If 1 or both tablets of Actonel 75 are missed and the next month's scheduled doses are within 7 days,* omit and return to schedule next mo. Encourage patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Caution patients to remain upright for 30 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D (see Appendix J).
- Inform patient that severe musculoskeletal pain may occur within days, mo, or yr after starting risedronate. Symptoms my resolve completely after discontinuation or slow or incomplete resolution may occur. Notify health care professional if severe pain occurs.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise patient to practice good mouth care during therapy and to notify health care professional if signs and symptoms of ONJ (jaw pain, toothache, sores on gums) occur.
- Advise patient to inform health care professional of risedronate therapy prior to dental surgery.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. May impair female and male fertility.

Evaluation/Desired Outcomes

- Reversal of the progression of osteoporosis with decreased fractures and other sequelae. For patients at low risk of fracture, discontinue after 3 to 5 yr of use.
- Decrease in serum alkaline phosphatase and the progression of Paget's disease.

BEERS

risperiDONE (riss-**per**-i-done)
Perseris, RisperDAL, RisperDAL Consta, RisperDAL M-TAB

Classification
Therapeutic: antipsychotics, mood stabilizers
Pharmacologic: benzisoxazoles

© F.A. Davis Publishing

Indications

Schizophrenia. Short-term treatment of acute manic or mixed episodes associated with Bipolar I Disorder (oral only) and maintenance treatment of Bipolar I Disorder (IM only); can be used with lithium or valproate (adults only). Irritability associated with autistic disorder (oral only).

Action

May act by antagonizing dopamine and serotonin in the CNS. **Therapeutic Effects:** Decreased symptoms of psychoses, bipolar mania, or autism.

Pharmacokinetics

Absorption: 70% after administration of tablets, solution, or orally disintegrating tablets. Following IM administration, small initial release of drug, followed by 3-wk lag; the rest of release starts at 3 wk and lasts 4–6 wk. Following subcutaneous administration, initial release of drug occurs at 4–6 hr, with the rest of release occurring at 10–14 days after administration.

Distribution: Unknown.

Metabolism and Excretion: Primarily metabolized by the liver by the CYP2D6 isoenzyme to 9-hydroxyrisperidone (has similar pharmacological properties as risperidone). Risperidone and its active metabolite are renally eliminated.

Half-life: *Extensive metabolizers*—3 hr for risperidone, 21 hr for 9-hydroxyrisperidone. *Poor metabolizers*—20 hr for risperidone and 30 hr for 9-hydroxyrisperidone; *Subcutaneous*—9–11 days.

TIME/ACTION PROFILE (clinical effects)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	unknown	up to 6 wk†
IM	3 wk	4–6 wk	up to 6 wk†
Subcut	2 wk	6–8 wk	unknown

†After discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to risperidone or paliperidone; Lactation: Lactation.

Use Cautiously in: Debilitated patients, patients with renal or hepatic impairment (initial dose reduction recommended); Underlying cardiovascular disease (↑ risk of arrhythmias and hypotension); History of seizures; History of drug abuse; Diabetes or risk factors for diabetes (may worsen glucose control); Patients at risk for aspiration or falls; Renal or hepatic impairment; OB: Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children <13 yr (schizophrenia), <10 yr (bipolar disorder), or <5 yr (autism) ; Geri: Initial dose ↓ recommended in older adults. ↑ risk of mortality and cerebrovascular events in older adults treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CV: arrhythmias, orthostatic hypotension, tachycardia. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, itching/skin rash, dry skin, ↑ pigmentation, sweating, photosensitivity, seborrhea. **EENT:** pharyngitis, rhinitis, visual disturbances. **Endo:** dyslipidemia, galactorrhea, hyperglycemia. **GI:** constipation, diarrhea, dry mouth, nausea, abdominal pain, anorexia, dyspepsia, dysphagia, polydipsia, ↑ salivation, vomiting. **GU:** ↓ libido, dysmenorrhea/menorrhagia, amenorrhea, difficulty urinating, gynecomastia, ↓ fertility (females), impotence, polyuria, priapism. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **Metab:** weight gain, weight loss. **MS:** arthralgia, back pain. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, aggressive behavior, dizziness, extrapyramidal reactions, headache, ↑ dreams, ↑ sleep duration, insomnia, sedation, fatigue, impaired temperature regulation, nervousness, tardive dyskinesia. **Resp:** cough, dyspnea. **Misc:** HYPERSENITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: May ↓ the antiparkinsonian effects of **levodopa** or other **dopamine agonists**. **Strong CYP3A4 inducers**, including **carbamazepine**, **phenytoin**, **rifampin**, and **phenobarbital** may ↑ metabolism and may ↓ effectiveness; dose adjustments may be necessary. **Fluoxetine** and **paroxetine** ↑ blood levels and may ↑ effects; dose adjustments may be necessary. **Clozapine** ↓ metabolism and may ↑ effects of risperidone. ↑ CNS depression may occur with other **CNS depressants**, including **alcohol**, **antihistamines**, **sedative/hypnotics**, or **opioid analgesics**. Concurrent use with **methylphenidate** may ↑ risk of extrapyramidal symptoms.

Drug-Natural Products: Kava, valerian, or chamomile can ↑ CNS depression.

Route/Dosage

Schizophrenia

PO (Adults): 1 mg twice daily, ↑ by 1–2 mg/day no more frequently than every 24 hr to 4–8 mg daily.

PO (Children 13–17 yr): 0.5 mg once daily, ↑ by 0.5–1.0 mg no more frequently than every 24 hr to 3 mg daily. May administer half the daily dose twice daily if drowsiness persists.

IM (Adults): 25 mg every 2 wk; some patients may benefit from a higher dose of 37.5 or 50 mg every 2 wk.

Subcut (Adults): *Currently taking 3 mg/day of oral risperidone*—90 mg once monthly; *Currently taking 4 mg/day of oral risperidone*—120 mg once monthly; *Planned therapy with fluoxetine or paroxetine*—Initiate 90 mg once monthly 2–4 wk before starting fluoxetine or paroxetine therapy; *Concurrent use of strong CYP3A4 inducer*—If receiving 90 mg once monthly regimen, consider ↑ dose to 120 mg once monthly; if receiving 120 mg once monthly regimen, consider using additional oral risperidone.

© F.A. Davis Publishing

Hepatic/Renal Impairment

PO (Adults): *Severe renal impairment (CCr <30 mL/min) or severe hepatic impairment*—Start with 0.5 mg twice daily; ↑ by 0.5 mg twice daily, up to 1.5 mg twice daily; then ↑ at weekly intervals if necessary.

Hepatic/Renal Impairment

Subcut (Adults): Titrate patients up to at least 3 mg/day of oral risperidone before initiating subcutaneous risperidone. If patient tolerates this dose of oral risperidone, consider subcutaneous dose of 90 mg once monthly.

Acute Manic or Mixed Episodes Associated With Bipolar I Disorder

PO (Adults): 2–3 mg/day as a single daily dose, dose may be ↑ at 24-hr intervals by 1 mg (range 1–5 mg/day).

PO (Children 13–17 yr): 0.5 mg once daily, ↑ by 0.5–1 mg no more frequently than every 24 hr to 2.5 mg daily. May administer half the daily dose twice daily if drowsiness persists.

PO (Geriatric Patients or Debilitated Patients): Start with 0.5 mg twice daily; ↑ by 0.5 mg twice daily, up to 1.5 mg twice daily; then ↑ at weekly intervals if necessary. May also be given as a single daily dose after initial titration.

Hepatic/Renal Impairment

PO (Adults): *Severe renal impairment (CCr <30 mL/min) or severe hepatic impairment*—Start with 0.5 mg twice daily; ↑ by 0.5 mg twice daily, up to 1.5 mg twice daily; then ↑ at weekly intervals if necessary.

Maintenance Treatment of Bipolar I Disorder

IM (Adults): 25 mg every 2 wk; some patients may benefit from a higher dose of 37.5 or 50 mg every 2 wk.

Irritability Associated With Autistic Disorder

PO (Children 5–16 yr weighing <20 kg): 0.25 mg/day initially. After at least 4 days of therapy, may ↑ to 0.5 mg/day. Dose ↑ in increments of 0.25 mg/day may be considered at 2 wk or longer intervals. May be given as a single or divided dose.

PO (Children 5–16 yr weighing >20 kg): 0.5 mg/day initially. After at least 4 days of therapy, may ↑ to 1 mg/day. Dose ↑ in increments of 0.5 mg/day may be considered at 2 wk or longer intervals. May be given as a single or divided dose.

Hepatic/Renal Impairment

PO (Adults): *Severe renal impairment (CCr <30 mL/min) or severe hepatic impairment*—Start with 0.5 mg twice daily; ↑ by 0.5 mg twice daily, up to 1.5 mg twice daily; then ↑ at weekly intervals if necessary.

Availability (generic available)

Immediate-release tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg. **Cost:** *Generic*—0.25 mg $18.40/180, 0.5 mg $22.58/180, 1 mg $24.13/180, 2 mg $28.94/180, 3 mg $34.94/180, 4 mg $38.30/180. **Orally disintegrating tablets (Risperdal M-Tabs):** 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg. **Cost:** *Generic*—0.5 mg $131.86/28, 1 mg $154.07/28, 2 mg $250.49/28, 3 mg $316.12/28, 4 mg $424.45/28. **Oral solution:** 1 mg/mL. **Cost:** *Generic*—$152.56/30 mL. **Extended-release microspheres for IM injection (Risperdal Consta) (requires reconstitution):** 12.5 mg/vial kit, 25 mg/vial kit, 37.5 mg/vial kit, 50 mg/vial kit. **Extended-release suspension for subcut injection (Perseris):** 90 mg/vial kit, 120 mg/vial kit.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) and mood before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression, especially during early therapy. Restrict amount of drug available to patient.
- Assess weight and BMI initially and throughout therapy. Monitor for symptoms of hyperglycemia (polydipsia, polyuria, polyphagia, weakness) periodically during therapy.
- Monitor BP (sitting, standing, lying down) and pulse before and frequently during initial dose titration. May cause prolonged QT interval, tachycardia, and orthostatic hypotension. If hypotension occurs, dose may need to be decreased.
- Observe patient when administering medication to ensure medication is swallowed and not hoarded or cheeked.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation may be necessary. Trihexyphenidyl or benztropine may be used to control symptoms.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).

R

© F.A. Davis Publishing

- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- Monitor for skin rash during therapy. May require discontinuation of therapy.
- ***Lab Test Considerations:*** May cause ↑ serum prolactin levels.
- May cause ↑ AST and ALT.
- May also cause anemia, thrombocytopenia, leukocytosis, and leukopenia.
- Obtain fasting blood glucose and cholesterol levels initially and periodically during therapy.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Implementation

- Do not confuse risperidone with ropinirole. Do not confuse Risperdal with Restoril (temazepam) or ropinirole.
- When switching from other antipsychotics, discontinue previous agents when starting risperidone and minimize the period of overlapping antipsychotic agents.
- If therapy is reinstituted after an interval off risperidone, follow initial titration schedule.
- For IM use, establish tolerance with oral dosing before IM use and continue oral dosing for 3 wk following initial IM injection. Do not increase dose more frequently than every 4 wk.
- **PO:** Daily doses can be taken in the morning or evening.
- For orally disintegrating tablets, open blister pack by pealing back foil to expose tablet; do not try to push tablet through foil. Use dry hands to remove tablet from blister and immediately place entire tablet on tongue. Tablets disintegrate in mouth within sec and can be swallowed with or without liquid. Do not attempt to split or chew tablet. Do not try to store tablets once removed from blister.
- Oral solution can be mixed with water, coffee, orange juice, or low-fat milk; do not mix with cola or tea.
- **Subcut:** Mix *Perseris* according to manufacturer's instructions. With patient in supine position, inject into abdomen; avoid areas with nodules, lesions, excessive pigment, irritation, redness, bruising, infection, or scarring. Hold syringe upright for several sec to allow air bubbles to rise; depress the plunger to expel excess air. Pinch skin to avoid IM injection. Do not rub site after injection. Advise patient that they may have a lump for several wk; will decrease in size over time. Instruct patient not to rub or massage injection site and avoid constriction by belts or clothing waistbands.
- **IM:** Reconstitute with 2 mL of diluent provided by manufacturer. Administer via deep deltoid (1-in. needle) or gluteal (2-in. needle) injection using enclosed safety needle; alternate arms or buttocks with each injection. Allow solution to warm to room temperature prior to injection. Administer immediately after mixed with diluent; shake well to mix suspension. Must be administered within 6 hr of reconstitution. Store dose pack in refrigerator.
- Do not combine dose strengths in a single injection.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes in temperature should also be avoided; this drug impairs body temperature regulation.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, tremors, or symptoms of hyperglycemia occur.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding. Encourage women who become pregnant while taking risperidone to enroll in the National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/. Monitor neonates for extrapyramidal and/or withdrawal symptoms. Monitor infants exposed to risperidone through breastmilk for excess sedation, failure to thrive, jitteriness, and extrapyramidal symptoms (tremors and abnormal muscle movements). May impair fertility in females; usually reversible.

© F.A. Davis Publishing

- Emphasize the importance of routine follow-up exams to monitor side effects and continued participation in psychotherapy to improve coping skills.

Evaluation/Desired Outcomes

- Decrease in excited, manic behavior.
- Decrease in positive symptoms (delusions, hallucinations) of schizophrenia.
- Decreased aggression toward others, deliberate self-injury, temper tantrums, and mood changes in children with autism.
- Decrease in negative symptoms (social withdrawal, flat, blunted affects) of schizophrenia.
- Decrease in autism symptoms.

ritonavir (ri-toe-na-veer)

Norvir

Classification

Therapeutic: antiretrovirals
Pharmacologic: protease inhibitors

Indications

HIV infection (in combination with other antiretrovirals).

Action

Inhibits the action of HIV protease and prevents the cleavage of viral polyproteins. **Therapeutic Effects:** Increased CD4 cell counts and decreased viral load with subsequent slowed progression of HIV infection and its sequelae.

Pharmacokinetics

Absorption: Appears to be well absorbed after oral administration.
Distribution: Poor CNS penetration.
Protein Binding: 98–99%.
Metabolism and Excretion: Primarily metabolized by the CYP3A4 and CYP2D6 isoenzymes in the liver; one metabolite has antiretroviral activity; 3.5% excreted unchanged in urine.
Half-life: 3–5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	4 hr*	12 hr

*Nonfasting.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of alfuzosin, amiodarone, apalutamide, colchicine, dihydroergotamine, dronedarone, ergotamine, flecainide, fluticasone, lomitapide, lovastatin, lurasidone, meperidine, methylergonovine, midazolam (PO), pimozide, propafenone, quinidine, ranolazine, simvastatin, sildenafil (Revatio), St. John's wort, triazolam, or voriconazole; Hypersensitivity or intolerance to alcohol or castor oil (present in liquid); OB: Avoid oral solution during pregnancy (because of alcohol content); Lactation: Breast feeding not recommended in patients infected with HIV.

Use Cautiously in: Impaired hepatic function, history of hepatitis; Diabetes mellitus; Hemophilia (↑ risk of bleeding); Structural heart disease, conduction abnormalities, ischemic heart disease, or heart failure (↑ risk of heart block); Pedi: Children <1 mo (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: heart block, orthostatic hypotension, PR interval prolongation, vasodilation. **Derm:** STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), rash, skin eruptions, sweating, urticaria. **EENT:** pharyngitis, throat irritation. **Endo:** hyperglycemia. **F and E:** dehydration. **GI:** abdominal pain, altered taste, anorexia, diarrhea, nausea, vomiting, constipation, dyspepsia, flatulence. **GU:** renal insufficiency. **Metab:** hyperlipidemia. **MS:** ↑ creatine kinase, myalgia. **Neuro:** circumoral paresthesia, peripheral paresthesia, SEIZURES, abnormal thinking, weakness, dizziness, headache, malaise, somnolence, syncope. **Resp:** bronchospasm. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), fat redistribution, fever, immune reconstitution syndrome.

Interactions

Drug-Drug: ↑ levels and risk of toxicity from some **antiarrhythmics (amiodarone, dronedarone, flecainide, pimozide, propafenone, quinidine), ergot derivatives (dihydroergotamine, ergotamine, methylergonovine), fluticasone (inhalation), lomitapide, lurasidone, meperidine, ranolazine, sildenafil (Revatio), alfuzosin, lovastatin, simvastatin, voriconazole, midazolam (oral),** and **triazolam**; concurrent use contraindicated. May ↑ **colchicine** levels; concurrent use in patients with renal or hepatic impairment contraindicated; ↓ dose of colchicine in patients without renal or hepatic impairment. **Apalutamide** may ↓ levels and promote resistance; concurrent use contraindicated. ↑ levels of **maraviroc**; ↓ maraviroc dose to 150 mg twice daily. ↑ levels of **clarithromycin**; ↓ clarithromycin dose if CCr <60 mL/min. ↑ levels of **rifabutin**; ↓ rifabutin dose to 150 mg every other day or 3 times weekly. May also ↑ levels and effects of some **opioid analgesics (alfentanil, fentanyl, hydrocodone, oxycodone), tramadol**; some **NSAIDs (diclofenac, ibuprofen, indomethacin)**; some **antiarrhythmics (disopyramide, lidocaine, mexiletine)**; many **antidepressants (amitriptyline, clomipramine, desipramine, imipramine, nortriptyline, nefazodone, sertraline, trazodone, fluoxetine, paroxetine, venlafaxine)**; some **antiemetics (dronabinol, ondansetron)**; some **beta**

© F.A. Davis Publishing

blockers (**metoprolol**, **pindolol**, **propranolol**, **timolol**); many **calcium channel blockers** (**amlodipine**, **diltiazem**, **felodipine**, **isradipine**, **nicardipine**, **nifedipine**, **nimodipine**, **nisoldipine**, **verapamil**); some **immunosuppressants** (**cyclosporine**, **tacrolimus**); some **antipsychotics** (**chlorpromazine**, **haloperidol**, **perphenazine**, **risperidone**, **thioridazine**); and also **atazanavir**, **darunavir**, **fosamprenavir**, **quinidine**, **saquinavir**, **tipranavir**, **bedaquiline**, **methamphetamine**, and **warfarin**; dosage ↓ may be necessary. May ↑ **vincristine** and **vinblastine** levels; consider holding or switching to another antiretroviral regimen that does not contain a CYP3A or P-glycoprotein inhibitor. May ↑ **dasatinib** and **nilotinib** levels; may need to ↓ doses of dasatinib and nilotinib. May ↑ **venetoclax** and **ibrutinib** levels and ↑ risk of tumor lysis syndrome; avoid concurrent use. May ↑ **abemaciclib** and **neratinib** levels and risk of toxicity; avoid concurrent use. May ↑ levels and risk of toxicity of **glecaprevir/pibrentasvir** and **sofosbuvir/velpatasvir/voxilaprevir**, **ombitasvir**, and **paritaprevir**; avoid concurrent use. May ↑ levels of systemic, inhaled, nasal, or ophthalmic **corticosteroids** (**betamethasone**, **budesonide**, **ciclesonide**, **dexamethasone**, **fluticasone**, **methylprednisolone**, **mometasone**, **prednisone**, or **triamcinolone**; consider alternative corticosteroid such as beclomethasone or prednisolone. ↓ levels and effects of **hormonal contraceptives**, **zidovudine**, **bupropion**, and **theophylline**; dose alteration or alternative therapy may be necessary. Levels may be ↑ by **clarithromycin** or **fluoxetine**. ↑ risk of heart block with **beta blockers**, **verapamil**, **diltiazem**, **digoxin**, or **atazanavir**. May ↑ concentrations of phosphodiesterase type 5 inhibitors (PDE5) causing hypotension, visual changes, priapism; ↓ starting doses not to exceed 25 mg within 48 hr for **sildenafil** (Viagra), 2.5 mg every 72 hr for **vardenafil** and 10 mg every 72 hr for **tadalafil**. May ↑ risk of adverse effects with **salmeterol**; concurrent use not recommended. ↑ risk of myopathy with **atorvastatin** or **rosuvastatin**; use lowest possible dose of statin. May ↑ **bosentan** levels; initiate bosentan at 62.5 mg once daily or every other day; if patient already receiving bosentan, discontinue bosentan at least 36 hr before initiation of ritonavir and then restart bosentan at least 10 days later at 62.5 mg once daily or every other day. May ↑ **tadalafil (Adcirca)** levels; initiate tadalafil (Adcirca) at 20 mg once daily; if patient already receiving tadalafil (Adcirca), discontinue tadalafil (Adcirca) at least 24 hr before initiation of ritonavir and then restart tadalafil (Adcirca) at least 7 days later at 20 mg once daily. May ↑ **colchicine** levels; ↓ dose of colchicine; do not administer colchicine if patients have renal or hepatic impairment. May ↑ **quetiapine** levels; ↓ quetiapine dose to ⅙ of current dose. **Dexamethasone** may ↓ levels/effects; consider use of alternative corticosteroid, such as beclomethasone or prednisolone. **Encorafenib** and **ivosidenib** may ↑ risk of QT interval prolongation; avoid concurrent use, if possible. If concurrent use necessary, ↓ dose of encorafenib and ivosidenib. Concurrent use with **elagolix** may ↑ elagolix levels and ↓ ritonavir levels; do use with elagolix 200 mg twice daily for longer than 1 mo; do not use with elagolix 150 mg once daily for longer than 6 mo. May ↑ levels of active metabolite of **fostamatinib** which can ↑ risk of hepatotoxicity and neutropenia; may need to ↓ dose of fostamatinib.

Drug-Natural Products: **St. John's wort** may ↓ levels and promote resistance; concurrent use contraindicated.

Drug-Food: **Food** ↑ absorption.

Route/Dosage

PO (Adults): 300 mg twice daily for 2–3 days, then 400 mg twice daily for 2–3 days, then 500 mg twice daily for 2–3 days, then 600 mg twice daily as maintenance.

PO (Children >1 mo): 250 mg/m² twice daily initially; ↑ by 50 mg/m² twice daily every 2–3 days up to 400 mg/m² twice daily (if unable to get up to 400 mg/m² twice daily, consider alternative antiretroviral therapy).

Availability (generic available)

Tablets: 100 mg. **Oral powder:** 100 mg/pkt. **Oral solution (contains alcohol):** 80 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess patient for rash (mild to moderate rash usually occurs in the 2nd wk of therapy and resolves within 1–2 wk of continued therapy). If rash is severe (extensive erythematous or maculopapular rash with moist desquamation or angioedema) or accompanied by systemic symptoms (serum sickness-like reaction, SJS, TEN), therapy must be discontinued immediately.
- ***Lab Test Considerations:*** Monitor viral load and CD4 counts regularly during therapy.
- Monitor for hyperglycemia, new onset diabetes mellitus, or an exacerbation of diabetes mellitus. May cause hyperglycemia.
- Monitor serum triglycerides and total cholesterol prior to and periodically during therapy. May cause ↑ serum AST, ALT, GGT, total bilirubin, CK, triglycerides, and uric acid concentrations.

Implementation

- Do not confuse ritonavir with Retrovir (zidovudine).
- **PO:** Administer with a meal or light snack.
- Oral powder may be mixed with apple sauce, vanilla pudding, water, chocolate milk, or infant formula. Oral solution may be mixed with chocolate milk, *Ensure*, or *Advera* within 1 hr of dosing to improve taste. Use calibrated oral dosing syringe for oral solution. Oral solution does not require refrigeration if

© F.A. Davis Publishing

used within 30 days and stored below 77 F in the original container. Keep cap tightly closed. Tablets should be swallowed whole; do not crush, break, or chew. Store tablets at room temperature.
- May be administered via feeding tubes compatible with ethanol and propylene glycol, such as silicone and polyvinyl chloride (PVC); do not use with polyurethane feeding tubes due to potential incompatibility.
- If nausea occurs on dose of 600 mg twice daily, may titrate by 300 mg twice daily for 1 day, then 400 mg twice daily for 2 days, then 500 mg twice daily for 1 day, then 600 mg twice daily thereafter.
- Patients initiating concurrent therapy with nucleoside analogues may have less GI intolerance by initiating ritonavir for 2 wk and then adding the nucleoside analogue.

Patient/Family Teaching
- Emphasize the importance of taking ritonavir as directed, at evenly spaced times throughout day. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Take missed doses as soon as remembered; do not double doses.
- Instruct patient that ritonavir should not be shared with others.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Inform patient that ritonavir does not cure AIDS or prevent associated or opportunistic infections. Ritonavir does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others. Advise patient that the long-term effects of ritonavir are unknown at this time.
- Inform patient that ritonavir may cause hyperglycemia. Advise patient to notify health care professional if increased thirst or hunger; unexplained weight loss; increased urination; fatigue; or dry, itchy skin occurs.
- Instruct patient to notify health care professional immediately if rash occurs.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Rep: Advise patient taking oral contraceptives to use a nonhormonal method of birth control during ritonavir therapy. If pregnancy is suspected notify health care professional promptly. Encourage pregnant women to enroll in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263. Advise female patient to avoid breast feeding during therapy.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and improvement in CD4 cell counts.

riTUXimab (ri-tux-i-mab)
Riabni, Rituxan, Ruxience, Truxima

Classification
Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies

Indications
Riabni, Rituxan, Ruxience, and Truxima: Treatment of the following conditions: Relapsed or refractory, low-grade or follicular, CD20-positive, B-cell non-Hodgkin's lymphoma (NHL) (as monotherapy). Previously untreated follicular, CD20-positive, B-cell NHL in combination with first-line chemotherapy and, in patients achieving a complete or partial response to rituximab in combination with chemotherapy, as single-agent maintenance therapy. Non-progressing, low-grade, CD20-positive, B-cell NHL following treatment with cyclophosphamide, vincristine, and prednisone (as monotherapy). Previously untreated diffuse large B-cell, CD20-positive, NHL (in combination with CHOP or another anthracycline-based chemotherapy regimen). CD-20 positive chronic lymphocytic leukemia (CLL) (in combination with fludarabine and cyclophosphamide. Granulomatosis with polyangiitis (GPA) (Wegener's granulomatosis) and microscopic polyangiitis (MPA) (in combination with glucocorticoids). **Rituxan and Truxima only:** Treatment of the following condition: Moderately-to-severely active rheumatoid arthritis in patients who have had an inadequate response to ≥1 TNF antagonist therapies (with methotrexate), **Rituxan only:** Treatment of the following condition: Moderate to severe pemphigus vulgaris.

Action
Binds to the CD20 antigen on the surface of lymphoma cells, preventing the activation process for cell cycle initiation and differentiation. **Therapeutic Effects:** Death of lymphoma cells. Prolonged progression-free survival in CLL. Reduced signs and symptoms of rheumatoid arthritis. Achievement of complete remission in GPA, MPA, and pemphigus vulgaris.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Binds specifically to CD20 binding sites on lymphoma cells.
Metabolism and Excretion: Unknown.
Half-life: 59.8–174 hr (depending on tumor burden).

TIME/ACTION PROFILE (B-cell depletion)

ROUTE	ONSET	PEAK	DURATION
IV	within 14 days	3–4 wk	6–9 mo†

†Duration of depletion after 4 wk of treatment.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to murine (mouse) proteins; OB: Can pass placental barrier potentially causing fetal B-cell depletion. Give only if clearly needed; Lactation: Lactation.
Use Cautiously in: Pre-existing bone marrow depression; Hepatitis B infection (may reactivate infection during and for several mo after treatment); Systemic lupus erythematosus (may cause fatal progressive multifocal leukoencephalopathy); HIV infection (may increase risk of HIV-associated lymphoma); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established for children <2 yr (GPA and MPA) and children <18 yr (all other indications).

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS hypotension, peripheral edema. **Derm:** STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), flushing, urticaria. **Endo:** hyperglycemia. **F and E:** hypocalcemia. **GI:** HEPATITIS B REACTIVATION, abdominal pain, altered taste, dyspepsia. **GU:** renal failure. **Hemat:** ANEMIA, NEUTROPENIA, THROMBOCYTOPENIA. **MS:** arthralgia, back pain. **Neuro:** PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY, headache. **Resp:** bronchospasm, cough, dyspnea. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), INFUSION REACTIONS, TUMOR LYSIS SYNDROME, fever/chills/rigors (infusion related), infection.

Interactions

Drug-Drug: May ↓ antibody response to or ↑ risk of adverse reactions to **live vaccines**; avoid use during treatment; inactive vaccines should be administered ≥4 wk prior to start of therapy.

Route/Dosage

Relapsed or Refractory, Low-Grade or Follicular, CD20-Positive, B-Cell Non-Hodgkin's Lymphoma

IV (Adults): 375 mg/m² once weekly for 4 or 8 doses; may retreat with 375 mg/m² once weekly for 4 doses.

Previously Untreated Follicular, CD20–Positive, B-Cell Non-Hodgkin's lymphoma

IV (Adults): 375 mg/m² given on Day 1 of each cycle of CVP for up to 8 doses; if patients experience complete or partial response, give 375 mg/m² (as monotherapy) every 8 wk for 12 doses (initiate this maintenance therapy 8 wk after completion of rituximab + CVP regimen).

Non-Progressing Low-Grade, CD20-Positive, B-Cell Non-Hodgkin's lymphoma

IV (Adults): For patients who have not progressed following 6–8 cycles of CVP chemotherapy, 375 mg/m² given once weekly for 4 doses given every 6 mo for up to 16 doses.

Diffuse Large B-Cell Non-Hodgkin's lymphoma

IV (Adults): 375 mg/m² given on Day 1 of each cycle of chemotherapy for up to 8 infusions.

Chronic Lymphocytic Leukemia

IV (Adults): 375 mg/m² given on the day before initiating FC chemotherapy, then 500 mg/m² on Day 1 of cycles 2–6 (every 28 days).

Rheumatoid Arthritis

IV (Adults): 1000 mg every 2 wk for 2 doses; subsequent courses should be administered every 24 wk (not sooner than every 16 wk).

Granulomatosis With Polyangiitis and Microscopic Polyangiitis

IV (Adults): *Induction treatment*—375 mg/m² once weekly for 4 wk; *Follow-up treatment in patients who have achieved disease control with induction treatment*—500 mg every 2 wk for 2 doses (should be started 16–24 wk after last rituximab induction dose; if achieved disease control with another agent, start follow-up treatment within 4 wk after last induction dose of that agent), then 500 mg every 6 mo thereafter.
IV (Children ≥2 yr): *Induction treatment*—375 mg/m² once weekly for 4 wk; *Follow-up treatment in patients who have achieved disease control with induction treatment*—250 mg/m² every 2 wk for 2 doses (should be started 16–24 wk after last rituximab induction dose; if achieved disease control with another agent, start follow-up treatment within 4 wk after last induction dose of that agent), then 250 mg/m² every 6 mo thereafter.

Pemphigus Vulgaris

IV (Adults): 1000 mg every 2 wk for 2 doses, then maintenance dose of 500 mg infusion at month 12 and then every 6 mo thereafter. Upon relapse, administer 1000 mg.

Availability

Solution for injection: 10 mg/mL.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Monitor patient for fever, chills/rigors, nausea, urticaria, fatigue, headache, pruritus, bronchospasm, dyspnea, sensation of tongue or throat swelling, rhinitis, vomiting, hypotension, flushing, and pain at disease sites. Infusion-related events occur frequently within 30 min–2 hr of beginning 1st infusion and may resolve with slowing or discontinuing infusion and treatment with IV saline, diphenhydramine, and acetaminophen. Patients with increased risk (females, patients with pulmonary infiltrates, chronic lymphocytic leukemia, or mantle cell leukemia) may have more severe reactions, which may be fatal. Signs of severe reactions include hypotension, angioedema, hypoxia, or bronchospasm and may require interruption of infusion. May result in pulmonary infiltrates, adult respiratory distress syndrome, MI, ventricular fibrillation, and cardiogenic shock. Monitor closely. Incidence decreases with subsequent infusions.
- Monitor patient for tumor lysis syndrome due to rapid reduction in tumor volume (acute renal failure, hyperkalemia, hypocalcemia, hyperuricemia, or hypophosphatemia) usually occurring 12–24 hr after 1st infusion. Risks are higher in patients with greater tumor burden; may be fatal. Correct electrolyte abnormalities, monitor renal function and fluid balance, and administer supportive care, including dialysis, as indicated.
- Assess for signs and symptoms of hypersensitivity reactions (hypotension, bronchospasm, angioedema) during administration. May respond to decrease in infusion rate. Premedication with diphenhydramine and acetaminophen is recommended. Treatment includes diphenhydramine, acetaminophen, bronchodilators, or IV saline as indicated. Epinephrine, antihistamines, and corticosteroids should be readily available in the event of a severe reaction. If severe reactions occur, discontinue infusion; may be resumed at 50% of the rate when symptoms have resolved completely.
- Monitor ECG during and immediately after infusion in patients with pre-existing cardiac conditions (arrhythmias, angina) or patients who have developed arrhythmias during previous infusions of rituximab. Life-threatening arrhythmias may occur.
- Assess for signs of progressive multifocal leukoencephalopathy (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) periodically during therapy.
- Assess for infection during and for 1 yr after therapy. Bacterial, fungal, and new or reactivated viral infections may occur. Screen patient for hepatitis B infection prior to therapy. Discontinue rituximab and any concomitant chemotherapy in patients who develop viral hepatitis or other serious infections, and institute appropriate treatment.
- Assess for mucocutaneous reactions periodically during therapy. May cause SJS and TEN. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** Verify negative pregnancy status before starting therapy.
- Monitor CBC and platelet count before starting and regularly during therapy and frequently in patients with blood dyscrasias. May cause anemia, thrombocytopenia, or neutropenia.
- Frequently causes B-cell depletion with an associated ↓ in serum immunoglobulins in a minority of patients; does not appear to cause an increased incidence of infection.
- Obtain HBsAg and anti-HBc to screen patient for HBV infection before initiating therapy. May cause reactivation of hepatitis B up to 24 mo after therapy.

Implementation

- Do not confuse rituximab with infliximab.
- Transient hypotension may occur during infusion; antihypertensive medications may be held for 12 hr before infusion.
- **Rheumatoid Arthritis:** Administer 100 mg methylprednisolone IV or equivalent 30 min prior to each infusion to minimize infusion reactions.
- **GPA and MPA:** Administer methylprednisolone 1000 mg IV per day for 1 to 3 days followed by oral prednisone 1 mg/kg/day (not to exceed 80 mg/day and tapered per clinical need) to treat severe vasculitis symptoms. Begin regimen within 14 days prior to or with the initiation of rituximab and may continue during and after the 4-wk course of rituximab treatment.
- Prophylaxis against *Pneumocystis jiroveci* pneumonia and herpes virus recommended during treatment and for up to 12 mo following treatment as appropriate for patients with CLL, and during and for at least 6 mo following last rituximab infusion for patients with WG and MPA.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute with 0.9% NaCl or D5W. ***Concentration:*** 1–4 mg/mL. Gently invert bag to mix. Solution is clear to slightly opalescent and colorless to slightly yellow; do not administer solutions that are cloudy, discolored, or contain particulate matter. Discard unused portion remaining in vial. Solution is stable for 12 hr at room temperature and for 24 hr if refrigerated. ***Rate:*** Do not administer as an IV push or bolus.
- *First infusion:* Administer at an initial rate of 50 mg/hr. If hypersensitivity or infusion-related events do

© F.A. Davis Publishing

not occur, rate may be escalated in 50-mg/hr increments every 30 min to a maximum of 400 mg/hr.
- *Subsequent infusions:* May be administered at an initial rate of 100 mg/hr and increased by 100-mg/hr increments at 30-min intervals to a maximum of 400 mg/hr.
- For previously untreated non-Hodgkin's lymphoma and B-cell non-Hodgkin's lymphoma, if no Grade 3 or 4 infusion-related reactions occurred in Cycle 1, may administer via 90-min infusion using glucocorticoids. Begin at rate of 20% of dose over 30 min, with remaining 80% dose over 60 min. If tolerated, then can be used for remainder of therapy.
- **Y-Site Compatibility:** acyclovir, amifostine, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dactinomycin, daunorubicin hydrochloride, dexamethasone, dexrazoxane, digoxin, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, doxycycline, droperidol, enalaprilat, etoposide phosphate, famotidine, fentanyl, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, leucovorin calcium, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, mitomycin, mitoxantrone, morphine, nalbuphine, paclitaxel, pentamidine, piperacillin/tazobactam, potassium chloride, prochlorperazine, promethazine, sargramostim, streptozocin, theophylline, thiotepa, tobramycin, trimethoprim/sulfamethoxazole, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** aldesleukin, amphotericin B deoxycholate, ciprofloxacin, cyclosporine, doxorubicin hydrochloride, furosemide, levofloxacin, minocycline, ondansetron, quinapristin/dalfopristin, sodium bicarbonate, topotecan, vancomycin.
- **Additive Incompatibility:** Do not admix with other medications.

Patient/Family Teaching
- Inform patient of the purpose of the medication. Advise patient to read the *Medication Guide* prior to starting therapy and before each infusion in case of changes.
- Advise patient to report infusion-related events or symptoms of hypersensitivity reactions immediately.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; orthostatic hypotension; or painful ulcers or sores on your skin, lips, or in mouth, blisters, peeling skin, rash, pustule occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Advise patient to consult health care professional prior to receiving any vaccinations.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during therapy and for 12 mo following therapy, and to avoid breast feeding during and for at least 6 mo after last dose. Observe newborns and infants of women taking rituximab during pregnancy for signs of infection.

Evaluation/Desired Outcomes
- Decrease in spread of malignancy.
- Reduced signs and symptoms of rheumatoid arthritis.
- Achievement of complete remission in GPA and MPA.

rivaroxaban (ri-va-**rox**-a-ban)
Xarelto

Classification
Therapeutic: anticoagulants
Pharmacologic: antithrombotics, factor Xa inhibitors

Indications
Prevention of deep vein thrombosis (DVT) that may lead to pulmonary embolism (PE) following knee or hip replacement surgery. Prevention of venous thromboembolism (VTE) and VTE-related death during hospitalization and following hospital discharge in patients admitted for an acute medical illness who are at risk for thromboembolic complications and not at high risk of bleeding. Treatment of DVT or PE. Reduction in risk of recurrence of DVT and/or PE in patients at continued risk for recurrent DVT or PE after completion of initial treatment for at least 6 mo. Reduction in risk of stroke/systemic embolism in patients with nonvalvular atrial fibrillation (AF). Reduction in risk of major cardiovascular events (cardiovascular death, MI, and stroke) in patients with chronic coronary artery disease (in combination with aspirin). Reduction in risk of major thrombotic vascular events (MI, ischemic stroke, acute limb ischemia, and major amputation of a vascular etiology) in patients with peripheral artery disease (PAD), including patients who have recently undergone a lower extremity revascularization procedure due to symptomatic PAD (in combination with aspirin).

© F.A. Davis Publishing

Action

Acts as selective factor X inhibitor that blocks the active site of factor Xa, inactivating the cascade of coagulation.

Therapeutic Effects: Treatment and prevention of thromboembolic events and major cardiovascular events.

Pharmacokinetics

Absorption: Well absorbed (80%) following oral administration; absorption occurs in the stomach and ↓ as it enters the small intestine.

Distribution: Unknown.

Metabolism and Excretion: 51% metabolized by the liver; 36% excreted unchanged in urine. Metabolites do not have anticoagulant activity.

Half-life: 5–9 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr†	24 hr

†Blood levels.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active major bleeding; Severe renal impairment (CCr <15 mL/min [DVT/PE treatment or prevention]); Prosthetic heart valves; Transcatheter aortic valve replacement (↑ risk of death and bleeding); Moderate to severe hepatic impairment (Child-Pugh B or C) or any liver pathology resulting in altered coagulation; PE with hemodynamic instability or requiring thrombolysis or pulmonary embolectomy; Concurrent use of drugs that are combined P-gp inducers/strong CYP3A4 inducers or combined P-gp inhibitors/strong CYP3A4 inhibitors; Triple positive antiphospholipid syndrome (↑ risk of thrombosis); Lactation: Lactation.

Use Cautiously in: Neuroaxial spinal anesthesia or spinal puncture, especially if concurrent with an indwelling epidural catheter, drugs affecting hemostasis, history of traumatic/repeated spinal puncture or spinal deformity (↑ risk of spinal hematoma); CCr ≤50 mL/min (AF) (↓ dose); Use of feeding tube (proper placement of tube must be documented to ensure absorption); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Rep: Women of reproductive potential with abnormal uterine bleeding (↑ risk of uterine bleeding); Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Derm: blister, pruritus. **Hemat:** BLEEDING. **Local:** wound secretion. **MS:** extremity pain, muscle spasm. **Neuro:** syncope.

Interactions

Drug-Drug: Rivaroxaban acts as a substrate of these subsets of the CYP450 enzyme system: CYP3A4/5, CYP2J2, and ATP-binding cassette G2 (ABCG2). Drugs that inhibit or induce these systems may alter effectiveness. Concurrent use of drugs that are combined P-gp inhibitors/strong CYP3A4 inhibitors, including **ketoconazole**, **itraconazole**, **lopinavir/ritonavir**, **ritonavir**, **indinavir**, and **conivaptan** may ↑ levels; avoid concomitant use. Concurrent use of drugs that are combined P-gp inducers/strong CYP3A4 inducers, including **carbamazepine**, **phenytoin**, or **rifampin** may ↓ levels; avoid concomitant use. Concurrent use of drugs that are combined P-gp inhibitors/moderate CYP3A4 inhibitors, including **erythromycin**, in patients with renal impairment (CCr 15–79 mL/min) may ↑ levels; avoid concomitant use. ↑ risk of bleeding with other **anticoagulants**, **aspirin**, **clopidogrel**, **ticagrelor**, **prasugrel**, **fibrinolytics**, **NSAIDs**, **SNRIs**, or **SSRIs**.

Drug-Natural Products: **St. John's wort** may ↓ levels; avoid concomitant use.

Route/Dosage

Prevention of DVT Following Knee or Hip Replacement Surgery

PO (Adults): 10 mg once daily, initiated 6–10 hr postoperatively (when hemostasis is achieved) continued for 35 days after hip replacement or 12 days after knee replacement.

Prevention of VTE in Acutely Ill Medical Patients at Risk for Thromboembolic Complications Not at High Risk of Bleeding

PO (Adults): 10 mg once daily while in the hospital and after hospital discharge for a total of 31–39 days.

Treatment of DVT or PE

PO (Adults): 15 mg twice daily for 21 days, then 20 mg once daily for remainder of treatment period.

Reduction in Risk of Recurrent DVT and/or PE in Patients at Continued Risk for Recurrent DVT and/or PE

PO (Adults): 10 mg once daily to be initiated after ≥6 mo of standard anticoagulant treatment.

Reduction in Risk of Stroke/Systemic Embolism in Nonvalvular AF

PO (Adults): 20 mg once daily with evening meal.

Renal Impairment

PO (Adults): *CCr ≤50 mL/min*— 15 mg once daily with evening meal.

R

© F.A. Davis Publishing

Reduction in Risk of Major Cardiovascular Events in Patients With Chronic Coronary Artery Disease or Reduction in Risk of Major Thrombotic Vascular Events in PAD, Including Patients After Lower Extremity Revascularization Due to Symptomatic PAD

PO (Adults): 2.5 mg twice daily.

Availability

Tablets: 2.5 mg, 10 mg, 15 mg, 20 mg.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or BP; guaiac-positive stools); bleeding from surgical site. Notify health care professional if these occur. May use prothrombin concentrate complex, activated prothrombin complex concentrate or recombinant factor VIIa attempt to reverse life-threatening bleeding; efficacy and safety studies have not been done.
- Monitor patients with epidural catheters frequently for signs and symptoms of neurologic impairment (midline back pain, sensory and motor deficits [numbness, tingling, weakness in lower limbs], bowel and/or bladder dysfunction). Epidural catheter should not be removed earlier than 18 hr in young patients aged 20–45 yrs and 26 hrs in elderly patients aged 60–76 yrs after last administration of rivaroxaban; next dose should be at least 6 hr after catheter removal.
- ***Lab Test Considerations:*** May cause ↑ serum AST, ALT, total bilirubin, and GGT levels.
- Monitor renal function periodically during therapy.
- ***Toxicity and Overdose:*** Antidote is andexanet alfa; effects persist for at least 24 hr after last dose. Other agents and hemodialysis do not have a significant effect. Consider using prothrombin complex concentrate (PCC) or Factor VIIa.

Implementation

- *When switching from warfarin to rivaroxaban,* discontinue warfarin and start rivaroxaban as soon as INR <3.0 to avoid periods of inadequate anticoagulation. *When switching from anticoagulants other than warfarin to rivaroxaban,* start rivaroxaban 0–2 hr prior to next scheduled evening dose and omit dose of other anticoagulant. For continuous heparin, discontinue heparin and administer rivaroxaban at same time. *When switching from rivaroxaban to warfarin or other anticoagulants,* no data is available. May discontinue rivaroxaban and begin both parenteral anticoagulant and warfarin at time of next rivaroxaban dose.
- Discontinue at least 24 hr prior to surgery and other interventions. Restart as soon as hemostasis has been re-established.
- If rivaroxaban must be discontinued for other than bleeding, consider replacing with another anticoagulant; discontinuation increases risk of thrombotic events.
- **PO:** *Prophylaxis of DVT following surgery:* Administer 1st dose 6–10 hr after surgery, once hemostasis has been established. 10-mg tablet may be administered without regard to food; 15-mg and 20-mg tablet should be taken with food.
- If unable to swallow tablet, 15-mg and 20-mg tablets may be crushed, mixed with applesauce, and administered immediately after mixing. Follow dose immediately with food. Tablets are stable in applesauce for up to 4 hr.
- If administering crushed tablet via GI feeding tube, check placement of tube. Rivaroxaban is absorbed from the GI tract, not the small intestine. Suspend crushed tablet in 50 mL water and administer. Follow administration of 15-mg or 20-mg tablet immediately with food.
- Crushed tablets are stable in water or applesauce for up to 4 hr.
- *Reduction in Risk of Stroke in Nonvalvular Atrial Fibrillation:* Administer with evening meal.
- *Treatment of DVT and/or PE:* Administer with food, at the same time each day.
- *Reduction in the Risk of Recurrence of DVT and/or PE in patients at continued risk for DVT and/or PE, Prophylaxis of VTE in Acutely Ill Medical Patients at Risk for Thromboembolic Complications Not at High Risk of Bleeding, or Reduction of Risk of Major Cardiovascular Events (CV Death, MI, and Stroke) in Chronic CAD or PAD:* Administer without regard for food.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered that day. If taking 2.5 mg twice daily, take a single 2.5 mg dose at next scheduled dose. If taking 15 mg twice daily, may take two 15-mg tablets to achieve 30 mg daily dose, then return to regular schedule. If taking 10 mg, 15 mg, or 20 mg once daily, take missed dose immediately; do not double dose. Inform health care professional of missed doses at time of checkup or lab tests. Inform patients that anticoagulant effect may persist for 2–5 days following discontinuation. Advise patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes. Caution patients not to discontinue medication early without consulting health care professional.
- Advise patient to report any symptoms of unusual bleeding or bruising (bleeding gums; nosebleed; black, tarry stools; hematuria; excessive menstrual flow) and symptoms of spinal or epidural hematoma (tingling; numbness, especially in lower extremities; muscular weakness) to health care professional immediately.

© F.A. Davis Publishing

- Instruct patient not to drink alcohol or take other Rx, OTC, or herbal products, especially those containing aspirin, NSAIDs, or St. John's wort, or to start or stop any new medications during rivaroxaban therapy without advice of health care professional.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Monitor for bleeding in fetus and/or neonate of women taking rivaroxaban during pregnancy.

Evaluation/Desired Outcomes

- Prevention of blood clots and subsequent pulmonary emboli following knee/hip replacement surgery. Duration of treatment is 35 days for patients with hip replacement and 12 days for patients with knee replacement surgery.
- Treatment and prevention of thromboembolic events and major cardiovascular events.

rivastigmine (rye-va-**stig**-meen)
Exelon

Classification
Therapeutic: antiAlzheimer's agents
Pharmacologic: cholinergics (cholinesterase inhibitors)

Indications

PO: Mild to moderate dementia associated with Alzheimer's disease. **Transdermal:** Treatment of mild, moderate, or severe dementia associated with Alzheimer's disease and mild to moderate dementia associated with Parkinson's disease.

Action

Enhances cholinergic function by reversible inhibition of cholinesterase. Does not cure the disease. **Therapeutic Effects:** Decreased dementia (temporary) associated with Alzheimer's disease and Parkinson's disease. Enhanced cognitive ability.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Transdermal patch is slowly absorbed over 8 hr.
Distribution: Widely distributed.
Metabolism and Excretion: Rapidly and extensively metabolized by the liver; metabolites are excreted by the kidneys.
Half-life: *PO*—1.5 hr; *Transdermal*—24 hr.

TIME/ACTION PROFILE (improvement in dementia)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 wk	up to 12 wk	unknown
Transdermal	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to rivastigmine or other carbamates; History of application site reactions with transdermal product suggestive of allergic contact dermatitis.
Use Cautiously in: History of asthma or obstructive pulmonary disease; History of GI bleeding; Sick sinus syndrome or other supraventricular cardiac conduction abnormalities; Moderate or severe renal impairment (dose ↓ may be needed); Mild or moderate hepatic impairment (dose ↓ may be needed); Patients weighing <50 kg; at risk for ↑ adverse reactions (dose ↓ may be needed); OB: Safety not established; Lactation: Use during breast feeding only if benefit to patient outweighs potential risk to infant; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: edema, heart failure, hypotension. **Derm:** allergic dermatitis. **GI:** anorexia, dyspepsia, nausea, vomiting, abdominal pain, diarrhea, flatulence. **Local:** application reactions (for transdermal patch only). **Metab:** weight gain (unusual), weight loss. **Neuro:** tremor, weakness, dizziness, drowsiness, headache, sedation (unusual). **Misc:** fever.

Interactions

Drug-Drug: Nicotine may ↑ metabolism and ↓ levels.

Route/Dosage

PO (Adults): 1.5 mg twice daily initially; after at least 2 wk, dose may be ↑ to 3 mg twice daily. Further increments may be made at 2-wk intervals up to 6 mg twice daily.
Transdermal (Adults): *Initial Dose*—4.6 mg/24-hr transdermal patch intially; ↑ to 9.5 mg/24-hr transdermal patch after at least 4 wk; may ↑ to 13.3 mg/24-hr transdermal patch if needed (is recommended effective dose for patients with severe Alzheimer's disease).

Hepatic Impairment

Transdermal (Adults): *Mild-moderate hepatic impairment*—Do not exceed dose of 4.6 mg/24 hr.

Availability (generic available)

Capsules: 1.5 mg, 3 mg, 4.5 mg, 6 mg. **Transdermal patch:** 4.6 mg/24 hr, 9.5 mg/24 hr, 13.3 mg/24 hr.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically throughout therapy.
- Monitor patient for nausea, vomiting, anorexia, and weight loss. Notify health care professional if these side effects occur.
- Monitor for hypersensitivity skin reactions; may occur after oral or transdermal administration. If aller-

© F.A. Davis Publishing

gic contact dermatitis is suspected after transdermal use, may switch to oral rivastigmine after negative allergy testing. If disseminated hypersensitivity reaction of the skin occurs, discontinue therapy.

Implementation

- Patients switching from oral doses of <6 mg to transdermal doses should use 4.6 mg/24 hr patch. Patients taking oral doses of 6–12 mg may be converted directly to 9.5 mg/24 hr patch. Apply patch on the day following the last oral dose.
- **PO:** Administer in the morning and evening with food.
- **Transdermal:** Apply patch to clean, dry, hairless area that will not be rubbed by tight clothing. Upper or lower back is recommended, may also use upper arm or chest. Do not apply to red, irritated, or cut skin. Rotate sites to prevent irritation, do not use same site within 14 days. Remove adhesive liner and apply by pressing patch firmly until edges stick well. May be worn during bathing and hot weather. Each 24 hr, remove old patch and discard by folding in half and apply new patch to a new area.

Patient/Family Teaching

- **PO:** Emphasize the importance of taking rivastigmine at regular intervals as directed.
- Caution patient and caregiver that rivastigmine may cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, anorexia, or weight loss occur. If adverse effects become intolerable during treatment with *transdermal patch,* instruct patient to discontinue patches for several days and then restart at same or next lower dose level. If treatment is interrupted for more than several days, lowest dose level should be used when restarting and titrate according to Route and Dosage section.
- Advise patient and caregiver to notify health care professional of medication regimen prior to treatment or surgery.
- Inform patient and caregiver that improvement in cognitive functioning may take wk to mo and that the degenerative process is not reversed.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- **Transdermal:** Instruct patient and caregiver on the correct application, rotation, and discarding of patch. Patch should be folded in half and discarded out of reach of children and pets; medication remains in discarded patch. Replace missed doses immediately and apply next patch at usual time. Advise patient and caregiver to avoid contact with eyes and to wash hands after applying patch. Avoid exposure to heat sources (excessive sunlight, saunas, heating pads) for long periods.
- Advise patient and caregiver to notify health care professional if skin reactions occur.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.

Evaluation/Desired Outcomes

- Temporary improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.
- Improvement in cognitive function and overall functioning in patients with Parkinson's disease.

rizatriptan (riz-a-trip-tan)

Maxalt, Maxalt-MLT

Classification

Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Indications

Acute treatment of migraine with or without aura.

Action

Acts as an agonist at specific 5-HT_1 receptor sites in intracranial blood vessels and sensory trigeminal nerves.
Therapeutic Effects: Cranial vessel vasoconstriction with associated decrease in release of neuropeptides and resultant decrease in migraine headache.

Pharmacokinetics

Absorption: Completely absorbed after oral administration, but first-pass metabolism results in 45% bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Primarily metabolized by monoamine oxidase-A (MAO-A); minor conversion to an active compound; 14% excreted unchanged in urine.
Half-life: 2–3 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	30 min	1–1.5 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Ischemic or vasospastic cardiovascular, cerebrovascular, or peripheral vascular syndromes; History of significant cardiovascular disease; Uncontrolled hypertension; Should not be used within 24 hr of other 5-HT_1 agonists or ergot-type compounds (dihydroergotamine); Basilar or hemiplegic migraine; Concurrent MAO-A inhibitor therapy or within 2 wk of discontinuing MAO-A inhibitor therapy; Phenylketonuria (orally disintegrating tablet contains aspartame).
Use Cautiously in: Severe renal impairment, especially in patients on dialysis; Moderate hepatic impair-

© F.A. Davis Publishing

ment; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <6 yr (safety and effectiveness not established).

Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision.

Adverse Reactions/Side Effects

CV: CORONARY ARTERY VASOSPASM, MI, VENTRICULAR ARRHYTHMIAS, chest pain, myocardial ischemia. **Derm:** TOXIC EPIDERMAL NECROLYSIS. **GI:** dry mouth, nausea. **Neuro:** dizziness, drowsiness, weakness. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema), pain.

Interactions

Drug-Drug: Concurrent use with **MAO-A inhibitors** ↑ levels and adverse reactions (concurrent use or use within 2 wk of MAO inhibitor is contraindicated). Concurrent use with other **5-HT agonists** or **ergot-type compounds (dihydroergotamine)** may result in ↑ vasoactive properties (avoid use within 24 hr of each other). **Propranolol** ↑ levels and risk of adverse reactions (↓ dose of rizatriptan; rizatriptan not recommended in children <40 kg). ↑ risk of serotonin syndrome when used with **SSRI or SNRI antidepressants**.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): 5–10 mg (use 5-mg dose in patients receiving propranolol); may be repeated in 2 hr; not to exceed 3 doses/24 hr.

PO (Children 6–17 yr): *≥40 kg*— 10 mg single dose (use 5-mg dose in patients receiving propranolol); *<40 kg*— 5 mg single dose (do NOT use in patients receiving propranolol).

Availability (generic available)

Tablets: 5 mg, 10 mg. **Orally disintegrating tablets (Maxalt-MLT) (peppermint flavor):** 5 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs).

Implementation

- **PO:** Tablets should be swallowed whole with liquid.
- Orally disintegrating tablets should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on tongue. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.

Patient/Family Teaching

- Inform patient that rizatriptan should be used only during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer rizatriptan as soon as symptoms of a migraine attack appear, but it may be administered at any time during an attack. If migraine symptoms return, a 2nd dose may be used. Allow at least 2 hr between doses, and do not use more than 30 mg in any 24-hr period.
- If 1st dose does not relieve headache, additional rizatriptan doses are not likely to be effective; notify health care professional.
- Caution patient not to take rizatriptan within 24 hr of other vascular headache suppressants.
- Advise patient that lying down in a darkened room after rizatriptan administration may further help relieve headache.
- Advise patient that overuse (use more than 10 days/mo) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of rizatriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional before next dose of rizatriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during rizatriptan use.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.

R

© F.A. Davis Publishing

- Advise patient to notify health care professional immediately if signs or symptoms of serotonin syndrome occur.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Relief of migraine attack.

rolapitant (rol-**ap**-i-tant)
Varubi

Classification
Therapeutic: antiemetics
Pharmacologic: neurokinin antagonists

Indications

To prevent delayed nausea and vomiting associated with initial/repeat courses of emetogenic cancer chemotherapy (to be used with dexamethasone and a $5-HT_3$ antagonist).

Action

Acts as a selective antagonist at substance P/neurokinin 1 (NK_1) receptors in the brain. **Therapeutic Effects:** Decreased nausea and vomiting associated with chemotherapy. Augments the antiemetic effects of dexamethasone and 5-HT_3 antagonists.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Extensively distributed to tissues.
Protein Binding: 99.8%.
Metabolism and Excretion: Mostly metabolized, primarily by CYP3A4; one metabolite, C4–pyrrolidine-hydroxylated rolapitant (M19), has antiemetic activity. Excretion is mainly via hepatic/biliary elimination. 14% excreted in urine (8% as metabolites), 73% in feces (38% as unchanged drug).
Half-life: *Rolapitant*—7 days; *M19*—7 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	within 30 min	4 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of CYP2D6 substrates with a narrow therapeutic index.
Use Cautiously in: Concurrent use of other CYP2D6 substrates; Severe hepatic impairment (avoid if possible; if unavoidable, monitor carefully); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Older adults may be more sensitive to drug effects.

Adverse Reactions/Side Effects

CV: dizziness. **GI:** abdominal pain, ↓ appetite, dyspepsia, hiccups, stomatitis. **GU:** ↓ fertility (females). **Hemat:** anemia, neutropenia. **Misc:** infusion reactions.

Interactions

Drug-Drug: ↑ levels and risk of serious cardiac toxicity with **CYP2D6 substrates** with a narrow therapeutic index, including **thioridazine** and **pimozide**; concurrent use contraindicated. May ↑ levels and risk of toxicity of other **CYP2D6 substrates** for an extended period of time (≥28 days). May ↑ levels and risk of toxicity of **breast cancer resistance protein (BCRP) substrates**, including **irinotecan**, **methotrexate**, **rosuvastatin**, and **topotecan**; dose reduction may be necessary. May ↑ levels and risk of toxicity of **P-glycoprotein (P-gp) substrates**, including **digoxin**; avoid concurrent use with P-gp substrates with a narrow therapeutic index. **Strong CYP3A4 inducers**, including **rifampin**, ↓ levels and effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults): 180 mg administered within 2 hr prior to start of chemotherapy.

Availability

Tablets: 90 mg.

NURSING IMPLICATIONS

Assessment

- Assess nausea, vomiting, appetite, bowel sounds, and abdominal pain prior to and following administration.
- ***Lab Test Considerations:*** May cause ↓ WBC.

Implementation

- **PO:** Administer 2 hr before starting chemotherapy without regard to food. Due to long action, administer no more frequently than once every 14 days. Given with dexamethasone and a 5-HT_3 antagonist.

Patient/Family Teaching

- Instruct patient to take rolapitant as directed. Direct patient to read the *Patient Package Insert* before starting therapy and each time Rx renewed in case of changes.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient and family to use general measures to decrease nausea (begin with sips of liquids and small, nongreasy meals; provide oral hygiene; remove noxious stimuli from environment).
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. May impair fertility in females; impairment is reversible.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Decreased delayed nausea and vomiting associated with emetogenic chemotherapy.

romosozumab

(**roe**-moe-**soz**-ue-mab)
Evenity

Classification
Therapeutic: bone resorption inhibitors
Pharmacologic: sclerostin inhibitors

Indications

Treatment of osteoporosis in postmenopausal women who are at high risk for a fracture or have failed or are intolerant to other medications used to treat osteoporosis.

Action

Inhibits sclerostin, which leads to increased bone formation and decreased bone resorption. **Therapeutic Effects:** Reduction in vertebral and non-vertebral fractures and improvement in bone mineral density.

Pharmacokinetics

Absorption: Unknown.
Distribution: Not widely distributed to tissues.
Metabolism and Excretion: Degraded into small peptides and amino acids; elimination pathway unknown.
Half-life: 12.8 days.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	5 days	4 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypocalcemia (correct before administration); MI or stroke in past year (↑ risk of cardiovascular death, MI, or stroke); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Patients with risk factors for cardiovascular disease; Severe renal impairment (CCr 15–29 mL/min), or receiving dialysis (monitor serum calcium concentrations and calcium and vitamin D intake); Invasive dental procedures, cancer, receiving chemotherapy, corticosteroids, or angiogenesis inhibitors, poor oral hygiene, diabetes, gingival infections, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (↑ risk of jaw osteonecrosis); Pedi: Safety and effectiveness not established in children; Geri: Older adults may be more sensitive to drug effects.

Adverse Reactions/Side Effects

CV: CARDIOVASCULAR DEATH, MI, peripheral edema. **F and E:** hypocalcemia. **MS:** arthralgia, atypical femoral fracture, muscle spasm, osteonecrosis of the jaw. **Local:** injection site reactions. **Neuro:** paresthesia, STROKE, headache, insomnia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: None reported.

Route/Dosage

Subcut (Adults): 210 mg every month for 12 months.

Availability

Solution for injection (prefilled syringes): 105 mg/1.17 mL.

NURSING IMPLICATIONS

Assessment

- Assess patients for low bone mass before and periodically during therapy.
- Assess cardiac history. Avoid administration in patients who have had an MI or stroke within the preceding year. Discontinue romosozumab if MI or stroke occurs.
- Monitor for signs and symptoms of hypocalcemia (spasms, twitches, or cramps in muscles; numbness or tingling in fingers, toes, or around mouth) periodically during therapy.
- Perform a routine oral exam prior to initiation of therapy. Dental exam with appropriate preventative dentistry should be considered prior to therapy. Patients with history of tooth extraction, poor oral hygiene, gingival infections, diabetes, cancer, receiving radiation, anemia, coagulopathy, or use of a dental appliance or those taking immunosuppressive therapy, angiogenesis inhibitors, or systemic corticosteroids are at greater risk for osteonecrosis of the jaw.

Implementation

- Duration of therapy is limited to 1 yr due to ↓ effectiveness. If continued therapy is needed, continue therapy with an anti-resorptive agent.
- Supplement patient with calcium and vitamin D during therapy.
- If a dose is missed, administer as soon as possible and reschedule monthly from date of last dose.
- **Subcut:** Administer by a health care professional. Allow romosozumab to warm to room temperature for at least 30 min; do not warm in any other way. Solution is clear to opalescent, colorless to light yellow; do not administer solutions that are cloudy, discolored, or contain particulate matter. Do not shake. Dose requires 2 injections in separate sites; thigh, abdomen, outer area of upper arm. Do not inject into areas where the skin is tender, bruised, red, or

© F.A. Davis Publishing

hard. Avoid injecting into areas with scars or stretch marks. Refrigerate solution in original carton to protect from light; do not freeze. Stable for 30 days at room temperature.

Patient/Family Teaching

- Explain purpose of romosozumab to patient.
- Advise patient to notify health care professional immediately if signs and symptoms of MI or hypersensitivity occur.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise patient to notify health care professional if signs and symptoms if osteonecrosis of the jaw (pain, numbness, swelling of or drainage from the jaw, mouth, or teeth) or hypocalcemia (spasms, twitches, or cramps in muscles; numbness or tingling in fingers, toes, or around mouth) or thigh, hip, or groin pain occur.
- Advise parents to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Not indicated for women of reproductive potential.

Evaluation/Desired Outcomes

- Reduction in vertebral and non-vertebral fractures and improvement in bone mineral density.

rOPINIRole (roe-**pin**-i-role)

~~Requip~~, ~~Requip XL~~

Classification

Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Indications

Management of signs and symptoms of idiopathic Parkinson's disease. Restless leg syndrome (immediate-release only).

Action

Stimulates dopamine receptors in the brain. **Therapeutic Effects:** Decreased tremor and rigidity in Parkinson's disease. Decreased leg restlessness.

Pharmacokinetics

Absorption: 55% absorbed following oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Extensively metabolized by the liver (primarily by the CYP1A2 isoenzyme); <10% excreted unchanged in urine.
Half-life: 6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Major psychotic disorder; Impulsive control/compulsive behaviors.

Use Cautiously in: Hepatic impairment (slower titration may be required); Severe cardiovascular disease; OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; may inhibit lactation; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of hallucinations in older adults.

Adverse Reactions/Side Effects

CV: orthostatic hypotension, hypertension, peripheral edema, syncope. **Derm:** sweating. **EENT:** abnormal vision. **GI:** constipation, dry mouth, dyspepsia, nausea, vomiting. **Neuro:** SLEEP ATTACKS, dizziness, syncope, agitation, aggression, confusion, delirium, delusions, disorientation, drowsiness, dyskinesia, fatigue, hallucinations, headache, impulse control disorders (gambling, sexual, uncontrolled spending, binge/compulsive eating), insomnia, paranoid ideation, psychosis, somnolence, weakness.

Interactions

Drug-Drug: CYP1A2 inhibitors, including **ciprofloxacin** may ↑ levels. **CYP1A2 inducers**, including **cigarette smoke** may ↓ levels. Effects may be ↑ by **estrogens**. Effects may be ↓ by **phenothiazines**, **butyrophenones**, **thioxanthenes**, or **metoclopramide**. May ↑ effects of **levodopa** (may allow dose ↓ of levodopa).

Route/Dosage

Parkinson's Disease

PO (Adults): *Immediate-release*—0.25 mg 3 times daily for 1 wk, then 0.5 mg 3 times daily for 1 wk, then 0.75 mg 3 times daily for 1 wk, then 1 mg 3 times daily for 1 wk; then may ↑ by 1.5 mg/day every wk up to 9 mg/day; then may ↑ by up to 3 mg/day every wk up to 24 mg/day; *Extended-release*—2 mg once daily for 1–2 wk; may ↑ by 2 mg/day; do not exceed 8 mg/day in patients with advanced Parkinson's disease or 12 mg/day in patients with early Parkinson's disease.

Renal Impairment

PO (Adults): *Hemodialysis*—0.25 mg 3 times daily; may ↑ dose as needed based on response and tolerability (not to exceed 18 mg/day).

Restless Leg Syndrome

PO (Adults): *Immediate-release*—0.25 mg once daily initially, 1–3 hr before bedtime. After 2 days, ↑ to 0.5 mg once daily and to 1 mg once daily by the end of first wk of dosing, then ↑ by 0.5 mg weekly, up to 4 mg/day as needed/tolerated.

© F.A. Davis Publishing

Renal Impairment

PO (Adults): *Hemodialysis*—0.25 mg once daily; may ↑ dose as needed based on response and tolerability (not to exceed 3 mg/day).

Availability (generic available)

Immediate-release tablets: 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg. **Cost:** *Generic*—0.25 mg $250.21/100, 0.5 mg $250.21/100, 1 mg $250.21/100, 2 mg $250.21/100, 3 mg $259.54/100, 4 mg $259.85/100, 5 mg $259.85/100. **Extended-release tablets:** 2 mg, 4 mg, 6 mg, 8 mg, 12 mg. **Cost:** *Generic*—2 mg $82.05/30, 4 mg $164.10/30, 6 mg $246.16/30, 8 mg $246.16/30, 12 mg $410.47/30.

NURSING IMPLICATIONS

Assessment

- Assess BP periodically during therapy.
- Assess patient for drowsiness and sleep attacks. Drowsiness is a common side effect of ropinirole, but sleep attacks or episodes of falling asleep during activities that require active participation may occur without warning. Assess patient for concomitant medications that have sedating effects or may increase serum ropinirole levels (see Interactions). May require discontinuation of therapy.
- Assess patient for signs and symptoms of psychotic-like behavior (confusion, paranoid ideation, delusions, hallucinations, psychotic-like behavior, disorientation, aggressive behavior, agitation, delirium, hallucinations). Risk of symptoms increases with age. Notify health care professional if these occur.
- **Parkinson's Disease:** Assess patient for signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxic gait) prior to and during therapy.
- **Restless Leg Syndrome:** Assess sleep patterns and frequency of restless leg disturbances.
- Monitor for *augmentation* (earlier onset of symptoms in the evening or afternoon), increase in symptoms, and spread of symptoms to involve other extremities and *rebound* (new onset of symptoms in the early morning hrs). If symptoms occur, consider dose adjustment or discontinuation of therapy.
- ***Lab Test Considerations:*** May cause ↑ BUN.

Implementation

- Do not confuse ropinirole with Risperdal (risperidone) or risperidone.
- **PO:** May be administered with or without food. Administration with food may decrease nausea. ***DNC:*** Swallow extended-release tablets whole; do not break, crush, or chew.
- Taper or discontinuation may cause withdrawal symptoms (apathy, anxiety, depression, fatigue, insomnia, sweating, pain); symptoms do not respond to levodopa. Trial readministration of ropinirole at lowest dose may be considered.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Missed doses should be taken as soon as possible, but not if almost time for next dose. Do not double doses. Do not stop abruptly; may cause hyperpyrexia and confusion. Taper doses gradually over 7 days.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness and unexpected episodes of falling asleep. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Advise patient to notify health care professional if episodes of falling asleep occur.
- Advise patient to avoid alcohol and other CNS depressants concurrently with ropinirole.
- Advise patient that increasing fluids, sugarless gum or candy, ice, or saliva substitutes may help minimize dry mouth. Consult health care professional if dry mouth continues for >2 wk.
- Advise patient to have periodic skin exams to check for lesions that may be melanoma.
- Advise patient to notify health care professional if new or increased gambling, sexual, or other impulse control disorders or psychotic-like behaviors occur.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Advise patients that ropinirole could inhibit lactation because ropinirole inhibits prolactin secretion.

Evaluation/Desired Outcomes

- Decreased tremor and rigidity in Parkinson's disease.
- Decrease in restless legs and improved sleep.

rosuvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

rucaparib (roo-kap-a-rib)

Rubraca

Classification

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Indications

Deleterious *BRCA* mutation-associated epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have been treated with ≥2 chemotherapies. Maintenance treatment of recurrent epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have experienced a complete or partial re-

© F.A. Davis Publishing

sponse to platinum-based chemotherapy. Deleterious *BRCA* mutation-associated metastatic, castration-resistant prostate cancer in patients who have been treated with androgen-receptor directed therapy and a taxane-based chemotherapy regimen.

Action

Acts as a poly (ADP-ribose) polymerase (PARP) inhibitor, thereby disrupting DNA transcription, cell cycle regulation and DNA repair. **Therapeutic Effects:** Decreased growth and spread of epithelial ovarian, fallopian tube, primary peritoneal, or prostate cancer.

Pharmacokinetics

Absorption: 30–45% absorbed following oral administration; bioavailability increased but delayed with high-fat meal.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Extensively metabolized (primarily by the CYP2D6 isoenzyme; minor pathways include CYP1A2 and CYP3A4); information regarding mode of elimination unknown.
Half-life: 17–19 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	unknown

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Derm: photosensitivity, rash, palmar-plantar erythrodysaesthesia syndrome, pruritus. **Endo:** hypercholesterolemia. **GI:** abdominal pain, constipation, ↓ appetite, diarrhea, ↑ liver function tests, nausea, vomiting. **GU:** ↑ serum creatinine. **Hemat:** MYELODYSPLASTIC SYNDROME/ACUTE MYELOID LEUKEMIA, anemia, lymphocytopenia, neutropenia, thrombocytopenia. **Neuro:** dysgeusia, fatigue, dizziness. **Resp:** dyspnea. **Misc:** fever.

Interactions

Drug-Drug: None known.

Route/Dosage

PO (Adults): 600 mg twice daily until disease progression or unacceptable toxicity.

Availability

Tablets: 200 mg, 250 mg, 300 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of myelodysplastic syndrome/acute myeloid leukemia during therapy. May require discontinuation of therapy.
- ***Lab Test Considerations:*** For patient selection for *BRCA*-mutated ovarian cancer, information on the FDA-approved test for the detection of a tumor BRCA mutation in patients with ovarian cancer is available at: http://www.fda.gov/CompanionDiagnostics.
- Verify negative pregnancy test prior to starting therapy.
- Monitor CBC prior to and monthly during therapy. Do not start rucaparib until hematologic toxicity from previous chemotherapy has recovered to ≤Grade 1. For prolonged hematologic toxicities, interrupt rucaparib and monitor CBC weekly until recovery. If levels have not recovered to ≤Grade 1 after 4 wk, refer patient to hematologist for further investigations, including bone marrow analysis and blood sample for cytogenetics. If myelodysplastic syndrome/acute myeloid leukemia is confirmed, discontinue rucaparib.
- May cause anemia, thrombocytopenia, lymphocytopenia, and neutropenia.
- May cause ↑ serum creatinine, ALT, AST, and cholesterol.

Implementation

- **PO:** Administer 2 tablets twice daily approximately 12 hr apart, without regard to food.

Patient/Family Teaching

- Instruct patient to take rucaparib as directed. If a dose is missed, omit and take next dose at scheduled time. Do not replace vomited doses.
- Advise patient to notify health care professional if signs and symptoms of myelodysplastic syndrome/acute myeloid leukemia (weakness, feeling tired, fever, weight loss, frequent infections, bruising, bleeding easily, breathlessness, blood in urine or stool) occur.
- Advise patient to wear protective clothing and sunscreen to prevent photosensitivity reactions.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 6 mo following last dose of rucaparib and to avoid breast feeding during and for 2 wk after last dose. Advise males with female partners of reproductive potential to use effective contraception during and for 3 mo after last dose. Advise males to avoid donating sperm for 3 mo after last dose.

Evaluation/Desired Outcomes

- Decrease in growth and spread of ovarian, fallopian tube, primary peritoneal, or prostate cancer.

© F.A. Davis Publishing

sacubitril/valsartan

(sa-**ku**-bi-tril/val-**sar**-tan)
Entresto

Classification
Therapeutic: vasodilators, antihypertensives
Pharmacologic: angiotensin II receptor antagonists, neprilysin inhibitors

Indications
Chronic HF in adults. Symptomatic HF in children ≥1 yr with systemic left ventricular systolic dysfunction.

Action
sacubitril—a pro-drug converted to LBQ657, its active moiety. LBQ657 inhibits the enzyme neprilysin. Neprilysin degrades vasoactive peptides, including natriuretic peptides, bradykinin, and adrenomedullin resulting in ↑ levels of these peptides, causing vasodilation and ↓ extracellular fluid volume via sodium excretion. *Valsartan*—Blocks vasoconstrictor and aldosterone-producing effects of angiotensin II at receptor sites, including vascular smooth muscle and the adrenal glands. **Therapeutic Effects:** Reduction in cardiovascular death and hospitalizations due to HF in adults. Reduction in NT-proBNP concentrations in children.

Pharmacokinetics
Absorption: *Sacubitril*—≥60% absorbed following oral administration; rapidly converted to LBQ657, its active form. *Valsartan*—Absorption in combinations with sacubitril is greater than 10–35% absorbed following oral administration of single-entity formulation.
Distribution: *Sacubitril*—small amounts cross the blood-brain barrier. *Valsartan*—crosses the placenta.
Protein Binding: *Sacubitril, valsartan*—94–97%.
Metabolism and Excretion: *Sacubitril*—following conversion to LBQ657 metabolism is minimal; 52–68% excreted in urine. *Valsartan*—Minor metabolism by the liver; 13% excreted in urine, 83% in feces.
Half-life: *Sacubitril*—1.4 hr. *LBQ657*—11.5 hr. *Valsartan*—9.9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
sacubitril	unknown	0.5 hr	12 hr
LBQ657	unknown	2 hr	12 hr
Valsartan	unknown	1.5 hr	12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity, hereditary angioedema, or history of angioedema from previous ACE inhibitors or ARBs; Concurrent use of ACE inhibitors during or for 36 hr before or after; Concurrent use with aliskiren in patients with diabetes or moderate-to-severe renal impairment (CCr <60 mL/min); Severe hepatic impairment; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: HF (may result in azotemia, oliguria, acute renal failure and/or death); Volume- or salt-depleted patients or patients receiving high doses of diuretics (correct deficits before initiating therapy or initiate at lower doses); Black patients (may not be effective); Impaired renal function due to primary renal disease or HF (may worsen renal function); Rep: Women of reproductive potential; Pedi: Children <1 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects
CV: hypotension. **F and E:** hyperkalemia. **Neuro:** dizziness. **Resp:** cough. **Misc:** ANGIOEDEMA.

Interactions
Drug-Drug: **NSAIDs** and selective **COX-2 inhibitors** may ↑ the risk of renal dysfunction. ↑ risk of hypotension with other **antihypertensives** and **diuretics**. Concurrent use of **potassium-sparing diuretics**, **potassium-containing salt substitutes**, or **potassium supplements** may ↑ risk of hyperkalemia. ↑ risk of hyperkalemia, renal dysfunction, hypotension, and syncope with concurrent use of **ACE inhibitors** or **aliskiren**; avoid concurrent use with aliskiren in patients with diabetes or CCr <60 mL/min; avoid concurrent use with ACE inhibitors. May ↑ **lithium** levels.

Route/Dosage
PO (Adults): Sacubitril 49 mg/valsartan 51 mg twice daily initially; double dose in 2–4 wk to target dose of sacubitril 97 mg/valsartan 103 mg as tolerated. *Patients not currently receiving angiotensin-converting enzyme inhibitors or angiotensin receptor blockers or receiving low doses of these agents*—Sacubitril 24 mg/valsartan 26 mg twice daily initially; double dose every 2–4 wk to target dose of sacubitril 97 mg/valsartan 103 mg as tolerated.

Hepatic/Renal Impairment
PO (Adults): *Severe renal impairment (CCr <30 mL/min/1.73 m² or moderate hepatic impairment (Child-Pugh class B)*—Sacubitril 24 mg/valsartan 26 mg twice daily initially; double dose every 2–4 wk to target dose of sacubitril 97 mg/valsartan 103 mg as tolerated.
PO (Children ≥1 yr and ≥50 kg): Sacubitril 49 mg/valsartan 51 mg twice daily initially; ↑ dose in 2 wk to sacubitril 72 mg/valsartan 78 mg twice daily as tolerated, then ↑ dose again in 2 wk to target dose of sacubitril 97 mg/valsartan 103 mg twice daily as tolerated. *Patients not currently receiving angiotensin-converting enzyme inhibitors or angiotensin receptor blockers or receiving low doses of these agents*—Sacubitril 24 mg/valsartan 26 mg twice daily initially; ↑ dose in 2 wk to sacubitril 49 mg/valsartan 51 mg twice daily as tolerated, then ↑ dose again in 2 wk to sacubi-

© F.A. Davis Publishing

tril 72 mg/valsartan 78 mg twice daily as tolerated, then ↑ dose again in 2 wk to target dose of sacubitril 97 mg/valsartan 103 mg twice daily as tolerated.

Hepatic/Renal Impairment

PO (Children ≥1 yr and ≥50 kg): *Severe renal impairment (CCr <30 mL/min/1.73 m² or moderate hepatic impairment (Child-Pugh class B)* — Sacubitril 24 mg/valsartan 26 mg twice daily initially; ↑ dose in 2 wk to sacubitril 49 mg/valsartan 51 mg twice daily as tolerated, then ↑ dose again in 2 wk to sacubitril 72 mg/valsartan 78 mg twice daily as tolerated, then ↑ dose again in 2 wk to target dose of sacubitril 97 mg/valsartan 103 mg twice daily as tolerated.

PO (Children ≥1 yr and 40–<50 kg): Sacubitril 24 mg/valsartan 26 mg twice daily initially; ↑ dose in 2 wk to sacubitril 49 mg/valsartan 51 mg twice daily as tolerated, then ↑ dose again in 2 wk to target dose of sacubitril 72 mg/valsartan 78 mg twice daily as tolerated. *Patients not currently receiving angiotensin-converting enzyme inhibitors or angiotensin receptor blockers or receiving low doses of these agents* — 0.8 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily initially; ↑ dose in 2 wk to 1.6 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated, then ↑ dose in 2 wk to 2.3 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated, then ↑ dose again in 2 wk to target dose of 3.1 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated.

Hepatic/Renal Impairment

PO (Children ≥1 yr and 40–<50 kg): *Severe renal impairment (CCr <30 mL/min/1.73 m² or moderate hepatic impairment (Child-Pugh class B)* — 0.8 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily initially; ↑ dose in 2 wk to 1.6 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated, then ↑ dose in 2 wk to 2.3 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated, then ↑ dose again in 2 wk to target dose of 3.1 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated.

PO (Children ≥1 yr and <40 kg): 1.6 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily initially, then ↑ dose in 2 wk to 2.3 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated, then ↑ dose again in 2 wk to target dose of 3.1 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated. *Patients not currently receiving angiotensin-converting enzyme inhibitors or angiotensin receptor blockers or receiving low doses of these agents*— 0.8 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily initially; ↑ dose in 2 wk to 1.6 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated, then ↑ dose in 2 wk to 2.3 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated, then ↑ dose again in 2 wk to target dose of 3.1 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated.

Hepatic/Renal Impairment

PO (Children ≥1 yr and <40 kg): *Severe renal impairment (CCr <30 mL/min/1.73 m² or moderate hepatic impairment (Child-Pugh class B)* — 0.8 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily initially; ↑ dose in 2 wk to 1.6 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated, then ↑ dose in 2 wk to 2.3 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated, then ↑ dose again in 2 wk to target dose of 3.1 mg/kg (represents combined mg dose of sacubitril and valsartan) of oral suspension twice daily as tolerated.

Availability

Tablets: sacubitril 24 mg/valsartan 26 mg, sacubitril 49 mg/valsartan 51 mg, sacubitril 97 mg/valsartan 103 mg.

NURSING IMPLICATIONS

Assessment

- Assess BP (lying, sitting, standing) and pulse frequently during initial dose adjustment and periodically throughout therapy. Correct volume or salt depletion prior to administration of therapy. If hypotension occurs, consider reducing dose of diuretics, concomitant antihypertensive agents, and treatment of other causes of hypotension (hypovolemia). If hypotension persists, reduce the dose or temporarily discontinue therapy. Permanent discontinuation of therapy is usually not required.
- Monitor daily weight and assess patient routinely for resolution of fluid overload (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Monitor frequency of prescription refills to determine compliance.
- Assess patients for signs of angioedema (dyspnea, orofacial swelling); may occur more frequently in Black patients. If signs occur, discontinue therapy, provide supportive therapy, and monitor for airway compromise.
- ***Lab Test Considerations:*** Monitor renal function. May cause increase in BUN and serum creatinine. May require ↓ dose.
- May cause hyperkalemia. May require ↓ dose.
- May cause ↓ in hemoglobin and hematocrit.

© F.A. Davis Publishing

Implementation

- **PO:** Administer twice daily.
- If switching from an ACE inhibitor to *Entresto*, allow 36 hrs between last ACE inhibitor dose and starting *Entresto*. For patients unable to swallow pills, a suspension can be made by a pharmacist.

Patient/Family Teaching

- Instruct patient to take *Entresto* as directed, at the same time each day, even if feeling well. Take missed doses as soon as remembered if not almost time for next dose; do not double doses. Warn patient not to discontinue therapy unless directed by health care professional. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Caution patient to avoid salt substitutes containing potassium or foods containing high levels of potassium or sodium unless directed by health care professional. See Appendix J.
- Instruct patient to notify health care professional if swelling of face, eyes, lips, or tongue or if difficulty swallowing or breathing occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products, especially NSAIDs, potassium supplements or salt substitute, ACE inhibitors, ARBs, lithium, or aliskiren, without consulting health care professional.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: May cause fetal harm. Advise females of reproductive potential to use contraception and avoid breast feeding during therapy. Notify health care professional if pregnancy is planned or suspected. *Entresto* should be discontinued as soon as possible when pregnancy is detected.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.

Evaluation/Desired Outcomes

- Decreased heart-failure-related hospitalizations in patients with heart failure.

safinamide (sa-fin-a-mide)

Xadago

Classification

Therapeutic: antiparkinson agents
Pharmacologic: monoamine oxidase type B inhibitors

Indications

Adjunctive treatment to levodopa/carbidopa in patients with Parkinson's disease (PD) who are experiencing "off" episodes.

Action

Irreversibly inhibits monoamine oxidase (MAO) B, which leads to ↑ dopamine levels in the CNS. **Therapeutic Effects:** Increased amount of "on" time without dyskinesia or with non-troublesome dyskinesia.

Pharmacokinetics

Absorption: 95% absorbed following oral administration.
Distribution: Extensively distributed to the tissues; readily crosses the blood-brain barrier.
Metabolism and Excretion: Extensively metabolized by hydrolytic oxidation or oxidative cleavage to inactive metabolites; 76% excreted in urine (primarily as inactive metabolites).
Half-life: 20–26 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of other MAO inhibitors; Concurrent use of opioids, SNRIs, TCAs, cyclobenzaprine, methylphenidate, amphetamine, or St. John's wort; Concurrent use of dextromethorphan; Severe hepatic impairment (Child-Pugh C); Psychotic disorder; Lactation: Discontinue breast feeding or discontinue the safinamide.
Use Cautiously in: Retinal disease; Moderate hepatic impairment (Child-Pugh B) (do not exceed maximum recommended dose); OB: Use only if maternal benefit outweighs fetal risk; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: hypertension, orthostatic hypotension. **EENT:** visual changes. **GI:** ↑ liver enzymes, nausea. **Neuro:** dyskinesia, paresthesia, anxiety, drowsiness, hallucinations, impulse control disorders (gambling, sexual, binge eating), ↑ fall risk, insomnia, psychosis, sleep attacks, sleep driving. **Resp:** cough. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Concurrent use of other **MAO inhibitors**, including **linezolid** and **isoniazid**, may ↑ risk of hypertensive crises and is contraindicated; separate administration by ≥14 days. Concurrent use of **meperidine**, **methadone**, **tramadol**, **SNRIs**, **TCAs**, **cyclobenzaprine**, **methylphenidate**, or **amphetamine** may ↑ risk of serotonin syndrome and is contraindicated; separate administration by ≥14 days; SSRIs may

S

© F.A. Davis Publishing

be used at the lowest dose possible. Concurrent use with **dextromethorphan** may result in psychosis/bizarre behavior and is contraindicated. Hypertensive crisis may occur with cough and cold products containing **sympathomimetic amines** including **pseudoephedrine** and **phenylephrine**; monitor patient's BP closely. May ↑ levels/toxicity of **imatinib**, **irinotecan**, **lapatinib**, **methotrexate**, **mitoxantrone**, **rosuvastatin**, **sulfasalazine**, and **topotecan**; monitor closely for adverse effects. **Dopamine antagonists**, including **antipsychotics** and **metoclopramide** may ↓ effectiveness of safinamide.

Drug-Natural Products: Concurrent use with **St. John's wort** may ↑ risk of serotonin syndrome; concurrent use contraindicated.

Drug-Food: Ingestion of foods containing high amounts of **tyramine** (>150 mg) (e.g., cheese) may result in hypertensive crisis.

Route/Dosage

PO (Adults): 50 mg once daily; after 2 wk, may ↑ dose to 100 mg once daily.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh B)* — Do not exceed 50 mg/day; *Severe hepatic impairment (Child-Pugh C)* — Contraindicated.

Availability

Tablets: 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxic gait) prior to and during therapy.
- Monitor for new-onset hypertension or hypertension not adequately controlled after starting safinamide. Sustained BP elevation may require dose reduction.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- ***Toxicity and Overdose:*** Concurrent ingestion of tyramine-rich foods and many medications may result in a life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, tachycardia or bradycardia, severe headache, neck stiffness or soreness, nausea and vomiting, sweating, photosensitivity, and enlarged pupils.

Implementation

- **PO:** Administer once daily, at the same time each day, without regard to food.

Patient/Family Teaching

- Instruct patient to take safinamide as directed. Missed doses should be omitted and next dose taken at usual time the following day. Do not double doses. Do not discontinue abruptly; may cause elevated temperature, muscular rigidity, altered consciousness, and autonomic instability. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Caution patient to avoid alcohol, CNS depressants, and foods or beverages containing tyramine (see Appendix J) during and for at least 2 wk after therapy has been discontinued; they may precipitate a hypertensive crisis. Contact health care professional immediately if symptoms of hypertensive crisis or serotonin syndrome develop.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Caution patient to avoid use of St. John's wort, cough or cold products containing dextromethorphan, and analgesics meperidine, tramadol, or methadone during therapy.
- May cause drowsiness and unexpected episodes of falling asleep. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Advise patient to notify health care professional if episodes of falling asleep occur.
- Advise patient to notify health care professional if new or increased gambling, sexual, or other impulse control disorders or psychotic-like behaviors occur.
- Advise female patients to notify health care professionals if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improvement in symptoms of Parkinson's disease, allowing increase in function.

salmeterol (sal-**me**-te-role)

Serevent Diskus

Classification

Therapeutic: bronchodilators
Pharmacologic: adrenergics

Indications

As concomitant therapy for the treatment of asthma and the prevention of bronchospasm in patients who are currently taking but are inadequately controlled on a long-term asthma-control medication (e.g., inhaled corticosteroid). Prevention of exercise-induced bronchospasm. Maintenance treatment to prevent bronchospasm in chronic obstructive pulmonary disease (COPD) including chronic bronchitis and emphysema.

Action

Produces accumulation of cyclic adenosine monophosphate (cAMP) at beta$_2$-adrenergic receptors. Relatively specific for beta (pulmonary) receptors. **Therapeutic Effects:** Bronchodilation.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Minimal systemic absorption follows inhalation.
Distribution: Action is primarily local.
Metabolism and Excretion: Unknown.
Half-life: 3–4 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhaln	10–25 min	3–4 hr	12 hr†

†9 hr in adolescents.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to salmeterol or milk proteins; Acute attack of asthma (onset of action is delayed); Patients not receiving a long-term asthma-control medication (e.g., inhaled corticosteroid) (↑ risk of asthma-related death); Patients whose asthma is currently controlled on low- or medium-dose inhaled corticosteroid therapy.

Use Cautiously in: Cardiovascular disease (including angina and hypertension); Seizure disorders; Diabetes; Glaucoma; Hyperthyroidism; Pheochromocytoma; Excessive use (may lead to tolerance and paradoxical bronchospasm); OB: Use only if potential maternal benefit justifies potential fetal risk; may inhibit contractions during labor; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <4 yr (safety not established); a fixed-dose combination product containing salmeterol and an inhaled corticosteroid should be strongly considered to ensure adherence.

Adverse Reactions/Side Effects

CV: palpitations, tachycardia. **GI:** abdominal pain, diarrhea, nausea. **MS:** muscle cramps/soreness. **Neuro:** trembling, headache, nervousness. **Resp:** paradoxical bronchospasm, cough.

Interactions

Drug-Drug: Beta blockers may ↓ therapeutic effects. **MAO inhibitors** and **tricyclic antidepressants** potentiate cardiovascular effects. ↑ levels and ↑ risk of cardiovascular effects when used with potent CYP3A4 inhibitors (e.g., **ketoconazole**, **itraconazole**, **ritonavir**, **atazanavir**, **clarithromycin**, **indinavir**, **nefazodone**, **nelfinavir**, or **saquinavir**); concurrent use is not recommended.

Drug-Natural Products: Use with caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) ↑ stimulant effect.

Route/Dosage

Asthma

Inhaln (Adults and Children ≥4 yr): 50 mcg (1 inhalation) twice daily (approximately 12 hr apart).

Prevention of Exercise-Induced Bronchospasm

Inhaln (Adults and Children ≥4 yr): 50 mcg (1 inhalation) ≥30 min before exercise; additional doses should not be used for ≥12 hr.

COPD

Inhaln (Adults): 50 mcg (1 inhalation) twice daily (approximately 12 hr apart).

Availability

Powder for oral inhalation (Serevent Diskus): 50 mcg/blister. ***In combination with:*** fluticasone (Advair Diskus, Advair HFA, AirDuo RespiClick, Wixhela Inhub). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and BP before administration and periodically during therapy.
- Monitor pulmonary function tests before initiating therapy and periodically during therapy.
- Observe for paradoxical bronchospasm (wheezing, dyspnea, tightness in chest) and hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). Frequently occurs with first use of new canister or vial. If condition occurs, withhold medication and notify physician or other health care professional immediately.
- ***Lab Test Considerations:*** May cause ↑ serum glucose concentrations; occurs rarely with recommended doses and is more pronounced with frequent use of high doses.
- May cause ↓ serum potassium concentrations, which are usually transient and dose related; rarely occurs at recommended doses and is more pronounced with frequent use of high doses.
- ***Toxicity and Overdose:*** Symptoms of overdose include persistent agitation, chest pain or discomfort, decreased BP, dizziness, hyperglycemia, hypokalemia, seizures, tachyarrhythmias, persistent trembling, and vomiting.
- Treatment includes discontinuing salmeterol and other beta-adrenergic agonists and providing symptomatic, supportive therapy. Cardioselective beta blockers are used cautiously because they may induce bronchospasm.

Implementation

- Salmeterol should be used along with an inhaled corticosteroid, not as monotherapy. Patients taking salmeterol twice daily should not use additional doses for exercise-induced bronchospasm.
- **Inhaln:** *Serevent Diskus:* Once removed from foil overwrap, discard diskus when every blister has been used or 6 wk have passed, whichever comes first.

S

© F.A. Davis Publishing

Patient/Family Teaching

- Advise patient to take salmeterol as directed. Do not use more than the prescribed dose. If a regularly scheduled dose is missed, use as soon as possible and resume regular schedule. Do not double doses. If symptoms occur before next dose is due, use a rapid-acting inhaled bronchodilator.
- Instruct patient using *powder for inhalation* never to exhale into diskus device and always to hold device in a level horizontal position. Mouthpiece should be kept dry; never wash.
- Caution patient not to use salmeterol to treat acute symptoms. A rapid-acting inhaled beta-adrenergic bronchodilator should be used for relief of acute asthma attacks.
- Advise patients on chronic therapy not to use additional salmeterol to prevent exercise-induced bronchospasm. Patients using salmeterol for prevention of exercise-induced bronchospasm should not use additional doses of salmeterol for 12 hr after prophylactic administration.
- Advise patient to notify health care professional immediately if difficulty in breathing persists after use of salmeterol, if condition worsens, if more inhalations of rapid-acting bronchodilator than usual are needed to relieve an acute attack, or if using 4 or more inhalations of a rapid-acting bronchodilator for 2 or more consecutive days or more than 1 canister in an 8-wk period.
- Salmeterol is often used with inhaled corticosteroids and is not a substitute for corticosteroids or adrenergic bronchodilators. Advise patients using inhalation or systemic corticosteroids to consult health care professional before stopping or reducing therapy.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of regular follow-up exams to determine progress during therapy.

Evaluation/Desired Outcomes

- Prevention of bronchospasm or reduction of frequency of acute asthma attacks in patients with chronic asthma. Improvement in asthma control can occur within 15 min of starting therapy, but full benefit may take 1 wk or longer. Time to onset and degree of symptom relief will vary with individual.
- Prevention of exercise-induced asthma.

sarilumab (sar-il-ue-mab)

Kevzara

Classification

Therapeutic: antirheumatics, immunosuppressants

Pharmacologic: interleukin antagonists

Indications

Moderately- to severely-active rheumatoid arthritis in patients who have not responded to ≥1 disease-modifying antirheumatic drugs (DMARD) (as monotherapy or in combination with methotrexate or other non-biologic DMARDs).

Action

Acts as an inhibitor of interleukin-6 (IL-6) receptors by binding to them. IL-6 is a mediator of various inflammatory processes. **Therapeutic Effects:** Slowed progression of rheumatoid arthritis.

Pharmacokinetics

Absorption: Well absorbed via subcutaneous injection.

Distribution: Well distributed.

Metabolism and Excretion: Metabolic pathway has not been defined. Elimination is predominantly through the linear, non-saturable proteolytic pathway at high concentrations; at lower concentrations, elimination is predominately through non-linear saturable target-mediated pathway.

Half-life: *200 mg every 2 wk dose*—up to 10 days; *150 mg every 2 wk dose*—up to 8 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Subcut		2–4 days	28–43 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active infection; Active hepatic disease/impairment; Absolute neutrophil count (ANC) <2000/mm³ (<500/mm³ while on therapy) or platelet count <150,000/mm³ (<50,000/mm³ while on therapy); Concurrent use with biological DMARDs.

Use Cautiously in: Chronic or recurrent infection; History of serious or opportunistic infection; Exposure to tuberculosis; Lived in or traveled to areas of endemic tuberculosis or endemic mycoses; Diverticulitis or concomitant use of NSAIDs or corticosteroids (↑ risk for GI perforation); Severe renal impairment; Geri: ↑ risk of infections; OB: Use only if potential benefit justifies potential risk to fetus; Lactation: Use only if potential benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

GI: GASTROINTESTINAL PERFORATION, ↑ liver enzymes. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA. **Metab:** dyslipidemia. **Misc:** INFECTIONS (including tuberculosis, disseminated fungal infections, and infections with opportunistic pathogens), MALIGNANCY, hypersensitivity reactions (including rash and urticaria), injection site reactions.

Interactions

Drug-Drug: May alter the activity of CYP450 enzymes; the effects of the following drugs should be

© F.A. Davis Publishing

monitored: **cyclosporine**, **theophylline**, **warfarin**, **hormonal contraceptives**, **atorvastatin**, and **lovastatin**. Other drugs which are substrates for this system should also be monitored; effect may persist for several wk after discontinuation. May ↓ antibody response to and ↑ risk of adverse reactions to **live virus vaccines**; do not administer concurrently.

Route/Dosage

Subcut (Adults): 200 mg every 2 wk.

Availability

Solution for subcutaneous injection (prefilled syringes and prefilled pens): 150 mg/1.14 mL, 200 mg/1.14 mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to injection. Sarilumab is contraindicated in patients with active infection. Monitor new infections closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Signs and symptoms of inflammation may be lessened due to suppression from sarilumab. Infections may be fatal, especially in patients taking immunosuppressive therapy. If patient develops a serious infection, discontinue sarilumab until infection is controlled.
- Monitor for signs and symptoms of viral reactivation: herpes zoster (rash, blisters), hepatitis B (jaundice, dark urine, light-colored stools, fatigue, weakness, loss of appetite, nausea, vomiting, stomach pain) during therapy.
- ***Lab Test Considerations:*** Monitor neutrophil count prior to, and 4 and 8 wk after starting, and every 3 mo during therapy. Base dose modifications on measures from end of dosing interval. *If ANC >1000 cells/mm^3,* maintain current dose of sarilumab. *If ANC 500–1000 cells/mm^3,* withhold therapy until ANC >1000. Resume at 150 mg every 2 wk and ↑ to 200 mg every 2 wk as appropriate. If ANC <500 cells/mm^3, discontinue sarilumab.
- Monitor platelet count prior to, and 4 and 8 wk after starting, and every 3 mo during therapy. *If platelet count 50,000–100,000 cells/mm^3,* suspend therapy until platelets >100,000. Resume at 150 mg every 2 wk and ↑ to 200 mg every 2 wk as appropriate.
- Monitor serum AST and ALT prior to, and 4 and 8 wk after starting, and every 3 mo during therapy. *If ALT > upper limits of normal (ULN) to 3 × ULN or less,* consider modifying dose of concomitant DMARDs as clinically appropriate. *If ALT >3 × ULN to 5 × ULN or less,* hold therapy until ALT <3 × ULN. Resume at 150 mg every 2 wk and ↑ to 200 mg every 2 wk as appropriate. *If ALT >5 × ULN,* discontinue sarilumab.
- Monitor serum lipid levels 4–8 wk following start of therapy, then at 6-mo intervals. Manage with clinical guidelines for hyperlipidemia.

Implementation

- Administer a tuberculin skin test prior to administration of sarilumab. Patients with latent TB should be treated for TB prior to therapy.
- Other DMARDs should be continued during sarilumab therapy.
- **Subcut:** Refrigerate in original carton to protect from light. Do not freeze or shake. May be stored for up to 14 days in original carton at room temperature. Inject full amount in syringe. Rotate injection sites; avoid areas where skin is tender, damaged, or has bruises or scars. Solution is clear and colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter.

Patient/Family Teaching

- Instruct patient on the purpose for sarilumab. If a dose is missed, contact health care professional to schedule next infusion. Instruct patient and caregiver in correct technique for subcut injections and care and disposal of equipment. Advise patient to read the *Medication Guide* before starting and with each Rx refill in case of changes.
- Caution patient to notify health care professional immediately if signs of infection (fever, sweating, chills, muscle aches, cough, shortness of breath, blood in phlegm, weight loss, warm, red or painful skin or sores, diarrhea or stomach pain, burning on urination, urinary frequency, feeling tired), fever and stomach-area pain that does not go away, change in bowel habits, severe rash, swollen face, or difficulty breathing occurs while taking. If signs and symptoms of anaphylaxis occur, discontinue injections and notify health care professional immediately.
- Advise patient to avoid receiving live vaccines during therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding, Encourage women who become pregnant while taking sarilumab to participate in the pregnancy registry by calling 1-877-311-8972.

Evaluation/Desired Outcomes

- Slowed progression of rheumatoid arthritis.

S

© F.A. Davis Publishing

BEERS

scopolamine (scoe-pol-a-meen)

Transderm-Scop

Classification

Therapeutic: antiemetics
Pharmacologic: anticholinergics

Indications

Prevention of motion sickness. Prevention of postoperative nausea and vomiting.

Action

Inhibits the muscarinic activity of acetylcholine. Corrects the imbalance of acetylcholine and norepinephrine in the CNS, which may be responsible for motion sickness. **Therapeutic Effects:** Reduction of postoperative nausea and vomiting. Reduction of spasms.

Pharmacokinetics

Absorption: Well absorbed following transdermal administration.
Distribution: Crosses the placenta and blood-brain barrier.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 8 hr.

TIME/ACTION PROFILE (antiemetic, sedative properties)

ROUTE	ONSET	PEAK	DURATION
Transdermal	4 hr	unknown	72 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Acute hemorrhage; Tachycardia secondary to cardiac insufficiency or thyrotoxicosis.
Use Cautiously in: Possible intestinal obstruction; Prostatic hyperplasia; Chronic renal, hepatic, pulmonary, or cardiac disease; OB: Avoid use in pregnant women with severe pre-eclampsia (may cause seizures); otherwise, use only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi, Geri: ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CV: tachycardia, palpitations. **Derm:** ↓ sweating. **EENT:** blurred vision, mydriasis, photophobia. **GI:** dry mouth, constipation. **GU:** urinary hesitancy, urinary retention. **Neuro:** drowsiness, confusion.

Interactions

Drug-Drug: ↑ anticholinergic effects with **antihistamines**, **antidepressants**, **quinidine**, or **disopyramide**. ↑ CNS depression with **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, or **sedative/hypnotics**. May alter the absorption of other **orally administered drugs** by slowing motility of the GI tract. May ↑ GI mucosal lesions in patients taking oral **wax-matrix potassium chloride preparations**.
Drug-Natural Products: ↑ anticholinergic effects with **jimson weed** and **scopolia**.

Route/Dosage

Transdermal (Adults): *Motion sickness*—Apply 1 patch 4 hr prior to travel and then every 3 days (as needed); *Preoperative*—Apply 1 patch the evening before surgery (remove 24 hr after surgery).

Availability (generic available)

Transdermal system: Transderm-Scop—1.5 mg scopolamine/patch releases 0.5 mg scopolamine over 3 days.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of urinary retention periodically during therapy.

Implementation

- **Transdermal:** Apply at least 4 hr (US product) before exposure to travel to prevent motion sickness.

Patient/Family Teaching

- **Transdermal:** Instruct patient on application of transdermal patches. Apply at least 4 hr (US product) before exposure to travel to prevent motion sickness. Wash hands and dry thoroughly before and after application. Apply to hairless, clean, dry area behind ear; avoid areas with cuts or irritation. Apply pressure over system to ensure contact with skin. System is effective for 3 days. If system becomes dislodged, replace with a new system on another site behind the ear. System is waterproof and not affected by bathing or showering.
- Instruct patient to remove patch and notify health care professional immediately if symptoms of acute angle-closure glaucoma (pain or reddening of the eyes with pupil dilation) occur.
- Caution patients engaging in underwater sports of potentially distorting effects of scopolamine.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered. Do not double doses.
- May cause drowsiness or blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to use caution when exercising and in hot weather; overheating may result in heatstroke.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants with this medication.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth.

© F.A. Davis Publishing

- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes
- Prevention of motion sickness.
- Prevention of postoperative nausea and vomiting.

secnidazole (sek-**nid**-a-zole)
Solosec

Classification
Therapeutic: anti-infectives
Pharmacologic: imidazoles

Indications
Bacterial vaginosis. Trichomoniasis.

Action
Disrupts DNA synthesis in susceptible organisms.
Therapeutic Effects: Resolution of bacterial vaginosis. Resolution of trichomoniasis. **Spectrum:** Active against *Bacteroides spp.*, *Gardnerella vaginalis*, *Prevotella spp.*, *Mobiluncus spp.*, and *Trichomonas vaginalis*.

Pharmacokinetics
Absorption: Rapidly and completely absorbed following oral administration.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Primarily metabolized by CYP450 system in liver; 15% excreted unchanged in urine.
Half-life: 17 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	4 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; cross-sensitivity with other imidazoles may occur; Lactation: Lactation.
Use Cautiously in: OB: Safety not established in pregnancy; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
GI: abdominal pain, diarrhea, metallic taste, nausea, vomiting. **GU:** vulvovaginal candidiasis, vulvovaginal pruritus. **Neuro:** headache.

Interactions
Drug-Drug: Alcohol or preparations containing **ethanol** or **propylene glycol** may lead to nausea, vomiting, diarrhea, abdominal pain, dizziness, and headache. Avoid use during secnidazole therapy and for ≥2 days after completing therapy.

Route/Dosage

Bacterial Vaginosis
PO (Adults): 2-g single dose.

Trichomoniasis
PO (Adults): 2-g single dose. Any sexual partners should also be treated with a 2-g single dose.

Availability
Oral granules: 2 g/pkt.

NURSING IMPLICATIONS

Assessment
- Assess for symptoms of bacterial vaginosis before and periodically following secnidazole.
- ***Lab Test Considerations:*** Obtain specimen for culture and sensitivity before starting therapy.

Implementation
- **PO:** Administer packet once without regard to meals. Open packet and sprinkle entire contents onto applesauce, yogurt, or pudding. Granules will not dissolve. Consume all of the mixture within 30 min without chewing or crunching granules. May be followed with a glass of water to aid in swallowing. Granules are not intended to be dissolved in any liquid.

Patient/Family Teaching
- Instruct patient in correct technique for taking secnidazole. Advise patient to read *Patient Information* before taking secnidazole.
- Advise patient to notify health care professional if signs and symptoms of vulvovaginal candidiasis (vaginal itching, white or yellowish discharge [discharge may be lumpy or look like cottage cheese]) occur. May require treatment with antifungal agents.
- Advise patient to avoid alcohol during and for 2 days after last dose of secnidazole. May cause nausea, vomiting, diarrhea, abdominal pain, dizziness, and headache when taken with alcohol.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications during therapy.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected. Advise female patient to avoid breast feeding for at least 96 hrs (4 days) following secnidazole dose.

Evaluation/Desired Outcomes
- Resolution of bacterial vaginosis.
- Resolution of trichomoniasis.

© F.A. Davis Publishing

selegiline (se-le-ji-leen)

~~Eldepryl~~, Zelapar

Classification

Therapeutic: antiparkinson agents
Pharmacologic: monoamine oxidase type B inhibitors

Indications

Management of Parkinson's disease (with levodopa or levodopa/carbidopa) in patients who fail to respond to levodopa/carbidopa alone.

Action

Following conversion by MAO to its active form, selegiline inactivates MAO by irreversibly binding to it at type B (brain) sites. Inactivation of MAO leads to increased amounts of dopamine available in the CNS. **Therapeutic Effects:** Increased response to levodopa/dopamine therapy in Parkinson's disease.

Pharmacokinetics

Absorption: Appears to be well absorbed following oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Metabolism involves some conversion to amphetamine and methamphetamine. 45% excreted in urine as metabolites.
Half-life: Unknown; orally disintegrating tablets 1.3 hr.

TIME/ACTION PROFILE (onset of beneficial effects in Parkinson's disease)

ROUTE	ONSET	PEAK	DURATION
PO	2–3 days	40–90 min	unknown
Orally disintegrating	5 min	10–15 min	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Major psychotic disorder; Concurrent use of opioids, other MAO inhibitors, St. John's wort, cyclobenzaprine, or dextromethorphan; Lactation: Lactation.
Use Cautiously in: Doses >10 mg/day (tablets/capsules) or >2.5 mg/day (orally disintegrating tablets) (↑ risk of hypertensive reactions with tyramine-containing foods and some medications); History of peptic ulcer disease; Phenylketonuria (orally disintegrating tablets only); OB: Safety not established in pregnancy; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of orthostatic hypotension in older adults.

Adverse Reactions/Side Effects

CV: orthostatic hypotension. **GI:** nausea, abdominal pain, dry mouth. **Neuro:** SEROTONIN SYNDROME, aggression, agitation, confusion, delirium, delusions, disorientation, dizziness, fainting, hallucinations, insomnia, paranoia, psychosis, sedation, urges (gambling, sexual), vivid dreams.

Interactions

Drug-Drug: Use with **opioid analgesic** (e.g. **meperidine**) or **cyclobenzaprine** may ↑ risk of serotonin syndrome; concurrent use contraindicated. Selegiline should be discontinued for ≥2 wk before initiating any of these medications. Use with other **MAO inhibitors**, including **linezolid**, may ↑ risk of hypertensive crises; concurrent use contraindicated. Selegiline should be discontinued for ≥2 wk before initiating any other medication with MAO inhibitor properties. Use with products containing **dextromethorphan** may lead to episodes of psychosis or bizarre behavior; concurrent use contraindicated. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **fentanyl**, **buspirone**, **amphetamines**, and **triptans** may ↑ risk of serotonin syndrome; avoid concurrent use with any antidepressant. Selegiline should be discontinued for ≥14 days before initiating any antidepressant. Fluoxetine should be discontinued for ≥5 wk before initiating selegiline. May initially ↑ risk of side effects (primarily dyskinesia) of **levodopa/carbidopa** (dose of levodopa/carbidopa may need to be ↓ by 10–30%). **Antipsychotics** and **metoclopramide** may ↓ effectiveness.
Drug-Natural Products: Use with **St. John's wort** may ↑ risk of serotonin syndrome; concurrent use contraindicated.
Drug-Food: Doses >10 mg/day (tablets/capsules) or >2.5 mg/day (orally disintegrating tablets) may produce hypertensive reactions with **tyramine-containing foods** (see Appendix J).

Route/Dosage

PO (Adults): *Capsules or tablets*—5 mg twice daily with breakfast and lunch (some patients may require further dividing of doses—2.5 mg 4 times daily). *Orally disintegrating tablets*—1.25 mg once daily for ≥6 wk. After 6 wk, may ↑ to 2.5 mg once daily if effect not achieved and patient is tolerating medication.

Availability (generic available)

Capsules: 5 mg. **Tablets:** 5 mg. **Orally disintegrating tablets (contain phenylalanine) (grapefruit-flavor):** 1.25 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of Parkinson's disease (tremor, muscle weakness and rigidity, ataxic gait) prior to and during therapy.
- Assess BP periodically during therapy.

Implementation

- Do not confuse selegiline with Salagen (pilocarpine). Do not confuse Zelapar (selegiline) with Zyprexa (olanzapine).
- An attempt to reduce the dose of levodopa/carbidopa by 10–30% may be made after 2–3 days of selegiline therapy.

© F.A. Davis Publishing

- **PO:** Administer 5-mg tablet with breakfast and lunch.
- Administer *orally disintegrating tablets* in the morning, before breakfast and without liquid. Remove tablet gently from blister pack with clean, dry hands immediately before administering. Do not attempt to push tablet through backing. Tablet will disintegrate within sec when placed on tongue. Avoid food or liquid within 5 min of administering orally disintegrating tablets.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible, but not if late afternoon or evening or almost time for next dose. Do not double doses. Caution patient that taking more than the prescribed dose may increase side effects and place patient at risk for hypertensive crisis if foods containing tyramine are consumed (see Appendix J).
- Advise patients taking selegiline ≥20 mg/day to avoid large amounts of tyramine-containing foods (see Appendix J), alcoholic beverages, large quantities of caffeine-containing beverages, or OTC or herbal cough or cold medications.
- Caution patient and caregiver that selegiline may cause drowsiness and dizziness. Monitor and assist with ambulation and caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Inform patient and family of the signs and symptoms of MAO inhibitor–induced hypertensive crisis (severe headache, chest pain, nausea, vomiting, photosensitivity, enlarged pupils). Advise patient to notify health care professional immediately if severe headache or any other unusual symptoms occur.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to notify health care professional of signs and symptoms of serotonin syndrome (mental status changes [agitation, hallucinations, delirium, and coma], autonomic instability [tachycardia, labile BP, dizziness, diaphoresis, flushing, hyperthermia], neuromuscular changes [tremor, rigidity, myoclonus, hyperreflexia, incoordination], seizures, and/or gastrointestinal symptoms [nausea, vomiting, diarrhea]).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if agitation, aggression, delirium, hallucinations, new or increased gambling, sexual, or other intense urges occur.
- Advise patient that increasing fluids, sugarless gum or candy, ice, or saliva substitutes may help minimize dry mouth. Consult health care professional if dry mouth continues for >2 wk.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected. Advise patient to avoid breast feeding during and for 7 days after final dose.

Evaluation/Desired Outcomes

- Improved response to levodopa/carbidopa in patients with Parkinson's disease.

selegiline transdermal

(se-**le**-ji-leen)

Emsam

Classification

Therapeutic: antidepressants

Pharmacologic: monoamine oxidase type B inhibitors

Indications

Major depressive disorder.

Action

Following conversion by MAO to its active form, selegiline inactivates MAO by irreversibly binding to it at type B (brain) sites; this results in higher levels of monoamine neurotransmitters in the brain (dopamine, serotonin, norepinephrine). **Therapeutic Effects:** Decreased symptoms of depression.

Pharmacokinetics

Absorption: 25–30% of patch content is transdermally absorbed, blood levels are higher than those following oral administration because there is less first-pass hepatic metabolism.

Distribution: Rapidly distributes to all body tissues; crosses the blood-brain barrier.

Metabolism and Excretion: Mostly metabolized by the liver, primarily by the CYP2A6, CYP2C9, and CYP3A4/5 enzyme systems. 10% excreted in urine as metabolites, 2% in feces; negligible renal excretion of unchanged drug.

Half-life: 18–25 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Transdermal	unknown	2 or more wk	2 wk (after discontinuation)

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pheochromocytoma; Concurrent selective serotonin reuptake inhibitors (fluoxetine, paroxetine, citalopram, escitalopram, and others), nonselective serotonin re-uptake inhibitors (venlafaxine, duloxetine), tricyclic antide-

© F.A. Davis Publishing

pressants (amitriptyline, imipramine, and others), carbamazepine, oxcarbazepine, amphetamines, vasoconstrictors (ephedrine, pseudoephedrine), bupropion, meperidine, tramadol, methadone, dextromethorphan, mirtazapine cyclobenzaprine, other MAO inhibitors (isocarboxazid, phenelzine, tranylcypromine), oral selegiline, sympathomimetic amines, amphetamines, cocaine, local anesthetics with vasoconstrictors, or St. John's wort; Alcohol; Pedi: Children <12 yr (↑ risk of hypertensive crises).

Use Cautiously in: Elective surgery within 10 days; benzodiazepines, rapacuronium, fentanyl, morphine, and codeine may be used cautiously; May ↑ risk of suicide attempt/ideation, especially during early treatment or dose adjustment; risk may be greater in children or adolescents (safe use in children <12 yr not established); History of mania; Dosing at 9 mg/24 hr or 12 mg/24 hr requires dietary modification (avoid foods containing large amounts of tyramine); Geri: May be more susceptible to orthostatic hypotension; OB: Use only if benefit outweighs risk to the fetus; Lactation: Safety not established; Pedi: May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; risk may be greater in children or adolescents; Pedi: Children 12–17 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: HYPERTENSIVE CRISIS, chest pain, orthostatic hypotension, peripheral edema. **Derm:** application site reactions, acne, ecchymoses, pruritus, sweating. **EENT:** tinnitus. **GI:** diarrhea, altered taste, anorexia, constipation, flatulence, gastroenteritis, vomiting. **GU:** dysmenorrhea, metrorrhagia, urinary frequency. **MS:** mylagia, neck pain, pathologic fracture. **Neuro:** paresthesia, SEROTONIN SYNDROME, insomnia, abnormal thinking, agitation, amnesia, worsening of mania/hypomania. **Resp:** cough.

Interactions

Drug-Drug: Concurrent **selective serotonin reuptake inhibitors** (**fluoxetine**, **paroxetine**, **citalopram**, **escitalopram**, and others), **nonselective serotonin re-uptake inhibitors** (**venlafaxine**, **duloxetine**), **tricyclic antidepressants** (**amitriptyline**, **imipramine**, and others), **carbamazepine**, **oxcarbazepine**, **amphetamines**, **vasoconstrictors** (**ephedrine**, **pseudoephedrine**, **phenylprolanolamine**), **bupropion**, **meperidine**, **tramadol**, **methadone**, **dextromethorphan**, **mirtazapine**, **cyclobenzaprine**, other MAO inhibitors (**isocarboxazid**, **phenelzine**, **tranylcypromine**), oral **selegiline**, **sympathomimetic amines**, **amphetamines**, **cocaine**, or **local anesthetics with vasoconstrictors**; these may all ↑ risk of hypertensive crisis. (**Fluoxetine** should not be used within 2 wk of initiating therapy.).

Drug-Natural Products: **St. John's wort** may ↑ risk of hypertensive crisis.

Route/Dosage

Transdermal (Adults): Apply 6 mg/24 hr patch once daily initially; if necessary, may be ↑ at 2-wk intervals in increments of 3 mg/24 hr patch (max dose = 12 mg/24 hr).

Availability

Transdermal patch : 6 mg/24 hr, 9 mg/24 hr, 12 mg/24 hr.

NURSING IMPLICATIONS

Assessment

- Assess mental status, mood changes, and anxiety level frequently. Assess for suicidal tendencies, agitation, irritability, and unusual changes in behavior especially during early therapy. Assess for any personal or family history of bipolar disorder, mania, or hypomania before starting therapy. Monitor pediatric patients face-to-face weekly during first 4 wk, every other wk for 4 wk, at 12 wk, and as clinically indicated during therapy. Restrict amount of drug available to patient.
- Monitor BP and pulse rate before and frequently during therapy. Report significant changes promptly.
- ***Toxicity and Overdose:*** Concurrent ingestion of tyramine-rich foods and many medications may result in a life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, tachycardia or bradycardia, severe headache, neck stiffness or soreness, nausea and vomiting, sweating, photosensitivity, and enlarged pupils. If hypertensive crisis occurs, discontinue selegiline transdermal and administer labetalol 20 mg slowly IV to control hypertension. Manage fever with external cooling. Monitor patient closely until symptoms have stabilized.

Implementation

- **Transdermal:** Apply system to dry, intact skin on the upper torso such as chest, back, upper thigh, or outer surface of the upper arm once every 24 hr at the same time each day. Avoid areas that are hairy, oily, irritated, broken, scarred, or calloused. Wash area gently with soap and warm water, rinse thoroughly. Allow skin to dry completely before application. Apply immediately after removing from package. Do not alter the system (i.e., cut) in any way before application. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure contact is complete. Remove used system and fold so that adhesive edges are together. Only 1 selegiline patch should be worn at a time. Dispose away from children and pets. Apply new system to a different site. Wash hands thoroughly with soap and water to remove any medicine that may have gotten on them.

Patient/Family Teaching

- Instruct patient to apply patch as directed. Advise patients and caregivers to read the *Medication Guide*

© F.A. Davis Publishing

about Using Antidepressants in Children and Teenagers. Inform patient that improvement may be noticed after 1 to several wk of therapy. Advise patient not to discontinue therapy without consulting health care professional.

- Caution patient to avoid alcohol and CNS depressants during and for at least 2 wk after therapy has been discontinued; they may precipitate a hypertensive crisis. Contact health care professional immediately if symptoms of hypertensive crisis develop. Patients taking 9 mg/24 hr or 12 mg/24 hr must avoid foods or beverages containing tyramine (see Appendix J) from the 1st day of the increased dose through 2 wk after discontinuation of selegiline transdermal therapy.
- Advise patient to avoid exposing application site to external sources of direct heat such as heating pads, electric blankets, heat lamps, saunas, hot tubs, heated water beds, and prolonged direct sunlight.
- May cause dizziness or drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Geriatric patients are at increased risk for this side effect.
- Advise patient to notify health care professional of signs and symptoms of serotonin syndrome (mental status changes [agitation, hallucinations, delirium, and coma], autonomic instability [tachycardia, labile BP, dizziness, diaphoresis, flushing, hyperthermia], neuromuscular changes [tremor, rigidity, myoclonus, hyperreflexia, incoordination], seizures, and/or gastrointestinal symptoms [nausea, vomiting, diarrhea]).
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- Advise patients and caregivers to notify health care professional if severe headache, neck stiffness, heart racing or palpitations, anxiety, agitation, panic attacks, insomnia, irritability, hostility, aggressiveness, impulsivity, akathisia, hypomania, mania, change in behavior, worsening of depression, or suicidal ideation occur, especially during initial therapy or during changes in dose.
- Instruct patient to consult health care professional before taking any Rx, OTC, or herbal products. Caution patient to avoid use of St. John's wort and the analgesics meperidine, tramadol, or methadone during therapy.
- Advise patient to notify health care professional of medication regimen before treatment or surgery. If possible, therapy should be discontinued at least 2 wk before surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved mood in depressed patients.
- Decreased anxiety.
- Increased appetite.
- Improved energy level.
- Improved sleep. Evaluate effectiveness of therapy periodically.

semaglutide (sem-a-**gloo**-tide)

Ozempic, Rybelsus, Wegovy

Classification

Therapeutic: antidiabetics, weight control agents

Pharmacologic: glucagon-like peptide-1 (GLP-1) receptor agonists

Indications

Ozempic and Rybelsus: Type 2 diabetes mellitus (as adjunct to diet and exercise). **Ozempic**: To reduce the risk of major adverse cardiovascular events in patients with type 2 diabetes mellitus and established cardiovascular disease (injection only). **Wegovy**: Chronic weight management in patients who are obese (body mass index [BMI] ≥30 kg/m^2) or are overweight (BMI ≥27 kg/m^2) with ≥1 weight-related comorbid condition (e.g. hypertension, dyslipidemia, type 2 diabetes) (as adjunct to reduced-calorie diet and increased physical activity).

Action

Acts as an acylated human glucagon-like peptide-1 (GLP-1, an incretin) receptor agonist; increases intracellular cyclic AMP (cAMP) leading to insulin release when glucose is elevated, which then subsides as blood glucose decreases toward euglycemia. Also decreases glucagon secretion and delays gastric emptying. Also helps to suppress appetite, leading to decreased caloric intake. **Therapeutic Effects:** Improved glycemic control. Reduction in risk of cardiovascular death, nonfatal MI, or non-fatal stroke. Reduction in body weight.

Pharmacokinetics

Absorption: 89% absorbed following subcutaneous injection; 0.4–1% absorbed following oral administration.

Distribution: Minimally distributed to tissues.

Protein Binding: >99%.

Metabolism and Excretion: Endogenously metabolized; eliminated in the urine (3% as unchanged drug) and feces.

Half-life: 1 wk.

© F.A. Davis Publishing

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	1–3 days	unknown
PO	unknown	1 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Personal or family history of medullary thyroid carcinoma; Multiple endocrine neoplasia syndrome type 2; Type 1 diabetes; Diabetic ketoacidosis.

Use Cautiously in: History of pancreatitis; Diabetic retinopathy (↑ risk of complications); History of angioedema or anaphylaxis to another GLP-1 receptor agonist; History of diabetic retinopathy; History of suicidal attempt or active suicidal ideations; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: ↑ heart rate. **Derm:** hair loss. **EENT:** retinopathy complications. **Endo:** THYROID C-CELL TUMORS, hypoglycemia. **GI:** PANCREATITIS, abdominal pain, constipation, diarrhea, nausea, vomiting, abdominal distention, cholelithiasis, ↓ appetite, dyspepsia, flatulence, ↑ amylase, ↑ lipase, vomiting. **GU:** acute kidney injury. **Local:** injection site reactions. **Neuro:** SUICIDAL BEHAVIOR/IDEATION (Wegovy only), fatigue, headache, dizziness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Concurrent use with **agents that increase insulin secretion**, including **sulfonylureas** or **insulin**, may ↑ the risk of serious hypoglycemia; use cautiously and consider dose ↓ of agent increasing insulin secretion. May alter absorption of concomitantly administered **oral medications** due to delayed gastric emptying.

Route/Dosage

Type 2 Diabetes

PO (Adults): 3 mg once daily for 30 days, then 7 mg once daily; after 30 days, may ↑ to 14 mg once daily if additional glycemic control needed.

Subcut (Adults): *Ozempic*—0.25 mg once weekly initially for 4 wk, then 0.5 mg once weekly for 1 wk; may then ↑ dose after 4 wk, if needed, up to 1 mg once weekly.

Reduction in Risk of Major Adverse Cardiovascular Events in Patients with Type 2 Diabetes Mellitus and Established Cardiovascular Disease

Subcut (Adults): *Ozempic*—0.25 mg once weekly initially for 4 wk, then 0.5 mg once weekly for 1 wk; may then ↑ dose after 4 wk, if needed, up to 1 mg once weekly.

Chronic Weight Management

Subcut (Adults): *Wegovy*—0.25 mg once weekly initially for 4 wk, then 0.5 mg once weekly for 4 wk, then 1 mg once weekly for 4 wk, then 1.7 mg once weekly for 4 wk, then 2.4 mg once weekly thereafter.

Availability

Tablets (Rybelsus): 3 mg, 7 mg, 14 mg. **Solution for injection (Ozempic) (prefilled pens):** 2 mg/1.5 mL (delivers doses of 0.25 mg, 0.5 mg, or 1 mg), 4 mg/3 mL (delivers dose of 1 mg). **Solution for injection (Wegovy) (prefilled pens):** 0.25 mg/0.5 mL, 0.5 mg/0.5 mL, 1 mg/0.5 mL, 1.7 mg/0.75 mL, 2.4 mg/0.75 mL.

NURSING IMPLICATIONS

Assessment

- Observe patient taking concurrent insulin for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety, headache, blurred vision, slurred speech, irritability).
- Monitor for pancreatitis (persistent severe abdominal pain, sometimes radiating to the back, with or without vomiting). If pancreatitis is suspected, discontinue semaglutide; if confirmed, do not restart semaglutide.
- Monitor weight before and periodically during therapy.
- Monitor for signs and symptoms of hypersensitivity reactions (swelling of face, lips, tongue or throat; problems breathing or swallowing; severe rash or itching; fainting or feeling dizzy; very rapid heartbeat) during therapy.
- ***Lab Test Considerations:*** Monitor serum HbA_{1c} periodically during therapy to evaluate effectiveness.
- *Wegovy:* In patients with type 2 diabetes, monitor blood glucose prior to starting and during therapy.
- May ↑ lipase and pancreatic amylase.

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- Patients treated with PO *Rybelsus* 14 mg daily can be transitioned to *Ozempic* subcut 0.5 mg once-weekly. Patients can start *Ozempic* the day after their last dose of *Rybelsus*. Patients treated with once weekly *Ozempic* 0.5 mg subcut can be transitioned to PO *Rybelsus* 7 mg or 14 mg. Patients can start *Rybelsus* up to 7 days after last injection of *Ozempic*. There is no equivalent dose of *Rybelsus* for *Ozempic* 1 mg.
- **PO:** Administer at least 30 min before first food, beverage, or other oral medications of the day with no >4 oz of plain water only. Waiting <30 min, or taking *Rybelsus* with food, beverages (other than plain water), or other PO medications decreases absorp-

© F.A. Davis Publishing

tion and will lessen effects. Waiting >30 min to eat may increase absorption. ***DNC:*** Swallow tablets whole; do not split, crush, or chew.

- *Wegovy:* If dose escalation is not tolerated, may delay dose escalation for 4 wks. If patients do not tolerate maintenance dose of 2.4 mg once-weekly, dose can be temporarily decreased to 1.7 mg once-weekly, for a maximum of 4 wks. After 4 wks, increase to maintenance dose of 2.4 mg once-weekly. Discontinue *Wegovy:* if patient cannot tolerate 2.4 mg dose.
- **Subcut:** Administer once weekly on same day each wk, any time of day without regard to meals. May change day of injection as long as time between doses is >48 hrs. Inject into abdomen, thigh, or upper arm, rotating sites each wk. Solution is clear and colorless; do not administer solutions that are cloudy, discolored, or contain particulate matter. Store pens in refrigerator in original box until administration to protect from light; do not freeze. *Wegovy:* single-use pens are stable for up to 28 days. *Ozempic* multi-dose pens are stable if refrigerated without the needle for 56 days after 1st use. Use a new needle for each injection.

Patient/Family Teaching

- Instruct patient to take semaglutide as directed. If a PO dose is missed, omit dose and take next dose the following day. Instruct patient in correct technique for injection and disposal of materials. Follow manufacturer's instructions for pen use. Pen should never be shared between patients, even if needle is changed. Administer missed *Ozempic* doses as soon as remembered within 5 days of missed dose; if >5 days, skip dose and administer next dose on regular scheduled day. Administer missed *Wegovy* doses as soon as remembered. If 1 dose is missed and next scheduled dose is >2 days away (48 hrs), administer *Wegovy* as soon as possible. If one dose is missed and the next scheduled dose is <2 days away (48 hrs), omit dose and resume dosing on regularly scheduled day of wk. If >2 consecutive doses are missed, resume dosing as scheduled or restart *Wegovy* and follow dose escalation schedule; may reduce occurrence of GI symptoms. Advise patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient taking insulin and semaglutide to never mix insulin and semaglutide together. Give as 2 separate injections. Both injections may be given in the same body area, but should not be given right next to each other.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness, and health care professional should be notified if significant changes occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional and discontinue semaglutide immediately if signs of pancreatitis (nausea, vomiting, abdominal pain radiating to back) or hypersensitivity (swelling of face, lips, tongue or throat, problems breathing or swallowing, severe rash or itching, fainting or feeling dizzy, very rapid heartbeat) occur.
- Inform patient of risk of benign and malignant thyroid C-cell tumors. Advise patient to notify health care professional if symptoms of thyroid tumors (lump in neck, hoarseness, trouble swallowing, shortness of breath) occur.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Rep: Insulin is the preferred method of controlling blood glucose during pregnancy. Advise females of reproductive potential and males with female partners of reproductive potential to discontinue semaglutide in women at least 2 mo before a planned pregnancy to allow for long washout period of semaglutide. Counsel female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to semaglutide during pregnancy. Pregnant women exposed to semaglutide and health care professionals are encouraged to contact Novo Nordisk at 1-800-727-6500.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Improved glycemic control.
- Reduction in risk of cardiovascular death, non-fatal MI, or non-fatal stroke.
- Reduction in body weight.

S

sennosides (sen-oh-sides)

Black-Draught, Ex-Lax, Ex-Lax Chocolated, Fletchers' Castoria, Maximum Relief Ex-Lax, Sena-Gen, Senexon, Senokot, SenokotXTRA

Classification

Therapeutic: laxatives
Pharmacologic: stimulant laxatives

Indications

Treatment of constipation, particularly when associated with: Slow transit time, Constipating drugs, Irritable or spastic bowel syndrome, Neurologic constipation.

Action

Active components of senna (sennosides) alter water and electrolyte transport in the large intestine, resulting in accumulation of water and increased peristalsis.
Therapeutic Effects: Laxative action.

Pharmacokinetics

Absorption: Minimally absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE (laxative effect)

ROUTE	ONSET	PEAK	DURATION
PO	6–12 hr†	unknown	3–4 days

†May take as long as 24 hr.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abdominal pain of unknown cause, especially if associated with fever; Rectal fissures; Ulcerated hemorrhoids; Known alcohol intolerance (some liquid products).
Use Cautiously in: Chronic use (may lead to laxative dependence); Possible intestinal obstruction; OB, Lactation: Safety not established.

Adverse Reactions/Side Effects

GI: cramping, diarrhea, nausea. **GU:** pink-red or brown-black discoloration of urine. **F and E:** electrolyte abnormalities (chronic use or dependence).
Misc: laxative dependence.

Interactions

Drug-Drug: May ↓ absorption of other **orally administered drugs** because of ↓ transit time.

Route/Dosage

Larger doses have been used to treat/prevent opioid-induced constipation. Consult labeling of individual OTC products for more specific dosing information.
PO (Adults and Children >12 yr): 12–50 mg 1–2 times daily.
PO (Children 6–12 yr): 6–25 mg 1–2 times daily.
PO (Children 2–6 yr): 3–12.5 mg 1–2 times daily.

Availability (generic available)

Tablets: 6 mg[OTC], 8.6 mg[OTC], 15 mg [OTC], 17 mg[OTC], 25 mg[OTC]. **Granules:** 15 mg/5 mL[OTC], 20 mg/5 mL[OTC]. **Syrup:** 8.8 mg/5 mL[OTC]. **Liquid:** 25 mg/15 mL[OTC], 33.3 mg/mL senna concentrate[OTC]. ***In combination with:*** psyllium and docusate[OTC]. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Implementation

- **PO:** Take with a full glass of water. Administer at bedtime for evacuation 6–12 hr later. Administer on an empty stomach for more rapid results.
- Shake oral solution well before administering.
- Granules should be dissolved or mixed in water or other liquid before administration.

Patient/Family Teaching

- Advise patient that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Encourage patient to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake, and increasing mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Inform patient that this medication may cause a change in urine color to pink, red, violet, yellow, or brown.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient not to use laxatives when abdominal pain, nausea, vomiting, or fever is present.

Evaluation/Desired Outcomes

- A soft, formed bowel movement.

sertraline (ser-tra-leen)

Zoloft

Classification

Therapeutic: antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Indications

Major depressive disorder. Panic disorder. Obsessive-compulsive disorder (OCD). Post-traumatic stress disorder (PTSD). Social anxiety disorder (social phobia). Premenstrual dysphoric disorder (PMDD). **Unlabeled Use:** Generalized anxiety disorder (GAD).

© F.A. Davis Publishing

Action

Inhibits neuronal uptake of serotonin in the CNS, thus potentiating the activity of serotonin. Has little effect on norepinephrine or dopamine. **Therapeutic Effects:** Antidepressant action. Decreased incidence of panic attacks. Decreased obsessive and compulsive behavior. Decreased feelings of intense fear, helplessness, or horror. Decreased social anxiety. Decrease in premenstrual dysphoria.

Pharmacokinetics

Absorption: Appears to be well absorbed after oral administration.
Distribution: Extensively distributed throughout body tissues.
Protein Binding: 98%.
Metabolism and Excretion: Extensively metabolized by the liver; 1 metabolite has some antidepressant activity; 14% excreted unchanged in feces.
Half-life: 24 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 2–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of pimozide; Oral concentrate contains alcohol; avoid in patients with known intolerance.
Use Cautiously in: Severe hepatic or renal impairment; Patients with a history of mania; History of suicide attempt; Angle-closure glaucoma; OB: Use during 3rd trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support. Use only if potential benefit justifies potential risk to fetus; Pedi: May ↑ risk of suicide attempt/ideation, especially during early treatment or dose adjustment; risk may be greater in children or adolescents.

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, chest pain, palpitations, QT interval prolongation. **Derm:** ↑ sweating, hot flashes, rash. **EENT:** pharyngitis, rhinitis, tinnitus, visual abnormalities. **Endo:** diabetes. **F and E:** hyponatremia. **GI:** diarrhea, dry mouth, nausea, abdominal pain, altered taste, anorexia, constipation, dyspepsia, flatulence, ↑ appetite, vomiting. **GU:** ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction, menstrual disorders, urinary disorders, urinary frequency. **MS:** back pain, myalgia. **Neuro:** tremor, hypertonia, hypoesthesia, paresthesia, twitching, SUICIDAL THOUGHTS, dizziness, drowsiness, fatigue, headache, insomnia, agitation, anxiety, confusion, emotional lability, impaired concentration, manic reaction, nervousness, weakness, yawning. **Misc:** SEROTONIN SYNDROME, fever, ↑ thirst.

Interactions

Drug-Drug: Serious, potentially fatal reactions (hyperthermia, rigidity, myoclonus, autonomic instability, with fluctuating vital signs and extreme agitation, which may proceed to delirium and coma) may occur with concurrent **MAO inhibitors**. MAO inhibitors should be stopped at least 14 days before sertraline therapy. Sertraline should be stopped at least 14 days before MAO inhibitor therapy. Concurrent use with **MAO-inhibitor–like drugs**, such as **linezolid** or **methylene blue**, may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving sertraline, immediately discontinue sertraline and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume sertraline therapy 24 hr after last dose of linezolid or methylene blue). May ↑ **pimozide** levels and the risk of QT interval prolongation and ventricular arrhythmias; concurrent use contraindicated. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans**, ↑ risk of serotonin syndrome. May ↑ sensitivity to **adrenergics** and ↑ the risk of serotonin syndrome. Concurrent use with **alcohol** is not recommended. May ↑ levels/effects of **warfarin**, **phenytoin**, **tricyclic antidepressants**, some **benzodiazepines (alprazolam)**, or **clozapine**. ↑ risk of bleeding with **NSAIDs**, **aspirin**, **clopidogrel**, or **warfarin**. **Cimetidine** ↑ blood levels and effects. Concurrent use of **QT interval prolonging medications** may ↑ risk of QT interval prolongation and torsades de pointes; avoid concurrent use.
Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

Depression/OCD

PO (Adults): 50 mg once daily in the morning or evening initially; after several wk may be ↑ at weekly intervals up to 200 mg/day, depending on response.
PO (Children 13–17 yr): *OCD*—50 mg once daily.
PO (Children 6–12 yr): *OCD*—25 mg once daily.

Panic Disorder

PO (Adults): 25 mg once daily initially, may ↑ after 1 wk to 50 mg once daily.

© F.A. Davis Publishing

PTSD

PO (Adults): 25 mg once daily for 7 days, then ↑ to 50 mg once daily; may then be ↑ if needed at intervals of at least 7 days (range 50–200 mg once daily).

Social Anxiety Disorder

PO (Adults): 25 mg once daily initially, then 50 mg once daily; may be ↑ at weekly intervals up to 200 mg/day.

PMDD

PO (Adults): 50 mg/day initially either daily or daily during luteal phase of cycle. Daily dosing may be titrated upward in 50-mg increments at the beginning of a cycle. In luteal phase–only dosing a 50 mg/day titration step for 3 days at the beginning of each luteal phase dosing period should be used (range 50–150 mg/day).

Availability (generic available)

Capsules: 25 mg, 50 mg, 100 mg. **Oral solution (concentrated) (contains 12% alcohol):** 20 mg/mL. **Cost:** *Generic*— $64.28/60 mL. **Tablets:** 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg $17.68/90, 50 mg $22.22/90, 100 mg $19.73/90.

NURSING IMPLICATIONS

Assessment

- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- Monitor appetite and nutritional intake. Weigh weekly. Notify health care professional of continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper-reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Assess sexual function before starting sertraline. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- **Depression:** Monitor mood changes. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **OCD:** Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning.
- **Panic Attacks:** Assess frequency and severity of panic attacks.
- **PTSD:** Assess patient for feelings of fear, helplessness, and horror. Determine effect on social and occupational functioning.
- **Social Anxiety Disorder:** Assess patient for symptoms of social anxiety disorder (blushing, sweating, trembling, tachycardia during interactions with new people, people in authority, or groups) periodically during therapy.
- **Premenstrual Dysphoric Disorder:** Assess patient for symptoms of premenstrual dysphoric disorder (feeling angry, tense, or tired; crying easily, feeling sad or hopeless; arguing with family or friends for no reason; difficulty sleeping or paying attention; feeling out of control or unable to cope; having cramping, bloating, food craving, or breast tenderness) periodically during therapy.
- ***Lab Test Considerations:*** May cause false-positive urine screening tests for benzodiazepines.
- May cause hyperglycemia and diabetes mellitus; monitor serum glucose if clinical symptoms occur.

Implementation

- Do not confuse sertraline with cetirizine or Soriatane (acitretin).
- Periodically reassess dose and continued need for therapy.
- **PO:** Administer as a single dose in the morning or evening.
- For oral concentrate, use dropper provided to remove oral concentrate and mix with 4 oz (1/2 cup) of water, ginger ale, lemon/lime soda, lemonade, or orange juice ONLY. Do not mix with other liquids. Take immediately after mixing. Do not mix in advance. Slight haze may appear after mixing; this is normal. Dropper dispenser contains dry natural rubber; advise patient with latex allergy.

Patient/Family Teaching

- Instruct patient to take sertraline as directed. Take missed doses as soon as possible and return to regular dosing schedule. Do not double doses. Do not stop abruptly; may cause dysphoric mood, irritability, agitation, dizziness, sensory disturbances (paresthesias such as electric shock sensations), anxiety, confusion, headache, lethargy, emotional lability, insomnia, and hypomania.
- May cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood

© F.A. Davis Publishing

or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and to consult with health care professional before taking other medications and to avoid alcohol or other CNS depressant drugs during therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort or SAMe.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Advise patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional if headache, weakness, nausea, anorexia, anxiety, or insomnia persists.
- Inform patient that sertraline may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Rep: Advise females of reproductive potential to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding. If used during pregnancy, should be tapered during 3rd trimester to avoid neonatal serotonin syndrome. Monitor infants exposed to sertraline for excess sedation, restlessness, agitation, poor feeding, poor weight gain, respiratory distress; may ↑ risk of persistent pulmonary hypertension of the newborn. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patients by calling the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clnical-and-researchprograms/pregnancyregistry/antidepressants/.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy to improve coping skills.

Evaluation/Desired Outcomes
- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.
- Decrease in obsessive-compulsive behaviors.
- Decrease in frequency and severity of panic attacks.
- Decrease in symptoms of PTSD.
- Decrease in social anxiety disorder.
- Decrease in symptoms of premenstrual dysphoric disorder.

sevelamer (se-vel-a-mer)
Renagel, Renvela

Classification
Therapeutic: electrolyte modifiers
Pharmacologic: phosphate binders

Indications
Reduction of serum phosphate levels in patients with hyperphosphatemia associated with end-stage renal disease.

Action
A polymer that binds phosphate in the GI tract, preventing its absorption. **Therapeutic Effects:** Decreased serum phosphate levels and reduction in the consequences of hyperphosphatemia (ectopic calcification, secondary hyperparathyroidism with osteitis fibrosa).

Pharmacokinetics
Absorption: Not absorbed; action is local (in GI tract).
Distribution: Unknown.
Metabolism and Excretion: Eliminated in feces.
Half-life: Unknown.

TIME/ACTION PROFILE (↓ in serum phosphate levels)

ROUTE	ONSET	PEAK	DURATION
PO	5 days	2 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Hypophosphatemia; Bowel obstruction.
Use Cautiously in: Dysphagia, swallowing disorders, severe GI motility disorders, or major GI tract surgery (avoid use of tablets); OB: Not systemically absorbed; no fetal exposure expected. May ↓ levels of folate and fat-soluble minerals; consider supplementation during pregnancy; Lactation: Not systemically absorbed; no expected presence in breast milk. May ↓ levels of folate and fat-soluble minerals; consider supplementation while breast feeding; Pedi: Safety and effectiveness not established in children <18 yr (Renagel) and children <6 yr (Renvela).

Adverse Reactions/Side Effects
GI: BLEEDING GI ULCER, BOWEL OBSTRUCTION/NECROSIS/PERFORATION, ESOPHAGEAL OBSTRUCTION (tablet), diarrhea, dyspepsia, vomiting, choking (tablet), colitis, constipation, dysphagia (tablet), flatulence, nausea, ulceration. **Misc:** hypersensitivity reactions.

© F.A. Davis Publishing

Interactions
Drug-Drug: May ↓ absorption of other drugs and ↓ effectiveness, especially **drugs whose efficacy is dependent on tightly controlled blood levels**. ↓ absorption of **ciprofloxacin**.

Route/Dosage
PO (Adults): 800–1600 mg 3 times daily with meals; may titrate by 800 mg every 2 wk to achieve target serum phosphorus levels.
PO (Children ≥6 yr and BSA ≥1.2 m²): *Renvela*—1600 mg 3 times daily with meals; may titrate by 800 mg every 2 wk to achieve target serum phosphorus levels.
PO (Children ≥6 yr and BSA 0.75–<1.2 m²): *Renvela*—800 mg 3 times daily with meals; may titrate by 400 mg every 2 wk to achieve target serum phosphorus levels.

Availability (generic available)
Powder for oral suspension: 800 mg/pkt, 2400 mg/pkt. **Tablets:** 400 mg, 800 mg.

NURSING IMPLICATIONS
Assessment
- Assess patient for GI side effects periodically during therapy.
- ***Lab Test Considerations:*** Monitor serum phosphorous, calcium, bicarbonate, and chloride levels periodically during therapy.

Implementation
- Do not confuse Renagel with Renvela.
- Doses of concurrent medications, especially antiarrhythmics, should be spaced at least 1 hr before or 3 hr after sevelamer.
- **PO:** Administer with meals. ***DNC:*** Do not break, chew, or crush tablets; contents expand in water.
- Use suspension for patients with swallowing disorders. Place contents of powder packet in a cup and mix thoroughly with at least 1 oz of water for the 0.8-g dose or 2 oz of water for the 2.4-g dose packet. Stir mixture vigorously (it does not dissolve) and drink entire preparation within 30 min or resuspend the preparation right before drinking.

