- **Y-Site Incompatibility:** allopurinol, amphotericin B lipid complex, amphotericin B liposome, cefepime, chloramphenicol, dantrolene, diazepam, doxorubicin liposomal, fluorouracil, furosemide, ganciclovir, ketorolac, methotrexate, micafungin, mitomycin, pantoprazole, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, rifampin, thiopental.

Patient/Family Teaching

- Advise patient to take medication as directed at the same time each day, even if feeling well. Take missed doses as soon as possible unless almost time for next dose; do not double doses. May need to be discontinued gradually.
- Advise patient to avoid large amounts (6–8 glasses of grapefruit juice/day) during therapy.
- Instruct patient on correct technique for monitoring pulse. Instruct patient to contact health care professional if heart rate is <50 bpm.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient on importance of maintaining good dental hygiene and seeing dentist frequently for teeth cleaning to prevent tenderness, bleeding, and gingival hyperplasia (gum enlargement).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of alcohol or OTC medications and herbal products, especially NSAIDs and cold preparations, without consulting health care professional.
- Advise patient to notify health care professional if rash, irregular heartbeat, dyspnea, swelling of hands and feet, pronounced dizziness, nausea, constipation, or hypotension occurs or if headache is severe or persistent.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Angina:** Instruct patient on concurrent nitrate or beta-blocker therapy to continue taking both medications as directed and to use SL nitroglycerin as needed for anginal attacks.
- Advise patient to contact health care professional if chest pain does not improve, worsens after therapy, or occurs with diaphoresis; if shortness of breath occurs; or if severe, persistent headache occurs.
- Caution patient to discuss exercise restrictions with health care professional before exertion.
- **Hypertension:** Encourage patient to comply with other interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management). Medication controls but does not cure hypertension.
- Instruct patient and family in proper technique for monitoring BP. Advise patient to take BP weekly and to report significant changes to health care professional.

Evaluation/Desired Outcomes

- Decrease in BP.
- Decrease in frequency and severity of anginal attacks.
- Decrease in need for nitrate therapy.
- Increase in activity tolerance and sense of well-being.
- Suppression and prevention of tachyarrhythmias.

dimethyl fumarate

(dye-**meth**-il **fue**-ma-rate)

Tecfidera

Classification

Therapeutic: anti-multiple sclerosis agents

Indications

Relapsing forms of multiple sclerosis, including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease.

Action

Activates nuclear factor (Nrf2) pathway involved in cellular response to oxidative stress. **Therapeutic Effects:** Decreased incidence/severity of relapse with decreased progression of lesions and disability.

Pharmacokinetics

Absorption: Following oral administration rapidly converted to active metabolite monomethyl fumarate (MMF) by enzymes in GI tract, blood, and tissue.

Distribution: Unknown.

Metabolism and Excretion: MMF is metabolized by the tricarboxylic acid (TCA) cycle. 60% eliminated via exhalation of CO_2. Minor amounts eliminated by renal (16%) and fecal (1%) routes, trace amounts in urine.

Half-life: *MMF*—1 hr.

TIME/ACTION PROFILE (effects on disability)

ROUTE	ONSET	PEAK	DURATION
PO	24 wk	60 wk	Unknown

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Serious infections (treatment may be withheld); Persistent lymphopenia (>6 mo) (↑ risk of PML); OB: Use only if potential maternal benefit justifies potential fetal risk; Lactation: Use cautiously if breast feeding; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

Derm: flushing, erythema, pruritus, rash. **GI:** HEPATOTOXICITY, abdominal pain, diarrhea, nausea, dyspepsia, ↑ liver enzymes, vomiting. **Hemat:** lymphopenia. **Neuro:** PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML). **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), INFECTION (bacterial, viral [especially herpes zoster], and fungal).

Interactions

Drug-Drug: None noted.

Route/Dosage

PO (Adults): 120 mg twice daily for one wk, then 240 mg twice daily.

Availability (generic available)

Extended-release capsules: 120 mg, 240 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of infections (fever, sore throat, herpes zoster, fungal and bacterial infections). Consider withholding medication until serious infections are resolved.
- Monitor for signs and symptoms of PML (progressive weakness on one side of body or clumsiness of limbs, disturbance of vision, changes in thinking, memory, and orientation causing confusion and personality changes). Symptoms are diverse, progress over days to weeks. Withhold medication and obtain diagnostic evaluation.
- Monitor for signs and symptoms of hypersensitivity reactions (difficulty breathing, urticaria, swelling of throat and tongue) during therapy.
- ***Lab Test Considerations:*** Monitor CBC with lymphocyte count before initiating therapy, after 6 mo, and every 6–12 mo thereafter. If lymphocyte count is $<0.5 \times 10^9$/L for >6 mo, may interrupt therapy. Consider withholding therapy for patients with serious infections.
- Assess serum aminotransferase, alkaline phosphatase, and total bilirubin levels prior to starting therapy and as clinically indicated. May cause ↑ hepatic transaminases. Discontinue therapy if clinically significant liver injury is suspected.
- May cause transient ↑ mean eosinophil count during first 2 mo of therapy.

Implementation

- **PO:** Administer 120 mg twice daily for 7 days then increase to maintenance dose of 240 mg twice daily without regard to food. For patients with difficulty tolerating maintenance dose, may temporarily decrease to 120 mg twice daily; resume maintenance dose within 4 wk. ***DNC:*** Swallow capsules whole; do not open, crush, chew, or sprinkle on food. Discard any unused capsules 90 days after opening.

Patient/Family Teaching

- Instruct patient to take dimethyl fumarate as directed. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Caution patient not to share medication with others, even if they have the same symptoms; may be dangerous.
- May cause flushing (warmth, redness, itching, and/or burning sensation). Usually begins after starting and resolves over time. Administration of dimethyl fumarate with food or administration of nonenteric coated aspirin (up to a dose of 325 mg) 30 min prior to dimethyl fumarate dosing may decrease incidence or severity of flushing.
- Advise patient to notify health care professional if signs or symptoms of infections or liver injury (fatigue, anorexia, right upper abdominal discomfort, dark urine, jaundice) occur.
- Advise patient to notify health care professional promptly if signs and symptoms of PML (new or worsening weakness; trouble using their arms or legs; or changes to thinking, eyesight, strength or balance) or hypersensitivity reactions (difficulty breathing, urticaria, swelling of throat and tongue) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise female patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Encourage patients who become pregnant to join the pregnancy registry by calling 1-866-810-1462 or visiting www.tecfiderapregnancyregistry.com.

Evaluation/Desired Outcomes

- Decreased incidence/severity of relapse of multiple sclerosis.

dinoprostone

(dye-noe-**prost**-one)

Cervidil, Prepidil

Classification

Therapeutic: cervical ripening agent

Pharmacologic: oxytocics, prostaglandins

Indications

Used to "ripen" the cervix in pregnancy at or near term when induction of labor is indicated.

© F.A. Davis Publishing

Action

Produces contractions similar to those occurring during labor at term by stimulating the myometrium (oxytocic effect). Initiates softening, effacement, and dilation of the cervix ("ripening"). Also stimulates GI smooth muscle. **Therapeutic Effects:** Initiation of labor.

Pharmacokinetics

Absorption: Rapidly absorbed.
Distribution: Unknown. Action is mostly local.
Metabolism and Excretion: Metabolized by enzymes in lung, kidneys, spleen, and liver tissue.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cervical ripening (gel)	rapid	30–45 min	unknown
Cervical ripening (insert)	rapid	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to prostaglandins or additives in the gel or suppository; Should be avoided in situations in which prolonged uterine contractions should be avoided, including: Previous cesarean section or uterine surgery; Cephalopelvic disproportion; Traumatic delivery or difficult labor; Multiparity (≥6 term pregnancies); Hyperactive or hypertonic uterus; Fetal distress (if delivery is not imminent); Unexplained vaginal bleeding; Placenta previa; Vasa previa; Active herpes genitalis; Obstetric emergency requiring surgical intervention; Situations in which vaginal delivery is contraindicated; Presence of acute pelvic inflammatory disease or ruptured membranes; Concurrent oxytocic therapy (wait for 30 min after removing insert before using oxytocin).
Use Cautiously in: Uterine scarring; Asthma; Hypotension; Cardiac disease; Adrenal disorders; Anemia; Jaundice; Diabetes mellitus; Epilepsy; Glaucoma; Pulmonary, renal, or hepatic disease; Multiparity (up to 5 previous term pregnancies); Women >30 yr, those with complications during pregnancy, and those with a gestational age >40 wk (↑ risk of disseminated intravascular coagulation).

Adverse Reactions/Side Effects

GU: uterine contractile abnormalities, warm feeling in vagina. **MS:** back pain. **Misc:** AMNIOTIC FLUID EMBOLISM, fever.

Interactions

Drug-Drug: Augments the effects of other **oxytocics**.

Route/Dosage

Cervical Ripening

Vag (Adults, Cervical): *Endocervical gel*—0.5 mg; if response is unfavorable, may repeat in 6 hr (not to exceed 1.5 mg/24 hr). *Vaginal insert*—one 10-mg insert.

Availability

Endocervical gel (Prepidil): 0.5 mg dinoprostone in 3 g of gel vehicle in a prefilled syringe with catheters.
Vaginal insert (Cervidil): 10 mg.

NURSING IMPLICATIONS

Assessment

- Monitor uterine activity, fetal status, and dilation and effacement of cervix continuously throughout therapy. Assess for hypertonus, sustained uterine contractility, and fetal distress. Insert should be removed at the onset of active labor.

Implementation

- **Vaginal Insert:** Place vaginal insert transversely in the posterior vaginal fornix immediately after removing from foil package. Warming of insert and sterile conditions are not required. Use vaginal insert only with a retrieval system. Use minimal amount of water-soluble lubricant during insertion; avoid excess because it may hamper release of dinoprostone from insert. Patient should remain supine for 2 hr after insertion, then may ambulate. Store vaginal inserts in freezer.
- Vaginal insert delivers dinoprostone 0.3 mg/hr over 12 hr. Remove insert at the onset of active labor, before amniotomy, or after 12 hr.
- Oxytocin should not be used during or <30 min after removal of insert.
- **Endocervical Gel:** Determine degree of effacement before insertion of the endocervical catheter. Do not administer above the level of the internal os. Use a 20-mm endocervical catheter if no effacement is present and a 10-mm catheter if the cervix is 50% effaced.
- Use caution to prevent contact of dinoprostone gel with skin. Wash hands thoroughly with soap and water after administration.
- Bring gel to room temperature just before administration. Do not force warming with external sources (water bath, microwave). Remove peel-off seal from end of syringe; then remove the protective end cap and insert end cap into plunger stopper assembly in barrel of syringe. Aseptically remove catheter from package. Firmly attach catheter hub to syringe tip; click is evidence of attachment. Fill catheter with sterile gel by pushing plunger to expel air from catheter before administration to patient. Gel is stable for 24 mo if refrigerated.

© F.A. Davis Publishing

- Patient should be in dorsal position with cervix visualized using a speculum. Introduce gel with catheter into cervical canal using sterile technique. Administer gel by gentle expulsion from syringe and then remove catheter. Do not attempt to administer small amount of gel remaining in syringe. Use syringe for only 1 patient; discard syringe, catheter, and unused package contents after using.
- Patient should remain supine for 15–30 min after administration to minimize leakage from cervical canal.
- Oxytocin may be administered 6–12 hr after desired response from dinoprostone gel. If no cervical/uterine response to initial dose of dinoprostone is obtained, repeat dose may be administered in 6 hr.

Patient/Family Teaching

- Explain purpose of medication and vaginal exams.
- **Cervical Ripening:** Inform patient that she may experience a warm feeling in her vagina during administration.
- Advise patient to notify health care professional if contractions become prolonged.

Evaluation/Desired Outcomes

- Cervical ripening and induction of labor.

BEERS

diphenhydrAMINE (oral, parenteral)

(dye-fen-**hye**-dra-meen)

Aller-Aide, Allerdryl, Allergy Formula, AllerMax, Allernix, Banophen, Benadryl Dye-Free Allergy, Benadryl Allergy, Benadryl, Benylin, Calmex, Compoz, Compoz Nighttime Sleep Aid, Dimetane Allergy, Diphen AF, Diphen Cough, Diphenhist, Dormex, Dormiphen, Genahist, 40 Winks, Hyrexin-50, Insomnal, Maximum Strength Nytol, Maximum Strength Sleepinal, Midol PM, Miles Nervine, Nadryl, Nighttime Sleep Aid, Nytol, Scot-Tussin Allergy DM, Siladril, Silphen, Sleep-Eze 3, Sleepwell 2-night, Sominex, Snooze Fast, Sominex, Tusstat, Twilite, Unisom Nighttime Sleep-Aid

Classification

Therapeutic: allergy, cold, and cough remedies, antihistamines, antitussives

Indications

Relief of allergic symptoms caused by histamine release including: Anaphylaxis, Seasonal and perennial allergic rhinitis, Allergic dermatoses. Parkinson's disease and dystonic reactions from medications. Mild nighttime sedation. Prevention of motion sickness. Antitussive (syrup only).

Action

Antagonizes the effects of histamine at H_1-receptor sites; does not bind to or inactivate histamine. Significant CNS depressant and anticholinergic properties. **Therapeutic Effects:** Decreased symptoms of histamine excess (sneezing, rhinorrhea, nasal and ocular pruritus, ocular tearing and redness, urticaria). Relief of acute dystonic reactions. Prevention of motion sickness. Suppression of cough.

Pharmacokinetics

Absorption: Well absorbed after oral or IM administration but 40–60% of an oral dose reaches systemic circulation due to first-pass metabolism.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Metabolism and Excretion: 95% metabolized by the liver.
Half-life: 2.4–7 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	15–60 min	2–4 hr	4–8 hr
IM	20–30 min	2–4 hr	4–8 hr
IV	rapid	unknown	4–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute attacks of asthma; Lactation: Lactation; Known alcohol intolerance (some liquid products).
Use Cautiously in: Severe liver disease; Angle-closure glaucoma; Seizure disorders; Prostatic hyperplasia; Peptic ulcer; May cause paradoxical excitation in young children; Hyperthyroidism; OB: Safety not established; Geri: Appears on *Beers list*. Geriatric patients are more susceptible to adverse drug reactions and anticholinergic effects (delirium, acute confusion, dizziness, dry mouth, blurred vision, urinary retention, constipation, tachycardia); dose ↓ or nonanticholinergic antihistamine recommended.

Adverse Reactions/Side Effects

EENT: blurred vision, tinnitus. **CV:** hypotension, palpitations. **GI:** anorexia, dry mouth, constipation, nausea. **GU:** dysuria, frequency, urinary retention. **Derm:** photosensitivity. **Neuro:** drowsiness, dizziness, headache, paradoxical excitation (increased in children). **Resp:** chest tightness, thickened bronchial secretions, wheezing. **Local:** pain at IM site.

Interactions

Drug-Drug: ↑ risk of CNS depression with other **antihistamines**, **alcohol**, **opioid analgesics**, and **sedative/hypnotics**. ↑ anticholinergic effects with **tricyclic antidepressants**, **quinidine**, or

© F.A. Davis Publishing

disopyramide. **MAO inhibitors** intensify and prolong the anticholinergic effects of antihistamines.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

PO (Adults and Children >12 yr): *Antihistaminic/antiemetic/antivertiginic*—25–50 mg every 4–6 hr, not to exceed 300 mg/day. *Antitussive*—25 mg every 4 hr as needed, not to exceed 150 mg/day. *Antidyskinetic*—25–50 mg every 4 hr (not to exceed 400 mg/day). *Sedative/hypnotic*—50 mg 20–30 min before bedtime.

PO (Children 6–12 yr): *Antihistaminic/antiemetic/antivertiginic*—12.5–25 mg every 4–6 hr (not to exceed 150 mg/day). *Antidyskinetic*—1–1.5 mg/kg every 6–8 hr as needed (not to exceed 300 mg/day). *Antitussive*—12.5 mg every 4 hr (not to exceed 75 mg/day). *Sedative/hypnotic*—1 mg/kg/dose 20–30 min before bedtime (not to exceed 50 mg).

PO (Children 2–6 yr): *Antihistaminic/antiemetic/antivertiginic*—6.25–12.5 mg every 4–6 hr (not to exceed 37.5 mg/day). *Antidyskinetic*—1–1.5 mg/kg every 4–6 hr as needed (not to exceed 300 mg/day). *Antitussive*—6.25 mg every 4 hr (not to exceed 37.5 mg/24 hr). *Sedative/hypnotic*—1 mg/kg/dose 20–30 min before bedtime (not to exceed 50 mg).

IM, IV (Adults): 25–50 mg every 4 hr as needed (may need up to 100-mg dose, not to exceed 400 mg/day).

IM, IV (Children): 1.25 mg/kg (37.5 mg/m^2) 4 times daily (not to exceed 300 mg/day).

Topical (Adults and Children ≥2 yr): Apply to affected area up to 3–4 times daily.

Availability (generic available)

Capsules: 25 mg$^{Rx, OTC}$, 50 mg$^{Rx, OTC}$. **Tablets:** 12.5 mg$^{Rx, OTC}$, 25 mg$^{Rx, OTC}$, 50 mg$^{Rx, OTC}$. **Chewable tablets (grape flavor):** 25 mg$^{Rx, OTC}$. **Orally disintegrating strips (cherry and grape flavor):** 12.5 mg$^{Rx, OTC}$, 25 mg^{OTC}. **Orally disintegrating tablets:** 12.5 mg^{OTC}, 25 mg^{OTC}, 50 mg$^{Rx, OTC}$. **Elixir (cherry and other flavors):** 12.5 mg/5 mL$^{Rx, OTC}$. **Syrup (cherry and raspberry flavor):** 6.25 mg/5 mL$^{Rx, OTC}$, 12.5 mg/5 mL$^{Rx, OTC}$. **Cream:** 1%$^{Rx, OTC}$, 2%$^{Rx, OTC}$. **Topical gel:** 2%^{OTC}. **Topical spray:** 2%^{OTC}. **Topical stick:** 2%^{OTC}. **Injection:** 50 mg/mL. ***In combination with:*** analgesics, decongestants, and expectorants, in OTC pain, sleep, cough, and cold preparations. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Diphenhydramine has multiple uses. Determine why the medication was ordered and assess symptoms that apply to the individual patient. Geri: Appears in the *Beers list.* May cause sedation and confusion due to increased sensitivity to anticholinergic effects. Monitor carefully, assess for confusion, delirium, other anticholinergic side effects and fall risk. Institute measures to prevent falls.
- **Prevention and Treatment of Anaphylaxis:** Assess for urticaria and for patency of airway.
- **Allergic Rhinitis:** Assess degree of nasal stuffiness, rhinorrhea, and sneezing.
- **Parkinsonism and Extrapyramidal Reactions:** Assess movement disorder before and after administration.
- **Insomnia:** Assess sleep patterns.
- **Motion Sickness:** Assess nausea, vomiting, bowel sounds, and abdominal pain.
- **Cough Suppressant:** Assess frequency and nature of cough, lung sounds, and amount and type of sputum produced. Unless contraindicated, maintain fluid intake of 1500–2000 mL daily to decrease viscosity of bronchial secretions.
- **Pruritus:** Assess degree of itching, skin rash, and inflammation.
- ***Lab Test Considerations:*** May ↓ skin response to allergy tests. Discontinue 4 days before skin testing.

Implementation

- Do not confuse Benadryl with benazepril. Do not confuse diphenhydramine with dimenhydrinate.
- When used for insomnia, administer 20 min before bedtime and schedule activities to minimize interruption of sleep.
- When used for prophylaxis of motion sickness, administer at least 30 min and preferably 1–2 hr before exposure to conditions that may precipitate motion sickness.
- **PO:** Administer with meals or milk to minimize GI irritation. Capsule may be emptied and contents taken with water or food.
- Orally disintegrating tablets and strips should be left in the package until use. Remove from the blister pouch. Do not push tablet through the blister; peel open the blister pack with dry hands and place tablet on tongue. Tablet will dissolve rapidly and be swallowed with saliva. No liquid is needed to take the orally disintegrating tablet.
- **IM:** Administer 50 mg/mL into well-developed muscle. Avoid subcut injections.

IV Administration

- **IV Push:** ***Dilution:*** May be further diluted in 0.9% NaCl, 0.45% NaCl, D5W, D10W, dextrose/saline combinations, Ringer's solution, LR, and dextrose/Ringer's combinations. ***Concentration:*** 25 mg/mL. ***Rate:*** Infuse at a rate not to exceed 25 mg/min.
- **Y-Site Compatibility:** acetaminophen, aldesleukin, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, amiodarone, amphotericin B lipid complex, amphotericin B liposome, amsacrine, ani-

dulafungin, argatroban, ascorbic acid, atracurium, atropine, azithromycin, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, ceftaroline, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, folic acid, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketamine, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, metaraminol, methotrexate, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, mitomycin, mitoxantrone, morphine, moxifloxacin, multiple vitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxime, quinipristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, aminophylline, amphotericin B deoxycholate, ampicillin, azathioprine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, dantrolene, dexamethasone, diazepam, diazoxide, fluorouracil, foscarnet, furosemide, ganciclovir, indomethacin, insulin, ketorolac, methylprednisolone, milrinone, nitroprusside, oxacillin, pantoprazole, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, trimethoprim/sulfamethoxazole.
- **Topical:** Apply a thin coat and rub gently until absorbed. Only for topical use; avoid ingestion.

Patient/Family Teaching

- Instruct patient to take medication as directed; do not exceed recommended amount. Caution patient not to use oral OTC diphenhydramine products with any other product containing diphenhydramine, including products used topically.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- May cause dry mouth. Inform patient that frequent oral rinses, good oral hygiene, and sugarless gum or candy may minimize this effect. Notify health care professional if dry mouth persists for more than 2 wk.
- Teach sleep hygiene techniques (dark room, quiet, bedtime ritual, limit daytime napping, avoidance of nicotine and caffeine) to patients taking diphenhydramine to aid sleep.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Caution patient to avoid use of alcohol and other CNS depressants concurrently with this medication.
- Pedi: Can cause excitation in children. Caution parents or caregivers about proper dose calculation; overdose, especially in infants and children, can cause hallucinations, seizures, or death. Caution parents to avoid OTC cough and cold products while breast feeding or to children <4 yr.
- Geri: Instruct older adults to avoid OTC products that contain diphenhydramine due to increased sensitivity to anticholinergic effects and potential for adverse reactions related to these effects.
- Advise patients taking diphenhydramine in OTC preparations to notify health care professional if symptoms worsen or persist for more than 7 days.

Evaluation/Desired Outcomes

- Prevention of, or decreased urticaria in, anaphylaxis or other allergic reactions.
- Decreased dyskinesia in parkinsonism and extrapyramidal reactions.
- Sedation when used as a sedative/hypnotic.
- Prevention of or decrease in nausea and vomiting caused by motion sickness.
- Decrease in frequency and intensity of cough without eliminating cough reflex.

DIURETICS (POTASSIUM-SPARING)

aMILoride (a-**mill**-oh-ride)
Midamor

spironolactone
(speer-oh-no-**lak**-tone)
Aldactone, Carospir

triamterene (trye-**am**-ter-een)
Dyrenium

Classification
Therapeutic: diuretics
Pharmacologic: potassium-sparing diuretics

© F.A. Davis Publishing

Indications

Counteract potassium loss caused by other diuretics. Used with other agents (thiazides) to treat edema or hypertension. Primary hyperaldosteronism (spironolactone only). New York Heart Association (NYHA) class III-IV HF (spironolactone only). **Unlabeled Use:** Acne (spironolactone only). Hormone therapy for transgender females (male-to-female) (spironolactone only).

Action

Inhibition of sodium reabsorption in the kidney while saving potassium and hydrogen ions (spironolactone achieves this effect by antagonizing aldosterone receptors). **Therapeutic Effects:** Weak diuretic and antihypertensive response when compared with other diuretics. Conservation of potassium. Improved survival in patients with NYHA class II-IV HF.

Pharmacokinetics

Absorption: *Amiloride*—30–90% absorbed; *spironolactone*—>90% absorbed; oral suspension results in 15–37% higher serum concentrations compared to tablets. *triamterene*—30–70% absorbed. **Distribution:** *Amiloride* and *triamterene*—widely distributed; all cross the placenta and enter breast milk. **Protein Binding:** *Spironolactone* >90%. **Metabolism and Excretion:** *Amiloride*—50% eliminated unchanged in urine, 40% excreted in the feces; *spironolactone*—converted by the liver to its active diuretic compound (canrenone); *triamterene*—80% metabolized by the liver, some excretion of unchanged drug. **Half-life:** *Amiloride*—6–9 hr; *spironolactone*—78–84 min (spironolactone); 13–24 hr (canrenone); *triamterene*—1.7–2.5 hr.

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
Amiloride	2 hr†	6–10 hr†	24 hr†
Spironolactone	unknown	2–3 days‡	2–3 days‡
Triamterene	2–4 hr†	1–several days‡	7–9 hr†

†Single dose.
‡Multiple doses.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hyperkalemia; Anuria; Acute renal insufficiency; Significant renal impairment (CCr ≤30 mL/min or SCr >2.5 mg/dL). **Use Cautiously in:** Hepatic impairment; Diabetes (↑ risk of hyperkalemia); History of gout or kidney stones (triamterene only); Concurrent use of potassium supplements or potassium-containing salt substitutes; OB, Lactation, Pedi: Safety not established; Geri: Presence of age-related renal dysfunction may lead to ↑ risk of hyperkalemia.

Adverse Reactions/Side Effects

CV: arrhythmias. **GI:** *amiloride*—constipation, nausea, vomiting. **GU:** *spironolactone*—erectile dysfunction; *triamterene*—nephrolithiasis. **Derm:** STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN); *triamterene*—photosensitivity. **Endo:** *spironolactone*—breast tenderness, gynecomastia, irregular menses, voice deepening. **F and E:** hyperkalemia, hyponatremia. **Hemat:** *spironolactone*—agranulocytosis; *triamterene*—hemolytic anemia, thrombocytopenia. **MS:** muscle cramps. **Neuro:** dizziness; *spironolactone only*, clumsiness, headache. **Misc:** allergic reactions.

Interactions

Drug-Drug: ↑ hypotension with acute ingestion of **alcohol**, other **antihypertensives**, or **nitrates**. Use with **ACE inhibitors**, **angiotensin II receptor antagonists**, **NSAIDs**, **potassium supplements**, **cyclosporine**, or **tacrolimus** ↑ risk of hyperkalemia. May ↑ levels/risk of toxicity from **lithium**. Effectiveness may be ↓ by **NSAIDs**. Spironolactone may ↑ levels and risk of toxicity of **digoxin**; monitor levels closely. Spironolactone may ↑ levels and risk of toxicity of **CYP2C8 substrates**, including **repaglinide**. Spironolactone may ↑ levels and risk of toxicity of **CYP3A4/5 substrates**, including **midazolam**, **sirolimus**, or **tacrolimus**.

Route/Dosage

Amiloride

PO (Adults): *HTN*—5–10 mg/day (up to 20 mg). **PO (Children 1–17 yr):** 0.4–0.625 mg/kg/day (maximum = 20 mg/day) (unlabeled use).

Spironolactone

Oral suspension is not therapeutically equivalent to tablets. If patient requires a dose >100 mg, use tablets, NOT suspension. Suspension doses >100 mg may result in higher than expected spironolactone concentrations.

PO (Adults): *Edema*—Tablets: 25–200 mg/day as a single dose or 2 divided doses. Suspension: 75 mg/day as a single dose or 2 divided doses. *HTN*—Tablets: 25–100 mg/day as a single dose or 2 divided doses; may titrate dose every 2 wk (max dose = 100 mg/day). Suspension: 20–75 mg/day as a single dose or 2 divided doses; may titrate dose every 2 wk (max dose = 75 mg/day). *Diuretic-induced hypokalemia*—25–100 mg/day in 1–2 divided doses. *Diagnosis of primary hyperaldosteronism*—100–400 mg/day in 1–2 divided doses. *HF with serum potassium ≤5 mEq/L and eGFR >50 mL/min/1.73 m²*—Tablet: 25 mg once daily; may then ↑ to 50 mg once daily; if develop hyper-

© F.A. Davis Publishing

kalemia with 25 mg once daily, ↓ dose to 25 mg every other day. Suspension: 20 mg once daily; may then ↑ to 37.5 mg once daily; if develop hyperkalemia with 20 mg once daily, ↓ dose to 20 mg every other day. *HF with serum potassium ≤5 mEq/L and eGFR 30–50 mL/min/1.73 m²*—Tablets: 25 mg every other day. Suspension: 10 mg once daily. *Acne (off-label use)*—50–200 mg once daily. *Hormone therapy for transgender females (off-label use)*—25 mg once or twice daily in combination with other appropriate agents. Increase at 1-wk intervals based on serum testosterone levels and tolerability to a usual dose of 50–150 mg twice daily (max dose = 200 mg twice daily).
PO (Children 1–17 yr): *Diuretic, HTN*—1 mg/kg/day in 1–2 divided doses (should not exceed 3.3 mg/kg/day or 100 mg/day) (unlabeled use). *Diagnosis of primary hyperaldosteronism*—125–375 mg/m²/day in 1–2 divided doses (unlabeled use).
PO (Neonates): 1–3 mg/kg/day in 1–2 divided doses.

Triamterene

PO (Adults): *HTN*—100 mg twice daily (not to exceed 300 mg/day; lower doses in combination products).
PO (Children): *HTN*—1–2 mg/kg/day in 2 divided doses; should not exceed 4 mg/kg/day or 300 mg/day.

Availability

Amiloride (generic available)

Tablets: 5 mg. **Cost:** *Generic*—$59.00/100.

Spironolactone (generic available)

Tablets: 25 mg, 50 mg, 100 mg. **Cost:** *Generic*—25 mg $10.83/100, 50 mg $23.97/100, 100 mg $24.87/100. **Oral suspension (banana-flavor):** 25 mg/5 mL. ***In combination with:*** hydrochlorothiazide (Aldactazide). See Appendix N.

Triamterene

Capsules: 50 mg, 100 mg. **Cost:** 50 mg $404.14/100, 100 mg $372.44/100. ***In combination with:*** hydrochlorothiazide (Dyazide, Maxzide). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor intake and output ratios and daily weight during therapy.
- If medication is given as an adjunct to antihypertensive therapy, monitor BP before administering.
- Assess patient frequently for development of hyperkalemia (fatigue, muscle weakness, paresthesia, confusion, dyspnea, ECG changes, cardiac arrhythmias). Patients who have diabetes mellitus or kidney disease and geriatric patients are at increased risk of developing these symptoms.
- Periodic ECGs are recommended in patients receiving prolonged therapy.
- Assess patient for skin rash frequently during therapy. Discontinue diuretic at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- ***Lab Test Considerations:*** Serum potassium levels should be evaluated before and routinely during therapy. Hold drug and notify health care professional if patient becomes hyperkalemic.
- Monitor BUN, serum creatinine, and electrolytes before and periodically during therapy. May cause ↑ serum magnesium, BUN, creatinine, potassium, and urinary calcium excretion levels. May also cause ↓ sodium levels.
- Discontinue potassium-sparing diuretics 3 days before a glucose tolerance test because of risk of severe hyperkalemia.
- *Spironolactone* may cause false ↑ of plasma cortisol concentrations. Spironolactone should be withdrawn 4–7 days before test.
- Monitor platelet count and total and differential leukocyte count periodically during therapy in patients taking *triamterene*.

Implementation

- Do not confuse amiloride with amlodipine.
- *Carospir* is not therapeutically equivalent to *Aldactone*; do not interchange.
- **PO:** Administer in AM to avoid interrupting sleep pattern.
- Administer with food or milk to minimize gastric irritation and to increase bioavailability. Administer with or without food, but take consistently with respect to food.
- *Triamterene* capsules may be opened and contents mixed with food or fluids for patients with difficulty swallowing.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- Caution patient to avoid salt substitutes and foods that contain high levels of potassium or sodium unless prescribed by health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications concurrently with this therapy, especially OTC decongestants, cough or cold preparations, or appetite suppressants due to potential for increased BP.
- Advise patients taking *triamterene* to use sunscreen and protective clothing to prevent photosensitivity reactions.

© F.A. Davis Publishing

- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to notify health care professional if rash, muscle weakness or cramps; fatigue; or severe nausea, vomiting, or diarrhea occurs.
- Inform male patients that spironolactone may cause gynecomastia; may require dose decrease. Usually reversible.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the need for follow-up exams to monitor progress.
- **Hypertension:** Reinforce need to continue additional therapies for hypertension (weight loss, restricted sodium intake, stress reduction, moderation of alcohol intake, regular exercise, and cessation of smoking). Medication helps control but does not cure hypertension.
- Teach patient and family the correct technique for checking BP weekly.

Evaluation/Desired Outcomes

- Increase in diuresis and decrease in edema while maintaining serum potassium level in an acceptable range.
- Decrease in BP.
- Prevention of hypokalemia in patients taking diuretics.
- Treatment of hyperaldosteronism.
- Improved survival in patients with NYHA class II-IV HF.
- Reduced male characteristics in Male-to-Female (MtF) transgender patients.

DIURETICS (THIAZIDE)

chlorothiazide (klor-oh-**thye**-a-zide)
Diuril

chlorthalidone (thiazide–like) (klor-**thal**-i-doan)
~~Thalitone~~

hydroCHLOROthiazide (hye-droe-klor-oh-**thye**-a-zide)
Microzide, Urozide

Classification
Therapeutic: antihypertensives, diuretics
Pharmacologic: thiazide diuretics

Indications

Management of mild to moderate hypertension. Treatment of edema associated with: HF, Renal dysfunction, Cirrhosis, Glucocorticoid therapy, Estrogen therapy.

Action

Increases excretion of sodium and water by inhibiting sodium reabsorption in the distal tubule. Promotes excretion of chloride, potassium, magnesium, and bicarbonate. May produce arteriolar dilation. **Therapeutic Effects:** Lowering of BP in hypertensive patients and diuresis with mobilization of edema.

Pharmacokinetics

Absorption: All are rapidly absorbed after oral administration.
Distribution: All cross the placenta and enter breast milk.
Metabolism and Excretion: All are excreted mainly unchanged by the kidneys.
Half-life: *Chlorothiazide*—1–2 hr; *chlorthalidone*—35–50 hr; *hydrochlorothiazide*—6–15 hr.

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
Chlorothiazide PO	2 hr	4 hr	6–12 hr
Chlorothiazide IV	15 min	30 min	2 hr
Chlorthalidone	2 hr	2 hr	48–72 hr
Hydrochlorothiazide†	2 hr	3–6 hr	6–12 hr

†Onset of antihypertensive effect is 3–4 days and does not become maximal for 7–14 days of dosing.

Contraindications/Precautions

Contraindicated in: Hypersensitivity (cross-sensitivity with other thiazides or sulfonamides may exist); Some products contain tartrazine and should be avoided in patients with known intolerance; Anuria; Lactation: Lactation.
Use Cautiously in: Renal or hepatic impairment; OB: Pregnancy (jaundice or thrombocytopenia may be seen in the newborn).

Adverse Reactions/Side Effects

CV: hypotension. **Derm:** SKIN CANCER (non-melanoma), STEVENS-JOHNSON SYNDROME, photosensitivity, rash. **EENT:** acute angle-closure glaucoma (hydrochlorothiazide), acute myopia (hydrochlorothiazide). **Endo:** hyperglycemia. **F and E:** hypokalemia, dehydration, hypercalcemia, hypochloremic alkalosis, hypomagnesemia, hyponatremia, hypophosphatemia, hypovolemia. **GI:** anorexia, cramping, hepatitis, nausea, pancreatitis, vomiting. **Hemat:** thrombocytopenia. **Metab:** hypercholesterolemia, hyperuricemia. **MS:** muscle cramps. **Neuro:** dizziness, drowsiness, lethargy, weakness.

© F.A. Davis Publishing

Interactions

Drug-Drug: Additive hypotension with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Additive hypokalemia with **corticosteroids**, **amphotericin B**, or **piperacillin/tazobactam**. May ↑ **lithium** levels. **Cholestyramine** or **colestipol** ↓ absorption. Hypokalemia ↑ risk of **digoxin** toxicity. **NSAIDs** may ↓ effectiveness.

Route/Dosage

When used as a diuretic in adults, generally given daily, but may be given every other day or 2–3 days/wk.

Chlorothiazide

PO (Adults): 125 mg–2 g/day in 1–2 divided doses.
PO (Children >6 mos): 20 mg/kg/day in 1–2 divided doses (maximum dose = 1 g/day).
PO (Neonates ≤6 mo): 10–20 mg/kg every 12 hr (maximum dose = 375 mg/day).
IV (Adults): 500 mg–1 g/day in 1–2 divided doses.
IV (Children >6 mos): 4 mg/kg/day in 1–2 divided doses (maximum dose = 20 mg/kg/day) (unlabeled use).
IV (Neonates ≤6 mo): 1–4 mg/kg every 12 hr (maximum dose = 20 mg/kg/day) (unlabeled use).

Chlorthalidone

PO (Adults): 12.5–100 mg once daily (daily doses above 25 mg are associated with greater likelihood of electrolyte abnormalities).

Hydrochlorothiazide

PO (Adults): 12.5–100 mg/day in 1–2 divided doses (up to 200 mg/day); not to exceed 50 mg/day for hypertension; daily doses above 25 mg are associated with greater likelihood of electrolyte abnormalities.
PO (Children >6 mo): 1–3 mg/kg/day in 2 divided doses (not to exceed 37.5 mg/day).
PO (Children <6 mo): 1–3 mg/kg/day in 2 divided doses.

Availability

Chlorothiazide (generic available)

Oral suspension: 250 mg/5 mL. **Cost:** *Generic*—$63.36/237 mL. **Powder for injection:** 500 mg/vial. **Tablets:** 250 mg, 500 mg. **Cost:** *Generic*—250 mg $13.08/100, 500 mg $25.25/100.

Chlorthalidone (generic available)

Tablets: 25 mg, 50 mg. **Cost:** *Generic*—25 mg $55.17/100, 50 mg $68.04/100, 100 mg $101.25/100. ***In combination with:*** atenolol (Tenoretic), clonidine (Clorpres). See Appendix N.

Hydrochlorothiazide (generic available)

Tablets: 12.5 mg, 25 mg, 50 mg. **Cost:** *Generic*—12.5 mg $82.43/100, 25 mg $8.48/100, 50 mg $16.45/100. **Capsules:** 12.5 mg. ***In combination with:*** numerous antihypertensive agents. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor BP, intake, output, and daily weight and assess feet, legs, and sacral area for edema daily.
- Assess patient, especially if taking digoxin, for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Notify health care professional if these signs of electrolyte imbalance occur. Patients taking digoxin are at risk of digoxin toxicity because of the potassium-depleting effect of the diuretic.
- If hypokalemia occurs, consideration may be given to potassium supplements or ↓ dose of diuretic.
- Assess patient for allergy to sulfonamides. Assess patient for skin rash frequently during therapy. Discontinue diuretic at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- **Hypertension:** Monitor BP before and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- ***Lab Test Considerations:*** Monitor electrolytes (especially potassium), blood glucose, BUN, serum creatinine, and uric acid levels before and periodically during therapy.
- May cause ↑ in serum and urine glucose in diabetic patients.
- May cause ↑ in serum bilirubin, calcium, creatinine, and uric acid, and ↓ in serum magnesium, potassium, sodium, and urinary calcium concentrations.
- May cause ↑ serum cholesterol, low-density lipoprotein, and triglyceride concentrations.