Patient/Family Teaching
- Instruct patient to take sevelamer with meals as directed and to adhere to prescribed diet.
- Caution patient to space concurrent medications at least 1 hr before or 3 hr after sevelamer.
- Advise patient to notify health care professional if GI effects (worsening of existing constipation, bloody stools) occur.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Sevelamer is not systemically absorbed, but may decrease serum levels of fat-soluble vitamins and folic acid in pregnant women. May consider supplementation.

Evaluation/Desired Outcomes
- Decrease in serum phosphorous concentration to ≤6 mg/dL. Dose adjustment is based on serum phosphorous concentrations.

sildenafil (sil-den-a-fil)
Revatio, Viagra

Classification
Therapeutic: erectile dysfunction agents, vasodilators
Pharmacologic: phosphodiesterase type 5 inhibitors

Indications
Viagra: Erectile dysfunction. *Revatio:* Pulmonary arterial hypertension (WHO Group I).

Action
Viagra: Enhances effects of nitric oxide released during sexual stimulation. Nitric oxide activates guanylate cyclase, which produces increased levels of cyclic guanosine monophosphate (cGMP). cGMP produces smooth muscle relaxation of the corpus cavernosum, which promotes increased blood flow and subsequent erection. cGMP also leads to vasodilation of the pulmonary vasculature. Sildenafil inhibits the enzyme phosphodiesterase type 5 (PDE5), PDE5 inactivates cGMP. *Revatio:* Produces vasodilation of the pulmonary vascular bed. **Therapeutic Effects:** *Viagra:* Enhanced blood flow to the corpus cavernosum and erection sufficient to allow sexual intercourse. Requires sexual stimulation. *Revatio:* Improved exercise tolerance and delayed worsening of disease.

Pharmacokinetics
Absorption: Rapidly absorbed (41%) after oral administration; IV administration results in complete bioavailability.
Distribution: Widely distributed to tissues; negligible amount in semen.
Protein Binding: 96%.
Metabolism and Excretion: Mostly metabolized by the liver (by P450 3A4 enzyme system); 1 metabolite is active and accounts for 20% or more of drug effect. Metabolites excreted mostly (80%) in feces; 13% excreted in urine.
Half-life: 4 hr (for sildenafil and active metabolite).

TIME/ACTION PROFILE (vasodilation, ability to produce erection)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	30–120 min	up to 4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of nitrates or riociguat; Pulmonary veno-occlusive disease; Pedi: *Revatio*—Chronic use not recommended for pulmonary hypertension due to lack of efficacy and ↑ risk of death.

© F.A. Davis Publishing

Use Cautiously in: Serious underlying cardiovascular disease (including history of MI, stroke, or serious arrhythmia within 6 mo), cardiac failure, or coronary artery disease with unstable angina; History of HF, coronary artery disease, uncontrolled hypertension (BP >170/110 mm Hg) or hypotension (BP <90/50 mm Hg), dehydration, autonomic dysfunction, or severe left ventricular outflow obstruction; Pulmonary hypertension secondary to sickle cell anemia (may ↑ risk of vaso-occlusive crises); Concurrent treatment with antihypertensives or glipizide; Renal impairment (CCr <30 mL/min, hepatic impairment; all result in ↑ blood levels; ↓ dose required with Viagra); Anatomic penile deformity (angulation, cavernosal fibrosis, Peyronie disease); Conditions associated with priapism (sickle cell anemia, multiple myeloma, leukemia); Bleeding disorders or active peptic ulceration; History of sudden severe vision loss or at risk for non-arteritic ischemic optic neuropathy (NAION) (low cup-to-disc ratio in eye, age >50 yr, diabetes, hypertension, coronary artery disease, hyperlipidemia, and smoking); may ↑ risk of recurrence; Retinitis pigmentosa; Alpha adrenergic blockers (patients should be on stable dose of alpha blockers before starting sildenafil); OB: *Revatio*—Use during pregnancy only if maternal benefit outweighs potential risk to fetus; Lactation: Safety not established; Geri: ↑ blood levels and may require lower doses; consider age-related decrease in cardiac, hepatic, and renal function as well as concurrent drug therapy and chronic disease states.

Adverse Reactions/Side Effects

CV: MYOCARDIAL INFARCTION, SUDDEN DEATH, hypotension, vaso-occlusive crises. **Derm:** flushing, rash. **EENT:** epistaxis, hearing loss, nasal congestion, vision loss. **GI:** dyspepsia, diarrhea. **GU:** priapism, urinary tract infection. **MS:** mylagia. **Neuro:** paresthesias, headache, dizziness, insomnia.

Interactions

Drug-Drug: Concurrent use of **nitrates** may cause serious, life-threatening hypotension and is contraindicated. Concurrent use of **riociguat** may result in severe hypotension; concurrent use contraindicated. Blood levels and effects, including the risk of hypotension, may be ↑ by **CYP3A4 inhibitors** including **cimetidine**, **erythromycin**, **tacrolimus**, **ketoconazole**, **itraconazole**, and **protease inhibitor antiretrovirals** including **nelfinavir**, **indinavir**, **ritonavir**, and **saquinavir** (initial dose of sildenafil for erectile dysfunction should be ↓ to 25 mg) (concurrent use of potent CYP3A inhibitors not recommended with oral Revatio). ↑ risk of hypotension with **alpha adrenergic blockers** and acute ingestion of **alcohol**. **CYP3A4 inducers**, including **rifampin**, **bosentan**, **barbiturates**, **carbamazepine**, **phenytoin**, **efavirenz**, **nevirapine**, **rifampin**, or **rifabutin** may ↓ blood levels and effects; dose adjustments may be necessary in the treatment of pulmonary arterial hypertension. ↑ levels of **bosentan**. Use cautiously with **glipizide**. May ↑ risk of bleeding with **warfarin**.

Route/Dosage

Viagra (for erectile dysfunction)

PO (Adults): 50 mg taken 1 hr before sexual activity (range 25–100 mg taken 30 min–4 hr before sexual activity); not more than once daily; *Concurrent use with alpha-blocker antihypertensives*—do not use 50–100 mg dose within 4 hr of alpha blocker, 25-mg dose may be taken anytime.
PO (Geriatric Patients ≥65 yr or with concurrent enzyme inhibitors): 25 mg taken 1 hr before sexual activity (range 25–100 mg taken 30 min–4 hr before sexual activity); not more than once daily.

Hepatic/Renal Impairment

PO (Adults): 25 mg taken 1 hr before sexual activity (range 25–100 mg taken 30 min–4 hr before sexual activity); not more than once daily.

Revatio (for pulmonary arterial hypertension)

IV therapy is indicated for patients unable to take PO therapy

PO (Adults): 5 mg or 20 mg 3 times daily; dose adjustments may be necessary for concurrent bosentan, barbiturates, carbamazepine, phenytoin, efavirenz, nevirapine, rifampin, or rifabutin.
IV (Adults): 2.5 mg or 10 mg 3 times daily.

Availability (generic available)

Powder for oral suspension (requires reconstitution) (Revatio) (grape flavor): 10 mg/mL. **Solution for injection (Revatio):** 0.8 mg/mL. **Tablets (Revatio):** 20 mg. **Tablets (Viagra):** 25 mg, 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- **Viagra:** Determine erectile dysfunction before administration. Sildenafil has no effect in the absence of sexual stimulation.
- **Revatio:** Monitor hemodynamic parameters and exercise tolerance prior to and periodically during therapy.

Implementation

- Do not confuse Viagra (sildenafil) with Allegra (fexofenadine).
- **PO:** Dose for *erectile dysfunction* is usually administered 1 hr before sexual activity. May be administered 30 min–4 hr before sexual activity.
- Dose for *pulmonary arterial hypertension* is administered 3 times daily without regard to food. Doses should be spaced 4–6 hr apart.

© F.A. Davis Publishing

- Use syringe provided for accurate dosing of oral suspension. Shake well before using. Solution is stable for 60 days from date of reconstitution.

IV Administration

- **IV Push:** Administer undiluted. Solution is clear and colorless; do not administer solutions that are discolored or contain a precipitate. ***Rate:*** Administer as a bolus three times daily.

Patient/Family Teaching

- Instruct patient to take sildenafil as directed. For *erectile dysfunction,* take approximately 1 hr before sexual activity and not more than once per day. If taking sildenafil for *pulmonary arterial hypertension*, take missed doses as soon as remembered unless almost time for next dose; do not double doses.
- Advise patient that *Viagra* is not indicated for use in women.
- Caution patient not to take sildenafil concurrently with alpha-adrenergic blockers (unless on a stable dose of nitrates). If chest pain occurs after taking sildenafil, instruct patient to seek immediate medical attention. Advise patient taking sildenafil for *pulmonary arterial hypertension* to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional promptly if erection lasts longer than 4 hr or if experiencing sudden or decreased vision loss in 1 or both eyes or loss or decrease in hearing, ringing in the ears, or dizziness.
- Inform patient that sildenafil offers no protection against sexually transmitted diseases. Counsel patient that protection against sexually transmitted diseases and HIV infection should be considered.

Evaluation/Desired Outcomes

- Male erection sufficient to allow intercourse.
- Increased exercise tolerance.

silodosin (si-lo-do-sin)

Rapaflo

Classification

Therapeutic: benign prostatic hyperplasia (BPH) agents

Pharmacologic: alpha-adrenergic blockers

Indications

Treatment of the signs/symptoms of benign prostatic hyperplasia (BPH).

Action

Blocks post synaptic alpha$_1$-adrenergic receptors. Decreases contractions in the smooth muscle of the prostatic capsule. **Therapeutic Effects:** Decreased signs and symptoms of BPH (urinary urgency, hesitancy, nocturia).

Pharmacokinetics

Absorption: 32% absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 97%.

Metabolism and Excretion: Extensively metabolized (CYP3A4, UGT2B7, and other metabolic pathways involved); 33.5% excreted in urine and 54.9% in feces.

Half-life: 13.3 hr.

TIME/ACTION PROFILE (effect on symptoms of BPH)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	24 hr	24 hr*

*Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Not indicated for use in women or children; Severe renal impairment (CrCl less than 30 mL/min); Severe hepatic impairment (Child-Pugh score of ≥10); Concurrent use of strong CYP3A4 inhibitors or P-gp inhibitors.

Use Cautiously in: Moderate inhibitors of the CYP3A4 enzyme system; Cataract surgery (may cause intraoperative floppy iris syndrome); Moderate renal impairment (lower dose recommended); Geri: ↑ risk of orthostatic hypotention; Pedi: Safety and effectiveness have not been established.

Adverse Reactions/Side Effects

CV: orthostatic hypotension. **GI:** diarrhea. **GU:** retrograde ejaculation. **Derm:** pruritis, rash, urticaria. **Neuro:** dizziness, headache. **Misc:** allergic reactions.

Interactions

Drug-Drug: Strong inhibitors of CYP3A4 (including **ketoconazole**, **clarithromycin**, **itraconazole**, and **ritonavir**) ↓ metabolism, ↑ blood levels and risk of toxicity; concurrent use is contraindicated. Concurrent use with **moderate CYP3A4 inhibitors** (including **diltiazem**, **erythromycin**, and **verapamil**) may ↑ levels; use cautiously. Concurrent use with **antihypertensives** (including **calcium channel blockers** and **thiazides**), other **alpha blockers** and **phosphodiesterase type 5 inhibitors** (including **sildenafil**, **tadalafil**, and **vardenafil**) ↑ the risk of dizziness and orthostatic hypotension. **P-glycoprotein (P-gp) inhibitors** including **cyclosporine**) may ↑ levels; concurrent use not recommended.

Route/Dosage

PO (Adults): 8 mg once daily.

Renal Impairment

PO (Adults): *CCr 30–50 mL/min*—4 mg once daily.

Availability (generic available)

Capsules: 4 mg, 8 mg.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of benign prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, frequency, dysuria, nocturia, urgency) before and periodically during therapy.
- Assess patient for orthostatic reaction and syncope. Monitor BP (lying and standing) and during initial therapy and periodically thereafter.
- Rule out prostatic carcinoma before therapy; symptoms are similar.

Implementation

- ***High Alert:*** Do not confuse Rapaflo with Rapamune (sirolimus). Do not confuse silodosin with sirolimus.
- **PO:** Administer with food at the same meal each day.
- If unable to swallow capsule, may open capsule and sprinkle powder inside on a tablespoonful of applesauce. Swallow immediately, within 5 min, without chewing; follow with 8 oz of cool water to ensure complete dose is swallowed. Use cool applesauce, soft enough to be swallowed without chewing. Do not store for future use or subdivide capsule contents.

Patient/Family Teaching

- Instruct patient to take medication with the same meal each day.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension, especially patients with low BP or concurrently taking antihypertensives. Geri: Assess risk for falls; instruct patient and family in preventing falls at home.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication regimen before any surgery. Patients planning cataract surgery should notify ophthalmologist of silodosin therapy prior to surgery.
- Inform patient that silodosin may cause retrograde ejaculation (orgasm with reduced or no semen). This does not pose a safety concern and is reversible with discontinuation.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.

Evaluation/Desired Outcomes

- Decreased symptoms of benign prostatic hyperplasia.

simvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

sirolimus (sir-oh-li-mus)

Rapamune

Classification

Therapeutic: immunosuppressants

Indications

Prevention of organ rejection in allogenic kidney transplantation (with corticosteroids and cyclosporine). Treatment of lymphangioleiomyomatosis (LAM).

Action

Inhibits T-lymphocyte activation/proliferation, which occurs as a response to antigenic and cytokine stimulation; antibody production is also inhibited. **Therapeutic Effects:** Decreased incidence and severity of organ rejection. Improvement in pulmonary function.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration (14% bioavailability).
Distribution: Concentrates in erythrocytes; distributes to heart, intestines, kidneys, liver, lungs, muscle, spleen, and testes in high concentrations.
Protein Binding: 92%.
Metabolism and Excretion: Extensively metabolized (some metabolism by P450 3A4 system); 91% excreted in feces.
Half-life: 62 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Alcohol intolerance/sensitivity (solution contains ethanol); Concurrent ketoconazole, voriconazole, itraconazole, erythromycin, clarithromycin, rifampin, rifabutin, or grapefruit juice; Severe hepatic impairment; OB: Pregnancy (may cause fetal harm).
Use Cautiously in: Mild to moderate hepatic impairment; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Rep: Women of reproductive potential; Pedi: Children <13 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

Reflects combined therapy with corticosteroids and cyclosporine.
CV: edema, hypotension, pericardial effusion. **Derm:** acne, rash, thrombocytopenic purpura. **F and E:** hy-

© F.A. Davis Publishing

pokalemia. **Endo:** hyperglycemia. **GI:** ascites, hepatotoxicity. **GU:** amenorrhea, infertility (males), menorrhagia, ovarian cysts, renal impairment. **Hemat:** leukopenia, thrombocytopenia, anemia. **Metab:** hypercholesterolemia, hypertriglyceridemia. **MS:** arthralgias. **Neuro:** tremor, PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), insomnia. **Resp:** INTERSTITIAL LUNG DISEASE, PULMONARY HYPERTENSION. **Misc:** ANGIOEDEMA, INFECTION (including activation of latent viral infections such as BK virus-associated nephropathy and *Clostridioides difficile*-associated diarrhea [CDAD]), ↓ wound healing, lymphocele, lymphoma.

Interactions

Drug-Drug: Cyclosporine (modified) greatly ↑ blood levels (administer sirolimus 4 hr after cyclosporine). Drugs that inhibit the CYP3A4 enzyme system may be expected to ↑ blood levels and the risk of adverse reactions. **Ketoconazole**, **voriconazole**, **itraconazole**, **clarithromycin**, and **erythromycin** significantly ↑ blood levels (concurrent use is contraindicated). Blood levels are also ↑ by **diltiazem** and **verapamil** (monitor sirolimus levels and adjust dose as necessary) and may be ↑ by **nicardipine**, **verapamil**, **clotrimazole**, **fluconazole**, **metoclopramide**, **cimetidine**, **danazol**, and **protease inhibitors**. **Rifampin** and **rifabutin** ↑ metabolism by stimulating the CYP3A4 enzyme system and significantly ↓ blood levels. Blood levels may also be ↓ by **carbamazepine**, **phenobarbital**, **phenytoin**, and **rifapentine**. Risk of renal impairment may be ↑ by concurrent use of other **nephrotoxic agents**. Concurrent use with **tacrolimus** and **corticosteroids** in lung transplantation may ↑ risk of anastomotic dehiscence; fatalites have been reported (not approved for this use). Concurrent use with **tacrolimus** and **corticosteroids** in liver transplantation may ↑ risk of hepatic artery thrombosis; fatalites have been reported (not approved for this use). Concurrent use with **ACE inhibitors** may ↑ risk of angioedema. May ↓ antibody response to and ↑ risk of adverse reactions to **live-virus vaccines**; avoid vaccination. May ↑ **verapamil** levels.

Drug-Natural Products: Concomitant use with **echinacea** and **melatonin** may interfere with immunosuppression. **St. John's wort** may ↑ blood levels and the risk of toxicity.

Drug-Food: Grapefruit juice ↓ CYP3A4 metabolism and ↑ levels; do not use as a diluent and avoid concurrent ingestion.

Route/Dosage

Kidney Transplantation

PO (Adults and Children ≥13 yr): 6-mg loading dose, followed by 2 mg/day maintenance dose. *Dosing following cyclosporine withdrawal*—Patients at low to moderate risk for rejection after transplantation may be withdrawn from cyclosporine over 4–8 wk beginning 2–4 mo after transplant. Thereafter, sirolimus dose should be titrated upward to maintain a whole blood trough level of 12–14 ng/mL. Clinical assessment should also be used to gauge dose. Dose changes can be made at 7–14 day intervals. The following formula may also be used: sirolimus maintenance dose = current dose × (target concentration/current concentration). If a large ↑ is needed, a loading dose may be given and blood levels reassessed 3–4 days later. Loading dose may be calculated by the following formula: sirolimus loading dose = 3 × (new maintenance dose-current maintenance dose). Loading doses >40 mg should be spread over 2 days.

PO (Adults and Children ≥13 yr and <40 kg): 3 mg/m^2 loading dose, followed by 1 mg/m^2/day maintenance dose. *See adjustments above for doses following cyclosporine withdrawal.*

Hepatic Impairment

PO (Adults and Children): *Mild or moderate hepatic impairment*—↓ maintenance dose by 33%; loading dose is unchanged; *Severe hepatic impairment*—↓ maintenance dose by 50%; loading dose is unchanged.

Lymphangioleiomyomatosis

PO (Adults): 2 mg once daily. Monitor whole blood trough level in 10–20 days and titrate dose to maintain level of 5–15 ng/mL. The following formula may also be used to adjust dose: sirolimus maintenance dose = current dose × (target concentration/current concentration). Further dose changes can be made at 7–14 day intervals. Once stable dose achieved, should monitor whole blood trough levels at least every 3 mo.

Hepatic Impairment

(Adults): *Mild or moderate hepatic impairment*—↓ dose by 33%; *Severe hepatic impairment*—↓ dose by 50%.

Availability (generic available)

Oral solution (contains alcohol): 1 mg/mL. **Tablet:** 0.5 mg, 1 mg, 2 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP closely during therapy. Hypertension is a common complication of sirolimus therapy and should be treated.
- Assess for any new signs or symptoms that may be suggestive of PML, an opportunistic infection of the brain that leads to death or severe disability; withhold dose and notify health care professional promptly. Symptoms of PML may include hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia. Consider decreasing the amount of immunosuppression in these patients.
- **Lymphangioleiomyomatosis:** Monitor for signs and symptoms of LAM (wheezing; cough, which may be bloody; shortness of breath; chest pain; pneumothorax) periodically during therapy.
- ***Lab Test Considerations:*** Monitor sirolimus blood levels when dose forms are changed and in

© F.A. Davis Publishing

patients likely to have altered drug metabolism, patients ≥13 yr who weigh <40 kg, patients with hepatic impairment, and during concurrent administration of drugs that may interact with sirolimus. Trough concentrations of ≥15 ng/mL are associated with an ↑ in adverse effects.
- Monitor patients for hyperlipidemia. May require additional interventions to treat hyperlipidemia.
- May cause anemia, leukopenia, thrombocytopenia, and hypokalemia.
- May cause ↑ AST, ↑ ALT, hypophosphatemia, and hyperglycemia.

Implementation
- Therapy with sirolimus should be started as soon as possible post-transplant. Concurrent therapy with cyclosporine and corticosteroids is recommended. Sirolimus should be taken 4 hr after cyclosporine (MODIFIED, Neoral).
- Sirolimus should be ordered only by physicians skilled in immunosuppressive therapy, with the staff and facilities to manage renal transplant patients.
- Antimicrobial prophylaxis for *Pneumocystis jirovecii* pneumonia for 1 yr and for cytomegalovirus protection for 3 mo post-transplant are recommended.
- **PO:** Administer consistently with or without food. Swallow tablet whole; do not crush, break, or chew. Do not administer with or mix with grapefruit juice.
- To dilute from bottle, use amber oral dose syringe to withdraw prescribed amount. Empty sirolimus from syringe into a glass or plastic container holding at least 2 oz (60 mL) of water or orange juice; do not use other liquids. Stir vigorously and drink at once. Refill container with at least 4 oz of additional liquid, stir vigorously, and drink at once.
- If using the pouch, empty entire contents of pouch into at least 2 oz of water or orange juice; do not use other liquids. Stir vigorously and drink at once. Refill container with at least 4 oz of additional liquid, stir vigorously, and drink at once.
- Store bottles and pouches in refrigerator. Protect from light. Solution may develop a slight haze when refrigerated; allow to stand at room temperature and shake gently until haze disappears. Sirolimus may remain in syringe at room temperature or refrigerated for up to 24 hr. Discard syringe after 1 use. Oral solution must be used within 1 mo of opening bottle.

Patient/Family Teaching
- Instruct patient to take sirolimus at the same time each day, as directed. Advise patient to avoid taking with or diluting with grapefruit juice. Do not skip or double up on missed doses. Do not discontinue medication without advice of health care professional.
- Advise patient to avoid grapefruit and grapefruit juice during therapy.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ and stress need to notify health care professional immediately if they occur.
- Advise patient to notify health care professional if swelling of your face, eyes, or mouth; trouble breathing or wheezing; throat tightness; chest pain or tightness; feeling dizzy or faint; rash or peeling of skin; swelling of hands or feet; or symptoms of PML occur.
- Advise patient to wear sunscreen and protective clothing and limit time in sunlight and UV light due to increased risk of skin cancer.
- Caution patient to notify health care professional if signs of infection occur.
- Advise patient to avoid vaccinations with a live virus during therapy; sirolimus may decrease vaccine effectiveness.
- Rep: Advise patient of the risk of taking sirolimus during pregnancy. Caution women of reproductive potential to use effective contraception prior to, during, and for 12 wk following therapy. May cause male infertility.
- Emphasize the importance of repeated lab tests during sirolimus therapy.

Evaluation/Desired Outcomes
- Prevention of transplanted kidney rejection.
- Reduction in symptoms of lymphangioleiomyomatosis (LAM).

S

SITagliptin (sit-a-**glip**-tin)
Januvia

Classification
Therapeutic: antidiabetics
Pharmacologic: enzyme inhibitors

Indications
Type 2 diabetes mellitus (as an adjunct to diet and exercise).

Action
Inhibits the enzyme dipeptidyl peptidase-4 (DPP-4), which slows the inactivation of incretin hormones, resulting in increased levels of active incretin hormones. These hormones are released by the intestine throughout the day and are involved in regulation of glucose homeostasis. Increased/prolonged incretin levels result in an increase in insulin release and decrease in glucagon levels. **Therapeutic Effects:** Improved control of blood glucose.

Pharmacokinetics
Absorption: 87% absorbed following oral administration.

© F.A. Davis Publishing

Distribution: Unknown.
Metabolism and Excretion: 79% excreted unchanged in urine, minor metabolism.
Half-life: 12.4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Type 1 diabetes mellitus; Hypersensitivity.
Use Cautiously in: Renal impairment (↓ dose ↓ for CCr <45 mL/min); History of pancreatitis; History of angioedema to another DPP-4 inhibitor; History of HF or renal impairment (↑ risk of HF); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Consider age-related ↓ in renal function when determining dose in older adults.

Adverse Reactions/Side Effects

CV: HF. **Derm:** STEVENS-JOHNSON SYNDROME (SJS), bullous pemphigoid, rash, urticaria. **GI:** PANCREATITIS, nausea, diarrhea. **GU:** acute renal failure. **Neuro:** headache. **Resp:** upper respiratory tract infection, nasopharyngitis. **MS:** RHABDOMYOLYSIS, arthralgia, back pain, myalgia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: May slightly ↑ serum digoxin levels; monitoring recommended. ↑ risk of hypoglycemia when used with **insulin**, **glyburide**, **glipizide**, or **glimepiride**; may need to ↓ dose of insulin or sulfonylurea.

Route/Dosage

PO (Adults): 100 mg once daily.

Renal Impairment

PO (Adults): *CCr 30– <45 mL/min*— 50 mg once daily; *CCr <30 mL/min, hemodialysis, or peritoneal dialysis*— 25 mg once daily.

Availability

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** 25 mg $801.18/90, 50 mg $816.93/90, 100 mg $816.93/90. ***In combination with:*** ertugliflozin (Steglujan); metformin (Janumet); metformin XR (Janumet XR). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Monitor for signs of pancreatitis (nausea, vomiting, anorexia, persistent severe abdominal pain, sometimes radiating to the back) during therapy. If pancreatitis occurs, discontinue sitagliptin and monitor serum and urine amylase, amylase/creatinine clearance ratio, electrolytes, serum calcium, glucose, and lipase.
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** Monitor hemoglobin A1C prior to and periodically during therapy.
- Monitor renal function prior to and periodically during therapy.

Implementation

- Do not confuse sitagliptin with saxagliptin or sumatriptan. Do not confuse Januvia (sitagliptin) with Jantoven (warfarin) or Janumet (sitagliptin/metformin).
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take sitagliptin as directed. Take missed doses as soon as remembered, unless it is almost time for next dose; do not double doses. Advise patient to read the *Medication Guide* before starting and with each Rx refill in case of changes.
- Explain to patient that sitagliptin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to stop taking sitagliptin and notify health care professional promptly if symptoms of hypersensitivity reactions (rash; hives; swelling of face, lips, tongue, and throat; difficulty in breathing or swallowing) or pancreatitis occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.

© F.A. Davis Publishing

- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Encourage patients who become pregnant while taking sitagliptin to join the pregnancy exposure registry by calling 1-800-986-8999 to collect information about pregnancy outcomes.

Evaluation/Desired Outcomes

- Improved hemoglobin A1C, fasting plasma glucose and 2-hr post-prandial glucose levels.

sodium bicarbonate

(**soe**-dee-um bye-**kar**-boe-nate)

Baking Soda, Bell-Ans, Citrocarbonate, Neut, Soda Mint

Classification

Therapeutic: antiulcer agents

Pharmacologic: alkalinizing agents

Indications

PO, IV: Management of metabolic acidosis. **PO, IV:** Used to alkalinize urine and promote excretion of certain drugs in overdosage situations (phenobarbital, aspirin). **PO:** Antacid. **Unlabeled Use:** Stabilization of acid-base status in cardiac arrest and treatment of life-threatening hyperkalemia.

Action

Acts as an alkalinizing agent by releasing bicarbonate ions. Following oral administration, releases bicarbonate, which is capable of neutralizing gastric acid.

Therapeutic Effects: Alkalinization. Neutralization of gastric acid.

Pharmacokinetics

Absorption: Following oral administration, excess bicarbonate is absorbed and results in metabolic alkalosis and alkaline urine.

Distribution: Widely distributed into extracellular fluid.

Metabolism and Excretion: Sodium and bicarbonate are excreted by the kidneys.

Half-life: Unknown.

TIME/ACTION PROFILE (PO = antacid effect; IV = alkalinization)

ROUTE	ONSET	PEAK	DURATION
PO	immediate	30 min	1–3 hr
IV	immediate	rapid	unknown

Contraindications/Precautions

Contraindicated in: Metabolic or respiratory alkalosis; Hypocalcemia; Hypernatremia; Excessive chloride loss; As an antidote following ingestion of strong mineral acids; Patients on sodium-restricted diets (oral use as an antacid only); Renal failure (oral use as an antacid only); Severe abdominal pain of unknown cause, especially if associated with fever (oral use as an antacid only).

Use Cautiously in: HF; Renal insufficiency; Concurrent corticosteroid therapy; Chronic use as an antacid (may cause metabolic alkalosis and possible sodium overload); Pedi: May ↑ risk of cerebral edema in children with diabetic ketoacidosis.

Adverse Reactions/Side Effects

CV: edema. **GI:** *PO*—flatulence, gastric distention. **F and E:** metabolic alkalosis, hypernatremia, hypocalcemia, hypokalemia, sodium and water retention. **Local:** irritation at IV site. **Neuro:** tetany, cerebral hemorrhage (with rapid injection in infants).

Interactions

Drug-Drug: Following oral administration, may ↓ absorption of **ketoconazole**. Concurrent use with **calcium-containing antacids** may lead to milk-alkali syndrome. Urinary alkalinization may result in ↓ **salicylate** or **barbiturate** blood levels; ↑ blood levels of **quinidine**, **mexiletine**, **flecainide**, or **amphetamines**; ↑ risk of crystalluria from **fluoroquinolones**; ↓ effectiveness of **methenamine**. May negate the protective effects of **enteric-coated products** (do not administer within 1–2 hr of each other).

Route/Dosage

Contains 12 mEq of sodium/g.

Alkalinization of Urine

PO (Adults): 48 mEq (4 g) initially. Then 12–24 mEq (1–2 g) every 4 hr (up to 48 mEq every 4 hr) or 1 tsp of powder every 4 hr as needed.

PO (Children): 1–10 mEq/kg (84–840 mg/kg) per day in divided doses.

IV (Adults and Children): 2–5 mEq/kg as a 4–8 hr infusion.

Antacid

PO (Adults): *Tablets/powder*—325 mg–2 g 1–4 times daily or ½ tsp every 2 hr as needed. *Effervescent powder*—3.9–10 g in water after meals; patients >60 yr should receive 1.9–3.9 g after meals.

Systemic Alkalinization/Cardiac Arrest

IV (Adults and Children and Infants): *Cardiac arrest/urgent situations*—1 mEq/kg; may repeat 0.5 mEq/kg every 10 min. *Less urgent situations*—2–5 mEq/kg as a 4–8 hr infusion.

Renal Tubular Acidosis

PO (Adults): 0.5–2 mEq/kg/day in 4–5 divided doses.

PO (Children): 2–3 mEq/kg/day in 3–4 divided doses.

© F.A. Davis Publishing

Availability (generic available)

Oral powder: (20.9 mEq Na/½ tsp) in 120-, 240-, 480-, and 2400-g containers[OTC]. **Tablets:** 325 mg (3.9 mEq Na/tablet)[OTC], 500 mg (6.0 mEq Na/tablet[OTC], 520 mg (6.2 mEq Na/tablet)[OTC], 650 mg (7.7 mEq Na/tablet)[OTC]. **Solution for injection:** 4.2% (0.5 mEq/mL) in 2.5-, 5-, and 10-mL prefilled syringes, 5% (0.6 mEq/mL) in 500-mL containers, 7.5% (0.9 mEq/mL) in 50-mL vials and prefilled syringes and 200-mL vials, 8.4% (1 mEq/mL) in 10- and 50-mL vials and prefilled syringes. **Neutralizing additive solution for injection:** 4% (0.48 mEq/mL) in 5-mL vials, 4.2% (0.5 mEq/mL) in 6-mL vials.

NURSING IMPLICATIONS

Assessment

- **IV:** Assess fluid balance (intake and output, daily weight, edema, lung sounds) throughout therapy. Report symptoms of fluid overload (hypertension, edema, dyspnea, rales/crackles, frothy sputum) if they occur.
- Assess patient for signs of acidosis (disorientation, headache, weakness, dyspnea, hyperventilation), alkalosis (confusion, irritability, paresthesia, tetany, altered breathing pattern), hypernatremia (edema, weight gain, hypertension, tachycardia, fever, flushed skin, mental irritability), or hypokalemia (weakness, fatigue, U wave on ECG, arrhythmias, polyuria, polydipsia) throughout therapy.
- Observe IV site closely. Avoid extravasation, as tissue irritation or cellulitis may occur. If infiltration occurs, confer with physician or other health care professional regarding warm compresses and infiltration of site with lidocaine or hyaluronidase.
- **Antacid:** Assess patient for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- ***Lab Test Considerations:*** Monitor serum sodium, potassium, calcium, bicarbonate concentrations, serum osmolarity, acid-base balance, and renal function prior to and periodically throughout therapy.
- Obtain arterial blood gases (ABGs) frequently in emergency situations and during parenteral therapy.
- Monitor urine pH frequently when used for urinary alkalinization.
- Antagonizes effects of pentagastrin and histamine during gastric acid secretion test. Avoid administration during the 24 hr preceding the test.

Implementation

- This medication may cause premature dissolution of enteric-coated tablets in the stomach.
- **PO:** Tablets must be taken with a full glass of water.
- When used in treatment of peptic ulcers, may be administered 1 and 3 hr after meals and at bedtime.

IV Administration

- **IV Push:** Used in cardiac arrest or urgent situations. ***Dilution:*** Use premeasured ampules or prefilled syringes to ensure accurate dose. ***Rate:*** Administer by rapid bolus. Flush IV line before and after administration to prevent incompatible medications used in arrest management from precipitating.
- **Continuous Infusion:** ***Dilution:*** May be diluted in dextrose, saline, and dextrose/saline combinations. Premixed infusions are already diluted and ready to use. ***Rate:*** May be administered over 4–8 hr.
- **Y-Site Compatibility:** acyclovir, amifostine, amikacin, aminophylline, asparaginase, atropine, aztreonam, bivalirudin, bumetanide, cefazolin, cefepime, ceftazidime, ceftriaxone, chloramphenicol, cimetidine, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, daptomycin, daunorubicin, dexamethasone sodium phosphate, dexmedetomidine, digoxin, docetaxel, doxorubicin, enalaprilat, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, furosemide, gemcitabine, gentamicin, granisetron, heparin, hydrocortisone sodium succinate, ifosfamide, indomethacin, insulin, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, melphalan, mesna, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, milrinone, morphine, nafcillin, nitroglycerin, nitroprusside, paclitaxel, palonosetron, pantoprazole, pemetrexed, penicillin G potassium, phenylephrine, phytonadione, piperacillin/tazobactam, potassium chloride, procainamide, propranolol, propofol, protamine, remifentanil, tacrolimus, thiotepa, tirofiban, tobramycin, tolazoline, vasopressin, vitamin B complex with C, voriconazole.
- **Y-Site Incompatibility:** allopurinol, amiodarone, amphotericin B, amphotericin B cholesteryl sulfate complex, ampicillin, anidulafungin, calcium chloride, calcium gluconate, caspofungin, cefotaxime, cefoxitin, cefuroxime, diazepam, diphenhydramine, dobutamine, doxorubicin liposome, doxycycline, epinephrine, fenoldopam, ganciclovir, haloperidol, hydroxyzine, idarubicin, imipenem/cilastatin, isoproterenol, lansoprazole, leucovorin, meperidine, midazolam, nalbuphine, norepinephrine, ondansetron, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, sargramostim, trimethoprim/sulfamethoxazole, verapamil, vincristine, vinorelbine.
- **Solution Incompatibility:** Do not add to Ringer's solution, LR, or Ionosol products, as compatibility varies with concentration.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose.
- Review symptoms of electrolyte imbalance with patients on chronic therapy; instruct patient to notify health care professional if these symptoms occur.

© F.A. Davis Publishing

- Advise patient not to take milk products concurrently with this medication. Renal calculi or hypercalcemia (milk-alkali syndrome) may result.
- Emphasize the importance of regular follow-up examinations to monitor serum electrolyte levels and acid-base balance and to monitor progress.
- **Antacid:** Advise patient to avoid routine use of sodium bicarbonate for indigestion. Dyspepsia that persists >2 wk should be evaluated by a health care professional.
- Advise patient on sodium-restricted diet to avoid use of baking soda as a home remedy for indigestion.
- Instruct patient to notify health care professional if indigestion is accompanied by chest pain, difficulty breathing, or diaphoresis or if stools become dark and tarry.

Evaluation/Desired Outcomes

- Increase in urinary pH.
- Clinical improvement of acidosis.
- Enhanced excretion of selected overdoses and poisonings.
- Decreased gastric discomfort.

sodium ferric gluconate complex, See IRON SUPPLEMENTS.

sodium polystyrene sulfonate

(**soe**-dee-um po-lee-**stye**-reen **sul**-fon-ate)

Kalexate, Kayexalate, Solystat, SPS

Classification

Therapeutic: hypokalemic, electrolyte modifiers

Pharmacologic: cationic exchange resins

Indications

Mild to moderate hyperkalemia (if severe, more immediate measures such as sodium bicarbonate IV, calcium, or glucose/insulin infusion should be instituted).

Action

Exchanges sodium ions for potassium ions in the intestine (each 1 g is exchanged for 1 mEq potassium).

Therapeutic Effects: Reduction of serum potassium levels.

Pharmacokinetics

Absorption: Distributed throughout the intestine but is nonabsorbable.

Distribution: Not distributed.

Metabolism and Excretion: Eliminated in the feces.

Half-life: Unknown.

TIME/ACTION PROFILE (decrease in serum potassium)

ROUTE	ONSET	PEAK	DURATION
PO	2–12 hr	unknown	6–24 hr
Rectal	2–12 hr	unknown	4–6 hr

Contraindications/Precautions

Contraindicated in: Life-threatening hyperkalemia (other, more immediate measures should be instituted); Hypersensitivity to saccharin or parabens (some products); Ileus; Abnormal bowel function (↑ risk for intestinal necrosis); Postoperative patients with no bowel movement (↑ risk for intestinal necrosis); History of impaction, chronic constipation, inflammatory bowel disease, ischemic colitis, vascular intestinal atherosclerosis, previous bowel resection, or bowel obstruction (↑ risk for intestinal necrosis); Known alcohol intolerance (suspension only).

Use Cautiously in: Heart failure; Hypertension; Edema; Sodium restriction; Constipation.

Adverse Reactions/Side Effects

F and E: hypocalcemia, hypokalemia, sodium retention, hypomagnesemia. **GI:** INTESTINAL NECROSIS, constipation, fecal impaction, anorexia, gastric irritation, ischemic colitis, nausea, vomiting.

Interactions

Drug-Drug: May ↓ absorption of any other orally administered medication; administer sodium polystyrene sulfonate ≥3 hr before or after other oral medications (≥6 hr for patients with gastroparesis). Administration with **calcium** or **magnesium-containing antacids** may ↓ resin-exchanging ability and ↑ risk of systemic alkalosis. Hypokalemia may enhance **digoxin** toxicity. Use with **sorbitol** may ↑ risk of colonic necrosis (concomitant use not recommended).

Route/Dosage

4 level tsp = 15 g (4.1 mEq sodium/g).

PO (Adults): 15 g 1–4 times daily in water (up to 40 g 4 times daily).

Rect (Adults): 30–50 g as a retention enema; repeat as needed every 6 hr.

PO, Rect (Children): 1 g/kg/dose every 6 hr.

Availability (generic available)

Oral suspension: 15 g sodium polystyrene sulfonate with 20 g sorbitol/60 mL, 15 g sodium polystyrene sulfonate with 14.1 g sorbitol/60 mL. **Powder for suspension (requires reconstitution):** 454 g/bottle. **Rectal suspension:** 30 g/120 mL, 50 g/200 mL.

NURSING IMPLICATIONS

Assessment

- Monitor response of symptoms of hyperkalemia (fatigue, muscle weakness, paresthesia, confusion,

© F.A. Davis Publishing

dyspnea, peaked T waves, depressed ST segments, prolonged QT segments, widened QRS complexes, loss of P waves, and cardiac arrhythmias). Assess for development of hypokalemia (weakness, fatigue, arrhythmias, flat or inverted T waves, prominent U waves).
- Monitor intake and output ratios and daily weight. Assess for symptoms of fluid overload (dyspnea, rales/crackles, jugular venous distention, peripheral edema). Concurrent low-sodium diet may be ordered for patients with HF (see Appendix J).
- In patients receiving concurrent digoxin, assess for symptoms of digoxin toxicity (anorexia, nausea, vomiting, visual disturbances, arrhythmias).
- Assess abdomen and note character and frequency of stools. Discontinue sodium polystyrene sulfonate if patient becomes constipated. Concurrent sorbitol or laxatives may be ordered to prevent constipation or impaction. Some products contain sorbitol to prevent constipation. Patient should ideally have 1–2 watery stools each day during therapy. Monitor for intestinal necrosis if sorbitol is added.
- ***Lab Test Considerations:*** Monitor serum potassium daily during therapy. Notify health care professional when potassium ↓ to 4–5 mEq/L.
- Monitor renal function and electrolytes (especially sodium, calcium, bicarbonate, and magnesium) prior to and periodically throughout therapy.

Implementation
- Consult health care professional regarding discontinuation of medications that may increase serum potassium (angiotensin-converting enzyme inhibitors, potassium-sparing diuretics, potassium supplements, salt substitutes).
- Administer PO doses at least 3 hrs before or 3 hrs after other medications (patients with gastroparesis may require a 6-hr separation).
- An osmotic laxative (sorbitol) is usually administered concurrently to prevent constipation.
- **PO:** For oral or NG tube administration, shake commercially available suspension well before use. Solution is stable for 24 hr when refrigerated. When using powder, add prescribed amount to 3–4 mL water/g of powder. Shake well. Do not mix in orange juice or in any fruit juice known to contain potassium. Do not heat solution to enhance dissolution of powder; heating impairs exchange resin properties. Chilling and adding syrup may improve palatability. May also be added to food. Resin cookie or candy recipes are available; discuss with pharmacist or dietitian.
- **Retention Enema:** Precede retention enema with cleansing enema. Administer solution via rectal tube or 28-French Foley catheter with 30-mL balloon. Insert tube at least 20 cm and tape in place.
- For retention enema, add powder to 100 mL of prescribed solution (usually sorbitol or 20% dextrose in water). Shake well to dissolve powder thoroughly; should be of liquid consistency. Position patient on left side and elevate hips on pillow if solution begins to leak. Follow administration of medication with additional 50–100 mL of diluent to ensure administration of complete dose. Encourage patient to retain enema as long as possible, at least 30–60 min.
- After retention period, irrigate colon with 1–2 L of non–sodium-containing solution. Y-connector with tubing may be attached to Foley or rectal tube; cleansing solution is administered through 1 port of the Y and allowed to drain by gravity through the other port.

Patient/Family Teaching
- Explain purpose and method of administration of medication to patient.
- Advise patient to avoid taking antacids or laxatives during therapy, unless approved by health care professional; may cause systemic alkalosis.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Inform patient of need for frequent lab tests to monitor effectiveness.

Evaluation/Desired Outcomes
- Normalization of serum potassium levels.

sofosbuvir/velpatasvir
(soe-**fos**-bue-vir/vel-**pat**-as-vir)
Epclusa

Classification
Therapeutic: antivirals
Pharmacologic: NS5B inhibitors, NS5A inhibitors

Indications
Chronic hepatitis C virus (HCV) genotype 1, 2, 3, 4, 5, or 6 infection in patients without cirrhosis or with compensated cirrhosis. Chronic hepatitis C virus (HCV) genotype 1, 2, 3, 4, 5, or 6 infection in patients with decompensated cirrhosis (in combination with ribavirin).

Action
Sofosbuvir—inhibits the HCV NS5B RNA-dependent RNA polymerase, resulting in inhibition of viral replication. *Velpatasvir*—inhibits the HCV NS5A protein, resulting in inhibition of viral replication. **Therapeutic Effects:** Decreased levels of HCV with sustained virologic response and lessened sequelae of chronic HCV infection.

Pharmacokinetics
Sofosbuvir
Absorption: Rapidly metabolized following absorption (extensive first-pass effect).
Distribution: Unknown.

© F.A. Davis Publishing

Metabolism and Excretion: Extensively metabolized primarily to GS-461203, an active antiviral moiety, then converted to GS-331007, which does not have antiviral activity. 80% excreted in urine mostly as GS-331007 (3.5% as unchanged drug), 14% excreted in feces, 2.5% excreted in expired air.
Half-life: *Sofosbuvir*—0.4 hr; *GS-331007*—25 hr.

Velpatasvir
Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: >99.5%.
Metabolism and Excretion: Metabolized primarily via CYP2B6, CYP2C8, and CYP3A4. Primarily undergoes biliary excretion, with 94% excreted in feces and 0.4% eliminated in urine.
Half-life: 47 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
sofosbuvir (PO)	unknown	0.5–1 hr	24 hr
velpatasvir (PO)	unknown	3 hr	24 hr

Contraindications/Precautions

Contraindicated in: Situations when ribavirin is contraindicated (when ribavirin required); Should not be used with other drugs/regimens containing sofosbuvir; Receiving immunosuppressant or chemotherapy medications (↑ risk of hepatitis B virus reactivation); OB: Pregnant women or men whose partners are pregnant (when ribavirin is required; ribavirin may cause fetal harm); Lactation: Lactation (when ribavirin required).
Use Cautiously in: OB: Safety not established in pregnancy (when ribavirin not required); Lactation: Safety not established in breast feeding (when ribavirin not required); Pedi: Children <3 yo (safety and effectiveness not established); Geri: Older adults may be more sensitive to drug effects.

Adverse Reactions/Side Effects

Without ribavirin

Derm: rash **GI:** hepatitis B virus reactivation, ↑ lipase, nausea. **Neuro:** headache, insomnia, irritability. **Misc:** fatigue.

With ribavirin

CNS: headache, insomnia. **Derm:** rash. **GI:** diarrhea, nausea, hepatitis B virus reactivation, ↑ lipase. **Hemat:** anemia. **Misc:** fatigue.

Interactions

Drug-Drug: Concurrent use of **P-glycoprotein inducers** may ↓ levels/effectiveness of sofosbuvir and velpatasvir; concurrent use not recommended. Concurrent use of **moderate-to-strong CYP2B6, CYP2C8, or CYP3A4 inducers** may ↓ levels/effectiveness of velpatasvir; concurrent use not recommended. **Amiodarone** may ↑ risk of symptomatic bradycardia when used with sofosbuvir-containing regimens; concurrent use not recommended; if amiodarone necessary, monitor patients in inpatient setting for first 48 hr of concomitant use and then monitor heart rate on outpatient basis for at least the first 2 wk of treatment; follow same monitoring procedure if discontinuing amiodarone immediately before initiation of sofosbuvir/velpatasvir. **Acid-reducing agents** may ↓ levels of velpatasvir; separate administration from **antacids**, including **magnesium hydroxide** and **aluminum hydroxide** by 4 hr; administer **H_2-receptor antagonists** simultaneously or 12 hr apart from sofosbuvir/velpatasvir (dose of H_2 antagonist should not exceed famotidine 40 mg twice daily or equivalent); concurrent use with **proton-pump inhibitors** not recommended (if proton pump inhibitor necessary, administer sofosbuvir/velpatasvir with food and take 4 hr before **omeprazole** 20 mg; use with other proton pump inhibitors not studied). May ↑ levels/toxicity of **digoxin**; therapeutic monitoring of serum digoxin concentrations recommended. May ↑ levels/toxicity of **topotecan**; concurrent use not recommended. **Carbamazepine**, **phenytoin**, **phenobarbital**, and **oxcarbazepine** may ↓ levels/effectiveness of sofosbuvir and velpatasvir; concurrent use not recommended. **Rifabutin**, **rifampin**, and **rifapentine** may ↓ levels/effectiveness of sofosbuvir and velpatasvir; concurrent use not recommended. **Efavirenz** may ↓ levels/effectiveness of velpatasvir; concurrent use not recommended. May ↑ levels/toxicity of **tenofovir disoproxil fumarate** and **tenofovir disoproxil fumarate-containing combinations**; monitor closely. **Tipranavir/ritonavir** may ↓ levels/effectiveness of sofosbuvir and velpatasvir; concurrent use not recommended. May ↑ levels/toxicity of **rosuvastatin** and **atorvastatin**; rosuvastatin dose should not exceed 10 mg/day; monitor closely for atorvastatin-induced myopathy or rhabdomyolysis. May cause fluctuations in INR when used with **warfarin**; closely monitor INR. May ↑ risk of hypoglycemia when used with certain **antidiabetic agents**.
Drug-Natural Products: St. John's wort may ↓ levels/effectiveness of sofosbuvir and velpatasvir; concurrent use not recommended.

Route/Dosage

Dosing recommendations below may also be followed for patients coinfected with HIV.
PO (Adults): *Patients without cirrhosis or with compensated cirrhosis (including liver transplant recipients) (Child–Pugh A)*—One 400-mg/100-mg tablet once daily for 12 wk; *Patients with decompen-*

© F.A. Davis Publishing

sated cirrhosis (Child–Pugh B or C) — One 400-mg/100-mg tablet once daily for 12 wk in combination with ribavirin.

PO (Children ≥3 yr or ≥30 kg): *Patients without cirrhosis or with compensated cirrhosis (including liver transplant recipients) (Child–Pugh A)* — One 400-mg/100-mg tablet once daily for 12 wk *or* two 200-mg/50-mg tablets once daily for 12 wk *or* two 200-mg/50-mg pellet packets once daily for 12 wk; *Patients with decompensated cirrhosis (Child–Pugh B or C)* — One 400-mg/100-mg tablet once daily for 12 wk in combination with ribavirin *or* two 200-mg/50-mg tablets once daily for 12 wk in combination with ribavirin *or* two 200-mg/50-mg pellet packets once daily for 12 wk in combination with ribavirin.

PO (Children ≥3 yr or 17–<30 kg): *Patients without cirrhosis or with compensated cirrhosis (including liver transplant recipients) (Child–Pugh A)* — one 200-mg/50-mg tablet once daily for 12 wk *or* one 200-mg/50-mg pellet packet once daily for 12 wk; *Patients with decompensated cirrhosis (Child–Pugh B or C)* — one 200-mg/50-mg tablet once daily for 12 wk in combination with ribavirin *or* one 200-mg/50-mg pellet packet once daily for 12 wk in combination with ribavirin.

PO (Children ≥3 yr or <17 kg): *Patients without cirrhosis or with compensated cirrhosis (including liver transplant recipients) (Child–Pugh A)* — one 150-mg/37.5-mg pellet packet once daily for 12 wk; *Patients with decompensated cirrhosis (Child–Pugh B or C)* — one 150-mg/37.5-mg pellet packet once daily for 12 wk in combination with ribavirin.

Availability

Tablets: sofosbuvir 400 mg/velpatasvir 100 mg, sofosbuvir 200 mg/velpatasvir 50 mg. **Oral pellets:** sofosbuvir 200 mg/velpatasvir 50 mg per pkt, sofosbuvir 150 mg/velpatasvir 37.5 mg per pkt.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of hepatitis B reactivation (jaundice, dark urine, light-colored stools, fatigue, weakness, loss of appetite, nausea, vomiting, stomach pain) during therapy.
- ***Lab Test Considerations:*** Measure hepatitis B surface antigen (HBsAg) and hepatitis core antibody (anti-HBc) in all patients before starting hepatitis C virus therapy. May cause hepatitis B virus reactivation. Monitor for clinical and laboratory signs of hepatitis flare (↑ AST, ALT, bilirubin, liver failure, death) or HBV reactivation (rapid ↑ in serum HBV DNA level) during HCV treatment and post-treatment follow-up.
- May cause ↑ serum lipase and amylase levels.
- May cause ↑ creatine kinase and indirect bilirubin levels.

Implementation

- **PO:** Administer one tablet daily without regard to food for 12 wk.
- Do not chew oral pellets; causes a bitter aftertaste. May be administered directly into mouth and swallowed whole or taken with food. In pediatric patients <6 years of age, administer oral pellets with food to increase tolerability and palatability. Sprinkle oral pellets on one or more spoonfuls of non-acidic soft food (pudding, chocolate syrup, ice cream) at or below room temperature. Take oral pellets within 15 min of gently mixing with food and swallow entire contents without chewing.
- Administer antacids 4 hrs apart from sofosbuvir/velpatasvir. May administer simultaneously or 12 hr apart with H_2–receptor antagonists at doses not to exceed famotidine 40 mg twice daily. Avoid administration with proton pump inhibitors; if medically necessary, administer sofosbuvir/velpatasvir with food and 4 hr before omeprazole 20 mg.

Patient/Family Teaching

- Instruct patient to take *Epclusa*™ as directed. Do not skip or miss doses or stop medication without consulting health care professional. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- Advise patient to notify health care professional if they have a history of HBV. May cause reactivation.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Rep: Advise patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Advise females of reproductive potential who take *Epclusa*™ with ribavirin to use effective contraception during and for 6 mo after therapy is completed. Notify health care professional immediately if pregnancy is suspected.

Evaluation/Desired Outcomes

- Decreased levels of HCV with sustained virologic response and lessened sequelae of chronic HCV infection.

solifenacin (so-li-**fen**-a-sin)

VESIcare, VESIcare LS

Classification

Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

Indications

Overactive bladder with symptoms (urge incontinence, urgency, frequency) (tablets only). Neurogenic detrusor overactivity (suspension only).

© F.A. Davis Publishing

Action
Acts as a muscarinic (cholinergic) receptor antagonist; antagonizes bladder smooth muscle contraction.
Therapeutic Effects: Decreased symptoms of overactive bladder. Improved maximum cystometric capacity in neurogenic detrusor overactivity.

Pharmacokinetics
Absorption: Well absorbed (90%).
Distribution: Extensively distributed to tissues.
Protein Binding: 98%.
Metabolism and Excretion: Extensively metabolized by the CYP3A4 isoenzyme. 69% excreted in urine as metabolites, 22% in feces.
Half-life: *Tablets*—45–68 hr; *Suspension*—26 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Oral	unknown	3–8 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Urinary retention; Gastric retention; Uncontrolled angle-closure glaucoma; Severe hepatic impairment; History of QT interval prolongation or concurrent use of QT interval prolonging medications.
Use Cautiously in: Concurrent use of CYP3A4 inhibitors (use lower dose/clinical monitoring may be necessary); Moderate hepatic impairment (lower dose recommended); Renal impairment; Bladder outflow obstruction; GI obstructive disorders, severe constipation, or ulcerative colitis; Myasthenia gravis; Angle-closure glaucoma; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <2 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects
CV: palpitations, QT interval prolongation, tachycardia. **EENT:** blurred vision. **GI:** constipation, dry mouth, abdominal pain, dyspepsia, nausea. **GU:** urinary tract infection. **MS:** muscle weakness. **Neuro:** confusion, drowsiness, hallucinations, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedemia).

Interactions
Drug-Drug: Strong CYP3A4 inhibitors, including **ketoconazole** may significantly ↑ levels and risk of toxicity. **QT interval prolonging medications** may ↑ risk of QT interval prolongation; avoid concurrent use.

Route/Dosage

Overactive Bladder
PO (Adults): *Tablets*—5 mg once daily, may ↑ to 10 mg once daily; *Concurrent use of strong CYP3A4 inhibitors*—Tablets: Not to exceed 5 mg once daily.

Renal Impairment
PO (Adults): *CCr <30 mL/min*—Tablets: Not to exceed 5 mg once daily.

Hepatic Impairment
PO (Adults): *Moderate hepatic impairment*—Tablets: Not to exceed 5 mg once daily.

Neurogenic Detrusor Overactivity
PO (Children ≥2 yr and >60 kg): *Suspension*—5 mg once daily, may ↑ to 10 mg once daily; *Concurrent use of strong CYP3A4 inhibitors*—Suspension: Not to exceed 5 mg once daily.
PO (Children ≥2 yr and 46–60 kg): *Suspension*—4 mg once daily, may ↑ to 8 mg once daily; *Concurrent use of strong CYP3A4 inhibitors*—Suspension: Not to exceed 4 mg once daily.
PO (Children ≥2 yr and 31–45 kg): *Suspension*—3 mg once daily, may ↑ to 6 mg once daily; *Concurrent use of strong CYP3A4 inhibitors*—Suspension: Not to exceed 3 mg once daily.
PO (Children ≥2 yr and 16–30 kg): *Suspension*—3 mg once daily, may ↑ to 5 mg once daily; *Concurrent use of strong CYP3A4 inhibitors*—Suspension: Not to exceed 3 mg once daily.
PO (Children ≥2 yr and 9–15 kg): *Suspension*—2 mg once daily, may ↑ to 4 mg once daily; *Concurrent use of strong CYP3A4 inhibitors*—Suspension: Not to exceed 2 mg once daily.

Renal Impairment
PO (Children ≥2 yr): *CCr <30 mL/min*—>60 kg: Not to exceed 5 mg once daily (suspension); 46–60 kg: Not to exceed 4 mg once daily (suspension); 16–45 kg: Not to exceed 3 mg once daily (suspension); 9–15 kg: Not to exceed 2 mg once daily (suspension).

Hepatic Impairment
PO (Children ≥2 yr): *Moderate hepatic impairment*—>60 kg: Not to exceed 5 mg once daily (suspension); 46–60 kg: Not to exceed 4 mg once daily (suspension); 16–45 kg: Not to exceed 3 mg once daily (suspension); 9–15 kg: Not to exceed 2 mg once daily (suspension).

Availability (generic available)
Tablets: 5 mg, 10 mg. **Cost:** All strengths $703.66/90.
Oral suspension (orange-flavor) (Vesicare LS): 1 mg/mL.

NURSING IMPLICATIONS
Assessment
- **Overactive Bladder:** Monitor voiding pattern and assess symptoms of overactive bladder (urinary urgency, urinary incontinence, urinary frequency) to and periodically during therapy.
- **Neurogenic Detrusor Overactivity:** Measure bladder capacity as directed.

© F.A. Davis Publishing

Implementation

- **PO:** Administer once daily without regard to food. Tablets must be swallowed whole; do not break, crush, or chew.
- Administer suspension once daily followed by water or milk. Shake before use. Use calibrated measuring device to ensure accurate dose.

Patient/Family Teaching

- Instruct patient to take solifenacin as directed. Advise patient to read the *Patient Information* before starting therapy and with each prescription refill. *Overactive bladder:* if a dose is missed, skip dose and take next day; do not take 2 doses in same day. *Neurogenic Detrusor Overactivity:* take missed doses as soon as remembered if within 12 hr; if >12 hr since missed dose, omit dose and take next dose at usual time.
- Do not share solifenacin with others; may be dangerous.
- May cause dizziness and blurred vision. Caution patient to avoid driving and other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional immediately if hives; rash; swelling or lips, face, tongue, or throat; trouble breathing occurs.
- Inform patient of potential anticholinergic side effects (constipation, urinary retention, blurred vision, heat prostration in a hot environment).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in symptoms of overactive bladder (urge urinary incontinence, urgency, frequency).
- Improved bladder capacity in neurogenic detrusor overactivity.

solriamfetol (sol-ri-am-fe-tol)

Sunosi

Classification

Therapeutic: none assigned

Pharmacologic: dopamine norepinephrine reuptake inhibitors

Schedule IV

Indications

Treatment of excessive daytime sleepiness due to narcolepsy or obstructive sleep apnea.

Action

Selective dopamine and norepinephrine reuptake inhibitor. **Therapeutic Effects:** Improved wakefulness.

Pharmacokinetics

Absorption: 95% absorbed following oral administration; high-fat food delays absorption.

Distribution: Extensively distributed to tissues.

Metabolism and Excretion: Undergoes minimal metabolism; primarily excreted in urine as unchanged drug (95%).

Half-life: 7 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.25–3 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use or use within 14 days of discontinuation of MAO inhibitors; End-stage renal disease.

Use Cautiously in: Cardiovascular disease, cerebrovascular disease, or hypertension; Moderate or severe renal impairment (↑ risk of adverse reactions) (↓ dose recommended); Psychoses or bipolar disorder; History of drug (especially stimulants) or alcohol abuse; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; Geri: Because of reduced renal function, older adults may be at ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CV: ↑ BP, ↑ HR, palpitations. **Derm:** ↑ sweating. **GI:** abdominal pain, constipation, dry mouth, diarrhea, nausea. **Metab:** ↓ appetite. **Neuro:** headache, anxiety, dizziness, insomnia, irritability.

Interactions

Drug-Drug: Concurrent use with or within 14 days of discontinuation of **MAO inhibitors** may ↑ risk of hypertensive crises and is contraindicated. Use cautiously with other **drugs that increase BP or HR**. **Dopaminergic drugs** may have synergistic effects.

Route/Dosage

PO (Adults): *Narcolepsy*—75 mg once daily; may ↑ dose to 150 mg once daily, if needed, after ≥3 days. *Obstructive sleep apnea*—37.5 mg once daily; may double dose at intervals of at least every 3 days, if needed (max dose = 150 mg/day).

Renal Impairment

PO (Adults): *Moderate renal impairment (eGFR 30–59 mL/min/1.73 m²) (for either narcolepsy or obstructive sleep apnea)*—37.5 mg once daily; may ↑ dose to 75 mg once daily after ≥7 days, if needed. *Severe renal impairment (eGFR 15–29 mL/min/1.73 m²) (for either narcolepsy or obstructive sleep apnea)*—37.5 mg once daily.

© F.A. Davis Publishing

Availability
Tablets: 75 mg, 150 mg.

NURSING IMPLICATIONS
Assessment
- Observe and document frequency of narcoleptic episodes.
- Assess BP and control hypertension before starting therapy. Monitor BP during therapy and treat new-onset hypertension and exacerbations of pre-existing hypertension.

Implementation
- **PO:** Administer once daily upon awakening without regard to food.

Patient/Family Teaching
- Instruct patient to take solriamfetol as directed. Avoid taking medication within 9 hrs of planned bedtime; may impair ability to fall asleep.
- Advise patient that sharing this medication with others, even those with same symptoms, is dangerous and illegal. Advise patient that solriamfetol is a drug with known abuse potential. Protect it from theft; store out of sight and reach of children, and in a location not accessible by others.
- Advise patient to notify health care professional if anxiety, insomnia, irritability, agitation, or signs of psychosis or bipolar disorders occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. If alcohol is used during therapy, intake should be limited to moderate amounts.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Monitor breast-fed infants for agitation, insomnia, anorexia and reduced weight gain. Encourage women who become pregnant to enroll in the pregnancy exposure registry to monitor outcomes for women exposed to solriamfetol during pregnancy by calling 1-877-283-6220 or contacting www.SunosiPregnancyRegistry.com.

Evaluation/Desired Outcomes
- Improved ability to stay awake.

sotalol (soe-ta-lole)
Betapace, Betapace AF, Rylosol, Sorine, Sotylize

Classification
Therapeutic: antiarrhythmics (class III)

Indications
Life-threatening ventricular arrhythmias. **Betapace AF and Sotylize:** Maintenance of normal sinus rhythm in patients with highly symptomatic atrial fibrillation/atrial flutter (AF/AFL) who are currently in sinus rhythm.

Action
Blocks stimulation of $beta_1$ (myocardial) and $beta_2$ (pulmonary, vascular, and uterine) adrenergic receptor sites. **Therapeutic Effects:** Suppression of arrhythmias.

Pharmacokinetics
Absorption: Well absorbed following oral administration (bioavailability 90–100%).
Distribution: Crosses the placenta; enters breast milk.
Metabolism and Excretion: Elimination is mostly renal.
Half-life: 12 hr (↑ in renal impairment).

TIME/ACTION PROFILE (antiarrhythmic effects)

ROUTE	ONSET	PEAK	DURATION
PO	hr	2–3 days	8–12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Asthma; Cardiogenic shock or decompensated HF; Congenital or acquired long QT syndromes; Baseline QT interval >450 msec (for AF/atrial flutter only); Sinus bradycardia, sick sinus syndrome, or 2nd- and 3rd-degree AV block (unless a functioning pacemaker is present); Hypokalemia (↑ risk of arrhythmias); CCr <40 mL/min in patients who are being treated with Betapace AF or Sotylize; Lactation: Lactation.
Use Cautiously in: Renal impairment (↑ dosing interval recommended if CCr ≤60 mL/min for patients with ventricular arrhythmias); Hepatic impairment; Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); OB: May cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children; Geri: Older adults may have ↑ sensitivity to beta blockers.

Adverse Reactions/Side Effects
CV: *ARRHYTHMIAS*, *BRADYCARDIA*, *HF*, *PULMONARY EDEMA*, orthostatic hypotension, peripheral vasoconstriction. **Derm:** itching, rash. **EENT:** blurred vision, dry eyes, nasal stuffiness. **Endo:** hyperglycemia, hypoglycemia. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, ↓ libido. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** fatigue, weakness, anxiety, dizziness,

© F.A. Davis Publishing

drowsiness, insomnia, memory loss, mental depression, mental status changes, nervousness, nightmares, paresthesia. **Resp:** bronchospasm, wheezing. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: Concurrent use with other **class 1A antiarrhythmics** is not recommended due to ↑ risk of arrhythmias. **General anesthesia**, **IV phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**, **beta-blockers**, **verapamil**, and **diltiazem**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamines**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid hormone** administration may ↓ effectiveness. May alter the effectiveness of **insulin** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ the effectiveness of **beta-adrenergic bronchodilators** and **theophylline**. May ↓ the beneficial $beta_1$ cardiovascular effects of **dopamine** or **dobutamine**. Discontinuation of **clonidine** in patients receiving sotalol may result in excessive rebound hypertension. Use cautiously within 14 days of **MAO inhibitors** (may result in hypertension).

Route/Dosage

Ventricular Arrhythmias

PO (Adults): 80 mg twice daily; may be gradually ↑ (usual maintenance dose is 160–320 mg/day in 2–3 divided doses; some patients may require up to 480–640 mg/day).

Renal Impairment

PO (Adults): *CCr 30–59 mL/min*—initial dose of 80 mg, with subsequent doses given every 24 hr; *CCr 10–29 mL/min*—initial dose of 80 mg, with subsequent doses given every 36–48 hr.

Atrial Fibrillation/Atrial Flutter

PO (Adults): 80 mg twice daily, may be ↑ during careful monitoring to 120 mg twice daily if necessary.

Renal Impairment

PO (Adults): *CCr 40–60 mL/min*—Administer every 24 hr.

Availability (generic available)

Tablets : 80 mg, 120 mg, 160 mg, 240 mg. **Tablets (Betapace AF):** 80 mg, 120 mg, 160 mg. **Oral solution (Sotylize) (grape flavor):** 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor ECG prior to and periodically during therapy. May cause life-threatening ventricular tachycardia associated with QT interval prolongation. Do not initiate sotalol therapy if baseline QTc is longer than 450 ms. If QT interval becomes ≥500 ms, reduce dose, prolong duration of infusion, or discontinue therapy.
- Monitor BP and pulse frequently during dose adjustment period and periodically during therapy. Assess for orthostatic hypotension when assisting patient up from supine position.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Calculate creatinine clearance prior to dosing.
- May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause increased ANA titers.
- May cause increase in blood glucose levels.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.
- Glucagon has been used to treat bradycardia and hypotension.

Implementation

- Do not confuse sotalol with Sudafed (pseudoephedrine).
- Patients should be hospitalized and monitored for arrhythmias for at least 3 days during initiation of therapy and dose increases.
- Do not substitute Betapace for Betapace AF. Make sure patients transferred from Betapace to Betapace AF have enough Betapace AF upon leaving the hospital to allow for uninterrupted therapy until Betapace AF prescription can be filled.
- **PO:** Take apical pulse prior to administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer on an empty stomach, 1 hr before or 2 hr after meals. Administration with food, especially milk or milk products, reduces absorption by approximately 20%.
- Avoid administering antacids containing aluminum or magnesium within 2 hr of sotalol.
- For patients unable to swallow pills, pharmacist can convert tablets to a solution.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia. Advise patients taking *Betapace AF* to read the *Medication Guide* before starting and with each Rx refill in case of changes.

© F.A. Davis Publishing

- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Caution patient to avoid taking antacids containing aluminum or magnesium within 2 hr of sotalol.
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly. Advise patient to hold dose and contact physician or other health care professional if pulse is <50 bpm or if BP changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patients to change positions slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased.
- Caution patient that this medication may increase sensitivity to cold.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cold preparations.
- Diabetic patients should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask tachycardia and increased BP as signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional immediately if new fast heartbeats with lightheadedness and fainting occurs, or if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, confusion, depression, rash, fever, sore throat, unusual bleeding, bruising, or if pain or swelling at the infusion site occurs.
- Instruct patient to inform health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional promptly if pregnancy is planned or suspected and to avoid breast feeding during therapy. May cause growth restriction, transient fetal bradycardia, hyperbilirubinemia, hypoglycemia, uterine contractions, and possible intrauterine death in the exposed fetus. Monitor newborns exposed to sotalol for symptoms of beta blockade. May impair fertility by causing erectile dysfunction.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Control of arrhythmias without appearance of detrimental side effects.

spironolactone, See DIURETICS (POTASSIUM-SPARING).

streptomycin, See AMINOGLYCOSIDES.

sucralfate (soo-kral-fate)

Carafate, Sulcrate, Sulcrate Plus

Classification

Therapeutic: antiulcer agents
Pharmacologic: GI protectants

Indications

Short-term management of duodenal ulcers. Maintenance (preventive) therapy of duodenal ulcers. **Unlabeled Use:** Management of gastric ulcer or gastroesophageal reflux. Prevention of gastric mucosal injury caused by high-dose aspirin or other NSAIDs in patients with rheumatoid arthritis or in high-stress situations (e.g., intensive care unit). **Suspension:** Mucositis/stomatitis/rectal or oral ulcerations from various etiologies.

Action

Aluminum salt of sulfated sucrose reacts with gastric acid to form a thick paste, which selectively adheres to the ulcer surface. **Therapeutic Effects:** Protection of ulcers, with subsequent healing.

Pharmacokinetics

Absorption: Systemic absorption is minimal (<5%).
Distribution: Unknown.
Metabolism and Excretion: >90% is eliminated in the feces.
Half-life: 6–20 hr.

TIME/ACTION PROFILE (mucosal protectant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	unknown	6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Renal failure (accumulation of aluminum can occur); Diabetes (↑ risk of hyperglycemia with suspension); Impaired swallowing (↑ risk of tablet aspiration).

Adverse Reactions/Side Effects

Derm: pruritus, rashes. **Endo:** hyperglycemia (with suspension). **GI:** constipation, diarrhea, dry mouth, gastric discomfort, indigestion, nausea. **Neuro:** dizzi-

© F.A. Davis Publishing

ness, drowsiness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: May ↓ absorption of **phenytoin**, **fat-soluble vitamins**, or **tetracycline**. ↓ effectiveness when used with **antacids** or **cimetidine**. ↓ absorption of **fluoroquinolones** (separate administration by 2 hr).

Route/Dosage

Treatment of Ulcers

PO (Adults): 1 g 4 times daily, given 1 hr before meals and at bedtime; or 2 g twice daily, on waking and at bedtime.

Prevention of Ulcers

PO (Adults): 1 g twice daily, given 1 hr before a meal.

Gastroesophageal Reflux

PO (Adults): 1 g 4 times daily, given 1 hr before meals and at bedtime.

PO (Children): 40–80 mg/kg/day divided every 6 hr, given 1 hr before meals and at bedtime.

Stomatitis

PO (Adults and Children): 5–10 mL of suspension, swish and spit or swish and swallow 4 times daily.

Proctitis

Rect (Adults): 2 g of suspension given as an enema once or twice daily.

Availability (generic available)

Oral suspension (cherry flavor): 1 g/10 mL, 200 mg/mL. **Cost:** $122.42/420 mL. **Tablets:** 1 g. **Cost:** *Generic*—$23.86/100.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for abdominal pain and frank or occult blood in the stool.

Implementation

- **PO:** Administer on an empty stomach, 1 hr before meals and at bedtime. Tablet may be broken or dissolved in water before ingestion. Shake suspension well before administration.
- Oral suspension is only for oral use; do not administer IV. Shake well before use. Store at room temperature, do not freeze.
- If antacids are also required for pain, administer 30 min before or after sucralfate dose.

Patient/Family Teaching

- Advise patient to continue with course of therapy for 4–8 wk, even if feeling better, to ensure ulcer healing. If a dose is missed, take as soon as remembered unless almost time for next dose; do not double doses.
- Advise patient that increase in fluid intake, dietary bulk, and exercise may prevent drug-induced constipation.
- Emphasize the importance of routine examinations to monitor progress.

Evaluation/Desired Outcomes

- Decrease in abdominal pain.
- Prevention and healing of duodenal ulcers, seen by x-ray examination and endoscopy.

sulconazole, See ANTIFUNGALS (TOPICAL).

sulfaSALAzine

(sul-fa-**sal**-a-zeen)

Azulfidine, Azulfidine EN-tabs, Salazopyrin

Classification

Therapeutic: antirheumatics (DMARD), gastrointestinal anti-inflammatories

Indications

Mild-to-moderate ulcerative colitis or as adjunctive therapy in severe ulcerative colitis. Rheumatoid arthritis unresponsive or intolerant to salicylates and/or NSAIDs.

Action

Locally acting anti-inflammatory action in the colon, where activity is probably a result of inhibition of prostaglandin synthesis. **Therapeutic Effects:** Reduction in the symptoms of ulcerative colitis or rheumatoid arthritis.

Pharmacokinetics

Absorption: 10–15% absorbed after oral administration.

Distribution: Widely distributed; crosses the placenta and enters breast milk.

Protein Binding: 99%.

Metabolism and Excretion: Split by intestinal bacteria into sulfapyridine and 5-aminosalicylic acid. Some absorbed sulfasalazine is excreted by bile back into intestines; 15% excreted unchanged by the kidneys. Sulfapyridine also excreted mostly by the kidneys.

Half-life: 6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	1.5–6 hr	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity reactions to sulfonamides, salicylates, or sulfasalazine; Cross-sensitivity with furosemide, sulfonylurea hypoglycemic agents, or carbonic anhydrase inhibitors may exist; Glucose-6–phosphate dehydrogenase (G6PD) deficiency (↑ risk of hemolysis); Hypersensitivity to bisulfites (mesalamine enema only); Urinary tract or intestinal obstruction; Porphyria.

© F.A. Davis Publishing

Use Cautiously in: Severe hepatic or renal impairment; History of porphyria; Blood dyscrasias; OB: Neural tube defects have been reported; use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: May compete with bilirubin for binding sites on plasma proteins in the newborn and cause kernicterus; bloody stools or diarrhea reported in breast-fed infants; Pedi: Children <2 yr (safety not established).

Adverse Reactions/Side Effects

Derm: DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), rash, photosensitivity, yellow discoloration. **GI:** anorexia, diarrhea, nausea, vomiting, drug-induced hepatitis. **GU:** crystalluria, infertility, oligospermia, orange-yellow discoloration of urine. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, blood dyscrasias, eosinophilia, hemolytic anemia, megaloblastic anemia, thrombocytopenia. **Neuro:** peripheral neuropathy, headache. **Resp:** pneumonitis. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), fever.

Interactions

Drug-Drug: May ↑ action/risk of toxicity from **oral hypoglycemic agents**, **phenytoin**, **methotrexate**, **zidovudine**, or **warfarin**. ↑ risk of drug-induced hepatitis with other **hepatotoxic agents**. ↑ risk of crystalluria with **methenamine**. May ↓ metabolism and ↑ effects/toxicity of **mercaptopurine** or **thioguanine**. **Drug-Food:** May ↓ **iron** and **folic acid** absorption.

Route/Dosage

Ulcerative Colitis

PO (Adults): 1 g every 6–8 hr (may start with 500 mg every 6–12 hr), followed by maintenance dose of 500 mg every 6 hr.
PO (Children >2 yr): *Initial*—6.7–10 mg/kg every 4 hr *or* 10–15 mg/kg every 6 hr *or* 13.3–20 mg/kg every 8 hr. *Maintenance*—7.5 mg/kg every 6 hr (not to exceed 2 g/day).

Rheumatoid arthritis

PO (Adults): 500 mg–1 g/day (as delayed-release tablets) for 1 wk, then ↑ by 500 mg/day every wk up to 2 g/day in 2 divided doses; if no benefit seen after 12 wk, ↑ to 3 g/day in 2 divided doses.
PO (Children ≥6 yr): 30–50 mg/kg/day in 2 divided doses (as delayed-release tablets); initiate therapy at ¼–⅓ of planned maintenance dose and ↑ every 7 days until maintenance dose is reached (not to exceed 2 g/day).

Availability (generic available)

Tablets: 500 mg. **Delayed-release (enteric-coated) tablets (Azulfidine EN-tabs):** 500 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for allergy to sulfonamides and salicylates. Therapy should be discontinued if rash, difficulty breathing, swelling of face or lips, or fever occur.
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- Assess for rash periodically during therapy. May cause SJS, TEN, and DRESS. Discontinue therapy if severe or if accompanied by fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Ulcerative Colitis:** Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and during therapy.
- **Rheumatoid Arthritis:** Assess range of motion and degree of swelling and pain in affected joints before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor urinalysis, BUN, and serum creatinine before and periodically during therapy. May cause crystalluria and urinary cell calculi formation.
- Monitor CBC with differential and liver function tests before and every 2nd wk during first 3 mo of therapy, monthly during the 2nd 3 mo, and every 3 mo thereafter or as clinically indicated. Discontinue sulfasalazine if blood dyscrasias occur.
- Serum sulfapyridine levels may be monitored; concentrations >50 μg/mL may be associated with increased incidence of adverse reactions.
- Higher than recommended doses can interfere with a variety of lab assays that use nicotinamide adenine dinucleotide [NAD(H)] or nicotinamide adenine dinucleotide phosphate (CK-MB, AST/ALT, ammonia, thyroxine, glucose).

Implementation

- Do not confuse sulfasalazine with cefuroxime or sulfadiazine.
- Varying dosing regimens of sulfasalazine may be used to minimize GI side effects.
- **PO:** Administer after meals or with food to minimize GI irritation, with a full glass of water. ***DNC:*** Swallow enteric-coated tablets whole; do not crush or chew.

Patient/Family Teaching

- Instruct patient on the correct method of administration. Advise patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose.
- May cause dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.

S

© F.A. Davis Publishing

- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, unusual bleeding or bruising, wheezing, fever, or hives occur.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Inform patient that this medication may cause orange-yellow discoloration of urine and skin, which is not significant. May permanently stain contact lenses yellow.
- Instruct patient to notify health care professional if symptoms worsen or do not improve. If symptoms of acute intolerance (cramping, acute abdominal pain, bloody diarrhea, fever, headache, rash) occur, discontinue therapy and notify health care professional immediately.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding during therapy. Monitor newborns for kernicterus if mother taking sulfasalazine; monitor breast-fed infants for bloody stool or diarrhea. Inform male patient that sulfasalazine may cause infertility; usually reversible.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 mo of therapy.

Evaluation/Desired Outcomes

- Decrease in diarrhea and abdominal pain.
- Return to normal bowel pattern in patients with ulcerative colitis. Effects may be seen within 3–21 days. The usual course of therapy is 3–6 wk.
- Maintenance of remission in patients with ulcerative colitis.
- Decrease in pain and inflammation and increase in mobility in patients with rheumatoid arthritis.

HIGH ALERT

SULFONYLUREAS

glimepiride (glye-**me**-pye-ride)
Amaryl

glipiZIDE (**glip**-i-zide)
Glucotrol, Glucotrol XL

glyBURIDE (**glye**-byoo-ride)
DiaBeta, Euglucon, Glynase

Classification
Therapeutic: antidiabetics
Pharmacologic: sulfonylureas

Indications

Control of blood glucose in type 2 diabetes mellitus when diet therapy fails. Require some pancreatic function.

Action

Lower blood glucose by stimulating the release of insulin from the pancreas and increasing the sensitivity to insulin at receptor sites. May also decrease hepatic glucose production. **Therapeutic Effects:** Lowering of blood glucose in diabetic patients.

Pharmacokinetics

Absorption: All agents are well absorbed after oral administration.
Distribution: *Glyburide*—reaches high concentrations in bile and crosses the placenta.
Protein Binding: *Glimepiride*—99.5%, *glipizide*—99%, *glyburide*—99%.
Metabolism and Excretion: All agents are mostly metabolized by the liver. *Glimepiride*—converted to a metabolite with some hypoglycemic activity; *Glyburide*—Primarily metabolized by CYP2C9.
Half-life: *Glimepiride*—5–9.2; *glipizide*—2.1–2.6 hr; *glyburide*—10 hr.

TIME/ACTION PROFILE (hypoglycemic activity)

ROUTE	ONSET	PEAK	DURATION
Glimepiride	unknown	2–3 hr	24 hr
Glipizide	15–30 min	1–2 hr	up to 24 hr
Glyburide	45–60 min	1.5–3 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity with sulfonamides (cross-sensitivity may occur); Type 1 diabetes; Diabetic coma or ketoacidosis; Concurrent use of bosentan (glyburide only).
Use Cautiously in: Glucose 6-phosphate dehydrogenase deficiency (↑ risk of hemolytic anemia); Renal or hepatic dysfunction (↑ risk of hypoglycemia); Infection, trauma, or surgery (may alter requirements for control of blood glucose); Impaired pituitary or adrenal function; Prolonged nausea or vomiting; Debilitated or malnourished patients (↑ risk of hypoglycemia); OB: Cross the placenta and ↑ risk of neonatal hypoglycemia; should be discontinued ≥2 wk before delivery; insulin recommended during pregnancy; Lactation: May ↑ risk of hypoglycemia in infant; use while breast feeding only if benefit to patient outweighs potential risk to infant; Pedi: Safety and effectiveness not established; Geri: ↑ sensitivity; dose reduction may be required.

Adverse Reactions/Side Effects

Derm: ERYTHEMA MULTIFORME, photosensitivity, exfoliative dermatitis, rash. **Endo:** hypoglycemia. **F and E:** hyponatremia. **GI:** constipation, cramps, diarrhea, drug-induced hepatitis, heartburn, ↑ appetite, nausea, vomiting. **Hemat:** APLASTIC ANEMIA, agranulocytosis, hemolytic anemia, leukopenia, pancytopenia, thrombocytopenia. **Metab:** ↑ weight. **Neuro:** dizziness, drowsiness, headache, weakness.

Interactions

Drug-Drug: ↑ risk of elevated liver enzymes when **bosentan** used with glyburide (avoid concurrent use). Effectiveness may be ↓ by concurrent use of **diuretics**, **corticosteroids**, **atypical antipsychotics**, **danazol**, **phenothiazines**, **oral contraceptives**, **estrogens**,

© F.A. Davis Publishing

progestins, **glucagon**, **protease inhibitors**, **somatropin**, **thyroid preparations**, **phenytoin**, **niacin**, **sympathomimetics**, **calcium channel blockers** and **isoniazid**. **Alcohol**, **ACE inhibitors**, **angiotensin II receptor blockers**, **chloramphenicol**, **fibric acid derivatives**, **fluoxetine**, **disopyramide**, **fluoroquinolones**, **MAO inhibitors**, **NSAIDs** (except diclofenac), **pentoxifylline**, **probenecid**, **salicylates**, **voriconazole**, **H_2 receptor antagonists**, **sulfonamides**, and **warfarin** may ↑ risk of hypoglycemia. Concurrent use with **warfarin** may alter the response to both agents (↑ effects of both initially, then ↓ activity); close monitoring recommended during any changes in dose. **Beta blockers** may mask the signs and symptoms of hypoglycemia. May ↑ **cyclosporine** levels. **Colesevelam** may ↓ effects; administer glyburide, glipizide, and glimepiride ≥4 hr before colesevelam. **Topiramate** may ↓ levels and ↓ effects of glyburide.

Route/Dosage

Glimepiride

PO (Adults): 1–2 mg once daily initially; may ↑ every 1–2 wk up to 8 mg/day (usual range 1–4 mg/day).
PO (Geriatric Patients): 1 mg once daily initially.

Glipizide

PO (Adults): 5 mg once daily initially, may ↑ by 2.5–5 mg/day at weekly intervals as needed (max dose = 40 mg/day immediate-release; 20 mg/day extended-release). Extended-release tablets are given once daily. Doses >15 mg/day of immediate-release tablets should be given as 2 divided doses.
PO (Geriatric Patients): 2.5 mg once daily initially.

Glyburide

The nonmicronized formulation (DiaBeta) cannot be used interchangeably with the micronized formulation (Glynase PresTab)

PO (Adults): *DiaBeta (nonmicronized)* — 2.5–5 mg once daily initially; may ↑ by 2.5–5 mg/day at weekly intervals (range 1.25–20 mg/day). *Glynase PresTab (micronized)* — 1.5–3 mg/day initially; may ↑ by 1.5 mg/day at weekly intervals (range 0.75–12 mg/day; doses >6 mg/day should be given as divided doses).
PO (Geriatric Patients): *DiaBeta (nonmicronized)* — 1.25 mg once daily initially; may ↑ by 2.5 mg/day at weekly intervals. *Glynase PresTab (micronized)* — 0.75 mg once daily /day; may ↑ by 1.5 mg/day at weekly intervals.

Availability

Glimepiride (generic available)

Tablets: 1 mg, 2 mg, 4 mg. **Cost:** *Generic* — 1 mg $9.83/100, 2 mg $10.83/100, 4 mg $10.83/100.
In combination with: pioglitazone (Duetact); rosiglitazone (Avandaryl); see Appendix N.

Glipizide (generic available)

Extended-release tablets: 2.5 mg, 5 mg, 10 mg. **Cost:** *Generic* — 2.5 mg $23.76/90, 5 mg $22.86/90.
Tablets: 5 mg, 10 mg. **Cost:** *Generic* — 5 mg $10.83/100, 10 mg $7.18/100. ***In combination with:*** Metformin (Metaglip); see Appendix N.

Glyburide (generic available)

Micronized tablets: 1.5 mg, 3 mg, 6 mg. **Cost:** *Generic* — 1.5 mg $37.50/100, 3 mg $60.50/100, 6 mg $107.32/100. **Tablets:** 1.25 mg, 2.5 mg, 5 mg. **Cost:** *Generic* — All strengths $10.83/100. ***In combination with:*** metformin (Glucovance); see Appendix N.

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- Assess patient for allergy to sulfonamides.
- Patients on concurrent beta blocker therapy may have very subtle signs of hypoglycemia.
- ***Lab Test Considerations:*** Monitor serum glucose and glycosylated hemoglobin (HbA1C) periodically during therapy to evaluate effectiveness of treatment.
- Monitor CBC periodically during therapy. Report ↓ in blood counts promptly.
- May cause an ↑ in AST, LDH, BUN, and serum creatinine.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated with administration of oral glucose. Severe hypoglycemia should be treated with IV D50W followed by continuous IV infusion of more dilute dextrose solution at a rate sufficient to keep serum glucose at approximately 100 mg/dL.

Implementation

- ***High Alert:*** Accidental administration of oral hypoglycemic agents to non-diabetic adults and children has resulted in serious harm or death. Before administering, confirm that patient has type 2 diabetes.
- ***High Alert:*** Do not confuse Diabeta (glyburide) with Zebeta (bisoprolol).
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- To convert from other oral hypoglycemic agents, gradual conversion is not required. For insulin dose of less than 20 units/day, change to oral hypoglycemic agents can be made without gradual dose adjustment. Patients taking 20 or more units/day should convert gradually by receiving oral agent and

© F.A. Davis Publishing

a 25–30% reduction in insulin dose every day or every 2nd day with gradual insulin dose reduction as tolerated. Monitor serum or urine glucose and ketones at least 3 times/day during conversion.
- **PO:** May be administered once in the morning with breakfast or divided into 2 doses.
- Administer *glipizide* 30 min before a meal.
- Do not administer *nonmicronized glyburide* with a meal high in fat. *Micronized glyburide* cannot be substituted for *nonmicronized glyburide*. These preparations are not equivalent.

Patient/Family Teaching
- Instruct patient to take medication at same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not take if unable to eat.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water or an appropriate number of glucose tablets and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified if significant changes occur.
- Concurrent use of alcohol may cause a disulfiram-like reaction (abdominal cramps, nausea, flushing, headaches, and hypoglycemia).
- May occasionally cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid other medications, especially alcohol, while on this therapy without consulting health care professional.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Advise patient to notify health care professional promptly if unusual weight gain, swelling of ankles, drowsiness, shortness of breath, muscle cramps, weakness, sore throat, rash, or unusual bleeding or bruising occurs.
- Insulin is the recommended method of controlling blood glucose during pregnancy. Counsel females of reproductive potential to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected and to avoid breast feeding. If therapy continued during breast feeding, monitor infant for hypoglycemia.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes
- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

SUMAtriptan (soo-ma-**trip**-tan)
Imitrex, Imitrex DF, Imitrex STAT-dose, Onzetra Xsail, Tosymra, Zembrace SymTouch

Classification
Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Indications
Subcut, PO, Intranasal: Acute treatment of migraine attacks. **Subcut:** Acute treatment of cluster headache episodes.

Action
Acts as a selective agonist of 5-HT_1 at specific vascular serotonin receptor sites, causing vasoconstriction in large intracranial arteries. **Therapeutic Effects:** Relief of acute attacks of migraine.

Pharmacokinetics
Absorption: Well absorbed (97%) after subcut administration. Absorption after oral administration is incomplete and significant amounts undergo substantial hepatic metabolism, resulting in poor bioavailability (14%). Well absorbed after intranasal administration.
Distribution: Does not cross the blood-brain barrier. Remainder of distribution not known.
Metabolism and Excretion: Mostly metabolized (80%) by the liver.
Half-life: 2 hr.

TIME/ACTION PROFILE (relief of migraine)

ROUTE	ONSET	PEAK	DURATION
PO	within 30 min	2–4 hr	up to 24 hr
Subcut	30 min	up to 2 hr	up to 24 hr
Nasal	within 60 min	2 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to sumatriptan or latex (needle shield of prefilled syringe contains rubber [latex derivative]); Ischemic heart disease or signs and symptoms of ischemic heart disease, Prinzmetal's angina, or uncontrolled hypertension; Stroke or transient ischemic attack; Peripheral vascular disease (including, but not limited to, ischemic bowel disease); Concurrent MAO inhibitor therapy; Hemiplegic or basilar migraine; Concurrent use of (within 24 hr) ergota-

© F.A. Davis Publishing

mine-containing or ergot-type drugs or other $5HT_1$ agonists; Severe hepatic impairment; Geri: Excessive risk of cardiovascular complications.

Use Cautiously in: OB: Use during pregnancy only if maternal benefit outweighs potential fetal risk; Lactation: Use while breast feeding only if maternal benefit outweighs potential risk to infant; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established.

Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia, smoking, obesity, diabetes, family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision.

Adverse Reactions/Side Effects

All adverse reactions are less common after oral administration.

CV: MI, angina, chest pressure, chest tightness, coronary vasospasm, ECG changes, transient hypertension. **Derm:** tingling, warm sensation, burning sensation, cool sensation, flushing. **EENT:** alterations in vision, nasal sinus discomfort, throat discomfort. **GI:** abdominal discomfort, dysphagia. **Local:** injection site reaction. **MS:** jaw discomfort, muscle cramps, myalgia, neck pain, neck stiffness. **Neuro:** numbness, dizziness, vertigo, anxiety, drowsiness, fatigue, feeling of heaviness, feeling of tightness, headache, malaise, strange feeling, tight feeling in head, weakness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: The risk of vasospastic reactions may be ↑ by concurrent use of **ergotamine** or **dihydroergotamine** (avoid within 24 hr of each other). Avoid concurrent use with other **$5HT_1$ agonists**. **MAO inhibitors** may ↑ levels (do not use within 2 wk of discontinuing MAO inhibitor). ↑ risk of serotonin syndrome with **SSRIs**, **SNRIs**, **TCAs**, **triptans**, **meperidine**, **bupropion**, or **buspirone**; avoid concurrent use.

Drug-Natural Products: ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): 25 mg initially; if response is inadequate at 2 hr, up to 100 mg may be given (initial doses of 25–50 mg may be more effective than 25 mg). If headache recurs, doses may be repeated every 2 hr (not to exceed 300 mg/day). If PO therapy is to follow subcut injection, additional PO sumatriptan may be taken every 2 hr (not to exceed 200 mg/day).

Subcut (Adults): 6 mg; may repeat after 1 hr (not to exceed 12 mg in 24 hr); *Zembrace SymTouch*—3 mg; may repeat after 1 hr (not to exceed 12 mg/24 hr).

Intranasal (Adults): *Nasal spray (Imitrex)*—Single dose of 5, 10, or 20 mg in 1 nostril; may be repeated in 2 hr (not to exceed 40 mg/24 hr or treatment of >5 episodes/mo); *Nasal spray (Tosymra)*—Single dose of 10 mg in 1 nostril; may be repeated in 1 hr (not to exceed 30 mg/24 hr); *Nasal powder*—11 mg in each nostril; may be repeated in 2 hr (not to exceed 44 mg/24 hr or treatment of >4 episodes/mo).

Hepatic Impairment

PO (Adults): 25 mg initially; if response is inadequate at 2 hr, up to 50 mg may be given (initial doses of 25–50 mg may be more effective than 25 mg). If headache recurs, doses may be repeated every 2 hr (not to exceed 300 mg/day). If PO therapy is to follow subcut injection, additional PO sumatriptan may be taken every 2 hr (not to exceed 200 mg/day); no single oral dose should exceed 50 mg.

Availability (generic available)

Nasal powder capsules: 11 mg. **Nasal spray:** 5 mg/spray, 10 mg/spray, 20 mg/spray. **Cost:** *Generic*—All strengths $49.26/device. **Solution for injection:** 3 mg/0.5-mL (autoinjectors), 4 mg/0.5-mL (prefilled syringes), 6 mg/0.5-mL (prefilled syringes or vials). **Cost:** *Generic*—4 mg/0.5 mL $60.56/0.5 mL, 6 mg/0.5 mL $31.20/0.5 mL. **Tablets:** 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg $243.47/9, 50 mg $226.26/9, 100 mg $226.26/9. ***In combination with:*** naproxen (Treximet); see Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Give initial subcut dose under observation to patients with potential for coronary artery disease including postmenopausal women, men >40 yr, patients with risk factors for coronary artery disease such as hypertension, hypercholesterolemia, obesity, diabetes, smoking, or family history. Monitor BP before and for 1 hr after initial injection. If angina occurs, monitor ECG for ischemic changes.
- Monitor for serotonin syndrome in patients taking SSRIs or SNRIs concurrently with sumatriptan.

Implementation

- Do not confuse sumatriptan with sitagliptin or zolmitriptan.
- **PO:** Tablets should be swallowed whole; do not crush, break, or chew. Tablets are film-coated to prevent contact with tablet contents, which have an unpleasant taste and may cause nausea and vomiting.
- **Subcut:** Administer as a single injection. Solution is clear and colorless or pale yellow; do not use if dark-colored or cloudy or if beyond expiration date.

© F.A. Davis Publishing

- **Intranasal:** 10-mg dose may be administered as 2 sprays of 5 mg in 1 nostril or 1 spray in each nostril.
- **Nasal Powder**: Remove clear device cap from the reusable delivery device, then remove a disposable nosepiece from foil pouch and click nosepiece into device body. Press fully and promptly release white piercing button on device body to pierce capsule inside nosepiece. White piercing button should only be pressed once and released prior to administration to each nostril. Insert nosepiece into nostril making a tight seal. Rotate device to place mouthpiece into the mouth. Patient blows forcefully through mouthpiece to deliver the sumatriptan powder into nasal cavity. Vibration (e.g., a rattling noise) may occur, and indicates that patient is blowing forcefully, as directed. Once medication in the first nosepiece has been administered, remove and discard nosepiece.

Patient/Family Teaching

- Inform patient that sumatriptan should be used only *during* a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Instruct patient to administer sumatriptan as soon as symptoms of a migraine attack appear, but it may be administered at any time during an attack. If migraine symptoms return, a 2nd injection may be used. Allow at least 1 hr between doses, and do not use more than 2 injections in any 24-hr period. Additional sumatriptan doses are not likely to be effective, and alternative medications may be used. If no relief from 1st dose, unlikely 2nd dose will provide relief. Advise patient to read *Patient Information* prior to using and with each Rx refill; new information may be available.
- Advise patient that lying down in a darkened room after sumatriptan administration may further help relieve headache.
- Advise patient that overuse (use more than 10 days/mo) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of sumatriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional before next dose of sumatriptan if pain or tightness in chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately, and do not take more sumatriptan without approval of health care professional. If usual dose fails to relieve 3 consecutive headaches, or if frequency and/or severity increases, notify health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- Sumatriptan may cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during sumatriptan use.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Patients concurrently taking SSRI or SNRI antidepressants should notify health care professional promptly if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyper-reflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.
- Caution patient not to use sumatriptan if pregnancy is planned or suspected or if breast feeding. Adequate contraception should be used during therapy.
- **Subcut:** Instruct patient on the proper technique for loading, administering, and discarding the *Imitrex STATdose pen* autoinjector. Patient information pamphlet is provided. Instructional video is available from the manufacturer.
- Inform patient that pain or redness at the injection site usually lasts less than 1 hr.
- **Intranasal:** Instruct patient in proper technique for intranasal administration. Usual dose is a single spray in 1 nostril. If headache returns, a 2nd dose may be administered in ≥2 hr. Do not administer 2nd dose if no relief was provided by 1st dose without consulting health care professional.

Evaluation/Desired Outcomes

- Relief of migraine attack.

SUNItinib (su-**ni**-ti-nib)

Sutent

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Gastrointestinal stromal tumor (GIST) that has progressed or intolerance to imatinib. Advanced renal cell carcinoma (RCC). Adjuvant treatment of patients at high risk of recurrent RCC following nephrectomy. Advanced pancreatic neuroendocrine tumors (pNET).

Action

Inhibits multiple receptor tyrosine kinases, which are enzymes implicated in tumor growth, abnormal vascular growth, and tumor metastases. **Therapeutic Effects:** Decreased tumor spread.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: *Sunitinib*—95%; *primary active metabolite*—90%.
Metabolism and Excretion: Metabolized by the CYP3A4 enzyme system to its primary active metabolite. This metabolite is further metabolized by CYP3A4. Excretion is primarily fecal.
Half-life: *Sunitinib*—40–60 hr; *primary active metabolite*—80–110 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6–12 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; NYHA class II-IV HF; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Hepatic/renal impairment; Concurrent use of bisphosphonates or a history of dental disease (may ↑ risk of jaw osteonecrosis); History of myocardial ischemia or MI; LVEF <50% and >20% below baseline with no signs/symptoms of HF (need to interrupt therapy or ↓ dose); Diabetes (↑ risk of hypoglycemia); History of QT interval prolongation, use of antiarrhythmics, cardiac disease, bradycardia, or electrolyte disturbances; Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: HF, MI, TORSADES DE POINTES, hypertension, peripheral edema, QT interval prolongation, thromboembolic events. **Derm:** ERYTHEMA MULTIFORME, NECROTIZING FASCIITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, alopecia, hand-foot syndrome, hair color change, impaired wound healing, rash, skin discoloration. **EENT:** epistaxis. **Endo:** hypoglycemia, hypothyroidism, adrenal insufficiency, hyperthyroidism. **F and E:** dehydration, hypophosphatemia. **GI:** HEPATOTOXICITY, GI PERFORATION, diarrhea, dyspepsia, nausea, stomatitis, vomiting, altered taste, anorexia, cholecystitis, constipation, esophagitis, ↑ lipase/amylase, ↑ liver enzymes, oral pain. **GU:** HEMOLYTIC UREMIC SYNDROME, ↓ fertility, nephrotic syndrome, proteinuria, renal failure. **Hemat:** HEMORRHAGE, THROMBOTIC THROMBOCYTOPENIC PURPURA, anemia, lymphopenia, neutropenia, thrombocytopenia. **Metab:** hyperuricemia. **MS:** arthralgia, back pain, limb pain, myalgia, osteonecrosis (primarily of jaw). **Neuro:** POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), fatigue, dizziness, headache. **Misc:** TUMOR LYSIS SYNDROME, fever.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **ketoconazole**, may ↑ levels and the risk of toxicity; avoid concurrent use, if possible. If strong inhibitor must be used, ↓ sunitinib dose. **Strong CYP3A4 inducers**, including **rifampin**, may ↓ levels and effectiveness; avoid concurrent use, if possible. If strong inducer must be used, ↑ sunitinib dose. Concurrent use with **alendronate**, **etidronate**, **ibandronate**, **pamidronate**, **risedronate**, **tiludronate**, or **zoledronic acid** may ↑ risk of jaw osteonecrosis. ↑ risk of microangiopathic hemolytic anemia when used with **bevacizumab**; concurrent use not recommended. Concurrent use of other **QT-interval prolonging medications** may ↑ risk of torsades de pointes.
Drug-Natural Products: St. John's wort may ↓ levels and effectiveness; avoid concurrent use.
Drug-Food: Grapefruit juice may ↑ levels and the risk of toxicity; avoid concurrent use.

Route/Dosage

GIST and RCC

PO (Adults): 50 mg once daily for 4 wk, followed by 2 wk off; continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inhibitor*—37.5 mg once daily for 4 wk, followed by 2 wk off; continue until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inducer*—87.5 mg once daily for 4 wk, followed by 2 wk off; continue until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *End-stage renal disease (on hemodialysis)*—No initial adjustment required; subsequent dosage ↑ (up to 2-fold) may be required due to reduced exposure.

Adjuvant Treatment of RCC

PO (Adults): 50 mg once daily for 4 wk, followed by 2 wk off for a total of nine 6-wk cycles. *Concurrent use of strong CYP3A4 inhibitor*—37.5 mg once daily for 4 wk, followed by 2 wk off for a total of nine 6-wk cycles. *Concurrent use of strong CYP3A4 inducer*—87.5 mg once daily for 4 wk, followed by 2 wk off for a total of nine 6-wk cycles.

Renal Impairment

PO (Adults): *End-stage renal disease (on hemodialysis)*—No initial adjustment required; subsequent dosage ↑ (up to 2-fold) may be required due to reduced exposure.

pNET

PO (Adults): 37.5 mg once daily until disease progression or unacceptable toxicity. *Concurrent use of strong CYP3A4 inhibitor*—25 mg once daily until disease progression or unacceptable toxicity. *Concurrent*

S

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

use of strong CYP3A4 inducer—62.5 mg once daily until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *End-stage renal disease (on hemodialysis)*—No initial adjustment required; subsequent dosage ↑ (up to 2-fold) may be required due to reduced exposure.

Availability (generic available)

Capsules: 12.5 mg, 25 mg, 37.5 mg, 50 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs of HF (dyspnea, edema, jugular venous distention) during therapy. Assess left ventricular ejection fraction (LVEF) at baseline and periodically during therapy in patients with cardiac events in the previous 12 mo and a baseline ejection fraction in patients without cardiovascular risk factors. *If asymptomatic cardiomyopathy (LVEF >20% but <50% below baseline or below lower limit of normal if baseline was not obtained) occurs,* hold sunitinib until resolution to Grade 0 or 1 or baseline. Resume at a reduced dose. *If clinically manifested HF occurs,* discontinue sunitinib permanently.
- Monitor for hypertension and treat with standard antihypertensive therapy. *If Grade 3 hypertension occurs,* hold sunitinib until resolution to Grade 0 or 1 or baseline. Resume at a reduced dose. *If Grade 4 hypertension occurs,* permanently discontinue therapy.
- Monitor for signs and symptoms of bleeding (epistaxis, GI bleeding) during therapy. If Grade 3 or 4 hemorrhage occurs, hold sunitinib until resolution to Grade 0 to 1 or baseline. Either resume at reduced dose or discontinue depending on the severity and persistence of adverse reaction.
- Perform an oral examination before starting and periodically during therapy. Monitor for signs and symptoms of osteonecrosis of the jaw (tooth or jaw pain, swelling of the jaw) during therapy. Patients taking bisphosphonates, who have dental disease, or undergo invasive dental procedures, are at increased risk. Hold sunitinib for at least 3 wks before scheduled dental surgery or invasive dental procedures, if possible. Hold therapy for development of ONJ until complete resolution occurs.
- Monitor ECG and electrolytes periodically during therapy; may cause QT prolongation and torsades de pointes.
- Monitor for rash. If progressive skin rash with blisters or mucosal lesions or necrotizing fasciitis occurs, discontinue and do not restart sunitinib.
- Monitor for signs and symptoms of PRES (hypertension, headache, decreased alertness, altered mental functioning, visual loss, including cortical blindness) during therapy. Magnetic resonance imaging is necessary to confirm diagnosis. Discontinue sunitinib in patients developing PRES.
- ***Lab Test Considerations:*** Monitor CBC with platelet count and serum chemistries including phosphate at the beginning of each treatment cycle. May cause neutropenia, lymphopenia, anemia, and thrombocytopenia. May cause ↑ serum creatinine, hypokalemia, and hyperuricemia.
- Monitor ALT, AST, and bilirubin before starting therapy, during each cycle of treatment, and as clinically indicated. *If Grade 3 hepatotoxicity occurs,* hold sunitinib until resolution to Grade 0 or 1 or baseline. Resume therapy at reduced dose. If Grade 3 hepatotoxocity recurs or Grade 4 hepatotoxicity occurs, permanently discontinue sunitinib. May cause ↑ AST, ALT, alkaline phosphatase, total and indirect bilirubin, amylase, and lipase.
- Monitor thyroid function at baseline and in patients with symptoms of hypothyroidism or hyperthyroidism. May be treated with standard medical practice.
- Monitor urinalysis for urine protein at baseline and periodically during therapy. Follow up with 24-hr urine protein as clinically indicated. *If ≥3 grams proteinuria in 24 hrs in the absence of nephrotic syndrome occurs,* hold sunitinib until resolution to Grade 0 or 1 or baseline. Resume therapy at reduced dose. *If nephrotic syndrome or recurrent proteinuria of ≥3 grams per 24 hrs despite dose reductions occurs,* permanently discontinue sunitinib.
- Monitor blood glucose levels periodically during and after therapy. Assess if antidiabetic drug dose needs to be adjusted to minimize the risk of hypoglycemia.

Implementation

- Do not confuse sunitinib with sorafenib.
- **Recommended Dose Modifications:** For patients with GIST and Advanced RCC: *First dose reduction,* 37.5 once daily. *Second dose reduction,* 25 mg once daily. For patients with Adjuvant RCC: *First dose reduction,* 37.5 mg once daily. For patients with pNET: *First dose reduction,* 25 mg once daily.
- **PO:** Administer once daily with or without food.

Patient/Family Teaching

- Instruct patient to take sunitinib as directed. Take missed doses as soon as remembered if within 12 hr of missed dose. If >12 hr since missed dose, omit dose and take next dose at regular time. Do not take more than 1 dose at a time. Tell your health care professional about the missed dose.
- Advise patient to avoid grapefruit juice and grapefruit products during therapy.
- Instruct patient to notify health care professional promptly if signs and symptoms of liver failure (itching, yellow eyes or skin, dark urine, pain or discomfort in the right upper stomach area), rash, bleeding (painful, swollen abdomen, black, sticky stools, bloody urine, vomiting blood, headache, coughing

© F.A. Davis Publishing

up blood, change in your mental status), ONJ (tooth or jaw pain, jaw swelling) or tumor lysis syndrome (nausea, shortness of breath, irregular heartbeat, clouding of urine, tiredness) occur.
- Advise patient that GI disorders (diarrhea, nausea, stomatitis, dyspepsia, vomiting) are common and may require antiemetic and antidiarrheal medications.
- Inform patient that sunitinib may cause discoloration (yellow) of skin and depigmentation of hair or skin.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient to notify health care professionals of therapy. Therapy must be stopped for at least 3 wk before scheduled dental surgery, invasive dental procedures, or elective surgeries and then held for at least 2 wk after major surgery until adequate wound healing.
- Advise patient to notify health care professional if bleeding or swelling occur.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and after therapy and to avoid breast feeding during and for 4 wk after last dose. Advise males with female partners of reproductive potential to use effective contraception during and for 7 wks after last dose. May impair male and female fertility.

Evaluation/Desired Outcomes

- Decrease in tumor spread.

suvorexant (soo-voe-**rex**-ant)

Belsomra

Classification

Therapeutic: sedative/hypnotics
Pharmacologic: orexin receptor antagonists

Schedule IV

Indications

Insomnia associated with difficulty in sleep onset and/or maintenance.

Action

Antagonizes the effects of orexins A and B, naturally occurring neuropeptides that promote wakefulness, by binding to their receptors. **Therapeutic Effects:** Improved sleep.

Pharmacokinetics

Absorption: 82% absorbed following oral administration; a high-fat meal will delay absorption and sleep onset. ↑ absorption in obese females.

Distribution: Does not distribute into RBCs.
Protein Binding: >99%.
Metabolism and Excretion: Extensively metabolized by the CYP3A isoenzyme (minor metabolism by CYP2C19; metabolites are not active). 66% excreted in feces, 23% in urine, mostly as metabolites.
Half-life: 12 hr (↑ in hepatic impairment).

TIME/ACTION PROFILE (sleep)

ROUTE	ONSET	PEAK	DURATION
PO	30 min (delayed by food)	unknown	7 hr†

†Excess sedation may persist for several days after discontinuation.

Contraindications/Precautions

Contraindicated in: Narcolepsy; Concurrent use of strong inhibitors of CYP3A; Severe hepatic impairment.
Use Cautiously in: History of substance abuse or drug dependence; Concurrent use of moderate inhibitors of CYP3A (dose ↓ recommended); Obese patients (↑ levels, especially in women, dose ↓ may be warranted); History of or concurrent psychiatric diagnoses; Underlying pulmonary disease; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of falls in older adults.

Adverse Reactions/Side Effects

Adverse reactions, especially related to CNS depression are dose-related, especially at the 20-mg dose.
Neuro: drowsiness, cataplexy, complex sleep behaviors (including sleep driving, sleep walking, or engaging in other activities while sleeping), daytime drowsiness, hallucinations (during sleep), worsening of depression/suicidal ideation, sleep paralysis.

Interactions

Drug-Drug: Concurrent use of **strong inhibitors of CYP3A** including **clarithromycin**, **conivaptan**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **posaconazole**, **ritonavir**, and **saquinavir** ↑ risk of excessive sedation and should be avoided. Concurrent use of **moderate inhibitors of CYP3A** including **aprepitant**, **atazanavir**, **ciprofloxacin**, **diltiazem**, **erythromycin**, **fluconazole**, **fosamprenavir**, **imatinib**, and **verapamil** may result in ↑ sedation (↓ dose recommended). Risk of CNS depression, next-day impairment, "sleep-driving" and other complex behaviors while not fully awake ↑ with other **CNS depressants** including **alcohol**, some **antihistamines**, **opioids**, other **sedative/hypnotics** (including **benzodiazepines**) and **tricyclic antidepressants**; dose adjustments may be necessary. Concurrent use of

© F.A. Davis Publishing

CYP3A inducers including **carbamazepine**, **phenytoin**, and **rifampin** may ↓ effectiveness. May alter **digoxin** levels (blood level monitoring recommended).
Drug-Food: Grapefruit juice may result in ↑ blood levels and excess sedation (↓ dose recommended).

Route/Dosage

PO (Adults): 10 mg within 30 min of going to bed; if well tolerated but not optimally effective, dose may be increased next night, not to exceed 20 mg (dose may not be repeated on a single night and should be when at least 7 hr of sleep time is anticipated before planned awakening). *Concurrent use of moderate inhibitors of CYP3A* — 5 mg initially, dose may be ↑ to 10 mg if lower dose is tolerated but not optimally effective. Lowest effective dose should be used.

Availability

Tablets: 5 mg, 10 mg, 15 mg, 20 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status, sleep patterns, and potential for abuse prior to administration. Prolonged use of >7–10 days may lead to physical and psychological dependence. Limit amount of drug available to the patient.
- Assess alertness at time of peak effect. Notify health care professional if desired sedation does not occur.

Implementation

- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.
- Protect patient from injury. Raise bed side rails. Assist with ambulation. Remove patient's cigarettes.
- Use lowest effective dose.
- **PO:** Administer no more than once/night and within 30 min of going to bed. Take only if at least 7 hr remaining before awaking. ***DNC:*** Swallow tablets whole with full glass of water. For faster onset of sleep, do not administer with or immediately after a meal.

Patient/Family Teaching

- Instruct patient to take suvorexant as directed. Advise patient not to take suvorexant unless able to stay in bed a full night (7 hr) before being active again. Do not take more than the amount prescribed because of the habit-forming potential. Not recommended for use longer than 7–10 days. Instruct patient to read the *Medication Guide* for correct product before taking and with each Rx refill, changes may occur.
- Because of rapid onset, advise patient to go to bed immediately after taking suvorexant.
- May cause daytime drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness for at least 8 hr after dosing until response to this medication is known.
- Caution patient that complex sleep-related behaviors (sleep-driving) may occur while asleep. Inform families and advise to notify health care professional if these behaviors occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products without consulting health care professional.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants, including opioids.
- Advise patient to notify health care professional if depression worsens or suicidal thoughts occur.
- Advise patient to notify health care professional immediately if signs of anaphylaxis (swelling of the tongue or throat, trouble breathing, and nausea and vomiting) occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Relief of insomnia.

© F.A. Davis Publishing

TACROLIMUS

tacrolimus (oral, IV)
(ta-**kroe**-li-mus)
Advagraf, Astagraf XL,
Envarsus PA, Envarsus XR, Prograf

tacrolimus (topical)
Protopic

Classification
Therapeutic: immunosuppressants

Indications

PO, IV: Prevention of organ rejection in patients who have undergone allogeneic liver, kidney, heart, or lung transplantation (in combination with other immunosuppressants) (extended-release only indicated for kidney transplant). **Topical:** Moderate to severe atopic dermatitis in patients who do not respond to or cannot tolerate alternative, conventional therapies.

Action

Inhibit T-lymphocyte activation. **Therapeutic Effects:** Prevention of transplanted organ rejection. Improvement in signs/symptoms of atopic dermatitis.

Pharmacokinetics

Absorption: Absorption following oral administration is erratic and incomplete (bioavailability ranges 5–67%); minimal amounts absorbed following topical use.
Distribution: Crosses the placenta and enters breast milk.
Protein Binding: 99%.
Metabolism and Excretion: 99% metabolized by the liver; <1% excreted unchanged in the urine.
Half-life: *Liver transplant patients*—11.7 hr; *healthy volunteers*—21.2 hr.

TIME/ACTION PROFILE (immunosuppression)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.3–3.2 hr*	12 hr
PO-ER	unknown	unknown	24 hr
IV	rapid	unknown	8–12 hr
Topical†	unknown	1–2 wk	unknown

*Blood level.
†Improvement in atopic dermatitis.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to tacrolimus or to castor oil (a component in the injection); Concurrent use with cyclosporine or sirolimus should be avoided; Congenital long QT syndrome; Weakened/compromised immune system; Malignant or premalignant skin condition; Lactation: Lactation.
Use Cautiously in: Heart failure, bradycardia, or electrolyte disorders (hypokalemia, hypomagnesemia, hypocalcemia); Concurrent use of other drugs known to prolong the QT interval; Renal or hepatic impairment (dose ↓ may be required; if oliguria occurs, wait 48 hr before initiating tacrolimus); Exposure to sunlight/UV light (may ↑ risk of malignant skin changes); Superficial skin infections; Rep: Women and men of reproductive potential; OB: Hyperkalemia and renal impairment may occur in the newborn; use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Higher end of dosing range is required to maintain adequate blood levels in children.

Adverse Reactions/Side Effects

Noted primarily for PO and IV use.
CV: hypertension, peripheral edema, QT interval prolongation. **Derm:** pruritus, rash, alopecia, herpes simplex, hirsutism, photosensitivity, sweating. **EENT:** abnormal vision, amblyopia, sinusitis, tinnitus. **Endo:** hyperglycemia, hyperlipidemia. **F and E:** hyperkalemia, hypomagnesemia, hyperphosphatemia, hypocalcemia, hyponatremia, hypophosphatemia, metabolic acidosis, metabolic alkalosis. **GI:** GI BLEEDING, GI PERFORATION, abdominal pain, anorexia, ascites, constipation, diarrhea, dyspepsia, ↑ liver enzymes, nausea, vomiting, cholangitis, cholestatic jaundice, dysphagia, flatulence, ↑ appetite, oral thrush, peritonitis. **GU:** nephrotoxicity, urinary tract infection, ↓ fertility. **Hemat:** anemia, leukocytosis, leukopenia, thrombocytopenia, coagulation defects, pure red cell aplasia. **Local:** *topical*—burning, stinging. **MS:** arthralgia, hypertonia, leg cramps, muscle spasm, myalgia, myasthenia, osteoporosis. **Neuro:** paresthesia, neuropathy, POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), SEIZURES, dizziness, headache, insomnia, tremor, abnormal dreams, agitation, anxiety, confusion, depression, emotional lability, hallucinations, psychoses, somnolence. **Resp:** cough, pleural effusion, asthma, bronchitis, pharyngitis, pneumonia, pulmonary edema. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, INFECTION (including activation of latent viral infections such as BK virus-associated nephropathy), MALIGNANCY (including lymphoma and skin cancer), generalized pain, abnormal healing, chills, fever.

Interactions

Noted primarily for PO and IV use, but should be considered for topical use.
Drug-Drug: Risk of nephrotoxicity is ↑ by concurrent use of **aminoglycosides**, **amphotericin B**, **cisplatin**, or **cyclosporine** (allow 24 hr to pass after stopping cyclosporine before starting tacrolimus). Concurrent use of **potassium-sparing diuretics**, **ACE inhibitors**, or **angiotensin II receptor blockers** ↑ risk of hyperkalemia. **Strong CYP3A4 inhibitors**, including **chloramphenicol**, **clarithromycin**, **cobicistat**, **itraconazole**, **ketoconazole**, **nefazodone**, **po-**

T

© F.A. Davis Publishing

saconazole, **protease inhibitors**, and **voriconazole**, may significantly ↑ levels; ↓ tacrolimus dose by 2/3 when used with voriconazole or posaconazole; closely monitor tacrolimus whole blood trough concentrations. **Mild CYP3A4 inhibitors** and **moderate CYP3A4 inhibitors**, including **amiodarone**, **calcium channel blockers**, **cimetidine**, **clotrimazole**, **danazol**, **erythromycin**, **ethinyl estradiol**, **fluconazole**, **imatinib**, **isavuconazonium**, **lansoprazole**, **letermovir**, **nilotinib**, and **omeprazole**, may ↑ levels and risk of toxicity; closely monitor tacrolimus whole blood trough concentrations and adjust tacrolimus dose, if needed. **Magnesium/aluminum hydroxide** and **metoclopramide** may ↑ levels and risk of toxicity; closely monitor tacrolimus whole blood trough concentrations and adjust tacrolimus dose, if needed. **Strong CYP3A4 inducers**, including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, and **rifampin** may ↓ levels; ↑ tacrolimus dose and closely monitor tacrolimus whole blood trough concentrations. **Mild CYP3A4 inducers** and **moderate CYP3A4 inducers**, including **methylprednisolone** or **prednisone** may ↓ levels; closely monitor tacrolimus whole blood trough concentrations and adjust tacrolimus dose, if needed. **Vaccinations** may be less effective if given concurrently with tacrolimus (avoid use of live-virus vaccines). May ↑ levels of **mycophenolate mofetil** or **mycophenolic acid**.

Drug-Natural Products: Concomitant use with **astragalus**, **echinacea**, and **melatonin** may interfere with immunosuppression. **St. John's wort** may ↓ levels; ↑ tacrolimus dose and closely monitor tacrolimus whole blood trough concentrations. **Schisandra sphenanthera** may significantly ↑ levels; closely monitor tacrolimus whole blood trough concentrations.

Drug-Food: Food ↓ the rate and extent of GI absorption. **Grapefruit juice** may ↑ levels and risk of toxicity; avoid concurrent use.

Route/Dosage

Because of the potential risk for anaphylaxis, the IV route of administration should be reserved for those patients unable to take the drug orally. Extended-release capsules are not interchangeable with immediate-release capsules/granules or other extended-release products. When converting between immediate-release capsules and granules, the total daily dose should remain the same. Black patients may require a higher dose to achieve desired tacrolimus trough concentrations. Patients with cystic fibrosis may also require a higher dose for lung transplantation due to a reduced bioavailability.

Kidney Transplantation

PO (Adults): *Immediate-release capsules (in combination with azathioprine)* — 0.2 mg/kg/day in 2 divided doses initially; titrate to achieve recommended whole blood trough concentration; *Immediate-release capsules (in combination with mycophenolate mofetil and IL-2 antagonist)* — 0.1 mg/kg/day in 2 divided doses initially; titrate to achieve recommended whole blood trough concentration; *Extended-release capsules (Astagraf XL) (in combination with basiliximab induction)* — 0.15 mg/kg once daily (to be started either before or within 48 hr of completion of transplant); *Extended-release capsules (Astagraf XL) (without basiliximab induction)* — 0.1 mg/kg given as single dose preoperatively within 12 hr prior to reperfusion, followed by 0.2 mg/kg once daily started postoperatively at least 4 hr after preoperative dose and within 12 hr after reperfusion; *Conversion from immediate-release capsules to extended-release capsules (Envarsus XR)* — Initiate extended-release treatment with a once-daily dose that is 80% of the total daily dose of the immediate-release product (also appropriate for Black patients).

PO (Children): *Immediate-release capsules or suspension* — 0.3 mg/kg/day in 2 divided doses initially; titrate to achieve recommended whole blood trough concentration.

IV (Adults): 0.03–0.05 mg/kg/day as a continuous infusion initially; titrate to achieve recommended blood concentration.

Liver Transplantation

PO (Adults): *Immediate-release capsules* — 0.1–0.15 mg/kg/day in 2 divided doses initially; titrate to achieve recommended blood concentration.

PO (Children): *Immediate-release capsules* — 0.15–0.2 mg/kg/day in 2 divided doses initially; titrate to achieve recommended blood concentration. *Suspension* — 0.2 mg/kg/day in 2 divided doses initially; titrate to achieve recommended blood concentration.

IV (Adults): 0.03–0.05 mg/kg/day as a continuous infusion initially; titrate to achieve recommended blood concentration.

IV (Children): 0.03–0.05 mg/kg/day.

Heart Transplantation

PO (Adults): *Immediate-release capsules* — 0.075 mg/kg/day in 2 divided doses initially; titrate to achieve recommended blood concentration.

PO (Children): *Immediate-release capsules or suspension (without antibody induction treatment)* — 0.3 mg/kg/day in 2 divided doses initially; titrate to achieve recommended whole blood trough concentration. *Immediate-release capsules or suspension (with antibody induction treatment)* — 0.1 mg/kg/day in 2 divided doses initially; titrate to achieve recommended whole blood trough concentration.

IV (Adults): 0.01 mg/kg/day as a continuous infusion initially; titrate to achieve recommended blood concentration.

Lung Transplantation

PO (Adults): *Immediate-release capsules* — 0.075 mg/kg/day in 2 divided doses initially; titrate to achieve recommended blood concentration.

© F.A. Davis Publishing

PO (Children): *Immediate-release capsules or suspension (without antibody induction treatment)* — 0.3 mg/kg/day in 2 divided doses initially; titrate to achieve recommended whole blood trough concentration. *Immediate-release capsules or suspension (with antibody induction treatment)* — 0.1 mg/kg/day in 2 divided doses initially; titrate to achieve recommended whole blood trough concentration.
IV (Adults): 0.01–0.03 mg/kg/day as a continuous infusion initially; titrate to achieve recommended blood concentration.

Atopic Dermatitis

Topical (Adults): Apply 0.03% or 0.1% ointment twice daily. Discontinue when signs/symptoms of atopic dermatitis resolve.
Topical (Children ≥2–15 yr): Apply 0.03% ointment twice daily. Discontinue when signs/symptoms of atopic dermatitis resolve.

Availability (generic available)

Capsules: 0.5 mg, 1 mg, 5 mg. **Extended-release capsules (Astragraf XL):** 0.5 mg, 1 mg, 3 mg, 5 mg. **Extended-release tablets (Envarsus XR):** 0.75 mg, 1 mg, 4 mg. **Granules for oral suspension:** 0.2 mg/pkt, 1 mg/pkt. **Solution for injection:** 5 mg/mL. **Topical ointment:** 0.03%, 0.1%.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of PRES (headache, altered mental status, seizures, visual disturbances, hypertension) periodically during therapy. Confirm diagnosis by radiologic procedure. If PRES is suspected or diagnosed, maintain BP control and immediately reduce immunosuppression. Symptoms are usually reversed on reduction or discontinuation of immunosuppression.
- **Prevention of Organ Rejection:** Monitor BP closely during therapy. Hypertension is a common complication of tacrolimus therapy and should be treated.
- Observe patients receiving IV tacrolimus for the development of anaphylaxis (rash, pruritus, laryngeal edema, wheezing) for at least 30 min and frequently thereafter. If signs develop, stop infusion and initiate treatment.
- **Atopic Dermatitis:** Assess skin lesions prior to and periodically during therapy.
- Use only for short time, not continuously, and in the minimum dose possible to decrease risk of developing skin cancer.
- ***Lab Test Considerations:*** Tacrolimus blood level monitoring may be helpful in the evaluation of rejection and toxicity, dose adjustments, and assessment of compliance. *For kidney transplantation*, during the first 3 mo, most patients maintained tacrolimus whole blood concentrations between 7–20 ng/mL and then between 5–15 ng/mL through 1 yr. *For de novo kidney transplantation*, during the first mo, most patients maintained tacrolimus whole blood concentrations between 6–11 ng/mL and then between 4–11 ng/mL through month 1. *For heart transplantation*, from wk 1 to 3 mo, most patients maintained tacrolimus trough whole blood concentrations between 8–20 ng/mL and then between 6–18 ng/mL from 3–18 mo post-transplant.
- Monitor serum creatinine, potassium, and glucose closely. ↑ serum creatinine and ↓ urine output may indicate nephrotoxicity. May also cause insulin-dependent post-transplant diabetes mellitus (🧬 incidence is higher in Black and Hispanic patients).
- May also cause hyperuricemia, hypokalemia, hyperkalemia, hypomagnesemia, metabolic acidosis, metabolic alkalosis, hyperlipidemia, hyperphosphatemia, hypophosphatemia, hypocalcemia, and hyponatremia.
- Monitor CBC. May cause anemia, leukocytosis, and thrombocytopenia.

Implementation

- Do not confuse Prograf (tacrolimus) with Prozac (fluoxetine).
- Do not confuse immediate-release tacrolimus with extended-release tacrolimus.
- Should only be prescribed by health care professionals experienced with immunosuppressive therapy and organ transplant patients.
- Begin therapy with tacrolimus no sooner than 6 hr post-transplantation. Concurrent therapy with corticosteroids is recommended in the early postoperative period.
- Tacrolimus should not be used concomitantly with cyclosporine. Tacrolimus or cyclosporine should be discontinued at least 24 hr before starting the other.
- Oral therapy is preferred because of the risk of anaphylactic reactions with IV tacrolimus. IV therapy should be replaced with oral therapy as soon as possible.
- Adults should be started at the lower end of the dose range; children require higher doses to maintain blood trough concentrations similar to adults.
- Immediate and extended-release capsules are not interchangeable.
- **PO:** Oral doses can be initiated 8–12 hr after discontinuation of IV doses. May be taken without regard to food, but should be consistent, with or without food and at same time each day.
- Take extended-release capsules at the same time each day, preferably in the morning, on an empty stomach at least 1 hr before or 2 hrs after breakfast. Swallow capsules whole; do not chew, divide, or crush.

T

© F.A. Davis Publishing

- **Topical:** Do not use continuously for a long time.
- **Topical:** Wash hands before applying. Apply a thin layer of ointment twice daily to affected skin. Use smallest amount of ointment needed to control signs and symptoms of eczema. Do not cover treated area with bandages, dressings, or wraps. If not treating areas on hands, wash hands with soap and water after applying to remove any ointment on hands.

IV Administration

- **Continuous Infusion:** ***Dilution:*** Dilute in 0.9% NaCl or D5W. ***Concentration:*** 0.004–0.02 mg/mL. May be stored in polyethylene or glass containers for 24 hr following dilution. Do not store in PVC containers. Do not administer solutions that are discolored or contain particulate matter. ***Rate:*** Administer daily dose as a continuous infusion over 24 hr.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G potassium, pentamidine, phentolamine, phenylephrine, piperacillin, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, streptozocin, succinylcholine, sufentanil, tedizolid, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, azathioprine, cefepime, dantrolene, diazepam, esomeprazole, folic acid, ganciclovir, gemtuzumab ozogamicin, iron sucrose, levothyroxine, phenytoin, thiopental.

Patient/Family Teaching

- Instruct patient to take tacrolimus at the same time each day, with or without food, as directed. Do not skip or double up on missed doses. Do not discontinue medication without advice of health care professional. Take missed doses of extended-release capsule as soon as remembered unless more than 14 hr after scheduled dose; do not double doses. Advise patient to read the *Patient Information* before starting tacrolimus and with each refill in case of changes. Instruct patient to inspect capsules with each new Rx, before taking. Contact health care professional if appearance of capsules or dose has changed.
- Advise patient to avoid grapefruit and grapefruit juice and alcohol during therapy.
- Reinforce the need for lifelong therapy to prevent transplant rejection. Review symptoms of rejection for transplanted organ and stress need to notify health care professional immediately if they occur.
- Advise patient to avoid eating raw oysters or other shellfish; make sure they are fully cooked before eating.
- Instruct patient to notify health care professional if signs of diabetes mellitus (frequent urination, increased thirst or hunger), infection (fever, sweats, chills, cough or flu-like symptoms, muscle aches, warm, red, painful areas on skin), neurotoxicity (vision changes, deliriums, or tremors), or PRES occur.
- Advise patient to wear protective clothing and sunscreen to avoid photosensitivity reactions.
- Instruct patient to avoid exposure to chicken pox, measles, mumps, and rubella. If exposed, see health care professional for prophylactic therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient of the risk of lymphoma or skin cancer with tacrolimus therapy.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feed-

© F.A. Davis Publishing

ing. Encourage females who become pregnant and males who have fathered a pregnancy during treatment with tacrolimus to enroll in the pregnancy registry to collect information about birth outcomes by calling 1-877- 955-6877 or https://www.transplantpregnancyregistry.org/.
- Emphasize the importance of repeated lab tests during tacrolimus therapy.
- **Topical:** Instruct apply ointment as directed. Advise patient to read the *Medication Guide* prior to starting and with each Rx renewal; new information may be available.
- Advise patient not to bathe, shower, or swim right after applying; may wash off ointment. May use moisturizers with ointment. Instruct patient to check with health care professional first about products to use. If moisturizers are used, apply them after application of ointment.
- Advise patients to contact health care professional if their symptoms do not improve after 6 wk of therapy, if their symptoms worsen, or they develop a skin infection.
- Instruct patient to use ointment only on areas of skin with atopic dermatitis.
- Advise patient to stop using the ointment when the signs/symptoms of atopic dermatitis go away.
- Advise patient to limit sun exposure during treatment.
- Advise patient of the risk of using topical tacrolimus during pregnancy.
- Inform patient of the risk of lymphoma or skin cancer with topical tacrolimus therapy.

Evaluation/Desired Outcomes
- Prevention of transplanted organ rejection.
- Management of atopic dermatitis.

tacrolimus (oral, IV), See TACROLIMUS.

tacrolimus (topical), See TACROLIMUS.

tadalafil (ta-da-la-fil)
Adcirca, Alyq, Cialis

Classification
Therapeutic: erectile dysfunction agents, vasodilators
Pharmacologic: phosphodiesterase type 5 inhibitors

Indications
Cialis: Treatment of: Erectile dysfunction (ED), Benign prostatic hyperplasia (BPH). *Adcirca and Alyq:* Pulmonary arterial hypertension.

Action
Increases cyclic guanosine monophosphate (cGMP) levels by inhibiting phosphodiesterase type 5 (PDE5) an enzyme responsible for the breakdown of cGMP. cGMP produces smooth muscle relaxation of the corpus cavernosum, which in turn promotes increased blood flow and subsequent erection. cGMP also leads to vasodilation of the pulmonary vasculature. **Therapeutic Effects:** *Cialis:* Enhanced blood flow to the corpus cavernosum and erection sufficient to allow sexual intercourse. Improved signs and symptoms of BPH. *Adcirca and Alyq:* Improved exercise tolerance.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Extensive tissue distribution; penetrates semen.
Protein Binding: 94%.
Metabolism and Excretion: Mostly metabolized by the liver (mainly CYP3A4 enzyme system); metabolites are excreted in feces (61%) and urine (36%).
Half-life: 17.5 hr.

TIME/ACTION PROFILE (vasodilation, improved erectile function)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.5–6 hr	36

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of nitrates or riociguat; Unstable angina, recent history of stroke, life-threatening heart failure within 6 mo, uncontrolled hypertension, arrhythmias, stroke within 6 mo or MI within 90 days; Any other cardiovascular pathology precluding sexual activity; Known hereditary degenerative retinal disorders; Severe hepatic impairment; Severe renal impairment (Adcirca and Alyq); Severe renal impairment (CCr <30 mL/min) (Cialis once-daily dosing); Congenital or acquired QT interval prolongation or concurrent use of Class IA or III antiarrhythmics; Concurrent use of ketoconazole, itraconazole, or rifampin (Adcirca and Alyq); Alpha adrenergic blockers (when tadalafil used for BPH); Women; Pedi: Children or newborns.
Use Cautiously in: Left ventricular outflow obstruction; Penile deformity; Renal impairment; Underlying conditions predisposing to priapism including sickle cell anemia, multiple myeloma, or leukemia; Bleeding disorders or active peptic ulcer disease; Strong inhibitors of the CYP3A4 enzyme system; Alpha adrenergic

© F.A. Davis Publishing

blockers (patients should be on stable dose of alpha blockers before starting tadalafil for ED); History of sudden severe vision loss or nonarteritic ischemic optic neuropathy (NAION); may ↑ risk of recurrence; Low cup-to-disk ratio, age >50 yr, diabetes, hypertension, coronary artery disease, hyperlipidemia, or smoking (↑ risk of NAION); Geri: ↑ risk of diarrhea.

Adverse Reactions/Side Effects

CV: hypotension peripheral edema. **Derm:** flushing. **EENT:** hearing loss, nasal congestion, vision loss. **GI:** diarrhea, dyspepsia. **GU:** ↓ fertility, priapism. **MS:** back pain, limb pain, myalgia. **Neuro:** headache.

Interactions

Drug-Drug: Concurrent use of **nitrates** may cause serious, life-threatening hypotension and is contraindicated. Concurrent use of **riociguat** may result in severe hypotension; concurrent use contraindicated. ↑ risk of hypotension with **alpha adrenergic blockers** and acute ingestion of **alcohol**; discontinue alpha-adrenergic blocker therapy ≥1 day before starting Cialis for BPH. Strong inhibitors of CYP3A4 including **ritonavir**, **ketoconazole**, **itraconazole** ↑ effects and the risk of adverse reactions (dose adjustments recommended; ketoconazole and itraconazole contraindicated with Adcirca and Alyq). Similar effects may be expected of other **inhibitors of CY3A4**. **CYP3A4 inducers** may ↓ effects (**rifampin** contraindicated with Adcirca or Alyq).

Route/Dosage

Cialis (for ED)

PO (Adults): 10 mg prior to sexual activity (range 5–20 mg; not to exceed one dose/24 hr) *or* 2.5 mg once daily (max: 5 mg/day); *Concurrent use of CYP3A4 inhibitors including itraconazole, ketoconazole and ritonavir*—single dose should not exceed 10 mg in any 72-hr period; for once-daily dose regimen, should not exceed 2.5 mg/day.

Renal Impairment

PO (Adults): *CCr 30–50 mL/min (as-needed dosing)*—Initial dose should not exceed 5 mg/day; maximum dose should not exceed 10 mg in 48 hr; *CCr <30 mL/min (as-needed dosing)*—Maximum dose should not exceed 5 mg in 72 hr; *CCr <30 mL/min (once-daily dosing)*—Not recommended for use.

Hepatic Impairment

PO (Adults): *Mild or moderate hepatic impairment (Child–Pugh class A or B)*—Daily dose should not exceed 10 mg (once-daily dose regimen not recommended) *Severe hepatic impairment (Child–Pugh class C)*—Not recommended for use.

Cialis (for BPH or ED/BPH)

PO (Adults): 5 mg once daily; *Concurrent use of CYP3A4 inhibitors including itraconazole, ketoconazole and ritonavir*—Should not exceed 2.5 mg/day.

Renal Impairment

PO (Adults): *CCr 30–50 mL/min*—Initial dose should not exceed 2.5 mg/day; maximum dose should not exceed 5 mg/day; *CCr <30 mL/min*—Not recommended for use.

Hepatic Impairment

PO (Adults): Not recommended for use.

Adcirca and Alyq (for pulmonary arterial hypertension)

PO (Adults): 40 mg once daily; *If receiving ritonavir for ≥1 wk*—start 20 mg once daily; may then ↑ to 40 mg once daily based on tolerability; *If initiating ritonavir while on Adcirca or Alyq*—stop Adcirca or Alyq ≥24 hr before starting ritonavir; may reinitiate Adcirca or Alyq at 20 mg once daily after ≥1 wk of therapy with ritonavir; may then ↑ to 40 mg once daily based on tolerability.

Renal Impairment

(Adults): *CCr 31–80 mL/min*—Start 20 mg once daily; may then ↑ to 40 mg once daily based on tolerability.

Hepatic Impairment

PO (Adults): *Mild or moderate hepatic impairment (Child–Pugh class A or B)*—Start with 20 mg once daily.

Availability (generic available)

Tablets (Cialis): 2.5 mg, 5 mg, 10 mg, 20 mg. **Tablets (Adcirca or Alyq):** 20 mg.

NURSING IMPLICATIONS

Assessment

- *Cialis for ED*: Determine ED before administration. Tadalafil has no effect in the absence of sexual stimulation.
- *Cialis for BPH*: Assess for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Digital rectal examinations should be performed before and periodically during therapy for BPH.
- *Adcirca*: Monitor hemodynamic parameters and exercise tolerance prior to and periodically during therapy.

Implementation

- **PO:** Administer dose *as needed for ED* at least 30 min prior to sexual activity; effectiveness may continue for 36 hr.
- Administer dose for *pulmonary hypertension, BPH, ED/BPH, or daily for ED* once daily at the same time each day.
- May be administered without regard to food. Swallow tablets whole; do not crush, break, or chew.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take tadalafil as needed for ED at least 30 min before sexual activity and not more than once per day. Inform patient that sexual stimulation is required for an erection to occur after taking tadalafil.
- Advise patient that tadalafil is not indicated for use in women.
- Caution patient not to take tadalafil concurrently with alpha adrenergic blockers (unless on a stable dose) or nitrates. If chest pain occurs after taking tadalafil, instruct patient to seek immediate medical attention.
- Advise patient to avoid excess alcohol intake (≥5 units) in combination with tadalafil; may increase risk of orthostatic hypotension, increased heart rate, decreased standing BP, dizziness, headache.
- Instruct patient to notify health care professional promptly if erection lasts longer than 4 hr, if they are not satisfied with their sexual performance or develop unwanted side effects, or if they experience sudden or decreased vision loss in one or both eyes or loss or decrease in hearing, ringing in the ears, or dizziness.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Inform patient that tadalafil offers no protection against sexually transmitted diseases. Counsel patient that protection against sexually transmitted diseases and HIV infection should be considered.

Evaluation/Desired Outcomes

- Male erection sufficient to allow intercourse.
- Decrease in urinary symptoms of benign prostatic hyperplasia.
- Increased exercise tolerance.

tamoxifen (ta-mox-i-fen)

~~Nolvadex~~, Nolvadex-D, Soltamox

Classification

Therapeutic: antineoplastics
Pharmacologic: antiestrogens

Indications

Estrogen-receptor positive metastatic breast cancer. Adjuvant treatment of early-stage estrogen-receptor positive breast cancer. To reduce the occurrence of contralateral breast cancer when used as adjuvant therapy for breast cancer. Prevention of breast cancer in high-risk patients. To reduce risk of invasive breast cancer in women with ductal carcinoma *in situ* (DCIS) following breast surgery and radiation.

Action

Competes with estrogen for binding sites in breast and other tissues. Reduces DNA synthesis and estrogen response. **Therapeutic Effects:** Suppression of tumor growth. Reduced incidence of breast cancer in high-risk patients.

Pharmacokinetics

Absorption: Absorbed after oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Primarily metabolized by the liver by the CYP3A isoenzyme into N-desmethyltamoxifen and via the CYP2D6 isoenzyme into 4-hydroxytamoxifen. Both of these metabolites are further metabolized into endoxifen (N-desmethyltamoxifen via CYP2D6 and 4-hydroxytamoxifen via CYP3A). Both endoxifen and 4-hydroxytamoxifen are 30 to 100-fold greater potency in suppressing estrogen-dependent cell proliferation. The CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↓ endoxifen concentrations and ↓ effectiveness of tamoxifen). Slowly eliminated in the feces. Minimal amounts excreted in the urine.
Half-life: 7 days.

TIME/ACTION PROFILE (tumor response)

ROUTE	ONSET	PEAK	DURATION
PO	4–10 wk	several mo	several wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent warfarin therapy with history of deep vein thrombosis or pulmonary embolism (patients with DCIS or at high risk for breast cancer only); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: ↓ bone marrow reserve; History of thromboembolic events; Rep: Women of reproductive potential.

Adverse Reactions/Side Effects

CV: THROMBOEMBOLISM, edema. **EENT:** blurred vision. **F and E:** hypercalcemia. **GI:** nausea, vomiting. **GU:** UTERINE MALIGNANCIES, vaginal bleeding. **Hemat:** leukopenia, thrombocytopenia. **Metab:** hot flashes. **MS:** bone pain. **Neuro:** STROKE, confusion, depression, headache, weakness. **Misc:** tumor flare.

Interactions

Drug-Drug: Estrogens may ↓ effectiveness of concurrently administered tamoxifen. Blood levels are ↑ by **bromocriptine**. May ↑ the anticoagulant effect of **warfarin**. Risk of thromboembolic events is ↑ by concurrent use of other **antineoplastics**.

Route/Dosage

Metastatic Breast Cancer

PO (Adults): 20 mg once daily *or* 20 mg twice daily.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Adjuvant Treatment of Breast Cancer
PO (Adults): 20 mg once daily for 5–10 yrs.

Prevention of Breast Cancer in High-Risk Women or Ductal Carcinoma *in Situ*
PO (Adults): 20 mg once daily for 5 yrs.

Availability (generic available)
Oral solution (licorice aniseed-flavor): 10 mg/5 mL. **Tablets:** 10 mg, 20 mg.

NURSING IMPLICATIONS

Assessment
- Assess for an increase in bone or tumor pain. Confer with health care professional regarding analgesics. This transient pain usually resolves despite continued therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor CBC, platelets, and calcium levels before and during therapy. May cause transient hypercalcemia in patients with metastases to the bone. An estrogen receptor assay should be assessed before initiation of therapy.
- Monitor serum cholesterol and triglyceride concentrations in patients with pre-existing hyperlipidemia. May cause ↑ concentrations.
- Monitor hepatic function tests and thyroxine (T_4) periodically during therapy. May cause ↑ serum hepatic enzyme and thyroxine concentrations.
- Gynecologic examinations should be performed regularly; may cause variations in Papanicolaou and vaginal smears.

Implementation
- **PO:** Administer with food or fluids if GI irritation becomes a problem. Consult health care professional if patient vomits shortly after administration of medication to determine need for repeat dose.
- Do not crush, break, chew, or administer an antacid within 1–2 hr of enteric-coated tablet.

Patient/Family Teaching
- Instruct patient to take medication as directed. If a dose is missed, it should be omitted. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- If skin lesions are present, inform patient that lesions may temporarily increase in size and number and may have increased erythema.
- Advise patient to report bone pain to health care professional promptly. This pain may be severe. Analgesics should be ordered to control pain. Inform patient that this may be an indication of the drug's effectiveness and will resolve over time.
- Instruct patient to monitor weight weekly. Weight gain or peripheral edema should be reported to health care professional.
- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome.
- Instruct patient to notify health care professional promptly if pain or swelling of legs, shortness of breath, weakness, sleepiness, confusion, nausea, vomiting, weight gain, dizziness, headache, loss of appetite, or blurred vision occurs. Patient should also report menstrual irregularities, vaginal bleeding, pelvic pain or pressure.
- Rep: May cause fetal harm. Advise females of reproductive potential to use a nonhormonal method of contraception during and for 2 mo after last dose of tamoxifen and to avoid breast feeding for 3 mo after last dose. May cause female infertility.

Evaluation/Desired Outcomes
- Decrease in the size or spread of breast cancer. Observable effects of therapy may not be seen for 4–10 wk after initiation.
- Reduced incidence of breast cancer in high-risk patients.

tamsulosin (tam-soo-loe-sin)
Flomax, Flomax CR

Classification
Therapeutic: none assigned
Pharmacologic: peripherally acting antiadrenergics

Indications
Benign prostatic hyperplasia (BPH).

Action
Decreases contractions in smooth muscle of the prostatic capsule by preferentially binding to alpha$_1$-adrenergic receptors. **Therapeutic Effects:** Decreased symptoms of BPH (urinary urgency, hesitancy, nocturia).

Pharmacokinetics
Absorption: Slowly absorbed after oral administration.
Distribution: Widely distributed.
Protein Binding: 94–99%.
Metabolism and Excretion: Primarily metabolized by the liver via the CYP3A4 and CYP2D6 isoenzymes; the CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↑ tamsulosin concentrations and an ↑ risk of adverse effects).<10% excreted unchanged in urine.
Half-life: 14 hr.

TIME/ACTION PROFILE (↑ in urine flow)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Patients at risk for prostate carcinoma (symptoms may be similar); Patients undergo-

© F.A. Davis Publishing

ing cataract surgery (↑ risk of intraoperative floppy iris syndrome); Sulfa allergy; 🧬 CYP2D6 poor metabolizers (especially when using higher dose of 0.8 mg/day).

Adverse Reactions/Side Effects

CV: orthostatic hypotension. **EENT:** intraoperative floppy iris syndrome, rhinitis. **GU:** priapism, retrograde/diminished ejaculation. **Neuro:** dizziness, headache.

Interactions

Drug-Drug: Cimetidine may ↑ levels and the risk of toxicity. ↑ risk of hypotension with other peripherally acting anti-adrenergics (**doxazosin**, **prazosin**, **terazosin**); concurrent use should be avoided. ↑ risk of hypotension with **sildenafil**, **tadalafil**, and **vardenafil**. Strong **CYP3A4 inhibitors** and **CYP2D6 inhibitors** may ↑ levels (concurrent use should be avoided).

Route/Dosage

PO (Adults): 0.4 mg once daily after a meal; may ↑ after 2–4 wk to 0.8 mg/day.

Availability (generic available)

Capsules: 0.4 mg. **Cost:** *Generic*—$26.89/100. ***In combination with:*** dutasteride (Jalyn); see Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of BPH (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Assess patient for first-dose orthostatic hypotension and syncope. Incidence may be dose related. Observe patient closely during this period and take precautions to prevent injury.
- Monitor intake and output ratios and daily weight, and assess for edema daily, especially at beginning of therapy. Report weight gain or edema.
- Rectal exams prior to and periodically throughout therapy to assess prostate size are recommended.

Implementation

- Do not confuse tamsulosin with tacrolimus.
- **PO:** Administer daily dose 30 min after the same meal each day. ***DNC:*** Swallow capsules whole; do not open, crush, or chew.
- If dose is interrupted for several days at either the 0.4-mg or 0.8-mg dose, restart therapy with the 0.4-mg/day dose.

Patient/Family Teaching

- Instruct patient to take tamsulosin as directed. Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. If a dose is missed, take as soon as remembered unless almost time for next dose. Do not double doses. Advise patient to read *Patient Information* before starting tamsulosin and with each Rx refill in case of changes.
- May cause dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially cough, cold, or allergy remedies.
- Inform patient that tamsulosin may cause abnormal ejaculation including ejaculation failure, ejaculation disorder, retrograde ejaculation, and ejaculation decrease, which may impair fertility. Symptoms are reversible when medication is discontinued.
- Emphasize the importance of follow-up visits to determine effectiveness of therapy.

Evaluation/Desired Outcomes

- Decrease in urinary symptoms of BPH (urinary urgency, hesitancy, nocturia).

REMS

tapentadol (ta-pen-ta-dol)

Nucynta, 🍁 Nucynta IR, Nucynta ER

Classification

Therapeutic: analgesics (centrally acting), opioid analgesics

Pharmacologic: opioid agonists

Schedule II

T

Indications

Acute pain that is severe enough to require an opioid analgesic and for which alternative treatments are inadequate. Moderate to severe chronic pain in opioid-tolerant patients requiring use of daily, around-the-clock long-term opioid treatment and for which alternative treatment options are inadequate (extended-release only). Diabetic pain associated with diabetic peripheral neuropathy in patients requiring around-the-clock opioid analgesia for an extended time (extended-release only).

Action

Acts as μ-opioid receptor agonist. Also inhibits the reuptake of norepinephrine. **Therapeutic Effects:** Decrease in pain severity.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: 32% absorbed following oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: Undergoes extensive first-pass hepatic metabolism (97%); metabolites have no analgesic activity; metabolized drug is 99% renally excreted.
Half-life: 4 hr.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	4–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Significant respiratory depression in unmonitored settings or where resuscitative equipment is not readily available; Paralytic ileus; Severe hepatic or renal impairment; Concurrent MAO inhibitors or use of MAO inhibitors in the preceding 2 wk; Acute or severe bronchial asthma; Acute, mild, intermittent, or postoperative pain (extended-release only).
Use Cautiously in: Conditions associated with hypoxia, hypercapnea, or ↓ respiratory reserve including asthma, chronic obstructive pulmonary disease, cor pulmonale, extreme obesity, sleep apnea syndrome, myxedema, kyphoscoliosis, CNS depression, use of other CNS depressants or coma (↑ risk of further respiratory depression); use smallest effective dose; History of substance abuse or addiction disorder; Seizure disorders; Moderate hepatic impairment; OB: Labor or delivery; OB, Lactation: Avoid chronic use; prolonged use of opioids during pregnancy can result in neonatal opioid withdrawal syndrome; Geri: ↑ risk of respiratory depression in older adults; dose ↓ suggested; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: hypotension. **Endo:** adrenal insufficiency. **GI:** diarrhea, nausea, vomiting. **GU:** ↓ fertility. **Neuro:** SEIZURES, dizziness, headache, somnolence. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia). **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Concurrent **MAO inhibitors** or use of MAO inhibitors in the preceding 2 wk can result in potentially life-threatening adverse cardiovascular reactions due to additive effects on norepinephrine levels. Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. **Alcohol** may ↑ levels and ↑ the risk of toxicity. **Mixed agonist/antagonist analgesics**, including **nalbuphine** or **butorphanol** and **partial agonist analgesics**, including **buprenorphine**, may ↓ tapentadol's analgesic effects and/or precipitate opioid withdrawal in physically dependent patients. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT$_3$ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Route/Dosage

When switching from immediate-release to extended-release product, the same total daily dose can be used.

PO (Adults): *Immediate-release*— 50 mg, 75 mg, or 100 mg initially, then every 4–6 hr as needed and tolerated. If pain control is not achieved within first hr of first dose, additional dose may be given. Doses should not exceed 700 mg on the first day or 600 mg/day thereafter; *Extended-release*— 50 mg twice daily; titrate dose up to 100–250 mg twice daily (not to exceed dose of 500 mg/day).

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*— Immediate release: 50 mg every 8 hr initially, then titrate to maintain analgesia without intolerable side effects; Extended-release: 50 mg once daily; may titrate up to maximum dose of 100 mg once daily, if needed.

Availability

Immediate-release tablets: 50 mg, 75 mg, 100 mg.
Extended-release tablets: 50 mg, 100 mg, 150 mg, 200 mg, 250 mg.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain before and 1 hr (peak) after administration.
- Assess BP and respiratory rate before and periodically during administration. Monitor for respiratory depression especially during initial dosing and with patients at increased risk.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated. Consider drugs for opioid-induced constipation.
- Prolonged use may lead to physical and psychological dependence and tolerance, although these may be milder than with opioids. This should not prevent patient from receiving adequate analgesia. Patients who receive tapentadol for pain rarely develop psychological dependence.
- Monitor patient for seizures. May occur within recommended dose range. Risk is increased in patients

© F.A. Davis Publishing

with a history of seizures and in patients taking antidepressants (SSRIs, SNRIs, tricyclics) or other drugs that decrease the seizure threshold.
- Monitor for serotonin syndrome (mental-status changes [agitation, hallucinations, coma]), autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination] and/or gastrointestinal symptoms [nausea, vomiting, diarrhea] in patients taking SSRIs, SNRIs, triptans, tricyclic antidepressants, or MAO inhibitors concurrently with tapentadol.
- Assess risk for opioid addiction, abuse, or misuse prior to administration. Abuse or misuse of extended-release preparations by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of tapentadol and can result in overdose and death.
- ***Toxicity and Overdose:*** Overdose may cause respiratory depression. Naloxone (Narcan) may reverse some, but not all, of the symptoms of overdose. Treatment should be symptomatic and supportive. Maintain adequate respiratory exchange.

Implementation

- Initial immediate-release dose of 50 mg, 75 mg, or 100 mg is individualized based on pain severity, previous experience with similar drugs, and ability to monitor patient. 2nd dose may be administered as soon as 1 hr after first dose if adequate pain relief is not obtained with first dose.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms. For patients on long-acting agents who are physically opioid-dependent, initiate the taper by a small enough increment (e.g., no greater than 10% to 25% of total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2 to 4 wk. Patients who have been taking opioids for briefer periods of time may tolerate a more rapid taper. Monitor frequently to manage pain and withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). If withdrawal symptoms occur, pause the taper for a period of time or raise the dose of opioid analgesic to the previous dose, and then proceed with a slower taper. Also, monitor patients for changes in mood, emergence of suicidal thoughts, or use of other substances. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the opioid analgesic.
- **PO:** Tapentadol may be administered without regard to meals.
- ***DNC:*** Swallow extended-release tablets whole; do not crush, break or chew.
- Use calibrated syringe to administer correct dose of oral solution.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.

Patient/Family Teaching

- ***REMS:*** Instruct patient on how and when to ask for and take pain medication and to take tapentadol as directed; do not adjust dose without consulting health care professional. Report breakthrough pain and adverse reactions to health care professional. Do not take tapentadol if pain is mild or can be controlled with other pain medications such as NSAIDs or acetaminophen. Do not stop abruptly; may cause withdrawal symptoms (anxiety, sweating, insomnia, rigors, pain, nausea, tremors, diarrhea, upper respiratory symptoms, hallucinations). Decrease dose gradually. Advise patient to read the *Medication Guide* prior to taking tapentadol and with each Rx refill, in case of changes. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. The Patient Counseling Guide (PCG) is available at www.fda.gov/OpioidAnalgesicREMSPCG.
- Advise patient that tapentadol is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed; may be dangerous. Store out of sight and reach of children, and in a location not accessible by others.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

T

© F.A. Davis Publishing

- Inform patient that tapentadol may cause seizures. Stop taking tapentadol and notify health care professional immediately if seizures occur.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional if signs of serotonin syndrome occur.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to tapentadol through breast milk for excess sedation and respiratory depression. Chronic use may reduce fertility in females and males.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

tedizolid (ted-eye-**zoe**-lid)

Sivextro

Classification

Therapeutic: anti-infectives
Pharmacologic: oxazolidinones

Indications

Treatment of acute bacterial skin and skin structure infections (ABSSSI).

Action

Inhibits bacterial protein synthesis at the level of the 23S ribosome of the 50S subunit. **Therapeutic Effects:** Bacteriostatic action against enterococci, staphylococci and streptococci, resulting in resolution of infection. **Spectrum:** Active against *Staphylococcus aureus* including methicillin-resistant strains (MRSA), *Streptococcus pyogens*, *Streptococcus agalactiae*, *Streptococcus anginosus* group (including *Streptococcus anginosus*, *Streptococcus intermedius*, *Streptococcus constellatus*), and *Enterococcus faecalis*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability; well absorbed (91%) following oral administration, rapidly converted by phosphatases to its active form.
Distribution: Penetrates interstitial fluid space of adipose and skeletal muscle resulting in similar levels to plasma.
Metabolism and Excretion: Eliminated via liver with inactive metabolites excreted in feces (82%) and urine (18%); <3% excreted unchanged in urine or feces.
Half-life: 12 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2.5 hr	24 hr
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Uncontrolled HTN, pheochromocytoma, thyrotoxicosis, or concurrent use of sympathomimetic agents, vasopressors, or dopaminergic agents (↑ risk of hypertensive response); Concurrent or recent (<2 wk) use of MAO inhibitors (↑ risk of hypertensive response); Carcinoid syndrome or concurrent use of SSRIs, TCAs, triptans, meperidine, or buspirone (↑ risk of serotonin syndrome); OB: Pregnancy (may cause fetal harm).
Use Cautiously in: Neutropenia (safety and efficacy not established if WBC <1000 cells/mm^3); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

GI: CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), nausea, diarrhea, vomiting. **Neuro:** dizziness, headache. **Misc:** infusion reactions.

Interactions

Drug-Drug: ↑ risk of hypertensive response with **MAO inhibitors**, **sympathomimetics** (e.g., **pseudoephedrine**), **vasopressors** (e.g., **epinephrine**, **norepinephrine**), and **dopaminergic agents** (e.g., **dopamine**, **dobutamine**); concurrent or recent use should be avoided. ↑ risk of serotonin syndrome with **SSRIs**, **TCAs**, **triptans**, **meperidine**, **bupropion**, or **buspirone**; avoid concurrent use. May ↑ levels of **methotrexate**, **topotecan**, or **rosuvastatin**; discontinue these medications temporarily during tedizolid treatment.

© F.A. Davis Publishing

Route/Dosage

PO, IV (Adults and Children ≥12 yr): 200 mg once daily for 6 days.

Availability

Tablets: 200 mg. **Lyophilized powder for injection:** 200 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of CDAD. May begin up to several mo following cessation of therapy.
- ***Lab Test Considerations:*** Consider alternate therapies in patients with neutrophil counts <1000 cells/mm^3.
- May cause anemia.

Implementation

- Dose adjustment is not necessary when switching from IV to oral dose.
- **PO:** May be administered with or without food.

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute each vial with 4 mL of sterile water for injection. Gently swirl and let vial stand until completely dissolved; avoid shaking. ***Dilution:*** Dilute further with 250 mL of 0.9% NaCl by slowly injecting reconstituted solution into 250 mL bag. Gently invert bag to mix; avoid shaking to minimize foaming. Solution is clear and colorless to pale yellow; do not administer solutions that are discolored or contain particulate material. Must be used within 24 hrs of reconstitution at room temperature or under refrigeration. ***Rate:*** Infuse over 1 hr.
- **Y-Site Compatibility:** amikacin, amiodarone, ampicillin/sulbactam, anidulafungin, azithromycin, aztreonam, bumetanide, cefazolin, cefepime, ceftazidime, ceftazidime/avibactam, ceftolozane/tazobactam, ceftriaxone, cefuroxime, ciprofloxacin, cisatracurium, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, dopamine, epinephrine, eptifibatide, ertapenem, esomeprazole, famotidine, fentanyl, fosphenytoin, furosemide, heparin, hydrocortisone, hydromorphone, imipenem/cilastatin, insulin, regular, labetalol, levofloxacin, lidocaine, lorazepam, mannitol, meperidine, meropenem, meropenem/vaborbactam, mesna, methylprednisolone, metoclopramide, metronidazole, micafungin, midazolam, milrinone, morphine, naloxone, nitroglycerin, norepinephrine, ondansetron, pantoprazole, penicillin G potassium, phenylephrine, piperacillin/tazobactam, plazomicin, potassium chloride, potassium phosphates, rocuronium, sodium bicarbonate, sodium phosphates, tacrolimus, tigecycline, vancomycin, vasopressin, vecuronium.
- **Y-Site Incompatibility:** albumin (human), calcium chloride, calcium gluconate, caspofungin, ceftaroline, cyclosporine, diphenhydramine, dobutamine, doxycycline, esmolol, gentamicin, Hartmann's solution, isavuconazonium, lactated Ringer's, magnesium sulfate, nicardipine, phenytoin, tobramycin.

Patient/Family Teaching

- Advise patients taking oral tedizolid to take as directed, for full course of therapy, even if feeling better. Take missed doses as soon as remembered up to 8 hrs before next dose; if less than 8 hrs before next dose, wait until next scheduled dose. Do not double dose.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional if changes in vision occur or immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Advise patient to notify health care professional if no improvement is seen in a few days.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.

telavancin (tel-a-**van**-sin)

Vibativ

Classification

Therapeutic: anti-infectives
Pharmacologic: lipoglycopeptides

Indications

Treatment of complicated skin/skin structure infections caused by susceptible bacteria. Hospital-acquired and ventilator-associated bacterial pneumonia caused by *Staphylococcus aureus*.

© F.A. Davis Publishing

Action

Inhibits bacterial cell wall synthesis by interfering with the polymerization and cross-linking of peptidoglycan.

Therapeutic Effects: Bactericidal action against susceptible organisms. **Spectrum:** Active against *Staphylococcus aureus* (including methicillin-susceptible and -resistant strains), *Streptococcus pyogenes*, *Streptococcus agalactiae*, *Streptococcus anginosus* (including *S. anginosus*, *S. intermedius*, and *S. constellatus*), and *Enterococcus faecalis* (vancomycin-susceptible strains only).

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Penetrates blister fluid.

Metabolism and Excretion: Metabolism is not known; 76% excreted unchanged in urine <1% in feces.

Half-life: 8 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Congenital long QT syndrome, known prolongation of the QT interval, uncompensated HF, or severe left ventricular hypertrophy (risk of fatal arrhythmias); Concurrent use of unfractionated heparin (aPTT may be falsely ↑ for up to 18 hr after telavancin therapy); OB: Do not use during pregnancy unless potential maternal benefit significantly outweighs potential fetal risk (may cause fetal harm).

Use Cautiously in: Renal impairment (efficacy may be ↓; dose ↓ recommended for CCr ≤50 mL/min) (↑ risk of mortality in patients with CCr ≤50 mL/min; use only if benefit outweighs risk) (↑ risk of renal impairment); Diabetes, HF, hypertension (↑ risk of renal impairment); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children (may be associated with poor outcomes in children <1 yr who have immature renal function); Geri: Consider age-related ↓ in renal function, adjust dose accordingly (↑ risk of adverse renal reactions).

Adverse Reactions/Side Effects

CV: QT interval prolongation. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), taste disturbance, nausea, vomiting, abdominal pain. **GU:** foamy urine, nephrotoxicity. **Neuro:** dizziness. **Misc:** ANAPHYLAXIS, infusion reactions.

Interactions

Drug-Drug: Concurrent use of other **medications known to prolong QT interval** may ↑ risk of arrhythmias. Concurrent use of **NSAIDs**, **ACE inhibitors**, and **loop diuretics** may ↑ risk of adverse renal effects.

Route/Dosage

Complicated Skin/Skin Structure Infections

IV (Adults): 10 mg/kg ever 24 hr for 7–14 days.

Hospital-Acquired/Ventilator-Associated Bacterial Pneumonia

IV (Adults): 10 mg/kg ever 24 hr for 7–21 days.

Renal Impairment

IV (Adults): *CCr 30–50 mL/min*—7.5 mg/kg every 24 hr; *CCr 10–≤30 mL/min*—10 mg/kg every 48 hr.

Availability

Lyophilized powder for injection: 750 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Rep: Assess women of childbearing age for pregnancy. Women should have a negative serum pregnancy test before starting telavancin.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of CDAD. May begin up to several wk following cessation of therapy.
- Monitor for infusion-related reactions (resembling vancomycin flushing syndrome—flushing of upper body, urticaria, pruritus, rash). May resolve with stopping or slowing infusion.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of anaphylactic reaction.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor renal function (serum creatinine, CCr) prior to, every 48–72 hrs during, and at the end of therapy. May cause nephrotoxicity. If renal function decreases, reassess need for telavancin.
- May interfere with prothrombin time, INR, aPTT, activated clotting time, and coagulation-based factor Xa tests. Collect blood samples for these tests as close to next dose of telavancin as possible.
- Interferes with urine qualitative dipstick protein assays and quantitative dye methods; may use microalbumin assays.

© F.A. Davis Publishing

Implementation

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute the 750-mg vial with 45 mL of D5W, sterile water for injection, or 0.9% NaCl for concentrations of 15 mg/mL. Reconstitution time is usually under 2 min but may require up to 20 min. Mix thoroughly with contents dissolved completely. Do not administer solution that is discolored or contains particulate matter. Discard vial if vacuum did not pull diluent into vial. Time in vial plus time in bag should not exceed 4 hr at room temperature or 72 hr if refrigerated. ***Dilution:*** For doses of 150–800 mg, dilute further with 100–250 mL of D5W, 0.9% NaCl, or LR. ***Concentration:*** For doses <150 mg or >800 mg, dilute for a final concentration of 0.6–8 mg/mL. ***Rate:*** Administer over at least 60 min to minimize infusion reactions. Flush line with D5W, 0.9% NaCl, or LR before and after administration.
- **Y-Site Compatibility:** amphotericin B lipid complex, ampicillin/sulbactam, azithromycin, calcium gluconate, caspofungin, cefepime, ceftazidime, ceftriaxone, ciprofloxacin, dexamethasone, diltiazem, dobutamine, dopamine, doxycycline, ertapenem, famotidine, fluconazole, gentamicin, hydrocortisone, labetalol, magnesium sulfate, mannitol, meropenem, metoclopramide, milrinone, norepinephrine, ondansetron, pantoprazole, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphates, sodium bicarbonate, sodium phosphates, tigecycline, tobramycin, vasopressin.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B liposome, digoxin, esomeprazole, furosemide, levofloxacin, micafungin.

Patient/Family Teaching

- Instruct patient to notify health care professional immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Inform patient that common side effects include taste disturbance, nausea, vomiting, headache, and foamy urine. Notify health care professional if signs of infusion reaction occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 2 days after last dose and to notify health care professional if pregnancy is suspected. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to telavancin during pregnancy. Encourage pregnant patients to enroll in the VIBATIV pregnancy registry by calling 1-877-484-2700. May impair fertility in males.
- Instruct the patient to notify health care professional if symptoms do not improve.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

telmisartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

tenecteplase, See THROMBOLYTIC AGENTS.

tenofovir alafenamide

(te-**noe**-fo-veer al-a-**fen**-a-mide)

Vemlidy

Classification

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors

T

Indications

Chronic hepatitis B virus (HBV) infection in patients with compensated liver disease.

Action

Converted by hydrolysis to tenofovir and subsequently phosphorylated to the active metabolite, tenofovir diphosphate, which inhibits replication of HBV through incorporation into viral DNA by the HBV reverse transcriptase resulting in disruption of DNA synthesis.

Therapeutic Effects: Decreased progression/sequelae of chronic hepatitis B infection.

Pharmacokinetics

Absorption: Tenofovir alafenamide is a prodrug, which is hydrolyzed into tenofovir; absorption enhanced by high-fat meals.

Distribution: Unknown.

Metabolism and Excretion: Tenofovir is phosphorylated to tenofovir diphosphate (active metabolite); 32% excreted in feces, <1% in urine.

Half-life: 0.51 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.5 hr	24 hr

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: End-stage renal disease (CCr <15 mL/min) (not receiving hemodialysis); Decompensated hepatic impairment (Child-Pugh B or C).
Use Cautiously in: Co-infection with HIV and chronic hepatitis B; Renal impairment or receiving nephrotoxic medications (↑ risk of renal impairment); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

GI: LACTIC ACIDOSIS/HEPATOMEGALY WITH STEATOSIS, abdominal pain, ↑ amylase, ↑ liver enzymes, nausea. **GU:** ACUTE RENAL FAILURE/FANCONI SYNDROME, glycosuria. **Metab:** hyperlipidemia. **MS:** back pain, ↑ creatine kinase. **Neuro:** fatigue, headache. **Resp:** cough.

Interactions

Drug-Drug: Nephrotoxic agents, including **NSAIDs** ↑ risk of nephrotoxicity; avoid concurrent use. Medications that compete for active tubular secretion, including **acyclovir**, **cidofovir**, **ganciclovir**, **valacyclovir**, **valganciclovir**, or **aminoglycosides**, may ↑ tenofovir levels and toxicity; avoid if possible. **Carbamazepine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampin**, or **rifapentine** may ↓ tenofovir levels and its effectiveness; concurrent use with oxcarbazepine, phenobarbital, phenytoin, rifabutin, rifampin, or rifapentine not recommended; ↑ tenofovir alafenamide dose to 50 mg once daily when used with carbamazepine.
Drug-Natural Products: **St. John's wort** may ↓ tenofovir levels and its effectiveness; concurrent use not recommended.

Route/Dosage

PO (Adults): 25 mg once daily.

Renal Impairment

PO (Adults): *Hemodialysis*—Administer dose after dialysis session.

Availability

Tablets: 25 mg. ***In combination with:*** bictegravir and emtricitabine (Biktarvy); darunavir, cobicistat, and emtricitabine (Symtuza); elvitegravir, cobicistat, and emtricitabine (Genvoya); emtricitabine (Descovy); emtricitabine and rilpivirine (Odefsey). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor signs of hepatitis (jaundice, fatigue, anorexia, pruritus) during therapy. Upon discontinuation of therapy, monitor for exacerbations of hepatitis B for at least several mos after stopping therapy.
- ***Lab Test Considerations:*** Test patient for HIV-1 infection before starting therapy; *Vemlidy* should not be used alone in patient with HIV-1 infection.
- Monitor liver function tests and hepatitis B virus levels throughout and following therapy. If therapy is discontinued, may cause severe exacerbation of hepatitis B. May cause ↑ AST, ALT, alkaline phosphatase, creatine kinase, amylase, and triglyceride concentrations. Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women.
- May cause renal impairment. Monitor serum creatinine, estimated CCr, urine glucose, and urine protein before starting and periodically during therapy. Also assess serum phosphorous in patients with chronic kidney disease. Discontinue medication in patients who develop clinically significant ↓ in renal function or evidence of Fanconi syndrome.
- May cause ↑ ALT, AST, serum creatine kinase, serum amylase, LDL cholesterol, and glycosuria.

Implementation

- **PO:** Administer once daily with food.

Patient/Family Teaching

- Instruct patient to take medication as directed. Avoid missing doses. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- Advise patient to notify health care professional immediately if symptoms of lactic acidosis (feel very weak or tired, have unusual [not normal] muscle pain, have trouble breathing, have stomach pain with nausea or vomiting, feel cold, especially in your arms and legs, feel dizzy or lightheaded, have a fast or irregular heartbeat) or severe liver problems (yellow skin or whites eyes, dark "tea-colored" urine, light-colored bowel stools, loss of appetite, nausea, pain, aching, or tenderness in right side of abdomen) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise patient taking oral contraceptives to use a nonhormonal method of birth control during therapy. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to *Vemlidy* during pregnancy. Register patient in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263.

Evaluation/Desired Outcomes

- Decreased progression/sequelae of chronic hepatitis B infection.

© F.A. Davis Publishing

BEERS

terazosin (ter-ay-zoe-sin)

Hytrin, ~~Hytrin~~

Classification

Therapeutic: antihypertensives

Pharmacologic: peripherally acting antiadrenergics

Indications

Mild to moderate hypertension (alone or with other agents). Treatment of signs/symptoms of benign prostatic hyperplasia (BPH).

Action

Dilates both arteries and veins by blocking postsynaptic alpha$_1$-adrenergic receptors. Decreases contractions in smooth muscle of the prostatic capsule. **Therapeutic Effects:** Lowering of BP. Decreased symptoms of prostatic hyperplasia (urinary urgency, hesitancy, nocturia).

Pharmacokinetics

Absorption: Well absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: 50% metabolized by the liver. 10% excreted unchanged by the kidneys. 20% excreted unchanged in feces. 40% eliminated in bile.

Half-life: 12 hr.

TIME/ACTION PROFILE

ROUTE	ONSET†	PEAK‡	DURATION†
PO-hypertension	15 min	6–8 wk	24 hr
PO-BPH	2–6 wk	unknown	unknown

†After single dose.

‡After multiple oral dosing.

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Deyhdration, volume or sodium depletion (↑ risk of hypotension); Patients undergoing cataract surgery (↑ risk of intraoperative floppy iris syndrome); OB, Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects

EENT: nasal congestion, blurred vision, conjunctivitis, intraoperative floppy iris syndrome, sinusitis. **Resp:** dyspnea. **CV:** first-dose orthostatic hypotension, arrhythmias, chest pain, palpitations, peripheral edema, tachycardia. **GI:** nausea, abdominal pain, diarrhea, dry mouth, vomiting. **GU:** erectile dysfunction, urinary frequency. **Derm:** pruritus. **Metab:** weight gain. **MS:** arthralgia, back pain, extremity pain. **Neuro:** paresthesia, dizziness, headache, weakness, drowsiness, nervousness.. **Misc:** fever.

Interactions

Drug-Drug: ↑ risk of hypotension with **sildenafil**, **tadalafil**, **vardenafil**, other **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. **NSAIDs**, **sympathomimetics**, or **estrogens** may ↓ effects of antihypertensive therapy.

Route/Dosage

The first dose should be taken at bedtime.

Hypertension

PO (Adults): 1 mg initially, then slowly ↑ up to 5 mg/day (usual range 1–5 mg/day); may be given as single dose or in 2 divided doses (not to exceed 20 mg/day).

Benign Prostatic Hyperplasia

PO (Adults): 1 mg at bedtime; gradually may be ↑ up to 5–10 mg/day.

Availability (generic available)

Capsules: 1 mg, 2 mg, 5 mg, 10 mg. **Tablets:** 1 mg, 2 mg, 5 mg, 10 mg. **Cost:** *Generic*—All strengths $160.38/100.

NURSING IMPLICATIONS

Assessment

- Assess for first-dose orthostatic reaction (dizziness, weakness) and syncope. May occur 30 min–2 hr after initial dose and occasionally thereafter. Incidence may be dose related. Volume-depleted or sodium-restricted patients may be more sensitive. Observe patient closely during this period; take precautions to prevent injury. First dose may be given at bedtime to minimize this reaction.
- Monitor intake and output ratios and daily weight; assess for edema daily, especially at beginning of therapy.
- **Hypertension:** Monitor BP and pulse frequently during initial dosage adjustment and periodically throughout therapy. Report significant changes.
- Monitor frequency of prescription refills to determine adherence.
- **BPH:** Assess patient for symptoms of BPH (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Rule out prostatic carcinoma before therapy; symptoms are similar.

Implementation

- May be used in combination with diuretics or beta blockers to minimize sodium and water retention. If these are added to terazosin therapy, reduce dose of terazosin initially and titrate to effect.
- **PO:** Administer daily dose at bedtime. If necessary, dose may be increased to twice daily.

T

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered. If not remembered until next day, omit; do not double doses.
- Advise patient to weigh self twice weekly and assess feet and ankles for fluid retention.
- May cause dizziness or drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Alcohol, CNS depressants, standing for long periods, hot showers, and exercising in hot weather should be avoided because of enhanced orthostatic effects.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially NSAIDs, cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication regimen before any surgery.
- Advise patient to notify health care professional if frequent dizziness, fainting, or swelling of feet or lower legs occurs.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Hypertension:** Emphasize the importance of continuing to take this medication as directed, even if feeling well. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management).
- Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and to report significant changes.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of side effects.
- Decreased symptoms of BPH. May require 2–6 wk of therapy before effects are noticeable.

terbinafine, See ANTIFUNGALS (TOPICAL).

terbutaline (ter-byoo-ta-leen)

~~Bricanyl~~

Classification

Therapeutic: bronchodilators
Pharmacologic: adrenergics

Indications

Management of reversible airway disease due to asthma or COPD; inhalation and subcut used for short-term control and oral agent as long-term control. **Unlabeled Use:** Management of preterm labor (tocolytic) (the FDA has recommended that injectable terbutaline should not be used in pregnancy for the prevention or prolonged treatment [>48–72 hr] of preterm labor in either the inpatient or outpatient settings because of the potential for serious maternal heart problems and death; oral terbutaline should not be used for the prevention or any treatment of preterm labor because of a lack of efficacy and the potential for serious material heart problems and death).

Action

Results in the accumulation of cyclic adenosine monophosphate (cAMP) at beta-adrenergic receptors. Produces bronchodilation. Inhibits the release of mediators of immediate hypersensitivity reactions from mast cells. Relatively selective for $beta_2$(pulmonary)-adrenergic receptor sites, with less effect on $beta_1$(cardiac)-adrenergic receptors. **Therapeutic Effects:** Bronchodilation.

Pharmacokinetics

Absorption: 35–50% absorbed following oral administration but rapidly undergoes first-pass metabolism. Well absorbed following subcut administration.
Distribution: Enters breast milk.
Metabolism and Excretion: Partially metabolized by the liver; 60% excreted unchanged by the kidneys following subcut administration.
Half-life: Unknown.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
PO	within 60–120 min	within 2–3 hr	4–8 hr
Subcut	within 15 min	within 0.5–1 hr	1.5–4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to adrenergic amines.
Use Cautiously in: Cardiac disease; Hypertension; Hyperthyroidism; Diabetes; Glaucoma; Geri: More susceptible to adverse reactions; may require dose ↓; Excessive use may lead to tolerance and paradoxical bronchospasm (inhaler); OB, Lactation: Pregnancy (near term) and lactation.

Adverse Reactions/Side Effects

Neuro: nervousness, restlessness, tremor, headache, insomnia. **Resp:** pulmonary edema. **CV:** angina, arrhythmias, hypertension, myocardial ischemia, tachycardia. **GI:** nausea, vomiting. **Endo:** hyperglycemia. **F and E:** hypokalemia.

Interactions

Drug-Drug: Concurrent use with other **adrenergics** (sympathomimetic) will have additive adrenergic side effects. Use with **MAO inhibitors** may lead to hyper-

© F.A. Davis Publishing

tensive crisis. **Beta blockers** may negate therapeutic effect.

Drug-Natural Products: Use with caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) ↑ stimulant effect.

Route/Dosage

PO (Adults and Children >15 yr): *Bronchodilation*—2.5–5 mg 3 times daily, given every 6 hr (not to exceed 15 mg/24 hr).

PO (Children 12–15 yr): *Bronchodilation*—2.5 mg 3 times daily (given every 6 hr) (not to exceed 7.5 mg/24 hr).

PO (Children <12 yr): *Bronchodilation*—0.05 mg/kg 3 times daily; may ↑ gradually (not to exceed 0.15 mg/kg 3–4 times daily or 5 mg/24 hr).

Subcut (Adults and Children ≥12 yr): *Bronchodilation*—250 mcg; may repeat in 15–30 min (not to exceed 500 mcg/4 hr).

Subcut (Children <12 yr): *Bronchodilation*—0.005–0.01 mg/kg; may repeat in 15–20 min.

IV (Adults): *Tocolysis*—2.5–10 mcg/min infusion; ↑ by 5 mcg/min every 10 min until contractions stop (not to exceed 30 mcg/min). After contractions have stopped for 30 min, ↓ infusion rate to lowest effective amount and maintain for 4–8 hr (unlabeled).

Availability (generic available)

Tablets: 2.5 mg, 5 mg. **Solution for injection:** 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- **Bronchodilator:** Assess lung sounds, respiratory pattern, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced, and notify health care professional of abnormal findings.
- Monitor pulmonary function tests before initiating therapy and periodically throughout therapy to determine effectiveness of medication.
- **Preterm Labor:** Monitor maternal pulse and BP, frequency and duration of contractions, and fetal heart rate. Notify health care professional if contractions persist or increase in frequency or duration or if symptoms of maternal or fetal distress occur. Maternal side effects include tachycardia, palpitations, tremor, anxiety, and headache.
- Assess maternal respiratory status for symptoms of pulmonary edema (increased rate, dyspnea, rales/crackles, frothy sputum).
- Monitor mother and neonate for symptoms of hypoglycemia (anxiety; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; excessive hunger; headache; irritability; nausea; nervousness; rapid pulse; shakiness; unusual tiredness; or weakness) and mother for hypokalemia (weakness, fatigue, U wave on ECG, arrhythmias).
- ***Lab Test Considerations:*** May cause transient ↓ in serum potassium concentrations with higher than recommended doses.
- Monitor maternal serum glucose and electrolytes. May cause hypokalemia and hypoglycemia. Monitor neonate's serum glucose, because hypoglycemia may also occur in neonates.
- ***Toxicity and Overdose:*** Symptoms of overdose include persistent agitation, chest pain or discomfort, decreased BP, dizziness, hyperglycemia, hypokalemia, seizures, tachyarrhythmias, persistent trembling, and vomiting.
- Treatment includes discontinuing beta-adrenergic agonists and symptomatic, supportive therapy. Cardioselective beta blockers are used cautiously because they may induce bronchospasm.

Implementation

- **PO:** Administer with meals to minimize gastric irritation.
- Tablet may be crushed and mixed with food or fluids for patients with difficulty swallowing.
- **Subcut:** Administer subcut injections in lateral deltoid area. Do not use solution if discolored.

IV Administration

- **Continuous Infusion:** ***Dilution:*** May be diluted in D5W, 0.9% NaCl, or 0.45% NaCl. ***Concentration:*** 1 mg/mL (undiluted). ***Rate:*** Use infusion pump to ensure accurate dose. Begin infusion at 10 mcg/min. Increase dosage by 5 mcg every 10 min until contractions cease. Maximum dose is 80 mcg/min. Begin to taper dose in 5-mcg decrements after a 30–60 min contraction-free period is attained. Switch to oral dose form after patient is contraction-free 4–8 hr on the lowest effective dose.
- **Y-Site Compatibility:** insulin.

Patient/Family Teaching

- Instruct patient to take medication as directed. If on a scheduled dosing regimen, take a missed dose as soon as possible; space remaining doses at regular intervals. Do not double doses. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Advise patient to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.

T

© F.A. Davis Publishing

- **Preterm Labor:** Notify health care professional immediately if labor resumes or if significant side effects occur.

Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.
- Increase in ease of breathing.
- Control of preterm labor in a fetus of 20–36 wk gestational age.

terconazole, See ANTIFUNGALS (VAGINAL).

teriflunomide

(ter-i-**floo**-noe-mide)

Aubagio

Classification

Therapeutic: anti-multiple sclerosis agents
Pharmacologic: immune response modifiers, pyrimidine synthesis inhibitors

Indications

Relapsing forms of multiple sclerosis (MS), including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease.

Action

Inhibits an enzyme required for pyrimidine synthesis; has antiproliferative and anti-inflammatory effects.

Therapeutic Effects: ↓ incidence and severity of relapses in MS, with a decrease in disability progression.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: >99%.

Metabolism and Excretion: Eliminated via biliary excretion of unchanged drug with renal excretion of metabolites (37.5 in feces and 22.6% in urine), some metabolism occurs.

Half-life: 18–19 days.

TIME/ACTION PROFILE (decrease in disability progression)

ROUTE	ONSET	PEAK	DURATION
PO	3–6 mo	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to teriflunomide or leflunomide; Severe hepatic impairment; Concurrent leflunomide treatment; Live virus vaccinations; Active acute or chronic infection; Severe immunodeficiency, bone marrow disease or severe uncontrolled infection; Rep: Women of reproductive potential not using effective contraception; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Pre-existing liver disease; Severe immunodeficiency, bone marrow disease or severe uncontrolled infection; Concurrent use of neurotoxic medications or diabetes mellitus (↑ risk of peripheral neuropathy); Hypertension (treat appropriately prior); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of peripheral neuropathy in older adults.

Adverse Reactions/Side Effects

CV: hypertension. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), alopecia. **F and E:** hyperkalemia, hypophosphatemia. **GI:** HEPATOTOXICITY, diarrhea, ↑ transaminases, nausea. **GU:** acute renal failure (urate nephropathy). **Hemat:** leukopenia, neutropenia, thrombocytopenia. **Neuro:** paresthesia, peripheral neuropathy. **Resp:** INTERSTITIAL LUNG DISEASE (rare). **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, and urticaria), INFECTION (including latent TB and viral infections).

Interactions

Drug-Drug: May ↑ levels and effects of **drugs metabolized by the CYP2C8 enzyme system** including **paclitaxel**, **pioglitazone**, **repaglinide**, and **rosiglitazone**. May ↓ levels and effectiveness of **drugs metabolized by the CYP1A2 enzyme system** including **alosetron**, **duloxetine**, **thoephylline**, and **tizanidine**. May ↓ response to and ↑ risk of adverse reactions from **live vaccines** (avoid live vaccinations and consider long half-life of teriflunomide before administering). May ↑ levels and effects of **ethinyl estradiol** and **levonorgestrel**. May ↑ risk of bleeding with **warfarin**. ↑ risk of additive immunosuppression with other **immunosuppressants** or **antineoplastics** (consider long half-life of teriflunomide). Levels and effects may be ↑ by breast cancer resistant protein (BCRP) inhibitors including **cyclosporine**, **eltrombopag**, and **gefitinib**. May alter response to **warfarin**. May ↑ risk of adverse reactions and ↓ antibody response to **live virus vaccines**.

Route/Dosage

PO (Adults): 7 mg once daily *or* 14 mg once daily.

Availability (generic available)

Film-coated tablets: 7 mg, 14 mg.

NURSING IMPLICATIONS

Assessment

- Assess BP before starting and periodically during therapy. Treat hypertension as needed.
- Assess for rash periodically during therapy. May cause SJS or TEN. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue,

© F.A. Davis Publishing

muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy and/or facial swelling, eosinophilia, in association with other organ system involvement, such as hepatitis, nephritis, hematologic abnormalities, myocarditis, or myositis, sometimes resembling an acute viral infection). Discontinue teriflunomide if DRESS is confirmed.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor liver function tests (transaminases, bilirubin) within 6 mo of starting therapy and monthly after teriflunomide therapy begins. Do not administer if ALT >2 × upper limit of normal. Consider discontinuing therapy if serum transaminase ↑ >3 × upper limit of normal is confirmed. Monitor serum transaminase and bilirubin in patients with symptoms of liver dysfunction. If liver injury is suspected, discontinue teriflunomide, begin accelerated elimination procedure, and monitor liver function tests weekly until normal.
- Monitor CBC with platelet count within 6 mo prior to starting and periodically during therapy based on signs and symptoms of infection. Mean decrease in WBC occurs during first 6 wk and remains low during therapy.
- Monitor INR closely in patients taking warfarin; a decrease in warfarin peak may occur.

Implementation

- Administer a tuberculin skin test prior to administration of teriflunomide. Patients with active latent TB should be treated for TB prior to therapy.
- **PO:** Administer once daily without regard to food.
- **Drug Elimination Procedure:** Females of reproductive potential who wish to become pregnant, females who become pregnant during therapy, and males who want to father a child must continue teriflunomide and go through one of the drug elimination procedures. Either of the following procedures is recommended to achieve nondetectable plasma levels <0.02 mg/L after stopping treatment with teriflunomide; 1) Administer cholestyramine 8 g 3 times daily (every 8 hrs) for 11 days. If cholestyramine 8 g is not well tolerated, cholestyramine 4 g 3 times/day can be used. *or* 2) Administration of 50 g oral activated charcoal powder every 12 hr for 11 days. (Days do not need to be consecutive unless rapid lowering of levels is desired.) Verify plasma levels <0.02 mg/L by 2 separate tests at least 14 days apart. Plasma levels may take up to 2 yr to reach nondetectable levels without drug elimination procedure.

Patient/Family Teaching

- Instruct patient to take teriflunomide as directed. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional promptly if symptoms of liver problems (nausea, vomiting, stomach pain, loss of appetite, tiredness, skin or whites of eyes yellowing, dark urine), serious skin problems (redness or peeling), infection (fever, tiredness, body aches, chills, nausea, vomiting), or interstitial lung disease (cough, dyspnea, with or without fever) occur.
- Instruct patient to notify health care professional if symptoms of peripheral neuropathy (numbness and tingling in hands and feet different from symptoms of MS), kidney problems (flank pain), high potassium level (nausea or racing heartbeat), or high BP occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Instruct patient to avoid vaccinations with live vaccines during and following therapy without consulting health care professional.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Rep: May cause fetal harm. Effective birth control should be used during therapy and until blood levels of teriflunomide are low enough. If pregnancy is planned or suspected, or if breast feeding, notify health care professional immediately; an accelerated elimination procedure may be used to decrease blood levels more rapidly. Male patients with female partner of reproductive potential who plans to become pregnant may also use this method. If female partner does not plan to become pregnant, use effective birth control until blood levels are low enough; may require 2 yr. Females of reproductive potential are recommended to undergo accelerated elimination procedure upon discontinuation of teriflunomide. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to teriflunomide during pregnancy. Patients who become pregnant should be encouraged to enroll in the Aubagio Pregnancy Registry at 1-800-745-4447 to collect information about mother and baby's health. Advise patient to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decrease in the number of MS flares (relapses) and slowing of physical problems caused by MS.

BEERS REMS

TESTOSTERONE
(tess-**toss**-te-rone)

testosterone cypionate
Depo-Testosterone

testosterone enanthate
~~Delatestryl~~, Xyosted

testosterone nasal gel
Natesto

testosterone pellets
Testopel

testosterone transdermal gel
Androgel, Fortesta, Testim, Vogelxo

testosterone transdermal patch
Androderm

testosterone transdermal solution
~~Axiron~~

testosterone undecanoate
Aveed, Jatenzo

Classification
Therapeutic: hormones
Pharmacologic: androgens

Schedule III

Indications
Hypogonadism in men with low testosterone serum concentrations. Delayed puberty in men (enanthate and pellets). Androgen-responsive breast cancer in postmenopausal women (palliative) (enanthate). **Unlabeled Use:** Part of masculinizing hormone therapy in Female to Male (FtM) transgender patients.

Action
Responsible for the normal growth and development of male sex organs. Maintenance of male secondary sex characteristics: Growth and maturation of the prostate, seminal vesicles, penis, scrotum, Development of male hair distribution, Vocal cord thickening, Alterations in body musculature and fat distribution. **Therapeutic Effects:** Correction of hormone deficiency in male hypogonadism: Initiation of male puberty. Suppression of tumor growth in some forms of breast cancer.

Pharmacokinetics
Absorption: Well absorbed from IM or subcut sites, through skin, or through nasal mucosa. Cypionate, enanthate, and undecanoate salts are absorbed slowly. Skin serves as reservoir for sustained release of testosterone into systemic circulation; 10% absorbed into systemic circulation during 24-hr period.
Distribution: Crosses the placenta.
Protein Binding: 98%.
Metabolism and Excretion: Metabolized by the liver. 90% eliminated in urine as metabolites.
Half-life: *Enanthate (IM), nasal gel, pellets, topical gel, topical solution, undecanoate*—10–100 min; *transdermal*—70 min; *cypionate*—8 days; *enanthate (subcut)*—Unknown.

TIME/ACTION PROFILE (androgenic effects†)

ROUTE	ONSET	PEAK	DURATION
IM—cypionate, enanthate	unknown	unknown	2–4 wk
IM—undecanoate	unknown	unknown	10 wk
Subcut—enanthate	unknown	unknown	unknown
Nasal gel	unknown	unknown	3 mo
Oral	unknown	unknown	unknown
Pellets	unknown	unknown	3–6 mo
Transdermal (solution)	unknown	14 days	7–10 days
Transdermal (gel)	30 min	unknown	24 hr
Transdermal (patch)	unknown	6–8 hr‡	24 hr§

†Response is highly variable among individuals; may take mo.
‡Plasma testosterone levels following applications of patch.
§Following patch removal.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Men with breast or prostate cancer; Age-related hypogonadism (undecanoate [PO]); Some products contain benzyl alcohol and should be avoided in patients with known hypersensitivity; Women (pellets, nasal gel, patch, tablets, topical gel, topical solution); OB: Pregnancy (may cause fetal virilization); Lactation: Lactation.
Use Cautiously in: Diabetes mellitus; Established cardiovascular disease or risk factors for cardiovascular disease; Hypertension; Renal or hepatic impairment; Benign prostatic hyperplasia; Hypercalcemia; Obesity or chronic lung disease (↑ risk of sleep apnea); Polycythemia; Nasal disorders, nasal/sinus surgery, nasal fracture in previous 6 mo, nasal fracture that caused deviated anterior nasal septum, mucosal inflammatory disorders (e.g. Sjogren's syndrome), or sinus disorders (nasal gel); Pedi: Prepubertal males exposed to testosterone may experience premature development of secondary sexual characteristics, aggression, and other side effects; Geri: ↑ risk of prostatic hyperplasia/carcinoma in older adults.

Adverse Reactions/Side Effects
CV: MI, STROKE, VENOUS THROMBOEMBOLISM, edema, ↑ blood pressure. **Derm:** male pattern baldness. **EENT:** deepening of voice; *nasal gel*, epistaxis, nasal scabbing, nasopharyngitis, rhinorrhea. **Endo:** *women*—change in libido, clitoral enlargement, ↓ breast size; *men*—acne, facial hair, gynecomastia, erectile dysfunction, oligospermia, priapism. **F and E:**

© F.A. Davis Publishing

hypercalcemia, hyperkalemia, hyperphosphatemia. **GI:** HEPATOTOXICITY, abdominal cramps, changes in appetite, nausea, vomiting; *buccal*—bitter taste, ginigivitis, gum edema, gum tenderness. **GU:** ↓ fertility, ↓ sperm count, menstrual irregularities, nocturia, priapism, prostatic enlargement, urinary hesitancy, urinary incontinence. **Hemat:** ↑ hematocrit. **Local:** ANAPHYLAXIS, chronic skin irritation (transdermal), pain at injection/implantation site, pulmonary oil microembolism reactions (IM). **Metab:** hyperlipidemia. **Neuro:** SUICIDAL THOUGHTS/BEHAVIOR, anxiety, confusion, depression, fatigue, headache, vertigo. **Resp:** sleep apnea.

Interactions

Drug-Drug: May ↑ action of **warfarin**, **oral hypoglycemic agents**, and **insulin**. Concurrent use with **corticosteroids** may ↑ risk of edema formation.

Route/Dosage

Replacement Therapy

IM (Adults): 50–400 mg every 2–4 wk (enanthate or cypionate); 750 mg initially, then at wk 4, then every 10 wk (undecanoate).
Subcut (Adults): 75 mg once weekly (enanthate).
Intranasal (Adults): 1 actuation (5.5 mg) in each nostril 3 times daily.
PO (Adults): 158 mg twice daily; may titrate up to 396 mg twice daily based on serum testosterone concentrations.
Transdermal (patch) (Adults): One 4–mg/day system applied every 24 hr in the evening; adjust dose based on serum testosterone concentrations (dosing range = 2–6 mg/day).
Transdermal (Adults): *Androgel 1% or Testim*—5 g (contains 50 mg of testosterone; 5 mg systemically absorbed) applied once daily (morning preferable), if needed may be ↑ to maximum of 10 g (contains 100 mg of testosterone; 10 mg systemically absorbed); *Androgel 1.62%*—40.5 mg of testosterone (2 pump actuations) applied once daily (morning preferable); dose may be adjusted down to a minimum of 20.25 mg or up to a maximum of 81 mg of testosterone, if needed (dose based on serum testosterone levels) *Fortesta*—40 mg of testosterone (4 pump actuations) applied once daily (morning preferable); dose may be adjusted down to a minimum of 10 mg or up to a maximum of 70 mg of testosterone, if needed (dose based on serum testosterone levels); *Vogelxo*—50 mg of testosterone (1 tube, 1 packet, or 4 pump actuations) applied once daily; dose may be adjusted up to a maximum of 100 mg of testosterone, if needed (dose based on serum testosterone levels).
Subcut (for subcutaneous implantation) (pellets) (Adults): 150–450 mg every 3–6 mo.
Topical (Adults): 60 mg (2 pump actuations) applied once daily; may be ↑ up to 120 mg (4 pump actuations) based on serum testosterone concentrations.

Delayed Male Puberty

IM (Children): 50–200 mg every 2–4 wk for up to 6 mo (enanthate).
Subcut (for subcutaneous implantation) (pellets) (Children): 150–450 mg every 3–6 mo.

Palliative Management of Breast Cancer

IM (Adults): 200–400 mg every 2–4 wk (enanthate).

Availability (generic available)

Capsules (Jatenzo): 158 mg, 198 mg, 237 mg. **Nasal gel:** 5.5 mg/pump actuation. **Pellets:** 75 mg. **Solution for intramuscular injection (cypionate) (in oil):** 100 mg/mL, 200 mg/mL. **Solution for intramuscular injection (enanthate) (in oil):** 200 mg/mL. **Solution for intramuscular injection (undecanoate) (in oil):** 250 mg/mL. **Solution for subcutaneous injection (enanthate) (autoinjector) (Xyosted):** 50 mg/0.5 mL, 75 mg/0.5 mL, 100 mg/0.5 mL. **Transdermal gel (Androgel):** 20.25 mg/packet (1.62%), 25 mg/packet (1%), 40.5 mg/packet (1.62%), 50 mg/packet (1%), 75-g metered dose pump (each pump dispenses 60 metered 12.5-mg doses [1%]), 88-g metered dose pump (each pump dispenses 60 metered 20.25-mg doses [1.62%]). **Transdermal gel (Fortesta):** 60-g metered dose pump (each pump dispenses 120 metered 10-mg doses [2%]). **Transdermal gel (Testim):** 50 mg/unit–dose tube (1%). **Transdermal gel (Vogelxo):** 50 mg/packet or unit–dose tube (1%), 75-g metered dose pump (each pump dispenses 60 metered 12.5-mg doses [1%]). **Transdermal patch:** 2 mg/24 hr, 4 mg/24 hr. **Transdermal solution:** 30 mg/pump actuation.

T

NURSING IMPLICATIONS

Assessment

- Monitor intake and output ratios, weigh patient twice weekly, and assess patient for edema. Report significant changes indicative of fluid retention.
- Assess for abuse using higher doses than prescribed and usually in conjunction with other anabolic androgenic steroids. May result in heart attack, heart failure, stroke, depression, hostility, aggression, liver toxicity, and infertility. Measure serum testosterone if abuse is suspected.
- **Men:** Monitor for precocious puberty in boys (acne, darkening of skin, development of male secondary sex characteristics—increase in penis size, frequent erections, growth of body hair). Bone age determinations should be measured every 6 mo to determine rate of bone maturation and effects on epiphyseal closure.
- Monitor for breast enlargement, persistent erections, and increased urge to urinate in men. Monitor

© F.A. Davis Publishing

for difficulty urinating in elderly men, because prostate enlargement may occur.
- **Women:** Assess for virilism (deepening of voice, unusual hair growth or loss, clitoral enlargement, acne, menstrual irregularity).
- In women with metastatic breast cancer, monitor for symptoms of hypercalcemia (nausea, vomiting, constipation, lethargy, loss of muscle tone, thirst, polyuria).
- ***Lab Test Considerations:*** Prior to therapy, measure serum testosterone in the morning on at least two separate days. Normal range (300 to 1050 ng/dL). Monitor serum testosterone concentrations 4–12 wk after starting therapy. Discontinue therapy is concentrations are consistently outside of normal range.
- Monitor hemoglobin and hematocrit periodically during therapy; may cause polycythemia.
- Monitor hepatic function tests, prostate specific antigen and serum cholesterol levels periodically during therapy. May cause ↑ serum AST, ALT, and bilirubin, ↑ cholesterol levels, and suppress clotting factors II, V, VII, and X.
- Monitor serum and urine calcium levels and serum alkaline phosphatase concentrations in women with metastatic breast cancer.
- Monitor serum sodium, chloride, potassium, and phosphate concentrations (may be ↑).
- Monitor blood glucose closely in patients with diabetes who are receiving oral hypoglycemic agents or insulin.
- *Transdermal patch:* Monitor serum testosterone concentrations 2 wk after starting therapy; these concentrations should be obtained in the morning (following application of patch during the previous evening). Serum testosterone concentrations measured in the early morning outside range of 400 – 930 ng/dL require increasing daily dose to 6 mg (one 4 mg/day and one 2 mg/day system) or decreasing daily dose to 2 mg (one 2 mg/day system), maintaining nightly application.
- *Transdermal Solution:* Measure serum testosterone concentrations after initiation of therapy to ensure desired concentrations (300–1050 ng/dL) are achieved. Adjust dose based on serum testosterone concentration from a single blood draw 2–8 hrs after applying and at least 14 days after starting treatment or following dose adjustment. If concentration is below 300 ng/dL, daily dose may be increased from 60 mg (2 pump actuations) to 90 mg (3 pump actuations) or from 90 mg to 120 mg (4 pump actuations). If concentration exceeds 1050 ng/dL, the daily testosterone dose should be decreased from 60 mg (2 pump actuations) to 30 mg (1 pump actuation) as instructed by health care professional. If concentration consistently exceeds 1050 ng/dL at lowest daily dose of 30 mg (1 pump actuation), discontinue therapy.
- *Nasal gel:* Monitor serum testosterone concentrations after 1 mo and periodically during therapy. If total testosterone concentrations consistently exceed 1050 ng/dL, discontinue therapy. If total testosterone concentrations are consistently below 300 ng/dL, consider alternative therapy.

Implementation

- Range-of-motion exercises should be done with all bedridden patients to prevent mobilization of calcium from the bone.
- **PO:** Administer twice daily, in the morning and evening, with food.
- **IM:** Administer IM deep into gluteal muscle. Crystals may form when vials are stored at low temperatures; warming and shaking vial will redissolve crystals. Use of a wet syringe or needle may cause solution to become cloudy but will not affect its potency.
- **Subcut:** Pellets are to be implanted subcutaneously by a health care professional.
- **Transdermal: Patch:** Apply patch to clean, dry, hairless skin on the back, abdomen, upper arms, or thighs. Do not apply to the scrotum. Avoid application over bony prominences or a part of the body that may be subject to prolonged pressure during sleep or sitting. The patch does not need to be removed while swimming or taking a shower or bath.
- The sites of application should be rotated; once a patch is removed, the same site should not be used again for at least 1 wk.
- If skin irritation occurs, apply a small amount of OTC topical hydrocortisone cream after system removal or a small amount of 0.1% triamcinolone cream may be applied to the skin under the central drug reservoir of the *Androderm* system without affecting the absorption of testosterone. Ointment formulations should not be used for pretreatment because they may significantly reduce testosterone absorption.
- Patch should be removed if undergoing a magnetic resonance imaging (MRI) scan. The system contains aluminum and may predispose the patient to skin burns during the test.
- **Transdermal: Solution:** Apply to axilla using applicator at the same time each morning, to clean, dry, intact skin. Do not apply to other parts of the body including to the scrotum, penis, abdomen, shoulders, or upper arms. Prime pump when using for first time by depressing pump 3 times, discard any product dispensed directly into a basin, sink, or toilet, and then wash liquid away thoroughly. Prime only prior to first use of each pump. After priming, completely depress pump once with nozzle over applicator cup to dispense 30 mg of testosterone. Apply in 30 mg (1 pump actuation) increments. Place actuator into the axilla and wipe steadily down and up into the axilla. If solution drips or runs, wipe back up with applicator cup. Do not rub into skin with fingers or hand. Repeat process for each 30 mg

© F.A. Davis Publishing

dose needed. When repeat application to same axilla, allow axilla to dry completely before more is applied. Rinse applicator under room temperature, running water and pat dry with a tissue. Allow axilla to dry completely prior to dressing. Solution has an alcohol base and is flammable until dry. Apply deodorant prior to application of testosterone solution. Avoid swimming or washing for 2 hrs after application. Wash hands immediately with soap and water after application.

- **Transdermal: Gel:** Apply gel once daily, preferably in the morning, to clean dry intact skin of shoulders and upper arms (*Androgel*, *Testim*, and *Vogelxo*) or abdomen (Androgel only) or front or inner thighs (Fortesta). Gel should not be applied to scrotum (5–30 times more permeable than other sites). Refer to the chart on the pump label to determine how many full pump depressions are required for the daily prescribed dose.
- The dose of Fortesta should be titrated based on the serum testosterone concentration from a single blood draw 2 hrs after applying Fortesta and at approximately 14 days and 35 days after starting treatment or following dose adjustment.
- **Intranasal:** Prime pump by inverting, depressing pump 10 times, and discarding any amount dispensed directly into a sink and washing gel away thoroughly with warm water. Wipe tip with a clean, dry tissue. If gel gets on hands, wash hands with warm water and soap. Priming should be done only prior to first use of each dispenser. Blow nose. Place right index finger on pump of actuator and while in front of a mirror, slowly advance tip of actuator into left nostril upwards until finger on the pump reaches the base of the nose. Tilt the actuator so that the opening on the tip of the actuator is in contact with the lateral wall of the nostril to ensure that the gel is applied to the nasal wall. Slowly depress the pump until it stops. Remove the actuator from the nose while wiping the tip along the inside of the lateral nostril wall to fully transfer the gel. Repeat with right nostril. Press on the nostrils at a point just below bridge of the nose and lightly massage. Refrain from blowing nose or sniffing for 1 hr after administration.

Patient/Family Teaching

- Advise patient to report the following signs and symptoms promptly: *in male patients,* priapism (sustained and often painful erections) difficulty urinating, or gynecomastia; *in female patients,* virilism (which may be reversible if medication is stopped as soon as changes are noticed) or hypercalcemia (nausea, vomiting, constipation, and weakness); *in male or female patients,* edema (unexpected weight gain, swelling of feet), hepatitis (yellowing of skin or eyes and abdominal pain), or unusual bleeding or bruising.
- Instruct patient to use testosterone as directed. Do not use higher than prescribed doses. Explain rationale for prohibiting use of testosterone for increasing athletic performance. Testosterone is neither safe nor effective for this use and has a potential risk of serious side effects.
- Advise diabetic patients to monitor blood closely for alterations in blood glucose concentrations.
- Emphasize the importance of regular follow-up physical exams, lab tests, and x-ray exams to monitor progress.
- Radiologic bone age determinations should be evaluated every 6 mo in prepubertal children to determine rate of bone maturation and effects on epiphyseal centers.
- Instruct females to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding.
- **Transdermal: Patch:** Advise patient to notify health care professional if their female sexual partner develops signs/symptoms of virilization (e.g. change in body hair distribution, significant increase in acne, deepening of voice, menstrual irregularities).
- Instruct patient that the protective plastic liner must be removed before applying the patch.
- Instruct patient to apply patch to a clean, dry area of skin on back, abdomen, upper arms, or thighs. The patch should not be applied to their genitals or over bony areas (e.g., upper shoulders or upper hip).
- Instruct patient to rotate the sites of application. Once a patch is removed, the site should not be used again for at least 1 wk.
- Advise patient that the patch does not need to be removed while showering, bathing, or swimming.
- Avoid contact of patch with women and children.
- Advise patient that the patch should be removed prior to undergoing an MRI scan.
- If a patch falls off before noon, advise patient to replace it with a fresh patch which should be worn until a new patch is applied in the evening. If a patch falls off after noon, advise patient that it does not need to be replaced until a fresh patch is applied in the evening.
- **Transdermal: Gel or Solution:** Explain application to patient.
- Advise patient that women and children should avoid contact with unclothed or unwashed application site. Patients should cover the application site(s) with clothing (T-shirt) after solution has dried. For direct skin-to-skin contact, patient should wash application site thoroughly with soap and water to remove any testosterone residue. If unwashed or unclothed skin with testosterone solution comes in direct contact

T

© F.A. Davis Publishing

with skin of another person, wash area of contact with soap and water as soon as possible.
- **Intranasal:** Advise patient to notify health care professional if nasal signs or symptoms (nasopharyngitis, rhinorrhea, epistaxis, nasal discomfort, nasal scabbing) occur.

Evaluation/Desired Outcomes
- Resolution of the signs of androgen deficiency without side effects. Therapy is usually limited to 3–6 mo followed by bone growth or maturation determinations.
- Decrease in the size and spread of breast malignancy in postmenopausal women. In antineoplastic therapy, response may require 3 mo of therapy; if signs of disease progression appear, therapy should be discontinued.
- Increased male characteristics in Female to Male (FtM) transgender patients.

tetracycline, See TETRACYCLINES.

TETRACYCLINES

doxycycline (dox-i-**sye**-kleen)
Acticlate, Apprilon, Atridox, Doryx, Doxy, Doxycin, Doxytab, Monodox, Oracea, Periostat, Vibramycin

minocycline (min-oh-**sye**-kleen)
Amzeeq, Dynacin, Minocin, Minolira, Solodyn, Ximino, Zilxi

tetracycline (te-tra-**sye**-kleen)
~~Sumycin~~

Classification
Therapeutic: anti-infectives
Pharmacologic: tetracyclines

Indications
Treatment of various infections caused by unusual organisms, including: *Mycoplasma*, *Chlamydia*, *Rickettsia*, *Borellia burgdorferi*. Gonorrhea and syphilis in penicillin-allergic patients. Prevention of exacerbations of chronic bronchitis. Treatment of inhalational anthrax (postexposure) and cutaneous anthrax (doxycycline only). Treatment of acne. Malaria prophylaxis (doxycycline only). Inflammatory lesions of non-nodular acne vulgaris (Solodyn and Ximino). Rosacea (Zilxi).

Action
Inhibits bacterial protein synthesis at the level of the 30S bacterial ribosome. **Therapeutic Effects:** Bacteriostatic action against susceptible bacteria. **Spectrum:** Includes activity against some gram-positive pathogens: *Bacillus anthracis*, *Clostridioides perfringens*, *Clostridioides tetani*, *Listeria monocytogenes*, *Nocardia*, *Propionibacterium acnes*, *Actinomyces israelii*. Active against some gram-negative pathogens: *Haemophilus influenzae*, *Legionella pneumophila*, *Yersinia enterocolitica*, *Yersinia pestis*, *Neisseria gonorrhoeae*, *Neisseria meningitidis*. Also active against several other pathogens, including: *Mycoplasma*, *Treponema pallidum*, *Chlamydia*, *Rickettsia*, *B. burgdorferi*.

Pharmacokinetics
Absorption: *Tetracycline*—60–80% absorbed following oral administration. *Doxycycline*—Well absorbed from the GI tract. *Minocycline*—Well absorbed from the GI tract; minimal absorption following topical administration.
Distribution: Widely distributed, some penetration into CSF; crosses the placenta and enters breast milk.
Metabolism and Excretion: *Doxycycline*—20–40% excreted unchanged by the urine; some inactivation in the intestine and some enterohepatic circulation with excretion in bile and feces. *Minocycline*—5–20% excreted unchanged by the urine; some metabolism by the liver with enterohepatic circulation and excretion in bile and feces. *Tetracycline*—Excreted mostly unchanged by the kidneys.
Half-life: *Doxycycline*—14–17 hr (↑ in severe renal impairment). *Minocycline*—11–26 hr. *Tetracycline*—6–12 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Doxycycline-PO	1–2 hr	1.5–4 hr	12 hr
Doxycycline-IV	rapid	end of infusion	12 hr
Minocycline-PO	rapid	2–3 hr	6–12 hr
Minocycline-PO—ER	unknown	3.5–4 hr	24 hr
Tetracycline-PO	1–2 hr	2–4 hr	6–12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to any of the tetracyclines; Some products contain alcohol or bisulfites; avoid in patients with known hypersensitivity or intolerance; OB: Risk of permanent staining of teeth in infant if used during last half of pregnancy (doxycycline may be used to treat anthrax in pregnant women due to the seriousness of the disease); Lactation: Lactation; Pedi: Children <8 yr (permanent staining of teeth) (unless used for anthrax; doxycycline may be used to treat anthrax in children due to the seriousness of the disease).
Use Cautiously in: Renal impairment; Hepatic impairment (minocycline); Nephrogenic diabetes insipidus; OB: Women of reproductive potential (↑ risk of intracranial hypertension if overweight or have a previous history of intracranial hypertension); Pedi: Children <9 yr (safety and effectiveness of topical formulation not established).

© F.A. Davis Publishing

Adverse Reactions/Side Effects

Derm: DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), ERYTHEMA MULTIFORME, EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, erythema (topical minocycline only), photosensitivity, dry skin (topical minocycline only), hyperpigmentation of skin and mucous membranes (minocycline only), itching (topical minocycline only), rash, skin peeling (topical minocycline only). **EENT:** vestibular reactions (minocycline only). **Endo:** *minocycline*—thyroid disorders. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), HEPATOTOXICITY, PANCREATITIS, diarrhea, nausea, vomiting, dysphagia, esophagitis, glossitis. **Hemat:** blood dyscrasias. **MS:** *minocycline*—lupus-like syndrome. **Local:** *doxycycline, minocycline*—phlebitis at IV site. **Neuro:** intracranial hypertension; *minocycline*, dizziness.. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), superinfection.

Interactions

Drug-Drug: May ↑ effect of **warfarin**. May ↓ effectiveness of **estrogen-containing hormonal contraceptives**. **Antacids**, **calcium**, **iron**, **zinc**, **aluminum**, and **magnesium** form insoluble compounds (chelates) and ↓ absorption of tetracyclines. **Sucralfate** may bind to tetracycline and ↓ its absorption from the GI tract. **Cholestyramine** or **colestipol** ↓ oral absorption of tetracyclines. **Adsorbent antidiarrheals** may ↓ absorption of tetracyclines. **Barbiturates**, **carbamazepine**, or **phenytoin** may ↓ activity of doxycycline. **Isotretinoin** may ↑ risk of intracranial hypertension with doxycycline; avoid concomitant use.
Drug-Food: **Calcium** in foods or **dairy products** ↓ absorption by forming insoluble compounds (chelates).

Route/Dosage

Doxycycline

PO (Adults and Children >8 yr and >45 kg): *Most infections*—100 mg every 12 hr on the 1st day, then 100–200 mg once daily or 50–100 mg every 12 hr; *Gonorrhea*—100 mg every 12 hr for 7 days or 200 mg once daily for 7 days (delayed-release tablets) or 300 mg followed 1 hr later by another 300-mg dose; *Uncomplicated urethral, endocervical, or rectal infection caused by Chlamydia trachomatis*—100 mg every 12 hr for 7 days; *Syphilis (early)*—100 mg every 12 hr for 14 days; *Syphilis (>1 yr duration)*—100 mg every 12 hr for 4 wk; *Malaria prophylaxis*—100 mg once daily; *Lyme disease*—100 mg twice daily; *Periodontitis*—20 mg twice daily; *Rosacea*—40 mg once daily in morning.
PO (Children >8 yr and ≤45 kg): *Most infections*—2.2 mg/kg every 12 hr on the 1st day, then 2.2–4.4 mg/kg once daily or 1.1–2.2 mg/kg every 12 hr; *Malaria prophylaxis*—2 mg/kg once daily.
PO, IV (Adults and Children >45 kg): *Inhalational anthrax (post-exposure)*—100 mg IV every 12 hr; change to 100 mg PO every 12 hr when clinically appropriate for a total of 60 days; one or two other antiinfectives may be added initially, depending on clinical situation; *Cutaneous anthrax*—100 mg PO every 12 hr for 60 days; some patients may require IV therapy initially depending on clinical situation.
PO, IV (Children ≤45 kg): *Inhalational anthrax (post-exposure)*—2.2 mg/kg IV every 12 hr; change to 2.2 mg/kg PO every 12 hr when clinically appropriate for a total of 60 days; one or two other anti-infectives may be added initially, depending on clinical situation; *Cutaneous anthrax*—2.2 mg/kg every 12 hr for 60 days; some patients may require IV therapy initially depending on clinical situation.

Minocycline

PO (Adults): 100–200 mg initially, then 100 mg every 12 hr or 50 mg every 6 hr.
PO, IV (Children ≥8 yr): 4 mg/kg initially, then 2 mg/kg every 12 hr.
PO (Adults and Children ≥12 yrs [Solodyn and Ximino]): *126–136 kg*—135 mg once daily for 12 wk; *111–125 kg*—115 mg once daily for 12 wk; *97–110 kg*—105 mg once daily for 12 wk; *85–96 kg*—90 mg once daily for 12 wk; *72–84 kg*—80 mg once daily for 12 wk; *60–71 kg*—65 mg once daily for 12 wk; *50–59 kg*—55 mg once daily for 12 wk; *45–49 kg*—45 mg once daily for 12 wk.
IV (Adults): 200 mg initially, then 100 mg every 12 hr (max dose = 400 mg/day).
Topical (Adults): *Zilxi*—Apply to affected area(s) once daily ≥1 hr before bedtime.
Topical (Adults and Children ≥9 yr): *Amzeeq*—Apply to affected area(s) once daily ≥1 hr before bedtime.

Tetracycline

PO (Adults): 250–500 mg every 6 hr or 500 mg–1 g every 12 hr. *Chronic treatment of acne*—500 mg–2 g/day for 3 wk, then ↓ to 125 mg–1 g/day.
PO (Children ≥8 yr): 6.25–12.5 mg/kg every 6 hr or 12.5–25 mg/kg every 12 hr.

Availability

Doxycycline (generic available)

Delayed-release capsules: 40 mg. **Cost:** $501.12/30. **Delayed-release tablets:** 50 mg, 75 mg, 80 mg, 100 mg, 120 mg, 150 mg, 200 mg. **Cost:** *Generic*—75 mg $613.45/60, 100 mg $1,314.83/100, 150 mg $1,759.94/100. **Immediate-release capsules:** 50 mg, 75 mg, 100 mg, 150 mg. **Cost:** *Generic*—50 mg $118.74/100, 75 mg $1,639.77/100, 100 mg $96.92/

T

© F.A. Davis Publishing

50, 150 mg $1,479.01/60. **Immediate-release tablets:** 20 mg, 50 mg, 75 mg, 100 mg, 150 mg. **Cost:** *Generic*—20 mg $118.90/100, 50 mg $335.71/100, 75 mg $498.35/100, 100 mg $246.02/50, 150 mg $274.17/30. **Oral suspension (raspberry flavor):** 25 mg/5 mL. **Cost:** *Generic*—$22.77/60 mL. **Powder for injection:** 100 mg/vial, 200 mg/vial. **Syrup (apple-raspberry flavor):** 50 mg/5 mL. **Cost:** $339.47/473 mL.

Minocycline (generic available)

Extended-release capsules: 90 mg, 135 mg. **Extended-release tablets:** 45 mg, 55 mg, 65 mg, 80 mg, 90 mg, 105 mg, 115 mg, 135 mg. **Cost:** *Generic*—45 mg $605.01/30, 90 mg $605.01/30, 135 mg $605.01/30; *Solodyn*—55 mg $1,044.22/30, 65 mg $1,044.22/30, 80 mg $1,044.22/30, 105 mg $1,044.22/30, 115 mg $1,044.22/30. **Immediate-release capsules:** 50 mg, 75 mg, 100 mg. **Cost:** *Generic*—50 mg $169.87/100, 75 mg $197.96/100, 100 mg $169.87/50. **Immediate-release tablets:** 50 mg, 75 mg, 100 mg. **Cost:** *Generic*—50 mg $343.47/100, 75 mg $504.25/100, 100 mg $300.98/50. **Lyophilized powder for injection:** 100 mg/vial. **Topical foam (Amneeq):** 4%. **Topical foam (Zilxi):** 1.5%.

Tetracycline (generic available)

Capsules: 250 mg, 500 mg. **Cost:** *Generic*—250 mg $6.88/100, 500 mg $11.80/100.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling), associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- **IV:** Assess IV site frequently; may cause thrombophlebitis.
- ***Lab Test Considerations:*** Monitor renal and hepatic function and CBC periodically during long-term therapy.
- May cause ↑ AST, ALT, serum alkaline phosphatase, bilirubin, and amylase concentrations. Tetracyclines, except doxycycline, may cause ↑ serum BUN.

Implementation

- Do not confuse Oracea with Orencia (abatacept). Do not confuse Dynacin with Dynacirc (isradipine).
- May cause yellow-brown discoloration and softening of teeth and bones if administered prenatally or during early childhood. Not recommended for children under 8 yr of age or during pregnancy or lactation unless used for the treatment of anthrax.
- **PO:** Administer around the clock. Administer at least 1 hr before or 2 hr after meals. *Doxycycline and minocycline* may be taken with food or milk if GI irritation occurs. Administer with a full glass of liquid and at least 1 hr before going to bed to avoid esophageal ulceration. Use calibrated measuring device for liquid preparations. Shake liquid preparations well. Do not administer within 1–3 hr of other medications.
- Do not open, break, crush or chew extended release capsules and tablets.
- Avoid administration of calcium, zinc, antacids, magnesium- or aluminum-containing medications, sodium bicarbonate, or iron supplements within 1–3 hr of oral tetracyclines.

Doxycycline

- The *Oracea* product is only indicated for rosacea, not for infections.
- **PO: Public Health Emergency—Exposure to Anthrax**: To prepare doses for infants and children exposed to anthrax, place one 100-mg tablet in a small bowl and crush to a fine powder with a metal spoon, leaving no large pieces. Add 4 level teaspoons of lowfat milk, lowfat chocolate milk, regular chocolate milk, chocolate pudding, or apple juice. Mix food or drink and doxycycline powder until powder dissolves. Mixture is stable in a covered container for 24 hr if refrigerated (if made with milk or pudding) or at room temperature (if made with juice). Number of teaspoons to administer/dose is based on child's weight (0–12.5 lb—1/2 tsp; 12.5–25 lb—1 tsp; 25–37.5 lb—1 1/2 tsp; 37.5–50 lb—2 tsp; 50–62.5 lb—2 1/2 tsp; 62.5–75 lb—3 tsp; 75–87.5 lb—3 1/2 tsp; 87.5–100 lb—4 tsp).
- Capsules may also be administered by carefully opening and sprinkling capsule contents on a spoonful of applesauce. The applesauce should be swallowed immediately without chewing and followed with a cool 8-oz glass of water to ensure complete swallowing of the capsule contents. The applesauce should not be hot, and it should be soft enough to be swallowed without chewing. If mixture

© F.A. Davis Publishing

cannot be taken immediately, discard; do not store for later use.

IV Administration

- **Intermittent Infusion:** Reconstitute each 100 mg with 10 mL of sterile water or 0.9% NaCl for injection. ***Dilution:*** Dilute further in 100–1000 mL of 0.9% NaCl, D5W, D5/LR, Ringer's, or lactated Ringer's solution. Solution is stable for 12 hr at room temperature and 72 hr if refrigerated. If diluted with D5/LR or lactated Ringer's solution, administer within 6 hr. Protect solution from direct sunlight. ***Concentration:*** Concentrations of less than 1 mcg/mL or greater than 1 mg/mL are not recommended. ***Rate:*** Administer over a minimum of 1–4 hr. Avoid rapid administration. Avoid extravasation.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanyl, amifostine, amikacin, aminophylline, amiodarone, anidulafungin, argatroban, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefotaxime, ceftriaxone, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, papaverine, pentamidine, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiamine, thiotepa, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** allopurinol, aminocaproic acid, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, cefazolin, cefotetan, cefoxitin, ceftazidime, cefuroxime, chloramphenicol, dantrolene, dexamethasone, diazepam, erythromycin, fluorouracil, folic acid, furosemide, ganciclovir, heparin, hydrocortisone, indomethacin, ketorolac, methotrexate, methylprednisolone, nafcillin, oxacillin, palonosetron, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium acetate, sodium bicarbonate, trimethoprim/sulfamethoxazole.

Minocycline

IV Administration

- IV doses are indicated only when oral therapy is not adequate or tolerated. Resume oral doses as soon as possible.
- **Intermittent Infusion:** Reconstitute vial with 5 mL of sterile water for injection. ***Dilution:*** 100 mL–1,000 mL 0.9% NaCl, D5W, or D5/0.9% NaCl, or in 250 mL–1000 mL LR, but not with other solutions containing calcium; precipitate may form, especially in neutral and alkaline solutions. Solutions are stable for 4 hr at room temperature or 24 hr if refrigerated. ***Rate:*** Infuse over 60 min. Do not infuse rapidly.
- **Y-Site Incompatibility:** Do not administer with other medications or solutions. Flush line between doses.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Take missed doses as soon as possible unless it is almost time for next dose; do not double doses. Advise patient that sharing of this medication may be dangerous.
- Advise patient to avoid taking milk or other dairy products concurrently with oral tetracyclines. Also avoid taking antacids, zinc, calcium, magnesium- or aluminum-containing medications, sodium bicarbonate, and iron supplements within 1–3 hr of oral tetracyclines.
- Instruct patient to notify health care professional immediately if rash, diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- *Minocycline* commonly causes dizziness or unsteadiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Notify health care professional if these symptoms occur.

© F.A. Davis Publishing

- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) or intracranial hypertension (headache, blurred vision, diplopia, vision loss). Women who are overweight, of childbearing age, or have a history of IH are at greater risk for developing tetracyclines-associated IH. Skin rash, pruritus, and urticaria should also be reported.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: Advise females of reproductive potential to use a nonhormonal method of contraception while taking tetracyclines and until next menstrual period. Men attempting to father a child should not take minocycline.
- Instruct patient to notify health care professional if symptoms do not improve within a few days for systemic preparations.
- Caution patient to discard outdated or decomposed tetracyclines; they may be toxic.
- **Malaria Prophylaxis:** Advise patient to avoid being bitten by mosquitoes by using protective measures, especially from dusk to dawn (e.g., staying in well-screened areas, using mosquito nets, covering the body with clothing, and using an effective insect repellant). Doxycycline prophylaxis should begin 1–2 days before travel to the malarious area, continued daily while in the malarious area, and after leaving the malarious area, should be continued for 4 more wk to avoid development of malaria. Do not exceed 4 mo.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.
- Decrease in acne lesions.
- Treatment of inhalation anthrax (post exposure) or treatment of cutaneous anthrax (doxycycline).
- Prevention of malaria.
- Reduction in inflammatory lesions associated with rosacea.

REMS

thalidomide (tha-lid-oh-mide)

Thalomid

Classification

Therapeutic: immunosuppressants

Indications

Cutaneous manifestations of moderate to severe erythema nodosum leprosum (ENL). Prevention (maintenance) and suppression of recurrent ENL. Newly diagnosed multiple myeloma (with dexamethasone).

Unlabeled Use: Bechet's syndrome. HIV-associated wasting syndrome. Aphthous stomatitis (including HIV associated). Crohn's disease.

Action

May suppress excess levels of tumor necrosis factor-alpha (TNF-alpha) in patients with ENL and alter leukocyte migration by altering characteristics of cell surfaces. **Therapeutic Effects:** Decreased skin lesions in ENL and prevention of recurrence.

Pharmacokinetics

Absorption: 67–93% absorbed following oral administration.

Distribution: Crosses the placenta; highly protein bound.

Protein Binding: Highly bound.

Metabolism and Excretion: Hydrolyzed in plasma to multiple metabolites.

Half-life: 5–7 hr.

TIME/ACTION PROFILE (dermatologic effects)

ROUTE	ONSET	PEAK	DURATION
PO	48 hr	1–2 mo	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Seizure disorders; Concurrent use of pembrolizumab in patients with multiple myeloma (↑ risk of mortality); OB: May cause fetal harm; Lactation: Avoid breast feeding (potential for serious adverse reactions in the infant).

Use Cautiously in: Rep: Women of childbearing potential and men with female sexual partners of childbearing potential; Pedi: Children <12 yr (safety not established).

Adverse Reactions/Side Effects

CV: bradycardia, edema, orthostatic hypotension, thromboembolic events (↑ risk with dexamethasone in multiple myeloma). **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, photosensitivity. **GI:** constipation. **Hemat:** neutropenia, thrombocytopenia. **Neuro:** peripheral neuropathy, SEIZURES, dizziness, drowsiness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), SEVERE BIRTH DEFECTS, TUMOR LYSIS SYNDROME, ↑ HIV viral load.

Interactions

Drug-Drug: ↑ CNS depression with concurrent use of **barbiturates**, **sedative/hypnotics**, **alcohol**, **chlorpromazine**, or other **CNS depressants**. Concurrent use of **agents that may cause peripheral neuropathy** ↑ risk of peripheral neuropathy.

© F.A. Davis Publishing

Drug-Natural Products: Concommitant use with **echinacea** and **melatonin** may interfere with immunosuppression.

Route/Dosage

ENL

PO (Adults ≥50 kg): 100–300 mg once daily initially; up to 400 mg/day has been used, depending on previous response. Every 3–6 mo, attempts should be made to taper and discontinue in decrements of 50 mg every 2–4 wk.

PO (Adults <50 kg): 100 mg once daily initially; up to 400 mg/day has been used, depending on previous response. Every 3–6 mo, attempts should be made to taper and discontinue in decrements of 50 mg every 2–4 wk.

Multiple Myeloma

PO (Adults): 200 mg once daily in 28-day treatment cycles.

Availability

Capsules: 50 mg, 100 mg, 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess monthly for initial 3 mo and periodically during therapy to detect early signs of peripheral neuropathy (numbness, tingling, or pain in hands and feet). Commonly occurs with prolonged therapy, but has occurred following short-term use or following completion of therapy. May be severe and irreversible. Electrophysiologic testing may be done at baseline and every 6 mo to detect asymptomatic peripheral neuropathy. If symptoms occur, discontinue thalidomide immediately to limit further damage. Reinstate therapy only if neuropathy returns to baseline.
- Monitor for signs of hypersensitivity reaction (erythematous macular rash, fever, tachycardia, hypotension). May require discontinuation of therapy if severe. If reaction recurs when dosing is resumed, discontinue thalidomide.
- Monitor for signs and symptoms of bleeding (petechiae, epistaxis, gastrointestinal bleeding) during therapy. May require dose interruption, reduction, or discontinuation.
- Monitor for side effects (constipation, oversedation, peripheral neuropathy); may require discontinuation or dose reduction until side effects resolve.
- **Multiple Myeloma:** Assess for venous thromboembolism (dyspnea, chest pain, arm or leg swelling) periodically during therapy, especially in patients concurrently taking dexamethasone. Consider prophylaxis depending on patient risk factors.
- ***Lab Test Considerations:*** Assess pregnancy status prior to starting therapy. Pregnancy tests with a sensitivity of at least 50 mIU/mL must be done within 10–14 days and within 24 hrs of starting therapy. Once treatment has started, pregnancy tests should occur weekly during first 4 wk of use, then every 4 wk in females with a regular menstrual cycle and every 2 wk in females with an irregular cycle.
- Monitor WBC with differential and platelet count during therapy. May cause ↓ WBC. Do not initiate therapy with an ANC ≤750/mm^3. If ANC ↓ to ≤750/mm^3 during therapy, re-evaluate medication regimen; if neutropenia persists, consider discontinuing therapy. May cause thrombocytopenia.
- May cause ↑ viral load levels in patients with HIV.

Implementation

- Do not confuse Thalomid (thalidomide) with thiamine.
- Rep: Due to teratogenic effects, thalidomide may be prescribed only by prescribers registered in the *System for Thalidomide Education and Prescribing Safety (STEPS)* program. Thalidomide is started within 24 hr of a negative pregnancy test with a sensitivity of at least 50 mIU/mL. Pregnancy testing must occur weekly during first mo of therapy, then monthly thereafter in women with a regular menstrual cycle. For women with irregular menses, pregnancy testing should occur every 2 wk. If pregnancy occurs, thalidomide should be discontinued immediately. Any suspected fetal exposure must be reported to the FDA and the manufacturer, and patient should be referred to an obstetrician/gynecologist experienced in reproductive toxicity.
- If health care professionals or other caregivers are exposed to body fluids from patients receiving thalidomide, use appropriate precautions, such as wearing gloves to prevent the potential cutaneous exposure to thalidomide or washing the exposed area with soap and water.
- Corticosteroids may be used concurrently with thalidomide for patients with moderate to severe neuritis associated with a severe ENL reaction. Use of corticosteroids can be tapered and discontinued when neuritis resolves.
- **PO:** Administer once daily with water, preferably at bedtime and at least 1 hr after the evening meal. If divided doses are used, administer at least 1 hr after meals.

Patient/Family Teaching

- Instruct patient to take thalidomide as directed. Do not discontinue without notifying health care professional; dose should be tapered gradually. Explain *STEPS* program to patient.
- Advise patient that thalidomide should not be shared with others.

© F.A. Davis Publishing

- Frequently causes drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Instruct patient not to donate blood and male patients not to donate sperm while taking thalidomide and for 1 mo following discontinuation.
- Advise patient to notify health care professional immediately if pain, numbness, tingling, or burning in hands or feet or shortness of breath, chest pain, swelling of arms or legs occur.
- Rep: Inform female patients of reproductive potential that they must use one highly effective method (IUD, hormonal contraceptive, tubal ligation, partner's vasectomy) and one additional method (latex condom, diaphragm, cervical cap) AT THE SAME TIME for at least 4 wk before, during therapy and interruptions of therapy, and for 4 wk following discontinuation of therapy, even with a history of infertility, unless due to a hysterectomy or patient has been postmenopausal naturally for 24 consecutive mo. Advise female patients to avoid breast feeding during therapy. Males with female partners of reproductive potential receiving thalidomide must always use a latex condom during and for up to 4 wk following discontinuation, even if they have undergone a successful vasectomy. Thalidomide must be discontinued if pregnancy is suspected or confirmed. Suspected fetal exposure must be reported to FDA via MedWatch at 1-800-FDA-1088 and to manufacturer at 1-888-668-2528. Inform females there is a Pregnancy Exposure Registry that monitors pregnancy outcomes in females exposed to thalidomide during pregnancy and that they can contact the Pregnancy Exposure Registry by calling 1-888-423-5436.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. Concomitant use of HIV-protease inhibitors, modafinil, penicillins, rifampin, rifabutin, phenytoin, carbamazepine, or certain herbal supplements such as St. John's wort with hormonal contraceptive agents may reduce the effectiveness of contraception during and for up to one mo after discontinuation of these concomitant therapies. Therefore, women requiring treatment with one or more of these drugs must use two other effective or highly effective methods of contraception or abstain from heterosexual sexual contact while taking thalidomide.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of active ENL reaction. Usually requires at least 2 wk of therapy; then taper medication in 50-mg decrements every 2–4 wk.
- Prevention of recurrent ENL. Tapering off medication should be attempted every 3–6 mo in decrements of 50 mg every 2–4 wk.
- Decrease in serum and urine paraprotein measurements in patients with multiple myeloma.

thiamine (thye-a-min)

Betaxin, vitamin B1

Classification

Therapeutic: vitamins
Pharmacologic: water-soluble vitamins

Indications

Treatment of thiamine deficiencies (beriberi). Prevention of Wernicke's encephalopathy. Dietary supplement in patients with GI disease, alcoholism, or cirrhosis.

Action

Required for carbohydrate metabolism. **Therapeutic Effects:** Replacement in deficiency states.

Pharmacokinetics

Absorption: Well absorbed from the GI tract by an active process. Excessive amounts are not absorbed completely. Also well absorbed from IM sites.
Distribution: Widely distributed. Enters breast milk.
Metabolism and Excretion: Metabolized by the liver. Excess amounts are excreted unchanged by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (time for symptoms of deficiency—edema and heart failure—to resolve†)

ROUTE	ONSET	PEAK	DURATION
PO, IM, IV	hr	days	days–wk

†Confusion and psychosis take longer to respond.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Known alcohol intolerance or bisulfite hypersensitivity (elixir only).
Use Cautiously in: Wernicke's encephalopathy (condition may be worsened unless thiamine is administered before glucose).

Adverse Reactions/Side Effects

Adverse reactions and side effects are extremely rare and are usually associated with IV administration or extremely large doses.
EENT: tightness of the throat. **Neuro:** restlessness, weakness.. **Resp:** pulmonary edema, respiratory distress. **CV:** VASCULAR COLLAPSE, hypotension, vasodilation. **GI:** GI bleeding, nausea. **Derm:** cyanosis, pruritus, sweating, tingling, urticaria, warmth. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: None significant.

© F.A. Davis Publishing

Route/Dosage

Thiamine Deficiency (Beriberi)

PO (Adults): 5–10 mg 3 times daily.
PO (Children): 10–50 mg/day in divided doses.
IM, IV (Adults): 5–100 mg 3 times daily.
IM, IV (Children): 10–25 mg/day.

Dietary Supplement

PO (Adults): 1–1.6 mg/day.
PO (Children 4–10 yr): 0.9–1 mg/day.
PO (Children birth–3 yr): 0.3–0.7 mg/day.

Availability (generic available)

Tablets: 5 mg[OTC], 10 mg[OTC], 25 mg[OTC], 50 mg[OTC], 100 mg[OTC], 250 mg[OTC], 500 mg[OTC]. **Injection:** 100 mg/mL. ***In combination with:*** other vitamins, minerals, and trace elements in multi-vitamin preparations[OTC].

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of thiamine deficiency (anorexia, GI distress, irritability, palpitations, tachycardia, edema, paresthesia, muscle weakness and pain, depression, memory loss, confusion, psychosis, visual disturbances, elevated serum pyruvic acid levels).
- Assess patient's nutritional status (diet, weight) prior to and throughout therapy.
- Monitor patients receiving IV thiamine for anaphylaxis (wheezing, urticaria, edema).
- ***Lab Test Considerations:*** May interfere with certain methods of testing serum theophylline, uric acid, and urobilinogen concentrations.

Implementation

- Do not confuse thiamine with Thalomid (thalidomide).
- Because of infrequency of single B-vitamin deficiencies, combinations are commonly administered.
- **IM, IV:** Parenteral administration is reserved for patients in whom oral administration is not feasible.
- **IM:** Administration may cause tenderness and induration at injection site. Cool compresses may decrease discomfort.

IV Administration

- **IV:** Sensitivity reactions and death have occurred from IV administration. An intradermal test dose is recommended in patients with suspected sensitivity. Monitor site for erythema and induration.
- **IV Push:** ***Concentration:*** Administer undiluted at 100 mg/mL. ***Rate:*** Administer at a rate of 100 mg over 5 min.
- **Continuous Infusion:** ***Dilution:*** May be diluted in dextrose/Ringer's or LR combinations, dextrose/saline combinations, D5W, D10W, Ringer's and LR injection, 0.9% NaCl, or 0.45% NaCl. Usually administered with other vitamins.
- **Y-Site Compatibility:** alfentanil, amikacin, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefonocid, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, famotidine, fentanyl, gentamicin, glycopyrrolate, heparin, insulin, isoproterenol, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine, metaraminol, methoxamine, methyldopate, metoclopramide, metoprolol, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, oxacillin, oxytocin, papaverine, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, succinylcholine, sufentanil, theophylline, tobramycin, tolazoline, trimetaphan, vancomycin, vasopressin, verapamil.
- **Y-Site Incompatibility:** aminophylline, amphotericin B deoxycholate, azathioprine, ceftazidime, chloramphenicol, dantrolene, diazepam, diazoxide, folic acid, furosemide, ganciclovir, hydrocortisone, imipenem/cilastatin, indomethacin, methylprednisolone, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, trimethoprim/sulfamethoxazole.
- **Additive Incompatibility:** Solutions with neutral or alkaline pH, such as carbonates, bicarbonates, citrates, and acetates.

Patient/Family Teaching

- Encourage patient to comply with dietary recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups.
- Teach patient that foods high in thiamine include cereals (whole grain and enriched), meats (especially pork), and fresh vegetables; loss is variable during cooking.
- Caution patients self-medicating with vitamin supplements not to exceed RDA. The effectiveness of megadoses of vitamins for treatment of various medical conditions is unproven and may cause side effects.

Evaluation/Desired Outcomes

- Prevention of or decrease in the signs and symptoms of vitamin B deficiency.
- Decrease in the symptoms of neuritis, ocular signs, ataxia, edema, and heart failure may be seen within hrs of administration and may disappear within a few days.
- Confusion and psychosis may take longer to respond and may persist if nerve damage has occurred.

T

© F.A. Davis Publishing

HIGH ALERT

THROMBOLYTIC AGENTS

alteplase (**al**-te-plase)
Activase, Activase rt-PA, Cathflo Activase, tissue plasminogen activator, t-PA

reteplase (**re**-te-plase)
Retavase

tenecteplase (te-**nek**-te-plase)
TNKase

Classification
Therapeutic: thrombolytics
Pharmacologic: plasminogen activators

Indications

Alteplase, reteplase, tenecteplase: Acute myocardial infarction (MI). **Alteplase:** Acute ischemic stroke. Acute massive pulmonary emboli. **Alteplase:** Occluded central venous access devices.

Action

Directly activate plasminogen, converting it to plasmin, which is then able to degrade fibrin present in clots.
Therapeutic Effects: Lysis of thrombi in coronary arteries, with preservation of ventricular function or improvement of ventricular function (and ↓ risk of HF or death). Lysis of pulmonary emboli or deep vein thrombosis. Lysis of thrombi causing ischemic stroke, reducing risk of neurologic sequelae. Restoration of cannula or catheter patency and function.

Pharmacokinetics

Absorption: Complete after IV administration. Intracoronary administration or administration into occluded catheters or cannulae has a more localized effect.
Distribution: Unknown.
Metabolism and Excretion: *Alteplase, tenecteplase*—Rapidly metabolized by the liver. *Reteplase*—Cleared primarily by the liver and kidneys.
Half-life: *Alteplase*—35 min; *reteplase*—13–16 min; *tenecteplase*—20–24 min (initial phase), 90–130 min (terminal phase).

TIME/ACTION PROFILE (fibrinolysis)

ROUTE	ONSET	PEAK	DURATION
Alteplase IV	30 min	60 min	unknown
Reteplase IV	30 min	30–90 min	48 hr
Tenecteplase IV	rapid	unknown	unknown

Contraindications/Precautions

Contraindicated in: Active internal bleeding; History of cerebrovascular accident; Recent (within 2 mo) intracranial or intraspinal injury or trauma; Intracranial neoplasm, AV malformation, or aneurysm; Severe uncontrolled hypertension; Known bleeding tendencies; Hypersensitivity; cross-sensitivity with other thrombolytics may occur.
Use Cautiously in: Recent (within 10 days) major surgery, trauma, GI, or GU bleeding; Left heart thrombus; Severe hepatic or renal disease; Hemorrhagic ophthalmic conditions; Septic phlebitis; Previous puncture of a noncompressible vessel; Subacute bacterial endocarditis or acute pericarditis; OB, Lactation, Pedi: Safety not established; Geri: ↑ risk of intracranial bleeding in patients >75 yr.
Exercise Extreme Caution in: Patients receiving concurrent anticoagulant therapy (↑ risk of intracranial bleeding).

Adverse Reactions/Side Effects

CV: hypotension, reperfusion arrhythmias. **Derm:** ecchymoses, flushing, urticaria. **EENT:** epistaxis, gingival bleeding. **GI:** GI BLEEDING, RETROPERITONEAL BLEEDING, nausea, vomiting. **GU:** GENITOURINARY TRACT BLEEDING. **Hemat:** BLEEDING. **Local:** hemorrhage at injection sites, phlebitis at IV site. **MS:** musculoskeletal pain. **Neuro:** INTRACRANIAL HEMORRHAGE. **Resp:** bronchospasm, hemoptysis. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever.

Interactions

Drug-Drug: Concurrent use of **aspirin**, other **NSAIDs**, **warfarin**, **heparin**, **low-molecular-weight heparins**, **direct thrombin inhibitors**, **eptifibatide**, **tirofiban**, **clopidogrel**, or **dipyridamole** may ↑ risk of bleeding, although these agents are frequently used together or in sequence. Effects may be ↓ by **antifibrinolytic agents**, including **aminocaproic acid** or **tranexamic acid**.
Drug-Natural Products: ↑ anticoagulant effect and bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **dong quai**, **fenugreek**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, **licorice**, and others.

Route/Dosage

Alteplase

Myocardial Infarction (Accelerated or Front-Loading Infusion)

IV (Adults): 15 mg bolus, then 0.75 mg/kg (up to 50 mg) over 30 min, then 0.5 mg/kg (up to 35 mg) over next 60 min; usually accompanied by heparin therapy.

Myocardial Infarction (3-Hr Infusion)

IV (Adults >65 kg): 60 mg over 1st hr (6–10 mg given as a bolus over first 1–2 min), 20 mg over the 2nd hr, and 20 mg over the 3rd hr for a total dose of 100 mg.
IV (Adults <65 kg): 0.75 mg/kg over 1st hr (0.075–0.125 mg/kg given as a bolus over first 1–2 min), 0.25 mg/kg over the 2nd hr, and 0.25 mg/kg over the 3rd hr for a total dose of 1.25 mg/kg (not to exceed 100 mg total).

Pulmonary Embolism

IV (Adults): 100 mg over 2 hr; follow with heparin.

© F.A. Davis Publishing

Acute Ischemic Stroke
IV (Adults): 0.9 mg/kg (not to exceed 90 mg), given as an infusion over 1 hr, with 10% of the dose given as a bolus over the 1st min.

Occluded Venous Access Devices
IV (Adults and Children >30 kg): 2 mg/2 mL instilled into occluded catheter; if unsuccessful, may repeat once after 2 hr.
IV (Adults and Children <30 kg): 110% of the lumen volume (not to exceed 2 mg in 2 mL) instilled into occluded catheter; if unsuccessful, may repeat once after 2 hr.

Reteplase
IV (Adults): 10 units, followed 30 min later by an additional 10 units.

Tenecteplase
IV (Adults <60 kg): 30 mg.
IV (Adults ≥60 kg and <70 kg): 35 mg.
IV (Adults ≥70 kg and <80 kg): 40 mg.
IV (Adults ≥80 kg and <90 kg): 45 mg.
IV (Adults ≥90 kg): 50 mg.

Availability

Alteplase
Powder for injection: 2 mg/vial, 50 mg/vial, 100 mg/vial.

Reteplase
Powder for injection: 10.8 units/vial.

Tenecteplase
Powder for injection: 50 mg/vial.

NURSING IMPLICATIONS

Assessment
- Begin therapy as soon as possible after the onset of symptoms.
- Monitor vital signs, including temperature, continuously for coronary thrombosis and at least every 4 hr during therapy for other indications. Do not use lower extremities to monitor BP. Notify health care professional if systolic BP >180 mm Hg or diastolic BP >110 mm Hg. Should not be given if hypertension is uncontrolled. Inform health care professional if hypotension occurs. Hypotension may result from the drug, hemorrhage, or cardiogenic shock.
- Assess patient carefully for bleeding every 15 min during the 1st hr of therapy, every 15–30 min during the next 8 hr, and at least every 4 hr for the duration of therapy. Frank bleeding may occur from sites of invasive procedures or from body orifices. Internal bleeding may also occur (decreased neurologic status; abdominal pain with coffee-grounds emesis or black, tarry stools; hematuria; joint pain). If uncontrolled bleeding occurs, stop medication and notify health care professional immediately.
- Assess neurologic status throughout therapy. Altered sensorium or neurologic changes may be indicative of intracranial bleeding.
- **Myocardial Infarction:** Monitor ECG continuously. Notify health care professional if significant arrhythmias occur. Monitor cardiac enzymes. Radionuclide myocardial scanning and/or coronary angiography may be ordered 7–10 days after therapy to monitor effectiveness of therapy.
- Assess intensity, character, location, and radiation of chest pain. Note presence of associated symptoms (nausea, vomiting, diaphoresis). Notify health care professional if chest pain is unrelieved or recurs.
- Monitor heart sounds and breath sounds frequently. Inform health care professional if signs of HF occur (rales/crackles, dyspnea, S_3 heart sound, jugular venous distention).
- **Acute Ischemic Stroke:** Assess neurologic status. Determine time of onset of stroke symptoms. Alteplase must be administered within 3–4.5 hr of onset (within 3 hr in patients older than 80 yr, those taking oral anticoagulants, those with a baseline National Institutes of Health Stroke Scale score 25, or those with both a history of stroke and diabetes).
- **Pulmonary Embolism:** Monitor pulse, BP, hemodynamics, and respiratory status (rate, degree of dyspnea, ABGs).
- **Cannula/Catheter Occlusion:** Monitor ability to aspirate blood as indicator of patency. Ensure that patient exhales and holds breath when connecting and disconnecting IV syringe to prevent air embolism.
- ***Lab Test Considerations:*** Hematocrit, hemoglobin, platelet count, fibrin/fibrin degradation product (FDP) titer, fibrinogen concentration, prothrombin time, thrombin time, and activated partial thromboplastin time (aPTT) may be evaluated before and frequently during therapy. Bleeding time may be assessed before therapy if patient has received platelet inhibitors.
- Obtain type and crossmatch and have blood available at all times in case of hemorrhage.
- Stools should be tested for occult blood loss and urine for hematuria periodically during therapy.
- ***Toxicity and Overdose: High Alert:*** If local bleeding occurs, apply pressure to site. If severe or internal bleeding occurs, discontinue infusion. Clotting factors and/or blood volume may be restored through infusions of whole blood, packed RBCs, fresh frozen plasma, or cryoprecipitate. Do not administer dextran; it has antiplatelet activity. Aminocaproic acid (Amicar) may be used as an antidote.

Implementation
- ***High Alert:*** Overdose and underdose of thrombolytic medications have resulted in patient harm or death. Have second practitioner independently check original order, dose calculations, and infusion pump settings.

© F.A. Davis Publishing

- Thrombolytic agents should be used only in settings in which hematologic function and clinical response can be adequately monitored.
- Starting two IV lines before therapy is recommended: one for the thrombolytic agent, the other for any additional infusions.
- Avoid invasive procedures, such as IM injections or arterial punctures, with this therapy. If such procedures must be performed, apply pressure to all arterial and venous puncture sites for at least 30 min. Avoid venipunctures at noncompressible sites (jugular vein, subclavian site).
- Acetaminophen may be ordered to control fever.

Alteplase

IV Administration

- **Intermittent Infusion:** Vials are packaged with sterile water for injection (without preservatives) to be used as diluent. Do not use bacteriostatic water for injection. Reconstitute 20-mg vials with 20-mL and 50-mg vials with 50 mL using an 18-gauge needle. Avoid excess agitation during dilution; swirl or invert gently to mix. Solution may foam upon reconstitution. Bubbles will resolve upon standing a few min. Solution will be clear to pale yellow. Stable for 8 hr at room temperature. ***Concentration:*** May be administered as reconstituted (1 mg/mL). ***Dilution:*** May be further diluted immediately before use in an equal amount of 0.9% NaCl or D5W. ***Rate:*** Flush line with 20–30 mL of saline at completion of infusion to ensure entire dose is received. See Route and Dosage section for specific rates.
- **Y-Site Compatibility:** eptifibatide, lidocaine, metoprolol, propranolol.
- **Y-Site Incompatibility:** bivalirudin, dobutamine, dopamine, heparin, nitroglycerin.
- **Cathflo Activase:** Reconstitute by withdrawing 2.2 mL of sterile water (provided) and injecting into *Cathflo Activase* vial, directing diluent into powder for a concentration of 1 mg/mL. Allow slight foaming to dissipate by letting vial stand undisturbed. Do not use bacteriostatic water. Mix by gently swirling to dissolve; complete dissolution should occur within 3 min. Do not shake. Solution should be colorless to pale yellow. Use solution within 8 hr.
- Withdraw 2.0 mL of reconstituted solution and instill into occluded catheter. After 30 min dwell time, attempt to aspirate blood. If catheter remains occluded, allow 120 min dwell time. If catheter function is not restored after one dose, 2nd dose may be instilled. If catheter function is restored, aspirate 4–5 mL of blood to remove *Cathflo Activase* and residual clot. Gently irrigate catheter with 0.9% NaCl.

Reteplase

IV Administration

- **IV Push:** Reconstitute using diluent, needle, syringe, and dispensing pin provided. Reconstitute only with sterile water for injection without preservatives. Solution is colorless. Do not administer solutions that are discolored or contain a precipitate. Slight foaming may occur; allow vial to stand undisturbed for several min to dissipate bubbles. Reconstitute immediately before use. Stable for 4 hr at room temperature. ***Concentration:*** Administer undiluted. ***Rate:*** Administer each bolus over 2 min into an IV line containing D5W; flush line before and after bolus.
- **Y-Site Incompatibility:** bivalirudin, heparin; No other medication should be infused or injected into line used for reteplase.

Tenecteplase

IV Administration

- **Intermittent Infusion:** Vials are packaged with sterile water for injection (without preservatives) to be used as diluent. Do not use bacteriostatic water for injection. Do not discard shield assembly. To reconstitute aseptically withdraw 10 mL of diluent and inject into the tenecteplase vial, directing the stream into the powder. Slight foaming may occur; large bubbles will dissipate if left standing undisturbed for several min. Swirl gently until contents are completely dissolved; do not shake. ***Concentration:*** Solution containing 5 mg/mL is clear and colorless to pale yellow. Withdraw dose from reconstituted vial with the syringe and discard unused portion. Once dose is in syringe, stand the shield vertically on a flat surface (with green side down) and passively recap the red hub cannula. Remove the entire shield assembly, including the red hub cannula, by twisting counter clockwise. Shield assembly also contains the clear-ended blunt plastic cannula; retain for split septum IV access. Reconstitute immediately before use. May be refrigerated and administered within 8 hr. ***Rate:*** Administer as a single IV bolus over 5 sec.
- **Y-Site Incompatibility:** Precipitate forms in line when administered with dextrose-containing solutions. Flush line with saline-containing solution prior to and following administration of tenecteplase.
- **Additive Incompatibility:** Do not admix.

Patient/Family Teaching

- Explain purpose of medication and the need for close monitoring to patient and family. Instruct patient to report hypersensitivity reactions (rash, dyspnea) and bleeding or bruising.
- Explain need for bedrest and minimal handling during therapy to avoid injury. Avoid all unnecessary procedures such as shaving and vigorous tooth brushing.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Lysis of thrombi and restoration of blood flow.
- Prevention of neurologic sequelae in acute ischemic stroke.
- Cannula or catheter patency.

© F.A. Davis Publishing

ticagrelor (tye-ka-grel-or)

Brilinta

Classification

Therapeutic: antiplatelet agents

Pharmacologic: platelet aggregation inhibitors

Indications

To reduce the risk of cardiovascular death, MI, and stroke in patients with acute coronary syndrome (ACS) or a history of MI. Also reduces the risk of stent thrombosis in patients who have received an intracoronary stent for ACS (in combination with aspirin). To reduce the risk of first MI or stroke in patients with coronary artery disease who are at high risk for such events (in combination with aspirin). To reduce the risk of stroke in patients with acute ischemic stroke (NIH Stroke Scale score ≤5) or high-risk transient ischemic attack (TIA) (in combination with aspirin).

Action

Both parent drug and its active metabolite inhibit platelet aggregation by reversibly interacting with platelet $P2Y_{12}$ADP-receptors, preventing signal transduction and platelet activation. **Therapeutic Effects:** Reduction in risk of cardiovascular death, MI, and stroke associated with ACS. Reduction in stent thrombosis. Reduction in risk of first MI or stroke in high-risk patients with coronary artery disease. Reduction in risk of stroke in patients with acute ischemic stroke or TIA.

Pharmacokinetics

Absorption: 36% absorbed following oral administration.

Distribution: Well distributed to tissues.

Protein Binding: 99%.

Metabolism and Excretion: Mostly metabolized in the liver (CYP3A4 enzyme system, some metabolism by CYP3A5) with conversion to an active metabolite (AR-C124910XX); excretion primarily via biliary secretion; <1% excreted unchanged or as active metabolite in urine.

Half-life: *Ticagrelor*—7 hr; *Active metabolite*—9 hr.

TIME/ACTION PROFILE (inhibition of platelet aggregation)

ROUTE	ONSET	PEAK	DURATION
PO	within 30 min	4 hr	5 days†

† Following discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active bleeding; History of intracranial bleeding; Severe hepatic impairment (↑ risk of bleeding); Impending coronary artery bypass graft (CABG) surgery or other surgery (discontinue 5 days prior); Use of thrombolytics for treatment of acute ischemic stroke; Strong inhibitors/inducers of CYP3A enzyme system (avoid concurrent use if possible); Lactation: Lactation.

Use Cautiously in: Moderate hepatic impairment; History of sick sinus syndrome, 2nd- or 3rd-degree heart block, or bradycardia-related syncope in the absence of a pacemaker; Hypotension following recent CABG or percutaneous coronary intervention (PCI) in patients receiving ticagrelor (consider bleeding as a cause); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children; Geri: Some older adults may be more sensitive to drug effects.

Adverse Reactions/Side Effects

CV: bradycardia, heart block. **Endo:** gynecomastia. **Hemat:** BLEEDING. **Resp:** dyspnea, central sleep apnea, Cheyne-Stokes respiration. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions

Drug-Drug: Strong inhibitors of CYP3A4/5 including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, and **voriconazole**↑ levels and the risk of bleeding and should be avoided. **Potent inducers of CYP3A** including **carbamazepine**, **dexamethasone**, **phenobarbital**, **phenytoin**, **rifampin** may ↓ levels and effectiveness and should be avoided. **P-glycoprotein (P-gp) inhibitors** including **cyclosporine** may ↑ levels and the risk of bleeding. Concurrent use of **lovastatin** or **simvastatin** in doses >40 mg/day ↑ risk of statin-related adverse reactions. Effectiveness is ↓ by **aspirin** >100 mg/day (maintain aspirin at 75–100 mg/day). May alter **digoxin** levels (monitoring recommended). Risk of bleeding ↑ by **anticoagulants**, **fibrinolytics**, and chronic **NSAIDs**. **Opioids** may ↓ absorption of ticagrelor and its active metabolite and ↓ antiplatelet effects; consider using parenteral antiplatelet in patients with acute coronary syndrome if concurrent use of opioids needed.

Route/Dosage

Acute Coronary Syndrome or History of Myocardial Infarction

PO (Adults): *Loading dose*—180 mg; followed by *maintenance dose*—90 mg twice daily for 1 yr, then 60 mg twice daily.

Coronary Artery Disease Without a History of Myocardial Infarction or Stroke

PO (Adults): 60 mg twice daily.

© F.A. Davis Publishing

Acute Ischemic Stroke or Transient Ischemic Attack

PO (Adults): *Loading dose*—180 mg; followed by *maintenance dose*—90 mg twice daily for up to 30 days.

Availability (generic available)

Tablets: 60 mg, 90 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of stroke, peripheral vascular disease, or MI periodically during therapy.
- Observe patient for signs and symptoms of hypersensitivity reactions (rash, facial swelling, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if symptoms occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of anaphylactic reaction.
- ***Lab Test Considerations:*** May cause ↑ serum uric acid and ↑ serum creatinine.
- May cause false negative results in heparin-induced platelet aggregation (HIPA) assay for patients with heparin-induced thrombocytopenia (HIT).

Implementation

- **PO:** Administer without regard for food.
- For patients unable to swallow, tablets can be crushed and mixed with water. Mixture can also be administered via a nasogastric tube.
- Patients who have received a loading dose of clopidogrel may be started on ticagrelor.
- For acute ischemic stroke or transient ischemic attack (TIA), administer a loading dose of aspirin (300–325 mg) and a daily maintenance dose of aspirin (75–100 mg) with ticagrelor.
- Discontinue ticagrelor 5 days before planned surgical procedures with a major risk of bleeding. If ticagrelor must be temporarily discontinued, restart as soon as possible. Premature discontinuation of therapy may increase risk of myocardial infarction, stent thrombosis, and death.

Patient/Family Teaching

- Instruct patient to take ticagrelor exactly as directed. Take missed doses as soon as possible unless almost time for next dose; do not double doses. Do not discontinue ticagrelor without consulting health care professional; may increase risk of cardiovascular events. Advise patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient that daily aspirin should not exceed 100 mg and to avoid taking other medications that contain aspirin.
- Inform patient that they will bleed and bruise more easily and it will take longer to stop bleeding. Advise patient to notify health care professional promptly if unusual, prolonged, or excessive bleeding or blood in stool or urine occurs.
- Inform patient that ticagrelor may cause shortness of breath, which usually resolves during therapy. Advise patient to notify health care professional if unexpected or severe shortness of breath or symptoms of hypersensitivity reactions occur.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery or dental procedure. Prescriber should be consulted before stopping ticagrelor.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially aspirin or NSAIDs.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decreased thrombotic cardiovascular events in patients with ACS.
- Reduction in risk of first MI or stroke in high-risk patients with coronary artery disease.
- Reduction in risk of stroke in patients with acute ischemic stroke or TIA.

tigecycline (tye-gi-**sye**-kleen)

Tygacil

Classification

Therapeutic: anti-infectives
Pharmacologic: glycylcyclines

Indications

Complicated skin/skin structure infections, complicated intra-abdominal infections, or community-acquired bacterial pneumonia caused by susceptible bacteria (Should only be used when alternative treatments are not suitable; should NOT be used for diabetic foot infections).

Action

Inhibits bacterial protein synthesis by binding to the 30S ribosomal subunit. **Therapeutic Effects:** Resolution of infection. **Spectrum:** Active against the following Gram-positive bacteria: *Enterococcus faecalis* (vancomycin-susceptible strains only), *Staphylococcus aureus* (methicillin-sensitive and methicillin-resistant strains), *Streptococcus agalactiae*, *Streptococcus anginosus, Streptococcus pneumoniae* (penicillin-susceptible isolates), and *Streptococcus pyogenes*. Also active against these Gram-negative organisms: *Citrobacter freundii*, *Enterobacter cloacae*, *Escherichia coli*, *Haemophilus influenzae*, *Legionella pneumophila*, *Klebsiella oxytoca*, and *Klebsiella pneumoniae*. Additionally active

© F.A. Davis Publishing

against the following anaerobes: *Bacteroides fragilis*, *Bacteroides thetaiotaomicron*, *Bacteroides uniformis*, *Bacteroides vulgatus*, *Clostridium perfringens*, and *Peptostreptococcus micros*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Widely distributed with good penetration into gall bladder, lung, and colon; crosses the placenta.

Metabolism and Excretion: Minimal metabolism; primary route of elimination is biliary/fecal excretion of unchanged drug and metabolites (59%), 33% renal (22% unchanged).

Half-life: 27.1 hr (after 1 dose); 42.4 hr after multiple doses.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Diabetic foot infections; Hospital-acquired or ventilator-associated pneumonia; Pedi: Children.

Use Cautiously in: Complicated intra-abdominal infections due to perforation; Severe hepatic impairment (↓ maintenance dose recommended); OB: Use during pregnancy only if potential maternal benefit outweighs potential fetal risk; may cause permanent teeth discoloration and suppress bone growth in fetus, especially when used during 2nd or 3rd trimester; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Geri: Older adults may be more sensitive to adverse effects.

Adverse Reactions/Side Effects

Derm: STEVENS-JOHNSON SYNDROME (SJS). **Endo:** hyperglycemia, hypoglycemia. **F and E:** hypocalcemia, hyponatremia. **GI:** PANCREATITIS, CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), nausea, vomiting, altered taste, anorexia, dry mouth, hepatotoxicity, jaundice. **GU:** ↑ serum creatinine. **Hemat:** hypofibrinogenemia. **Local:** injection site reactions. **Neuro:** somnolence. **Resp:** pneumonia. **Misc:** DEATH, allergic reactions.

Interactions

Drug-Drug: May ↓ the effectiveness of **hormonal contraceptives**. Effects on **warfarin** are unknown (monitoring recommended). May ↑ trough levels and risk of toxicity of **calcineurin inhibitors**, including **cyclosporine** and **tacrolimus**.

Route/Dosage

IV (Adults): 100 mg initially, then 50 mg every 12 hr for 5–14 days (skin/skin structure infections and intra-abdominal infections) or 7–14 days (pneumonia).

Hepatic Impairment

IV (Adults): *Child-Pugh C*— 100 mg initially, then 25 mg every 12 hr.

Availability (generic available)

Lyophilized powder for injection: 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. 1st dose may be given before receiving results.
- Before initiating therapy, obtain a history of tetracycline hypersensitivity; may also have an allergic response to tigecycline.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of CDAD. May begin up to several wk following cessation of therapy.
- Assess patient for signs of pancreatitis (nausea, vomiting, abdominal pain, increased serum lipase or amylase) periodically during therapy. May require discontinuation of therapy.
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- ***Lab Test Considerations:*** Monitor baseline blood coagulation parameters, including fibrinogen, before starting therapy and regularly during therapy.
- May cause anemia, leukocytosis, and thrombocythemia.
- May cause ↑ serum alkaline phosphatase, amylase, bilirubin, LDH, AST, and ALT.
- May cause hyperglycemia, hypokalemia, hypoproteinemia, hypocalcemia, hyponatremia, and ↑ BUN level.

Implementation

- May cause yellow-brown discoloration and softening of teeth and bones if administered prenatally or during early childhood. Not recommended for children under 8 yr of age or during pregnancy or lactation unless used for the treatment of anthrax.

IV Administration

- **Intermittent Infusion:** Reconstitute each vial with 5.3 mL of 0.9% NaCl or D5W to achieve a concentra-

T

© F.A. Davis Publishing

tion of 10 mg/mL. ***Dilution:*** Dilute further in 100 mL of D5W, LR, or 0.9% NaCl. Reconstituted solution should be yellow to orange in color. Do not administer solutions that are discolored or contain particulate matter. Infusion is stable for up to 24 hr at room temperature or for up to 48 hr if refrigerated. ***Concentration:*** Final concentration of infusion should be ≤1 mg/mL. ***Rate:*** Infuse over 30–60 min. Flush line before and after infusion with 0.9% NaCl or D5W.

- **Y-Site Compatibility:** acetylcysteine, acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, argatroban, arsenic trioxide, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, droperidol, enalaprilat, epinephrine, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isuvuconazonium, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, meropenem/vaborbactam, mesna, methohexital, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, tedizolid, telavancin, theophylline, thiopental, thiotepa, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amiodarone, amphotericin B deoxycholate, bleomycin, chloramphenicol, chlorpromazine, dantrolene, diazepam, epirubicin, esomeprazole, hydralazine, idarubicin, nicardipine, phenytoin, quinupristin/dalfopristin, verapamil.

Patient/Family Teaching

- Advise patient that full course of therapy should be completed, even if feeling better. Skipping doses or not completing full course of therapy may result in decreased effectiveness and increased risk of bacterial resistance.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools). Skin rash, pruritus, and urticaria should also be reported.
- Rep: Advise females of reproductive potential to use a nonhormonal method of contraception while taking tigecycline and until next menstrual period. Use during the second and third trimesters may cause permanent yellow-gray-brown discoloration of the teeth and reversible inhibition of bone growth. Advise patient to avoid breast feeding during and for 9 days after last dose of tigecycline. Advise patient to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection.

tildrakizumab

(til-dra-**kiz**-ue-mab)

Ilumya

Classification

Therapeutic: antipsoriatics

Pharmacologic: interleukin antagonists, monoclonal antibodies

Indications

Moderate-to-severe plaque psoriasis in patients who are candidates for phototherapy or systemic therapy.

Action

Binds to the p19 protein subunit of the interleukin (IL)-23 cytokine to prevent its interaction with the IL-23 receptor. This cytokine is normally involved in inflammatory and immune responses. Binding to interleukins antagonizes their effects, inhibiting the release of proinflammatory cytokines and chemokines. **Therapeutic Effects:** Decrease in area and severity of psoriatic lesions.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: 73–80% absorbed following subcutaneous administration.
Distribution: Well distributed to tissues.
Metabolism and Excretion: Broken down by catabolic processes into peptides and amino acids.
Half-life: 23 days.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	6 days	12 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active, untreated infection.
Use Cautiously in: History of tuberculosis (possibility of reactivation); OB: Use only if potential maternal benefit justifies potential risk to fetus; Lactation: Use only if potential maternal benefit justifies potential risk to fetus; Pedi: Safety and effectiveness not established.
Exercise Extreme Caution in: Chronic infection or history of recurrent infection.

Adverse Reactions/Side Effects

GI: diarrhea. **Local:** injection site reactions. **Misc:** HYPERSENSITIVITY REACTIONS (angioedema, urticaria), infection.

Interactions

Drug-Drug: May ↓ antibody response to and ↑ risk of adverse reactions from **live vaccines**; avoid use during therapy.

Route/Dosage

Subcut (Adults): 100 mg initially and 4 wk later, then 100 mg every 12 wk.

Availability

Solution for subcutaneous injection: 100 mg/mL in prefilled syringes.

NURSING IMPLICATIONS

Assessment

- Assess affected area(s) prior to and periodically during therapy.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with tildrakizumab. Monitor patients for signs and symptoms of active TB during and after therapy.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to injection. Monitor new infections closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections.

Implementation

- Injection should be administered by a health care professional.
- Update immunizations to current prior to initiating therapy.
- **Subcut:** Allow prefilled syringe to sit in carton at room temperature for 30 min prior to injection. Solution is clear to slightly opalescent, colorless to slightly yellow solution; do not administer solutions that are cloudy, discolored, or contain particulate matter. Air bubbles in solution do not need removal; do not shake. Inject into abdomen, thigh, or upper arm. Do not inject within 2 inches of umbilicus, or into skin that is tender, bruised, erythematous, indurated, affected by psoriasis or into scars, stretch marks, or blood vessels. Follow manufacturer's directions for retractable needle syringe. Store in refrigerator in original carton until time of use; do not freeze. May be stored at room temperature in original carton for up to 30 days.

Patient/Family Teaching

- Explain purpose of tildrakizumab to patient. If a dose is missed, administer as soon as possible. Resume dosing at regularly scheduled interval. Advise patient and caregiver to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if signs and symptoms of hypersensitivity reaction (feel faint, swelling of face, eyelids, lips, mouth, tongue or throat, skin rash, trouble breathing or throat tightness, chest tightness and infection (fever; sweats; chills; sore throat; cough; shortness of breath); blood in phlegm (mucus); muscle aches; warm, red, or painful skin or sores different from psoriasis; weight loss; diarrhea or stomach pain; burning during urination or urinating more often than normal) occur.
- Instruct patient to avoid receiving live vaccines during therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in extent and severity of psoriatic lesions.

tioconazole, See ANTIFUNGALS (VAGINAL).

© F.A. Davis Publishing

tiotropium (tye-o-trope-ee-yum)

Spiriva, Spiriva Handihaler, Spiriva Respimat

Classification

Therapeutic: bronchodilators
Pharmacologic: anticholinergics

Indications

Long-term maintenance treatment of bronchospasm due to COPD. Reduce exacerbations in patients with COPD. Long-term maintenance treatment of asthma.

Action

Acts as anticholinergic by selectively and reversibly inhibiting M_3 receptors in smooth muscle of airways.

Therapeutic Effects: Decreased incidence and severity of bronchospasm in COPD and asthma.

Pharmacokinetics

Absorption: *Handihaler*—19% absorbed following inhalation; *Respimat*—33% absorbed following inhalation.

Distribution: Extensive tissue distribution; due to route of administration ↑ concentrations occur in lung.

Metabolism and Excretion: 74% excreted unchanged in urine; 25% of absorbed drug is metabolized.

Half-life: 5–6 days.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
inhaln	rapid	5 min	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to tiotropium or ipratropium; Concurrent ipratropium.

Use Cautiously in: Hypersensitivity to atropine or milk proteins; Narrow-angle glaucoma, prostatic hyperplasia, bladder neck obstruction (may worsen condition); CCr ≤60 mL/min (monitor closely); OB, Lactation: Safety not established; Pedi: Children <6 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: tachycardia. **Derm:** rash. **EENT:** glaucoma. **GI:** dry mouth, constipation. **GU:** urinary difficulty, urinary retention. **Resp:** paradoxical bronchospasm. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions

Drug-Drug: Should not be used concurrently with **ipratropium** due to risk of additive anticholinergic effects.

Route/Dosage

Inhaln (Adults): *Handihaler*—18 mcg once daily; *Respimat*—2 inhalations of 2.5 mcg once daily.

Inhaln (Adults and Children ≥6 yr): *Respimat*—2 inhalations of 1.25 mcg once daily.

Availability

Dry powder capsules for inhalation (Handihaler): 18 mcg. **Cost:** $317.33/30 capsules. **Inhalation solution (Respimat):** 1.25 mcg/inhalation in cartridge (delivers 28 or 60 metered inhalations), 2.5 mcg/inhalation in cartridge (delivers 28 or 60 metered inhalations).

NURSING IMPLICATIONS

Assessment

- **Inhaln:** Assess respiratory status (rate, breath sounds, degree of dyspnea, pulse) before administration and at peak of medication. Consult health care professional about alternative medication if severe bronchospasm is present; onset of action is too slow for patients in acute distress. If paradoxical bronchospasm (wheezing) occurs, withhold medication and notify health care professional immediately.

Implementation

- Do not confuse Spiriva (tiotropium) with Apidra (insulin glulisine) or Inspra (eplerenone).
- **Inhaln:** See Appendix C for administration of inhalation medications.

Patient/Family Teaching

- Instruct patient to take medication as directed. Capsules are for inhalation only and must not be swallowed. Take missed doses as soon as remembered unless almost time for the next dose; space remaining doses evenly during day. Do not double doses.
- Advise patient that tiotropium is not to be used for acute bronchospasm attacks, but may be continued during an acute exacerbation.
- Advise patient to notify health care professional immediately if signs and symptoms of angioedema (swelling of the lips, tongue, or throat, itching, rash) or signs of glaucoma (eye pain or discomfort, blurred vision, visual halos or colored images in association with red eyes from conjunctival congestion and corneal edema) occur.
- Caution patient to avoid spraying medication in eyes; may cause blurring of vision and pupil dilation.
- Advise patient that rinsing mouth after using inhaler, good oral hygiene, and sugarless gum or candy may minimize dry mouth; usually resolves with continued treatment.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, including eye drops.
- Advise patient to inform health care professional if pregnancy is planned or suspected or if breast feeding.
- **Handihaler:** Instruct patient in proper use and cleaning of the Handihaler inhaler. Review the *Patient's Instructions for Use* guide with patient. Capsules should be stored in sealed blisters; remove im-

© F.A. Davis Publishing

mediately before use or effectiveness of capsules is reduced. Tear blister strip carefully to expose only one capsule at a time. Discard capsules that are inadvertently exposed to air. *Spiriva* should be administered only via the Handihaler and the Handihaler should not be used with other medications. When disposing of capsule, tiny amount of powder left in capsule is normal.

- **Respimat:** Advise patient to prime inhaler by actuating inhaler toward the ground until an aerosol cloud is visible, then repeat process 3 more times. If not used for >3 days, actuate inhaler once to prepare inhaler for use. If not used for >21 days, actuate inhaler until an aerosol cloud is visible, then repeat 3 more times to prepare inhaler for use. Discard 3 mo from 1st use.

Evaluation/Desired Outcomes

- Decreased dyspnea.
- Improved breath sounds.
- Fewer exacerbations in patients with COPD and asthma.

HIGH ALERT

tirofiban (tye-roe-**fye**-ban)

Aggrastat

Classification

Therapeutic: antiplatelet agents

Pharmacologic: glycoprotein IIb/IIIa inhibitors

Indications

To reduce the incidence of thrombotic cardiovascular events (death, MI, or refractory ischemia/repeat cardiac procedure in patients with non-ST elevation acute coronary syndrome [unstable angina/non-ST-elevation MI]).

Action

Decreases platelet aggregation by reversibly antagonizing the binding of fibrinogen to the glycoprotein IIb/IIIa binding site on platelet surfaces. **Therapeutic Effects:** Inhibition of platelet aggregation resulting in decreased incidence of new MI, death, or refractory ischemia with the need for repeat cardiac procedures.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Excreted mostly unchanged by the kidneys (65%); 25% excreted unchanged in feces.

Half-life: 2 hr.

TIME/ACTION PROFILE (effects on platelet function)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	30 min†	brief‡

†>90% inhibition of platelet aggregation at end of initial 30-min infusion.

‡Inhibition is reversible following cessation of infusion.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active internal bleeding or history of bleeding within previous 30 days; History of intracranial hemorrhage, intracranial neoplasm, arteriovenous malformation or aneurysm; History of thrombocytopenia during previous tirofiban therapy; History of hemorrhagic stroke or other stroke within 30 days; Major surgical procedure or severe physical trauma within 30 days; History, symptoms, or other findings associated with aortic aneurysm; Severe hypertension (systolic BP >180 mm Hg and/or diastolic BP >110 mm Hg); Concurrent use of other glycoprotein IIb/IIIa receptor antagonists; Acute pericarditis.

Use Cautiously in: Platelet count <150,000/mm^3; Hemorrhagic retinopathy; Females (↑ risk of bleeding); Severe renal impairment (↓ rate of infusion if CCr ≤60 mL/min); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of bleeding in older adults.

Adverse Reactions/Side Effects

Noted for patients receiving heparin and aspirin in addition to tirofiban.

CV: bradycardia, coronary dissection, edema, vasovagal reaction. **Derm:** hives, rash, sweating. **GI:** nausea. **Hemat:** bleeding, thrombocytopenia. **MS:** leg pain. **Neuro:** headache, dizziness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever, pelvic pain.

Interactions

Drug-Drug: Concurrent use of **aspirin**, **NSAIDs**, **warfarin**, **heparin**, **heparin-like agents**, **eptifibatide**, **clopidogrel**, or **dipyridamole** may ↑ risk of bleeding, although these agents are frequently used together or in sequence. Risk of bleeding may be ↑ by concurrent use of **cefotetan** **valproic acid**.

Drug-Natural Products: ↑ anticoagulant effect and bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **dong quai**, **fenugreek**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, **licorice**, and others.

Route/Dosage

IV (Adults): 25 mcg/kg within 5 min, then 0.15 mcg/kg/min for up to 18 hr.

Renal Impairment

IV (Adults): *CCr ≤60 mL/min* — 25 mcg/kg within 5 min, then 0.075 mcg/kg/min for up to 18 hr.

© F.A. Davis Publishing

Availability (generic available)

Premixed infusion: 5 mg/100 mL 0.9% NaCl, 12.5 mg/250 mL 0.9% NaCl. **Solution for injection:** 250 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for bleeding. Most common is oozing from the arterial access site for cardiac catheterization. Arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and nasogastric tubes should be minimized. Noncompressible sites for IV access should be avoided. If bleeding cannot be controlled with pressure, discontinue tirofiban and heparin immediately.
- During vascular access, avoid puncturing posterior wall of femoral artery. Maintain bedrest with head of bed elevated 30° and affected limb restrained in a straight position while the vascular sheath is in place. Heparin should be discontinued for 3–4 hr and activated clotting time (ACT) <180 sec or activated partial thromboplastin time (aPTT) <45 sec prior to pulling the sheath. Use compressive techniques to obtain hemostasis and monitor closely. Sheath hemostasis should be maintained for >4 hr before discharge from the hospital.
- Monitor for signs of thrombocytopenia (chills, low-grade fever) during therapy.
- ***Lab Test Considerations:*** Assess hemoglobin, hematocrit, and platelet count prior to tirofiban therapy, within 6 hr following loading infusion, and at least daily during therapy (more frequently if evidence of significant decline). May cause ↓ hemoglobin and hematocrit.
- If platelet count ↓ to <90,000/mm^3, perform additional platelet counts to rule out pseudothrombocytopenia. If thrombocytopenia is confirmed, tirofiban and heparin should be discontinued and condition monitored and treated.
- To monitor unfractionated heparin, assess aPTT 6 hr after the start of heparin infusion. Adjust heparin to maintain aPTT at approximately 2 times control.
- May cause presence of urine and fecal occult blood.

Implementation

- Do not confuse Aggrastat (tirofiban) with argatroban.
- ***High Alert:*** Use of antiplatelet medications has resulted in patient harm and/or death from internal hemorrhage or intracranial bleeding. Have second practitioner independently check original order, dosage calculations, and infusion pump settings.
- Most patients receive heparin and aspirin concurrently with tirofiban.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused portion.

IV Administration

- **IV Push:** Withdraw bolus dose from 15-mL premixed bolus vial into a syringe; may also be administered from the 100-mL premixed vial or from the 250-mL premixed bag. Do not dilute. Administer within 5 min via syringe or IV pump. Immediately following bolus dose, administer maintenance infusion from the 100-mL premixed vial or 250-mL premixed bag via an IV pump. Discard any unused portion left in the vial or bag.
- **Intermittent Infusion:** ***Dilution:*** Tirofiban injection premix is ready for administration and dose not require any further dilution. ***Concentration:*** 50 mcg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate-cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibitide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapa-

© F.A. Davis Publishing

mil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B lipid complex, dantrolene, diazepam, phenytoin.

Patient/Family Teaching
- Explain purpose of tirofiban to patient.
- Instruct patient to notify health care professional immediately if any bleeding is noted.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes
- Inhibition of platelet aggregation resulting in decreased incidence of new MI, death, or refractory ischemia with the need for repeat cardiac procedures.

tisotumab vedotin
(tye-**sot**-ue-mab ve-**doe**-tin)
Tivdak

Classification
Therapeutic: antineoplastics
Pharmacologic: antimicrotubulars, tissue factor-directed antibody drug conjugates

Indications
Recurrent or metastatic cervical cancer with disease progression during or after chemotherapy.

Action
Acts as an antibody-drug conjugate (ADC) composed of a human IgG1 monoclonal antibody that is directed against tissue factor (located on the cell surface of cancer cells). Monomethyl auristatin E (MMAE) (an agent that disrupts microtubles and subsequently causes apoptosis) is attached to the antibody via a cleavable linker. The ADC binds to tissue factor on the cancer cells; the complex is then internalized, and then the MMAE is cleaved and released inside the cancer cells.
Therapeutic Effects: Reduced progression of recurrent or metastatic cervical cancer.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Minimally distributed to extravascular tissues.
Metabolism and Excretion: Monoclonal antibody component is degraded into smaller peptides via catabolism. MMAE is primarily metabolized in the liver via CYP3A4 isoenzyme. 17% of MMAE excreted in feces, and 6% excreted in urine, primarily as unchanged drug.
Half-life: *ADC*—4 days; *MMAE*—2.5 days.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	ADC: end of infusion; MMAE: 2–3 days	unknown

Contraindications/Precautions
Contraindicated in: Moderate or severe hepatic impairment; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
CV: VENOUS THROMBOEMBOLISM. **Derm:** alopecia, pruritus, rash. **EENT:** blepharitis, conjunctival abrasion/erosion, conjunctival hemorrhage, conjunctival hyperemia, conjunctival scar, conjunctivitis, corneal bleeding, corneal erosion, corneal scar, dry eye, epistaxis, keratitis, ocular hyperemia, blepharitis. **Endo:** hypoglycemia. **F and E:** hypomagnesemia, hyponatremia. **GI:** abdominal pain, constipation, diarrhea, hypoalbuminemia, ↑ liver enzymes, nausea, vomiting, ileus. **GU:** ↑ serum creatinine, urinary tract infection, ↓ fertility (males). **Hemat:** HEMORRHAGE, anemia, ↑ activated partial thromboplastin time, ↑ prothrombin time, leukopenia, lymphocytopenia, neutropenia. **Metab:** ↓ appetite, ↓ weight, hyperuricemia. **MS:** arthralgia, ↑ creatine kinase, myalgia, muscle weakness. **Neuro:** fatigue, peripheral neuropathy. **Resp:** PNEUMONITIS, pneumonia. **Misc:** fever.

Interactions
Drug-Drug: Strong CYP3A4 inhibitors, including **ketoconazole**, may ↑ levels and risk of toxicity of MMAE; monitor closely.

Route/Dosage
IV (Adults ≥100 kg): 200 mg every 3 wk; continue until disease progression or unacceptable toxicity.
IV (Adults <100 kg): 2 mg/kg every 3 wk; continue until disease progression or unacceptable toxicity.

Availability
Lyophilized powder for injection: 40 mg/vial.

NURSING IMPLICATIONS

Assessment
- May cause changes in the corneal epithelium and conjunctiva resulting in changes in vision, including

© F.A. Davis Publishing

severe vision loss, and corneal ulceration; usually begin within first 1–2 mo of therapy. Refer patients to an eye care provider for an ophthalmic exam including visual acuity and slit lamp exam at baseline, prior to each dose, and as clinically indicated. Adhere to premedication and required eye care to reduce the risk of ocular adverse reactions. Promptly refer patients to an eye care provider for any new or worsening ocular signs and symptoms. *If superficial punctate* **keratitis** *(SPK) occurs,* monitor patient. *For first occurrence of confluent superficial keratitis,* hold tisotumab dose until SPK or normal, then resume therapy at next lower dose. *For second occurrence of confluent superficial keratitis,* permanently discontinue tisotumab. *For first occurrence of* **conjunctival ulceration**, hold dose until complete conjunctival re-epithelialization, then resume therapy at next lower dose. *For second occurrence of conjunctival ulceration,* permanently discontinue tisotumab. *If* **conjunctival or corneal scarring or symblepharon** *occur,* permanently discontinue tisotumab. *If Grade 1* **conjunctivitis and other ocular adverse reactions** *occur,* monitor patient. *For first occurrence of Grade 2 conjunctivitis and other ocular adverse reactions,* hold dose until Grade ≤1, then resume therapy at same dose. For second occurrence, hold dose until Grade ≤1, then resume therapy at next lower dose level. If no resolution to Grade ≤1, permanently discontinue. *For third occurrence of Grade 3 or 4 conjunctivitis,* permanently discontinue tisotumab.

- Monitor for signs and symptoms of neuropathy, (paresthesia, tingling or a burning sensation, neuropathic pain, muscle weakness, dysesthesia) during therapy; usually occurs within first 2–3 mo of therapy. *If Grade 2 peripheral neuropathy occurs,* hold dose until Grade ≤1, then resume therapy at next lower dose. If Grade 3 or 4 peripheral neuropathy occurs, permanently discontinue tisotumab.
- Monitor for signs and symptoms of hemorrhage. *If pulmonary or CNS hemorrhage occurs,* permanently discontinue tisotumab. *For Grade 2 hemorrhage in any other location,* hold tisotumab until bleeding has resolved then resume at same dose. *For first occurrence of Grade 3 hemorrhage in any other location,* hold tisotumab until bleeding has resolved then resume at same dose. *For second occurrence of Grade 3 or Grade 4 hemorrhage,* permanently discontinue tisotumab.
- Monitor for signs and symptoms of pneumonitis (hypoxia, cough, dyspnea or interstitial infiltrates on radiologic exams) during therapy. *If Grade 2 pneumonitis occurs,* hold dose until Grade ≤1 for persistent or recurrent pneumonitis, consider resuming therapy at next lower dose. If Grade 3 or 4 pneumonitis occurs, discontinue tisotumab permanently.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- May cause ↓ hemoglobin, ↓ lymphocytes, ↓ leukocytes, and ↓ neutrophils.
- May cause ↑ serum creatinine, AST, ALT, LDH, urate, alkaline phosphatase, and creatine kinase levels.
- May cause ↓ blood glucose, sodium, magnesium, and albumin.
- May cause increased prothrombin INR and prolonged activated partial thromboplastin time.

Implementation

- After examination with a slit lamp, administer first drop of topical corticosteroid eye drops in each eye prior to each infusion. Instruct patient to continue to administer eye drops in each eye for 72 hours after each infusion.
- Administer topical ocular vasoconstrictor drops in each eye immediately prior to each infusion. Change cold packs as needed throughout infusion to ensure eye area remains cold.
- Use cooling eye pads during the infusion.
- **Recommended Dose Reductions:** *Starting dose:* 2 mg/kg. *First dose reduction:* 1.3 mg/kg. *Second dose reduction:* 0.9 mg/kg.

IV Administration

- **IV:** Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers.
- **Intermittent Infusion:** Reconstitute each 40 mg vial with 4 mL of Sterile Water for Injection. Slowly swirl each vial until contents are completely dissolved; do not shake. Allow reconstituted vial(s) to settle. Do not expose to direct sunlight. Reconstituted solution is clear to slightly opalescent, colorless to brownish-yellow; do not administer solutions that are cloudy, discolored, or contain particulate matter. Add to diluent immediately. Reconstituted solution is stable for 8 hr at room temperature or 24 hr if refrigerated; do not freeze. ***Concentration:*** 10 mg/mL. ***Dilution:*** Dilute further with D5W, 0.9% NaCl, or LR. Mix by gentle inversion. ***Concentration:*** 0.7 mg/mL to 2.4 mg/mL. Diluted solution is clear to slightly opalescent, colorless to brownish-yellow; do not administer solutions that are cloudy, discolored, or contain particulate matter. *If diluted with 0.9% NaCl,* solution is stable up to 18 hr if refrigerated. *If diluted with D5W,* solution is stable up to 24 hr if refrigerated. *If diluted with LR,* solution is stable up to 12 hr if refrigerated. Do not freeze. Once removed from refrigerator, complete infusion within 4 hr. ***Rate:*** Infuse over 30 min through an IV line containing a 0.2 micron in-line filter. Do not administer as IV push or bolus.
- **Y-Site Incompatibility:** Do not mix with or administer with other medications.

© F.A. Davis Publishing

Patient/Family Teaching

- Explain purpose of tisotumab to patient. Advise patient to read *Medication Guide* before starting and periodically during therapy in case of changes.
- Inform patient of potential eye problems and eye drop regimen. Instruct patient to use steroid eye drops before each infusion and as prescribed for 72 hrs after each infusion. Instruct patient to use vasoconstrictor eye drops right before each infusion. Instruct patient to administer topical lubricating eye drops for duration of therapy and for 30 days after last dose of tisotumab. Advise patient to notify health care professional if new or worsening vision changes or eye problems develop during therapy.
- Advise patients to avoid wearing contact lenses unless advised by their eye care provider for the entire duration of therapy.
- Advise patient to notify health care professional immediately if signs and symptoms of bleeding (blood in stools or black stools, blood in urine, cough up or vomit blood, unusual vaginal bleeding, any unusual or heavy bleeding), lung problems (trouble breathing, shortness of breath, cough) or peripheral neuropathy (numbness in hands or feet, muscle weakness) occur.
- Discuss with patient the possibility of hair loss. Explore methods of coping. May also cause darkening of skin and fingernails.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 2 mo after last dose and to avoid breast feeding during and for 3 wk after last dose. Advise males with female partners of reproductive potential to use effective contraception during and for 4 mo after last dose. May impair male fertility.

Evaluation/Desired Outcomes

- Reduced progression of recurrent or metastatic cervical cancer.

tobramycin, See AMINOGLYCOSIDES.

tocilizumab (toe-si-liz-oo-mab)

Actemra, Actemra ACTPen

Classification

Therapeutic: antirheumatics, immunosuppressants

Pharmacologic: interleukin antagonists

Indications

Moderately- to severely-active rheumatoid arthritis in patients who have not responded to at least one disease-modifying antirheumatic drug [DMARD] (as monotherapy or in combination with methotrexate or other non-biologic DMARDs). Active systemic juvenile idiopathic arthritis (as monotherapy or in combination with methotrexate). Active polyarticular juvenile idiopathic arthritis (as monotherapy or in combination with methotrexate). Giant cell arteritis. Chimeric antigen receptor (CAR) T cell-induced severe or life-threatening cytokine release syndrome. Systemic sclerosis-associated interstitial lung disease.

Action

Acts as in inhibitor of interleukin-6 (IL-6) receptors by binding to them. IL-6 is a mediator of various inflammatory processes. **Therapeutic Effects:** Slowed progression of rheumatoid arthritis, systemic/polyarticular juvenile idiopathic arthritis, giant cell arteritis. Resolution of cytokine release syndrome. Slowing in rate of decline in pulmonary function in systemic sclerosis-associated interstitial lung disease.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability; 80% absorbed following subcut administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: *4 mg/kg dose*— up to 11 days; *8 mg/kg*— up to 13 days.

TIME/ACTION PROFILE (improvement)

ROUTE	ONSET	PEAK	DURATION
IV	within 1 mo	4 mo	unknown
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Serious infections; Active hepatic disease/impairment; Absolute neutrophil count (ANC) <2000/mm^3 (<500/mm^3 while on therapy) or platelet count below 100,000/mm^3 (<50,000/mm^3 while on therapy); Lactation: Lactation.

Use Cautiously in: Patients at risk for GI perforation, including patients with diverticulitis; Renal or hepatic impairment; Concurrent use of other hepatotoxic medications (↑ risk of hepatotoxicity); Patients with tuberculosis risk factors; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Children <2 yr (safety not established); Geri: ↑ risk of adverse reactions in older adults.

Adverse Reactions/Side Effects

CV: hypertension. **Derm:** STEVENS-JOHNSON SYNDROME, rash. **EENT:** nasopharyngitis. **GI:** GASTROINTESTINAL PERFORATION, HEPATOTOXICITY, ↑ liver en-

© F.A. Davis Publishing

zymes. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA. **Metab:** ↑ lipids. **Neuro:** headache, dizziness.. **Resp:** upper respiratory tract infections. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), INFECTION (including tuberculosis, disseminated fungal infections and infections with opportunistic pathogens), infusion reactions.

Interactions

Drug-Drug: May alter the activity of CYP450 enzymes; the effects of the following drugs should be monitored: **cyclosporine**, **theophylline**, **warfarin**, **hormonal contraceptives**, **atorvastatin**, and **lovastatin**. Other drugs which are substrates for this system should also be monitored; effect may persist for several wk after discontinuation. Concurrent use of other hepatotoxic medications, including **methotrexate**, may ↑ risk of hepatotoxicity. May ↓ antibody response to and ↑ risk of adverse reactions to **live virus vaccines**; do not administer concurrently.

Route/Dosage

Rheumatoid Arthritis

IV (Adults): 4 mg/kg every 4 wk; may ↑ to 8 mg/kg every 4 wk based on clinical response.
Subcut (Adults ≥100 kg): 162 mg once weekly.
Subcut (Adults <100 kg): 162 mg every 2 wk, may ↑ to every wk based on clinical response.