Implementation

- Do not confuse hydrochlorothiazide with hydroxyzine or hydralazine.
- Administer in the morning to prevent disruption of sleep cycle.
- Intermittent dose schedule may be used for continued control of edema.
- **PO:** May give with food or milk to minimize GI irritation. Tablets may be crushed and mixed with fluid to facilitate swallowing.

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute chlorothiazide with at least 18 mL of sterile water for injection. Shake to dissolve. Stable for 24 hr at room temperature. ***Dilution:*** May be given undiluted or may be diluted further with D5W or 0.9% NaCl. ***Concentration:*** Up to 28 mg/mL. ***Rate:*** If administered undiluted may give by IV push over 3–5 min. If diluted, may infuse over 30 min.
- **Y-Site Compatibility:** alprostadil, aminophylline, atropine, calcium chloride, calcium gluconate, chloramphenicol, cyclophosphamide, dexamethasone, digoxin, epinephrine, erythromycin, furosemide, gentamicin, heparin, hydrocortisone sodium succinate, isoproterenol, lidocaine, methohexital,

© F.A. Davis Publishing

norepinephrine, oxytocin, penicillin G, phenobarbital, phentolamine, potassium chloride, procainamide, propranolol, succinylcholine.
- **Y-Site Incompatibility:** chlorpromazine, hydralazine, prochlorperazine, promethazine.

Patient/Family Teaching
- Instruct patient to take this medication at the same time each day. Take missed dose as soon as remembered but not just before next dose is due. Do not double doses.
- Instruct patient to monitor weight biweekly and notify health care professional of significant changes.
- Caution patient to change positions slowly to minimize orthostatic hypotension. This may be potentiated by alcohol.
- Advise patient to use sunscreen and protective clothing to prevent photosensitivity reactions. Advise patient of importance of regular skin cancer screenings.
- Instruct patient to discuss dietary potassium requirements with health care professional (see Appendix J).
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to report rash, muscle weakness, cramps, nausea, vomiting, diarrhea, or dizziness to health care professional.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of routine follow-up exams.
- **Hypertension:** Advise patient to continue taking the medication even if feeling better. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).
- Instruct patient and family in correct technique for monitoring weekly BP.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially cough or cold preparations.

Evaluation/Desired Outcomes
- Decrease in BP.
- Increase in urine output.
- Decrease in edema.

divalproex sodium, See VALPROATES.

HIGH ALERT

DOBUTamine
(doe-**byoo**-ta-meen)
~~Dobutrex~~

Classification
Therapeutic: inotropics
Pharmacologic: adrenergics

D

Indications
Short-term (<48 hr) management of heart failure caused by depressed contractility from organic heart disease or surgical procedures.

Action
Stimulates $beta_1$ (myocardial)-adrenergic receptors with relatively minor effect on heart rate or peripheral blood vessels. **Therapeutic Effects:** Increased cardiac output without significantly increased heart rate.

Pharmacokinetics
Absorption: Administered by IV infusion only, resulting in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Metabolized by the liver and other tissues.
Half-life: 2 min.

TIME/ACTION PROFILE (inotropic effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	10 min	brief (min)

Contraindications/Precautions
Contraindicated in: Hypersensitivity to dobutamine or bisulfites; Idiopathic hypertrophic subaortic stenosis.
Use Cautiously in: History of hypertension (↑ risk of exaggerated pressor response); MI; Atrial fibrillation (pretreatment with digoxin recommended); History of ventricular atopic activity (may be exacerbated); Hypovolemia (correct before administration); OB: Safety not established.

Adverse Reactions/Side Effects
CV: hypertension, increased heart rate, premature ventricular contractions, angina pectoris, arrhythmias, hypotension, palpitations. **GI:** nausea, vomiting. **Local:** phlebitis. **Neuro:** headache. **Resp:** shortness of breath. **Misc:** hypersensitivity reactions, nonanginal chest pain.

Interactions
Drug-Drug: Use with **nitroprusside**; may have a synergistic effect on ↑ cardiac output. **Beta blockers** may negate the effect of dobutamine. ↑ risk of arrhythmias or hypertension with some **anesthetics** (**cyclopropane**, **halothane**), **MAO inhibitors**, **oxytocics**, or **tricyclic antidepressants**.

© F.A. Davis Publishing

Route/Dosage

IV (Adults and Children): 2.5–15 mcg/kg/min; titrate to response (max dose = 40 mcg/kg/min).
IV (Neonates): 2–15 mcg/kg/min.

Availability (generic available)

Solution for injection (requires dilution): 12.5 mg/mL. **Premixed infusion:** 250 mg/250 mL, 500 mg/250 mL, 1000 mg/250 mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, heart rate, ECG, pulmonary capillary wedge pressure (PCWP), cardiac output, CVP, and urinary output continuously during the administration. Report significant changes in vital signs or arrhythmias. Consult physician for parameters for pulse, BP, or ECG changes for adjusting dose or discontinuing medication.
- Palpate peripheral pulses and assess appearance of extremities routinely during dobutamine administration. Notify health care professional if quality of pulse deteriorates or if extremities become cold or mottled.
- ***Lab Test Considerations:*** Monitor potassium concentrations during therapy; may cause hypokalemia.
- Monitor electrolytes, BUN, creatinine, and prothrombin time weekly during prolonged therapy.
- ***Toxicity and Overdose:*** If overdose occurs, reduction or discontinuation of therapy is the only treatment necessary because of the short duration of dobutamine.

Implementation

- ***High Alert:*** IV vasoactive medications are potentially dangerous. Have second practitioner independently check original order, dose calculations, and infusion pump settings. Do not confuse dobutamine with dopamine. If available as floor stock, store in separate areas.
- Correct hypovolemia with volume expanders before initiating dobutamine therapy.
- Administer into a large vein and assess administration site frequently. Extravasation may cause pain and inflammation.

IV Administration

- **Continuous Infusion:** ***Dilution:*** Vials must be diluted before use. Dilute 250–1000 mg in 250–500 mL of D5W, 0.9% NaCl, 0.45% NaCl, D5/0.45% NaCl, D5/0.9% NaCl, or LR. Admixed infusions stable for 48 hr at room temperature and 7 days if refrigerated. Premixed infusions are already diluted and ready to use. ***Concentration:*** 0.25–5 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Administer via infusion pump to ensure precise amount delivered. Titrate to patient response (heart rate, presence of ectopic activity, BP, urine output, CVP, PCWP, cardiac index). Dose should be titrated so heart rate does not increase by >10% of baseline.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, caspofungin, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fosfomycin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, irinotecan, isoproterenol, ketamine, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methyldopate, methylprednisolone sodium succinate, metoclopramide, metoprolol, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pentamidine, phentolamine, phenylephrine, posaconazole, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxime, remifentanil, rituximab, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, televancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, alteplase, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azathioprine, bivalirudin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, dacarbazine, dantrolene, dexamethasone, dexrazoxane, diazoxide, ertapenem, fluorouracil, folic acid, foscarnet, fosphenytoin, ganciclovir, hydrocortisone sodium succinate, hydroxycobalamin, ibuprofen, indomethacin, ketorolac, methotrexate, micafungin, mitomycin, oxacillin, pantoprazole, pemetrexed, penicillin G, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole, warfarin.

© F.A. Davis Publishing

Patient/Family Teaching

- Explain to patient the dobutamine and the need for frequent monitoring.
- Advise patient to inform nurse immediately if chest pain; dyspnea; or numbness, tingling, or burning of extremities occurs.
- Instruct patient to notify nurse immediately of pain or discomfort at the site of administration.
- **Home Care Issues:** Instruct caregiver on proper care of IV equipment.
- Instruct caregiver to report signs of worsening HF (shortness of breath, orthopnea, decreased exercise tolerance), abdominal pain, and nausea or vomiting to health care professional promptly.

Evaluation/Desired Outcomes

- Increase in cardiac output.
- Improved hemodynamic parameters.
- Increased urine output.

HIGH ALERT

DOCEtaxel (doe-se-**tax**-el)

Taxotere

Classification

Therapeutic: antineoplastics
Pharmacologic: taxoids

Indications

Breast cancer (locally advanced/metastatic breast cancer or with doxorubicin and cyclophosphamide as adjuvant treatment of operable node-positive disease). Non–small-cell lung cancer (locally advanced/metastatic) after failure on platinum regimen or with cisplatin as initial therapy. Metastatic castration-resistant prostate cancer (with prednisone). Squamous cell carcinoma of the head and neck (locally advanced) with cisplatin and fluorouracil. Gastric adenocarcinoma (advanced) with cisplatin and fluorouracil as initial therapy.

Action

Interferes with normal cellular microtubule function required for interphase and mitosis. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver; metabolites undergo fecal elimination.
Half-life: 11.1 hr.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	5–9 days	7 days

D

Contraindications/Precautions

Contraindicated in: Hypersensitivity to docetaxel, paclitaxel, or medications formulated with polysorbate 80; Known alcohol intolerance; Neutrophil count <1500/mm^3; Liver impairment (serum bilirubin > upper limit of normal, ALT and/or AST >1.5 times upper limit of normal, with alkaline phosphatase >2.5 times upper limit of normal); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects

CV: ASCITES, CARDIAC TAMPONADE, PERICARDIAL EFFUSION, PULMONARY EDEMA, peripheral edema. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, alopecia, edema, rash, dermatitis, desquamation, erythema, nail disorders. **EENT:** cystoid macular edema. **GI:** ENTEROCOLITIS, NEUTROPENIC COLITIS, diarrhea, nausea, stomatitis, vomiting. **GU:** amenorrhea, ↓ fertility (males). **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** injection site reactions. **MS:** myalgia, arthralgia. **Neuro:** neurosensory deficits, peripheral neuropathy, fatigue, weakness, alcohol intoxication. **Resp:** ACUTE RESPIRATORY DISTRESS SYNDROME, INTERSTITIAL LUNG DISEASE, PULMONARY FIBROSIS, bronchospasm, dyspnea. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), MALIGNANCY (including leukemias, myelodysplastic syndrome, non-Hodgkin's lymphoma, and renal cancer), tumor lysis syndrome.

Interactions

Drug-Drug: ↑ bone marrow depression may occur with other **antineoplastics** or **radiation therapy**. Strong inhibitors of CYP3A4, including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, or **voriconazole** ↑ levels and the risk of toxicity; avoid concomitant use (if need to use, ↓ docetaxel dose by 50%).

Route/Dosage

IV (Adults): *Breast cancer*—60–100 mg/m^2 every 3 wk; *Breast cancer adjuvant therapy*—75 mg/m^2 every 3 wk for 6 cycles (with doxorubicin and cyclophosphamide); *Non–small-cell lung cancer*—75 mg/m^2 every 3 wk (alone or with platinum); *Prostate cancer*—75 mg/m^2 every 3 wk (with oral prednisone); *Squamous cell head and neck cancer*—75

© F.A. Davis Publishing

mg/m² every 3 wk for 3–4 cycles (with cisplatin and fluorouracil); *Gastric adenocarcinoma*—75 mg/m² every 3 wk (with cisplatin and fluorouracil).

Availability (generic available)

Solution for injection (concentrate): 10 mg/mL (dose of 100 mg/m² contains 0.15 g/m² of ethanol), 20 mg/mL (dose of 100 mg/m² contains 1.975 g/m² of ethanol).

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and after administration.
- Assess infusion site for patency. Docetaxel is not a vesicant. If extravasation occurs, discontinue docetaxel immediately and aspirate the IV needle. Apply cold compresses to the site for 24 hr.
- Monitor for signs and symptoms of hypersensitivity reactions (bronchospasm, hypotension, erythema) continuously during infusion; most common after first and second doses of docetaxel. Treat mild to moderate reactions symptomatically and slow or stop infusion until reaction subsides. Discontinue therapy if severe reactions occur. Do not readminister docetaxel to patients with previous severe reactions. Severe edema may also occur. Weigh patients before each treatment. Fluid accumulation may result in edema, ascites, and pleural or pericardial effusions. Pretreatment with corticosteroids is recommended to minimize edema and hypersensitivity reactions. PO furosemide may be used to treat edema. For hormone-refractory metastatic prostate cancer (given with prednisone), premedicate with dexamethasone.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Assess for rash. May occur on feet or hands but may also occur on arms, face, or thorax, usually with pruritus. Rash usually occurs within 1 wk after infusion and resolves before next infusion. May cause Stevens-Johnson syndrome, toxic epidermal necrolysis, and acute generalized exanthematous pustulosis; permanently discontinue docetaxel if severe cutaneous reactions occur.
- Assess for development of neurosensory deficit (paresthesia, dysesthesia, pain, burning). May also cause weakness. Pyridoxine may be used to minimize symptoms. Severe symptoms may require dose reduction or discontinuation.
- Assess for arthralgia and myalgia, which are usually relieved by nonopioid analgesics but may be severe enough to require treatment with opioid analgesics.
- Assess for diarrhea and stomatitis. If Grade 3 or 4, reduce dose.
- Monitor for tumor lysis syndrome due to rapid reduction in tumor volume (acute renal failure, hyperkalemia, hypocalcemia, hyperuricemia, or hypophosphatemia). Risks are higher in patients with greater tumor burden and rapidly proliferating tumors; may be fatal. Correct electrolyte abnormalities, monitor renal function and fluid balance, and administer supportive care, including dialysis, as indicated.
- Monitor for signs and symptoms of fluid retention (edema, weight gain), usually begins with peripheral edema in lower extremities. May be treated with sodium restriction and diuretics.
- Monitor patients for second primary malignancies.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor CBC and differential before each treatment. Frequently causes neutropenia (<2000 neutrophils/mm³); may require dose adjustment. *If neutrophil count <1500/mm³,* hold dose. Neutropenia is reversible and not cumulative. The nadir is 8 days, with a duration of 7 days. May also cause thrombocytopenia and anemia.
- Monitor liver function studies (AST, ALT, alkaline phosphatase, bilirubin) before each cycle. *If AST/ALT >2.5 to ≤5 times upper limit of normal (ULN) and alkaline phosphatase ≤2.5 times ULN, or AST/ALT >1.5 to ≤5 × upper limit of normal and alkaline phosphatase >2.5 to ≤5 × ULN,* reduce dose by 20%. *If AST/ALT >5 × upper limit of normal and/or alkaline phosphatase >5 times ULN,* discontinue therapy.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse Taxotere (docetaxel) with Taxol (paclitaxel).
- Premedicate with dexamethasone 8 mg twice daily for 3 days starting 1 day before docetaxel infusion to reduce incidence and severity of fluid retention and hypersensitivity reactions. Premedicate patients with hormone-refractory metastatic prostate cancer with PO dexamethasone 8 mg, at 12 hr, 3 hr, and 1 hr before docetaxel infusion.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. If powder or solution comes in contact with skin or mucosa, wash thoroughly with soap and water. Discard equipment in specially designated containers.

IV Administration

- **Intermittent Infusion:** *For injection concentrate:* Before dilution, allow vials to stand at room temperature for 5 min. Solution is pale yellow to brownish

© F.A. Davis Publishing

yellow. Use a 21-gauge needle to withdraw docetaxel from vial; larger bore needles may result in stopper coring and rubber particles. ***Dilution:*** Withdraw required amount and inject into 250-mL bag of 0.9% NaCl or D5W. If a dose >200 mg is required, use a larger volume diluent so that concentration of 0.74 mg/mL is not exceeded. Rotate gently to mix. Do not administer solutions that are cloudy or contain a precipitate. Diluted solution must be infused within 6 hr. ***Concentration:*** 0.3 mg/mL to 0.74 mg/mL. Solution is supersaturated and may crystallize over time. If crystals appear, solution must be discarded. ***Rate:*** Administer over 1 hr.

- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nafcillin, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B liposome, dantrolene, doxorubicin liposome, idarubicin, methylprednisolone, mitomycin, nalbuphine, phenytoin.

Patient/Family Teaching

- Explain purpose of docetaxel to patient.
- Instruct patient to report symptoms of hypersensitivity reactions (trouble breathing; sudden swelling of face, lips, tongue, throat; trouble swallowing; hives; rash; redness all over body) to health care professional immediately.
- Advise patient to notify health care professional if fever >101°F; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occur. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor.
- Patient should be cautioned to avoid alcohol and products containing aspirin or NSAIDs.
- Fatigue is a frequent side effect of docetaxel. Advise patient that frequent rest periods and pacing of activities may minimize fatigue.
- Instruct patient to notify health care professional if signs of fluid retention (peripheral edema in the lower extremities, weight gain, dyspnea), colitis (abdominal pain or tenderness, diarrhea, with or without fever), yellow skin, weakness, paresthesia, gait disturbances, swelling of the feet, or joint or muscle aches occur.
- Alcohol content of docetaxel may impair CNS. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to inspect oral mucosa for redness and ulceration. If mouth sores occur, advise patient to use sponge brush and rinse mouth with water after eating and drinking.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional if changes in vision occur. Obtain a prompt and comprehensive ophthalmologic examination. May require discontinuation of docetaxel and use of a nontaxane cancer therapy.
- Discuss with patient the possibility of hair loss. Complete hair loss usually begins after 1 or 2 treatments and is reversible after discontinuation of therapy. Explore coping strategies.

© F.A. Davis Publishing

- Instruct patient not to receive any vaccinations without advice of health care professional.
- Rep: Advise females of reproductive potential to use effective contraception during and for 6 mo after last dose of therapy and to avoid breast feeding during and for 1 wk after last dose. Advise men with female partners of reproductive potential to use effective contraception during and for 3 mo after last dose of therapy. May impair fertility in male patients.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancy in women with advanced breast cancer.
- Decrease in size or spread of malignancy in locally advanced or metastatic non–small-cell lung cancer, squamous cell carcinoma of the head and neck, and gastric adenocarcinoma.
- Decreased size or spread of advanced metastatic hormone-refractory prostate cancer.

DOCUSATE (dok-yoo-sate)

docusate calcium
Kao-Tin, Kaopectate Stool Softener

docusate sodium
Colace, Correctol, Diocto, Docu-Soft, Docusoft S, DOK, Dosolax, DSS, Dulcolax, Dulcolax Stool Softener, Enemeez, Fleet Pedialax, Fleet Sof-Lax, Phillips Liquid-Gels, Selax, Silace, Soflax

Classification
Therapeutic: laxatives
Pharmacologic: stool softeners

Indications

PO: Prevention of constipation (in patients who should avoid straining, such as after MI or rectal surgery).
Rect: Used as enema to soften fecal impaction.

Action

Promotes incorporation of water into stool, resulting in softer fecal mass. May also promote electrolyte and water secretion into the colon. **Therapeutic Effects:** Softening and passage of stool.

Pharmacokinetics

Absorption: Small amounts may be absorbed from the small intestine after oral administration. Absorption from the rectum is not known.
Distribution: Unknown.
Metabolism and Excretion: Amounts absorbed after oral administration are eliminated in bile.
Half-life: Unknown.

TIME/ACTION PROFILE (softening of stool)

ROUTE	ONSET	PEAK	DURATION
PO	12–72 hr	unknown	unknown
Rectal	2–15 min	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Abdominal pain, nausea, or vomiting, especially when associated with fever or other signs of an acute abdomen.
Use Cautiously in: Excessive or prolonged use may lead to dependence; Should not be used if prompt results are desired; OB, Lactation: Has been used safely.

Adverse Reactions/Side Effects

EENT: throat irritation. **GI:** mild cramps, diarrhea.
Derm: rashes.

Interactions

Drug-Drug: None significant.

Route/Dosage

Docusate Calcium

PO (Adults): 240 mg once daily.

Docusate Sodium

PO (Adults and Children >12 yr): 50–400 mg in 1–4 divided doses.
PO (Children 6–12 yr): 40–150 mg in 1–4 divided doses.
PO (Children 3–6 yr): 20–60 mg in 1–4 divided doses.
PO (Children <3 yr): 10–40 mg in 1–4 divided doses.
PO (Infants): 5 mg/kg/day in 1–4 divided doses.
Rect (Adults): 50–100 mg or 1 unit containing 283 mg docusate sodium, soft soap, and glycerin.

Availability (generic available)

Docusate Calcium

Capsules: 240 mg[OTC].

Docusate Sodium (generic available)

Tablets: 100 mg[OTC]. **Capsules:** 50 mg[OTC], 100 mg[OTC], 250 mg[OTC]. **Syrup:** 20 mg/5 mL[OTC]. **Liquid:** 50 mg/5 mL[OTC]. **Enema:** 283 mg/5 mL[OTC]. ***In combination with:*** stimulant laxatives[OTC]. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.

Implementation

- Do not confuse Colace with Cozaar. Do not confuse Dulcolax (docusate sodium) with Dulcolax (bisacodyl). Do not confuse Kaopectate Stool Softener (docusate calcium) with Kaopectate (bismuth subsalicylate).

© F.A. Davis Publishing

- This medication does not stimulate intestinal peristalsis; stimulant laxative may be required for constipation.
- **PO:** Administer with a full glass of water or juice. May be administered on an empty stomach for more rapid results.
- Oral solution may be diluted in milk, infant formula, or fruit juice to decrease bitter taste.
- Do not administer within 2 hr of other laxatives, especially mineral oil. May cause increased absorption.
- **Rect:** Administer as a retention or flushing enema.

Patient/Family Teaching

- Advise patients that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Encourage patients to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake (6–8 full glasses/day), and increasing mobility. Normal bowel habits are variable and may vary from 3 times/day to 3 times/wk.
- Instruct patients with cardiac disease to avoid straining during bowel movements (Valsalva maneuver).
- Advise patient not to use laxatives when abdominal pain, nausea, vomiting, or fever is present.
- Advise patient not to take docusate within 2 hr of other laxatives.

Evaluation/Desired Outcomes

- A soft, formed bowel movement, usually within 24–48 hr. Therapy may take 3–5 days for results. Rectal dose forms produce results within 2–15 min.

dofetilide (doe-fet-il-ide)

~~Tikosyn~~

Classification

Therapeutic: antiarrhythmics (class III)

Indications

Maintenance of normal sinus rhythm (delay in time to recurrence of atrial fibrillation/atrial flutter [AF/AFl]) in patients with AF/AFl lasting more than one wk, and who have been converted to normal sinus rhythm. Conversion of AF and AFl to normal sinus rhythm.

Action

Blocks cardiac ion channels responsible for transport of potassium. Increases monophasic action potential duration. Increases effective refractory period. **Therapeutic Effects:** Prevention of recurrent AF/AFl. Conversion of AF/AFl to normal sinus rhythm.

Pharmacokinetics

Absorption: Well absorbed (>90%) following oral administration.

Distribution: Unknown.

Metabolism and Excretion: 80% excreted by kidneys via cationic renal secretion, mostly as unchanged drug; 20% excreted as inactive metabolites; some metabolism in the liver via cytochrome P450 system (CYP3A4 isoenzyme).

Half-life: 10 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	within hrs	2–3 hr†	12–24 hr

†Steady state levels are achieved after 2–3 days.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Congenital or acquired prolonged QT syndromes; Baseline QT interval or QTc of >440 msec (500 msec in patients with ventricular conduction abnormalities); CCr <20 mL/min; Concurrent use of verapamil, cimetidine, dolutegravir, ketoconazole, itraconazole, trimethoprim, megestrol, prochlorperazine, hydrochlorothiazide, or other QT-interval prolonging drugs; Lactation: Lactation.

Use Cautiously in: Underlying electrolyte abnormalities (↑ risk of serious arrhythmias; correct prior to administration); CCr 20–60 mL/min (dose ↓ recommended); Severe hepatic impairment; OB: Use only when potential maternal benefit justifies potential fetal risk; Pedi: Safety not established.

Adverse Reactions/Side Effects

CV: VENTRICULAR ARRHYTHMIAS (including torsades de pointes), chest pain, QT interval prolongation. **Neuro:** dizziness, headache.

Interactions

Drug-Drug: Hydrochlorothiazide, **verapamil**, **cimetidine**, **ketoconazole**, **itraconazole**, **trimethoprim**, **megestrol**, **dolutegravir**, and **prochlorperazine** ↑ dofetilide levels and the risk of QT interval prolongation with arrhythmias; concurrent use is contraindicated. **QT interval prolonging drugs** may ↑ the risk of QT interval prolongation with arrhythmias; concurrent use contraindicated. **Amiloride**, **metformin**, and **triamterene** may also ↑ dofetilide levels; use with caution. Inhibitors of the cytochrome P450 system (CYP450 3A4 isoenzyme) including **macrolide antiinfectives**, **azole antifungals**, **protease inhibitor antiretrovirals**, **SSRI antidepressants**, **amiodarone**, **diltiazem**, **nefazodone**, **quinine**, and **zafirlukast** may also ↑ blood levels and the risk of arrhythmias and concurrent use should be undertaken with caution. Should not be used concurrently with other **class I or III antiarrhythmics** due to ↑ risk of arrhythmias. Hypokalemia or hypomagnesemia from **potassium-depleting diuretics** ↑ the risk of arrhythmias; correct abnormalities prior to administration.

© F.A. Davis Publishing

Concurrent use of **digoxin** may ↑ the risk of arrhythmias.

Drug-Food: Grapefruit juice may ↑ levels; avoid concurrent use.

Route/Dosage

Dosing should be adjusted according to renal function and assessment of QT interval.

PO (Adults): *Starting dose*—500 mcg twice daily; *maintenance dose*—250 mcg twice daily (not to exceed 500 mcg twice daily).

Renal Impairment

PO (Adults): *CCr 40–60 mL/min Starting dose*—250 mcg twice daily; *maintenance dose*—125 mcg twice daily; *CCr 20–40 mL/min Starting dose*—125 mcg twice daily; *maintenance dose*—125 mcg once daily.

Availability (generic available)

Capsules: 125 mcg, 250 mcg, 500 mcg.

NURSING IMPLICATIONS

Assessment

- Monitor ECG, pulse, and BP continuously during initiation of therapy and for at least 3 days or a minimum of 12 hr after electrical or pharmacological conversion to normal sinus rhythm, whichever is greater, then periodically during therapy. Evaluate QTc (or QT interval if heart rate <60 bpm) before starting therapy and every 3 mo during therapy. If QTc exceeds 440 msec (500 msec in patients with ventricular conduction abnormalities), discontinue dofetilide and monitor patient until QTc returns to baseline.
- Within 2–3 hr after first dose, determine QTc or QT (if heart rate is less than 60 beats per min). If QTc or QT >15% compared to baseline or if QTc or QT >500 msec (550 msec in patients with ventricular conduction abnormalities), adjust doses as follows: *if initial dose was 500 mcg twice daily,* change to 250 mcg twice daily; *if initial dose was 250 mcg twice daily,* administer 125 mcg twice daily; *if initial dose was 125 mcg twice daily,* give 125 mcg once a day. Determine QTc or QT within 2–3 hr after each subsequent dose for hospital doses 2–5. No further down titration is recommended. Discontinue dofetilide if at any time after second dose is given QTc or QT is >500 msec (550 msec in patients with ventricular conduction abnormalities).
- Assess the patient's medication history including OTC, Rx, and natural/herbal products, with emphasis on those that interact with dofetilide (see Interactions).
- ***Lab Test Considerations:*** Calculate creatinine clearance prior to administration to determine dose and every 3 mo during therapy.
- Correct hypokalemia before starting therapy. Maintain serum potassium in normal range during dofetilide therapy.

Implementation

- Dofetilide must be initiated or reinitiated and monitored for at least 3 days in a setting that provides continuous ECG monitoring and has personnel trained in the management of serious ventricular arrhythmias. Due to the potential for life-threatening ventricular arrhythmias, dofetilide is usually used for patients with highly symptomatic AF/AFl.
- Patients with AF should be anticoagulated according to usual protocol prior to electrical or pharmacological cardioversion.
- Make sure patient has an adequate supply of dofetilide prior to discharge to prevent interruption of therapy.
- Patients should not be discharged from the hospital within 12 hr of electrical or pharmacological conversion to normal sinus rhythm.
- **PO:** Administer at the same time each day without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling well. If a dose is missed, skip dose; do not double next dose. Take next dose at usual time.
- Advise patient to avoid grapefruit juice during therapy; may increase drug levels.
- Advise patient to read *Medication Guide* prior to starting therapy and each Rx refill in case of changes. Emphasize need for adherence with therapy, potential for drug interactions, and need for periodic monitoring to minimize the risk of serious arrhythmias.
- Instruct patient or family member on how to take pulse. Advise patient to report changes in pulse rate or rhythm to health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Advise patient to consult health care professional immediately if they faint, become dizzy, or have fast heartbeat. If health care professional is unavailable, instruct patient to go to nearest hospital emergency department, take remaining dofetilide capsules to hospital, and show them to health care professional. If symptoms associated with altered electrolyte balance such as excessive or prolonged diarrhea, sweating, or vomiting or loss of appetite or thirst occur, notify health care professional immediately.
- Rep: Advise female patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.
- Emphasize the importance of routine follow-up exams to monitor progress.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Prevention of recurrent AF/AFl.
- Conversion of AF/AFl to normal sinus rhythm.
- If patients do not convert to normal sinus rhythm within 24 hr of initiation of therapy, electrical conversion should be considered.

dolutegravir/lamivudine

(doe-loo-**teg**-ra-vir/la-**mi**-vyoo-deen)

Dovato

Classification

Therapeutic: antiretrovirals

Pharmacologic: integrase strand transfer inhibitors (INSTI), nucleoside reverse transcriptase inhibitors

Indications

HIV-1 infection in patients with no antiretroviral treatment history and with no known substitutions associated with resistance to dolutegravir or lamivudine.

HIV-1 infection as a replacement for the current antiretroviral regimen in patients who are virologically suppressed (HIV-1 RNA <50 copies/mL, taking a stable antiretroviral regimen, have no history of treatment failure, and have no known substitutions associated with resistance to dolutegravir or lamivudine.

Action

Dolutegravir—Inhibits HIV-1 integrase, which is required for viral replication. *Lamivudine*—After intracellular conversion to its active form (lamivudine-5-triphosphate), inhibits viral DNA synthesis by inhibiting the enzyme reverse transcriptase. **Therapeutic Effects:** Evidence of decreased viral replication and reduced viral load with slowed progression of HIV and its sequelae.

Pharmacokinetics

Dolutegravir

Absorption: Bioavailability unknown.

Distribution: Unknown.

Protein Binding: >98.9%.

Metabolism and Excretion: Metabolized primarily by the UGT1A1 enzyme system with some metabolism by CYP3A4. Poor UGT1A1 metabolizers have ↑ dolutegravir concentrations and an ↑ risk of adverse effects. 64% excreted in feces (53% as unchanged drug), 31% excreted in urine (<1% as unchanged drug).

Half-life: 14 hr.

Lamivudine

Absorption: Well absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly excreted unchanged in urine (70% as unchanged drug).

Half-life: 13–19 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Dolutegravir (PO)	unknown	2.5 hr	24 hr
Lamivudine (PO)	unknown	1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Prior hypersensitivity reaction to dolutegravir; Concurrent use of dofetilide; CCr <30 mL/min; Severe hepatic impairment; OB: Avoid use through first trimester of pregnancy (may ↑ risk of neural tube defects); Lactation: Breast feeding not recommended in patients with HIV.

Use Cautiously in: Coinfection with hepatitis B virus (HBV) (hepatitis may recur after discontinuation of lamivudine and ↑ risk of lamivudine-resistant HBV); Underlying hepatic disease, including hepatitis B or C (↑ risk of hepatotoxicity); Women and obesity (↑ risk of lactic acidosis and severe hepatomegaly with steatosis); OB: Can consider use during second or third trimester if potential maternal benefit justifies potential fetal risk; Rep: Women of reproductive potential; Pedi: Safety and effectiveness in children not established; Geri: Consider age-related ↓ in cardiac, renal and hepatic function, chronic disease states and concurrent medications.

Adverse Reactions/Side Effects

Endo: hyperglycemia. **F and E:** LACTIC ACIDOSIS, hypophosphatemia. **GI:** HEPATOMEGALY WITH STEATOSIS, HEPATOTOXICITY (↑ with hepatitis B or C), diarrhea, ↑ lipase, ↑ liver enzymes, nausea. **Metab:** hyperlipidemia. **MS:** ↑ creatine kinase. **Neuro:** dizziness, fatigue, headache, insomnia. **Misc:** hypersensitivity reactions (including rash, constitutional symptoms, and liver injury), immune reconstitution syndrome.

Interactions

Drug-Drug: May ↑ levels and risk of toxicity from **dofetilide**; concurrent use contraindicated. May ↑ blood levels and risk of toxicity from **metformin**. **Carbamazepine** and **rifampin** may ↓ levels and effectiveness of dolutegravir; additional 50-mg dose of dolutegravir should be given 12 hr after dose of dolutegravir/lamivudine. **Oxcarbazepine**, **phenobarbital**, and **phenytoin** may ↓ levels and effectiveness of dolutegravir; avoid concurrent use. Absorption and effectiveness may be ↓ by cation-containing **antacids** or **laxatives**, as well as **buffered medications**, or **sucralfate**; dolutegravir should be taken 2 hr before or 6 hr after these medications. Absorption and effectiveness may be ↓ by **calcium supplements** (oral) or **iron supplements** (oral); under fasting conditions, dolutegravir

© F.A. Davis Publishing

should be taken 2 hr before or 6 hr after these medications; when taken with food, dolutegravir and calcium or iron supplements may be taken at the same time. May ↑ **dalfampridine** levels and risk of seizures. **Sorbitol** may ↓ levels of lamivudine; avoid concurrent use. May ↑ **dalfampridine** levels and risk of seizures.

Drug-Natural Products: St. John's wort may ↓ levels and effectiveness of dolutegravir; avoid concurrent use.

Route/Dosage

PO (Adults): One tablet (dolutegravir 50 mg/lamivudine 300 mg) once daily.

Availability

Tablets: dolutegravir 50 mg/lamivudine 300 mg.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, fever, malaise, fatigue, muscle or joint aches, blisters or peeling of skin, oral blisters or lesions, conjunctivitis, facial edema, hepatitis, eosinophilia, angioedema, difficulty breathing). Discontinue therapy and do not restart.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor viral load and CD4 counts regularly during therapy.
- Assess for hepatitis B virus (HBV). *Dovato* is not approved for administration in patients with HIV and HBV. If therapy is discontinued, may cause severe exacerbation of hepatitis B. Monitor liver function in co-infected patients for several months after stopping therapy.
- Monitor liver function tests prior to, during and following therapy. May cause ↑ LDL cholesterol, total cholesterol, and triglyceride concentrations. Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women. Discontinue therapy if symptoms occur.

Implementation

- **PO:** Administer once daily without regard to food.
- Iron and calcium supplements may be taken with dolutegravir/lamivudine and food. If taken separately, administer dolutegravir/lamivudine ≥2 hr before or ≥6 hr after iron and calcium supplements.

Patient/Family Teaching

- Instruct patient on the importance of taking medication as directed, even if feeling better. Take missed dose as soon as remembered; do not double doses. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Discontinuing therapy may lead to severe exacerbations. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes. Caution patient not to share or trade *Dovato*™ with others.
- Inform patient of importance of hepatitis B testing before starting antiretroviral therapy.
- Inform patient that *Dovato*™ does not cure AIDS and may reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and avoid sharing needles or donating blood to prevent spreading HIV to others.
- Advise patient to notify health care professional immediately if symptoms of hypersensitivity reactions, lactic acidosis (nausea, vomiting, unusual or unexpected stomach discomfort, unusual muscle pain, difficulty breathing, feeling cold, especially in arms and legs, dizziness, fast or irregular heartbeat, and weakness or tiredness), liver problems (yellow skin or whites of eyes, dark urine, light colored stools, loss of appetite, nausea, stomach pain), or signs of Immune Reconstitution Syndrome (signs and symptoms of an infection or inflammation) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Rep: Advise females of reproductive potential to use effective contraception during *Dovato*™ therapy and to avoid breast feeding during therapy. Advise patient to notify health care professional if pregnancy is planned or suspected. Enroll pregnant women in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Slowed progression of HIV infection and decreased occurrence of sequelae.

donepezil (doe-**nep**-i-zill)

Aricept, ~~Aricept ODT~~

Classification

Therapeutic: antiAlzheimer's agents
Pharmacologic: cholinergics (cholinesterase inhibitors)

Indications

Mild, moderate, or severe dementia/neurocognitive disorder associated with Alzheimer's disease.

Action

Inhibits acetylcholinesterase thus improving cholinergic function by making more acetylcholine available.

Therapeutic Effects: May temporarily lessen some

© F.A. Davis Publishing

of the dementia associated with Alzheimer's disease. Enhances cognition. Does not cure the disease.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Protein Binding: 96%.
Metabolism and Excretion: Partially metabolized by the liver (CYP2D6 and CYP3A4 enyzmes) and partially excreted by kidneys (17% unchanged). Two metabolites are pharmacologically active. The CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↑ donepezil concentrations and an ↑ risk of adverse effects).
Half-life: 70 hr.

TIME/ACTION PROFILE (improvement in symptoms)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	several wk	6 wk†

†Return to baseline after discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to donepezil or piperidine derivatives.
Use Cautiously in: Underlying cardiac disease, especially sick sinus syndrome or supraventricular conduction defects; History of ulcer disease or currently taking NSAIDs; History of seizures; History of asthma or obstructive pulmonary disease; OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: atrial fibrillation, hypertension, hypotension, vasodilation. **Derm:** ecchymoses. **GI:** diarrhea, nausea, anorexia, vomiting, weight gain (unusual). **GU:** frequent urination. **Metab:** hot flashes, weight loss. **MS:** arthritis, muscle cramps. **Neuro:** headache, abnormal dreams, depression, dizziness, drowsiness, fatigue, insomnia, syncope, sedation (unusual).

Interactions

Drug-Drug: Exaggerates muscle relaxation from **succinylcholine**. Interferes with the action of **anticholinergics**. ↑ cholinergic effects of **bethanechol**. May ↑ risk of GI bleeding from **NSAIDs**. **Quinidine** and **ketoconazole** ↓ metabolism of donepezil. **Rifampin**, **carbamazepine**, **dexamethasone**, **phenobarbital**, and **phenytoin** induce the enzymes that metabolize donepezil and may ↓ its effects.
Drug-Natural Products: Jimson weed and **scopolia** may antagonize cholinergic effects.

Route/Dosage

Mild to Moderate Alzheimer's Disease

PO (Adults): 5 mg once daily; may ↑ to 10 mg once daily after 4–6 wk (dose should not exceed 5 mg/day in frail, elderly females).

Severe Alzheimer's Disease

PO (Adults): 5 mg once daily; may ↑ to 10 mg once daily after 4–6 wk; after 3 mo, may then ↑ to 23 mg once daily.

Availability (generic available)

Tablets: 5 mg, 10 mg, 23 mg. **Cost:** *Aricept*—23 mg $1,059.91/90; *Generic*—All strengths $23.97/90.
Orally disintegrating tablets: 5 mg, 10 mg. **Cost:** *Generic*—All strengths $233.62/30. ***In combination with:*** memantine (Namzaric). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- Monitor heart rate periodically during therapy. May cause bradycardia.

Implementation

- Do not confuse Aricept with Aciphex or Azilect.
- **PO:** Administer in the evening just before going to bed. May be taken without regard to food.
- *Oral disintegrating tablets* should be allowed to dissolve on tongue; follow with water.
- Swallow *23-mg tablet* whole. ***DNC:*** Do not split, crush, or chew; may increase rate of absorption.