Systemic Juvenile Idiopathic Arthritis

IV (Children ≥2 yr and ≥30 kg): 8 mg/kg every 2 wk.
IV (Children ≥2 yr and <30 kg): 12 mg/kg every 2 wk.
Subcut (Children ≥2 yr and ≥30 kg): 162 mg once weekly.
Subcut (Children ≥2 yr and <30 kg): 162 mg every 2 wk.

Polyarticular Juvenile Idiopathic Arthritis

IV (Children ≥2 yr and ≥30 kg): 8 mg/kg every 4 wk.
IV (Children ≥2 yr and <30 kg): 10 mg/kg every 4 wk.
Subcut (Children ≥2 yr and ≥30 kg): 162 mg every 2 wk.
Subcut (Children ≥2 yr and <30 kg): 162 mg every 3 wk.

Giant Cell Arteritis

Subcut (Adults): 162 mg once weekly (with a tapering course of corticosteroids); may also consider giving 162 mg every 2 wk (with a tapering course of corticosteroids) based on clinical response.

Cytokine Release Syndrome

IV (Adults and Children ≥2 yr and ≥30 kg): 8 mg/kg (max = 800 mg/dose) initially; if patient does not clinically improve after initial dose, up to 3 additional doses may be administered every 8 hr.
IV (Adults and Children ≥2 yr and <30 kg): 12 mg/kg initially; if patient does not clinically improve after initial dose, up to 3 additional doses may be administered every 8 hr.

Systemic Sclerosis-Associated Interstitial Lung Disease

Subcut (Adults): 162 mg once weekly.

Availability

Solution for intravenous injection: 20 mg/mL. **Solution for subcutaneous injection (autoinjectors or prefilled syringes):** 162 mg/0.9 mL.

NURSING IMPLICATIONS

Assessment

- Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to injection. Tocilizumab is contraindicated in patients with active infection. Monitor new infections closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Signs and symptoms of inflammation may be lessened due to suppression from tocilizumab. Infections may be fatal, especially in patients taking immunosuppressive therapy. If patient develops a serious infection, discontinue tocilizumab until infection is controlled.
- Monitor for injection site reactions (redness and/or itching, rash, hemorrhage, bruising, pain, or swelling). Rash will usually disappear within a few days. Application of a towel soaked in cold water may relieve pain or swelling.
- Monitor patient for signs of anaphylaxis (urticaria, dyspnea, facial edema) following injection. Medications (antihistamines, corticosteroids, epinephrine) and equipment should be readily available in the event of a severe reaction. Discontinue tocilizumab immediately if anaphylaxis or other severe allergic reaction occurs.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with tocilizumab.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dypsnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping tocilizumab until the infection has been diagnosed and adequately treated.
- ***Lab Test Considerations:*** Assess CBC with platelet count prior to initiating therapy and after 4–8

© F.A. Davis Publishing

wk, then every 3 mo during therapy. Do not administer tocilizumab to patients with an ANC <2000/mm³, platelet count <100,000/mm³, or ALT or AST above 1.5 times the upper limit of normal (ULN).

- *If ANC >1000/mm³, maintain dose. If ANC 500–1000/mm³,* interrupt IV tocilizumab until ANC >1000/mm³, then resume at 4 mg/kg and ↑ to 8 mg/kg as clinically appropriate or reduce subcut tocilizumab to every other wk and increase frequency to every wk as clinically appropriate. *If ANC <500/mm³,* discontinue tocilizumab.
- *If platelet count 50,000–100,000/mm³,* interrupt dosing until platelet count is >100,000/mm³, then resume IV dosing at 4 mg/kg and ↑ to 8 mg/kg as clinically appropriate or reduce subcut tocilizumab to every other wk and increase frequency to every wk as clinically appropriate. *If platelet count is <50,000/mm³,* discontinue tocilizumab.
- **For rheumatoid arthritis, giant cell arteritis and interstitial lung disease,** obtain liver test panel (serum alanine aminotransferase [ALT], aspartate aminotransferase [AST], alkaline phosphatase, and total bilirubin before starting therapy, every 4–8 wk after start of therapy for first 6 mo and every 3 mo thereafter. *If liver enzymes persistently ↑ >1–3 × ULN,* reduce IV tocilizumab dose to 4 mg/kg and reduce subcut injection to every other wk or interrupt until AST/ALT have normalized. *If >3–5 × ULN* (confirmed by repeat testing), interrupt tocilizumab until <3 × ULN and follow recommendations for ↑ >1–3 × ULN. *If persistent ↑ >1–3 × ULN or >5 × ULN,* discontinue tocilizumab. **For Systemic Juvenile Idiopathic Arthritis (SJIA) and Polyarticular Juvenile Idiopathic Arthritis (PJIA),** monitor liver test panel at the time of the 2nd administration and thereafter every 4–8 wk for PJIA and every 2 to 4 wk for SJIA.
- Monitor lipid levels after 4–8 wk of therapy, then follow clinical guidelines for management of hyperlipidemia. May cause ↑ total cholesterol, triglycerides, LDL cholesterol, and/or HDL cholesterol.

Implementation

- Administer a tuberculin skin test prior to administration of tocilizumab. Patients with latent TB should be treated for TB prior to therapy.
- Immunizations should be current prior to initiating therapy. Patients on tocilizumab may receive concurrent vaccinations, except for live vaccines.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused solution.
- Other DMARDs should be continued during tocilizumab therapy.
- **Children:** Do not change dose based on single visit weight; weight fluctuates.
- To switch from IV to Subcut, administer next dose Subcut instead of IV.
- **Subcut:** Solution is clear and colorless to pale yellow; do not administer solutions that are discolored or contain particulate matter. Rotate injection sites; avoid sites with moles, scars, areas where skin is tender, bruised, red, hard, or not intact.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Withdraw volume of 0.9% NaCl or 0.45% NaCl from a 100-mL bag (50 mL bag for children <30 kg) equal to volume of solution required for patient's dose. Slowly add tocilizumab from each vial to infusion bag. Invert slowly to mix; avoid foaming. Do not infuse solutions that are discolored or contain particulate matter. Diluted solution is stable for 24 hr if refrigerated or at room temperature; protect from light. Allow solution to reach room temperature before infusing. ***Rate:*** Infuse over 60 min. Do not administer via IV push or bolus.
- **Y-Site Incompatibility:** Do not infuse concomitantly in the same line with other drugs.

Patient/Family Teaching

- Instruct patient on the purpose for tocilizumab. If a dose is missed, contact health care professional to schedule next infusion. Instruct patient and caregiver in correct technique for subcut injections and care and disposal of equipment. Advise patient and caregiver to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Caution patient to notify health care professional immediately if signs of infection (fever, sweating, chills, muscle aches, cough, shortness of breath, blood in phlegm, weight loss, warm, red or painful skin or sores, diarrhea or stomach pain, burning on urination, urinary frequency, feeling tired), fever and stomach-area pain that does not go away, change in bowel habits, severe rash, swollen face, or difficulty breathing occurs while taking. If signs and symptoms of anaphylaxis occur, discontinue injections and notify health care professional immediately.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to tocilizumab during pregnancy. Register patient by calling 1-877-311-8972.

T

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis, systemic idiopathic juvenile arthritis, polyarticular juvenile idiopathic arthritis, or giant cell arteritis.
- Slowing in rate of decline in pulmonary function in systemic sclerosis-associated interstitial lung disease.

tofacitinib (toe-fa-sye-ti-nib)

Xeljanz, Xeljanz XR

Classification

Therapeutic: antirheumatics
Pharmacologic: kinase inhibitors

Indications

Moderately to severely active rheumatoid arthritis (RA) in patients who have had an inadequate response/intolerance to methotrexate (as monotherapy or in combination with methotrexate or other nonbiologic disease-modifying antirheumatic drugs [DMARDs]) (not to be used with biologic DMARDs or potent immunosuppressants including azathioprine and cyclosporine) (immediate-release and extended-release tablets only). Active psoriatic arthritis in patients who have had an inadequate response/intolerance to methotrexate or other DMARDs (in combination with other nonbiologic DMARDs) (not to be used with biologic DMARDs or potent immunosuppressants including azathioprine and cyclosporine) (immediate-release and extended-release tablets only). Moderately-to-severely active ulcerative colitis in patients who have had an inadequate response/intolerance to tumor necrosis factor inhibitors (not to be used with biologic therapies or potent immunosuppressants including azathioprine and cyclosporine) (immediate-release and extended-release tablets only). Active polyarticular course juvenile idiopathic arthritis (immediate-release tablets and oral solution only).

Action

Acts as a Janus kinase (JAK) inhibitor. Some results of inhibition include decreased hematopoiesis and immune cell function. Decreases circulating killer cells, increases B cell count, and decreases serum C-reactive protein (CRP). **Therapeutic Effects:** Improvement in clinical and symptomatic parameters of RA, psoriatic arthritis, and ulcerative colitis.

Pharmacokinetics

Absorption: Well absorbed following oral administration (74%).

Distribution: Distributes equally between red blood cells and plasma.

Metabolism and Excretion: 70% metabolized by the liver (primarily CYP3A4 with some contribution from CYP2C19). 30% renal excretion of the parent drug.

Half-life: 3 hr.

TIME/ACTION PROFILE (clinical improvement)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 wk	3 mo	unknown
PO-ER	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Active infection; Administration of live vaccines; Severe hepatic impairment; Increased risk for thrombosis; Lymphocyte count <500 cells/mm^3, absolute neutrophil count (ANC) <1000 cells/mm^3, or hemoglobin levels <9 g/dL; Lactation: Lactation.

Use Cautiously in: Patients with RA who are >50 yr old and have ≥1 cardiovascular risk factor (↑ risk of mortality and thrombosis with use of higher than recommended doses for RA); Risk of GI perforation; Chronic lung disease (↑ risk of infection); Japanese patients (↑ risk of herpes zoster); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children <18 yr (RA, psoriatic arthritis, and ulcerative colitis) or <2 yr (active polyarticular course juvenile idiopathic arthritis); Geri: Infection risk may be ↑ in older adults.

Adverse Reactions/Side Effects

CV: ARTERIAL THROMBOSIS, DEEP VEIN THROMBOSIS, peripheral edema. **Derm:** erythema, pruritus, rash. **F and E:** dehydration. **GI:** GI PERFORATION, abdominal pain, diarrhea, dyspepsia, gastritis, ↑ liver enzymes, vomiting. **GU:** ↑ serum creatinine. **Hemat:** anemia, neutropenia. **Metab:** ↑ lipids. **MS:** arthralgia, joint swelling, musculoskeletal pain, tendonitis. **Neuro:** paresthesia, fatigue, headache, insomnia. **Resp:** PULMONARY EMBOLISM. **Misc:** DEATH, HYPERSENSITIVITY REACTIONS (including angioedema and urticaria), INFECTION (including tuberculosis, bacterial, invasive fungal infections, viral, and other infections due to opportunistic pathogens), MALIGNANCY, fever.

Interactions

Drug-Drug: May ↑ risk of adverse reactions and ↓ antibody response to **live vaccines**; avoid concurrent use. Blood levels and effects may be ↑ by **strong CYP3A4 inhibitors** including **ketoconazole** or **moderate CYP3A4 inhibitors/strong CYP2C19 inhibitors** including **fluconazole**; dose ↓ recommended. Blood levels and effectiveness may be ↓ **strong CYP3A4 inducers** including **rifampin**; avoid concurrent use. ↑ risk of immunosuppression when used concurrently with other potent **immunosuppressants** including **azathioprine**, **cyclosporine**, **tacrolimus**, **antineoplastics**, or **radiation therapy**.

© F.A. Davis Publishing

Route/Dosage

RA and Psoriatic Arthritis

PO (Adults): *Immediate-release tablets*—5 mg twice daily; *Extended-release tablets*—11 mg once daily; *Concurrent use of strong CYP3A4 inhibitors or concurrent use of moderate CYP3A4 inhibitor with a strong CYP2C19 inhibitor*—5 mg once daily (immediate-release tablets); if taking 11 mg once daily (extended-release tablets), then switch to 5 mg once daily (immediate-release tablets).

Renal Impairment

PO (Adults): *Moderate or severe renal impairment*—5 mg once daily (immediate-release); if taking 11 mg once daily (extended-release tablets), then switch to 5 mg once daily (immediate-release tablets). For patients undergoing hemodialysis, administer dose after dialysis session.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—5 mg once daily (immediate-release tablets); if taking 11 mg once daily (extended-release tablets), then switch to 5 mg once daily (immediate-release tablets).

Ulcerative Colitis

PO (Adults): *Immediate-release tablets*—Induction: 10 mg twice daily for ≥8 wk; based on therapeutic response, may transition to maintenance dose or continue 10 mg twice daily for an additional 8 wk. Discontinue therapy if inadequate response achieved after 16 wk using 10 mg twice daily. Maintenance: 5 mg twice daily; if patient experiences loss of response on 5 mg twice daily, then use 10 mg twice daily after assessing the benefits and risks and use for the shortest duration; use lowest effective dose to maintain response; *Extended-release tablets*—Induction: 22 mg once daily for ≥8 wk; based on therapeutic response, may transition to maintenance dose or continue 22 mg once daily for an additional 8 wk. Discontinue therapy if inadequate response achieved after 16 wk using 22 mg once daily. Maintenance: 11 mg once daily; if patient experiences loss of response on 11 mg once daily, then use 22 mg once daily after assessing the benefits and risks and use for the shortest duration; use lowest effective dose to maintain response; *Concurrent use of strong CYP3A4 inhibitors or concurrent use of moderate CYP3A4 inhibitor with a strong CYP2C19 inhibitor*—if taking 10 mg twice daily (immediate-release tablets), ↓ to 5 mg twice daily (immediate-release tablets); if taking 5 mg twice daily (immediate-release tablets), ↓ to 5 mg once daily (immediate-release tablets). If taking 22 mg once daily (extended-release tablets), then ↓ to 11 mg once daily (extended-release tablets); if taking 11 mg once daily (extended-release tablets), then switch to 5 mg once daily (immediate-release tablets).

Renal Impairment

PO (Adults): *Moderate or severe renal impairment*—if taking 10 mg twice daily (immediate-release tablets), ↓ to 5 mg twice daily (immediate-release tablets); if taking 5 mg twice daily (immediate-release tablets), ↓ to 5 mg once daily (immediate-release tablets). If taking 22 mg once daily (extended-release tablets), then ↓ to 11 mg once daily (extended-release tablets); if taking 11 mg once daily (extended-release tablets), then switch to 5 mg once daily (immediate-release tablets). For patients undergoing hemodialysis, administer dose after dialysis session.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—if taking 10 mg twice daily (immediate-release tablets), ↓ to 5 mg twice daily (immediate-release tablets); if taking 5 mg twice daily (immediate-release tablets), ↓ to 5 mg once daily (immediate-release tablets). If taking 22 mg once daily (extended-release tablets), then ↓ to 11 mg once daily (extended-release tablets); if taking 11 mg once daily (extended-release tablets), then switch to 5 mg once daily (immediate-release).

Active Polyarticular Course Juvenile Idiopathic Arthritis

PO (Children ≥ 2 yr and ≥40 kg): *Immediate-release tablets or oral solution*—5 mg twice daily. *Concurrent use of strong CYP3A4 inhibitors or concurrent use of moderate CYP3A4 inhibitor with a strong CYP2C19 inhibitor*—5 mg once daily (immediate-release tablets or oral solution).

PO (Children ≥ 2 yr and 20–<40 kg): *Oral solution*—4 mg twice daily. *Concurrent use of strong CYP3A4 inhibitors or concurrent use of moderate CYP3A4 inhibitor with a strong CYP2C19 inhibitor*—4 mg once daily (oral solution).

PO (Children ≥ 2 yr and 10–<20 kg): *Oral solution*—3.2 mg twice daily. *Concurrent use of strong CYP3A4 inhibitors or concurrent use of moderate CYP3A4 inhibitor with a strong CYP2C19 inhibitor*—3.2 mg once daily (oral solution).

Renal Impairment

PO (Children ≥ 2 yr): *Moderate or severe renal impairment*—≥40 kg: 5 mg once daily (immediate-release tablets or oral solution); 20–<40 kg: 4 mg once daily (oral solution). 10–<20 kg: 3.2 mg once daily (oral solution). For patients undergoing hemodialysis, administer dose after dialysis session.

Hepatic Impairment

PO (Children ≥2 yr): *Moderate hepatic impairment*—≥40 kg: 5 mg once daily (immediate-release tablets or oral solution); 20–<40 kg: 4 mg once daily (oral solution). 10–<20 kg: 3.2 mg once daily (oral solution).

T

© F.A. Davis Publishing

Availability (generic available)

Immediate-release tablets: 5 mg, 10 mg. **Extended-release tablets:** 11 mg, 22 mg. **Oral solution (grape flavor):** 1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to and periodically during therapy. Interrupt therapy if patient develops an active infection. Monitor new infections closely; most common are pneumonia, cellulitis, herpes zoster, urinary tract infection, diverticulitis, and appendicitis. Infections may be fatal, especially in patients taking immunosuppressive therapy.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dypsnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping tofacitinib until the infection has been diagnosed and adequately treated.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with tofacitinib.
- ***Lab Test Considerations:*** Monitor CBC prior to and periodically during therapy. Do not initiate tofacitinib in patients with lymphocyte count <500 cells/mm^3, an ANC <1000 cells/mm^3, or who have hemoglobin level <9 g/dL.
- Monitor lymphocyte count at baseline and every 3 mo thereafter. *If lymphocyte count ≥500 cells/mm^3* maintain dose. *If lymphocyte count <500 cells/mm^3 and confirmed by repeat testing,* discontinue tofacitinib.
- Monitor neutrophil count at baseline, after 4–8 wk of therapy, and every 3 mo thereafter. *If ANC >1000 cells/mm^3*, maintain dose. *If ANC 500–1000 cells/mm^3*, for persistent decreases in this range, interrupt dosing until ANC is >1000 cells/mm^3. *If ANC <500 cells/mm^3 and confirmed by repeat testing*, discontinue tofacitinib.
- Monitor hemoglobin at baseline, after 4–8 wk of therapy, and every 3 mo thereafter. *If hemoglobin ≤2 g/dL decrease and ≥9.0 g/dL and confirmed by repeat testing*, maintain dose. *If hemoglobin >2 dL decrease and <8.0 g/dL*, interrupt administration of tofacitinib until hemoglobin values have normalized.
- Monitor liver enzymes prior to and periodically during therapy.
- Monitor total cholesterol, LDL cholesterol, HDL cholesterol 4–8 wk following initiation of therapy.

Implementation

- Administer a tuberculin skin test prior to administration of tofacitinib. Patients with active latent TB should be treated for TB prior to therapy.
- Immunizations should be current prior to initiating therapy. Patients on tofacitinib should not receive live vaccines.
- Screen patient for viral hepatitis before starting therapy.
- Extended-release tablets are not interchangeable with oral solution.
- *To switch from immediate release to extended release,* patients treated with *Xeljanz* 5 mg twice daily may be switched to *Xeljanz XR* 11 mg once daily the day following the last dose of *Xeljanz* 5 mg.
- **PO:** Administer twice daily without regard to food. ***DNC:*** Swallow extended release tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct patient to take tofacitinib as directed. Advise patient to read Medication Guide before starting and with each Rx refill in case of changes.
- Caution patient to notify health care professional immediately if signs of infection (fever, sweating, chills, muscle aches, cough, shortness of breath, blood in phlegm, weight loss, warm, red, or painful skin or sores, diarrhea or stomach pain, burning on urination or urinating more often than normal, feeling very tired) or stomach or intestinal perforation (fever, stomach-area pain that does not go away, change in bowel habits) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Inform patient of increased risk of lymphoma and other cancers. Advise patient to have periodic skin exams for new lesions of skin cancer.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to tofacitinib during pregnancy. Encourage patients who become pregnant during therapy to enroll in the pregnancy registry by calling 1-877-311-8972. May impair female fertility.
- Emphasize the importance of follow-up lab tests to monitor for adverse reactions.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Decreased pain and swelling with improved physical functioning and decreased rate of joint destruction in patients with rheumatoid arthritis, psoriatic arthritis, and polyarticular course juvenile idiopathic arthritis.
- Decrease in diarrhea and abdominal pain in patients with ulcerative colitis.

tolnaftate, See ANTIFUNGALS (TOPICAL).

tolterodine (tol-ter-oh-deen)

Detrol, Detrol LA

Classification

Therapeutic: urinary tract antispasmodics
Pharmacologic: anticholinergics

Indications

Treatment of overactive bladder function that results in urinary frequency, urgency, or urge incontinence.

Action

Acts as a competitive muscarinic receptor antagonist resulting in inhibition of cholinergically mediated bladder contraction. **Therapeutic Effects:** Decreased urinary frequency, urgency, and urge incontinence.

Pharmacokinetics

Absorption: Well absorbed (77%) following oral administration.
Distribution: Unknown.
Protein Binding: 96.3%.
Metabolism and Excretion: Extensively metabolized by the liver (primarily by CYP2D6 isoenzyme) (the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly ↑ tolterodine concentrations and an ↑ risk of adverse effects); one metabolite (5-hydroxymethyltolterodine) is active; other metabolites are excreted in urine.
Half-life: *Tolterodine*—1.9–3.7 hr; *5-hydroxymethyltolterodine*—2.9–3.1 hr.

TIME/ACTION PROFILE (effects on bladder function)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivty to tolterodine or fesoterodine; Urinary retention; Gastric retention; Severe hepatic impairment; End-stage renal disease (CCr <10 mL/min); Uncontrolled angle-closure glaucoma; Lactation: Lactation.
Use Cautiously in: GI obstructive disorders, including pyloric stenosis (↑ risk of gastric retention); Significant bladder outflow obstruction (↑ risk of urinary retention); Controlled angle-closure glaucoma; Myasthenia gravis; Mild-to-moderate hepatic impairment (↓ dose); Severe renal impairment (CCr 10–30 mL/min) (↓ dose); OB: Use only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

Derm: STEVENS-JOHNSON SYNDROME. **EENT:** blurred vision, dry eyes. **GI:** dry mouth, constipation, dyspepsia. **Neuro:** headache, dizziness, sedation. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **erythromycin**, **clarithromycin**, **cyclosporine**, **itraconazole**, **ketoconazole**, and **vinblastine** may ↑ levels and risk of toxicity.

Route/Dosage

Immediate-Release Tablets

PO (Adults): 2 mg twice daily; may be lowered depending on response; *Concurrent use of strong CYP3A4 inhibitors*—1 mg twice daily.

Hepatic/Renal Impairment

PO (Adults): *Mild-to-moderate hepatic impairment (Child-Pugh Class A or B) or severe renal impairment (CCr 10–30 mL/min)*—1 mg twice daily.

Extended-Release Capsules

PO (Adults): 4 mg once daily; may be lowered depending on response; *Concurrent use of strong CYP3A4 inhibitors*—2 mg once daily.

Hepatic/Renal Impairment

PO (Adults): *Mild-to-moderate hepatic impairment (Child-Pugh Class A or B) or severe renal impairment (CCr 10–30 mL/min)*—2 mg once daily.

Availability (generic available)

Extended-release capsules: 2 mg, 4 mg. **Cost:** 2 mg $458.03/60, 4 mg $447.85/60. **Tablets:** 1 mg, 2 mg. **Cost:** *Generic*—1 mg $198.55/60, 2 mg $203.79/60.

NURSING IMPLICATIONS

Assessment

- Assess patient for urinary urgency, frequency, and urge incontinence periodically during therapy.
- Monitor for signs and symptoms of anaphylaxis and angioedema (difficulty breathing, upper airway obstruction, fall in BP, rash, swelling of face or neck). Have emergency equipment readily available.

© F.A. Davis Publishing

- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.

Implementation

- **PO:** Administer without regard to food.
- Extended-release capsules should be swallowed whole; do not open, crush, dissolve, or chew.

Patient/Family Teaching

- Instruct patient to take tolterodine as directed.
- May cause dizziness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional immediately if rash or signs and symptoms of anaphylaxis or angioedema occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decreased urinary frequency, urgency, and urge incontinence.

REMS

tolvaptan (tol-**vap**-tan)

Jinarc, Jynarque, Samsca

Classification

Therapeutic: electrolyte modifiers
Pharmacologic: vasopressin antagonists

Indications

Samsca: Treatment of significant hypervolemic and euvolemic hyponatremia (serum sodium <125 mEq/L or less marked symptomatic hyponatremia that has resisted correction by fluid restriction), including patients with heart failure and syndrome of inappropriate antidiuretic hormone (SIADH). **Jynarque:** Patients at risk of rapidly progressing autosomal dominant polycystic kidney disease (ADPKD).

Action

Acts as a selective vasopressin V2-receptor antagonist, resulting in increased renal water excretion and increased serum sodium. **Therapeutic Effects:** Correction of hyponatremia (Samsca). Slow deterioration of renal function (Jynarque).

Pharmacokinetics

Absorption: 40% absorbed following oral administration.
Distribution: >99%.
Metabolism and Excretion: Extensively metabolized primarily by the CYP3A4 enzyme system; no renal elimination.
Half-life: 12 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	within 8 hr	2–4 hr†	7 days

† Blood level.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Liver disease; Urgent need to acutely raise serum sodium (Samsca); Patients who cannot appropriately sense/respond to thirst; Hypovolemia; Uncorrected abnormal serum sodium concentrations (Jynarque); Concurrent use of strong or moderate CYP3A inhibitors (Samsca); Concurrent use of strong CYP3A inhibitors (Jynarque); Anuria; Uncorrected urinary outflow obstruction; Lactation: Lactation.

Use Cautiously in: Severe malnutrition, alcoholism or advanced liver disease (↑ risk of osmotic demyelination; correct electrolyte abnormalities at a slower rates); Cirrhosis (↑ risk of GI bleeding, use only when the need to treat outweighs risk); Concurrent use of moderate CYP3A inhibitors (↓ dose) (Jynarque); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children; Geri: Older adults may have ↑ sensitivity to effects.

Adverse Reactions/Side Effects

CV: palpitations. **Derm:** dry skin, rash. **Endo:** hyperglycemia, hyperuricemia. **F and E:** thirst, hypernatremia, hypovolemia. **GI:** HEPATOTOXICITY, constipation, diarrhea, dry mouth, ↓ appetite, dyspepsia. **GU:** polyuria. **Neuro:** osmotic demyelination, dizziness, weakness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Strong CYP3A inhibitors, including **ketoconazole**, **clarithromycin**, **itraconazole**, **saquinavir**, **nelfinavir**, **ritonavir**, and **nefazodone** as well as **moderate CYP3A inhibitors**, including **erythromycin**, **fluconazole**, **aprepitant**, **diltiazem**, and **verapamil** may ↑ levels and risk of toxicity; avoid concurrent use. **CYP3A inducers**, including **rifampin**, may ↓ levels and effectiveness; avoid concurrent use with Jynarque; dosage adjustments may be necessary with Samsca. **P-gp inhibitors**, including **cyclosporine**, may ↑ levels and risk of toxicity; dosage adjustments may be necessary. May ↑ risk of hyperkalemia with **angiotensin receptor blockers**, **ACE inhibitors**, and **potassium-sparing diuretics**. **Diuretics** may ↑ risk of too rapid correction of sodium. May inhibit effects of **desmopressin**; avoid concurrent use.

Drug-Food: Grapefruit juice ↑ levels and the risk of toxicity; avoid concurrent use.

Route/Dosage

Samsca and Jynarque should not be used interchangeably.

© F.A. Davis Publishing

Hyponatremia (Samsca)

PO (Adults): 15 mg once daily initially; may ↑ at intervals of ≥1 day to 30 mg once daily, up to a maximum of 60 mg once daily. Do not use for longer than 30 days.

Autosomal Dominant Polycystic Kidney Disease (Jynarque and Jinarc)

PO (Adults): 60 mg/day initially (taken as 45 mg upon wakening and then 15 mg 8 hr later); may be ↑ after at least 1 wk to 90 mg/day (taken as 60 mg upon wakening and then 30 mg 8 hr later); may then be ↑ after at least 1 wk to 120 mg/day (taken as 90 mg upon wakening and then 30 mg 8 hr later); *Concurrent use of moderate CYP3A inhibitors*— 30 mg/day initially (taken as 15 mg upon wakening and then 15 mg 8 hr later); may be ↑ after at least 1 wk to 45 mg/day (taken as 30 mg upon wakening and then 15 mg 8 hr later); may then be ↑ after at least 1 wk to 60 mg/day (taken as 45 mg upon wakening and then 15 mg 8 hr later).

Availability (generic available)

Tablets (Jynarque): 15 mg, 30 mg, 45 mg, 60 mg, 90 mg. **Tablets (Samsca):** 15 mg, 30 mg.

NURSING IMPLICATIONS

Assessment

- Monitor neurologic status and assess for signs and symptoms of osmotic demyelination syndrome (trouble speaking, dysphagia, drowsiness, confusion, mood changes, involuntary movements, weakness, seizures), especially during initiation and after titration. If a rapid ↑ in sodium or symptoms occur, discontinue tolvaptan and consider administration of hypotonic fluid.
- Monitor fluid balance. If hypovolemia occurs interrupt or discontinue tolvaptan and provide supportive care (monitor vital signs, balance fluid and electrolytes).
- Monitor for signs and symptoms of liver injury (fatigue, anorexia, right upper abdominal discomfort, dark urine, jaundice) periodically during therapy. If symptoms occur, discontinue therapy.
- ***Lab Test Considerations:*** Monitor serum sodium levels frequently during initiation and dose titration and periodically during therapy. Too rapid correction of hyponatremia (>12 mEq/L/24 hr) can cause osmotic demyelination syndrome.
- Monitor serum potassium in patients with serum potassium >5 mEq/L or taking medication known to ↑ potassium.
- Monitor ALT, AST, and bilirubin 2 wk and 4 wk after starting therapy, then monthly for first 18 mo and every 3 mo thereafter. If ALT, AST, or bilirubin increase to >2 × ULN, immediately discontinue *Jynarque;* repeat tests as soon as possible (within 48-72 hrs). If levels stabilize or resolve, *Jynarque* may be reinitiated with increased frequency of monitoring as long as ALT and AST remain below 3 times ULN. Do not restart in patients with signs or symptoms of hepatic injury or whose ALT or AST ever exceeds 3 times ULN during therapy with tolvaptan, unless another explanation for liver injury exists and the injury has resolved. In patients with a stable, low baseline AST or ALT, an increase >2 times baseline, even if <2 times ULN, may indicate early liver injury. Suspend and promptly (48-72 hrs) reevaluate liver levels before reinitiating therapy with more frequent monitoring.

Implementation

- Initiate and re-initiate therapy in a hospital.
- ***REMS:*** REMS requirements are for *Jynarque* product. Avoid fluid restriction during first 24 hr of therapy.
- **PO:** Administer once daily without regard to meals.

Patient/Family Teaching

- Instruct patient to take tolvaptan as directed. Avoid drinking grapefruit juice during therapy; may cause ↑ levels. Take missed doses as soon as remembered, but not if just before next dose; do not double doses. Do not stop and restart therapy. Restarting therapy may require hospitalization.
- ***REMS:*** Explain requirements of Jynarque REMS program (patient must enroll, comply with ongoing monitoring requirements, must get Jynarque from pharmacies participating in REMS program).
- Inform patients they can continue fluid ingestion in response to thirst during therapy and should have water available to drink at all times during therapy. Following discontinuation of therapy, resume fluid restriction.
- Advise patient to notify health care professional immediately if signs and symptoms of hepatotoxicity (feeling tired, fever, loss of appetite, rash, nausea, itching, right upper abdomen pain or tenderness, yellowing of skin and white part of eye, vomiting, dark urine) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if signs of dehydration (vomiting, diarrhea, inability to drink normally, dizziness, feeling faint) or bleeding (vomiting bright red blood, dark blood clots, or coffee-ground-like material; black, tarry stools; bloody stools).
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding.

Evaluation/Desired Outcomes

- Normalization of serum sodium levels. Therapy should be limited to 30 days.

T

© F.A. Davis Publishing

topiramate (toe-peer-i-mate)

Qudexy XR, Topamax, Topamax Sprinkle, Trokendi XR

Classification

Therapeutic: anticonvulsants, mood stabilizers

Indications

Seizures including: partial-onset, primary generalized tonic-clonic, seizures due to Lennox-Gastaut syndrome. Prevention of migraine headache. **Unlabeled Use:** Adjunct in treatment of bipolar disorder. Infantile spasms.

Action

Action may be due to: Blockade of sodium channels in neurons, Enhancement of gamma-aminobutyrate (GABA), an inhibitory neurotransmitter, Prevention of activation of excitatory receptors. **Therapeutic Effects:** Decreased incidence of seizures. Decreased incidence/severity of migraine headache.

Pharmacokinetics

Absorption: Well absorbed (80%) after oral administration.

Distribution: Unknown.

Metabolism and Excretion: 70% excreted unchanged in urine.

Half-life: 21 hr; *Extended-release*—31 hr.

TIME/ACTION PROFILE (blood levels†)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	12 hr
PO-ER	unknown	24 hr	unknown

†After single dose.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recent alcohol use (within 6 hr before and after use of extended-release product); Metabolic acidosis (on metformin) (with extended-release product only).

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (dose ↓ recommended if CCr <70 mL/min/1.73 m²); Hepatic impairment; Dehydration; Patients predisposed to metabolic acidosis; Sulfa allergy; Rep: Women of reproductive potential; OB: May ↑ risk for cleft palate and/or cleft lip, and being small for gestational age in infants exposed during pregnancy; use only if potential maternal benefit outweighs potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit outweighs potential risk to infant; Pedi: Children <2 yr (immediate-release) and <6 yr (extended-release) (safety and effectiveness not established); children are more prone to oligohydrosis and hyperthermia; Geri: Consider age-related ↓ in renal/hepatic impairment, concurrent disease states and drug therapy.

Adverse Reactions/Side Effects

Derm: STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, oligohydrosis (↑ in children). **EENT:** abnormal vision, diplopia, nystagmus, acute myopia/secondary angle closure glaucoma, ↑ intraocular pressure, mydriasis, ocular pain, ocular redness, retinal detachment, visual field defects. **F and E:** hyperchloremic metabolic acidosis. **GI:** nausea, abdominal pain, anorexia, constipation, dry mouth, encephalopathy, hyperammonemia. **GU:** kidney stones. **Hemat:** BLEEDING, leukopenia. **Metab:** weight loss, hyperthermia (↑ in children). **Neuro:** ataxia, paresthesia, tremor, SEIZURES, SUICIDAL THOUGHTS, cognitive disorders, dizziness, drowsiness, fatigue, impaired concentration/memory, nervousness, psychomotor slowing, speech problems, sedation, aggressive reaction, agitation, anxiety, confusion, depression, malaise, mood problems. **Misc:** fever.

Interactions

Drug-Drug: **Alcohol** use within 6 hr before or after use of Trokendi XR may significantly alter topiramate levels; use during this time frame contraindicated. Levels and effects may be ↓ by **phenytoin**, **carbamazepine**, or **valproic acid**. May ↑ levels and effects of **phenytoin**, **amitriptyline**, or **lithium**. May ↓ levels and effects of **hormonal contraceptives**, **risperidone**, or **valproic acid**. ↑ risk of CNS depression with **alcohol** or other **CNS depressants**. **Carbonic anhydrase inhibitors** (e.g. **acetazolamide** or **zonisamide**) may ↑ risk of metabolic acidosis and kidney stones. Concurrent use with **valproic acid** may ↑ risk of hyperammonemia, encephalopathy, and hypothermia. ↑ risk of bleeding with **aspirin**, **clopidogrel**, **ticagrelor**, **prasugrel**, **warfarin**, **dabigatran**, **rivaroxaban**, **apixaban**, **edoxaban**, **NSAIDs**, or **SSRIs**.

Route/Dosage

Epilepsy (monotherapy)

PO (Adults and Children ≥10 yr): *Immediate-release*—25 mg twice daily initially, gradually ↑ at weekly intervals to 200 mg twice daily over a 6-wk period; *Extended-release (Qudexy XR or Trokendi XR)*—50 mg once daily initially, gradually ↑ at weekly intervals to 400 mg once daily over a 6-wk period.

PO (Children 2–<10 yr [6–<10 yr for Trokendi XR] and >38 kg): *Immediate-release*—25 mg once daily in the evening initially, gradually ↑ at weekly intervals to 125 mg twice daily over a 5–7-wk period; if needed may continue to titrate dose on a weekly basis up to 200 mg twice daily; *Extended-release (Qudexy XR or Trokendi XR)*—25 mg once daily for 1 wk, then ↑ to 50 mg once daily for 1 wk, then ↑ by 25–50 mg/day at weekly intervals over a 5–7-wk period to target dose of 250–400 mg once daily.

PO (Children 2–<10 yr [6–<10 yr for Trokendi XR] and 32–38 kg): *Immediate-release*—25 mg once daily in the evening initially, gradually ↑ at weekly intervals to 125 mg twice daily over a 5–7-wk period; if

© F.A. Davis Publishing

needed, may continue to titrate dose on a weekly basis up to 175 mg twice daily; *Extended-release (Qudexy XR or Trokendi XR)* — 25 mg once daily for 1 wk, then ↑ to 50 mg once daily for 1 wk, then ↑ by 25–50 mg/day at weekly intervals over a 5–7-wk period to target dose of 250–350 mg once daily.

PO (Children 2–<10 yr [6–<10 yr for Trokendi XR] and 23–31 kg): *Immediate-release* — 25 mg once daily in the evening initially, gradually ↑ at weekly intervals to 100 mg twice daily over a 5–7-wk period; if needed; may continue to titrate dose on a weekly basis up to 175 mg twice daily; *Extended-release (Qudexy XR or Trokendi XR)* — 25 mg once daily for 1 wk, then ↑ to 50 mg once daily for 1 wk, then ↑ by 25–50 mg/day at weekly intervals over a 5–7-wk period to target dose of 200–350 mg once daily.

PO (Children 2–<10 yr [6–<10 yr for Trokendi XR] and 12–22 kg): *Immediate-release* — 25 mg once daily in the evening initially, gradually ↑ at weekly intervals to 100 mg twice daily over a 5–7-wk period; if needed, may continue to titrate dose on a weekly basis up to 150 mg twice daily; *Extended-release (Qudexy XR or Trokendi XR)* — 25 mg once daily for 1 wk, then ↑ to 50 mg once daily for 1 wk, then ↑ by 25–50 mg/day at weekly intervals over a 5–7-wk period to target dose of 200–300 mg once daily.

PO (Children 2–<10 yr [6–<10 yr for Trokendi XR] and ≤11 kg): *Immediate-release* — 25 mg once daily in the evening initially, gradually ↑ at weekly intervals to 75 mg twice daily over a 5–7-wk period; if needed, may continue to titrate dose on a weekly basis up to 125 mg twice daily; *Extended-release (Qudexy XR or Trokendi XR)* — 25 mg once daily for 1 wk, then ↑ to 50 mg once daily for 1 wk, then ↑ by 25–50 mg/day at weekly intervals over a 5–7-wk period to target dose of 150–250 mg once daily.

Renal Impairment

PO (Adults): *CCr <70 mL/min* — ↓ dose by 50%.

Epilepsy (adjunctive therapy)

PO (Adults and Children ≥17 yr): *Immediate-release* — 25–50 mg/day initially, ↑ by 25–50 mg/day at weekly intervals up to 200–400 mg/day in 2 divided doses (200–400 mg/day in 2 divided doses for partial seizures or Lennox-Gastaut syndrome and 400 mg/day in 2 divided doses for primary generalized tonic-clonic seizures); *Extended-release (Qudexy XR or Trokendi XR)* — 25–50 mg once daily initially, ↑ by 25–50 mg/day at weekly intervals up to 200–400 mg once daily (for partial seizures or Lennox-Gastaut syndrome) and 400 mg once daily (for primary generalized tonic-clonic seizures).

PO (Children 2–16 yr): *Immediate-release and extended-release (Qudexy XR)* — 25 mg once daily at night initially for first wk, ↑ at 1–2 wk intervals by 1–3 mg/kg/day up to 5–9 mg/kg/day in 2 divided doses.

PO (Children 6–16 yr): *Extended-release (Trokendi XR)* — 25 mg once daily at night initially for first wk, ↑ at 1–2 wk intervals by 1–3 mg/kg/day up to 5–9 mg/kg/day given once daily at night.

Renal Impairment

PO (Adults): *CCr <70 mL/min* — ↓ dose by 50%.

Migraine Prevention

PO (Adults and Children ≥12 yr): *Immediate-release* — 25 mg at night initially, ↑ by 25 mg/day at weekly intervals up to target dose of 100 mg/day in 2 divided doses; *Extended-release (Qudexy XR)* — 25 mg once daily initially, ↑ by 25 mg/day at weekly intervals up to target dose of 100 mg once daily.

Renal Impairment

PO (Adults): *CCr <70 mL/min* — ↓ dose by 50%.

Availability (generic available)

Immediate-release tablets: 25 mg, 50 mg, 100 mg, 200 mg. **Cost:** *Generic* — 25 mg $21.85/180, 50 mg $33.03/180, 100 mg $41.48/180, 200 mg $54.38/180. **Extended-release capsules (Qudexy XR):** 25 mg, 50 mg, 100 mg, 150 mg, 200 mg. **Extended-release capsules (Trokendi XR):** 25 mg, 50 mg, 100 mg, 200 mg. **Sprinkle capsules:** 15 mg, 25 mg. **Cost:** *Generic* — 15 mg $144.97/60, 25 mg $175.26/60. ***In combination with:*** phentermine (Qsymia). See Appendix N.

T

NURSING IMPLICATIONS

Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Migraines:** Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack. Monitor frequency and intensity of pain on pain scale.
- **Bipolar Disorder:** Assess mental status (mood, orientation, behavior) and cognitive abilities before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count before therapy to determine baseline levels and periodically during therapy. Frequently causes anemia.
- Hepatic function should be monitored periodically throughout therapy. May cause ↑ AST and ALT levels.
- Evaluate serum bicarbonate prior to and periodically during therapy. Monitor for signs and symptoms of metabolic acidosis (hyperventilation, fatigue, anorexia, cardiac arrhythmias, stupor). If

© F.A. Davis Publishing

metabolic acidosis occurs, dosing taper or discontinuation may be necessary.

Implementation

- Implement seizure precautions.
- Do not confuse Topamax (topiramate) with Toprol XL (metoprolol).
- **PO:** May be administered without regard to meals.
- ***DNC:*** Do not break/crush tablets because of bitter taste.
- Contents of the sprinkle capsules can be sprinkled on a small amount (teaspoon) of soft food, such as applesauce, custard, ice cream, oatmeal, pudding, or yogurt. To open, hold the capsule upright so that you can read the word "TOP." Carefully twist off the clear portion of the capsule. It may be best to do this over the small portion of the food onto which you will be pouring the sprinkles. Sprinkle the entire contents of the capsule onto the food. Be sure the patient swallows the entire spoonful of the sprinkle/food mixture immediately without chewing. Follow with fluids immediately to make sure all of the mixture is swallowed. Never store a sprinkle/food mixture for use at another time.
- A 6 mg/mL oral suspension may be compounded by pharmacy for pediatric patients.
- ***DNC:*** Swallow extended-release capsules *(Trokendi XR)* whole; do not sprinkle on food, break, crush, dissolve, or chew.
- ***DNC:*** Swallow extended-release capsules *(Qudexy XR)* whole; may be opened and sprinkled on soft food; do not crush or chew. Swallow immediately; do not save for later.

Patient/Family Teaching

- Instruct patient to take topiramate exactly as directed. Take missed doses as soon as possible but not just before next dose; do not double doses. Notify health care professional if more than 1 dose is missed. Medication should be gradually discontinued to prevent seizures and status epilepticus. Instruct patient to read the *Medication Guide* before starting and with each Rx refill in case of changes.
- May cause decreased sweating and increased body temperature. Advise patients, especially parents of pediatric patients, to provide adequate hydration and monitoring, especially during hot weather.
- May cause dizziness, drowsiness, confusion, and difficulty concentrating. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to maintain a fluid intake of 2000–3000 mL of fluid/day to prevent the formation of kidney stones.
- Instruct patient to notify health care professional immediately if periorbital pain or blurred vision occur. Medication should be discontinued if ocular symptoms occur. May lead to permanent loss of vision.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood; or rash occur.
- Inform patients that topiramate may cause encephalopathy. If signs and symptoms (unexplained lethargy, vomiting, changes in mental status) occur, notify health care professional.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient not to take alcohol or other CNS depressants concurrently with this medication. Avoid alcohol 6 hrs before and 6 hrs after taking *Trokendi XR*.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to use sunscreen and wear protective clothing to prevent photosensitivity reactions.
- Rep: May cause fetal harm. Advise patient to use a nonhormonal form of contraception while taking topiramate; may make hormonal contraceptives less effective. Notify health care professional if pregnancy is planned or suspected or if breast feeding. If pregnancy occurs, encourage patient to enroll in the North American Drug Pregnancy Registry by calling 1-888-233-2334 or online at http://www.aedpregnancyregistry.org/.
- Advise patient to carry identification describing disease and medication regimen at all times.

Evaluation/Desired Outcomes

- Absence or reduction of seizure activity.
- Decrease in incidence and severity of migraine headaches.
- Remission of manic symptoms.

HIGH ALERT

topotecan (toe-poe-**tee**-kan)

Hycamtin

Classification

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Indications

IV: Metastatic ovarian cancer that has not responded to previous chemotherapy. Small cell lung cancer unresponsive to first line therapy. Stage IV-B persistent or recurrent cervical cancer not amenable to treatment with surgery or radiation (with cisplatin). **PO:** Relapsed small cell lung cancer in patients with a complete or partial prior response and who are at least 45 days from the end of first-line chemotherapy.

© F.A. Davis Publishing

Action
Interferes with DNA synthesis by inhibiting the enzyme topoisomerase. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: 30% excreted in urine; small amounts metabolized by the liver.
Half-life: *PO*—3–6 hr; *IV*—2–3 hr.

TIME/ACTION PROFILE (effects on WBCs)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	24 hr
IV	within days	11 days	7 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Impaired renal function (↓ dose if CCr <40 mL/min); Platelet count <25,000 cells/mm³ (↓ dose); History of interstitial lung disease, pulmonary fibrosis, lung cancer, thoracic radiation, or use of pneumotoxic drugs or colony stimulating factors; Rep: Women of reproductive potential; Geri: Older adults may require dose ↓ due to age-related ↓ in renal function.

Adverse Reactions/Side Effects
Derm: alopecia. **GI:** abdominal pain, diarrhea, nausea, vomiting, anorexia, constipation, ↑ liver enzymes, stomatitis. **Hemat:** anemia, leukopenia, thrombocytopenia. **MS:** arthralgia. **Neuro:** headache, fatigue, weakness. **Resp:** INTERSTITIAL LUNG DISEASE, dyspnea.

Interactions
Drug-Drug: P-glycoprotein inhibitors, including **amiodarone**, **azithromycin**, **captopril**, **carvedilol**, **clarithromycin**, **conivaptan**, **cyclosporine**, **diltiazem**, **dronedarone**, **erythromycin**, **felodipine**, **itraconazole**, **ketoconazole**, **lopinavir**, **ritonavir**, **quinidine**, **ranolazine**, **ticagrelor**, or **verapamil** may ↑ levels; avoid concurrent use. Neutropenia is prolonged by concurrent use of **filgrastim** (do not use until day 6; 24 hr following completion of topotecan). ↑ myelosuppression with other **antineoplastics** (especially **cisplatin**) or **radiation therapy**. May ↓ antibody response to and ↑ risk of adverse reactions from **live virus vaccines**.

Route/Dosage
PO (Adults): 2.3 mg/m²/day for 5 days starting on day 1 of a 21-day course (round calculated oral dose to nearest 0.25 mg and prescribe the minimum number of 1 mg and 0.25 mg capsules with the same number of capsules prescribed for each of the 5 days).

IV (Adults): *Ovarian and Small Cell Lung Cancer*—1.5 mg/m²/day for 5 days starting on day 1 of a 21-day course; *Cervical Cancer*—75 mg/m² on Days 1, 2, and 3 followed by cisplatin on Day 1 and repeated every 21 days.

Renal Impairment
PO (Adults): *CCr 30–49 mL/min*—1.5 mg/m²/day for 5 days starting on day 1 of a 21-day course; dose may be ↑after first course by 0.4 mg/m²/day if no severe hematologic or GI toxicities occur; *CCr <30 mL/min*—0.6 mg/m²/day for 5 days starting on day 1 of a 21-day course; dose may be ↑after first course by 0.4 mg/m²/day if no severe hematologic or GI toxicities occur.

Renal Impairment
IV (Adults): *CCr 20–39 mL/min*—0.75 mg/m²/day for 5 days starting on day 1 of a 21-day course. *Cervical Cancer*—Administer at standard doses only if serum creatinine ≤1.5 mg/dL. Do not administer if serum creatinine >1.5 mg/dL.

Availability (generic available)
Capsules: 0.25 mg, 1 mg. **Powder for injection:** 4 mg/vial. **Solution for injection:** 1 mg/mL.

NURSING IMPLICATIONS
Assessment
- Monitor vital signs frequently during administration.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Nausea and vomiting are common. Pretreatment with antiemetics should be considered.
- Assess IV site frequently for extravasation, which causes mild local erythema and bruising.
- Monitor for signs and symptoms of interstitial lung disease (cough, fever, dyspnea, hypoxia). Discontinue topotecan if interstitial lung disease is confirmed.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor CBC with differential and platelet count prior to administration and frequently during therapy. Baseline neutrophil count of ≥1500 cells/mm³ and platelet count of ≥100,000 cells/mm³ are required before first dose. The nadir of neutropenia occurs in 11 days, with a duration of 7 days. The nadir of thrombocytopenia occurs in 15 days, with a duration of 5 days. The nadir of anemia occurs in 15 days. Subsequent doses should not be administered

T

© F.A. Davis Publishing

until neutrophils recover to >1000 cells/mm³, platelets recover to >100,000 cells/mm³, and hemoglobin levels recover to 9.0 mg/dL. **When topotecan used as a single-agent,** ↓ dose to 1.25 mg/m² if *neutrophil <500 cells/mm³*, or administer granulocyte-colony stimulating factor (G-CSF) starting no sooner than 24 hrs following the last dose or *platelet counts less than 25,000 cells/mm³* during previous cycle. **When topotecan used with cisplatin,** ↓ dose to 0.60 mg/m² (and to 0.45 mg/m² if necessary) for febrile neutropenia (*neutrophil counts <1,000 cells/mm³ with temperature of ≥38°C (100.4°F)*), or administer G-CSF starting no sooner than 24 hrs following the last dose or *platelet counts less than 25,000 cells/mm³* during previous cycle.

- Monitor liver function. May cause transient ↑ in AST, ALT, and bilirubin concentrations.

Implementation

- ***High Alert:*** Check dose carefully before administration.
- **PO:** May be taken without regard to food. ***DNC:*** Capsules must be swallowed whole; do not open, crush, or chew. If patient vomits after taking dose, do not replace dose.
- Do not administer capsules to patients with Grade 3 or 4 diarrhea. When recovered to ≤Grade 1, resume with dose decreased by 0.4 mg/m²/day for subsequent courses.

IV Administration

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute each vial with 4 mL of sterile water for injection. ***Dilution:*** Dilute further in D5W or 0.9% NaCl. Infusion is stable for 24 hr at room temperature or up to 7 days if refrigerated. Solution is yellow to yellow-green. ***Concentration:*** 10–50 mcg/mL. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, amiodarone, anidulafungin, argatroban, aztreonam, bivalirudin, buprenorphine, butorphanol, calcium chloride, carboplatin, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cyclophosphamide, cyclosporine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, furosemide, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, insulin, regular, isoproterenol, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pentamidine, phenylephrine, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, remifentanil, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, amifostine, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, bumetanide, calcium gluconate, cefepime, ceftazidime, clindamycin, dantrolene, dexamethasone, diazepam, digoxin, ertapenem, fluorouracil, foscarnet, fosphenytoin, ganciclovir, hydrocortisone, imipenem/cilastatin, ketorolac, meropenem, methohexital, mitomycin, nafcillin, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium acetate, potassium phosphates, rituximab, sodium bicarbonate, sodium phosphates, thiopental, trastuzumab, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take as directed. If patient vomits after taking, do not replace dose; notify health care professional. Do not take missed doses; take next scheduled dose and notify health care professional. If any capsules are broken or leaking, do not touch with bare hands; dispose of capsules and wash hands with soap and water. Patient should be instructed to read the *Patient Information* guide prior to first dose and with each Rx refill in case of changes.
- May cause drowsiness or sleepiness during and for several days after therapy. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool; emesis; or signs and symptoms of interstitial lung disease occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- May cause diarrhea. Advise patient to notify health care professional if diarrhea with fever or stomach pain or cramps or diarrhea that occurs more than 3 times/day.

© F.A. Davis Publishing

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 6 months after last dose of topotecan and to avoid breast feeding during and for 1 wk after last dose. Advise males with female partners of reproductive potential to use effective contraception during and for 3 months after last dose. May impair fertility in females and males.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size and spread of malignancy.

torsemide (tore-se-mide)

~~Demadex~~, Soaanz

Classification

Therapeutic: antihypertensives
Pharmacologic: loop diuretics

Indications

Edema due to: HF, hepatic or renal disease. Hypertension.

Action

Inhibits the reabsorption of sodium and chloride from the loop of Henle and distal renal tubule. Increases renal excretion of water, sodium, chloride, magnesium, hydrogen, and calcium. Effectiveness persists in impaired renal function. **Therapeutic Effects:** Diuresis and subsequent mobilization of excess fluid (edema, pleural effusions). Decreased BP.

Pharmacokinetics

Absorption: 80% absorbed after oral administration.
Distribution: Widely distributed.
Protein Binding: ≥99%.
Metabolism and Excretion: Primarily metabolized by CYP2C9, with minor metabolism via CYP2C8 and CYP2C18. 80% metabolized by liver, 20% excreted in urine.
Half-life: 3.5 hr.

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 60 min	60–120 min	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with thiazides and sulfonamides may occur; Hepatic coma; Anuria.
Use Cautiously in: Severe liver disease (may precipitate hepatic coma; concurrent use with potassium-sparing diuretics may be necessary); Electrolyte depletion; Severe renal impairment and hypoproteinemia (↑ risk of ototoxicity); Diabetes mellitus; Increasing azotemia; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Older adults may have ↑ risk of side effects, especially hypotension and electrolyte imbalance, at usual doses.

Adverse Reactions/Side Effects

CV: hypotension. **Derm:** STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), photosensitivity, rash. **EENT:** hearing loss, tinnitus. **Endo:** hyperglycemia. **F and E:** dehydration, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, hypovolemia, metabolic alkalosis. **GI:** constipation, diarrhea, dry mouth, dyspepsia, nausea, vomiting. **GU:** acute renal failure, renal impairment, excessive urination. **Metab:** hyperuricemia. **MS:** arthralgia, muscle cramps, myalgia. **Neuro:** dizziness, headache, nervousness.

Interactions

Drug-Drug: ↑ hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. ↑ risk of hypokalemia with other **diuretics**, **amphotericin B**, **stimulant laxatives**, and **corticosteroids**. Hypokalemia may ↑ risk of **digoxin** toxicity and ↑ risk of arrhythmia in patients taking drugs that prolong the QT interval. **CYP2C9 inhibitors**, including **amiodarone**, **fluconazole**, **miconazole**, and **oxandrolone** may ↑ levels and risk of toxicity. **CYP2C9 inducers**, including **rifampin**, may ↓ levels and effectiveness. May ↑ levels and risk of toxicity of **CYP2C9 substrates**, including **celecoxib**, **phenytoin**, or **warfarin**. ↑ risk of nephrotoxicity with other **nephrotoxic drugs**, including **aminoglycosides**, **cisplatin**, **NSAIDs**, **ACE inhibitors**, **angiotensin II receptor blockers**, and **radiocontrast agents**. May ↑ risk of **lithium** toxicity. ↑ risk of ototoxicity with **aminoglycosides**. **NSAIDs** may ↓ effects. ↑ risk of **salicylate** toxicity (with use of high-dose **salicylate** therapy). **Cholestyramine** may ↓ absorption.

Route/Dosage

Heart Failure

PO (Adults): *Generic or Soaanz*— 20 mg once daily; dose may be doubled until desired effect is obtained (max = 200 mg/day).

© F.A. Davis Publishing

Chronic Renal Failure

PO (Adults): *Generic or Soaanz*—20 mg once daily; dose may be doubled until desired effect is obtained (max = 200 mg/day).

Hepatic Cirrhosis

PO (Adults): *Generic only*—5–10 mg once daily (with aldosterone antagonist or potassium-sparing diuretic); dose may be doubled until desired effect is obtained (max = 40 mg/day).

Hypertension

PO (Adults): *Generic only*—2.5–5 mg once daily, may be ↑ to 10 mg once daily after 4–6 wk (if still not effective, add another agent).

Availability (generic available)

Tablets: 5 mg, 10 mg, 20 mg, 60 mg, 100 mg. **Cost:** *Generic*—5 mg $63.42/100, 10 mg $70.27/100, 20 mg $82.08/100, 100 mg $304.00/100.

NURSING IMPLICATIONS

Assessment

- Assess fluid status during therapy. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes. Notify health care professional if thirst, dry mouth, lethargy, weakness, hypotension, or oliguria occurs.
- Monitor BP and pulse before and during administration. Monitor frequency of prescription refills to determine adherence in patients treated for hypertension.
- Assess patients receiving digoxin for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Patients taking digoxin are at increased risk of digoxin toxicity due to potassium-depleting effect of the diuretic. Potassium supplements or potassium-sparing diuretics may be used concurrently to prevent hypokalemia.
- Assess patient for tinnitus and hearing loss. Audiometry is recommended for patients receiving prolonged high-dose IV therapy. Hearing loss is most common following rapid or high-dose IV administration in patients with decreased renal function or those taking other ototoxic drugs.
- Assess for allergy to sulfonamides.
- Assess patient for skin rash frequently during therapy. Discontinue torsemide at first sign of rash; may be life-threatening. SJS or TEN may develop. Treat symptomatically; may recur once treatment is stopped.
- Geri: Diuretic use is associated with increased risk for falls in older adults. Assess falls risk and implement fall prevention strategies.
- ***Lab Test Considerations:*** Monitor electrolytes, renal and hepatic function, serum glucose, and uric acid levels before and periodically during therapy. May cause ↓ serum sodium, potassium, calcium, and magnesium concentrations. May also cause ↑ BUN, serum glucose, serum creatinine, and uric acid levels.

Implementation

- Administer medication in the morning to prevent disruption of sleep cycle.
- **PO:** May be taken with food or milk to minimize gastric irritation.

Patient/Family Teaching

- Instruct patient to take torsemide as directed. Take missed doses as soon as possible; do not double doses.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Caution patient that the use of alcohol, exercise during hot weather, or standing for long periods during therapy may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding a diet high in potassium (see Appendix J).
- Advise patient to contact health care professional if they gain more than 2–3 lb/day.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to contact health care professional immediately if rash muscle weakness, cramps, nausea, dizziness, numbness, or tingling of extremities occurs.
- Advise diabetic patients to monitor blood glucose closely; may cause increased blood glucose levels.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of routine follow-up examinations.
- **Hypertension:** Advise patients on antihypertensive regimen to continue taking medication even if feeling better. Torsemide controls but does not cure hypertension.
- Reinforce the need to continue additional therapies for hypertension (weight loss, exercise, restricted sodium intake, stress reduction, regular exercise, moderation of alcohol consumption, cessation of smoking).

Evaluation/Desired Outcomes

- Decrease in edema.
- Decrease in abdominal girth and weight.
- Increase in urinary output.
- Decrease in BP.

© F.A. Davis Publishing

REMS

traMADol (tra-ma-dol)

ConZip, Durela, Qdolo, Ralivia, Tridural, Ultram, ~~Ultram ER~~, Zytram XL

Classification

Therapeutic: analgesics (centrally acting), opioid analgesics

Schedule IV

Indications

Moderate to moderately severe pain (extended-release formulations indicated for patients who require around-the-clock pain management).

Action

Binds to μ-opioid receptors. Inhibits reuptake of serotonin and norepinephrine in the CNS. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics

Absorption: *Immediate-release*—75% absorbed after oral administration; *Extended-release (Ultram)*—85–90% (compared with immediate-release).

Distribution: Crosses the placenta; enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver (primarily by CYP2D6 and CYP3A4); primarily metabolized by CYP2D6 to active metabolite with analgesic activity (M1); CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly ↑ concentrations of tramadol and ↓ concentrations of M1 metabolite. 1–10% of Whites, 3–4% of Blacks, and 1–2% of East Asians may be ultra-rapid metabolizers of CYP2D6 and have significantly ↑ concentrations of M1 metabolite. 30% eliminated unchanged in the urine.

Half-life: *Tramadol*—6–8 hr, *ER*—7.9 hr; *active metabolite*—7–9 hr; both are ↑ in renal or hepatic impairment.

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2–3 hr	4–6 hr
ER	unknown	12 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with opioids may occur; Significant respiratory depression; Acute or severe bronchial asthma (in unmonitored setting or in absence of resuscitative equipment); Known or suspected GI obstruction (including paralytic ileus); Concurrent use of MAO inhibitors (or use within the past 14 days); Patients who are acutely intoxicated with alcohol, sedatives/hypnotics, centrally acting analgesics, opioid analgesics, or psychotropic agents; Patients who are physically dependent on opioid analgesics (may precipitate withdrawal); Ultra-rapid metabolizers of CYP2D6 (↑ risk of respiratory depression and death); *ER only*—CCr <30 mL/min or hepatic impairment; Lactation: Lactation (↑ risk of drowsiness and respiratory depression in infant); Pedi: Children <12 yr, children <18 yr following tonsillectomy and/or adenoidectomy, and children 12–18 yr who are postoperative, have obstructive sleep apnea, obesity, or severe pulmonary disease, neuromuscular disease; or are taking other medications that cause respiratory depression (↑ risk of respiratory depression and death).

Use Cautiously in: Patients with a history of epilepsy or risk factors for seizures; Diabetes mellitus (↑ risk of hypoglycemia); Renal impairment (↑ dosing interval recommended if CCr <30 mL/min); Hepatic impairment (↑ dosing interval recommended in patients with cirrhosis); Patients receiving neuroleptics, SSRIs, or TCAs, or other CNS depressants; Patients who are suicidal or prone to addiction (↑ risk of suicide); Excessive use of alcohol (↑ risk of suicide); ↑ intracranial pressure or head trauma; Patients with a history of opioid dependence or who have recently received large doses of opioids; OB: Prolonged use during pregnancy can result in neonatal opioid withdrawal syndrome; Geri: *Immediate-release*—Not to exceed 300 mg/day in patients >75 yr; *ER*—Use with extreme caution in patients >75 yr. ↑ risk of hyponatremia in females >65 yr.

Adverse Reactions/Side Effects

CV: vasodilation. **Derm:** pruritus, sweating. **EENT:** visual disturbances. **Endo:** hypoglycemia. **F and E:** hyponatremia. **GI:** constipation, nausea, abdominal pain, anorexia, diarrhea, dry mouth, dyspepsia, flatulence, vomiting. **GU:** ↓ fertility, menopausal symptoms, urinary retention/frequency. **Neuro:** hypertonia, SEIZURES, dizziness, headache, somnolence, anxiety, confusion, coordination disturbance, euphoria, malaise, nervousness, sleep disorder, stimulation, weakness.. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia). **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: **MAO inhibitors** ↑ risk of adverse reactions; concurrent use or use within previous 14 days contraindicated. ↑ risk of CNS depression when used concurrently with other **CNS depressants**, including **alcohol**, **antihistamines**, **sedative/hypnotics**, **opioid analgesics**, **anesthetics**, or **psychotropic agents**. **Mixed agonist/antagonist analgesics**, in-

© F.A. Davis Publishing

cluding **nalbuphine** or **butorphanol** and **partial agonist analgesics**, including **buprenorphine**, may ↓ tramadol's analgesic effects and/or precipitate opioid withdrawal in physically dependent patients. ↑ risk of seizures with high doses of **penicillins**, **cephalosporins**, **phenothiazines**, **opioid analgesics**, or **antidepressants**. **Carbamazepine** ↑ metabolism and ↓ effectiveness of tramadol (increased doses may be required). **CYP2D6 inhibitors**, including **quinidine**, **fluoxetine**, **paroxetine**, and **bupropion**, may ↓ levels of active metabolite (M1) and lead to ↓ analgesic effects. **CYP3A4 inhibitors**, including **erythromycin**, **clarithromycin**, **ketoconazole**, **itraconazole**, and **protease inhibitors** may allow for a greater degree of metabolism via CYP2D6 and ↑ levels of the active metabolite (M1) leading to respiratory depression. **CYP3A4 inducers** may ↓ levels. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **trazodone**, **mirtazapine**, **5−HT$_3$ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. ↑ risk of serotonin syndrome when used with **St. John's wort**.

Route/Dosage

Immediate-release

PO (Adults ≥18 yr): *Rapid titration*— 50−100 mg every 4−6 hr (not to exceed 400 mg/day [300 mg in patients >75 yr]). *Gradual titration*— 25 mg/day initially, ↑ by 25 mg/day every 3 days to reach dose of 25 mg 4 times daily, then ↑ by 50 mg/day every 3 days to reach dose of 50 mg 4 times daily; may then use 50−100 mg every 4−6 hr (maximum dose = 400 mg/day).

Renal Impairment

PO (Adults): *CCr <30 mL/min*— ↑ dosing interval to every 12 hr (not to exceed 200 mg/day).

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*— 50 mg every 12 hr.

Extended-release

PO (Adults): *Not currently receiving immediate-release*— 100 mg once daily initially, may then titrate every 5 days up to 300 mg/day; *Currently receiving immediate-release*— calculate 24-hr total dose of immediate-release product and give same dose (rounded down to next lowest 100-mg increment) of ER once daily (maximum dose = 300 mg/day).

Availability (generic available)

Immediate-release tablets: 50 mg. **Cost:** *Generic*— $83.40/100. **Extended-release capsules (Conzip):** 100 mg, 200 mg, 300 mg. **Cost:** 100 mg $232.19/30, 200 mg $289.79/30, 300 mg $365.98/30. **Extended-release tablets:** 🍁 75 mg, 100 mg, 🍁 150 mg, 200 mg, 300 mg, 🍁 400 mg. **Cost:** *Generic*— 100 mg $126.95/30, 200 mg $209.95/30, 300 mg $292.93/30. **Oral solution (grape flavor):** 5 mg/mL. ***In combination with:*** acetaminophen. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain before and 2−3 hr (peak) after administration.
- Assess BP and respiratory rate before and periodically during administration. Respiratory depression has not occurred with recommended doses.
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects.
- Prolonged use may lead to physical and psychological dependence and tolerance, although these may be milder than with opioids. This should not prevent patient from receiving adequate analgesia. Patients who receive tramadol for pain rarely develop psychological dependence. If tolerance develops, changing to an opioid agonist may be required to relieve pain.
- Monitor patient for seizures. May occur within recommended dose range. Risk is increased with higher doses and in patients taking antidepressants (SSRIs, SNRIs, tricyclics, or MAO inhibitors), opioid analgesics, or other drugs that decrease the seizure threshold. Also monitor for serotonin syndrome (mental-status changes (e.g., agitation, hallucinations, coma), autonomic instability (e.g., tachycardia, labile BP, hyperthermia), neuromuscular aberrations (e.g., hyperreflexia, incoordination) and/or gastrointestinal symptoms (e.g., nausea, vomiting, diarrhea) in patients taking these drugs concurrently).
- Assess risk for opioid addiction, abuse, or misuse prior to administration. Abuse or misuse of extended-release preparations by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of tramadol and can result in overdose and death.
- ***Lab Test Considerations:*** May cause ↑ serum creatinine, ↑ liver enzymes, ↓ hemoglobin, and proteinuria.
- May cause hyponatremia and hypoglycemia.
- ***Toxicity and Overdose:*** Overdose may cause respiratory depression and seizures. Naloxone may reverse some, but not all, of the symptoms of overdose. Treatment should be symptomatic and supportive. Maintain adequate respiratory exchange. Hemodialysis is not helpful because it removes only a small portion of administered dose. Seizures may be managed with barbiturates or benzodiazepines; naloxone increases risk of seizures.

Implementation

- ***High Alert:*** Do not confuse tramadol with trazodone. Do not confuse Ultram with lithium.

© F.A. Davis Publishing

- Tramadol is considered to provide more analgesia than codeine 60 mg but less than combined aspirin 650 mg/codeine 60 mg for acute postoperative pain.
- For chronic pain, daily doses of 250 mg of tramadol provide pain relief similar to that of 5 doses/day of acetaminophen 300 mg/codeine 30 mg, 5 doses/day of aspirin 325 mg/codeine 30 mg, or 2–3 doses/day of acetaminophen 500 mg/oxycodone 5 mg.
- Explain therapeutic value of medication before administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Tramadol should be discontinued gradually after long-term use to prevent withdrawal symptoms. For patients on long-acting agents who are physically opioid-dependent, initiate the taper by a small enough increment (no greater than 10%–25% of total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2–4 wk. Patients who have been taking opioids for briefer periods of time may tolerate a more rapid taper. Monitor frequently to manage pain and withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). If withdrawal symptoms occur, pause the taper for a period of time or raise the dose of opioid analgesic to the previous dose, and then proceed with a slower taper. Also, monitor patients for changes in mood, emergence of suicidal thoughts, or use of other substances. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the opioid analgesic.
- **PO:** Tramadol may be administered without regard to meals. ***DNC:*** Swallow extended-release tablets and capsules whole; do not crush, break, dissolve, or chew.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.

Patient/Family Teaching

- ***REMS:*** Instruct patient on how and when to ask for pain medication. Do not stop taking without discussing with health care professional; may cause withdrawal symptoms if discontinued abruptly after prolonged use. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. The Patient Counseling Guide (PCG) is available at www.fda.gov/OpioidAnalgesicREMSPCG.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient that tramadol is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication. Advise patient to notify health care professional before taking other RX, OTC, or herbal products concurrently.
- Advise patient to notify health care professional if seizures or if symptoms of serotonin syndrome occur.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to

T

© F.A. Davis Publishing

gain weight); usually occur the first days after birth. Monitor infants exposed to tramadol through breast milk for excess sedation and respiratory depression. Chronic use may reduce fertility in females and males.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.

trandolapril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

HIGH ALERT

trastuzumab

(traz-**too**-zoo-mab)

Herceptin, Herzuma, Kanjinti, Ogivri, Ontruzant, Trazimera

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies

Indications

HER2-overexpressing metastatic gastric or gastroesophageal adenocarcinoma in patients who have not received prior treatment for metastatic disease (in combination with cisplatin and capecitabine or 5-fluorouracil). HER2-overexpressing node-positive or node-negative breast cancer (as part of one of the following regimens: doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel; or docetaxel and carboplatin) (as adjuvant therapy). HER2-overexpressing node-positive or node-negative breast cancer (to be used alone after multi-modality anthracycline-based therapy) (as adjuvant therapy). Metastatic breast cancer that displays overexpression of the human epidermal growth factor receptor 2 (HER2) protein (as first-line therapy) (in combination with paclitaxel). HER2-overexpressing metastatic breast cancer in patients who have already received ≥1 other chemotherapy regimens for metastatic disease (as monotherapy).

Action

A monoclonal antibody that binds to HER2 sites in breast cancer tissue and inhibits proliferation of cells that overexpress HER2 protein. **Therapeutic Effects:** Regression of breast, gastric, or gastroesophageal cancer and metastases.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Binds to HER2 proteins.

Metabolism and Excretion: Unknown.

Half-life: 10-mg dose—1.7 days; 500-mg dose—12 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation (may cause harm to infant).

Use Cautiously in: Pre-existing pulmonary conditions; Hypersensitivity to trastuzumab, Chinese hamster ovary cell proteins, or other components of the product; Hypersensitivity to benzyl alcohol (use sterile water for injection instead of bacteriostatic water, which accompanies the vial); Rep: Women of reproductive potential; Pedi: Safety not established; Geri: May have ↑ risk of cardiac dysfunction.

Exercise Extreme Caution in: Patients with pre-existing cardiac dysfunction.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, HF, hypertension, tachycardia. **Derm:** rash, acne, herpes simplex. **F and E:** edema. **GI:** abdominal pain, anorexia, diarrhea, nausea, vomiting. **Hemat:** anemia, leukopenia. **MS:** back pain, arthralgia, bone pain. **Neuro:** neuropathy, paresthesia, peripheral neuritis, dizziness, headache, insomnia, weakness, depression. **Resp:** INTERSTITIAL PNEUMONITIS, PULMONARY EDEMA, PULMONARY FIBROSIS, dyspnea, increased cough, pharyngitis, rhinitis, sinusitis. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), INFECTION, chills, fever, pain, flu-like syndrome.

Interactions

Drug-Drug: Concurrent **anthracycline** (**daunorubicin**, **doxorubicin**, or **idarubicin**) therapy may ↑ risk of cardiotoxicity. Blood levels are ↑ by concurrent **paclitaxel**.

Route/Dosage

Adjuvant Treatment of Breast Cancer

IV (Adults): *During and following paclitaxel, docetaxel, or docetaxel/carboplatin*—4 mg/kg initially, then 2 mg/kg once weekly during chemotherapy for the first 12 wk (paclitaxel or docetaxel) or 18 wk (docetaxel/carboplatin); 1 wk after the last weekly dose, give 6 mg/kg every 3 wk. Do not exceed treatment duration of 1 yr; *As single agent within 3 wk following completion of multi-modality, anthracycline-based chemotherapy regimens*—8 mg/kg initially, then 6 mg/kg every 3 wk. Do not exceed treatment duration of 1 yr.

Metastatic Breast Cancer

IV (Adults): 4 mg/kg initially, then 2 mg/kg once weekly until disease progression.

© F.A. Davis Publishing

Metastatic Gastric Cancer

IV (Adults): 8 mg/kg initially, then 6 mg/kg every 3 wk until disease progressiones.

Availability

Lyophilized powder for injection (requires reconstitution and dilution): 150 mg/vial (single-dose vial), 420 mg/vial (multidose vial).

NURSING IMPLICATIONS

Assessment

- Assess for infusion-related symptoms (chills, fever, nausea, vomiting, pain [in some cases at tumor sites], headache, dizziness, dyspnea, hypotension, rash, and asthenia) following initial infusion. Severe reactions (bronchospasm, anaphylaxis, angioedema, hypoxia, severe hypotension) may occur during or immediately following the initial infusion. May be treated with epinephrine, corticosteroids, diphenhydramine, bronchodilators, and oxygen. Discontinue if dyspnea or severe hypotension occurs and discontinue permanently if severe reaction occurs.
- Assess for signs and symptoms of HF (dyspnea, increased cough, paroxysmal nocturnal dyspnea, peripheral edema, S_3 gallop, reduced ejection fraction) prior to and frequently during therapy. Baseline cardiac assessment of history, physical exam, and left ventricular ejection fraction (LVEF) with ECG or multiple gated acquisition (MUGA) scan. Monitor LVEF every 3 mo and at completion of therapy, every 6 mo for 2 yr. Withhold trastuzumab for ≥16% absolute decrease in LVEF from pre-treatment values or an LVEF value below institutional limits of normal and ≥10% absolute decrease in LVEF from pretreatment values. Repeat LVEF measures every 4 wk if dose is withheld. HF associated with trastuzumab may be severe, resulting in cardiac failure, death, and stroke. Trastuzumab should be discontinued upon the development of significant HF.
- Monitor patient for signs of pulmonary hypersensitivity reactions (dyspnea, pulmonary infiltrates, pleural effusion, noncardiogenic pulmonary edema, pulmonary insufficiency, hypoxia, acute respiratory distress syndrome). Patients with symptomatic pulmonary disease or extensive lung tumor involvement are at increased risk. Infusion should be discontinued if severe symptoms occur.
- ***Lab Test Considerations:*** Obtain a negative pregnancy test before starting therapy.
- HER2 protein overexpression is used to determine whether treatment with trastuzumab is indicated. HER2 protein overexpression is detected by HercepTest (IHC assay) and PathVysion (FISH assay).
- Verify negative pregnancy status before starting therapy.
- May cause anemia and leukopenia.

Implementation

- ***High Alert:*** Do not confuse trastuzumab (Herceptin) with ado-trastuzumab (Kadcyla).
- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations and infusion pump settings.
- May be administered in the outpatient setting.
- *If a dose is missed by ≤1 wk,* administer usual maintenance dose as soon as possible. Do not wait until next planned cycle. Administer subsequent maintenance doses 7 days or 21 days later according to the weekly or three-weekly schedules, respectively. *If a dose is missed by >1 wk,* administer a re-loading dose as soon as possible. Administer subsequent maintenance doses 7 days or 21 days later according to weekly or three-weekly schedules, respectively.

IV Administration

- **Intermittent Infusion:** Reconstitute each vial with 20 mL of bacteriostatic water for injection, directing the stream of diluent into lyophilized cake of trastuzumab. ***Concentration:*** 21 mg/mL. Swirl the vial gently; do not shake. May foam slightly; allow the vial to stand undisturbed for 5 min. Solution should be clear to slightly opalescent and colorless to pale yellow, without particulate matter. Label vial immediately in the area marked "Do not use after" with the date 28 days from the date of reconstitution. Stable for 24 hr at room temperature or 28 days if refrigerated. If patient is allergic to benzyl alcohol, use sterile water for injection for reconstitution. Use immediately and discard any unused portion. ***Dilution:*** Calculate to volume required for the desired dose, withdraw, and add it to an infusion containing 250 mL of 0.9% NaCl. Invert bag gently to mix. ***Rate:*** Infuse the 4 mg/kg loading dose over 90 min and the weekly 2 mg/kg dose over 30 min or 6 mg/kg dose over 30–90 min every 3 wk, or 8 mg/kg dose over 90 min if the loading dose was well tolerated. Do not administer as an IV push or bolus.
- **Y-Site Compatibility:** acyclovir, amifostine, aminophylline, ampicillin, ampicillin/sulbactam, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daunorubicin hydrochloride, dexamethasone, digoxin, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, etoposide phosphate, famotidine, fentanyl,

T

© F.A. Davis Publishing

filgrastim, fluconazole, fluorouracil, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, leucovorin calcium, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, mitomycin, mitoxantrone, paclitaxel, pentamidine, potassium chloride, prochlorperazine, promethazine, remifentanil, sargramostim, sodium bicarbonate, theophylline, thiotepa, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.

- **Y-Site Incompatibility:** aldesleukin, amikacin, aztreonam, cefotaxime, cefotetan, cefoxitin, chlorpromazine, clindamycin, cyclosporine, fludarabine, furosemide, idarubicin, irinotecan, levofloxacin, levorphanol, morphine, nalbuphine, ondansetron, piperacillin/tazobactam, streptozocin, topotecan.
- **Additive Incompatibility:** Do not dilute trastuzumab with or add to solutions containing dextrose. Do not mix or dilute with other drugs.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if new onset or worsening shortness of breath, cough, swelling of the ankles/legs, swelling of the face, palpitations, weight gain of more than 5 pounds in 24 hrs, dizziness or loss of consciousness occur. Caution patient to avoid crowds and persons with known infections.
- Advise patient not to receive any vaccinations without advice of health care professional.
- Rep: Advise female patient that trastuzumab is teratogenic and to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding. Caution patient to use effective contraception during and for 7 mo following last dose. Advise women who are breast feeding to discontinue nursing or discontinue trastuzumab. Encourage women who may be exposed during pregnancy to report exposure to the Genentech Adverse Event Line at 1-888-835-2555. Monitor patients who become pregnant for oligohydramnios.

Evaluation/Desired Outcomes

- Regression of breast, gastric, or gastroesophageal cancer and metastases.

trastuzumab/hyaluronidase

(traz-**too**-zoo-mab/ hye-al-yoor-**on**-i-dase)

Herceptin Hylecta

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies

Indications

Human epidermal growth factor receptor 2 (HER2)-overexpressing node-positive or node-negative breast cancer (as part of one of the following regimens: doxorubicin, cyclophosphamide, and either paclitaxel or docetaxel; or docetaxel and carboplatin) (as adjuvant therapy). HER2-overexpressing node-positive or node-negative breast cancer (to be used alone after multimodality anthracycline-based therapy) (as adjuvant therapy). Metastatic breast cancer that displays overexpression of the human epidermal growth factor receptor 2 (HER2) protein (as first-line therapy) (in combination with paclitaxel). HER2-overexpressing metastatic breast cancer in patients who have already received ≥1 other chemotherapy regimens for metastatic disease (as monotherapy).

Action

Trastuzumab— A monoclonal antibody that binds to HER2 sites in breast cancer tissue and inhibits proliferation of cells that overexpress HER2 protein; *Hyaluronidase*—Acts locally by depolymerizing hyaluronan, which increases permeability of the subcutaneous tissue. **Therapeutic Effects:** Regression of breast cancer and metastases.

Pharmacokinetics

Absorption: 77% absorbed following subcutaneous administration.

Distribution: Contained within the central compartment.

Metabolism and Excretion: Unknown.

Half-life: Unknown.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	Unknown	1–4 days	Unknown

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm).

Use Cautiously in: Pulmonary disease or extensive tumor involvement of lungs (↑ risk of pulmonary toxicity); Patients with dyspnea at rest (↑ risk of hypersensitivity reaction); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Rep: Women of reproductive potential; Pedi: Safety and effectiveness in children not established; Geri: May have ↑ risk of cardiac dysfunction.

Exercise Extreme Caution in: Pre-existing cardiac dysfunction.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, HF, SUDDEN CARDIAC DEATH, edema, hypertension. **Derm:** alopecia, flushing, rash, erythema, pruritus, skin discoloration. **EENT:** epistaxis. **GI:** abdominal pain, constipation, diarrhea, dyspepsia, nausea, stomatitis, vomiting, ↑ liver enzymes. **GU:** menstrual abnormalities, urinary tract infection.

© F.A. Davis Publishing

Hemat: NEUTROPENIA, anemia, leukopenia. **Local:** injection site pain. **Metab:** ↓ appetite. **MS:** arthralgia, myalgia. **Neuro:** peripheral neuropathy, dizziness, dysgeusia, headache, insomnia. **Resp:** ACUTE RESPIRATORY DISTRESS SYNDROME, INTERSTITIAL PNEUMONITIS, PULMONARY EDEMA, PULMONARY FIBROSIS, cough, upper respiratory tract infection, dyspnea, pleural effusion. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), fatigue, fever.

Interactions

Drug-Drug: Concurrent administration of myelosuppressive **chemotherapy drugs** may worsen degree of neutropenia. Concurrent **anthracycline** (**daunorubicin**, **doxorubicin**, or **idarubicin**) therapy may ↑ risk of cardiotoxicity; if possible, avoid anthracycline-based therapy for up to 7 mo after stopping trastuzumab hyaluronidase.

Route/Dosage

Do not substitute with or for ado-trastuzumab emtansine. Dosage and route of administration is different from trastuzumab.

Subcut (Adults): Trastuzumab 600 mg/hyaluronidase 10,000 units every 3 wk for 52 wk or disease recurrence, whichever occurs first (for adjuvant therapy) or until disease progression (for metastatic disease).

Availability

Solution for injection: trastuzumab 120 mg and hyaluronidase 2,000 units/mL.

NURSING IMPLICATIONS

Assessment

- Conduct thorough cardiac assessment, including history, physical examination, and determination of LVEF by echocardiogram or MUGA scan immediately before starting therapy. Determine LVEF measurements every 3 mo during and upon completion of therapy. Repeat LVEF measures at 4 wk intervals if trastuzumab hyaluronidase is held for LVEF dysfunction. Conduct LVEF measurements every 6 mo for at least 2 years following completion of therapy. *If ≥16% absolute ↓ in LVEF from pretreatment values or LVEF is below institutional limits of normal and ≥10% absolute decrease in LVEF from pretreatment values,* hold trastuzumab hyaluronidase for at least 4 wks. Therapy may be resumed if, within 4–8 wks, LVEF returns to normal limits and absolute decrease from baseline is ≤15%. *If persistent (>8 wks) LVEF decline or suspension of trastuzumab hyaluronidase for >3 occasions for cardiomyopathy,* permanently discontinue trastuzumab hyaluronidase.
- Monitor patient for signs and symptoms of pulmonary toxicity (dyspnea, pulmonary infiltrates, pleural effusion, noncardiogenic pulmonary edema, pulmonary insufficiency, hypoxia, acute respiratory distress syndrome). Patients with symptomatic pulmonary disease or extensive lung tumor involvement are at increased risk. Infusion should be discontinued if severe symptoms occur.
- Monitor for signs and symptoms of hypersensitivity reactions especially during first administration. Permanently discontinue trastuzumab hyaluronidase in patients with anaphylaxis or severe hypersensitivity reactions.
- ***Lab Test Considerations:*** Verify negative pregnancy status before starting therapy.
- Patient selection is based on HER2 protein overexpression or HER2 gene amplification in tumor specimens. Assessment of HER2 protein overexpression and HER2 gene amplification should be performed using FDA-approved tests specific for breast cancer by laboratories with demonstrated proficiency. Information on FDA-approved tests for the detection of HER2 protein overexpression and HER2 gene amplification is available at: http://www.fda.gov/CompanionDiagnostics.

Implementation

- ***High Alert:*** Do not confuse trastuzumab hyaluronidase (Herceptin Hylecta) with trastuzumab (Herceptin) or with ado-trastuzumab (Kadcyla).
- Extending therapy beyond 1 yr is not recommended.
- Before administration, check the vial to ensure that drug being administered is trastuzumab hyaluronidase and not IV trastuzumab or ado-trastuzumab.
- **Subcut:** Injection should be administered by a health care professional. Solution does to not need to be diluted. Solution is colorless to yellowish and clear to opalescent; do not administer solutions that are cloudy, discolored, or contain particulate matter. Syringes are for single use only. Attach the hypodermic injection needle to the syringe immediately prior to administration to avoid clogging the needle, then adjust volume to 5 mL. Solution is compatible with polypropylene and polycarbonate syringe material and stainless steel transfer and injection needles. Solution is stable for 24 hr if refrigerated or 4 hr at room temperature; protect from light. Do not freeze or shake. Alternate injection between right and left thigh. Give new injection at least 2.5 cm from previous injection site. Avoid areas where skin is red, bruised, tender, or hard, or areas where there are moles or scars. Administer dose over 2–5 min.

Patient/Family Teaching

- Explain purpose of trastuzumab hyaluronidase to patient.
- Advise patients to contact a health care professional immediately if signs and symptoms of HF (new onset or worsening shortness of breath, cough, swelling of

© F.A. Davis Publishing

the ankles/legs, swelling of face, palpitations, weight gain >5 pounds in 24 hr, dizziness, loss of consciousness) or hypersensitivity reactions (dizziness, nausea, chills, fever, vomiting, diarrhea, urticaria, angioedema, breathing problems, chest pain) occur.

- Rep: May cause fetal harm (oligohydramnios, pulmonary hypoplasia, skeletal abnormalities, neonatal death). Advise females of reproductive potential to use effective contraception during and for 7 mo after last dose. Monitor women who received trastuzumab hyaluronidase during pregnancy or within 7 mo prior to conception for oligohydramnios. If oligohydramnios occurs, perform fetal testing. Advise patients to notify health care professional if pregnancy is suspected or if breast feeding. Inform patient of *Pregnancy Pharmacovigilance Program*. Patients who become pregnant during or with 7 mo of therapy should call immediately to report exposure to Genentech at 1-888-835-2555.

Evaluation/Desired Outcomes

- Regression of breast cancer and metastases.

traZODone (traz-oh-done)

~~Desyrel~~, Oleptro, Trazorel

Classification

Therapeutic: antidepressants

Indications

Major depression. **Unlabeled Use:** Insomnia, chronic pain syndromes, including diabetic neuropathy, and anxiety.

Action

Alters the effects of serotonin in the CNS. **Therapeutic Effects:** Antidepressant action, which may develop only over several wk.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Widely distributed.
Protein Binding: 89–95%.
Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 enzyme system); minimal excretion of unchanged drug by the kidneys.
Half-life: 5–9 hr (immediate-release).

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 wk	2–4 wk	wks

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recovery period after MI; Concurrent electroconvulsive therapy; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Angle-closure glaucoma.
Use Cautiously in: Cardiovascular disease; Suicidal behavior; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; Severe hepatic or renal disease (dose ↓ recommended); Lactation: Discontinue drug or bottle feed; Pedi: Suicide risk may be greater in children and adolescents; safety not established; Geri: Initial dose ↓ recommended.

Adverse Reactions/Side Effects

EENT: blurred vision, tinnitus. **CV:** hypotension, arrhythmias, chest pain, hypertension, palpitations, QT interval prolongation, tachycardia. **GI:** dry mouth, altered taste, constipation, diarrhea, excess salivation, flatulence, nausea, vomiting. **GU:** hematuria, erectile dysfunction, priapism, urinary frequency. **Derm:** rash. **Hemat:** anemia, leukopenia. **MS:** myalgia. **Neuro:** tremor, SUICIDAL THOUGHTS, drowsiness, confusion, dizziness, fatigue, hallucinations, headache, insomnia, nightmares, slurred speech, syncope, weakness.

Interactions

Drug-Drug: Serious, potentially fatal reactions (hyperthermia, rigidity, myoclonus, autonomic instability, with fluctuating vital signs and extreme agitation, which may proceed to delirium and coma) may occur with concurrent **MAO inhibitors**. MAO inhibitors should be stopped at least 14 days before trazodone therapy. Trazodone should be stopped at least 14 days before MAO inhibitor therapy. Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue**, may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving trazodone, immediately discontinue trazodone and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume trazodone therapy 24 hr after last dose of linezolid or methylene blue). May ↑ **digoxin** or **phenytoin** serum levels. ↑ CNS depression with other **CNS depressants**, including **alcohol**, **opioid analgesics**, and **sedative/hypnotics**. ↑ hypotension with **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **fluoxetine** ↑ levels and risk of toxicity from trazodone. **Drugs that inhibit the CYP3A4 enzyme system**, including **ritonavir**, **indinavir**, and **ketoconazole**, ↑ levels and the risk of toxicity. **Drugs that induce the CYP3A4 enzyme system**, including **carbamazepine**, ↓ levels and may decrease effectiveness. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **fentanyl**, **buspirone**, **tramadol** and **triptans** ↑ risk of serotonin syndrome. ↑ risk of bleeding with **NSAIDS**, **aspirin**, **clopidogrel**, or **warfarin**.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. ↑ risk of serotinergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

© F.A. Davis Publishing

Route/Dosage

Depression

PO (Adults): 150 mg/day in 3 divided doses; ↑ by 50 mg/day every 3–4 days until desired response (not to exceed 400 mg/day in outpatients or 600 mg/day in hospitalized patients).
PO (Geriatric Patients): 75 mg/day in divided doses initially; may be ↑ every 3–4 days.

Insomnia

PO (Adults): 25–100 mg at bedtime.

Availability (generic available)

Tablets (immediate-release): 50 mg, 100 mg, 150 mg, 300 mg. **Cost:** *Generic*— All strengths $10.83/100. **Tablets (extended-release) (Oleptro):** 🍁 150 mg, 🍁 300 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse rate before and during initial therapy. Monitor ECGs in patients with pre-existing cardiac disease before and periodically during therapy to detect arrhythmias.
- Assess for possible sexual dysfunction.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper-reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **Depression:** Assess mental status (orientation, mood, and behavior) frequently.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- **Pain:** Assess location, duration, intensity, and characteristics of pain before and periodically during therapy. Use pain scale to assess effectiveness of medicine.
- ***Lab Test Considerations:*** Assess CBC and renal and hepatic function before and periodically during therapy. Slight, clinically insignificant ↓ in leukocyte and neutrophil counts may occur.

Implementation

- Do not confuse trazodone with tramadol.
- **PO:** Administer with or immediately after meals to minimize side effects (nausea, dizziness) and allow maximum absorption of trazodone. A larger portion of the total daily dose may be given at bedtime to decrease daytime drowsiness and dizziness.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, take as soon as remembered. Do not take if within 4 hr of next scheduled dose; do not double doses. Consult health care professional before discontinuing medication; gradual dose reduction is necessary to prevent aggravation of condition. Advise patient to read *Medication Guide* prior starting therapy and with each Rx refill in case of changes.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to avoid concurrent use of alcohol or other CNS depressant drugs.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially aspirin and NSAIDs.
- Inform patient that frequent rinses, good oral hygiene, and sugarless candy or gum may diminish dry mouth. Health care professional should be notified if this persists >2 wk. An increase in fluid intake, fiber, and exercise may prevent constipation.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional if priapism, irregular heartbeat, fainting, confusion, skin rash, or tremors occur or if dry mouth, nausea and vomiting, dizziness, headache, muscle aches, constipation, or diarrhea becomes pronounced.
- Instruct patient to notify health care professional if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyperreflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

T

© F.A. Davis Publishing

- Emphasize the importance of follow-up exams to evaluate progress.

Evaluation/Desired Outcomes

- Resolution of depression.
- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Improved sleep.
- Decrease in severity of pain in chronic pain syndromes. Therapeutic effects are usually seen within 1 wk, although 4 wk may be required to obtain significant therapeutic results.

triamcinolone, See CORTICOSTEROIDS (NASAL), CORTICOSTEROIDS (SYSTEMIC), and CORTICOSTEROIDS (TOPICAL/LOCAL).

triamterene, See DIURETICS (POTASSIUM-SPARING).

tricalcium phosphate (39% Ca or 19.5 mEq/g), See CALCIUM SALTS.

trimethoprim/sulfamethoxazole

(trye-**meth**-oh-prim/sul-fa-meth-**ox**-a-zole)

Bactrim, Bactrim DS, Septra, Septra DS, Sulfatrim, Sulfatrim DS, Sulfatrim Pediatric

Classification

Therapeutic: anti-infectives, antiprotozoals
Pharmacologic: folate antagonists, sulfonamides

Indications

Treatment of: Bronchitis, *Shigella* enteritis, Otitis media, *Pneumocystis jirovecii* pneumonia (PCP), Urinary tract infections, Traveler's diarrhea. Prevention of PCP in HIV-positive patients. **Unlabeled Use:** Biliary tract infections, osteomyelitis, burn and wound infections, chlamydial infections, endocarditis, gonorrhea, intra-abdominal infections, nocardiosis, rheumatic fever prophylaxis, sinusitis, eradication of meningococcal carriers, prophylaxis of urinary tract infections, and an alternative agent in the treatment of chancroid. Prevention of bacterial infections in immunosuppressed patients.

Action

Combination inhibits the metabolism of folic acid in bacteria at two different points. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against many strains of gram-positive aerobic pathogens including: *Streptococcus pneumoniae*, *Staphylococcus aureus*. Has activity against many aerobic gram-negative pathogens, such as: *Enterobacter*, *Klebsiella*, *Morganella morganii*, *Escherichia coli*, *Proteus mirabilis*, *Proteus vulgaris*, *Shigella*, *Haemophilus influenzae*. *Pneumocystis jirovecii*. Not active against *Pseudomonas aeruginosa*.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Widely distributed. Crosses the blood-brain barrier and placenta and enters breast milk.
Protein Binding: *Trimethoprim*—45%; *Sulfamethoxazole*—68%.
Metabolism and Excretion: Some metabolism by the liver (20%); remainder excreted unchanged by the kidneys.
Half-life: *Trimethoprim*—6–11 hr; *sulfamethoxazole*—9–12 hr, both prolonged in renal failure.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	6–12 hr
IV	rapid	end of infusion	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to sulfonamides or trimethoprim; History of drug-induced immune thrombocytopenia due to sulfonamides or trimethoprim; Megaloblastic anemia secondary to folate deficiency; Severe hepatic or renal impairment; Concurrent use with dofetilide; Lactation: Avoid breast-feeding infants who have glucose-6–phosphate dehydrogenase (G6PD) deficiency or hyperbilirubinemia; Pedi: Children <2 mo (can cause kernicterus).
Use Cautiously in: Mild to moderate hepatic or renal impairment (dose ↓ required if CCr <30 mL/min); G6PD deficiency (↑ risk hemolysis); HIV-positive patients (↑ incidence of adverse reactions); Concurrent use with other products containing propylene glycol (IV only) (↑ risk of lactic acidosis); OB: ↑ risk of neural tube defects, cardiovascular malformations, urinary tract defects, oral clefts, and club foot in fetus when used during pregnancy; use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects

CV: hypotension. **Derm:** ACUTE FEBRILE NEUTROPHILIC DERMATOSIS, ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), ERYTHEMA MULTIFORME, FEBRILE

© F.A. Davis Publishing

NEUTROPHILIC DERMATOSIS, STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS, rash, photosensitivity. **Endo:** hypoglycemia. **F and E:** hyperkalemia, hyponatremia. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), HEPATIC NECROSIS, nausea, vomiting, diarrhea, stomatitis, hepatitis, cholestatic jaundice, pancreatitis. **GU:** crystalluria. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, hemolytic anemia, leukopenia, megaloblastic anemia, thrombocytopenia. **Local:** phlebitis at IV site. **Neuro:** fatigue, hallucinations, headache, insomnia, mental depression, kernicterus in neonates. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and respiratory failure), fever.

Interactions

Drug-Drug: May ↑**dofetilide** levels and the risk of QT interval prolongation with arrhythmias; concurrent use contraindicated. May ↑ levels of **phenytoin**; closely monitor phenytoin levels. May ↑ levels of and risk of bleeding from **warfarin**; closely monitor INR. May ↑ hypoglycemic effects of **sulfonylureas**, **pioglitazone**, **rosiglitazone**, **repaglinide**, and **metformin**. May ↑ toxicity of **methotrexate**; avoid concurrent use. ↑ risk of thrombocytopenia from **thiazide diuretics**, especially in older adults. May ↑ risk of nephrotoxicity associated with **cyclosporine**; avoid concurrent use. May ↑ **digoxin** levels, especially in older adults; closely monitor digoxin levels. **Indomethacin** may ↑ levels and risk of toxicity; avoid concurrent use. Concurrent use with **ACE inhibitors** may ↑ risk of hyperkalemia; avoid concurrent use. May ↓ the effects of **tricyclic antidepressants**. May ↑ risk of myelosuppression with **zidovudine**. may ↑ **procainamide** levels and the risk of QT interval prolongation with arrhythmias; closely monitor procainamide levels.

Route/Dosage

(TMP = trimethoprim; SMX = sulfamethoxazole). Dosing based on TMP content.

Bacterial Infections

PO, IV (Adults and Children >2 mo): *Mild-moderate infections*—6–12 mg TMP/kg/day divided every 12 hr; *Serious infection/Pneumocystis*—15–20 mg TMP/kg /day divided every 6–8 hr.

PO (Adults): *Urinary tract infection/chronic bronchitis*—1 double-strength tablet (160 mg TMP/800 mg SMX) every 12 hr for 10–14 days.

Urinary Tract Infection Prophylaxis

PO, IV (Adults and Children >2 mo): 2 mg TMP/kg/dose once daily or 5 mg TMP/kg/dose twice weekly.

P. jirovecii Pneumonia (Prevention)

PO (Adults): 1 double-strength tablet (160 mg TMP/800 mg SMX) once daily (may also be given 3 times weekly).

PO (Children >1 mo): 150 mg TMP/m²/day divided every 12 hr or given as a single dose on 3 consecutive days/wk (not to exceed 320 mg TMP/1600 mg SMX per day).

Availability (generic available)

Oral suspension (cherry, grape flavors): 40 mg TMP/200 mg SMX per 5 mL. **Cost:** *Generic*—$58.10/473 mL. **Solution for injection:** 16 mg TMP/80 mg SMX per mL (contains 40% propylene glycol). **Tablets:** 20 mg TMP/100 mg SMX, 80 mg TMP/400 mg SMX, 160 mg TMP/800 mg SMX (double-strength). **Cost:** *Generic*—80 mg TMP/400 mg SMX $6.99/30, 160 mg TMP/800 mg SMX $6.70/30.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Inspect IV site frequently. Phlebitis is common.
- Assess patient for allergy to sulfonamides.
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of CDAD. May begin up to several wk following cessation of therapy.
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** Monitor CBC and urinalysis periodically during therapy.
- May produce ↑ serum bilirubin, serum potassium, serum creatinine, and alkaline phosphatase.
- May cause hypoglycemia.

Implementation

- Do not confuse DS (double-strength) formulations with single-strength formulations.
- Do not administer medication IM.
- **PO:** Administer around the clock with a full glass of water. Use calibrated measuring device for liquid preparations.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute each 5 mL of trimethoprim/sulfamethoxazole with 125 mL of D5W (stable for 24 hr at room temperature). May also dilute each 5 mL of drug with 75 mL of D5W if fluid restriction is required (stable for 6 hr at room temperature). Do not refrigerate. ***Concentration:***

T

© F.A. Davis Publishing

Should not exceed 1.06 mg/mL. ***Rate:*** Infuse over 60–90 min.

- **Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, allopurinol, amifostine, aminocaproic acid, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, azithromycin, bivalirudin, bleomycin, cangrelor, carboplatin, carmustine, cefepime, ceftaroline, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, defibrotide, dexmedetomidine, diltiazem, docetaxel, doxorubicin liposome, eptifibatide, ertapenem, etoposide, etoposide phosphate, fenoldopam, filgrastim, fludarabine, fluorouracil, fosphenytoin, gemcitabine, gemtuzumab ozogamicin, granisetron, hetastarch, hydromorphone, ifosfamide, irinotecan, leucovorin calcium, levofloxacin, linezolid, lorazepam, melphalan, meropenem, mesna, methotrexate, metronidazole, milrinone, mitoxantrone, octreotide, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, perphenazine, piperacillin/tazobactam, potassium acetate, remifentanil, rituximab, sargramostim, sodium acetate, thiotepa, tigecycline, tirofiban, trastuzumab, vecuronium, vinblastine, vincristine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alfentanil, amikacin, aminophylline, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, ascorbic acid, atropine, azathioprine, benztropine, blinatumomab, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, clindamycin, cyanocobalamin, cyclosporine, dantrolene, daunorubicin hydrochloride, dexamethasone, dexrazoxane, diazepam, diazoxide, digoxin, diphenhydramine, dobutamine, dopamine, doxorubicin hydrochloride, doxycycline, ephedrine, epinephrine, epirubicin, epoetin alfa, erythromycin, famotidine, fentanyl, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, heparin, hydralazine, hydrocortisone, hydroxyzine, idarubicin, imipenem/cilastatin, indomethacin, insulin, regular, isoproterenol, ketamine, ketorolac, lactated Ringer's, lidocaine, mannitol, methadone, methylprednisolone, metoclopramide, metoprolol, midazolam, minocycline, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oritavancin, oxacillin, oxytocin, papaverine, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phenytoin, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, sodium bicarbonate, succinylcholine, sufentanil, theophylline, thiamine, tobramycin, topotecan, vancomycin, verapamil, vinorelbine.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish drug completely as directed, even if feeling well. Take missed doses as soon as remembered unless almost time for next dose. Advise patient that sharing of this medication may be dangerous.
- Instruct patient to notify health care professional if rash or fever and diarrhea develop, especially if diarrhea contains blood, mucus, or pus. Advise patient not to treat diarrhea without consulting health care professional.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, or unusual bleeding or bruising occurs.
- Instruct patient to notify health care professional if symptoms do not improve within a few days.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize importance of regular follow-up exams to monitor blood counts in patients on prolonged therapy.
- **Home Care Issues:** Instruct family or caregiver on dilution, rate, and administration of drug and proper care of IV equipment.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.
- Resolution of symptoms of traveler's diarrhea.
- Prevention of *Pneumocystis jirovecii* pneumonia in patients with HIV.

© F.A. Davis Publishing

ubrogepant (ue-broe-je-pant)
Ubrelvy

Classification
Therapeutic: vascular headache suppressants
Pharmacologic: calcitonin gene-related peptide receptor antagonists

Indications
Acute treatment of migraine with or without aura.

Action
Binds to and antagonizes the calcitonin gene-related peptide (CGRP) receptor, which reduces the neuroinflammatory and vasodilatory effects of CGRP. **Therapeutic Effects:** Relief of pain associated with acute migraine attacks.

Pharmacokinetics
Absorption: Rapidly absorbed. Absorption delayed by high-fat food.
Distribution: Widely distributed to extravascular tissues.
Metabolism and Excretion: Primarily metabolized by the liver via CYP3A4 enzyme to inactive metabolites. Eliminated in bile/feces (42% as unchanged drugs) and urine (6% as unchanged drug).
Half-life: 5–7 hr.

TIME/ACTION PROFILE (pain relief)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	2 hr	24 hr

Contraindications/Precautions
Contraindicated in: Concurrent use of strong CYP3A4 inhibitors; End-stage renal disease (CCr <15 mL/min).
Use Cautiously in: Severe hepatic impairment (↓ dose); Severe renal impairment (CCr 15–29 mL/min); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects
GI: dry mouth, nausea. **Neuro:** drowsiness.

Interactions
Drug-Drug: **Strong CYP3A4 inhibitors**, including **clarithromycin**, **itraconazole**, or **ketoconazole** may significantly ↑ levels and risk of toxicity; concurrent use contraindicated. **Moderate CYP3A4 inhibitors** as well as **weak CYP3A4 inhibitors**, including **ciprofloxacin**, **cyclosporine**, **fluconazole**, **fluvoxamine**, or **verapamil** may ↑ levels and risk of toxicity; ↓ ubrogepant dose. **Strong CYP3A4 inducers**, including **phenobarbital**, **phenytoin**, or **rifampin** may significantly ↓ levels and effectiveness; avoid concurrent use. **Moderate CYP3A4 inducers** or **weak CYP3A4 inducers** may ↓ levels and effectiveness; ↑ ubrogepant dose. **P-glycoprotein (P-gp) inhibitors** as well as **breast cancer resistant protein (BCRP) inhibitors**, including **carvedilol**, **eltrombopag**, or **quinidine**, may ↑ levels and risk of toxicity; ↓ ubrogepant dose.
Drug-Natural Products: **St. John's wort** may ↓ levels and effectiveness; avoid concurrent use.
Drug-Food: **Grapefruit juice** may ↑ levels and risk of toxicity; ↓ ubrogepant dose.

Route/Dosage
PO (Adults): 50 mg or 100 mg initially; if response is inadequate at 2 hr, may repeat dose (not to exceed 200 mg/24 hr). *Concurrent use of moderate CYP3A4 inhibitor*—50 mg initially (not to exceed 50 mg/24 hr). *Concurrent use of weak CYP3A4 inhibitor*—50 mg initially; if response is inadequate at 2 hr, may repeat dose (not to exceed 100 mg/24 hr). *Concurrent use of weak or moderate CYP3A4 inducer*—100 mg initially; if response is inadequate at 2 hr, may repeat dose (not to exceed 200 mg/24 hr). *Concurrent use of P-gp or BCRP inhibitor*—50 mg initially; if response is inadequate at 2 hr, may repeat dose (not to exceed 100 mg/24 hr).

Renal Impairment
PO (Adults): *CCr 15–29 mL/min*—50 mg initially; if response is inadequate at 2 hr, may repeat dose (not to exceed 100 mg/24 hr).

Hepatic Impairment
PO (Adults): *Severe hepatic impairment (Child–Pugh Class C)*—50 mg initially; if response is inadequate at 2 hr, may repeat dose (not to exceed 100 mg/24 hr).

Availability
Tablets: 50 mg, 100 mg.

NURSING IMPLICATIONS
Assessment
- Assess pain location, character, intensity, and duration and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.

Implementation
- **PO:** Administer without regard to food. If needed, a second dose may be taken at least 2 hr after initial dose.

Patient/Family Teaching
- Instruct patient to take ubrogepant as soon as symptoms of a migraine attack appear, but it may be administered any time during an attack. If migraine symptoms return, a second dose may be used. Allow at least 2 hr between doses, and do not use more than 100 mg in any 24-hr period. Advise patient to

U

© F.A. Davis Publishing

read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Inform patient that ubrogepant should only be used during a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Advise patient to avoid grapefruit and grapefruit juice during therapy. Instruct patient not take a second tablet within 24 hr if grapefruit or grapefruit juice was consumed.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol, which aggravates headaches, during ubrogepant use.
- Advise patient that lying down in a darkened room following ubrogepant administration may further help relieve headache.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Relief of migraine attack.

ulipristal, See CONTRACEPTIVES, HORMONAL.

umeclidinium
(ue-mek-li-**din**-ee-um)
Incruse Ellipta

Classification
Therapeutic: bronchodilators
Pharmacologic: anticholinergics

Indications
Maintenance treatment of COPD.

Action
Acts as an anticholinergic by inhibiting M3 muscarinic receptors in bronchial smooth muscle resulting in bronchodilation. **Therapeutic Effects:** Bronchodilation with decreased airflow obstruction.

Pharmacokinetics
Absorption: Minimal oral absorption; remainder of absorption occurs in lungs.
Distribution: Unknown.
Metabolism and Excretion: Primarily metabolized by CYP2D6, metabolites do not contribute to bronchodilation.
Half-life: 11 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
inhaln	1 hr	2–12 hr	24 hr

Contraindications/Precautions
Contraindicated in: Severe/acute symptoms of airflow obstruction; Severe hypersensitivity to milk proteins or other ingredients; Concurrent use with other anticholinergics.
Use Cautiously in: Narrow-angle glaucoma (may cause acute angle closure); Urinary retention, prostatic hyperplasia, bladder-neck obstruction; Severe hepatic impairment; OB: Safety not established; Lactation: Use while breast feeding only if maternal benefit outweighs potential risk to infant; Pedi: Safety and effectiveness not established; Geri: May be more sensitive to drug effects.

Adverse Reactions/Side Effects
CV: chest pain. **EENT:** acute narrow-angle glaucoma, cough, nasopharyngitis. **GU:** urinary retention. **MS:** arthralgia. **Resp:** PARADOXICAL BRONCHOSPASM. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions
Drug-Drug: ↑ risk of adverse anticholinergic adverse reactions when used concurrently with other **anticholinergics** (avoid concurrent use).

Route/Dosage
Inhaln (Adults): One inhalation (62.5 mcg) once daily.

Availability
Powder for inhalation in blister strips (contains lactose): 62.5 mcg/blister. ***In combination with:*** vilanterol (Anoro Ellipta), fluticasone and vilanterol (Trelegy Ellipta). See Appendix N.

NURSING IMPLICATIONS

Assessment
- Assess respiratory status (rate, breath sounds, degree of dyspnea, pulse) before administration and at peak of medication. Consult health care professional about alternative medication if severe bronchospasm is present; onset of action is too slow for patients in acute distress. If paradoxical bronchospasm (wheezing) occurs, withhold medication and notify health care professional immediately.

Implementation
- **Inhaln:** Follow manufacturer's instructions for use of inhaler. Breathe out; do not blow into mouthpiece. Close lips around mouthpiece. Breathe in a long, steady deep breath. Continue to hold breath as long as possible while removing inhaler from mouth. Slide cover over mouthpiece.

Patient/Family Teaching
- Instruct patient in the correct use of inhaler. Advise patient not to discontinue without consulting health care professional; symptoms may recur.

© F.A. Davis Publishing

- Inform patient that umeclidinium should not be used for treating sudden breathing problems.
- Advise patient to notify health care professional if worsening symptoms; decreasing effectiveness of inhaled, short-acting beta$_2$-agonists; need for more inhalations than usual of inhaled, short-acting beta$_2$-agonists; or significant decrease in lung function occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products without consulting health care professional.
- Advise patient to notify health care professional if signs and symptoms of worsening narrow-angle glaucoma (eye pain or discomfort, blurred vision, visual halos, colored images associated with red dyes from conjunctival congestion, corneal edema) or worsening urinary retention (difficulty passing urine, painful urination) occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in the number of flare-ups or the worsening of COPD symptoms (exacerbations).

upadacitinib

(ue-**pad**-a-sye-ti-nib)

Rinvoq

Classification

Therapeutic: antirheumatics

Pharmacologic: kinase inhibitors

Indications

Moderately to severely active rheumatoid arthritis (RA) in patients who have had an inadequate response/intolerance to methotrexate (as monotherapy or in combination with methotrexate) (not to be used with other Janus kinase [JAK] inhibitors, biologic disease-modifying antirheumatic drugs [DMARDs] or potent immunosuppressants [including azathioprine or cyclosporine]).

Action

Inhibits JAK enzymes which prevents the activation of signal transducers and activators of transcription (STATs), which ultimately results in decreased hematopoiesis and immune cell function. **Therapeutic Effects:** Improvement in clinical and symptomatic parameters of RA.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Distributes equally between red blood cells and plasma.

Metabolism and Excretion: Primarily metabolized by the liver via the CYP3A4 isoenzyme (with some contribution from CYP2D6); 38% excreted in feces and 24% excreted in urine as unchanged drug.

Half-life: 8–14 hr.

TIME/ACTION PROFILE (clinical improvement)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 wk	3 mo	unknown

Contraindications/Precautions

Contraindicated in: Active infection; Lymphocyte count <500 cells/mm^3, absolute neutrophil count (ANC) <1000 cells/mm^3, or hemoglobin levels <8 g/dL; Severe hepatic impairment; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Previously exposed to tuberculosis; History of serious or opportunistic infection; Resided or traveled in areas of endemic tuberculosis or endemic mycoses; Underlying conditions that predispose to infection; Malignancy (other than successfully treated non-melanoma skin cancer); ↑ risk for thrombosis; History of diverticulitis or use of nonsteroidal anti-inflammatory drugs (NSAIDs) (↑ risk of GI perforation); End-stage renal disease; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: ARTERIAL THROMBOSIS, DEEP VEIN THROMBOSIS. **GI:** GI PERFORATION, ↑ liver enzymes, nausea. **Hemat:** NEUTROPENIA, anemia, lymphopenia. **Metab:** dyslipidemia. **MS:** ↑ creatine kinase. **Resp:** PULMONARY EMBOLISM, cough. **Misc:** INFECTION (including tuberculosis, bacterial, invasive fungal, viral, or opportunistic infections; tuberculosis; and reactivation of herpes virus or hepatitis B virus), MALIGNANCY, fever.

Interactions

Drug-Drug: May ↑ risk of adverse reactions and ↓ antibody response to **live vaccines**; avoid concurrent use. **Strong CYP3A4 inhibitors**, including **ketoconazole**, may ↑ levels and risk of toxicity; use concurrently with caution. **Strong CYP3A4 inducers**, including **rifampin**, may ↓ levels and effectiveness; concurrent use not recommended. **NSAIDs** may ↑ risk of GI perforation; concurrent use requires careful monitoring. ↑ risk of immunosuppression when used concurrently with other potent **immunosuppressants** including **azathioprine**, **cyclosporine**, **tacrolimus**, **antineoplastics**, or **radiation therapy**.

Route/Dosage

PO (Adults): 15 mg once daily.

© F.A. Davis Publishing

Availability

Extended-release tablets: 15 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain and range of motion before and periodically during therapy.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis and hepatitis B virus (HBV), prior to and periodically during therapy. Upadacitinib is contraindicated in patients with active infection. Monitor new infections closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections. Infections may be fatal, especially in patients taking immunosuppressive therapy.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with upadacitinib.
- Assess skin for new lesions periodically during therapy; risk of skin cancer is increased.
- Monitor for signs and symptoms of thrombosis (swelling, pain or tenderness in the leg, sudden unexplained chest pain, shortness of breath) during therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor neutrophil count at baseline and periodically during therapy. Do not start therapy and interrupt therapy if ANC <1000 cells/mm^3 and restart therapy once ANC returns above this value.
- Monitor lymphocyte count at baseline and periodically during therapy. Do not start therapy and interrupt therapy if absolute lymphocyte count (ALC) <500 cells/mm^3 and restart therapy once ALC returns above this value.
- May cause anemia. Monitor hemoglobin at baseline and periodically during therapy. Do not start therapy and interrupt therapy if hemoglobin level <8 g/dL.
- May cause increases in total cholesterol, low-density lipoprotein (LDL) cholesterol, and high-density lipoprotein (HDL) cholesterol. Monitor levels 12 wk after starting therapy and periodically thereafter for hyperlipidemia.
- Monitor liver enzymes at baseline and periodically thereafter. If AST or ALT are increased and drug-induced liver injury is suspected, hold upadacitinib.

Implementation

- Immunizations, prophylactic zoster vaccinations, should be current before starting therapy. Patients on upadacitinib may receive concurrent vaccinations, except for live vaccines.
- Administer a tuberculin skin test prior to administration of upadacitinib. Patients with active latent TB should be treated for TB prior to therapy.
- Screen patient for viral hepatitis before starting therapy.
- **PO:** Administer once daily without regard to food. ***DNC:*** Swallow tablets whole; do not split, crush, or chew.

Patient/Family Teaching

- Instruct patient to take upadacitinib as directed. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid live vaccines during therapy.
- Caution patient to notify health care professional immediately if signs of infection (fever, sweating, chills, muscle aches, cough, shortness of breath, blood in phlegm, weight loss, warm, red, or painful skin or sores, diarrhea or stomach pain, burning on urination or urinating more often than normal, feeling very tired), blood clots, or stomach or intestinal perforation (fever, stomach-area pain that does not go away, change in bowel habits) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Inform patient of increased risk of lymphoma and other cancers. Advise patient to have periodic skin exams for new lesions of skin cancer.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 4 wk after final dose and to avoid breast feeding during and for 6 days (10 half-lives) after last dose. Advise patient to notify health care professional immediately if pregnancy is suspected.
- Emphasize the importance of regular lab tests to monitor for adverse drug reactions.

Evaluation/Desired Outcomes

- Improved physical function and decreased fatigue.

© F.A. Davis Publishing

valACYclovir

(val-ay-**sye**-kloe-veer)
Valtrex

Classification
Therapeutic: antivirals

Indications

Treatment of herpes zoster (shingles). Treatment/suppression of genital herpes. Reduction of transmission of genital herpes. Treatment of chickenpox. Treatment of herpes labialis (cold sores).

Action

Rapidly converted to acyclovir. Acyclovir interferes with viral DNA synthesis. **Therapeutic Effects:** Inhibited viral replication, decreased viral shedding, reduced time to healing of lesions. Reduced transmission of genital herpes.

Pharmacokinetics

Absorption: 54% bioavailable as acyclovir after oral administration of valacyclovir.
Distribution: CSF concentrations of acyclovir are 50% of plasma concentrations. Acyclovir crosses placenta; enters breast milk.
Metabolism and Excretion: Rapidly converted to acyclovir via intestinal/hepatic metabolism.
Half-life: 2.5–3.3 hr; up to 14 hr in renal impairment (acyclovir).

TIME/ACTION PROFILE (blood levels†)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.5–2.5 hr	8–24 hr

†Acyclovir.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to valacyclovir or acyclovir.
Use Cautiously in: Renal impairment (↓ dose/↑ dosing interval recommended if CCr <50 mL/min); OB, Lactation, Pedi: Pregnancy, lactation, or children <2 yr (safety not established); Geri: Dose ↓ may be necessary due to ↑ risk of acute renal failure and CNS side effects.

Adverse Reactions/Side Effects

GI: nausea, abdominal pain, anorexia, constipation, diarrhea. **GU:** RENAL FAILURE, crystalluria. **Hemat:** THROMBOTIC THROMBOCYTOPENIC PURPURA/HEMOLYTIC UREMIC SYNDROME (very high doses in immunosuppressed patients). **Neuro:** headache, agitation, confusion, delirium, dizziness, encephalopathy, hallucinations, seizures, weakness.

Interactions

Drug-Drug: Probenecid and **cimetidine** ↑ blood levels; significant only in renal impairment. Concurrent use of other **nephrotoxic drugs** ↑ risk of adverse renal effects.

Route/Dosage

Herpes Zoster

PO (Adults): 1 g 3 times daily for 7 days.

Genital Herpes

PO (Adults): *Initial treatment*—1 g twice daily for 10 days. *Recurrence*—500 mg twice daily for 3 days. *Suppression of recurrence*—1 g once daily or 500 mg once daily in patients experiencing <10 recurrences/yr. *Suppression of recurrence in HIV-infected patients*—500 mg every 12 hr. *Reduction of transmission*—500 mg once daily for source partner.

Herpes Labialis

PO (Adults and Children ≥12 yr): 2 g then 2 g 12 hr later.

Chickenpox

PO (Children ≥2 yr): 20 mg/kg 3 times daily for 5 days (not to exceed 1 g 3 times daily).

Renal Impairment

PO (Adults): *CCr 30–49 mL/min*—1 g every 12 hr for herpes zoster treatment, no ↓ required for treatment of genital herpes; 1 g then 1 g 12 hr later for herpes labialis. *CCr 10–29 mL/min*—1 g every 24 hr for initial treatment of genital herpes, 500 mg every 24 hr for treatment of recurrent episodes of genital herpes, 500 mg every 48 hr for suppression of genital herpes in patients with 9 or fewer recurrences/yr, 500 mg every 24 hr for suppression of genital herpes in patients with ≥10 recurrences/yr or HIV-infected patients, 1 g every 24 hr for treatment of herpes zoster; 500 mg then 500 mg 12 hr later for herpes labialis. *CCr <10 mL/min*—500 mg every 24 hr for initial treatment of genital herpes, 500 mg every 24 hr for treatment of recurrent episodes of genital herpes, 500 mg every 48 hr for suppression of genital herpes in patients with 9 or fewer recurrences/yr, 500 mg every 24 hr for suppression of genital herpes in patients with ≥10 recurrences/yr or HIV-infected patients, 500 mg every 24 hr for treatment of herpes zoster; single 500 mg dose for herpes labialis.

Availability (generic available)

Tablets: 500 mg, 1 g. **Cost:** *Generic*—500 mg $31.44/30, 1 g $53.34/30.

NURSING IMPLICATIONS

Assessment

- Assess lesions before and daily during therapy.
- Monitor patient for signs of thrombotic thrombocytic purpura/hemolytic uremic syndrome (thrombocytopenia, microangiopathic hemolytic anemia, neurologic findings, renal dysfunction, fever). Requires prompt treatment; may be fatal.

© F.A. Davis Publishing

Implementation

- ***High Alert:*** Do not confuse valacyclovir with valganciclovir. Do not confuse Valtrex (valacyclovir) with Valcyte (valganciclovir).
- **PO:** May be administered without regard to meals.
- **Herpes Zoster:** Implement valacyclovir therapy as soon as possible after the onset of signs or symptoms of herpes zoster; most effective if started within 48 hr of the onset of zoster rash. Efficacy of treatment started >72 hr after rash onset is unknown.
- **Genital Herpes and Herpes Labialis:** Implement treatment for genital herpes as soon as possible after onset of symptoms (tingling, itching, burning).
- **Chicken Pox:** Initiate therapy at the earliest sign or symptom; preferably within 24 hr of onset of rash.

Patient/Family Teaching

- Instruct patient to take valacyclovir exactly as directed for the full course of therapy. Take missed doses as soon as remembered if not just before next dose; do not double doses. Advise patient to read the *Patient Information* before starting therapy.
- Advise patient to maintain adequate hydration during therapy.
- Advise patient to notify health care professional promptly if nervous system symptoms (aggressive behavior, unsteady movement, shaky movements, confusion, speech problems, hallucinations, seizures, coma) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Instruct female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- **Herpes Zoster:** Inform patient that valacyclovir does not prevent the spread of infection to others. Precautions should be taken around others who have not had chickenpox or varicella vaccine, or are immunosuppressed, until all lesions have crusted.
- **Genital Herpes and Herpes Labialis:** Inform patient that valacyclovir does not prevent the spread of herpes labialis to others. Advise patient to avoid contact with lesions while lesions or symptoms are present. Valacyclovir reduces transmission of genital herpes to others. Advise patient to practice safe sex (avoid sexual intercourse when lesions are present and wear a condom made of latex or polyurethane during sexual contact).

Evaluation/Desired Outcomes

- Decrease in time to full crusting, loss of vesicles, loss of ulcers, and development of crusts in patients with acute herpes zoster (shingles).
- Decrease in time to full crusting, loss of vesicles, loss of ulcers, and development of crusts in patients with genital herpes.
- Decrease in frequency of outbreaks in patients with genital herpes.
- Decrease in time to full crusting, loss of vesicles, loss of ulcers, and development of crusts in patients with herpes labialis. Decrease in transmission of genital herpes.
- Treatment of chickenpox.

valbenazine (val-ben-a-zeen)

Ingrezza

Classification

Therapeutic: none assigned

Pharmacologic: reversible monoamine depleters

Indications

Tardive dyskinesia.

Action

Acts as a reversible inhibitor of the vesicular monoamine transporter 2 (VMAT2), which inhibits the reuptake of serotonin, norepinephrine, and dopamine into vesicles in presynaptic neurons. **Therapeutic Effects:** Reduced severity of tardive dyskinesia.

Pharmacokinetics

Absorption: 49% absorbed following oral administration.

Distribution: Well distributed.

Protein Binding: >99%.

Metabolism and Excretion: Rapidly and extensively metabolized by the liver via hydrolysis to the active metabolite, α-dihydrotetrabenazine (α-HTBZ); also metabolized via CYP3A4 to form other minor metabolites. α-HTBZ is further metabolized, in part, via CYP2D6. The CYP2D6 enzyme system exhibits genetic polymorphism; 7% of population may be poor metabolizers and may have significantly ↑ concentrations and an ↑ risk of adverse effects. 60% eliminated in urine (<2% as unchanged drug) and 30% eliminated in feces (<2% as unchanged drug).

Half-life: 15–22 hr (valbenazine and α-HTBZ).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.5–1 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Congenital long QT syndrome or history of torsades de pointes; Concurrent use of MAO inhibitors or strong CYP3A4 inducers; Lactation: Lactation.

Use Cautiously in: Poor CYP2D6 metabolizers or taking strong CYP2D6 inhibitor (may need to ↓ valbenazine dose); Concurrent use of strong CYP3A4 inhibitor (↓ dose of valbenazine); Moderate or severe hepatic impairment (↓ dose); OB: Safety not established in pregnancy; Pedi: Safety and effectiveness not established in children.

© F.A. Davis Publishing

Adverse Reactions/Side Effects

EENT: blurred vision. **GI:** constipation, nausea, vomiting, xerostomia. **GU:** urinary retention. **MS:** arthralgia, bradykinesia. **Neuro:** akathisia, balance difficulty, gait disturbances, parkinsonism, restlessness, tremor, unsteady gait, fatigue, sedation/somnolence, dizziness, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions

Drug-Drug: MAO inhibitors may ↑ risk of serotonin syndrome and/or ↓ effect of valbenazine; avoid concurrent use. **Strong CYP3A4 inhibitors**, including **itraconazole**, **ketoconazole**, or **clarithromycin** may ↑ levels of valbenazine and its active metabolite (α-HTBZ); ↓ valbenazine dose. **Strong CYP2D6 inhibitors**, including **fluoxetine**, **paroxetine**, or **quinidine** may ↑ levels of the active metabolite (α-HTBZ); may need to ↓ valbenazine dose. **Strong CYP3A4 inducers**, including **rifampin**, **carbamazepine**, or **phenytoin** may ↓ levels and effect of valbenazine; concurrent use not recommended. May ↑ **digoxin** levels. **Drug-Natural Products: St. John's wort** may ↓ levels and effect of valbenazine; concurrent use not recommended.

Route/Dosage

PO (Adults): 40 mg once daily; after 1 wk, ↑ to 80 mg once daily. *Known CYP2D6 poor metabolizer*—40 mg once daily (with no additional titration). *Concurrent use of strong CYP3A4 inhibitors or strong CYP2D6 inhibitors*—40 mg once daily (with no additional titration).

Hepatic Impairment

PO (Adults): *Moderate or severe hepatic impairment*—40 mg once daily (with no additional titration).

Availability

Capsules: 40 mg, 60 mg, 80 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for changes in signs and symptoms of tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue, excessive eye blinking) periodically during therapy.

Implementation

- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take valbenazine as directed. Do not stop taking valbenazine without consulting health care professional. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- May cause drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if symptoms of heart rhythm problems (fast, slow, or irregular heartbeat, shortness of breath, dizziness, fainting) or if a fast or irregular heartbeat occurs.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during and for 5 days after last dose of therapy.

Evaluation/Desired Outcomes

- Decrease in severity of uncontrolled movements.

valGANciclovir

(val-gan-**sye**-kloe-veer)
Valcyte

Classification
Therapeutic: antivirals

Indications

Treatment of cytomegalovirus (CMV) retinitis in patients with AIDS. Prevention of CMV disease in kidney, kidney/pancreas and heart transplant patients at risk.

Action

Valganciclovir is a prodrug which is rapidly converted to ganciclovir by intestinal and hepatic enzymes. CMV virus converts ganciclovir to its active form (ganciclovir phosphate) inside host cell, where it inhibits viral DNA polymerase. **Therapeutic Effects:** Antiviral effect directed preferentially against CMV-infected cells.

Pharmacokinetics

Absorption: 59.4% absorbed following oral administration, rapidly converted to ganciclovir.
Distribution: Unknown.
Metabolism and Excretion: Rapidly converted to ganciclovir; ganciclovir is mostly excreted by the kidneys.
Half-life: 4.1 hr (intracellular half-life of ganciclovir phosphate is 18 hr).

TIME/ACTION PROFILE (ganciclovir blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2 hr	12–24 hr

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity to valganciclovir or ganciclovir; Hemodialysis; Patients undergoing liver transplantation; Lactation: Lactation.

Use Cautiously in: Renal impairment (dosage ↓ recommended if CCr <60 mL/min); Pre-existing bone marrow depression; Previous or concurrent myelosuppressive drug therapy or radiation therapy; Rep: Women of reproductive potential and men with female partners of reproductive potential; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk (based on animal data, has potential to cause birth defects); Pedi: Children <4 mo (safety and effectiveness not established); Geri: Age-related ↓ in renal function requires dosage ↓.

Adverse Reactions/Side Effects

GI: abdominal pain, diarrhea, nausea, vomiting. **GU:** ↓ fertility, renal impairment. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA, anemia, aplastic anemia, bone marrow depression, pancytopenia. **Neuro:** ataxia, paresthesia, peripheral neuropathy, SEIZURES, headache, insomnia, agitation, confusion, dizziness, hallucinations, psychosis, sedation. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), INFECTION, fever.

Interactions

Drug-Drug: ↑ risk of hematologic toxicity with **zidovudine**. Blood levels and effects may be ↑ by **probenecid**. Patients with renal impairment may experience accumulation of metabolites of **mycophenolate** and valganciclovir. ↑ blood levels and risk of toxicity from **didanosine**.

Drug-Food: Food ↑ absorption.

Route/Dosage

Treatment of CMV Disease

PO (Adults): *Induction*—900 mg twice daily for 21 days; *Maintenance treatment or patients with inactive CMV retinitis*—900 mg once daily.

Renal Impairment

CCr 40–59 mL/min (Adults): *Induction*—450 mg twice daily for 21 days; *Maintenance treatment or patients with inactive CMV retinitis*—450 mg once daily.

Renal Impairment

CCr 25–39 mL/min (Adults): *Induction*—450 mg once daily for 21 days; *Maintenance treatment or patients with inactive CMV retinitis*—450 mg every 2 days.

Renal Impairment

CCr 10–24 mL/min (Adults): *Induction*—450 mg every 2 days for 21 days; *Maintenance treatment or patients with inactive CMV retinitis*—450 mg twice weekly.

Prevention of CMV Disease in Transplant Patients

PO (Adults): *Kidney/pancreas or heart transplant*—900 mg once daily, starting 10 days prior to transplant and continued for 100 days after; *Kidney transplant*—900 mg once daily, starting 10 days prior to transplant and continued for 200 days after.

Renal Impairment

PO (Adults): *CCr 40–59 mL/min*—450 mg once daily; *CCr 25–39 mL/min*—450 mg every 2 days; *CCr 12–24 mL/min*—450 mg twice weekly.

PO (Children 4 mo-16 yr): *Kidney transplant*—Dose is based on body surface area (BSA) and CCr. Dose = 7 × BSA × CCr (see prescribing information for equations used for BSA and CCr); all calculated doses should be rounded to nearest 25 mg (max = 900 mg) and administered as oral solution; should be started 10 days prior to transplant and continued for 200 days after.

PO (Children 4 mo-16 yr): *Heart transplant*—Dose is based on BSA and CCr. Dose = 7 × BSA × CCr (see prescribing information for equations used for BSA and CCr); all calculated doses should be rounded to nearest 25 mg (max = 900 mg) and administered as oral solution; should be started 10 days prior to transplant and continued for 100 days after.

Renal Impairment

PO (Adults): *CCr 40–59 mL/min*—450 mg once daily; *CCr 25–39 mL/min*—450 mg every 2 days; *CCr 12–24 mL/min*—450 mg twice weekly.

Availability (generic available)

Tablets: 450 mg. **Oral solution (tutti-frutti flavor):** 50 mg/mL.

NURSING IMPLICATIONS

Assessment

- Diagnosis of CMV retinitis should be determined by ophthalmoscopy prior to treatment with valganciclovir.
- Culture for CMV (urine, blood, throat) may be taken prior to administration. However, a negative CMV culture does not rule out CMV retinitis. If symptoms do not respond after several wk, resistance to valganciclovir may have occurred. Ophthalmologic exams should be performed weekly during induction and every 2 wk during maintenance or more frequently if the macula or optic nerve is threatened. Progression of CMV retinitis may occur during or following ganciclovir treatment.
- Assess for signs of infection (fever, chills, cough, hoarseness, lower back or side pain, sore throat, difficult or painful urination). Notify health care professional if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae, or guaiac stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.

© F.A. Davis Publishing

- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- May cause granulocytopenia, anemia, and thrombocytopenia. Monitor neutrophil and platelet count closely throughout therapy. Do not administer if ANC $<500/mm^3$, platelet count $<25,000/mm^3$, or hemoglobin <8 g/dL. Recovery begins within 3–7 days of discontinuation of therapy.
- Monitor BUN and serum creatinine at least once every 2 wk throughout therapy. May cause ↑ in serum creatinine.

Implementation

- Do not confuse valganciclovir with valacyclovir. Do not confuse Valcyte (valganciclovir) with Valtrex (valacyclovir).
- **PO:** Administer tablets and oral solution with food. Adults should take tablets, not oral solution. Handle valganciclovir tablets carefully. Do not break or crush. Avoid direct contact with broken or crushed tablets. If contact with the skin or mucous membranes occurs, wash thoroughly with soap and water and rinse eyes thoroughly with plain water.
- Oral solution (50 mg/mL) must be prepared by the pharmacist prior to dispensing to the patient. Shake well prior to use. Use oral dispenser provided for accurate dose. Store oral solution in refrigerator for no longer than 49 days.

Patient/Family Teaching

- Instruct patient to take valganciclovir with food, as directed. Take missed doses as soon as remembered, unless almost time for next dose; do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Inform patient that valganciclovir is not a cure for CMV retinitis. Progression of retinitis may continue in immunocompromised patients during and following therapy. Advise patients to have regular ophthalmic exams at least every 4–6 wk. Duration of therapy for CMV prevention is based on the duration and degree of immunosuppression.
- May cause seizures, sedation, dizziness, ataxia, and/or confusion. Caution patient not to drive or do other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if fever; chills; sore throat; other signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for at least 30 days following therapy and to avoid breast feeding. Advise males with female partners of reproductive potential to use a barrier method of contraception during and for at least 90 days following therapy. Advise patient to notify health care professional immediately if pregnancy is suspected. May cause temporary or permanent infertility.
- Emphasize the importance of frequent follow-up exams to monitor blood counts.

Evaluation/Desired Outcomes

- Management of the symptoms of CMV retinitis in patients with AIDS.
- Prevention of CMV disease in kidney, kidney/pancreas and heart transplant patients at risk.

VALPROATES

divalproex sodium (dye-val-**proe**-ex **soe**-dee-um) Depakote, Depakote ER, Depakote Sprinkle, Epival

valproate sodium (val-**proe**-ate **soe**-dee-um) ~~Depacon~~

valproic acid (val-**proe**-ik **as**-id) ~~Depakene~~

Classification
Therapeutic: anticonvulsants, vascular headache suppressants

V

Indications

Monotherapy and adjunctive therapy for simple and complex absence seizures. Monotherapy and adjunctive therapy for complex partial seizures. Adjunctive therapy for patients with multiple seizure types, including absence seizures. **Divalproex sodium only**. Manic episodes associated with bipolar disorder. Prevention of migraine headache.

Action

Increase levels of GABA, an inhibitory neurotransmitter in the CNS. **Therapeutic Effects:** Suppression of seizure activity. Decreased manic episodes. Decreased frequency of migraine headaches.

Pharmacokinetics

Absorption: Well absorbed following oral administration; divalproex is enteric-coated, and absorption is delayed. ER form produces lower blood levels. IV administration results in complete bioavailability.

© F.A. Davis Publishing

Distribution: Rapidly distributed into plasma and extracellular water. Cross blood-brain barrier and placenta; enter breast milk.

Protein Binding: 80–90%, decreased in neonates, elderly, renal impairment, or chronic hepatic disease.

Metabolism and Excretion: Mostly metabolized by the liver; minimal amounts excreted unchanged in urine.

Half-life: Adults: 9–16 hr.

TIME/ACTION PROFILE (onset = anticonvulsant effect; peak = blood levels)

ROUTE	ONSET	PEAK	DURATION
PO—liquid	2–4 days	15–120 min	6–24 hr
PO—capsules	2–4 days	1–4 hr	6–24 hr
PO—delayed-release products	2–4 days	3–5 hr	12–24 hr
PO—extended-release products	2–4 days	7–14 hr	24 hr
IV	2–4 days	end of infusion	6–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hepatic impairment; Known/suspected urea cycle disorders (may result in fatal hyperammonemic encephalopathy); Mitochondrial disorders caused by mutations in mitochondrial DNA polymerase gamma (↑ risk for potentially fatal hepatotoxicity); Rep: Women of reproductive potential not using effective contraception (for migraine prophylaxis only); OB: Pregnancy (may cause fetal harm) (for migraine prophylaxis only); Lactation: Lactation; Pedi: Children <2 yr with suspected mitochondrial disorder caused by mutations in mitochondrial DNA polymerase gamma (↑ risk for potentially fatal hepatotoxicity).

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Bleeding disorders; History of liver disease; Organic brain disease; Bone marrow depression; Renal impairment; Rep: Women of reproductive potential (use for seizure disorders or bipolar disorders only if other medications are ineffective, poorly tolerated, or inappropriate); OB: Pregnancy (may cause fetal harm including ↓ IQ, neurodevelopmental disorders [including autism spectrum disorders and attention deficit/hyperactivity disorder], neural tube defects, hearing impairment/loss, and other major congenital malformations); use for seizure disorders or bipolar disorders only if other medications are ineffective, poorly tolerated, or inappropriate; Geri: ↑ risk of adverse effects in older adults.

Adverse Reactions/Side Effects

CV: peripheral edema. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS) alopecia, rashes. **EENT:** visual disturbances. **GI:** HEPATOTOXICITY, PANCREATITIS, abdominal pain, anorexia, diarrhea, indigestion, nausea, vomiting, constipation, ↑ appetite. **Hemat:** thrombocytopenia, leukopenia. **Metab:** HYPERAMMONEMIA, weight gain. **Neuro:** HYPOTHERMIA, tremor, ataxia, SUICIDAL THOUGHTS, agitation, dizziness, headache, insomnia, sedation, confusion, depression.

Interactions

Drug-Drug: ↑ risk of bleeding with **warfarin**. Blood levels and toxicity may be ↑ by **aspirin**, **carbamazepine**, **chlorpromazine**, **cimetidine**, **erythromycin**, or **felbamate**. ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioid analgesics**, **MAO inhibitors**, and **sedative/hypnotics**. **MAO inhibitors** and other **antidepressants** may ↓ seizure threshold and ↓ effectiveness of valproate. **Carbamazepine**, **meropenem**, **phenobarbital**, **phenytoin**, **estrogen-containing contraceptives**, or **rifampin** may ↓ valproate levels. May ↑ levels of **carbamazepine**, **diazepam**, **amitriptyline**, **nortriptyline**, **ethosuximide**, **lamotrigine**, **phenobarbital**, **phenytoin**, **rufinamide**, **topiramate**, or **zidovudine**; dosage adjustments of these medications may be necessary. May ↑ levels of **propofol**; ↓ dose of propofol. Concurrent use with **topiramate** may ↑ risk of hypothermia and hyperammonemia with or without encephalopathy. **Ertapenem**, **imipenem**, or **meropenem** may ↓ valproate levels. **Cholestyramine** may ↓ valproate levels; separate administration by 3 hr.

Route/Dosage

Regular-release and delayed-release formulations usually given in 2–4 divided doses daily; extended-release formulation (Depakote ER) usually given once daily.

Anticonvulsant

PO (Adults and Children >10 yr): *Single-agent therapy (complex partial seizures)*—Initial dose of 10–15 mg/kg/day in 1–4 divided doses; ↑ by 5–10 mg/kg/day weekly until therapeutic response achieved (not to exceed 60 mg/kg/day); when daily dose exceeds 250 mg, give in divided doses. *Polytherapy (complex partial seizures)*—Initial dose of 10–15 mg/kg/day; ↑ by 5–10 mg/kg/day weekly until therapeutic response achieved (not to exceed 60 mg/kg/day); when daily dosage exceeds 250 mg, give in divided doses.

PO (Adults and Children >2 yr [>10 yr for Depakote ER]): *Simple and complex absence seizures*—Initial dose of 15 mg/kg/day in 1–4 divided doses; ↑ by 5–10 mg/kg/day weekly until therapeutic response achieved (not to exceed 60 mg/kg/day); when daily dose exceeds 250 mg, give in divided doses.

IV (Adults and Children): Give same daily dose and at same frequency as was given orally; switch to oral formulation as soon as possible.

Rect (Adults and Children): Dilute syrup 1:1 with water for use as a retention enema. Give 17–20 mg/kg load, maintenance 10–15 mg/kg/dose every 8 hr.

© F.A. Davis Publishing

Mood Stabilizer

PO (Adults): *Depakote*—Initial dose of 750 mg/day in divided doses initially, titrated rapidly to desired clinical effect or trough plasma levels of 50–125 mcg/mL (not to exceed 60 mg/kg/day). *Depakote ER*—Initial dose of 25 mg/kg once daily; titrated rapidly to desired clinical effect of trough plasma levels of 85–125 mcg/mL (not to exceed 60 mg/kg/day).

Migraine Prevention

PO (Adults and Children ≥16 yr): *Depakote*—250 mg twice daily (up to 1000 mg/day). *Depakote ER*—500 mg once daily for 1 wk, then ↑ to 1000 mg once daily.

Availability

Valproic Acid (generic available)

Capsules: 250 mg, 🍁 500 mg. **Cost:** *Generic*—$37.90/100. **Syrup:** 250 mg/5 mL.

Valproate Sodium (generic available)

Solution for injection: 100 mg/mL.

Divalproex Sodium (generic available)

Delayed-release tablets (Depakote): 125 mg, 250 mg, 500 mg. **Cost:** 125 mg $89.72/100, 250 mg $176.23/100, 500 mg $324.97/100. **Extended-release tablets (Depakote ER):** 250 mg, 500 mg. **Cost:** 250 mg $167.91/100, 500 mg $295.36/100. **Sprinkle capsules:** 125 mg. **Cost:** $137.53/100.

NURSING IMPLICATIONS

Assessment

- **Seizures:** Assess location, duration, and characteristics of seizure activity. Institute seizure precautions.
- **Bipolar Disorder:** Assess mood, ideation, and behavior frequently.
- **Migraine Prophylaxis:** Monitor frequency and intensity of migraine headaches.
- Geri: Assess geriatric patients for excessive somnolence.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr.
- Monitor for signs and symptoms of pancreatitis (abdominal pain, nausea, vomiting, anorexia). If pancreatitis occurs, valproates should be discontinued and alternate therapy initiated.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, hepatitis, nephritis, hematological abnormalities, myocarditis, myositis, eosinophilia). If symptoms occur and DRESS is confirmed, discontinue valproate and do not restart.
- ***Lab Test Considerations:*** Monitor CBC, platelet count, and bleeding time prior to and periodically during therapy. May cause leukopenia and thrombocytopenia.
- Monitor hepatic function (LDH, AST, ALT, and bilirubin) and serum ammonia concentrations prior to and periodically during therapy. May cause hepatotoxicity; monitor closely, especially during initial 6 mo of therapy; fatalities have occurred. Therapy should be discontinued if hyperammonemia occurs.
- May interfere with accuracy of thyroid function tests.
- May cause false-positive results in urine ketone tests.
- ***Toxicity and Overdose:*** Therapeutic serum levels range from 50–100 mcg/mL (50–125 mcg/mL for mania). Doses are gradually ↑ until a pre-dose serum concentration of at least 50 mcg/mL is reached. However, a good correlation among daily dose, serum level, and therapeutic effects has not been established. Monitor patients receiving near the maximum recommended 60 mg/kg/day for toxicity.

Implementation

- Do not confuse *Depakote ER* and regular dose forms. *Depakote ER* produces lower blood levels than *Depakote* dosing forms. If switching from *Depakote* to *Depakote ER*, increase dose by 8-20%.
- Single daily doses are usually administered at bedtime because of sedation.
- **PO:** Administer with or immediately after meals to minimize GI irritation. ***DNC:*** Extended-release and delayed-release tablets and capsules should be swallowed whole, do not open, break, or chew; will cause mouth or throat irritation and destroy extended release mechanism. Do not administer tablets with milk or carbonated beverages (may cause premature dissolution). Delayed-release divalproex sodium may cause less GI irritation than valproic acid capsules.
- Shake liquid preparations well before pouring. Use calibrated measuring device to ensure accurate dose. Syrup may be mixed with food or other liquids to improve taste.
- Sprinkle capsules may be swallowed whole or opened and entire capsule contents sprinkled on a teaspoonful of soft, cool food (applesauce, pudding). Do not chew mixture. Administer immediately; do not store for future use.
- To convert from valproic acid to divalproex sodium, initiate divalproex sodium at same total daily dose and dosing schedule as valproic acid. Once patient is stabilized on divalproex sodium, attempt administration 2–3 times daily.
- **Rect:** Dilute syrup 1:1 with water for use as a retention enema.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** May be diluted in at least 50 mL of D5W, 0.9% NaCl, or LR. Solution is stable for 24 hr at room temperature. ***Concentration:*** 2 mg/mL. ***Rate:*** Infuse over 60 min (≤20 mg/min). Rapid infusion may cause increased side

V

© F.A. Davis Publishing

effects. Has been given as an infusion of ≤15 mg/kg over 5–10 min (1.5–3 mg/kg/min). Rapid loading doses of doses of 20 to 40 mg/kg have been administered over 1 to 5 min. In pediatric patients, an infusion rate of 1.5 to 3 mg/kg/minute has been recommended.

- **Y-Site Compatibility:** cefepime, ceftazidime, meropenem, naloxone.
- **Y-Site Incompatibility:** vancomycin.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed on a once-a-day schedule, take as soon as remembered that day. If on a multiple-dose schedule, take it within 6 hr of the scheduled time, then space remaining doses throughout the remainder of the day. Abrupt withdrawal may lead to status epilepticus. Advise patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until effects of medication are known. Tell patient not to resume driving until physician gives clearance based on control of seizure disorder.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially CNS depressants. Caution patient to avoid alcohol during therapy.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if anorexia, abdominal pain, severe nausea and vomiting, yellow skin or eyes, fever, sore throat, malaise, weakness, facial edema, lethargy, unusual bleeding or bruising, pregnancy, or loss of seizure control occurs. Children <2 yr of age are especially at risk for fatal hepatotoxicity.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during therapy and to notify health care professional immediately if pregnancy is planned or suspected, or if breast feeding. May cause abnormal clotting and hepatic failure in pregnant woman and neonate. May cause adverse effects on neurodevelopment, including increases in autism spectrum disorders and attention deficit/hyperactivity disorder (ADHD), decreased IQ, neural tube defects, and hearing impairment/loss. Advise pregnant patients taking valproates to enroll in the NAAED Pregnancy Registry to monitor pregnancy outcomes by calling 1-888-233-2334; call must be made by patient. Registry website is www.aedpregnancyregistry.org. May cause male infertility. Monitor breast-fed infant for signs of liver damage including jaundice and unusual bruising or bleeding.
- Advise patient to carry identification at all times describing medication regimen.
- Emphasize the importance of routine exams to monitor progress.

Evaluation/Desired Outcomes

- Decreased seizure activity.
- Decreased incidence of manic episodes in patients with bipolar disorders.
- Decreased frequency of migraine headaches.

valproic acid, See VALPROATES.

valsartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

vancomycin (van-koe-**mye**-sin)

Firvanq, Vancocin

Classification

Therapeutic: anti-infectives

Indications

IV: Treatment of potentially life-threatening infections when less toxic anti-infectives are contraindicated. Particularly useful in staphylococcal infections, including: endocarditis, meningitis, osteomyelitis, pneumonia, septicemia, soft-tissue infections in patients who have allergies to penicillin or its derivatives or when sensitivity testing demonstrates resistance to methicillin. **PO:** Treatment of staphylococcal enterocolitis or diarrhea due to *Clostridioides difficile*. **IV:** Part of endocarditis prophylaxis in high-risk patients who are allergic to penicillin.

Action

Binds to bacterial cell wall, resulting in cell death. **Therapeutic Effects:** Bactericidal action against susceptible organisms. **Spectrum:** Active against gram-positive pathogens, including: Staphylococci (including methicillin-resistant strains of *Staphylococcus aureus*), Group A beta-hemolytic streptococci, *Streptococcus pneumoniae*, *Corynebacterium*, *Clostridioides difficile*, *Enterococcus faecalis*, *Enterococcus faecium*.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Poorly absorbed from the GI tract.
Distribution: Widely distributed. Some penetration (20–30%) of CSF; crosses placenta.
Metabolism and Excretion: Oral doses excreted primarily in the feces; IV vancomycin eliminated almost entirely by the kidneys.
Half-life: Neonates: 6–10 hr; Children 3 mo–3 yr: 4 hr; Children >3 yr: 2–2.3 hr; Adults: 5–8 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Renal impairment (dosage reduction required if CCr ≤80 mL/min); Hearing impairment; Intestinal obstruction or inflammation (↑ systemic absorption when given orally); OB: Pharmacokinetics of IV vancomycin may be altered in pregnancy (volume of distribution may be ↑); systemic absorption of PO vancomycin expected to be minimal; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects

CV: hypotension. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS, LINEAR IGA BULLOUS DERMATOSIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash. **EENT:** ototoxicity. **GI:** nausea, vomiting. **GU:** nephrotoxicity. **Hemat:** eosinophilia, leukopenia. **Local:** phlebitis. **MS:** back and neck pain. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), chills, fever, vancomycin flushing syndrome (with rapid infusion).

Interactions

Drug-Drug: May cause additive ototoxicity and nephrotoxicity with other **ototoxic** and **nephrotoxic drugs** (**aspirin**, **aminoglycosides**, **cyclosporine**, **cisplatin**, **loop diuretics**). May enhance neuromuscular blockade from **nondepolarizing neuromuscular blocking agents**. ↑ risk of histamine flush when used with **general anesthetics** in children.

Route/Dosage

Serious Systemic Infections

IV (Adults): 500 mg every 6 hr *or* 1 g every 12 hr (up to 4 g/day).
IV (Children >1 mo): 40 mg/kg/day divided every 6–8 hr *Staphylococcal CNS infection*— 60 mg/kg/day divided every 6 hr, maximum dose: 1 g/dose.
IV (Neonates 1 wk–1 mo): <1200 g: 15 mg/kg every 24 hr. 1200–2000 g: 10–15 mg/kg every 8–12 hr. >2000 g: 15–20 mg/kg every 8 hr.
IV (Neonates <1 wk): <1200 g: 15 mg/kg every 24 hr. 1200–2000 g: 10–15 mg/kg every 12–18 hr. >2000 g: 10–15 mg/kg every 8–12 hr.
IT (Adults): 20 mg/day.
IT (Children): 5–20 mg/day.
IT (Neonates): 5–10 mg/day.

Endocarditis Prophylaxis in Penicillin-Allergic Patients

IV (Adults and Adolescents): 1 g single dose 1 hr preprocedure.
IV (Children): 20 mg/kg single dose 1 hr preprocedure.

Diarrhea Due to *C. difficile*

PO (Adults): 125 mg every 6 hr for 10 days.
PO (Children): 40 mg/kg/day divided into 3 or 4 doses for 7–10 days (not to exceed 2 g/day).

Staphylococcal Enterocolitis

PO (Adults): 500–2000 mg/day in 3–4 divided doses for 7–10 days.
PO (Children): 40 mg/kg/day in 3–4 divided doses for 7–10 days (not to exceed 2 g/day).

Renal Impairment

IV (Adults): An initial loading dose of 750 mg–1 g (not less than 15 mg/kg); serum level monitoring is optimal for choosing maintenance dose in patients with renal impairment; these guidelines may be helpful. *CCr 50–80 mL/min*— 1 g every 1–3 days; *CCr 10–50 mL/min*— 1 g every 3–7 days; *CCr <10 mL/min*— 1 g every 7–14 days.

Availability (generic available)

Capsules: 125 mg, 250 mg. **Powder for oral solution (grape-flavor):** 3.75 g/bottle, 7.5 g/bottle, 15 g/bottle. **Premixed infusion:** 500 mg/100 mL D5W, 750 mg/150 mL D5W, 1000 mg/200 mL D5W or 0.9% NaCl, 1250 mg/200 mL D5W, 1500 mg/300 mL D5W, 1750 mg/350 mL D5W, 2000 mg/400 mL D5W. **Solution for injection:** 250 mg/vial, 500 mg/vial, 750 mg/vial, 1 g/vial, 1.5 g/vial, 5 g/vial, 10 g/vial, 100 g/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Monitor IV site closely. Vancomycin is irritating to tissues and causes necrosis and severe pain with extravasation. Rotate infusion site.

V

© F.A. Davis Publishing

- Monitor BP during IV infusion.
- Evaluate eighth cranial nerve function by audiometry and serum vancomycin levels prior to and throughout therapy in patients with borderline renal function or those >60 yr of age. Prompt recognition and intervention are essential in preventing permanent damage.
- Monitor intake and output ratios and daily weight. Cloudy or pink urine may be a sign of nephrotoxicity.
- Assess patient for signs of superinfection (black, furry overgrowth on tongue; vaginal itching or discharge; loose or foul-smelling stools). Report occurrence.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- ***C. difficile*-Associated Diarrhea:** Assess bowel status (bowel sounds, frequency and consistency of stools, presence of blood in stools) throughout therapy.
- ***Lab Test Considerations:*** Monitor for casts, albumin, or cells in the urine or decreased specific gravity, CBC, and renal function periodically during therapy.
- May cause increased BUN levels.
- ***Toxicity and Overdose:*** Trough concentrations should not exceed 10 mcg/mL (mild-moderate infections) or 15–20 mcg/mL (for severe infections).

Implementation

- Vancomycin must be given orally for treatment of staphylococcal enterocolitis and *C. difficile*-associated diarrhea. Orally administered vancomycin is not effective for other types of infections.
- **PO:** Use calibrated measuring device for liquid preparations. Shake well before use. Oral solution is stable for 14 days if refrigerated.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** To reconstitute, add 10 mL of sterile water for injection to 500-mg vial or 20 mL of sterile water for injection to 1-g vial for a concentration of 50 mg/mL. Dilute further with at least 100 mL of 0.9% NaCl, D5W, D5/0.9% NaCl, or LR for every 500 mg of vancomycin being administered. Reconstituted vials stable for 14 days if refrigerated. Infusion is stable for 96 hr if refrigerated. ***Concentration:*** ≤5 mg/mL. ***Rate:*** Infuse over at least 60 min (90 min for doses >1 g). Do not administer rapidly or as a bolus, to minimize risk of thrombophlebitis, hypotension, and vancomycin flushing syndrome (sudden, severe hypotension; flushing and/or maculopapular rash of face, neck, chest, and upper extremities). May need to slow infusion further to 1.5–2 hr if vancomycin flushing syndrome occurs.
- **IT:** ***Dilution:*** Dilute with preservative-free NS. ***Concentration:*** 1–5 mg/mL. ***Rate:*** Directly instill into ventricular cerebrospinal fluid.
- **Y-Site Compatibility:** acetaminophen, acetylcysteine, acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminocaproic acid, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, benztropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, ceftolozane/tazobactam, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxapram, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, eravacycline, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, folic acid, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydromorphone, ifosfamide, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketamine, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem/vaborbactam, mesna, methadone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, remifentanil, rifampin, sodium acetate, sodium bicarbonate, sodium citrate, succinylcholine, sufentanil, tacrolimus, tedizolid, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** albumin, human, aminophylline, amphotericin B deoxycholate, amphotericin lipid complex, amphotericin B liposome, azathioprine, bivalirudin, chloramphenicol, dantrolene, daptomycin, diazepam, epoetin alfa, fluorouracil, furosemide, ganciclovir, gemtuzumab ozogamicin, ibuprofen lysine, idarubicin, indomethacin, ketorolac, leucovorin calcium, methylprednisolone, mitomycin, moxifloxacin, phenytoin, rituximab, trimethoprim/sulfamethoxazole, valproate sodium.

© F.A. Davis Publishing

Patient/Family Teaching

- Advise patients on oral vancomycin to take as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double dose.
- Instruct patient to report signs of hypersensitivity, tinnitus, vertigo, or hearing loss.
- Advise patient to notify health care professional if no improvement is seen in a few days.
- Patients with a history of rheumatic heart disease or valve replacement need to be taught importance of using antimicrobial prophylaxis prior to invasive dental or medical procedures.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.
- Endocarditis prophylaxis.

REMS

vandetanib (van-**det**-a-nib)

Caprelsa

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Treatment of symptomatic/progressive medullary thyroid cancer in patients with unresectable, locally advanced, or metastatic disease.

Action

Inhibits tyrosine kinase; results in inhibited action of epidermal growth factor (EGFR), vascular endothelial cell growth factor (VEGF) and other kinase-based actions. Inhibits endothelial cell migration/proliferation/survival and new blood vessel formation. Also inhibits EGFR-dependent cell survival. **Therapeutic Effects:** Decreased spread of thyroid cancer.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; 44% excreted in feces, 25% in urine.
Half-life: 19 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–10 hr	24 hr

Contraindications/Precautions

Contraindicated in: Congenital long QT syndrome or QTcF interval >450 msec; Hypocalcemia (serum calcium should be within normal range), hypokalemia (serum potassium should >4.0 mEq/L and within normal range), or hypomagnesemia (serum magnesium should be within normal range); Concurrent use of strong inducers of the CYP3A4 enzyme system; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Diarrhea (↑ risk of electrolyte abnormalities and risk of arrhythmias); Renal impairment (dose ↓ recommended for CCr <50 mL/min with close monitoring of QT interval); Moderate to severe hepatic impairment (Child-Pugh Class B or C; safety and effectiveness not established); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.
Exercise Extreme Caution in: Concurrent use of other drugs know to prolong QT interval (avoid if possible; if medically necessary, monitoring is required).

Adverse Reactions/Side Effects

CV: HF, ISCHEMIC CEREBROVASCULAR EVENTS, TORSADES DE POINTES, hypertension, QT interval prolongation. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, acne, impaired wound healing, photosensitivity reaction, rash, skin reactions, pruritus. **Endo:** hypothyroidism. **F and E:** hypocalcemia. **GI:** abdominal pain, ↓ appetite, diarrhea, nausea, dyspepsia, intestinal perforation, vomiting. **GU:** proteinuria. **Hemat:** BLEEDING. **Neuro:** REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME, fatigue, headache, depression, insomnia, reversible posterior leukoencephalopathy. **Resp:** INTERSTITIAL LUNG DISEASE, upper respiratory tract infection.

Interactions

Drug-Drug: Strong CYP3A4 inducers including **carbamazepine**, **dexamethasone**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampin**, **rifapentine**, and **phenobartital**; may ↓ levels and effectiveness; concurrent use should be avoided. Concurrent use with other drugs that prolong the QT interval should be including some **antiarrhythmics** (**amiodarone**, **disopyramide**, **procainamide**, **sotalol**, **dofetilide**), **chloroquine**, **clarithromycin**, **granisetron**, **haloperidol**, **methadone**, **moxifloxacin**, and **pimozide**. May ↑ **metformin** and **digoxin** levels.
Drug-Natural Products: St. John's wort may ↓ levels and effectiveness and should be avoided.

Route/Dosage

PO (Adults): 300 mg once daily.

Renal Impairment

PO (Adults): *CCr <50 mL/min* — 200 mg once daily.

V

© F.A. Davis Publishing

Availability
Tablets: 100 mg, 300 mg.

NURSING IMPLICATIONS

Assessment
- May prolong the QT interval. Obtain ECG at baseline, at 2–4 wk, at 8–12 wk after starting therapy and every 3 mo there after. Use these parameters to assess QT interval following dose reduction for QT prolongation or dose interruption >2 wk. May require more frequent monitoring if diarrhea occurs.
- Assess patient for rash periodically during therapy. Mild to moderate skin reactions may include rash, acne, dry skin, dermatitis, and pruritus and may be treated with topical or systemic corticosteroids, oral antihistamines, and topical and systemic antibiotics. Treatment of severe rash (Grade 3 or greater) may include systemic corticosteroids and discontinuation of treatment until improved. Upon improvement, may be restarted at a reduced dose.
- Assess for signs and symptoms of interstitial lung disease (hypoxia, pleural effusion, cough, dyspnea). If radiological changes occur with few or no symptoms, therapy may continue. If symptoms are moderate, consider interrupting therapy until symptoms improve. If symptoms are severe, discontinue therapy; permanent discontinuation should be considered. Treat with antibiotics and corticosteroids.
- Assess for signs and symptoms of heart failure (intake and output rations, daily weight, peripheral edema, rales and crackles upon lung auscultation, dyspnea) periodically during therapy.
- Monitor BP during therapy. Control hypertension during therapy.
- Monitor for diarrhea. If severe diarrhea develops, hold therapy until resolved.
- Monitor for signs and symptoms of reversible posterior leukoencephalopathy syndrome (seizures, headache, visual disturbances, confusion, altered mental status); may require discontinuation of therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor serum calcium, potassium, and magnesium periodically during therapy. Maintain serum potassium at ≥4 mEq/L. Maintain serum calcium and magnesium within normal limits. May require more frequent monitoring if diarrhea occurs.
- Monitor TSH at baseline, at 2–4 wk, at 8–12 wk, and every 3 mo thereafter in patients with thyroidectomy. If symptoms of hypothyroidism occur, check TSH levels and adjust thyroid replacement.
- May cause ↓ serum glucose, WBC, hemoglobin, neutrophils, and platelets.
- May cause ↑ serum ALT, serum creatinine, serum bilirubin, and serum glucose.

Implementation
- ***REMS:*** Only prescribers and pharmacies certified with the Caprelsa REMS program are able to prescribe and dispense vandetanib.
- Correct hypocalcemia, hypokalemia, and hypomagnesemia prior to therapy.
- **PO:** May be administered daily without regard to food. ***DNC:*** Swallow tablets whole; do not crush, break, or chew. If unable to swallow tablet, tablet may be dispersed in a class containing 2 oz of non-carbonated water and stirred for approximately 10 min until tablet is dispersed (will not completely dissolve). No other liquids should be used. Swallow dispersion immediately, then mix any residue with 4 oz of non-carbonated water and swallow. Dispersion may also be administered through nasogastric or gastrostomy tubes. Avoid direct contact with crushed tablets with skin or mucous membranes. Wash thoroughly to avoid exposure.

Patient/Family Teaching
- Instruct patient to take vandetanib as directed. Take missed doses as soon as remembered unless within 12 hrs of next dose. Instruct patient to read *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- Advise patients to notify health care professional if rash or signs and symptoms of interstitial lung disease or reversible posterior leukoencephalopathy syndrome. If diarrhea occurs, instruct patient to treat with antidiarrheal medications and notify health care professional if diarrhea becomes severe or persistent.
- May cause tiredness, weakness, or blurred vision. Caution patients to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to wear sunscreen and protective clothing during and for 4 mo after therapy is discontinued to prevent photosensitivity reactions.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- May impair wound healing. Advise patient to notify health care professionals of therapy. Therapy must be stopped for at least 1 month before elective dental surgery, invasive dental procedures, or elective surgeries and then held for at least 2 wk after major surgery until adequate wound healing.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 4 mo after therapy and to avoid breast feeding during therapy. May impair female and male fertility.
- Emphasize the importance of regular follow-up exams, ECGs, and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes
- Decreased spread of thyroid cancer.

© F.A. Davis Publishing

vardenafil (var-den-a-fil)

Levitra, Staxyn

Classification

Therapeutic: erectile dysfunction agents
Pharmacologic: phosphodiesterase type 5 inhibitors

Indications

Erectile dysfunction.

Action

Increases cyclic guanosine monophosphate (cGMP) levels by inhibiting phosphodiesterase type 5 (PDE5) an enzyme responsible for the breakdown of cGMP. cGMP produces smooth muscle relaxation of the corpus cavernosum, which in turn promotes increased blood flow and subsequent erection. **Therapeutic Effects:** Enhanced blood flow to the corpus cavernosum and erection sufficient to allow sexual intercourse. Requires sexual stimulation.

Pharmacokinetics

Absorption: 15% absorbed following oral administration; absorption is rapid.
Distribution: Extensive tissue distribution; penetrates semen.
Protein Binding: 95%.
Metabolism and Excretion: Mostly metabolized by the liver (mainly CYP3A4 enzyme system, minor metabolism by CYP2C). M1 metabolite has anti-erectile dysfunction activity. Parent drug and metabolites are mostly excreted in feces. 2–6% renally eliminated.
Half-life: 4–6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.5–2 hr	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of nitrates or riociguat; Unstable angina, recent history of stroke, life-threatening arrhythmias, HF or MI within 6 mo; End-stage renal disease requiring dialysis; Known hereditary degenerative retinal disorders; Moderate hepatic impairment (Child-Pugh B) (orally disintegrating tablets only); Severe hepatic impairment (Child-Pugh C); Congenital or acquired QT prolongation or concurrent use of Class IA or III antiarrhythmics; Moderate or potent inhibitors of the CYP3A4 enzyme system (e.g. ketoconazole, itraconazole, ritonavir, indinavir, saquinavir, atazanavir, clarithromycin erythromycin) (orally disintegrating tablets only).
Use Cautiously in: Other serious underlying cardiovascular disease or left ventricular outflow obstruction; Penile deformity; Underlying conditions predisposing to priapism including sickle cell anemia, multiple myeloma, or leukemia; Bleeding disorders or active peptic ulcer diseases; History of sudden severe vision loss or non-arteritic ischemic optic neuropathy (NAION); may ↑ risk of recurrence; Low cup-to-disk ratio, age >50 yr, diabetes, hypertension, coronary artery disease, hyperlipidemia, or smoking (↑ risk of NAION); Moderate or potent inhibitors of the CYP3A4 enzyme system (ketoconazole, itraconazole, ritonavir, indinavir, saquinavir, atazanavir, clarithromycin, erythromycin); need to ↓ dose of Levitra; Alpha-adrenergic blockers (patients should be on stable dose of alpha blockers before starting vardenafil; should start therapy with tablets [orally disintegrating tablets should not be used]); Geri: Older adults may have ↑ blood levels; ↓ dose required.

Adverse Reactions/Side Effects

Derm: flushing. **EENT:** HEARING LOSS, VISION LOSS, rhinitis, sinusitis. **GI:** dyspepsia, nausea. **GU:** priapism. **Neuro:** headache, amnesia, dizziness. **Misc:** flu syndrome.

Interactions

Drug-Drug: Concurrent use of **nitrates** may cause serious, life-threatening hypotension and is contraindicated. Concurrent use of **riociguat** may result in severe hypotension; concurrent use contraindicated. Concurrent use of Class IA antiarrhythmics (such as **quinidine** or **procainamide**) or **Class III antiarrhythmics** (such as **amiodarone** or **sotalol**) ↑ risk of serious arrhythmias and should be avoided. Concurrent use of alpha-adrenergic blockers may cause serious hypotension, lowest doses of each should be used initially. Strong inhibitors of CYP3A4 including **ritonavir**, **saquinavir**, **indinavir**, **atazanavir**, **ketoconazole**, **itraconazole**, and **clarithromycin** ↑ levels and the risk of adverse reactions; concurrent use of moderate inhibitors of CYP3A4 including **erythromycin** may also ↑ effects; concurrent use of any of these drugs is contraindicated with Staxyn; dose of Levitra must be ↓. ↑ risk of hypotension with **alpha-adrenergic blockers** and acute ingestion of **alcohol**.

Route/Dosage

The tablets and orally disintegrating tablets are not interchangeable; the orally disintegrating tablets provide a higher level of systemic exposure compared to the tablets.

Tablets

PO (Adults): 10 mg taken 1 hr prior to sexual activity (range 5–20 mg; not to exceed one dose/24 hr); *Concurrent use of ritonavir*—single dose should not exceed 2.5 mg in any 72-hr period; *Concurrent use of indinavir, saquinavir, atazanavir, clarithromycin, ketoconazole 400 mg daily, or itraconazole 400 mg*

V

© F.A. Davis Publishing

daily—single dose should not exceed 2.5 mg/24 hr; *Concurrent use of ketoconazole 200 mg daily, itraconazole 200 mg daily, or erythromycin*—single dose should not exceed 5 mg/24 hr; *Concurrent use of stable alpha-blocker therapy (not on potent CYP3A4 inhibitor)*—5 mg initial dose; titrate as tolerated; *Concurrent use of stable alpha-blocker and potent CYP3A4 inhibitor therapy*—2.5 mg initial dose; titrate as tolerated.

PO (Geriatric Patients ≥65 yr): 5 mg initial dose; titrate as tolerated.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh B)*—May start with 5 mg dose (not to exceed 10 mg).

Orally Disintegrating Tablets

PO (Adults): 10 mg taken 1 hr prior to sexual activity (not to exceed one dose/24 hr).

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg. **Orally disintegrating tablets (peppermint-flavor):** 10 mg.

NURSING IMPLICATIONS

Assessment

- Determine erectile dysfunction before administration. Vardenafil has no effect in the absence of sexual stimulation.

Implementation

- *Tablets* and *orally disintegrating tablets* are not interchangeable.
- **PO:** *Tablets* are usually administered 1 hr before sexual activity. May be administered 30 min to 4 hr before sexual activity.
- Administer *orally disintegrating tablets* 1 hr before sexual activity. These tablets should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on tongue. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.
- May be administered without regard to food.

Patient/Family Teaching

- Instruct patient to take vardenafil approximately 30 min–1 hr before sexual activity and not more than once per day. Inform patient that sexual stimulation is required for an erection to occur after taking vardenafil.
- Advise patient that vardenafil is not indicated for use in women.
- Caution patient not to take vardenafil concurrently with alpha adrenergic blockers (unless on a stable dose) or nitrates. If chest pain occurs after taking vardenafil, instruct patient to seek immediate medical attention.
- Instruct patient to notify health care professional promptly if erection lasts longer than 4 hr or if sudden or decreased vision loss in one or both eyes, or loss or decrease in hearing, ringing in the ears, or dizziness occurs.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient that vardenafil offers no protection against sexually transmitted diseases. Counsel patient that protection against sexually transmitted diseases and HIV infection should be considered.

Evaluation/Desired Outcomes

- Male erection sufficient to allow intercourse.

varenicline (ver-**en**-i-cline)

Champix, Chantix

Classification

Therapeutic: smoking deterrents
Pharmacologic: nicotine agonists

Indications

Treatment of smoking cessation; in conjunction with nonpharmacologic support (educational materials/counseling).

Action

Selectively binds to $alpha_4$, $beta_2$ nicotinic acetylcholine receptors, acting as a nicotine agonist; prevents the binding of nicotine to receptors. **Therapeutic Effects:** Decreased desire to smoke.

Pharmacokinetics

Absorption: 100% absorbed following oral administration.
Distribution: 24 hr.
Metabolism and Excretion: Minimally metabolized; 92% excreted in urine unchanged.
Half-life: 24 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation: Lactation.

Use Cautiously in: Severe renal impairment (↓ dose recommended if CCr <30 mL/min); Stable cardiovascular disease (may ↑ risk of cardiovascular events); Psychiatric illness; Seizure disorders; OB: Use during pregnancy only if potential maternal benefit outweighs potential fetal risk; Pedi: Safety not established in children; Geri: Consider age-related ↓ in renal function.

Adverse Reactions/Side Effects

CV: MYOCARDIAL INFARCTION, syncope. **Derm:** STEVENS-JOHNSON SYNDROME (SJS), flushing, hyperhidrosis, acne, dermatitis, dry skin. **EENT:** blurred vision, visual

© F.A. Davis Publishing

disturbances. **GI:** diarrhea, gingivitis, nausea, ↑ appetite, constipation, dyspepsia, dysphagia, enterocolitis, eructation, flatulence, gallbladder disorder, GI bleeding, ↑ liver enzymes, vomiting. **Hemat:** anemia. **MS:** arthralgia, back pain, musculoskeletal pain, muscle cramps, myalgia, restless legs. **Neuro:** HOMICIDAL THOUGHTS/BEHAVIOR, SEIZURES, STROKE, SUICIDAL THOUGHTS/BEHAVIOR, anxiety, ↓ attention span, depression, insomnia, irritability, dizziness, restlessness, abnormal dreams, agitation, aggression, amnesia, anxiety, delusions, disorientation, dissociation, hallucinations, hostility, mania, mood changes, migraine, panic, paranoia, psychosis, sleepwalking. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema), accidental injury, chills, fever, mild physical dependence.

Interactions

Drug-Drug: Smoking cessation may ↓ metabolism of **theophylline**, **warfarin**, and **insulin** resulting in ↑ effects; careful monitoring is recommended. Risk of adverse reactions (nausea, vomiting, dizziness, fatigue, headache) may be ↑ with **nicotine** replacement therapy (nicotine transdermal patches). Concomitant use with **alcohol** may ↑ risk of worsening neuropsychiatric events.

Route/Dosage

PO (Adults): Treatment is started one wk prior to planned smoking cessation (may also begin dosing and then quit smoking between days 8 and 35 of treatment); 0.5 mg once daily on the first three days, then 0.5 mg twice daily for the next 4 days, then 1 mg twice daily.

Renal Impairment

PO (Adults): *CCr <30 mL/min*— 0.5 mg daily, may ↑ to 0.5 mg twice daily.

Availability (generic available)

Tablets: 0.5 mg, 1 mg. **Cost:** All strengths $237.71/56.

NURSING IMPLICATIONS

Assessment

- Assess for desire to stop smoking.
- Assess for nausea. Usually dose-dependent. May require dose reduction.
- Assess mental status and mood changes, especially during initial few mo of therapy and during dose changes. Risk may be increased in children, adolescents, and adults ≤24 yr. Inform health care professional if patient demonstrates significant increase in signs of depression (depressed mood, loss of interest in usual activities, significant change in weight and/or appetite, insomnia or hypersomnia, psychomotor agitation or retardation, increased fatigue, feelings of guilt or worthlessness, slowed thinking or impaired concentration, suicide attempt or suicidal or homicidal ideation). Restrict amount of drug available to patient.
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- ***Lab Test Considerations:*** May cause anemia.

Implementation

- **PO:** Administer after eating with a full glass of water.

Patient/Family Teaching

- Instruct patient to take varenicline as directed. Set a date to stop smoking. Start taking varenicline 1 wk before quit date. Patient may also begin varenicline and then quit smoking between days 8 and 35 of therapy. Begin with 0.5 mg/day for the first 3 days, then for the next 4 days take one 0.5 mg tablet in the morning and in the evening. After first 7 days, increase to 1 mg tablet in the morning and evening. Advise patient to read *Medication Guide* before starting therapy.
- Encourage patient to attempt to quit, even if they had early lapses after quit day.
- Advise patient to stop taking varenicline and contact health care professional promptly if agitation, depressed mood, any changes in behavior that are not typical of nicotine withdrawal, or if suicidal thoughts or behavior; rash with mucosal lesions or skin reaction, or chest pain, pressure, or dyspnea occur. Encourage patient to reduce amount of alcohol consumed until effects of medication are known.
- Provide patient with educational materials and counseling to support attempts to quit smoking.
- Caution patient not to share varenicline with others. May be harmful.
- May cause blurred vision, dizziness, and disturbance in attention. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Inform patient that nausea, insomnia, and vivid, unusual, or strange dreams may occur and are usually transient. Advise patient to notify health care professional if these symptoms are persistent and bothersome; dose reduction may be considered.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Inform patient that some medications may require dose adjustments after quitting smoking.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Monitor breast-fed infants for seizures and excessive vomiting.

Evaluation/Desired Outcomes

- Smoking cessation. Patients who have successfully stopped smoking at the end of 12 wk should take an

V

© F.A. Davis Publishing

additional 12-wk course to increase the likelihood of long-term abstinence. Patients who do not succeed in stopping smoking during 12 wk of initial therapy or who relapse after treatment should be encouraged to make another attempt once factors contributing to the failed attempt have been identified and addressed.

vasopressin (vay-soe-press-in)

~~Pitressin~~, Vasostrict

Classification

Therapeutic: hormones
Pharmacologic: antidiuretic hormones, vasopressors

Indications

Central diabetes insipidus due to deficient antidiuretic hormone. Vasodilatory shock. **Unlabeled Use:** Gastrointestinal hemorrhage.

Action

Alters the permeability of the renal collecting ducts, allowing reabsorption of water. Directly stimulates musculature of GI tract. In high doses acts as a nonadrenergic peripheral vasoconstrictor. **Therapeutic Effects:** Decreased urine output and increased urine osmolality in diabetes insipidus. Increased BP.

Pharmacokinetics

Absorption: IM absorption may be unpredictable.
Distribution: Widely distributed throughout extracellular fluid.
Metabolism and Excretion: Rapidly degraded by the liver and kidneys; <5% excreted unchanged by the kidneys.
Half-life: <10 min.

TIME/ACTION PROFILE (antidiuretic effect)

ROUTE	ONSET	PEAK	DURATION
IM, subcut	unknown	unknown	2–8 hr
IV	unknown	unknown	30–60 min

Contraindications/Precautions

Contraindicated in: Chronic renal failure with ↑ BUN; Hypersensitivity to 8-L arginine vasopressin or chlorobutanol (only in multidose vial).
Use Cautiously in: Perioperative polyuria (↑ sensitivity to vasopressin effects); Comatose patients; Seizures; Migraine headaches; Asthma; Heart failure; Cardiovascular disease; Renal impairment; OB: Higher doses (0.07 units/min) for vasodilatory shock may be needed in 2nd and 3rd trimesters; Lactation: Safety not established in breast feeding; Geri: Older adults may have ↑ sensitivity to effects.

Adverse Reactions/Side Effects

CV: MI, angina, chest pain. **Derm:** paleness, perioral blanching, sweating. **Endo:** diabetes insipidus. **F and E:** water intoxication (higher doses). **GI:** abdominal cramps, belching, diarrhea, flatulence, heartburn, nausea, vomiting. **Neuro:** trembling, dizziness, "pounding" sensation in head. **Misc:** allergic reactions, fever.

Interactions

Drug-Drug: Antidiuretic effect may be ↓ by concurrent administration of **clozapine**, **lithium**, **demeclocycline**, **foscarnet**. Antidiuretic effect may be ↑ by concurrent administration of **cyclophosphamide**, **enalapril**, **felbamate**, **haloperidol**, **ifosfamide**, **pentamidine**, **tricyclic antidepressants**, **SSRIs**, or **vincristine**. Vasopressor effect may be ↑ by concurrent administration of **ganglionic blocking agents**, **indomethacin**, or **catecholamines**. **Furosemide** ↑ urine flow.

Route/Dosage

Diabetes Insipidus

IM, Subcut (Adults): 5–10 units 2–4 times daily.
IM, Subcut (Children): 2.5–10 units 2–4 times daily.
IV (Adults and Children): 0.0005 units/kg/hr, double dose every 30 min as needed to a maximum of 0.01 units/kg/hr.

Vasodilatory Shock

IV (Adults): 0.01 units/min, titrate by 0.005 units/min every 10–15 min until target BP achieved (max dose = 0.07 units/min).
IV (Infants and Children): 0.0003–0.002 units/kg/min, titrate to effect.

GI Hemorrhage

IV (Adults): 0.2–0.4 units/min then titrate to maximum dose of 0.9 units/min; if bleeding stops, continue same dose for 12 hr then taper off over 24–48 hr.
IV (Children): 0.002–0.005 units/kg/min then titrate to maximum dose of 0.01 units/kg/min; if bleeding stops, continue same dose for 12 hr then taper off over 24–48 hr.

Availability (generic available)

Solution for injection: 20 units/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, HR, and ECG periodically throughout therapy and continuously throughout cardiopulmonary resuscitation.
- **Diabetes Insipidus:** Monitor urine osmolality and urine volume frequently to determine effects of medication. Assess patient for symptoms of dehydration (excessive thirst, dry skin and mucous membranes, tachycardia, poor skin turgor). Weigh patient daily, monitor intake and output, and assess for edema.
- ***Lab Test Considerations:*** Monitor urine specific gravity throughout therapy.
- Monitor serum electrolyte concentrations periodically during therapy.
- ***Toxicity and Overdose:*** Signs and symptoms of water intoxication include confusion, drowsiness, headache, weight gain, difficulty urinating, seizures, and coma.

© F.A. Davis Publishing

- Treatment of overdose includes water restriction and temporary discontinuation of vasopressin until polyuria occurs. If symptoms are severe, administration of mannitol, hypertonic dextrose, urea, and/or furosemide may be used.

Implementation

- Aqueous vasopressin injection may be administered subcut or IM for diabetes insipidus.
- Administer 1–2 glasses of water at the time of administration to minimize side effects (blanching of skin, abdominal cramps, nausea).

IV Administration

- **Continuous Infusion:** ***Dilution:*** Dilute 2.5 mg or 5 mg of vasopresssin in 500 mL or 100 mL respectively of 0.9% NaCl or D5W. Solution is clear and colorless; do not administer solutions that are cloudy, discolored, or contain particulate matter. ***Concentration:*** 0.1 units/mL or 1 unit/mL. Solution is stable for 18 hrs at room temperature or 24 hr if refrigerated. ***Rate:*** See Route/Dosage section.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftazidime/avibactam, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eravacycline, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, meropenem/vaborbactam, mesna, methadone, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pantoprazole, papaverine, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, tedizolid, telavancin, theophylline, thiamine, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B lipid complex, dantrolene, diazepam, gemtuzumab ozogamicin, indomethacin, pemetrexed, phenytoin.

Patient/Family Teaching

- Explain purpose of vasopressin to patient.
- Advise patient to drink 1–2 glasses of water at time of administration to minimize side effects (blanching of skin, abdominal cramps, nausea). Inform patient that these side effects are not serious and usually disappear in a few min.
- Caution patient to avoid concurrent use of alcohol while taking vasopressin.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Patients with diabetes insipidus should carry identification at all times describing disease process and medication regimen.

Evaluation/Desired Outcomes

- Decrease in urine volume.
- Relief of polydipsia.
- Increased urine osmolality in patients with central diabetes insipidus.
- Increase in BP.

V

vedolizumab

(ve-doe-**liz**-yoo-mab)

Entyvio

Classification

Therapeutic: gastrointestinal anti-inflammatories

Pharmacologic: monoclonal antibodies, integrin receptor antagonists

© F.A. Davis Publishing

Indications
Moderately to severely active ulcerative colitis or Crohn's disease that has not responded adequately to/lost response to/become intolerant to tumor necrosis factor (TNF) blockers or immunomodulators; or has become intolerant to/dependant on corticosteroids and failed to induce/maintain beneficial response/remission, improved endoscopic appearance (ulcerative colitis) or achieved corticosteroid-free remission.

Action
A monoclonal antibody that binds to certain integrins, blocking their interaction with substances involved in mucosal cell adhesion, also inhibits migration of memory T-lymphocytes across endothelium into inflamed GI tissue. **Therapeutic Effects:** Decreased chronic GI inflammation and symptomatology associated with ulcerative colitis and Crohn's disease.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 25 days.

TIME/ACTION PROFILE (clinical improvement)

ROUTE	ONSET	PEAK	DURATION
IV	within 6 wk	unknown	up to 8 wk

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Active severe infection; Live-virus vaccinations; Concurrent use of natalizumab; Concurrent use of TNF blockers.
Use Cautiously in: OB: Use during pregnancy only if maternal benefits justify fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
Derm: pruritus, rash. **GI:** ↑ liver enzymes, oropharyngeal pain. **MS:** arthralgia, back pain, extremity pain. **Neuro:** PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), headache, fatigue. **Resp:** cough. **Misc:** fever, HYPERSENSITIVITY REACTIONS (including anaphylaxis), INFECTION, INFUSION REACTIONS.

Interactions
Drug-Drug: May ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines** (complete immunizations prior to treatment). Concurrent use with **natalizumab** may ↑ risk of infections and Progressive Multifocal Leukoencephalopathy and should be avoided. Concurrent use with **TNF blockers** may ↑ risk of infections and should be avoided.

Route/Dosage
IV (Adults): 300 mg initially, then 2 and 6 wk later, then every 8 wk; treatment may be continued if beneficial response is obtained by wk 14.

Availability
Lyophilized powder for injection: 300 mg/vial.

NURSING IMPLICATIONS

Assessment
- Assess abdominal pain and frequency, quantity, and consistency of stools at beginning and during therapy.
- Assess for signs of hypersensitivity or infusion-related reactions (dyspnea, bronchospasm, urticaria, flushing, rash, swelling of lips, tongue, throat, or face, wheezing, hypertension, tachycardia). If anaphylaxis or serious allergic reactions occur, discontinue vedolizumab and treat symptoms.
- Assess for new signs or symptoms suggestive of PML, an opportunistic infection of the brain caused by the JC virus, leading to death or severe disability; withhold dose and notify health care professional promptly. Monitor during therapy and for at least 6 mo following discontinuation. PML symptoms may begin gradually but usually over days to wk and leads to death or severe disability over wk to mo. Symptoms include progressive weakness on one side of body or clumsiness of limbs, disturbance of vision, changes in thinking, memory and orientation leading to confusion and personality changes. Diagnosis is usually made via gadolinium-enhanced MRI and CSF analysis. Withhold vedolizumab at first sign of PML.
- ***Lab Test Considerations:*** May cause ↑ AST, ALT, and serum bilirubin. Discontinue in patients with jaundice or other evidence of liver injury.

Implementation
- Perform test for latent TB. If positive, begin treatment for TB prior to starting vedolizumab therapy. Monitor for TB throughout therapy, even if latent TB test is negative.
- Ensure patient is up to date according to current immunization guidelines before starting therapy.

IV Administration
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute with 4.8 mL sterile water for injection using 21- to 25-gauge needle. Direct stream to wall of vial to prevent excessive foaming. Gently swirl vial for at least 15 sec to dissolve; do not invert of shake vigorously. Allow to sit for up to 20 min at room temperature for reconstitution and settling of foam. If not fully dissolved after 20 min, allow another 10 min. Do not use vial if not dissolved within 30 min. Solution is clear or opalescent, colorless to light brownish yellow; do not administer solutions that are cloudy, discolored or contain particulate matter. Swirl gently and invert vial 3 times prior to withdrawing. Use immediately after reconstitution. Reconstituted solution is stable for 8 hr if refrigerated. Withdraw 5 mL (300 mg) using 21- to 25-gauge needle. Discard unused portion. ***Dilution:*** 250 mL 0.9% NaCl or LR. Gently mix bag. Use as soon as possible.

© F.A. Davis Publishing

Use solutions diluted with LR immediately or store in refrigerator up to 6 hr. Solutions diluted with 0,9% NaCl are stable up to 12 hr at room temperature or 24 hrs if refrigerated; do not freeze. ***Rate:*** Infuse over 30 min; do not administer as IV push or bolus. Flush line with 30 mL of 0.9% NaCl or LR after infusion.

- **Y-Site Incompatibility:** Do not administer with other solutions or medications.

Patient/Family Teaching

- Explain purpose of vedolizumab to patient. Advise patient to read *Medication Guide* prior to therapy.
- Instruct patient to report symptoms of PML (progressive weakness on one side of the body or clumsiness of limbs; disturbance of vision; changes in thinking, memory, and orientation leading to confusion and personality changes), hypersensitivity reactions, hepatotoxicity (yellowing of the skin and eyes, unusual darkening of the urine, anorexia, nausea, feeling tired or weak, vomiting, right upper abdominal pain), or worsening of symptoms (new or sudden change in your thinking, eyesight, balance, or strength or other problems) that persist over several days to health care professional immediately.
- Inform patient of risk of infection. Advise patient to notify health care professional if symptoms of infection (fever, chills, muscle aches, shortness of breath, runny nose, cough, sore throat, red or painful skin or open cuts or sores, tiredness, pain during urination) occur.
- Advise patient to avoid live and oral vaccines during therapy.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Encourage pregnant women to join Entyvio Pregnancy Registry by calling 1-877-825-3327. Registry monitors pregnancy outcomes in women exposed to vedolizumab during pregnancy.

Evaluation/Desired Outcomes

- Decreased chronic GI inflammation and symptomatology associated with ulcerative colitis and Crohn's disease. Discontinue therapy if no improvement by Week 14.

vemurafenib (vem-u-raf-e-nib)

Zelboraf

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Treatment of unresectable or metastatic melanoma with BRAF ^{V600E} mutation. Treatment of Erdheim-Chester disease (ECD) with BRAF ^{V600E} mutation.

Action

Inhibits mutated forms of the enzyme kinase. Inhibits proliferation that occurs in conjunction with activated BRAF proteins. **Therapeutic Effects:** Decreased spread of melanoma and ECD.

Pharmacokinetics

Absorption: Some absorption follows oral administration; bioavailability is not known.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized by the liver (mostly by the CYP3A4 enzyme system), 1% eliminated in urine.
Half-life: 57 hr (range 30–120 hr).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3 hr	12 hr

Contraindications/Precautions

Contraindicated in: Underlying electrolyte abnormalities (↑ risk of serious arrhythmias; correct prior to administration); Congenital or acquired prolonged QT syndromes; Baseline QTc interval >500 msec; Concurrent use of QT-interval prolonging drugs; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Pre-existing severe hepatic or renal impairment; Concurrent use of strong CYP3A4 inducers/inhibitors or drugs that are substrates of CYP3A4, CYP1A2, or CYP2D6 enzyme systems; monitoring of effects and necessary dose adjustments may be necessary; Receiving radiation therapy prior to, during, or after therapy (↑ risk of radiation sensitization/recall); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of cutaneous squamous cell carcinoma, nausea, ↓ appetite, peripheral edema, keratoacanthoma, and atrial fibrillation in older adults.

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, peripheral edema, QT interval prolongation. **Derm:** SKIN CANCER, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), alopecia, dry skin, rash (↑ in females), pruritus, rash, photosensitivity (↑ in females), skin papilloma, keratoacanthoma (↑ in males). **EENT:** iritis, retinal vein occlusion, uveitis. **GI:** HEPATOTOXICITY, ↓ appetite, nausea. **GU:** acute interstitial nephritis, acute tubular necrosis, ↑ creatinine (↑ in females). **MS:** arthralgia (↑ in females), myalgia, back pain, Dupuy-

V

© F.A. Davis Publishing

tren's contracture, musculoskeletal pain, plantar fascial fibromatosis. **Neuro:** dysgeusia, fatigue, weakness, headache. **Resp:** cough. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever, radiation sensitization/recall.

Interactions

Drug-Drug: QT interval prolonging drugs may ↑ the risk of QT interval prolongation with arrhythmias; concurrent use contraindicated. Concurrent use with **agents with narrow therapeutic indices that are metabolized by the CYP1A2 enzyme systems** not recommended. Consider dose ↓ of substrates. **Strong CYP3A inhibitors**, including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, and **voriconazole**, may ↑ levels and effects; avoid concurrent use; if concurrent use is necessary, consider ↓ vemurafenib dose. **Strong CYP3A inducers**, including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampin**, and **rifapentine**, may ↓ levels and effectiveness; avoid concurrent use; if concurrent use necessary, ↑ vemurafenib dose. May ↑ risk of bleeding with **warfarin**. Concurrent use with **ipilimumab** may ↑ risk of hepatotoxicity. May ↑ **digoxin** levels and lead to toxicity. May ↑ **tizanidine** levels.

Route/Dosage

PO (Adults): 960 mg (4 tablets) twice daily until disease progression or unacceptable toxicity; *Concurrent use of strong CYP3A4 inducers*— 1200 mg (5 tablets) twice daily until disease progression or unacceptable toxicity.

Availability

Tablets: 240 mg.

NURSING IMPLICATIONS

Assessment

- Perform dermatologic evaluation prior to initiation and every 2 mo during therapy. Excise any suspicious lesions, send for dermapathologic evaluation, and treat with standard care. Continue monitoring for 6 mo following discontinuation of therapy.
- Monitor ECG 15 days after initiation of therapy, monthly during first 3 mo, every 3 mo thereafter, and more often if clinically indicated.
- Monitor for hypersensitivity reactions (rash, erythema, hypotension). Permanently discontinue therapy if severe reaction occurs.
- Monitor for signs and symptoms of uveitis periodically during therapy. May require treatment with steroid and mydriatic ophthalmic drops.
- Assess patient for rash (mild to moderate rash usually occurs in the 2nd wk of therapy and resolves within 1–2 wk of continued therapy). If rash is severe (extensive erythematous or maculopapular rash with moist desquamation or angioedema) or accompanied by systemic symptoms (serum sickness-like reaction, SJS, TEN), therapy must be discontinued immediately.
- ***Lab Test Considerations:*** Information on FDA-approved tests for the detection of BRAF V600 mutations in melanoma is available at www.fda.gov/CompanionDiagnostics.
- Monitor serum potassium, magnesium, and calcium before starting therapy and after dose modification.
- Monitor AST, ALT, alkaline phosphatase, and bilirubin before starting therapy, monthly during therapy, and as clinically indicated. May require dose reduction, treatment interruption, or discontinuation.
- Monitor serum creatinine before starting and periodically during therapy.

Implementation

- **PO:** Administer (four 240-mg tablets) twice daily, without regard to food. Take first dose in the morning with 2nd dose about 12 hrs later. ***DNC:*** Swallow tablets whole; do not crush or chew.
- Adverse reactions or QTc prolongation may occur requiring dose modification. *If Grade 1 or 2 (tolerable) occur,* maintain dose at 960 mg twice daily. *If Grade 2 (Intolerable) or Grade 3, 1st appearance occurs,* interrupt therapy until Grade 0–1. Resume dosing at 720 mg twice daily. *If 2nd appearance,* interrupt therapy until Grade 0–1. Resume dosing at 480 mg twice daily. *If 3rd appearance,* discontinue permanently. *If Grade 4, 1st appearance occurs,* discontinue permanently or interrupt therapy until Grade 0–1. Resume dosing at 480 twice daily. *If 2nd appearance,* discontinue permanently. Doses below 480 mg twice daily are not recommended.

Patient/Family Teaching

- Instruct patient to take vemurafenib as directed. If vomiting occurs, do not an additional dose; take next dose as scheduled. Take missed doses as soon as remembered up to 4 hrs before next dose; do not double dose.
- Inform patient that assessment of BRAF mutation is required for selection of patients.
- Instruct patient to stop taking vemurafenib and notify health care professional immediately if signs and symptoms of allergic reaction (rash or redness all over body; feeling faint; difficulty breathing or swallowing; throat tightness or hoarseness; fast heartbeat; swelling of face, lips, or tongue) or severe skin reactions (blisters on skin; blisters or sores in mouth; peeling of skin, fever, redness or swelling of face, hands, or soles of feet) occur.
- Advise patient to wear broad spectrum UVA/UVB sunscreen, lip balm (SPF ≥30), and protective clothing, and to avoid sun exposure to prevent photosensitivity reactions. Severe photosensitivity reactions may require dose modifications.
- Advise patient to notify health care professional if signs and symptoms of liver dysfunction (yellow skin or whites of eyes; feeling tired; urine turns dark or brown; nausea or vomiting; loss of appetite; pain on right side of stomach) or eye problems (eye pain,

© F.A. Davis Publishing

swelling, or redness; blurred vision; vision changes) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Inform patient that regular assessments of skin and assessments for signs and symptoms of other malignancies must be done during and for up to 6 mo after therapy. Advise patient to notify health care professional immediately if any changes in skin occur.
- Rep: Advise women of reproductive potential to use effective contraception during and for at least 2 wk after last dose of vemurafenib, and to avoid breast feeding during and for 2 wk after last dose.

Evaluation/Desired Outcomes
- Decreased spread of melanoma.

venlafaxine (ven-la-fax-een)
~~Effexor~~, Effexor XR

Classification
Therapeutic: antidepressants, antianxiety agents
Pharmacologic: selective serotonin/norepinephrine reuptake inhibitors

Indications
Major depressive disorder. Generalized anxiety disorder (Effexor XR only). Social anxiety disorder (Effexor XR only). Panic disorder (Effexor XR only). **Unlabeled Use:** Premenstrual dysphoric disorder.

Action
Inhibits serotonin and norepinephrine reuptake in the CNS. **Therapeutic Effects:** Decrease in depressive symptomatology, with fewer relapses/recurrences. Decreased anxiety. Decrease in panic attacks.

Pharmacokinetics
Absorption: 92–100% absorbed after oral administration.
Distribution: Extensive distribution into body tissues.
Metabolism and Excretion: Extensively metabolized on first pass through the liver (primarily through CYP2D6 enzyme pathway); the CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↑ venlafaxine concentrations and an ↑ risk of adverse effects). One metabolite, O-desmethylvenlafaxine (ODV), has antidepressant activity. 5% of venlafaxine is excreted unchanged in urine; 30% of the active metabolite is excreted in urine.
Half-life: *Venlafaxine*—3–5 hr; *ODV*—9–11 hr (both are ↑ in hepatic/renal impairment).

TIME/ACTION PROFILE (antidepressant action)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 wk	2–4 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Lactation: Lactation.
Use Cautiously in: Cardiovascular disease, including hypertension; Hepatic or renal impairment (↓ dose recommended); History of seizures or neurologic impairment; History of mania; History of drug abuse; Angle-closure glaucoma; OB: Use only if potential maternal benefit justifies potential fetal risk (potential for discontinuation syndrome or toxicity in the neonate when venlafaxine is taken during the 3rd trimester); Pedi: ↑ risk of suicidal thinking and behavior (suicidality) in children and adolescents with major depressive disorder and other psychiatric disorders.

Adverse Reactions/Side Effects
CV: chest pain, hypertension, palpitations, tachycardia. **Derm:** ecchymoses, itching, photosensitivity, skin rash. **EENT:** rhinitis, visual disturbances, epistaxis, tinnitus. **GI:** abdominal pain, altered taste, anorexia, constipation, diarrhea, dry mouth, dyspepsia, nausea, vomiting, weight loss. **GU:** ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction, urinary frequency, urinary retention. **Hemat:** bleeding. **Neuro:** paresthesia, twitching, NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, abnormal dreams, anxiety, dizziness, headache, insomnia, nervousness, weakness, abnormal thinking, agitation, confusion, depersonalization, drowsiness, emotional lability, worsening depression. **Misc:** SEROTONIN SYNDROME, chills, yawning.

Interactions
Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious, potentially fatal reactions (wait at least 2 wk after stopping MAO inhibitor before initiating venlafaxine; wait at least 1 wk after stopping venlafaxine before starting MAO inhibitors). Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue**, may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving venlafaxine, immediately discontinue venlafaxine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume venlafaxine therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **alcohol** or other **CNS depressants**, including **seda-**

© F.A. Davis Publishing

tives/hypnotics, **antihistamines**, and **opioid analgesics**, in depressed patients is not recommended. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans**, ↑ risk of serotonin syndrome. **Lithium** may have ↑ serotonergic effects with venlafaxine; use cautiously in patients receiving venlafaxine. ↑ blood levels and may ↑ effects of **desipramine** and **haloperidol**. **Cimetidine** may ↑ the effects of venlafaxine (may be more pronounced in geriatric patients, those with hepatic or renal impairment, or those with pre-existing hypertension). **Ketoconazole** may ↑ the effects of venlafaxine. ↑ risk of bleeding with **NSAIDs**, **aspirin**, **clopidogrel**, or **warfarin**.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression. ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

Major Depressive Disorder

PO (Adults): *Tablets*—75 mg/day in 2–3 divided doses; may ↑ by up to 75 mg/day every 4 days, up to 225 mg/day (not to exceed 375 mg/day in 3 divided doses); *Extended-release (XR) capsules*—75 mg once daily (some patients may be started at 37.5 mg once daily) for 4–7 days; may ↑ by up to 75 mg/day at intervals of not less than 4 days (not to exceed 225 mg/day).

General Anxiety Disorder

PO (Adults): *Extended-release (XR) capsules*—75 mg once daily (some patients may be started at 37.5 mg once daily) for 4–7 days; may ↑ by up to 75 mg/day at intervals of not less than 4 days (not to exceed 225 mg/day).

Social Anxiety Disorder

PO (Adults): *Extended-release (XR) capsules*—75 mg once daily.

Panic Disorder

PO (Adults): *Extended-release (XR) capsules*—37.5 mg once daily for 7 days; may then ↑ to 75 mg once daily; may then ↑ by 75 mg/day every 7 days (not to exceed 225 mg/day).

Hepatic Impairment

PO (Adults): ↓ daily dose by 50% in patients with mild-to-moderate hepatic impairment.

Renal Impairment

PO (Adults): *CCr 10–70 mL/min*—↓ daily dose by 25–50%; *Hemodialysis*—↓ daily dose by 50%.

Availability (generic available)

Immediate-release tablets: 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg. **Cost:** *Generic*—25 mg $32.24/100, 37.5 mg $39.41/100, 75 mg $38.00/100. **Extended-release capsules:** 37.5 mg, 75 mg, 150 mg. **Cost:** *Generic*—37.5 mg $32.14/90, 75 mg $271.37/100, 150 mg $29.94/100. **Extended-release tablets:** 37.5 mg, 75 mg, 150 mg, 225 mg. **Cost:** *Generic*—37.5 mg $32.14/90, 75 mg $271.37/100, 150 mg $29.94/100.

NURSING IMPLICATIONS

Assessment

- Assess mental status and mood changes. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess suicidal tendencies, especially in early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr.
- Monitor BP before and periodically during therapy. Sustained hypertension may be dose-related; decrease dose or discontinue therapy if this occurs.
- Monitor appetite and nutritional intake. Weigh weekly. Report continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper-reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Assess sexual function before starting venlafaxine. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- ***Lab Test Considerations:*** Monitor CBC with differential and platelet count periodically during therapy. May cause anemia, leukocytosis, leukopenia, thrombocytopenia, basophilia, and eosinophilia.
- May cause an ↑ in serum alkaline phosphatase, bilirubin, AST, ALT, BUN, and creatinine.
- May also cause ↑ serum cholesterol.
- May cause electrolyte abnormalities (hyperglycemia or hypoglycemia, hyperkalemia or hypokalemia, hyperuricemia, hyperphosphatemia or hypophosphatemia, and hyponatremia).
- May cause false-positive immunoassay screening tests for phencyclidine (PCP) and amphetamine.

Implementation

- Do not confuse Effexor XR (venlafaxine) with Enablex (darifenacin).
- **PO:** Administer venlafaxine with food.
- ***DNC:*** Swallow extended-release capsules and tablets whole; do not crush, break, or chew.
- Extended-release capsules may be opened and contents sprinkled on a spoonful of applesauce. Take immediately and follow with a glass of water. Do not store mixture for later use.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take venlafaxine as directed at the same time each day. Take missed doses as soon as possible unless almost time for next dose. Do not double doses or discontinue abruptly. Patients taking venlafaxine for >6 wk should have dose gradually decreased before discontinuation.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability; aggressiveness; acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Caution patient to avoid taking alcohol or other CNS-depressant drugs, including opioids, during therapy.
- Instruct patient to notify health care professional if signs of allergy (rash, hives) occur.
- Inform patient that venlafaxine may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Rep: Advise females of reproductive potential to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding. If used during pregnancy, should be tapered during 3rd trimester to avoid neonatal serotonin syndrome. Monitor infants exposed to venlafaxine for excess sedation, restlessness, agitation, poor feeding, poor weight gain, respiratory distress; may ↑ risk of persistent pulmonary hypertension of the newborn. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patients by calling the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clnical-and-researchprograms/pregnancyregistry/antidepressants/.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Therapy is usually continued for several mo.
- Decreased anxiety.

verapamil (ver-**ap**-a-mil)

~~Calan~~, Calan SR, Isoptin SR, Verelan, Verelan PM

Classification

Therapeutic: antianginals, antiarrhythmics (class IV), antihypertensives, vascular headache suppressants

Pharmacologic: calcium channel blockers

Indications

Management of hypertension, angina pectoris, and/or vasospastic (Prinzmetal's) angina. Management of supraventricular arrhythmias and rapid ventricular rates in atrial flutter or fibrillation. **Unlabeled Use:** Prevention of migraine headache.

Action

Inhibits the transport of calcium into myocardial and vascular smooth muscle cells, resulting in inhibition of excitation-contraction coupling and subsequent contraction. Decreases SA and AV conduction and prolongs AV node refractory period in conduction tissue. **Therapeutic Effects:** Systemic vasodilation resulting in decreased BP. Coronary vasodilation resulting in decreased frequency and severity of attacks of angina. Reduction of ventricular rate during atrial fibrillation or flutter.

Pharmacokinetics

Absorption: 90% absorbed after oral administration, but much is rapidly metabolized, resulting in bioavailability of 20–25%.

Distribution: Small amounts enter breast milk.

Protein Binding: 90%.

Metabolism and Excretion: Mostly metabolized by the liver (primarily by CYP3A4).

Half-life: 4.5–12 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	1–2 hr	30–90 min†	3–7 hr
PO-ER	unknown	5–7 hr	24 hr
IV	1–5 min‡	3–5 min	2 hr‡

†Single dose; effects from multiple doses may not be evident for 24–48 hr.

‡Antiarrhythmic effects; hemodynamic effects begin 3–5 min after injection and persist for 10–20 min.

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sick sinus syndrome; 2nd- or 3rd-degree AV block (unless an artificial pacemaker is in place); Systolic BP <90 mm Hg; HF, severe ventricular dysfunction, or cardiogenic shock, unless associated with supraventricular tachyarrhythmias; Concurrent IV beta blocker therapy; Lactation: Lactation.

Use Cautiously in: Severe hepatic impairment (dose ↓ recommended); History of serious ventricular arrhythmias or HF; OB: Safety not established in pregnancy; Geri: Dose ↓/slower IV infusion rates recommended in older adults (↑ risk of hypotension).

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, HF, bradycardia, chest pain, hypotension, palpitations, peripheral edema, syncope, tachycardia. **Derm:** STEVENS-JOHNSON SYNDROME (SJS), dermatitis, erythema multiforme, flushing, photosensitivity, pruritus/urticaria, rash, sweating. **EENT:** blurred vision, disturbed equilibrium, epistaxis, tinnitus. **Endo:** gynecomastia, hyperglycemia. **GI:** ↑ liver enzymes, anorexia, constipation, diarrhea, dry mouth, dyspepsia, nausea, vomiting. **GU:** dysuria, nocturia, polyuria, sexual dysfunction, urinary frequency. **Hemat:** anemia, leukopenia, thrombocytopenia. **Metab:** weight gain. **MS:** joint stiffness, muscle cramps. **Neuro:** dysgeusia, paresthesia, tremor, abnormal dreams, anxiety, confusion, dizziness/lightheadedness, drowsiness, extrapyramidal reactions, headache, jitteriness, nervousness, psychiatric disturbances, weakness.. **Resp:** cough, dyspnea. **Misc:** gingival hyperplasia.

Interactions

Drug-Drug: Additive hypotension may occur when used concurrently with **fentanyl**, other **antihypertensives**, **nitrates**, acute ingestion of **alcohol**, or **quinidine**. Antihypertensive effects may be ↓ by concurrent use of **NSAIDs**. May ↑ **digoxin** levels. Concurrent use with **beta blockers**, **digoxin**, **clonidine**, or **ivabradine** may result in bradycardia or conduction defects; avoid concurrent use with ivabradine. ↑ risk of hypotension and bradycardia with **erythromycin**, **clarithromycin**, or **ritonavir**. May ↓ metabolism of and ↑ risk of toxicity from **cyclosporine**, **quinidine**, **theophylline**, or **carbamazepine**. **Rifampin** and **phenobarbital** may ↓ levels. ↑ the muscle-paralyzing effects of **nondepolarizing neuromuscular-blocking agents**. May alter **lithium** levels. May ↑ risk of bleeding with **aspirin**. Concurrent use with **sirolimus**, **temsirolimus**, or **everolimus** may result in ↑ levels of sirolimus, temsirolimus, everolimus, and verapamil; consider ↓ dose of sirolimus, temsirolimus, everolimus, and verapamil. ↑ risk of myopathy with **simvastatin** and **lovastatin**; do not exceed 10 mg/day of simvastatin and 20 mg/day of lovastatin.

Drug-Natural Products: ↑ **caffeine** levels with caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**).

Drug-Food: **Grapefruit juice** ↑ levels and effect.

Route/Dosage

PO (Adults): 80–120 mg 3 times daily, ↑ as needed. *Patients with hepatic impairment or geriatric patients*— 40 mg 3 times daily initially. *Extended-release preparations*— 120–240 mg/day as a single dose; may be ↑ as needed (range 240–480 mg/day).
PO (Children up to 15 yr): 4–8 mg/kg/day in divided doses.
IV (Adults): 5–10 mg (75–150 mcg/kg); may repeat with 10 mg (150 mcg/kg) after 15–30 min.
IV (Children 1–15 yr): 2–5 mg (100–300 mcg/kg); may repeat after 30 min (initial dose not to exceed 5 mg; repeat dose not to exceed 10 mg).
IV (Children <1 yr): 0.75–2 mg (100–200 mcg/kg); may repeat after 30 min.

Availability (generic available)

Immediate-release tablets: 40 mg, 80 mg, 120 mg. **Cost:** *Generic*— 40 mg $21.85/100, 80 mg $10.83/100. **Extended-release capsules (Verelan):** 120 mg, 180 mg, 240 mg, 360 mg. **Cost:** *Generic*— 120 mg $130.25/100, 180 mg $135.16/100, 240 mg $152.54/100, 360 mg $209.94/100. **Extended-release capsules (Verelan PM):** 100 mg, 200 mg, 300 mg. **Cost:** *Generic*— 100 mg $195.84/100, 200 mg $252.23/100, 300 mg $366.98/100. **Extended-release tablets:** 120 mg, 180 mg, 240 mg. **Cost:** *Generic*— 120 mg $31.44/100, 180 mg $35.98/100, 240 mg $27.80/100. **Solution for injection:** 2.5 mg/mL. ***In combination with:*** trandolapril; see Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse before therapy, during dosage titration, and periodically throughout therapy. Monitor ECG periodically during prolonged therapy. Verapamil may cause prolonged PR interval.
- Monitor intake and output ratios and daily weight. Assess for signs of HF (peripheral edema, rales/crackles, dyspnea, weight gain, jugular venous distention).
- Patients receiving digoxin concurrently with calcium channel blockers should have routine serum digoxin levels and be monitored for signs and symptoms of digoxin toxicity.
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **Angina:** Assess location, duration, intensity, and precipitating factors of patient's anginal pain.
- **Arrhythmias:** Monitor ECG continuously during administration. Notify health care professional promptly if bradycardia or prolonged hypotension occurs. Emergency equipment and medication should be available. Monitor BP and pulse before and frequently during administration.

© F.A. Davis Publishing

- ***Lab Test Considerations:*** Total serum calcium concentrations are not affected by calcium channel blockers.
- Monitor serum potassium periodically. Hypokalemia ↑ risk of arrhythmias and should be corrected.
- Monitor renal and hepatic functions periodically during long-term therapy. May cause ↑ hepatic enzymes after several days of therapy, which return to normal on discontinuation of therapy.

Implementation

- **PO:** Administer verapamil with meals or milk to minimize gastric irritation.
- ***DNC:*** Swallow extended-release tablets and capsules whole; do not open, crush, break, crush or chew. Empty tablets that appear in stool are not significant.

IV Administration

- **IV:** Patients should remain recumbent for at least 1 hr after IV administration to minimize hypotensive effects.
- **IV Push:** ***Dilution:*** Administer undiluted. ***Concentration:*** 2.5 mg/mL. ***Rate:*** Administer over 2 min. Geri: Administer over 3 min.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amikacin, aminocaproic acid, amphotericin B lipid complex, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, albumin, human, aminophylline, amphotericin B deoxycholate, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azathioprine, ceftazidime, chloramphenicol, dantrolene, diazepam, ertapenem, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, indomethacin, pantoprazole, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, propofol, sodium bicarbonate, thiotepa, tigecycline, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Advise patient to take medication as directed, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid large amounts (6–8 glasses of grapefruit juice/day) during therapy.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially cold preparations.
- Advise patient to notify health care professional if irregular heartbeats, rash, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and avoid breast feeding during therapy.

V

© F.A. Davis Publishing

- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath occurs; or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- Advise patient to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding during therapy.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring BP. Advise patient to take BP weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.
- Suppression and prevention of atrial tachyarrhythmias.

vilazodone (vil-az-oh-done)

Viibryd

Classification

Therapeutic: antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs), benzofurans

Indications

Treatment of major depressive disorder.

Action

Increases serotonin activity in the CNS by inhibiting serotonin reuptake. Also binds selectively with high affinity to 5-HT_{1A} receptors and is a 5-HT_{1A} receptor partial agonist. **Therapeutic Effects:** Improvement in symptoms of depression.

Pharmacokinetics

Absorption: 72% absorbed following oral administration with food.
Distribution: Unknown.
Protein Binding: 96–99%.
Metabolism and Excretion: Mostly metabolized by the liver, primarily by the CYP3A4 enzyme system; 1% excreted unchanged in urine.
Half-life: 25 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–5 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue).
Use Cautiously in: History of seizure disorder; History of suicide attempt/suicidal ideation; Bipolar disorder; may ↑ risk of mania/hypomania; Angle-closure glaucoma; OB: Use only if potential maternal benefit justifies potential fetal risk; use during third trimester may result in need for prolonged hospitalization, respiratory support, and tube feeding; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; ↑ risk of suicidal thinking/behavior in children, adolescents, and young adults.

Adverse Reactions/Side Effects

Endo: ↓ libido, sexual dysfunction, syndrome of inappropriate antidiuretic hormone (SIADH). **F and E:** hyponatremia. **GI:** PANCREATITIS, diarrhea, nausea, dry mouth, restlessness, vomiting. **GU:** ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction. **Hemat:** bleeding. **Neuro:** NEUROLEPTIC MALIGNANT-LIKE SYNDROME, SEIZURES, SUICIDAL THOUGHTS, insomnia, abnormal dreams, dizziness, sleep paralysis. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: Concurrent use with, or use within 14 days of starting or stopping, **MAOIs** may ↑ risk of neuroleptic malignant syndrome or serotonin syndrome and should be avoided. Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue**, may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving vilazodone, immediately discontinue vilazodone and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume vilazodone therapy 24 hr after last dose of linezolid or methylene blue). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans**, ↑ risk of serotonin syndrome. Concurrent use with **NSAIDs**, **aspirin**, **antiplatelet drugs**, or other **drugs that affect coagulation** may ↑ risk of bleeding. Concurrent use of **strong inhibitors of CYP3A4**, including **ketoconazole**, ↑ blood levels and the risk of adverse reactions/toxicity; daily dose should not exceed 20 mg. Concurrent use of **moderate inhibitors of CYP3A4**, including **erythromycin**, may require dose ↓ to 20 mg daily if adverse reactions/toxicity occurs. Concurrent use of **strong in-**

© F.A. Davis Publishing

ducers of CYP3A4, including **carbamazepine**, for >14 days may require ↑ dose up to 2-fold (do not exceed dose of 80 mg/day). Use cautiously with other **CNS-active drugs**.
Drug-Natural Products: ↑ risk of serotonin syndrome with **St. John's wort**.

Route/Dosage

PO (Adults): 10 mg once daily for one wk, then 20 mg once daily for one wk; dose may be ↑ to 40 mg once daily (recommended dose = 20–40 mg/day). *Concurrent use of strong inhibitors of CYP3A4*—not to exceed 20 mg/day; *Concurrent use of strong inducers of CYP3A4 (if used for >14 days)*—may need to ↑ dose up to 2–fold (daily dose should not exceed 80 mg).

Availability (generic available)

Tablets: 10 mg, 20 mg, 40 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status and mood changes. Inform health care professional if patient demonstrates significant ↑ in anxiety, nervousness, or insomnia.
- Prior to starting therapy, screen patient for bipolar disorder (detailed psychiatric history, including family/personal history of suicide, bipolar disorder, depression). Use cautiously in patients with a positive history.
- Assess suicidal tendencies, especially in early therapy. Restrict amount of drug available to patient. Risk may be ↑ in children, adolescents, and adults ≤24 yr.
- Assess for signs and symptoms of hyponatremia (headache, difficulty concentrating, memory impairment, confusion, weakness, unsteadiness). May require discontinuation of therapy.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyper-reflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Monitor for development of neuroleptic malignant syndrome (fever, muscle rigidity, altered mental status, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, loss of bladder control). Discontinue vilazodone and notify health care professional immediately if these symptoms occur.
- Assess sexual function before starting vilazodone. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- ***Lab Test Considerations:*** Monitor serum sodium concentrations periodically during therapy. May cause hyponatremia potentially as a result of SIADH.
- May cause altered anticoagulant effects. Monitor patients receiving warfarin, NSAIDs, or aspirin concurrently.

Implementation

- **PO:** Administer vilazodone with food; administration without food can result in inadequate drug concentrations and may ↓ effectiveness.
- When discontinuing therapy, decrease dose gradually; 40 mg once daily to 20 mg once daily for 4 days, followed by 10 mg once daily for 3 days. Taper patients taking 20 mg once daily dose to 10 mg once daily for 7 days. Stopping abruptly may cause flu-like symptoms (headache, sweating, and nausea), anxiety, high or low mood, irritability, feeling restless or sleepy, dizziness, electric shock-like sensations, tremor, and confusion.

Patient/Family Teaching

- Instruct patient to take vilazodone as directed at the same time each day. Take missed doses as soon as possible unless almost time for next dose. Do not double doses or discontinue abruptly. Gradually ↓ dose before discontinuation. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill; new information may be available.
- Advise patient, family, and caregivers to look for activation of mania/hypomania and suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability; aggressiveness; acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Caution patient of the risk of serotonin syndrome and neuroleptic malignant syndrome, especially when taking triptans, tramadol, tryptophan supplements, and other serotonergic or antipsychotic agents.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products, especially NSAIDs, aspirin, and warfarin, without consulting health care professional.
- Caution patient to avoid taking alcohol or other CNS-depressant drugs, including opioids, during therapy.

V

© F.A. Davis Publishing

- Inform patient that vilazodone may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Rep: Advise females of reproductive potential to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding. If used during pregnancy, should be tapered during 3rd trimester to avoid neonatal serotonin syndrome. Monitor infants exposed to vilazodone for excess sedation, restlessness, agitation, poor feeding, poor weight gain, respiratory distress; may ↑ risk of persistent pulmonary hypertension of the newborn. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patients by calling the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clnical-and-researchprograms/pregnancyregistry/antidepressants/.
- Emphasize the importance of follow-up exams to monitor progress. Encourage patient participation in psychotherapy.

Evaluation/Desired Outcomes

- ↑ sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Therapy is usually continued for several mo.
- ↓ anxiety.

HIGH ALERT

vinBLAStine (vin-**blass**-teen)

Classification
Therapeutic: antineoplastics
Pharmacologic: vinca alkaloids

Indications

Combination chemotherapy of: Lymphomas, Nonseminomatous testicular carcinoma, Advanced breast cancer, Other tumors.

Action

Binds to proteins of mitotic spindle, causing metaphase arrest. Cell replication is stopped as a result (cell cycle–specific for M phase). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Has immunosuppressive properties.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Does not cross the blood-brain barrier well.
Metabolism and Excretion: Converted by the liver to an active antineoplastic compound; excreted in the feces via biliary excretion, some renal elimination.
Half-life: 24 hr.

TIME/ACTION PROFILE (effects on white blood cell counts)

ROUTE	ONSET	PEAK	DURATION
IV	5–7 days	10 days	7–14 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB, Lactation: Pregnancy or lactation.
Use Cautiously in: Infection; ↓ bone marrow reserve; Patients with impaired hepatic function (↓ dose by 50% if serum bilirubin >3 m g/dL); Rep: Women with childbearing potential.

Adverse Reactions/Side Effects

Resp: BRONCHOSPASM. **GI:** nausea, vomiting, anorexia, constipation, diarrhea, stomatitis. **GU:** gonadal suppression. **Derm:** alopecia, dermatitis, vesiculation. **Endo:** syndrome of inappropriate antidiuretic hormone (SIADH). **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site. **Metab:** hyperuricemia. **Neuro:** neuritis, paresthesia, peripheral neuropathy, SEIZURES, mental depression, neurotoxicity, weakness.

Interactions

Drug-Drug: Additive bone marrow depression with other **antineoplastics** or **radiation therapy**. Bronchospasm may occur in patients who have been previously treated with **mitomycin**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. May ↓ **phenytoin** levels.

Route/Dosage

Doses may vary greatly, depending on tumor, schedule, condition of patient, and blood counts.
IV (Adults): *Initial*— 3.7 mg/m² (100 mcg/kg), single dose; ↑ weekly as tolerated by 1.8 mg/m² (50 mcg/kg) to maximum of 18.5 mg/m² (usual dose is 5.5–7.4 mg/m²). *Maintenance*— 10 mg 1–2 times/mo or one increment less than last dose every 7–14 days.
IV (Children): *Initial*— 2.5 mg/m², single dose; ↑ weekly as tolerated by 1.25 mg/m² to maximum of 7.5 mg/m². *Maintenance*— one increment less than last dose every 7 days.

Availability (generic available)

Solution for injection: 1 mg/mL. **Powder for injection (requires reconstitution):** 10 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory rate during therapy. Bronchospasm can be life-threatening and may occur at time of infusion or several hrs to wk later.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae,

© F.A. Davis Publishing

guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- May cause nausea and vomiting. Monitor intake and output, appetite, and nutritional intake. Prophylactic antiemetics may be used. Adjust diet as tolerated.
- Assess injection site frequently for redness, irritation, or inflammation. If extravasation occurs, infusion must be stopped and restarted elsewhere to avoid damage to subcut tissue. Standard treatment includes infiltration with hyaluronidase and application of heat.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid per day. Allopurinol or alkalinization of urine may be used to decrease uric acid levels.
- ***Lab Test Considerations:*** Monitor CBC prior to and routinely throughout therapy. If WBC <2000, subsequent doses are usually withheld until WBC is ≥4000. The nadir of leukopenia occurs in 5–10 days and recovery usually occurs 7–14 days later. Thrombocytopenia may also occur in patients who have received radiation or other chemotherapy agents.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically throughout therapy.
- May cause ↑ uric acid. Monitor periodically during therapy.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations, and infusion pump settings. Do not administer subcut, IM, or intrathecally (IT). IT administration is fatal. Vinblastine must be dispensed in an overwrap stating, "For IV use only." Overwrap should remain in place until immediately before administration.
- ***High Alert:*** Do not confuse vinblastine with vincristine.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Do not inject into extremities with impaired circulation; may cause thrombophlebitis.

IV Administration

- **IV Push:** ***Dilution:*** Dilute each 10 mg with 10 mL of 0.9% NaCl for injection with phenol or benzyl alcohol. Solution is clear. Reconstituted medication is stable for 28 days if refrigerated. ***Concentration:*** 1 mg/mL. ***Rate:*** Administer each single dose over 1 min through Y-site injection of a free-flowing infusion of 0.9% NaCl or D5W.
- **Intermittent Infusion:** Dilution in large volumes (100–250 mL) or prolonged infusion (≥30 min) increases chance of vein irritation and extravasation.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, tripmethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

V

© F.A. Davis Publishing

- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B liposome, cefepime, dantrolene, diazepam, furosemide, pantoprazole, phenytoin.

Patient/Family Teaching

- Advise patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for redness and ulceration. Advise patient that, if ulceration occurs, to avoid spicy foods, use sponge brush, and rinse mouth with water after eating and drinking. Topical agents may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Instruct patient to report symptoms of neurotoxicity (paresthesia, pain, difficulty walking, persistent constipation).
- Advise patient that jaw pain, pain in organs containing tumor tissue, nausea, and vomiting may occur. Avoid constipation and report other adverse reactions.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Rep: Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 2 mo after therapy is concluded.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Regression of malignancy without the appearance of detrimental side effects.

HIGH ALERT

vinCRIStine (vin-kriss-teen)

~~Vincasar PFS~~

Classification

Therapeutic: antineoplastics
Pharmacologic: vinca alkaloids

Indications

Used alone and in combination with other treatment modalities (antineoplastics, surgery, or radiation therapy) in treatment of: Hodgkin's disease, Leukemias, Neuroblastoma, Malignant lymphomas, Rhabdomyosarcoma, Wilms' tumor, Other tumors.

Action

Binds to proteins of mitotic spindle, causing metaphase arrest. Cell replication is stopped as a result (cell cycle–specific for M phase). Has little or no effect on bone marrow. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Has immunosuppressive properties.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Rapidly and widely distributed; extensively bound to tissues.
Metabolism and Excretion: Metabolized by the liver and eliminated in the feces via biliary excretion.
Half-life: 10.5–37.5 hr.

TIME/ACTION PROFILE (effects on blood counts†)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	4 days	7 days

†Usually mild.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB, Lactation: Pregnancy or lactation.
Use Cautiously in: Infection; ↓ bone marrow reserve; Hepatic impairment (50% dose ↓ recommended if serum bilirubin >3 m g/dL); Rep: Women with childbearing potential.

Adverse Reactions/Side Effects

EENT: cortical blindness, diplopia. **Resp:** bronchospasm. **GI:** nausea, vomiting, abdominal cramps, anorexia, constipation, ileus, stomatitis. **GU:** gonadal suppression, nocturia, oliguria, urinary retention. **Derm:** alopecia. **Endo:** syndrome of inappropriate antidiuretic hormone (SIADH). **Hemat:** anemia, leukopenia, thrombocytopenia (mild and brief). **Local:** phlebitis at IV site, tissue necrosis (from extravasation). **Metab:** hyperuricemia. **Neuro:** ascending peripheral neuropathy, agitation, insomnia, mental depression, mental status changes.

Interactions

Drug-Drug: Bronchospasm may occur in patients who have been previously treated with **mitomycin**. **L-asparaginase** may ↓ hepatic metabolism of vincristine (give vincristine 12–24 hr prior to asparaginase). May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Many other protocols are used.
IV (Adults): 10–30 mcg/kg (0.4–1.4 mg/m²); may repeat weekly (not to exceed 2 mg/dose).
IV (Children >10 kg): 1.5–2 mg/m² single dose; may repeat weekly.
IV (Children <10 kg): 50 mcg/kg single dose; may repeat weekly.

Availability (generic available)

Solution for injection: 1 mg/mL.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiratory rate during therapy. Report significant changes.
- Monitor neurologic status. Assess for paresthesia (numbness, tingling, pain), loss of deep tendon reflexes (Achilles reflex is usually first involved), weakness (wrist drop or footdrop, gait disturbances), cranial nerve palsies (jaw pain, hoarseness, ptosis, visual changes), autonomic dysfunction (ileus, difficulty voiding, orthostatic hypotension, impaired sweating), and CNS dysfunction (decreased level of consciousness, agitation, hallucinations). Notify physician if these symptoms develop, as they may persist for mo.
- Monitor intake and output ratios and daily weight; report significant discrepancies. Decreased urine output with concurrent hyponatremia may indicate SIADH, which usually responds to fluid restriction.
- Assess infusion site frequently for redness, irritation, or inflammation. If extravasation occurs, infusion must be stopped and restarted elsewhere to avoid damage to subcut tissue. Cellulitis and discomfort may be minimized by infiltration with hyaluronidase and application of moderate heat or by application of cold compresses.
- Assess nutritional status. An antiemetic may be used to minimize nausea and vomiting.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 liters of fluid per day. Allopurinol or alkalinization of urine may be used to decrease uric acid levels.
- ***Lab Test Considerations:*** Monitor CBC prior to and periodically throughout therapy. May cause slight leukopenia 4 days after therapy, which resolves within 7 days. Platelet count may ↑ or ↓.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically throughout therapy.
- May cause ↑ uric acid. Monitor periodically during therapy.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations, and infusion pump settings. Do not administer subcut, IM, or intrathecally (IT). IT administration is fatal. Vincristine must be dispensed in an overwrap stating "For IV use only." Overwrap should remain in place until immediately before administration.
- ***High Alert:*** Do not confuse vincristine with vinblastine.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.

IV Administration

- **IV Push:** ***Dilution:*** Does not need to be reconstituted. ***Concentration:*** Administer undiluted at 1 mg/mL. ***Rate:*** Administer each dose IV push over 1 min through Y-site injection of a free-flowing infusion of 0.9% NaCl or D5W.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cladribine, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, fosphenytoin, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, methoprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomy-

V

© F.A. Davis Publishing

cin, vasopressin, vecuronium, verapamil, vinblastine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, cefepime, diazepam, idarubicin, nafcillin, pantoprazole, phenytoin.

Patient/Family Teaching
- Instruct patient to notify health care professional immediately if redness, swelling, or pain at injection site occurs.
- Instruct patient to report symptoms of neurotoxicity (paresthesia, pain, difficulty walking, persistent constipation). Inform patient that increased fluid intake, dietary fiber, and exercise may minimize constipation. Stool softeners or laxatives may be used. Patient should inform health care professional if severe constipation or abdominal discomfort occurs, as this may be a sign of neuropathy.
- Advise patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; or mouth sores occur. Caution patient to avoid crowds and persons with known infections.
- Discuss with patient the possibility of hair loss. Explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Rep: Advise patient that this medication may have teratogenic effects. Contraception should be used during and for at least 2 mo after therapy is concluded.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes
- Regression of malignancy without the appearance of detrimental side effects.

HIGH ALERT

vinorelbine (vine-oh-**rel**-been)
~~Navelbine~~

Classification
Therapeutic: antineoplastics
Pharmacologic: vinca alkaloids

Indications
Inoperable non–small-cell cancer of the lung in ambulatory patients (alone or with cisplatin).

Action
Binds to a protein (tubulin) of cellular microtubules, where it interferes with microtubule assembly. Cell replication is stopped as a result (cell cycle–specific for M phase). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Highly bound to platelets and lymphocytes.
Metabolism and Excretion: Mostly metabolized by the liver. At least one metabolite is active. Large amounts eliminated in feces; 11% excreted unchanged by the kidneys.
Half-life: 28–44 hr.

TIME/ACTION PROFILE (effect on WBCs)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	7–10 days	7–15 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Active infection; ↓ bone marrow reserve; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Hepatic impairment (dose ↓ recommended if total bilirubin >2 m g/dL); Debilitated patients (↑ risk of hyponatremia); Granulocytopenic patients (temporarily discontinue or reduce dose); Pedi: Safety not established; Rep: Women of reproductive potential.

Adverse Reactions/Side Effects
CV: chest pain. **Derm:** alopecia, rash. **F and E:** hyponatremia. **GI:** constipation, nausea, abdominal pain, anorexia, diarrhea, transient ↑ in liver enzymes, vomiting. **Hemat:** anemia, neutropenia, thrombocytopenia. **Local:** irritation at IV site, skin reactions, phlebitis. **MS:** arthralgia, back pain, jaw pain, myalgia. **Neuro:** neurotoxicity, fatigue. **Resp:** shortness of breath. **Misc:** pain in tumor-containing tissue.

Interactions
Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. Concurrent use with **cisplatin** ↑ risk and severity of bone marrow depression. Concurrent use with **mitomycin** or **chest radiation** ↑ risk of pulmonary reactions.

Route/Dosage
IV (Adults): 30 mg/m² once weekly.

Hepatic Impairment
IV (Adults): *Total bilirubin 2.1–3 mg/dL*—15 mg/m² once weekly; *total bilirubin ≥3 mg/dL*—7.5 mg/m² once weekly.

Availability (generic available)
Solution for injection (requires dilution): 10 mg/mL.

NURSING IMPLICATIONS
Assessment
- Monitor BP, pulse, and respiratory rate during therapy. Note significant changes. Acute shortness of breath and severe bronchospasm may occur infrequently shortly after administration. Treatment with corticosteroids, bronchodilators, and supplemental oxygen may be required, especially in patients with a history of pulmonary disease.

© F.A. Davis Publishing

- Assess frequently for signs of infection (sore throat, temperature, cough, mental status changes), especially when nadir of granulocytopenia is expected.
- Monitor neurologic status. Assess for paresthesia (numbness, tingling, pain), loss of deep tendon reflexes (Achilles reflex is usually first involved), weakness (wrist drop or footdrop, gait disturbances), cranial nerve palsies (jaw pain, hoarseness, ptosis, visual changes), autonomic dysfunction (constipation, ileus, difficulty voiding, orthostatic hypotension, impaired sweating), and CNS dysfunction (decreased level of consciousness, agitation, hallucinations). These symptoms may persist for mo. The incidence of neurotoxicity associated with vinorelbine is less than that of other vinca alkaloids.
- Monitor intake and output and daily weight for significant discrepancies.
- Assess nutritional status. Mild to moderate nausea is common. An antiemetic may be used to minimize nausea and vomiting.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid/day. Allopurinol and alkalinization of urine may decrease uric acid levels.
- ***Lab Test Considerations:*** Monitor CBC prior to each dose and routinely during therapy. The nadir of granulocytopenia usually occurs 7–10 days after vinorelbine administration and recovery usually follows within 7–15 days. If granulocyte count is $<1500/mm^3$, dose reduction or temporary interruption of vinorelbine may be warranted. If repeated episodes of fever and/or sepsis occur during granulocytopenia, future dose of vinorelbine should be modified. May also cause mild to moderate anemia. Thrombocytopenia rarely occurs.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, creatinine) prior to and periodically during therapy. May cause ↑ uric acid; monitor periodically during therapy.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double check single, daily, and course-of-therapy dose limits; have second practitioner independently double check original order, dose calculations, and infusion pump settings.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Assess infusion site frequently for redness, irritation, or inflammation. Vinorelbine is a vesicant. If extravasation occurs, infusion must be stopped and restarted elsewhere to avoid damage to subcut tissue. Treatment of extravasation includes application of warm compresses applied over the area immediately for 30–60 min, then alternating on/off every 15 min for 1 day to increase systemic absorption of the drug. Hyaluronidase 150 units diluted in 1–2 mL of 0.9% NaCl, 1 mL for each mL extravasated, should be injected through existing IV cannula or subcut if the needle has been removed to enhance absorption and dispersion of the extravasated drug.

IV Administration

- **IV Push:** ***Dilution:*** Dilute vinorelbine with 0.9% NaCl or D5W. ***Concentration:*** 1.5–3 mg/mL. ***Rate:*** Infuse over 6–10 min into Y-site closest to bag of a free-flowing IV or into a central line.
- Flush vein with at least 75–125 mL of 0.9% NaCl or D5W administered over 10 min or more following administration of vinorelbine.
- **Intermittent Infusion:** ***Dilution:*** Dilute vinorelbine with 0.9% NaCl, D5W, 0.45% NaCl, D5/0.45% NaCl, Ringer's or lactated Ringer's injection. Solution should be colorless to pale yellow. Do not administer solutions that are discolored or contain particulate matter. Diluted solution is stable for 24 hr at room temperature. ***Concentration:*** 0.5–2 mg/mL. ***Rate:*** Infuse over 6–10 min (up to 30 min) into Y-site closest to bag of a free-flowing IV or into a central line.
- Flush vein with at least 75–125 mL of 0.9% NaCl or D5W administered over 10 min or more following administration of vinorelbine.
- **Y-Site Compatibility:** amikacin, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefotaxime, ceftazidime, chlorpromazine, cimetidine, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin, dexamethasone sodium phosphate, diphenhydramine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, etoposide, famotidine, filgrastim, floxuridine, fluconazole, fludarabine, gemcitabine, gentamicin, granisetron, haloperidol, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, lorazepam, mannitol, melphalan, meperidine, mesna, methotrexate, metoclopramide, metronidazole, mitoxantrone, morphine, nalbuphine, ondansetron, oxaliplatin, potassium chloride, prochlorperazine, promethazine, streptozocin, tobramycin, vancomycin, vinblastine, vincristine, zidovudine.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B deoxycholate, ampicillin, cefazolin, ceftriaxone, cefuroxime, fluorouracil, furosemide, ganciclovir, lansoprazole, methylprednisolone, mitomycin, sodium bicarbonate, thiotepa, trimethoprim/sulfamethoxazole.

V

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to report symptoms of neurotoxicity (paresthesia, pain, difficulty walking, persistent constipation).
- Inform patient that increased fluid intake, dietary fiber, and exercise may minimize constipation. Stool softeners or laxatives may be necessary. Patient should be advised to report severe constipation or abdominal discomfort, as this may be a sign of ileus, which may occur as a consequence of neuropathy.
- Advise patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; or mouth sores occur.
- Caution patient to avoid crowds and persons with known infections.
- Advise patient that this medication may have teratogenic effects. Advise females of reproductive potential to use effective contraception during and for at least 2 mo after last dose of vinorelbine and to avoid breast feeding during and for 9 days after last dose.
- Discuss with patient the possibility of hair loss and explore coping strategies.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in the size or spread of malignancy without detrimental side effects.

VITAMIN B_{12} PREPARATIONS

cyanocobalamin
(sye-an-oh-koe-**bal**-a-min)
Nascobal

hydroxocobalamin
(hye-drox-oh-koe-**bal**-a-min)
Cyanokit

Classification
Therapeutic: antianemics, vitamins
Pharmacologic: water-soluble vitamins

Indications

Vitamin B_{12} deficiency (parenteral product or nasal spray should be used when deficiency is due to malabsorption). Pernicious anemia (only parenteral products should be used for initial therapy; nasal or oral products are not indicated until patients have achieved hematologic remission following parenteral therapy and have no signs of CNS involvement). Part of the Schilling test (vitamin B_{12} absorption test) (diagnostic). Cyanide poisoning (Cyanokit only).

Action

Necessary coenzyme for metabolic processes, including fat and carbohydrate metabolism and protein synthesis. Required for cell production and hematopoiesis.
Therapeutic Effects: Corrects manifestations of pernicious anemia (megaloblastic indices, GI lesions, and neurologic damage). Corrects vitamin B_{12} deficiency. Reverses symptoms of cyanide toxicity (Cyanokit only).

Pharmacokinetics

Absorption: Oral absorption in GI tract requires intrinsic factor and calcium; well absorbed after IM, subcut, and nasal administration.
Distribution: Stored in the liver and bone marrow; crosses placenta, enters breast milk.
Metabolism and Excretion: Primarily excreted unchanged in urine.
Half-life: *Cyanocobalamin*—6 days (400 days in liver); *Hydroxocobalamin*—26–31 hr.

TIME/ACTION PROFILE (reticulocytosis)

ROUTE	ONSET	PEAK	DURATION
Cyanocobalamin IM, subcut, nasal	unknown	3–10 days	unknown
Hydroxocobalamin IM	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation: *Cyanokit*—Breast feeding not recommended; Pedi: Avoid using preparations containing benzyl alcohol in premature infants (associated with fatal "gasping syndrome").
Use Cautiously in: Hereditary optic nerve atrophy (accelerates nerve damage); Uremia, folic acid deficiency, concurrent infection, iron deficiency (response to B_{12} will be impaired); Renal dysfunction (when using aluminum-containing products); Pedi: *Cyanokit*—Safety and effectiveness not established; OB: *Cyanokit*—Use during pregnancy only if maternal benefit outweighs potential risk to fetus.

Adverse Reactions/Side Effects

CV: heart failure; *Cyanokit*, hypertension, chest pain, tachycardia. **Derm:** itching; *Cyanokit*, erythema, rash. **EENT:** *Cyanokit*—dry throat, eye redness, eye swelling. **GI:** diarrhea; *Cyanokit*, abdominal discomfort, dyspepsia, dysphagia, hematochezia, nausea, vomiting. **F and E:** hypokalemia. **GU:** *Cyanokit*—red urine, acute renal failure. **Hemat:** thrombocytosis. **Local:** pain at IM site. **Neuro:** headache; *Cyanokit*, dizziness, memory impairment, restlessness. **Resp:** pulmonary edema; *Cyanokit*, dyspnea. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Chloramphenicol and **antineoplastics** may ↓ hematologic response to vitamin B_{12}. **Colchicine**, **aminosalicylic acid**, **cimetidine**, and ex-

© F.A. Davis Publishing

cess intake of **alcohol** or **vitamin C** may ↓ oral absorption/effectiveness of vitamin B_{12}.

Route/Dosage

Cyanocobalamin (oral products are usually not recommended due to poor absorption and should be used only if patient refuses the IM, deep subcutaneous, or intranasal route of administration)

PO (Adults and Children): *Vitamin B_{12} deficiency*—amount depends on deficiency (up to 1000 mcg/day have been used).
PO (Adults): *Pernicious anemia (for hematologic remission only)*—1000–2000 mcg once daily.
IM, Subcut (Adults): *Vitamin B_{12} deficiency*—30 mcg once daily for 5–10 days, then 100–200 mcg once monthly. *Pernicious anemia*—100 mcg once daily for 6–7 days; if improvement, give same dose every other day for 7 doses, then every 3–4 days for 2–3 wk; once hematologic values return to normal (remission), can give maintenance dose of 100 mcg once monthly (doses up to 1000 mcg have been used for maintenance) (could alternatively use oral or intranasal formulations below for maintenance at specified doses). *Schilling test*—Flushing dose is 1000 mcg.
IM, Subcut (Children): *Vitamin B_{12} deficiency*—0.2 mcg/kg once daily for 2 days, then 1000 mcg once daily for 2–7 days, then 100 mcg once weekly for 1 mo. *Pernicious anemia*—30–50 mcg once daily for ≥2 wk (to a total dose of 1000–5000 mcg), then give maintenance dose of 100 mcg once monthly (doses up to 1000 mcg have been used for maintenance).
Intranasal (Adults): *Vitamin B_{12} deficiency*—500 mcg (one spray) in one nostril once weekly. *Pernicious anemia (for hematologic remission only)*—500 mcg (one spray) in one nostril once weekly.

Hydroxocobalamin

IM (Adults): *Vitamin B_{12} deficiency*—30 mcg once daily for 5–10 days, then 100–200 mcg once monthly. *Pernicious anemia*—100 mcg once daily for 6–7 days; if improvement, give same dose every other day for 7 doses, then every 3–4 days for 2–3 wk; once hematologic values return to normal (remission), give maintenance dose of 100 mcg once monthly. *Schilling test*—Flushing dose is 1000 mcg.
IM (Children): *Vitamin B_{12} deficiency*—100 mcg once daily for ≥2 wk (to achieve total dose of 1000–5000 mcg), then 30–50 mcg once monthly. *Pernicious anemia*—30–50 mcg once daily for ≥2 wk (to achieve total dose of 1000–5000 mcg), then 100 mcg once monthly.
IV (Adults): *Cyanide poisoning (Cyanokit only)*—5 g over 15 min; another 5 g dose may be infused over 15–120 min depending upon severity of poisoning (maximum cumulative dose = 10 g).

Availability

Cyanocobalamin (generic available)

Extended-release tablets: 1000 mcg^{OTC}. **Lozenges:** 50 mcg ^{OTC}, 100 mcg^{OTC}, 250 mcg^{OTC}, 500 mcg^{OTC}. **Nasal spray:** 500 mcg/0.1 mL actuation (8 sprays/bottle). **Solution for injection:** 1000 mcg/mL. **Sublingual tablets:** 2500 mcg^{OTC}. **Tablets:** 100 mcg^{OTC}, 250 mcg^{OTC}, 500 mcg^{OTC}, 1000 mcg^{OTC}.

Hydroxocobalamin (generic available)

Solution for intramuscular injection: 1000 mcg/mL. **Powder for intravenous injection (requires reconstitution) (Cyanokit):** 5 g/vial.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of vitamin B_{12} deficiency (pallor; neuropathy; psychosis; red, inflamed tongue) before and periodically during therapy.
- ***Lab Test Considerations:*** Monitor plasma folic acid, vitamin B_{12}, and iron levels, hemoglobin, hematocrit, and reticulocyte count before treatment, 1 mo after the start of therapy, and then every 3–6 mo. Evaluate serum potassium level in patients receiving vitamin B_{12} for pernicious anemia for hypokalemia during the first 48 hr of treatment. Serum potassium and platelet counts should be monitored routinely during the course of therapy.
- **Cyanokit: :** Management of cyanide poisoning should also include establishment of airway, ensuring adequate oxygenation and hydration, cardiovascular support, and seizure management. Monitor BP and heart rate continuously during and after infusion and immediately report significant changes. The maximal ↑ in BP usually occurs toward the end of the infusion. BP usually returns to baseline within 4 hr of drug administration.

Implementation

- Usually administered in combination with other vitamins; solitary vitamin B_{12} deficiencies are rare.
- Administration of vitamin B_{12} by the oral route is useful only for nutritional deficiencies. Patients with small-bowel disease, malabsorption syndrome, or gastric or ileal resections require parenteral administration.
- **PO:** Administer with meals to increase absorption.
- May be mixed with fruit juices. Administer immediately after mixing; ascorbic acid alters stability.
- **Intranasal:** Dose should not be administered within 1 hr of hot food or liquids (these substances may result in the formation of nasal secretions which may result in ↓ effectiveness of nasal spray).
- **IM, Subcut:** Vials should be protected from light.
- If subcutaneous route used, deep subcutaneous administration is preferred.

V

© F.A. Davis Publishing

IV Administration

- **IV:** IV route should only be used with Cyanokit.
- **Intermittent Infusion:** ***Dilution:*** Dilute each Cyanokit vial with 200 mL of 0.9% NaCl, D5W, or LR. Gently invert the vial for at least 60 sec prior to infusion. Reconstituted vial can be hung for infusion and is stable for 6 hr at room temperature. Discard any unused solution after 6 hr. ***Rate:*** Administer initial 5-g dose over 15 min. Administer additional 5-g dose over 15–120 min.
- **Y-Site Incompatibility:** ascorbic acid, blood products, diazepam, dobutamine, dopamine, fentanyl, nitroglycerin, pentobarbital, propofol, sodium thiosulfate, thiopental.

Patient/Family Teaching

- Encourage patient to comply with diet recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the four basic food groups.
- Foods high in vitamin B_{12} include meats, seafood, egg yolk, and fermented cheeses; few vitamins are lost with ordinary cooking.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. Effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects.
- Inform patients with pernicious anemia of the lifelong need for vitamin B_{12} replacement.
- Emphasize the importance of follow-up exams to evaluate progress.
- **Intranasal:** Instruct patient in proper administration technique. Review *Patient Information Sheet* and demonstrate use of actuator. Unit must be primed with 3 strokes upon using for the first time. Unit must be primed with 1 stroke before each of the remaining doses. Advise patient to clear nose, then place tip approximately 1 inch into nostril and press pump once, firmly and quickly. After dose, remove unit from nose and massage dosed nostril gently for a few sec. Vial delivers 8 doses. Unit should be stored at room temperature and protected from light.
- **Intermittent Infusion:** Advise patient that skin redness may last up to 2 wk and that their urine may remain red for up to 5 wk after drug administration. Instruct patient to avoid sun exposure while their skin is red. Advise patient to contact health care professional if skin or urine redness persist after these time periods. Advise patient that a rash may develop from 7–28 days after drug administration. It will usually resolve without treatment within a few wk. Advise patient to contact health care professional if rash persists after this time period.

Evaluation/Desired Outcomes

- Resolution of the symptoms of vitamin B_{12} deficiency.
- Increase in reticulocyte count.
- Improvement in manifestations of pernicious anemia.
- Resolution of symptoms of cyanide poisoning.

VITAMIN D COMPOUNDS

calcifediol (kal-si-fe-**dye**-ol)
Rayaldee

calcitriol (kal-si-**trye**-ole)
~~Calcijex~~, Rocaltrol

cholecalciferol (kol-e-kal-**sif**-e-role)
Delta-D3, Euro D

doxercalciferol
(**dox**-er-kal-**sif**-e-role)
Hectorol

ergocalciferol
(**er**-goe-kal-**sif**-e-role)
Drisdol

paricalcitol (par-i-**kal**-si-tole)
Zemplar

Classification
Therapeutic: vitamins
Pharmacologic: fat-soluble vitamins

Indications

Cholecalciferol: Secondary hyperparathyroidism in patients with stage 3 or 4 chronic kidney disease and serum total 25-hydroxyvitamin D levels <30 ng/mL. **Calcitriol:** Treatment of the following conditions: Hypocalcemia in chronic renal dialysis (IV and PO); Hypocalcemia in patients with hypoparathyroidism or pseudohypoparathyroidism (PO only); Secondary hyperparathyroidism and resulting metabolic bone disease in predialysis patients with moderate to severe renal insufficiency (CCr 15–55 mL/min) (PO only). **Cholecalciferol:** Treatment or prevention of vitamin D deficiency. **Doxercalciferol:** Treatment of the following conditions: Secondary hyperparathyroidism in patients undergoing chronic renal dialysis (IV and PO); Secondary hyperparathyroidism in patients with Stage 3 or 4 chronic kidney disease (PO only). **Ergocalciferol:** Treatment of the following conditions: Familial hypophosphatemia; Hypoparathyroidism; Vitamin D-resistant rickets. **Paricalcitol:** Prevention and treatment of secondary hyperparathyroidism in patients with Stage 3 or 4 (PO) or Stage 5 (PO and IV) chronic kidney disease.

Action

Calcifediol is a prohormone of the active form of vitamin D_3, calcitriol. Cholecalciferol requires activation in the liver and kidneys to create the active form of vitamin D_3 (calcitriol). Doxercalciferol and ergocalciferol require activation in the liver to create the active form of vitamin D_2. Paricalcitol is a synthetic analogue of calcitriol. Vitamin D promotes the absorption of calcium and ↓ parathyroid hormone concentration. **Therapeutic Effects:** Treatment and prevention of deficiency states, particularly bone manifestations. Im-

© F.A. Davis Publishing

proved calcium and phosphorous homeostasis in patients with chronic kidney disease.

Pharmacokinetics

Absorption: *Calcifediol, calcitriol, doxercalciferol, ergocalciferol, paricalcitol*—Well absorbed following oral administration. *Calcitriol, doxercalciferol, paricalcitol*—IV administration results in complete bioavailability.

Distribution: Calcitriol and paricalcitol cross the placenta; calcitriol also enters breast milk.

Protein Binding: *Calcifediol*—>98%; *Calcitriol and paricalcitol*—99.9%.

Metabolism and Excretion: *Calcifediol*—Converted to calcitriol by the 1-alpha-hydroxylase enzyme, CYP27B1, in kidney; also metabolized by CYP24A1 to inactive metabolites; primarily excreted in feces. *Calcitriol*—Undergoes enterohepatic recycling and is excreted mostly in bile. *Cholecalciferol*—Converted by the liver and kidneys to calcitriol (active form of vitamin D_3). *Ergocalciferol*—Converted to active form of vitamin D_2 by sunlight, the liver, and the kidneys. *Doxercalciferol*—Converted by the liver to the active form of vitamin D_2. *Paricalcitol*—mostly metabolized by the liver and excreted via hepatobiliary elimination.

Half-life: *Calcifediol*—25 days. *Calcitriol*—5–8 hr. *Cholecalciferol*—14 hr. *Doxercalciferol*—32–37 hr (up to 96 hr). *Paricalcitol*—14–20 hr.

TIME/ACTION PROFILE (effects on serum calcium)

ROUTE	ONSET	PEAK	DURATION
Calcifediol-PO	2 wk	20 wk	unknown
Calcitriol-PO	2–6 hr	2–6 hr	3–5 days
Calcitriol-IV	unknown	unknown	unknown
Cholecalciferol-PO	unknown	unknown	unknown
Doxercalciferol PO	unknown	8 wk	1 wk
Doxercalciferol-IV	unknown	8 wk	1 wk
Ergocalciferol-PO	12–24 hr	unknown	up to 6 mo
Paricalcitol-PO	unknown	2–4 wk	unknown
Paricalcitol IV	unknown	up to 2 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypercalcemia; Vitamin D toxicity; Concurrent use of magnesium-containing antacids or other vitamin D supplements; **Ergocalciferol**: Known intolerance to tartrazine; **Cholecalciferol and ergocalciferol**: Malabsorption problems.

Use Cautiously in: **Calcitriol, doxercalciferol, paricalcitol**: Patients receiving digoxin; OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit outweighs potential risk to infant; Pedi: Safety and effectiveness of calcifediol and doxercalciferol not established in children.

Adverse Reactions/Side Effects

Seen primarily as manifestations of toxicity (hypercalcemia).

CV: *calcifediol*—HF, arrhythmias, edema, hypertension; *doxercalciferol*, bradycardia; *paricalcitol*, palpitations. **Derm:** pruritus. **EENT:** conjunctivitis, photophobia, rhinorrhea. **F and E:** HYPERCALCEMIA; *calcifediol*, hyperkalemia, hyperphosphatemia, polydipsia. **GI:** PANCREATITIS, abdominal pain, anorexia, constipation, dry mouth, ↑ liver enzymes, metallic taste, nausea, polydipsia, vomiting, weight loss. **GU:** albuminuria, azotemia, ↓ libido, nocturia, polyuria. **Hemat:** *calcifediol*—anemia. **Local:** pain at injection site. **Metab:** hyperthermia; *calcifediol*, ↓ appetite, ↓ weight. **MS:** bone pain, muscle pain; *doxercalciferol*, arthralgia; *paricalcitol*, metastatic calcification. **Neuro:** *calcifediol*—SEIZURES, headache, somnolence, weakness; *calcifediol*, confusion; *doxercalciferol*, dizziness, malaise. **Resp:** *doxercalciferol and ergocalciferol*—dyspnea. **Misc:** *calcitriol*—allergic reactions, chills, fever; *doxercalciferol*, HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, hypotension, dyspnea, and cardiac arrest).

Interactions

Drug-Drug: Cholestyramine, **colestipol**, or **mineral oil** ↓ absorption of vitamin D analogues. **Calcium-containing drugs**, **thiazide diuretics**, and other **vitamin D analogs** may ↑ risk of hypercalcemia. **Corticosteroids** ↓ effectiveness of vitamin D analogues. Using calcifediol, calcitriol, doxercalciferol, or paricalcitol with **digoxin** may ↑ risk of arrhythmias. Vitamin D requirements ↓ by **phenytoin**, **fosphenytoin**, **sucralfate**, **barbiturates**, and **primidone**. Concurrent use with **magnesium-containing drugs** may lead to hypermagnesemia. Concurrent use of **calcium-containing drugs** may ↑ risk of hypercalcemia. **Agents that induce liver enzymes** (**phenobarbital**, **rifampin**) and **agents that inhibit liver enzymes** (**atazanavir**, **clarithromycin**, **erythromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, **verapamil**, **voriconazole**) may alter requirements for calcifediol, doxercalciferol, and paricalcitol (monitoring of calcium and phosphorus recommended).

Drug-Food: Ingestion of **foods high in calcium content** (see Appendix J) may lead to hypercalcemia.

Route/Dosage

Calcifediol

PO (Adults): 30 mcg once daily at bedtime; if desired intact PTH level remains elevated after 3 mo, ↑ to 60

© F.A. Davis Publishing

mcg once daily at bedtime. Maintenance dose should target total 25-hydroxyvitamin D levels of 30–100 ng/mL, intact PTH levels within desired therapeutic range, serum calcium <9.8 mg/dL, and serum phosphorus ≤5.5 mg/dL.

Calcitriol

PO (Adults): *Hypocalcemia during dialysis*—0.25 mcg once daily or every other day; if needed, may ↑ by 0.25 mcg/day at 4–8 wk intervals (typical dosage = 0.5–1 mcg/day). *Hypoparathyroidism*—0.25 mcg once daily initially; if needed, may ↑ dose by 0.25 mcg/day at 2–4 wk intervals (typical dosage = 0.5–2 mcg/day). *Predialysis patients*—0.25 mcg once daily (up to 0.5 mcg/day).
PO (Children): *Hypocalcemia during dialysis*—0.25–2 mcg once daily. *Hypoparathyroidism (children ≥6 yr)*—0.25 mcg once daily initially; if needed, may ↑ dose by 0.25 mcg/day at 2–4 wk intervals (typical dosage = 0.5–2 mcg/day). *Hypoparathyroidism (children 1–5 yr)*—0.25–0.75 mcg once daily. *Hypoparathyroidism (children <1 yr)*—0.04–0.08 mcg/kg/day. *Predialysis patients (children ≥3 yr)*—0.25 mcg once daily (up to 0.5 mcg/day). *Predialysis patients (children <3 yr)*—10–15 ng/kg/day.
IV (Adults): *Hypocalcemia during dialysis*—0.5 mcg (0.01 mcg/kg) 3 times weekly. May be ↑ by 0.25–0.5 mcg/dose at 2–4 wk intervals (typical maintenance dose = 0.5–3.0 mcg 3 times weekly [0.01–0.05 mcg/kg 3 times weekly]).
IV (Children): *Hypocalcemia during dialysis*—0.01–0.05 mcg/kg 3 times weekly.

Cholecalciferol

PO (Adults): 400–1000 units once daily.
PO (Infants): *Exclusively or partially breast fed*—400 units once daily.

Doxercalciferol

PO (Adults): *Dialysis patients*—10 mcg 3 times weekly (at dialysis); dose may be adjusted by 2.5 mcg at 8-wk intervals based on intact PTH concentrations (maximum dose = 20 mcg 3 times weekly). *Non-dialysis patients*—1 mcg once daily; dose may be adjusted by 0.5 mcg at 2 wk intervals based on intact PTH concentrations (maximum dose = 3.5 mcg/day).
IV (Adults): 4 mcg 3 times weekly at the end of dialysis; dose may be adjusted by 1–2 mcg at 8-wk intervals based on intact PTH concentrations (maximum dose = 6 mcg 3 times weekly).

Ergocalciferol

PO (Adults): *Vitamin D–resistant rickets*—12,000–500,000 units/day (to be used with phosphate supplement). *Familial hypophosphatemia*—10,000–80,000 units/day (with phosphorus 1–2 g/day). *Hypoparathyroidism*—50,000–200,000 units/day (to be used with calcium supplement).
PO (Children): *Vitamin D–resistant rickets*—40,000–80,000 units/day (to be used with phosphate supplement). *Familial hypophosphatemia*—10,000–80,000 units/day (with phosphorus 1–2 g/day). *Hypoparathyroidism*—50,000–200,000 units/day (to be used with calcium supplement).
PO (Infants): *Exclusively or partially breast fed*—400 units once daily.

Paricalcitol

Stage 3 or 4 Chronic Kidney Disease

PO (Adults): *Baseline intact PTH concentration ≤500 pg/mL*—Initiate with 1 mcg once daily or 2 mcg 3 times weekly; dose can be adjusted at 2–4 wk intervals based on intact PTH, calcium, and phosphate concentrations. *Baseline intact PTH concentration >500 pg/mL*—Initiate with 2 mcg once daily or 4 mcg 3 times weekly; dose can be adjusted at 2–4 wk intervals based on intact PTH, calcium, and phosphate concentrations.

Stage 5 Chronic Kidney Disease

PO (Adults): Initial dose (in mcg) is based on following equation: baseline intact PTH concentration (pg/mL)/80; dose should be given 3 times weekly; dose can be adjusted at 2–4 wk intervals based on intact PTH, calcium, and phosphate concentrations.
IV (Adults and Children ≥5 yr): 0.04–0.1 mcg/kg 3 times weekly during dialysis; dose can be adjusted by 2–4 mcg at 2–4 wk intervals based on intact PTH, calcium, and phosphate concentrations (doses up to 0.24 mcg/kg have been used).

Availability

Calcifediol

Extended-release capsules: 30 mcg.

Calcitriol (generic available)

Capsules: 0.25 mcg, 0.5 mcg. **Oral solution:** 1 mcg/mL. **Solution for injection:** 1 mcg/mL.

Cholecalciferol

Capsules: 1,000 units OTC, 2,000 units OTC, 5,000 units OTC, 10,000 units OTC, 25,000 units OTC, 50,000 units OTC. **Chewable tablets:** 400 units OTC. **Oral solution:** 400 units/mL OTC, 5,000 units/mL OTC. **Tablets:** 400 units OTC, 1,000 units OTC, 2,000 units OTC, 3,000 units OTC, 5,000 units OTC, 50,000 units OTC. ***In combination with:*** alendronate (Fosamax Plus D), see Appendix N.

Doxercalciferol (generic available)

Capsules: 0.5 mcg, 1 mcg, 2.5 mcg. **Solution for injection:** 2 mcg/mL.

Ergocalciferol (generic available)

Capsules: 50,000 units. **Oral solution:** 8000 units/mL Rx, OTC. **Tablets:** 400 units, 2,000 units.

Paricalcitol (generic available)

Capsules: 1 mcg, 2 mcg, 4 mcg. **Solution for injection:** 2 mcg/mL, 5 mcg/mL.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of vitamin deficiency prior to and periodically during therapy.
- Monitor for signs and symptoms of hypercalcemia (feeling tired, difficulty thinking clearly, loss of appetite, nausea, vomiting, constipation, increased thirst, increased urination, weight loss) during therapy. May increase risk of cardiac arrhythmias and seizures. May require frequent monitoring and change in dose.
- Assess patient for bone pain and weakness prior to and during therapy.
- Observe patient carefully for evidence of hypocalcemia (paresthesia, muscle twitching, laryngospasm, colic, cardiac arrhythmias, and Chvostek's or Trousseau's sign). Protect symptomatic patient by raising and padding side rails; keep bed in low position.
- Monitor serum and signs and symptoms of digitalis toxicity (abdominal pain, anorexia, nausea, vomiting, visual disturbances, bradycardia, other arrhythmias) during therapy in patients taking concomitant digoxin. Hypercalcemia may increase risk of digitalis toxicity in patients taking digoxin.
- **Calcifediol:** Monitor for signs and symptoms of adynamic bone disease (fractures) during therapy. May develop if intact PTH levels are abnormally low due to suppression.
- Pedi: Monitor height and weight; growth arrest may occur in prolonged high-dose therapy.
- **Rickets/Osteomalacia:** Assess patient for bone pain and weakness prior to and during therapy.
- ***Lab Test Considerations:*** During *calcitriol* therapy, serum calcium and phosphate concentrations should be drawn twice weekly initially. Serum calcium, magnesium, alkaline phosphatase, and intact PTH should then be monitored at least monthly. During *cholecalciferol* therapy, serum calcium, phosphate, and alkaline phosphatase concentrations should be monitored periodically. During *doxercalciferol* therapy, serum ionized calcium, phosphate, and intact PTH concentrations should be monitored prior to initiation of therapy, and then weekly during the first 12 wk of therapy, then periodically. Alkaline phosphatase should be monitored periodically. During *ergocalciferol* therapy, serum calcium and phosphate concentrations should be monitored every 2 wk. During oral *paricalcitol* therapy, serum calcium, phosphate, and intact PTH concentrations should be monitored at least every 2 wk for the first 3 mo of therapy or after any dosage adjustment, then monthly for 3 mo, then every 3 mo. During IV *paricalcitol* therapy, serum calcium and phosphate concentrations should be monitored twice weekly initially until dosage stabilized, and then at least monthly. Serum intact PTH concentrations should be monitored every 3 mo.
- Ensure serum calcium is <9.8 mg/dL before starting calcifediol therapy.
- During calcifediol therapy, monitor serum calcium, phosphorus, total 25-hydroxyvitamin D, and intact PTH levels at least every 3 mo after starting therapy or dose adjustment, and then at least every 6 to 12 mo.
- The serum calcium × phosphate product (Ca × P) should not exceed 70 mg^2/dL^2 (55 mg^2/dL^2 for doxercalciferol) (patients may be at ↑ risk of calcification).
- Calcitriol may cause false ↑ cholesterol levels.
- ***Toxicity and Overdose:*** Toxicity is manifested as hypercalcemia, hypercalciuria, and hyperphosphatemia. Assess patient for appearance of nausea, vomiting, anorexia, weakness, constipation, headache, bone pain, and metallic taste. Later symptoms include polyuria, polydipsia, photophobia, rhinorrhea, pruritus, and cardiac arrhythmias. Notify health care professional immediately if these signs of hypervitaminosis D occur. Treatment usually consists of discontinuation of calcitriol, a low-calcium diet, use of low-calcium dialysate in peritoneal dialysis patients, and administration of a laxative. IV hydration and loop diuretics may be ordered to increase urinary excretion of calcium. Hemodialysis may also be used.

Implementation

- **PO:** May be administered without regard to meals. Measure solution accurately with calibrated dropper provided by manufacturer. May be mixed with juice, cereal, or food, or dropped directly into mouth. Calcitriol capsules or solution should be protected from light.
- **Calcifediol**: ***DNC:*** Administer at bedtime; swallow capsules whole, do not open, crush, or chew.

IV Administration

- **IV Push:** Administer *calcitriol, doxercalciferol, and paricalcitol* undiluted by rapid injection through the catheter at the end of a hemodialysis period.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered that day, unless almost time for next dose; do not double up on doses. If a *calcifediol* dose is missed, omit and take next dose at the next regularly scheduled time; do not double doses.
- Review diet modifications with patient. See Appendix J for foods high in calcium and vitamin D. Renal patients must still consider renal failure diet in food selection. Health care professional may order concurrent calcium supplement.

© F.A. Davis Publishing

- Encourage patient to comply with dietary recommendations of health care professional. Explain that the best source of vitamins is a well-balanced diet with foods from the 4 basic food groups and the importance of sunlight exposure. See Appendix J for foods high in vitamin D.
- Patients self-medicating with vitamin supplements should be cautioned not to exceed RDA. The effectiveness of megadoses for treatment of various medical conditions is unproved and may cause side effects.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Advise patient to avoid concurrent use of antacids containing magnesium.
- Review symptoms of overdose and instruct patient to report these promptly to health care professional.
- Emphasize the importance of follow-up exams to evaluate progress.
- **Calcifediol:** Advise patient to notify health care professional if signs and symptoms of hypercalcemia occur.
- Emphasize importance of routine lab tests.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Monitor infants exposed to calcifediol through breast milk for signs and symptoms of hypercalcemia, including seizures, vomiting, constipation and weight loss. Consider monitoring of serum calcium in the infant.

Evaluation/Desired Outcomes

- Normalization of serum calcium and parathyroid hormone levels.
- Resolution or prevention of vitamin D deficiency.
- Improvement in symptoms of vitamin D–resistant rickets.
- **Calcifediol:** Serum total hydroxyvitamin D levels between 30 and 100 ng/mL, intact PTH levels within therapeutic range, serum calcium (corrected for low albumin) within normal range and serum phosphorus <5.5 mg/dL.

voriconazole (vor-i-kon-a-zole)

Vfend

Classification

Therapeutic: antifungals

Indications

Invasive aspergillosis. Candidemia (in patients without neutropenia) and serious *Candida* infections in skin, bladder, abdomen, kidney, and wounds. Esophageal candidiasis. Scedosporiosis and fusariosis in patients intolerant of or refractory to other therapies.

Action

Inhibits fungal ergosterol synthesis leading to production of abnormal fungal plasma membrane. **Therapeutic Effects:** Antifungal activity. **Spectrum:** Spectrum is notable for activity against: *Aspergillus* spp., *Candida* spp., *Scedosporium apiospermum*, *Fusarium* spp.

Pharmacokinetics

Absorption: Well absorbed following oral administration (96%); IV administration results in complete bioavailability.

Distribution: Extensive tissue distribution.

Protein Binding: 58%.

Metabolism and Excretion: Highly metabolized by the hepatic P450 enzymes (CYP2C19, CYP2C9, CYP3A4); <2% excreted unchanged in urine. Much individual variation in metabolism; metabolites are inactive. The CYP2C19 enzyme system exhibits genetic polymorphism; 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ voriconazole concentrations and an ↑ risk of adverse effects.

Half-life: Dose-dependent (adults 6–9 hrs); ↑ in hepatic impairment.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	12 hr
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of dihydroergotamine, carbamazepine, efavirenz (≥400 mg/day), ergotamine, ivabradine, naloxegol, phenobarbital, pimozide, rifabutin, rifampin, ritonavir (400 mg every 12 hr), quinidine, sirolimus, St. John's wort, tolvaptan, and venetoclax; Tablets contain lactose and should be avoided in patients with galactose intolerance, Lapp lactase deficiency, or glucose-galactose malabsorption; Severe hepatic impairment; OB: Pregnancy (may cause fetal harm).

Use Cautiously in: Mild to moderate hepatic impairment (↓ IV and PO maintenance doses); Renal impairment (CCr <50 mL/min) (Vehicle in IV formulation can accumulate resulting in toxicity; avoid use of IV unless potential benefit greatly outweighs potential risk, use oral form only); Congenital/acquired QT interval prolongation, HF, sinus bradycardia, hypokalemia, hypomagnesemia, or symptomatic arrhythmias; Concurrent use of drugs that prolong the QTc interval; Hematologic malignancy (↑ risk of hepatotoxicity); Rep: Women of reproductive potential; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <2 yr (safety and effectiveness not established); suspension contains benzyl alcohol which may cause potentially fatal "gasping syndrome" in neonates; ↑ risk of photosensitivity reactions in children.

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: changes in BP, peripheral edema, QT interval prolongation, tachycardia. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS, MELANOMA, SQUAMOUS CELL CARCINOMA, STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS, photosensitivity, rash. **EENT:** visual disturbances, eye hemorrhage. **Endo:** ADRENAL INSUFFICIENCY. **F and E:** hypokalemia, hypomagnesemia, hyperglycemia. **GI:** HEPATOTOXICITY, abdominal pain, diarrhea, nausea, pancreatitis, vomiting. **MS:** fluorosis, periostitis. **Neuro:** dizziness, hallucinations, headache. **Misc:** chills, fever, infusion reactions.

Interactions

Drug-Drug: Voriconazole is a substrate and inhibitor of the **CYP3A4**, **CYP2C9**, and **CYP2C19** enzyme systems. **Carbamazepine**, **phenobarbital**, and **rifampin** may significantly ↓ levels and effectiveness; concurrent use contraindicated. May significantly ↑ levels of **ivabradine**, **pimozide**, and **quinidine**, which can ↑ the risk of QT interval prolongation and torsades de pointes; concurrent use contraindicated. May significantly ↑ levels and risk of toxicity of **dihydroergotamine**, **ergotamine**, **sirolimus**, and **tolvaptan**; concurrent use contraindicated. May ↑ levels of **naloxegol**, which could precipitate symptoms of opioid withdrawal; concurrent use contraindicated. Concurrent use with **efavirenz** at doses of ≥400 mg every 24 hr is contraindicated since it may significantly ↑ efavirenz levels and significantly ↓ voriconazole levels; if used together, ↑ oral maintenance dose of voriconazole to 400 mg every 12 hr and ↓ dose of efavirenz to 300 mg daily. Concurrent use with **ritonavir** at dose of 400 mg every 12 hr is contraindicated since ritonavir may significantly ↓ voriconazole levels; use with ritonavir at dose of 100 mg every 12 hr should also be avoided, if possible. Concurrent use with **rifabutin** may significantly ↑ rifabutin levels and significantly ↓ voriconazole levels; if used together, ↑ oral maintenance dose of voriconazole to 400 mg every 12 hr and ↓ dose of efavirenz to 300 mg daily. Concurrent use with **venetoclax** at initiation and during ramp-up phase in patients with chronic lymphocytic leukemia or small lymphocytic leukemia is contraindicated because may ↑ risk of tumor lysis syndrome. **Fluconazole** may ↑ levels of voriconazole; avoid concurrent use. May ↑ levels of **cyclosporine**; ↓ cyclosporine dose by 50%. May ↑ levels of **tacrolimus**; ↓ tacrolimus dose to ⅓ of the starting dose. May ↑ levels of **HMG-CoA reductase inhibitors**, some **benzodiazepines** (**alprazolam**, **midazolam**, **triazolam**), **fentanyl**, **oxycodone**, **NSAIDs** (**ibuprofen**, **diclofenac**), some **calcium channel blockers**, **sulfonylureas** (**glipizide**, **glyburide**), **phenytoin**, **alfentanil**, **warfarin**, and **vinca alkaloids** (**vincristine**, **vinblastine**); dose ↓ may be needed and careful monitoring required during concurrent use. May ↑ **methadone** levels and ↑ risk of QT interval prolongation. May ↑ levels of **corticosteroids** and ↑ risk of adrenal suppression. May ↑ levels and risk of toxicity of **ivacaftor**; ↓ ivacaftor dose. Concurrent use with **hormonal contraceptives** containing **ethinyl estradiol** and **norethindrone** may ↑ voriconazole, ethinyl estradiol and norethindrone levels. May ↑ levels of **everolimus**; concurrent use not recommended. ↑ blood levels of **omeprazole**; if patient receiving ≥40 mg/day of omeprazole, ↓ omeprazole dose by 50%. Similar effects may occur with other **proton-pump inhibitors**. May ↓ metabolism and ↑ blood levels and effects of **protease-inhibitor antiretrovirals** and **non-nucleoside reverse transcriptase inhibitor antiretrovirals**; frequent monitoring recommended. **Non-nucleoside reverse transcriptase inhibitor antiretrovirals**; may induce or inhibit the metabolism of voriconazole; frequent monitoring recommended. **Letermovir** may ↓ levels; avoid concurrent use.

Drug-Natural Products: **St. John's wort** may significantly ↓ levels and effectiveness; concurrent use contraindicated.

Route/Dosage

Invasive Aspergillosis, Scedosporiosis, or Fusariosis

IV, PO (Adults ≥40 kg): *Loading dose (IV)* — 6 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 4 mg/kg IV every 12 hr (use 5 mg/kg IV every 12 hr if concurrently using with phenytoin). Continue IV therapy for ≥7 days, then switch to oral maintenance dose once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 200 mg PO every 12 hr (use 400 mg PO every 12 hr if concurrently using with phenytoin or efavirenz); if response inadequate, may ↑ to 300 mg every 12 hr. Total duration of therapy: ≥6–12 wk.

IV, PO (Adults <40 kg): *Loading dose (IV)* — 6 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 4 mg/kg IV every 12 hr (use 5 mg/kg IV every 12 hr if concurrently using with phenytoin). Continue IV therapy for ≥7 days, then switch to oral maintenance dose once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 100 mg PO every 12 hr (use 200 mg PO every 12 hr if concurrently using with phenytoin; use 400 mg PO every 12 hr if concurrently using with efavirenz); if response inadequate, may ↑ to 150 mg every 12 hr. Total duration of therapy: ≥6–12 wk.

IV, PO (Children ≥15 yr): *Loading dose (IV)* — 6 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 4 mg/kg IV every 12 hr. Continue IV therapy for ≥7 days, then switch to oral maintenance dose once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* —

V

© F.A. Davis Publishing

200 mg every 12 hr; if response inadequate, may ↑ to 300 mg every 12 hr. Total duration of therapy: ≥6–12 wk.

IV, PO (Children 12–14 yr and ≥50 kg): *Loading dose (IV)* — 6 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 4 mg/kg IV every 12 hr. Continue IV therapy for ≥7 days, then switch to oral maintenance dose once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 200 mg every 12 hr; if response inadequate, may ↑ to 300 mg every 12 hr. Total duration of therapy: ≥6–12 wk.

IV, PO (Children 12–14 yr and <50 kg): *Loading dose (IV)* — 9 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 8 mg/kg IV every 12 hr; if response inadequate, may ↑ maintenance dose by 1 mg/kg. Continue IV therapy for ≥7 days, then switch to oral maintenance dose once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 9 mg/kg every 12 hr (not to exceed 350 mg every 12 hr); if response inadequate, may ↑ by 1 mg/kg or 50 mg (not to exceed 350 mg every 12 hr). Total duration of therapy: ≥6–12 wk.

IV, PO (Children 2–11 yr): *Loading dose (IV)* — 9 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 8 mg/kg IV every 12 hr; if response inadequate, may ↑ maintenance dose by 1 mg/kg. Continue IV therapy for ≥7 days, then switch to oral maintenance dose once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 9 mg/kg every 12 hr (not to exceed 350 mg every 12 hr); if response inadequate, may ↑ by 1 mg/kg or 50 mg (not to exceed 350 mg every 12 hr). Total duration of therapy: ≥6–12 wk.

Hepatic Impairment

IV, PO (Adults): *Child-Pugh Class A and B* — Use standard IV loading dose, ↓ maintenance doses (IV or PO) by 50%; *Child-Pugh Class C* — Not recommended.

Candidemia in Non-Neutropenic Patients or Other Deep Tissue *Candida* Infections

IV, PO (Adults ≥40 kg): *Loading dose (IV)* — 6 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 3–4 mg/kg IV every 12 hr (use 5 mg/kg IV every 12 hr if concurrently using with phenytoin). Switch to oral dosing once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 200 mg PO every 12 hr (use 400 mg PO every 12 hr if concurrently using with phenytoin or efavirenz); if response inadequate, may ↑ to 300 mg every 12 hr. Total duration of therapy: ≥14 days following resolution of symptoms or following last positive culture, whichever is longer.

IV, PO (Adults <40 kg): *Loading dose (IV)* — 6 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 3–4 mg/kg IV every 12 hr (use 5 mg/kg IV every 12 hr if concurrently using with phenytoin). Switch to oral dosing once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 100 mg PO every 12 hr (use 200 mg PO every 12 hr if concurrently using with phenytoin; use 400 mg PO every 12 hr if using concurrently with efavirenz); if response inadequate, may ↑ to 150 mg every 12 hr. Total duration of therapy: ≥14 days following resolution of symptoms or following last positive culture, whichever is longer.

IV, PO (Children ≥15 yr): *Loading dose (IV)* — 6 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 3–4 mg/kg IV every 12 hr. Switch to oral dosing once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 200 mg every 12 hr; if response inadequate, may ↑ to 300 mg every 12 hr. Total duration of therapy: ≥14 days following resolution of symptoms or following last positive culture, whichever is longer.

IV, PO (Children 12–14 yr and ≥50 kg): *Loading dose (IV)* — 6 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 3–4 mg/kg IV every 12 hr. Switch to oral dosing once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 200 mg every 12 hr; if response inadequate, may ↑ to 300 mg every 12 hr. Total duration of therapy: ≥14 days following resolution of symptoms or following last positive culture, whichever is longer.

IV, PO (Children 12–14 yr and <50 kg): *Loading dose (IV)* — 9 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 8 mg/kg IV every 12 hr; if response inadequate, may ↑ maintenance dose by 1 mg/kg. Switch to oral dosing once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 9 mg/kg every 12 hr (not to exceed 350 mg every 12 hr); if response inadequate, may ↑ by 1 mg/kg or 50 mg (not to exceed 350 mg every 12 hr). Total duration of therapy: ≥14 days following resolution of symptoms or following last positive culture, whichever is longer.

IV, PO (Children 2–11 yr): *Loading dose (IV)* — 9 mg/kg IV every 12 hr for 2 doses, followed by *maintenance dose (IV)* of 8 mg/kg IV every 12 hr; if response inadequate, may ↑ maintenance dose by 1 mg/kg. Switch to oral dosing once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 9 mg/kg every 12 hr (not to exceed 350 mg every 12 hr); if response inadequate, may ↑ by 1 mg/kg or 50 mg (not to exceed 350 mg every 12 hr). Total duration of therapy: ≥14 days following resolution of symptoms or following last positive culture, whichever is longer.

Hepatic Impairment

IV, PO (Adults): *Child-Pugh Class A and B* — Use standard IV loading dose, ↓ maintenance doses (IV or PO) by 50%; *Child-Pugh Class C* — Not recommended.

Esophageal Candidiasis

PO (Adults ≥40 kg): 200 mg every 12 hr (use 400 mg every 12 hr if concurrently using with phenytoin or

© F.A. Davis Publishing

efavirenz); if response inadequate, may ↑ to 300 mg every 12 hr. Duration of therapy: ≥14 days and for ≥7 days following resolution of symptoms.

PO (Adults <40 kg): 100 mg every 12 hr (use 200 mg every 12 hr if concurrently using with phenytoin; use 400 mg every 12 hr if using concurrently with efavirenz); if response inadequate, may ↑ to 150 mg every 12 hr. Duration of therapy: ≥14 days and for ≥7 days following resolution of symptoms.

PO (Children ≥15 yr): 200 mg every 12 hr; if response inadequate, may ↑ to 300 mg every 12 hr. Duration of therapy: ≥14 days and for ≥7 days following resolution of symptoms.

PO (Children 12–14 yr and ≥50 kg): 200 mg every 12 hr; if response inadequate, may ↑ to 300 mg every 12 hr. Duration of therapy: ≥14 days and for ≥7 days following resolution of symptoms.

IV, PO (Children 12–14 yr and <50 kg): Initiate therapy with *maintenance dose (IV)* of 4 mg/kg IV every 12 hr; if response inadequate, may ↑ maintenance dose by 1 mg/kg. Switch to oral dosing once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 9 mg/kg every 12 hr (not to exceed 350 mg every 12 hr); if response inadequate, may ↑ by 1 mg/kg or 50 mg (not to exceed 350 mg every 12 hr). Total duration of therapy: ≥14 days and for ≥7 days following resolution of symptoms.

IV, PO (Children 2–11 yr): Initiate therapy with *maintenance dose (IV)* of 4 mg/kg IV every 12 hr; if response inadequate, may ↑ maintenance dose by 1 mg/kg. Switch to oral dosing once patient has clinically improved and can tolerate oral medications. *Maintenance dose (PO)* — 9 mg/kg every 12 hr (not to exceed 350 mg every 12 hr); if response inadequate, may ↑ by 1 mg/kg or 50 mg (not to exceed 350 mg every 12 hr). Total duration of therapy: ≥14 days and for ≥7 days following resolution of symptoms.

Hepatic Impairment

IV, PO (Adults): *Child-Pugh Class A and B* — Use standard IV loading dose, ↓ maintenance doses (IV or PO) by 50%; *Child-Pugh Class C* — Not recommended.

Availability (generic available)

Tablets: 50 mg, 200 mg. **Oral suspension (orange-flavor):** 40 mg/mL. **Powder for injection:** 200 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of fungal infections prior to and during therapy.
- Obtain specimens for culture and histopathology prior to therapy to isolate and identify organism. Therapy may be started before results are received.
- Monitor visual function including visual acuity, visual field, and color perception in patients receiving more than 28 days of therapy. Vision usually returns to normal within 14 days after discontinuation of therapy.
- Monitor for allergic reactions during infusion of voriconazole (flushing, fever, sweating, tachycardia, chest tightness, dyspnea, faintness, nausea, pruritus, rash). Symptoms occur immediately upon start of infusion. May require discontinuation.
- Monitor patients with risk factors for acute pancreatitis (recent chemotherapy, hematopoietic stem cell transplantation [HSCT]) for the signs of pancreatitis (abdominal pain, ↑ serum amylase and lipase).
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- ***Lab Test Considerations:*** Monitor liver function tests (AST, ALT, and bilirubin) prior to, weekly during first mo and monthly during therapy. If abnormal liver function tests occur, monitor for development of severe hepatic injury. Discontinue therapy if markedly ↑ or clinical signs and symptoms of liver disease develop.
- Monitor renal function (serum creatinine) during therapy.

Implementation

- Once patient can tolerate oral medication, PO voriconazole may be used.
- Correct electrolyte disturbances (hypokalemia, hypomagnesemia, hypocalcemia) prior to initiation and during therapy.
- **PO:** Administer at least 1 hr before or 1 hr after a meal.
- Shake suspension well (approximately 10 sec) before measuring suspension. Use oral dispenser provided to ensure accurate dose. Do not mix suspension with other medicine, flavored liquid, or syrup. Store suspension at room temperature up to 14 days, then discard.

IV Administration

- Do not administer voriconazole with blood products or concentrated electrolytes, even in separate lines. Non-concentrated electrolytes can be infused at same time, but separate lines must be used. TPN can be administered simultaneously but must be via separate line or via a different port in a multi-lumen catheter.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute each 200-mg vial with 19 mL of sterile water for injection to achieve concentration of 10 mg/mL.Calculate volume of 10 mg/mL solution required for patient dose. ***Dilution:*** Withdraw and discard equal volume of diluent from infusion bag or bottle to be used. Withdraw required volume of voricona-

© F.A. Davis Publishing

zole solution from vial(s) and add to appropriate volume of 0.9% NaCl, LR, D5/LR, D5/0.45% NaCl, D5W, 0.45% NaCl, or D5/0.9% NaCl. Reconstituted solution stable for 24 hr if refrigerated. Discard partially used vials. ***Concentration:*** Final concentration of infusion should be 0.5–5 mg/mL. ***Rate:*** Infuse over 1–3 hr at a rate not to exceed 3 mg/kg/hr.

- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, azithromycin, aztreonam, bivalirudin, bleomycin, buprenorphine, butorphanol, bumetanide, buprenorphine, butorphanol, calcium acetate, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methadone, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B lipid complex, busulfan, cefepime, cyclosporine, dantrolene, diazepam, doxorubicin hydrochloride, gemtuzumab ozogamicin, idarubicin, mitoxantrone, moxifloxacin, nitroprusside, pantoprazole, phenytoin, thiopental.

Patient/Family Teaching

- Advise patient to take voriconazole as directed, on an empty stomach. Advise patient to read *Patient Information* before starting voriconazole and with each Rx refill in case of changes.
- May cause blurred vision, photophobia, and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Also advise patient to avoid driving at night during voriconazole therapy.
- Advise patient to avoid direct sunlight, sunlamps and tanning beds during voriconazole therapy. Use sunscreen and protective clothing to prevent severe sunburn. Advise patient to have dermatologic evaluation regular basis to allow early detection and management of premalignant lesions; squamous cell carcinoma of the skin and melanoma have been reported during long-term therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional if rash or signs and symptoms of allergic reaction occur.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and notify health care professional if pregnancy is planned or suspected, or if breast feeding. Monitor for adverse reactions if voriconazole is administered concurrently with oral contraceptives. If pregnancy is detected, discontinue medication as soon as possible.

Evaluation/Desired Outcomes

- Resolution of fungal infections.

voxelotor (vox-**el**-oh-tor)

Oxbryta

Classification

Therapeutic: none assigned
Pharmacologic: hemoglobin S polymerization inhibitors

Indications

Treatment of sickle cell disease.

Action

Binds to hemoglobin S (HgbS) (sickle hemoglobin) and improves affinity of HgbS for oxygen. Through this increased affinity, it inhibits polymerization of HgbS, which inhibits sickling of red blood cells, improves deformability of red blood cells, and reduces viscosity of whole blood. **Therapeutic Effects:** Increase in Hgb of more than 1 g/dL compared to baseline.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Absorption increased with high-fat, high-calorie meal.
Distribution: Primarily distributed into red blood cells.
Protein Binding: 99.8%.
Metabolism and Excretion: Primarily metabolized in liver via CYP3A4 isoenzyme (also undergoes minor metabolism by CYP2C19, CYP2B6, and CYP2C9 isoenzymes); also undergoes glucuronidation. Primarily excreted in feces (33% as unchanged drug), with 35% excreted in urine (mostly as metabolites).
Half-life: 35.5 hr.

TIME/ACTION PROFILE (whole blood concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6–18 hr	unknown

Contraindications/Precautions

Contraindicated in: Serious hypersensitivity; Lactation: Lactation.
Use Cautiously in: Severe hepatic impairment (↓ dose); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risks; Pedi: Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

Derm: rash. **GI:** abdominal pain, diarrhea, nausea. **Neuro:** headache. **Misc:** fatigue, fever, hypersensitivity reactions.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **ketoconazole**, may ↑ levels and risk of toxicity; avoid concurrent use. If concurrent use unavoidable, ↓ voxelotor dosage. **Fluconazole** may ↑ levels and risk of toxicity; avoid concurrent use. If concurrent use unavoidable, ↓ voxelotor dosage. **Strong CYP3A4 inducers**, including **rifampin**, or **moderate CYP3A4 inducers**, including **efavirenz**, may ↓ levels and efficacy; avoid concurrent use. If concurrent use unavoidable, ↑ voxelotor dosage. May ↑ levels and risk of toxicity of **CYP3A4 substrates** with narrow therapeutic index, including **midazolam**; avoid concurrent use. If concurrent use unavoidable, ↓ dosage of CYP3A4 substrate.

Route/Dosage

PO (Adults and Children ≥12 yr): 1500 mg once daily. *Concurrent use of strong CYP3A4 inhibitors or fluconazole*— 1000 mg once daily. *Concurrent use of strong or moderate CYP3A4 inducers*— 2500 mg once daily.

Hepatic Impairment

PO (Adults and Children ≥12 yr): *Severe hepatic impairment (Child-Pugh C)*— 1000 mg once daily.

Availability

Tablets: 500 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of hypersensitivity reaction (rash, urticaria, mild shortness of breath, mild facial swelling, eosinophilia) during therapy. If symptoms occur, treat symptoms and discontinue therapy; do not restart therapy.
- ***Lab Test Considerations:*** May interfere with measurement of Hgb subtypes (HgbA, HgbS, and HgbF) by high-performance liquid chromatography (HPLC). If precise quantitation of Hgb species is required, perform chromatography when the patient is not receiving voxelotor therapy.

Implementation

- **PO:** Administer once daily without regard to food. ***DNC:*** Swallow tablets whole; do not cut, crush, or chew.

Patient/Family Teaching

- Instruct patient to take as directed. If a dose is missed, omit and continue with dosing on the next day. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if signs and symptoms of hypersensitivity reactions (rash, hives, shortness of breath, swelling of face) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during and for at least 2 wk after last dose.

Evaluation/Desired Outcomes

- Increase in Hgb of more than 1 g/dL compared to baseline.

V

© F.A. Davis Publishing

© F.A. Davis Publishing

HIGH ALERT

warfarin (war-fa-rin)

~~Coumadin~~, Jantoven

Classification

Therapeutic: anticoagulants
Pharmacologic: coumarins

Indications

Prophylaxis and treatment of: Venous thrombosis, Pulmonary embolism, Atrial fibrillation with embolization. Management of myocardial infarction: Decreases risk of death, Decreases risk of subsequent MI, Decreases risk of future thromboembolic events. Prevention of thrombus formation and embolization after prosthetic valve placement.

Action

Interferes with hepatic synthesis of vitamin K-dependent clotting factors (II, VII, IX, and X). **Therapeutic Effects:** Prevention of thromboembolic events.

Pharmacokinetics

Absorption: Well absorbed from the GI tract after oral administration.
Distribution: Crosses the placenta but does not enter breast milk.
Protein Binding: 99%.
Metabolism and Excretion: Primarily metabolized by the liver via the CYP2C9 isoenzyme, with some metabolism via the CYP3A4 isoenzyme; the CYP2C9 isoenzyme exhibits genetic polymorphism (intermediate or poor metabolizers may have significantly ↑ (S)-warfarin concentrations and an ↑ risk of adverse reactions).
Half-life: 42 hr.

TIME/ACTION PROFILE (effects on coagulation tests)

ROUTE	ONSET	PEAK	DURATION
PO	36–72 hr	5–7 days†	2–5 days‡

†At a constant dose
‡After discontinuation

Contraindications/Precautions

Contraindicated in: Uncontrolled bleeding; Open wounds; Active ulcer disease; Recent brain, eye, or spinal cord injury or surgery; Severe liver or kidney disease; Uncontrolled hypertension; OB: Pregnancy (may cause fetal harm).
Use Cautiously in: Malignancy; Patients with history of ulcer, liver disease, or acute kidney injury; History of poor compliance; Asian patients or those who carry the CYP2C9*2 allele and/or the CYP2C9*3 allele, or with the VKORC1 AA genotype (↑ risk of bleeding with standard dosing; lower initial doses should be considered); Rep: Women of reproductive potential; Pedi: Has been used safely in children, but may require more frequent PT/INR assessments; Geri: Due to greater than expected anticoagulant response, initiate and maintain at lower doses in older adults.

Adverse Reactions/Side Effects

Derm: dermal necrosis. **GI:** cramps, nausea. **GU:** CALCIPHYLAXIS. **Hemat:** BLEEDING. **Misc:** fever.

Interactions

Drug-Drug: Androgens, **capecitabine**, **cefotetan**, **chloramphenicol**, **clopidogrel**, **disulfiram**, **fluconazole**, **fluoroquinolones**, **itraconazole**, **metronidazole** (including vaginal use), **thrombolytics**, **eptifibatide**, **tirofiban**, **sulfonamides**, **quinidine**, **quinine**, **NSAIDs**, **valproates**, and **aspirin** may ↑ the response to warfarin and ↑ the risk of bleeding. Chronic use of **acetaminophen** may ↑ the risk of bleeding. Chronic **alcohol** ingestion may ↓ action of warfarin; if chronic **alcohol** abuse results in significant liver damage, action of warfarin may be ↑ due to ↓ production of clotting factor. Acute **alcohol** ingestion may ↑ action of warfarin. **Barbiturates**, **carbamazepine**, **rifampin**, and **hormonal contraceptives containing estrogen** may ↓ the anticoagulant response to warfarin. **Many other drugs** may affect the activity of warfarin.
Drug-Natural Products: St. John's wort ↓ effect. ↑ bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **dong quai**, **fenugreek**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, **licorice**, and others.
Drug-Food: Ingestion of large quantities of **foods high in vitamin K content** (see list in Appendix J) may antagonize the anticoagulant effect of warfarin.