Patient/Family Teaching

- Emphasize the importance of taking donepezil daily, as directed. Missed doses should be skipped and regular schedule returned to the following day. Do not take more than prescribed; higher doses do not increase effects but may increase side effects.
- Inform patient/family that it may take weeks before improvement in baseline behavior is observed.
- Caution patient and caregiver that donepezil may cause dizziness. Advise patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient and caregiver to notify health care professional if nausea, vomiting, diarrhea, or changes in color of stool occur or if new symptoms occur or previously noted symptoms increase in severity.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.

© F.A. Davis Publishing

- Advise patient and caregiver to notify health care professional of medication regimen before treatment or surgery.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

HIGH ALERT

DOPamine (dope-a-meen)

Classification
Therapeutic: inotropics, vasopressors
Pharmacologic: adrenergics

Indications

Adjunct to standard measures to improve: BP, Cardiac output, Urine output in treatment of shock unresponsive to fluid replacement. Increase renal perfusion (low doses).

Action

Small doses (0.5–3 mcg/kg/min) stimulate dopaminergic receptors, producing renal vasodilation. Larger doses (2–10 mcg/kg/min) stimulate dopaminergic and beta$_1$-adrenergic receptors, producing cardiac stimulation and renal vasodilation. Doses greater than 10 mcg/kg/min stimulate alpha-adrenergic receptors and may cause renal vasoconstriction. **Therapeutic Effects:** Increased cardiac output, increased BP, and improved renal blood flow.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed but does not cross the blood-brain barrier.
Metabolism and Excretion: Metabolized in liver, kidneys, and plasma.
Half-life: 2 min.

TIME/ACTION PROFILE (hemodynamic effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	up to 10 min	<10 min

Contraindications/Precautions

Contraindicated in: Tachyarrhythmias; Pheochromocytoma; Hypersensitivity to bisulfites (some products).
Use Cautiously in: Hypovolemia; MI; Occlusive vascular diseases; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Geri: Older patients may be more susceptible to adverse effects.

Adverse Reactions/Side Effects

CV: arrhythmias, hypotension, angina, palpitations, vasoconstriction. **Derm:** piloerection. **EENT:** mydriasis (high dose). **GI:** nausea, vomiting. **Local:** irritation at IV site. **Neuro:** headache. **Resp:** dyspnea.

Interactions

Drug-Drug: Use with **MAO inhibitors**, **ergot alkaloids** (**ergotamine**), **doxapram**, or some **antidepressants** results in severe hypertension. Use with IV **phenytoin** may cause hypotension and bradycardia. Use with **general anesthetics** may result in arrhythmias. **Beta blockers** may antagonize cardiac effects.

Route/Dosage

IV (Adults): *Dopaminergic (renal vasodilation) effects*—1–5 mcg/kg/min continuous infusion. *Beta-adrenergic (cardiac stimulation) effects*—5–15 mcg/kg/min. *Alpha-adrenergic (increased peripheral vascular resistance) effects*—>15 mcg/kg/min continuous infusion; infusion rate may be increased as needed.
IV (Children and Infants): 1–20 mcg/kg/min continuous infusion, depending on desired response (1–5 mcg/kg/min has been used to improve renal blood flow).
IV (Neonates): 1–20 mcg/kg/min continuous infusion.

Availability (generic available)

Injection for dilution: 40 mg/mL, 80 mg/mL, 160 mg/mL. **Premixed injection:** 200 mg/250 mL, 400 mg/250 mL, 400 mg/500 mL, 800 mg/250 mL, 800 mg/500 mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, heart rate, pulse pressure, ECG, pulmonary capillary wedge pressure (PCWP), cardiac output, CVP, and urinary output continuously during administration. Report significant changes in vital signs or arrhythmias. Consult physician for parameters for pulse, BP, or ECG changes for adjusting dose or discontinuing medication.
- Monitor urine output frequently throughout administration. Report decreases in urine output promptly.
- Palpate peripheral pulses and assess appearance of extremities routinely during dopamine administration. Notify physician if quality of pulse deteriorates or if extremities become cold or mottled.
- If hypotension occurs, administration rate should be increased. If hypotension continues, more potent vasoconstrictors (norepinephrine) may be administered.
- ***Toxicity and Overdose:*** If excessive hypertension occurs, rate of infusion should be decreased or temporarily discontinued until BP is decreased.

© F.A. Davis Publishing

Implementation

- ***High Alert:*** IV vasoactive medications are potentially dangerous. Have second practitioner independently check original order, dose calculations, and infusion pump settings. Do not confuse dopamine with dobutamine. If both are available as floor stock, store in separate areas.
- Correct hypovolemia with volume expanders before initiating dopamine therapy.
- Extravasation may cause severe irritation, necrosis, and sloughing of tissue. Administer into a large vein and assess administration site frequently. If extravasation occurs, affected area should be infiltrated liberally with 10–15 mL of 0.9% NaCl containing 5–10 mg of phentolamine. For pediatric patients, use 1 mL of phentolamine dilution to infiltrate (do not exceed 5 mg total). Infiltration within 12 hr of extravasation produces immediate hyperemic changes.

IV Administration

- **Continuous Infusion:** ***Dilution:*** Dopamine vials must be diluted before use. Dilute 200–800 mg of dopamine in 250–500 mL of 0.9% NaCl, D5W, D5/LR, D5/0.45% NaCl, D5/0.9% NaCl, or LR. Admixed solution is stable for 24 hr. Discard solutions that are cloudy, discolored, or contain a precipitate. Premixed infusions are already diluted and ready to use. ***Concentration:*** 0.8–3.2 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Infusion must be administered via infusion pump to ensure precise amount delivered. Titrate to response (BP, heart rate, urine output, peripheral perfusion, presence of ectopic activity, cardiac index). Decrease rate gradually when discontinuing to prevent marked decreases in BP.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftazidime/avibactam, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alpha, eptifibatide, eravacycline, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin/relebactam, imipenem/cilastatin, irinotecan, isavuconazonium, isoproterenol, ketamine, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem/vaborbactam, mesna, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, remifentanil, sargramostim, sodium acetate, succinylcholine, sufentanil, tacrolimus, tedizolid, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, warfarin, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, alteplase, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, azathioprine, cefazolin, chloramphenicol, dacarbazine, dantrolene, diazepam, esomeprazole, ganciclovir, hydroxycobalamin, ibuprofen lysine, indomethacin, methotrexate, mitomycin, phenytoin, sodium bicarbonate, thiopental, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Explain purpose of dopamine to patient and the need for frequent monitoring.
- Advise patient to inform nurse immediately if chest pain; dyspnea; numbness, tingling, or burning of extremities occurs.
- Instruct patient to inform nurse immediately of pain or discomfort at the site of administration.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Increase in BP.
- Increase in peripheral circulation.
- Increase in urine output.

© F.A. Davis Publishing

doravirine/lamivudine/tenofovir disoproxil fumarate

(**dor**-a-**vir**-een/la-**mi**-vyoo-deen/te-**noe**-fo-veer dye-soe-**prox**-il **fue**-ma-rate)

Delstrigo

Classification

Therapeutic: antiretrovirals

Pharmacologic: non-nucleoside reverse transcriptase inhibitors, nucleoside reverse transcriptase inhibitors

Indications

HIV-1 infection in patients with no prior antiretroviral treatment history. To replace the current antiretroviral regimen in patients with HIV-1 infection who are virologically suppressed (HIV-1 RNA <50 copies/mL), receiving a stable antiretroviral regimen with no history of treatment failure, and have no known substitutions associated with resistance to doravirine, lamivudine, or tenofovir disoproxil fumarate.

Action

Doravirine—Binds to the enzyme reverse transcriptase, which results in disrupted viral DNA synthesis. *Lamivudine*—After intracellular conversion to its active form (lamivudine-5-triphosphate), inhibits viral DNA synthesis by inhibiting the enzyme HIV reverse transcriptase. *Tenofovir disoproxil fumarate*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase resulting in disruption of DNA synthesis.

Therapeutic Effects: Evidence of decreased viral replication and reduced viral load with slowed progression of HIV and its sequelae.

Pharmacokinetics

Doravirine

Absorption: 64% absorbed following oral administration.

Distribution: Extensively distributed to tissues.

Metabolism and Excretion: Primarily metabolized in the liver by CYP3A enzymes. Primarily excreted in feces (as metabolites), 6% unchanged in urine.

Half-life: 15 hr.

Lamivudine

Absorption: 86% absorbed after oral administration.

Distribution: Extensively distributed to tissues.

Metabolism and Excretion: 71% excreted unchanged in urine by glomerular filtration and active tubular secretion.

Half-life: 5–7 hr.

Tenofovir

Absorption: 25% absorbed after oral administration.

Distribution: Extensively distributed to tissues.

Metabolism and Excretion: 70–80% excreted unchanged in urine by glomerular filtration and active tubular secretion.

Half-life: 17 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Doravirine (PO)	unknown	2 hr	24 hr
Lamivudine (PO)	unknown	unknown	24 hr
Tenofovir (PO)	unknown	1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity reaction to lamivudine; Concurrent use of carbamazepine, enzalutamide, mitotane, oxcarbazepine, phenobarbital, phenytoin, rifampin, rifapentine, and St. John's wort; Concurrent or recent use of nephrotoxic medications; CCr <50 mL/min; Lactation: Breast feeding not recommended in women infected with HIV.

Use Cautiously in: Coinfection with hepatitis B virus (HBV) (hepatitis may recur after discontinuation of lamivudine and ↑ risk of lamivudine-resistant HBV); Severe hepatic impairment (Child-Pugh Class C); OB: Safety of doravirine not established; Pedi: Safety and effectiveness not established; Geri: Consider age-related ↓ in organ function and body mass, concurrent disease states and medications.

Adverse Reactions/Side Effects

Derm: rash. **Endo:** Graves' disease. **GI:** HEPATOTOXICITY (↑ with hepatitis B or C), autoimmune hepatitis, diarrhea, hyperbilirubinemia, ↑ lipase, ↑ liver enzymes, nausea. **GU:** ACUTE RENAL FAILURE/FANCONI SYNDROME, ↑ serum creatinine. **MS:** arthralgia, ↓ bone mineral density, ↑ creatine kinase, muscle weakness, myalgia, osteomalacia, polymyositis. **Neuro:** Guillan-Barré syndrome, abnormal dreams, dizziness, insomnia, sedation. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: **Strong CYP3A inducers**, including **carbamazepine**, **enzalutamide**, **mitotane**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifampin**, and **rifapentine** may significantly ↓ levels and effectiveness of doravirine; concurrent use contraindicated; should discontinue these medications for ≥4 wk before initiating doravirine/lamivudine/tenofovir disoproxil fumarate therapy. **Rifabutin** may ↓ levels and effectiveness of doravirine; take one doravirine 100-mg tablet 12 hr after doravirine/lamivudine/tenofovir disoproxil fumarate dose. Nephrotoxic drugs, including **acyclovir**, **aminoglycosides**, **cidofovir**, **ganciclovir**, **NSAIDs**, **valacyclovir**, or **valganciclovir** may ↑ risk of nephrotoxicity; avoid recent or concurrent use. **Ledipasvir/sofosbuvir** and **sofosbuvir/velpatasvir** may ↑ tenofovir levels and risk of toxicity; closely moni-

© F.A. Davis Publishing

tor. Medications containing **sorbitol** may ↓ lamivudine levels; avoid concurrent use.
Drug-Natural Products: St. John's wort may significantly ↓ levels and effectiveness of doravirine; concurrent use contraindicated; should discontinue this medication for ≥4 wk before initiating doravirine therapy.

Route/Dosage

PO (Adults): One tablet (doravirine 100 mg/lamivudine 300 mg/tenofovir disoproxil fumarate 300 mg) once daily.

Availability

Tablets: doravirine 100 mg/lamivudine 300 mg/tenofovir disoproxil fumarate 300 mg.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess bone mineral density (BMD) in patients with HIV who have a history of pathologic bone fracture or other risk factors for osteoporosis or bone loss. Consider supplementation with calcium and vitamin D.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- Assess for hepatitis B virus (HBV). *Delstrigo*™ is not approved for administration in patients with HIV and HBV. If therapy is discontinued, may cause severe exacerbation of hepatitis B. Monitor liver function in coinfected patients for several mo after stopping therapy.
- Monitor liver function tests before and periodically during therapy, especially in patients with underlying liver disease or marked ↑ transaminases. May cause ↑ serum creatinine, AST, ALT, total bilirubin, total cholesterol, LDL, and triglycerides. May cause lactic acidosis and severe hepatomegaly with steatosis. These events are more likely to occur if patients are female, obese, or receiving nucleoside analogue medications for extended periods of time. Monitor patient for signs (increased serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- Assess serum creatinine, creatinine clearance, urine glucose, and urine protein before starting and periodically during therapy. Also assess serum phosphorous in patients with chronic kidney disease. Patients taking nephrotoxic agents, including NSAIDs, are at increased risk for renal impairment.

Implementation

- Administer once daily without regard to meals.

Patient/Family Teaching

- Instruct patient on the importance of taking medication as directed, even if feeling better. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Discontinuing therapy may lead to severe exacerbations. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes. Caution patient not to share or trade *Delstrigo*™ with others.
- Inform patient of importance of hepatitis B testing before starting antiretroviral therapy.
- Inform patient that *Delstrigo*™ does not cure AIDS and does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and avoid sharing needles or donating blood to prevent spreading HIV to others.
- Advise patient to notify health care professional if bone pain (bone pain that does not go away or worsening bone pain; pain in arms, legs, hands or feet; broken bones, muscle pain or weakness). May be symptoms of a bone or kidney problem.
- Advise patient to notify health care professional if signs and symptoms of immune reconstitution syndrome (signs and symptoms of an infection) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected. Encourage pregnant women to enroll in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263. Advise female patient that pregnancy is not recommended during *Delstrigo*™ and avoid breast feeding during therapy.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

© F.A. Davis Publishing

BEERS

doxazosin (dox-ay-zoe-sin)

Cardura, Cardura XL

Classification

Therapeutic: antihypertensives

Pharmacologic: peripherally acting antiadrenergics

Indications

Hypertension (alone or with other agents) (immediate-release only). Symptomatic benign prostatic hyperplasia (BPH).

Action

Dilates both arteries and veins by blocking postsynaptic alpha$_1$-adrenergic receptors. **Therapeutic Effects:** Lowering of BP. Increased urine flow and decreased symptoms of BPH.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Probably enters breast milk; rest of distribution unknown.

Protein Binding: 98–99%.

Metabolism and Excretion: Extensively metabolized by the liver.

Half-life: 22 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO†	1–2 hr	2–6 hr	24 hr
PO-XL‡	5 wk	unknown	unknown

†Antihypertensive effect.

‡Improved urinary flow and BPH symptoms.

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Hepatic dysfunction; Gastrointestinal narrowing (XL only); Geri: Appears on Beers list. Geriatric patients are at ↑ risk for hypotension; OB, Lactation, Pedi: Safety not established; Patients undergoing cataract surgery (↑ risk of intraoperative floppy iris syndrome).

Adverse Reactions/Side Effects

EENT: abnormal vision, blurred vision, conjunctivitis, epistaxis, intraoperative floppy iris syndrome. **Neuro:** dizziness, headache, depression, drowsiness, fatigue, nervousness, weakness. **Resp:** dyspnea. **CV:** first-dose orthostatic hypotension, arrhythmias, chest pain, edema, palpitations. **GI:** abdominal discomfort, constipation, diarrhea, dry mouth, flatulence, nausea, vomiting. **GU:** ↓ libido, priapism, sexual dysfunction. **Derm:** flushing, rash, urticaria. **MS:** arthralgia, arthritis, gout, myalgia.

Interactions

Drug-Drug: ↑ risk of hypotension with **sildenafil**, **tadalafil**, **vardenafil**, other **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. **NSAIDs**, **sympathomimetics**, or **estrogens** may ↓ effects of antihypertensive therapy.

Route/Dosage

Hypertension

PO (Adults): — 1 mg once daily, may be gradually ↑ at 2-wk intervals to 2–16 mg/day; incidence of postural hypotension greatly ↑ at doses >4 mg/day. *BPH* — 1 mg once daily, may be gradually increased to 8 mg/day.

Benign Prostatic Hyperplasia

PO (Adults): *Immediate release* — 1 mg once daily, may be ↑ every 1–2 wk up to 8 mg/day; *Extended release* — 4 mg once daily (with breakfast), may be ↑ in 3–4 wk to 8 mg/day.

Availability (generic available)

Tablets: 1 mg, 2 mg, 4 mg, 8 mg. **Cost:** *Generic* — 1 mg $60.00/100, 2 mg $79.89/100, 4 mg $85.34/100, 8 mg $60.41/100. **Extended-release tablets:** 4 mg, 8 mg. **Cost:** 4 mg $84.62/30, 8 mg $88.90/30.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse 2–6 hr after first dose, with each increase in dose, and periodically during therapy. Report significant changes.
- Assess for first-dose orthostatic hypotension and syncope. Incidence may be dose related. Observe patient closely during this period and take precautions to prevent injury.
- Monitor intake and output ratios and daily weight, and assess for edema daily, especially at beginning of therapy. Report weight gain or edema.
- **BPH:** Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) prior to and periodically during therapy.

Implementation

- Do not confuse Cardura with Coumadin.
- **PO:** Administer daily dose at bedtime.
- XL tablets should be swallowed whole; do not break, crush, or chew.
- **Hypertension:** May be administered concurrently with a diuretic or other antihypertensive.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.

© F.A. Davis Publishing

- Caution patient to change positions slowly to decrease orthostatic hypotension. May cause syncopal episodes, especially within first 24 hr of therapy, with dose increase, and with resumption of therapy after interruption.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of alcohol or OTC medications and herbal products, especially cold preparations, without consulting health care professional, especially cough, cold, or allergy remedies.
- Advise male patient to notify health care professional if priapism or erection of longer than 4 hr occurs; may lead to permanent impotence if not treated.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up visits to determine effectiveness of therapy.
- **Hypertension:** Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and report significant changes.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management).

Evaluation/Desired Outcomes

- Decrease in BP without appearance of side effects.
- Decrease in urinary symptoms of BPH.

doxercalciferol, See VITAMIN D COMPOUNDS.

HIGH ALERT

DOXOrubicin hydrochloride

(dox-oh-**roo**-bi-sin)

Adriamycin PFS, Myocet

Classification

Therapeutic: antineoplastics

Pharmacologic: anthracyclines

Indications

Alone or with other modalities in the treatment of various solid tumors including: Breast, Ovarian, Bladder, Bronchogenic carcinoma, Malignant lymphomas and leukemias.

Action

Inhibits DNA and RNA synthesis by forming a complex with DNA; action is cell-cycle S-phase–specific. Also has immunosuppressive properties. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.

Distribution: Widely distributed; does not cross the blood-brain barrier; extensively bound to tissues.

Metabolism and Excretion: Mostly metabolized by the liver (primarily by CYP2D6 and CYP3A4). Converted by liver to an active compound. Excreted predominantly in the bile, 50% as unchanged drug. Less than 5% eliminated unchanged in the urine.

Half-life: 16.7 hr.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	10 days	14 days	21–24 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: History of cardiac disease or high cumulative doses of anthracyclines; Depressed bone marrow reserve; Hepatic impairment (↓ dose if serum bilirubin >1.2 mg/dL); Pedi, Geri: Children, geriatric patients, mediastinal radiation, concurrent cyclophosphamide (↑ risk of cardiotoxicity); Rep: Women of reproductive potential and men with female partners of reproductive potential;.

Adverse Reactions/Side Effects

CV: CARDIOMYOPATHY, ECG changes. **Derm:** alopecia, photosensitivity. **Endo:** sterility, prepubertal growth failure with temporary gonadal impairment (children only). **GI:** diarrhea, esophagitis, nausea, stomatitis, vomiting. **GU:** red urine. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** phlebitis at IV site, tissue necrosis. **Metab:** hyperuricemia. **Resp:** recall pneumonitis. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: CYP2D6 inhibitors, **CYP3A4 inhibitors**, and **P-glycoprotein inhibitors** may ↑ risk of toxicity; avoid concurrent use. **CYP2D6 inducers**, **CYP3A4 inducers**, and **P-glycoprotein inducers** may ↓ effect and ↑ risk of therapeutic failure; avoid concurrent use. ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. Pediatric patients who have received concurrent doxorubicin and **dactinomycin** have an ↑ risk of recall pneumonitis at variable times following local radiation therapy. May ↑ skin reactions at previous **radiation therapy** sites. If **paclitaxel** is administered first, clearance of doxorubicin is ↓ and the incidence and severity of neutropenia

© F.A. Davis Publishing

and stomatitis are ↑ (problem is diminished if doxorubicin is administered first). Hematologic toxicity is ↑ and prolonged by concurrent use of **cyclosporine**; risk of coma and seizures is also ↑. Incidence and severity of neutropenia and thrombocytopenia are ↑ by concurrent **progesterone**. **Phenobarbital** may ↑ clearance and ↓ effects of doxorubicin. Doxorubicin may ↓ metabolism and ↑ effects of **phenytoin**. **Streptozocin** may ↑ the half-life of doxorubicin (dosage ↓ of doxorubicin recommended). May ↑ risk of hemorrhagic cystitis from **cyclophosphamide**. May ↑ risk of hepatotoxicity from **mercaptopurine**. Cardiac toxicity may be ↑ by **radiation therapy** or **cyclophosphamide**. ↑ risk of cardiac toxicity with **trastuzumab**; avoid use of doxorubicin for up to 7 mo after discontinuing trastuzumab. If **dexrazoxane** is administered at initiation of doxorubicin-containing regimens, may ↑ risk of therapeutic failure and tumor progression. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Other regimens are used.

IV (Adults): 60–75 mg/m² daily, repeat every 21 days; or 25–30 mg/m² daily for 2–3 days, repeat every 3–4 wk or 20 mg/m²/wk. Total cumulative dose should not exceed 550 mg/m² without monitoring of cardiac function or 400 mg/m² in patients with previous chest radiation or other cardiotoxic chemotherapy.

IV (Children): 30 mg/m²/day for 3 days every 4 wk.

Hepatic Impairment

IV (Adults): *Serum bilirubin 1.2–3 mg/dL*—↓ dose by 50%; *Serum bilirubin 3.1–5 mg/dL*—↓ dose by 75%.

Availability (generic available)

Powder for injection: 10 mg/vial, 20 mg/vial, 50 mg/vial, 150 mg/vial. **Solution for injection:** 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, and report occurrence of significant discrepancies. Encourage fluid intake of 2000–3000 mL/day. Allopurinol and alkalinization of the urine may be used to decrease serum uric acid levels and to help prevent urate stone formation.
- Severe and protracted nausea and vomiting may occur as early as 1 hr after therapy and may last 24 hr. Administer parenteral antiemetics 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration.
- Monitor for development of signs of cardiac toxicity, which may be either acute and transient (ST segment depression, flattened T wave, sinus tachycardia, and extrasystoles) or late onset (usually occurs 1–6 mo after initiation of therapy) and characterized by intractable HF (peripheral edema, dyspnea, rales/crackles, weight gain). Chest x ray, echocardiography, ECGs, and radionuclide angiography may be ordered prior to and periodically during therapy. Cardiotoxicity is more prevalent in children younger than 2 yr and geriatric patients. Dexrazoxane may be used to prevent cardiotoxicity in patients receiving cumulative doses of >300 mg/m².
- Assess injection site frequently for redness, irritation, or inflammation during and for up to 2 hr after completion of infusion. Doxorubicin is a vesicant but may infiltrate painlessly even if blood returns on aspiration of infusion needle. Severe tissue damage may occur if doxorubicin extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein. Local infiltration of antidote is not recommended. If extravasation is suspected, intermittent application of ice to site for 15 min. 4 times daily for 3 days may be useful. Because of the progressive nature of extravasation reactions, close observation and plastic surgery consultation are recommended. Blistering, ulceration, and/or persistent pain are indications for wide excision surgery, followed by split-thickness skin grafting. May use dexrazoxane to treat extravasation. Administer first infusion of dexrazoxane as soon as possible within 6 hr of extravasation. Remove ice packs for at least 15 min prior to and during dexrazoxane administration. Recommended dose of dexrazoxane for day 1 is 1000 mg/m² (up to 2000 mg); the dose for day 2 is 1000 mg/m² (up to 2000 mg); the dose for day 3 is 500 mg/m² (up to 1000 mg). Dexrazoxane is administered as an IV infusion over 1–2 hr. If swelling, redness, and/or pain persists beyond 48 hr, immediate consultation for possible debridement is indicated.
- Assess oral mucosa frequently for development of stomatitis. Increased dosing interval and/or decreasing dose is recommended if lesions are painful or interfere with nutrition.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor CBC and differential prior to and periodically during therapy. WBC nadir occurs 10–14 days after administration, and recovery usually occurs by the 21st day. Thrombocytopenia and anemia may also occur. Increased dosing interval and/or decreased dose is recommended if ANC is <1000 cells/mm³ and/or platelet count is <50,000 cells/mm³.

© F.A. Davis Publishing

- Monitor renal (BUN and serum creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to and periodically during therapy. Dose reduction is required for bilirubin >1.2 m g/dL or serum creatinine >3 m g/dL.
- May cause ↑ serum and urine uric acid concentrations.

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse doxorubicin hydrochloride with doxorubicin liposomal (Doxil) or with daunorubicin hydrochloride or with idarubicin. Clarify orders that do not include both generic and brand names.
- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- Aluminum needles may be used to administer doxorubicin but should not be used during storage, because prolonged contact results in discoloration of solution and formation of a dark precipitate. Solution is red.

IV Administration

- **IV Push:** ***Dilution:*** Dilute each 10 mg with 5 mL of 0.9% NaCl (nonbacteriostatic) for injection. Shake to dissolve completely. Do not add to IV solution. Reconstituted medication is stable for 24 hr at room temperature and 48 hr if refrigerated. Protect from sunlight. ***Concentration:*** 2 mg/mL. ***Rate:*** Administer each dose over 3–5 min through Y-site of a free-flowing infusion of 0.9% NaCl or D5W. Facial flushing and erythema along involved vein frequently occur when administration is too rapid.
- **Intermittent Infusion:** Has also been mixed in 100–250 mL of 0.9% NaCl. ***Rate:*** Infuse over 30–60 min.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, anidulafungin, argatroban, arsenic trioxide, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, chlorpromazine, ciprofloxacin, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, D5W, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, gemcitabine, gentamicin, granisetron, haloperidol, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, lidocaine, linezolid, lorazepam, mannitol, melphalan, meperidine, mesna, methotrexate, metoclopramide, metoprolol, midazolam, milrinone, mitomycin, morphine, moxifloxacin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, 0.9% NaCl, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, phenylephrine, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, sargramostim, sodium acetate, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, azithromycin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, diazepam, digoxin, ertapenem, foscarnet, fosphenytoin, ganciclovir, gemtuzumab ozogamicin, magnesium sulfate, meropenem, methohexital, minocycline, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium phosphate, propofol, rituximab, sodium phosphate, thiopental, trimethoprim/sulfamethoxazole, voriconazole.

Patient/Family Teaching

- Explain purpose of doxorubicin to patient.
- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs, because these may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care pro-

© F.A. Davis Publishing

fessional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. The risk of developing stomatitis is greatest 5–10 days after a dose; usual duration is 3–7 days.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, swelling of lower extremities, or skin irritation (swelling, pain, or redness of feet or hands) occurs.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy.
- Advise family and/or caregivers to take precautions (i.e., latex gloves) in handling body fluids for at least 5 days post-treatment.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Inform patient that doxorubicin may increase risk of developing secondary cancers.
- Rep: May have teratogenic effects. Advise females of reproductive potential to use effective contraception during and for 6 mo after last dose and to avoid breast feeding during and for 10 days after last dose. Advise males with female partners of reproductive potential to use effective contraception during and for at least 3 mo after last dose of doxorubicin. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression, or irreversible amenorrhea or early menopause.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignancies in solid tumors.
- Improvement of hematologic status in leukemias.

HIGH ALERT

DOXOrubicin, liposomal

(dox-oh-**roo**-bi-sin **lye**-poe-sohm-al)

Caelyx, Doxil

Classification

Therapeutic: antineoplastics
Pharmacologic: anthracyclines

Indications

AIDS-related Kaposi's sarcoma (KS) in patients who cannot tolerate or fail conventional therapy. Ovarian cancer that has progressed or recurred after platinum-based chemotherapy. Multiple myeloma with bortezomib in patients who have not previously received bortezomib and have received at least one prior therapy.

Action

Inhibits DNA and RNA synthesis by forming a complex with DNA; action is cell-cycle S-phase–specific. Also has immunosuppressive properties. Encapsulation in a liposome increases uptake by tumors, prolongs action, and may decrease some toxicity. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: Administered IV only, resulting in complete bioavailability.
Distribution: Widely distributed; does not cross the blood-brain barrier; extensively bound to tissues (↑ concentrations delivered to KS lesions due to liposomal carrier).
Metabolism and Excretion: Mostly metabolized by the liver with conversion to an active compound. Excreted mostly in bile, 50% as unchanged drug. <5% eliminated unchanged in the urine.
Half-life: 55 hr.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	10 days	14 days	21–24 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Pre-existing cardiac disease or ↑ cumulative doses of anthracyclines; Depressed bone marrow reserve; Hepatic impairment (dose ↓ required if serum bilirubin >1.2 m g/dL); Rep: Women of reproductive potential; Geri, Pedi: Children, geriatric patients, prior mediastinal radiation, concurrent cyclophosphamide (↑ risk of cardiotoxicity).

Adverse Reactions/Side Effects

CV: CARDIOMYOPATHY. **Derm:** hand-foot syndrome, alopecia. **GI:** nausea, diarrhea, ↑ alkaline phosphatase, moniliasis, ORAL MALIGNANCY, stomatitis, vomiting. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** injection site reactions. **Neuro:** weakness. **Misc:** ANAPHYLACTOID ALLERGIC REACTIONS, acute infusion-related reactions, fever.

Interactions

Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. Pediatric patients who have received concurrent doxorubicin and **dactinomycin** have ↑ risk of recall pneumonitis following local radiation therapy. May ↑ skin reactions at previous **radiation therapy** sites. If **paclitaxel** is administered first, clearance of doxorubicin is ↓ and inci-

© F.A. Davis Publishing

dence and severity of neutropenia and stomatitis are ↑ (problem is less if doxorubicin is administered first). Hematologic toxicity is ↑ by concurrent use of **cyclosporine**; risk of coma and seizures is also ↑. Incidence and severity of neutropenia and thrombocytopenia are ↑ by concurrent **progesterone**. **Phenobarbital** may ↑ clearance and ↓ effects of doxorubicin. Doxorubicin may ↓ metabolism and ↑ effects of **phenytoin**. **Streptozocin** may ↑ the half-life of doxorubicin (dose reduction of doxorubicin recommended). May ↑ risk of hemorrhagic cystitis from **cyclophosphamide** or hepatitis from **mercaptopurine**. Cardiac toxicity may be ↑ by **radiation therapy** or **cyclophosphamide**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

AIDS-Related KS

IV (Adults): 20 mg/m² every 3 wk until disease progression or unacceptable toxicity.

Ovarian Cancer

IV (Adults): 50 mg/m² every 4 wk until disease progression or unacceptable toxicity.

Multiple Myeloma

IV (Adults): 30 mg/m² on day 4 (after bortezomib) of each 21-day cycle for 8 cycles or until disease progression or unacceptable toxicity.

Availability (generic available)

Liposomal dispersion for injection (requires dilution): 2 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor for acute infusion-related reactions consisting of flushing, shortness of breath, facial swelling, headache, chills, chest pain, back pain, chest or throat tightness, fever, tachycardia, pruritus, rash, cyanosis, syncope, bronchospasm, asthma, apnea, and hypotension. Reactions usually resolve over 1 day and are usually limited to first dose. Slowing infusion rate may minimize this reaction. Reaction is thought to be due to liposome.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue doxorubicin liposome and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios, and report occurrence of significant discrepancies. Encourage fluid intake of 2000–3000 mL/day. Allopurinol and alkalinization of the urine may be used to decrease serum uric acid levels and to help prevent urate stone formation.
- Severe and protracted nausea and vomiting may occur as early as 1 hr after therapy and may last 24 hr. Administer parenteral antiemetics 30–45 min prior to therapy and routinely around the clock for the next 24 hr as indicated. Monitor amount of emesis and notify health care professional if emesis exceeds guidelines to prevent dehydration.
- Assess left ventricular cardiac function (MUGA or echocardiogram) prior to initiation of therapy, during treatment to detect acute changes, and after treatment to detect delayed cardiotoxicity. Monitor for development of signs of cardiac toxicity, which may be either acute and transient (ST segment depression, flattened T wave, sinus tachycardia, and extrasystoles) or late onset (usually occurs 1–6 mo after initiation of therapy) and characterized by intractable HF (peripheral edema, dyspnea, rales/crackles, weight gain); occurs more frequently in patients receiving a cumulative dose of ≥550 mg/m². Cardiotoxicity is more prevalent in children younger than 2 yr and geriatric patients. Dexrazoxane may be used to prevent cardiotoxicity in patients receiving cumulative doses of >300 m g/m².
- Assess injection site frequently for redness, irritation, or inflammation. Doxorubicin liposome is an irritant but may infiltrate painlessly even if blood returns on aspiration of infusion needle. Severe tissue damage may occur if doxorubicin liposome extravasates. If extravasation occurs, stop infusion immediately, restart, and complete dose in another vein. If possible, withdraw 3–5 mL of blood to remove doxorubicin liposome. Apply ice to site for 15 min 4 times daily for 3 days. Local infiltration of antidote is not recommended. Delineate the infiltrated area on patient's skin with a felt-tip marker. Elevate for 48 hr above heart level using a sling or stockinette dressing with an observation window cut in the dressing. Avoid pressure or friction. Do not rub the area. Observe for signs of increased erythema, pain, or skin necrosis. If increased symptoms occur, consult a plastic surgeon. After 48 hr, encourage patient to use extremity normally to promote full range of motion.

© F.A. Davis Publishing

- Assess oral mucosa frequently for development of stomatitis. Increased dosing interval and/or decreased dose is recommended if lesions are painful or interfere with nutrition. *For Grade 1: Painless ulcers, erythema, or mild soreness,* If no previous Grade 3 or 4 toxicity: no dose adjustment. If previous Grade 3 or 4 toxicity: delay up to 2 wk then ↓ dose by 25%. *For Grade 2: Painful erythema, edema, or ulcers, but can eat,* Delay dosing up to 2 wk or until resolved to Grade 0-1. Discontinue therapy if no resolution after 2 wk. If resolved to Grade 0-1 within 2 wk: if no previous Grade 3 or 4 stomatitis: resume therapy at previous dose. If previous Grade 3 or 4 toxicity: ↓ dose by 25%. *For Grade 3: Painful erythema, edema, or ulcers, and cannot eat,* Delay dosing up to 2 wk or until resolved to Grade 0-1. ↓ dose by 25% and return to original dose interval. If no resolution after 2 wk, discontinue therapy. *For Grade 4: Requires parenteral or enteral support,* Delay dosing up to 2 wk or until resolved to Grade 0-1. ↓ dose by 25% and return to original dose interval. If no resolution after 2 wk, discontinue therapy.
- Continue to assess oral mucosa regularly during and for at least 6 yr for ulceration or any discomfort; may indicate secondary oral cancer.
- Monitor for skin toxicity with prolonged use; hand-foot syndrome (HFS) usually occurs after 6 wk of treatment and consists of swelling, pain, and erythema of the hands and feet. This may progress to desquamation but usually regresses after 2 wk. In severe cases, modification and delay of future doses of doxorubicin liposome may be necessary. *For Grade 1: Mild erythema, swelling, or desquamation not interfering with daily activities,* if no previous Grade 3 or 4 HFS: no dose adjustment. If previous Grade 3 or 4 HFS: delay dose up to 2 wk, then ↓ dose by 25%. *For Grade 2: Erythema, desquamation, or swelling interfering with, but not precluding normal physical activities; small blisters or ulcerations less than 2 cm in diameter,* delay dosing up to 2 wk or until resolved to Grade 0-1. Discontinue therapy if no resolution after 2 wk. If resolved to Grade 0-1 within 2 wk: if no previous Grade 3 or 4 HFS: continue treatment at previous dose. If previous Grade 3 or 4 toxicity: ↓ dose by 25%. *For Grade 3: Blistering, ulceration, or swelling interfering with walking or normal daily activities; cannot wear regular clothing,* Delay dosing up to 2 wk or until resolved to Grade 0-1, then ↓ dose by 25%. Discontinue therapy if no resolution after 2 wk. *For Grade 4: Diffuse or local process causing infectious complications, or a bedridden state or hospitalization,* Delay dosing up to 2 wk or until resolved to Grade 0-1, then ↓ dose by 25%. Discontinue therapy if no resolution after 2 wk.
- ***Lab Test Considerations:*** Obtain negative pregnancy test before starting therapy.
- Monitor CBC and differential prior to and periodically during therapy. The WBC nadir occurs 10–14 days after administration, and recovery usually occurs by the 21st day. Thrombocytopenia and anemia may also occur. ↑ dosing interval and/or ↓ dose is recommended if ANC is <1000 cells/mm^3 and/or platelet count is <50,000 cells/mm^3. *If ANC 1500–1900 cells/mm^3 and platelets 75,000–150,000 cells/mm^3 (Grade 1),* resume treatment with no dose reduction. *If ANC 1000–<1500 cells/mm^3 and platelets 50,000–<75,000 cells/mm^3 (Grade 2),* wait until ANC >1500 and platelets >75,000; then redose with no dose reduction. *If ANC 500–999 cells/mm^3 and platelets 25,000–<50,000 cells/mm^3 (Grade 3),* wait until ANC >1500 and platelets >75,000; then redose with no dose reduction. *If ANC <500 and platelets <25,000 cells/mm^3 (Grade 4),* wait until ANC >1500 and platelets >75,000, then redose at 25% dose reduction or continue full dose with prophylactic granulocyte growth factor.
- **Recommended modifications of doxorubicin liposomal when administered with bortezomib.** *If fever ≥38°C and ANC <1,000/mm^3,* withhold dose for this cycle if before Day 4; ↓ dose by 25%, if after Day 4 of previous cycle. *If on any day of drug administration after Day 1 of each cycle: Platelet count <25,000/mm^3 or Hemoglobin <8 g/dL or ANC <500/mm^3,* withhold dose for this cycle if before Day 4; ↓ dose by 25%, if after Day 4 of previous cycle AND if bortezomib is reduced for hematologic toxicity. *If Grade 3 or 4 nonhematologic drug related toxicity,* do not dose until recovered to Grade <2, then ↓ dose by 25%.
- Monitor renal (BUN and creatinine) and hepatic (AST, ALT, LDH, and serum bilirubin) function prior to and periodically during therapy. Dose reduction is required for bilirubin >1.2 m g/dL or serum creatinine >3 m g/dL.
- May cause ↑ serum and urine uric acid concentrations.

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse doxorubicin liposomal (Doxil) with doxorubicin hydrochloride or with daunorubicin hydrochloride. Do not confuse Doxil (doxorubicin liposomal) with Paxil (paroxetine). Clarify orders that do not include both generic and brand names.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.