Route/Dosage

PO (Adults): 2–5 mg/day for 2–4 days; then adjust daily dose by results of INR. Initiate therapy with lower doses in geriatric or debilitated patients or in Asian patients or those with CYP2C9*2 and/or CYP2C9*3 alleles or VKORC1 AA genotype.
PO (Children >1 mo): *Initial loading dose*—0.2 mg/kg (maximum dose: 10 mg) for 2–4 days then adjust daily dose by results of INR, use 0.1 mg/kg if liver dysfunction is present. *Maintenance dose range*—0.05–0.34 mg/kg/day.

Availability (generic available)

Tablets: 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg, 10 mg. **Cost:** *Generic*—1 mg $10.83/100, 2 mg $10.83/100, 2.5 mg $10.83/100, 3 mg $10.83/100, 4 mg $10.83/100, 5 mg $8.52/100, 6 mg $10.64/100, 7.5 mg $10.83/100, 10 mg $10.83/100.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; tarry, black stools; hematuria; fall in hematocrit or BP; guaiac-positive stools, urine, or nasogastric aspirate).
- Assess for evidence of additional or increased thrombosis. Symptoms depend on area of involvement.
- ***Lab Test Considerations:*** Monitor PT, INR, and other clotting factors frequently during therapy; monitor more frequently in patients with renal impairment. Therapeutic PT ranges 1.3–1.5 times greater than control; however, the INR, a standardized system that provides a common basis for communicating and interpreting PT results, is usually referenced. Normal INR (not on anticoagulants) is 0.8–1.2. An INR of 2.5–3.5 is recommended for patients at very high risk of embolization (for example, patients with mitral valve replacement and ventricular hypertrophy). Lower levels are acceptable when risk is lower. Heparin may affect the PT/INR; draw blood for PT/INR in patients receiving both heparin and warfarin at least 5 hr after the IV bolus dose, 4 hr after cessation of IV infusion, or 24 hr after subcut heparin injection. Asian patients and those who carry the CYP2C9*2 allele and/or the CYP2C9*3 allele, or those with VKORC1 AA genotype may require more frequent monitoring and lower doses.
- Geri: Patients over 60 yr exhibit greater than expected PT/INR response. Monitor for side effects at lower therapeutic ranges.
- Pedi: Achieving and maintaining therapeutic PT/INR ranges may be more difficult in pediatric patients. Assess PT/INR levels more frequently.
- Monitor hepatic function and CBC before and periodically throughout therapy.
- Monitor stool and urine for occult blood before and periodically during therapy.
- ***Toxicity and Overdose:*** Withholding 1 or more doses of warfarin is usually sufficient if INR is excessively elevated or if minor bleeding occurs. If overdose occurs or anticoagulation needs to be immediately reversed, the antidote is vitamin K (phytonadione, Aquamephyton). Administration of whole blood or plasma also may be required in severe bleeding because of the delayed onset of vitamin K.

Implementation

- ***High Alert:*** Do not confuse Coumadin (warfarin) with Avandia (rosiglitazone) or Cardura (doxazosin). Do not confuse Jantoven (warfarin) with Janumet (sitagliptin/metformin) or Januvia (sitagliptin).
- Because of the large number of medications capable of significantly altering warfarin's effects, careful monitoring is recommended when new agents are started or other agents are discontinued. Interactive potential should be evaluated for all new medications (Rx, OTC, and herbal products).
- **PO:** Administer medication at same time each day. Medication requires 3–5 days to reach effective levels; usually begun while patient is still on heparin.
- Do not interchange brands; potencies may not be equivalent.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered that day; do not double doses. Inform health care professional of missed doses at time of checkup or lab tests. Inform patients that anticoagulant effect may persist for 2–5 days following discontinuation. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Review foods high in vitamin K (see Appendix J). Patient should have consistent limited intake of these foods, as vitamin K is the antidote for warfarin, and alternating intake of these foods will cause PT levels to fluctuate. Advise patient to avoid cranberry juice or products during therapy.
- Caution patient to avoid IM injections and activities leading to injury. Instruct patient to use a soft toothbrush, not to floss, and to shave with an electric razor during warfarin therapy. Advise patient that venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation.
- Advise patient to report any symptoms of unusual bleeding or bruising (bleeding gums; nosebleed; black, tarry stools; hematuria; excessive menstrual flow) and pain, color, or temperature change to any area of your body to health care professional immediately. Patients with a deficiency in protein C and/or S mediated anticoagulant response may be at greater risk for tissue necrosis.
- Instruct patient not to drink alcohol or take other Rx, OTC, or herbal products, especially those containing aspirin or NSAIDs, or to start or stop any new medications during warfarin therapy without advice of health care professional.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 1 month after last dose. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient to carry identification describing medication regimen at all times and to inform all health care personnel caring for patient on anticoagulant therapy before lab tests, treatment, or surgery.
- Emphasize the importance of frequent lab tests to monitor coagulation factors.

Evaluation/Desired Outcomes

- Prolonged PT (1.3–2.0 times the control; may vary with indication) or INR of 2–4.5 without signs of hemorrhage.

© F.A. Davis Publishing

zaleplon (za-lep-lon)
Sonata

Classification
Therapeutic: sedative/hypnotics

Schedule IV

Indications
Short-term management of insomnia in patients unable to get at least 4 hr of sleep; especially useful in sleep initiation disorders.

Action
Produces CNS depression by binding to GABA receptors in the CNS. Has no analgesic properties. **Therapeutic Effects:** Induction of sleep.

Pharmacokinetics
Absorption: Rapidly absorbed following oral administration.
Distribution: Enters breast milk.
Metabolism and Excretion: Extensively metabolized in the liver (mostly by aldehyde oxidase and some by CYP 450 3A4 enzymes).
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	within min	unknown	3–4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; History of experiencing complex sleep behaviors with zaleplon; Severe hepatic impairment; OB, Lactation: Pregnancy or lactation.
Use Cautiously in: Mild to moderate hepatic impairment, weight ≤50 kg, or concurrent cimetidine therapy (initiate therapy at lowest dose); Impaired respiratory function; History of suicide attempt; Pedi: Safety not established; Geri: ↑ risk of cognitive impairment and falls. Initial dose ↓ recommended.

Adverse Reactions/Side Effects
CV: peripheral edema. **Derm:** photosensitivity. **EENT:** abnormal vision, ear pain, epistaxis, hearing sensitivity, ocular pain, altered sense of smell. **GI:** abdominal pain, anorexia, colitis, dyspepsia, nausea. **GU:** dysmenorrhea. **Neuro:** hyperesthesia, paresthesia, tremor, COMPLEX SLEEP BEHAVIORS (including sleep driving, sleep walking, or engaging in other activities while sleeping), abnormal thinking, amnesia, anxiety, behavior changes, depersonalization, dizziness, drowsiness, hallucinations, headache, impaired memory (briefly following dose), impaired psychomotor function (briefly following dose), malaise, nightmares, vertigo, weakness. **Misc:** fever.

Interactions
Drug-Drug: Cimetidine ↓ metabolism and ↑ effects (initiate therapy at a lower dose). Additive CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioid analgesics**, other **sedative/hypnotics**, **phenothiazines**, and **tricyclic antidepressants**. Effects may be ↓ by drugs that induce the CYP 450 3A4 enzyme system including **rifampin**, **phenytoin**, **carbamazepine**, and **phenobarbital**.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.
Drug-Food: Concurrent ingestion of a **high-fat meal** slows the rate of absorption.

Route/Dosage
PO (Adults <65 yr): 10 mg (range 5–20 mg) at bedtime.
PO (Geriatric Patients or Patients <50 kg): Initiate therapy at 5 mg at bedtime (not to exceed 10 mg at bedtime).

Hepatic Impairment
PO (Adults): Initiate therapy at 5 mg at bedtime (not to exceed 10 mg at bedtime).

Availability (generic available)
Capsules: 5 mg, 10 mg.

NURSING IMPLICATIONS
Assessment
- Assess mental status, sleep patterns, and potential for abuse prior to administering this medication. Zaleplon is used to treat short-term difficulty in falling asleep; decreases time to sleep onset. May not increase total sleep time or decrease number of wakenings after falling asleep. Prolonged use of >7–10 days may lead to physical and psychological dependence. Limit amount of drug available to the patient.
- Assess alertness at time of peak effect. Notify health care professional if desired sedation does not occur.
- Assess patient for pain. Medicate as needed. Untreated pain decreases sedative effects.

Implementation
- Do not confuse Sonata with Soriatane.
- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.
- Protect patient from injury. Supervise ambulation and transfer of patients after administration. Remove cigarettes. Side rails should be raised and call bell within reach at all times.
- **PO:** Tablets should be swallowed whole with full glass of water immediately before bedtime or after going to bed and experiencing difficulty falling asleep. Do not administer with or immediately after a high-fat or heavy meal.

Z

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take zaleplon as directed. Do not take more than the amount prescribed because of the habit-forming potential. Not recommended for use longer than 7–10 days. Rebound insomnia (1–2 nights) may occur when stopped. If used for 2 wk or longer, abrupt withdrawal may result in dysphoria, insomnia, abdominal or muscle cramps, vomiting, sweating, tremors, and seizures.
- Because of rapid onset, advise patient to go to bed immediately after taking zaleplon.
- May cause daytime drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to this medication is known.
- Inform patient that amnesia may occur, but can be avoided if zaleplon is only taken when patient is able to get >4 hr sleep.
- Caution patient that complex sleep-related behaviors (sleep-driving, making phone calls, preparing and eating food, having sex, sleep walking) may occur while asleep. Inform patient to notify health care professional if sleep-related behaviors (may include sleep-driving—driving while not fully awake after ingestion of a sedative-hypnotic product, with no memory of the event) occur.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Improved ability to fall asleep; decreased time to sleep onset.

zidovudine (zye-doe-vue-deen)

Retrovir

Classification

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors

Indications

HIV infection (in combination with other antiretrovirals). Reduction of maternal/fetal transmission of HIV.

Unlabeled Use: Chemoprophylaxis after occupational exposure to HIV.

Action

Following intracellular conversion to its active form, inhibits viral RNA synthesis by inhibiting the enzyme DNA polymerase (reverse transcriptase). Prevents viral replication. **Therapeutic Effects:** Virustatic action against selected retroviruses. Slowed progression and decreased sequelae of HIV infection. Decreased viral load and improved CD4 cell counts. Decreased transmission of HIV to infants born to HIV-infected mothers.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Widely distributed; enters the CNS. Crosses the placenta.

Metabolism and Excretion: Mostly (75%) metabolized by the liver; 15–20% excreted unchanged by the kidneys.

Half-life: 1 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.5–1.5 hr	4 hr
IV	rapid	end of infusion	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Lactation: Breast feeding not recommended in mothers with HIV.

Use Cautiously in: ↓ bone marrow reserve (dose ↓ required for anemia or granulocytopenia); Women and obese patients (↑ risk of lactic acidosis and severe hepatomegaly); Severe hepatic or renal disease (dose modification may be required); Latex allergy (IV only); Geri: Select dose carefully due to potential for age-related ↓ in hepatic, renal, or cardiac function.

Adverse Reactions/Side Effects

Derm: nail pigmentation. **Endo:** gynecomastia, lipoatrophy. **F and E:** LACTIC ACIDOSIS. **GI:** HEPATOMEGALY (with steatosis), PANCREATITIS, abdominal pain, diarrhea, nausea, anorexia, dyspepsia, oral mucosa pigmentation, vomiting. **Hemat:** anemia, granulocytopenia, pure red-cell aplasia, thrombocytosis. **MS:** back pain, myopathy. **Neuro:** tremor, SEIZURES, headache, weakness, anxiety, confusion, ↓ mental acuity, dizziness, insomnia, mental depression, restlessness, syncope. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: ↑ bone marrow depression with other **agents having bone marrow–depressing properties**, **antineoplastics**, **radiation therapy**, or **ganciclovir**. ↑ neurotoxicity may occur with **acyclovir**. Toxicity may be ↑ by concurrent administration of **probenecid** or **fluconazole**. Levels are ↓ by **clarithromycin**.

Route/Dosage

Management of HIV Infection

PO (Adults): 100 mg every 4 hr while awake or 200 mg 3 times daily or 300 mg twice daily (depends on combination and clinical situation).

PO (Children 4 wk–<18 yr): *4–8.9 kg*—12 mg/kg twice daily or 8 mg/kg 3 times daily; *9–29.9 kg*—9 mg/kg twice daily or 6 mg/kg 3 times daily; ≥*30 kg*—300 mg twice daily or 200 mg 3 times daily.

IV (Adults and Children >12 yr): 1 mg/kg every 4 hr. Change to oral therapy as soon as possible.

© F.A. Davis Publishing

IV (Children): 120 mg/m² every 6 hr (not to exceed 160 mg/dose) or 20 mg/m²/hr as a continuous infusion.

Prevention of Maternal/Fetal Transmission of HIV Infection

PO (Adults >14 wk Pregnant): 100 mg 5 times daily until onset of labor.
IV (Adults during Labor and Delivery): 2 mg/kg over 1 hr, then continuous infusion of 1 mg/kg/hr until umbilical cord is clamped.
PO (Neonates): 2 mg/kg every 6 hr until 6 wk of age.
IV (Neonates): 1.5 mg/kg every 6 hr until 6 wk of age.

Availability (generic available)

Capsules: 100 mg. **Oral solution:** 50 mg/5 mL. **Solution for injection:** 10 mg/mL. **Tablets:** 300 mg. ***In combination with:*** lamivudine (Combivir); abacavir and lamivudine (Trizivir); see Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of symptoms of HIV and for symptoms of opportunistic infections during therapy.
- ***Lab Test Considerations:*** Monitor viral load and CD4 counts prior to and periodically during therapy.
- Monitor CBC every 2 wk during the first 8 wk of therapy in patients with advanced HIV disease, and decrease to every 4 wk after the first 2 mo if zidovudine is well tolerated or monthly during the first 3 mo and every 3 mo thereafter unless indicated in patients who are asymptomatic or have early symptoms. Commonly causes granulocytopenia and anemia. Anemia may occur 2–4 wk after initiation of therapy. Anemia may respond to epoetin administration (see epoetin monograph). Granulocytopenia usually occurs after 6–8 wk of therapy. Consider dose reduction, discontinuation of therapy, or blood transfusions if hemoglobin <7.5 g/dL or reduction of >25% from baseline and/or granulocyte count <750/mm³ or reduction of >50% from baseline. Therapy may be gradually resumed when bone marrow recovery is evident.
- May cause ↑ serum AST, ALT, and alkaline phosphatase levels. Lactic acidosis may occur with hepatic toxicity, causing hepatic steatosis; may be fatal, especially in women.
- Monitor serum amylase, lipase, and triglycerides periodically during therapy. Elevated serum levels may indicate pancreatitis and require discontinuation.

Implementation

- Do not confuse Retrovir (zidovudine) with ritonavir.
- **PO:** Administer doses around the clock.
- For neonates, use a syringe with 0.1-mL graduations to ensure accurate dosing of the syrup.
- **IV:** Patient should receive the IV infusion only until oral therapy can be administered.

IV Administration

- **Intermittent Infusion:** *Retrovir* vial stoppers contain latex; may cause allergic reactions in latex-sensitive individuals. ***Dilution:*** Remove calculated dose from the vial and dilute with D5W or 0.9% NaCl. Do not use solutions that are discolored. Stable for 24 hr at room temperature or 48 hr if refrigerated. ***Concentration:*** Not to exceed 4 mg/mL. ***Rate:*** Infuse at a constant rate over 1 hr or over 30 min in neonates. Avoid rapid infusion or bolus injection.
- **Continuous Infusion:** Has also been administered via continuous infusion.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, allopurinol, amifostine, amikacin, aminocaproic acid, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, azithromycin, aztreonam, bivalirudin, bleomycin, carboplatin, carmustine, caspofungin, cefepime, ceftazidime, ceftriaxone, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, diltiazem, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, epirubicin, eptifibatide, ertapenem, erythromycin lactobionate, etoposide, etoposide phosphate, fenoldopam, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gemcitabine, gentamicin, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, leucovorin calcium, levofloxacin, linezolid, lorazepam, melphalan, meperidine, meropenem, mesna, methadone, methotrexate, metoclopramide, metronidazole, milrinone, mitoxantrone, morphine, mycophenolate, nafcillin, nicardipine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, quinapristin/dalfopristin, remifentanil, rituxumab, rocuronium, sargramostim, sodium acetate, tacrolimus, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** dexrazoxane, gentuzumab ozogamicin.
- **Additive Incompatibility:** blood products or protein solutions, dexrazoxane.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take zidovudine as directed, around the clock, even if sleep is interrupted. Emphasize the importance of compliance with therapy, not taking more than prescribed amount, and not discontinuing without consulting health care professional. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Inform patient that long-term effects of zidovudine are unknown at this time.
- Instruct patient that zidovudine should not be shared with others.
- Zidovudine may cause dizziness or fainting. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient that zidovudine does not cure HIV and may reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and avoid sharing needles or donating blood to prevent spreading the AIDS virus to others.
- Instruct patient to notify health care professional promptly if signs of pancreatitis (nausea, vomiting, abdominal pain), lactic acidosis (feel very weak or tired; feel cold, especially in arms and legs; unusual muscle pain; feel dizzy or lightheaded; trouble breathing; fast or irregular heartbeat; stomach pain with nausea and vomiting), liver problems (yellowing of skin or white part of eyes; loss of appetite; nausea; dark or "tea-colored" urine; pain, aching, or tenderness on right side of abdomen; light-colored stools) or immune reconstitution syndrome (signs and symptoms of an infection, *Mycobacterium avium* infection, cytomegalovirus, *Pneumocystis jirovecii* pneumonia, tuberculosis) occur.
- Instruct patient to notify health care professional promptly if fever, sore throat, signs of infection, muscle weakness, or shortness of breath occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush, to use caution when using toothpicks or dental floss, and to have dental work done prior to therapy or deferred until blood counts return to normal.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise patient taking oral contraceptives to use a nonhormonal method of birth control during therapy. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to zidovudine during pregnancy. Enroll patients in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in viral load and increase in CD4 counts in patients with HIV.
- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Reduction of maternal/fetal transmission of HIV.

BEERS

ziprasidone (zi-pra-si-done)

Geodon, Zeldox

Classification

Therapeutic: antipsychotics, mood stabilizers
Pharmacologic: piperazine derivatives

Indications

Schizophrenia; IM form is reserved for control of acutely agitated patients. Treatment of acute manic or mixed episodes associated with bipolar I disorder (oral only). Maintenance treatment of bipolar I disorder (as adjunct to lithium or valproate) (oral only).

Action

Effects probably mediated by antagonism of dopamine type 2 (D2) and serotonin type 2 ($5\text{-}HT_2$). Also antagonizes α_2 adrenergic receptors. **Therapeutic Effects:** Diminished schizophrenic behavior. Reduced symptoms of mania.

Pharmacokinetics

Absorption: 60% absorbed following oral administration; 100% absorbed from IM sites.
Distribution: Unknown.
Protein Binding: 99%; potential for drug interactions due to drug displacement is minimal.
Metabolism and Excretion: 99% metabolized by the liver; <1% excreted unchanged in urine.
Half-life: *PO*—7 hr; *IM*—2–5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	within hrs	1–3 days†	unknown
IM	rapid	60 min	unknown

†Steady state achieved following continuous use.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of QT prolongation (persistent QTc measurements >500 msec), arrhythmias, recent MI or uncompensated heart failure; Concurrent use of other drugs known to prolong the QT interval including quinidine, dofetilide, sotalol, other class Ia and III antiarrhythmics, pimozide, sotalol, thioridazine, chlorpromazine, pentamidine, ar-

© F.A. Davis Publishing

senic trioxide, mefloquine, tacrolimus, droperidol, and moxifloxacin; Hypokalemia or hypomagnesemia.
Use Cautiously in: Concurrent diuretic therapy or diarrhea (may ↑ the risk of hypotension, hypokalemia, or hypomagnesemia); Significant hepatic impairment; History of cardiovascular or cerebrovascular disease; Hypotension, concurrent antihypertensive therapy, dehydration, or hypovolemia (may ↑ risk of orthostatic hypotension); Patients at risk for aspiration pneumonia or falls; History of suicide attempt; OB: Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety not established in children; Geri: Alzheimer's dementia or age >65 yr (may ↑ risk of seizures). Older adults may require ↓ doses; ↑ risk of mortality, stroke, and transient ischemic attack in elderly patients treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CV: orthostatic hypotension, QT interval prolongation. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), rash, urticaria. **Endo:** galactorrhea, hyperglycemia, hyperlipidemia, weight gain. **GI:** constipation, diarrhea, nausea, dysphagia. **GU:** amenorrhea, impotence. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, seizures, dizziness, drowsiness, restlessness, extrapyramidal reactions, syncope, tardive dyskinesia. **Resp:** cough, rhinorrhea.

Interactions

Drug-Drug: Concurrent use of **quinidine**, **dofetilide**, **other class Ia and III antiarrhythmics**, **pimozide**, **sotalol**, **thioridazine**, **chlorpromazine**, **pentamidine**, **arsenic trioxide**, **mefloquine**, **tacrolimus**, **droperidol**, **moxifloxacin**, or other agents that prolong the QT interval may result in potentially life-threatening adverse drug reactions (concurrent use contraindicated). Additive CNS depression may occur with **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, or **sedative/hypnotics**. Blood levels and effectiveness may be ↓ by **carbamazepine**. Blood levels and effects may be ↑ by **ketoconazole**.

Route/Dosage

Schizophrenia

PO (Adults): 20 mg twice daily initially; dose increments may be made at 2-day intervals up to 80 mg twice daily.
IM (Adults): 10–20 mg as needed up to 40 mg/day; may be given as 10 mg every 2 hr or 20 mg every 4 hr.

Acute Manic or Mixed Episodes Associated with Bipolar I Disorder

PO (Adults): 40 mg twice on first day, then 60 or 80 mg twice daily on 2nd day, then 40–80 mg twice daily.

Maintenance Treatment of Bipolar I Disorder (as adjunct to lithium or valproate)

PO (Adults): Continue same dose on which patient was initially stabilized (range: 40–80 mg twice daily).

Availability (generic available)

Capsules: 20 mg, 40 mg, 60 mg, 80 mg. **Cost:** *Generic*— 20 mg $380.02/180, 40 mg $544.16/180, 60 mg $451.99/180, 80 mg $451.99/180. **Lyophilized powder for injection:** 20 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess weight and BMI initially and periodically during therapy.
- Monitor BP (sitting, standing, lying) and pulse rate prior to and frequently during initial dose titration. Patients found to have persistent QTc measurements of >500 msec should have ziprasidone discontinued. Patients who experience dizziness, palpitations, or syncope may require further evaluation (i.e., Holter monitoring).
- Assess for rash during therapy. May be treated with antihistamines or corticosteroids. Usually resolves upon discontinuation of ziprasidone. Medication should be discontinued if no alternative etiology for rash is found. May cause SJS or DRESS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Observe carefully when administering medication to ensure medication is actually taken and not hoarded or cheeked.
- Monitor for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*— difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors and dystonic muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Notify health care professional if these symptoms occur, as reduction in dose or discontinuation of medication may be necessary. Trihexyphenidyl or benztropine may be used to control these symptoms.
- Although not yet reported for ziprasidone, monitor for possible tardive dyskinesia (uncontrolled rhyth-

© F.A. Davis Publishing

mic movement of mouth, face, and extremities, lip smacking or puckering, puffing of cheeks, uncontrolled chewing, rapid or worm-like movements of tongue). Report these symptoms immediately; may be irreversible.
- Monitor frequency and consistency of bowel movements. Increasing bulk and fluids in the diet may help to minimize constipation.
- Ziprasidone lowers the seizure threshold. Institute seizure precautions for patients with history of seizure disorder.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- ***Lab Test Considerations:*** Monitor serum potassium and magnesium prior to and periodically during therapy. Patients with low potassium or magnesium should have levels treated and checked prior to resuming therapy. Obtain fasting blood glucose and cholesterol levels initially and periodically during therapy.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Implementation

- Dose adjustments should be made at intervals of no less than 2 days. Usually patients should be observed for several wk before dose titration.
- Patients on parenteral therapy should be converted to oral doses as soon as possible.
- **PO:** Administer capsules with food or milk to decrease gastric irritation. ***DNC:*** Swallow capsules whole; do not open, crush, or chew.
- **IM:** ***Reconstitution:*** Add 1.2 mL of sterile water for injection to the vial; shake vigorously until all drug is dissolved for a concentration of 20 mg/mL. Discard unused portion. Do not mix with other products or solutions. Do not administer solutions that are discolored or contain particulate matter.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day. Do not discontinue medication without discussing with health care professional, even if feeling well. Patients on long-term therapy may need to discontinue gradually.
- Inform patient of possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- May cause seizures and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional promptly if dizziness, loss of consciousness, palpitations, menstrual abnormalities, galactorrhea, or sexual dysfunction occur.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding during therapy. Monitor neonates exposed to ziprasidone during third trimester for extrapyramidal and/or withdrawal symptoms. Some neonates recovered within hours or days without specific treatment; others required prolonged hospitalization. Monitor infants exposed through breastmilk for excess sedation, irritability, poor feeding, and extrapyramidal symptoms (tremors and abnormal muscle movements). May impair fertility in females. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to atypical antipsychotics. Register patients by contacting the National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or online at http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/.
- Advise patient of need for continued medical follow-up for psychotherapy, eye exams, and laboratory tests.

Evaluation/Desired Outcomes

- Decrease in acute excited, manic behavior.
- Decrease in positive (delusions, hallucinations) and negative symptoms (social withdrawal, flat, blunted affect) of schizophrenia.
- Management of signs and symptoms of Bipolar I Disorder.

zoledronic acid

(zoe-led-**dron**-ic **as**-id)

Aclasta, Reclast, Zometa

Classification

Therapeutic: bone resorption inhibitors, electrolyte modifiers, hypocalcemics

Pharmacologic: biphosphonates

© F.A. Davis Publishing

Indications
Hypercalcemia of malignancy (Zometa only). Multiple myeloma and metastatic bone lesions from solid tumors (Zometa only). Paget's disease (Reclast only). Treatment of osteoporosis in men (Reclast only). Treatment and prevention of osteoporosis in postmenopausal women (Reclast only). Treatment and prevention of glucocorticoid-induced osteoporosis in patients expected to be on glucocorticoids for at least 12 mo (Reclast only).

Action
Inhibits bone resorption. Inhibits increased osteoclast activity and skeletal calcium release induced by tumors.
Therapeutic Effects: Decreased serum calcium. Decreased serum alkaline phosphatase. Decreased fractures, radiation/surgery to bone, or spinal cord compression in patients with multiple myeloma or metastatic bone lesions. Decreased hip, vertebral, or non-vertebral osteoporosis-related fractures in postmenopausal women. Increased bone mass in men, postmenopausal women, and patients on prolonged corticosteroid therapy.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Mostly excreted unchanged by the kidneys.
Half-life: 167 hr.

TIME/ACTION PROFILE (effect on serum calcium)

ROUTE	ONSET	PEAK	DURATION
IV	within 4 days	4–7 days	30 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity to zoledronic acid or other bisphosphonates; Severe renal impairment (CCr <35 mL/min) or acute renal failure; Hypocalcemia (correct before administering); adequate supplemental calcium and vitamin D required; OB: Pregnancy (may cause fetal harm).
Use Cautiously in: History of aspirin-induced asthma; Chronic renal impairment; Chronic renal impairment, concurrent use of diuretics or nephrotoxic drugs, or dehydration (↑ risk of renal impairment; correct deficits prior to use); Concurrent use of nephrotoxic drugs; Invasive dental procedures, cancer, receiving chemotherapy, corticosteroids, or angiogenesis inhibitors, undergoing radiation, poor oral hygiene, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (may ↑ risk of jaw osteonecrosis); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Potential for long-term retention in bone in children; use only if potential benefit outweighs potential risk; Geri: ↑ risk of renal impairment in older adults.

Adverse Reactions/Side Effects
CV: hypotension, chest pain, leg edema. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus, rash. **EENT:** conjunctivitis. **F and E:** hypophosphatemia, hypocalcemia, hypokalemia, hypomagnesemia. **GI:** abdominal pain, constipation, diarrhea, nausea, vomiting, dysphagia. **GU:** ↓ fertility (females), renal impairment/failure. **Hemat:** anemia. **MS:** musculoskeletal pain, femur fractures, osteonecrosis (primarily of jaw). **Neuro:** agitation, anxiety, confusion, insomnia. **Resp:** asthma exacerbation. **Misc:** fever, flu-like syndrome.

Interactions
Drug-Drug: Concurrent use of **loop diuretics**, **calcitonin**, or **aminoglycosides** ↑ risk of hypocalcemia. Concurrent use of **NSAIDs** may ↑ risk of nephrotoxicity.

Route/Dosage

Reclast
IV (Adults): *Paget's disease*—5 mg as a single dose (information regarding retreatment unknown); *Treatment of osteoporosis in men or postmenopausal women, treatment/prevention of glucocorticoid-induced osteoporosis*—5 mg once yearly; *Prevention of osteoporosis in postmenopausal women*—5 mg every 2 yr.

Zometa
IV (Adults): *Hypercalcemia of malignancy*—4 mg; may be repeated after 7 days; *Multiple myeloma and bone metastases from solid tumors*—4 mg every 3–4 wk (has been used for up to 15 mo).

Availability (generic available)
Premixed infusion (Reclast): 5 mg/100 mL. **Premixed infusion (Zometa):** 4 mg/100 mL. **Solution for injection (Zometa):** 0.8 mg/mL.

Z

NURSING IMPLICATIONS
Assessment
- Monitor intake and output ratios. Initiate a vigorous saline hydration promptly and maintain a urine output of 2 L/day during therapy. Patients should be adequately hydrated, but avoid overhydration. Do not use diuretics prior to treatment of hypovolemia.
- Assess for acute-phase reaction (fever, myalgia, flu-like symptoms, headache, arthralgia). Usually occur within 3 days of dose and resolve within 3 days of onset, but may take 7–14 days to resolve; incidence decreases with repeat dosing.

© F.A. Davis Publishing

- Perform a routine oral exam prior to initiation of therapy. Dental exam with appropriate preventative dentistry should be considered prior to therapy. Patients with history of tooth extraction, poor oral hygiene, gingival infections, diabetes, cancer, receiving radiation, anemia, coagulopathy, or use of a dental appliance or those taking immunosuppressive therapy, angiogenesis inhibitors, or systemic corticosteroids are at greater risk for osteonecrosis of the jaw.
- **Hypercalcemia:** Monitor symptoms of hypercalcemia (nausea, vomiting, anorexia, weakness, constipation, thirst, cardiac arrhythmias).
- Observe for evidence of hypocalcemia (paresthesia, muscle twitching, laryngospasm, Chvostek's or Trousseau's sign).
- **Paget's Disease:** Assess for symptoms of Paget's disease (bone pain, headache, decreased visual and auditory acuity, increased skull size) periodically during therapy.
- **Osteoporosis:** Assess patients via bone density study for low bone mass before and periodically during therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor serum creatinine, calculated based on actual body weight using the Cockcroft-Gault formula, prior to each treatment. Patients with a normal serum creatinine prior to treatment, who develop an increase of 0.5 mg/dL within 2 wk of next dose should have next dose withheld until serum creatinine is within 10% of baseline value. Patients with an abnormal serum creatinine prior to treatment who have an increase of 1.0 mg/dL within 2 wk of next dose should have next dose withheld until serum creatinine is within 10% of baseline value.
- Assess serum calcium, phosphate, and magnesium before and periodically during therapy. If hypocalcemia, hypophosphatemia, or hypomagnesemia occur, temporary supplementation may be required. Hypocalcemia and vitamin D deficiency should be treated before initiating zoledronic acid therapy.
- Monitor CBC with differential and hemoglobin and hematocrit closely during therapy.
- *Paget's Disease:* Monitor serum alkaline phosphatase prior to and periodically during therapy to monitor effectiveness.

Implementation

- Vigorous saline hydration alone may be sufficient to treat mild, asymptomatic hypercalcemia. Adequate rehydration is required prior to administration.
- Patients on long-term therapy should have 1200 mg of oral calcium and 800–1000 units of vitamin D each day.
- Patients treated for *Paget's disease* should receive 1500 mg elemental calcium and 800 IU of vitamin D daily, particularly during the 2 wk after dosing. Patients with osteoporosis should take 1200 mg of calcium and 800–1000 units of vitamin D daily. Patients with multiple myeloma and bone metastasis of solid tumors take an oral calcium supplement of 500 mg and a multiple vitamin containing 400 international units of vitamin D daily.
- Administration of acetaminophen or ibuprofen following administration may reduce the incidence of acute-phase reaction symptoms.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute 4-mg dose further with 100 mL of 0.9% NaCl or D5W. If not used immediately, may be refrigerated for up to 24 hr. *Reclast* comes ready to use 5 mg in 100-mL solution. If refrigerated, allow solution to reach room temperature prior to administration. Do not administer solution that is discolored or contains particulate matter. ***Rate:*** Administer as a single infusion over at least 15 min. Rapid infusions increase risk of renal deterioration and renal failure.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride,

© F.A. Davis Publishing

potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.

- **Y-Site Incompatibility:** alemtuzumab, calcium-containing solutions, dantrolene, diazepam, gemtuzumab ozogamicin, phenytoin. Manufacturer recommends administration as a single infusion in a line separate from all other drugs.
- **Additive Incompatibility:** Do not mix with solutions containing calcium, such as Lactated Ringer's solution.

Patient/Family Teaching

- Explain the purpose of zoledronic acid to patient. Advise patient to read *Medication Guide* prior to each administration in case of changes.
- Advise patients of the importance of adequate hydration. Patient should be instructed to drink at least two glasses of water prior to receiving dose.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to eat a balanced diet and consult health care professional about the need for supplemental calcium and vitamin D.
- Inform patient that severe musculoskeletal pain may occur within days, mo, or yr after starting zoledronic acid. Symptoms may resolve completely after discontinuation or slow or incomplete resolution may occur. Notify health care professional if severe pain occurs.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Advise patient to notify health care professional if signs and symptoms if osteonecrosis of the jaw (pain, numbness, swelling of or drainage from the jaw, mouth, or teeth) or hypocalcemia (spasms, twitches, or cramps in muscles; numbness or tingling in fingers, toes, or around mouth) or thigh, hip, or groin pain occur.
- Advise patient to inform health care professional of zoledronic acid therapy prior to dental surgery.
- Rep: May cause fetal harm. Advise females of reproductive potential use effective contraception and avoid breast feeding during and after therapy. May impair fertility in females.
- Emphasize the importance of lab tests to monitor progress.

Evaluation/Desired Outcomes

- Decrease in serum calcium.
- Decrease in serum alkaline phosphatase and the progression of Paget's disease.
- Reversal of the progression of osteoporosis with decreased fractures and other sequelae. Discontinuation after 3–5 yr should be considered for postmenopausal women with low risk for fractures.

ZOLMitriptan (zole-mi-**trip**-tan)

Zomig, Zomig-ZMT

Classification

Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Indications

Acute treatment of migraine headache.

Action

Acts as an agonist at specific 5-HT_1 receptor sites in intracranial blood vessels and sensory trigeminal nerves.

Therapeutic Effects: Cranial vessel vasoconstriction with resultant decrease in migraine headache.

Pharmacokinetics

Absorption: Well absorbed (40%) following oral and intranasal administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver; some conversion to metabolites that are more active than zolmitriptan. 8% excreted unchanged in urine.

Half-life: 3 hr (for zolmitriptan and active metabolite).

TIME/ACTION PROFILE (relief of headache)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.5 hr*	unknown
Intranasal	unknown	3 hr	unknown

*3 hr for orally disintegrating tablets.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Significant underlying heart disease (including ischemic heart disease, history of MI, coronary artery vasospasm, uncontrolled hypertension); Stroke or transient ischemic attack; Peripheral vascular disease (including, but not limited to ischemic bowel disease); Concurrent (or within 24 hr) use of other 5-HT agonists, ergotamine, or ergot-type medications; Concurrent (or within 2 wk) use of MAO inhibitors; Hemiplegic or basilar migraine; Symptomatic Wolff-Parkinson-White syndrome or other arrhythmias; Moderate-severe hepatic impairment (nasal spray only).

© F.A. Davis Publishing

Use Cautiously in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal females or males >40 yr [use only if cardiovascular status has been evaluated and determined to be safe and 1st dose is administered under supervision]); Hepatic impairment (use lower doses of oral); OB: Safety not established; Lactation: Use while breast feeding only if benefit to patient outweighs potential risk to infant; Pedi: Children <18 yr (safety and effectiveness not established for PO); children <12 yr (safety and effectiveness not established for intranasal).

Adverse Reactions/Side Effects

CV: MI, angina, chest pain/pressure/tightness/heaviness, hypertension, palpitations. **Derm:** sweating, warm/cold sensation. **EENT:** throat pain/tightness/pressure. **GI:** dry mouth, dyspepsia, dysphagia, nausea. **MS:** myalgia, myasthenia. **Neuro:** hypesthesia, paresthesia, dizziness, drowsiness, vertigo, weakness. **Misc:** pain.

Interactions

Drug-Drug: Because of ↑ risk of cerebral vasospasm, avoid concurrent use of other **5-HT agonists** (**naratriptan**, **sumatriptan**, **rizatriptan**) and/or **ergot-type preparations** (**dihydroergotamine**). Concurrent use of **MAO inhibitors** ↑ blood levels and risk of toxicity (avoid use within 2 wk of MAO inhibitors). Blood levels may be ↑ by **hormonal contraceptives**. **Cimetidine** ↑ half-life of zolmitriptan and its active metabolite. ↑ risk of serotonin syndrome with **SSRIs**, **SNRIs**, **TCAs**, **triptans**, **meperidine**, **bupropion**, or **buspirone**; avoid concurrent use.

Drug-Natural Products: ↑ risk of serotinergic side effects including serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): 1.25–2.5 mg initially; if headache returns, dose may be repeated after 2 hr (not to exceed 10 mg/24 hr); *Concurrent cimetidine therapy*—Single dose not to exceed 2.5 mg (not to exceed 5 mg/24 hr).

Hepatic Impairment

PO (Adults): *Moderate-severe hepatic impairment (oral tablets only)*—1.25 mg initially; if headache returns, dose may be repeated after 2 hr (not to exceed 5 mg/24 hr).

Intranasal (Adults and Children ≥12 yr): Single 2.5 mg initially (maximum single dose = 5 mg); may be repeated after 2 hr (not to exceed 10 mg/24 hr); *Concurrent cimetidine therapy*—Single dose not to exceed 2.5 mg (not to exceed 5 mg/24 hr).

Availability (generic available)

Orally disintegrating tablets: 2.5 mg, 5 mg. **Nasal spray:** 2.5 mg/100 mcL unit-dose spray device (package of 6), 5 mg/100 mcL unit-dose spray device (package of 6). **Tablets:** 2.5 mg, 5 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Monitor for serotonin syndrome in patients taking SSRIs or SNRIs concurrently with zolmitriptan.

Implementation

- Do not confuse zolmitriptan with sumatriptan.
- **PO:** Initial dose is 2.5 mg. Lower doses can be achieved by breaking 2.5-mg tablet.
- Orally disintegrating tablets should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on tongue. Do not break orally disintegrating tablet. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.
- **Intranasal:** Remove cap from nasal spray. Hold upright and block one nostril. Tilt head slightly back, insert device into opposite nostril, and depress plunger. May repeat in 2 hr.

Patient/Family Teaching

- Inform patient that zolmitriptan should be used only during a migraine attack. It is meant to be used to relieve migraine attack but not to prevent or reduce the number of attacks.
- Instruct patient to administer zolmitriptan as soon as symptoms appear, but it may be administered any time during an attack. If migraine symptoms return, a 2nd dose may be used. Allow at least 2 hr between doses, and do not use more than 10 mg in any 24-hr period.
- If dose does not relieve headache, additional zolmitriptan doses are not likely to be effective; notify health care professional.
- Advise patient that lying down in a darkened room following zolmitriptan administration may further help relieve headache.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional prior to next dose of zolmitriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately and do not take more zolmitriptan without approval of health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- Advise patient to avoid alcohol, which aggravates headaches, during zolmitriptan use.

© F.A. Davis Publishing

- Advise patient that overuse (use more than 10 days/mo) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of zolmitriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications. Patients concurrently taking SSRI or SNRI antidepressants should notify health care professional promptly if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma; autonomic instability: tachycardia, labile BP, hyperthermia; neuromuscular aberrations: hyper-reflexia, incoordination; and/or gastrointestinal symptoms: nausea, vomiting, diarrhea) occur.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Relief of migraine attack.

BEERS

zolpidem (zole-pi-dem)

Ambien, Ambien CR, Edluar, ~~Intermezzo~~, Sublinox, Zolpimist

Classification

Therapeutic: sedative/hypnotics

Schedule IV

Indications

Insomnia with difficulties in sleep initiation (generic sublingual tablets are indicated for insomnia when a middle-of-the-night awakening is followed by difficulty returning to sleep).

Action

Produces CNS depression by binding to GABA receptors. Has no analgesic properties. **Therapeutic Effects:** Sedation and induction of sleep.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration. Controlled-release formulation releases 10 mg immediately, then another 2.5 mg later.

Distribution: Minimal amounts enter breast milk; remainder of distribution not known.

Metabolism and Excretion: Converted to inactive metabolites, which are excreted by the kidneys; clearance of sublingual tablet lower in women than in men.

Half-life: 2.5–3 hr (↑ in geriatric patients and patients with hepatic impairment).

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK*	DURATION
PO	rapid	30 min–2 hr	6–8 hr
PO-ER	rapid	2–4 hr	6–8 hr
PO-Spray	rapid	unknown	unknown
SL	rapid	unknown	unknown

*Food delays peak levels and effects.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of experiencing complex sleep behaviors with zolpidem; Sleep apnea; Severe hepatic impairment (↑ risk of hepatic encephalopathy).

Use Cautiously in: History of previous psychiatric illness, suicide attempt, drug or alcohol abuse; Mild or moderate hepatic impairment (↑ risk of hepatic encephalopathy; initial dose ↓ recommended); Pulmonary disease; Sleep apnea; Myasthenia gravis; OB: May ↑ risk of respiratory depression in neonates after birth; Lactation: May cause excess sedation in breast-fed infants; use while breast feeding only if potential maternal benefit justifies potential risk in infants; Pedi: Safety and effectiveness not established in children; Geri: Older adults at ↑ risk for falls; initial dose ↓ recommended.

Adverse Reactions/Side Effects

EENT: blurred vision, double vision. **GI:** diarrhea, nausea, vomiting. **Neuro:** COMPLEX SLEEP BEHAVIORS (including sleep driving, sleep walking, or engaging in other activities while sleeping), daytime drowsiness, dizziness, abnormal thinking, agitation, amnesia, behavior changes, hallucinations, prolonged reaction time. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: CNS depression may ↑ with **sedatives/hypnotics**, **alcohol**, **phenothiazines**, **tricyclic antidepressants**, **opioid analgesics**, or **antihistamines**. Concurrent use of **CYP3A4 inducers**, including **rifampin**, may ↓ levels. Concurrent use of **CYP3A4 inhibitors**, including **ketoconazole**, may ↑ levels; consider ↓ zolpidem dose.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. **St. John's wort** may ↓ levels; avoid concurrent use.

Drug-Food: **Food** ↓ and delays absorption.

Route/Dosage

PO, SL (Adults): *Tablets, spray, or SL tablets (Edluar)* — 5 mg (for women) and 5–10 mg (for men) at bedtime; may ↑ to 10 mg at bedtime if 5–mg dose not effective; *SL tablets (generic)* — 1.75 mg (for women) or 3.5 mg (for men) once upon awakening in the middle-of-the-night; *Extended-release tablets* — 6.25 mg

© F.A. Davis Publishing

(for women) and 6.25–12.5 mg (for men) at bedtime; may ↑ to 12.5 mg at bedtime if 6.25–mg dose not effective.

PO, SL (Geriatric Patients, Debilitated Patients, or Patients with Mild/Moderate Hepatic Impairment): *Tablets, spray or SL tablets (Edluar)* — Do not exceed dose of 5 mg at bedtime; *Extended-release tablets* — Do not exceed dose of 6.25 mg at bedtime. **SL (Geriatric Patients, Patients Taking Concomitant CNS Depressants, or Patients with Mild/Moderate Hepatic Impairment):** *SL tablets (generic)* — Do not exceed dose of 1.75 mg at bedtime (in either men or women).

Availability (generic available)

Immediate-release tablets: 5 mg, 10 mg. **Cost:** *Generic* — 5 mg $7.81/30. **Extended-release tablets:** 6.25 mg, 12.5 mg. **Cost:** *Generic* — 6.25 mg $42.14/30, 12.5 mg $37.39/30. **Oral spray (Zolpimist) (cherry-flavor):** 5 mg/spray (60 sprays/container). **Cost:** $79.20/7.7 mL. **Sublingual tablets (Edluar):** 5 mg, 10 mg. **Cost:** All strengths $235.19/30. **Sublingual tablets:** 1.75 mg, 3.5 mg. **Cost:** All strengths $248.46/30.

NURSING IMPLICATIONS

Assessment

- Assess mental status, sleep patterns, and potential for abuse prior to administration. Prolonged use of >7–10 days may lead to physical and psychological dependence. Limit amount of drug available to the patient.
- Assess alertness at time of peak effect. Notify health care professional if desired sedation does not occur.
- Assess patient for pain. Medicate as needed. Untreated pain decreases sedative effects.

Implementation

- ***High Alert:*** Do not confuse zolpidem with Zyloprim (allopurinol).
- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.
- Protect patient from injury. Raise bed side rails. Assist with ambulation. Remove patient's cigarettes.
- Use lowest effective dose.
- **PO:** Swallow tablets whole with full glass of water. For faster onset of sleep, do not administer with or immediately after a meal.
- ***DNC:*** Swallow extended-release tablets whole; do not crush, break, or chew.
- **SL:** To open the blister pack, separate the individual blisters at the perforations. Peel off top layer of paper and push tablet through foil. Place the tablet under the tongue, allow to disintegrate; do not swallow or take with water.
- Only take if at least 4 hr left prior to time to awakening.
- **Oral Spray:** Do not take with or immediately after a meal; may slow effect. Spray is a clear, colorless, and cherry-flavor solution.

Patient/Family Teaching

- Instruct patient to take zolpidem as directed. Take as a single dose and do not readminister during the same night. Advise patient not to take zolpidem unless able to stay in bed a full night (7–8 hr) before being active again. Do not take more than the amount prescribed because of the habit-forming potential. Not recommended for use longer than 7–10 days. If used for 2 wk or longer, abrupt withdrawal may result in fatigue, nausea, flushing, light-headedness, uncontrolled crying, vomiting, GI upset, panic attack, or nervousness. Instruct patient to read *Patient Information* for correct product before taking and with each Rx refill in case of changes.
- Because of rapid onset, advise patient to go to bed immediately after taking zolpidem.
- May cause daytime drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to this medication is known.
- Caution patient that complex sleep-related behaviors (sleep-driving) may occur while asleep.
- Advise patient to notify health care professional immediately if signs of anaphylaxis (swelling of the tongue or throat, trouble breathing, and nausea and vomiting) occur.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Monitor neonates exposed to zolpidem during pregnancy and labor for signs of excess sedation, hypotonia, and respiratory depression.
- **Oral Spray:** To prime, patients should be told to point the black spray opening away from their face and other people and spray 5 times. For administration, hold container upright with the black spray opening pointed directly into the mouth. Press down fully on pump to make sure a full dose (5 mg) is sprayed directly into mouth over tongue. For 10-mg dose, a 2nd spray should be administered. If not used for 14 days, re-prime with 1 spray.

Evaluation/Desired Outcomes

- Relief of insomnia.
- Re-evaluate insomnia after 7–10 days of sublingual tablets.

© F.A. Davis Publishing

Drugs Approved in Canada

These monographs describe medications approved for use in Canada by the Therapeutic Products Directorate, a division of Health Canada's Health Products and Food Branch. The medications are not approved by the United States Food and Drug Administration; however, similar formulations carrying different generic or brand names might be available in the U.S.

alfacalcidol (al-fa-kal-si-dol)

One-Alpha

Classification

Therapeutic: vitamins
Pharmacologic: vitamin D analogues

Indications

Management of hypocalcemia, secondary hyperparathyroidism and osteodystrophy associated with chronic renal failure.

Action

Stimulates intestinal absorption of calcium and phosphorus, reabsorption of calcium from bone and renal reabsorption of calcium. Does not require renal activation. **Therapeutic Effects:** Improved calcium and phosphorus homeostasis in patients with chronic kidney disease.

Pharmacokinetics

Absorption: Completely absorbed following oral administration.
Distribution: Unknown.
Protein Binding: Extensively protein bound.
Metabolism and Excretion: Following absorption, 50% is rapidly converted by liver to active metabolite ($1.25-(OH)_2D$; 13% renally excreted.
Half-life: 3 hr.

TIME/ACTION PROFILE (levels of active metabolite)

ROUTE	ONSET†	PEAK	DURATION‡
PO	6 hr	12 hr	few days–1 wk
IV	unknown	4 hr	few days–1 wk

†Effect on intestinal calcium absorption, bone pain and muscle weakness improve within 2 wk–3 mo.

‡Effect on serum calcium levels following discontinuation.

Contraindications/Precautions

Contraindicated in: Concurrent use of other vitamin D analogs or magnesium-containing antacids; Lactation: Avoid breast feeding.
Use Cautiously in: OB: Potential benefits should be weighed against hazards to fetus and mother; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CNS: headache, drowsiness, weakness. **CV:** ARRHYTHMIAS, hypertension. **EENT:** conjunctivitis, photophobia. **GI:** constipation, nausea, anorexia, dry mouth, metallic taste, pancreatitis, polydipsia, vomiting. **Derm:** pruritus. **F and E:** HYPERCALCEMIA, hyperphosphatemia, hyperthermia, ↑ thirst. **GU:** albuminuria, hypercalcuria, ↓ libido, nocturia, polyuria. **Metab:** ectopic calcification, hypercholesterolemia, hyperthermia. **MS:** bone pain, muscle pain.

Interactions

Drug-Drug: Hypercalcemia ↑ risk of toxicity from **digoxin**. ↑ risk of toxicity and adverse reactions with concurrent use of other **vitamin D analogs**. Concurrent use of **bile acid sequestrants**, including **cholestyramine**, or **mineral oil** ↓ absorption and effectiveness. Concurrent use of **barbiturates** and other **anticonvulsants** may ↓ effectiveness; larger doses of alfacalcidol may be required.

Route/Dosage

PO (Adults): *Pre-dialysis patients*— 0.25 mcg/day for 2 mo initially, if necessary dose increments of 0.25 mg/day may be made at 2 mo intervals (usual range 0.5–1.0 mcg/day); *dialysis patients*— 1 mcg/day, if necessary dose increments of 0.5 mcg/day may be made at 2–4 wk intervals (usual range 1–2 mcg/day, up to 3 mcg/day). When normalization occurs, dose should be ↓ to minimum amount required to maintain normal serum calcium levels.
IV (Adults): *Dialysis patients*— 1 mcg during each dialysis session (2–3 times weekly), if necessary dose may be ↑ weekly by 1 mcg per dialysis session up to 12 mcg/wk (range 1.5–12 mcg/wk). When normalization occurs, dose should be ↓ to minimum amount required to maintain normal serum calcium levels.

Availability

Soft gel capsules: 0.25 mcg, 1 mcg; Oral drops: 2 mcg/mL; Solution for injection (contains ethanol and propylene glycol): 2 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of vitamin D deficiency prior to and during treatment.
- Assess for bone pain and weakness during therapy; usually decreases within 2 wk to 3 mo.
- ***Lab Test Considerations:*** *For pre-dialysis patients:* Monitor serum calcium and phosphate levels monthly and electrolytes periodically during treatment. *For dialysis patients:* Monitor serum calcium at least twice weekly during dose titration. If hypercalcemia occurs decrease dose of alfacalcidol by

© F.A. Davis Publishing

50% and stop all calcium supplements until calcium levels return to normal. May cause ↑ plasma phosphorous levels. Maintain serum phosphate levels <2.0 mmol/L. Monitor inorganic phosphorus, magnesium, alkaline phosphatase, creatinine, BUN, 24-hr urinary calcium and protein as needed.

- ***Toxicity and Overdose:*** Toxicity is manifested as hypercalcemia, hypercalciuria, and hyperphosphatemia. Assess for appearance of nausea, vomiting, anorexia, weakness, constipation, headache, bone pain, and metallic taste. Later symptoms include polyuria, polydipsia, photophobia, rhinorrhea, pruritus, and cardiac arrhythmias. Notify health care professional immediately if these signs of hypervitaminosis D occur. Treatment usually consists of discontinuation of alfacalcidol, a low-calcium diet, stopping calcium supplements. Persistent or markedly elevated serum calcium levels in hemodialysis patients may be corrected by dialysis against a calcium-free dialysate.

Implementation

- **PO:** Administer with food. Use calibrated dropper with oral for accurate dose. Oral solution may be mixed with water or milk.
- **IV:** Administer IV during hemodialysis. Shake well before use. Keep refrigerated. Single use vials; discard unused portion.

Patient/Family Teaching

- Advise patient to take medication as directed. Do not stop taking without consulting with health care professional.
- Advise patient and family to notify health care professional if signs and symptoms of hypercalcemia occur.
- Review diet modifications with patient. See Appendix J for foods high in calcium and vitamin D. Renal patients must still consider renal failure diet in food selection. Health care professional may order concurrent calcium supplement.
- Encourage patient to comply with dietary recommendations. Explain that best source of vitamins is a well-balanced diet with foods from all 4 basic food groups, and sunlight exposure for vitamin D.
- Advise patient to avoid concurrent use of antacids containing magnesium during therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to evaluate progress.

Evaluation

- Improved levels of calcium and phosphorous in patients with kidney disease.

bezafibrate (bezz-uh-**fibe**-rate)

Bezalip SR

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

Indications

Use in conjunction with diet and other modalities in the treatment of hypercholesterolemia (Type IIa and IIb mixed hyperlipidemia, to decrease serum TG, LDL cholesterol and apolipoprotein B and increase HDL cholesterol, and apolipoprotein A). Treatment of adults with hypertriglyceridemia (Type IV and V hyperlipidemias) at risk pancreatitis and other sequelae.

Action

Inhibits triglyceride synthesis. **Therapeutic Effects:** Lowered cholesterol and triglycerides, increased HDL, with decreased risk of pancreatitis and other sequelae.

Pharmacokinetics

Absorption: Well absorbed (100%) following oral administration.
Distribution: Unknown.
Metabolism and Excretion: 50% metabolized, 50% excreted unchanged in urine, remainder as metabolites. 3% excreted in feces.
Half-life: 1–2 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity/photosensitivity to bezafibrate or other fibric acid or fibrate derivatives; Severe hepatic or renal impairment (CCr <60 mL/min), primary biliary cirrhosis, gallstone or gallbladder disease or hypoalbuminemia; OB: Avoid use during pregnancy (discontinue several mo prior to conception); Lactation: Discontinue breast feeding.
Use Cautiously in: History of liver disease; Doses >400 mg/day in conjuction with HMG CoA reductase inhibitors (statins) with any risk factors (renal impairment, infection, trauma, surgery, hormonal or electrolyte imbalance) ↑ risk for rhabdomyolysis; Geri: Consider age-related ↓ in renal function; avoid in patients >70 yr; Pedi: Limited experience in children at a dose of 10–20 mg/kg/day.

Adverse Reactions/Side Effects

CNS: dizziness, headache. **GI:** dyspepsia, flatulence, gastritis, abdominal distension, abdominal pain, ↓ appetite, cholestasis, constipation, diarrhea, nausea. **GU:** erectile dysfunction, renal failure. **Derm:** alopecia, pruritus, urticaria, photosensitivity reaction, alopecia, rash. **MS:** RHABDOMYOLYSIS, muscle cramps, muscular weakness, myalgia. **Misc:** hypersensitivity reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: ↑ risk of bleeding with **oral anticoagulants**; ↓ dose of anticoagulant by 50% with frequent

© F.A. Davis Publishing

monitoring. **Cyclosporine** ↑ risk of severe myositis/rhabdomyolysis; risk of combined therapy should be undertaken with caution. Concurrent use of **immunosuppressants** may ↑ risk of reversible renal impairment. ↑ risk of myopathy with **HMG CoA reductase inhibitors (statins)**; combination therapy should be undertaken with extreme caution and must be discontinued at the first signs of myopathy and should not be undertaken in the presence of predisposing factors including impaired renal function, severe infection, trauma, surgery, hormonal /electrolyte imbalance or ↑ alcohol intake. ↑ risk of serious hypoglycemia with **insulin** or **sulfonylureas**. Concurrent use with **MAO inhibitors** may ↑ risk of hepatotoxicity. **Cholestyramine** and other **bile-acid sequestrants** may ↓ absorption, separate administration by ≥2 hr. Effectiveness may be ↓ by concurrent **estrogen**.

Route/Dosage

PO (Adults): 400 mg once daily.

Availability

Sustained-release tablet: 400 mg.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history with regard to fat consumption. Before starting benzafibrate, every attempt should be made to obtain a normal triglyceride level with diet, exercise and weight loss.
- Assess for cholelithiasis. If gallbladder studies are indicated, and gallstones are found, discontinue therapy.
- ***Lab Test Considerations:*** Monitor serum lipids prior to and periodically during therapy.
- ***Lab Test Considerations:*** Monitor AST and ALT serums periodically during therapy to assess for ↑ levels. Discontinue therapy if levels rise >3 times normal value.
- ***Lab Test Considerations:*** If patient develops muscle tenderness during therapy, monitor CPK levels. If CPK levels are markedly ↑ or myopathy occurs, discontinue therapy.

Implementation

- **PO:** Administer without regard to meals. Swallow sustained-release tablets whole; do not crush, break, or chew.

Patient/Family Teaching

- Instruct the patient to take the medication as directed, and to not share medication. Missed doses should be taken as soon as remembered; do not double dose. Medication helps control but does not cure elevated serum triglyceride levels.
- Advise patient that medication should be taken in conjunction with diet restrictions of fat, cholesterol, carbohydrates, and alcohol, as well as an exercise regimen, and cessation of smoking.
- Instruct patient to notify health care professional of unexplained muscle pain or weakness, tiredness, fever, nausea, vomiting, abdominal pain.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Instruct female patients to immediately notify health care professional if pregnancy is planned or suspected.
- Emphasize importance of follow-up appointments, and lab tests to evaluate effectiveness.

Evaluation

- A decrease in serum triglyceride and LDL cholesterol levels.
- An increase in HDL levels.

buserelin (bue-se-**rel**-in)

Suprefact

Classification

Therapeutic: antineoplastics, hormones
Pharmacologic: luteinizing hormone-releasing hormone (LHRH) analogues

Indications

Subcutaneous injection— Initial and maintenance palliative treatment of advanced hormone-dependent prostate cancer (usually given with an anti-androgen). *Nasal solution*— Maintenance palliative treatment of advanced hormone-dependent prostate cancer (usually given with an anti-androgen). *Nasal solution*— Non-surgical treatment of endometriosis (course of treatment 6–9 mo).

Action

Acts as a synthetic analog of endogenous gonadotropin-releasing hormone (GnRH/LHRH). Chronic use results in inhibited secretion of gonadotropin release and gonadal steroid production. The overall effect is due to down-regulation of pituitary LHRH receptors. In males, testosterone synthesis and release is decreased. In females, secretion of estrogen is decreased. **Therapeutic Effects:** Decreased spread of advanced prostate cancer. Decreased sequelae of endometriosis (pain, dysmenorrhea).

Pharmacokinetics

Absorption: *Subcut*— 70%; *intranasal*— 1–3%; *implant*— drug is slowly absorbed over 2–3 mo.
Distribution: Accumulates in liver, kidneys and anterior pituitary lobe; enters breast milk in small amounts.
Metabolism and Excretion: Metabolized in liver, kidneys and by enzymes on membranes in the pituitary gland.
Half-life: *Subcut*— 80 min; *intranasal*— 1–2 hr; *implant*— 20–30 days.

© F.A. Davis Publishing

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
prostate cancer †	7 days	4 mo	until discontinuation
endometriosis ‡(intranasal)	unknown	unknown	duration of treatment

†↓ in testosterone levels.
‡Symptom improvement.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Nonhormonal-dependent prostate cancer or previous orchiectomy; Females with undiagnosed vaginal bleeding; OB: Pregnancy (avoid use); Lactation: Avoid breast feeding (small amounts enter breast milk; injection contains benzyl alcohol).

Use Cautiously in: Prostate cancer with urinary tract obstruction or spinal lesions; Pedi: Safety and effectiveness not established (injection contains benzyl alcohol).

Adverse Reactions/Side Effects

CNS: depression, dizziness. **CV:** hypertension. **Endo:** glucose intolerance. **Hemat:** anemia. **Local:** injection site reactions. **MS:** osteoporosis (long-term use). **Misc:** transient exacerbation of metastatic prostate cancer or endometriosis.

Prostate cancer

CNS: headache (nasal solution). **EENT:** nasal irritation (nasal spray). **GU:** ↓ libido, impotence. **Derm:** hot flushes. **Endo:** gynecomastia, testosterone flair. **MS:** bone pain.

Endometriosis

CNS: headache, weakness, insomnia. **CV:** edema. **GI:** constipation, gastrointestinal disorders, nausea. **GU:** ↓ libido, vaginal dryness, menorrhagia. **Derm:** hot flushes, acne. **Endo:** supression of ovulation. **MS:** back pain.

Interactions

Drug-Drug: Risk of serious arrhythmias may be ↑ by concurrent **amiodarone**, **disopyramide**, **dofetilide**, **flecainide ibutilide**, **propafenone quinidine**, **sotalol**, **antipsychotics** (including **chlorpromazine**) **antidepressants** (including **amitrypline** and **nortriptyline**), **opioids** (including **methadone**), **macrolide anti-infectives** (including **azithromycin**, **erythromycin** and **clarithromycin**), **fluoroquinolones** (including **moxifloxacin**), **azole antifungals**, **5-HT3 antagonists** (including **ondansetron**), **beta-2 receptor agonists** (including **salbutamol**), **pentamidine**, and **quinine**.

Route/Dosage

Prostate cancer

Subcut (Adults): *Initial treatment*—500 mcg every 8 hr for 7 days, *Maintenance treatment*—200 mcg daily.
Intranasal (Adults): *Maintenance treatment*—400 mcg (200 mcg in each nostril) 3 times daily.
Subcut implant (Adults): 6.3 mg every 2 mo or 9.45 mg every 3 mo.

Endometriosis

Intranasal (Adults): 400 mcg (200 mcg in each nostril) 3 times daily. Treatment is usually continued for 6 mo; not to exceed 9 mo.

Availability

Solution for subcutaneous injection (contains benzyl alcohol): 1000 mcg/mL; Intranasal Solution: 1000 mcg/mL (delivers 100 mcg per actuation); Subcutaneous implant (depot): 6.3 mg (2–mo implant), 9.45 mg (3–mo implant).

NURSING IMPLICATIONS

Assessment

- **Cancer:** Monitor patients with vertebral metastases for increased back pain and decreased sensory/motor function.
- Monitor intake and output ratios and assess for bladder distention in patients with urinary tract obstruction during initiation of therapy.
- **Endometriosis:** Assess for signs and symptoms of endometriosis before and periodically during therapy. Amenorrhea usually occurs within 8 wk of initial administration and menses usually resume 8 wk after completion.
- ***Lab Test Considerations:*** Monitor serum testosterone levels every 3 mo during treatment with male patients. When treatment begins, testosterone levels can temporarily markedly ↑ and patients may need another medication to ↓ levels.
- Monitor blood glucose in patients with diabetes frequently; may affect blood glucose levels.
- Verify negative pregnancy test before starting therapy for women.

Implementation

Prostate Cancer

- **Subcut:** Only use syringes that come with kit for accurate dose. Inject into fatty tissue of abdomen, arm, or leg 3 times/day for 7 days; then daily during maintenance.
- **Intranasal:** When used as maintenance, begin nasal spray in each nostril 3 times daily. If patient also receives decongestant nasal spray, wait 30 min to give buserelin spray before or after the decongestant.
- **Implant:** Implant is inserted in subcut tissue of upper abdominal wall every 28 days. Local anesthesia may be used before injection.
- If the implant needs to be removed for any reason, it can be located by ultrasound.

Endometriosis

- **Intranasal:** One spray in each nostril 3 times daily for 6–9 mo.

Patient/Family Teaching

- Inform male patients that they may experience breast swelling and tenderness, decreased libido, hot flashes and sweats, impotence and weight gain. Notify health care professional if these symptoms occur.
- Inform female patients that they may experience decreased libido, constipation, painful sexual intercourse, menopausal symptoms, changes in hair

© F.A. Davis Publishing

growth. Notify health care professional if these symptoms occur.
- Caution both male and female patients to use contraception while taking this drug. Advise female patient to inform health care professional if pregnancy is suspected. Buserelin can be harmful to a fetus.
- **Subcut:** Instruct patient in proper technique for self-injection, care and disposal of equipment. Use only syringes included in kit. Instruct patients that syringes may only be used once, and then discarded.
- **Intranasal:** Instruct patient on proper nasal spray technique. Prime pump before use.
- Advise patients that the nasal spray can cause nose bleeds, and may change smell and taste senses.

Evaluation
- Decrease in the spread of prostate cancer.
- Decrease in lesions and pain in endometriosis.

cannabidiol (ka-**na**-bi-dye-ole)

delta-9–tetrahydrocannabinol (THC) (**del**-ta nine tet-re-hye-dro-ka-**na**-bi-nole)

Sativex

Classification

Therapeutic: analgesic adjuncts, therapeutic antispasticity agents
Pharmacologic: cannabinoids

Indications
Adjunct treatment of spasticity in adults with multiple sclerosis (MS) who have not responded to other therapies. Analgesic adjunct in the management of neuropathic pain in patients with MS or advanced cancer who have not responded to opioids or other analgesics for severe pain.

Action
Acts on cannabinoid receptors located in pain pathways in the brain, spinal cord, and peripheral nerve terminals. Has analgesic and muscle relaxant properties.
Therapeutic Effects: Decreased pain and spasticity.

Pharmacokinetics
Absorption: Buccal absorption is slower than inhalation.
Distribution: Highly lipid soluble, distributes and accumulates in fatty tissues. Cannabinoids enter breast milk in considerable amounts.
Metabolism and Excretion: Some first-pass hepatic metabolism occurs; highly metabolized by the CYP450 enzyme system. Metabolites can be stored in fatty tissues and re-released over time (up to weeks); one metabolite of THC is pharmacologically active (11–hydroxy-THC). Further metabolism occurs in renal and biliary systems.
Half-life: Bi-exponential half-lives with short initial phases of *Cannabidiol*— 1.4–1.8 hr; *THC*— 1.3–1.7 hr *11–hydroxy-THC*— 1.9–2.1 hr; terminal elimination half-life of *cannabinoids*— 24–26 hr or more.

TIME/ACTION PROFILE (analgesic and antispasticity effects)

ROUTE	ONSET	PEAK†	DURATION
cannabidiol	unknown	1.6–2.8 hr	up to 12 hr
THC	unknown	1.6–2.4 hr	up to 12 hr

†Blood levels peak more quickly when administered under the tongue.

Contraindications/Precautions
Contraindicated in: Allergy/hypersensitivity to cannabinoids, propylene glycol or peppermint oil; Serious cardiovascular disease, including ischemic heart disease, arrhythmias, poorly controlled hypertension or severe heart failure; History of schizophrenia/psychoses; Patients with childbearing potential who are not using reliable contraception; Sore/inflamed mucosa (may alter absorption); OB: Pregnancy (avoid use); Lactation: Avoid breast feeding (cannabinoids enter breast milk in considerable amounts); Pedi: Safety and effectiveness not established.
Use Cautiously in: Epilepsy/recurrent seizures; Substance abuse; Perioperative state (consider possible changes in cardiovascular status); History of depression/suicide attempt or ideation; Significant hepatic/renal impairment; Women of reproductive potential (reliable contraception must be ensured); Cancer patients with urinary tract pathology (↑ risk of urinary tract adverse reactions); Geri: Use cautiously.

Adverse Reactions/Side Effects
CNS: dizziness, fatigue, confusion, depression, disorientation, drowsiness, euphoria, hallucinations, psychotic reactions, suicidal ideation, weakness. **CV:** hypertension, palpitations, tachycardia, postural hypotension. **GI:** appetite change, constipation, dry mouth, dysgeusia, mucosal/teeth discoloration, nausea (↑ in cancer patients), stomatitis. **GU:** urinary retention (↑ in cancer patients). **Local:** application site irritation. **Misc:** physical dependence, psychological dependence.

Interactions
Drug-Drug: ↑ risk of CNS depression with other **CNS depressants** including **alcohol**, some **antidepressants**, some **antihistamines**, **benzodiazepines**, **GABA inhibitors**, **sedative/hypnotics**, **opioids**, and **psychotropics/antipsychotics**. Cannabidiol inhibits the CYP450 enzyme system; may ↑ effects of **amitriptyline**, **alfentanil**, **fentanyl** and **sufentanil**.
Drug-Natural Products: ↑ risk of intoxication with other forms of **cannibis**.

Route/Dosage
Buccal (Adults): *Day 1*— One spray in the morning and one in the evening; may ↑ by 1 spray/day on subsequent days. If unacceptable effects occur, temporarily discontinue and restart at a lower # of sprays/day or use longer intervals between sprays. Titrate to optimal maintenance dose (usual range 4–8 sprays/day, usually not

© F.A. Davis Publishing

more than 12 sprays/day; higher doses have been used/tolerated). Adjust dose to changes in patient condition.

Availability

Buccal spray contains ethanol (50% v/v), propylene glycol and peppermint oil: Each ml contains *Cannabidiol*—25 mg and *THC*—27 mg/ml. Delivers 100 microliters/spray, each spray provides cannabidiol 2.5 mg and THC 2.7 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient's pain level before and after cannabidiol.

Implementation

- Prime pump before first use. Shake vial gently and remove protective cap. Hold vial in an upright position and press firmly and quickly on the actuator 2 or 3 times, until a fine spray appears. Point spray into a tissue, away from patient.
- Administer one spray 2 times/day, in morning and in evening, on first day. Administer under tongue or in buccal area. Rotate sites in mouth to avoid irritation. Effects should be noticed in about 30 min. Do not spray the back of throat or into nose. After first day, increase dose by 1 spray every 24 hr, spacing doses evenly. No more than 12 doses should be used over a 24 hr period. Space each spray by at least 15 min.

Patient/Family Teaching

- Caution patient to use medication as directed.
- Instruct patient on correct spray technique. Instruct patient to rotate sites in the mouth between the tongue and buccal locations.
- Instruct patient to store unopened bottles in refrigerator. Do not freeze. Keep away from sources of heat such as direct sunlight or flames (product is flammable). Opened bottles may be stored at room temperature. Keep out of reach of children.
- Inform patient that any unused contents should be discarded after 28 days. Do not dispose of medications in wastewater (e.g., down the sink or in the toilet) or in household garbage. Consult pharmacist how to dispose of expired or unneeded medication.
- Caution patient to avoid alcohol while taking cannabidiol.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation

- Decrease in pain.
- Decrease in muscle spasticity.

cilazapril (sye-lay-za-pril)

Inhibace

Classification

Therapeutic: antihypertensives
Pharmacologic: ACE inhibitors

Indications

Alone or with other agents in the management of hypertension. HF.

Action

ACE inhibitors block the conversion of angiotensin I to the vasoconstrictor angiotensin II. ACE inhibitors also prevent the degradation of bradykinin and other vasodilatory prostaglandins. ACE inhibitors also ↑ plasma renin levels and ↓ aldosterone levels. Net result is systemic vasodilation. **Therapeutic Effects:** Lowering of BP in hypertensive patients. Improved symptoms in patients with HF.

Pharmacokinetics

Absorption: Well absorbed following oral administration, rapidly converted to active metabolite, cilazaprilat (57% bioavailability for cilazaprilat).
Distribution: Enters breast milk.
Metabolism and Excretion: Cilazaprilat is eliminated unchanged by the kidneys (91%).
Half-life: *Early elimination phase*—0.9 hr; *terminal elimination phase (enzyme–bound cilazaprilat)* 36–49 hr.

TIME/ACTION PROFILE (effects on hemodynamics)

ROUTE	ONSET	PEAK	DURATION
PO (hypertension)	within 1 hr	3–7 hr	12–24 hr
PO (heart failure)	1–2 hr	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of angioedema with previous use of ACE inhibitors; Concurrent use with aliskiren in patients with diabetes or moderate-to-severe renal impairment (CCr <60 mL/min); OB: Can cause injury or death of fetus—if pregnancy occurs, discontinue immediately; Lactation: Discontinue drug or use formula.
Use Cautiously in: Renal impairment, hepatic impairment, hypovolemia, hyponatremia, concurrent diuretic therapy; Black patients with hypertension (monotherapy less effective, may require additional therapy; ↑ risk of angioedema); Women of reproductive potential; Surgery/anesthesia (hypotension may be exaggerated); Geri: Initial dose ↓ recommended for most agents due to age-related ↓ in renal function; Pedi: Safety and effectiveness not established.
Exercise Extreme Caution in: Family history of angioedema.

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue, headache, insomnia, vertigo, weakness. **Resp:** cough, dyspnea. **CV:** hypotension, chest pain, edema, tachycardia. **Endo:** hyperuricemia. **GI:** taste disturbances, abdominal pain, anorexia, constipation, diarrhea, nausea, vomiting. **GU:** erectile dysfunction, proteinuria, renal dysfunction, renal failure. **Derm:** flushing, pruritis, rashes. **F and E:** hyperkalemia. **Hemat:** AGRANULOCYTOSIS. **MS:** back pain, muscle cramps, myalgia. **Misc:** ANGIOEDEMA, fever.

Interactions

Drug-Drug: Excessive hypotension may occur with concurrent use of **diuretics** or other **anti-**

© F.A. Davis Publishing

hypertensives or **alcohol**. ↑ risk of hyperkalemia with concurrent use of **potassium supplements**, **potassium-sparing diuretics**, or **potassium-containing salt substitutes**. ↑ risk of hyperkalemia, renal impairment, hypotension, and syncope with concurrent use of **angiotensin II receptor antagonists** or **aliskiren**; avoid concurrent use with aliskiren in patients with diabetes or CCr <60 mL/min. **NSAIDs** and selective **COX-2 inhibitors** may blunt the antihypertensive effect and ↑ the risk of renal dysfunction. ↑ levels and may ↑ risk of **lithium** toxicity.

Route/Dosage

Hypertension

PO (Adults ≤65 yr): *As monotherapy*— 2.5 mg once daily initially, may be increased every 2 wk by 2.5 mg/day; usual dose 2.5–5 mg once daily, not to exceed 10 mg/day. Twice daily administration may be necessary in some patients; *With diuretics*— 0.5 mg once daily initially, titrate carefully.
PO (Adults >65 yr): *As monotherapy*— 1.25 mg once daily initially, titrate carefully.

Renal Impairment

PO (Adults): *CCr >40 mL/min*— 1 mg once daily initially, titrate carefully, not to exceed 5 mg once daily; *CCr 10–40 mL/min*— 0.5 mg once daily initially, titrate carefully, not to exceed 2.5 mg once daily; *CCr <10 mL/min*— not recommended.

Hepatic Impairment

PO (Adults): 0.5 mg once daily or less.

Heart Failure

PO (Adults): After considering concurrent diuretic therapy/salt/volume depletion, *Initial dose*— 0.5 mg/day with careful monitoring, after 5 days dose may be ↑ to 1 mg/day, dose may then be carefully titrated as needed/tolerated up to 2.5 mg/day, rarely patients may require 5 mg/day.

Renal Impairment

PO (Adults): *CCr 10–40 mL/min*— 0.25–0.5 mg once daily; *CCr <10 mL/min*— not recommended.

Availability

Tablets: 1 mg, 2.5 mg, 5 mg. ***In combination with:*** hydrochlorothiazide 12.5 mg (Inhibace Plus).

NURSING IMPLICATIONS

Assessment

- Assess patient for signs of angioedema; dyspnea and facial swelling.
- **Hypertension:** Monitor BP and pulse frequently during initial dose adjustment and periodically during therapy. Notify health care professional of significant changes.
- **Heart Failure:** Monitor daily weight and assess frequently for fluid overload (dyspnea, rales/crackles, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** Monitor BUN, creatinine, and serum electrolyte levels periodically during therapy.
- Monitor CBC periodically. May cause agranulocytosis.
- May cause ↑ AST, ALT, alkaline phosphatase, serum bilirubin, uric acid, and glucose.

Implementation

- **PO:** Tablets may be taken before or after meals.

Patient/Family Teaching

- Instruct patient to take cilazapril as directed. Take missed dose as soon as remembered. If not until the following day, skip missed dose. Do not double doses.
- Caution patient to change positions slowly to minimize hypotension. Use of alcohol, standing for long periods, exercising, and hot weather may ↑ orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient on proper technique for monitoring blood pressure. Advise patient to check BP and weight weekly and record and report results to health care professional.
- Provide patient with additional interventions for hypertension control (weight reduction, low sodium diet, cessation of smoking, exercise regimen, stress management, and moderation of alcohol consumption). Medication controls but does not cure hypertension.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially cough, cold, or allergy remedies.
- Advise women of childbearing potential to use contraception and to notify health care professional if planning or suspecting pregnancy. Discontinue medication immediately if pregnancy is confirmed.

Evaluation

- Decrease in blood pressure.
- Decrease in signs and symptoms of heart failure.

cloxacillin (klox-a-**sill**-in)

Classification
Therapeutic: anti-infectives
Pharmacologic: penicillinase resistant penicillins

Indications

Treatment of the following infections due to penicillinase-producing staphylococci: respiratory tract infections, sinusitis, septicemia, endocarditis, osteomyelitis, skin and skin structure infections.

© F.A. Davis Publishing

Action
Bind to bacterial cell wall, leading to cell death. Not inactivated by penicillinase enzymes. **Therapeutic Effects:** Bactericidal action. **Spectrum:** Active against most gram-positive aerobic cocci. Spectrum is notable for activity against: Penicillinase-producing strains of *Staphylococcus aureus* and *Staphylococcus epidermidis*. Not active against methicillin-resistant bacteria (MRSA).

Pharmacokinetics
Absorption: IV administration results in complete bioavailability. Moderately absorbed (50%) following oral administration.
Distribution: Widely distributed; penetration into CSF is minimal but sufficient in the presence of inflamed meninges; crosses the placenta and enters breast milk.
Metabolism and Excretion: Some metabolism by the liver (9–22%) and some renal excretion of unchanged drug (20 %).
Half-life: 0.5–1.1 hr (↑ in severe hepatic impairment, renal impairment, and in neonates).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	30 min	30–120 min	6 hr
IM	unknown	unknown	6 hr
IV	rapid	end of injection/infusion	6 hr

Contraindications/Precautions
Contraindicated in: Previous hypersensitivity to penicillins (cross-sensitivity exists with cephalosporins and other beta-lactam antibiotics).
Use Cautiously in: Severe renal or hepatic impairment; OB: Safety not established; Pedi: Safety in premature and newborn infants not established.

Adverse Reactions/Side Effects
CNS: SEIZURES. **GI:** CLOSTRIDIUM DIFFICILE-ASSOCIATED DIARRHEA (CDAD) diarrhea, epigastric distress, nausea, vomiting. **GU:** interstitial nephritis. **Derm:** rash, urticaria. **Hemat:** eosinophilia, leukopenia. **Misc:** allergic reactions including ANAPHYLAXIS and SERUM SICKNESS, superinfection.

Interactions
Drug-Drug: May ↓ effectiveness of **oral contraceptive agents**. **Probenecid** ↓ renal excretion and ↑ levels (therapy may be combined for this purpose). **Neomycin** may ↓ absorption. Concurrent use with **methotrexate** ↓ methotrexate elimination and ↑ risk of serious toxicity.
Drug-Food: Food ↓ oral absorption by 50%.

Route/Dosage
PO (Adults): 250–500 mg every 6 hr.
PO (Children >1 mo): 50–100 mg/kg/day divided every 6 hr up to a maximum of 4 g/day.
IM, IV (Adults): 250–500 mg every 6 hr, maximum dose 6 g/day.
IM, IV (Children up to 20 kg): 25–50 mg/kg/day in 4 equally divided doses every 6 hr.

Availability
Capsules: 250 mg, 500 mg; Oral solution: 125 mg/5 mL; Powder for injection (requires reconstitution/dilution: 250 mg/vial, 500 mg/vial, 1 g/vial, 2 g/vial.

NURSING IMPLICATIONS

Assessment
- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to cephalosporins or other beta-lactam antibiotics. Persons with no history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing, abdominal pain). Discontinue drug and notify health care professional immediately if these occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridium difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause leukopenia and neutropenia, especially with prolonged therapy or hepatic impairment.
- May cause positive direct Coombs' test result.
- May cause ↑ AST, ALT, LDH, and serum alkaline phosphatase concentrations.

Implementation
- **PO:** Administer around the clock on an empty stomach at least 1 hr before or 2 hr after meals. Take with a full glass of water; acidic juices may decrease absorption of penicillins. Swallow capsules whole; do not crush, chew, or open capsules.
- Use calibrated measuring device for liquid preparations. Shake well. Solution is stable for 14 days if refrigerated.
- **IM:** Reconstitute by adding 1.9 mL and 1.7 mL sterile water to 250 mg and 500 mg respectively, for concentrations of 125 mg/mL and 250 mg/mL. Shake well to dissolve. Stable for 24 hr at room temperature or 48 hr if refrigerated.
- **IV:** For IV use, reconstitute 250 mg vial with 4.9 mL, 500 mg vial with 4.8 mL, and 1000 mg vial with 9.6 mL sterile water for concentrations of 50 mg/mL, 100 mg/mL, and 100 mg/mL respectively. Shake well. Use reconstituted solution immediately. Infuse over 2–4 min.
- **IV:** Reconstitute for infusion with sterile water for injection using 3.4 mL for 1000 mg, 6.8 mL for 2000 mg, and 34 mL for 10,000 mg, resulting in 250 mg/mL. Add to an appropriate infusion fluid in amount

© F.A. Davis Publishing

calculated to give desired dose. Shake well to dissolve. Use solution immediately. Infuse over 30–40 min.

- **Y-Site Compatibility:** epinephrine ketamine.
- **Y-Site Incompatibility:** pantoprazole, rocuronium.

Patient/Family Teaching

- Instruct patient to take medication around the clock and to finish the drug completely as directed, even if feeling better. Missed doses should be taken as soon as remembered. Advise patient that sharing of this medication may be dangerous.
- Advise patient to report signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional if symptoms do not improve.

Evaluation

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

cyproterone (sy-proe-te-rone)

Androcur

Classification

Therapeutic: antineoplastics, hormones
Pharmacologic: antiandrogens

Indications

Palliative treatment of advanced prostate cancer.

Action

Has antiandrogenic and progestogenic/antigonadotropic properties, resulting in blocked binding of the active metabolite of testosterone on the surface of prostatic cancer cells and decreased production of testicular testosterone. **Therapeutic Effects:** Decreased spread of prostate cancer.

Pharmacokinetics

Absorption: Completely absorbed following oral administration. Absorption after IM depot injection is delayed and prolonged.
Distribution: Unknown.
Metabolism and Excretion: Metabolized by the CYP3A enzyme system; excreted in feces (60%) and urine (33%), as unchanged drug and metabolites.
Half-life: *PO*—38 hr; *IM*—4 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–4 hr	8–12 hr
IM (depot)	unknown	3.4 days	1–2 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Liver disease/hepatic impairment/liver tumors (not due to prostate cancer); Dubin Johnson syndrome; Rotor syndrome; History of meningioma; Wasting diseases (not related to prostate cancer); Severe depression; Thromboembolism; OB: Not indicated for use in women; Pedi: Not recommended for use in children <18 yr.
Use Cautiously in: History of cardiovascular disease; Renal impairment.

Adverse Reactions/Side Effects

CNS: MENINGIOMAS, fatigue, weakness, depression. **Resp:** cough, dyspnea, pulmonary microembolism. **CV:** THROMBOEMBOLISM, edema, heart failure, myocardial infarction, hypotension, syncope, tachycardia, vasovagal reactions. **GI:** HEPATOTOXICITY, LIVER TUMORS, anorexia, constipation, diarrhea, nausea, vomiting. **Derm:** dry skin, hot flashes, ↑ sweating, patchy hair loss. **Endo:** adrenal suppression, antiandrogen withdrawal syndrome, gynecomastia. **F and E:** hypercalcemia. **GU:** infertility, impotence. **Hemat:** anemia, thrombocytopenia. **Metab:** glucose intolerance, hyperlipidemia. **MS:** osteoporosis (long term use). **Misc:** allergic reactions.

Interactions

Drug-Drug: Antiandrogenic effect may be ↓ by **alcohol**. Effectiveness/long-term survival may be ↓ by concurrent **GnRH agonist** treatment. ↑ risk of myopathy with **HMG CoA reductase inhibitors (statins)**. Blood levels and effects may be ↑ by **strong inhibitors of CYP3A4** including **clotrimazole**, **itraconazole**, **ketoconazole** and **ritonavir**. Blood levels and effectiveness may be ↓ by **inducers of CYP3A4** including **phenytoin**, and **rifampicin**. Use cautiously with other **drugs that are substrates of the P450 enzymes**.
Drug-Natural Products: Blood levels and effectiveness may be ↓ by **St. John's wort**.

Route/Dosage

PO (Adults): 200–300 mg/day in 2–3 divided doses, not to exceed 300 mg/day; *After orchiectomy*—100–200 mg/day.
IM (Adults): 300 mg once weekly; *After orchiectomy*—300 mg every 2 wk.

Availability

Tablets: 50 mg; Depot injection: 100 mg/mL in 3–mL.
In combination with: Ethinyl estradiol (Diane-35, Cyestra-35, Cleo-35).

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of thromboembolism (chest pain, dyspnea, vital signs, level of consciousness). Discontinue therapy if symptoms occur.
- Monitor mood changes, especially during first 6–8 wk. Note degree to which these thoughts and behaviors interfere with daily functioning. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.

© F.A. Davis Publishing

- ***Lab Test Considerations:*** Monitor PSA during therapy. May cause increase in PSA. If PSA increase occurs discontinue therapy and monitor for 6–8 wk for withdrawal response prior to any decision to proceed with other prostate cancer therapy.
- ***Lab Test Considerations:*** May impair carbohydrate metabolism. Monitor fasting blood glucose and glucose tolerance tests periodically during therapy, especially in patients with diabetes. May require dose changes in insulin or oral antidiabetic agents.
- ***Lab Test Considerations:*** Monitor CBC and platelet count periodically during therapy.
- ***Lab Test Considerations:*** Monitor liver function tests prior to and periodically during therapy and if symptoms of hepatotoxicity occur. May develop several wk to mo after therapy starts. Discontinue therapy if hepatotoxicity occurs.
- ***Lab Test Considerations:*** Monitor adrenocortical function tests by serum cortisol assay periodically during therapy.

Implementation

- **PO:** Take by mouth two or three times a day with or just after meals as directed. Dose is usually lower after orchiectomy.

Patient/Family Teaching

- Instruct patient to take cyproterone as directed. Take missed doses as soon as remembered, unless almost time for next dose, then skip missed dose and resume usual dosing schedule. Do not double dose.
- Inform patient that benign breast lumps may occur; they generally subside 1–3 mo after discontinuation of therapy and/or after dose reduction. Dose reduction should be weighed against the risk of inadequate tumor control.
- Advise patient to avoid alcohol during therapy.
- May cause fatigue and lassitude during first few wk of therapy; then diminishes. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Inform patient that sperm count and volume of ejaculate decrease with therapy. Infertility is common but is reversible when therapy is discontinued.
- Discuss with patient potential for patchy hair loss. Explore methods of coping.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up appointments and blood tests to monitor progression of treatment.

Evaluation

- Decreased spread of prostate cancer.

danaparoid sodium

(da-**nap**-a-roid)

Orgaran

Classification

Therapeutic: anticoagulants

Pharmacologic: heparins (low molecular weight)

Indications

Prevention of thromboembolic phenomena including deep vein thrombosis and pulmonary emboli after surgical procedures known to increase the risk of such complications (knee/hip replacement, abdominal surgery). Management of non-hemorrhagic stroke. Treatment/prevention of thromboembolic phenomena in patients with a history of heparin-induced thrombocytopenia (HIT).

Action

Potentiates the inhibitory effect of antithrombin on factor Xa and thrombin. Danaparoid sodium is a heparinoid. **Therapeutic Effects:** Prevention of thrombus formation.

Pharmacokinetics

Absorption: 100% absorbed after subcut administration; IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Excreted mostly by the kidneys.

Half-life: 24 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	2–5 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to danaparoid sodium, pork products, or sulfites; Uncontrolled bleeding; Imminent/threatened abortion; Lactation: Avoid breast feeding.

Use Cautiously in: Severe hepatic or renal impairment (dosage ↓ may be necessary in severe renal impairment); Retinopathy (hypertensive or diabetic); Untreated hypertension; Recent history of ulcer disease; Spinal/epidural anesthesia; History of congenital or acquired bleeding disorder; Malignancy; History of thrombocytopenia related to heparin (HIT), has been used successfully; OB: Safe use in pregnancy has not been established; Geri: Dosage ↓ may be necessary in severe renal impairment; Pedi: Safety not established.

Exercise Extreme Caution in: Severe uncontrolled hypertension; Bacterial endocarditis, bleeding disorders; GI bleeding/ulceration/pathology; Hemorrhagic stroke; Recent CNS or ophthalmologic surgery; Active GI bleeding/ulceration.

Adverse Reactions/Side Effects

CNS: dizziness, headache, insomnia. **CV:** edema. **GI:** constipation, nausea, reversible increase in liver en-

© F.A. Davis Publishing

zymes, vomiting. **GU:** urinary retention. **Derm:** ecchymoses, pruritus, rash, urticaria. **Hemat:** BLEEDING, anemia, thrombocytopenia. **Local:** erythema at injection site, hematoma, irritation, pain. **Misc:** fever.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of other **anticoagulants** including **warfarin** or **drugs that affect platelet function**, including **aspirin**, **NSAIDs**, **dipyridamole**, some **penicillins**, **clopidogrel**, **ticlopidine**, and **dextran**.

Route/Dosage

Prophylaxis of DVT (non HIT patients)

Subcut (Adults): 750 anti-factor Xa IU every 12 hr starting 1–4 hr preop and at least 2 hr postop for 7–10 days or until ambulatory (up to 14 days). *Prophylaxis of DVT following Orthopedic, Major Abdominal Surgery and Thoracic Surgery*— 750 anti-factor Xa units, twice daily up to 14 days, initiate 1–4 hr preop.

IV, Subcut (Adults): *Prophylaxis of Deep Vein Thrombosis in Non-hemorrhagic Stroke Patients*— up to 1000 anti-Xa units IV, followed by 750 anti-Xa units subcutaneously, twice daily for 7–14 days.

HIT

IV, Subcut (Adults): *DVT prophylaxis, current HIT, ≤90 kg*— 750 anti-Xa units SC two or three times daily for 7–10 days (initial bolus of 1250 anti-Xa units IV may be used); *DVT prophylaxis, current HIT, >90 kg*— 1250 anti-Xa units SC two or three times daily for 7–10 days (initial bolus of 1250 anti-Xa units IV may be used); *DVT prophylaxis, past (>3 mo) HIT, ≤90 kg*— 750 anti-Xa units SC two or three times daily for 7–10 days; *DVT prophylaxis, past (>3 mo) HIT, >90 kg*— 750 anti-Xa units SC three times daily or 1250 anti-Xa units SC twice daily for 7–10 days; *Established pulmonary embolism or DVT, thrombus <5 days, >90 kg*— 3750 anti-Xa units IV bolus, then 400 anti-Xa units/hr for 4 hr, then 300 anti-Xa units/hr for 4 hr, then 150–200 anti-Xa units/hr for 5–7 days or 1750 anti-Xa units SC twice daily for 4–7 days; *Established pulmonary embolism or DVT, thrombus <5 days, 55–90 kg*— 2250–2500 anti-Xa units IV bolus, then 400 anti-Xa units/hr for 4 hr, then 300 anti-Xa units/hr for 4 hr, then 150–200 anti-Xa units/hr for 5–7 days or 2000 anti-Xa units SC twice daily for 4–7 days; *Established pulmonary embolism or DVT, thrombus <5 days, <55 kg*— 1250–1500 anti-Xa units IV bolus, then 400 anti-Xa units/hr for 4 hr, then 300 anti-Xa units/hr for 4 hr, then 150–200 anti-Xa units/hr for 5–7 days or 1500 anti-Xa units SC twice daily for 4–7 days; *Established pulmonary embolism or DVT, thrombus ≥5 days, >90 kg*— 1250 anti-Xa units IV bolus, then 750 anti-Xa units SC three times daily or 1250 anti-Xa units twice daily; *Established pulmonary embolism or DVT, thrombus ≥5 days, ≤90 kg*— 1250 anti-Xa units IV bolus, then 750 anti-Xa units SC 2–3 times daily; *Surgical prophylaxis, nonvascular surgery, >90 kg*— 750 anti-Xa units SC, repeat ≥6 hr after procedure, then 1250 anti-Xa units SC twice daily for 7–10 days; *Surgical prophylaxis, nonvascular surgery, ≤90 kg*— 750 anti-Xa units SC, repeat ≥6 hr after procedure, then 750 anti-Xa units SC twice daily for 7–10 days; *Surgical prophylaxis, embolectomy, >90 kg*— 2250–2500 anti-Xa units IV bolus before procedure, then 150–200 anti-Xa units/hr IV starting ≥6 hr after procedure for 5–7 days or 750 anti-Xa units 2–3 times daily or change to oral anticoagulants after several days; *Surgical prophylaxis, embolectomy, 55–90 kg*— 2250–2500 anti-Xa units IV bolus before procedure, then 1250 anti-Xa units SC twice daily starting ≥6 hr after procedure, then 750 anti-Xa units 2–3 times daily or change to oral anticoagulants after several days; *Cardiac catheterization >90 kg*— 3750 anti-Xa units IV bolus prior to procedure; *Cardiac catheterization <90 kg*— 2500 anti-Xa units IV bolus prior to procedure; *Percutaneous transluminal coronary angioplasty*— 2500 anti-Xa units IV prior to procedure, then 150–200 anti-Xa units/hr IV for 1–2 days after procedure, may be followed by 750 anti-Xa units SC for several several days; *Intra-aortic balloon pump catherization, >90 kg*— 3750 anti-Xa units IV bolus before procedure, then 150–200 anti-Xa units/hr IV or a 2nd bolus of 1250 anti-Xa units IV or 750 anti-Xa units SC two or three times daily or 1250 anti-Xa units SC twice daily; *Intra-aortic balloon pump catherization, <90 kg*— 2500 anti-Xa units IV bolus before procedure, then 150–200 anti-Xa units/hr IV or a 2nd bolus of 1250 anti-Xa units IV or 750 anti-Xa units SC two or three times daily or 1250 anti-Xa units SC twice daily; *Peripheral vascular bypass*— 2250–2500 anti-Xa units IV bolus before procedure, then 150–200 anti-Xa units/hr IV started ≥6 hr after procedure for 5–7 days or 750 anti-Xa units SC two or three times daily or change to oral anticoagulants.

Availability

Solution for injection (contains sulfites): 750 anti-factor Xa units/0.6 mL ampule.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or BP; guaiac-positive stools); bleeding from surgical site. Notify health care professional if these occur.
- Assess for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement. Monitor neurological status frequently for signs of neurological impairment. May require urgent treatment.
- Monitor patient for hypersensitivity reactions (chills, fever, urticaria).
- Monitor patients with epidural catheters frequently for signs and symptoms of neurologic impairment.
- **Subcut:** Observe injection sites for hematomas, ecchymosis, or inflammation.
- ***Lab Test Considerations:*** Monitor CBC, and stools for occult blood periodically during therapy.

© F.A. Davis Publishing

Monitor platelet count every other day for first wk, twice weekly for next 2 wk, and weekly thereafter. If thrombocytopenia occurs, monitor closely. If hematocrit decreases unexpectedly, assess patient for potential bleeding sites.
- Special monitoring of clotting times (aPTT) is not necessary.
- May cause ↑ in AST, ALT, and alkaline phosphatase levels.
- ***Toxicity and Overdose:*** Danaparoid sodium is not reversed with protamine sulfate. If overdose occurs, discontinue danaparoid sodium. Transfusion with fresh frozen plasma and plasmapheresis has been used if bleeding is uncontrollable.

Implementation
- Cannot be used interchangeably (unit for unit) with unfractionated heparin or other low-molecular-weight heparins.
- Conversion to oral anticogulant therapy (unless it is contraindicated) should not be started until adequate antithrombotic control with parenteral danaparoid sodium has been achieved; conversion may take up to 5 days.
- **Subcut:** Administer deep into subcut tissue. Alternate injection sites daily between the left and right anterolateral and left and right posterolateral abdominal wall. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter.
- If excessive bruising occurs, ice cube massage of site before injection may lessen bruising.

IV Administration
- **IV Push:** Subcut is preferred route. ***Dilution:*** If administered IV, give as a bolus. May dilute with 0.9% NaCl, D5/0.9% NaCl, Ringer's, LR, and mannitol. Stable for up to 48 hr at room temperature.
- **Y-Site Incompatibility:** Administer separately; do not mix with other drugs.

Patient/Family Teaching
- Instruct patient in correct technique for self-injection, care and disposal of equipment.
- Advise patient to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to health care professional immediately.
- Instruct patient not to take aspirin, naproxen, or ibuprofen without consulting health care professional while on danaparoid sodium therapy.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation
- Prevention of deep vein thrombosis and pulmonary emboli.

domperidone (dom-per-i-done)

Classification
Therapeutic: gastric stimulant
Pharmacologic: butyrophenones dopamine antagonists

Indications
Management of symptoms associated with GI motility disorders including subacute/chronic gastritis and diabetic gastroparesis. Treatment of nausea/vomiting associated with dopamine agonist antiparkinson therapy.
Unlabeled Use: To stimulate lactation.

Action
Acts as a peripheral dopamine receptor blocker. Increases GI motility, peristalsis, and lower esophageal sphincter pressure. Facilitates gastric emptying and decreases small bowel transit time. Also increases prolactin levels. **Therapeutic Effects:** Improved GI motility. Decreased nausea/vomiting associated with dopamine agonist antiparkinson therapy.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Does not cross the blood-brain barrier; enters breast milk in low concentrations.
Metabolism and Excretion: Undergoes extensive first-pass hepatic metabolism; much via the CYP3A4 enzyme system. 31% excreted in urine, 66% in feces.
Half-life: 7 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	30 min (blood levels)	6–8 hr

Contraindications/Precautions
Contraindicated in: Known hypersensitivity/intolerance; Concurrent use of ketoconazole; Prolactinoma; Conditions where GI stimulation is dangerous including GI hemorrhage/mechanical obstruction/perforation; Lactation: Breast feeding is not recommended unless potential benefits outweigh potential risks.
Use Cautiously in: History of breast cancer; Hepatic impairment; Severe renal impairment (dose adjustment may be necessary during chronic therapy); OB: Use only if expected benefit outweighs potential hazard; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects
CNS: headache, insomnia. **GI:** dry mouth. **GU:** amenorrhea, impotence. **Derm:** hot flushes, rash. **Endo:** galactorrhea, gynecomastia, hyperprolactinemia.

Interactions
Drug-Drug: **Ketoconazole** ↑ levels and the risk of cardiovascular toxicity; concurrent use contraindicated; other **azole antifungals**, **macrolide anti-infectives**, and **protease inhibitors** may have similar effects. Risk of adverse cardiovascular reactions may be ↑ by concurrent use of **drugs known to ↑ QT interval** including

© F.A. Davis Publishing

antiarrhythmics, some **fluoroquinolones**, **antipsychotics**, **beta-2 adrenergic agonists**, **antimalarials**, **SSRIs**, **tri/tetracyclic antidepressants**, and **nefazodone** and should be undertaken cautiously, especially if other risk factors for *torsade de pointes* exists. Effectiveness may be ↓ by concurrent use of **anticholinergics**. Due to effects on gastric motility, absorption of drugs from the small intestine may be accelerated, while absorption of drugs from the stomach may be slowed, especially **sustained-release** or **enteric-coated** formulations. Concurrent use with **MAOIs** should be undertaken with caution.
Drug-Food: Grapefruit juice may ↑ levels.

Route/Dosage
PO (Adults): *Upper GI motility disorders*— 10 mg 3–4 times daily; may be ↑ to 20 mg 3–4 times daily; *Nausea/vomiting due to dopamine agonist antiparkinson agents*— 20 mg 3–4 times daily, higher doses may be required during dose titration.

Renal Impairment
PO (Adults): Depending on degree of impairment, dosing during chronic therapy should be reduced to once or twice daily.

Availability
Tablets: 10 mg.

NURSING IMPLICATIONS

Assessment
- Assess for nausea, vomiting, abdominal distention, and bowel sounds before and after administration.
- Monitor BP (sitting, standing, lying down) and pulse before and periodically during therapy. May cause prolonged QT interval, tachycardia, and orthostatic hypotension, especially in patients older than 60 yr or taking >30 mg/day.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- ***Lab Test Considerations:*** May cause ↑ serum ALT, AST, and cholesterol.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Implementation
- Use lowest effective dose.
- Administer 3–4 times daily, 15–30 min before meals and at bedtime.

Patient/Family Teaching
- Instruct patient to take as directed. Advise patient to avoid grapefruit juice during therapy.
- Advise patient to notify health care professional if galactorrhea (excessive or spontaneous flow of breast milk), gynecomastia (excessive development of male mammary gland), menstrual irregularities (spotting or delayed periods), palpitations, irregular heartbeat (arrhythmia), dizziness, or fainting occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation
- Prevention or relief of nausea and vomiting.
- Decreased symptoms of gastric stasis.

flupentixol (floo-**pen**-tiks-ol)
Fluanxol

Classification
Therapeutic: antipsychotics
Pharmacologic: thioxanthenes

Indications
Maintenance treatment of schizophrenia in patients whose symptomatology does not include excitement, agitation, or hyperactivity. Not indicated for the treatment of dementia in the elderly.

Action
Alters the effects of dopamine in the CNS. Has some anticholinergic and alpha-adrenergic blocking activity.
Therapeutic Effects: Diminished signs and symptoms of schizophrenia.

Pharmacokinetics
Absorption: *Flupentixol dihydrochloride*— 40% absorbed following oral administration; *Flupentixol decanoate*— slowly released from IM injection sites.
Distribution: Distributes to lungs, liver, and spleen; enter CNS; extensive tissue distribution.
Protein Binding: 99%.
Metabolism and Excretion: Mostly metabolized, metabolites do not have antipsychotic activity. Most metabolites are excreted in feces, some renal elimination.
Half-life: *Flupentixol dihydrochloride*— 35 hr; *Flupentixol decanoate*— 3 wk.

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 2–3 days	3–8 hr (blood level)	8 hr
IM (depot)	24–72 hr	4–7 days (blood level)	2–4 wk

Contraindications/Precautions
Contraindicated in: Hypersensitivity to flupentixol or other thioxanthines (cross-sensitivity with phenothiazines may occur); CNS depression due to any cause, including comatose states, cortical brain damage (known or suspected), or circulatory collapse; Opiate, alcohol, or barbiturate intoxication; Hepatic impairment, cerebrovascular insufficiency, or severe cardiovascular pathology; Concurrent use of other drugs known to prolong QT interval; Pedi: Safety and effectiveness not established; not recommended.

© F.A. Davis Publishing

Use Cautiously in: Brain tumors or intestinal obstruction (may mask symptoms); Patients exposed to extreme heat or organophosphorous insecticides; Risk factors for/history of stroke; Any risk factors for QT prolongation including hypokalmia, hypomagnesemia, genetic predisposition, cardiovascular disease history (including bradycardia), recent MI, HF, or arrhythmias; Known/suspected glaucoma; History of seizures (may ↓ seizure threshold); Parkinson's disease (may worsen symptoms); Geri: Consider age-related ↓ in renal, cardiac, and hepatic function; OB: Use only if expected benefit outweighs potential risks to infant; Lactation: Safe use not established; low levels in breast milk are not expected to affect infant if therapeutic doses are used.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME dizziness. **EENT:** blurred vision. **CV:** QT INTERVAL PROLONGATION, THROMBOEMBOLISM, extrapyramidal symptoms, tachycardia, hypotension, sedation, tardive dyskinesia. **GI:** constipation, dry mouth, excess salivation, hepatotoxicity. **GU:** ↓ libido, urinary retention. **Derm:** photosensitivity reactions, rash, sweating. **Endo:** glucose intolerance, hyperprolactinemia, menstrual irregularity. **Hemat:** agranulocytosis, granulocytopenia, neutropenia. **Metab:** weight change. **MS:** osteoporosis (long term use).

Interactions

Drug-Drug: ↑ CNS depression with other **CNS depressants** including **alcohol**, some **antidepressants**, some **antihistamines**, **anxiolytics**, **benzodiazepines**, and **sedative/hypnotics**. ↑ risk of QT prolongation and serious arrhythmias with **Class Ia and III antiarrhythmics** (including **quinidine**, **amiodarone**, and **sotalol**), some **antipsychotics** (including **thioridazine**), some **macrolides** (including **erythromycin**), and some **fluoroquinolones** (including **moxifloxacin**); concurrent use should be avoided. Concurrent use of **diuretics** and other **drugs affecting electrolytes** may ↑ risk of QT interval prolongation and serious arrthythmias. ↑ risk of anticholinergic adverse reactions, including paralytic ileus when used concurrently with other **anticholinergics** or **drugs with anticholinergic side effects**. May ↓ metabolism and ↑ effects of **tricyclic antidepressants**. ↑ risk of extrapyramidal symptoms with **metoclopramide**. May ↓ effectiveness of **levodopa** and **dopamine agonists**.

Route/Dosage

PO (Adults): 1 mg 3 times daily initially; ↑ by 1 mg every 2–3 days until desired response, usual effective dose is 3–6 mg/day in divided doses (up to 12 mg/day has been used); if insomnia occurs, evening dose may be ↓.

IM (Adults): Initiate with a 5–20 mg test dose (use 5 mg dose in elderly/frail/cachectic patients) as the 2% injection. Patients previously treated with long-acting neuroleptic injections may tolerate initial doses of 20 mg. A 2nd 20 mg dose may be given 4–10 days later and then 20–40 mg every 2–3 wk depending on response. Oral flupentixol should be continued, but gradually decreased in the first wk following depot injection. Guidelines for conversion from PO to depot IM injection: daily oral dose (mg) × 4 = dose of depot injection (mg) given every 2 wk *or* daily oral dose (mg) × 8 = depot injection (mg) given every 4 wk.

Availability

Tablets (flupentixol dihydrochloride): 0.5 mg, 3 mg, 5 mg; Depot injection (flupentixol decanoate—contains medium-chain triglycerides [coconut oil]): 20 mg/mL (2%), 100 mg/mL (10%).

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy.
- Monitor BP (sitting, standing, lying), ECG, pulse, and respiratory rate before and frequently during the period of dose adjustment. May cause Q-T prolongation.
- Observe carefully when administering oral medication to ensure that medication is actually taken and not hoarded.
- Assess weight and BMI initially and throughout therapy.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet help minimize constipation.
- Monitor for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Reduction in dose or discontinuation of medication may be necessary. Benztropine or diphenhydramine may be used to control these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, arrhythmias, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report immediately.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- ***Lab Test Considerations:*** Monitor CBC and liver function tests periodically during treatment. May cause ↑ AST, ALT, and alkaline phosphatase.
- Monitor blood glucose prior to and periodically during therapy. May cause hyperglycemia.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.
- May cause false-positive pregnancy tests.

© F.A. Davis Publishing

Implementation

- **PO:** Initially, take tablets 3 times daily, without regard to food. Dose will increase for first few days until desired results. Maintenance dose is usually taken in morning.
- When converting to IM doses, PO dose is usually continued in decreasing doses for first wk.
- **IM:** Inject deep IM preferably into gluteus maximus. Solution is a yellow viscous oil, aspirate prior to injection to ensure dose is not injected IV. Do not administer solutions that are discolored, hazy, or contain particulate matter.
- For large doses or pain with large volume, flupentizol decanoate BP 10% (100 mg/mL) may be used instead of flupentixol decanoate BP 2% (20 mg/mL).

Patient/Family Teaching

- Instruct patient to take as directed. If a dose is missed, omit and take next dose as scheduled. Discontinuation should be gradual; abrupt discontinuation may cause withdrawal symptoms (nausea, vomiting, anorexia, diarrhea, rhinorrhea, sweating, myalgias, paraesthesias, insomnia, restlessness, anxiety, agitation, vertigo, feelings of warmth and coldness, tremor). Symptoms begin within 1 to 4 days of withdrawal and abate within 7 to 14 days. Advise patient to read *Patient Information* leaflet prior to starting therapy and with each Rx refill in case of changes.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Caution patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools occur.
- Instruct patient to avoid sun exposure and to wear protective clothing and sunscreen when outdoors.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation

- Decreased symptoms of schizophrenia (delusions, hallucinations, social withdrawal, flat, blunt affect).

fusidic acid (fyoo-**sid**-ik **as**-id)

Fucidin, Fucithalmic

Classification

Therapeutic: anti-infectives

Indications

Topical: Local treatment of primary and secondary bacterial skin infections including impetigo contagiosa, erythrasma and secondary skin infections such as infected wounds/burns. **Ophth:** Treatment of superficial eye infections.

Action

Inhibits bacterial protein synthesis. **Therapeutic Effects:** Resolution of localized bacterial infections. Not active against Gram-negative organisms; active against Staphylococci, Streptococci, and Corynebacterium.

Pharmacokinetics

Absorption: Unknown.
Distribution: Systemically absorbed drug crosses the placenta and enters breast milk.
Metabolism and Excretion: Absorbed drug is extensively metabolized.
Half-life: 5–6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Top	unknown	unknown	6–8 hr
Ophth	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fusidic acid or other components of the formulation (topical ointment contains lanolin).
Use Cautiously in: OB: Potential benefits should be weighed against the possible hazards to the fetus (crosses the placenta); Lactation: Safe use during breast feeding has not been established (enters breast milk).

Adverse Reactions/Side Effects

Derm: mild local irritation.

Interactions

Drug-Drug: None noted.

Route/Dosage

Topical (Adults and Children): Apply to affected area 3–4 times daily.
Ophth (Adults and Children): One drop into conjunctival sac of both eyes every 12 hr for 7 days.

Availability

Topical cream: 2% (20 mg/g); Topical ointment (contains lanolin): 2% (20 mg/g); Ophthalmic viscous drops (microcrystalline suspension): 1%. ***In combination with:*** hydrocortisone (Fucidin H).

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Inspect involved areas of skin and mucous membranes before and frequently during therapy. Increased skin irritation may indicate need to discontinue medication.

Implementation

- Do not confuse topical product with ophthalmic product.
- **Topical:** Consult health care professional for proper cleansing technique before applying medication. Apply small amount to cover affected area completely. Avoid the use of occlusive wrappings or dressings unless directed by health care professional.
- **Ophth:** Administer 1 drop into conjunctival sac of both eyes every 12 hr for 7 days. See Appendix C for instructions.

Patient/Family Teaching

- Instruct patient to apply medication as directed for full course of therapy, even if feeling better. Emphasize the importance of avoiding the eyes.
- Advise patient to report increased skin irritation or lack of response to therapy to health care professional.

Evaluation

- Resolution of skin or eye infection.

gliclazide (glik-la-zide)

Diamicron MR

Classification

Therapeutic: antidiabetics
Pharmacologic: sulfonylureas

Indications

Control of blood sugar in type 2 diabetes mellitus when control of diet and exercise fails or when insulin is not an option. Requires some pancreatic function.

Action

Lowers blood glucose by stimulating the release of insulin from the pancreas and increasing sensitivity to insulin at receptor sites. **Therapeutic Effects:** Lowering of blood glucose in diabetic patients.

Pharmacokinetics

Absorption: Well absorbed following oral administration (97%).
Distribution: Unknown.
Protein Binding: 95%.
Metabolism and Excretion: Extensively metabolized, metabolites are mostly eliminated (60–70%) in urine, 10–20% in feces; <1% excreted unchanged in urine.
Half-life: *Tablets*—10.4 hr; *modified-release tablets*—16 hr.

TIME/ACTION PROFILE (effect on blood sugar)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4–6 hr (blood levels)	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; cross-sensitivity with other sulfonylureas may occur; Unstable diabetes, type 1 diabetes mellitus, diabetic ketoacidosis, diabetic coma or pre-coma; Severe hepatic or renal impairment; Concurrent use of oral/oromucosal miconazole, alcohol or alcohol-containing medications, or systemic phenylbutazone; OB: Should not be used during pregnancy, insulin is preferred; Lactation: Should not be used during lactation, insulin is perferred.
Use Cautiously in: Glucose 6-phosphate dehydrogenase deficiency (↑ risk of hemolytic anemia); Infection, stress, or changes in diet may alter requirements for control of blood sugar or require use of insulin; Impaired thyroid, pituitary, or adrenal function; Malnutrition, high fever, prolonged nausea, or vomiting; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

Endo: hypoglycemia. **GI:** abdominal pain, diarrhea, dyspepsia, ↑ liver enzymes, nausea, vomiting. **Derm:** photosensitivity, rash.

Interactions

Drug-Drug: Concurrent use of **alcohol**, **angiotensin converting-enzyme inhibitors**, **antitubercular**s, **azole antifungals**, **beta-blockers**, **clarithromycin**, **clofibrate**, **disopyramide**, **H2–receptor antagonists**, **MAO inhibitors**, **NSAIDs**, **phenylbutazone**, **salicylates**, long-acting **sulfonamides**, **warfarin**, may ↑ risk of hypoglycemia. ↑ risk of hypoglycemia with other **antidiabetic agents** including **alpha glucosidase inhibitors**, **biguanides**, and **insulin**. Concurrent use of **chlorpromazine**, **corticosteroids**, **danazol**, **diuretics** (including **thiazides**, and **furosemide**), **hormonal contraceptives** (**estrogen** and **progestogen**), **nicotinic acid** (pharmacologic doses), **ritodrine**, **salbutamol**, **terbutaline**, or **tetracosactrin** may ↑ risk of hyperglycemia and lead to loss of diabetic control. May ↑ risk of bleeding with **warfarin**. Concurrent use with **alcohol** may result in a disulfiram-like reaction and should be avoided. **Beta-blockers** may ↓ some symptoms of hyperglycemia.

Route/Dosage

PO (Adults): *Tablets*—80–320 mg/day, doses >160 mg/day should be divided and given twice daily; *modified-release tablets*—30 mg daily, may be ↑ in 30 mg increments every 2 wk until blood sugar is controlled up to 120 mg/day.

Availability

Tablets (contain lactose): 80 mg; Modified-release tablets: 30 mg, 60 mg.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemia (hunger, weakness, sweating, dizziness, tachycardia, anxiety).
- Assess patient for allergy to sulfonyureas.
- ***Lab Test Considerations:*** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of treatment.
- Monitor liver function periodically in patients with mild to moderate liver dysfunction. May cause ↑ AST, ALT, alkaline phosphatase, and LDH.
- Monitor renal function periodically in patients with mild to moderate renal dysfunction. May cause ↑ creatinine and hyponatremia.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated with administration of oral glucose. Treat severe hypoglycemia with IV D50W followed by continuous IV infusion of more dilute dextrose solution at a rate sufficient to keep serum glucose at approximately 100 mg/dL.

Implementation

- Patients on a diabetic regimen exposed to stress, fever, infection, trauma, or surgery may require administration of insulin.
- **PO:** Administer with meals at the same time every day.

Patient/Family Teaching

- Instruct patient to take gliclazides as directed at the same time every day.
- Explain to patient that this medication does not cure diabetes and must be used in conjunction with a prescribed diet, exercise regimen, to prevent hypoglycemic and hyperglycemic events.
- Instruct patient on proper technique for home glucose monitoring. Monitor closely during periods of stress or illness and notify health care professional if significant changes occur.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to drink a glass of orange juice or ingest 2–3 tsp of sugar, honey, or corn syrup dissolved in water or an appropriate number of glucose tablets and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Concurrent use of alcohol may cause a disulfiram-like reaction (abdominal cramps, nausea, flushing, headaches, and hypoglycemia).
- Instruct patient to avoid sun exposure and to wear protective clothing and sunscreen when outdoors.
- Caution patient to avoid other medications, especially aspirin and alcohol, while on this therapy without consulting health care professional.
- Advise patient to notify health care professional promptly if unusual weight gain, swelling of ankles, drowsiness, shortness of breath, muscle cramps, weakness, sore throat, rash, or unusual bleeding or bruising occurs.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to carry sugar packets or candy, and identification describing diabetes diagnosis and medication regimen.
- Insulin is the recommended method of controlling blood sugar during pregnancy. Counsel female patients to use a form of contraception other than oral contraceptives and to notify health care professional promptly if pregnancy is planned or suspected.
- Emphasize the importance of routine follow-up exams.

Evaluation

- Control of blood glucose levels to avoid episodes of hypoglycemia and hyperglycemia.

methotrimeprazine

(meth-oh-try-**mep**-ra-zeen)

Methoprazine, Nozinan

Classification

Therapeutic: antipsychotics, nonopioid analgesics

Pharmacologic: phenothiazines

Indications

Management of psychotic disturbances. Management of conditions associated with anxiety/tension. As an analgesic and adjunct in pain due to cancer, zona, trigeminal neuralgia, intercostal neuralgia, phantom limb pain, and muscular discomforts. Used as a preoperative sedative. As an antiemetic. As a sedative in the treatment of insomnia.

Action

Sedation. **Therapeutic Effects:** Reduction in severity of pain.

Pharmacokinetics

Absorption: Well absorbed after PO/IM administration. IV administration results in complete bioavailability.

Distribution: Enters CSF and crosses the placenta. Minimal amounts enter breast milk.

Metabolism and Excretion: Mostly metabolized by the liver. Some metabolites are active; 1% excreted unchanged by the kidneys.

Half-life: *PO*— 10.3–10.8 hr; *IM*— 15–30 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (blood levels)	unknown	2.7–2.9 hr	8–12 hr
IM (analgesia)	unknown	20–40 min	8 hr (up to 24 hr in children)

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.

*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Blood dyscrasias; Hepatic impairment; Hypersensitivity to methotrimeprazine, phenothiazines or sulfites; Comatose patients or those who have overdosed on CNS depressants including alcohol, analgesics, opioids, or sedative/hypnotics; OB: Third-trimester use may result in agitation, hypotonia, tremor, somnolence, respiratory distress, and feeding disturbances in newborn and should be avoided.
Use Cautiously in: History of seizures; History of glaucoma or prostatic hypertrophy (↑ risk of anticholinergic adverse reactions); Bradycardia, electrolyte abnormalities, congenital/acquired prolonged QT interval or concurrent use of drugs that may prolong QT interval (↑ risk of serious arrhythmias); Underlying cardiovascular disease including stroke, arteriosclerosis, or thromboembolism (↑ risk of adverse cardiovascular effects); Geri: Initial dosage ↓ recommended, ↑ risk of death in elderly patients with dementia; Lactation: Safety not established; Pedi: Safety not established.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, amnesia, drowsiness, excess sedation, disorientation, euphoria, extrapyramidal reactions, headache, slurred speech, tardive dyskinesia, weakness. **EENT:** nasal congestion. **CV:** orthostatic hypotension, bradycardia, palpitations, tachycardia. **GI:** constipation, abdominal discomfort, dry mouth, nausea, vomiting. **GU:** difficulty in urination. **Endo:** hyperglycemia, hyperprolactinemia. **Hemat:** blood dyscrasias. **Local:** pain at injection site. **Misc:** chills.

Interactions

Drug-Drug: ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **antidepressants**, **opioids**, or **sedative/hypnotics**; ↓ dose of these agents by 50% initially. ↑ anticholinergic effects with **antihistamines**, **antidepressants**, **phenothiazines**, **quinidine**, **disopyramide**, **atropine**, or **scopolamine**; ↓ doses of concurrent atropine or scopolamine. Reverses vasopressor effects of **epinephrine**; avoid concurrent use—if vasopressor required, use phenylephrine or norepinephrine. ↑ risk of hypotension with acute ingestion of **alcohol**, **nitrates**, **MAO inhibitors**, or **antihypertensives**. Concurrent use with **succinylcholine** may result in tachycardia, hypotension, CNS stimulation, delirium, and ↑ extrapyramidal symptoms.
Drug-Natural Products: Concomitant use of **kava**, **valerian**, **skullcap**, **chamomile**, or **hops** ↑ risk of CNS depression.

Route/Dosage

PO (Adults): *Minor conditions*—6–25 mg/day in 3 divided doses (if sedation occurs, use smaller daytime doses and a larger dose at bedtime); *Night time sedative*—10–25 mg as a single bedtime dose; *Psychoses/intense pain*—50–75 mg/day in 2–3 divided doses, dose may be titrated upward to desired effect (doses of 1 g/day have been used, if daily dose exceeds 100–200 mg, administer in divided doses and keep patient at bedrest).
PO (Children): 0.25 mg/kg/day in 2–3 divided doses (not to exceed 40 mg/day in children <12 yr).
IM (Adults): *Postoperative analgesic adjunct*—10–25 mg every 8 hr, if given with opioids, ↓ opioid dose by 50%.
IM (Children): *Analgesia*—62.5–125 mcg (0.0625–0.125 mg)/kg/day single dose or divided doses, change to oral medication as soon as possible.
IV (Children): *Palliative care setting*—62.5 mcg (0.0625 mg)/kg/day in 250 mL of 5% dextrose solution as a slow infusion (20–40 drops/min).

Availability

Tablets: 2 mg, 5 mg, 25 mg, 50 mg; Solution for injection: 25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain before and 30 min after administration.
- Monitor BP frequently after injection. Orthostatic hypotension, fainting, syncope, and weakness frequently occur from 10 min to 12 hr after administration. Patient should remain supine for 6–12 hr after injection.
- Assess weight and BMI initially and throughout therapy.
- Observe patient carefully for extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs). Usually occur only after prolonged or high-dose therapy. Usually resolve with dose decrease or administration of antiparkinsonian agent.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately and discontinue therapy; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue methotrimeprazine and notify health care professional immediately if these symptoms occur.
- Methotrimeprazine potentiates the action of other CNS depressants but can be given in conjunction with modified doses of opioid analgesics for management of severe pain. This medication does not significantly depress respiratory status and can be useful where pulmonary reserve is low.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- ***Lab Test Considerations:*** Monitor CBC prior to and periodically during therapy and liver function tests should be evaluated periodically throughout long-term (>30 days) therapy.
- Monitor blood glucose prior to and periodically during therapy. May cause hyperglycemia.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Implementation

- **PO:** May be administered during day or only at night depending on indication.

© F.A. Davis Publishing

- **IM:** Do not inject subcut. Inject slowly into deep, well-developed muscle. Rotate injection sites.
- **Intermittent Infusion:** For patients in palliative care, may be infused as 0.0625 mg/kg/day in 250 mL of D5W. ***Rate:*** Infuse slowly 20–40 drops per min.
- **Y-Site Compatibility:** fentanyl hydromorphone, methadone, morphine, sufentanil.
- **Y-Site Incompatibility:** heparin.

Patient/Family Teaching

- Instruct patient on how and when to ask for pain medication.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double dose. Advise patient to read *Patient Information* leaflet prior to starting therapy and with each Rx refill in case of changes.
- Advise patients to make position changes slowly and to remain recumbent for 6–12 hr after administration to minimize orthostatic hypotension.
- May cause drowsiness. Caution patient to request assistance with ambulation and transfer and to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Caution patient to avoid taking alcohol or other CNS depressants concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun. Extremes of temperature should also be avoided because this drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, dark-colored urine, or clay-colored stools or signs of blood clots (swelling, pain, and redness in an arm or leg that can be warm to touch, sudden chest pain, difficulty breathing, heart palpitations) occur.

Evaluation

- Decrease in severity of pain.
- Sedation.

moclobemide

(moe-**kloe**-be-mide)

Manerix

Classification

Therapeutic: antidepressants

Pharmacologic: monamine oxidase (MAO) inhibitors, benzamides

Indications

Treatment of depression.

Action

Short-acting, reversible inhibitor of monoamine oxidase type A. Increases concentrations of serotonin, norepinephrine, and dopamine. **Therapeutic Effects:** Decreased symptoms of depression, with improved mood and quality of life.

Pharmacokinetics

Absorption: 98% absorbed following oral administration, but undergoes first-pass hepatic metabolism resulting in 90% bioavailability.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized (partially by CYP2C19 and CYP2D6), very small amounts are pharmacologically active, less than 1% excreted unchanged in urine.

Half-life: 1.5 hr (↑ with dose).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	days–several wk (antidepressant effect)	0.5–3.5 hr (blood levels)	24 hr (MAO-A inhibition)

Contraindications/Precautions

Contraindicated in: Known hypersensitivity; Acute confusional states; Concurrent use of tricyclic antidepressants; Concurrent use of SSRIs or other MAO inhibitors; Concurrent use of dextromethorphan, meperidine, selegiline, or thioridazine; Pedi: Safety not established, use is not recommended.

Use Cautiously in: History of suicide attempt or ideation; History of thyrotoxicosis or pheochromocytoma (possible risk of hypertensive reaction); Severe hepatic impairment (↓ dose required); Renal impairment; OB: Should not be used unless anticipated benefits justify potential harm to fetus; Lactation: Not recommended unless anticipated benefits justify potential harm to infant.

Adverse Reactions/Side Effects

CNS: SUICIDAL IDEATION, agitation, insomnia, restlessness, tremor. **CV:** hypotension.

Interactions

Drug-Drug: ↑ levels and risk of QT prolongation with **thioridazine**, avoid concurrent use. Concurrent use with **selegiline** greatly ↑ sensitivity to tyramine and is contraindicated. Concurrent use with **tricyclic antidepressants** may result in severe adverse reactions and is contraindicated. Should not be used with **SSRIs** or other **MAO inhibitors**; when making a switch allow 4–5 half-lives of previous drug; for **fluoxetine** wait at least 5 wk. Exessive **alcohol** should be avoided. **Cimetidine** ↓ metabolism and ↑ blood levels, ↓ moclobemide dose by 50%. Because of the potential for interactions with **anesthetics**, especially local anesthetics containing **epinephrine**, moclobemide should be discontinued at least 2 days prior to procedures. Concurrent use with **opioids** should be avoided; dosage adjustments may be necessary. Concurrent use of **sympathomimetics** in-

© F.A. Davis Publishing

cluding **ephedrine** and **amphetamines** may ↑ blood pressure and should be avoided. Concurrent use with **dextromethorphan** may result in vertigo, tremor, nausea and vomiting and should be avoided. Concurrent use with **antihypertensives** should be carefully monitored. **Drug-Food:** Ingestion of large amounts of **tyramine-containing foods** including some cheeses and **Marmite yeast extract** may result in hypertension and arrhythmias and should be undertaken with caution.

Route/Dosage

PO (Adults): 150 mg twice daily initially; may be ↑ gradually after one wk as needed/tolerated up to 600 mg/day.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment or concurrent enzyme inhibitor (cimetidine)* — ↓ daily dose to ⅓ to ½ of standard dose.

Availability

Tablets: 100 mg, 150 mg, 300 mg.

NURSING IMPLICATIONS

Assessment

- Assess mental status for orientation, mood, behavior, and anxiety. Assess for suicidal tendencies. Restrict amount of drug available to patient.
- Monitor BP and pulse before and frequently during therapy. Report significant changes promptly.
- Monitor mood changes. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor intake and output ratios and daily weight. Assess patient for peripheral edema and urinary retention.
- ***Lab Test Considerations:*** Monitor liver and kidney function periodically during treatment.
- Monitor serum glucose closely in diabetic patients; hypoglycemia may occur.
- ***Toxicity and Overdose:*** Concurrent ingestion of tyramine-rich foods and many medications may result in a life-threatening hypertensive crisis. Signs and symptoms of hypertensive crisis include chest pain, tachycardia, severe headache, nausea and vomiting, photosensitivity, and enlarged pupils. Treatment includes IV phentolamine.
- Symptoms of overdose include anxiety, irritability, tachycardia, hypertension or hypotension, respiratory distress, dizziness, drowsiness, hallucinations, confusion, seizures, fever, and diaphoresis. Treatment includes induction of vomiting or gastric lavage and supportive therapy as symptoms arise.

Implementation

- Administer after meals. Swallow tablet whole; do not crush, break, or chew. Dose may be adjusted gradually during the first wk of therapy.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses if remembered unless almost time for next dose; do not double doses. Do not discontinue abruptly; withdrawal symptoms (nausea, vomiting, malaise, nightmares, agitation, psychosis, seizures) may occur. Advise patient to read *Patient Information* leaflet prior to starting and with each Rx refill in case of changes.
- Caution patient to avoid alcohol, CNS depressants, OTC drugs, and foods or beverages containing tyramine (see Appendix J) during and for at least 2 wk after therapy has been discontinued; they may precipitate a hypertensive crisis. Contact health care professional immediately if symptoms of hypertensive crisis develop.
- Caution patient to notify health care professional if neck stiffness, changes in vision, diarrhea, constipation, rapid/pounding heartbeat, sudden and severe headache, stiff neck, confusion, disorientation, slurred speech, behavioral changes, seizures.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Instruct patient to carry identification describing medication regimen.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Encourage patient to participate in psychotherapy in conjunction with taking medication.

Evaluation

- Improved mood in depressed patients.
- Decreased anxiety.

pinaverium

(pin-ah-**veer**-ee-um)

Dicetel

Classification

Therapeutic: anti-irritable bowel syndrome agents

Pharmacologic: calcium channel blockers

Indications

Management of symptoms of irritable bowel syndrome, (IBS) including abdominal pain, bowel disturbances and discomfort. Treatment of symptoms related to biliary tract disorders.

Action

Acts as a calcium channel blocker with specific selectivity for intestinal smooth muscle. Relaxes gastrointestinal (mainly colon) and biliary tracts, inhibits colonic motor response to food/pharmacologic stimulation. **Therapeutic Effects:** Decreased symptoms of IBS.

Pharmacokinetics

Absorption: Poorly absorbed (1–10%).

Distribution: Distributes selectively to digestive tract.

© F.A. Davis Publishing

Protein Binding: 97%.
Metabolism and Excretion: Minimal enterohepatic cycling, eliminated almost entirely in feces. Some metabolism.
Half-life: 1.5 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	unknown

Contraindications/Precautions
Contraindicated in: Known hypersensitivity; Galactose intolerance/Lapp lactase deficiency/glucose-galactose malabsorption (tablets contain lactose); Lactation: Avoid use if breast feeding; Pedi: Safety and effectiveness not established, use is not recommended.
Use Cautiously in: Pre-existing esophageal lesions/hiatal hernia (glass of water and snack should be taken with each dose); OB: Should be used only if essential to welfare of patient.

Adverse Reactions/Side Effects
All less than 1%. **CNS:** drowsiness, headache, vertigo. **GI:** constipation, diarrhea, distention, dry mouth, epigastric pain/fullness, esophageal irritation, nausea. **Derm:** rash.

Interactions
Drug-Drug: Concurrent use of **anticholinergics** may ↑ spasmolytic effects.

Route/Dosage
PO (Adults): 50 mg 3 times daily; may be ↑ as needed/tolerated up to 100 mg 3 times daily.

Availability
Tablets (contain lactose): 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment
- Assess for symptoms of IBS (abdominal pain or discomfort, bloating, constipation).
- Assess for lactose intolerance; product contains lactose.

Implementation
- **PO:** Administer tablet with a glass of water and food. Swallow tablet whole, do not crush, chew, or suck. If >3 tablets/day prescribed, take additional tablets with glass of water and a snack. May be irritating to esophagus. Do not take the tablet while lying down or just before bedtime.

Patient/Family Teaching
- Instruct patient to take pinaverium as directed. Take missed doses as soon as remembered unless almost time for next dose; do not double doses.
- Caution patient to inform health care professional if the following side effects persist or worsen: stomach pain or fullness, nausea, constipation or diarrhea, heartburn, headache, dry mouth, dizziness, skin rash.
- Instruct patient to avoid alcohol intake while taking this medication.
- Advise female patient to inform health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation
- A decrease in symptoms of irritable bowel syndrome. The length of treatment depends on the condition being treated.

prucalopride succinate
(proo-**kal**-o-pride)
Resotran

Classification
Therapeutic: prokinetic agents
Pharmacologic: dihydrobenzofurancarboxamides

Indications
Treatment of chronic idiopathic constipation in adult females who do not respond to laxatives.

Action
Acts as a serotonin ($5-HT_4$) receptor agonist with prokinetic properties. Enhances peristalsis and gastrointestinal propulsion. **Therapeutic Effects:** Laxative effect.

Pharmacokinetics
Absorption: Rapidly absorbed (90%) following oral administration.
Distribution: Rapidly and extensively distributed, enters breast milk.
Metabolism and Excretion: 60% excreted unchanged in urine, 3–8% unchanged in feces, minor amounts are extensively metabolized.
Half-life: 24 hr.

TIME/ACTION PROFILE (normalization of bowel movements)

ROUTE	ONSET	PEAK	DURATION
PO	3–4 days	1–4 wk	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Renal impairment requiring dialysis; Intestinal obstruction/perforation (structural or functional), obstructive ileus, severe gastrointestinal inflammatory disease, including Crohn's disease, ulcerative colitis, toxic megacolon/megarectum; Galactose intolerance, Lapp lactase deficiency or glucose/galactose malabsorption (tablets contain lactose); OB: Not recommended for use during pregnancy; Lactation: Not recommended for use while breast feeding; Pedi: Safety and effectiveness not established; not recommended for use.
Use Cautiously in: Severe/clinically stable concurrent chronic diseases including liver, cardiovascular or lung disease, neurological or psychiatric disorders, can-

© F.A. Davis Publishing

cer, AIDS or other disorders or insulin-dependent diabetes mellitus; History of arrhythmias or cardiovascular disease, ischemic heart disease, pre-excitation syndromes (including Wolff-Parkinson-White syndrome, Lown-Ganong-Levine syndrome, or AV nodal disorders (↑ risk of arrhythmias); Severe renal impairment (↓ dose recommended); Geri: Due to age-related ↓ in renal function, ↓ dose is recommended.

Adverse Reactions/Side Effects

CNS: headache, dizziness, fatigue. **CV:** palpitations, ↓ PR interval, tachycardia. **GI:** abdominal pain, diarrhea, nausea, vomiting.

Interactions

Drug-Drug: Severe diarrhea may ↓ effectiveness of **oral hormonal contraceptives**; additional method of contraception recommended. Blood levels and effects are ↑ by concurrent CYP3A4 and P-gp inhibitors including **ketoconazole**, **verapamil**, **cyclosporine**, and **quinidine**. Beneficial effects may be ↓ by concurrent use of **anticholinergics**.

Route/Dosage

PO (Adults): 2 mg once daily. If no bowel movement occurs in 3–4 days, add-on laxatives should be considered. If benefit is not obtained after 4 wk, prucalopride succinate should be discontinued.

PO (Adults >65 yr): 1 mg once daily.

Renal Impairment

PO (Adults): *GFR <30 mL/min/1.73m²* — 1 mg once daily.

Availability

Tablets (contain lactose): 1 mg, 2 mg.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of chronic constipation (abdominal pain or discomfort, bloating, constipation).

Implementation

- **PO:** Medication should be taken with food or on an empty stomach at the same time each day.

Patient/Family Teaching

- Instruct patient to take prucalopride succinate as directed.
- Caution the patient to discontinue the medication and notify health care professional with occurrence of severe diarrhea, signs of heart attack, black tarry stools, vomiting of blood or material that looks like coffee grounds.
- Advise patient on a nutritional regimen and hydration, and exercise to decrease constipation.
- Inform patient that if no bowel movement within 3 days of treatment, a "rescue" laxative may be added occasionally while taking prucalopride succinate.
- Advise women of childbearing age who are taking prucalopride succinate to use an effective method of birth control during treatment. If pregnant occurs while taking this medication, contact health care professional immediately.

Evaluation

- A soft, formed bowel movement.

trimebutine (try-meh-boo-teen)

Modulon

Classification

Therapeutic: lower gastrointestinal tract motility regulators, spasmolytics

Indications

Symptomatic treatment of irritable bowel syndrome (IBS). Treatment of postoperative paralytic ileus.

Action

Acts as a spasmolytic. **Therapeutic Effects:** ↓ symptoms of IBS. Resumption of intestinal transit following abdominal surgical procedures.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized, <2.4% excreted unchanged in urine.

Half-life: 2.7–3.1 hr.

TIME/ACTION PROFILE (symptom relief)

ROUTE	ONSET	PEAK	DURATION
PO	within 3 days–2 wk	1 hr (blood level)	>1 wk (following discontinuation)

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: OB: Not recommended for use; Pedi: Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CNS: dizziness, drowsiness, fatigue, headache. **GI:** diarrhea, dry mouth, dysguesia, dyspepsia, epigastric pain, nausea. **Derm:** hot/cold sensation, rash.

Interactions

Drug-Drug: None known.

Route/Dosage

PO (Adults): 200 mg 3 times daily.

Availability

Tablets: 100 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of irritable bowel syndrome (cramping, constipation and diarrhea, mucus in stools).
- Assess for abdominal distention and assess bowel sounds.
- Monitor intake and output and record.

Implementation

- **PO:** Administer three times daily before meals.

© F.A. Davis Publishing

Patient/Family Teaching
- Instruct patient to take trimebutine as directed.
- Advise female patient to inform health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation
- Decrease signs and symptoms of irritable bowel disease.

zopiclone (zoe-pi-clone)
Imovane

Classification
Therapeutic: sedative/hypnotics
Pharmacologic: cyclopyrrolones

Indications
Short-term treatment of insomnia characterized by difficulty falling asleep and frequent/early awakenings.

Action
Interacts with GABA-receptor complexes; not a benzodiazepine. **Therapeutic Effects:** Improved sleep with decreased latency and increased maintenance of sleep.

Pharmacokinetics
Absorption: Rapidly absorbed (75%) following oral administration.
Distribution: Rapidly distributed from extravascular compartment. Enters breast milk in concentrations that are 50% of plasma levels.
Metabolism and Excretion: Extensively metabolized (mostly by the CYP3A4 enzyme system), metabolites have minimal sedative/hypnotic activity; 4–5% excreted unchanged in urine.
Half-life: 5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2 hr	6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Myasthenia gravis; Severe hepatic impairment; Severe respiratory impairment (including sleep apnea); Galactose intolerance (5 mg tablet contains lactose); OB: May cause fetal harm, neonatal CNS depression or withdrawal; Lactation: Breast feeding not recommended.
Use Cautiously in: Renal, hepatic, or pulmonary impairment (dosage ↓ may be recommended); Past history of paradoxical reactions to sedative/hypnotics or alcohol or violent behavior; History of depression or suicidal ideation; Geri: ↑ sensitivity may ↑ the risk of falls, confusion, or anterograde amnesia (use lowest effective dose); Pedi: Safety and effectiveness not established.
Exercise Extreme Caution in: History of substance/alcohol abuse.

Adverse Reactions/Side Effects
CV: abnormal thinking, behavioral changes, sleep-driving. **GI:** bitter taste, anorexia, constipation, dry mouth, dyspepsia. **Misc:** allergic reactions including ANAPHYLAXIS, ANAPHYLACTOID REACTIONS, and ANGIOEDEMA.

Interactions
Drug-Drug: ↑ risk of CNS depression with other **CNS depressants** including **antihistamines**, **antidepressants**, **opioids**, **sedative/hypnotics**, and **antipsychotics**. ↑ levels and risk of CNS depression with **drugs that inhibit the CYP3A4 enzyme system**, including **erythromycin ketoconazole**, **itraconazole**, **clarithromycin**, **nefazodone**, **ritonavir**, and **nelfinavir**; ↓ dose may be necessary. Levels and effectiveness may be ↓ by **drugs that induce the CYP3A4 enzyme system**, including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifampicin**, and **rifampin**; dose ↑ may be necessary.

Route/Dosage
PO (Adults): 5–7.5 mg taken immediately before bedtime; not to exceed 7.5 mg or 7–10 days use. Geri: 3.75 mg initially taken immediately before bedtime; may be ↑ up to 7.5 mg if needed..

Hepatic/Renal Impairment
PO (Adults): 3.75 mg initially taken immediately before bedtime; may be ↑ up to 7.5 mg if needed.

Availability
Tablets: 5 mg, 7.5 mg.

NURSING IMPLICATIONS

Assessment
- Assess mental status, sleep patterns, and previous use of sedative/hypnotics. Prolonged use of >7–10 days may lead to physical and psychological dependence.
- Assess alertness at time of peak of drug. Notify health care professional if desired sedation does not occur.
- Assess patient for pain. Medicate as needed. Untreated pain decreases sedative effects.

Implementation
- Before administering, reduce external stimuli and provide comfort measures to increase effectiveness of medication.
- Protect patient from injury. Raise bed side rails. Assist with ambulation. Remove patient's cigarettes.
- Use lowest effective dose.
- **PO:** Tablets should be swallowed with full glass of water. For faster onset of sleep, do not administer with or immediately after a meal.

Patient/Family Teaching
- Instruct patient to take zopiclone as directed. Advise patient not to take zopiclone unless able to stay in bed a full night (7–8 hr) before being active again. Do not take more than the amount prescribed because of the habit-forming potential. Not recom-

© F.A. Davis Publishing

mended for use longer than 7–10 days. If used for 2 wk or longer, abrupt withdrawal may result in fatigue, nausea, flushing, light-headedness, uncontrolled crying, vomiting, GI upset, panic attack, or nervousness. Instruct patient to read *Patient Information* for correct product before taking and with each Rx refill, changes may occur.

- Because of rapid onset, advise patient to go to bed immediately after taking zopiclone.
- May cause daytime drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to this medication is known.
- Caution patient that complex sleep-related behaviors (sleep-driving) may occur while asleep.
- Advise patient to notify health care professional immediately if signs of anaphylaxis (swelling of the tongue or throat, trouble breathing, and nausea and vomiting) occur.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.

Evaluation

- Relief of insomnia by improved falling asleep and decreased frequency of nocturnal and early morning awakenings.

zuclopenthixol

(zoo-kloe-pen-**thix**-ole)

Clopixol, Clopixol-Acuphase, Clopixol Depot

Classification

Therapeutic: antipsychotics

Pharmacologic: thioxanthenes

Indications

Management of schizophrenia; *oral*—initial and maintenance management; *IM (acuphase)*—initial treatment of acute psychotic episodes or exacerbation of psychosis due to schizophrenia; *IM (depot)*—maintenance management of schizophrenia.

Action

Has high affinity for dopamine D_1 and D_2 receptors, α_1–adrenergic and 5–HT_2 receptors. Dopaminergic blockade produces neuroleptic activity. **Therapeutic Effects:** Decreases psychoses due to schizophrenia.

Pharmacokinetics

Absorption: *PO*—well absorbed following oral administration; *IM (depot and acuphase)*—slowly absorbed from IM sites.

Distribution: Enters breast milk.

Metabolism and Excretion: Mostly metabolized (partially by the CYP2D6 enzyme system), metabolites do not have antipsychotic activity; minimal amounts excreted unchanged in urine.

Half-life: *PO*—20 hr.

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	within hrs	4 hr (blood level)	8–24 hr
IM (acetate [Acuphase])	2–4 hr	8 hr (sedation)	2–3 days
IM (decanoate [Depot])	within 3 days	3–7 days (blood level)	2–4 wk

Contraindications/Precautions

Contraindicated in: Treatment of dementia; Narrow angle glaucoma; Pedi: Safety and effectiveness not established, use not recommended.

Use Cautiously in: Hepatic or renal impairment; Electrolyte abnormalities, including hypokalemia, hypomagnesemia, concurrent diuretic therapy or drugs affecting QT interval or cardiovascular disease/history (↑ risk of serious arrhythmias); Intestinal pathology or brain lesions (antiemetic effect may mask symptoms); History of seizures (may ↓ threshold); Parkinson's disease (may cause deterioration); Risk factors/history of stroke; Abrupt discontinuation (should be tapered); Geri: Consider age-related ↓ in renal, hepatic, and cardiovascular function, concurrent disease states and drug therapies; OB: Infants exposed in the third trimester may exhibit extrapyramidal and withdrawal reactions including agitation, hyertonia, hypotonia, tremor, somnolence, respiratory distress, and feeding disorders; do not use in pregnancy unless expected benefit to the mother outweighs potential fetal risks; Lactation: Enters breast milk; safety not established.

Adverse Reactions/Side Effects

CNS: NEUROLEPTIC MALIGNANT SYNDROME, dizziness, extrapyramidal symptoms, fatigue, sedation, tardive dyskinesia, weakness, syncope. **EENT:** abnormal vision accommodation. **CV:** THROMBOEMBOLISM, arrhythmias, hypotension, tachycardia. **GI:** constipation, dry mouth, diarrhea, thirst, vomiting. **Derm:** photosensitivity reactions, ↑ sweating. **Endo:** hyperprolactinemia, hyperglycemia. **GU:** ↓ libido, abnormal urination. **Hemat:** anemia, granulocytopenia. **Metab:** weight change. **MS:** myalgia.

Interactions

Drug-Drug: ↑ risk of CNS depression with other **CNS depressants** including **alcohol**, some **antihistamines**, some **antidepressants**, **anxiolytics**, **barbiturates**, **benzodiazepines**, and **sedative/hypnotics**. ↑ levels and risk of toxicity with **CYP2D6 inhibitors**. Concurrent use of **diuretics**, **lithium**, **Class Ia and III antiarrhythmics** including **amiodarone**, **sotalol**, and **quinidine**; some **antipsychotics** including **thioridazine**, some **macrolides** including **erythromycin**; and some **fluoroquinolones** including **moxifloxacin** ↑ risk of QT interval prolongation and serious arrhythmias; concurrent use should be avoided. ↑ risk of anticholinergic adverse reactions with other **anticholingeric drugs**. ↑ risk of hypotension with **antihypertensives** and **diuretics**. Concurrent use with **tricyclic antidepressants** may result in altered metabolism and effects of both. ↑ risk of extra-

© F.A. Davis Publishing

pyramidal symptoms with **metoclopramide**. May ↓ beneficial effects of **levodopa** and **dopamine agonists**.