© F.A. Davis Publishing

- Aluminum needles may be used to administer doxorubicin but should not be used during storage, because prolonged contact results in discoloration of solution and formation of a dark precipitate. Solution is red.
- Do not increase dose if reduction is made due to toxicity.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute dose, up to 90 mg, in 250 mL and doses >90 mg in 500 mL of D5W. Do not dilute with other diluents or diluents containing a bacteriostatic agent. Solution is not clear, but a translucent red liposomal dispersion. Do not use in-line filters. Refrigerate diluted solutions and administer within 24 hr of dilution. ***Rate:*** Initial rate of infusion should be 1 mg/min to minimize risk of infusion reactions. If no reactions occur, increase rate to complete administration within 1 hr. Do not administer as a bolus or undiluted solution. Rapid infusion may increase infusion-related reactions.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposomal, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, butorphanol, calcium gluconate, carboplatin, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, digoxin, diphenhydramine, dobutamine, dopamine, droperidol, enalaprilat, ephedrine, epinephrine, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone, ifosfamide, imipenem/cilastatin, insulin regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, meropenem, mesna, methotrexate, methyldopate, methylprednisolone, metoprolol, midazolam, milrinone, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, thiopental, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amiodarone, amphotericin B deoxycholate, buprenorphine, calcium chloride, ceftazidime, dantrolene, diazepam, diltiazem, docetaxel, gemcitabine, hydralazine, hydroxyzine, mannitol, metoclopramide, mitoxantrone, morphine, paclitaxel, phenytoin, piperacillin/tazobactam, promethazine, sodium bicarbonate, theophylline.

Patient/Family Teaching

- Instruct patient to notify health care professional promptly if fever; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate gastric bleeding.
- Instruct patient to report pain at injection site immediately.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush, rinse mouth with water after eating and drinking, and confer with health care professional if mouth pain interferes with eating. Pain may require treatment with opioid analgesics. The risk of developing stomatitis is greatest 5–10 days after a dose; the usual duration is 3–7 days.
- Instruct patient to notify health care professional immediately if irregular heartbeat, shortness of breath, swelling of lower extremities, or skin irritation (swelling, pain, or redness of feet or hands) occurs.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that medication may cause urine to appear red for 1–2 days.
- Instruct patient to notify health care professional if skin irritation occurs at site of previous radiation therapy.
- Advise family and/or caregivers to take precautions (i.e., latex gloves) in handling body fluids for at least 5 days post-treatment.
- Rep: May have teratogenic effects. Advise females of reproductive potential and males with female part-

© F.A. Davis Publishing

ners of reproductive potential to use effective contraception during and for at least 6 mo after last dose of therapy. Inform patient before initiating therapy that this medication may cause irreversible gonadal suppression. In females, may cause infertility, amenorrhea, and premature menopause. In men, may result in oligospermia, azoospermia, and permanent loss of fertility. Some sperm counts have returned to normal several yr after therapy ended. Advise female patient to avoid breast feeding during therapy.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes
- Decrease in size or spread of malignancies.
- Arrested progression of KS in patients with HIV infection.

doxycycline, See TETRACYCLINES.

doxylamine/pyridoxine
(dox-**il**-a-meen peer-ih-**dox**-een)
Bonjesta, Diclegis, Diclectin

Classification
Therapeutic: antiemetics
Pharmacologic: antihistamines, vitamin B6 analogues

Indications
Treatment of nausea and vomiting during pregnancy that has not responded to conservative management.

Action
Combination of an antihistamine and a vitamin B_6 analog. Mechanism not known. **Therapeutic Effects:** Decreased nausea and vomiting associated with pregnancy.

Pharmacokinetics
Absorption: Well absorbed following oral administration. Food delays/↓ absorption.
Distribution: Doxylamine probably enters breast milk.
Metabolism and Excretion: Doxylamine is mostly metabolized by the liver, inactive metabolites are renally excreted. Pyridoxine is a pro-drug, converted to its active metabolite by the liver.
Half-life: *Doxylamine*—12.5 hr; *pyridoxine*—0.4–0.5 hr.

TIME/ACTION PROFILE (anti-emetic effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	8–24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to doxylamine or pyridoxine; Concurrent use of MAOIs; Lactation: Doxylamine probably enters breast milk and may cause irritability, excitement, or sedation in infants; breast feeding should be avoided.
Use Cautiously in: Asthma; ↑ intraocular pressure or narrow angle glaucoma; Stenosing peptic ulcer or pyloroduodenal obstruction; Urinary bladder-neck obstruction; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects
Neuro: drowsiness.

Interactions
Drug-Drug: ↑ risk of CNS depression with other **CNS depressants** including **alcohol**, other **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Concurrent use of **MAOIs** ↑ intensity/duration of adverse CNS (anticholinergic) reactions.

Route/Dosage

Delayed-Release Tablets
PO (Adults): *Day 1*—2 tablets (doxylamine 10 mg/pyridoxine 10 mg) at bedtime; if symptoms are controlled continue this regimen; *Day 2, if symptoms persist into afternoon on day 2*—2 tablets at bedtime on day 2 and then 1 tablet in the morning on day 3 and 2 tablets in the evening; if symptoms are controlled, continue this regimen; *Day 4, if symptoms persist*—1 tablet in the morning, 1 tablet mid-afternoon and 2 tablets at bedtime (not to exceed four tablets daily).

Extended-Release Tablets
PO (Adults): *Day 1*—1 tablet (doxylamine 20 mg/pyridoxine 20 mg) at bedtime; if symptoms are controlled, continue this regimen; *Day 2, if symptoms persist on day 2*—1 tablet in AM and 1 tablet at bedtime on day 2; if symptoms are controlled, continue this regimen (not to exceed two tablets daily).

Availability (generic available)
Delayed-release tablets (Diclegis): doxylamine 10 mg/pyridoxine 10 mg. **Extended-release tablets (Bonjesta):** doxylamine 20 mg/pyridoxine 20 mg.

NURSING IMPLICATIONS

Assessment
- Assess for frequency and amount of emesis daily during therapy. Reassess need for medication as pregnancy progresses.
- Monitor hydration status to prevent dehydration.
- ***Lab Test Considerations:*** May cause false positive urine screening tests for methadone, opiates, and PCP.

Implementation
- **PO:** Administer on an empty stomach with a full glass of water; food delays onset of medication. Swallow tablets whole; do not crush, break, or chew.

Patient/Family Teaching
- Instruct patient to take as directed. Do not take more than prescribed amount.

© F.A. Davis Publishing

- May cause drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to avoid alcohol and CNS depressants, including sedatives, tranquilizers, antihistamines, opioids, and some cough and cold medications with doxylamine pyridoxine.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patient to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decrease in frequency of nausea and vomiting during pregnancy.

drospirenone, See CONTRACEPTIVES, HORMONAL.

dulaglutide (doo-la-gloo-tide)

Trulicity

Classification

Therapeutic: antidiabetics
Pharmacologic: glucagon-like peptide-1 (GLP-1) receptor agonists

Indications

Type 2 diabetes (as adjunct to diet and exercise). To reduce the risk of major cardiovascular events in patients with type 2 diabetes who have established cardiovascular disease or multiple risk factors for cardiovascular disease.

Action

Acts as an acylated human Glucagon-Like Peptide-1 (GLP-1, an incretin) receptor agonist; increases intracellular cyclic AMP (cAMP) leading to insulin release when glucose is elevated, which then subsides as blood glucose decreases toward euglycemia. Also decreases glucagon secretion and delays gastric emptying. **Therapeutic Effects:** Improved glycemic control. Reduction in risk of cardiovascular death, non-fatal MI, or non-fatal stroke.

Pharmacokinetics

Absorption: *0.75 mg dose*—65% absorbed following subcutaneous administration; *1.5 mg dose*—47% absorbed following subcutaneous administration.
Distribution: Unknown.
Metabolism and Excretion: Degraded by protein catabolic processes.
Half-life: 5 days.

TIME/ACTION PROFILE (↓ in A_{1c})

ROUTE	ONSET	PEAK	DURATION
Subcut	within 4 wk	13 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Personal or family history of medullary thyroid carcinoma; Multiple Endocrine Neoplasia syndrome type 2; History of pancreatitis; Type 1 diabetes; Diabetic ketoacidosis; Severe gastrointestinal disease (including severe gastroparesis).
Use Cautiously in: History of angioedema or anaphylaxis to another GLP-1 receptor agonist; Hepatic/renal impairment; Diabetic retinopathy (may ↑ risk of complications); OB: Use only if potential maternal benefit justifies potential fetal risk; Lactation: Use only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects

Derm: pruritus, rash. **Endo:** THYROID C-CELL TUMORS. **GI:** PANCREATITIS, abdominal pain, nausea, vomiting, constipation, ↓ appetite, diarrhea, dyspepsia. **GU:** acute renal failure. **Local:** injection site reactions. **Neuro:** fatigue. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Concurrent use with **insulin** or **agents that increase insulin secretion** including **sulfonylureas** may ↑ the risk of serious hypoglycemia; use cautiously and consider dose ↓ of insulin or agents increasing insulin secretion. May alter absorption of concomitantly administered **oral medications** due to delayed gastric emptying.

Route/Dosage

Subcut (Adults): 0.75 mg once weekly; may ↑ to 1.5 mg once weekly to obtain glycemic control; if additional glycemic control still needed, may then ↑ to 3 mg once weekly after receiving the 1.5 mg/wk dose for ≥4 wk; if additional glycemic control still needed, may then ↑ to 4.5 mg once weekly after receiving the 3 mg/wk dose for ≥4 wk.

Availability

Solution for injection (single-dose, prefilled pens): 0.75 mg/0.5 mL, 1.5 mg/0.5 mL, 3 mg/0.5 mL, 4.5 mg/0.5 mL.

NURSING IMPLICATIONS

Assessment

- Observe patient taking concurrent insulin for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety, headache, blurred vision, slurred speech, irritability).

© F.A. Davis Publishing

- If thyroid nodules or elevated serum calcitonin are noted, patient should be referred to an endocrinologist.
- Monitor for pancreatitis (persistent severe abdominal pain, sometimes radiating to the back, with or without vomiting). If pancreatitis is suspected, discontinue dulaglutide; if confirmed, do not restart dulaglutide.
- ***Lab Test Considerations:*** Monitor serum A_{1c} periodically during therapy to evaluate effectiveness.
- May ↑ lipase and pancreatic amylase.

Implementation

- Do not confuse Trulicity (dulaglutide) with Toujeo (insulin glargine), Tradjenta (linagliptin), or Tresiba (insulin degludec).
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **Subcut:** Administer once weekly at any time of the day, without regard to food. Day of wk may be changed as long as at least 72 hr before next dose. Inject into abdomen, thigh, or upper arm. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter.

Patient/Family Teaching

- Instruct patient on use of pen and to take dulaglutide as directed. Follow manufacturer's instructions for pen use. Pen should never be shared between patients, even if needle is changed. Store pen in refrigerator; do not freeze. After initial use, pen may be stored at room temperature up to 14 days. Advise patient to read the *Medication Guide* before starting dulaglutide and with each Rx refill in case of changes.
- Take missed dose as soon as remembered as long as 3 days (72 hr) until next scheduled dose. If less than 3 days until next scheduled dose, skip and take next scheduled dose.
- Inform patient that nausea is the most common side effect, but usually decreases over time.
- Advise patient taking insulin and dulaglutide to never mix insulin and dulaglutide together. Give as 2 separate injections. Both injections may be given in the same body area, but should not be given right next to each other.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness, and health care professional should be notified if significant changes occur.
- Advise patient to notify health care professional if changes in vision occur during therapy.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to notify health care professional immediately if signs of pancreatitis (nausea, vomiting, abdominal pain) or hypersensitivity (swelling of face, lips, tongue or throat, problems breathing or swallowing, severe rash or itching, fainting or feeling dizzy, very rapid heartbeat) occur.
- Inform patient of risk of benign and malignant thyroid C-cell tumors. Advise patient to notify health care professional if symptoms of thyroid tumors (lump in neck, hoarseness, trouble swallowing, shortness of breath) or if signs of allergic reaction (swelling of face, lips, tongue, or throat; fainting or feeling dizzy; very rapid heartbeat; problems breathing or swallowing; severe rash or itching) occur.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Rep: Insulin is the preferred method of controlling blood glucose during pregnancy. Counsel female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Improved glycemic control.
- Reduction in risk of cardiovascular death, non-fatal MI, or non-fatal stroke.

DULoxetine (do-lox-e-teen)

Cymbalta, Drizalma Sprinkle

Classification

Therapeutic: antidepressants
Pharmacologic: selective serotonin/norepinephrine reuptake inhibitors

Indications

Major depressive disorder. Diabetic peripheral neuropathic pain. Generalized anxiety disorder. Chronic musculoskeletal pain (including chronic lower back pain and chronic pain from osteoarthritis). Fibromyalgia.

© F.A. Davis Publishing

Action

Inhibits serotonin and norepinephrine reuptake in the CNS. Both antidepressant and pain inhibition are centrally mediated. **Therapeutic Effects:** Decreased depressive symptomatology. Decreased neuropathic pain. Decreased symptoms of anxiety. Decreased pain.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: >90%.
Metabolism and Excretion: Mostly metabolized, primarily by the CYP2D6 and CYP1A2 enzyme pathways; ⚷ the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly ↑ duloxetine concentrations and an ↑ risk of adverse effects.
Half-life: 12 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	6 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Severe renal impairment (CCr <30 mL/min); Hepatic impairment or substantial alcohol use (↑ risk of hepatitis).
Use Cautiously in: History of suicide attempt or ideation; History of mania (may activate mania/hypomania); Concurrent use of other centrally acting drugs (↑ risk of adverse reactions); History of seizure disorder; Diabetes (may worsen glycemic control); Angle-closure glaucoma; OB: Use during 3rd trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support; may ↑ risk of postpartum hemorrhage in mother when used in the month before delivery; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children or adolescents. Safety and effectiveness not established in children <7 yr (generalized anxiety disorder) or <13 yr (fibromyalgia); Geri: ↑ risk of orthostatic hypotension and falls in older adults.

Adverse Reactions/Side Effects

CV: ↑ BP, orthostatic hypotension. **Derm:** ERYTHEMA MULTIFORME (EM), STEVENS-JOHNSON SYNDROME (SJS), ↑ sweating, pruritus, rash. **EENT:** blurred vision, ↑ intraocular pressure. **F and E:** hyponatremia. **GI:** HEPATOTOXICITY, PANCREATITIS, ↓ appetite, constipation, dry mouth, nausea, diarrhea, ↑ liver enzymes, gastritis, vomiting. **GU:** dysuria, ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction, urinary retention. **Hemat:** BLEEDING. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, fatigue, drowsiness, insomnia, activation of mania, dizziness, fainting, falls, nightmares, tremor. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious potentially fatal reactions (Do not use within 14 days of discontinuing MAO inhibitor. Wait at least 5 days after stopping duloxetine to start MAO inhibitor). Concurrent use with **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving duloxetine, immediately discontinue duloxetine and monitor for signs/symptoms of serotonin syndrome for 5 days or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume duloxetine therapy 24 hr after last dose of linezolid or methylene blue). ↑ risk of hepatotoxicity with alcohol use disorder/**alcohol** abuse. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome. **Strong CYP1A2 inhibitors**, including **cimetidine**, **ciprofloxacin**, and **fluvoxamine**, may ↑ levels; avoid concurrent use. **Drugs that inhibit CYP2D6**, including **paroxetine**, **fluoxetine**, and **quinidine** ↑ levels of duloxetine and may increase the risk of adverse reactions. Duloxetine also inhibits CYP2D6 and may ↑ levels of drugs metabolized by CYP2D6, including **tricyclic antidepressants**, **phenothiazines**, and **class Ic antiarrhythmics** (**propafenone** and **flecainide**); concurrent use should be undertaken with caution. ↑ risk of serious arrhythmias with **thioridazine**; avoid concurrent use. ↑ risk of bleeding with **apixaban**, **aspirin**, **dabigatran**, **edoxaban**, **NSAIDs**, **rivaroxaban**, or **warfarin**.
Drug-Natural Products: Use with **St. John's wort** ↑ serotonin syndrome.

Route/Dosage

Major Depressive Disorder

PO (Adults): 40–60 mg/day (as 20 mg or 30 mg twice daily or as 60 mg once daily) as initial therapy, then 60 mg once daily as maintenance therapy.

Generalized Anxiety Disorder

PO (Adults ≥65 yr): 30 mg once daily for 2 wk; may then consider ↑ to 60 mg once daily, then may ↑ by 30 mg once daily to maintenance dose of 60–120 mg once daily.

© F.A. Davis Publishing

PO (Adults <65 yr): 30–60 mg once daily as initial therapy (if initiated on 30 mg once daily, should titrate to 60 mg once daily after 1 wk), then may ↑ by 30 mg once daily to maintenance dose of 60–120 mg once daily.
PO (Children ≥7 yr): 30 mg once daily for 2 wk; may then consider ↑ to 60 mg once daily; recommended maintenance dose = 30–60 mg once daily (not to exceed 120 mg once daily).

Diabetic Peripheral Neuropathic Pain

PO (Adults): 60 mg once daily.

Fibromyalgia

PO (Adults): 30 mg once daily for 1 wk, then ↑ to 60 mg once daily.
PO (Children ≥13 yr): *Cymbalta only*— 30 mg once daily; may ↑ to 60 mg once daily based on response and tolerability.

Chronic Musculoskeletal Pain

PO (Adults): 30 mg once daily for 1 wk, then ↑ to 60 mg once daily.

Availability (generic available)

Delayed-release capsules: 20 mg, 30 mg, 40 mg, 60 mg. **Cost:** 20 mg $437.15/60, 30 mg $473.58/60, 60 mg $478.64/60. **Delayed-release sprinkle capsules:** 20 mg, 30 mg, 40 mg, 60 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP before and periodically during therapy. Sustained hypertension may be dose related; decrease dose or discontinue therapy if this occurs.
- Monitor appetite and nutritional intake. Weigh weekly. Report continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess sexual function before starting duloxetine. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression, especially in early therapy or during dose changes. Risk may be increased in children, adolescents, and adults ≤24 yr. Restrict amount of drug available to patient.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- Assess for rash periodically during therapy. May cause SJS. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- **Depression or Anxiety:** Assess mental status (orientation, mood, and behavior). Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- **Pain or Fibromyalgia:** Assess intensity, quality, and location of pain periodically during therapy. May require several wk for effects to be seen.
- ***Lab Test Considerations:*** May cause ↑ ALT, AST, bilirubin, CK, and alkaline phosphatase.
- May cause hyponatremia.
- Monitor blood sugar and A1c. May cause slight ↑ in blood glucose.

Implementation

- Do not confuse duloxetine with fluoxetine, paroxetine, or Dexilant (dexlansoprazole). Do not confuse Cymbalta (duloxetine) with Symbyax (olanzapine/fluoxetine).
- **PO:** May be administered without regard to meals. ***DNC:*** Capsules should be swallowed whole. Do not crush, chew, or open and sprinkle contents on food or liquids; may affect enteric coating.
- *Drizalma Sprinkle:* May be administered without regard to meals. ***DNC:*** Swallow sprinkle whole; do not chew or crush capsule. Capsule can be opened and contents sprinkled over applesauce. Swallowed along with a small amount (tablespoonful) of applesauce immediately; do not store for later use.
- *Drizalma Sprinkle:* May be administered via NG tube. Open capsule and add contents to an all plastic catheter tip syringe; add 50 mL of water. Gently shake syringe for 10 sec. Promptly deliver through a 12 French or larger nasogastric tube. Ensure no pellets are left in syringe. Rinse with additional water (about 15 mL) if needed.

Patient/Family Teaching

- Instruct patient to take duloxetine as directed at the same time each day. Take missed doses as soon as possible unless time for next dose. Do not stop abruptly; may cause dizziness, headache, nausea, diarrhea, paresthesia, irritability, vomiting, insomnia, anxiety, hyperhidrosis, and fatigue; must be decreased gradually. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Encourage patient and family to be alert for emergence of anxiety, agitation, panic attacks, insomnia, irritability, hostility, impulsivity, akathisia, hypomania, mania, worsening of depression and suicidal ideation, especially during early antidepressant therapy. If these symptoms occur, notify health care professional.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to make position changes slowly to minimize orthostatic hypotension and falls, especially in elderly patients and those taking antihypertensive medications.

© F.A. Davis Publishing

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially NSAIDs or aspirin.
- Instruct patient to notify health care professional if signs of serotonin syndrome (mental status changes: agitation, hallucinations, coma); autonomic instability (tachycardia, labile BP, hyperthermia); neuromuscular aberrations (hyperreflexia, incoordination); and/or gastrointestinal symptoms (nausea, vomiting, diarrhea); liver damage (pruritus, dark urine, jaundice, right upper quadrant tenderness, unexplained "flu-like" symptoms), bleeding (ecchymoses, hematomas, epistaxis, petechiae, hemorrhage), or rash occur.
- Advise patient to avoid taking alcohol during duloxetine therapy.
- Inform patient that duloxetine may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Rep: Instruct patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Use of duloxetine in last month of pregnancy may increase risk or postpartum hemorrhage. Monitor infants exposed to duloxetine via breast feeding for sedation, poor feeding, and poor weight gain. Register patients exposed to duloxetine during pregnancy in the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/antidepressants/.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed. Patients may notice improvement within 1–4 wk, but should be advised to continue therapy as directed. Therapy is usually continued for several mo.
- Decrease in neuropathic pain associated with diabetic peripheral neuropathy.
- Decrease in chronic musculoskeletal pain and pain and soreness associated with fibromyalgia.
- Decrease in anxiety.

dupilumab (doo-pil-ue-mab)

Dupixent

Classification

Therapeutic: anti-inflammatories, anti-asthmatics

Pharmacologic: interleukin antagonists

Indications

Moderate-to-severe atopic dermatitis not controlled by other prescription therapies or when these therapies cannot be used (with or without topical corticosteroids). Add-on maintenance treatment of moderate-to-severe asthma that is of an eosinophilic phenotype or that is dependent on oral corticosteroids. Add-on maintenance treatment of inadequately controlled chronic rhinosinusitis with nasal polyposis.

Action

Monoclonal antibody that inhibits interleukin-4 (IL-4) and IL-13, which inhibits cytokine-induced inflammatory responses. Mechanism in asthma not fully established. **Therapeutic Effects:** Decreased severity of atopic dermatitis. Decreased incidence of asthma exacerbations. Reduction in nasal polyps and nasal congestion.

Pharmacokinetics

Absorption: 61–64% absorbed following subcut administration.

Distribution: Minimally distributed to tissues.

Metabolism and Excretion: Degraded by proteolytic enzymes located throughout the body.

Half-life: Unknown.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	1 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute bronchospasm or status asthmaticus.

Use Cautiously in: Pre-existing helminth infections; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <6 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: vasculitis. **EENT:** conjunctivitis, keratitis. **Hemat:** eosinophilia. **Resp:** eosinophilic pneumonia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), injection site reactions.

Interactions

Drug-Drug: Avoid use of **live vaccines**.

Route/Dosage

Atopic Dermatitis

Subcut (Adults and Children ≥6 yr and ≥60 kg): 600 mg (given as two 300-mg injections) initially, then 300 mg in 2 wk, then 300 mg every 2 wk.

© F.A. Davis Publishing

Subcut (Children ≥6 yr and 30–59 kg): 400 mg (given as two 200-mg injections) initially, then 200 mg in 2 wk, then 200 mg every 2 wk.
Subcut (Children ≥6 yr and 15–29 kg): 600 mg (given as two 300-mg injections) initially, then 300 mg in 4 wk, then 300 mg every 4 wk.

Asthma

Subcut (Adults and Children ≥12 yr): 400 mg (given as two 200-mg injections) initially, then 200 mg in 2 wk, then 200 mg every 2 wk *or* 600 mg (given as two 300-mg injections) initially, then 300 mg in 2 wk, then 300 mg every 2 wk. *Patients with oral corticosteroid-dependent asthma or concomitant moderate-to-severe atopic dermatitis*—600 mg (given as two 300-mg injections) initially, then 300 mg in 2 wk, then 300 mg every 2 wk.

Chronic Rhinosinusitis with Nasal Polyposis

Subcut (Adults): 300 mg every 2 wk.

Availability

Solution for injection (prefilled syringes and pens): 300 mg/2 mL, 200 mg/1.14 mL.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of hypersensitivity reactions (rash, urticaria, erythema nodosum, serum sickness) during therapy. If severe reaction occurs, treat symptomatically and discontinue dupilumab.
- Monitor for signs and symptoms of conjunctivitis and keratitis (eye redness or irritation) periodically during therapy.
- Monitor lung sounds periodically during therapy.
- Monitor for signs and symptoms of rhinosinusitis periodically during therapy.
- **Atopic Dermatitis:** Monitor skin lesions before starting and periodically during therapy.
- **Asthma:** Assess lung sounds, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced.

Implementation

- **Subcut:** Dose must be divided into two injections for 400 mg and 600 mg doses. Administer at different sites. Thigh and abdomen may be used if patient administers dose. May also use upper arm if administered by caregiver. Rotate site with each injection; do not inject in skin that is tender, damaged, bruised, or scarred. Allow solution to reach room temperature (45 min for 300 mg dose, 30 min for 200 mg dose) before injecting. Solution is clear to slightly opalescent, colorless to pale yellow; do not administer solutions that are cloudy, discolored, or contain particulate matter.

Patient/Family Teaching

- Instruct patient and caregiver in correct injection technique and disposal of equipment. Administer every other week missed dose as soon as remembered if within 7 days, then resume original schedule. If longer than 7 days, skip dose and resume with next scheduled dose. If every 4 wk dose is missed, administer injection within 7 days from missed dose and resume original schedule. If missed dose is not administered within 7 days, administer dose and start a new schedule based on this date. Advise patient to read *Instructions for Use* before starting therapy and with each Rx refill in case of changes.
- Inform patient that dupilumab is not used for acute asthma symptoms or exacerbations. Instruct patient to notify health care professional if asthma symptoms remain uncontrolled or worsen after starting dupilumab therapy.
- Advise patient to notify health care professional if new onset or worsening eye symptoms occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Advise patient to avoid live vaccines during therapy.
- Advise patient to have helminth infections treated before starting dupilumab therapy.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to dupilumab during pregnancy. Health care professionals and patients may call 1-877-311-8972 or go to https://mothertobaby.org/ongoing-study/dupixent/ to enroll in or to obtain information about the registry.

Evaluation/Desired Outcomes

- Decreased severity of atopic dermatitis.
- Decreased incidence of asthma exacerbations.
- Reduction in symptoms of chronic rhinosinusitis with nasal polyposis.

dutasteride (doo-**tas**-te-ride)
Avodart

Classification
Therapeutic: benign prostatic hyperplasia (BPH) agents
Pharmacologic: androgen inhibitors

Indications

Management of the symptoms of benign prostatic hyperplasia (BPH) in men with an enlarged prostate gland (alone or with tamsulosin).

Action

Inhibits the enzyme 5-alpha-reductase, which is responsible for converting testosterone to its potent me-

© F.A. Davis Publishing

tabolite 5-alpha-dihydrotestosterone in the prostate gland and other tissues. 5-Alpha-dihydrotestosterone is partly responsible for prostatic hyperplasia. **Therapeutic Effects:** Reduced prostate size with associated decrease in urinary symptoms.

Pharmacokinetics

Absorption: Well absorbed (60%) following oral administration; also absorbed through skin.
Distribution: 11.5% of serum concentration partitions into semen.
Protein Binding: 99% bound to albumin; 96.6% bound to alpha-1 glycoprotein.
Metabolism and Excretion: Mostly metabolized by the liver via the CYP3A4 metabolic pathway; metabolites are excreted in feces.
Half-life: 5 wk.

TIME/ACTION PROFILE (reduction in dihydrotestosterone levels†)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 wk	unknown

†Symptoms may only improve over 3–12 mo.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other 5-alpha-reductase inhibitors may occur; Women; Pedi: Children.
Use Cautiously in: Hepatic impairment.

Adverse Reactions/Side Effects

GU: PROSTATE CANCER (high-grade), ↓ libido, ejaculation disorders, erectile dysfunction, testicular pain, testicular swelling. **Endo:** gynecomastia. **Derm:** rash, urticaria. **Neuro:** depressed mood. **Misc:** ALLERGIC REACTIONS, ANGIOEDEMA.

Interactions

Drug-Drug: Blood levels and effects may be ↑ by **ritonavir**, **ketoconazole**, **verapamil**, **diltiazem**, **cimetidine**, **ciprofloxacin**, or other **CYP3A4 enzyme inhibitors**.

Route/Dosage

PO (Adults): 0.5 mg once daily (with or without tamsulosin).

Availability (generic available)

Soft gelatin capsules: 0.5 mg. ***In combination with:*** tamsulosin (Jalyn); see Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess patient for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Digital rectal examinations should be performed before and periodically during therapy for BPH.
- ***Lab Test Considerations:*** Serum prostate-specific antigen (PSA) concentrations, used to screen for prostate cancer, decrease by about 20% within the 1st mo of therapy and stabilize at about 50% of the pretreatment level within 6 mo. New baseline PSA concentrations should be established at 3 and 6 mo of therapy and evaluated periodically during therapy. Any increase in PSA during dutaseride therapy may be a sign of prostate cancer and should be evaluated, even those within normal limits. Isolated PSA values from men taking dutaseride for 3 mo or more should be doubled for comparison in untreated men.

Implementation

- **PO:** Administer once daily with or without meals. Do not break, crush, or chew capsule.

Patient/Family Teaching

- Instruct patient to take dutasteride at the same time each day as directed, even if symptoms improve or are unchanged. Take missed doses as soon as remembered later in the day or omit dose. Do not make up by taking double doses the next day.
- Caution patient that sharing of dutasteride may be dangerous.
- Inform patient that the volume of ejaculate may be decreased during therapy but that this will not interfere with normal sexual function.
- Advise patient to avoid donating blood for at least 6 mo after last dose of dutasteride to prevent a pregnant female from receiving dutasteride through a blood transfusion.
- Inform patient of potential increase risk in high-grade prostate cancer.
- Caution patient that dutasteride poses a potential risk to a male fetus. Women who are pregnant or may become pregnant should avoid exposure to semen of a partner taking dutasteride and should not handle dutasteride because of the potential for absorption.
- Emphasize the importance of periodic follow-up exams to determine whether a clinical response has occurred.

Evaluation/Desired Outcomes

- Decrease in urinary symptoms of BPH.

© F.A. Davis Publishing

© F.A. Davis Publishing

econazole, See ANTIFUNGALS (TOPICAL).

edaravone (e-dar-a-vone)
Radicava

Classification
Therapeutic: agents for amyotrophic lateral sclerosis

Indications
Amyotrophic lateral sclerosis (ALS).

Action
Unknown. **Therapeutic Effects:** Improved functional ability.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: 92%.
Metabolism and Excretion: Metabolized via sulfation and glucuronidation into inactive metabolites. Primarily eliminated in urine (1% as unchanged drug).
Half-life: 4.5–6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Sulfite allergy.
Use Cautiously in: Severe renal impairment; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects
Derm: contusion, dermatitis, eczema, fungal infection (tinea). **GU:** glycosuria. **Neuro:** gait abnormality, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions
Drug-Drug: None known.

Route/Dosage
IV (Adults): 60 mg once daily for 14 days, followed by a drug-free period of 14 days. Each subsequent cycle should consist of 60 mg once daily for 10 days out of 14 days, followed by a drug-free period of 14 days.

Availability
Premixed infusion: 60 mg/100 mL.

NURSING IMPLICATIONS

Assessment
- Assess respiratory and functional status prior to and periodically during therapy.
- Monitor for signs and symptoms of hypersensitivity reactions or sulfite allergic reactions (redness, wheals, erythema multiforme, urticaria, decreased blood pressure, dyspnea) with each infusion. If reaction occurs, discontinue therapy and treat with standard care.

Implementation
IV Administration
- **Intermittent Infusion:** Do not use if oxygen indicator has turned blue or purple before opening package. Use within 24 hrs of opening overwrap. Solution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. ***Rate:*** Infuse over 60 min at 1 mg/min.
- **Y-Site Incompatibility:** Do not mix with other medications.

Patient/Family Teaching
- Explain purpose of medication to patient. Advise patient to read *Patient Information* before starting therapy.
- Instruct patient to notify health care professional immediately if signs and symptoms of hypersensitivity or allergic reactions (hives; swelling of lips, tongue, face; fainting; breathing problems; dizziness; itching; wheezing) occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Improved functional ability.

edoxaban (e-dox-a-ban)
Lixiana, Savaysa

Classification
Therapeutic: anticoagulants
Pharmacologic: factor Xa inhibitors

Indications
Reduction of stroke/systemic embolization risk associated with nonvalvular atrial fibrillation (NVAF). Treatment of deep vein thrombosis (DVT) and pulmonary embolism (PE) following 5–10 days of initial therapy with a parenteral anticoagulant.

Action
Selective inhibitor of factor Xa. Does not inhibit platelet aggregation directly, but does inhibit thrombin-induced platelet aggregation. Decreases thrombin generation and thrombus development. **Therapeutic Effects:** Decreased thrombotic events associated with atrial fibrillation including stroke and systemic embolization. Resolution of DVT and PE.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: 62% absorbed following oral administration.

Distribution: Widely distributed to extravascular tissues.

Metabolism and Excretion: Minimal metabolism, one metabolite is pharmacologically active. Excreted mostly unchanged in urine.

Half-life: 10–14 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Active bleeding; CCr >95 mL/min (↓ effectiveness); Concurrent use of other anticoagulants or rifampin; Presence of mechanical heart valves or severe mitral stenosis; Moderate to severe hepatic impairment; Triple—positive antiphospholipid syndrome (↑ risk of thrombosis); Lactation: Lactation.

Use Cautiously in: Elective/planned invasive/surgical procedures (discontinue at least 24 hr prior to ↓ risk of bleeding); Premature discontinuation (↑ risk of ischemic events); Neuroaxial anesthesia/spinal puncture (↑ risk of spinal/epidural hematoma and potential paralysis); Renal impairment (↓ dose for CCr 15–50 mL/min); Deteriorating or improving renal function (may require dose change); Body weight ≤60 kg (requires lower dose); Rep: Women of reproductive potential; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

GI: abnormal liver function tests. **Hemat:** BLEEDING, anemia.

Interactions

Drug-Drug: ↑ risk of bleeding with other **anticoagulants**, **aspirin**, **clopidogrel**, **ticagrelor**, **prasugrel**, **fibrinolytics**, **NSAIDs**, **SNRIs**, or **SSRIs**. Rifampin may ↓ blood levels and effectiveness and is contraindicated. Concurrent use of **P-gp inhibitors** including **azithromycin**, **clarithromcyin**, **erythromycin**, **itraconazole** (oral), **ketoconazole** (oral), **quinidine**, or **verapamil** ↑ blood levels and the risk of bleeding (lower dose required).

Route/Dosage

Treatment of NVAF

PO (Adults): 60 mg once daily.

Renal Impairment

PO (Adults): *CCr 15–50 mL/min*—30 mg once daily.

Treatment of DVT/PE

PO (Adults >60 kg): 60 mg once daily.

PO (Adults ≤60 kg or certain concurrent P-gp inhibitors): 30 mg once daily.

Renal Impairment

PO (Adults): *CCr 15–50 mL/min*—30 mg once daily.

Availability

Tablets: 15 mg, 30 mg, 60 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for bleeding. Discontinue edoxaban if active bleeding occurs. Concomitant drugs (aspirin, other antiplatelet agents, other antithrombotic agents, fibrinolytic therapy, chronic use of NSAIDs) may increase risk of bleeding. Anticoagulant effects of edoxaban persist for about 24 hr after last dose. Anticoagulant effects cannot be reliably monitored with standard laboratory tests. No reversal agent is available; protamine sulfate, vitamin K, and tranexamic acid do not reverse anticoagulant activity. May consider prothrombin complex concentrates (PCC), or other procoagulant reversal agents such as activated prothrombin complex concentrate (APCC) or recombinant factor VIIa (rFVIIa). If PCC is used, monitoring anticoagulation effect of edoxaban using clotting test (PT, INR, or aPTT) or anti-FXa activity is not useful. Hemodialysis does not significantly contribute to edoxaban clearance.
- Monitor frequently for signs and symptoms of neurological impairment (numbness or weakness of legs, bowel, or bladder dysfunction, back pain, tingling, muscle weakness); if noted, urgent treatment is required. Intrathecal or epidural catheters should not be removed earlier than 12 hr after last dose of edoxaban. Next dose of edoxaban should not be given less than 2 hr after removal of catheter.
- ***Lab Test Considerations:*** Assess creatinine clearance (CCr) using Cockcroft-Gault equation CCr = (140 − age) × (weight in kg) × (0.85 if female)/(72 × serum creatinine in mg/dL) before starting therapy.

Implementation

- Discontinue edoxaban at least 24 hr prior to invasive or surgical procedures; may increase risk of bleeding. Edoxaban may be restarted as soon as adequate hemostasis is established; time to onset of pharmacodynamic effect is 1–2 hr.
- **PO:** Tablets may be crushed and mixed with 2–3 oz of water and immediately administered by mouth or through a gastric tube. May also mix with applesauce and administered immediately.
- *If transitioning from warfarin or other vitamin K antagonists to edoxaban,* discontinue warfarin and start edoxaban when INR ≤2.5. *If transitioning from oral anticoagulants other than warfarin or other vitamin K antagonists to edoxaban,* discontinue current oral anticoagulant and start edoxaban at time of next scheduled dose of other oral anticoagulant. *If transitioning from low molecular weight heparin (LMWH) to edoxaban,* discontinue LMWH and start edoxaban at time of next scheduled admin-

© F.A. Davis Publishing

istration of LMWH. *If transitioning from unfractionated heparin to edoxaban,* discontinue infusion and start edoxaban 4 hr later.

- *If transitioning from edoxaban to warfarin,* Oral Option: For patients taking 60 mg of edoxaban, reduce dose to 30 mg and begin warfarin concomitantly. For patients taking 30 mg edoxaban, reduce dose to 15 mg and begin warfarin concomitantly. Measure INR at least weekly and just prior to daily dose of edoxaban to minimize influence of edoxaban on INR measurements. Once stable INR ≥2.0 achieved, discontinue edoxaban and continue warfarin. Parenteral Option: Discontinue edoxaban and administer a parenteral anticoagulant and warfarin at time of next scheduled edoxaban dose. Once stable INR ≥2.0 achieved, discontinue parenteral anticoagulant and continue warfarin. *If transitioning from edoxaban to non-vitamin-K dependant oral anticoagulant,* discontinue edoxaban and start other oral anticoagulant at time of next dose of edoxaban. *If transitioning from edoxaban to parenteral anticoagulant,* discontinue edoxaban and start parenteral anticoagulant at time of next dose of edoxaban.

Patient/Family Teaching

- Instruct patient to take edoxaban as directed. Take missed doses as soon as remembered on same day. Return to regular schedule next day. Do not double doses in one day. Do not discontinue without consulting health care professional; stopping may increase risk of stroke. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Caution patient that they may bleed more easily, longer, or bruise more easily during therapy. Advise patient to notify health care professional immediately if bleeding or a fall, especially with head injury, occurs.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially other aspirin or NSAIDs.
- Advise patient to notify health care professional of therapy before surgery, medical, or dental procedures are scheduled.
- Rep: Advise female patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. May increase risk of uterine bleeding in females of reproductive potential and those with abnormal uterine bleeding. Monitor neonates for bleeding.