Route/Dosage

PO (Adults): *Acute psychoses* — 10–50 mg/day in 2–3 divided doses initially; may be ↑ by 10–20 mg/day every 2–3 days, titrate according to response. Usual dose range is 20–60 mg/day; doses >100 mg/day are not recommended. Dose should be ↓ to lowest dose needed to control symptoms (usual range 20–40 mg/day). Once maintenance dose is established, may be given as a single daily dose.

IM (Adults): *Zuclopenthixol acetate [Acuphase]* — 50–150 mg, may be repeated every 2–3 days if necessary, some patients may need an additional dose 1–2 days after first injection only; care must be taken to avoid over-medicating due to delay in absorption and antipsychotic effects. Maximum cumulative dose should not exceed 400 mg or four injections. *Zuclopenthixol acetate (Acuphase)* dose form is not meant for long-term use, duration should not exceed 2 wk. If injection volume exceeds 2 mL, dose should be divided and given in two sites. If oral maintenance is to be used, treatment with tablets should be initiated 2–3 days following the last dose of the *Zuclopenthixol acetate (Acuphase)* dose form; if *Zucopenthixol decanoate (Depot)* dose form is to be used for maintenance, may be given concurrently with the last injection of *Zuclopenthixol acetate (Acuphase)* dose form. *Suggested transfer regimen to oral dosing* — If *Zuclopenthixol acetate (Acuphase)* dose was 50 mg, then daily oral dose could be 20 mg; if *Zuclopenthixol acetate (Acuphase)* dose was 100 mg, then daily oral dose could be 40 mg; if *Zuclopenthixol acetate (Acuphase)* dose was 150 mg, then daily oral dose could be 60 mg. *Suggested transfer regimen to Zuclopenthixol decanoate (Depot) dosing* — If *Zuclopenthixol acetate (Acuphase)* dose was 50 mg, then IM dose of *Zuclopenthixol decanoate (Depot)* could be 100 mg every 2 wk; if *Zuclopenthixol acetate (Acuphase)* dose was 100 mg, then IM dose of *Zuclopenthixol decanoate (Depot)* could be 200 mg every 2 wk; if *Zuclopenthixol acetate (Acuphase)* dose was 150 mg, then IM dose of *Zuclopenthixol decanoate (Depot)* could be 300 mg every 2 wk.

IM (Adults): *Zuclopenthixol decanoate [depot]* — Usual maintenance dose is 150–300 mg every 2–4 wk, regimens should be individualized according to response, care must be taken not to over-medicate due to delayed/prolonged absorption and effects. If injection volume exceeds 2 mL, dose should be divided and given in two sites.

Availability

Zuclopenthixol hydrochloride tablets — contain castor oil: 10 mg, 25 mg; Zuclopenthixol acetate injection (Acuphase) — contains medium-chain triglycerides: 50 mg/mL; Zuclopenthixol decanoate injection (Depot) — contains medium-chain triglycerides: 200 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) before and periodically during therapy.
- Observe carefully when administering oral medication to ensure that medication is actually taken and not hoarded.
- Assess weight and BMI initially and throughout therapy.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet help minimize constipation.
- Monitor for onset of akathisia (restlessness or desire to keep moving) and extrapyramidal side effects (*parkinsonian* — difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; *dystonic* — muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) every 2 mo during therapy and 8–12 wk after therapy has been discontinued. Reduction in dose or discontinuation of medication may be necessary. Benztropine or diphenhydramine may be used to control these symptoms.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Report immediately; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, arrhythmias, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report immediately.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- ***Lab Test Considerations:*** Monitor CBC and liver function tests every 6 mo and periodically as needed during treatment. May cause ↑ AST, ALT, and alkaline phosphatase.
- Monitor blood glucose prior to and periodically during therapy. May cause hyperglycemia.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Implementation

- **PO:** Administer tablets before or after meals.
- **IM:** Administer deep in large muscle. A test dose may be ordered for first administration.

Patient/Family Teaching

- Instruct patient to take as directed. If a dose is missed, omit and take next dose as scheduled. Discontinuation should be gradual.
- Inform patient of possibility of extrapyramidal symptoms and tardive dyskinesia. Caution patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension.

© F.A. Davis Publishing

- Medication may cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, weakness, tremors, visual disturbances, dark-colored urine, or clay-colored stools occur.
- Instruct patient to avoid sun exposure and to wear protective clothing and sunscreen when outdoors.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding or planning to breast feed.

Evaluation

- Decreased symptoms of schizophrenia (delusions, hallucinations, social withdrawal, flat, blunt affect).

© F.A. Davis Publishing

Natural/Herbal Products

The following monographs introduce some commonly used natural products. Because the amounts of active ingredients in these agents are not standardized or currently subject to FDA guidelines for medicines, *Davis's Drug Guide for Nurses*, although respectful of patients' right to choose from a variety of therapeutic options, does not endorse their routine use unless supervised by a knowledgeable health care professional. Users should take into account the possibility of adverse reactions and interactions and consider the relative lack of data supporting widespread use of these products. Doses are poorly standardized, and individuals are advised to read package labels carefully to ensure safe and efficacious use.

aloe (al-oh)

Other Name(s):
Aloe vera, Cape aloe, Aloe latex, Burn plant, Curacao aloe

Classification
Therapeutic: laxatives, wound/ulcer/decubiti healing agent

Common Uses
PO: Cathartic laxative. **Topical:** Use on burns/sunburns, wounds, irritated skin, psoriasis; topical antiinfective.

Action
PO: Exerts a laxative effect by causing increased mucous secretion and peristalsis. The cathartic effects occur within 10 hr. Water and electrolyte reabsorption are inhibited. **Topical:** May help accelerate wound healing through inhibition of thromboxane A2 and increased microcirculation preventing ischemia in wounds, although the evidence is inconsistent. May have some activity against gram-positive, gram-negative bacteria and yeast. **Therapeutic Effects:** Relief of constipation. Improved wound healing.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO, Topical	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Intestinal obstruction; Inflammatory intestinal diseases (including Crohn's disease); Appendicitis and abdominal pain of unknown origin; OB: Safety not established; Pedi: Oral aloe not appropriate for children <12 yr. Topically applied aloe gel-containing formulations have been safely used in clinical trials.
Use Cautiously in: Renal disease; Fluid or electrolyte abnormalities; Diabetes; Alcohol-containing products should be used cautiously in patients with known intolerance or liver disease; Pedi: Cautious use in children >12 yr.

Adverse Reactions/Side Effects
Derm: Contact dermatitis, skin irritation. **Endo:** hypoglycemia. **F and E:** HYPOKALEMIA, dehydration. **GI:** Cramping, diarrhea, laxative dependence (chronic use). **GU:** hematuria.

Interactions
Natural Product-Drug: Combining oral aloe with potassium-wasting drugs (e.g., **diuretics**, other **laxatives**, **corticosteroids**, **cisplatin**, **amphotericin B**) may worsen hypokalemia. Hypokalemia may ↑ risk of toxicity from **digoxin** and some **antiarrhythmics**. May have additive effects with **antidiabetic** agents. May ↑ bleeding risk with **warfarin**. **Alcohol**-containing preparations may interact with **disulfiram** and **metronidazole**.
Natural-Natural: ↑ hypokalemia risk with **licorice** and **horsetail**. Additive effects with stimulant laxative herbs and herbs with hypoglycemic potential. ↑ bleeding risk with antiplatelet herbs.

Route/Commonly Used Doses
PO (Adults): *Constipation*—100–200 mg aloe or 50 mg of aloe extract taken in the evening. Do not use for >1–2 wk without medical advice; *Juice*—1 teaspoonful tid after meals.
Topical (Adults): Aloe gel can be applied liberally to affected areas 2–3 times daily.

Availability
Alone or in combination with other herbal medicinals[OTC]; Capsules[OTC]; Juice[OTC]; Tincture (1:10 in 50% alcohol)[OTC]; Topical or gel or applied directly from cut plant.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- **Constipation:** Assess for abdominal distention, presence of bowel sounds, and usual pattern of elimination.
- Assess color, consistency, and amount of stool produced.
- **Topical:** Perform baseline skin assessment prior to applying aloe to minor wounds, burns, and abrasions. Observe the size, character, and location of the affected area prior to the application of aloe.
- Note topical response assessing for increased inflammation, drainage, pain, warmth, and/or pruritus.
- ***Lab Test Considerations:*** Monitor serum potassium in patients with chronic use and CBC in patients who self-medicate and experience bloody diarrhea or have ulcerative colitis or Crohn's disease.

Implementation

- **PO:** Administer laxative at bedtime to induce a bowel movement in the morning.
- **Topical:** Wash hands and then apply liberally to affected area of skin. Cover broken areas of skin with a light non-adhering dressing (e.g., band-aid dressing with *Telfa* lining) to facilitate keeping area clean. Do not apply an occlusive dressing over site of application.

Patient/Family Teaching

- **Constipation:** Instruct patients with pre-existing intestinal disorders (e.g., ulcerative colitis, Crohn's disease, irritable bowel syndrome) not to take aloe juice without the advice of a health care professional.
- Counsel patients that the oral juice should not be taken if they are experiencing abdominal pain, nausea, vomiting, or fever.
- Inform patients that occasional constipation may not be an issue but persistent constipation may represent a more serious health problem and to consult their health care professional.
- Advise patients to expect laxative response to the oral juice in 8–12 hr.
- Caution patients that the laxative effects may be dramatic and that accompanying dehydration and electrolyte imbalances may occur. If severe diarrhea occurs or persists, seek out treatment from their health care professional.
- Advise patients other than those with spinal cord injury that laxatives should only be used for short-term therapy. Although this is considered by some to be a natural way of correcting constipation it still carries the risk of electrolyte imbalance and dependency with chronic use.
- Encourage patients to use other forms of bowel regulation: increasing bulk in the diet, increasing fluid intake, and increasing mobility, as appropriate. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Advise patients to consume 1500–2000 mL/day of fluids during therapy to prevent dehydration.
- Caution patients with a known cardiac history not to take this herbal supplement without the advice of their health care professional because of the risk of hypokalemia worsening arrhythmias.
- Caution patients with cardiac history to avoid straining during bowel movements (Valsalva maneuver).
- **Topical:** Advise patients that topical applications should only be used for minor burns, abrasions, or wounds. Wounds of larger size or more serious burns should be treated by a health care professional.
- Instruct patients using topical application on a non-intact skin surface about signs and symptoms of infection (milky or discolored drainage, redness, warmth, swelling, pain) and to promptly seek out treatment of a health care professional if this occurs.
- Counsel patients that if improvement in the wound is not occurring or it worsens, stop treatment with aloe vera and seek the advice of a health care professional.
- Warn patients with risk factors for delayed wound healing (e.g., diabetic patients, vascular disease) not to self-medicate with aloe vera without the approval of their health care professional.

Evaluation

- A soft, formed bowel movement.
- Evacuation of the colon.
- Relief of sunburn pain.
- Wound healing in small localized burns or abrasions.

arnica (ar-ni-cuh)

Other Name(s):
Arnica montana, leopard's bane, mountain tobacco, mountain snuff, wolf's bane

Classification
Therapeutic: anti-inflammatories, immune stimulants

© F.A. Davis Publishing

Common Uses
Topical treatment of insect bites, bruises, acne, boils, sprains, muscle, and joint pain.

Action
Polysaccharides in arnica may produce a slight anti-inflammatory and analgesic effect. Some antibacterial effects are seen, in addition to a counterirritant effect, which may aid in wound healing. **Therapeutic Effects:** Decreased inflammation. Pain relief.

Pharmacokinetics
Absorption: Systemic absorption may occur following topical application to broken skin.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Topical	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Not for oral use (except in highly diluted homeopathic preparations); Arnica allergy; Avoid use on broken skin; Infectious or inflammatory GI conditions; OB: Pregnancy and lactation.
Use Cautiously in: Infectious or inflammatory GI conditions; Surgery (discontinue use 2 wk prior to procedure due to antiplatelet effects).

Adverse Reactions/Side Effects
GI: abdominal pain, vomiting, diarrhea (if taken orally). **Derm:** edematous dermatitis with pustules (chronic treatment of damaged skin), eczema (prolonged use). **Misc:** local allergic reactions.

Interactions
Natural Product-Drug: Alcohol-containing preparations may interact with **disulfiram** and **metronidazole**. May potentiate the effects of **anticoagulants** and **antiplatelet agents**, increasing the risk of bleeding.
Natural-Natural: May increase risk of bleeding with **clove**, **garlic**, **ginger**, **ginkgo**, and **ginseng**.

Route/Commonly Used Doses
Topical (Adults): *Topical*—rub or massage arnica tincture, cream, or gel onto injured area 2–3 times a day. Do not apply to broken skin; *Compress*—dilute 1 tablespoon of arnica tincture in ½ L water. Wet a gauze pad with solution and apply to affected area for 15 min. For use in poultices, dilute tincture 3–10 times with water.

Availability
Cream, tincture, salve, ointment, gel, and oil[OTC]; Topical (preparations should contain not more than 20–25% arnica tincture or 15% arnica oil)[OTC]; Homeopathic preparations[OTC].

NURSING IMPLICATIONS

Assessment
- Inspect skin for breaks prior to application to ensure arnica is applied only to an intact surface. Note the size, character, and location of affected area prior to application of arnica.
- After application, monitor affected area for signs of allergic response.
- ***Toxicity and Overdose:*** Systemic absorption may result in nausea, vomiting, organ damage, hypertension, cardiotoxicity, arrhythmias, muscular weakness, collapse, vertigo, renal dysfunction, coma, and death. If ingested orally, induce emesis and gastric lavage to remove undigested contents. Supportive care may be necessary. Do not take orally or apply to non-intact skin to avoid systemic absorption.

Implementation
- Clean skin with a non-alcohol containing cleanser prior to applying arnica. Apply topically to affected area, or site of injury, ensuring skin is intact.
- Do not take orally or apply to an open wound because of potential for systemic absorption with toxicity.

Patient/Family Teaching
- Teach patients to inspect the affected area for breaks in the skin and not to apply arnica to any areas where the skin is broken.
- Warn patients that use on non-intact skin and oral ingestion may cause life-threatening toxicity.
- Advise patients that arnica should only be used for short periods of time in the treatment of minor aches and pains associated with local muscle, joint, or skin pain. Prolonged use may cause allergic/hypersensitivity reactions to develop.
- Instruct patients taking antihypertensive agents to avoid concurrent use of arnica.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected. Arnica should be avoided during pregnancy.

Evaluation
- Relief of, or improvement in, minor aches and pains associated with muscle or joint overuse, or sprains and/or local skin irritation from insect bites, bruises, boils, or acne.

© F.A. Davis Publishing

bilberry (bill-beh-ree)

Other Name(s):
Vaccinium myrtillus, Tegens

Classification
Therapeutic: ocular agents, vascular agents

Common Uses
Visual acuity improvement, atherosclerosis, venous insufficiency, varicose veins, diabetes mellitus, diarrhea, hemorrhoids, peptic ulcer disease, osteoarthritis, and chronic fatigue syndrome.

Action
Anthocyanidins in bilberry have a variety of effects including increased glycosaminoglycans synthesis, decreased vascular permeability, reduced membrane thickness, redistribution of microvascular blood flow, and formation of interstitial fluid. **Therapeutic Effects:** Decreased inflammation. Decreased edema. Decreased blood glucose. Improved circulation.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Eliminated by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity or allergy to bilberry; Leaves are potentially toxic with chronic use of 1.5 g/kg/day.
Use Cautiously in: Diabetic patients; Patients at risk for bleeding; OB: Avoid use in pregnancy due to lack of safety data.

Adverse Reactions/Side Effects
Endo: low blood sugar. **GI:** diarrhea, upset stomach. **Hemat:** bleeding, bruising.

Interactions
Natural Product-Drug: May ↑ effects of **anticoagulants and antiplatelet drugs** and ↓ platelet activity. May ↑ effects of **antidiabetic agents** and cause hypoglycemia.
Natural-Natural: Avoid use with chromium-containing herbs and supplements (bilberry contains chromium). Avoid use with herbs with hypoglycemic properties.

Route/Commonly Used Doses
PO (Adults): *General use*—80–160 mg of aqueous extract three times daily. *Retinopathy*—160 mg of bilberry extract (Tegens®) has been taken twice daily for one mo. *Chronic venous insufficiency*—A bilberry extract equivalent to 173 mg of anthocyanins has been taken daily for 30 days.

Availability
Liquid extract; Tablets; Softgel capsules160 mg.

NURSING IMPLICATIONS

Assessment
- Monitor BP periodically during therapy, coagulation panel, blood glucose.
- ***Lab Test Considerations:*** Monitor coagulation studies in patients on anticoagulants and antiplatelet agents.
- Monitor blood glucose periodically during therapy. May cause hypoglycemia.

Implementation
- Administer without regard to food.

Patient/Family Teaching
- Instruct patient to take bilberry as directed.

Evaluation
- Improvement in vascular insufficiency.
- Decrease in diarrhea.

black cohosh (blak coe-hosh)
Remifemin

Other Name(s):
baneberry black snakeroot, bugbane, phytoestrogen, rattle root, rattleweed, rattle top, squaw root

Classification
Therapeutic: menopausal agents

Do not confuse black cohosh with blue or white cohosh

Common Uses
Management of menopausal symptoms. Premenstrual discomfort. Dysmenorrhea. Mild sedative. Rheumatism.

Action
Therapeutic effects are produced by glycosides isolated from the fresh or dried rhizome with attached roots. Mechanism of action is unclear. **Therapeutic Effects:** May decrease symptoms of menopause, including hot flashes, sweating, sleep disturbance, and anxiety. Has no effect on vaginal epithelium.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.

© F.A. Davis Publishing

Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: OB: Pregnancy and lactation.
Use Cautiously in: Breast cancer (may increase risk of metastasis); Hormone-sensitive cancers; Protein S deficiency (increased risk for thrombosis); Liver disease.

Adverse Reactions/Side Effects
Neuro: SEIZURES (in combination with evening primrose and chasteberry), headache, dizziness. **GI:** GI upset, hepatotoxicity. **Derm:** rash. **Misc:** weight gain, cramping, breast tenderness, vaginal spotting/bleeding.

Interactions
Natural Product-Drug: Unknown effects when combined with hormone replacement therapy and **antiestrogens** (e.g., **tamoxifen**). Concurrent use with **hepatotoxic drugs** may ↑ risk of liver damage. **Alcohol-containing preparations** may interact with **disulfiram** and **metronidazole**. May ↓ cytotoxic effects of **cisplatin**. May precipitate hypotension when used in combination with **antihypertensives**.
Natural-Natural: May ↑ risk of hepatotoxicity when used with **chaparral**, **comfrey**, **kava-kava**, and **niacin**.

Route/Commonly Used Doses
PO (Adults): *Tablets (Remifemin)* — 20 mg twice daily. *Liquid extract* — 0.3–2 mL 2–3 times daily. *Tincture* — 2–4 mL 2–3 times daily. *Dried rhizome* — 0.3–2 g 3 times daily. Do not use for more than 6 mo.

Availability
Alone or in combination with other herbal medicinals[OTC]; Tablets (Remifemin 20 mg [best studied black cohosh product])[OTC]; Liquid extract (1:1 in 90% alcohol)[OTC]; Tincture (1:10 in 60% alcohol)[OTC]; Dried rhizome.

NURSING IMPLICATIONS

Assessment
- Assess frequency and severity of menopausal symptoms.
- Monitor BP for patients on antihypertensive drugs; may increase effects and cause hypotension.
- Assess for history of seizures or liver disease.

Implementation
- Administration with food may help to minimize nausea.

Patient/Family Teaching
- Advise patients with seizures, liver dysfunction, excessive alcohol intake, cancer, or other medical problems to consult their health care professional prior to initiating self-therapy with this herb.
- Advise patient to consult health care professional before taking with other estrogen replacements.
- Advise patient to notify health care professional if pregnancy is planned or suspected. Avoid use during pregnancy; may induce a miscarriage.

Evaluation
- Resolution of menopausal vasomotor symptoms.

chondroitin (konn-droy-tinn)

Other Name(s):
chondroitin polysulfate, CPS, CDS

Classification
Therapeutic: nonopioid analgesics

Common Uses
Osteoarthritis. Ischemic heart disease. Hyperlipidemia. Osteoporosis. **Ophth:** In combination with sodium hyaluronate, for use as a surgical aid in cataract extraction or lens implantation, and as a lubricant.

Action
May serve as a building block of articular cartilage. May protect cartilage against degradation. May have antiatherogenic properties. **Therapeutic Effects:** Improvement in osteoarthritis symptoms.

Pharmacokinetics
Absorption: 8–18% is absorbed orally.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: OB: Pregnancy and lactation.
Use Cautiously in: Asthma (may exacerbate symptoms); Clotting disorders (may ↑ risk of bleeding); Prostate cancer (may ↑ risk of metastasis or recurrence).

© F.A. Davis Publishing

Adverse Reactions/Side Effects
GI: heartburn, nausea, diarrhea. **Hemat:** bleeding (antiplatelet effect). **Misc:** allergic reactions, edema, hair loss.

Interactions
Natural Product-Drug: Use of chondroitin with **anticoagulant** and **antiplatelet** drugs, **thrombolytics**, **NSAIDs**, some **cephalosporins**, and **valproates** may ↑ risk of bleeding.
Natural-Natural: Herbs with anticoagulant or antiplatelet properties may ↑ bleeding risk when combined with chondroitin, including: **anise**, **arnica**, **chamomile**, **clove**, **dong quai**, **fenugreek**, **feverfew**, **ginger**, **ginkgo**, **Panax ginseng**, **licorice**, and others.

Route/Commonly Used Doses
PO (Adults): *Osteoarthritis*—800–2000 mg daily, as a single dose or in 2–3 divided doses. *Prevention of recurrent myocardial infarction*—10 g daily in 3 divided doses for 3 mo followed by 1.5 g daily in 3 divided doses as maintenance therapy.
IM (Adults): *Osteoarthritis*—50 mg twice weekly for 8 wk every 4 mo.

Availability
Tablets[OTC]; Capsules[OTC]; Injection (not available in US); Ophthalmic Drops Rx in combination with sodium hyaluronate (Viscoat).

NURSING IMPLICATIONS

Assessment
- Evaluate drug profile before starting therapy with this herbal supplement. If the patient is taking anticoagulants or antiplatelet drugs, avoid use of this herb.
- Monitor pain (type, location, and intensity) and range of motion on an ongoing basis as an indicator of drug efficacy.
- Assess for gastric discomfort and instruct patient to seek out the advice of a health care professional if persistent gastric discomfort occurs.
- Assess for signs of bleeding and discontinue herbal supplement promptly and seek out health care professional for follow-up.

Implementation
- **PO:** Administer with food.

Patient/Family Teaching
- Advise patients that this herbal supplement is usually taken with glucosamine.
- Caution patients who take aspirin or NSAIDs or other non-prescription medications not to take this herbal supplement without conferring with their health care professional.
- Instruct patients that this medication works by building up cartilage and that this requires that the medication be taken consistently over a period of time. It is not recommended as a supplemental pain medication.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding; avoid use.

Evaluation
- Improvement in pain and range of motion.
- Reduced need for supplemental or breakthrough pain medication.

dong quai (don kwi)

Other Name(s):
Angelica sinensis, Chinese Angelica, Dang Gui, Danggui, Don Quai, Ligustilides, Phytoestrogen, *Radix angelicae gigantis*, Tang Kuei, Tan Kue Bai Zhi

Classification
Therapeutic: none assigned

Common Uses
Premenstrual syndrome. Various uses as a blood purifier. Topically in combination with other ingredients for premature ejaculation.

Action
May have vasodilating and antispasmodic properties. Binds to estrogen receptors. **Therapeutic Effects:** Improved ejaculatory latency.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Allergy to carrot, celery, mugwort, or other members of the Apiaceae family; OB: Pregnancy and lactation.
Use Cautiously in: Hormone-sensitive cancers and conditions (may exacerbate effects or stimulate growth of cancer cells); Protein S deficiency (↑ risk for thrombosis); Surgery (discontinue 2 wk prior to procedure).

Adverse Reactions/Side Effects
Derm: photosensitivity. **GI:** diarrhea. **Misc:** Some constituents are carcinogenic and mutagenic.

© F.A. Davis Publishing

Interactions

Natural Product-Drug: Alcohol-containing preparations may interact with **disulfiram** and **metronidazole**. Use of dong quai with **anticoagulant** and **antiplatelet** drugs, **thrombolytics**, **NSAIDs**, some **cephalosporins**, and **valproates** may increase risk of bleeding.

Natural-Natural: Herbs with antiplatelet or anticoagulant properties may increase bleeding risk when combined with dong quai including: **angelica**, **clove**, **danshen**, **garlic**, **ginger**, **ginkgo**, ***Panax ginseng***, and **willow**.

Route/Commonly Used Doses

PO (Adults): *Bulk herb*—3–4.5 g per day in divided doses with meals; *Extract*—1 mL (20–40 drops) three times daily.

Availability

Bulk herb^{OTC}; Extract^{OTC}.

NURSING IMPLICATIONS

Assessment

- Assess pain and menstrual patterns prior to and following menstrual cycle to determine effectiveness of this herbal supplement.
- Assess for pregnancy prior to recommending use of the herbal supplement.
- Assess for history of hormone-sensitive cancers or conditions and warn against use.
- Assess medication profile including prescription and over-the-counter use of products such as aspirin- and ibuprofen-based products to treat menstrual pain.

Implementation

- **PO:** Take with meals.

Patient/Family Teaching

- Caution patients to avoid use of aspirin or other NSAIDs concurrently because of the risk of bleeding.
- Notify patients that there are no studies supporting the use of this herbal supplement for treatment of menopausal symptoms.
- Advise patients to consult their health care professional if taking prescription medications before taking dong quai.
- Discontinue the herbal supplement if diarrhea or excessive bleeding occurs and contact a health care provider if symptoms do not resolve.
- Inform patients that photosensitivity may occur and to wear sunscreen and protective clothing if sun exposure is anticipated.
- Advise females of reproductive potential to avoid use if pregnancy is planned or suspected.

Evaluation

- Reduction in menstrual pain and cramping and regular periods with normal flow.

echinacea (*Echinacea purpurea*) (ek-i-**nay**-sha)

Other Name(s):
American coneflower, black sampson, black susan, *brauneria angustifolia*, kansas snakeroot, purple coneflower, red sunflower, *rudbeckia*, sampson root, scurvy root

Classification
Therapeutic: immune stimulants

Common Uses

Bacterial and viral infections. Prevention and treatment of colds, coughs, flu, and bronchitis. Fevers. Wounds and burns. Inflammation of the mouth and pharynx. Urinary tract infections. Vaginal candidiasis.

Action

Medicinal parts derived from the roots, leaves, or whole plant of perennial herb (Echinacea). *Echinacea purpurea herba* has been reported to promote wound healing, which may be due to an increase in white blood cells, spleen cells, and increased activity of granulocytes, as well as an increase in helper T cells and cytokines. *E. purpurea radix* has been shown to have antibacterial, antiviral, anti-inflammatory, and immune-modulating effects. **Therapeutic Effects:** Resolution of respiratory and urinary tract infections. Decreased duration and intensity of common cold. Improved wound healing. Stimulates phagocytosis; inhibits action of hyaluronidase (secreted by bacteria), which helps bacteria gain access to healthy cells. Externally, has antifungal and bacteriostatic properties.

Pharmacokinetics

Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Multiple sclerosis, leukosis, collagenoses, AIDS, tuberculosis, autoimmune diseases; Hypersensitivity and cross-sensitivity in patients allergic to plants in *Asteraceae/Compositae*

© F.A. Davis Publishing

plant family (daisies, chrysanthemums, marigolds, etc.); OB: Pregnancy and lactation.
Use Cautiously in: Diabetes; Pedi: May increase risk of rash in children; Tinctures should be used cautiously in alcoholics or patients with liver disease; Do not take longer than 8 wk—may suppress immune function.

Adverse Reactions/Side Effects

CNS: dizziness, fatigue, headache, somnolence. **EENT:** tingling sensation on tongue, sore throat. **GI:** nausea, vomiting, heartburn, constipation, abdominal pain, diarrhea. **Derm:** allergic reaction, rash (more common in children). **Misc:** fever.

Interactions

Natural Product-Drug: May possibly interfere with **immunosuppressants** because of its immunostimulant activity. May ↑ risk for hepaotoxicity from **anabolic steroids**, **methotrexate**, or **ketoconazole** when taken with echinacea. May ↑ **midazolam** availability.
Natural-Natural: May ↑ risk for hepatotoxicity when taken with **kava**.

Route/Commonly Used Doses

PO (Adults): *Tablets*—6.78 mg tablets, take 2 tabs 3 times daily. *Capsules*—500–1000 mg 3 times a day for 5–7 days. *Fluid extract*—1–2 mL tid; solid form (6.5:1)—150–300 mg tid. Should not be used for more than 8 wk at a time. *Tea*—½ tsp comminuted drug, steeped and strained after 10 min, 1 cup 5–6 times daily on the first day, titrating down to 1 cup daily over the next 5 days. *Echinacea purpuren herb juice*—6–9 mL/day. *Liquid*—20 drops every 2 hr for the first day of symptoms, then 3 times daily for up to 10 days.
Topical (Adults): *Ointment, lotion, tincture used externally*—1.5–7.5 mL tincture, 2–5 g dried root.

Availability

Capsules[OTC]; Tablets [OTC]; Dried Root[OTC]; The dried root can be steeped and strained in boiling water and taken as a tea[OTC]; Liquid extract[OTC]; 1:1 in 45% alcohol[OTC]; Tincture[OTC]; 1:5 in 45% alcohol[OTC]; Blended teas[OTC]; *Echinacea purpuren* herb juice[OTC].

NURSING IMPLICATIONS

Assessment

- Assess wound for size, appearance, and drainage prior to the start of and periodically during therapy.
- Assess frequency of common mild illnesses (such as a cold) in response to use.

Implementation

- Tinctures may contain significant concentrations of alcohol and may not be suitable for children, alcoholics, patients with liver disease, or those taking disulfiram, metronidazole, some cephalosporins, or sulfonylurea oral antidiabetic agents.
- Prolonged use of this agent may cause overstimulation of the immune system, and use beyond 8 wk is not recommended. Therapy of 10–14 days is usually considered sufficient.
- May be taken without regard to food.

Patient/Family Teaching

- Herb is more effective for treatment than prevention of colds. Take at first sign of symptoms.
- Advise patient to seek immediate treatment for an illness that does not improve after taking this herb.
- Instruct patient that the usual course of therapy is 10–14 days and 8 wk is the maximum.
- Inform patient that use of this herb is not recommended in severe illnesses (e.g., AIDS, tuberculosis) or autoimmune diseases (e.g., multiple sclerosis, collagen diseases, etc.).
- Caution patient that prolonged use of this herb may result in overstimulation of the immune system, possibly with subsequent immunosuppression.
- Instruct patient to consult health care professional before taking any prescription or OTC medications concurrently with echinacea.
- Keep tincture in a dark bottle away from sunlight. Should be taken several times a day.
- Store herb in airtight container away from sunlight.
- Advise females of reproductive potential to avoid pregnancy or breast feeding during use.

Evaluation

- Improved wound healing.
- Infrequent common illnesses.
- Illnesses of shorter duration and less severity.

feverfew (fee-vurr-fyoo)

Other Name(s):
Altamisa, Bachelor's Buttons, *Chrysanthemum parethenium*, Featerfoiul, Featherfew, Featherfoil, Flirtwort Midsummer Daisy, *Pyrethrum parthenium*, Santa Maria, *Tanaceti parthenii*, Wild chamomile, Wild quinine

Classification
Therapeutic: vascular headache suppressants

© F.A. Davis Publishing

Common Uses
PO: Migraine headache prophylaxis. **Topical:** Toothaches and as an antiseptic.

Action
The sesquiterpene lactone, parthenolide, may provide feverfew's migraine prophylaxis effects. Feverfew may also have antiplatelet and vasodilatory effects and block prostaglandin synthesis.
Therapeutic Effects: May reduce the symptoms and frequency of migraine headaches.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	2–4 mo	unknown	unknown

Contraindications/Precautions
Contraindicated in: OB: Pregnancy and lactation; Feverfew hypersensitivity or allergy to *Asteraceae/Compositae* family plants, including ragweed, chrysanthemums, daisies, and marigolds.
Use Cautiously in: Use >4 mo (safety and efficacy not established).

Adverse Reactions/Side Effects
CNS: "Post-Feverfew Syndrome" (anxiety, headache, insomnia, muscle and joint aches). **CV:** *with long-term use*—tachycardia. **GI:** nausea, vomiting, diarrhea, heartburn, mouth ulceration and soreness (from chewing fresh leaves). **Derm:** contact dermatitis (when used topically).

Interactions
Natural Product-Drug: Use of feverfew with **anticoagulant** and **antiplatelet** drugs, **thrombolytics**, **NSAIDs**, some **cephalosporins**, and **valproates** may increase risk of bleeding. Concomitant use with **NSAIDs** may also reduce feverfew effectiveness.
Natural-Natural: Use with **anise**, **arnica**, **chamomile**, **clove**, **dong quai**, **fenugreek**, **garlic**, **ginger**, **gingko**, **licorice**, and ***Panax ginseng*** may increase anticoagulant potential of feverfew.

Route/Commonly Used Doses
PO (Adults): 50–100 mg feverfew extract daily (standardized to 0.2–0.35% parthenolide) or 50–125 mg freeze-dried leaf daily with or after food.

Availability
Feverfew extract standardized to 0.2-0.35% parthenolide[OTC]; **Fresh leaf**[OTC]; **Freeze-dried leaf**[OTC].

NURSING IMPLICATIONS

Assessment
- Monitor frequency, intensity, and duration of migraine headaches prior to and during ongoing therapy.
- Assess for mouth ulcers or skin ulcerations during therapy.

Implementation
- Take with food or on a full stomach.

Patient/Family Teaching
- Instruct patients to take this medication on a consistent basis to prevent migraine headaches. This herbal supplement is not for treatment of migraines.
- Warn patients about mouth ulcers and sores and that if this occurs to seek the advice of a health care professional. Encourage proper oral hygiene.
- Advise patients not to abruptly stop this product because of the possibility of post-feverfew syndrome. Inform patients that anxiety, headache, insomnia, and muscle aches may indicate withdrawal. Feverfew should be gradually tapered.
- Review dietary and medication profile of patient to identify potential interactions. Instruct patient about other herbs that may interact with feverfew.
- Counsel patients on anticoagulants not to take feverfew except as directed by their health care provider.
- Advise patients to avoid using NSAIDs as this may reduce the effectiveness of feverfew.
- Instruct patients to look for signs of bleeding such as unusual bruising or inability to clot after a cut and to seek the advice of a health care professional if this occurs.
- Inform patients that feverfew should reduce the number of migraines and severity of symptoms but that duration of the migraine may not be affected.

Evaluation
- Reduction in the frequency and severity of migraine headaches.

garlic (gar-lik)

Other Name(s):
Alli sativa bulbus, *Allium sativum*

Classification
Therapeutic: lipid-lowering agents

Common Uses
PO: Hypertension, hyperlipidemia, cardiovascular disease prevention, colorectal and gastric cancer

© F.A. Davis Publishing

prevention. **Topical:** Dermal fungal infections including tinea corporis, cruris, and pedis.

Action
May have HMG-CoA inhibitor properties in lowering cholesterol, but less effectively than statin drugs; vasodilatory and antiplatelet properties. **Therapeutic Effects:** Decreased cholesterol levels. Decreased platelet aggregation.

Pharmacokinetics
Absorption: Garlic oil is well absorbed.
Distribution: Unknown.
Metabolism and Excretion: Kidney and lungs.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	4–25 wk	unknown	unknown

Contraindications/Precautions
Contraindicated in: Bleeding disorders. Discontinue use 1–2 wk prior to surgery.
Use Cautiously in: Diabetes, gastrointestinal infection or inflammation.

Adverse Reactions/Side Effects
CNS: dizziness. **GI:** Irritation of the mouth, esophagus, and stomach, nausea, bad breath, vomiting, flatulence, diarrhea. **Derm:** Contact dermatitis and other allergic reactions (asthma, rash, anaphylaxis [rare]), Diaphoresis. **Hemat:** Chronic use or excessive dose may lead to ↓ hemoglobin production and lysis of RBCs, platelet dysfunction, prolonged bleeding time. **Misc:** body odor.

Interactions
Natural Product-Drug: Use of garlic with **anticoagulants**, **antiplatelet agents**, and **thrombolytics** may ↑ risk of bleeding. May ↓ the effectiveness of **contraceptive drugs** and **cyclosporine**. May ↓ plasma concentrations of **saquinavir**, **nevirapine**, **delavirdine**, and **efavirenz**. May ↓ **isoniazid** levels by 65%.
Natural-Natural: Herbs with anticoagulant or antiplatelet properties may increase bleeding risk when combined with garlic, including: **angelica**, **anise**, **asafoetida**, **bogbean**, **boldo**, **capsicum**, **celery**, **chamomile**, **clove**, **danshen**, **dong quai**, **fenugreek**, **feverfew**, **ginger**, **ginkgo**, ***Panax ginseng***, **horse chestnut**, **horseradish**, **licorice**, **meadowsweet**, **papain**, **passionflower**, **poplar**, **prickly ash**, **onion**, **quassia**, **red clover**, **turmeric**, **wild carrot**, **wild lettuce**, **willow**, and others.

Route/Commonly Used Doses
PO (Adults): 200–400 mg tid of standardized garlic powder extract with 1.3% allin. *Fresh garlic*—1–7 cloves per day. One clove contains approximately 4 g of garlic.
Topical (Adults): *Tinea infections*—0.4% cream, 0.6% gel, or 1% gel applied bid x 7 days.

Availability
Capsules[OTC]**; Tablets**[OTC]**; Topical cream**; Topical gel; Fresh garlic[OTC].

NURSING IMPLICATIONS

Assessment
- Obtain usual dietary intake from patient, especially in regard to fat consumption.
- Assess patient's reason for using this herbal remedy and knowledge about hyperlipidemia.
- Ascertain the amount of garlic the patient consumes on a regular basis.

Implementation
- Take orally as fresh clove, capsule, or tablet.
- Do not exceed recommended dose.

Patient/Family Teaching
- Instruct patients about the need to follow a healthy diet (low in fat and high in vegetables and fruits) in conjunction with garlic. Other lipid-reducing strategies, such as exercise and smoking cessation, should also be employed.
- Inform patients that there are other more effective agents for lipid reduction available.
- Caution patients about the potential for bleeding and not to take this herbal remedy without notifying their health care provider if they are taking other medications. Instruct patients undergoing elective surgery to stop using garlic 2 wk prior to surgery and to notify the surgeon that they are taking garlic in the event of emergent surgery.
- Notify patients that allergies may occur and to discontinue use if symptoms develop.
- Emphasize the need for follow-up exams with a health care professional to assess effectiveness of the regimen.

Evaluation
- Normalization of lipid profile.
- Prevention of cardiac disease.

ginger (*Zingiber officinale*) (jin-jer)

Other Name(s):
Calicut, cochin, gengibre, ginger root, imber, ingwerwurzel, ingwer, Jamaica ginger, jenjibre, kankyo, jiang, zingiber

Classification
Therapeutic: antianemics

© F.A. Davis Publishing

Common Uses
Prevention and treatment of nausea and vomiting associated with motion sickness, loss of appetite, pregnancy, surgery, and chemotherapy. Prevention of postoperative nausea and vomiting. May be used for dyspepsia, flatulence, relief of joint pain in rheumatoid arthritis, cramping, and diarrhea. Migraine headache. Tonic (toning/strengthening agent) in gout, gas, respiratory infections, anti-inflammatory, stimulant (tones the gut, increases saliva and gastric juices, acts as anticoagulant, decreases blood cholesterol).

Action
Antiemetic effect due to increasing GI motility and transport; may act on serotonin receptors. Shown to be hypoglycemic, hypotensive, or hypertensive, and positive inotropic agent. Inhibits prostaglandins and platelets, lowers cholesterol, and improves appetite and digestion. **Therapeutic Effects:** ↓ nausea and vomiting due to motion sickness, surgery, and chemotherapy. ↓ joint pain and improvement of joint motion in rheumatoid arthritis. Antioxidant.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Lactation (if using large amounts); Gallstones.
Use Cautiously in: Pregnancy (preliminary evidence that ginger might affect fetal sex hormones); Patients with ↑ risk of bleeding; Diabetes; Anticoagulant therapy; Cardiovascular disease.

Adverse Reactions/Side Effects
GI: minor heartburn. **Derm:** dermatitis (when used topically).

Interactions
Natural Product-Drug: May ↑ risk of bleeding when used with **anticoagulants**, **antiplatelet agents**, and **thrombolytics**. May have additive effects with **antidiabetic agents** (causing hypoglycemia) and **calcium channel blockers** (causing hypotension).
Natural-Natural: May theoretically ↑ risk of bleeding when used with other **herbs** that have anticoagulant or antiplatelet activities.

Route/Commonly Used Doses
PO (Adults): *Motion sickness*—1000 mg dried ginger root taken 30 min–4 hr before travel or 250 mg qid. *Postoperative nausea prevention*—1000 mg ginger taken 1 hr before induction or anesthesia. *Chemotherapy–induced nausea*—2–4 g/day. Up to 2 g freshly powdered drug has been used as an antiemetic (not to exceed 4 g/day). *Migraine headache*—500 mg at onset then 500 mg every 4 hrs up to 1.5–2 g/day for 3–4 days. *Osteoarthritis*—170 mg tid or 255 mg bid of ginger extract. *Whole root rhizome*—0.25–1 g for other illnesses. *Tea*—pour 150 mL boiling water over 0.5–1 g of ginger and strain after 5 min. *Tinture*—0.25–3 mL.

Availability
Alone or in combination with other herbal medicinals[OTC]; Dried powdered root[OTC]; Syrup[OTC]; Tincture[OTC]; Tablets[OTC]; Capsules (≥550 mg)[OTC]; Spice[OTC]; Tea[OTC].

NURSING IMPLICATIONS

Assessment
- Assess patient for nausea, vomiting, abdominal distention, and pain prior to and after administration of the herb when used as an antiemetic agent.
- Assess pain location, duration, intensity, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Assess pain, swelling, and range of motion in affected joints prior to and after administration when used in the treatment of arthritis.
- Assess patient for epigastric pain prior to and after administration when used as a gastroprotective agent.
- Monitor BP and heart rate in patients with cardiovascular disease including hypertension.
- ***Lab Test Considerations:*** Monitor blood glucose and coagulation panels periodically during therapy.

Implementation
- Administer ginger prior to situations where nausea or vomiting is anticipated (e.g., motion sickness).
- Dose form and strengths vary with each disease state. Ensure that proper formulation and dose are administered for the indicated use.

Patient/Family Teaching
- Instruct patients receiving anticoagulants not to take this herb without the advice of health care professional (increased risk of bleeding).

© F.A. Davis Publishing

- Advise patient to stop the herb immediately if palpitations occur and notify health care professional.
- Advise patient to observe for easy bruising or other signs of bleeding. If they occur, stop the herb immediately and notify health care professional.
- Counsel patients with a history of gallbladder disease to use this herb only under the supervision of health care professional.
- Instruct patient to consult health care professional before taking any Rx, OTC, or other herbal products concurrently with ginger.
- Herb is meant to be used as a tonic, not for long-term use.

Evaluation

- Prevention of nausea and vomiting.
- Relief of epigastric pain.
- Improved joint mobility and relief of pain.
- Relief of migraine headache.

ginkgo (ging-ko)

Other Name(s):
Bai guo ye, fossil tree, ginkgo folium, Japanese silver apricot, kew tree, maidenhair-tree, *salisburia adiantifolia*, yinhsing

Classification
Therapeutic: antiplatelet agents, central nervous system stimulants

Common Uses

Symptomatic relief of organic brain dysfunction (dementia syndromes, short-term memory deficits, inability to concentrate, depression). Intermittent claudication. Vertigo and tinnitus of vascular origin. Improvement of peripheral circulation. Premenstrual syndrome.

Action

Improves tolerance to hypoxemia, especially in cerebral tissue. Inhibits development of cerebral edema and accelerates its regression. Improves memory, blood flow (microcirculation), compensation of disequilibrium, and rheological properties of blood. Inactivates toxic oxygen radicals. Antagonizes platelet-activating factor. Interferes with bronchoconstriction and phagocyte chemotaxis. **Therapeutic Effects:** Symptomatic relief of dementia syndromes. Inhibits arterial spasm, decreases capillary fragility and blood viscosity. Improves venous tone, relaxes vascular smooth muscle.

Pharmacokinetics

Absorption: 70–100% absorption.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Pregnancy and lactation.
Use Cautiously in: Bleeding disorders; Children (fresh seeds have caused seizures and death); Diabetes; Epilepsy; Surgery (discontinue use 2 wk prior).

Adverse Reactions/Side Effects

CNS: CEREBRAL BLEEDING, dizziness, headache, vertigo, seizure. **CV:** palpitations. **GI:** flatulence, stomach upset. **Derm:** allergic skin reaction. **Hemat:** bleeding. **Misc:** hypersensitivity reactions.

Interactions

Natural Product-Drug: Theoretically may potentiate effects of **anticoagulants**, **thrombolytics**, **antiplatelet agents**, and **MAO inhibitors**. May also ↑ risk of bleeding with some **cephalosporins**, **valproic acid**, and **NSAIDs**. May ↓ effectiveness of **anticonvulsants**. May alter **insulin** metabolism requiring dose adjustments of antidiabetic drugs.
Natural-Natural: May ↑ risk of bleeding when used with other **herbs** with antiplatelet effects (including **angelica**, **arnica**, **chamomile**, **feverfew**, **garlic**, **ginger**, and **licorice**).

Route/Commonly Used Doses

Organic Brain Syndromes

PO (Adults): 120–240 mg ginkgo leaf extract daily in 2 or 3 doses.

Intermittent Claudication

PO (Adults): 120–240 mg ginkgo leaf extract daily in 2 or 3 doses.

Vertigo and Tinnitus

PO (Adults): 120–160 mg ginkgo leaf extract daily in 2 or 3 doses.

Cognitive Function Improvement

PO (Adults): 120–600 mg per day.

Premenstrual Syndrome

PO (Adults): 80 mg BID starting on the 16th day of the menstrual cycle until the 5th day of the next cycle.

© F.A. Davis Publishing

Availability

Ginkgo leaf extract (acetone/water) 22–27% flavonoid glycosides, 5–7% terpene lactones, 2.6–3.2% bilobalide, <5 ppm of ginkgolic acids.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) prior to and periodically during therapy. Exclude other treatable causes of dementia prior to instituting treatment with ginkgo.
- Assess frequency, duration, and severity of muscle cramps (claudication) experienced by the patient prior to and periodically throughout therapy.
- Assess for headache and neurologic changes (thromboembolism).

Implementation

- **PO:** Start dose at 120 mg per day and increase as needed to minimize side effects.
- May be administered without regard to food. Administer at same time each day.
- Use of dried leaf preparations in the form of a tea is not recommended because of insufficient quantity of active ingredients.
- Advise patients to avoid crude ginkgo plant parts which can cause severe allergic reactions.

Patient/Family Teaching

- Advise patient to observe for easy bruising and other signs of bleeding and report to health care professional if they occur.
- Caution patient to keep this herb out of the reach of children; may cause seizures.
- Caution patient to avoid handling the pulp or seed coats because of the risk of contact dermatitis. Wash skin under free-flowing water promptly if contact does occur.
- Instruct patient not to exceed recommended doses; large doses may result in toxicity (restlessness, diarrhea, nausea and vomiting, headache).
- Notify patients receiving anticoagulant or antiplatelet therapy not to take this medication without approval of health care professional and frequent monitoring.
- Instruct patient to consult health care professional before taking any prescription or OTC medications concurrently with ginkgo.

Evaluation

- Improvement in walking distances pain-free.
- Improvement in tinnitus and vertigo.
- Improvement in short-term memory, attention span, and ability to perform simple tasks.
- Improvement in sexual function.
- Decreased symptoms of premenstrual syndrome.
- Administration for a minimum of 6–8 wk of 80 mg (tid) (not <6 wk) is required to determine response.

ginseng (*Panax ginseng*)

(**jin**-seng)

Other Name(s):
Asian ginseng, Chinese ginseng, hong shen, Japanese ginseng, Korean ginseng, red ginseng, renshen, white ginseng

Classification
Therapeutic: none assigned

Common Uses

Improving physical and mental stamina. General tonic to energize during times of fatigue and inability to concentrate. Sedative, sleep aid, antidepressant. Diabetes. Enhanced sexual performance/aphrodisiac. Increased longevity. Adjunctive treatment of cancer. Increased immune response. Increased appetite.

Action

Main active ingredient is ginsenoside from the dried root. Serves as CNS stimulant and depressant. Enhances immune function. Interferes with platelet aggregation and coagulation. Has analgesic, anti-inflammatory, and estrogen-like effects. **Therapeutic Effects:** Improves mental and physical ability. May improve appetite, memory, sleep pattern. May reduce fasting blood glucose level in diabetic patients.

Pharmacokinetics

Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Pregnancy (androgenization of fetus); Lactation; Children; Manic-depressive disorders and psychosis; Hypertension; Asthma; Infection; Organ transplant recipients (can interfere with immunosuppressive therapy); Hormone-sensitive cancers.

Use Cautiously in: Autoimmune diseases; Cardiovascular disease; Diabetes (may have hypoglycemic effects); Patients receiving anticoagulants; Bleeding disorders; Schizophrenia (may cause agitation).

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CNS: agitation, depression, dizziness, euphoria, headaches, insomnia, nervousness. **CV:** hypertension, tachycardia. **GI:** diarrhea. **GU:** amenorrhea, vaginal bleeding. **Derm:** skin eruptions. **Endo:** estrogen-like effects. **Misc:** fever, mastalgia, STEVENS-JOHNSON SYNDROME.

Interactions

Natural Product-Drug: May ↓ anticoagulant activity of **warfarin**. May interfere with **MAO inhibitors** treatment and cause headache, tremulousness, and manic episodes. May enhance blood glucose lowering effects of **oral hypoglycemics** and **insulin**. May interfere with **immunosuppressant** therapy. Use with caution when taking **estrogens**.
Natural-Natural: May ↑ risk of bleeding when used with **herbs** that have antiplatelet or anticoagulant activities. May prolong the QT interval when used with **bitter orange**, **country mallow**, and **ephedra** and ↑ risk of life-threatening arrhythmias. May ↑ risk of hypoglycemia when used with herbs with hypoglycemic potential.
Natural-Food: May potentiate effects of **caffeine** in **coffee** or **tea** and CNS stimulant effects of **mate**.

Route/Commonly Used Doses

PO (Adults): *Capsule*—200–600 mg/day; *extract*—100–300 mg 3 times daily; *crude root*—1–2g/day; *infusion—tea*—1–2 g root daily (½ tbsp/cup water) up to 3 times daily (*P. ginseng* tea bag usually contains 1500 mg of ginseng root). Do not use for longer than 3 mo. *Cold/flu prevention*—100 mg daily 4 wk prior to influenza vaccination and continued for 8 wk; *Chronic bronchitis*—100 mg BID for 9 days combined with antibiotic therapy; *Erectile dysfunction*—900 mg TID; *Type 2 diabetes*—200 mg daily.

Availability (generic available)

Root powder[OTC]; Extract in alcohol[OTC]; Capsules[OTC]; Tea bags[OTC].

NURSING IMPLICATIONS

Assessment

- Assess level of energy, attention span, and fatigue person is experiencing prior to initiating and periodically during therapy.
- Assess appetite; sleep duration; and perceived quality, emotional lability, and work efficiency prior to and during therapy.
- Patients with chronic medical problems should not use this herb without the advice of health care professional.
- Assess for ginseng toxicity (nervousness, insomnia, palpitations, and diarrhea).
- Monitor patients with diabetes more frequently for hypoglycemia until response to the agent is ascertained.
- Assess for the development of ginseng abuse syndrome (occurs when large doses of the herb are taken concomitantly with other psychomotor stimulants such as coffee and tea. May present as diarrhea, hypertension, restlessness, insomnia, skin eruptions, depression, appetite suppression, euphoria, and edema).

Implementation

- May be taken without regard to food.
- Take at the same time daily and do not increase dose above the recommended amount because of potential toxic effects.

Patient/Family Teaching

- Caution patients with cardiovascular disease, hypertension or hypotension, or on steroid therapy to avoid the use of this herb.
- Instruct patient in the symptoms of ginseng toxicity and to reduce dose or stop use of the herb if they occur.
- Advise patient to limit the amount of caffeine consumed.
- Advise patients with diabetes to monitor blood sugar levels until response to this agent is known.
- Teach patient about the signs and symptoms of hepatitis (yellow skin or whites of eyes, dark urine, light-colored stools, lack of appetite for several days or longer, nausea, abdominal pain) and to stop use of the herb and promptly contact health care professional if they occur. (This herb is hepatoprotectant at low doses, but hepatodestructive at high doses.).
- Caution patient not to exceed recommended doses because of potential side effects and toxicity.
- Instruct patient to discontinue ginseng if diarrhea develops.
- Instruct patient to consult health care professional before taking any Rx or OTC medications concurrently with ginseng.
- Advise females of reproductive potential to avoid use of ginseng if pregnancy is planned or suspected or if breast feeding.

Evaluation

- Improved energy level and sense of well-being.
- Improved quality of sleep.
- Improved concentration and work efficiency.
- Improved appetite.
- May need to take for several wk before seeing results.

© F.A. Davis Publishing

- Recommended course of therapy is 3 wk. A repeated course is feasible. Do not use for longer than 3 mo.

glucosamine
(glew-**kos**-ah-meen)

Other Name(s):
2-amino-2-deoxyglucose sulfate, chitosamine

Classification
Therapeutic: antirheumatics

Common Uses
Osteoarthritis. Temporomandibular joint (TMJ) arthritis. Glaucoma.

Action
May stop or slow osteoarthritis progression by stimulating cartilage and synovial tissue metabolism.
Therapeutic Effects: Decreased pain and improved joint function.

Pharmacokinetics
Absorption: 0.9% absorbed.
Distribution: Unknown.
Metabolism and Excretion: 74% eliminated via first-pass metabolism.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Shellfish allergy (glucosamine is often derived from marine exoskeletons); Pregnancy and lactation.
Use Cautiously in: Diabetes (may worsen glycemic control); Asthma (may exacerbate symptoms); Surgery (may affect blood glucose levels, discontinue glucosamine 2 wk before elective procedures).

Adverse Reactions/Side Effects
GI: nausea, heartburn, diarrhea, constipation. **CNS:** headache, drowsiness. **Derm:** skin reactions.
Endo: hyperglycemia.

Interactions
Natural Product-Drug: May antagonize the effects of **antidiabetics**. May induce resistance to some chemotherapy drugs such as **etoposide**, **teniposide**, and **doxorubicin**. May increase anticoagulant effects of **warfarin**.
Natural-Natural: None known.

Route/Commonly Used Doses
PO (Adults): 500 mg three times daily.
Topical (Adults): use cream as needed for up to 8 wk.

Availability
Tablets 500 mg[OTC]; **Capsules** 500 mg[OTC]; **Topical cream** 30 mg/g in combination with other ingredients[OTC].

NURSING IMPLICATIONS

Assessment
- Assess for shellfish allergy prior to initiating therapy.
- Monitor pain (type, location, and intensity) and range of motion periodically during therapy.
- Assess bowel function periodically during therapy. Constipation may be reduced by increased fluid intake and bulk in diet; bulk laxatives may be added if necessary.
- ***Lab Test Considerations:*** Monitor serum glucose levels periodically during therapy for patients with diabetes.

Implementation
- Administer prior to meals.

Patient/Family Teaching
- Instruct patients that effects of this drug come from stimulating cartilage and synovial tissue metabolism and that the supplement must be taken on a regular basis to achieve benefit. Do not use as an intermittent pain medication.
- Caution patients with a shellfish allergy that this herbal supplement should not be used.
- Advise patient to notify health care professional if gastric discomfort develops and persists.
- Advise diabetic patients to monitor glucose values closely during initial therapy.

Evaluation
- Improvement in pain and range of motion.

grape seed extract
(grayp seed **ex**-trakt)

Other Name(s):
Vitis vinifera, *Vitis coignetiae*, Oligomeric Proanthocyanidins (OPCs)

Classification
Therapeutic: cardioprotective agents

Common Uses
Chronic venous insufficiency, edema, diabetic retinopathy, varicose veins, cancer prevention, atherosclerosis, cirrhosis, prevention of collagen breakdown, vision problems, constipation, antioxidant, wound healing.

Action
Grape flavonoids have a wide range of effects including antioxidant, vasodilatory, antiplatelet, decreased

© F.A. Davis Publishing

superoxide production, free-radical removal, and inhibition of collagenase. **Therapeutic Effects:** Reduced risk of coronary disease. Decreased skin and vasculature breakdown.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity or allergy to grape seed extract; Patients with bleeding disorders or receiving anticoagulant therapy.
Use Cautiously in: OB: Avoid use in pregnancy due to lack of safety data.

Adverse Reactions/Side Effects
CV: hypertension. **CNS:** dizziness, headache. **Derm:** dry skin. **EENT:** sore throat, cough. **GI:** nausea, diarrhea. **Hemat:** ↑ risk of bleeding.

Interactions
Natural Product-Drug: May ↑ anticoagulant effects of **warfarin**. May ↓ plasma levels of CYP1A2 substrates.
Natural-Natural: May inhibit the growth of **lactobacillus acidophilus**. May ↑ BP in hypertensive patients also taking **vitamin c**.

Route/Commonly Used Doses
PO (Adults): 75–300 mg daily.

Availability
Tablets; Capsules.

NURSING IMPLICATIONS

Assessment
- Monitor BP periodically during therapy.
- ***Lab Test Considerations:*** Monitor serum cholesterol levels periodically during therapy.

Implementation
- Administer as directed. Doses may vary.

Patient/Family Teaching
- Advise patient not to take grape seed extract with vitamin C; may cause increase in BP.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected.

Evaluation
- Decrease in cholesterol.
- Decrease in BP.

green tea (green tee)

Other Name(s):
Camellia sinensis

Classification
Therapeutic: central nervous system stimulants

Common Uses
Bladder, esophageal, ovarian, and pancreatic cancer risk reduction, mental alertness, hypotension, cervical dysplasia associated with human papillomavirus infection, hyperlipidemia, weight loss, protection of the skin from sun damage, genital warts, dental caries, Parkinson's disease.

Action
Caffeine in green tea stimulates the CNS and cardiovascular system through adenosine receptor blockade and phosphodiesterase inhibition. **Therapeutic Effects:** Improved cognitive performance and mental alertness.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Allergy/hypersensitivity; Pregnancy and lactation (doses >200 mg/day due to caffeine content).
Use Cautiously in: Patients with caffeine sensitivity. Long-term use of doses >250 mg/day may produce tolerance, psychological dependence, tachyarrhythmias, and sleep disturbances; Iron deficiency anemia (may worsen); Diabetes (may impair glucose control); Cardiac conditions (may induce arrhythmias in sensitive individuals); Bleeding disorders.

Adverse Reactions/Side Effects
CV: arrhythmia, tachycardia. **CNS:** agitation, dizziness, excitement, insomnia, tremors. **GI:** nausea, vomiting, diarrhea, hepatotoxicity, abdominal pain. **F and E:** hypokalemia. **Endo:** hyperglycemia. **Hemat:** prolonged bleeding time.

Interactions
Natural Product-Drug: Green tea may ↓ effects of **adenosine**. ↑ risk of bleeding with **anticoagulants** or **antiplatelet** agents. ↑ effects of **CNS stimulants**. May impair glucose control from **antidiabetic** agents. Abrupt withdrawal can ↑ **lithium**

© F.A. Davis Publishing

levels. May ↓ **dipyridamole**—induced vasodilation. **Verapamil** can ↑ caffeine concentrations by 25%. Additive effects with **methylxanthines**. **Natural-Natural:** ↑ risk of adverse cardiovascular effects with **bitter orange**. ↑ risk of hepatotoxicity with hepatotoxic herbs or supplements. ↑ risk of seizures, hypertension, or stroke with **ephedra** and **creatine**.

Route/Commonly Used Doses

PO (Adults): Range: 1–10 cups/day. One cup provides approximately 60 mg of caffeine.

Availability

Tea leaves.

NURSING IMPLICATIONS

Assessment

- Monitor BP and heart rate periodically during therapy.
- ***Lab Test Considerations:*** Monitor serum glucose, homocysteine, and uric acid levels periodically during therapy.
- Monitor liver and kidney function periodically during therapy.

Implementation

- May be taken as tea or as an extract in capsules.

Patient/Family Teaching

- Advise females of reproductive potential to limit green tea due to the caffeine content.

Evaluation

- Improvement in memory.

hawthorn (Crataegus Species) (**haw**-thorn)

Other Name(s):
aubepine crataegi folium, cum flore, hagedorn, maybush, whitehorn

Classification
Therapeutic: antihypertensives, inotropics

Common Uses

Hypertension. Mild to moderate HF. Angina. Spasmolytic. Sedative.

Action

Active compounds in hawthorn include flavonoids and procyanidins. Increase coronary blood flow. Positive inotropic and chronotropic effects because of increased permeability to calcium and inhibition of phosphodiesterase. **Therapeutic Effects:** Increased cardiac output. Decreased BP, myocardial workload, and oxygen consumption.

Pharmacokinetics

Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6–8 wk	unknown

Contraindications/Precautions

Contraindicated in: Pregnancy (potential uterine activity); Lactation.
Use Cautiously in: Concurrent use with ACE inhibitors and digoxin; Do not discontinue use abruptly.

Adverse Reactions/Side Effects

CNS: agitation, dizziness, fatigue, vertigo, headache, sedation (high dose), sleeplessness, sweating. **CV:** hypotension (high dose), palpitations. **Derm:** rash. **GI:** nausea.

Interactions

Natural Product-Drug: May potentiate effects of **digoxin**, **calcium channel blockers**, and **beta blockers**. Concurrent use with **phosphodiesterase-5 inhibitors** (**sildenafil**, **tadalafil**, **vardenafil**) and **nitrates** may potentiate vasodilatory effects. May cause additive CNS depression when used with other **CNS depressants**.
Natural-Natural: Additive effect with other cardiac glycoside–containing **herbs** (**digitalis leaf**, **black hellebore**, **oleander leaf**, and others). Additive hypotensive effects with herbs than lower BP such as **ginger**, ***Panax ginseng***, **coenzyme Q-10**, and **valerian**. Additive effect with other cardioactive herbs (**devil's claw**, **fenugreek**, and others).

Route/Commonly Used Doses

PO (Adults): *Heart failure*—160–1800 mg standardized hawthorn leaf with flower extract in 2–3 divided doses daily. *Hawthorn fluid extract (1:1 in 25% alcohol)*—0.5–1 mL tid; *hawthorn fruit tincture (1:5 in 45% alcohol)*—1–2 mL tid; *dried hawthorn berries*—300–1000 mg tid.

Availability (generic available)

Dried fruit[OTC]; Liquid extract of the fruit or leaf[OTC]; Tincture of the fruit or leaf[OTC].

NURSING IMPLICATIONS

Assessment

- Monitor intake and output rations and daily weight. Assess for peripheral edema, auscultate lungs for rales and crackles during therapy.
- Assess BP and pulse periodically during therapy.

© F.A. Davis Publishing

Implementation

- Administered as 2–3 divided doses daily at the same time.
- May be taken without regard to food.

Patient/Family Teaching

- Advise patients that there are other proven therapies available for treatment of heart failure. These therapies should be employed prior to initiating treatment with hawthorn.
- Tell patient not to take hawthorn without the advice of health care professional.
- Instruct patients in the symptoms of a heart attack (pain in the region of the heart, jaw, arm, or upper abdomen; sweating; chest tightness) and heart failure (shortness of breath, chest tightness, dizziness, sweating) and to promptly notify health care professional and obtain emergency services if they occur.
- Advise patient to report weight gain or persistent swelling of the feet to health care professional.
- May cause dizziness and fatigue. Patients should avoid driving or other activities that require mental alertness until response to herb is known.
- Avoid alcohol and other CNS depressants while taking hawthorn without consulting health care professional.
- Profuse sweating and dehydration under extreme heat may increase the BP-lowering properties of hawthorn, leading to severe hypotension. Caution patients to avoid exertion in hot weather to minimize the risk of side effects.
- Instruct patients that hawthorn helps control the symptoms of heart failure but does not cure the disease. Lifestyle changes (salt restriction, weight management, exercise as tolerated, adherence to medication regimens) still need to be followed.
- Instruct patient to consult health care professional before taking Rx, OTC, or other herbal products concurrently with hawthorn.
- Advise females of reproductive potential to use effective contraception during therapy and to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation

- Decrease in symptoms of HF. Effects may not be seen for 6 wks.
- Improved cardiac output as evidenced by improved activity tolerance.

kava-kava (Piper methysticum) (**ka**-va **ka**-va)

Other Name(s):
Ava pepper, intoxicating pepper, kao, kew, tonga, wurzelstock, yagona

Classification
Therapeutic: antianxiety agents, sedative/hypnotics

Common Uses

Anxiety, stress, restlessness, insomnia, benzodiazepine withdrawal. Mild muscle aches and pains. Menstrual cramps and PMS.

Action

Alters the limbic system modulation of emotional processes. Shown to have centrally acting skeletal muscle relaxant properties activated. **Therapeutic Effects:** Relief of anxiety. Sedation.

Pharmacokinetics

Absorption: Peak plasma level occurs about 1.8 hr after an oral dose.
Distribution: Enters breast milk.
Metabolism and Excretion: Elimination occurs primarily by renal excretion (both unchanged and metabolites) and in the feces. Metabolized by the liver (reduction or demethylation).
Half-life: Approximately 9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	1.8 hr	unknown	8 hr

Contraindications/Precautions

Contraindicated in: OB, Lactation: Pregnancy (may affect uterine tone) and lactation; Patients with endogenous depression (may ↑ risk of suicide); Children <12 yr; Hepatitis or other liver disease.
Use Cautiously in: Concurrent use of other hepatotoxic agents; Depression and Parkinson's disease (may worsen symptoms); Should not be used for >3 mo to prevent psychological dependence.

Adverse Reactions/Side Effects

CNS: dizziness, headache, drowsiness, sensory disturbances, extrapyramidal effects. **EENT:** Pupil dilation, red eyes, visual accommodation disorders. **GI:** HEPATOTOXICITY, gastrointestinal complaints. **Derm:** allergic skin reactions, yellow discoloration of skin, pellagroid dermopathy. **Hemat:** ↓ lymphocytes, decreased platelets. **Metab:** weight loss (long term, high dose). **Neuro:** ataxia, muscle weakness.

© F.A. Davis Publishing

Interactions

Natural Product-Drug: Additive effect when used with **alprazolam**. Potentiates effect of **CNS depressants** (**ethanol**, **barbiturates**, **benzodiazepines**, **opioid analgesics**). Has ↓ effectiveness of **levodopa** in few cases. May have additive effects with **antiplatelet agents**. May ↑ risk of liver damage with other **hepatotoxic agents**.
Natural-Natural: Concurrent use with other hepatotoxic products such as **DHEA**, **coenzyme Q-10** (high doses), and **niacin** can ↑ risk of liver damage. May have additive sedative effects when used with other **herbs** with sedative properties.

Route/Commonly Used Doses

PO (Adults): *Antianxiety*—50–100 mg (70 mg kavalactones) 3 times daily; *Benzodiazepine withdrawal*—50–300 mg/day over one wk while tapering benzodiazepine over 2 wk (use 70% kavalactone extract). *Insomnia*—180–210 mg kavalactones. Typically taken as a tea by simmering the root in boiling water and then straining.

Availability (generic available)

Dried root extracts (alcohol or acetone based) containing 30–70% kavapyrones.

NURSING IMPLICATIONS

Assessment

- Assess muscle spasm, associated pain, and limitations of movement prior to and periodically during therapy.
- Assess degree of anxiety and level of sedation (visual disturbances and changes in motor reflexes are side effects) prior to and periodically during therapy.
- Assess sleep patterns and level of sedation upon arising.
- Prolonged use may lead to ↓ of platelet and lymphocyte counts and ↑ liver function tests.

Implementation

- Prepared as a drink from pulverized roots, tablets, capsules, or extract.

Patient/Family Teaching

- Inform patient that significant, serious side effects may occur with prolonged use. Use for longer than 1 mo is not recommended without supervision of health care professional.
- Caution patient to avoid alcohol or other CNS depressants while taking this herb; may increase sedative effect.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to herb is known.
- Caution patients to stop use of the herb immediately and notify health care professional if shortness of breath or signs of liver disease (yellowing of the skin or whites of the eyes, brown urine, nausea, vomiting, light-colored stools, unusual tiredness, weakness, stomach or abdominal pain, loss of appetite) occur.
- Instruct patients with liver disease, or taking drug products that can affect the liver, to consult health care professional before using kava-containing supplements.
- Inform patient that although there is no evidence of physiological dependence, the risk of psychological dependence still exists.
- Instruct patient to consult health care professional before taking any Rx, OTC, or other herbal products concurrently with kava-kava.
- Advise females of reproductive potential to use effective contraception during therapy and to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding.
- **Kava has been banned in other countries due to hepatotoxicity**.

Evaluation

- Decrease in anxiety level.
- Decrease in muscle spasms.
- Relief of insomnia.

milk thistle (milk **this**-ul)

Other Name(s):
Holy thistle, Lady's thistle, Mary Thistle, Silybin, Silymarin

Classification
Therapeutic: antidotes

Common Uses

Cirrhosis, chronic hepatitis, gallstones, psoriasis, liver cleansing and detoxification, treatment of liver toxicity due to Amanita mushroom poisoning (European IV formulation), and chemicals. Dyspepsia (in combination with other herbs). Diabetes.

Action

The active component, silymarin, has antioxidant and hepatoprotectant actions. Silymarin helps prevent toxin penetration and stimulates hepatocyte regeneration. **Therapeutic Effects:** Liver detoxification. Improved dyspepsia symptoms. Decreased fasting blood glucose.

Pharmacokinetics

Absorption: 23–47% absorbed after oral administration.
Distribution: Unknown.

© F.A. Davis Publishing

Metabolism and Excretion: Hepatic metabolism by cytochrome P450 3A4.
Half-life: 6 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	5–30 days or more	unknown	unknown

Contraindications/Precautions
Contraindicated in: Pregnancy and lactation (insufficient information available); Allergy to chamomile, ragweed, asters, chrysanthemums, and other members of the family *Asteraceae/Compositae*.
Use Cautiously in: Hormone-sensitive cancers/conditions (milk thistle plant parts may have estrogenic effects).

Adverse Reactions/Side Effects
GI: Laxative effect, nausea, bloating, anorexia. **Misc:** Allergic reactions.

Interactions
Natural Product-Drug: In vitro, milk thistle extract inhibited the drug-metabolizing enzyme **cytochrome P450 3A4**. Interactions have not been reported in humans, but milk thistle should be used cautiously with other drugs metabolized by 3A4, such as **cyclosporine**, **carbamazepine**, **HMG-CoA inhibitors**, **ketoconazole**, and **alprazolam**.
Natural-Natural: Herbs with hypoglycemic potential may have additive hypoglycemic effects.

Route/Commonly Used Doses
PO (Adults): *Hepatic cirrhosis*—420 mg/day of extract containing 70–80% silymarin; *Chronic active hepatitis*—140 mg tid of silymarin; 240 mg bid of silibinin; *Diabetes*—200 mg tid of silymarin; *Tea*—3–4 times daily 30 min before meals. Tea is not recommended as silymarin is not sufficiently water soluble.
IV (Adults): 20–50 mg/kg over 24 hr, 48 hr post mushroom ingestion (IV formulation not available in US).

Availability
Capsules[OTC]; Tablets[OTC]; Crude drug[OTC]; Tea[OTC]; Extract[OTC].

NURSING IMPLICATIONS

Assessment
- Assess patients for signs of liver failure (jaundice, mental status changes, abdominal distention, ascites, generalized edema).
- Evaluate consistency and frequency of bowel movements.
- ***Lab Test Considerations:*** Monitor liver function, lipid profile, and blood glucose periodically during therapy.

Implementation
- **PO:** Orally as an extract, capsule, tablets, or as a dried fruit as a single daily dose or divided into three doses.
- Tea is not recommended as milk thistle is not water-soluble.

Patient/Family Teaching
- Inform patient of symptoms of liver failure; advise patient to report worsening symptomatology promptly to health care professional.
- Advise patients to avoid alcohol and follow diet for liver or gall bladder disease being treated.
- Emphasize the need for blood tests to monitor liver function tests.

Evaluation
- Normalization of liver function tests.
- Reduction in jaundice, abdominal distention, fatigue, and other symptoms associated with liver disease.

SAMe (sam-ee)

Other Name(s):
Ademetionine, S-adenosylmethionine

Classification
Therapeutic: antidepressants

Common Uses
Treatment of depression. Has also been used to manage: osteoarthritis, fibromyalgia, liver disease, migraine headaches.

Action
May aid in the production, activation, and metabolism of various amines, phospholipids, hormones, and neurotransmitters. May stimulate articular cartilage growth and repair. **Therapeutic Effects:** Decreased depression. Anti-inflammatory and analgesic effects improve symptoms of osteoarthritis.

Pharmacokinetics
Absorption: Rapidly and extensively metabolized following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Actively metabolized by the liver.
Half-life: 100 min.

TIME/ACTION PROFILE (antidepressant action)

ROUTE	ONSET	PEAK	DURATION
PO (depression)	1–2 wk	unknown	unknown
PO (osteoarthritis)	30 days	unknown	unknown

© F.A. Davis Publishing

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Bipolar disorder; Lactation.
Use Cautiously in: Pregnancy or children (safety not established); Bipolar disorder (can induce mania); Parkinson's disease (may worsen symptoms); Surgery (discontinue 2 wk prior to elective procedures).

Adverse Reactions/Side Effects
CNS: agitation, dizziness, mild insomnia, manic reactions (in patients with bipolar disorder). **GI:** vomiting, diarrhea, flatulence.

Interactions
Natural Product-Drug: Avoid use with **antidepressants**, **meperidine**, **pentazocine**, **tramadol**, and **dextromethorphan** (additive serotonergic effects may occur). May ↓ effectiveness of **levodopa** and worsen Parkinsonian symptoms. Should not be used concurrently with **MAO inhibitors**. Avoid use of SAMe within 2 wk of using a **MAO inhibitor**.
Natural-Natural: Avoid use with natural products that increase serotonin levels such as **l-tryptophan** and **St. John's wort**.

Route/Commonly Used Doses
PO (Adults): *Depression*—200 mg once or twice daily, adjusted upward over 2 wk (range 400–1600 mg/day); *Liver disorders*—1200–1600 mg/day; *Osteoarthritis*—200–400 mg three times daily; *Fibromyalgia*—800 mg/day.

Availability
Tablets 100 mg, 200 mg, 400 mg[OTC].

NURSING IMPLICATIONS

Assessment
- Assess mental status for symptoms of depression prior to and periodically during therapy; advise patients with depression to be evaluated by a health care professional.
- Assess symptoms of pain and fatigue prior to and periodically during therapy.

Implementation
- **PO:** Administer on an empty stomach. Initial dose should be 200 mg once or twice daily to minimize GI disturbances. Dose may be adjusted upward over 1–2 wk depending on response and tolerance.

Patient/Family Teaching
- Instruct patient to take SAMe as directed.
- Advise patients to discontinue 2 wk prior to elective surgical procedures.
- Advise females of reproductive potential to consult health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation
- Decrease in symptoms of depression.
- Improvement in osteoarthritis symptoms.

saw palmetto
(saw pal-**met**-toe)

Other Name(s):
American Dwarf Palm Tree, Cabbage Palm, Ju-Zhong, Palmier Nain, Sabal, Sabal Fructus, Saw Palmetto Berry, *Serenoa repens*

Classification
Therapeutic: benign prostatic hyperplasia (BPH) agents

Common Uses
Benign prostatic hyperplasia.

Action
Exerts antiandrogenic, anti-inflammatory, and antiproliferative properties in prostate tissue resulting in improvement in BPH symptoms such as frequent urination, hesitancy, urgency, and nocturia. Comparable in efficacy to finasteride but may be less effective than prazosin. **Therapeutic Effects:** Decreased urinary symptoms of BPH.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	1–2 mo	unknown	48 wk (longest studied treatment duration)

Contraindications/Precautions
Contraindicated in: Pregnancy and lactation.
Use Cautiously in: Prior to surgery (discontinue 2 wk before to prevent bleeding).

Adverse Reactions/Side Effects
CNS: dizziness, headache. **GI:** nausea, vomiting, constipation, and diarrhea.

Interactions
Natural Product-Drug: Hormonal action may interfere with other hormonal therapies (**testosterone**, **hormonal contraceptives**). Avoid use with **antiplatelet** or **anticoagulant drugs** (may ↑ bleeding risk).

© F.A. Davis Publishing

Natural-Natural: Concomitant use with herbs that affect platelet aggregation such as **ginger**, **garlic**, **gingko**, and **ginseng** may ↑ bleeding risk.

Route/Commonly Used Doses

PO (Adults): *Lipophilic extract (80–90% fatty acids)* — 160 mg twice daily or 320 mg once daily. *Whole berries* — 1–2 g daily. *Liquid extract from berry pulp* — 1–2 mL three times daily. *Tea (efficacy is questionable due to lipophilicity of active constituents)* — 1 cup three times daily. Tea is prepared by steeping 0.5–1 g dried berry in 150 mL boiling water for 5–10 min.

Availability

Lipophilic extract (80-90% fatty acids)[OTC]**; Whole berries**[OTC]**; Liquid extract**[OTC]**.**

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of benign prostatic hypertrophy (BPH) (urinary hesitancy, feeling of incomplete bladder emptying, interruption in urinary stream, impairment in size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Perform rectal exams prior to and periodically during therapy to assess prostate size are recommended.

Implementation

- Take on a full stomach to minimize GI effects.

Patient/Family Teaching

- Advise patients to start therapy with saw palmetto only after evaluation by a health care professional who will provide continued follow-up care.
- Inform patients that saw palmetto does not alter the size of the prostate but still should relieve the symptoms associated with BPH.
- Advise patient that taking saw palmetto with food may reduce GI effects and improve tolerability.

Evaluation

- Decrease in urinary symptoms of BPH.

St. John's wort (*Hypericum perforatum*)

(saynt **jonz** wort)

Other Name(s):

Amber, Demon chaser, Goatweed, Hardhay, Klamath weed, Rosin rose, Tipton weed

Classification

Therapeutic: antidepressants

Common Uses

PO: Management of mild to moderate depression and obsessive compulsive disorder (OCD). (Not effective for major depression.). **Topical:** Inflammation of the skin, blunt injury, wounds, and burns. Other uses are for capillary strengthening, decreasing uterine bleeding, and reducing tumor size.

Action

Derived from *Hypericum perforatum*; the active component is *hypericin*. **PO:** Antidepressant action may be due to ability to inhibit reuptake of serotonin and other neurotransmitters. **Topical:** Anti-inflammatory, antifungal, antiviral, and antibacterial properties. **Therapeutic Effects: PO:** Decreased signs and symptoms of depression. **Topical:** Decreased inflammation of burns or other wounds.

Pharmacokinetics

Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: *Hypericum constituents* — 24.8–26.5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	10–14 days	within 4–6 wk	unknown

Contraindications/Precautions

Contraindicated in: Pregnancy and lactation.
Use Cautiously in: Children 6–17 years: use orally no longer than 8 wk; History of phototoxicity; Surgery (discontinue 2 wk prior to surgical procedures); Alzheimer's disease (may induce psychosis); Patients undergoing general anesthesia (may cause cardiovascular collapse); History of suicide attempt, severe depression, schizophrenia, or bipolar disorder (can induce hypomania or psychosis).

Adverse Reactions/Side Effects

CNS: dizziness, restlessness, sleep disturbances. **CV:** hypertension. **GI:** abdominal pain, bloating, diarrhea, dry mouth, feeling of fullness, flatulence, nausea, vomiting. **Neuro:** neuropathy. **Derm:** allergic skin reactions (hives, itching, skin rash), phototoxicity. **Misc:** serotonin syndrome.

Interactions

Natural Product-Drug: Concurrent use with **alcohol** or other **antidepressants** (including **SSRIs** and **MAO inhibitors**) may ↑ risk of adverse CNS reactions. May ↓ the effectiveness and serum concentrations of **digoxin**, **alprazolam**, **amitriptyline**, **imatinib**, **irinotecan**, **warfarin**, and **protease inhibitors**. Use with **MAO Inhibitors**, **tramadol**, **pentazocine**, and **selective serotonin**

© F.A. Davis Publishing

agonists could result in serotonin syndrome. May ↓ effectiveness of **oral contraceptives**. May ↓ plasma **cyclosporine** and **tacrolimus** levels by 30–70% and cause acute transplant rejection. May ↑ metabolism of **phenytoin** and **phenobarbital** and cause loss of seizure control. Avoid use of St. John's wort and **MAO Inhibitors** within 2 wk of each other.
Natural-Natural: May ↑ risk of serotonin syndrome when taken with **tryptophan** and **SAM-e**.

Route/Commonly Used Doses
PO (Adults): *Mild Depression*—300 mg of St. John's wort (standardized to 0.3% hypericin) 3 times daily or 250 mg twice daily of 0.2% hypericin extract. *OCD*—450 mg twice daily of extended release preparation.
Topical (Adults): 0.2–1 mg total hypericin daily.

Availability
Preparations for Oral Use
Dried herb[OTC]; Dried (hydroalcoholic) extract[OTC]; Oil[OTC]; Tincture[OTC].
Preparations for Topical Application
Liquid[OTC]; Semisolid[OTC].

NURSING IMPLICATIONS

Assessment
- **Depression:** Assess for depression periodically during therapy.
- **Inflammation:** Assess skin or skin lesions periodically during therapy.

Implementation
- **PO:** Tea can be prepared by mixing 2–4 dried herbs in 150 mL of boiling water and steeping for 10 min.

Patient/Family Teaching
- Instruct patient to take St. John's wort as directed.
- Patients with depression should be evaluated by health care professional. Standard therapy may be of greater benefit for moderate to severe depression.
- Instruct patient to consult health care professional before taking other Rx, OTC, or herbal products concurrently with St. John's wort. May reduce the therapeutic effectiveness of other drugs. May potentiate effect of sedatives and side effects of other antidepressants. Do not take within 2 wk of MAO inhibitor therapy.
- Caution patients to avoid sun exposure and use protective sunscreen to reduce the risk of photosensitivity reactions.
- Inform patient to purchase herbs from a reputable source and that products and their contents vary among different manufacturers.
- Caution patient not to use alcohol while taking St. John's wort.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Inform patient that St. John's wort is usually taken for a period of 4–6 wk. If no improvement is seen, another therapy should be considered.

Evaluation
- Decrease in signs and symptoms of depression or anxiety.
- Improvement in skin inflammation.

valerian (vuh-lare-ee-en)

Other Name(s):
Amantilla, All-Heal, Baldrian, Baldrianwurzel, Belgium Valerian, Common Valerian, Fragrant Valerian, Garden Heliotrope, Garden Valerian, Indian Valerian, Mexican Valerian, Pacific Valerian, Tagara, Valeriana, *Valeriana officinalis*, *Valerianae radix*, Valeriana rhizome, Valeriane

Classification
Therapeutic: antianxiety agents, sedative/hypnotics

Common Uses
Insomnia. Anxiety.

Action
May increase concentrations of the inhibitory CNS transmitter GABA. **Therapeutic Effects:** Improvement in sleep quality.

Pharmacokinetics
Absorption: Unknown.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	2 hr	unknown

Contraindications/Precautions
Contraindicated in: Pregnancy and lactation.
Use Cautiously in: Alcohol use (may have additive sedative effects); Surgery (discontinue use 2 wk prior to elective procedures); Children (do not use longer than 8 wk).

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CNS: drowsiness, headache. **GI:** dry mouth. **Misc:** Benzodiazepine-like withdrawal symptoms with discontinuation after long-term use.

Interactions

Natural Product-Drug: Additive CNS depression with **alcohol**, **antihistamines**, **anesthetic agents**, **sedative hypnotics**, and other **CNS depressants**. Alcohol-containing preparations may interact with **disulfiram** and **metronidazole**.
Natural-Natural: Additive sedative effects can occur when used with herbal supplements with sedative properties such as **kava**, **l-tryptophan**, **melatonin**, **SAMe**, and **St. John's wort**.

Route/Commonly Used Doses

PO (Adults): *Tea*—1 cup tea 1–5 times daily. Tea is made by steeping 2–3 g root in 150 mL boiling water for 5–10 min then straining. *Tincture*—1–3 mL 1–5 times daily. *Extract*—400–900 mg up to 2 hr before bedtime or 300–450 mg divided tid.

Availability

Capsules[OTC]; Extract[OTC]; Tea[OTC]; Tincture[OTC].

NURSING IMPLICATIONS

Assessment

- Assess degree of anxiety and level of sedation prior to and periodically throughout therapy.
- Assess sleep patterns.
- Assess response in the elderly population where drowsiness and loss of balance may pose a significant risk for injury.

Implementation

- Take 1–2 hr before bedtime if used for nighttime hypnotic.
- Administer orally three to five times daily to control anxiety.

Patient/Family Teaching

- Encourage patients to avoid stimulants such as caffeine and to provide an environment that promotes restful sleep.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to avoid use of alcohol and other medications or herbals that have a sedative effect; may increase drowsiness.
- Advise patients to discontinue 2 wk prior to elective surgical procedures.
- Inform patients that dependence with withdrawal symptoms may develop with prolonged use.
- Advise females of reproductive potential to avoid valerian if pregnancy is planned or suspected or breast feeding.

Evaluation

- Decreased anxiety level.
- Improvement in sleep with a feeling of restfulness without drowsiness upon awakening.

BEERS CRITERIA

The Beers criteria for potentially inappropriate medication use in adults 65 and older in the United States is a compilation of drugs and drug classes found to increase the risk of adverse events in older adults. Frequently, older adults are more sensitive to the medications or their side effects. These adverse events have significant economic and quality of life costs for society and individuals and can result in more frequent hospitalizations, permanent injury, or death. Often, the potential for adverse events can be minimized by prescribing safer alternatives or prescribing at the lowest effective dose. The list of medications below represents an update to the list previously published in 2015.

alprazolam (Xanax, Xanax XR)	diphenhydramine (Benadryl)
amiodarone (avoid using as first-line therapy for atrial fibrillation unless heart failure or significant left ventricular hypertrophy present) (Pacerone)	dipyridamole (short-acting)
amitriptyline	disopyramide (Norpace, Norpace CR)
amobarbital (Amytal Sodium)	doxazosin (avoid using for treatment of hypertension) (Cardura)
amoxapine	doxepin (avoid using dosage >6 m g/day) (Silenor)
aripiprazole (avoid use, except in schizophrenia or bipolar disorder) (Abilify, Abilify Maintena)	doxylamine
asenapine (avoid use, except in schizophrenia or bipolar disorder) (Saphris)	dronedarone (avoid use in permanent atrial fibrillation or in patients with severe or recently decompensated heart failure) (Multaq)
aspirin (avoid using dosage >325 m g/day)	ergoloid mesylates
atropine (does not apply to ophthalmic formulations) (Atropen)	esomeprazole (avoid scheduled use for >8 wk unless for high-risk patients or patients with erosive esophagitis, Barrett esophagitis, or pathological hypersecretory condition) (Nexium, Nexium 24HR)
belladonna alkaloids (Donnatal)	
benztropine (oral only) (Cogentin)	estazolam
brexpiprazole (avoid use, except in schizophrenia) (Rexulti)	estrogens (with or without progestins) (avoid systemic estrogens; intravaginal formulations acceptable to use)
brompheniramine	
butabarbital (Butisol Sodium)	eszopiclone (Lunesta)
butalbital	etodolac
carbinoxamine (Karbinal ER)	fenoprofen (Nalfon)
cariprazine (avoid use, except in schizophrenia or bipolar disorder) (Vraylar)	fluphenazine (avoid use, except in schizophrenia)
carisoprodol (Soma)	flurazepam
chlordiazepoxide (Librium)	glimepiride (Amaryl)
chlordiazepoxide-amitriptyline	glyburide (Diabeta, Glynase)
chlorpheniramine (Chlor-Trimeton)	growth hormone (avoid unless used for confirmed growth hormone deficiency)
chlorpromazine (avoid use, except in schizophrenia or bipolar disorder or for short-term use as antiemetic during chemotherapy)	guanfacine (Intuniv)
chlorzoxazone	haloperidol (avoid use, except in schizophrenia or bipolar disorder or for short-term use as antiemetic during chemotherapy) (Haldol)
clemastine (Dayhist Allergy)	hydroxyzine (Vistaril)
clidinium-chlordiazepoxide (Librax)	hyoscyamine (Anaspaz, Levsin)
clomipramine (Anafranil)	ibuprofen (Advil, Motrin)
clonazepam (Klonopin)	iloperidone (avoid use, except in schizophrenia) (Fanapt)
clonidine (avoid use for first-line treatment of hypertension) (Catapres, Duraclon, Kapvay)	imipramine (Tofranil)
clorazepate (Tranxene)	indomethacin (Indocin, Tivorbex)
clozapine (avoid use, except in schizophrenia or bipolar disorder) (Clozaril, Versacloz)	insulin (avoid use of regimens containing only short- or rapid-acting insulin without concurrent use of basal or long-acting insulin)
cyclobenzaprine (Amrix, Fexmid)	
cyproheptadine	isoxsuprine
desipramine (Norpramin)	ketoprofen
desmopressin (avoid use for treatment of nocturia or nocturnal polyuria) (DDAVP, Nocdurna, Noctiva, Stimate)	ketorolac
dessicated thyroid (Armour Thyroid)	lansoprazole (avoid scheduled use for >8 wk unless for high-risk patients or patients with erosive esophagitis, Barrett esophagitis, or pathological hypersecretory condition) (Prevacid, Prevacid 24HR, Prevacid SoluTab)
dexbrompheniramine	
dexchlorpheniramine	
dexlansoprazole (avoid scheduled use for >8 wk unless for high-risk patients or patients with erosive esophagitis, Barrett esophagitis, or pathological hypersecretory condition) (Dexilant)	lorazepam (Ativan)
	loxapine (avoid use, except in schizophrenia or bipolar disorder) (Adasuve)
	lurasidone (avoid use, except in schizophrenia or bipolar disorder) (Latuda)
diazepam (Valium)	meclizine
diclofenac (Cambia, Zipsor, Zorvolex)	meclofenamate
dicyclomine (Bentyl)	mefenamic acid (Ponstel)
diflunisal	megestrol (Megace ES)
digoxin (avoid using for first-line treatment of atrial fibrillation or heart failure; avoid using dosage >0.125 mg/day) (Lanoxin)	meloxicam (Mobic, Qmiiz ODT, Vivlodex)
	meperidine (Demerol)
dimenhydrinate (Dramamine)	meprobamate
	metaxalone (Skelaxin)

© F.A. Davis Publishing

BEERS CRITERIA continued	
methocarbamol (Robaxin)	pimozide
methscopolamine	piroxicam (Feldene)
methyldopa	prazosin (avoid using for treatment of hypertension) (Minipress)
methyltestosterone (avoid unless used for confirmed hypogonadism) (Android, Testred)	prochlorperazine (avoid use, except for short-term use as antiemetic during chemotherapy) (Compro)
metoclopramide (avoid use, except in gastroparesis [use should generally not exceed 12 wk]) (Reglan)	promethazine
mineral oil (oral)	propantheline
nabumetone	protriptyline
naproxen (Aleve, Anaprox, Naprelan, Naprosyn)	pyrilamine
nifedipine (immediate-release) (Procardia)	quazepam (Doral)
nitrofurantoin (avoid using if CCr <30 mL/min or for long-term suppression of urinary tract infections) (Furadantin, Macrobid, Microdantin)	quetiapine (avoid use, except in schizophrenia or bipolar disorder) (Seroquel, Seroquel XR)
nortriptyline (Pamelor)	rabeprazole (avoid scheduled use for >8 wk unless for high-risk patients or patients with erosive esophagitis, Barrett esophagitis, or pathological hypersecretory condition) (Aciphex, Aciphex Sprinkle)
olanzapine (avoid use, except in schizophrenia or bipolar disorder or for short-term use as antiemetic during chemotherapy) (Zyprexa, Zyprexa Relprevv, Zyprexa Zydis)	risperidone (avoid use, except in schizophrenia or bipolar disorder) (Perseris Kit, Risperdal, Risperdal Consta)
olanzapine-fluoxetine (avoid use, except in bipolar disorder) (Symbyax)	scopolamine (Transderm-Scop)
omeprazole (avoid scheduled use for >8 wk unless for high-risk patients or patients with erosive esophagitis, Barrett esophagitis, or pathological hypersecretory condition) (Prilosec, Prilosec OTC)	secobarbital (Seconal)
orphenadrine	sulindac
oxaprozin (Daypro)	temazepam (Restoril)
oxazepam	terazosin (avoid using for treatment of hypertension)
paliperidone (avoid use, except in schizophrenia or bipolar disorder) (Invega, Invega Sustenna, Invega Trinza)	testosterone (avoid unless used for confirmed hypogonadism) (Androderm, Androgel, Aveed, Fortesta, Natesto, Striant, Testim, Vogelxo, Xyosted)
pantoprazole (avoid scheduled use for >8 wk unless for high-risk patients or patients with erosive esophagitis, Barrett esophagitis, or pathological hypersecretory condition) (Protonix)	thioridazine (avoid use, except in schizophrenia)
paroxetine (Brisdelle, Paxil, Paxil CR, Pexeva)	thiothixene (avoid use, except in schizophrenia)
pentobarbital (Nembutal)	tolmetin
perphenazine (avoid use, except in schizophrenia or for short-term use as antiemetic during chemotherapy)	triazolam (Halcion)
perphenazine-amitriptyline (avoid use, except in schizophrenia)	trifluoperazine (avoid use, except in schizophrenia)
phenobarbital	trihexyphenidyl
	trimipramine
	triprolidine
	zaleplon (Sonata)
	ziprasidone (avoid use, except in schizophrenia or bipolar disorder) (Geodon)
	zolpidem (Ambien, Ambien CR, Edluar, Intermezzo, Zolpimist)

DRUGS ASSOCIATED WITH INCREASED RISK OF FALLS IN THE ELDERLY

Many factors are associated with falls in the elderly, including frailty, disease, vision, polypharmacy, and certain medications. Below is a list of drugs associated with falls. Assess geriatric patients on these medications for fall risk and implement fall reduction strategies.

ACE Inhibitors
- benazepril (Lotensin)
- captopril
- enalapril (Vasotec)
- fosinopril
- lisinopril (Prinivil, Zestril)
- moexipril
- perindopril
- quinapril (Accupril)
- ramipril (Altace)
- trandolapril

Angiotensin II Receptor Antagonists
- azilsartan (Edarbi)
- candesartan (Atacand)
- eprosartan
- irbesartan (Avapro)
- losartan (Cozaar)
- olmesartan (Benicar)
- telmisartan (Micardis)
- valsartan (Diovan)

Antiarrhythmics
- digoxin (Lanoxin)
- disopyramide (Norpace)

Anticonvulsants
- carbamazepine (Carbatrol, Epitol, Equetro, Tegretol)
- ethosuximide (Zarontin)
- felbamate (Felbatol)
- gabapentin (Gralise, Neurontin)
- lamotrigine (Lamictal)
- levetiracetam (Keppra, Spritam)
- methsuximide (Celontin)
- phenobarbital
- phenytoin (Dilantin, Phenytek)
- pregabalin (Lyrica)
- primidone (Mysoline)
- tiagabine (Gabatril)
- topiramate (Qudexy XR, Topamax, Trokendi XR)
- valproate (Depakote)
- zonisamide (Zonegran)

Antidepressants
- amitriptyline
- amoxapine
- bupropion (Aplenzin, Forfivo XL, Wellbutrin XL)
- citalopram (Celexa)
- clomipramine (Anafranil)
- desipramine (Norpramin)
- doxepin (Silenor)
- duloxetine (Cymbalta, Drizalma Sprinkle)
- escitalopram (Lexapro)
- fluoxetine (Prozac)
- fluvoxamine
- imipramine (Tofranil)
- isocarboxazid (Marplan)
- maprotiline
- mirtazapine (Remeron)
- nefazodone
- paroxetine (Paxil, Pexeva)
- phenelzine (Nardil)
- protriptyline (Vivactil)
- sertraline (Zoloft)
- tranylcypromine (Parnate)
- trazodone
- trimipramine
- venlafaxine (Effexor XR)

Antihistamines/Antinauseants
- dimenhydrinate (Dramamine)
- diphenhydramine (Benadryl)
- hydroxyzine (Vistaril)
- meclizine (Bonine)
- metoclopramide (Reglan)
- prochlorperazine (Compro)
- promethazine
- scopolamine patch (Transderm Scop)

Antiparkinsonian Agents
- amantadine (Gocovri, Osmolex ER)
- bromocriptine (Parlodel)
- entacapone (Comtan)
- levodopa/carbidopa (Duopa, Rytary, Sinemet, Sinemet CR)
- pramipexole (Mirapex, Mirapex ER)
- selegiline (Zelapar)

Antipsychotics (Atypical)
- aripiprazole (Abilify, Abilify Maintena, Aristada, Aristada Initio)
- clozapine (Clozaril, Versacloz)
- olanzapine (Zyprexa, Zyprexa Relprevv, Zyprexa Zydis)
- paliperidone (Invega, Invega Sustenna, Invega Trinza)
- quetiapine (Seroquel, Seroquel XR)
- risperidone (Perseris, Risperdal, Risperdal Consta)
- ziprasidone (Geodon)

Antipsychotics (Typical)
- chlorpromazine
- fluphenazine
- haloperidol (Haldol)
- loxapine (Adasuve)
- perphenazine
- pimozide
- thioridazine
- thiothixine
- trifluoperazine

Anxiolytics
- buspirone
- meprobamate

Benzodiazepines (Long-Acting)
- chlordiazepoxide (Librium)
- clonazepam (Klonopin)
- clorazepate (Tranxene)
- diazepam (Valium)
- flurazepam

Benzodiazepines (Intermediate-Acting)
- alprazolam (Xanax, Xanax XR)
- estazolam
- lorazepam (Ativan)
- oxazepam
- temazepam (Restoril)

Benzodiazepines (Short-Acting)
- triazolam (Halcion)

Beta Blockers
- acebutolol
- atenolol (Tenormin)
- bisoprolol
- carvedilol (Coreg, Coreg CR)
- labetalol (Trandate)
- metoprolol (Kaspargo Sprinkle, Lopressor, Toprol XL)
- propranolol (Inderal LA, InnoPran XL)
- timolol

Calcium Channel Blockers
- amlodipine (Katerzia, Norvasc)
- diltiazem (Cardizem, Cardizem CD, Cardizem LA, Cartia XT, Taztia XT, Tiazac)
- felodipine
- isradipine
- nicardipine (Cardene)
- nifedipine (Adalat CC, Procardia XL)
- nisoldipine (Sular)
- verapamil (Calan SR, Verelan, Verelan PM)

Diuretics
- amiloride/hydrochlorothiazide
- bumetanide (Bumex)
- furosemide (Lasix)
- hydrochlorothiazide (Microzide)
- triamterene/hydrochlorothiazide (Dyazide, Maxzide)

Opioid Analgesics
- codeine
- fentanyl (Abstral, Actiq, Duragesic, Fentora, Ionsys, Lazanda, Sublimaze, Subsys)
- hydrocodone (Hysingla ER, Zohydro ER)
- hydromorphone (Dilaudid)
- levorphanol
- meperidine (Demerol)
- methadone (Dolophine, Methadose)
- morphine (Duramorph, Infumorph, Kadian, Mitigo, Morphabond ER, MS Contin)
- oxycodone (Oxaydo, OxyContin, Roxicodone, Xtampza ER)
- oxymorphone (Opana)

Skeletal Muscle Relaxants
- baclofen (Gablofen, Lioresal, Ozobax)

Vasodilators
- doxazosin (Cardura, Cardura XL)
- hydralazine
- isosorbide dinitrate/mononitrate (Dilatrate SR, Isordil, Monoket)
- nitroglycerin (GoNitro, Minitran, Nitro-Dur, Nitrolingual, Nitromist, Nitrostat)
- prazosin (Minipress)
- terazosin

DO NOT CRUSH!

Do not crush any oral medication that is labeled as:

Antineoplastic **(AN)**
Buccal **(BU)**
Delayed Release **(DR)**
Enteric-Coated **(EC)**
Extended Release **(ER)**
Effervescent Tablet **(EVT)**
Mucous Membrane Irritant **(MMI)**
Orally Disintegrating Tablets **(ODT)**
Sustained-Release **(SR)**
Sublingual **(SL)**

Do not crush any oral medication that ends in the following letters:

CD CR ER LA SR XL XR XT

MEDICATIONS THAT SHOULD NOT BE CRUSHED:

Absorica Capsule **(MMI)**
Aciphex Sprinkle **(SR)**—see code "**C**"
Aciphex Tablet **(SR)**
Acticlate Tablet **(film-coated)**—see code "**B**"
Actiq Lozenge **(SR) (chewing or swallowing may↓ bioavailability)**
Actonel Tablet **(MMI)**
Adalat CC Tablet **(SR)**
Adderall XR Capsule **(SR)**—see code "**C**"
Adhansia XR Capsule **(SR)**—see code "**C**"
Adzenys XR-ODT Tablet **(ODT, SR)**—see code "**E**"
Afeditab CR Tablet **(SR)**
Afinitor Tablet **(MMI)**
Aggrenox Capsule **(SR)**
Alecensa Capsule **(AN)**
Altoprev Tablet **(SR)**
Alunbrig Tablet **(AN)**
Ambien CR Tablet **(SR)**
Amitiza Capsule **(SR)**
Amnesteem Capsule **(MMI)**
Ampyra Tablet **(SR)**
Amrix Capsule **(SR)**—see code "**C**"
Aplenzin Tablet **(SR)**
Apriso Capsule **(SR)**—see code "**C**"
Aptensio XR Capsule **(SR)**—see code "**C**"
Aptivus Capsule **(oil emulsion within spheres)**—taste issue—see code "**A**"
Aricept 23-mg Tablet **(crushing may↑rate of absorption)**
Arthrotec Tablet **(EC)**
Asacol HD Tablet **(SR)**
Aspirin Caplet or Tablet **(EC, SR)**
Astagraf XL Capsule **(SR)**
Atelvia Tablet **(SR, MMI)**
Augmentin XR Tablet **(SR)**—see codes "**A**," "**B**"
Austedo Tablet
Avodart Capsule **(MMI)**—see code "**F**"
Azulfidine EN-Tablet **(SR)**
Balversa Tablet **(AN)**
Bayer Low-Dose Aspirin Tablet **(EC)**
Belbuca Buccal Film **(BU, film-coated) (chewing or swallowing may↓bioavailability)**—see code "**E**"
Biaxin-XL Tablet **(SR)**
Biltricide Tablet **(crushing, breaking or chewing can leave bitter taste)**—see code "**B**"
Binosto Tablet **(EVT)**—see code "**G**"
Bisac-Evac Tablet **(EC)**—see code "**D**"
Bisacodyl Tablet **(EC)**—see code "**D**"
Boniva Tablet **(MMI)**
Bonjesta Tablet **(SR)**
Bosulif Tablet **(AN)**
Briviact Tablet **(film-coated)**—see code "**A**"
Bunavail Buccal Film **(BU, EC) (chewing or swallowing may↓ bioavailability)**
Bupropion ER Tablet **(SR)**
Cabometyx Tablet **(film-coated)**
Calquence Capsule **(AN)**
Caprelsa Tablet **(MMI)**
Carbaglu Tablet **(tablets should be completely dispersed in water)**
Carbatrol Capsule **(SR)**—see code "**C**"
Cardizem CD Capsule **(SR)**
Cardizem LA Tablet **(SR)**
Cardizem Tablet
Cardura XL Tablet **(SR)**
Cartia XT Capsule **(SR)**
Cefaclor ER Tablet **(SR)**—see code "**A**"
Cefuroxime Tablet **(may cause unpleasant taste)**—see code "**A**"
CellCept Capsule, Tablet—see codes "**A**," "**H**"
Cerdelga Capsule **(preferably taken with water)**
Cholbam Capsule —see code "**C**"
Claravis Capsule **(MMI)**
Colace Capsule **(crushing, breaking, or chewing can leave bitter taste)**
Colestid Tablet **(SR)**
Cometriq Capsule **(AN)**
Concerta Tablet **(SR)**
Contrave Tablet **(SR)**
Conzip Capsule **(SR) (crushing, chewing or dissolving may↑risk of fatal overdose)**
Copiktra Capsule **(AN)**
Coreg CR Capsule **(SR)**—see code "**C**"
Cotempla XR-ODT Tablet **(ODT, SR)**—see code "**E**"
Creon Capsule **(SR)**—see code "**C**"
Cresemba Capsule
Crixivan Capsule **(crushing, breaking, or chewing can leave bitter taste)**—see code "**C**"
Cyclophosphamide Tablet **(may be crushed; however, injection preferred)**
Cymbalta Capsule **(SR)**
Daurismo Tablet **(AN)**
Delzicol Capsule **(SR)**—see code "**C**"
Depakote ER Tablet **(SR)**
Depakote Tablet **(SR)**
Detrol LA Capsule **(SR)**
Dexilant Capsule **(SR)**—see code "**C**"
Diacomit Capsule—see code "**A**"
Diclegis Tablet **(SR)**
Dilatrate-SR Capsule **(SR)**
Ditropan XL Tablet **(SR)**
Doryx Tablet **(SR)**
Doryx MPC Tablet **(SR)**
Drisdol Capsule **(filled with liquid)**
Droxia Capsule **(wear gloves to administer)**
Duavee Tablet
Duexis Tablet
Dulcolax Tablet, Capsule **(EC)**—see code "**D**"
EC-Naprosyn Tablet **(SR, EC)**—see code "**A**"
Ecotrin Tablet **(EC)**
Edluar Sublingual Tablet **(SL)**—see code "**E**"
Effer-K Tablet **(EVT)**—see code "**G**"
Effexor XR Capsule **(SR)**—see code "**C**"
Elepsia XR Tablet **(SR)**—see code "**A**"
Enablex Tablet **(SR)**
Entocort EC Capsule **(EC)**—see code "**C**"
Envarsus XR Tablet **(SR)**
Equetro Capsule **(SR)**—see code "**C**"
Ergomar Sublingual Tablet **(SL)**—see code "**E**"
Erivedge Capsule—see code "**F**"
Erleada Tablet **(AN)**
Ery-Tab Tablet **(SR, EC)**
Erythromycin Base Tablet **(EC)**
Erythomycin Delayed-Release Capsule **(SR) (contains pellets)**—see code "**C**"
Evekeo Orally Disintengrating Tablet—see code "**E**"
Evista Tablet—see code "**F**"
Exjade Tablet **(tablets must be dispersed in liquid)**
Ezallor Capsule—see code "**C**"
Farydak Capsule **(MMI)**
Feldene Capsule **(MMI)**
Felodipine Tablet **(SR)**
Fentanyl Lozenge **(SR)**
Fentora Buccal Tablet **(BU) (crushing could↓effectiveness)**

Oxaydo Tablet **(may obstruct feeding tubes if crushed)**—see code "**A**"
Oxtellar XR Tablet **(SR)**
OxyContin Tablet **(SR) (crushing, chewing or dissolving may↑risk of fatal overdose)**
Pancreaze Capsule **(EC, SR)**—see code "**C**"
Paxil Tablet **(film-coated)**—see code "**A**"
Paxil CR Tablet **(SR)**
Pentasa Capsule **(SR)**—see code "**C**"
Pentoxifylline ER Tablet **(SR)**
Pertyze Capsule **(SR)**—see code "**C**"
Pexeva Tablet **(film-coated)**—see code "**A**"
Plaquenil Tablet **(film-coated)**
Pomalyst Capsule **(AN)**
Pradaxa Capsule **(breaking, chewing, or emptying may↑bioavailability)**
Prevacid 24HR Capsule **(SR)**
Prevacid Capsule **(SR)**—see code "**C**"
Prevacid SoluTab Tablet **(ODT) (may dissolve in water to administer via NG tube)**
Prevymis Tablet
Prilosec OTC Tablet **(SR)**
Pristiq Tablet **(SR)**
Procardia XL Tablet **(SR)**
Procysbi Capsule **(SR)**—see code "**C**"
Propecia Tablet—see code "**F**"
Proscar Tablet—see code "**F**"
Protonix Tablet **(SR)**—see code "**A**"
Prozac Weekly Capsule **(EC)**
Pylera Capsule **(MMI)**
Qtern Tablet
Qudexy XR Capsule **(SR)**—see code "**C**"
Ranexa Tablet **(SR)**
Rapamune Tablet—see code "**A**"
Rayaldee Capsule **(SR)**
Rayos Tablet **(SR)**—see code "**A**"
Razadyne ER Capsule **(SR)**
Renagel Tablet **(expands in liquid when crushed or broken)**—see code "**A**"
Renvela Tablet **(expands in liquid when crushed or broken)**—see code "**A**"
Requip XL Tablet **(SR)**
Revlimid Capsule—see code "**F**"
Reyataz Capsule **(oral powder available)**
Ritalin LA Capsule **(SR)**—see code "**C**"
Roweepra Tablet **(crushing or chewing can leave bitter taste)**—see code "**A**"
Roweepra ER Tablet **(SR)**—see code "**A**"
Rydapt Capsule **(AN)**
Rytary Capsule **(SR)**—see code "**C**"
Rythmol SR Capsule **(SR)**
Sensipar Tablet **(cutting tablets may cause variable dosing accuracy)**
Seroquel XR Tablet **(SR)**
Sinemet CR Tablet **(SR)**—see code "**B**"
Sirturo Tablet
Sitavig Buccal Tablet **(BU)**
Solodyn Tablet **(SR)**
Sprycel Tablet **(film-coated)**—see code "**F**"
Stalevo Tablet **(combining portions of tablets may lead to overdose of entacapone)**
Stivarga Tablet **(SR)**
Straterra Capsule **(contents can cause ocular irritation)**
Suboxone Sublingual Film **(SL)**—see code "**E**"
Sular Tablet **(SR)**
Symax Duotab Tablet **(SR)**
Symax SR Tablet **(SR)**
Symdeko Tablet
Synjardy XR Tablet **(SR)**
Tafinlar Capsule **(AN)**
Tagrisso Tablet **(may be dissolved in water)**
Talzenna Capsule **(AN)**
Tasigna Capsule —see code "**C**"
Taztia XT Capsule **(SR)**—see code "**C**"
Tecfidera Capsule **(SR)**
Tegretol-XR Tablet **(SR)**
Temodar Capsule **(SR, MMI)**—see code "**H**"
Tessalon Perles Capsule **(chewing or crushing may cause local anesthesia of mucous membranes which could lead to choking)**
Theo-24 Capsule **(SR)**
Theochron Tablet **(SR)**
Tiazac Capsule **(SR)**—see code "**C**"
Tibsovo Capsule **(AN)**
Tolsura Capsule—see code "**A**"
Topamax Tablet, Capsule **(crushing, breaking or chewing can leave bitter taste)**—see code "**C**"
Toprol XL Tablet **(SR)**—see code "**B**"
Toviaz Tablet **(SR)**
Traceleer Tablet—see code "**F**"
Treximet Tablet **(chewing, crushing, or breaking may cause rapid absorption)**
Trilipix Capsule **(SR)**

DO NOT CRUSH! continued

MEDICATIONS THAT SHOULD NOT BE CRUSHED:

Trokendi XR Capsule **(SR)**
Uceris Tablet **(SR)**
Uptravi Tablet **(film-coated)**
Urocit-K Tablet **(SR)**
Uroxatral Tablet **(SR)**
Valcyte Tablet—see codes "**A**," "**F**"
Valproic Acid Capsule **(SR, MMI)**—see code "**A**"
Vascepa Capsule
Venclexta Tablet **(AN, film-coated)**
Verelan Capsule **(SR)**—see code "**C**"
Verelan PM Capsule **(SR)**—see code "**C**"
Verzenio Tablet **(AN)**
Vesicare Tablet **(crushing, breaking or chewing can leave bitter taste)**
Videx EC Capsule **(EC, SR)**
Vimovo Tablet **(SR)**
Viokace Tablet **(MMI)**
Viramune XR Tablet **(SR)**—see code "**A**"
Vitrakvi Capsule **(AN)**—see code "**A**"
VoSpire ER Tablet **(SR)**
Votrient Tablet **(crushing may ↑ bioavailability)**
Vyndamax Capsule
Vyndaqel Capsule
Wellbutrin SR, XL Tablet **(SR)**
Xalkori Capsule **(AN)**
Xanax XR Tablet **(SR)**
Xarelto Tablet **(crushed tablet must be given within 4 hr)**
Xeljanz XR Tablet **(SR)**
Xigduo XR Tablet **(SR)**
Ximino Capsule **(SR)**
Xospata Tablet **(AN)**
Xtampza ER Tablet **(SR)**—see code "**A**"
Xtandi Capsule **(AN)**
Yonsa Tablet **(AN)**
Yosprala Tablet **(SR)**
Zegerid OTC Capsule **(SR)**—see code "**A**"
Zejula Capsule **(AN)**
Zelboraf Tablet **(AN)**
Zenatane Capsule **(MMI)**
Zenpep Capsule **(SR)**—see code "**C**"
Zolinza Capsule **(MMI)**
Zortress Tablet **(MMI)**
Zubsolv Sublingual Tablet **(SL)**—see code "**E**"
Zuplenz Oral Film—see code "**E**"
Zydelig Tablet **(AN, film-coated)**
Zyflo CR Tablet **(SR)**
Zytiga Tablet **(AN)**

CODES:

A: Liquid forms are available
B: Tablets that are scored may be broken in half
C: Capsule can be opened—contents may be used/sprinkled on certain foods or liquids as recommended by the manufacturer
D: Do not take with antacids or milk products
E: Disintegrates on or under the tongue—do not chew
F: Women who are of childbearing age should not handle crushed or broken tablets or the contents of opened capsules
G: Effervescent tablets must be dissolved in the volume of diluent recommended by the manufacturer
H: Avoid direct contact with skin as may enhance tumor development

LIST OF CONFUSED DRUG NAMES

Drug Name	Confused Drug Name
Abelcet	amphotericin B
Accupril	Aciphex
acetaminophen	acetaZOLAMIDE
acetaZOLAMIDE	acetaminophen
acetic acid for irrigation	glacial acetic acid
Aciphex	Accupril
Aciphex	Aricept
Activase	Cathflo Activase
Activase	TNKase
Actonel	Actos
Actos	Actonel
Adacel (Tdap)	Daptacel (DTaP)
ado-trastuzumab emtansine	trastuzumab
Aggrastat	argatroban
Aldara	Alora
Alkeran	Leukeran
Alkeran	Myleran
Allegra	Allegra Anti-Itch Cream (diphenhydramine/ allantoin)
Allegra	Viagra
Allegra Anti-Itch Cream (diphenhydramine/ allantoin)	Allegra
Alora	Aldara
ALPRAZolam	clonazePAM
ALPRAZolam	LORazepam
amantadine	amiodarone
Ambisome	amphotericin B
aMILoride	amLODIPine
amiodarone	amantadine
amLODIPine	aMILoride
amphotericin B	Abelcet
amphotericin B	Ambisome
amphotericin B	amphotericin B liposomal
amphotericin B liposomal	amphotericin B
antacid	Atacand
anticoagulant citrate dextrose solution formula A	anticoagulant sodium citrate solution
anticoagulant sodium citrate solution	anticoagulant citrate dextrose solution formula A
Apidra	Spiriva
argatroban	Aggrastat
Aricept	Aciphex
Aricept	Azilect
ARIPiprazole	proton pump inhibitors
ARIPiprazole	RABEprazole
Arista AH (absorbable hemostatic agent)	Arixtra
Arixtra	Arista AH (absorbable hemostatic agent)
Asacol	Os-Cal
Atacand	antacid
atomoxetine	atorvastatin
atorvastatin	atomoxetine
Avandia	Coumadin
azaCITIDine	azaTHIOprine

Drug Name	Confused Drug Name
azaTHIOprine	azaCITIDine
Azilect	Aricept
B & O (belladonna and opium)	Beano
BabyBIG	HBIG (hepatitis B immune globulin)
Beano	B & O (belladonna and opium)
Benadryl	benazepril
benazepril	Benadryl
Betadine (with povidone-iodine)	Betadine (without povidone-iodine)
Betadine (without povidone-iodine)	Betadine (with povidone-iodine)
betaine (anhydrous form)	betaine HCl
betaine HCl	betaine (anhydrous form)
Bicillin C-R	Bicillin L-A
Bicillin L-A	Bicillin C-R
Bidex	Videx
Brevibloc	Brevital
Brevital	Brevibloc
buprenorphine	HYDROmorphone
buPROPion	busPIRone
busPIRone	buPROPion
captopril	carvedilol
carBAMazepine	OXcarbazepine
CARBOplatin	CISplatin
Cardene	Cardizem
Cardizem	Cardene
Cardura	Coumadin
carvedilol	captopril
Cathflo Activase	Activase
ceFAZolin	cefTRIAXone
cefTRIAXone	ceFAZolin
cefuroxime	sulfaSALAzine
CeleBREX	CeleXA
CeleBREX	Cerebyx
CeleXA	CeleBREX
CeleXA	Cerebyx
CeleXA	ZyPREXA
Cerebyx	CeleBREX
Cerebyx	CeleXA
cetirizine	sertraline
cetirizine	stavudine
chlordiazePOXIDE	chlorproMAZINE
chlorproMAZINE	chlordiazePOXIDE
CISplatin	CARBOplatin
Claritin (loratadine)	Claritin Eye (ketotifen fumarate)
Claritin-D	Claritin-D 24
Claritin-D 24	Claritin-D
Claritin Eye (ketotifen fumarate)	Claritin (loratadine)
Clindesse	Clindets
Clindets	Clindesse
cloBAZam	clonazePAM
clomiPHENE	clomiPRAMINE
clomiPRAMINE	clomiPHENE

Brand names always start with an upper case letter. Some brand names incorporate tall man letters in initial characters and may not be readily recognized as brand names. Brand name products appear in black; generic/other products appear in red.

LIST OF CONFUSED DRUG NAMES continued

Drug Name	Confused Drug Name
clonazePAM	ALPRAZolam
clonazePAM	cloBAZam
clonazePAM	cloNIDine
clonazePAM	cloZAPine
clonazePAM	LORazepam
cloNIDine	clonazePAM
cloNIDine	cloZAPine
cloNIDine	KlonoPIN
cloZAPine	clonazePAM
cloZAPine	cloNIDine
Clozaril	Colazal
coagulation factor IX (recombinant)	factor IX complex, vapor heated
Colace	Cozaar
Colazal	Clozaril
colchicine	Cortrosyn
Cortrosyn	colchicine
Coumadin	Avandia
Coumadin	Cardura
Cozaar	Colace
Cozaar	Zocor
Cubicin	Cubicin RF
Cubicin RF	Cubicin
cyclophosphamide	cycloSPORINE
cycloSERINE	cycloSPORINE
cycloSPORINE	cyclophosphamide
cycloSPORINE	cycloSERINE
Cymbalta	Symbyax
dabigatran	vigabatrin
DACTINomycin	DAPTOmycin
Daptacel (DTaP)	Adacel (Tdap)
DAPTOmycin	DACTINomycin
DAUNOrubicin	DOXOrubicin
DAUNOrubicin	IDArubicin
Denavir	indinavir
Depakote	Depakote ER
Depakote ER	Depakote
DEPO-Medrol	SOLU—Medrol
Depo-Provera	Depo-subQ provera 104
Depo-subQ provera 104	Depo-Provera
desipramine	disopyramide
desmopressin	vasopressin
dexamethasone	dexmedetomidine
Dexilant	DULoxetine
dexmedetomidine	dexamethasone
dexmethylphenidate	methadone
diazePAM	dilTIAZem
Diflucan	Diprivan
dilTIAZem	diazePAM
dimenhyDRINATE	diphenhydrAMINE
diphenhydrAMINE	dimenhyDRINATE
Diprivan	Diflucan
Diprivan	Ditropan
disopyramide	desipramine
Ditropan	Diprivan
DOBUTamine	DOPamine
DOCEtaxel	PACLitaxel

Drug Name	Confused Drug Name
DOPamine	DOBUTamine
Doxil	Paxil
DOXOrubicin	DAUNOrubicin
DOXOrubicin	DOXOrubicin liposomal
DOXOrubicin	IDArubicin
DOXOrubicin liposomal	DOXOrubicin
Dramamine (dimenhyDRINATE)	Dramamine (ginger root)
Dramamine (dimenhyDRINATE)	Dramamine (meclizine)
Dramamine (ginger root)	Dramamine (dimenhyDRINATE)
Dramamine (ginger root)	Dramamine (meclizine)
Dramamine (meclizine)	Dramamine (dimenhyDRINATE)
Dramamine (meclizine)	Dramamine (ginger root)
Dulcolax (bisacodyl)	Dulcolax (docusate sodium)
Dulcolax (docusate sodium)	Dulcolax (bisacodyl)
DULoxetine	Dexilant
DULoxetine	FLUoxetine
DULoxetine	PARoxetine
Effexor XR	Enablex
elvitegravir, cobicistat, emtricitabine, and tenofovir alafenamide	elvitegravir, cobicistat, emtricitabine, and tenofovir disoproxil fumarate
elvitegravir, cobicistat, emtricitabine, and tenofovir disoproxil fumarate	elvitegravir, cobicistat, emtricitabine, and tenofovir alafenamide
Enablex	Effexor XR
Enbrel	Levbid
Engerix-B adult	Engerix-B pediatric/ adolescent
Engerix-B pediatric/ adolescent	Engerix-B adult
ePHEDrine	EPINEPHrine
EPINEPHrine	ePHEDrine
epiRUBicin	eriBULin
eriBULin	epiRUBicin
factor IX complex, vapor heated	coagulation factor IX (recombinant)
Fanapt	Xanax
Farxiga	Fetzima
Femara	Femhrt
Femhrt	Femara
fentaNYL	SUFentanil
Fetzima	Farxiga
Fioricet	Fiorinal
Fiorinal	Fioricet
flavoxATE	fluvoxaMINE
Flonase	Flovent
Floranex	Florinef
Florastor	Florinef
Florinef	Floranex
Florinef	Florastor
Flovent	Flonase

Brand names always start with an upper case letter. Some brand names incorporate tall man letters in initial characters and may not be readily recognized as brand names. Brand name products appear in black; generic/other products appear in red.

PEDIATRIC INTRAVENOUS MEDICATION QUICK REFERENCE CHART

Risk of fluid overload in infants and children is always a consideration when administering IV medications. The following table provides maximum concentrations—the smallest amount of fluid necessary for diluting specific medications—and the maximum rate at which the medications be given.

Drug	Maximum Concentration	Maximum Rate
acetaminophen	10 mg/mL	Give over 15 min
acetazolamide	100 mg/mL	500 mg/min^2
acyclovir	7 mg/mL	Give over 1 hr
adenosine	3 mg/mL	Give over 1–2 sec
allopurinol	6 mg/mL	Give over 30 min
amikacin	10 mg/mL	Give over 30–60 min
aminocaproic acid	20 mg/mL	Give over 1 hr
aminophylline	25 mg/mL	25 mg/min
amphotericin B deoxycholate (conventional)	0.1 mg/mL (peripherally) 0.5 mg/mL (centrally)	Give over 2–6 hr Give over 2–6 hr
amphotericin B lipid complex	2 mg/mL	Give over 2 hr
amphotericin B liposomal	2 mg/mL	Give over 2 hr
ampicillin	100 mg/mL	100 mg/min
ampicillin/sulbactam	30 mg/mL (ampicillin)	Give over 15–30 min
anidulafungin	0.77 mg/mL	1.1 mg/min
atropine	1 mg/mL	Give over 1 min
azithromycin	2 mg/mL	Give over 1 hr
aztreonam	20 mg/mL	Give over 20–60 min
bumetanide	0.25 mg/mL	Give over 1–2 min
caffeine citrate	20 mg/mL	Give over 10–20 min
calcitriol	2 mcg/mL	Give over 15 sec
calcium chloride	100 mg/mL	100 mg/min
calcium gluconate	100 mg/mL	100 mg/min
caspofungin	0.5 mg/mL	Give over 1 hr
cefazolin	138 mg/mL (IVP) 20 mg/mL (intermittent infusion)	Give over 3–5 min Give over 10–60 min
cefepime	160 mg/mL	Give over 30 min
cefotaxime	200 mg/mL (IVP) 60 mg/mL (intermittent infusion)	Give over 3–5 min Give over 10–30 min
cefoxitin	200 mg/mL (IVP) 40 mg/mL (intermittent infusion)	Give over 3–5 min Give over 10–60 min
ceftazidime	180 mg/mL (IVP) 40 mg/mL (intermittent infusion)	Give over 3–5 min Give over 10–30 min
ceftriaxone	40 mg/mL	Give over 10–30 min
cefuroxime	100 mg/mL (IVP) 137 mg/mL (intermittent infusion)	Give over 3–5 min Give over 15–30 min
chlorothiazide	28 mg/mL	Give over 3–5 min
chlorpromazine	1 mg/mL	0.5 mg/min
ciprofloxacin	2 mg/mL	Give over 60 min
clindamycin	18 mg/mL	30 mg/min
cyclosporine	2.5 mg/mL	Give over 2–6 hr
dexamethasone	10 mg/mL	Doses ≤10 mg: Give over 1–4 min Doses >10 mg: Give over 15–30 min
dexmedetomidine	4 mcg/mL	Give bolus over 5–10 min
diazepam	5 mg/mL	2 mg/min
digoxin	100 mcg/mL	Give over 5 min
diphenhydramine	25 mg/mL	25 mg/min
doxycycline	1 mg/mL	Give over 1 hr
enalaprilat	1.25 mg/mL	Give over 5 min
erythromycin	5 mg/mL	Give over 20–120 min
esomeprazole	8 mg/mL	Give over 10–30 min
ethacrynic acid	2 mg/mL	Give over 5–30 min
famotidine	4 mg/mL (IVP) 0.2 mg/mL (intermittent infusion)	10 mg/min Give over 15–30 min
fentanyl	50 mcg/mL	Give over 1–3 min
fluconazole	2 mg/mL	Give over 1–2 hr
flumazenil	0.1 mg/mL	0.2 mg/min
foscarnet	12 mg/mL (peripherally) 24 mg/mL (centrally)	60 mg/kg/hr
fosphenytoin	25 mg/mL	3 mg/kg/min
furosemide	10 mg/mL	0.5 mg/kg/min
ganciclovir	10 mg/mL	Give over 1 hr
gentamicin	10 mg/mL	Give over 30 min
glycopyrrolate	0.2 mg/mL	20 mcg/min
granisetron	1 mg/mL (IVP) 50 mcg/mL (intermittent infusion)	Give over 30 sec Give over 30–60 min

APPENDIX A

Recent Drug Approvals

To view full-text monographs of drugs that have been recently released from the FDA or to learn about changes to dosage forms, please visit www.DrugGuide.com.

amisulpride (am-ee-**sul**-pride)
Barhemsys

Classification
Therapeutic: antiemetics
Pharmacologic: dopamine antagonists

Indications
Prevention of postoperative nausea and vomiting (PONV) (as monotherapy or in combination with another antiemetic in a different pharmacologic class). Treatment of PONV in patients who have received antiemetic prophylaxis with an agent of a different pharmacologic class or have not received prophylaxis.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Congenital long QT syndrome; Concurrent use of droperidol; Severe renal impairment (eGFR <30 mL/min/m^2).
Use Cautiously in: Arrhythmias, conduction disorders, hypokalemia, hypomagnesemia, or HF (↑ risk of QT interval prolongation); Concurrent use of QT interval prolonging medications (↑ risk of QT interval prolongation); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only when potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness in children not established; Geri: May have ↑ risk of adverse reaction due to age-related decline in renal function.

Adverse Reactions/Side Effects
CV: hypotension (during surgical procedure), QT interval prolongation. **Endo:** hyperprolactinemia. **F and E:** hypokalemia. **GI:** abdominal distention. **Local:** pain at infusion site. **Misc:** chills.

Route/Dosage
Prevention of PONV
IV (Adults): 5 mg single dose administered at the time of anesthesia induction.

Treatment of PONV
IV (Adults): 10 mg single dose administered at onset of nausea/vomiting following surgical procedure.

bempedoic acid (**bem**-pe-**doe**-ik **as**-id)
Nexletol

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: adenosine triphosphate-citrate lyase inhibitors

Indications
Heterozygous familial hypercholesterolemia or established atherosclerotic cardiovascular disease in patients who require additional lowering of low-density lipoprotein cholesterol (LDL-C) levels (as adjunct to diet and maximally tolerated statin therapy).

Contraindications/Precautions
Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: History of gout; Concurrent use of corticosteroids or fluoroquinolones, renal failure, or previous tendon disorders (↑ risk of tendon rupture/injury); Severe renal impairment or end-stage renal disease; Severe hepatic impairment; Pedi: Safety and effectiveness in children not established; Geri: ↑ risk of tendon rupture/injury in patients >60 yr.

Adverse Reactions/Side Effects
CV: atrial fibrillation. **GI:** abdominal pain, ↑ liver enzymes. **GU:** benign prostatic hyperplasia, ↑ blood urea nitrogen, ↑ serum creatinine. **Hemat:** anemia. **Metab:** hyperuricemia, gout. **MS:** back pain, ↑ creatine kinase, muscle spasm, tendon rupture/injury. **Resp:** upper respiratory tract infection.

Route/Dosage
PO (Adults): 180 mg once daily.

© F.A. Davis Publishing

dostarlimab (dos-tar-li-mab) Jemperli

Classification
Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies, programmed death 1 inhibitors

Indications
Mismatch repair deficient (dMMR) recurrent or advanced endometrial cancer that has progressed on or following previous treatment with a platinum-containing regimen.

Contraindications/Precautions
Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Thoracic radiation (↑ risk of immune-mediated pneumonitis); Allogeneic hematopoietic stem cell transplantation recipients (↑ risk of transplant-related complications); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
CV: IMMUNE-MEDIATED MYOCARDITIS, immune-mediated pericarditis, immune-mediated vasculitis. **Derm:** IMMUNE-MEDIATED DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), IMMUNE-MEDIATED STEVENS-JOHNSON SYNDROME, IMMUNE-MEDIATED TOXIC EPIDERMAL NECROLYSIS, pruritus. **EENT:** immune-mediated iritis, immune-mediated uveitis. **Endo:** immune-mediated adrenal insufficiency, immune-mediated hyperthyroidism, immune-mediated hypoparathyroidism, immune-mediated hypophysitis, immune-mediated hypothyroidism, immune-mediated type 1 diabetes. **F and E:** hypercalcemia, hypokalemia, hyponatremia. **GI:** IMMUNE-MEDIATED HEPATITIS, constipation, diarrhea, hypoalbuminemia, ↑ liver enzymes, nausea, vomiting, immune-mediated colitis, immune-mediated gastritis, immune-mediated pancreatitis. **GU:** IMMUNE-MEDIATED NEPHRITIS, ↑ serum creatinine, urinary tract infection. **Hemat:** IMMUNE-MEDIATED APLASTIC ANEMIA, anemia, leukopenia, lymphopenia, immune-mediated hemolytic anemia. **Metab:** ↓ appetite. **MS:** IMMUNE-MEDIATED RHABDOMYOLYSIS, immune-mediated myositis. **Neuro:** IMMUNE-MEDIATED ENCEPHALITIS, IMMUNE-MEDIATED MENINGITIS, myalgia, autoimmune neuropathy, immune-mediated Guillain-Barré syndrome, immune-mediated myasthenic syndrome, immune-mediated myelitis. **Resp:** IMMUNE-MEDIATED PNEUMONITIS, cough. **Misc:** INFUSION-RELATED REACTIONS, fatigue.

Route/Dosage
IV (Adults): 500 mg every 3 wk for Doses 1–4, then give 1000 mg every 6 wk with Dose 5 starting 3 wk after Dose 4; continue until disease progression or unacceptable toxicity.

eptinezumab (ep-ti-nez-ue-mab) Vyepti

Classification
Therapeutic: vascular headache suppressants
Pharmacologic: monoclonal antibodies, calcitonin gene-related peptide receptor antagonists

Indications
Migraine prevention.

Contraindications/Precautions
Contraindicated in: Serious hypersensitivity.
Use Cautiously in: OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
EENT: nasopharyngitis. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Route/Dosage
IV (Adults): 100 mg every 3 mo; some patients may benefit from 300 mg every 3 mo.

evinacumab (e-vin-ak-ue-mab) Evkeeza

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: angiopoietin-like 3 (ANGPTL3) inhibitors, monoclonal antibodies

Indications
Homozygous familial hypercholesterolemia (HoFH) (as adjunct to other low-density lipoprotein-cholesterol [LDL-C] lowering therapies).

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy (may cause fetal harm) .

Use Cautiously in: Lactation: Safety not established in breast feeding; Rep: Women of reproductive potential; Pedi: Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

EENT: nasopharyngitis, nasal congestion, rhinorrhea. **GI:** abdominal pain, constipation, nausea. **MS:** pain. **Neuro:** dizziness. **Resp:** upper respiratory tract infection. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), infusion reactions.

Route/Dosage

IV (Adults and Children ≥12 yr): 15 mg/kg every 4 wk.

fostemsavir (fos-**tem**-sa-vir)
Rukobia

Classification
Therapeutic: antiretrovirals
Pharmacologic: gp120 attachment inhibitors

Indications

Human immunodeficiency virus type 1 (HIV-1) infection in heavily treatment-experienced patients with multidrug-resistant HIV-1 infection who have failed their current antiretroviral regimen due to resistance, intolerance, or safety considerations (in combination with other antiretroviral agents).

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of carbamazepine, enzalutamide, mitotane, phenytoin, rifampin, and St. John's wort; Lactation: Breast feeding not recommended for HIV-infected patients.

Use Cautiously in: History of QTc prolongation or cardiovascular disease; Hepatitis B and/or C coinfection (↑ risk of liver enzyme elevation); OB: Safety not established in pregnancy; Pedi: Safety and effectiveness not established in children; Geri: May be at ↑ risk of QT interval prolongation.

Adverse Reactions/Side Effects

CV: QT interval prolongation. **Derm:** rash. **Endo:** Graves' disease, hyperglycemia. **GI:** nausea, abdominal pain, autoimmune hepatitis, diarrhea, dyspepsia, hyperbilirubinemia, ↑ lipase, ↑ liver enzymes, vomiting. **GU:** ↑ serum creatinine. **Hemat:** anemia, neutropenia. **Metab:** hypercholesterolemia, hyperuricemia. **MS:** ↑ creatine kinase, polymyositis. **Neuro:** Guillain-Barré syndrome, headache, insomnia, sedation. **Misc:** fatigue, immune reconstitution syndrome.

Route/Dosage

PO (Adults): 600 mg twice daily.

molnupiravir
(mol-noo-**peer**-a-veer)
No trade name

Classification
Therapeutic: antivirals
Pharmacologic: nucleoside analogues

Indications

Treatment of mild-to-moderate COVID-19 infection in non-hospitalized patients with positive results of direct SARS-CoV-2 viral testing, and are at high risk for progression to severe COVID-19, including hospitalization or death, and for whom alternative COVID-19 treatment options authorized by FDA are not accessible or clinically appropriate. An Emergency Use Authorization (EUA) has been issued for this use of molnupiravir; this drug is not FDA-approved for the above indication.

Contraindications/Precautions

Contraindicated in: Pedi: Children <18 yr (may affect bone and cartilage growth); Lactation: Lactation.

Use Cautiously in: Rep: Women and men of reproductive potential; OB: Use during pregnancy only if the potential maternal benefit outweighs potential fetal risk (has caused fetal harm in animal studies).

Adverse Reactions/Side Effects

GI: diarrhea, nausea. **Neuro:** dizziness.

Route/Dosage

PO (Adults): 800 mg every 12 hr for 5 days. Should be started as soon as possible after diagnosis of COVID-19 and within 5 days of symptom onset.

© F.A. Davis Publishing

nirmatrelvir/ritonavir

(nur-ma**trel**-veer/ri-**toe**-na-veer)
Paxlovid

Classification
Therapeutic: antivirals
Pharmacologic: proteasome inhibitors

Indications
Treatment of mild-to-moderate COVID-19 infection in patients with positive results of direct SARS-CoV-2 viral testing, and who are at high risk for progression to severe COVID-19, including hospitalization or death. An Emergency Use Authorization (EUA) has been issued for this use of molnupiravir; this drug is not FDA-approved for the above use.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Concurrent use of alfuzosin, amiodarone, apalutamide, carbamazepine, clozapine, colchicine, dihydroergotamine, dronedarone, ergotamine, flecainide, lovastatin, lurasidone, methylergonovine, midazolam (PO), phenobarbital, phenytoin, piroxicam, pimozide, propafenone, quinidine, ranolazine, rifampin, simvastatin, sildenafil (Revatio), St. John's wort, or triazolam; Severe renal impairment; Severe hepatic impairment.
Use Cautiously in: Moderate renal impairment (↓ dose); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children. Not authorized for use in children <12 yr or <40 kg.

Adverse Reactions/Side Effects
CV: hypertension. **GI:** diarrhea. **MS:** myalgia. **Neuro:** dysgeusia.

Route/Dosage
PO (Adults and Children ≥12 yr and ≥40 kg): Two nirmatrelvir 150-mg tablets and one ritonavir 100-mg tablet twice daily for 5 days. Should be started as soon as possible after diagnosis of COVID-19 and within 5 days of symptom onset.

Renal Impairment
PO (Adults and Children ≥12 yr and ≥40 kg): *CCr 30–59 mL/min*—One nirmatrelvir 150-mg tablet and one ritonavir 100-mg tablet twice daily for 5 days. Should be started as soon as possible after diagnosis of COVID-19 and within 5 days of symptom onset.

olanzapine/samidorphan

(oh-**lan**-za-peen/**sam**-i-**dor**-fan)
Lybalvi

Classification
Therapeutic: antipsychotics, mood stabilizers
Pharmacologic: thienobenzodiazepines, opioid antagonists

Indications
Schizophrenia. Acute therapy of manic or mixed episodes associated with bipolar I disorder (as monotherapy or in combination with lithium or valproate). Maintenance therapy of bipolar I disorder.

Contraindications/Precautions
Contraindicated in: Using opioids or undergoing acute opioid withdrawal; End-stage renal disease.
Use Cautiously in: Cardiovascular or cerebrovascular disease; Diabetes or risk factors for diabetes (may worsen glucose control); History of seizures; Patients at risk for aspiration or falls; Low WBC or ANC or history of drug-induced neutropenia/leukopenia; Presence/history of constipation, urinary retention, prostatic hypertrophy, or paralytic ileus; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; Lactation: Use while breast feeding only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children; Geri: May require ↓ doses of olanzapine; ↑ risk of mortality and stroke/transient ischemic attack in older adults treated for dementia-related psychosis.

Adverse Reactions/Side Effects
CV: orthostatic hypotension, ↑ blood pressure, syncope. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS). **EENT:** ↑ salivation. **Endo:** hyperprolactinemia, galactorrhea, gynecomastia, hyperglycemia. **GI:** dry mouth, constipation, dyspepsia, dysphagia, ↑ liver enzymes, nausea. **GU:** amenorrhea, ↓ fertility (females), impotence. **Hemat:** AGRANULOCYTOSIS, leukopenia, neutropenia. **Metab:** dyslipidemia, ↑ appetite, ↑ weight. **MS:** bradykinesia, ↑ creatine kinase, muscle spasms. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, sedation, akathisia, dizziness, falls, headache, restlessness, speech impairment, tardive dyskinesia, tremor. **Misc:** aspiration, body temperature dysregulation, fatigue.

© F.A. Davis Publishing

Route/Dosage

Schizophrenia

PO (Adults): Olanzapine 5 mg/samidorphan 10 mg *or* olanzapine 10 mg/samidorphan 10 mg once daily; may ↑ dose on weekly basis in 5–mg increments of olanzapine based on clinical response and tolerability (max = olanzapine 20 mg/samidorphan 10 mg once daily).
PO (Adults ≥65 yr or patients at risk for orthostatic hypotension): Olanzapine 5 mg/samidorphan 10 mg; may ↑ dose on weekly basis in 5–mg increments of olanzapine based on clinical response and tolerability (max = olanzapine 20 mg/samidorphan 10 mg once daily).

Bipolar I Disorder

PO (Adults): *Monotherapy*—Olanzapine 10 mg/samidorphan 10 mg *or* olanzapine 15 mg/samidorphan 10 mg once daily; may ↑ dose no more frequently than every 24 hr in 5–mg increments of olanzapine based on clinical response and tolerability (max = olanzapine 20 mg/samidophan 10 mg once daily). *As adjunct to lithium or valproate*—Olanzapine 10 mg/samidorphan 10 mg once daily; may ↑ dose on weekly basis in 5–mg increments of olanzapine based on clinical response and tolerability (max = olanzapine 20 mg/samidophan 10 mg once daily).
PO (Adults ≥65 yr or patients at risk for orthostatic hypotension): *Monotherapy*—Olanzapine 5 mg/samidorphan 10 mg once daily; may ↑ dose no more frequently than every 24 hr in 5–mg increments of olanzapine based on clinical response and tolerability (max = olanzapine 20 mg/samidophan 10 mg once daily). *As adjunct to lithium or valproate*—Olanzapine 5 mg/samidorphan 10 mg once daily; may ↑ dose on weekly basis in 5–mg increments of olanzapine based on clinical response and tolerability (max = olanzapine 20 mg/samidophan 10 mg once daily).

opicapone (oh-pik-a-pone)
Ongentys

Classification
Therapeutic: antiparkinson agents
Pharmacologic: catechol-*O*-methyltransferase (COMT) inhibitors

Indications

Parkinson's disease in patients experiencing "off" episodes (as adjunctive therapy to levodopa/carbidopa).

Contraindications/Precautions

Contraindicated in: Concurrent use of nonselective MAO inhibitors; Pheochromocytoma, paraganglioma, or other catecholamine secreting neoplasms; Major psychotic disorders; End-stage renal disease (CCr <15 mL/min); Severe hepatic impairment.
Use Cautiously in: Severe renal impairment; Moderate hepatic impairment (↓ dose); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; Geri: Older adults may have ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CV: hypertension, hypotension, presyncope, syncope. **GI:** constipation, dry mouth. **Metab:** ↓ weight. **MS:** ↑ creatine kinase. **Neuro:** dyskinesia, aggressive behavior, agitation, delusions, dizziness, hallucinations, impulse control disorders (gambling, sexual, uncontrolled spending, binge/compulsive eating), insomnia, psychosis, somnolence.

Route/Dosage

PO (Adults): 50 mg once daily at bedtime.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—25 mg once daily at bedtime.

ponesimod (poe-nes-i-mod)
Ponvory

Classification
Therapeutic: anti-multiple sclerosis agents
Pharmacologic: receptor modulators

Indications

Relapsing forms of multiple sclerosis (MS), including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease.

Contraindications/Precautions

Contraindicated in: MI, unstable angina, stroke, TIA, or class III or IV HF within previous 6

© F.A. Davis Publishing

mo; Mobitz type II 2nd-degree AV heart block, 3rd-degree AV heart block, sick sinus syndrome, or sinoatrial block (in the absence of a pacemaker); Uncontrolled hypertension, cardiac arrest, cerebrovascular disease occurring >6 mo prior to treatment initiation, or severe untreated sleep apnea; Active acute/chronic untreated infections; Moderate or severe hepatic impairment; Concurrent use of phototherapy with UV-B radiation or PUVA-photochemotherapy; Prior use of alemtuzumab; OB: Pregnancy (may cause fetal harm).

Use Cautiously in: History of ischemic heart disease, MI, or class III/IV HF occurring more than 6 mo prior to treatment initiation (↑ risk of bradycardia/heart block); 1st- or 2nd-degree (Mobitz type I) AV heart block, sinus bradycardia, or recurrent syncope (↑ risk of bradycardia/heart block); QT interval >500 msec; Asthma, COPD, or pulmonary fibrosis; Diabetes mellitus/history of uveitis (↑ risk of macular edema); Rep: Women of reproductive potential; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Risk of adverse reactions may be ↑ consider age-related ↓ in cardiac/renal/hepatic function, chronic illnesses, and concurrent drug therapy.

Adverse Reactions/Side Effects

CV: hypertension, bradycardia, heart block. **Derm:** MELANOMA, SQUAMOUS CELL CARCINOMA, basal cell carcinoma. **EENT:** macular edema. **GI:** ↑ liver enzymes. **Hemat:** lymphopenia. **MS:** pain. **Metab:** hypercholesterolemia. **Neuro:** POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), SEIZURES, dizziness, somnolence, vertigo. **Resp:** cough, dyspnea, ↓ pulmonary function. **Misc:** INFECTION (including bacterial, viral and fungal), fever, ↑ C-reactive protein levels.

Route/Dosage

PO (Adults): 2 mg once daily for 2 days (Days 1 and 2), then 3 mg once daily for 2 days (Days 3 and 4), then 4 mg once daily for 2 days (Days 5 and 6), then 5 mg once daily for one day (Day 7), then 6 mg once daily for one day (Day 8), then 7 mg once daily for one day (Day 9), then 8 mg once daily for one day (Day 10), then 9 mg once daily for one day (Day 11), then 10 mg once daily for 3 days (Days 12–14), then 20 mg once daily thereafter (starting on Day 15).

sotorasib (soh-toh-ra-sib)
Lumakras

Classification
Therapeutic: antineoplastics
Pharmacologic: kras inhibitors

Indications

KRAS G12C-mutated locally advanced or metastatic non-small cell lung cancer (NSCLC) in patients who have previously received ≥1 systemic therapy.

Contraindications/Precautions

Contraindicated in: Lactation: Lactation.