Evaluation/Desired Outcomes

- Decreased thrombotic events (stroke and systemic embolization) associated with NVAF.
- Treatment of deep vein thrombosis DVT and pulmonary embolism PE.

efavirenz/lamivudine/tenofovir disoproxil fumarate

(e-**fav**-e-renz/la-**mi**-vyoo-deen/te-**noe**-fo-veer dye-soe-**prox**-il **fue**-ma-rate)

Symfi, Symfi Lo

E

Classification

Therapeutic: antiretrovirals, none assigned
Pharmacologic: non-nucleoside reverse transcriptase inhibitors, nucleoside reverse transcriptase inhibitors

Indications

HIV-1 infection.

Action

Efavirenz— Inhibits HIV reverse transcriptase, which results in disruption of DNA synthesis. *Lamivudine*— After intracellular conversion to its active form (lamivudine-5-triphosphate), inhibits viral DNA synthesis by inhibiting the enzyme HIV reverse transcriptase. *Tenofovir*— Phosphorylated intracellularly where it inhibits HIV reverse transcriptase resulting in disruption of DNA synthesis. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae.

Pharmacokinetics

Efavirenz

Absorption: 50% absorbed when ingested following a high-fat meal.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized by the liver by CYP3A and CYP2B6. 16–61% excreted in feces as unchanged drug, 14–34% excreted in urine (primarily as metabolites).
Half-life: *Following single dose*— 52–76 hr. *Following multiple doses*— 40–55 hr.

Lamivudine

Absorption: 86% absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly excreted unchanged in urine; <5% metabolized by the liver.
Half-life: 5–7 hr.

Tenofovir

Absorption: Tenofovir disoproxil fumarate is a prodrug, which is split into tenofovir, the active component; absorption enhanced by food.
Distribution: Unknown.
Metabolism and Excretion: 70–80% excreted unchanged in urine by glomerular filtration and active tubular secretion.
Half-life: 17 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Efavirenz (PO)	rapid	3–5 hr	24 hr
Lamivudine (PO)	unknown	0.9 hr	24 hr
Tenofovir (PO)	unknown	2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of elbasvir and grazoprevir; Coinfection with hepatitis B virus (HBV) (hepatitis may recur after discontinuation of lamivudine or tenofovir) (lamivudine dose not appropriate for patients coinfected with HBV); Concurrent or recent use of nephrotoxic medications; Concurrent use with ribavirin and/or interferon alfa (↑ risk of hepatic decompensation); Moderate or severe hepatic impairment; CCr <50 mL/min; OB: May cause fetal harm during 1st trimester of pregnancy; Lactation: Breast feeding not recommended for HIV-positive mothers.

Use Cautiously in: Mental illness, substance abuse, or use of psychiatric medications (↑ risk of psychiatric symptomatology); History of seizures (↑ risk of seizures); Rep: Women of reproductive potential; Pedi: Children with a prior history of antiretroviral exposure or history of pancreatitis (↑ risk of pancreatitis); Pedi: Children <40 kg (Symfi) or <35 kg (Symfi Lo) (safety and effectiveness not established); Geri: Cautious initial dosing due to ↑ incidence of renal, hepatic, or cardiac dysfunction.

Adverse Reactions/Side Effects

CV: QT INTERVAL PROLONGATION. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, rash. **Endo:** Graves' disease. **F and E:** LACTIC ACIDOSIS. **GI:** HEPATOMEGALY WITH STEATOSIS, HEPATOTOXICITY, PANCREATITIS, diarrhea, abdominal pain, autoimmune hepatitis, dyspepsia, ↑ amylase, ↑ liver enzymes, nausea, vomiting. **GU:** ACUTE RENAL FAILURE/FANCONI SYNDROME, hematuria. **Hemat:** neutropenia. **Metab:** hyperlipidemia. **MS:** ↑ creatine kinase, pain, arthralgia, ↓ bone mineral density, muscle weakness, myalgia, osteomalacia, polymyositis. **Neuro:** ataxia, Guillain-Barre syndrome, peripheral neuropathy, SEIZURES, SUICIDAL THOUGHTS/BEHAVIORS, depression, headache, abnormal dreams, aggressive behavior, anxiety, catatonia, delusions, dizziness, drowsiness, encephalopathy, fatigue, hallucinations, impaired concentration, insomnia, manic episodes, nervousness, paranoia, psychoses, sedation. **Misc:** fat redistribution, fever, immune reconstitution syndrome.

Interactions

Drug-Drug: May lead to loss of virologic response to **elbasvir/grazoprevir**; concurrent use contraindicated. Nephrotoxic drugs, including **acyclovir**, **aminoglycosides**, **cidofovir**, **ganciclovir**, **NSAIDs**, **valacyclovir**, or **valganciclovir**, may ↑ risk of nephrotoxicity; avoid recent or concurrent use. May ↑ risk of hepatic decompensation with **ribavirin** or **interferon alfa**; avoid concurrent use. Concurrent use with other **QT interval prolonging medications** may ↑ risk of QT interval prolongation or torsade de pointes. May alter the effects of **warfarin**. Concurrent use with **carbamazepine** may ↓ levels of carbamazepine and efavirenz; use alternative anticonvulsant agent. Concurrent use with **phenytoin** or **phenobarbital** may ↓ levels of phenytoin, carbamazepine, and efavirenz. May ↓ levels of **bupropion** and **sertraline**; may need to ↑ antidepressant dose. May ↓ **posaconazole** levels; avoid concurrent use. May ↓ **itraconazole** or **ketoconazole** levels; use alternative antifungal agent. May ↓ **clarithromycin** levels; consider using alternative antibiotic that does not cause QT interval prolongation. May ↓ **rifabutin** levels; ↑ daily dose of rifabutin by 50%. **Rifampin** may ↓ levels; ↑ dose of efavirenz. May ↓ **artemether/lumefantrine** levels; consider alternative antimalarial that does not cause QT interval prolongation. May ↓ **atovaquone/proguanil** levels; concurrent use not recommended. May ↓ levels of **calcium channel blockers**; may need to ↑ calcium channel blocker dose. May ↓ levels of **atorvastatin**, **pravastatin**, and **simvastatin**. May ↓ therapeutic effects of **pibrentasvir/glecaprevir**, **velpatasvir/sofosbuvir**, and **velpatasvir/sofosbuvir/voxilaprevir**; concurrent use not recommended. **Ledipasvir/sofosbuvir** may ↑ tenofovir levels. May ↓ the effectiveness of **progestin-containing hormonal contraceptives** (e.g., etonogestrel, norelgestromin, levonorgestrel); additional barrier contraceptive should be used. May ↓ levels of **cyclosporine**, **tacrolimus**, and **sirolimus**; may need to adjust dose of immunosuppressant. May ↓ **methadone** levels. Medications containing **sorbitol** may ↓ lamivudine levels.

Route/Dosage

PO (Adults and Children ≥40 kg): *Symfi* — 1 tablet (efavirenz 600 mg/lamivudine 300 mg/tenofovir disoproxil fumarate 300 mg) once daily.

PO (Adults and Children ≥35 kg): *Symfi Lo* — 1 tablet (efavirenz 400 mg/lamivudine 300 mg/tenofovir disoproxil fumarate 300 mg) once daily.

Availability (generic available)

Tablets (Symfi): efavirenz 600 mg/lamivudine 300 mg/tenofovir disoproxil fumarate 300 mg. **Tablets (Symfi Lo):** efavirenz 400 mg/lamivudine 300 mg/tenofovir disoproxil fumarate 300 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Assess patient for CNS and psychiatric symptoms (dizziness, impaired concentration, somnolence, abnormal dreams, insomnia, suicidal thoughts and behaviors) during therapy. Symptoms usually begin during 1st or 2nd day of therapy and resolve after 2–

© F.A. Davis Publishing

4 wk. Administration at bedtime may minimize symptoms. Concurrent use with alcohol or psychoactive agents may cause additive CNS symptoms.

- Assess for rash, especially during 1st mo of therapy. Onset is usually within 2 wk and resolves with continued therapy within 1 mo. May range from mild maculopapular with erythema and pruritus to exfoliative dermatitis and Stevens-Johnson syndrome. Occurs more often and may be more severe in children. If rash is severe or accompanied by blistering, desquamation, mucosal involvement, or fever, therapy must be discontinued immediately. *Symfi* may be reinstated concurrently with antihistamines or corticosteroids in patients discontinuing due to rash.
- Monitor for signs and symptoms of pancreatitis (abdominal pain with or without nausea and vomiting) during therapy. Discontinue therapy immediately if symptoms occur.
- Monitor for seizures during therapy. Institute seizure precautions.
- Assess bone mineral density in adult and pediatric patients with a history of pathologic bone fracture or other risk factors for osteoporosis or bone loss. May supplement with calcium and vitamin D.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor viral load and CD4 count before and routinely during therapy to determine response.
- Assess for hepatitis B virus (HBV). *Symfi* and *Symfi Lo* are not approved for administration in patients with HIV and HBV. If therapy is discontinued, may cause severe exacerbation of hepatitis B. Monitor liver function in coinfected patients for several months after stopping therapy.
- Monitor liver function tests prior to, during and following therapy. May cause ↑ LDL cholesterol, total cholesterol, and triglyceride concentrations. Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women. Discontinue therapy if symptoms occur.
- Calculate serum creatinine, CCr, urine glucose, and urine protein prior to and periodically during therapy and when clinically indicated. In patients with chronic kidney disease, assess serum creatinine, creatinine clearance, serum phosphorus, urine glucose, and urine protein prior to and periodically during therapy. May cause hypophosphatemia in patients with renal impairment.
- May cause increased lipids. Monitor total cholesterol and triglycerides before starting and periodically during therapy.
- May cause hyperglycemia and glycosuria.

Implementation

- **PO:** Administer once daily on an empty stomach, preferably at bedtime to minimize drowsiness.

Patient/Family Teaching

- Instruct patient on the importance of taking medication as directed, even if feeling better. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Discontinuing therapy may lead to severe exacerbations. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes. Caution patient not to share or trade *Symfi* or *Symfi Lo* with others.
- Inform patient of importance of hepatitis B testing before starting antiretroviral therapy.
- Inform patient that *Symfi* and *Symfi Lo* do not cure AIDS and may reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and avoid sharing needles or donating blood to prevent spreading HIV to others.
- May cause dizziness, impaired concentration, or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional immediately if rash or suicidal thoughts or behaviors occur.
- Advise patient to notify health care professional immediately if symptoms of lactic acidosis (nausea, vomiting, unusual or unexpected stomach discomfort; unusual muscle pain; difficulty breathing; feeling cold, especially in arms and legs; dizziness; fast or irregular heartbeat; and weakness or tiredness) liver problems (yellow skin or whites of eyes, dark urine, light-colored stools, loss of appetite, nausea, stomach pain) or signs of immune reconstitution syndrome (signs and symptoms of an infection or inflammation) occur.
- Advise patient to notify health care professional if bone pain (bone pain that does not go away or worsening bone pain; pain in arms, legs, hands, or feet; broken bones; muscle pain or weakness). May be symptoms of a bone or kidney problem.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Inform patient of risk of developing late-onset neurotoxicity (ataxia, encephalopathy); may occur months to years after starting therapy.
- Rep: May be teratogenic; may cause neural tube defects if administered during 1st trimester. Advise females of reproductive potential taking oral contraceptives to use a nonhormonal method of birth control during therapy and for at least 12 wk follow-

© F.A. Davis Publishing

ing discontinuation and to avoid breast feeding. Advise patient to notify health care professional if they become pregnant while taking *Symfi* or *Symfi Lo*. Encourage patients who become pregnant during therapy to join Antiretroviral Pregnancy Registry that monitors pregnancy outcomes in women exposed to efavirenz during pregnancy. Enroll patient by calling 1-800-258-4263.

- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

elagolix (el-a-goe-lix)
Orilissa

Classification
Therapeutic: analgesics
Pharmacologic: GnRH antagonist

Indications
Moderate to severe pain associated with endometriosis.

Action
Competitively binds to and inhibits gonadotropin-releasing hormone (GnRH) receptors in the pituitary gland, causing a decrease in the release of estradiol and progesterone by the ovaries. **Therapeutic Effects:** Reduction in dysmenorrhea and nonmenstrual pelvic pain.

Pharmacokinetics
Absorption: Rapidly absorbed.
Distribution: Unknown.
Metabolism and Excretion: Primarily metabolized in the liver via CYP3A enzymes; some metabolism by CYP2D6, CYP2C8, and UGT. 90% of dose excreted in feces, <3% in urine.
Half-life: 4–6 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Osteoporosis (may ↑ risk of bone loss); Severe hepatic impairment; Concurrent use of strong organic anion transporting polypeptide (OATP) 1B1 inhibitors; OB: Pregnancy (may ↑ risk of early pregnancy loss).
Use Cautiously in: History of low-trauma fracture or other risk factors for osteoporosis; History of suicidal thoughts/behaviors or depression; Moderate hepatic impairment (use lower dose); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects
Derm: rash. **Endo:** hot flushes, night sweats. **GI:** nausea, abdominal pain, constipation, diarrhea, ↑ liver enzymes. **GU:** ↓ libido, menstrual irregularities. **Metab:** dyslipidemia, ↑ weight. **MS:** arthralgia, ↓ bone density. **Neuro:** SUICIDAL THOUGHTS/BEHAVIOR, headache, anxiety, depression, dizziness, insomnia, mood swings. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions
Drug-Drug: Strong OATP1B1 inhibitors, including **cyclosporine** and **gemfibrozil** may significantly ↑ levels; concurrent use contraindicated. **Estrogen-containing oral contraceptives** may ↓ effectiveness; impact of **progestin-containing oral contraceptives** on effectiveness unknown; recommended to use nonhormonal contraceptives. May ↑ estrogen exposure when used with **estrogen-containing contraceptives** which may ↑ risk of thromboembolic events. May ↓ levels of **levonorgestrel-containing oral contraceptives** which may ↓ effectiveness. May ↓ levels of **CYP3A substrates**, including **midazolam**. May ↑ levels of **CYP2C19 substrates**, including **omeprazole**; consider ↓ omeprazole dose when using higher doses (>40 mg/day). May ↑ levels of **P-glycoprotein substrates**, including **digoxin**; closely monitor digoxin levels. **Strong CYP3A inhibitors** may ↑ levels; limit concurrent use with elagolix 200 mg twice daily to ≤1 mo; limit concurrent use with elagolix 150 mg once daily to ≤6 mo. **CYP3A inducers**, including **rifampin** may ↓ levels; concurrent use with elagolix 200 mg twice daily not recommended; limit concurrent use with elagolix 150 mg once daily to ≤6 mo. May ↓ **rosuvastatin** levels; consider ↑ rosuvastatin dose.

Route/Dosage
PO (Adults): *No dyspareunia*— 150 mg once daily for max duration of 24 mo; *Coexisting dyspareunia*— 200 mg twice daily for max duration of 6 mo.

Hepatic Impairment
PO (Adults): *Moderate hepatic impairment (Child–Pugh Class B)* — 150 mg once daily for max duration of 6 mo.

Availability
Tablets: 150 mg, 200 mg. ***In combination with:*** estradiol/norethindrone (Oriahnn). See Appendix N.

NURSING IMPLICATIONS
Assessment
- Assess bone mineral density in patients with a history of a low-trauma fracture or other risk factors for osteoporosis or bone loss. Vitamin D and calcium supplements may be considered.
- Assess for depression and mood changes during therapy. Refer patients with new or worsening de-

© F.A. Davis Publishing

pression, anxiety or other mood changes, suicidal ideation and behavior to a mental health professional. Consider benefits and risks of continuing elagolix.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy. Use lowest effective dose for limited duration to minimize bone loss.
- Monitor liver function tests periodically during therapy. May cause ↑ AST and ALT.
- May cause ↑ lipid levels during first 2 mo of therapy, then usually remains stable.

Implementation
- **PO:** Administer at the same time each day without regard to food.

Patient/Family Teaching
- Instruct patient to take elagolix as directed. Take missed doses as soon as remembered if same day as missed dose, then return to regular dosing schedule; do not double doses. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Inform patient that elagolix may change menstrual periods (irregular bleeding or spotting, a decrease in menstrual bleeding, no bleeding at all), and make it hard to know if you are pregnant. Watch for other signs of pregnancy (breast tenderness, weight gain, nausea).
- Advise patient and family to notify health care professional if signs and symptoms of mood or behavior changes (thoughts about suicide or dying, try to commit suicide, new or worse depression, new or worse anxiety, other unusual changes in behavior or mood) or liver problems (yellowing of skin or whites of eyes, dark amber-colored urine, feeling tired, nausea and vomiting, generalized swelling, right upper abdomen pain, bruising easily) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially birth control pills.
- Rep: May result in pregnancy loss if used in early pregnancy. Advise females of reproductive potential to use effective nonhormonal contraception during and for 28 days after last dose. Hormonal contraceptives may decrease effectiveness of elagolix and may increase risk of thromboembolic and vascular disorders. Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Encourage patient to enroll in pregnancy registry to monitor outcomes of women who become pregnant while taking elagolix by calling 1-833-782-7241. Discontinue elagolix if pregnancy occurs.

Evaluation/Desired Outcomes
- Reduction in dysmenorrhea and nonmenstrual pelvic pain.

elagolix/estradiol/norethindrone
(**el**-a-**goe**-lix/es-tra-**dye**-ole/nor-eth-**in**-drone)
Oriahnn

Classification
Therapeutic: hemostatic agents, hormones
Pharmacologic: GnRH antagonist, estrogens, progestins

E

Indications
Heavy menstrual bleeding associated with uterine fibroids in premenopausal women.

Action
Elagolix— competitively binds to and inhibits gonadotropin-releasing hormone (GnRH) receptors in the pituitary gland, causing a decrease in the release of estradiol and progesterone by the ovaries which reduces bleeding associated with uterine fibroids. *Estradiol*— binds to estrogen receptors and reduces the increase in bone resorption and potential bone loss associated with elagolix. *Norethindrone*— protects uterus from potential adverse endometrial effects caused by unopposed estrogen use. **Therapeutic Effects:** Reduced menstrual blood loss.

Pharmacokinetics
Elagolix
Absorption: Rapidly absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Primarily metabolized in the liver via CYP3A isoenzymes; some metabolism by CYP2D6, CYP2C8, and UGT. 90% of dose excreted in feces, <3% in urine.
Half-life: 4–6 hr.
Estradiol
Absorption: Well absorbed following oral administration.
Distribution: Widely distributed.
Protein Binding: 98%.
Metabolism and Excretion: Metabolized by the liver via CYP3A isoenzymes; also undergoes sulfation and glucuronidation. Enterohepatic recirculation occurs, and more absorption may occur from the GI tract.
Half-life: 8–20 hr.
Norethindrone
Absorption: Rapidly absorbed following oral administration.
Distribution: Unknown.
Protein Binding: 97%.
Metabolism and Excretion: Metabolized by the liver via CYP3A isoenzymes.

© F.A. Davis Publishing

Half-life: 5–13 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to elagolix, estradiol, or norethindrone; History of cigarette smoking and age >35 yr (↑ risk of cardiovascular or thromboembolic phenomenon); Thromboembolic disease (e.g., DVT, PE, MI, stroke); Cerebrovascular disease, coronary artery disease, or peripheral vascular disease; Valvular heart disease or thrombogenic heart rhythms; Protein C, protein S, or antithrombin deficiency or other thrombophilic disorder; Headache with focal neurological symptoms or migraine headaches with aura in women >35 yr; Uncontrolled hypertension; Major surgery with extended periods of immobility; Osteoporosis (may ↑ risk of bone loss); Breast cancer or other hormone-sensitive malignancy; ↑ risk for hormone sensitive malignancy; Hepatic impairment; Undiagnosed abnormal uterine bleeding; Concurrent use of strong organic anion transporting polypeptide (OATP) 1B1 inhibitors; OB: Pregnancy (may cause fetal harm).

Use Cautiously in: Aspirin hypersensitivity (contains tartrazine which may cause allergic reaction); History of low-trauma fracture or other risk factors for osteoporosis; History of suicidal thoughts/behaviors or depression; Controlled hypertension; Diabetes; Hypertriglyceridemia (↑ risk of pancreatitis); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: DEEP VEIN THROMBOSIS, MI, ↑ BP. **Derm:** alopecia. **Endo:** hot flushes, hyperglycemia. **GI:** cholelithiasis, ↑ liver enzymes, vomiting. **GU:** ↓ libido, metrorrhagia. **Metab:** hyperlipidemia, ↑ weight. **MS:** arthralgia, ↓ bone density. **Neuro:** STROKE, SUICIDAL THOUGHTS/BEHAVIOR, depression, headache, mood swings. **Resp:** PULMONARY EMBOLISM. **Misc:** MALIGNANCY (BREAST, ENDOMETRIAL, OVARIAN), fatigue.

Interactions

Drug-Drug: Strong OATP1B1 inhibitors, including **rifampin** may significantly ↑ elagolix levels and risk of toxicity; concurrent use contraindicated. **Corticosteroids**, **anticonvulsants**, and **proton pump inhibitors** may ↑ risk for bone loss. Elagolix may ↓ levels of **CYP3A substrates**, including **midazolam**; consider ↑ midazolam dose. Elagolix may ↑ levels of **CYP2C19 substrates**, including **omeprazole**; consider ↓ omeprazole dose when using higher doses (>40 mg/day). Elagolix may ↑ levels of **P-glycoprotein substrates**, including **digoxin**; closely monitor digoxin levels. May ↓ **rosuvastatin** levels; consider ↑ rosuvastatin dose. **Strong CYP3A inhibitors** may ↑ elagolix, estradiol, and norethindrone levels and risk of toxicity; concurrent use not recommended. **Strong CYP3A inducers** may ↓ elagolix, estradiol, and norethindrone levels and effectiveness.

Route/Dosage

PO (Adults): One capsule (elagolix 300 mg/estradiol 1 mg/norethindrone 0.5 mg) every AM and elagolix 300 mg every PM. Continue for no longer than 24 mo.

Availability

Capsules: elagolix 300 mg/estradiol 1 mg/norethindrone 0.5 mg (AM); elagolix 300 mg (PM).

NURSING IMPLICATIONS

Assessment

- Monitor amount of menstrual bleeding during therapy.
- Monitor for signs and symptoms of thromboembolic disorders and vascular events (pain, swelling, tenderness in extremities; headache; chest pain; blurred vision; sudden unexplained partial or complete loss of vision; proptosis; diplopia; papilledema retinal vascular lesions) during therapy. Discontinue therapy if symptoms occur or are suspected. Evaluate for retinal vein thrombosis if visual changes occur.
- Assess bone mineral density by dual-energy X-ray absorptiometry (DXA) at baseline and periodically during therapy. Consider discontinuing therapy if risk associated with bone loss exceeds potential benefit of treatment. Consider calcium and vitamin D supplementation for patients with inadequate dietary intake.
- Assess for new or worsening depression, anxiety, or other mood changes periodically during therapy. Consider referral to mental health professional. Re-evaluate benefits and risks of therapy if such events occur.
- Monitor BP prior to and periodically during therapy. Hold therapy for significant increases in BP.
- ***Lab Test Considerations:*** Verify negative pregnancy test within 7 days from onset of menses.
- May cause ↑ AST and ALT.
- May decrease glucose tolerance and ↑ blood glucose levels. Monitor blood glucose more frequently in women with prediabetes and diabetes.
- Monitor lipid levels periodically during therapy. May cause ↑ total cholesterol, low-density lipoprotein cholesterol (LDL-C), high-density lipoprotein cholesterol (HDL-C), and serum triglycerides.

Implementation

- **PO:** Administer morning and evening doses at same times each day without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed at the same times each day. Take missed doses within 4 hr of time it was supposed to be taken and take next dose at usual time. If more than 4 hr since capsule is usually taken, omit dose and take next dose at usual

© F.A. Davis Publishing

time. Take only one morning and one evening capsule each day. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.

- Advise patient to stop taking medication and notify health care professional immediately if signs and symptoms of cardiovascular conditions (leg pain or swelling that will not go away; sudden shortness of breath; double vision; bulging of the eyes; sudden blindness, partial or complete; pain or pressure in chest, arm, or jaw; sudden, severe headache unlike usual headaches; weakness or numbness in an arm or leg; trouble speaking) occur.
- Inform patient of risk of bone loss. Advise patient to take supplementary calcium and vitamin D and to avoid taking iron supplements at same time.
- Instruct patient to pay attention to changes in mood, behaviors, thoughts, or feelings. Advise patients to notify health care professional immediately if signs and symptoms of suicidal ideation and behavior (thoughts about suicide or dying, attempts to commit suicide, new or worse depression, new or worse anxiety, other unusual changes in behavior or mood) occur.
- Advise patient to notify health care professional if signs and symptoms of liver injury (jaundice, dark amber-colored urine, feeling tired, nausea and vomiting, generalized swelling, right upper stomach area pain, bruising easily) occur.
- Advise patient that alopecia, hair loss, and hair thinning in no specific pattern, may occur and may not completely resolve after discontinuing therapy. Advise patient to consult health care professional with concerns about changes to hair.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products without consulting health care professional.
- Dispose unused medication via a take-back option if available. Otherwise, follow FDA instructions for disposing medication in the household trash, www.fda.gov/drugdisposal. Do NOT flush down the toilet.
- Rep: Inform patient that *Oriahnn* may decrease menstrual bleeding or result in no menstrual bleeding, making it hard to know if you are pregnant; watch for other signs of pregnancy (breast tenderness, weight gain, nausea). May result in pregnancy loss if used in early pregnancy. Advise females of reproductive potential to use effective nonhormonal contraception during and for 1 wk after last dose. Hormonal contraceptives may decrease effectiveness of elagolix and may increase risk of thromboembolic and vascular disorders. Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Encourage patients who become pregnant during therapy to enroll in pregnancy exposure registry to monitor pregnancy outcomes by calling 1-833-782-7241.

Evaluation/Desired Outcomes

- Reduced menstrual blood loss.

elexacaftor/tezacaftor/ivacaftor

(e-lex-a-**kaf**-tor/tez-a-**kaf**-tor/**eye**-va-**kaf**-tor)

Trikafta

Classification

Therapeutic: cystic fibrosis therapy adjuncts

Pharmacologic: transmembrane conductance regulator potentiators

Indications

Cystic fibrosis (CF) in patients who have ≥1 *F508del* mutation in the cystic fibrosis transmembrane conductance regulator *(CFTR)* gene or a mutation in the *CFTR* gene that is responsive based on *in vitro* data.

Action

Elexacaftor and tezacaftor—facilitate the cellular processing and trafficking of *F508del*-CFTR to increase the amount of mature CFTR protein delivered to the cell surface. *Ivacaftor*—acts as a potentiator of the CFTR protein (a chloride channel on the surface of endothelial cells) facilitating chloride transport by increasing the channel-open probability (gating). **Therapeutic Effects:** Improved lung function.

Pharmacokinetics

Elexacaftor

Absorption: Well absorbed (88%) following oral administration; absorption is enhanced 2-fold by moderate-fat-containing foods.

Distribution: Well distributed to tissues.

Protein Binding: >99%.

Metabolism and Excretion: Primarily metabolized in liver via the CYP3A4 and CYP3A5 isoenzymes; one metabolite (M23) is pharmacologically active; 87% excreted in feces (primarily as metabolite); <1% excreted in urine.

Half-life: 30 hr.

Tezacaftor

Absorption: Some absorption following oral administration.

Distribution: Widely distributed to tissues.

Protein Binding: >99%.

Metabolism and Excretion: Primarily metabolized in liver via the CYP3A4 and CYP3A5 isoenzymes; one metabolite (M1) is pharmacologically active; 72% excreted in feces as unchanged drug or metabolite; 14% excreted in urine (primarily as metabolite).

© F.A. Davis Publishing

Half-life: 15 hr.

Ivacaftor

Absorption: Some absorption following oral administration; absorption is enhanced 3-fold by fat-containing foods.

Distribution: Widely distributed to tissues.

Protein Binding: >99%.

Metabolism and Excretion: Primarily metabolized in liver via the CYP3A4 and CYP3A5 isoenzymes; one metabolite (M1) is pharmacologically active; 87.8% eliminated in feces; negligible urinary elimination.

Half-life: 14 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Elexacaftor (PO)	unknown	6 hr	24 hr
Tezacaftor (PO)	unknown	4 hr	12 hr
Ivacaftor (PO)	unknown	6 hr	12 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of strong CYP3A inducers; Severe hepatic impairment.

Use Cautiously in: Moderate hepatic impairment (not recommended; if necessary, use only if benefit outweighs risk; dose ↓ recommended); Severe renal impairment (CCr <30 mL/min) or end stage renal disease; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <6 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

Derm: rash. **EENT:** nasal congestion, cataracts, rhinitis, rhinorrhea, sinusitis. **GI:** abdominal pain, diarrhea, ↑ liver enzymes, hyperbilirubinemia. **MS:** ↑ creatine kinase. **Neuro:** headache. **Resp:** upper respiratory tract infection. **Misc:** influenza.

Interactions

Drug-Drug: Strong CYP3A inducers, including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, and **rifampin**, may ↓ elexacaftor, tezacaftor, and ivacaftor levels and effectiveness; avoid concurrent use. **Strong CYP3A inhibitors**, including **clarithromycin**, **itraconazole**, **ketoconazole**, **posaconazole**, and **voriconazole** as well as **moderate CYP3A inhibitors**, including **erythromycin** and **fluconazole** may ↑ elexacaftor, tezacaftor, and ivacaftor levels and risk of toxicity; dose adjustment recommended. May ↑ levels and risk of bleeding with **warfarin**; monitor INR closely. May ↑ levels and risk of hypoglycemia with **glimepiride** or **glipizide**. May ↑ levels of **P-glycoprotein substrates**, including **cyclosporine**, **digoxin**, **everolimus**, **sirolimus**, and **tacrolimus**. May ↑ levels of **glyburide**, **nateglinide**, **repaglinide**, and **statins**. **Hormonal contraceptives** may ↑ risk of rash.

Drug-Natural Products: St. John's wort may ↓ elexacaftor, tezacaftor, and ivacaftor levels and effectiveness; avoid concurrent use.

Drug-Food: Grapefruit juice may ↑ elexacaftor, tezacaftor, and ivacaftor levels; avoid concurrent use.

Route/Dosage

PO (Adults and Children ≥12 yr): Two elexacaftor 100-mg/tezacaftor 50-mg/ivacaftor 75-mg tablets in AM and one ivacaftor 150-mg tablet in PM (approximately 12 hr apart) with fat-containing food. *Concurrent use of strong CYP3A inhibitor*—Two elexacaftor 100-mg/tezacaftor 50-mg/ivacaftor 75-mg tablets given twice weekly (3–4 days apart) in AM. Do not give ivacaftor 150-mg tablet in PM. *Concurrent use of moderate CYP3A inhibitor*—Two elexacaftor 100-mg/tezacaftor 50-mg/ivacaftor 75-mg tablets in AM on Day 1, then one ivacaftor 150-mg tablet in AM on Day 2; continue this regimen on alternate days in AM. Do not give ivacaftor 150-mg tablet in PM.

PO (Children 6–11 yr and ≥30 kg): Two elexacaftor 100-mg/tezacaftor 50-mg/ivacaftor 75-mg tablets in AM and one ivacaftor 150-mg tablet in PM (approximately 12 hr apart) with fat-containing food. *Concurrent use of strong CYP3A inhibitor*—Two elexacaftor 100-mg/tezacaftor 50-mg/ivacaftor 75-mg tablets given twice weekly (3–4 days apart) in AM. Do not give ivacaftor 150-mg tablet in PM. *Concurrent use of moderate CYP3A inhibitor*—Two elexacaftor 100-mg/tezacaftor 50-mg/ivacaftor 75-mg tablets in AM on Day 1, then one ivacaftor 150-mg tablet in AM on Day 2; continue this regimen on alternate days in AM. Do not give ivacaftor 150-mg tablet in PM.

PO (Children 6–11 yr and <30 kg): Two elexacaftor 50-mg/tezacaftor 25-mg/ivacaftor 37.5-mg tablets in AM and one ivacaftor 75-mg tablet in PM (approximately 12 hr apart) with fat-containing food. *Concurrent use of strong CYP3A inhibitor*—Two elexacaftor 50-mg/tezacaftor 25-mg/ivacaftor 37.5-mg tablets given twice weekly (3–4 days apart) in AM. Do not give ivacaftor 75-mg tablet in PM. *Concurrent use of moderate CYP3A inhibitor*—Two elexacaftor 50-mg/tezacaftor 25-mg/ivacaftor 37.5-mg tablets in AM on Day 1, then one ivacaftor 75-mg tablet in AM on Day 2; continue this regimen on alternate days in AM. Do not give ivacaftor 75-mg tablet in PM.

Hepatic Impairment

(Adults and Children ≥12 yr): *Moderate hepatic impairment (Child-Pugh Class B)*—Two elexacaftor 100-mg/tezacaftor 50-mg/ivacaftor 75-mg tablets in AM on Day 1, then one elexacaftor 100-mg/tezacaftor 50-mg/ivacaftor 75-mg tablet in AM on Day 2. Continue this regimen on alternate days in AM. Do not give ivacaftor 150-mg tablet in PM.

Hepatic Impairment

(Adults and Children 6–11 yr and ≥30 kg): *Moderate hepatic impairment (Child-Pugh Class B)*—Two elexacaftor 100-mg/tezacaftor 50-mg/ivacaftor 75-mg tablets in AM on Day 1, then one elexacaftor 100-mg/te-

© F.A. Davis Publishing

zacaftor 50-mg/ivacaftor 75-mg tablet in AM on Day 2. Continue this regimen on alternate days in AM. Do not give ivacaftor 150-mg tablet in PM.

Hepatic Impairment

(Adults and Children 6–11 yr and <30 kg): *Moderate hepatic impairment (Child-Pugh Class B)* — Two elexacaftor 50-mg/tezacaftor 25-mg/ivacaftor 37.5-mg tablets in AM on Day 1, then one elexacaftor 50-mg/tezacaftor 25-mg/ivacaftor 37.5-mg tablet in AM on Day 2. Continue this regimen on alternate days in AM. Do not give ivacaftor 75-mg tablet in PM.

Availability

Tablets: elexacaftor 100 mg/tezacaftor 50 mg/ivacaftor 75 mg (combo) + ivacaftor 150 mg (separate tablets), elexacaftor 50 mg/tezacaftor 25 mg/ivacaftor 37.5 mg (combo) + ivacaftor 75 mg (separate tablets).

NURSING IMPLICATIONS

Assessment

- Monitor lung function (FEV, lung sounds) before and periodically during therapy.
- Assess eyes for cataracts/opacities prior to and periodically during therapy.
- ***Lab Test Considerations:*** Determine patient's genotype prior to starting therapy. If genotype is unknown, use an FDA-cleared CF mutation test to detect the presence of a CFTR mutation followed by verification with bidirectional sequencing when recommended by the mutation test instructions for use.
- Monitor liver function (AST, ALT, bilirubin) prior to starting therapy, every 3 mo during 1st year, and yearly thereafter. May cause ↑ serum transaminases and bilirubin. Monitor AST and ALT before, every 3 mo for the first year, and annually thereafter. If AST or ALT >3 × upper limit of normal (ULN) with bilirubin >2 × ULN, interrupt therapy. Once AST or ALT have returned to normal, consider benefits and risks before resuming therapy.

Implementation

- **PO:** Administer tablets twice daily, 12 hr apart, with fat-containing food (meals or snacks that contain fat are those prepared with butter or oils or those containing eggs, cheeses, nuts, whole milk, or meats). ***DNC:*** Swallow tablets whole; do not crush, break or chew.

Patient/Family Teaching

- Instruct patient to take as directed with a fat-containing meal to increase absorption. Fat-containing foods include eggs, butter, peanut better, cheese pizza. Take missed doses within 6 hr of missed dose. If >6 hr since missed morning dose, take missed dose as soon as possible and omit the evening dose. Take next scheduled morning dose at usual time. If missed evening dose, omit the missed dose. Take next scheduled morning dose at usual time. Do not take morning and evening doses at same time. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid eating grapefruit or drinking grapefruit juice during therapy.
- May cause dizziness. Advise patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional immediately if symptoms of liver problems (pain or discomfort in right abdominal area, yellowing of skin or whites of eyes, loss of appetite, nausea, vomiting, dark amber-colored urine) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's Wort.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of blood tests to monitor liver function and eye examinations.

Evaluation/Desired Outcomes

- Improved lung function.

elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide

(el-vi-**teg**-ra-vir/koe-**bik**-i-stat/em-trye-**sye**-ta-been/ten-**of**-oh-vir al-a-**fen**-a-mide)

Genvoya

Classification

Therapeutic: antiretrovirals

Pharmacologic: integrase strand transfer inhibitors (INSTI), enzyme inhibitors, nucleoside reverse transcriptase inhibitors

Indications

HIV infection in treatment-naïve adults. HIV infection in patients with HIV-1 RNA <50 copies/mL (to replace their current antiretroviral regimen) who are on a stable antiretroviral regimen for ≥6 mo, have no history of treatment failure, and have no known substitutions associated with resistance to the individual medications in the combination product.

Action

Elvitegravir — An integrase strand transfer inhibitor that inhibits an enzyme necessary for viral replication. *Cobicistat* — A pharmacokinetic enhancer (inhibits CYP3A and CYP2D6) that increases systemic exposure to

© F.A. Davis Publishing

elvitegravir. *Emtricitabine*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in viral DNA chain termination. *Tenofovir alafenamide*—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase resulting in disruption of DNA synthesis. When compared to tenofovir disoproxil fumarate, tenofovir alafenamide is associated with fewer episodes of renal impairment and reductions in bone mineral density. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae.

Pharmacokinetics

Elvitegravir

Absorption: Absorption follows oral administration.
Distribution: Unknown.
Protein Binding: 98–99%.
Metabolism and Excretion: Metabolized by CYP3A; 94.5% eliminated in feces, 6.7% in urine.
Half-life: 12.9 hr.

Cobicistat

Absorption: Absorption follows oral administration.
Distribution: Unknown.
Protein Binding: 97–98%.
Metabolism and Excretion: Metabolized by CYP3A and to a small extent by CYP2D6; 86.2% eliminated in feces, 8.2% in urine.
Half-life: 3.5 hr.

Emtricitabine

Absorption: Rapidly and extensively absorbed; 93% bioavailable.
Distribution: Unknown.
Metabolism and Excretion: Some metabolism; 86% eliminated in urine, 14% in feces.
Half-life: 10 hr.

Tenofovir Alafenamide

Absorption: Tenofovir alafenamide is a prodrug, which is hydrolyzed into tenofovir, the active component; absorption enhanced by high-fat meals.
Distribution: Unknown.
Metabolism and Excretion: Tenofovir is phosphorylated to tenofovir diphosphate (active metabolite); 32% excreted in feces, <1% in urine.
Half-life: 0.51 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Elvitegravir PO	unknown	4 hr	24 hr
Cobicistat PO	unknown	3 hr	24 hr
Emtricitabine PO	rapid	1–2 hr	24 hr
Tenofovir alafenamide PO	unknown	0.5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment; Concurrent use of alfuzosin, carbamazepine, ergot derivatives, lomitapide, lovastatin, lurasidone, phenobarbital, phenytoin, pimozide, rifampin, sildenafil (Revatio), simvastatin, triazolam, or St. John's wort; Severe renal impairment (CCr 15–30 mL/min) or end-stage renal disease (CCr <15 mL/min) not receiving hemodialysis; Severe hepatic impairment; OB: Not recommended in pregnancy (significantly lower concentrations of elvitegravir and cobicistat); Lactation: Breast feeding not recommended in HIV-infected mothers.

Use Cautiously in: Female patients or obese patients (may be at ↑ risk for lactic acidosis/hepatic steatosis); Chronic hepatitis B virus infection (may exacerbate following discontinuation); Concurrent use of nephrotoxic drugs (↑ risk of renal impairment); Pedi: Children <25 kg (safety and effectiveness not established); Geri: Older adults may be more sensitive to drug effects; consider age-related ↓ in renal, hepatic, and cardiovascular function, as well as concurrent disease states and medications.

Exercise Extreme Caution in: Hepatitis B (may cause severe acute exacerbation).

Adverse Reactions/Side Effects

Endo: Graves' disease. **F and E:** hypophosphatemia. **GI:** LACTIC ACIDOSIS/HEPATOMEGALY WITH STEATOSIS, POST-TREATMENT ACUTE EXACERBATION OF HEPATITIS B, nausea, autoimmune hepatitis, diarrhea. **GU:** ACUTE RENAL FAILURE/FANCONI SYNDROME, proteinuria. **Metab:** ↑ lipids. **MS:** polymyositis. **Neuro:** Guillain-Barré syndrome, headache. **Misc:** fatigue, immune reconstitution syndrome.

Interactions

Drug-Drug: May alter blood levels and effects of other drugs metabolized by the CYP3A or CYP2D6 enzyme systems. Other drugs that induce the CYP3A system can alter blood levels and effects. Concurrent administration of other drugs that depend mainly on CYP3A for metabolism and whose blood levels, when ↑, are associated with serious/life-threatening adverse reactions including **alfuzosin**, **dihydroergotamine**, **ergotamine**, **lomitapide**, **lovastatin**, **lurasidone**, **methylergonovine**, **pimozide**, **sildenafil** (when used for pulmonary hypertension), **simvastatin**, and **triazolam**; concurrent use contraindicated. **Carbamazepine**, **phenobarbital**, **phenytoin**, or **rifampin** may significantly ↓ levels/effectiveness of cobicistat and elvitegravir and ↑ risk of resistance; concurrent use contraindicated. Nephrotoxic agents, including **NSAIDs** and **aminoglycosides**, may ↑ risk of nephrotoxicity; avoid concurrent use. Drugs that induce CYP3A will ↓ levels/effectiveness of elvitegravir, cobicistat, and tenofovir alafenamide. Drugs that inhibit CYP3A will ↑ levels/toxicity of cobicistat. **Acyclovir**, **cidofovir**, **ganciclovir**, **valacyclovir**, and **valganciclovir** may ↓ renal elimination and ↑ levels/toxicity of emtricitabine and tenofovir alafenamide. May ↑ levels/toxicity of **amiodarone**, **digoxin**, **disopyramide**, **flecainide**, **lidocaine**, **mexiletine**, **propafenone** and **quinidine**; careful monitoring recommended. May alter effects of **warfa-**

© F.A. Davis Publishing

rin; careful monitoring of INR recommended. Concurrent use with **clarithromycin** may ↑ levels/toxicity of clarithromycin and/or cobicistat (for patients with CCr 50–60 mL/min, ↓ dose of clarithromycin by 50%). May ↑ levels/toxicity of **ethosuximide**; clinical monitoring recommended. **Oxcarbazepine** may ↓ levels/effectiveness of cobicistat, elvitegravir, and tenofovir alafenamide; consider using alternative anticonvulsant. May ↑ levels/toxicity of **SSRIs** (except sertraline), **tricyclic antidepressants**, and **trazodone**; careful titration and monitoring recommended. Concurrent use with **itraconazole**, **ketoconazole**, or **voriconazole** may ↑ levels/toxicity of itraconazole, ketoconazole, voriconazole, elvitegravir, and cobicistat; (max dose of ketoconazole or itraconazole = 300 mg/day; assess risk vs. benefit before using voriconazole). May ↑ levels/toxicity of **colchicine**; concurrent use contraindicated in renal or hepatic impairment; *Dosing adjustment for gout flares*—0.6 mg, then 0.3 mg 1 hr later, do not repeat for ≥3 days; *Dosing adjustment for gout flare prophylaxis*—0.3 mg once daily if original regimen was 0.6 mg twice daily, 0.3 mg every other day if original regimen was 0.6 mg once daily; *Dosing adjustment for treatment of familial Mediterranean fever*—not to exceed 0.6 mg daily, may be given as 0.3 mg twice daily. **Rifabutin** or **rifapentine** may ↓ levels/effectiveness of cobicistat, elvitegravir, and tenofovir alafenamide and may foster resistance; concurrent use not recommended. May ↑ levels/toxicity of **beta blockers**; careful monitoring recommended; ↓ dose of beta blocker if necessary. May ↑ levels/toxicity of **calcium channel blockers** including **amlodipine**, **diltiazem**, **felodipine**, **nicardipine**, **nifedipine**, and **verapamil**; careful monitoring recommended. Concurrent use of corticosteroids that induce CYP3A, including **betamethasone**, **budesonide**, **ciclesonide**, **dexamethasone**, **fluticasone**, **methylprednisolone**, **mometasone**, **prednisone**, and **triamcinolone**, may ↓ levels/effectiveness and ↑ risk of resistance to elvitegravir; consider use of other corticosteroids, such as beclomethasone or prednisolone. Concurrent use of corticosteroids that are CYP3A substrates, including **betamethasone**, **budesonide**, **ciclesonide**, **dexamethasone**, **fluticasone**, **methylprednisolone**, **mometasone**, **prednisone**, and **triamcinolone**, may ↑ risk of Cushing's disease and adrenal suppression; consider use of other corticosteroids, such as beclomethasone or prednisolone. May ↑ levels/toxicity of **bosentan**; initiate bosentan at 62.5 mg once daily or every other day if already receiving elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide for ≥10 days; if already receiving bosentan, discontinue bosentan ≥36 hr prior to starting elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide; after 10 days, bosentan may be restarted at 62.5 mg once daily or every other day. May ↑ levels/toxicity of **atorvastatin**; initiate atorvastatin at lowest dose titrate cautiously; do not exceed dose of 20 mg/day. May ↑ levels/toxicity of **norgestimate** and ↓ levels of **ethinyl estradiol**; due to unpredictable effects, nonhormonal contraceptive methods should be considered. ↑ risk of hyperkalemia with contraceptives containing **drospirenone**; closely monitor serum potassium concentrations. May ↑ levels/toxicity of **immunosuppressants**, including **cyclosporine**, **sirolimus**, and **tacrolimus**; careful monitoring recommended. **Cyclosporine** may ↑ levels/toxicity of cobicistat and elvitegravir; careful monitoring recommended. May ↑ levels/toxicity of **buprenorphine** and ↓ levels of **naloxone**; carefully monitor for sedation and altered cognitive effects. May ↑ levels of **fentanyl**, and **tramadol**; monitor for respiratory depression; consider ↓ tramadol dose. May ↑ levels of and risk of adverse cardiovascular effects with **salmeterol**, concurrent use not recommended. ↑ levels/toxicity of **neuroleptics**, including **perphenazine**, **risperidone**, and **thioridazine**; may need to ↓ dose of neuroleptic. May ↑ levels of **quetiapine**; if taking quetiapine when initiating therapy, consider alternative antiretroviral therapy or ↓ quetiapine dose to ⅙ of the original dose and monitor for adverse effects. May ↑ levels/toxicity of **PDE5 inhibitors**, including **sildenafil**, **tadalafil**, and **vardenafil**; *Dosing adjustment for pulmonary hypertension*—sildenafil is contraindicated; in patients who have received elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide for ≥7 days, start tadalafil at 20 mg once daily and carefully titrate if tolerating to 40 mg once daily; in patients already receiving tadalafil, discontinue tadalafil for ≥24 hr before initiating elvitegravir/cobicistat/emtricitabine/tenofovir alafenamide; after ≥1 wk, resume tadalafil at 20 mg once daily and titrate if tolerating to 40 mg once daily; *Dosing adjustment for erectile dysfunction*—sildenafil dose should not exceed 25 mg in 48 hr, vardenafil dose should not exceed 2.5 mg in 72 hr, and tadalafil dose should not exceed 10 mg in 72 hr. ↑ levels/toxicity of **sedative/hypnotics**, including **midazolam** (parenteral), **diazepam**, **buspirone**, and **zolpidem**; consider dose ↓ of parenteral midazolam; clinical monitoring and dose ↓, if necessary, is recommended for other sedative/hypnotics. May ↑ bleeding risk with **rivaroxaban**; avoid concurrent use. May ↑ bleeding risk with **apixaban**; if taking apixaban 5–10 mg twice daily, ↓ apixaban dose by 50%; if taking apixaban 2.5 mg twice daily, avoid concurrent use. May ↑ bleeding risk with **dabigatran**; may need to avoid concurrent use if patient has moderate or severe renal impairment (depends on dabigatran indication). May ↑ bleeding risk with **edoxaban**; ↓ edoxaban dose by 50% when used for VTE treatment in patients with moderate or severe renal impairment. May ↑ bleeding risk with **ticagrelor**; concurrent use not recommended. May ↓ antiplatelet effects of **clopidogrel** and ↑ risk of thromboembolic events; concurrent use not recommended. Medications containing polyvalent cations, including **calcium**, **magnesium**,

© F.A. Davis Publishing

aluminum, **iron**, or **zinc**, may ↓ levels and effectiveness of elvitegravir; separate administration by ≥2 hr.

Drug-Natural Products: **St. John's wort** may significantly ↓ levels and effectiveness of cobicistat and elvitegravir and ↑ risk of resistance; concurrent use contraindicated.

Route/Dosage

PO (Adults and Children ≥25 kg): One tablet once daily.

Renal Impairment

PO (Adults): *CCr <15 mL/min AND receiving chronic hemodialysis*— One tablet once daily (give after dialysis on dialysis days).

Availability

Tablets: elvitegravir 150 mg/cobicistat 150 mg/emtricitabine 200 mg/tenofovir alafenamide 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- ***Lab Test Considerations:*** Monitor viral load and CD4 count before and routinely during therapy to determine response.
- Assess for hepatitis B virus (HBV). *Genvoya* is not approved for administration in patients with HIV and HBV. If therapy is discontinued, may cause severe exacerbation of hepatitis B. Monitor liver function in coinfected patients for several mo after stopping therapy.
- Monitor liver function tests prior to, during and following therapy. May cause ↑ LDL cholesterol, total cholesterol, and triglyceride concentrations. Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women. Discontinue therapy if symptoms occur.
- Calculate serum creatinine, CCr, urine glucose, and urine protein prior to and periodically during therapy and when clinically indicated. In patients with chronic kidney disease, assess serum creatinine, creatinine clearance, serum phosphorus, urine glucose, and urine protein prior to and periodically during therapy. May cause hypophosphatemia in patients with renal impairment.
- May cause hyperglycemia and glycosuria.

Implementation

- Do not confuse elvitegravir, cobicistat, emtricitabine, and tenofovir alafenamide with elvitegravir, cobicistat, emtricitabine, and tenofovir disoproxil fumarate.
- **PO:** Administer once daily with food.
- Administer antacids at least 2 hr before or after medication.

Patient/Family Teaching

- Instruct patient on the importance of taking medication as directed, even if feeling better. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Discontinuing therapy may lead to severe exacerbations. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Advise patient to read *Patient Information* prior to starting therapy and with each Rx refill in case of changes. Caution patient not to share or trade *Genvoya* with others.
- Inform patient of importance of hepatitis B testing before starting antiretroviral therapy.
- Advise patient if antacids containing aluminum, magnesium hydroxide, or calcium carbonate, take at least 2 hrs before or after *Genvoya*.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient to notify health care professional immediately if symptoms of lactic acidosis (nausea, vomiting, unusual or unexpected stomach discomfort; unusual muscle pain; difficulty breathing; feeling cold, especially in arms and legs; dizziness; fast or irregular heartbeat; and weakness or tiredness) liver problems (yellow skin or whites of eyes, dark urine, light-colored stools, loss of appetite, nausea, stomach pain) or signs of Immune Reconstitution Syndrome (signs and symptoms of an infection or inflammation, can occur many months after start of therapy) occur.
- Inform patient that *Genvoya* does not cure AIDS and may reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and avoid sharing needles or donating blood to prevent spreading HIV to others.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected. Monitor viral load closely during pregnancy. Encourage patients who become pregnant during therapy to join the Antiretroviral Pregnancy Registry that monitors pregnancy outcomes in women exposed to *Genvoya* during pregnancy. Enroll patient by calling 1-800-258-4263. Advise female patient to avoid breast feeding during therapy.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

empagliflozin

(em-pag-gli-**floe**-zin)
Jardiance

Classification
Therapeutic: antidiabetics
Pharmacologic: sodium-glucose co-transporter 2 (SGLT2) inhibitors

© F.A. Davis Publishing

Indications

Adjunct to diet and exercise in the management of type 2 diabetes. To reduce risk of cardiovascular death in patients with type 2 diabetes and established cardiovascular disease. To reduce the risk of cardiovascular death and hospitalization for heart failure in patients with heart failure and reduced ejection fraction (HFrEF).

Action

Inhibits proximal renal tubular sodium-glucose cotransporter 2 (SGLT2), which determines reabsorption of glucose from the tubular lumen. Inhibits reabsorption of glucose, lowers renal threshold for glucose, and increases excretion of glucose in urine. **Therapeutic Effects:** Improved glycemic control. Reduced death due to cardiovascular causes in patients with type 2 diabetes and cardiovascular disease. Reduced death due to cardiovascular causes and hospitalizations due to heart failure in patients with HFrEF.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Enters red blood cells, remainder of distribution unknown.

Metabolism and Excretion: Minimally metabolized; excreted in feces (41.2% mostly as unchanged drug) and urine (54.4% half as unchanged drug, half as metabolites).

Half-life: 12.4 hr.

TIME/ACTION PROFILE (↓ in A1c)

ROUTE	ONSET	PEAK	DURATION
PO	within 6 wk	12 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe renal impairment (eGFR <30 mL/min/1.73 m² [patients with type 2 diabetes] or eGFR <20 mL/min/1.73 m² [patients with HFrEF]) or receiving dialysis; Type 1 diabetes; Diabetic ketoacidosis; Lactation: Lactation.

Use Cautiously in: eGFR <60 mL/min/1.73 m² or concurrent use of loop diuretics (↑ risk of volume depletion or hypotension); History of pancreatitis, pancreatic surgery, reduced caloric intake due to illness or surgery, surgical procedures, or alcohol abuse (↑ risk of ketoacidosis); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of adverse reactions related to volume depletion in older adults.

Adverse Reactions/Side Effects

CV: hypotension, volume depletion. **Endo:** hypoglycemia (↑ with other medications). **F and E:** KETOACIDOSIS, hyperphosphatemia. **GU:** NECROTIZING FASCIITIS OF PERINEUM (FOURNIER'S GANGRENE), UROSEPSIS, acute kidney injury, genital mycotic infections, ↑ urination, urinary tract infection (including pyelonephritis), renal impairment. **Metab:** hyperlipidemia. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions

Drug-Drug: ↑ risk of hypotension with **antihypertensives** or **diuretics**. ↑ risk of hypoglycemia with other **antidiabetics** (dose adjustments may be required). ↑ risk of acute kidney injury with **diuretics**, **ACE inhibitors**, **angiotensin receptor blockers**, or **NSAIDs**.

Route/Dosage

Type 2 Diabetes

PO (Adults): 10 mg once daily, may ↑ to 25 mg once daily.

Type 2 Diabetes in Patients with Established Cardiovascular Disease

PO (Adults): 10 mg once daily, may ↑ to 25 mg once daily for additional glycemic control.

Heart Failure with Reduced Ejection Fraction

PO (Adults): 10 mg once daily.

Availability

Tablets: 10 mg, 25 mg. ***In combination with:*** linagliptin (Glyxambi); linagliptin and metformin XR (Trijardy XR); metformin (Synjardy); metformin XR (Synjardy XR). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Observe patient for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, confusion, headache, tremor, tachycardia, irritability, drowsiness).
- Monitor for signs and symptoms of volume depletion (dizziness, feeling faint, weakness, orthostatic hypotension) after initiating therapy, especially in elderly patients and patients with renal impairment, low systolic BP, or on diuretics.
- Monitor for signs and symptoms of urinary tract infection during therapy. Treat promptly.
- Monitor for infection (pain or burning on urination, frequency), new pain, tenderness, erythema, swelling, sores, or ulcers involving genital or perianal area, with fever or malaise; assess for necrotizing fasciitis. If suspected, start treatment immediately with broad-spectrum antibiotics and, if necessary, surgical debridement. Discontinue empagliflozin if these occur.
- Assess for ketoacidosis in patients presenting with signs and symptoms of dehydration and metabolic acidosis (nausea, vomiting, abdominal pain, malaise,

© F.A. Davis Publishing

shortness of breath), regardless of blood glucose level. Discontinue empagliflozin and treat promptly (insulin, fluid and caloric replacement) if suspected. Consider risk factors for ketoacidosis (pancreatic insulin deficiency, caloric restriction, alcohol abuse) before starting empagliflozin.

- ***Lab Test Considerations:*** Monitor hemoglobin A1C prior to and periodically during therapy.
- May ↑ serum creatinine and ↓ eGFR. Monitor renal function prior to starting and periodically during therapy. Do not begin therapy if eGFR <45 mL/min/1.73 m^2. Discontinue therapy if eGFR is persistently <45 mL/min/1.73 m^2.
- May cause ↑ serum phosphate levels. Monitor electrolytes periodically during therapy.
- May cause ↑ LDL-C. Monitor serum lipid levels periodically during therapy.
- May cause ↑ hematocrit.
- Monitor for ketoacidosis, especially during prolonged fasting for illness or surgery. May require temporary discontinuation of therapy.

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- Correct volume depletion prior to beginning therapy with empagliflozin.
- **PO:** Administer once daily in the morning with or without food.

Patient/Family Teaching

- Instruct patient to take empagliflozin as directed. Take missed doses as soon as remembered, unless it is almost time for next dose; do not double doses. Advise patient to read the *Medication Guide* before starting and with each Rx refill in case of changes.
- Explain to patient that empagliflozin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of serum glucose and ketones, especially during periods of stress or illness. Inform patient that empagliflozin will cause a positive test result when testing for urine glucose. Notify health care professional if significant changes occur.
- Advise patient to inform health care professional of therapy before surgery. Consider temporarily discontinuing empagliflozin for at least 3 days before surgery. Monitor for ketoacidosis during and after surgery. Advise patient discontinue empagliflozin and to notify health care professional immediately if signs and symptoms of ketoacidosis occur.
- Advise patient to notify health care professional immediately if new pain or tenderness, sores or ulcers, or infections involving the leg or foot occur and to immediately seek care if pain or tenderness, redness, or swelling of the genitals or area from the genitals back to the rectum, along with a fever above 100.4°F or malaise occur.
- Advise patient to notify health care professional if signs and symptoms of hypotension occur and to maintain adequate hydration as dehydration may increase risk of hypotension.
- Inform patient that empagliflozin may cause mycotic (yeast) infections. Women may have signs and symptoms of a vaginal yeast infection (vaginal odor, white or yellow vaginal discharge [may be lumpy or look like cottage cheese], vaginal itching). Men may have signs and symptoms of a yeast infection of the penis (redness, itching or swelling of penis; rash on penis; foul-smelling discharge from penis; pain in skin around penis). Advise patient to notify health care professional if yeast infection occurs.
- Advise patient to notify health care professional if signs and symptoms of urinary tract infection (burning feeling when passing urine, cloudy urine, pain in pelvis or back) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially other oral hypoglycemic medications.
- Advise patient to notify health care professional promptly if signs and symptoms of hypersensitivity reactions (rash; raised red patches on skin; swelling of face, lips, tongue, throat; difficulty breathing or swallowing) occur.
- Rep: Insulin is the recommended method of controlling blood sugar during pregnancy. Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.
- Emphasize importance of routine follow up with routine lab tests for blood glucose and renal function.

Evaluation/Desired Outcomes

- Improved hemoglobin A1C and glycemic control in adults with type 2 diabetes.
- Reduced risk of cardiovascular death in patients with type 2 diabetes and established cardiovascular disease.
- Reduced death due to cardiovascular causes and hospitalizations due to heart failure in patients with HFrEF.

© F.A. Davis Publishing

emtricitabine/rilpivirine/tenofovir alafenamide

(em-tri-**sye**-ti-been/**ril**-pi-vir-een/te-**noe**-fo-veer al-a-**fen**-a-mide)

Odefsey

Classification

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors, non-nucleoside reverse transcriptase inhibitors

Indications

Management of HIV infection in treatment-naïve patients with HIV-1 RNA <100,000 copies/mL at the start of therapy (for use as a complete regimen). Management of HIV infection in patients on a stable antiretroviral regimen with HIV-1 RNA <50 copies/mL for ≥6 mo and have no history of treatment failure or no known substitutions associated with resistance to the individual components of the medication (to replace their current antiretroviral regimen).

Action

Emtricitabine— Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in viral DNA chain termination. *Rilpivirine*— Inhibits HIV-replication by noncompetitively inhibiting HIV reverse transcriptase. *Tenofovir*— Phosphorylated intracellularly where it inhibits HIV reverse transcriptase resulting in disruption of DNA synthesis. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae.

Pharmacokinetics

Emtricitabine

Absorption: Rapidly and extensively absorbed; 93% bioavailable.

Distribution: Unknown.

Metabolism and Excretion: Some metabolism, 86% renally excreted, 14% fecal excretion.

Half-life: 10 hr.

Rilpivirine

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: 99.7%.

Metabolism and Excretion: Primarily metabolized by the liver via CYP3A; 25% excreted in feces unchanged, <1% excreted unchanged in urine.

Half-life: 50 hr.

Tenofovir alafenamide

Absorption: Tenofovir alafenamide is a prodrug, which is hydrolyzed into tenofovir, the active component; absorption enhanced by high-fat meals.

Distribution: Unknown.

Metabolism and Excretion: Tenofovir is phosphorylated to tenofovir diphosphate (active metabolite); 32% excreted in feces, <1% in urine.

Half-life: 0.51 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Emtricitabine PO	rapid	1–2 hr	24 hr
Rilpivirine PO	unknown	4–5 hr	24 hr
Tenofovir PO	unknown	1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of carbamazepine, oxcarbazepine, phenobarbital, phenytoin, rifampin, rifapentine, proton pump inhibitors, dexamethasone (>1 dose), or St. John's wort; Severe renal impairment (CCr 15–30 mL/min) or end-stage renal disease (CCr <15 mL/min) not receiving hemodialysis; Lactation: Breast feeding is not recommended in HIV-infected mothers.

Use Cautiously in: History of suicidal ideation or depression; HIV-1 RNA >100,000 copies/mL (↑ risk of virologic failure); Hepatitis B or C infection or hepatic impairment; Renal impairment or receiving nephrotoxic medications (↑ risk of renal impairment); Severe hepatic impairment; OB: Monitor viral load closely when used during pregnancy; Pedi: Children <12 yr or <35 kg (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: QT interval prolongation. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS). **Endo:** Graves' disease. **GI:** ACUTE EXACERBATION OF HEPATITIS B, HEPATOTOXICITY, LACTIC ACIDOSIS/HEPATOMEGALY WITH STEATOSIS, autoimmune hepatitis. **GU:** ACUTE RENAL FAILURE/FANCONI SYNDROME. **Metab:** hyperlipidemia. **MS:** polymyositis. **Neuro:** SUICIDAL ATTEMPTS/THOUGHTS, depression, Guillain-Barré syndrome, headache, sleep disturbances. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: **Strong CYP3A4 inducers**, including **carbamazepine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **dexamethasone** (more than a single dose), **rifampin**, and **rifapentine** may ↓ rilpivirine levels and its effectiveness; concurrent use contraindicated. **Proton pump inhibitors** including **esomeprazole**, **lansoprazole**, **omeprazole**, **pantoprazole**, and **rabeprazole** ↑ gastric pH and may ↓ rilpivirine levels and its effectiveness; concurrent use contraindicated. Concurrent use of **QT interval prolonging medications** may ↑ risk of torsades de pointes. Medications that compete for active tubular secretion, including **acyclovir**, **cidofovir**, **ganciclovir**, **valacyclovir**, **valganciclovir**,

© F.A. Davis Publishing

or **aminoglycosides** may ↑ emtricitabine and tenofovir levels and toxicity; avoid if possible. **Antacids** including **aluminum hydroxide**, **magnesium hydroxide**, and **calcium carbonate** ↑ gastric pH and may ↓ rilpivirine levels; administer antacid ≥2 hr before or ≥4 hr after. Blood levels and effectiveness may be ↓ by **H_2-antagonists** including **cimetidine**, **famotidine**, and **nizatidine** ↑ gastric pH and may ↓ rilpivirine levels; administer H_2-antagonist ≥12 hr before or ≥4 hr after. Nephrotoxic agents, including **NSAIDs**, ↑ risk of nephrotoxicity; avoid concurrent use. **Rifabutin** may ↓ rilpivirine and tenofovir alafenamide levels and their effectiveness; concurrent use not recommended. **Fluconazole**, **itraconazole**, **ketoconazole**, **posaconazole**, and **voriconazole** may ↑ rilpivirine and tenofovir alafenamide levels and risk of toxicity. May ↓ **ketoconazole** levels. May alter requirements for **methadone** maintenance. **Clarithromycin** or **erythromycin** may ↑ rilpivirine levels and risk of toxicity; consider azithromycin as an alternative. **Ledipasvir/sofosbuvir**, **sofosbuvir/velpatasvir**, and **sofosbuvir/velpatasvir/voxilaprevir** may ↑ tenofovir levels.

Drug-Natural Products: **St. John's wort** may ↓ rilpivirine levels and its effectiveness; concurrent use contraindicated.

Route/Dosage

PO (Adults and Children ≥12 yr and ≥35 kg): 1 tablet once daily.

Renal Impairment

PO (Adults and Children ≥12 yr and ≥35 kg):
End-stage renal disease (CCr <15 mL/min) receiving hemodialysis— 1 tablet once daily (to be given after hemodialysis).

Availability

Tablets: emtricitabine 200 mg/rilpivirine 25 mg/tenofovir alafenamide 25 mg.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Monitor for signs and symptoms of DRESS (fever; rash with fever, blisters, mucosal involvement, eye inflammation (conjunctivitis); lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- ***Lab Test Considerations:*** Monitor viral load and CD4 cell count regularly during therapy.
- Assess for hepatitis B virus (HBV). *Odefsey* is not approved for administration in patients with HIV and HBV. If therapy is discontinued, may cause severe exacerbation of hepatitis B. Monitor liver function in coinfected patients for several mo after stopping therapy.
- Monitor liver function tests before and periodically during therapy, especially in patients with underlying liver disease or marked ↑ transaminase. May cause ↑ serum creatinine, AST, ALT, total bilirubin, total cholesterol, LDL, and triglycerides. May cause lactic acidosis and severe hepatomegaly with steatosis. These events are more likely to occur if patients are female, obese, or receiving nucleoside analogue medications for extended periods of time. Monitor patient for signs (increased serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- Assess serum creatinine, creatinine clearance, urine glucose, and urine protein before starting and periodically during therapy. Also assess serum phosphorous in patients with chronic kidney disease. Patients taking nephrotoxic agents, including NSAIDs, are at increased risk for renal impairment.

Implementation

- **PO:** Administer once daily with a meal.

Patient/Family Teaching

- Instruct patient to take medication as directed. Avoid missing doses, may result in development of resistance. Do not stop taking *Odefsey* without consulting health care professional. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- Instruct patient that *Odefsey* should not be shared with others.
- Inform patient that *Odefsey* does not cure AIDS and may reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and avoid sharing needles or donating blood to prevent spreading HIV to others.
- Advise patient to notify health care professional immediately if symptoms of lactic acidosis (nausea, vomiting, unusual or unexpected stomach discomfort, and weakness), hypersensitivity (swelling of face, eyes, lips, mouth, tongue or throat; difficulty swallowing; shortness of breath), severe liver problems (yellow skin or white part of eyes, dark "tea-colored" urine, light-colored stools, loss of appetite, nausea, stomach-area pain), or DRESS occur.
- Inform patients and families of risk of suicidal thoughts and behavior and advise that behavioral changes, emergency or worsening signs and symptoms of depression, unusual changes in mood, or emergence of suicidal thoughts, behavior, or thoughts of self-harm should be reported to health care professional immediately.

© F.A. Davis Publishing

- Immune reconstitution syndrome may trigger opportunistic infections or autoimmune disorders. Notify health care professional if symptoms (signs and symptoms of an infection or inflammation) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected. Advise patient to avoid breast feeding during *Odefsey* therapy. Monitor viral load closely during pregnancy. Encourage women who become pregnant during *Odefsey* therapy to join the Antiviral Pregnancy Registry that monitors pregnancy outcomes in women exposed to *Odefsey* during pregnancy. Enroll patient by calling 1-800-258-4263.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.

emtricitabine/tenofovir disoproxil fumarate

(em-tri-**sye**-ti-been/te-**noe**-fo-veer dye-soe-**prox**-il **fue**-ma-rate)

Truvada

Classification

Therapeutic: antiretrovirals

Pharmacologic: nucleoside reverse transcriptase inhibitors

Indications

HIV infection (in combination with other antiretroviral agents). Pre-exposure prophylaxis (PrEP) to reduce the risk of sexually acquired HIV-1 infection in at-risk individuals.

Action

Emtricitabine and tenofovir disoproxil fumarate—Phosphorylated intracellularly where it inhibits HIV reverse transcriptase, resulting in inhibition of viral replication. **Therapeutic Effects:** Slowed progression of HIV infection and decreased occurrence of sequelae. Reduction in risk of sexually acquired HIV infection in at-risk individuals.

Pharmacokinetics

Emtricitabine

Absorption: Rapidly and extensively absorbed (93% bioavailable).

Distribution: Unknown.

Metabolism and Excretion: Undergoes some metabolism with 86% renally excreted and 14% excreted in feces as metabolites.

Half-life: 10 hr.

Tenofovir Disoproxil Fumarate

Absorption: Tenofovir disoproxil fumarate is a prodrug and undergoes hydrolysis to be converted to tenofovir, the active component.

Distribution: Unknown.

Metabolism and Excretion: 70–80% excreted unchanged in urine by glomerular filtration and active tubular secretion.

Half-life: 17 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Emtricitabine PO	rapid	1–2 hr	24 hr
Tenofovir PO	rapid	1–2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Unknown or positive HIV status (for PrEP); Severe renal impairment (HIV treatment) (CCr <30 mL/min); Moderate or severe renal impairment (PrEP) (CCr <60 mL/min); Lactation: Breast feeding should be avoided in mothers infected with HIV.

Use Cautiously in: Hepatitis B virus (may lead to acute exacerbation of hepatitis B upon discontinuation); Moderate renal impairment (CCr 30–49 mL/min) (adjust dosing interval); History of pathologic fractures/osteoporosis/bone loss; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk (in women with HIV, monitor viral load closely); Pedi: Safety and effectiveness not established in children who weigh <17 kg (HIV treatment) or <35 kg (PrEP).

Adverse Reactions/Side Effects

Endo: Graves' disease. **F and E:** hypophosphatemia. **GI:** LACTIC ACIDOSIS/HEPATOMEGALY WITH STEATOSIS, POST-TREATMENT ACUTE EXACERBATION OF HEPATITIS B, abdominal pain, autoimmune hepatitis, ↑ liver enzymes. **GU:** ACUTE RENAL FAILURE/FANCONI SYNDROME, renal impairment. **Metab:** ↓ weight. **MS:** ↓ bone mineral density, bone pain, muscle pain, osteomalacia, polymyositis. **Neuro:** Guillain-Barré syndrome, headache. **Misc:** immune reconstitution syndrome.

Interactions

Drug-Drug: Nephrotoxic agents, including **NSAIDs**, ↑ risk of nephrotoxicity; avoid concurrent use. Other drugs eliminated by active tubular secretion, including **acyclovir**, **adefovir**, **aminoglycosides**, **cidofovir**, **ganciclovir**, **valacyclovir**, and **valganciclovir**, may ↑ levels. May ↑ **didanosine** levels and risk of toxicity; in patients >60 kg, ↓ didanosine dose to 250 mg. May ↓ **atazanavir** levels and effectiveness; administer atazana-

© F.A. Davis Publishing

vir with ritonavir when used with emtricitabine/tenofovir disoproxil fumarate. **Lopinavir/ritonavir**, **atazanavir/ritonavir**, or **darunavir/ritonavir** may ↑ tenofovir levels and risk of toxicity; closely monitor. **Sofosbuvir/velpatasvir**, **sofosbuvir/velpatasvir/voxilaprevir**, or **ledipasvir/sofosbuvir** may ↑ tenofovir levels and risk of toxicity; closely monitor.

Route/Dosage

HIV-1 Infection

PO (Adults and Children ≥35 kg): One tablet (emtricitabine 200 mg/tenofovir disoproxil fumarate 300 mg) once daily.
PO (Children 28–<35 kg): One tablet (emtricitabine 167 mg/tenofovir disoproxil fumarate 250 mg) once daily.
PO (Children 22–<28 kg): One tablet (emtricitabine 133 mg/tenofovir disoproxil fumarate 200 mg) once daily.
PO (Children 17–<22 kg): One tablet (emtricitabine 100 mg/tenofovir disoproxil fumarate 150 mg) once daily.

Renal Impairment

PO (Adults ≥35 kg): *CCr 30–49 mL/min* — One tablet (emtricitabine 200 mg/tenofovir disoproxil fumarate 300 mg) every 48 hr. *CCr <30 mL/min (including hemodialysis)* — Not recommended.

HIV-1 PrEP

PO (Adults and Children ≥35 kg): One tablet (emtricitabine 200 mg/tenofovir disoproxil fumarate 300 mg) once daily.

Availability (generic available)

Tablets: emtricitabine 100 mg/tenofovir disoproxil fumarate 150 mg, emtricitabine 133 mg/tenofovir disoproxil fumarate 200 mg, emtricitabine 167 mg/tenofovir disoproxil fumarate 250 mg, emtricitabine 200 mg/tenofovir disoproxil fumarate 300 mg.

NURSING IMPLICATIONS

Assessment

- Assess for change in severity of HIV symptoms and for symptoms of opportunistic infections during therapy.
- Monitor weight periodically during therapy; may require dose modification.
- Monitor bone mineral density in patients who have a history of pathologic bone fracture or are at risk for osteoporosis or bone loss. Calcium and vitamin D supplementation may be beneficial for all patients.
- ***Lab Test Considerations:*** Screen patients for HIV-1 infection immediately before starting therapy for *HIV-1 PrEP* and at least every 3 mo during therapy, and upon diagnosis of any sexually transmitted infections. If recent (<1 mo) exposures to HIV-1 are suspected (condomless sex or condom breaking during sex with a partner of unknown HIV-1 status, unknown viremic status, or a recent STI) or clinical symptoms consistent with acute HIV-1 infection occur, use a test approved by the FDA as an aid in the diagnosis of acute or primary HIV-1 infection. If HIV-1 test indicates possible HIV-1 infection, or symptoms consistent with acute HIV-1 infection develop following a potential exposure event, convert *HIV-1 PrEP* regimen to HIV treatment regimen until negative infection status is confirmed.
- Monitor viral load and CD4 cell count regularly during therapy.
- Assess for hepatitis B virus (HBV). *Truvada* is not approved for administration in patients with HIV and HBV. If therapy is discontinued, may cause severe exacerbation of hepatitis B. Monitor liver function in coinfected patients for several months after stopping therapy. May use anti-hepatitis therapy. Offer vaccination to patients uninfected with HIV.
- Monitor liver function tests before and periodically during therapy, especially in patients with underlying liver disease or marked ↑ transaminase. May cause ↑ serum creatinine, AST, ALT, total bilirubin, total cholesterol, LDL, and triglycerides. May cause lactic acidosis and severe hepatomegaly with steatosis. These events are more likely to occur if patients are female, obese, or receiving nucleoside analogue medications for extended periods of time. Monitor patient for signs (increased serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Therapy should be suspended if clinical or laboratory signs occur.
- Monitor creatinine clearance (CCr), serum creatinine, urine glucose, and urine protein prior to therapy. CCr should be >70 mL/min before starting therapy. Monitor CCr, urine glucose, and urine protein in all patients periodically during therapy and serum phosphorous in patients with chronic kidney disease. Assess patients with persistent or worsening bone pain, pain in extremities, fractures and/or muscular pain, or weakness for proximal renal tubulopathy; evaluate renal function promptly.

Implementation

- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Emphasize the importance of taking *Truvada* as directed. Do not take more than prescribed amount and do not stop taking without consulting health care professional. Uninfected individuals who miss doses are at greater risk of acquiring HIV-1. Advise patient to read *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- Advise patients taking *Truvada* for *HIV-1 PrEP* to only take *Truvada* if confirmed HIV-1 negative. Some HIV-1 tests can miss HIV-1 infection in patients recently infected. Notify health care professional if flu-like symptoms (tiredness, fever, joint or muscle aches, headache, sore throat, vomiting or diarrhea, rash, night sweats, enlarged lymph nodes in the neck or groin) occur. Advise patient to use condoms consistently and correctly to lower chances of sexual

© F.A. Davis Publishing

contact with any body fluids (semen, vaginal secretions, blood), the importance of knowing their HIV-1 status and the HIV-1 status of their partner(s), the need to get tested at least every 3 mo or more frequently for HIV-1 and other sexually transmitted infections (syphilis, chlamydia, gonorrhea), and to ask their partner to get tested. Advise patient if they become HIV-1 positive, more antiretroviral medication than *Truvada* is needed to treat HIV-1.

- Advise patients taking *Truvada* to *treat HIV-1 infection* that *Truvada* alone is not a complete treatment for HIV-1; other antiretroviral medications are required.
- Instruct patient that *Truvada* should not be shared with others.
- Inform patient that *Truvada* does not cure AIDS or prevent other sexually transmitted infections, associated or opportunistic infections. *Truvada* may reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom and to avoid sharing needles or donating blood to prevent spreading the AIDS virus to others.
- Advise patient to notify health care professional immediately if signs and symptoms of lactic acidosis (nausea, vomiting, unusual or unexpected stomach discomfort, and weakness), severe liver problems (yellow skin or white part of eyes, dark "tea-colored" urine, light-colored stools, loss of appetite, nausea, stomach-area pain), or DRESS occur.
- Immune reconstitution syndrome may trigger opportunistic infections or autoimmune disorders (Graves' disease, polymyositis, Guillain-Barré syndrome, autoimmune hepatitis). Notify health care professional if symptoms (signs and symptoms of an infection or inflammation) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected. Advise patient to avoid breast feeding during *Truvada* therapy. Encourage women who become pregnant during *Truvada* therapy to join the Antiretroviral Pregnancy Registry that monitors pregnancy outcomes in women exposed to *Truvada* during pregnancy. Enroll patient by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood counts to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Delayed progression of AIDS and decreased opportunistic infections in patients with HIV.
- Decrease in viral load and increase in CD4 cell counts.
- Reduced risk of sexually acquired HIV-1 infection in at-risk individuals.

enalapril/enalaprilat, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

encorafenib (en-koe-raf-e-nib)

Braftovi

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Metastatic or unresectable melanoma in patients with a BRAF V600E or V600K mutation (in combination with binimetinib). Metastatic colorectal cancer (CRC) in patients with a BRAF V600E mutation (in combination with cetuximab).