Use Cautiously in: OB: Safety not established in pregnancy; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: edema. **F and E:** hypocalcemia, hyponatremia. **Derm:** rash. **GI:** HEPATOTOXICITY, abdominal pain, constipation, diarrhea, hypoalbuminemia, ↑ liver enzymes, nausea, vomiting. **GU:** proteinuria. **Hemat:** anemia, ↑ activated partial thromboplastin time, lymphocytopenia. **Metab:** ↓ appetite. **MS:** arthralgia, pain. **Resp:** INTERSTITIAL LUNG DISEASE/PNEUMONITIS, cough, dyspnea, pneumonia. **Misc:** fatigue.

Route/Dosage

PO (Adults): 960 mg once daily until disease progression or unacceptable toxicity.

teprotumumab
(tep-roe-toom-ue-mab)
Tepezza

Classification
Therapeutic: none assigned
Pharmacologic: insulin-like growth factor-1 receptor inhibitors

Indications

Thyroid eye disease.

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm).

Use Cautiously in: Inflammatory bowel disease (may cause exacerbation); Diabetes; Lactation: Safety not established in breast feeding; Rep:

© F.A. Davis Publishing

Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Derm: alopecia, dry skin. **EENT:** hearing impairment. **Endo:** hyperglycemia. **GI:** diarrhea, nausea. **MS:** muscle spasms. **Neuro:** dysgeusia, headache. **Misc:** fatigue, infusion reactions.

Route/Dosage

IV (Adults): 10 mg/kg initially, then 20 mg/kg every 3 wk for 7 additional doses.

tivozanib (tye-**voe**-za-nib)
Fotivda

Classification
Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Relapsed or refractory advanced renal cell carcinoma following ≥2 prior systemic therapies.

Contraindications/Precautions

Contraindicated in: SBP >150 mmHg or DBP >100 mmHg; History of symptomatic HF within preceding 6 mo; Patients at risk of or with history of arterial thrombotic events, including MI, angina or ischemic stroke within preceding 6 mo; Significant bleeding within preceding 6 mo; End-stage renal disease; Severe hepatic impairment; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Hypertension (control before initiating therapy); Heart failure; Patients at risk for or with history of venous thromboembolism; Patients at risk for or with history of bleeding; Surgery (interruption of therapy recommended); Thyroid abnormalities; Aspirin or tartrazine hypersensitivity; Moderate hepatic impairment (↓ dose); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: DEEP VEIN THROMBOSIS, HF, HYPERTENSIVE CRISES, MYOCARDIAL INFARCTION, hypertension. **Derm:** palmar-plantar erythrodysesthesia syndrome, rash, impaired wound healing. **Endo:** hypothyroidism, hyperglycemia, hyperthyroidism. **F and E:** hypercalcemia, hyperkalemia, hypomagnesemia, hyponatremia, hypophosphatemia. **GI:** diarrhea, hyperbilirubinemia, ↑ amylase, ↑ lipase, ↑ liver enzymes, nausea, stomatitis, vomiting. **GU:** HEPATOBILIARY DISORDERS, ↑ serum creatinine, acute kidney injury, ↓ fertility, proteinuria. **Hemat:** BLEEDING, THROMBOEMBOLIC EVENTS, anemia, ↑ activated partial thromboplastin time, ↑ hemoglobin, lymphocytopenia, thrombocytopenia. **Metab:** ↓ appetite, ↓ weight. **MS:** back pain, osteonecrosis. **Neuro:** POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), STROKE, delirium. **Resp:** PULMONARY EMBOLISM, RESPIRATORY FAILURE, cough, dysphonia, dyspnea. **Misc:** fatigue.

Route/Dosage

PO (Adults): 1.34 mg once daily on Days 1–21 of a 28-day cycle (i.e. 21 days of tivozanib therapy, followed by 7 days off of therapy); continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*— 0.89 mg once daily on Days 1–21 of a 28-day cycle (i.e. 21 days of tivozanib therapy, followed by 7 days off of therapy); continue until disease progression or unacceptable toxicity.

trilaciclib (**trye**-la-**sye**-klib)
Cosela

Classification
Therapeutic: myeloprotective agents
Pharmacologic: kinase inhibitors

Indications

To decrease the incidence of chemotherapy-induced myelosuppression in patients when administered prior to a platinum/etoposide-containing regimen or topotecan-containing regimen for extensive-stage small cell lung cancer.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Moderate or severe hepatic impairment (total bilirubin >1.5× ULN); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: peripheral edema. **Derm:** rash. **Endo:** hyperglycemia. **F and E:** hypocalcemia, hypokalemia,

© F.A. Davis Publishing

hypophosphatemia. **GI:** ↑ liver enzymes, upper abdominal pain. **Hemat:** BLEEDING, NEUTROPENIA, THROMBOSIS, anemia, thrombocytopenia, leukopenia. **Local:** injection site reactions. **Neuro:** STROKE, fatigue, headache. **Resp:** PNEUMONIA, INTERSTITIAL LUNG DISEASE/PNEUMONITIS, RESPIRATORY FAILURE. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), INFUSION REACTIONS.

Route/Dosage

IV (Adults): 240 mg/m² administered within 4 hr prior to the start of chemotherapy on each day chemotherapy is administered. Do not exceed an interval of more than 28 days between doses.

voclosporin (voe-kloe-spor-in)

Lupkynis

Classification

Therapeutic: immunosuppressants
Pharmacologic: calcineurin inhibitors

Indications

Active lupus nephritis (in combination with corticosteroids and mycophenolate).

Contraindications/Precautions

Contraindicated in: Severe hypersensitivity; Concurrent use of strong CYP3A4 inhibitors; Severe hepatic impairment; OB: Pregnancy (formulation contains alcohol; also used with mycophenolate, which can cause fetal harm); Lactation: Lactation. **Use Cautiously in:** Bradycardia, electrolyte disorders (hypokalemia, hypomagnesemia), QT interval prolongation, or concurrent use of QT interval prolonging medications; eGFR ≤45 mL/min/1.73 m² (↓ dose in severe renal impairment); Mild or moderate hepatic impairment (↓ dose recommended); Rep: Women of reproductive potential and men with female partners of reproductive potential (used with mycophenolate which can cause fetal harm); Pedi: Safety and effectiveness not established in children; Geri: Initiate therapy with lower dose in older adults due to age-related ↓ in renal and hepatic function.

Adverse Reactions/Side Effects

CV: hypertension, QT interval prolongation. **Derm:** alopecia, hypertrichosis. **F and E:** hyperkalemia. **GI:** diarrhea, abdominal pain, dyspepsia, gingivitis, mouth ulceration. **GU:** nephrotoxicity. **Hemat:** anemia, pure red cell aplasia. **Metab:** anorexia. **Neuro:** POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), SEIZURES, headache, attention disturbance, delirium, dizziness, fatigue, mental status changes, paresthesia, tremor. **Resp:** cough. **Misc:** INFECTION, MALIGNANCY (including lymphoma and skin cancer).

Route/Dosage

PO (Adults): 23.7 mg twice daily. *Concurrent use of moderate CYP3A4 inhibitor*—15.8 mg in the morning and 7.9 mg in the evening.

Renal Impairment

PO (Adults): *Severe renal impairment*—15.8 mg twice daily.

Hepatic Impairment

PO (Adults): *Mild or moderate hepatic impairment*—15.8 mg twice daily.

APPENDIX B

Ophthalmic Medications

General Info: See Appendix C for administration techniques for ophthalmic agents.
Consult health care professional regarding:
Concurrent use of contact lenses (medication or additives may be absorbed by the lens).
Concurrent administration of other ophthalmic agents (order and spacing may be important).
ADRs = adverse reactions.

DRUG NAME	DOSE	NOTES
Anesthetics		
Uses: Provide brief local anesthesia to allow measurement of intraocular pressure, removal of foreign bodies, or other superficial procedures. **CAUTIONS:** Repeated use may result in ↑ risk of CNS and cardiovascular toxicity; cross-sensitivity with some local anesthetics may occur.		
lidocaine (Akten)	**Adults and children:** 2 drops of 3.5% gel (single dose).	• Does not interact with ophthalmic cholinesterase inhibitors • ADRs: ophthalmic—irritation; systemic—irregular heartbeat, CNS depression
proparacaine (Alcaine)	**Adults and children:** 1–2 drops of 0.5% solution (single dose).	• Does not interact with ophthalmic cholinesterase inhibitors • ADRs: ophthalmic—irritation; systemic—irregular heartbeat, CNS depression
tetracaine (Altacaine)	**Adults:** 1–2 drops of 0.5% solution (single dose).	• May interact with ophthalmic cholinesterase inhibitors, resulting in ↑ duration of action and risk of toxicity • ADRs: ophthalmic—irritation; systemic—irregular heartbeat, CNS depression
Antihistamines		
Uses: Various forms of allergic conjunctivitis.		
alcaftadine (Lastacaft)	**Adults and children ≥2 yr:** 1 drop of 0.25% solution once daily.	• ADRs: transient burning/stinging, headache
azelastine	**Adults and children ≥3 yr:** 1 drop of 0.05% solution twice daily.	• ADRs: transient burning/stinging, headache, bitter taste
bepotastine (Bepreve)	**Adults and children ≥2 yr:** 1 drop of 1.5% solution twice daily.	• ADRs: taste disturbance, headache, local irritation
cetirizine (Zerviate)	**Adults and children ≥2 yr:** 1 drop of 0.24% solution twice daily (given 8 hr apart).	• ADRs: transient burning/stinging, ↓ visual acuity
epinastine	**Adults and children ≥2 yr:** 1 drop of 0.05% solution twice daily.	• ADRs: headache, local irritation
ketotifen (Alaway, Claritin Eye, Zaditor)	**Adults and children ≥3 yr:** 1 drop of 0.025% solution twice daily (given 8–12 hr apart).	• OTC • ADRs: local irritation
olopatadine (Pataday)	**Adults and children ≥2 yr:** *0.1% solution*—1 drop twice daily (given 6–8 hr apart); *0.2% solution*—1 drop once daily; *0.7% solution*—1 drop once daily.	• OTC • ADRs: headache, conjunctival irritation
Antibacterials/Antifungals/Antivirals		
Uses: Localized superficial ophthalmic infections (e.g., bacterial conjunctivitis). **CAUTIONS:** Small amounts may be absorbed and result in hypersensitivity reactions.		

© F.A. Davis Publishing

DRUG NAME	DOSE	NOTES
Antibacterials		
azithromycin (AzaSite)	**Adults and children ≥1 yr:** 1 drop of 1% solution twice daily (given 8–12 hr apart) for 2 days, then once daily for 5 more days.	• When used to treat ocular chlamydial infections, concurrent systemic therapy is required • ADRs: eye irritation
bacitracin	**Adults and children:** ¼–½-in. ointment strip every 3–4 hr for acute infections or 2–3 times daily for mild-moderate infections.	• ADRs: eye irritation
besifloxacin (Besivance)	**Adults and children ≥1 yr:** 1 drop of 0.6% suspension 3 times daily (given 4–12 hr apart) for 7 days.	• ADRs: headache, eye irritation
ciprofloxacin (Ciloxan)	**Adults and children of all ages (solution) or ≥2 yr (ointment):** *Bacterial conjunctivitis*—Solution: 1–2 drops of 0.3% solution every 2 hr while awake for 2 days, then every 4 hr while awake for 5 more days; Ointment: ½-in. strip 3 times daily for 2 days, then twice daily for 5 more days; *Corneal ulcers*—Solution: 2 drops of 0.3% solution every 15 min for 6 hr, then every 30 min while awake for rest of day, then every hr while awake for next 24 hr, then every 4 hr while awake for next 12 days or longer if re-epithelialization does not occur.	• May cause harmless white crystalline precipitate that resolves over time • ADRs: altered taste, systemic allergic reactions, photophobia, discomfort
erythromycin	**Adults and children:** *Treatment of infections*—½-in. ointment strip 2–6 times daily. **Infants:** *Prophylaxis of ophthalmia neonatorum*—½-in. ointment strip in each eye as a single dose.	• ADRs: irritation
fusidic acid (Canada: Fucithalmic)	**Adults and children ≥2 yr:** 1 drop of 1% suspension twice daily for 7 days.	• ADRs: irritation
gatifloxacin (Canada: Zymar, Zymaxid)	**Adults and children of all ages (Zymar) or ≥1 yr (Zymaxid):** *Zymaxid*—1 drop of 0.5% solution every 2 hr while awake (up to 8 times/day) for 1 day, then 2–4 times daily while awake for 6 more days; *Zymar*—1 drop of 0.3% solution every 2 hr while awake (up to 8 times/day) for 2 days, then 4 times daily while awake for 5 more days.	• ADRs: irritation, headache, ↓ visual acuity, taste disturbance
gentamicin (Genoptic, Gentak)	**Adults and children:** *Solution*—1–2 drops of 0.3% solution every 2–4 hr; *Ointment*—½-in. strip every 8–12 hr.	• ADRs: irritation, burning, stinging, blurred vision (ointment)
levofloxacin	**Adults and children ≥6 yr:** 1–2 drops of 0.5% solution every 2 hr while awake for 2 days (up to 8 times/day); then every 4 hr while awake for 5 more days (up to 4 times/day).	• ADRs: altered taste, systemic allergic reactions, photophobia
moxifloxacin (Moxeza, Vigamox)	**Adults and children ≥4 mo (Moxeza) or of all ages (Vigamox):** *Moxeza*—1 drop of 0.5% solution twice daily for 7 days; *Vigamox*—1 drop of 0.5% solution 3 times daily for 7 days.	• ADRs: irritation, ↓ visual acuity

© F.A. Davis Publishing

DRUG NAME	DOSE	NOTES
ofloxacin (Ocuflox)	**Adults and children ≥1 yr:** *Bacterial conjunctivitis*—1–2 drops of 0.3% solution every 2–4 hr while awake for 2 days, then 4 times daily for 5 more days; *Corneal ulcer*—1–2 drops of 0.3% solution every 30 min while awake and every 4–6 hr while sleeping for 2 days, then every hr while awake for 4–6 more days, then 4 times daily until cured.	• ADRs: altered taste, systemic allergic reactions, photophobia
sulfacetamide (Bleph-10)	**Adults and children ≥2 mo:** *Solution*—1–2 drops of 10% solution every 2–3 hr while awake (less frequently at night) for 7–10 days; *Ointment*—½-in. strip every 3–4 hr and at bedtime for 7–10 days.	• Cross-sensitivity with other sulfonamides (including thiazides) may occur • ADRs: local irritation
tobramycin (AK-Tob, Tobrex)	**Adults and children ≥2 mo:** *Solution*—1–2 drops of 0.3% solution every 2–4 hr depending on severity of infection; *Ointment*—½-in. strip every 8–12 hr.	• Ointment may retard corneal wound healing • ADRs: irritation, burning, stinging, blurred vision (ointment)
Antifungal		
natamycin (Natacyn)	**Adults:** *Fungal keratitis*—1 drop of 5% suspension every 1–2 hr for 3–4 days, then 6–8 times/day for 2–3 wk; *Fungal blepharitis or conjunctivitis*—1 drop of 5% suspension every 4–6 hr for 2–3 wk.	• ADRs: irritation, swelling
Antivirals		
ganciclovir (Zirgan)	**Adults and children ≥2 yr:** 1 drop of 0.15% gel 5 times daily (every 3 hr while awake) until corneal ulcer heals, then 3 times daily for 7 days.	• ADRs: blurred vision, irritation, keratopathy
trifluridine	**Adults and children ≥6 yr:** 1 drop of 1% solution every 2 hr while awake (up to 9 drops/day) until re-epithelialization occurs, then every 4 hr while awake for 7 more days (not to exceed 21 days).	• ADRs: burning, stinging, keratopathy
Artificial Tears/Ocular Lubricants (sterile buffered isotonic solutions/ointments) **Uses:** Artificial tears—keep the eyes moist with isotonic solutions and wetting agents in the management of dry eyes due to lack of tears; also provide lubrication for artificial eyes. Ocular lubricants—provide lubrication and protection in a variety of conditions including exposure keratitis, ↓ corneal sensitivity, corneal erosions, keratitis sicca, during/following ocular surgery or removal of a foreign body.		
Artificial tears (Bion Tears, Genteal Tears, HypoTears, LiquiTears, Murine Tears, Nature's Tears, Soothe, Systane, Teardrops,, Tears Naturale, Viva-Drops)	**Adults and children:** *Artificial tears*—Solution: 1–2 drops 3–4 times daily; Insert: 1 insert 1–2 times daily; *Ocular lubricants*—small amount instilled into conjunctiva several times daily.	• May alter effects of other concurrently administered ophthalmic medications • ADRs: photophobia, lid edema stinging (insert only), transient blurred vision, eye discomfort
Beta Blockers **Uses:** Treatment of open-angle glaucoma and other forms of ocular hypertension (↓ formation of aqueous humor). **CAUTIONS:** Systemic absorption is minimal but may occur. Systemic absorption may result in additive adverse cardiovascular effects (bradycardia, hypotension), especially when used with other cardiovascular agents (antihypertensives, antiarrhythmics). Other systemic adverse reactions may occur, including bronchospasm or delirium (geriatric patients). Concurrent use with ophthalmic epinephrine may ↓ effectiveness.		

© F.A. Davis Publishing

DRUG NAME	DOSE	NOTES
betaxolol (Betoptic S)	**Adults and children:** 1 drop of 0.25% suspension twice daily.	● ADRs: conjunctivitis, ↓ visual acuity, ocular burning, rash (may be less likely than others to cause bronchospasm if systemically absorbed)
carteolol	**Adults:** 1 drop of 1% solution twice daily.	● ADRs: ocular burning, ↓ visual acuity
levobunolol (Betagan)	**Adults:** 1–2 drops of 0.5% solution once daily.	● ADRs: conjunctivitis, ↓ visual acuity, ocular burning, rash
timolol (Betimol, Istalol, Timoptic, Timoptic-XE)	**Adults:** *Solution*—1 drop of 0.25–0.5% solution 1–2 times daily; *Gel-forming solution*—1 drop of 0.25–0.5% solution once daily. **Children:** *Solution*—1 drop of 0.25–0.5% solution twice daily; *Gel-forming solution*—1 drop of 0.25–0.5% solution once daily.	● ADRs: conjunctivitis, ↓ visual acuity, ocular burning, rash
Carbonic Anhydrase Inhibitors **Uses:** Treatment of open-angle glaucoma and other forms of ocular hypertension (↓ formation of aqueous humor). **CAUTIONS:** May exacerbate kidney stones; should not be used in patients with CCr <30 mL/min; may have cross-sensitivity with sulfonamides.		
brinzolamide (Azopt)	**Adults:** 1 drop of 1% suspension 3 times daily.	● ADRs: burning, stinging, unusual taste
dorzolamide (Trusopt)	**Adults and children:** 1 drop of 2% solution 3 times daily.	● ADRs: bitter taste, ocular irritation, or allergy
Cholinergics (direct-acting) **Uses:** Treatment of open-angle glaucoma (facilitates the outflow of aqueous humor); also used to facilitate miosis after ophthalmic surgery or before examination (to counteract mydriatics). Pilocarpine (Vuity™) used in treatment of presbyopia. **CAUTIONS:** Conditions in which pupillary constriction occurs should be avoided. If significant systemic absorption occurs, bronchospasm, sweating, and ↑ urination and salivation may occur.		
acetylcholine (Miochol-E)	**Adults:** 0.5–2 mL instilled into anterior chamber before or after securing one or more sutures.	● ADRs: corneal edema, corneal clouding
carbachol (Miostat)	**Adults:** 0.5 mL instilled into anterior chamber before or after securing sutures.	● ADRs: blurred vision, altered vision, stinging, eye pain
pilocarpine (Isopto Carpine, Vuity)	**Adults:** *Presbyopia (Vuity only)*—1 drop of 1.25% solution once daily. **Adults and children ≥2 yr:** *Glaucoma*—1 drop of 1–4% solution up to 4 times daily; *Counteracting mydriatic sympathomimetics*—1 drop of 1–4% solution (may be repeated prior to surgery). **Children <2 yr:** *Glaucoma*—1 drop of 1% solution 3 times daily.	● ADRs: blurred vision, altered vision, stinging, eye pain, headache
Cholinergics (cholinesterase inhibitors) **Uses:** Treatment of open-angle glaucoma not controlled with short-acting miotics or other agents; also used in varying doses for accommodative esotropia (diagnosis and treatment). **CAUTIONS:** Enhances neuromuscular blockade from succinylcholine; intensifies the actions of cocaine and some other local anesthetics; additive toxicity with antimyasthenics, anticholinergics, and cholinesterase inhibitors (including some pesticides). Use cautiously in patients with history or risk of retinal detachment.		
echothiophate (Phospholine Iodide)	**Adults:** 1 drop of 0.125% solution 1–2 times daily.	● Irreversible cholinesterase inhibitor ● May cause hyperactivity in patients with Down syndrome ● ADRs: blurred vision, change in vision, brow ache, miosis, eyelid twitching, watering eyes

© F.A. Davis Publishing

DRUG NAME	DOSE	NOTES
Corticosteroids		
Uses: Management of inflammatory eye conditions including allergic conjunctivitis, nonspecific superficial keratitis, anterior endogenous uveitis; infectious conjunctivitis (with anti-infectives); management of corneal injury; suppression of graft rejection following keratoplasty; prevention of postoperative inflammation; management of dry eye disease. **CAUTIONS:** Use cautiously in patients with infectious ocular processes (avoid in herpes simplex keratitis), especially fungal and viral ocular infections (may mask symptoms); diabetes, glaucoma, or epithelial compromise.		
dexamethasone (Maxidex)	**Adults and children:** *Solution*—1–2 drops of 0.1% solution every hr during the day and every 2 hr during the night, gradually ↓ the dose to 1 drop every 4 hr, then to 3–4 times daily; *Suspension*—1–2 drops of 0.1% suspension up to 4–6 times daily.	• As condition improves, ↓ frequency of administration • ADRs: corneal thinning, ↑ intraocular pressure, irritation
difluprednate (Durezol)	**Adults and children:** *Postoperative inflammation*—1 drop of 0.05% emulsion 4 times daily beginning 24 hr after surgery and continued for 2 wk, then 2 times daily for 1 wk, then taper; *Uveitis*—1 drop of 0.05% emulsion 4 times daily for 14 days, then taper.	• As condition improves, ↓ frequency of administration • ADRs: blepharitis, photophobia, ↓ visual acuity
fluorometholone (Flarex, FML, FML Forte)	**Adults and children ≥2 yr:** *Suspension*—1–2 drops of 0.1% suspension 4 times daily (up to 2 drops every 2 hr during initial 24–48 hr) or 1 drop of 0.25% suspension 2–4 times daily (up to 1 drop every 4 hr during initial 24–48 hr); *Ointment*—½-in. strip 1–3 times daily (up to every 4 hr during initial 24–48 hr).	• As condition improves, ↓ frequency of administration • ADRs: blurred vision (ointment), corneal thinning, ↑ intraocular pressure, irritation
loteprednol (Alrex, Eysuvis, Inveltys, Lotemax, Lotemax SM)	**Adults:** *Allergic conjunctivitis*—Alrex: 1 drop of 0.2% suspension 4 times daily; *Dry eye disease*—Eysuvis: 1–2 drops of 0.25% suspension 4 times daily for up to 2 wk; *Inflammatory conditions*—Lotemax: 1–2 drops of 0.5% suspension 4 times daily (up to 1 drop every hr may be used in first wk); *Postoperative inflammation/pain*—Lotemax gel/suspension: 1–2 drops of 0.5% gel/suspension 4 times daily beginning 24 hr after surgery and continued for 2 wk or 1 drop of 0.38% gel 3 times daily beginning 24 hr after surgery and continued for 2 wk; Lotemax ointment: ½-in. strip 4 times daily beginning 24 hr after surgery and continued for 2 wk; Inveltys suspension: 1–2 drops of 1% suspension 2 times daily beginning 24 hr after surgery and continued for 2 wk. **Children:** *Postoperative inflammation/pain*—Lotemax gel: 1–2 drops of 0.5% gel 4 times daily beginning 24 hr after surgery and continued for 2 wk.	• ADRs: corneal thinning, ↑ intraocular pressure, irritation
prednisolone (Pred Forte, Pred Mild)	**Adults and children:** 1–2 drops of 0.12–1% solution/suspension 2–4 times daily.	• As condition improves, ↓ frequency of administration • ADRs: corneal thinning, ↑ intraocular pressure, irritation
Cycloplegic Mydriatics		
Uses: Preparation for cycloplegic refraction; induction of mydriasis; management of uveitis (not tropicamide). **CAUTIONS:** Use cautiously in patients with a history of glaucoma; systemic absorption may cause anticholinergic effects such as confusion, unusual behavior, flushing, hallucinations, slurred speech, drowsiness, swollen stomach (infants), tachycardia, or dry mouth.		

© F.A. Davis Publishing

DRUG NAME	DOSE	NOTES
atropine (Isopto Atropine)	**Adults and children ≥3 mo:** *Cycloplegia/mydriasis*—Solution: 1–2 drops of 1% solution 40 min before procedure; Ointment: 0.3–0.5 cm strip 1–2 times daily.	• Effects on accommodation may last 6 days; mydriasis may last 12 days • ADRs: irritation, blurred vision, photophobia
cyclopentolate (Cyclogyl)	**Adults:** 1–2 drops of 0.5–2% solution; may repeat in 5–10 min. **Children:** 1 drop of 0.5–2% solution; may be followed 5–10 min later by 1 drop of 0.5–1% solution.	• Peak of cycloplegia is within 25–75 min and lasts 6–24 hr • Peak of mydriasis is within 30–60 min and may last several days • 2% solution used for heavily pigmented iris • ADRs: irritation, blurred vision, photophobia
homatropine	**Adults:** *Cycloplegic refraction*—1–2 drops of 2–5% solution, may repeat in 5–10 min for 2 more doses; *Uveitis*—1–2 drops of 2–5% solution 2–3 times daily (up to every 4 hr). **Children ≥3 mo:** *Cycloplegic refraction*—1–2 drops of 2% solution, may repeat in 10–15 min if needed; *Uveitis*—1–2 drops of 2% solution 2–3 times daily (up to every 4 hr).	• Cycloplegia and mydriasis may last for 24–72 hr • ADRs: irritation, blurred vision, photophobia
tropicamide (Mydriacyl)	**Adults and children:** 1–2 drops of 0.5–1% solution.	• Stronger solution/repeated dosing may be required in patients with dark irises • Peak effect occurs in 20–40 min • Cycloplegia lasts 2–6 hr; mydriasis lasts up to 7 hr • ADRs: irritation, blurred vision, photophobia

Immunomodulators

Uses: ↑ tear production when the cause of dry eye is inflammation secondary to keratoconjunctivitis sicca.
CAUTIONS: Tear production is not ↑ during concurrent use of ophthalmic NSAIDs or punctal plugs.

cyclosporine (Cequa, Restasis)	**Adults and children ≥16 yr:** Restasis: 1 drop of 0.05% emulsion every 12 hr. **Adults:** Cequa: 1 drop of 0.09% solution every 12 hr.	• Emulsion should be inverted to obtain uniform opaque appearance prior to use. • ADRs: irritation, blurred vision, conjunctival hyperemia
lifitegrast (Xiidra)	**Adults:** 1 drop of 5% solution every 12 hr.	• Emulsion should be inverted to obtain uniform opaque appearance prior to use. • ADRs: headache, irritation, blurred vision, metallic taste

Mast Cell Stabilizers

Uses: Vernal keratoconjunctivitis.
CAUTIONS: Require several days of treatment before effects are seen.

cromolyn	**Adults and children ≥4 yr:** 1–2 drops of 4% solution 4–6 times daily.	• ADRs: irritation
lodoxamide (Alomide)	**Adults and children ≥2 yr:** 1–2 drops of 0.1% solution 4 times daily for up to 3 mo.	• ADRs: blurred vision, foreign body sensation, irritation
nedocromil (Alocril)	**Adults and children ≥3 yr:** 1–2 drops of 2% solution twice daily throughout period of exposure to allergen.	• ADRs: headache, ocular burning, unpleasant taste, nasal congestion

Nonsteroidal Anti-inflammatory Drugs

Uses: Management of pain/inflammation following surgery (bromfenac, diclofenac, ketorolac, nepafenac), allergic conjunctivitis (ketorolac), inhibition of perioperative miosis (flurbiprofen).
CAUTIONS: Cross-sensitivity with systemic NSAIDs may occur; concurrent use of anticoagulants, other NSAIDs, thrombolytics, some cephalosporins, and valproates may ↑ the risk of bleeding. May slow/delay healing. Avoid contact lens use.

© F.A. Davis Publishing

DRUG NAME	DOSE	NOTES
bromfenac (Bromsite, Prolensa)	**Adults:** *Generic*—1 drop of 0.09% solution once daily starting 1 day before surgery and continued on day of surgery and for 2 wk after surgery; *Bromsite*—1 drop of 0.075% solution twice daily starting 1 day before surgery and continued on day of surgery and for 2 wk after surgery; *Prolensa*—1 drop of 0.07% solution once daily starting 1 day before surgery and continued on day of surgery and for 2 wk after surgery.	● Contains sulfites ● ADRs: irritation, headache
diclofenac	**Adults:** *Cataract surgery*—1 drop of 0.1% solution 4 times daily starting 24 hr after surgery and for 2 wk after surgery; *Corneal refractive surgery*—1–2 drops of 0.1% solution within hour before surgery, within 15 min after surgery, then continue 4 times daily for up to 3 days.	● ADRs: irritation, allergic reactions
flurbiprofen	**Adults:** 1 drop of 0.03% solution every 30 min, beginning 2 hr prior to surgery (4 drops total in each eye).	● ADRs: irritation, allergic reactions
ketorolac (Acular, Acular LS, Acuvail)	**Adults and children ≥2 yr:** *Allergic conjunctivitis*—Acular: 1 drop of 0.5% solution 4 times daily; *Postoperative pain/inflammation*—Acular: 1 drop of 0.5% solution 4 times daily starting 24 hr after cataract surgery and for 2 wk after surgery; Acular LS: 1 drop of 0.4% solution 4 times daily for up to 4 days after corneal refractive surgery; Acuvail: 1 drop of 0.45% solution twice daily starting 1 day before cataract surgery and continued for 2 wk after surgery.	● ADRs: irritation, allergic reactions
nepafenac (Ilevro, Nevanac)	**Adults and children ≥10 yr:** *Ilevro*—1 drop of 0.3% suspension once daily starting one day before cataract surgery and continued for 2 wk after surgery; instill 1 additional drop 30–120 min before surgery; *Nevanac*—1 drop of 0.1% suspension 3 times daily starting one day before cataract surgery and continued for 2 wk after surgery.	● ADRs: irritation, photophobia, headache, hypertension, nausea/vomiting

Ocular Decongestants/Vasoconstrictors

Uses: ↓ ocular congestion due to irritation by vasoconstricting conjunctival blood vessels; stronger solutions have mydriatic effects. Treatment of acquired blepharoptosis (Upneeq™).

CAUTIONS: Systemic absorption may result in adverse cardiovascular effects; excessive/prolonged use may produce rebound hyperemia; use caution in patients at risk for acute angle-closure glaucoma; cardiovascular effects may be exaggerated by MAO inhibitors and dose adjustment may be required within 21 days of MAO inhibitors; ↑ risk of arrhythmias with inhalation anesthetics.

naphazoline (Albalon, Clear Eyes Redness Relief, Diopticon, Naphcon Forte)	**Adults:** 1–2 drops of 0.012–0.025% solution up to 4 times daily (for up to 3 days) or 1–2 drops of 0.1% solution every 3–4 hr as needed.	● ADRs: ophthalmic-rebound hyperemia; systemic-dizziness, headache, nausea, sweating, weakness
oxymetazoline (Upneeq, Visine LR)	**Adults:** *Acquired blepharoptosis*—Upneeq: 1 drop of 0.1% solution once daily. **Adults and children ≥6 yr:** *Ocular redness/congestion*—Visine LR: 1–2 drops of 0.025% solution every 6 hr as needed (for up to 3 days).	● ADRs: ophthalmic-rebound hyperemia; systemic-headache, insomnia, nervousness, tachycardia

© F.A. Davis Publishing

DRUG NAME	DOSE	NOTES
phenylephrine (Mydfrin)	**Adults:** *Decongestant*—1–2 drops of 0.12% solution up to 4 times daily as needed (for up to 3 days); *Mydriasis*—1 drop of 2.5–10% solution, may repeat in 10–60 min as needed. **Children ≥1 yr:** *Mydriasis*—1 drop of 2.5–10% solution, may repeat in 10–60 min as needed.	• ADRs: ophthalmic-blurred vision, irritation; systemic-dizziness, tachycardia, hypertension, paleness, sweating, trembling
tetrahydrozoline (Visine)	**Adults:** 1–2 drops of 0.05% solution 2–4 times daily.	• ADRs: ophthalmic—irritation; systemic—tachycardia, hypertension

Prostaglandin Agonists

Uses: Treatment of open-angle glaucoma (↑ outflow of aqueous humor).
CAUTIONS: May change eye color to brown; will form precipitate with thimerosal-containing products; can be used with other agents to ↓ intraocular pressure.

bimatoprost (Lumigan, Vistitan)	**Adults and children ≥16 yr:** 1 drop of 0.01–0.03% solution once daily in the evening.	• ADRs: local irritation, foreign body sensation, ↑ eyelash growth, ↑ brown pigmentation in iris
latanoprost (Xalatan, Xelpros)	**Adults:** 1 drop of 0.005% solution/emulsion once daily in the evening.	• ADRs: local irritation, foreign body sensation, ↑ eyelash growth, ↑ brown pigmentation in iris
latanoprostene (Vyzulta)	**Adults:** 1 drop of 0.024% solution once daily in the evening.	• ADRs: conjunctival hyperemia, local irritation, eye pain, ↑ eyelash growth, ↑ brown pigmentation in iris
tafluprost (Zioptan)	**Adults:** 1 drop of 0.0015% solution once daily in the evening.	• ADRs: local irritation, foreign body sensation, ↑ eyelash growth, ↑ brown pigmentation in iris
travoprost (Travatan Z)	**Adults and children ≥16 yr:** 1 drop of 0.004% solution once daily in the evening.	• ADRs: local irritation, foreign body sensation, ↑ eyelash growth, ↑ brown pigmentation in iris

Rho Kinase Inhibitor

Uses: Treatment of open-angle glaucoma or ocular hypertension (↑ outflow of aqueous humor).
CAUTIONS: Can be used with other agents to ↓ intraocular pressure.

netarsudil (Rhopressa)	**Adults:** 1 drop of 0.02% solution once daily in the evening.	• ADRs: conjunctival hyperemia, corneal verticillata, conjunctival hemorrhage eye pain

Sympathomimetics

Uses: Treatment of open-angle glaucoma and other forms of intraocular hypertension (↓ formation of aqueous humor); brimonidine also available as over-the-counter product to ↓ ocular redness.
CAUTIONS: Systemic absorption may result in adverse cardiovascular and CNS reactions (especially in patients with cardiovascular disease); avoid use in patients predisposed to acute angle-closure glaucoma.

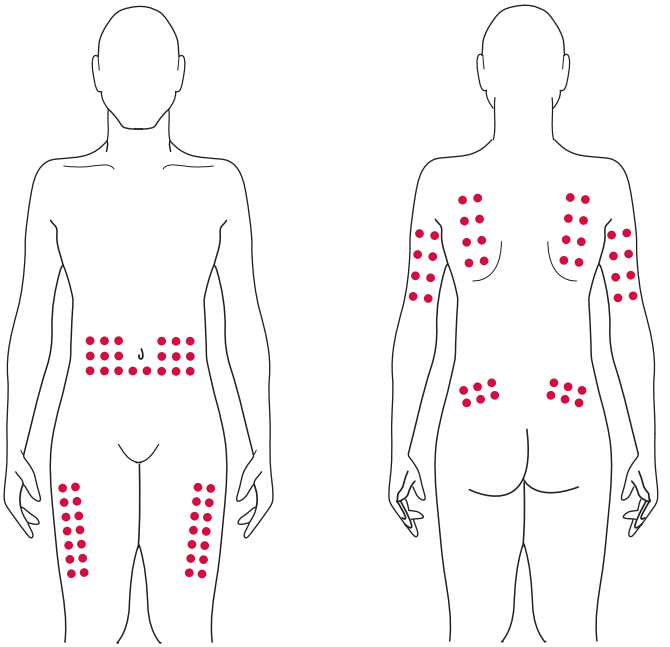
apraclonidine (Iopidine)	**Adults:** *Postoperative reduction of intraocular pressure*—1–2 drops of 0.5% solution 3 times daily or 1 drop of 1% solution 1 hr before surgery and upon completion of surgery.	• Used to ↓ intraocular pressure after surgery • A selective alpha-adrenergic agonist • Monitor pulse and blood pressure • Avoid concurrent use with MAO inhibitors • ADRs: ophthalmic-irritation, mydriasis; systemic-allergic reactions, arrhythmias, bradycardia, drowsiness, dry nose, fainting, headache, nervousness, weakness
brimonidine (Alphagan P, Lumify [OTC])	**Adults and children ≥2 yr:** *Glaucoma*—1 drop of 0.1–0.2% solution 3 times daily (8 hr apart). **Adults and children ≥5 yr:** *Ocular redness (Lumify™)*—1 drop of 0.025% solution every 6–8 hr as needed (up to 4 times daily).	• A selective alpha-adrenergic agonist • Avoid concurrent use with MAO inhibitors • Tricyclic antidepressants may ↓ effectiveness; additive CNS depression may occur with other CNS depressants, additive adverse cardiovascular effects with other cardiovascular agents • ADRs: ophthalmic—irritation; systemic—drowsiness, dizziness, dry mouth, headache, weakness, muscular pain

© F.A. Davis Publishing

APPENDIX C

Medication Administration Techniques

Subcutaneous Injection Sites



Administration of Ophthalmic Medications

For instillation of ophthalmic solutions, instruct patient to lie down or tilt head back and look at ceiling. Pull down on lower lid, creating a small pocket, and instill solution into pocket. With systemically acting drugs, apply pressure to the inner canthus for 1–2 min to minimize systemic absorption. Instruct patient to gently close eye. Wait 5 min before instilling second drop or any other ophthalmic solutions.

For instillation of ophthalmic ointment, instruct patient to hold tube in hand for several minutes to warm. Squeeze a small amount of ointment (¼–½ in.) inside lower lid. Instruct patient to close eye gently and roll eyeball around in all directions with eye closed. Wait 10 min before instilling any other ophthalmic ointments.

Do not touch cap or tip of container to eye, fingers, or any surface.

Administration of Medications With Metered-Dose Inhalers

Instruct patient on the proper use of the metered-dose inhaler. There are 3 methods of using a metered-dose inhaler. Shake inhaler well. (1) Take a drink of water to moisten the throat; place the inhaler mouthpiece 2 finger-widths away from mouth; tilt head back slightly. While activating the inhaler, take a slow, deep breath for 3–5 sec; hold the breath for 10 sec; and breathe out slowly. (2) Exhale and close lips firmly around mouthpiece. Administer during second half of inhalation, and hold breath for as long as possible to ensure deep instillation of medication. (3) Use of spacer. Consult health care professional to determine method desired prior to instruction. Allow 1–2 min between inhalations. Rinse mouth with

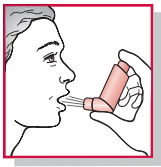
© F.A. Davis Publishing

water or mouthwash after each use to minimize dry mouth and hoarseness. Wash inhalation assembly at least daily in warm running water.

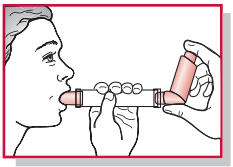
For use of dry powder inhalers, turn head away from inhaler and exhale (do not blow into inhaler). Do not shake. Close mouth tightly around the mouthpiece of the inhaler and inhale rapidly.

Steps for Using Your Inhaler*

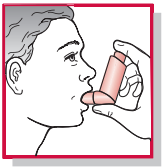
1. Remove the cap and hold inhaler upright.
2. Shake the inhaler.
3. Tilt your head back slightly and breathe out slowly.
4. Position the inhaler in one of the following ways (A or B is optimal, but C is acceptable for those who have difficulty with A or B. C is required for breath-activated inhalers):



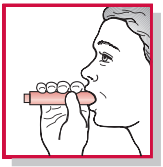
A. Open mouth with inhaler 1 to 2 inches away.



B. Use space/holding chamber (this is recommended especially for young children and for people using corticosteroids).



C. In the mouth. Do not use for corticosteroids.



D. NOTE: Inhaled dry powder capsules require a different inhalation technique. To use a dry powder inhaler, it is important to close the mouth tightly around the mouthpiece of the inhaler and to inhale rapidly.

5. Press down on the inhaler to release medication as you start to breathe in slowly.
6. Breathe in slowly (3–5 sec).
7. Hold your breath for 10 sec to allow the medicine to reach deeply into your lungs.
8. Repeat puff as directed. Waiting 1 min between puffs may permit second puff to penetrate your lungs better.
9. Spacers/holding chambers are useful for all patients. They are particularly recommended for young children and older adults and for use with **inhaled corticosteroids**.

Avoid common inhaler mistakes. Follow these inhaler tips:

- Breathe out before pressing your inhaler.
- Inhale slowly.
- Breathe in through your mouth, not your nose.
- Press down on your inhaler at the start of inhalation (or within the first sec of inhalation).
- Keep inhaling as you press down on inhaler.
- Press your inhaler only once while you are inhaling (one breath for each puff).
- Make sure you breathe in evenly and deeply.
- If you are using a short-acting bronchodilator inhaler and a corticosteroid inhaler, use the bronchodilator first, and allow 5 min to elapse before using the corticosteroid.

Other inhalers have become available in addition to the one illustrated here. Different types of inhalers may require different techniques.

Administration of Medications by Nebulizer

Administer in a location where patient can sit comfortably for 10–15 min. Plug in compressor. Mix medication as directed, or empty unit-dose vials into nebulizer. Do not mix different types of medications

*Source: Expert Panel Report 2: Guidelines for the Diagnosis and Management of Asthma. National Asthma Education and Prevention Program, National Heart, Lung, and Blood Institute, 1997.

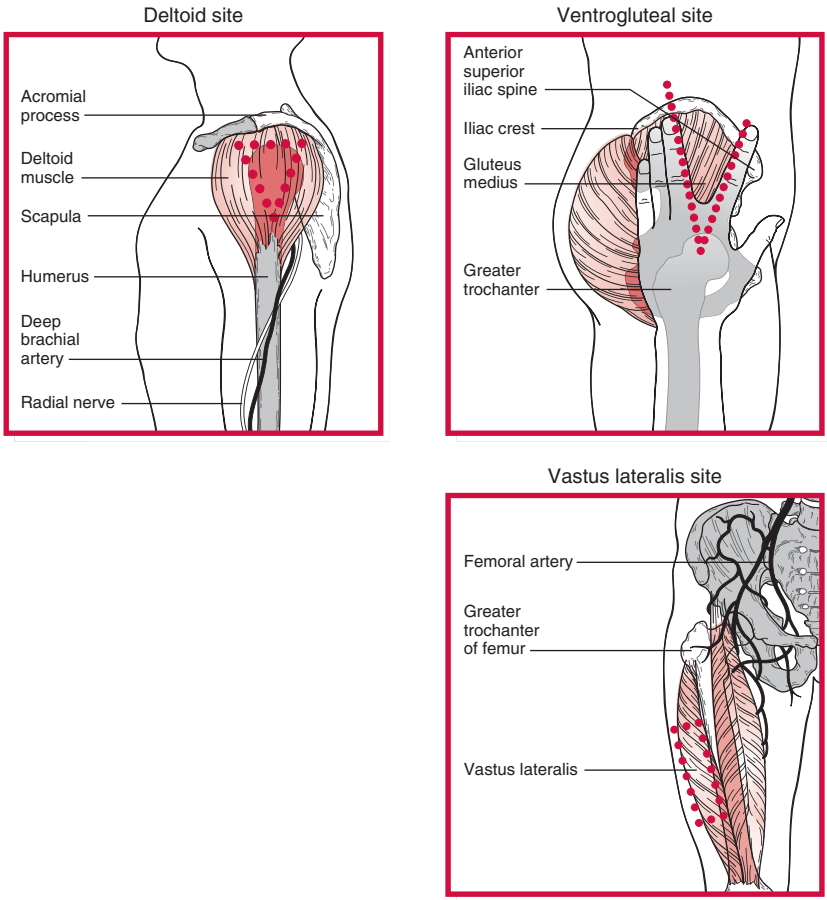
© F.A. Davis Publishing

without checking with health care professional. Assemble mask or mouthpiece and connect tubing to port on compressor. Have patient sit in a comfortable upright position. Make sure that mask fits properly over nose and mouth and that mist does not flow into eyes, or put mouthpiece into mouth. Turn on compressor. Instruct patient to take slow deep breaths. If possible, patient should hold breath for 10 sec before slowly exhaling. Continue this process until medication chamber is empty. Wash mask in hot soapy water; rinse well and allow to air dry before next use.

Administration of Nasal Sprays

Clear nasal passages of secretions prior to use. If nasal passages are blocked, use a decongestant immediately prior to use to ensure adequate penetration of the spray. Keep head upright. Breathe in through nose during administration. Sniff hard for a few minutes after administration.

Intramuscular Injection Sites



The deltoid and ventrogluteal sites are the preferred sites for adults; the vastus lateralis site is preferred in children under 2 yr of age.

© F.A. Davis Publishing

APPENDIX D

Administering Medications to Children

General Guidelines

Medication administration to a pediatric patient can be challenging. Prescribers should order dosage forms that are age appropriate for their patients. If a child is unable to take a particular dosage form, ask the pharmacist if another form is available or for other options.

Oral Liquids

Pediatric liquid medicines may be given with plastic medicine cups, oral syringes, oral droppers, or cylindrical dosing spoons. Parents should be taught to use these calibrated devices rather than using household utensils. If a medicine comes with a particular measuring device, do not use it with another product. For young children, it is best to squirt a little of the dose at a time into the side of the cheek away from the bitter taste buds at the back of the tongue.

Eye Drops/Ointments

Tilt the child's head back and gently press the skin under the lower eyelid and pull the lower lid away slightly until a small pouch is visible. Insert the ointment or drop (1 at a time) and close the eye for a few minutes to keep the medicine in the eye.

Ear Drops

Shake otic suspensions well before administration. For children <3 yr, pull the outer ear outward and downward before instilling drops. For children ≥ 3 yr, pull the outer ear outward and upward. Keep child on side for 2 min and instill a cotton plug into ear.

Nose Drops

Clear nose of secretions prior to use. A nasal aspirator (bulb syringe) may be used in infants and young children. Ask older children to blow their nose. Tilt child's head back over a pillow and squeeze dropper without touching the nostril. Keep child's head back for 2 min.

Suppositories

Keep refrigerated for easier administration. Wearing gloves, moisten the rounded end with water or petroleum jelly prior to insertion. Using your pinky finger for children <3 yr and your index finger for those ≥ 3 yr, insert the suppository into the rectum about 1 in. beyond the sphincter. If the suppository slides out, insert it a little farther than before. Hold the buttocks together for a few minutes and have the child hold their position for about 20 min, if possible.

Topicals

Clean affected area and dry well prior to application. Apply a thin layer to the skin and rub in gently. Do not apply coverings over the area unless instructed to do so by the prescriber.

Metered-Dose Inhalers

Generally the same principles apply in children as in adults, except the use of spacers is recommended for young children (see Appendix C).

APPENDIX E

Formulas Helpful for Calculating Doses

Ratio and Proportion

A ratio is the same as a fraction and can be expressed as a fraction (½) or in the algebraic form (1:2). This relationship is stated as *one is to two*.

A proportion is an equation of equal fractions or ratios.

$$\frac{1}{2} = \frac{4}{8}$$

To calculate doses, begin each proportion with the two known values, for example 15 grains = 1 gram (known equivalent) or 10 milligrams = 2 milliliters (dose available) on one side of the equation. Next, make certain that the units of measure on the opposite side of the equation are the same as the units of the known values and are placed on the same level of the equation.

Problem A:

$$\frac{15 \text{ gr}}{1 \text{ g}} = \frac{10 \text{ gr}}{x \text{ g}}$$

Problem B:

$$\frac{10 \text{ mg}}{2 \text{ mL}} = \frac{5 \text{ mg}}{x \text{ mL}}$$

Once the proportion is set up correctly, cross-multiply the opposing values of the proportion.

Problem A:

$$\frac{15 \text{ gr}}{1 \text{ g}} \times \frac{10 \text{ gr}}{x \text{ g}}$$

$$15x = 10$$

Problem B:

$$\frac{10 \text{ mg}}{2 \text{ mL}} \times \frac{5 \text{ mg}}{x \text{ mL}}$$

$$10x = 10$$

Next, divide each side of the equation by the number with the x to determine the answer. Then, add the unit of measure corresponding to x in the original equation.

Problem A:

$$\frac{15x}{15} = \frac{10}{15}$$

$$x = \frac{2}{3} \text{ or } 0.6 \text{ g}$$

Problem B:

$$\frac{10x}{10} = \frac{10}{10}$$

$$x = 1 \text{ mL}$$

© F.A. Davis Publishing

Calculation of IV Drip Rate

To calculate the drip rate for an intravenous infusion, 3 values are needed:

I. The amount of solution and corresponding time for infusion. May be ordered as:

1000 mL over 8 hr

or

125 mL/hr

II. The equivalent in time to convert hr to min.

$$1 \text{ hr} = 60 \text{ min}$$

III. The drop factor or number of drops that equal 1 mL of fluid. (This information can be <<005>found on the IV tubing box.)

$$10 \text{ gtt} = 1 \text{ mL}$$

Set up the problem by placing each of the 3 values in a proportion.

$$\frac{125 \text{ mL}}{1 \text{ hr}} \times \frac{1 \text{ hr}}{60 \text{ min}} \times \frac{10 \text{ gtt}}{1 \text{ mL}}$$

Units of measure can be canceled out from the upper and lower levels of the equation.
The units cancel, leaving:

$$\frac{125}{1} \times \frac{1}{60 \text{ min}} \times \frac{10 \text{ gtt}}{1}$$

Next, multiply each level across and divide the numerator by the denominator for the answer.

$$\frac{125}{1} \times \frac{1}{6 \text{ min}} \times \frac{1 \text{ gtt}}{1}$$

$$125/6 = 20.8 \text{ or } 21 \text{ gtt/min}$$

Calculation of Creatinine Clearance (CCr) in Adults from Serum Creatinine

$$\text{Men: CCr} = \frac{\text{ideal body weight (kg)} \times (140 - \text{age})}{72 \times \text{serum creatinine (mg/dL)}}$$

$$\text{Women: CCr} = 0.85 \times \text{calculation for men}$$

Calculation of Body Surface Area (BSA) in Adults and Children

Dubois method:

$$\text{SA (cm}^2\text{)} = \text{wt (kg)}^{0.425} \times 71.84$$

$$\text{SA (m}^2\text{) K} \times \sqrt[3]{\text{wt}^2 \text{ (kg)}} \text{ (common K value 0.1 for toddlers, 0.103 for neonates)}$$

Simplified method:

$$\text{BSA (m}^2\text{)} = \sqrt{\frac{\text{ht (cm)} \times \text{wt (kg)}}{3600}}$$

Body Mass Index

$$\text{BMI} = \text{wt (kg)/ht (m}^2\text{)}$$

© F.A. Davis Publishing

APPENDIX F

Pediatric Dosage Calculations

Most drugs in children are dosed according to body weight (mg/kg) or body surface area (BSA) (mg/m^2). Care must be taken to properly convert body weight from pounds to kilograms (1 kg = 2.2 lb) before calculating doses based on body weight. Doses are often expressed as mg/kg/day or mg/kg/dose, therefore orders written "mg/kg/d," which is confusing, *require further clarification from the prescriber*.

Chemotherapeutic drugs are commonly dosed according to body surface area, which requires an extra verification step (BSA calculation) prior to dosing. Medications are available in multiple concentrations, therefore *orders written in "mL" rather than "mg" are not acceptable and require further clarification*.

Dosing also varies by indication, therefore diagnostic information is helpful when calculating doses. The following examples are typically encountered when dosing medication in children.

Example 1.

Calculate the dose of amoxicillin suspension in mLs for otitis media for a 1-yr-old child weighing 22 lb. The dose required is 40 mg/kg/day divided BID and the suspension comes in a concentration of 400 mg/5 mL.

Step 1. Convert pounds to kg:	22 lb × 1 kg/2.2 lb = 10 kg
Step 2. Calculate the dose in mg:	10 kg × 40 mg/kg/day = 400 mg/day
Step 3. Divide the dose by the frequency:	400 mg/day ÷ 2 (BID) = 200 mg/dose BID
Step 4. Convert the mg dose to mL:	200 mg/dose ÷ 400 mg/5 mL = **2.5 mL BID**

Example 2.

Calculate the dose of ceftriaxone in mLs for meningitis for a 5-yr-old weighing 18 kg. The dose required is 100 mg/kg/day given IV once daily and the drug comes prediluted in a concentration of 40 mg/mL.

Step 1. Calculate the dose in mg:	18 kg × 100 mg/kg/day = 1800 mg/day
Step 2. Divide the dose by the frequency:	1800 mg/day ÷ 1 (daily) = 1800 mg/dose
Step 3. Convert the mg dose to mL:	1800 mg/dose ÷ 40 mg/mL = **45 mL once daily**

Example 3.

Calculate the dose of vincristine in mLs for a 4-yr-old with leukemia weighing 37 lb and is 97 cm tall. The dose required is 2 mg/m^2 and the drug comes in 1 mg/mL concentration.

Step 1. Convert pounds to kg:	37 lb × 1 kg/2.2 lb = 16.8 kg
Step 2. Calculate BSA:	$\sqrt{16.8 \text{ kg} \times 97 \text{ cm}/3600} = 0.67 \text{ m}^2$
Step 3. Calculate the dose in mg:	2 mg/m^2 × 0.67 m^2 = 1.34 mg
Step 4. Calculate the dose in mL:	1.34 mg ÷ 1 mg/mL = **1.34 mL**

APPENDIX H

Controlled Substances Schedules

General

A controlled substance is any type of drug that the federal government has categorized as having significant potential for abuse or addiction. While controlled substances are regulated in both the United States (U.S.) and Canada, differences exist between the two countries with respect to scheduling and enforcement.

IN THE UNITED STATES:

The Drug Enforcement Agency (DEA), an arm of the United States Justice Department, classifies controlled substances according to five schedules, based on whether they have a currently accepted medical use in treatment in the United States, the potential for abuse and dependence liability (physical and psychological) of the medication, and likelihood of causing dependence when abused. Some states may have stricter prescription regulations. Physicians, dentists, podiatrists, and veterinarians may prescribe controlled substances. Nurse practitioners and physician assistants may also prescribe controlled substances with limitations that vary from state to state.

Schedule I (C-I)

Potential for abuse is so high as to be unacceptable. Have no currently accepted medical use in the United States. May be used for research with appropriate limitations. Examples are marijuana, LSD, and heroin.

Schedule II (C-II)

High potential for abuse which may lead to severe physical and psychological dependence (amphetamines, opioid analgesics, certain barbiturates). Outpatient prescriptions must be in writing. In emergencies, telephone orders may be acceptable if a written prescription is provided within 72 hr. No refills are allowed.

Schedule III (C-III)

Substances in this schedule have a potential for abuse less than substances in Schedules I or II and abuse may lead to moderate or low physical dependence or high psychological dependence (certain nonbarbiturate sedatives, certain nonamphetamine CNS stimulants, and certain opioid analgesics). Outpatient prescriptions can be refilled 5 times within 6 mo from date of issue if authorized by prescriber. Telephone orders are acceptable.

Schedule IV (C-IV)

Less abuse potential than Schedule III with minimal liability for physical or psychological dependence (certain sedatives/hypnotics, certain antianxiety agents, certain nonamphetamine CNS stimulants, some barbiturates, and benzodiazepines). Outpatient prescriptions can be refilled 6 times within 6 mo from date of issue if authorized by prescriber. Telephone orders are acceptable.

Schedule V (C-V)

Minimal abuse potential. Number of outpatient refills determined by prescriber. Some products (cough suppressants with small amounts of codeine, antidiarrheals containing paregoric, pregabalin) may be available without prescription to patients >18 yr of age.

© F.A. Davis Publishing

IN CANADA:

The federal *Controlled Drugs and Substances Act (CDSA)* along with the *Narcotic Control Regulations*, Part G of the *Food and Drug Regulations*, and the *Benzodiazepines and Other Targeted Substances Regulations* regulate narcotics, controlled drugs, and targeted substances.

The CDSA classifies controlled substances according to eight schedules and three classes of precursors. While a few examples are listed below, a complete list of drugs scheduled in Canada's Controlled Drugs and Substances act can be accessed at: http://laws-lois.justice.gc.ca/eng/acts/C%2D38.8/

Schedule I

—opioids and derivatives and related drugs (e.g., morphine, oxycodone, heroin)

Schedule II

—cannabis (marijuana) and derivatives

Schedule III

—amphetamines and related drugs and substances (e.g., methylphenidate, LSD)

Schedule IV

—barbiturates and derivatives, anabolic steroids and related drugs, and benzodiazepines (e.g., diazepam)

Schedule VI

—precursors Class A (e.g., pseudoephedrine and salts)
—precursors Class B (e.g., acetone, toluene)
—precursors Class C (mixtures of the above)

Schedules VII & VIII

—cannabis and its resins in varying amounts
(Note: In Canada marijuana may be used for medical purposes. It is regulated by the Access to Cannabis for Medical Purposes Regulations, which can be accessed at: http://www.laws-lois.justice.gc.ca/eng/regulations/SOR-2016-230/page-1.html)

The CDSA federally regulates conditions of sale, distribution, and accountability relating to controlled substances. Provincial legislation compliments how patients access controlled substances from regulated health professionals. As such, it is imperative for an individual to become familiar with legislation pertaining to the specific province he/she is working in. Some federal regulations are as follows:

Narcotic drug—Two subcategories of prescription narcotics—"Straight" Narcotics and Verbal Prescription Narcotics

(e.g., codeine, morphine, fentanyl, oxycodone)

Straight Narcotics

- All single active ingredient products containing a narcotic, along with all narcotics for parenteral use and narcotic compounds containing more than one narcotic entity or less than two non-narcotic ingredients.
- Prescription can be written, faxed, or generated electronically in an authorized provincial electronic health record and must be signed and dated by prescriber.

© F.A. Davis Publishing

- Refills are not permitted, but a prescription may be dispensed in divided portions. Prescription transfers from one pharmacist to another are not permitted.

Verbal Prescription Narcotic

(e.g., Tylenol No. 2 and Tylenol No. 3)

- Refers to oral combination products containing only one narcotic and two or more non-narcotic ingredients in a therapeutic dose. (Excluding diacetylmorphine, oxycodone, hydrocodone, methadone, or pentazocine. This means that an oral combination product that contains these drugs cannot be classified as a Verbal Prescription Narcotic.)
- Similar rules as above but prescriptions may also be verbal.

Exempted Codeine Preparations

(e.g., Tylenol No. 1)

- Under federal regulations, products containing codeine (meaning codeine phosphate or its equivalent) may be purchased over the counter, without a prescription, provided they have two other medicinal ingredients and a **maximum** of 8 mg of codeine per solid oral dose unit or 20 mg per 30 mL of liquid.
- The product may not be supplied if there are reasonable grounds to suspect the product will be used for other than recognized medical or dental purposes.

Controlled Drugs—Part 1

(e.g., Dexedrine, Ritalin, pentobarbital, secobarbital)

- Refers to drugs listed in Part I of the Schedule to Part G of the Food and Drug Regulations.
- Prescription may be written or verbal; no refills allowed if prescription is verbal.
- Refills are permitted if the number of repeats and the frequency or interval between refills is specified. Prescription transfers are not permitted.

Controlled Drugs—Parts 2 and 3

(e.g., other barbiturates and anabolic steroids)

- Refers to drugs listed in Parts II and III of the Schedule to Part G of the Food and Drug Regulations.
- Prescription may be written or verbal.
- Refills are permitted if prescribed in writing or verbally and the number of repeats and frequency or interval between refills is specified. Prescription transfers are not permitted.

Benzodiazepines and Other Targeted Substances

(e.g., lorazepam, diazepam)

- Refers to all benzodiazepines except flunitrazepam, which is listed in Schedule III of the Act as an illicit substance.
- Prescriptions may be written or verbal. Refills are permitted if the prescription is less than 1 yr old and the prescriber specifies the number of times it can be refilled. If the prescriber indicated the interval between refills, the pharmacist cannot refill the prescription if that interval has expired. Prescription transfers are permitted, but only once.

APPENDIX I

Equianalgesic Dosing Guidelines

OPIOID ANALGESICS STARTING ORAL DOSE COMMONLY USED FOR SEVERE PAIN

	EQUIANALGESIC DOSE		STARTING ORAL DOSE			
NAME	ORAL*	PARENTERAL†	ADULTS	CHILDREN	COMMENTS	PRECAUTIONS AND CONTRAINDICATIONS
Morphine-like agonists (mu agonists)						
morphine	30 mg	10 mg	15–30 mg	0.3 mg/kg	Standard of comparison for opioid analgesics. Sustained release preparations (MS Contin) release over 8–12 hr. Other formulations (MS Contin) last 12–24 hr. Generic sustained release morphine preparations are now available.)	For all opioids, caution in patients with impaired ventilation, bronchial asthma, ↑ intracranial pressure, liver failure.
hydromorphone (Dilaudid)	7.5 mg	1.5 mg	Opioid naïve: 4–8 mg	0.06 mg/kg	Slightly shorter duration than morphine. Sustained release preparations release over 24 hr.	
fentanyl	—	0.1 mg	—	—		
oxycodone	20 mg	—	10–20 mg	0.2 mg/kg		
methadone	10 mg	5 mg	5–10 mg	0.2 mg/kg	Good oral potency, long plasma half-life (24–36 hr).	Accumulates with repeated dosing, requiring decreases in dose size and frequency, especially on days 2–5. Use with caution in older adults.
levorphanol	2 mg (acute), 1 mg (chronic)	—	2–4 mg	0.04 mg/kg	Long plasma half-life (12–16 hr, but may be as long as 90–120 hr after one wk of dosing).	Accumulates on days 2 and 3. Use with caution in older adults.
oxymorphone (Opana)	10 mg	—	—	—	—	
meperidine (Demerol)	300 mg	100 mg	Not Recommended	—	Slightly shorter acting than morphine; accumulates with repetitive dosing causing CNS excitation; avoid in children with impaired renal function or who are receiving monoamine oxidase inhibitors.‡	Use with caution. Normeperidine (toxic metabolite) accumulates with repetitive dosing causing CNS excitation and a high risk of seizure. Avoid in children, renal impairment, and patients on monoamine oxidase inhibitors.‡

© F.A. Davis Publishing

NAME	EQUIANALGESIC DOSE ORAL*	EQUIANALGESIC DOSE PARENTERAL†	STARTING ORAL DOSE ADULTS	STARTING ORAL DOSE CHILDREN	COMMENTS	PRECAUTIONS AND CONTRAINDICATIONS
Centrally acting mu agonists						
tramadol (UltramConZip)	120 mg	—	50–100 mg every 4–6 hr	—	Prodrug; significant serotonin reuptake inhibition. Maximum dose: IR 400 mg/day; ER 300 mg/day.	Caution with pre-existing seizure disorder, concurrent use of medications that ↓ seizure threshold, or medications that ↑ risk of serotonin syndrome.
tapentadol (Nucynta)	100 mg	—	50–100 mg every 4–6 hr	—	Sustained release preparation (Nucynta ER) releases over 12 hr. Blocks reuptake of norepinephrine > serotonin.)	Caution with pre-existing seizure disorder or concurrent use of medications that ↓ seizure threshold.
Mixed agonists–antagonists (kappa agonists)						
nalbuphine	—	10 mg	10 mg every 3–6 hr	0.1–0.2 mg/kg every 3–4 hr	Not available orally; not scheduled under Controlled Substances Act. Kappa agonist, partial mu antagonist.	Incidence of psychotomimetic effects lower than with pentazocine; may precipitate withdrawal in opioid-dependent patients.
butorphanol	—	2 mg	1–4 mg every 3–4 hr (IM); 0.5–2 mg every 3–4 hr (IV)	—	Kappa agonist, partial mu antagonist. Also available in nasal spray.	Likenalbuphine.
Partial agonist						
buprenorphine (Buprenex)	—	0.4 mg	0.3 mg every 6–8 hr (IM/IV)	2–12 yr: 0.2–0.6 mg every 4–6 hr (IM/IV)	Sublingual tablets now available both plain and with naloxone for opioid-dependent patient management for specially certified physicians. These tablets are not approved as analgesics. Also available as a long-acting transdermal patch (Butrans), and buccal film (Belbuca).	May precipitate withdrawal in opioid-dependent patients; not readily reversed by naloxone; avoid in labor.

*Starting dose should be lower for older adults.
†These are standard parenteral doses for acute pain in adults and can also be used to convert doses for IV infusions and repeated small IV boluses. For single IV boluses, use half the IM dose. IV doses for children >6 mo. = parenteral equianalgesic dose times weight (kg)/100.
‡Irritating to tissues with repeated IM injections.
Modified from *American Pain Society, Principles of Analgesic Use in the Treatment of Acute Pain and Cancer Pain*, ed.7. American Pain Society, 2016.

GUIDELINES FOR PATIENT-CONTROLLED INTRAVENOUS OPIOID ADMINISTRATION FOR ADULTS WITH ACUTE PAIN

DRUG*	USUAL STARTING DOSE AFTER LOADING	USUAL DOSE RANGE	USUAL LOCKOUT (MIN)	USUAL LOCKOUT RANGE (MIN)
Morphine (1 mg/mL)	1 mg	0.5–2.5 mg	8	5–10
Hydromorphone (0.2 mg/mL)	0.2 mg	0.05–0.4 mg	8	5–10
Fentanyl (50 mcg/mL)	20 mcg	10–50 mcg	6	5–8

*Standard concentrations for most PCA machines are listed in parentheses.
Modified from *American Pain Society, Principles of Analgesic Use in the Treatment of Acute Pain and Cancer Pain*, ed.7. American Pain Society, 2016.

FENTANYL TRANSDERMAL DOSE BASED ON DAILY MORPHINE DOSE*

ORAL 24-HRMORPHINE (mg/day)	TRANSDERMAL FENTANYL (mg/day)	FENTANYL TRANSDERMAL (mcg/hr)
30–90	0.6	25
91–150	1.2	50
151–210	1.8	75
211–270	2.4	100
271–330	3.0	125
331–390	3.6	150
391–450	4.2	175
451–510	4.8	200
511–570	5.4	225
571–630	6.0	250
631–690	6.6	275
691–750	7.2	300
For each additional 60 mg/day	+0.6	+25

*A 10-mg IM or 60-mg oral dose of morphine every 4 hr for 24 hr (total of 60 mg/day IM or 360 mg/day oral) was considered approximately equivalent to fentanyl transdermal 100 mcg/hr.

winter squash (acorn, butternut, hubbard)

Sodium-Rich Foods

baking mixes (pancakes, muffins)
barbecue sauce
buttermilk
salted butter/margarine
canned chili
canned seafood
canned soups
canned spaghetti sauce
cured meats
dry onion soup mix
"fast" foods
frozen dinners
macaroni and cheese
microwave dinners
Parmesan cheese
pickles
salad dressings (prepared)
salt
salted pretzels, potato chips
sauerkraut
tomato ketchup

Calcium-Rich Foods

almond (milk/nuts)
calcium fortified foods
canned salmon/sardines
cheese
cream soups (with milk)
greens: collard/mustard/turnip
kale
milk
soy (beans/milk)
spinach
tofu
yogurt

Vitamin K-Rich Foods

asparagus
beet greens
broccoli
brussel sprouts
cabbage
collard greens
dandelion leaves
garden cress
green tea leaves
kale
mustard greens
parsley
spinach
swiss chard
turnip greens

Low-Sodium Foods

canned pumpkin
egg yolk
fresh vegetables
fruit
grits (not instant)
honey
jams and jellies
low-calorie mayonnaise
macaroons
puffed wheat and rice
dried peas and beans
sherbet
unsalted nuts
whiskey

Foods that Acidify Urine

cheeses
corn
cranberries
eggs
fish
grains (breads and cereals)
lentils
meats
nuts (Brazil, filberts, walnuts)
pasta
plums
poultry
prunes
rice

Foods that Alkalinize Urine

all fruits except cranberries, prunes, plums
all vegetables (except corn)
milk
nuts (almonds, chesnuts)

Foods Containing Tyramine

aged cheeses (blue, Boursault, brick, Brie, Camembert, cheddar, Emmenthaler, Gruyère, mozzarella, Parmesan, Romano, Roquefort, Stilton, Swiss)
American processed cheese
avocados (especially over-ripe)
bananas
bean curd
beer and ale
caffeine-containing beverages (coffee, tea, colas)
caviar
chocolate
distilled spirits
fermented sausage (bologna, salami, pepperoni, summer sausage)
liver
meats prepared with tenderizer
miso soup
over-ripe fruit
peanuts
raisins
raspberries
red wine (especially Chianti)
sauerkraut
sherry
shrimp paste
smoked or pickled fish
soy sauce
vermouth
yeasts
yogurt

Iron-Rich Foods

cereals
clams
dried beans and peas
dried fruit
leafy green vegetables
lean red meats
molasses (blackstrap)
organ meats

Vitamin D-Rich Foods

canned salmon, sardines, tuna
cereals
fish
fish liver oils
fortified milk
nonfat dry milk

Foods that Interact With/Inhibit the CYP3A4 Isoenzyme

grapefruit
grapefruit juice
Seville oranges
tangelos

APPENDIX K

Insulins and Insulin Therapy

The goal of insulin therapy for patients with diabetes is to provide coverage that most closely resembles endogenous insulin production and results in the best glycemic control without hypoglycemia. Although daytime control of hyperglycemia may be accomplished with bolus doses of rapid-acting insulin analogs, elevations in fasting glucose may remain a problem. If fasting blood glucose levels remain elevated, the basal insulin dose (intermediate or long-acting) may have to be adjusted.

Most insulins used today are recombinant DNA human insulins. Produced through genetic engineering, synthetic human insulin is "manufactured" by yeast or nonpathogenic *E. coli*. In recent years, pharmaceutical companies have developed several new types and formulations of insulin.

Different insulins are distinguished by how quickly they are absorbed, the time and length of peak activity, and overall duration of action. Onset, peak, and duration of action times are approximate and vary according to individual factors such as injection site, blood supply, concurrent illnesses, lifestyle, and exercise level. These factors can vary from patient to patient and can vary in any patient from day to day.

There are 5 kinds of insulins: rapid-acting, short-acting, intermediate-acting, long-acting, and combination insulins.

Rapid-Acting Insulins

Rapid-acting insulins are analogs of regular insulin. An analog is a chemical structure very similar to another but differing in one component. Admelog/Humalog/Lyumjev (lispro), Apidra (glulisine), and Fiasp/Novolog (aspart) are rapid-acting insulin analogs. The amino acid sequences of these analogs are nearly identical to human insulin. They differ in the positioning of certain proteins, which allow them to enter the bloodstream rapidly—within 15 min of subcutaneous injection. This closely mimics the body's own insulin response and allows greater flexibility in eating schedules for diabetic patients. Also, because these insulins leave the bloodstream quickly, the risk of hypoglycemic episodes several hours after the meal is lessened. The peak time for rapid-acting insulins is 1–2 hr and the duration is 3–4 hr. Rapid-acting insulin solutions are clear. Insulin aspart, insulin glulisine, and insulin lispro (100 units/mL only) can be given intravenously in selected situations under medical supervision.

Short-Acting Insulins

Regular insulin is a short-acting insulin and is available commercially as Humulin R or Novolin R. The onset of regular insulin is 0.5–1 hr; its peak activity occurs 2–4 hr after subcutaneous injection and its duration of action is 5–7 hr. This time/action profile makes rigid meal scheduling necessary, as the patient must estimate that a meal will occur within 45 min of injection. Short-acting insulin solutions are clear. Regular insulin (100 units/mL only) can be given intravenously.

Intermediate-Acting Insulins

Intermediate-acting insulin contains protamine, which delays onset, peak, and duration of action to provide basal insulin coverage. Basal insulins are given to control blood glucose levels throughout the day when not eating. Commercially, intermediate-acting insulins are available as Humulin N or Novolin N. (The "N" stands for NPH.) Action starts between 2 and 4 hr after injecting. Peak activity occurs between 4 and 10 hr. Duration of action lasts 10–16 hr. The addition of protamine causes the cloudy appearance of intermediate-acting insulins and results in the formulation being a suspension rather than a solution. This is why these insulins must be gently mixed before administering. Intermediate-acting insulins can

© F.A. Davis Publishing

be mixed with short- or rapid-acting insulins to provide both basal and bolus coverage. Intermediate-acting insulins should not be administered intravenously.

Long-Acting Insulins

Long-acting insulins have the most delayed onset and the longest duration of all insulins. Products include Basaglar/Lantus/Semglee/Toujeo (glargine), Levemir (detemir), and Tresiba (degludec). Peaks are not as prominent in long-acting insulins. In fact, insulin glargine has no real peak action because it forms slowly dissolving crystals in the subcutaneous tissue. The onset of action of insulin glargine and insulin detemir is 3–4 hr and for insulin degludec is within 2 hr after subcutaneous injection. Full activity occurs within 4 to 5 hr and remains constant for 24 hr. Even though these insulins are clear solutions, they cannot be diluted or mixed with any other insulin or solution. Mixing these insulins with other insulin products can alter the onset of action and time to peak effect. If bolus insulin is to be given at the same time as insulin glargine, insulin detemir, or insulin degludec, two separate syringes and injection sites must be used. Long-acting insulins should not be administered intravenously.

Combination Insulins

Various combinations of premixed insulins are available, containing fixed proportions of two different insulins, usually a short- and an intermediate-acting insulin. Typically the intermediate-acting insulin makes up 70–75% of the mixture, with rapid- or short-acting insulin making up the remainder. Onset, peak, and duration vary according to each specific product. Brand names of these products include Humulin 70/30 (70% NPH, 30% regular), Humalog Mix 75/25 (75% insulin lispro protamine suspension and 25% insulin lispro), Humalog Mix 50/50 (50% insulin lispro protamine suspension and 50% insulin lispro), and Novolin 70/30 (70% NPH, 30% regular), or Novolog Mix 70/30 (70% insulin aspart protamine suspension and 30% insulin aspart).

BRAND NAME	GENERIC NAME	TYPE OF INSULIN	ONSET/PEAK/DURATION
Humalog Mix 75/25 Humalog Mix 50/50	insulin lispro protamine suspension & insulin lispro injection mixtures	Combination	15–30 min/2.8 hr/24 hr
Novolog Mix 70/30	insulin aspart protamine suspension & insulin aspart injection mixtures	Combination	15 min/1–4 hr/18–24 hr
Humulin 70/30	NPH/regular insulin mixture	Combination	30 min/2–12 hr/24 hr
Novolin 70/30	NPH/regular insulin mixture	Combination	30 min/2–12 hr/24 hr
Apidra	insulin glulisine	Rapid-Acting	Within 15 min/1–2 hr/3–4 hr
Admelog, Humalog, or Lyumjev	insulin lispro	Rapid-Acting	Within 15 min/1–2 hr/3–4 hr
Fiasp or Novolog	insulin aspart	Rapid-Acting	Within 15 min/1–2 hr/3–4 hr
Humulin R	regular insulin (subcut)	Short-Acting	½–1 hr/2–4 hr/5–7 hr
Novolin R	regular insulin (subcut)	Short-Acting	½–1 hr/2–4 hr/5–7 hr
Humulin R	regular insulin (IV)	Short-Acting	10–30 min/15–30 min/30–60 min
Novolin R	regular insulin (IV)	Short-Acting	10–30 min/15–30 min/30–60 min
Humulin N	NPH	Intermediate-Acting	2–4 hr/4–10 hr/10–16 hr
Novolin N	NPH	Intermediate-Acting	2–4 hr/4–10 hr/10–16 hr
Levemir	insulin detemir	Long-Acting	3–4 hr/3–14 hr/6–24 hr
Basaglar, Lantus, Semglee, or Toujeo	insulin glargine	Long-Acting	3–4 hr/No Peak/24 hr
Tresiba	insulin degludec	Long-Acting	Within 2 hr/12 hr/up to 42 hr

APPENDIX L

Differences in U.S. and Canadian Pharmaceutical Practices

In the United States (U.S.) and Canada, most drugs are prescribed and used similarly. However, certain processes and actions of the U.S. and Canadian pharmaceutical industries differ in significant ways, affecting both consumers and health care providers. Safety, marketing, and availability are three of these issues.

Safety

Controversy related to the importation of medications from Canada by U.S. consumers has sometimes raised concerns about the safety of these drugs. These fears are unfounded; in fact, the Canadian approval and manufacturing processes are very similar to U.S. processes. Both countries have pharmaceutical-related standards, laws, and policies to ensure that chemical entities marketed for human diseases and conditions are safe and effective. The process of taking a new drug from the laboratory to the pharmacy shelves includes:

Scientific development. The process begins with research. Scientists develop a new molecular entity targeted at a specific disease, symptom, or condition.

Patenting. A manufacturer applies for a patent, which prevents other drug companies from manufacturing a chemically identical drug. Patent protection lasts 17 years in the U.S. and 20 years in Canada. After a patent expires, any manufacturer can make generic versions of the chemical; generic drugs typically cost much less than the brand-name drugs.

Preclinical testing. Before a drug is taken by human subjects, preclinical testing of the chemical is performed first on animals. Testing helps identify drug action, toxicity effects, side effects, adverse reactions, dosage amounts and routes, and administration procedures. This phase can last anywhere from 3–5 years.

Permission to begin clinical testing. Once a drug is found to have demonstrable positive health effects and is safe for animal consumption, a manufacturer seeks permission to begin clinical studies with human subjects. In the U.S., this process is called New Drug Application (NDA) and is administered by the Food and Drug Administration (FDA). In Canada, the process is referred to as a Clinical Trial Application (CTA) and is administered by Health Canada.

Clinical trials. Clinical trials are initiated to establish the potential benefits and risks for humans. Several subphases are required in the clinical trials phase whereby increasingly larger sample sizes are necessary.

- Phase 0: A new designation for first-in-human trials, which are designed to assess whether the drug affects humans in a manner that is expected.
- Phase 1: Between 20 and 80 healthy volunteers are recruited to assess safety, tolerance, dose ranges, pharmacokinetics, and pharmacodynamics.
- Phase 2: Up to 300 patient volunteers with the drug-targeted disease are enrolled to assess efficacy and toxicity. Variables from Phase I trials may also be assessed.
- Phase 3: Between 1000 and 3000 patient volunteers are entered into a randomized, double-blinded study designed to confirm drug effectiveness, comparability with existing treatments, and further exploration of potential and real side effects.

Ongoing surveillance of a drug for rare or long-term effects, or Phase 4 in Canada, continues after approval is received and marketing begun.

Approval. The results of the clinical studies are reviewed by Health Canada in Canada and by the FDA in the U.S. These regulatory bodies assess all aspects of a drug, including the labeling. The approval process is often deemed excessively long by physicians and patients who are anxious to try new remedies for refractory or terminal diseases. Efforts are ongoing to shorten the process in both countries. For example, Health Canada is collaborating with the FDA to develop a harmonized system for new drug submissions. A jointly planned Common Electronic Submissions Gateway (CESG) has been developed to allow submissions to be sent to both Canada and the U.S. in a common platform, while the review of these submissions continues to be a separate process. [1]

Marketing. Once a drug has been approved, it can be prescribed to consumers or, if it does not require a prescription, purchased by them.

Postmarketing surveillance. More clinical data become available when a drug is marketed and used by many people for longer periods of time. Pharmacovigilance is the term used to refer to the process of ongoing assessment of a drug's safety and effectiveness during this phase. In Canada, this includes Adverse Drug Reaction reporting by consumers and health professionals as described in "Detecting and Managing Adverse Drug Reactions."

Differences Between Canadian and U.S. Drug Pricing and Marketing

One major difference between Canadian and U.S drug regulatory processes is pricing. In Canada, the Patented Medicine Prices Review Board (PMPRB) regulates the prices that manufacturers can charge for prescription and nonprescription medicines. This is

© F.A. Davis Publishing

to ensure that prices are not excessive. No such control exists in the U.S., which is why many citizens purchase their medications from Canadian online pharmacies. One study identified that U.S. citizens can save approximately 24% if they buy their medications from Canadian pharmacies rather than from a U.S. chain pharmacies.[2]

Another difference is in advertising. In the U.S., manufacturers can market drugs directly, and forcefully, to consumers, a controversial privilege that has resulted in consumers requesting specific medications despite not necessarily understanding all of the risks and benefits. In Canada, such advertising is limited and subject to the approval of the Advertising Standards Canada (ASC) agency and the Pharmaceutical Advertising Advisory Board (PAAB). To address this issue in the U.S., the Institute of Medicine (IOM) has recommended that the FDA ban direct-to-consumer advertising during the first 2 yr after a drug is marketed. Such a delay may help to prevent large numbers of people experiencing side effects not observed in the clinical trials, such as occurred with sildenafil (Viagra) when several patients died or developed vision problems in the first months after marketing began.

Natural Health Products

In Canada, Natural Health Products (NHPs) are regulated by Health Canada under the Natural Health Products Regulations. All NHPs must have a product license, and the Canadian sites that manufacture, package, label, and import these products must have a site license. A Natural Product Number (NPN) or Homeopathic Medicine Number (DIN-HM) is issued for the product only after it has been reviewed by Health Canada for its safety and efficacy. The term "Natural Product" refers to vitamins and mineral supplements, herbal remedies, traditional and homeopathic medicines, probiotics and other products such as amino acids, enzymes, essential fatty acids, protein supplements, or personal care items for consumption that contain natural ingredients.
In the U.S., the FDA classifies natural products as food products under the Dietary Supplements Health Education Act, so claims about the ability of a supplement to diagnose, prevent, treat, or cure a disease is prohibited. It is not necessary, however, for natural products to undergo review or approval, or for testing to be done for identity, purity of active ingredients.

Drug Schedule, Availability, and Pregnancy Category Differences

In Canada, drug schedules are used to classify medication according to accessibility. The Canadian drug schedules as defined by NAPRA (the National Pharmacy Regulatory Authorities) are:

- **Schedule I**: Available only by prescription and provided by a pharmacist.
- **Schedule II**: Available only from a pharmacist; does not require a prescription; must be kept in an area with no public access (i.e., behind-the-counter).
- **Schedule III**: Available via open access in a pharmacy only (i.e., over-the-counter) to guarantee access to a pharmacist; does not require a prescription.
- **Unscheduled**: Can be sold in any store without professional supervision.

Each province and territory in Canada decides where to schedule each individual drug (except narcotics and controlled substances), frequently changing schedules as new evidence is obtained. (Note: The province of Québec has not adopted this national model.)
The U.S., in contrast, categorizes medications according to two general classes:

- **Prescription Only**: Available only by prescription and provided by a pharmacist.
- **Over-the-Counter (OTC)**: Available via open access in the pharmacy.

As a result of these differences in accessibility some potentially dangerous drugs (such as heparin, insulin, and codeine-containing cough medicines) are available only with a prescription in the U.S. and available without a prescription but in consultation with a pharmacist in Canada. Similarly, some Canadian drugs are available in combinations not found in the U.S. (see Appendix N for new Canadian combination drugs). There can also be significant variation within Canada due to each province and territory independently scheduling drugs, with the exception of narcotics and controlled substances. Other differences also exist with respect to drug availability between the two countries.

ROUTINE PEDIATRIC IMMUNIZATIONS (0–18 yr)

GENERIC NAME (BRAND NAMES)	ROUTE/DOSAGE	CONTRAINDICATIONS	ADVERSE REACTIONS/ SIDE EFFECTS	NOTES
COVID-19 (mRNA) vaccine (Pfizer BioNTech)	Primary Series: *Pfizer BioNTech (12–17 yr):* 2 doses of 0.3 mL IM separated by 21 days*Pfizer BioNTech (5–11 yr):* 2 doses of 0.2 mL IM separated by 21 daysBooster Dose: *Pfizer BioNTech (12–17 yr):* 0.3 mL as a single dose IM ≥5 months after last primary series dose*Pfizer BioNTech (5–11 yr):* Not recommended	Anaphylactic reaction after a previous dose or to vaccine component; history of immediate allergic reaction (regardless of severity and occurring within 4 hours) to a previous dose	Pain/redness/swelling at injection site, myocarditis, pericarditis, arthralgia, chills, diarrhea, fatigue, fever, headache, myalgia, nausea, vomiting	3rd dose (0.3 mL for 12–17 yr; 0.2 mL for 5&ncash; 11 yr) given ≥28 days after 2nd dose recommended for immunocompromised patients (receiving immunosuppressive therapy; receipt of CAR-T-cell or hematopoietic stem cell transplant within 2 years of transplantation; moderate or severe primary immunodeficiency; advanced or untreated HIV infection)
Diphtheria toxoid, tetanus toxoid, and acellular pertussis vaccine (DTaP, Daptacel, Infanrix)	0.5 mL IM at 2, 4, 6, 15–18 mo and 4–6 yr (1st dose may be given as early as age 6 wk; 4th dose may be given as early as age 12 mo).	Anaphylactic reaction after a previous dose or to vaccine component; encephalopathy within 7 days of administration of previous dose of Tdap, DTP, or DTaP vaccines.	Crying, ↓ appetite, fever, irritability, malaise, redness, tenderness, vomiting.	Individual components may be given as separate injections if unusual reactions occur. The same product should be used for all doses when possible. Do not give to children ≥7 yr.
Haemophilus b conjugate vaccine (Hib, ActHIB, Hiberix, PedvaxHIB)	*ActHIB or Hiberix*—0.5 mL IM at 2, 4, and 6 mo, with a booster at 12–15 mo (1st dose may be given as early as age 6 wk); *PedvaxHIB*—0.5 mL IM at 2 and 4 mo, with a booster dose at 12–15 mo (1st dose may be given as early as age 6 wk).	Anaphylactic reaction after a previous dose or to vaccine component.	Anorexia, crying, diarrhea, fever, irritability, malaise, tenderness, vomiting, weakness.	If different brands of vaccine are used for 1st and 2nd doses, need to administer 3rd dose followed by a booster after 12 mo. Give only one dose to unvaccinated children 5–18 yr who are at ↑ risk for invasive Hib disease (i.e., HIV, splenectomy, chemotherapy/radiation). Give only one dose to unvaccinated children 15–59 mo.

GENERIC NAME (BRAND NAMES)	ROUTE/DOSAGE	CONTRAINDICATIONS	ADVERSE REACTIONS/ SIDE EFFECTS	NOTES
Hepatitis A vaccine (HepA, Havrix, Vaqta)	0.5 mL IM at 12–23 mo, followed by 0.5 mL IM of either *Vaqta* 6–18 mo after the 1st dose *OR Havrix* 6–12 mo after the 1st dose.	Anaphylactic reaction after a previous dose or to vaccine component.	↓ appetite, drowsiness, fever, headache, irritability, pain at injection site, weakness.	Also recommended in children ≥1 yr who live in areas with high rates of hepatitis A or are in other high-risk groups (e.g., chronic liver disease, HIV, illicit drug users, experiencing homelessness, adolescent males who have sex with other males, close personal contact within first 60 days of arrival of international adoptee from country where hepatitis A is endemic).
Hepatitis B vaccine (HepB, Engerix-B, Recombivax HB)	0.5 mL IM within 24 hr of birth, and then at 1–2 mo, and then ≥8 wk after 2nd dose or ≥16 wk after 1st dose (but no earlier than age 24 wk); if mother's HBsAg status is unknown, administer hepatitis B vaccine within 12 hr of birth. *Infants born to HBsAg-positive mothers:* Administer 0.5 mL of hepatitis B immune globulin IM and 1st dose of hepatitis B vaccine within 12 hr of birth; give 2nd and 3rd doses of hepatitis B vaccine at 1–2 mo and then ≥8 wk after 2nd dose or ≥16 wk after 1st dose (but no earlier than age 24 wk), respectively.	Anaphylactic reaction after a previous dose or to vaccine component (including yeast).	Injection site reactions.	A 2-dose series (separated by ≥4 mo) of the adult formulation (Recombivax HB) can be used in children 11–15 yr.
Human papillomavirus vaccine, 9–valent (HPV9, Gardasil 9)	0.5 mL IM at age 11–12 yr; if initiated before age 15, give 2 doses (1st dose may be given as early as age 9 yr), with 2nd dose being given 6–12 mo after 1st dose. If initiated at ≥15 yr, give 3 doses, with 2nd and 3rd doses being given at 1–2 mo and 6 mo, respectively after 1st dose.	Anaphylactic reaction after a previous dose or to vaccine component (including yeast).	Dizziness, fever, headache, pain at injection site, syncope.	Used to prevent: 1) cervical, vulvar, and vaginal cancers caused by HPV types 16, 18, 31, 33, 45, 52, and 58 in females; 2) anal, oropharyngeal, and other head and neck cancers caused by HPV types 16, 18, 31, 33, 45, 52, and 58 in males and females; 3) genital warts caused by HPV types 6 and 11 in males and females; and 4) various precancerous or dysplastic lesions caused by HPV types 16, 18, 31, 33, 45, 52, and 58 in males and females.
Influenza vaccine (Afluria Quadrivalent, Fluarix Quadrivalent, Flucelvax Quadrivalent, FluLaval Quadrivalent, Fluzone Quadrivalent)	For 2021, infants and children 6 mo to <9 years of age who received ≥2 doses of trivalent or quadrivalent influenza vaccine prior to July 1, 2020 need only one dose of the 2021–2022 seasonal influenza vaccine. The 2 doses need not have been received during the same season or consecutive seasons. All other children <9 years of age (including those whose vaccination status cannot be determined) should receive 2 doses separated by ≥4 wk in order to achieve satisfactory antibody response. *Age 6–35 mo:* 1–2 doses (see note above) of 0.25 mL (Afluria Quadrivalent or Fluzone Quadrivalent) or 0.5 mL (Fluzone Quadrivalent) IM. *Age 6 mo–8 yr (Fluarix Quadrivalent, Flucelvax Quadrivalent, or FluLaval Quadrivalent):* 1–2 doses (see above note) of 0.5 mL IM. *Age 3–8 yr (Afluria Quadrivalent):* 1–2 doses (see above note) of 0.5 mL IM. *Age ≥9 yr:* 0.5 mL IM single dose annually.	Anaphylactic reaction after a previous dose or to vaccine component, including eggs/egg products (except for Flucelvax Quadrivalent). Avoid use in patients with acute neurologic compromise.	Local soreness, fever, myalgia, possible neurologic toxicity.	If patient experiences anaphylactic reaction to eggs or egg-containing foods, inactivated influenza vaccine (all except for Flucelvax Quadrivalent) should be administered by health care professional with experience in recognition and management of severe allergic conditions and patient should be closely monitored for ≥15 min after vaccination.

© F.A. Davis Publishing

GENERIC NAME (BRAND NAMES)	ROUTE/DOSAGE	CONTRAINDICATIONS	ADVERSE REACTIONS/ SIDE EFFECTS	NOTES
Measles, mumps, and rubella vaccine (MMR, M-M-R II)	0.5 mL subcut at 12–15 mo and at 4–6 yr (2nd dose may be given earlier if ≥4 wk have elapsed since the 1st dose).	Anaphylactic reaction after a previous dose or to vaccine component (including neomycin or gelatin); severe immunosuppression (in the absence of severe immunosuppression, HIV is not a contraindication); pregnancy.	Arthralgia, encephalitis, fever, pain at injection site.	If unusual reactions occur, individual components may be given as separate injections. Immunosuppression may ↓ antibody response to injection and ↑ the risk of viral transmission.
Meningococcal conjugate vaccine *Serogroups A, C, W, and Y conjugate vaccines:* (Menactra [MenACWY-D], MenQuadfi [MenACWY-TT]), Menveo [MenACWY-CRM]); *Serogroup B vaccines:* , Bexsero [MenB-4C], Trumenba [MenB-FHbp])	Menactra, MenQuadfi, or Menveo: 0.5 mL IM single dose at 11–12 yr with a booster dose at age 16 yr; if received 1st dose at age 13–15 yr, should receive booster dose at age 16–18 yr [with an interval of ≥8 wk between doses] if received 1st dose at age ≥16 yr, no booster dose needed. Single dose should be given to previously unvaccinated college freshmen (≤21 yr) living in dormitories. Bexsero or Trumenba: Young adults aged 16–23 yr who are not at ↑ risk for meningococcal disease may be given 2 doses of either Bexsero (≥1 mo apart) or Trumenba (6 mo apart) (based on shared decision making).	Anaphylactic reaction after a previous dose or to vaccine component.	Anorexia, arthralgia, diarrhea, fatigue, fever, headache, myalgia, nausea, irritability, malaise, pain at injection site, vomiting.	Routine vaccination with meningococcal serogroup A, C, W, and Y conjugate vaccine is also recommended for certain children (≥2 mo for Menveo; ≥9 mo for Menactra; ≥2 yr for MenQuadfi) who are at high risk (anatomic or functional asplenia [including sickle cell disease] HIV; persistent complement component deficiency; complement inhibitor use; travel in areas where meningococcal disease is hyperendemic or epidemic). Routine vaccination with meningococcal serogroup B vaccine is also recommended for certain children (≥10 yr) who are at high risk (anatomic or functional asplenia [including sickle cell disease] persistent complement component deficiency; complement inhibitor use).
Pneumococcal conjugate vaccine, 13–valent (PCV13, Prevnar 13)	0.5 mL IM at 2, 4, 6, and 12–15 mo.	Anaphylactic reaction after a previous dose or to vaccine component (including diphtheria toxoid).	Arthralgia, chills, ↓ appetite, fatigue, fever, headache, insomnia, irritability, myalgia, pain at injection site, rash.	One dose may also be given to previously unvaccinated healthy children age 24–59 mo. For high-risk children (e.g., sickle cell disease; anatomic or functional asplenia; chronic cardiac, pulmonary, liver, or renal disease; diabetes; HIV; immunosuppression; cerebrospinal fluid leaks; cochlear implant) age 2–5 yr with <3 PCV13 doses, give 2 doses (≥8 wk apart, with 1st dose being given ≥8 wk after most recent dose). If previously received 3 doses, give 1 dose ≥8 wk after most recent dose. Should be administered before PPSV23.
Pneumococcal polysaccharide vaccine (PPSV23, Pneumovax 23)	0.5 mL IM or subcut ≥8 wk after final dose of PCV in high-risk children ≥2 yr (see Notes section for pneumococcal conjugate vaccine for definition of high risk).	Anaphylactic reaction after a previous dose or to vaccine component.	Chills, fever, injection site reactions.	A 2nd dose may be given 5 yr later in children with immunosuppression, sickle cell disease, chronic renal failure, or anatomic/functional asplenia.
Polio vaccine, inactivated (IPV, IPOL)	0.5 mL IM or subcut at 2, 4, and 6–18 mo and at 4–6 yr.	Anaphylactic reaction after a previous dose or to vaccine component (including neomycin, streptomycin, or polymyxin B).	Anorexia, fatigue, fever, irritability, pain at injection site, vomiting.	Oral polio vaccine (OPV) is no longer recommended for use in the United States.
Rotavirus vaccine (RV, Rotarix, RotaTeq)	*Rotarix*— 1 mL PO at 2 and 4 mo; *RotaTeq*— 2 mL PO at 2, 4, and 6 mo. First dose of either product may be given as early as age 6 wk; final dose should be given no later than age 8 mo.	Anaphylactic reaction after a previous dose or to vaccine component (if allergic to latex, do not use Rotarix); history of uncorrected congenital malformation of GI tract (Rotarix only); history of intussusception; severe combined immunodeficiency disease.	Diarrhea, fever, irritability, vomiting.	Series should not be started in infants ≥15 wk. Series should be completed with same product, when possible. If RotaTeq used in any of the doses, a total of 3 doses should be given.

© F.A. Davis Publishing

GENERIC NAME (BRAND NAMES)	ROUTE/DOSAGE	CONTRAINDICATIONS	ADVERSE REACTIONS/ SIDE EFFECTS	NOTES
Tetanus toxoid, **reduced** diphtheria toxoid, and acellular pertussis vaccine absorbed (Tdap, Adacel, Boostrix)	0.5 mL IM given at age 11–12 yr if previously completed DTaP series, then followed by booster doses of either Td or Tdap every 10 yr; one-time dose may be given if age ≥7 yr if did not previously complete DTaP series.	Anaphylactic reaction after a previous dose or to vaccine component; encephalopathy within 7 days of administration of previous dose of Tdap, DTP, or DTaP vaccines.	Abdominal pain, arthralgia, chills, diarrhea, fatigue, headache, myalgia, nausea, pain at injection site, vomiting.	Should also be given to pregnant adolescents during each pregnancy (preferably during 27–36 wk gestation) regardless of interval since prior Td or Tdap.
Varicella vaccine (Var, Varivax)	0.5 mL subcut at 12–15 mo and at 4–6 yr (2nd dose may be given earlier if ≥3 mo have elapsed since the 1st dose); for persons 7–18 yr who do not have evidence of immunity, 2 doses should be given (≥3 mo apart if 7–12 yr or ≥4 wk apart if ≥13 yr).	Anaphylactic reaction after a previous dose or to vaccine component (including gelatin or neomycin); severe immunosuppression (in the absence of severe immunosuppression, HIV is not a contraindication); pregnancy.	Anorexia, chills, diarrhea, fatigue, fever, headache, injection site reaction, irritability, nausea, vomiting.	Immunosuppression may ↓ antibody response to injection and ↑ the risk of viral transmission.

Nursing Implications:

Assessment

Assess previous immunization history and history of hypersensitivity.

Assess for history of latex allergy. Some prefilled syringes may use latex components and should be avoided in those with hypersensitivity.

Implementation

Measles, mumps, and rubella vaccine and diphtheria toxoid, tetanus toxoid, and pertussis vaccine may be given concomitantly.

Administer each immunization by appropriate route:

PO: Rotavirus.

Subcut: measles, mumps, rubella, polio, varicella, pneumococcal polysaccharide.

IM: diphtheria, tetanus toxoid, pertussis, polio, Haemophilus b, hepatitis B, meningococcal conjugate, hepatitis A, pneumococcal conjugate, pneumococcal polysaccharide, influenza injection, human papillomavirus.

Patient/Family Teaching

Inform parent of potential and reportable side effects of immunization. Notify health care professional if patient develops fever higher than 39.4 C (103 F); difficulty breathing; hives; itching; swelling of eyes, face, or inside of nose; sudden, severe tiredness or weakness; or convulsions.

Review next scheduled immunization with parent.

Evaluation

Prevention of diseases through active immunity.

ROUTINE ADULT IMMUNIZATIONS

GENERIC NAME (BRAND NAMES)	INDICATIONS	DOSAGE/ROUTE	CONTRAINDICATIONS	ADVERSE REACTIONS/ SIDE EFFECTS
COVID-19 (mRNA) vaccine (Moderna, Pfizer BioNTech)	All adults	Primary Series:*Moderna:* 2 doses of 0.5 mL IM separated by 28 days; 3rd dose of 0.5 mL IM ≥28 days after 2nd dose recommended for immunocompromised patients*Pfizer BioNTech:* 2 doses of 0.3 mL IM separated by 21 days; 3rd dose of 0.3 mL IM ≥28 days after 2nd dose recommended for immunocompromised patientsBooster Dose:*Moderna:* 0.25 mL as a single dose IM ≥5 months after last primary series dose*Pfizer BioNTech:* 0.3 mL as a single dose IM ≥5 months after last primary series dose	Anaphylactic reaction after a previous dose or to vaccine component; history of immediate allergic reaction (regardless of severity and occurring within 4 hours) to a previous dose	Pain/redness/swelling at injection site, myocarditis, pericarditis, arthralgia, chills, diarrhea, fatigue, fever, headache, myalgia, nausea, vomiting
Hepatitis A vaccine (HepA, Havrix, Vaqta)	Chronic liver disease; HIV; experiencing homelessness; users of injection/noninjection illicit drugs; men who have sex with men; working with infected primates or with hepatitis A virus in a research laboratory setting; health care facilities providing services to injection or noninjection drug users or group homes and nonresidential day care facilities for developmentally disabled persons; pregnancy (if at risk for infection or severe outcome from infection during pregnancy); travel to endemic areas; unvaccinated individuals who anticipate close personal contact with an international adoptee during the initial 60 days after their arrival in the U.S. from a country with intermediate or high endemicity.	1 mL IM initially, followed by 1 mL IM 6–12 mo (for Havrix) or 6–18 mo (for Vaqta) later.	Anaphylactic reaction after a previous dose or to vaccine component.	↓ appetite, drowsiness, fever, injection site reactions, irritability, headache.

© F.A. Davis Publishing

GENERIC NAME (BRAND NAMES)	INDICATIONS	DOSAGE/ROUTE	CONTRAINDICATIONS	ADVERSE REACTIONS/ SIDE EFFECTS
Hepatitis B vaccine (HepB, Engerix-B, Heplisav-B, Recombivax HB)	Chronic liver disease; HIV; sex partners of persons with chronic hepatitis B virus infection; sexually active persons not in mutually monogamous relationships; persons seeking evaluation or treatment for a sexually transmitted infection; men who have sex with men; experiencing homelessness; receive clotting factor concentrates; users of injection/noninjection illicit drugs; men who have sex with men; injection drug users; household contacts of persons with chronic hepatitis B infection; residents and staff of facilities for developmentally disabled persons; health care and public safety personnel with reasonably anticipated risk for exposure to blood or blood-contaminated body fluids; hemodialysis, peritoneal dialysis, home dialysis, and predialysis patients; diabetes mellitus (19–59 yr; ≥60 yr through shared decision making); incarcerated persons; pregnancy (if at risk for infection or severe outcome from infection during pregnancy); travel to endemic areas.	Recombivax HB and Engerix–B: 1 mL IM initially, followed by 1 mL IM at 1 mo and 6 mo after initial dose. Heplisav-B: 0.5 mL IM initially, followed by 0.5 mL IM ≥4 wk later.	Anaphylactic reaction after a previous dose or to vaccine component.	Injection site reactions.
Human papillomavirus vaccine, 9–valent (HPV9, Gardasil 9)	All previously unvaccinated or partially vaccinated persons through age 26..	Received no previous doses or received 1st dose at 15 yr of age or later: 0.5 mL IM initially, followed by 0.5 mL at 1–2 mo and 6 mo after initial dose. Partially vaccinated with 1st dose before 15 yr of age: If 2 doses administered ≥5 mo apart, no additional doses needed. Partially vaccinated with 1st dose before 15 yr of age: If only one dose administered or if 2 doses administered <5 mo apart, administer one additional dose of 0.5 mL IM.	Anaphylactic reaction after a previous dose or to vaccine component (including yeast); pregnancy.	Dizziness, fever, headache, pain at injection site, syncope.
Influenza vaccine (Afluria Quadrivalent, Fluad Quadrivalent, Fluarix Quadrivalent, Flublok Quadrivalent, Flucelvax Quadrivalent, FluLaval Quadrivalent, Fluzone High-Dose Quadrivalent, Fluzone Quadrivalent)	All adults.	All ages (all vaccines except for Fluzone High-Dose Quadrivalent): 0.5 mL IM annually. ≥65 yr (Fluzone High-Dose Quadrivalent): 0.7 mL IM annually	If patient experiences anaphylactic reaction to eggs or egg-containing foods, inactivated influenza vaccine should be administered by health care professional with experience in recognition and management of severe allergic conditions and patient should be closely monitored for ≥15 min after vaccination. Flucelvax Quadrivalent and Flublok Quadrivalent are the only egg-free influenza vaccines available in the U.S.	Fever, injection site reactions, myalgia.

© F.A. Davis Publishing

GENERIC NAME (BRAND NAMES)	INDICATIONS	DOSAGE/ROUTE	CONTRAINDICATIONS	ADVERSE REACTIONS/ SIDE EFFECTS
Measles, mumps, and rubella vaccine (MMR, M-M-R II)	Adults born in or after 1957 with unreliable documentation of previous vaccination (unless have laboratory evidence of immunity to all 3 diseases); health care workers born before 1957 who do not have laboratory evidence of immunity to measles, mumps, or rubella.	Adults born in or after 1957 with unreliable documentation of previous vaccination: 1 or 2 doses of 0.5 mL subcut (with ≥28 days between doses); high-risk groups should receive a total of 2 doses (with ≥28 days between doses).	Allergy to gelatin or neomycin; severe immunosuppression (in the absence of severe immunosuppression, HIV is not a contraindication); pregnancy (also avoid becoming pregnant for 4 wk after immunization).	Burning, stinging, pain at injection site; arthritis/arthralgia; fever; encephalitis; allergic reactions. Immunosuppression may ↓ antibody response to injection and ↑ the risk of viral transmission (live vaccine).
Meningococcal conjugate vaccine *Serogroups A,C,W, and Y conjugate vaccines:* (Menactra [MenACWY-D], MenQuadfi [MenACWY-TT]), Menveo [MenACWY-CRM]; *Serogroup B vaccines:* , Bexsero [MenB-4C], Trumenbra [MenB-FHbp])	*Serogroups A,C,W, and Y conjugate vaccines*—First-year college students living in residential housing if they have not previously received a dose on or after their 16th birthday; military recruits; anatomic or functional asplenia (including sickle cell disease); HIV; persistent complement component deficiency; complement inhibitor use; travel in areas in which meningococcal disease is hyperendemic or epidemic; persons at risk during a community outbreak. *Serogroup B vaccines:* Anatomic or functional asplenia (including sickle cell disease); persistent complement component deficiency; complement inhibitor use. May also administer to young adults aged 16–23 yr who are not at ↑ risk for meningococcal disease (based on shared decision making).	*Serogroups A,C,W, and Y conjugate vaccines*— Adults not previously vaccinated with functional or anatomic asplenia, HIV, persistent complement deficiency, or complement inhibitor use: 0.5 mL IM initially, followed by 0.5 mL IM ≥2 mo later. Repeat dose every 5 yr if person remains at ↑ risk. Adults not previously vaccinated who are traveling to areas where meningococcal disease is endemic/hyperendemic; at risk during a community outbreak; or military recruits: 0.5 mL IM single dose. Repeat dose every 5 yr if person remains at ↑ risk. Adults not previously vaccinated who are first-year college students living in residential housing: 0.5 mL IM single dose. *Serogroup B vaccines*— Patients at ↑ risk for serogroup B meningococcal disease: *Bexsero:* 0.5 mL IM initially, followed by 0.5 mL IM ≥1 mo after initial dose; *Trumenba:* 0.5 mL IM initially, followed by 0.5 mL IM 1–2 mo, and 6 mo after initial dose. Patients 16–23 yr of age who are not at risk for serogroup B meningococcal disease: *Bexsero:* 0.5 mL IM initially, followed by 0.5 mL IM ≥1 mo after initial dose; *Trumenba:* 0.5 mL IM initially, followed by 0.5 mL 6 mo after initial dose.	Anaphylactic reaction after a previous dose or to vaccine component.	Anorexia, arthralgia, diarrhea, fatigue, fever, headache, myalgia, nausea, irritability, malaise, pain at injection site, vomiting.
Pneumococcal conjugate vaccine, 13–valent (PCV13, Prevnar 13)	≥65 yr (based on shared decision making if previously did not receive); adults ≥19 yr with chronic renal failure, anatomic or functional asplenia (including sickle cell disease), cerebrospinal fluid leaks, cochlear implants, or immunosuppression (including HIV).	Adults ≥65 yr: 0.5 mL IM single dose followed by single dose of PPSV23 ≥1 yr later; if already received PPSV23, give PCV13 single dose (0.5 mL IM) ≥1 yr after dose of PPSV23. Adults ≥19 yr with specified medical conditions (under Indications column): 0.5 mL IM single dose followed by single dose of PPSV23 ≥8 wk later; if already received PPSV23, give PCV13 single dose (0.5 mL IM) ≥1 yr after dose of PPSV23.	Anaphylactic reaction after a previous dose or to vaccine component including diphtheria toxoid.	Arthralgia, chills, ↓ appetite, fatigue, fever, headache, insomnia, irritability, myalgia, pain at injection site, rash.

© F.A. Davis Publishing

GENERIC NAME (BRAND NAMES)	INDICATIONS	DOSAGE/ROUTE	CONTRAINDICATIONS	ADVERSE REACTIONS/ SIDE EFFECTS
Pneumococcal polysaccharide vaccine (PPSV23, Pneumovax 23)	All adults ≥65 yr; 19–64 yr with chronic cardiac (excluding hypertension), pulmonary (including COPD and asthma), or liver disease; alcoholism; diabetes, or cigarette smoking; ≥19 yr with chronic renal failure, anatomic or functional asplenia (including sickle cell disease), cerebrospinal fluid leaks, cochlear implants, or immunosuppression (including HIV).	0.5 mL IM or subcut; one-time revaccination should also be given ≥5 yr after 1st dose to those ≥65 yr (if 1st dose was given ≥5 yr ago and before age 65) and to high-risk patients age ≥19 yr (chronic renal failure, anatomic or functional asplenia, sickle cell disease, immunosuppression) ≥5 yr after 1st dose (if the most recent dose of PPSV23 was administered before age 65 yr, at age ≥65 yr, give another dose of PPSV23 ≥8 wk after PCV13 and ≥5 yr after the most recent dose of PPSV23).	Anaphylactic reaction after a previous dose or to vaccine component.	Chills, fever, injection site reactions.
Tetanus toxoid, **reduced** diphtheria toxoid and acellular pertussis vaccine absorbed (Tdap, Adacel, Boostrix)	Single dose should be given to replace one of the 10-yr Td boosters in all adults who did not previously receive a dose of Tdap or if their vaccine status is unknown. Single dose should also be given as soon as feasible to all pregnant women (preferred during 27–36 wks' gestation), close contacts of infants <12 mo, and health care workers with direct patient contact.	0.5 mL IM single dose.	Anaphylactic reaction after a previous dose or to vaccine component; encephalopathy within 7 days of administration of previous dose of Tdap, DTP, or DTaP vaccines.	Abdominal pain, arthralgia, chills, diarrhea, fatigue, headache, myalgia, nausea, pain at injection site, vomiting.
Tetanus-diphtheria (Td, Tenivac)	All adults who lack written documentation of a primary series consisting of ≥3 doses of tetanus– and diphtheria–toxoid-containing vaccine; booster dose should be given to all adults every 10 yr (see info above regarding use of Tdap to replace one dose of Td in booster series).	*Unimmunized:* 0.5 mL IM initially, followed by 0.5 mL IM ≥4 wk after initial dose; *Immunized:* 0.5 mL IM booster every 10 yr.	Anaphylactic reaction after a previous dose or to vaccine component.	Arthralgia, chills, diarrhea, fatigue, headache, myalgia, nausea, pain at injection site.
Varicella vaccine (Var, Varivax)	Any adult without a history of chickenpox or herpes zoster (shingles), without a history of receiving 2 doses of varicella vaccine ≥4 wk apart, or without laboratory evidence of immunity. Health care workers and pregnant women born in U.S. before 1980 who do not meet the above criteria should be tested for immunity.	0.5 mL subcut initially, followed by 0.5 mL subcut 4–8 wk after initial dose.	Anaphylactic reaction after a previous dose or to vaccine component (including gelatin or neomycin); severe immunosuppression (in the absence of severe immunosuppression, HIV is not a contraindication); pregnancy (also avoid becoming pregnant for 4 wk after immunization).	Fever, pain at injection site. Immunosuppression may ↓ antibody response to injection and ↑ the risk of viral transmission (live vaccine).
Zoster vaccine (Shingrix)	All adults ≥50 yr (regardless of previous history of herpes zoster or vaccination with Zostavax).	0.5 mL subcut initially, followed by 0.5 mL subcut 2–6 mo after initial dose.	Anaphylactic reaction after a previous dose or to vaccine component (including gelatin or neomycin); severe immunosuppression (in the absence of severe immunosuppression, HIV is not a contraindication); pregnancy (also avoid becoming pregnant for 4 wk after immunization).	Fever, pain at injection site. Immunosuppression may ↓ antibody response to injection and ↑ the risk of viral transmission (live vaccine).

APPENDIX N

Combination Drugs

Note: The drugs listed in this section are in alphabetical order according to trade names. If the trade name does not specify dose form, the dose form is either a tablet or capsule. Following each trade name are the generic names and doses of the active ingredients contained in each preparation. For information on these drugs, look up each generic name in the combination. For inert ingredients, see drug label. **(OTC)** signifies "over-the-counter" or nonprescription medication.

Acanya Topical Gel—1.2% clindamycin + 2.5% benzoyl peroxide
Accuretic 10/12.5—quinapril 10 mg + hydrochlorothiazide 12.5 mg
Accuretic 20/12.5—quinapril 20 mg + hydrochlorothiazide 12.5 mg
Accuretic 20/25—quinapril 20 mg + hydrochlorothiazide 25 mg
Activella 0.5/0.1—estradiol 0.5 mg + norethindrone 0.1 mg
Activella 1/0.5—estradiol 1 mg + norethindrone 0.5 mg
Actoplus Met 15/500—pioglitazone 15 mg + metformin 500 mg
Actoplus Met 15/850—pioglitazone 15 mg + metformin 850 mg
Advair Diskus 100—(per actuation) fluticasone 100 mcg + salmeterol 50 mcg
Advair Diskus 250—(per actuation) fluticasone 250 mcg + salmeterol 50 mcg
Advair Diskus 500—(per actuation) fluticasone 500 mcg + salmeterol 50 mcg
Advair HFA 45—(per actuation) fluticasone 45 mcg + salmeterol 21 mcg
Advair HFA 115—(per actuation) fluticasone 115 mcg + salmeterol 21 mcg
Advair HFA 230—(per actuation) fluticasone 230 mcg + salmeterol 21 mcg
Advil Allergy & Congestion Relief—phenylephrine 10 mg + ibuprofen 200 mg + chlorpheniramine 4 mg **(OTC)**
Advil Allergy Sinus—pseudoephedrine 30 mg + ibuprofen 200 mg + chlorpheniramine 2 mg **(OTC)**
Advil Cold & Sinus—pseudoephedrine 30 mg + ibuprofen 200 mg **(OTC)**
Advil Dual Action—acetaminophen 250 mg + ibuprofen 125 mg **(OTC)**
Advil PM—diphenhydramine citrate 38 mg + ibuprofen 200 mg **(OTC)**
Advil PM Liquigels—diphenhydramine 25 mg + ibuprofen 200 mg **(OTC)**
Advil Sinus Congestion & Pain—phenylephrine 10 mg + ibuprofen 200 mg **(OTC)**
Aggrenox—aspirin 25 mg + extended-release dipyridamole 200 mg
Airduo RespiClick 55—(per actuation) fluticasone 55 mcg + salmeterol 14 mcg
Airduo RespiClick 113—(per actuation) fluticasone 113 mcg + salmeterol 14 mcg
Airduo Respiclick 232—(per actuation) fluticasone 232 mcg + salmeterol 14 mcg
Alavert Allergy and Sinus D-12—loratadine 5 mg + pseudoephedrine 120 mg **(OTC)**
Aldactazide 25/25—hydrochlorothiazide 25 mg + spironolactone 25 mg
Aldactazide 50/50—hydrochlorothiazide 50 mg + spironolactone 50 mg
Aleve-D Sinus & Cold—naproxen 220 mg + extended-release pseudoephedrine 120 mg **(OTC)**
Aleve-D Sinus & Headache—naproxen 220 mg + extended-release pseudoephedrine 120 mg **(OTC)**
Aleve PM—naproxen 220 mg + diphenhydramine 25 mg **(OTC)**
Alka-Seltzer Effervescent, Extra-Strength—citric acid 1000 mg + sodium bicarbonate 1985 mg + aspirin 500 mg **(OTC)**
Alka-Seltzer Effervescent, Original—citric acid 1000 mg + sodium bicarbonate 1916 mg + aspirin 325 mg **(OTC)**
Alka-Seltzer Plus Cold & Cough Effervescent Tablets—dextromethorphan 10 mg + phenylephrine 7.8 mg + chlorpheniramine 2 mg + aspirin 325 mg **(OTC)**

© F.A. Davis Publishing

Alka-Seltzer Plus Cold Effervescent Tablets—phenylephrine 7.8 mg + chlorpheniramine 2 mg + aspirin 325 mg **(OTC)**
Alka-Seltzer Plus Cold Night Effervescent Tablets—dextromethorphan 10 mg + phenylephrine 7.8 mg + doxylamine 6.25 mg + aspirin 500 mg **(OTC)**
Alka-Seltzer Plus Day Severe Cold & Flu—(per packet) dextromethorphan 20 mg + phenylephrine 10 mg + acetaminophen 500 mg + guaifenesin 400 mg **(OTC)**
Alka-Seltzer Plus Maximum-Strength Cold & Cough Liquid Gels—dextromethorphan 10 mg + phenylephrine 5 mg + chlorpheniramine 2 mg + acetaminophen 325 mg **(OTC)**
Alka-Seltzer Plus Maximum-Strength Day Cold & Flu Liquid Gels—dextromethorphan 10 mg + phenylephrine 5 mg + acetaminophen 325 mg **(OTC)**
Alka-Seltzer Plus Maximum-Strength Night Cold & Flu Liquid Gels—acetaminophen 325 mg + doxylamine 6.25 mg + dextromethorphan 10 mg + phenylephrine 5 mg **(OTC)**
Alka-Seltzer Plus Maximum-Strength Severe Sinus, Allergy, & Cough Liquid Gels—acetaminophen 325 mg + doxylamine 6.25 mg + dextromethorphan 10 mg + phenylephrine 5 mg **(OTC)**
Alka-Seltzer Plus Severe Cold & Flu Formula Effervescent Tablets—dextromethorphan 10 mg + phenylephrine 5 mg + chlorpheniramine 2 mg + acetaminophen 250 mg **(OTC)**
Alka-Seltzer Plus Severe Cough, Mucus, & Congestion Liquid Gels—dextromethorphan 10 mg + phenylephrine 5 mg + acetaminophen 250 mg + guaifenesin 200 mg **(OTC)**
Alka-Seltzer Plus Severe Sinus Cold & Cough Liquid Gels—dextromethorphan 10 mg + phenylephrine 5 mg + acetaminophen 250 mg + guaifenesin 200 mg **(OTC)**
Allegra-D 12 Hour—fexofenadine 60 mg + extended-release pseudoephedrine 120 mg
Allegra-D 24 Hour—fexofenadine 180 mg + extended-release pseudoephedrine 240 mg
Allzital—acetaminophen 325 mg + butalbital 25 mg
Altavera—levonorgestrel 0.15 mg + ethinyl estradiol 30 mcg
Alyacen 1/35—norethindrone 1 mg + ethinyl estradiol 35 mcg
Alyacen 7/7/7
- **Phase I**—norethindrone 0.5 mg + ethinyl estradiol 35 mcg
- **Phase II**—norethindrone 0.75 mg + ethinyl estradiol 35 mcg
- **Phase III**—norethindrone 1 mg + ethinyl estradiol 35 mcg

Amabelz 0.5/0.1—estradiol 0.5 mg + norethindrone 0.1 mg
Amabelz 1/0.5—estradiol 1 mg + norethindrone 0.5 mg
Amethia—levonorgestrel 0.15 mg + ethinyl estradiol 30 mcg
Amethia Lo—levonorgestrel 0.1 mg + ethinyl estradiol 20 mcg
Amethyst—levonorgestrel 0.09 mg + ethinyl estradiol 20 mcg
Anacin—aspirin 400 mg + caffeine 32 mg **(OTC)**
Anexsia 5/325—hydrocodone 5 mg + acetaminophen 325 mg
Anexsia 7.5/325—hydrocodone 7.5 mg + acetaminophen 325 mg
Angeliq 0.25/0.5—drospirenone 0.25 mg + estradiol 0.5 mg
Angeliq 0.5/1—drospirenone 0.5 mg + estradiol 1 mg
Anoro Ellipta—(per actuation) umeclidinium 62.5 mcg + vilanterol 25 mcg
Apri-28—desogestrel 0.15 mg + ethinyl estradiol 30 mcg
Aranelle
- **Phase I**—norethindrone 0.5 mg + ethinyl estradiol 35 mcg
- **Phase II**—norethindrone 1 mg + ethinyl estradiol 35 mcg
- **Phase III**—norethindrone 0.5 mg + ethinyl estradiol 35 mcg

Arthrotec 50/200—diclofenac 50 mg + misoprostol 200 mcg
Arthrotec 75/200—diclofenac 75 mg + misoprostol 200 mcg
Ashlyna—levonorgestrel 0.15 mg + ethinyl estradiol 30 mcg/10 mcg
Atacand HCT 16/12.5—candesartan 16 mg + hydrochlorothiazide 12.5 mg
Atacand HCT 32/12.5—candesartan 32 mg + hydrochlorothiazide 12.5 mg
Atacand HCT 32/25—candesartan 32 mg + hydrochlorothiazide 25 mg
Atacand Plus 16/12.5—candesartan 16 mg + hydrochlorothiazide 12.5 mg
Atacand Plus 32/12.5—candesartan 32 mg + hydrochlorothiazide 12.5 mg
Atacand Plus 32/25—candesartan 32 mg + hydrochlorothiazide 25 mg

© F.A. Davis Publishing

Atripla—efavirenz 600 mg + emtricitabine 200 mg + tenofovir disoproxil fumarate 300 mg
Aubra—levonorgestrel 0.1 mg + ethinyl estradiol 20 mcg
Avalide 150/12.5—irbesartan 150 mg + hydrochlorothiazide 12.5 mg
Avalide 300/12.5—irbesartan 300 mg + hydrochlorothiazide 12.5 mg
Aviane-28—levonorgestrel 0.1 mg + ethinyl estradiol 20 mcg
Azor 5/20—amlodipine 5 mg + olmesartan 20 mg
Azor 5/40—amlodipine 5 mg + olmesartan 40 mg
Azor 10/20—amlodipine 10 mg + olmesartan 20 mg
Azor 10/40—amlodipine 10 mg + olmesartan 40 mg
Azurette—desogestrel 0.15 mg + ethinyl estradiol 20 mcg/10 mcg
Balziva-28—norethindrone 0.4 mg + ethinyl estradiol 35 mcg
Bekyree—desogestrel 0.15 mg + ethinyl estradiol 20 mcg/10 mcg
Benicar HCT 20/12.5—olmesartan 20 mg + hydrochlorothiazide 12.5 mg
Benicar HCT 40/12.5—olmesartan 40 mg + hydrochlorothiazide 12.5 mg
Benicar HCT 40/25—olmesartan 40 mg + hydrochlorothiazide 25 mg
BenzaClin Topical Gel—1% clindamycin + 5% benzoyl peroxide
Benzamycin Topical Gel—5% benzoyl peroxide + 3% erythromycin
Bevespi Aerosphere—(per actuation) glycopyrrolate 9 mcg + formoterol 4.8 mcg
Beyaz
  Phase I—drospirenone 3 mg + ethinyl estradiol 20 mcg + levomefolate 0.451 mg
  Phase II—levomefolate 0.451 mg
Bicitra Solution—(per 5 ml) sodium citrate 500 mg + citric acid 334 mg
Bidil—isosorbide dinitrate 20 mg + hydralazine 37.5 mg
Bijuva—estradiol 1 mg + progesterone 100 mg
Biktarvy—bictegravir 50 mg + emtricitabine 200 mg + tenofovir alafenamide 25 mg
Blephamide Ophthalmic Suspension/Ointment—0.2% prednisolone + 10% sodium sulfacetamide
Breo Ellipta 100/25—(per blister for inhalation) fluticasone 100 mcg + vilanterol 25 mcg
Breo Ellipta 200/25—(per blister for inhalation) fluticasone 200 mcg + vilanterol 25 mcg
Brevicon-28—norethindrone 0.5 mg + ethinyl estradiol 35 mcg
Briellyn—norethindrone 0.4 mg + ethinyl estradiol 35 mcg
Bromfed DM Liquid—(per 5 mL) brompheniramine 2 mg + dextromethorphan 10 mg + pseudoephedrine 30 mg
Bronkaid Dual Action—ephedrine 25 mg + guaifenesin 400 mg **(OTC)**
Bufferin—aspirin 325 mg + calcium carbonate 158 mg + magnesium oxide 63 mg + magnesium carbonate 34 mg **(OTC)**
Bunavail 2.1/0.3—buprenorphine 2.1 mg + naloxone 0.3 mg
Bunavail 4.2/0.7—buprenorphine 4.2 mg + naloxone 0.7 mg
Bunavail 6.3/1—buprenorphine 6.3 mg + naloxone 1 mg
Caduet 2.5/10—amlodipine 2.5 mg + atorvastatin 10 mg
Caduet 2.5/20—amlodipine 2.5 mg + atorvastatin 20 mg
Caduet 2.5/40—amlodipine 2.5 mg + atorvastatin 40 mg
Caduet 5/10—amlodipine 5 mg + atorvastatin 10 mg
Caduet 5/20—amlodipine 5 mg + atorvastatin 20 mg

Caduet 5/80—amlodipine 5 mg + atorvastatin 80 mg
Caduet 10/10—amlodipine 10 mg + atorvastatin 10 mg
Caduet 10/20—amlodipine 10 mg + atorvastatin 20 mg
Caduet 10/40—amlodipine 10 mg + atorvastatin 40 mg
Caduet 10/80—amlodipine 10 mg + atorvastatin 80 mg
Cafergot—ergotamine 1 mg + caffeine 100 mg
Caltrate 600+D_3—vitamin D 800 IU + calcium 600 mg **(OTC)**
Caziant
  Phase I—desogestrel 0.1 mg + ethinyl estradiol 25 mcg
  Phase II—desogestrel 0.125 mg + ethinyl estradiol 25 mcg

© F.A. Davis Publishing

Phase III—desogestrel 0.15 mg + ethinyl estradiol 25 mcg
Cetacaine Topical Spray—14% benzocaine + 2% tetracaine + 2% butamben + 0.005% cetyl dimethyl ethyl ammonium bromide
Chateal—levonorgestrel 0.15 mg + ethinyl estradiol 30 mcg
Children's Tylenol Cold + Cough + Runny Nose Suspension—(per 5 mL) acetaminophen 160 mg + dextromethorphan 5 mg + chlorpheniramine 1 mg **(OTC)**
Children's Tylenol Cold + Cough + Sore Throat Suspension—(per 5 mL) acetaminophen 160 mg + dextromethorphan 5 mg **(OTC)**
Children's Tylenol Cold + Flu Suspension—(per 5 mL) acetaminophen 160 mg + dextromethorphan 5 mg + chlorpheniramine 1 mg + phenylephrine 2.5 mg **(OTC)**
Cimduo—lamivudine 300 mg + tenofovir disoproxil fumarate 300 mg
Cipro HC Otic Suspension—0.2% ciprofloxacin + 1% hydrocortisone
Ciprodex Otic Suspension—0.3% ciprofloxacin + 0.1% dexamethasone
Clarinex-D 12 Hour—desloratadine 2.5 mg + pseudoephedrine 120 mg
Clarinex-D 24 Hour—desloratadine 5 mg + pseudoephedrine 240 mg
Claritin-D 12 Hour—loratadine 5 mg + pseudoephedrine 120 mg **(OTC)**
Claritin-D 24-Hour—loratadine 10 mg + pseudoephedrine 240 mg **(OTC)**
Climara Pro Transdermal Patch (release per day)—estradiol 0.045 mg + levonorgestrel 0.015 mg
Col-Probenecid—probenecid 500 mg + colchicine 0.5 mg
Coly-Mycin S Otic Suspension—1% hydrocortisone + 0.33% neomycin base + 0.3% colistin + 0.05% thonzonium bromide
Colyte—PEG 3350 240 g + sodium sulfate 22.72 g + sodium bicarbonate 6.72 g + sodium chloride 5.84 g + potassium chloride 2.98 g
Combigan Ophthalmic Solution—0.2% brimonidine + 0.5% timolol
CombiPatch 0.05/0.14—estradiol 0.05 mg/day + norethindrone 0.14 mg/day
CombiPatch 0.05/0.25—estradiol 0.05 mg/day + norethindrone 0.25 mg/day
Combivent Respimat—(per actuation) ipratropium bromide 20 mcg + albuterol 100 mcg
Combivir—lamivudine 150 mg + zidovudine 300 mg
Complera—emtricitabine 200 mg + rilpivirine 25 mg + tenofovir disoproxil fumarate 300 mg
Consensi 2.5/200—amlodipine 2.5 mg + celecoxib 200 mg
Consensi 5/200—amlodipine 5 mg + celecoxib 200 mg
Consensi 10/200—amlodipine 10 mg + celecoxib 200 mg
Contac Cold & Flu Day Maximum Strength Caplets—phenylephrine 5 mg + acetaminophen 500 mg **(OTC)**
Contac Cold & Flu Night Cooling Relief Liquid—(per 15 mL) doxylamine 6.25 mg + dextromethorphan 15 mg + acetaminophen 500 mg **(OTC)**
Contac Cold & Flu Night Maximum Strength Caplets—chlorpheniramine 2 mg + phenylephrine 5 mg + acetaminophen 500 mg **(OTC)**
Coricidin HBP Chest Congestion & Cough Liquid Gels—dextromethorphan 10 mg + guaifenesin 200 mg **(OTC)**
Coricidin HBP Cold & Flu Tablets—acetaminophen 325 mg + chlorpheniramine 2 mg **(OTC)**
Coricidin HBP Cough & Cold Tablets—chlorpheniramine 4 mg + dextromethorphan 30 mg **(OTC)**
Coricidin HBP Maximum Strength Flu Tablets—acetaminophen 325 mg + chlorpheniramine 2 mg + dextromethorphan 15 mg **(OTC)**
Coricidin HBP Nighttime Multi-Symptom Cold Liquid—(per 15 mL) acetaminophen 325 mg + doxylamine 6.25 mg + dextromethorphan 15 mg **(OTC)**
Cortisporin Topical Cream—(per g) neomycin 3.5 mg + polymyxin B 10,000 units + 0.5% hydrocortisone
Corzide 40/5—nadolol 40 mg + bendroflumethiazide 5 mg
Corzide 80/5—nadolol 80 mg + bendroflumethiazide 5 mg
Cosopt Ophthalmic Solution—2% dorzolamide + 0.5% timolol
Coversyl Plus—perindopril 4 mg + indapamide 1.25 mg
Coversyl Plus HD—perindopril 8 mg + indapamide 2.5 mg

© F.A. Davis Publishing

Coversyl Plus LD—perindopril 2 mg + indapamide 0.625 mg
Creon—lipase 3000 units + amylase 15,000 units + protease 9,500 units
Creon—lipase 6000 units + amylase 30,000 units + protease 19,000 units
Creon—lipase 12,000 units + amylase 60,000 units + protease 38,000 units
Creon—lipase 24,000 units + amylase 120,00 units + protease 76,000 units

Lotrel 5/10—amlodipine 5 mg + benazepril 10 mg
Lotrel 5/20—amlodipine 5 mg + benazepril 20 mg
Lotrel 5/40—amlodipine 5 mg + benazepril 40 mg
Lotrel 10/20—amlodipine 10 mg + benazepril 20 mg
Lotrel 10/40—amlodipine 10 mg + benazepril 40 mg
Lotrisone Topical Cream/Lotion—0.05% betamethasone + 1% clotrimazole
Low-Ogestrel-28—norgestrel 0.3 mg + ethinyl estradiol 30 mcg
Lutera—levonorgestrel 0.1 mg + ethinyl estradiol 20 mcg
Malarone—atovaquone 250 mg + proguanil 100 mg
Malarone Pediatric—atovaquone 62.5 mg + proguanil 25 mg
Marlissa—levonorgestrel 0.15 mg + ethinyl estradiol 30 mcg
Maxitrol Ophthalmic Suspension/Ointment—(per g) neomycin 3.5 mg + 0.1% dexamethasone + polymyxin B 10,000 units
Maxzide—hydrochlorothiazide 50 mg + triamterene 75 mg
Maxzide-25—hydrochlorothiazide 25 mg + triamterene 37.5 mg
Micardis HCT 40/12.5—telmisartan 40 mg + hydrochlorothiazide 12.5 mg
Micardis HCT 80/12.5—telmisartan 80 mg + hydrochlorothiazide 12.5 mg
Micardis HCT 80/25—telmisartan 80 mg + hydrochlorothiazide 25 mg
Microgestin 1/20—norethindrone 1 mg + ethinyl estradiol 20 mcg
Microgestin 1.5/30—norethindrone 1.5 mg + ethinyl estradiol 30 mcg
Microgestin Fe 1/20—norethindrone 1 mg + ethinyl estradiol 20 mcg + ferrous fumarate 75 mg
Microgestin Fe 1.5/30—norethindrone 1.5 mg + ethinyl estradiol 30 mcg + ferrous fumarate 75 mg
Midol Caplets—acetaminophen 500 mg + pamabrom 25 mg **(OTC)**
Midol Complete Caplets—acetaminophen 500 mg + caffeine 60 mg + pyrilamine 15 mg **(OTC)**
Migergot Suppositories—ergotamine 2 mg + caffeine 100 mg
Minastrin 24 Fe—norethindrone 1 mg + ethinyl estradiol 20 mcg + ferrous fumarate 75 mg
Mono-Linyah—norgestimate 0.25 mg + ethinyl estradiol 35 mcg
Mononessa—norgestimate 0.25 mg + ethinyl estradiol 35 mcg
Motrin PM—ibuprofen 200 mg + diphenhydramine 38 mg **(OTC)**
Moviprep—PEG 3350 100 g + sodium sulfate 7.5 g + sodium chloride 2.69 g + potassium chloride 1.02 g
Mucinex Cold, Cough, & Sore Throat Liquid for Children—(per 10 mL) acetaminophen 325 mg + guaifenesin 200 mg + dextromethorphan 10 mg + phenylephrine 5 mg **(OTC)**

© F.A. Davis Publishing

Mucinex Congestion & Cough Liquid for Children— (per 5 mL) guaifenesin 100 mg + dextromethorphan 5 mg + phenylephrine 2.5 mg **(OTC)**
Mucinex Cough Liquid for Children— (per 5 mL) guaifenesin 100 mg + dextromethorphan 5 mg **(OTC)**
Mucinex Cough Mini-Melts— guaifenesin 100 mg + dextromethorphan 5 mg **(OTC)**
Mucinex D Maximum Strength Tablets— guaifenesin 1200 mg + pseudoephedrine 120 mg **(OTC)**
Mucinex D Tablets— guaifenesin 600 mg + pseudoephedrine 60 mg **(OTC)**
Mucinex DM Extended Release Bi-Layer Tablets— guaifenesin 600 mg + dextromethorphan 30 mg **(OTC)**
Mucinex DM Maximum Strength Tablets— guaifenesin 1200 mg + dextromethorphan 60 mg **(OTC)**
Mucinex DM Tablets— guaifenesin 600 mg + dextromethorphan 30 mg **(OTC)**
Mucinex Maximum Strength Fast-Max Cold, Flu, & Sore Throat Caplets/Liquid Gels— acetaminophen 325 mg + guaifenesin 200 mg + dextromethorphan 10 mg + phenylephrine 5 mg **(OTC)**
Mucinex Maximum Strength Fast-Max Cold, Flu, & Sore Throat Liquid— (per 20 mL) acetaminophen 650 mg + guaifenesin 400 mg + dextromethorphan 20 mg + phenylephrine 10 mg **(OTC)**
Mucinex Maximum Strength Fast-Max Congestion & Headache Caplets/Liquid Gels— acetaminophen 325 mg + guaifenesin 200 mg + phenylephrine 5 mg **(OTC)**
Mucinex Maximum Strength Fast-Max Congestion & Headache Liquid— (per 20 mL) acetaminophen 325 mg + guaifenesin 200 mg + phenylephrine 5 mg **(OTC)**
Mucinex Maximum Strength Fast-Max DM Max Liquid— (per 20 mL) guaifenesin 400 mg + dextromethorphan 20 mg **(OTC)**
Mucinex Maximum Strength Fast-Max Night Time Cold & Flu Caplets— acetaminophen 325 mg + diphenhydramine 25 mg + phenylephrine 5 mg **(OTC)**
Mucinex Maximum Strength Fast-Max Night Time Cold & Flu Liquid— (per 20 mL) acetaminophen 650 mg + diphenhydramine 25 mg + phenylephrine 10 mg **(OTC)**
Mucinex Maximum Strength Fast-Max Severe Congestion & Cough Caplets— guaifenesin 200 mg + dextromethorphan 10 mg + phenylephrine 5 mg **(OTC)**
Mucinex Maximum Strength Fast-Max Severe Congestion & Cough Liquid— (per 20 mL) guaifenesin 400 mg + dextromethorphan 20 mg + phenylephrine 10 mg **(OTC)**
Mucinex Maximum Strength Sinus-Max Night Time Congestion & Cough Liquid— (per 20 mL) acetaminophen 650 mg + diphenhydramine 25 mg + phenylephrine 10 mg **(OTC)**
Mucinex Maximum Strength Sinus-Max Pressure & Pain Caplets— acetaminophen 325 mg + guaifenesin 200 mg + phenylephrine 5 mg **(OTC)**
Mucinex Maximum Strength Sinus-Max Severe Congestion Relief Caplets/Liquid Gels— acetaminophen 325 mg + guaifenesin 200 mg + phenylephrine 5 mg **(OTC)**
Mucinex Maximum Strength Sinus-Max Severe Congestion Relief Liquid— (per 20 mL) acetaminophen 650 mg + guaifenesin 400 mg + phenylephrine 10 mg **(OTC)**
Mucinex Multi-Symptom Cold & Fever Liquid for Children— (per 10 mL) acetaminophen 325 mg + guaifenesin 200 mg + dextromethorphan 10 mg + phenylephrine 5 mg **(OTC)**
Mucinex Multi-Symptom Cold Liquid for Children— (per 5 mL) guaifenesin 100 mg + dextromethorphan 5 mg + phenylephrine 2.5 mg **(OTC)**
Mucinex Night Time Multi-Symptom Cold Liquid for Children— (per 10 mL) acetaminophen 325 mg + diphenhydramine 12.5 mg + phenylephrine 5 mg **(OTC)**
Mucinex Stuffy Nose & Cold Liquid for Children— (per 5 mL) guaifenesin 100 mg + phenylephrine 2.5 mg **(OTC)**
Myzilra
Phase I— levonorgestrel 0.05 mg + ethinyl estradiol 30 mcg
Phase II— levonorgestrel 0.075 mg + ethinyl estradiol 40 mcg
Phase III— levonorgestrel 0.125 mg + ethinyl estradiol 30 mcg

Stalevo 125—carbidopa 31.25 mg + entacapone 200 mg + levodopa 125 mg
Stalevo 150—carbidopa 37.5 mg + entacapone 200 mg + levodopa 150 mg
Stalevo 200—carbidopa 50 mg + entacapone 200 mg + levodopa 200 mg
Steglujan 5/100—ertugliflozin 5 mg + sitagliptin 100 mg
Steglujan 15/100—ertugliflozin 15 mg + sitagliptin 100 mg
Stiolto Respimat—(per actuation) tiotropium 2.5 mcg + olodaterol 2.5 mcg
Suboxone 2/0.5—buprenorphine 2 mg + naloxone 0.5 mg
Suboxone 4/1—buprenorphine 4 mg + naloxone 1 mg
Suboxone 8/2—buprenorphine 8 mg + naloxone 2 mg
Suboxone 12/3—buprenorphine 12 mg + naloxone 3 mg
Sudafed PE Cough + Cold Children's Liquid—(per 5 mL)phenylephrine 2.5 mg + dextromethorphan 5 mg **(OTC)**
Sudafed PE Head Congestion + Flu Severe Caplets—acetaminophen 325 mg + phenylephrine 5 mg + guaifenesin 100 mg + dextromethorphan 10 mg **(OTC)**
Sudafed PE Head Congestion + Mucus Caplets—phenylephrine 5 mg + guaifenesin 200 mg + acetaminophen 325 mg **(OTC)**
Sudafed PE Head Congestion + Pain Caplets—phenylephrine 10 mg + ibuprofen 200 mg **(OTC)**
Sudafed PE Pressure + Pain + Cough Liquid—(per 15 mL) phenylephrine 5 mg + dextromethorphan 10 mg + acetaminophen 325 mg **(OTC)**
Sudafed PE Sinus Pressure + Pain Caplets—acetaminophen 325 mg + phenylephrine 5 mg **(OTC)**
Sudafed Sinus 12–Hour Pressure + Pain Caplets—naproxen 220 mg + extended-release pseudoephedrine 120 mg **(OTC)**
Syeda—drospirenone 3 mg + ethinyl estradiol 30 mcg
Symbicort 80/4.5—(per actuation) budesonide 80 mcg + formoterol 4.5 mcg
Symbicort 160/4.5—(per actuation) budesonide 160 mcg + formoterol 4.5 mcg
Symbyax 3/25—olanzapine 3 mg + fluoxetine 25 mg
Symbyax 6/25—olanzapine 6 mg + fluoxetine 25 mg
Symbyax 6/50—olanzapine 6 mg + fluoxetine 50 mg
Symbyax 12/25—olanzapine 12 mg + fluoxetine 25 mg
Symbyax 12/50—olanzapine 12 mg + fluoxetine 50 mg
Symfi—efavirenz 600 mg + lamivudine 300 mg + tenofovir disoproxil fumarate 300 mg
Symfi Lo—efavirenz 400 mg + lamivudine 300 mg + tenofovir disoproxil fumarate 300 mg
Symtuza—darunavir 800 mg + cobicistat 150 mg + emtricitabine 200 mg + tenofovir alafenamide 10 mg
Synera Transdermal Patch—lidocaine 70 mg + tetracaine 70 mg
Synjardy 5/500—empagliflozin 5 mg + metformin 500 mg
Synjardy 5/1000—empagliflozin 5 mg + metformin 1000 mg

© F.A. Davis Publishing

Synjardy 12.5/500—empagliflozin 12.5 mg + metformin 500 mg
Synjardy 12.5/1000—empagliflozin 12.5 mg + metformin 1000 mg
Synjardy XR 5/1000—empagliflozin 5 mg + metformin extended-release 1000 mg
Synjardy XR 10/1000—empagliflozin 10 mg + metformin extended-release 1000 mg
Synjardy XR 12.5/1000—empagliflozin 12.5 mg + metformin extended-release 1000 mg
Synjardy XR 25/1000—empagliflozin 25 mg + metformin extended-release 1000 mg
Taclonex Topical Ointment/Suspension—0.005% calcipotriene + 0.064% betamethasone
Tarka 1/240—trandolapril 1 mg + sustained-release verapamil 240 mg
Tarka 2/180—trandolapril 2 mg + sustained-release verapamil 180 mg
Tarka 2/240—trandolapril 2 mg + sustained-release verapamil 240 mg
Tarka 4/240—trandolapril 4 mg + sustained-release verapamil 240 mg
Tekturna HCT 150/12.5—aliskiren 150 mg + hydrochlorothiazide 12.5 mg
Tekturna HCT 150/25—aliskiren 150 mg + hydrochlorothiazide 25 mg
Tekturna HCT 300/12.5—aliskiren 300 mg + hydrochlorothiazide 12.5 mg
Tekturna HCT 300/25—aliskiren 300 mg + hydrochlorothiazide 25 mg
Temixys—lamivudine 300 mg + tenofovir disoproxil fumarate 300 mg
Tenoretic 50/25—atenolol 50 mg + chlorthalidone 25 mg
Tenoretic 100/25—atenolol 100 mg + chlorthalidone 25 mg
TheraFlu Cough Relief Hot Liquid Powder—(per packet) guaifenesin 400 mg + dextromethorphan 20 mg **(OTC)**
TheraFlu Daytime Severe Cold & Cough Hot Liquid Powder—(per packet) acetaminophen 650 mg + phenylephrine 10 mg + dextromethorphan 20 mg **(OTC)**
TheraFlu Expressmax Daytime Severe Cold & Cough Caplets—acetaminophen 325 mg + phenylephrine 5 mg + dextromethorphan 10 mg **(OTC)**
TheraFlu Expressmax Daytime Severe Cold & Cough Liquid—(per 30 mL) acetaminophen 650 mg + phenylephrine 10 mg + dextromethorphan 20 mg **(OTC)**
TheraFlu Expressmax Flu, Cough & Sore Throat Liquid—(per 30 mL) acetaminophen 650 mg + phenylephrine 10 mg + diphenhydramine 25 mg **(OTC)**
TheraFlu Expressmax Nighttime Severe Cold & Cough Caplets—acetaminophen 325 mg + phenylephrine 5 mg + diphenhydramine 12.5 mg **(OTC)**
TheraFlu Expressmax Nighttime Severe Cold & Cough Liquid—(per 30 mL) acetaminophen 650 mg + phenylephrine 10 mg + diphenhydramine 25 mg **(OTC)**
TheraFlu Expressmax Severe Cold & Flu Caplets—acetaminophen 325 mg + phenylephrine 5 mg + dextromethorphan 10 mg + guaifenesin 200 mg **(OTC)**
TheraFlu Expressmax Severe Cold & Flu Liquid—(per 30 mL) acetaminophen 650 mg + phenylephrine 10 mg + dextromethorphan 20 mg + guaifenesin 400 mg **(OTC)**
TheraFlu Flu & Sore Throat Hot Liquid Powder—(per packet) acetaminophen 650 mg + phenylephrine 10 mg + pheniramine 20 mg **(OTC)**
TheraFlu Multi-Symptom Severe Cold Hot Liquid Powder—(per packet) acetaminophen 500 mg + phenylephrine 10 mg + dextromethorphan 20 mg **(OTC)**
TheraFlu Nighttime Multi-Symptom Severe Cold Hot Liquid Powder—(per packet) acetaminophen 500 mg + phenylephrine 10 mg + diphenhydramine 25 mg **(OTC)**
TheraFlu Nighttime Severe Cold & Cough Hot Liquid Powder—(per packet) acetaminophen 650 mg + phenylephrine 10 mg + diphenhydramine 25 mg **(OTC)**
Tilia Fe
- **Phase I**—norethindrone 1 mg + ethinyl estradiol 20 mcg
- **Phase II**—norethindrone 1 mg + ethinyl estradiol 30 mcg
- **Phase III**—norethindrone 1 mg + ethinyl estradiol 35 mcg
- **Phase IV**—ferrous fumarate 75 mg

TobraDex Ophthalmic Suspension/Ointment—0.1% dexamethasone + 0.3% tobramycin
TobraDex ST Ophthalmic Suspension—0.05% dexamethasone + 0.3% tobramycin
Trelegy Ellipta—(per inhalation) fluticasone 100 mcg + umeclidinium 62.5 mcg + vilanterol 25 mcg
Treximet 10/60—sumatriptan 10 mg + naproxen 60 mg
Treximet 85/500—sumatriptan 85 mg + naproxen 500 mg