Action

Kinase inhibitor that targets BRAF V600E, a mutated enzyme that promotes tumor cell proliferation. **Therapeutic Effects:** Improvement in progression-free survival and overall survival in patients with melanoma and CRC.

Pharmacokinetics

Absorption: Well absorbed (86%) following oral administration.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Mostly metabolized by CYP3A4 and CYP2C19 enzyme systems. Primarily excreted as metabolites in feces (42%) and urine (45%).
Half-life: 3.5 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Wild-type BRAF melanoma (may ↑ proliferation); Long QT syndrome, bradyarrhythmias, severe or decompensated HF, hypokalemia, or hypomagnesemia (↑ risk of QT interval prolongation); Concurrent use of QT-interval prolonging medications; Baseline QTc interval >500 msec; Concurrent use of strong or moderate CYP3A4 inhibitors or inducers (may significantly alter levels and effects); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Moderate or severe hepatic impairment; Severe renal impairment; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: QT interval prolongation. **Derm:** BASAL CELL CARCINOMA, CUTANEOUS SQUAMOUS CELL CARCINOMA, alopecia, dry skin, hyperkeratosis, pruritus, rash, nodule formation. **EENT:** uveitis. **Endo:** hyperglycemia. **F and E:** hypermagnesemia, hyponatremia. **GI:** GI HEMORRHAGE, PANCREATITIS, abdominal pain, constipation, ↑ liver enzymes, nausea, vomiting. **GU:** ↑ serum creatinine, ↓ fertility (males). **Hemat:** BLEEDING, anemia, leukopenia, lymphopenia, neutropenia. **MS:** arthralgia, myalgia. **Neuro:** peripheral neuropathy, INTRACRANIAL HEMORRHAGE, dizziness, headache, fatigue, facial paralysis. **Misc:** HYPERSENSITIVITY REACTIONS, MALIGNANCY, fever.

Interactions

Drug-Drug: QT interval prolonging drugs may ↑ the risk of QT interval prolongation and torsades de pointes; avoid concurrent use. **Strong or moderate CYP3A4 inhibitors**, including **diltiazem** and **posaconazole** may ↑ levels and risk of toxicity; avoid concurrent use, if possible (if must use concurrently, ↓ encorafenib dose). **Strong or moderate CYP3A4 inducers** may ↓ levels and effectiveness; avoid concurrent use. May ↓ effectiveness of **hormonal contraceptives**.

Drug-Natural Products: St. John's wort may ↓ levels and effectiveness; avoid concurrent use.

Drug-Food: Grapefruit juice may ↑ levels and risk of toxicity; avoid concurrent use.

Route/Dosage

BRAF V600E or V600K Mutation-Positive Unresectable or Metastatic Melanoma

PO (Adults): 450 mg once daily until disease progression or unacceptable toxicity. *Concurrent use of moderate CYP3A4 inhibitor*— 225 mg once daily (if planned dose 450 mg once daily); 150 mg once daily (if planned dose 300 mg once daily); 75 mg once daily (if planned dose 225 mg once daily); *Concurrent use of strong CYP3A4 inhibitor*— 150 mg once daily (if planned dose 450 mg once daily); 75 mg once daily (if planned dose 300 mg once daily or 225 mg once daily).

BRAF V600E Mutation-Positive Metastatic CRC

PO (Adults): 300 mg once daily until disease progression or unacceptable toxicity. *Concurrent use of moderate CYP3A4 inhibitor*— 150 mg once daily (if planned dose 300 mg once daily); 75 mg once daily (if planned dose 225 mg once daily or 150 mg once daily); *Concurrent use of strong CYP3A4 inhibitor*— 75 mg once daily (if planned dose 300 mg once daily, 225 mg once daily, or 150 mg once daily).

Availability

Capsules: 75 mg.

NURSING IMPLICATIONS

Assessment

- Assess skin for lesions prior to starting, every 2 months during, and for up to 6 months following discontinuation of therapy. Manage suspicious skin lesions with excision and dermatopathologic evaluation. *For Grade 2 reaction,* if no improvement in 2 wk, hold encorafenib until Grade 0-1. Resume at same dose. *For Grade 3,* hold encorafenib until Grade 0-1. Resume at same dose if first occurrence or reduce dose if recurrent. *For Grade 4,* discontinue encorafenib permanently.
- Monitor for noncutaneous RAS mutation-positive malignancies. Permanently discontinue encorafenib if these malignancies occur.
- Monitor for signs and symptoms of hemorrhage (bleeding GI, rectal, anal, hemorrhoidal) periodically during therapy. *If Grade 2 or 1st occurrence of Grade 3:* Withhold encorafenib up to 4 wk. If improves to Grade 0-1 or to pretreatment level, resume at reduced dose. If no improvement, permanently discontinue encorafenib. *If 1st occurrence of Grade 4:* Discontinue encorafenib permanently or withhold up to 4 wk. If improves to Grade 0-1 or to pretreatment level, resume at reduced dose. If no improvement, permanently discontinue encorafenib. *If recurrent Grade 3:* Consider permanently discontinuing encorafenib. *If recurrent Grade 4:* permanently discontinue encorafenib.
- Monitor ECG in patients who already have or are at risk of QTc prolongation, including patients with known long QT syndromes, clinically significant bradyarrhythmias, severe or uncontrolled heart failure, and those taking other medications leading to QT prolongation. *If QTcF >500 ms and ≤60 ms increase from baseline,* hold encorafenib until QTcF ≤500 ms. Resume at reduced dose. If occurs more than once, permanently discontinue encorafenib. *If QTcF >500 ms and >60 ms increase from baseline,* discontinue encorafenib permanently.
- Assess for signs and symptoms of uveitis (visual changes, eye pain) during therapy. Perform ophthalmologic exam regularly and for new or worsening visual disturbances; follow new or persistent ophthalmologic findings. *If Grade 1 or 2 does not respond to ocular therapy, or for Grade 3 uveitis,* hold encorafenib for up to 6 wk. If improved, resume at same or reduced dose. If not improved, permanently discontinue encorafenib. *If Grade 4 uveitis occurs,* permanently discontinue encorafenib.
- ***Lab Test Considerations:*** Verify negative pregnancy status of females of reproductive potential prior to starting therapy.
- Confirm presence of a BRAF V600E or V600K mutation in tumor specimens before starting therapy for melanoma and of BRAF V600E mutation before starting therapy for CRC. Information on FDA-approved tests for the detection of BRAF V600E and V600K mu-

© F.A. Davis Publishing

tations is available at: http://www.fda.gov/CompanionDiagnostics.
- Monitor serum electrolytes periodically during therapy. Correct hypokalemia and hypomagnesemia prior to and during therapy. May also cause hyponatremia and hyperglycemia.
- May cause anemia, leukopenia, lymphopenia, and neutropenia.
- Monitor liver function periodically during therapy. May cause ↑ serum creatinine, GGT, AST, ALT, and alkaline phosphatase. *If Grade 2 AST or ALT ↑:* Continue encorafenib dose. If no improvement within 4 wk, hold encorafenib until Grade 0-1 or to baseline levels, then resume at same dose. If no improvement, permanently discontinue encorafenib. *If Grade 3 AST or ALT ↑:* Consider permanently discontinuing encorafenib. *If Grade 4 AST or ALT ↑:* Permanently discontinue encorafenib.

Implementation

- **Melanoma reduced dose recommendations**: If binimetinib is held, reduce encorafenib to maximum dose of 300 mg once daily until binimetinib is resumed. *First dose reduction:* 300 mg (four 75-mg capsules) orally once daily. *Second dose reduction:* 225 mg (three 75-mg capsules) orally once daily. *Subsequent modification:* Permanently discontinue if unable to tolerate encorafenib 225 mg (three 75-mg capsules) once daily. **CRC reduced dose recommendations**: If cetuximab is discontinued, discontinue encorafenib. *First dose reduction:* 225 mg (three 75-mg capsules) orally once daily. *Second dose reduction:* 150 mg (two 75-mg capsules) orally once daily. *Subsequent modification:* Permanently discontinue if unable to tolerate encorafenib 150 mg (two 75-mg capsules) once daily.
- **PO:** Administer once daily without regard to food. Store in original, tightly capped bottle at room temperature; do not remove desiccant, protect from moisture.

Patient/Family Teaching

- Instruct patient to take encorafenib as directed. Take missed dose within 12 hr of missed dose; do not take dose within 12 hr of next dose. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Inform patient that grapefruit products may increase amount of encorafenib in the body. Avoid grapefruit and grapefruit juice during therapy.
- Inform patient that encorafenib increases risk of developing new cutaneous malignancies. Notify health care professional immediately if new lesions (wart, skin sore or reddish bump that bleeds or does not heal) or changes in size or color of existing moles or lesions occur.
- Advise patient to notify health care professional immediately if signs and symptoms of bleeding (headaches, dizziness, weakness, coughing up blood or blood clots, vomiting blood or vomit looks like "coffee grounds," red or black stools that look like tar); liver dysfunction (yellow skin or whites of eyes, feeling tired, urine turns dark or brown, nausea or vomiting, loss of appetite, pain on right side of stomach), changes in heart rhythm (feeling faint, lightheaded, dizzy, heart beating irregularly or fast); or eye problems (blurred vision, loss of vision, other vision changes, seeing colored dots, seeing halos or blurred outline around objects, eye pain, swelling, redness) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Rep: May cause fetal harm. Encorafenib may decrease effectiveness of hormonal contraceptives. Advise female patient to use a highly effective nonhormonal form of contraception. Advise patient to notify health care professional if pregnancy is suspected and to avoid breast feeding during and for at least 2 wk after last dose. Advise patients to seek counseling on fertility and family planning prior to beginning therapy; may impair fertility in males.
- Inform patient that regular assessments of skin and assessments for signs and symptoms of other malignancies must be done every 2 mo during and for up to 6 mo after therapy. Advise patient to notify health care professional immediately if any changes in skin occur.

Evaluation/Desired Outcomes

- Decreased spread of melanoma and CRC.

enoxaparin, See HEPARINS (LOW MOLECULAR WEIGHT).

entacapone (en-tak-a-pone)

Comtan

Classification

Therapeutic: antiparkinson agents
Pharmacologic: catechol-*O*-methyltransferase (COMT) inhibitors

Indications

With levodopa/carbidopa to treat idiopathic Parkinson's disease when signs and symptoms of end-of-dose "wearing-off" (so-called fluctuating patients) occur.

Action

Acts as a selective and reversible inhibitor of the enzyme catechol *O*-methyltransferase (COMT). Inhibition of this enzyme prevents the breakdown of levodopa, increasing

© F.A. Davis Publishing

availability to the CNS. **Therapeutic Effects:** Prolongs duration of response to levodopa with end-of-dose motor fluctuations. Decreased signs and symptoms of Parkinson's disease.

Pharmacokinetics

Absorption: 35% absorbed following oral administration; absorption is rapid.
Distribution: Unknown.
Protein Binding: 98%.
Metabolism and Excretion: Minimal amounts excreted unchanged; highly metabolized followed by biliary excretion.
Half-life: *Initial phase*—0.4–0.7 hr; *second phase*—2.4 hr.

TIME/ACTION PROFILE (inhibition of COMT)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	up to 8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent nonselective MAO inhibitor therapy; Psychotic disorder.
Use Cautiously in: Hepatic impairment; Concurrent use of drugs that are metabolized by COMT; OB, Lactation: Safety not established; Pedi: No identified use in children.

Adverse Reactions/Side Effects

Resp: pulmonary infiltrates, pleural effusion, pleural thickening. **CV:** hypotension. **Derm:** melanoma. **GI:** abdominal pain, colitis, diarrhea, nausea (during initiation), retroperitoneal fibrosis. **GU:** brownish-orange discoloration of urine. **MS:** RHABDOMYOLYSIS, dyskinesia. **Neuro:** dyskinesia, NEUROLEPTIC MALIGNANT SYNDROME, agitation, aggressive behavior, confusion, delirium, disorientation, dizziness, hallucinations, paranoid ideation, syncope, urges (gambling, sexual).

Interactions

Drug-Drug: Concurrent use with selective **MAO inhibitors** is not recommended; both agents inhibit the metabolic pathways of catecholamines. Concurrent use of drugs that are metabolized by COMT such as **isoproterenol**, **epinephrine**, **norepinephrine**, **dopamine**, **dobutamine**, and **methyldopa** may ↑ risk of tachycardia, ↑ BP, and arrhythmias. **Probenecid**, **cholestyramine**, **erythromycin**, **rifampin**, **ampicillin**, and **chloramphenicol** may interfere with biliary elimination of entacapone; use concurrently with caution.

Route/Dosage

PO (Adults): 200 mg with each dose of levodopa/carbidopa up to a maximum of 8 times daily.

Availability (generic available)

Tablets: 200 mg. ***In combination with:*** levodopa/carbidopa (Stalevo), see Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian and extrapyramidal symptoms (restlessness or desire to keep moving, rigidity, tremors, pill rolling, mask-like face, shuffling gait, muscle spasms, twisting motions, difficulty speaking or swallowing, loss of balance control) prior to and during therapy. Dyskinesia may increase with therapy.
- Monitor patient for development of diarrhea. Usually occurs within 4 to 12 wk of start of therapy, but may occur as early as the first wk and as late as mo after initiation of therapy.
- Monitor patient for signs and symptoms of neuroleptic malignant syndrome (elevated temperature, muscular rigidity, altered consciousness, elevated CPK). Symptoms have been associated with rapid dose reduction or withdrawal of other dopaminergic drugs. Withdrawal should be gradual.

Implementation

- **PO:** Always administer entacapone with levodopa/carbidopa. Entacapone has no antiparkinsonism effects of its own.

Patient/Family Teaching

- Encourage patient to take entacapone as directed. Take missed doses as soon as possible, up to 2 hr before the next dose. Taper gradually when discontinuing or a withdrawal reaction may occur.
- May cause dizziness or hallucinations. Advise patient to avoid driving or other activities that require alertness until response to the drug is known.
- Inform patient that nausea may occur, especially at initiation of therapy and diarrhea. Advise patient with diarrhea to drink fluids to maintain adequate hydration and monitor for weight loss. If diarrhea is prolonged, may resolve with discontinuation. Therapy may cause change in urine color to brownish orange.
- Caution patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to notify health care professional if suspicious or unusual skin changes, agitation, aggression, delirium, hallucinations, or new or increased gambling, sexual, or other intense urges occur.
- Instruct patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Decreased signs and symptoms of Parkinson's disease.

entecavir (en-**tek**-aveer)
Baraclude

Classification
Therapeutic: antivirals
Pharmacologic: nucleoside analogues

© F.A. Davis Publishing

Indications
Chronic hepatitis B infection with evidence of active viral replication and either persistent elevations in AST or ALT or histologically active disease.

Action
Phosphorylated intracellularly to active form which acts as an analogue of guanosine, interfering with viral DNA synthesis. **Therapeutic Effects:** Decreased hepatic damage due to chronic hepatitis B infection.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Extensive tissue distribution.
Metabolism and Excretion: 62–73% excreted unchanged by kidneys.
Half-life: Plasma—128–149 hr; intracellular—15 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.5–1 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Renal impairment (dose ↓ recommended if CCr <50 mL/min; Liver transplant recipients (careful monitoring of renal function recommended); Patients coinfected with HIV (unless receiving highly active antiretroviral therapy; at ↑ risk for resistance); OB: Safety not established; Lactation: Use during breast feeding only if benefit to patient outweighs potential risk to infant; Pedi: Children <2 yr (safety and effectiveness not established); Geri: ↑ risk of toxicity due to age-related ↓ in renal function.

Adverse Reactions/Side Effects
Derm: alopecia, rash. **F and E:** LACTIC ACIDOSIS. **GI:** HEPATOMEGALY (WITH STEATOSIS), dyspepsia, nausea.
Neuro: dizziness, fatigue, headache.

Interactions
Drug-Drug: Concurrent use of drugs that may impair renal function may ↑ blood levels and risk of toxicity.

Route/Dosage
PO (Adults and Children >16 yr): *Compensated liver disease*—0.5 mg once daily (1 mg once daily if history of lamivudine resistance); *Decompensated liver disease*—1 mg once daily.

Renal Impairment
PO (Adults and Children >16 yr): *CCr 30–<50 mL/min*—0.25 mg once daily or 0.5 mg every 48 hr (0.5 mg once daily or 1 mg every 48 hr if history of lamivudine resistance); *CCr 10–<30 mL/min*—0.15 mg once daily or 0.5 mg every 72 hr (0.3 mg once daily or 1 mg every 72 hr if history of lamivudine resistance); *CCr <10 mL/min*—0.05 mg once daily or 0.5 mg every 7 days (0.1 mg once daily or 1 mg every 7 days if history of lamivudine resistance).
PO (Children 2–<16 yr and >30 kg): 0.5 mg once daily (1 mg once daily if history of lamivudine resistance).
PO (Children 2–<16 yr and >26–30 kg): 0.45 mg once daily (0.9 mg once daily if history of lamivudine resistance).
PO (Children 2–<16 yr and >23–26 kg): 0.4 mg once daily (0.8 mg once daily if history of lamivudine resistance).
PO (Children 2–<16 yr and >20–23 kg): 0.35 mg once daily (0.7 mg once daily if history of lamivudine resistance).
PO (Children 2–<16 yr and >17–20 kg): 0.3 mg once daily (0.6 mg once daily if history of lamivudine resistance).
PO (Children 2–<16 yr and >14–17 kg): 0.25 mg once daily (0.5 mg once daily if history of lamivudine resistance).
PO (Children 2–<16 yr and >11–14 kg): 0.2 mg once daily (0.4 mg once daily if history of lamivudine resistance).
PO (Children 2–<16 yr and 10–11 kg): 0.15 mg once daily (0.3 mg once daily if history of lamivudine resistance).

Availability (generic available)
Oral solution (orange flavor): 0.05 mg/mL. **Tablets:** 0.5 mg, 1 mg.

NURSING IMPLICATIONS
Assessment
- Monitor signs of hepatitis (jaundice, fatigue, anorexia, pruritus) during and for several mo following discontinuation of therapy. Exacerbations may occur when therapy is discontinued.
- May cause lactic acidosis and severe hepatomegaly with steatosis. Monitor patient for signs (↑ serum lactate levels, elevated liver enzymes, liver enlargement on palpation). Suspend therapy if clinical or laboratory signs occur.
- ***Lab Test Considerations:*** Monitor liver function closely during and for several mo following discontinuation of therapy. May cause ↑ AST, ALT, bilirubin, amylase, lipase, creatinine, and serum glucose. May cause ↓ serum albumin.

Implementation
- **PO:** Administer on an empty stomach at least 2 hr before or after a meal. Use oral solution for dose <0.5 mg and children up to 30 kg. Children >30 kg can use oral solution or tablet. Oral solution is ready to use; do not dilute or mix with water or any other liquid. Hold spoon in a vertical position and fill gradually to mark corresponding to prescribed dose. Rinse dosing spoon with water after each daily dose. Store in outer carton at room temperature. After opening, solution can be used until expiration date on bottle.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take entecavir as directed. Advise patient to read the *Patient Information* with each refill and to take entecavir as directed. Take missed doses as soon as possible unless almost time for next dose. Do not run out of entecavir; get more when supply runs low. Do not double doses. Emphasize the importance of compliance with full course of therapy, not taking more than the prescribed amount, and not discontinuing without consulting health care professional. Inform patient that hepatitis exacerbation may occur upon discontinuation of therapy. Caution patient not to share medication with others.
- Inform patient that entecavir does not cure HBV disease, but may lower the amount of HBV in the body, lower the ability of HBV to multiply and infect new liver cells, and may improve the condition of the liver. Entecavir does not reduce the risk of transmission of HBV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and avoid sharing needles or donating blood to prevent spreading HBV to others.
- Advise patient to notify health care professional promptly if signs of lactic acidosis (weakness or tiredness; unusual muscle pain; trouble breathing; stomach pain with nausea and vomiting; feeling cold, especially in arms or legs; dizziness; fast or irregular heartbeat) or hepatotoxicity (jaundice, dark urine, light-colored bowel movements, anorexia, nausea, lower stomach pain) occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected. Encourage pregnant women to enroll in the Antiretroviral Pregnancy Registry by calling 1-800-258-4263. Advise female patient to avoid breast feeding during therapy.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Decreased hepatic damage due to chronic hepatitis B infection.

enzalutamide

(en-za-**loo**-ta-mide)
Xtandi

Classification
Therapeutic: antineoplastics
Pharmacologic: androgen receptor inhibitors

Indications

Castration-resistant prostate cancer. Metastatic, castration-sensitive prostate cancer.

Action

Acts as an androgen receptor inhibitor, preventing the binding of androgen; also inhibits androgen nuclear translocation and DNA interaction. Decreases proliferation and induces cell death of prostate cancer cells.
Therapeutic Effects: Decreased growth and spread of prostate cancer.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: *Enzalutamide*—97–98%; *N-desmethylenzalutamide*—95%.
Metabolism and Excretion: Extensively metabolized by the liver via the CYP2C8 and CYP3A4 isoenzymes; one metabolite (N-desmethylenzalutamide) has antineoplastic activity. Metabolites are primarily renally excreted, only minimal amounts as unchanged drug.
Half-life: *Enzalutamide*—5.8 days; *N-desmethylenzalutamide*—7.8–8.6 days.

TIME/ACTION PROFILE (improved survival)

ROUTE	ONSET	PEAK	DURATION
PO	3 mo	unknown	unknown

Contraindications/Precautions

Contraindicated in: None.
Use Cautiously in: History of seizures, underlying brain pathology, cerebrovascular accident, transient ischemic attack (within 12 mo), brain metastases or brain arteriovenous malformation (may ↑ risk of seizures); Rep: Men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: Older adults may be more sensitive to drug effects.

Adverse Reactions/Side Effects

CV: ISCHEMIC HEART DISEASE, peripheral edema, hypertension. **Derm:** hot flush, dry skin, pruritus. **EENT:** epistaxis. **GI:** diarrhea. **GU:** hematuria, urinary frequency. **MS:** arthralgia, musculoskeletal pain, fracture, muscular stiffness, muscular weakness. **Neuro:** hypoesthesia, paresthesia, POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), SEIZURES, SPINAL CORD COMPRESSION/CAUDA EQUINA SYNDROME, headache, weakness, anxiety, dizziness, hallucinations, insomnia, mental impairment disorders. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema), falls.

Interactions

Drug-Drug: Strong CYP2C8 inhibitors, including **gemfibrozil**, may ↑ levels and risk of toxicity; avoid concurrent use (if concurrent administration necessary, ↓ enzalutamide dose). **Strong CYP3A4 inducers**, including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampin**, and **rifapentine** may ↓ levels and

© F.A. Davis Publishing

response; avoid concurrent use (if concurrent administration necessary, ↑ enzalutamide dose). May ↓ levels of **CYP3A4, CYP2C9, and CYP2C19 substrates** that have narrow therapeutic indexes including **cyclosporine**, **fentanyl**, **phenytoin**, **sirolimus**, **tacrolimus**, and **warfarin**; avoid concurrent use. **Drugs that ↓ seizure threshold** may ↑ risk of seizures.
Drug-Natural Products: St. John's wort may ↓ levels and response; avoid concurrent use (if concurrent administration necessary, ↑ enzalutamide dose).

Route/Dosage

Patients taking enzalutamide should also receive gonadotropin-releasing hormone (GnRH) analog concurrently or should have had bilateral orchiectomy.
PO (Adults): 160 mg once daily. *Concurrent use of strong CYP2C8 inhibitors*—80 mg once daily; *Concurrent use of strong CYP3A4 inducers*—240 mg once daily.

Availability (generic available)

Capsules: 40 mg. **Film-coated tablets:** 40 mg, 80 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for seizures. Implement seizure precautions. If a seizure occurs during therapy, permanently discontinue enzalutamide therapy.
- Monitor for signs and symptoms of PRES (seizure, headache, lethargy, confusion, blindness, other visual and neurological disturbances, hypertension) during therapy. Diagnosis is made with MRI. Discontinue enzalutamide in patients who develop PRES.
- Monitor for signs and symptoms of hypersensitivity reactions (swelling of face, tongue, lips or throat; dyspnea). Discontinue enzalutamide if serious hypersensitivity reactions occur.
- Monitor for signs and symptoms of ischemic heart disease (chest pain, fainting, dyspnea). Permanently discontinue enzalutamide if Grade 3 or 4 ischemic heart disease symptoms occur.
- Assess risk of falls and fractures periodically during therapy. May consider bone-targeted agents.
- ***Lab Test Considerations:*** May cause hematuria.

Implementation

- **PO:** Administer (two 80-mg tablets or four 40-mg tablets or four 40-mg capsules) once daily without regard to food. ***DNC:*** Swallow capsules whole; do not open, dissolve, or chew.
- If ≥Grade 3 toxicity or intolerable side effects occur, hold dose for 1 wk or until symptoms improve to <Grade 2, then resume at same or reduced dose (120 mg or 80 mg).

Patient/Family Teaching

- Instruct patient to take enzalutamide as directed at the same time each day. Take missed doses as soon as remembered within the same day. If a whole day is missed, omit dose and take next day's scheduled dose; do not double doses. Advise patient not to interrupt, modify dose, or stop taking enzalutamide without consulting health care professional. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- May cause seizures, dizziness, mental impairment, paresthesia, hypoesthesia, falls, and hallucinations. Caution patient to avoid driving and other activities requiring alertness until response to medication is known. Notify health care professional immediately if loss of consciousness, seizure, chest pain, or signs and symptoms of PRES or hypersensitivity reactions occur.
- Inform patient of common side effects associated with enzalutamide: asthenia/fatigue, back pain, diarrhea, arthralgia, hot flush, peripheral edema, musculoskeletal pain, headache, upper and lower respiratory infection, muscular weakness, dizziness, insomnia, spinal cord compression, cauda equina syndrome, hematuria, paresthesia, anxiety, and hypertension. Notify health care professional if falls or problems thinking clearly, or if side effects are bothersome.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially St. John's wort.
- Rep: May cause fetal harm and loss of pregnancy. Advise females of reproductive potential to use effective contraception and avoid breast feeding during and for 3 mo following completion of therapy. Instruct females of reproductive potential to avoid handling enzalutamide tablets. Advise males with female partners of reproductive potential to use a condom and effective contraception during and for 3 mo after last dose. May impair fertility in males.

Evaluation/Desired Outcomes

- Decreased growth and spread of prostate cancer.

HIGH ALERT

EPINEPHrine (ep-i-**nef**-rin)

Adrenaclick, Adrenalin, Allerject, Anapen, Anapen Junior, ~~Asthma-Nefrin~~, Auvi-Q, EpiPen, Primatene Mist, S-2 (racepinephrine), Symjepi, ~~Twin-Ject~~

Classification
Therapeutic: anti-asthmatics, bronchodilators, vasopressors
Pharmacologic: adrenergics

See Appendix B for ophthalmic use

© F.A. Davis Publishing

Indications

Subcut, IM, IV: Severe allergic reactions. **IV:** Hypotension associated with septic shock. **Inhaln:** Upper airway obstruction and croup (racemic epinephrine). Temporary relief of mild symptoms of intermittent asthma (over-the-counter). **Local/Spinal:** Adjunct in the localization/prolongation of anesthesia. **Unlabeled Use:** IV, Intracardiac, Intratracheal, Intraosseous (part of advanced cardiac life support [ACLS] and pediatric advanced life support [PALS] guidelines)**:** Cardiac arrest. **Subcut, IM:** Reversible airway disease due to asthma or COPD.

Action

Results in the accumulation of cyclic adenosine monophosphate (cAMP) at beta-adrenergic receptors. Affects both $beta_1$(cardiac)-adrenergic receptors and $beta_2$(pulmonary)-adrenergic receptor sites. Produces bronchodilation. Also has alpha-adrenergic agonist properties, which result in vasoconstriction. Inhibits the release of mediators of immediate hypersensitivity reactions from mast cells. **Therapeutic Effects:** Bronchodilation. Maintenance of heart rate and BP. Localization/prolongation of local/spinal anesthetic.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability; well absorbed following subcut administration; some absorption may occur following repeated inhalation of large doses.

Distribution: Does not cross the blood-brain barrier; crosses the placenta and enters breast milk.

Metabolism and Excretion: Action is rapidly terminated by metabolism and uptake by nerve endings.

Half-life: Unknown.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhaln	1 min	unknown	1–3 hr
Subcut	5–10 min	20 min	<1–4 hr
IM	6–12 min	unknown	<1–4 hr
IV	rapid	20 min	20–30 min

Contraindications/Precautions

Contraindicated in: Hypersensitivity to adrenergic amines; Some products may contain bisulfites and should be avoided in patients with known hypersensitivity or intolerance.

Use Cautiously in: Cardiac disease (angina, tachycardia, MI); Hypertension; Hyperthyroidism; Parkinson's disease; Pheochromocytoma; Diabetes; Cerebral arteriosclerosis; Glaucoma (except for ophthalmic use); Excessive use may lead to tolerance and paradoxical bronchospasm (inhaler); OB: Use only if potential maternal benefit outweighs potential risks to fetus; Lactation: High intravenous doses of epinephrine might ↓ milk production or letdown. Low-dose epidural, topical, inhaled, or ophthalmic epinephrine are unlikely to interfere with breast feeding (NIH); Pedi: Children <12 yr (over-the-counter product only); Geri: More susceptible to adverse reactions; may require ↓ dose.

Adverse Reactions/Side Effects

CV: angina, arrhythmias, hypertension, tachycardia. **Derm:** skin and soft tissue infections (including necrotizing fasciitis and myonecrosis). **Endo:** hyperglycemia. **GI:** nausea, vomiting. **GU:** renal impairment. **Neuro:** nervousness, restlessness, tremor, headache, insomnia. **Resp:** PARADOXICAL BRONCHOSPASM (EXCESSIVE USE OF INHALERS), pulmonary edema.

Interactions

Drug-Drug: Concurrent use with other **adrenergic agents** will have additive adrenergic side effects. Use with **MAO inhibitors** may lead to hypertensive crisis. **Beta blockers** may negate therapeutic effect. **Tricyclic antidepressants** enhance pressor response to epinephrine.

Drug-Natural Products: Use with caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) ↑ stimulant effect.

Route/Dosage

Subcut, IM (Adults and Children ≥30 kg): *Severe anaphylaxis*—0.3–0.5 mg (single dose not to exceed 0.5 mg); may repeat every 10–15 min as needed.

Subcut (Children <30 kg): *Severe anaphylaxis*—0.01 mg/kg (not to exceed 0.3 mg/dose); may repeat every 10–15 min as needed; *Auvi-Q or Symjepi (15–30 kg)*—0.15 mg; may repeat if anaphylactic symptoms persist; *Auvi-Q (7.5–15 kg)*—0.1 mg; may repeat if anaphylactic symptoms persist.

IV (Adults): *Severe anaphylaxis*—0.1–0.25 mg every 5–15 min; may be followed by 1–4 mcg/min continuous infusion; *Cardiopulmonary resuscitation (ACLS guidelines)*—1 mg every 3–5 min; *Bradycardia (ACLS guidelines)*—2–10 mcg/min continuous infusion; *Hypotension associated with septic shock*—0.05–2 mcg/kg/min continuous infusion; titrate every 10–15 min by 0.05–0.2 mcg/kg/min to achieve desired mean arterial pressure.

IV (Children): *Severe anaphylaxis*—0.1 mg (less in younger children); may be followed by 0.1 mcg/kg/min continuous infusion (may be ↑ up to 1.5 mcg/kg/min); *Symptomatic bradycardia/pulseless arrest (PALS guidelines)*—0.01 mg/kg, may be repeated every 3–5 min, higher doses (up to 0.1–0.2 mg/kg) may be considered; may also be given by the intraosseous route. May also be given by the endotracheal route in doses of 0.1–0.2 mg/kg diluted to a volume of 3–5 mL with normal saline followed by several positive pressure ventilations.

Inhaln (Adults): *Inhalation solution*—1 inhalation of 1% solution; may be repeated after 1–2 min; additional doses may be given every 3 hr; *Racepinephrine*—Via hand nebulizer, 2–3 inhalations of 2.25% solution; may repeat in 5 min with 2–3 more inhalations, up to 4–6 times daily.

Inhaln (Children >1 mo): 0.25–0.5 mL of 2.25% racemic epinephrine solution diluted in 3 mL normal saline.

© F.A. Davis Publishing

Inhaln (Adults and Children ≥12 yr): *Over-the-counter inhaler*—1–2 inhalations every 4 hr as needed (max = 8 inhalations/day).
IV, Intratracheal (Neonates): 0.01–0.03 mg/kg every 3–5 min as needed.
Intracardiac (Adults): 0.3–0.5 mg.
Endotracheal (Adults): *Cardiopulmonary resuscitation (ACLS guidelines)*—2–2.5 mg.
Topical (Adults and Children ≥6 yr): *Nasal decongestant*—Apply 1% solution as drops, spray, or with a swab.
Intraspinal (Adults and Children): 0.2–0.4 mL of 1:1000 solution.
With Local Anesthetics (Adults and Children): Use 1:200,000 solution with local anesthetic.

Availability (generic available)

Inhalation aerosol: 0.125 mg/inhalation (160 metered inhalations)[OTC]. **Inhalation solution (racepinephrine):** 2.25%. **Intranasal solution:** 1 mg/mL (1:1000). **Solution for injection:** 1 mg/mL (1:1000). **Solution for injection (autoinjectors) (Adrenaclick, Auvi-Q, EpiPen):** 0.1 mg/0.1 mL (1:1000), 0.15 mg/0.15 mL (1:1000), 0.15 mg/0.3 mL (1:2000), 0.3 mg/0.3 mL (1:1000). **Solution for injection (prefilled syringes):** 0.1 mg/mL (1:10,000), 0.15 mg/0.3 mL (1:2000), 0.3 mg/0.3 mL (1:1000).

NURSING IMPLICATIONS

Assessment

- Monitor IV infusion site for extravasation (cold, hard, pallid appearance). If blanching occurs, may change infusion site to allow effects of local vasoconstriction to subside. If extravasation occurs, infiltrate area liberally with 10 mL to 15 mL of 0.9% NaCl with 5 mg–10 mg of phentolamine using a syringe with a fine needle within 12 hr of extravasation. Local hyperemic changes are immediate.
- **Bronchodilator:** Assess lung sounds, respiratory pattern, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced, and notify health care professional of abnormal findings.
- Monitor pulmonary function tests before and periodically during therapy.
- Observe for paradoxical bronchospasm (wheezing). If condition occurs, withhold medication and notify health care professional immediately.
- Observe patient for drug tolerance and rebound bronchospasm. Patients requiring more than 3 inhalation treatments in 24 hr should be under close supervision. If minimal or no relief is seen after 3–5 inhalation treatments within 6–12 hr, further treatment with aerosol alone is not recommended.
- Assess for hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). If condition occurs, withhold medication and notify health care professional immediately.
- **Vasopressor:** Monitor BP, pulse, ECG, and respiratory rate frequently during IV administration. Continuous ECG, hemodynamic parameters, and urine output should be monitored continuously during IV administration.
- Monitor for chest pain, arrhythmias, heart rate >110 bpm, and hypertension. Consult health care professional for parameters of pulse, BP, and ECG changes for adjusting dose or discontinuing medication.
- **Shock:** Assess volume status. Correct hypovolemia prior to administering epinephrine IV.
- **Nasal Decongestant:** Assess patient for nasal and sinus congestion prior to and periodically during therapy.
- ***Lab Test Considerations:*** May cause transient ↓ in serum potassium concentrations with nebulization or at higher than recommended doses.
- May cause an ↑ in blood glucose and serum lactic acid concentrations.
- ***Toxicity and Overdose:*** Symptoms of overdose include persistent agitation, chest pain or discomfort, decreased BP, dizziness, hyperglycemia, hypokalemia, seizures, tachyarrhythmias, persistent trembling, and vomiting.
- Treatment includes discontinuing adrenergic bronchodilator and other beta-adrenergic agonists and symptomatic, supportive therapy. Cardioselective beta blockers are used cautiously because they may induce bronchospasm.

Implementation

- Do not confuse epinephrine with ephedrine.
- ***High Alert:*** Patient harm or fatalities have occurred from medication errors with epinephrine. Epinephrine is available in various concentrations, strengths, and percentages and used for different purposes. Packaging labels may be confused or products incorrectly diluted. Dilutions should be prepared by a pharmacist. IV doses should be expressed in milligrams not ampules, concentration, or volume. Prior to administration, have second practitioner independently check original order, dose calculations, concentration, route of administration, and infusion pump settings.
- Medication should be administered promptly at the onset of bronchospasm.
- Use a tuberculin syringe with a 26-gauge ½-in. needle for subcut injection to ensure that correct amount of medication is administered.
- Tolerance may develop with prolonged or excessive use. Effectiveness may be restored by discontinuing for a few days and then readministering.
- Do not use solutions that are pinkish or brownish or that contain a precipitate.

© F.A. Davis Publishing

- For anaphylactic shock, volume replacement should be administered concurrently with epinephrine. Antihistamines and corticosteroids may be used in conjunction with epinephrine.
- **IM Subcut:** Administer into anterolateral thigh, through clothing if necessary for anaphylaxis. Hold child's leg firmly to limit movement during injection to prevent lacerations, bent needles, and broken/embedded needles. Avoid injecting into gluteal muscle; may not be effective for anaphylaxis and may cause infection. Medication can cause irritation of tissue. Rotate injection sites to prevent tissue necrosis. Massage injection sites well after administration to enhance absorption and to decrease local vasoconstriction. Avoid IM administration in gluteal muscle.

IV Administration

- **IV Push:** ***Dilution:*** The 1:10,000 solution can be administered undiluted. Dilute 1 mg (1 mL) of a 1:1000 solution in 9 mL of 0.9% NaCl to prepare a 1:10,000 solution. ***Concentration:*** 0.1 mg/mL (1:10,000). ***Rate:*** Administer each 1 mg (10 mL) of a 1:10,000 solution over at least 1 min; more rapid administration may be used during cardiac resuscitation. Follow each dose with 20 mL IV saline flush.
- **Continuous Infusion:** ***Dilution:*** Dilute 1 mg (1 mL) of a 1:1000 solution in 250 mL of D5W or 0.9% NaCl. Protect from light. Infusion stable for 24 hr. ***Concentration:*** 4 mcg/mL. ***Rate:*** See Route/Dosage section. Titrate to response (BP, heart rate, respiratory rate).
- **Y-Site Compatibility:** meropenem/vaborbactam, plazomicin.
- **Inhaln:** When using epinephrine inhalation solution, 10 drops of 1% base solution should be placed in the reservoir of the nebulizer.
- The 2.25% inhalation solution of racepinephrine must be diluted for use in the combination nebulizer/respirator.
- Allow 1–2 min to elapse between inhalations of epinephrine inhalation solution to make certain the second inhalation is necessary.
- When epinephrine is used concurrently with corticosteroid or ipratropium inhalations, administer bronchodilator first and other medications 5 min apart to prevent toxicity from inhaled fluorocarbon propellants.
- **Endotracheal:** Epinephrine can be injected directly into the bronchial tree via the endotracheal tube if the patient has been intubated. Perform 5 rapid insufflations; forcefully administer 10 mL containing 2–2.5 mg epinephrine (1 mg/mL) directly into tube; follow with 5 quick insufflations.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. If on a scheduled dosing regimen, take a missed dose as soon as possible; space remaining doses at regular intervals. Do not double doses. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Advise patient to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- **Inhaln:** Review correct administration technique (aerosolization, IPPB) with patient.
- Do not spray inhaler near eyes.
- Advise patient to use bronchodilator first if using other inhalation medications, and allow 5 min to elapse before administering other inhalant medications, unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth.
- Advise patient to maintain adequate fluid intake (2000–3000 mL/day) to help liquefy tenacious secretions.
- Advise patient to consult health care professional if respiratory symptoms are not relieved or worsen after treatment or if chest pain, headache, severe dizziness, palpitations, nervousness, or weakness occurs.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Autoinjector:** Instruct patients using auto-injector for anaphylactic reactions to remove gray safety cap, placing black tip on thigh at right angle to leg. Press hard into thigh until auto-injector functions, hold in place for 10 sec, remove, and discard properly. Massage injected area for 10 sec. Pedi: Teach parents or caregivers signs and symptoms of anaphylaxis, how to use auto-injector safely, and to get the child to a hospital as soon as possible. Instruct parents or caregivers to teach child how to manage his or her allergy, how to self-inject, and what to do in an emergency. For children too young to self-inject and who will be separated from parent, tell parents to always discuss allergy and use of auto-injector with responsible adult.

Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.
- Increase in ease of breathing.
- Prevention of bronchospasm or reduction of frequency of acute asthma attacks in patients with chronic asthma.
- Prevention of exercise-induced asthma.
- Reversal of signs and symptoms of anaphylaxis.
- Increase in cardiac rate and output, when used in cardiac resuscitation.
- Increase in BP, when used as a vasopressor.
- Localization of local anesthetic.
- Decrease in sinus and nasal congestion.

© F.A. Davis Publishing

eplerenone (e-ple-re-none)
Inspra

Classification
Therapeutic: antihypertensives
Pharmacologic: aldosterone antagonists

Indications
Hypertension (alone, or with other agents). LV systolic dysfunction and evidence of HF post-MI.

Action
Blocks the effects of aldosterone by attaching to mineralocorticoid receptors. **Therapeutic Effects:** Lowering of BP. Improves survival in patients with evidence of HF post-MI.

Pharmacokinetics
Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A enzyme system); <5% excreted unchanged by the kidneys.
Half-life: 4–6 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4 wk	unknown

Contraindications/Precautions
Contraindicated in: Serum potassium >5.5 mEq/L; Type 2 diabetes with microalbuminuria (for patients with HTN; ↑ risk of hyperkalemia); Serum creatinine >2 mg/dL in males or >1.8 mg/dL in females (for patients with HTN); CCr ≤30 mL/min (for all patients); CCr <50 mL/min (for patients with HTN); Concurrent use of potassium supplements or potassium-sparing diuretics (for patients with HTN); Concurrent use of strong inhibitors of the CYP3A4 enzyme system (ketoconazole, itraconazole, nefazodone, clarithromycin, ritonavir, or nelfinavir); Lactation: Lactation.
Use Cautiously in: Moderate hepatic impairment; OB: Use only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established; Geri: ↑ risk of hyperkalemia due to age-related ↓ in renal function.

Adverse Reactions/Side Effects
Endo: abnormal vaginal bleeding, gynecomastia. **F and E:** HYPERKALEMIA. **GI:** abnormal liver function tests, abdominal pain, diarrhea. **GU:** albuminuria. **Metab:** hypercholesterolemia, hypertriglyceridemia. **Neuro:** dizziness, fatigue. **Misc:** flu-like symptoms.

Interactions
Drug-Drug: Concurrent use of strong CYP3A inhibitors, including **ketoconazole**, **itraconazole**, **nefazodone**, **clarithromycin**, **ritonavir**, or **nelfinavir** significantly ↑ effects of eplerenone; concurrent use contraindicated. Concurrent use of moderate CYP3A inhibitors, including **erythromycin**, **saquinavir**, **fluconazole**, or **verapamil**, may ↑ levels; ↓ dose of eplerenone. **NSAIDs** may ↓ antihypertensive effects. Concurrent use of **ACE inhibitors** or **Angiotensin II receptor blockers** may ↑ risk of hyperkalemia.

Route/Dosage
Hypertension
PO (Adults): 50 mg once daily initially; may be ↑ to 50 mg twice daily; *Patients receiving concurrent moderate CYP3A4 inhibitors (erythromycin, saquinavir, verapamil, fluconazole)* — 25 mg once daily initially; may be ↑ to 25 mg twice daily.

HF Post-MI
PO (Adults): 25 mg daily once initially; ↑ in 4 wk to 50 mg once daily; *Patients receiving concurrent moderate CYP3A4 inhibitors (erythromycin, saquinavir, verapamil, fluconazole)* — Do not exceed 25 mg once daily.

Availability (generic available)
Tablets: 25 mg, 50 mg.

NURSING IMPLICATIONS
Assessment
- Monitor BP periodically during therapy.
- Monitor prescription refills to determine adherence.
- ***Lab Test Considerations:*** May cause hyperkalemia. Monitor serum potassium levels prior to starting therapy, within the first wk, at 1 mo following start of therapy or dose adjustment, and periodically thereafter. Monitor serum potassium and serum creatinine in 3–7 days in patients who start taking a moderate CYP3A4 inhibitor.
- May cause ↓ serum sodium and ↑ serum triglyceride, cholesterol, ALT, GGT, creatinine, and uric acid levels.

Implementation
- Do not confuse Inspra (eplerenone) with Spiriva (tiotropium).
- **PO:** Administer once daily. May be increased to twice daily if response is inadequate.

Patient/Family Teaching
- Instruct patient to take medication as directed at the same time each day, even if feeling well.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, discontinuation of smoking, moderation of alcohol consumption, regular exercise, stress management).

© F.A. Davis Publishing

Medication controls, but does not cure, hypertension.
- Instruct patient and family on correct technique for monitoring BP. Advise them to monitor BP at least weekly, and notify health care professional of significant changes.
- Inform patient not to use potassium supplements, salt substitutes containing potassium, or other Rx, OTC, or herbal products without consulting health care professional.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if dizziness, diarrhea, vomiting, rapid or irregular heartbeat, lower extremity edema, or difficulty breathing occur.
- Advise patient to inform health care professional of treatment regimen prior to treatment or surgery.
- Advise patient to notify health care professional if pregnancy is planned or suspected. Advise patient to avoid breast feeding during therapy.
- Emphasize the importance of follow-up exams to check serum potassium.

Evaluation/Desired Outcomes
- Decrease in BP without appearance of side effects.
- Improvement in survival in patients with evidence of HF post-MI.

epoetin (e-poe-e-tin)
Epogen, Eprex, Procrit, Retacrit

Classification
Therapeutic: antianemics
Pharmacologic: hormones, erythropoiesis stimulating agents (ESA)

Indications
Anemia associated with chronic kidney disease (CKD). Anemia secondary to zidovudine (AZT) therapy in HIV-infected patients. Anemia from chemotherapy in patients with nonmyeloid malignancies when there is ≥2 additional mo of planned chemotherapy. Reduction of need for allogeneic red blood cell transfusions in patients undergoing elective, noncardiac, nonvascular surgery.

Action
Stimulates erythropoiesis (production of red blood cells). **Therapeutic Effects:** Maintains and may elevate RBCs, decreasing the need for transfusions.

Pharmacokinetics
Absorption: Well absorbed after subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: *Children and Adults*—4–13 hr; *Neonates*—11–17 hr.

TIME/ACTION PROFILE (increase in RBCs)

ROUTE	ONSET†	PEAK	DURATION
IV, Subcut	7–10 days	within 2 mo	2 wk‡

†Increase in reticulocytes.
‡After discontinuation.

Contraindications/Precautions
Contraindicated in: Hypersensitivity to albumin or mammalian cell-derived products; Uncontrolled hypertension; Patients with erythropoietin levels >200 mUnits/mL; Patients with cancer receiving hormonal agents, biologic products, or radiotherapy, unless also receiving concomitant myelosuppressive chemotherapy; Patients receiving chemotherapy when anticipated outcome is cure; Patients with cancer receiving myelosuppressive chemotherapy in whom the anemia can be managed by transfusion; Patients who require immediate correction of anemia when RBC transfusions can be used instead; Patients scheduled for surgery who are willing to donate autologous blood; Patients undergoing cardiac or vascular surgery; OB, Lactation: Multidose vials should not be used as they contain benzyl alcohol and may cause fatal gasping syndrome in fetus in-utero and breast-fed infants; Pedi: Neutropenia in newborns; multidose vials should not be used in neonates and infants as they contain benzyl alcohol, which can cause potentially fatal gasping syndrome.
Use Cautiously in: History of seizures or stroke; Cardiovascular disease; History of porphyria; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects
CV: HF, MI, STROKE, THROMBOEMBOLIC EVENTS (especially with hemoglobin >11 g/dL), hypertension.
Derm: ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, transient rashes.
Endo: restored fertility, resumption of menses.
Neuro: SEIZURES, headache. **Misc:** ↑ MORTALITY AND ↑ TUMOR GROWTH (with hemoglobin >12 g/dL).

Interactions
Drug-Drug: May ↑ requirement for **heparin** anticoagulation during hemodialysis.

Route/Dosage

Anemia of CKD
(Do not initiate if hemoglobin ≥10 g/dL).
Subcut, IV (Adults): 50–100 units/kg 3 times weekly initially; use lowest dose sufficient to ↓ the need for red blood cell transfusions (do not exceed hemoglobin of 11 g/dL [patients on dialysis] or 10 g/dL [patients not on dialysis]); if Hgb ↑ by >1.0 g/dL in 2 wk, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL after 4 wk of therapy (with adequate iron stores), ↑ dose by 25%; do not ↑ dose more frequently than every 4 wk.
Subcut, IV (Children 1 mo–16 yr): 50 units/kg 3 times weekly initially; use lowest dose sufficient to ↓ the

© F.A. Davis Publishing

need for red blood cell transfusions (do not exceed hemoglobin of 12 g/dL; if Hgb ↑ by >1.0 g/dL in 2 wk, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL after 4 wk of therapy (with adequate iron stores), ↑ dose by 25%; do not ↑ dose more frequently than every 4 wk.

Anemia Secondary to AZT Therapy

Subcut, IV (Adults): 100 units/kg 3 times weekly for 8 wk; if inadequate response, may ↑ by 50–100 units/kg every 4–8 wk (max: 300 units/kg 3 times weekly).
Subcut, IV (Children 8 mo–17 yr): 50–400 units/kg 2–3 times weekly.

Anemia From Chemotherapy

(Use only for chemotherapy-related anemia and discontinue when chemotherapy course is completed; do not initiate if hemoglobin ≥10 g/dL).
Subcut (Adults): 150 units/kg 3 times weekly or 40,000 units weekly; adjust dose to maintain lowest hemoglobin level sufficient to avoid blood transfusions (do not exceed hemoglobin of 12 g/dL); if Hgb ↑ by >1.0 g/dL in 2 wk or reaches a level needed to avoid red blood cell transfusions, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL (and remains <10 g/dL) after initial 4 wk of therapy (with adequate iron stores), ↑ dose to 300 units/kg 3 times weekly or 60,000 units weekly.
IV (Children 5–18 yr): 600 units/kg weekly; adjust dose to maintain lowest hemoglobin level sufficient to avoid blood transfusions (do not exceed hemoglobin of 12 g/dL); if Hgb ↑ by >1.0 g/dL in 2 wk or reaches a level needed to avoid red blood cell transfusions, ↓ dose by 25%; if Hgb ↑ by <1.0 g/dL (and remains <10 g/dL) after initial 4 wk of therapy (with adequate iron stores), ↑ dose to 900 units/kg (maximum = 60,000 units) weekly.

Surgery

Subcut (Adults): 300 units/kg/day for 10 days before surgery, day of surgery, and 4 days after *or* 600 units/kg 21, 14, and 7 days before surgery and on day of surgery.

Availability

Solution for injection: 2,000 units/mL, 3,000 units/mL, 4,000 units/mL, 10,000 units/mL, 20,000 units/mL, 40,000 units/mL. **Solution for injection (prefilled syringes):** 1,000 units/0.5 mL, 2,000 units/0.5 mL, 3,000 units/0.3 mL, 4,000 units/0.4 mL, 5,000 units/0.5 mL, 6000 units/0.6 mL, 8,000 units/0.8 mL, 10,000 units/1 mL, 20,000 units/0.5 mL, 30,000 units/0.75 mL, 40,000 units/1 mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP before and during therapy. Inform health care professional if severe hypertension is present or if BP begins to increase. Additional antihypertensive therapy may be required during initiation of therapy.
- Monitor for symptoms of anemia (fatigue, dyspnea, pallor).
- Monitor dialysis shunts (thrill and bruit) and status of artificial kidney during hemodialysis. Heparin dose may need to be increased to prevent clotting. Monitor patients with underlying vascular disease for impaired circulation.
- ***Lab Test Considerations:*** May cause ↑ in WBCs and platelets. May ↓ bleeding times.
- Monitor serum ferritin, transferrin, and iron levels to assess need for concurrent iron therapy. Administer supplemental iron therapy when serum ferritin <100 mcg/L or when serum transferrin saturation <20%.
- Monitor hemoglobin weekly until the hemoglobin level is stable and sufficient to minimize the need for RBC transfusion after starting therapy and after each dose adjustment.
- **Anemia of Chronic Kidney Disease:** Monitor hemoglobin at least weekly until stable, then at least monthly. Do not increase dose more frequently than once every 4 wk. Decreases in dose can be made more frequently. Avoid frequent dose adjustments. *If hemoglobin ↑ >1 g/dL in a 2-wk period,* ↓ dose by 25% or more. *If hemoglobin ↑ by <1 g/dL over 4 wk (and iron stores are adequate),* ↑ dose by 25%. If no response after 12 wk of escalation, further dose ↑ is unlikely to improve response and may increase risks. Use lowest dose that will maintain Hgb level sufficient to reduce need for transfusions.
- **Adults With Anemia of Chronic Kidney Disease on Dialysis:** Start epoetin when hemoglobin >10 g/dL. If hemoglobin ≥11 g/dL, reduce or hold dose.
- **Adults With Anemia of Chronic Kidney Disease not on Dialysis:** Start epoetin only when hemoglobin <10 g/dL AND rate of hemoglobin decline indicates likelihood of requiring a RBC transfusion AND reducing risk of alloimmunization and/or other RBC transfusion-related risks is a goal. If hemoglobin level >10 g/dL, reduce or hold dose, and use lowest epoetin dose sufficient to reduce need for RBC transfusions.
- **Children With Anemia of Chronic Kidney Disease:** Start epoetin only when hemoglobin <10 g/dL. If hemoglobin level >12 g/dL, reduce or hold dose.
- Monitor renal function studies and electrolytes closely; resulting increased sense of well-being may lead to decreased compliance with other therapies for renal failure. Increases in BUN, serum creatinine, uric acid, phosphorus, and potassium may occur.
- **Anemia Secondary to Zidovudine Therapy:** Before initiating therapy, determine serum erythropoietin level before transfusion. Patients receiving zidovudine with endogenous serum erythropoietin levels >500 mUnits/mL may not respond to therapy. *If hemoglobin does not ↑ after 8 wk of therapy,* ↑ dose by 50–100 units/kg at 4–8 wk intervals until hemoglobin reaches level needed to avoid RBC transfu-

© F.A. Davis Publishing

sions or 300 units/kg. *If hemoglobin ≥12 g/dL,* hold dose until hemoglobin drops to <11 g/dL, then ↓ dose by 25%. *If ↑ in hemoglobin is not achieved at a dose of 300 Units/kg for 8 wk,* discontinue therapy.

- **Anemia From Chemotherapy:** Start epoetin only if hemoglobin ≥10 g/dL and there is an additional 2 mo of planned chemotherapy. Patients with lower baseline serum erythropoietin levels may respond more rapidly; not recommended if levels >200 mUnits/mL. *If hemoglobin ↑ by >1.0 g/dL in any 2-wk period or hemoglobin reaches level needed to avoid RBC transfusion,* ↓ dose by 25%. *If hemoglobin ↑ <1 g/dL after 4 wk in absence of RBC transfusion) and remains <10 g/dL,* ↑ dose to 300 units/kg three times per wk in adults or 60,000 units weekly (adults) or 900 units/kg (max: 60,000 units) in children. *If no response in hemoglobin levels or if RBC transfusions are still required after 8 wk of therapy,* discontinue epoetin.
- **Surgery:** Implement prophylaxis of deep venous thrombosis during therapy.

Implementation

IV Administration

- Transfusions are still required for severe symptomatic anemia. Supplemental iron should be initiated with epoetin and continued throughout therapy.
- Institute seizure precautions in patients who experience greater than a 4-point increase in hematocrit in a 2-wk period or exhibit any change in neurologic status. Risk of seizures is greatest during the first 90 days of therapy.
- Do not shake vial; inactivation of medication may occur. Solution is clear and colorless; do not administer solutions that are discolored, cloudy, or contain a precipitate. Discard vial immediately after withdrawing dose from single-use 1-mL vial. Refrigerate multidose vials; stable for 21 days after initial entry.
- **Subcut:** This route is often used for patients not requiring dialysis.
- May be admixed in syringe immediately before administration with 0.9% NaCl with benzyl alcohol 0.9% in a 1:1 ratio to prevent injection site discomfort.
- **IV Push:** ***Dilution:*** Administer undiluted or dilute with an equal amount of 0.9% NaCl. ***Concentration:*** 1000–40,000 units/mL. ***Rate:*** May be administered as direct injection or bolus over 1–3 min into IV tubing or via venous line at end of dialysis session.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, diphenhydramine, dobutamine, dopamine, doxycycline, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, famotidine, fentanyl, fluconazole, folic acid, furosemide, ganciclovir, gentamicin, glycopyrrolate, heparin, hydrocortisone, imipenem-cilastatin, indomethacin, insulin, regular, isoproterenol, ketorolac, labetalol, lactated ringers, lidocaine, magnesium sulfate, mannitol, meperidine, methylprednisolone, metoclopramide, metoprolol, morphine, multivitamins, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, ondansetron, oxacillin, oxytocin, penicillin G, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium chloride, procainamide, promethazine, propranolol, protamine, pyridoxine, sodium bicarbonate, succinylcholine, sufentanil, theophylline, tobramycin, vasopressin, verapamil.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, chlorpromazine, dantrolene, diazepam, haloperidol, midazolam, minocycline, pentamidine, phenytoin, prochlorperazine, trimethoprim/sulfamethoxazole, vancomycin.

Patient/Family Teaching

- Advise patient to read the *Medication Guide* prior to initiating therapy and with each Rx refill in case of changes. Patient must sign the patient-health care provider acknowledgment form before each course of therapy.
- Explain rationale for concurrent iron therapy (increased red blood cell production requires iron).
- Discuss ways of preventing self-injury in patients at risk for seizures. Driving and activities requiring continuous alertness should be avoided.
- Inform patient that use of epoetin may result in shortened overall survival and/or ↓ time to tumor progression.
- Advise patient to notify health care professional immediately if signs and symptoms of blood clots (chest pain, trouble breathing or shortness of breath; pain in the legs, with or without swelling; a cool or pale arm or leg; sudden confusion; trouble speaking or trouble understanding others' speech; sudden numbness or weakness in the face, arm, or leg, especially on one side of the body; sudden trouble seeing; sudden trouble walking, dizziness, loss of balance or coordination; loss of consciousness or fainting; hemodialysis vascular access stops working), allergic reactions (rash, itching, shortness of breath, wheezing, dizziness and fainting, swelling around mouth or eyes, fast pulse, sweating), skin reactions (blisters, skin sores, peeling, or areas of skin coming off) occur.
- Advise patient to inform health care professional of medication prior to treatment or surgery.
- Rep: Discuss possible return of menses and fertility with health care professional. Advise female patients of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Anemia of Chronic Renal Failure:** Stress importance of compliance with dietary restrictions, medi-

© F.A. Davis Publishing

cations, and dialysis. Foods high in iron and low in potassium include liver, pork, veal, beef, mustard and turnip greens, peas, eggs, broccoli, kale, blackberries, strawberries, apple juice, watermelon, oatmeal, and enriched bread. Epoetin will result in increased sense of well-being, but it does not cure underlying disease.

- **Home Care Issues:** Home dialysis patients determined to be able to safely and effectively administer epoetin should be taught proper dosage, administration technique, and disposal of equipment. *Information for Home Dialysis Patients* should be provided to patient along with medication.

Evaluation/Desired Outcomes

- Increase in hematocrit to 30–36% with improvement in symptoms of anemia in patients with chronic renal failure.
- Increase in hematocrit in anemia secondary to zidovudine therapy.
- Increase in hematocrit in patients with anemia resulting from chemotherapy.
- Reduction of need for transfusions after surgery.

HIGH ALERT

eptifibatide (ep-ti-**fib**-a-tide)

~~Integrilin~~

Classification

Therapeutic: antiplatelet agents

Pharmacologic: glycoprotein IIb/IIIa inhibitors

Indications

Acute coronary syndrome (unstable angina/non-ST-elevation MI), including patients who will be managed medically and those who will undergo percutaneous coronary intervention (PCI). Patients undergoing PCI, including intracoronary stenting.

Action

Decreases platelet aggregation by reversibly antagonizing the binding of fibrinogen to the glycoprotein IIb/IIIa binding site on platelet surfaces. **Therapeutic Effects:** Reduction in risk of death or new MI in patients with ACS. Reduction in risk of death, new MI, or need for urgent intervention in patients undergoing PCI.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Metabolism and Excretion: 50% excreted by the kidneys.

Half-life: 2.5 hr.

TIME/ACTION PROFILE (effects on platelet function)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	following bolus	brief†

†Inhibition is reversible following cessation of infusion.

E

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active internal bleeding or history of bleeding within previous 30 days; Severe uncontrolled hypertension (systolic BP >200 mm Hg and/or diastolic BP >110 mm Hg); Major surgical procedure within 6 wk; History of hemorrhagic stroke or other stroke within 30 days; Concurrent use of other glycoprotein IIb/IIIa receptor antagonists; Platelet count <100,000/mm^3; Severe renal impairment (serum creatinine ≥4 mg/dL) or dependency on renal dialysis.

Use Cautiously in: Renal impairment (↓ infusion rate if CCr <50 mL/min); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: ↑ risk of bleeding in older adults.

Adverse Reactions/Side Effects

Noted for patients receiving heparin and aspirin in addition to eptifibatide.

CV: hypotension. **Hemat:** BLEEDING (including GI and intracranial bleeding, hematuria, and hematomas), thrombocytopenia.

Interactions

Drug-Drug: ↑ risk of bleeding with other drugs that affect hemostasis (**heparins**, **warfarin**, **NSAIDs**, **thrombolytic agents**, **dipyridamole**, **clopidogrel**, some **cephalosporins**, **valproates**).

Drug-Natural Products: ↑ bleeding risk with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, and ***Panax ginseng***.

Route/Dosage

Acute Coronary Syndrome

IV (Adults): 180 mcg/kg (max = 22.6 mg) as a bolus dose, followed by 2 mcg/kg/min (max = 15 mg/hr) infusion until hospital discharge or initiation of coronary artery bypass graft surgery (up to 72 hr). If a patient is to undergo PCI, the infusion should be continued until hospital discharge or for up to 18–24 hours after the PCI, whichever comes first, allowing for up to 96 hours of therapy.

Renal Impairment

IV (Adults): *CrCl <50 mL/min* — 180 mcg/kg (max = 22.6 mg) as a bolus dose, followed by 1 mcg/kg/min (max = 7.4 mg/hr) infusion until hospital discharge or initiation of coronary artery bypass graft surgery (up to 72 hr). If a patient is to undergo PCI, the infusion should be continued until hospital discharge or for up to 18–

© F.A. Davis Publishing

24 hours after the PCI, whichever comes first, allowing for up to 96 hours of therapy.

Percutaneous Coronary Intervention

IV (Adults): 180 mcg/kg (max = 22.6 mg) as a bolus dose, immediately before PCI, followed by 2 mcg/kg/min (max = 15 mg/hr) infusion; a 2nd bolus of 180 mcg/kg (max = 22.6 mg) is given 10 min after 1st bolus. Infusion should be continued until hospital discharge, or for up to 18 to 24 hours, whichever comes first (minimum of 12 hr).

Renal Impairment

(Adults): *CrCl <50 mL/min*— 180 mcg/kg (max = 22.6 mg) bolus followed by 1 mcg/kg/min (max = 7.4 mg/hr) infusion; a 2nd bolus of 180 mcg/kg (max = 22.6 mg) is given 10 min after 1st bolus.

Availability (generic available)

Solution for injection: 20 mg/10 mL, 75 mg/100 mL, 200 mg/100 mL.

NURSING IMPLICATIONS

Assessment

- Assess for bleeding. Most common sites are arterial access site for cardiac catheterization or GI or GU tract. Minimize arterial and venous punctures, IM injections, and use of urinary catheters, nasotracheal intubation, and NG tubes. Avoid noncompressible sites for IV access. If bleeding cannot be controlled with pressure, discontinue eptifibatide and heparin immediately.
- ***Lab Test Considerations:*** Prior to eptifibatide therapy, assess hemoglobin or hematocrit, platelet count, serum creatinine, and PT/aPTT. Activated clotting time (ACT) should also be measured in patients undergoing PCI.
- Maintain the aPTT between 50 and 70 sec unless PCI is to be performed. Maintain ACT between 300 and 350 sec during PCI.
- Arterial sheath should not be removed unless aPTT <45 sec.
- If platelet count decreases to <100,000 and is confirmed, discontinue eptifibatide and heparin and monitor and treat condition.

Implementation

- ***High Alert:*** Accidental overdose of antiplatelet medications has resulted in patient harm or death from internal hemorrhage or intracranial bleeding. Have second practitioner independently check original order, dose calculations, and infusion pump settings.
- Most patients receive heparin and aspirin concurrently with eptifibatide.
- After PCI, femoral artery sheath may be removed during eptifibatide treatment only after heparin has been discontinued and its effects mostly reversed.
- Do not administer solutions that are discolored or contain particulate matter. Discard unused portion.

IV Administration

- **IV Push:** ***High Alert: Dilution:*** Withdraw appropriate loading dose from bolus vial (20 mg/10-mL vial) into a syringe. Administer undiluted. ***Concentration:*** 2 mg/mL. ***Rate:*** Administer over 1–2 min.
- **Continuous Infusion:** ***Dilution:*** Administer undiluted directly from the 100-mL vial via an infusion pump. ***Concentration:*** 0.75 mg/mL or 2 mg/mL (depends on vial used). ***Rate:*** Based on patient's weight (see Route/Dosage section).
- **Y-Site Compatibility:** alemtuzumab, alfentanil, alteplase, amikacin, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, cefepime, cefotaxime, cefotetan, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, ciprofloxacin, cisatracurium, clindamycin, cyclosporine, daptomycin, dexamethasone, dexrazoxane, D5/0.9% NaCl, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, ertapenem, erythromycin, esmolol, famotidine, fentanyl, fluconazole, foscarnet, fosphenytoin, ganciclovir, gentamicin, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, imipenem/cilastatin, isavuconazonium, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, meropenem/vaborbactam, methylprednisolone, metoclopramide, metoprolol, micafungin, midazolam, milrinone, morphine, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, octreotide, ondansetron, oxytocin, palonosetron, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, remifentanil, rocuronium, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tedizolid, theophylline, tigecycline, tirofiban, tobramycin, vancomycin, vecuronium, verapamil, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amphotericin B deoxycholate, chlorpromazine, diazepam, furosemide, gemtuzumab ozogamicin, methohexital, mycophenolate, pentamidine, phenytoin, thiopental.

Patient/Family Teaching

- Inform patient of the purpose of eptifibatide.
- Instruct patient to notify health care professional immediately if any bleeding is noted.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Reduction in risk of death or new MI in patients with ACS.
- Reduction in risk of death, new MI, or need for urgent intervention in patients undergoing PCI.

erenumab (e-ren-ue-mab)
Aimovig

Classification
Therapeutic: vascular headache suppressants
Pharmacologic: monoclonal antibodies, calcitonin gene-related peptide receptor antagonists

Indications
Migraine prevention.

Action
Monoclonal antibody that binds to the calcitonin gene-related peptide (CGRP) receptor, which reduces the neuroinflammatory and vasodilatory effects of CGRP.
Therapeutic Effects: Reduction in frequency of migraines.

Pharmacokinetics
Absorption: Well absorbed (82%) following subcutaneous administration.
Distribution: Some tissue distribution.
Metabolism and Excretion: *Low concentrations*—Eliminated through saturable binding to CGRP receptor; *High concentrations*—Eliminated through nonspecific, nonsaturable proteolytic pathway.
Half-life: 28 days.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	6 days	1 mo

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Hypertension; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Choose dose carefully in older adults, considering concurrent disease states, drug therapy, and age-related ↓ in hepatic and renal function.

Adverse Reactions/Side Effects
CV: hypertension. **GI:** constipation. **Local:** injection site reactions. **MS:** muscle spasm. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions
Drug-Drug: Medications that ↓ GI motility may ↑ risk of more severe constipation.

Route/Dosage
Subcut (Adults): 70 mg once monthly; may ↑ dose, if needed, to 140 mg once monthly.

Availability
Solution for injection (prefilled syringes and autoinjectors): 70 mg/mL, 140 mg/mL.

NURSING IMPLICATIONS

Assessment
- Assess frequency and intensity of migraines.
- Assess for latex allergy. Needle shield within white or orange cap of prefilled autoinjector and gray needle cap of prefilled syringe contain dry natural rubber (a derivative of latex), may cause allergic reactions in individuals sensitive to latex.
- Monitor for new-onset hypertension, or worsening of pre-existing hypertension. May require discontinuation.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, angioedema, anaphylaxis); usually occur within hr of injection but >1 wk after injection. If reaction is severe, discontinue erenumab and treat as needed.

Implementation
- **Subcut:** Prior to use allow vial to sit at room temperature for at least 30 min, protect from direct sunlight. Do no use other methods to warm solution (hot water or microwave). Do not shake. Solution is clear to opalescent, colorless to light yellow; do not administer solutions that are discolored, cloudy, or contain particulate matter. Store in refrigerator in original carton to protect from light; do not freeze. May be stored up to 7 days at room temperature.
- Inject entire contents into abdomen, thigh, or upper arm. Do not inject into areas where the skin is tender, bruised, red, or hard.

Patient/Family Teaching
- Instruct patient to take as directed. Administer missed doses as soon as possible and schedule next dose 1 mo from last dose administered. Educate patient and/or caregiver on correct technique for injection and disposal of equipment. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Instruct patient to notify health care professional immediately if signs and symptoms of hypersensitivity reaction (swelling of face, mouth, tongue or throat, trouble breathing, rash) occur.
- Advise patient to notify health care professional if severe constipation occurs; may cause serious complications.

© F.A. Davis Publishing

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in frequency and intensity of migraines.

ergocalciferol, See VITAMIN D COMPOUNDS.

erlotinib (er-lo-ti-nib)

Tarceva

Classification

Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Indications

Treatment of metastatic non–small-cell lung cancer (NSCLC) that has epidermal growth factor exon 19 deletions or exon 21 substitution mutations in patients who are receiving first-line, maintenance, or second or greater line treatment after progression following ≥1 previous chemotherapy regimen. First-line therapy for locally advanced, surgically unresectable, or metastatic pancreatic cancer (with gemcitabine).

Action

Inhibits the enzyme tyrosine kinase, which is associated with human epidermal growth factor receptor (EGFR); blocks growth stimulation signals in cancer cells. **Therapeutic Effects:** Decreased spread of lung or pancreatic cancer with increased survival.

Pharmacokinetics

Absorption: 60% absorbed; bioavailability ↑ to 100% with food.
Distribution: Unknown.
Protein Binding: 93% protein bound.
Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system).
Half-life: 36 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Oral	unknown	4 hr	24 hr

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Hepatic impairment; Previous chemotherapy/radiation, pre-existing lung disease, metastatic lung disease (may ↑ risk of interstitial lung disease); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: MYOCARDIAL INFARCTION/ISCHEMIA (pancreatic cancer patients). **Derm:** BULLOUS AND EXFOLIATIVE SKIN DISORDERS, rash, dry skin, pruritus. **EENT:** abnormal eyelash growth, conjunctivitis, corneal perforation, corneal ulceration, keratitis, ↓ tear production. **GI:** HEPATOTOXICITY, GI PERFORATION, diarrhea, abdominal pain, anorexia, nausea, stomatitis, vomiting, ↑ liver enzymes. **GU:** RENAL FAILURE. **Hemat:** microangiopathic hemolytic anemia with thrombocytopenia (pancreatic cancer patients). **Neuro:** CEREBROVASCULAR ACCIDENT (pancreatic cancer patients), fatigue. **Resp:** INTERSTITIAL LUNG DISEASE, dyspnea, cough.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, or **voriconazole** ↑ levels and the risk of toxicity; consider alternative therapy or ↓ erlotinib dose. **Strong CYP3A4 inducers**, including **rifampin**, **rifabutin**, **rifapentine**, **phenytoin**, **carbamazepine**, or **phenobarbital**, ↓ levels and may ↓ response; consider alternative therapy or ↑ erlotinib dose. **CYP1A2 inhibitors**, including **ciprofloxacin**, may ↑ levels and the risk of toxicity; consider ↓ erlotinib dose if used with CYP3A4 inhibitor. **Smoking** may ↓ levels and may ↓ response; avoid smoking during therapy or consider ↑ erlotinib dose if smoking continues. **Moderate CYP1A2 inducers**, including **teriflunomide**, **rifampin**, or **phenytoin**; avoid concurrent use or ↑ erlotinib dose. May ↓ **midazolam** levels. May ↑ risk of bleeding with **warfarin**. ↓ levels with **proton pump inhibitors**, **H_2 blockers**, and **antacids**; avoid concurrent use with **proton pump inhibitors**; take 10 hr after **H_2 antagonist** and ≥2 hr before next dose of **H_2 antagonist**; separate from **antacid** by several hr.
Drug-Natural Products: St. John's wort may ↓ levels and may ↓ response; alternative therapy or ↑ dose should be considered.
Drug-Food: Grapefruit juice or **grapefruit**, a strong CYP3A4 inhibitor, ↑ levels and the risk of toxicity; consider dose ↓.

Route/Dosage

PO (Adults): *NSCLC*— 150 mg once daily; *Pancreatic cancer*— 100 mg once daily. *Concurrent use of strong CYP3A4 inhibitor or concurrent use of CYP3A4 and CYP1A2 inhibitor (e.g., ciprofloxacin)*—Consider ↓ dose in 50-mg increments (avoid concomitant use, if possible); *Concurrent use of strong CYP3A4 inducer*— consider ↑ dose by 50 mg every 2 wk (max dose = 450 mg/day) (avoid concomitant use, if possible); *Concurrent cigarette smoking or concurrent use of moderate CYP1A2 inducer*—↑ dose by 50 mg every 2 wk (max dose = 300 mg/day); immediately ↓ dose to recommended initial dose for indication upon smoking cessation.

Availability (generic available)

Tablets: 25 mg, 100 mg, 150 mg.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess respiratory status prior to and periodically during therapy. If dyspnea, cough, or fever occur, discontinue erlotinib, assess for interstitial lung disease, and institute treatment as needed.
- Assess for diarrhea. Usually responds to loperamide but may require dose reduction or discontinuation of therapy if unresponsive to therapy or patient becomes dehydrated.
- Assess skin throughout therapy. If bullous, blistering, and exfoliative skin conditions, including Stevens-Johnson syndrome/toxic epidermal necrolysis, occur, interrupt or discontinue treatment. Skin rash may require treatment with corticosteroids or anti-infectives with anti-inflammatory properties; acne treatments may aggravate dry skin and erythema.
- Assess eyes periodically during therapy. Discontinue erlotinib if corneal ulceration occurs. Hold erlotinib if Grade 3 or 4 keratitis, or Grade 2 lasting >2 wk, or if acute or worsening eye pain or disorders occur.
- Assess for GI pain. Patients receiving concomitant antiangiogenic agents, corticosteroids, NSAIDs, and/or taxane-based chemotherapy, or who have prior history of peptic ulceration or diverticular disease, are at increased risk for GI perforation. Permanently discontinue erlotinib in patients who develop gastrointestinal perforation.
- ***Lab Test Considerations:*** Test patients for epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 (L858R) substitution mutations in plasma or tumor specimens prior to starting therapy; presence is required for therapy. Information on FDA-approved tests for the detection of EGFR mutations in NSCLC is available at: http://www.fda.gov/CompanionDiagnostics.
- Monitor liver function tests (AST, ALT, bilirubin, alkaline phosphatase) periodically during therapy. Consider dose reduction or discontinuation of therapy if severe changes in liver function (doubling or tripling of transaminase levels in *patients with preexisting hepatic impairment* or total bilirubin ≥3 times upper limit of normal and/or transaminases ≥5 times upper limit of normal in *patients without preexisting hepatic impairment*) occur.
- Monitor renal function and electrolytes in patients at risk for dehydration. Withhold therapy if dehydration or Grade 3 or 4 renal toxicity occurs.
- Monitor INR regularly in patients taking warfarin. May cause ↑ INR.

Implementation

- Do not confuse Tarceva (erlotinib) with Tresiba (insulin degludec).
- **PO:** Administer at least 1 hr before or 2 hr after food.

Patient/Family Teaching

- Instruct patient to take erlotinib as directed.
- Advise patient to notify health care professional if severe or persistent diarrhea, nausea, anorexia, vomiting, onset or worsening of skin rash, unexplained dyspnea or cough, eye irritation, or signs and symptoms of a cerebrovascular accident (sudden weakness; paralysis [an inability to move] or numbness of the face, arms, or legs, especially on one side of the body; confusion; trouble speaking or understanding speech; trouble seeing in one or both eyes; problems breathing; dizziness, trouble walking, loss of balance or coordination, unexplained falls; loss of consciousness; sudden and severe headache) occur.
- Instruct patient to avoid proton pump inhibitors and if antacids are necessary, separate antacids and erlotinib dose by several hrs. If therapy with H_2 antagonists is required, take erlotinib 10 hr after H_2 antagonist and at least 2 hr before next dose of H_2 antagonist.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient to wear sunscreen and protective clothing to decrease skin reactions.
- Instruct patient to discontinue smoking during therapy; smoking decreases blood levels of erlotinib.
- Rep: May cause fetal harm. Caution patient to use highly effective contraceptive during and for at least 1 mo after completion of therapy and to avoid breast feeding during and for at least 2 wk following last dose. Advise female patients to notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Decrease in spread of non–small-cell lung or pancreatic cancer with increased survival.

ertapenem (er-ta-**pen**-em)

INVanz

Classification

Therapeutic: anti-infectives
Pharmacologic: carbapenems

Indications

Moderate to severe: complicated intra-abdominal infections, complicated skin and skin structure infections, community acquired pneumonia, complicated urinary tract infections (including pyelonephritis), acute pelvic infections including postpartum endomyometritis, septic abortion, and postsurgical gynecologic infections. Prophylaxis of surgical site infection following elective colorectal surgery.

© F.A. Davis Publishing

Action

Binds to bacterial cell wall, resulting in cell death. Ertapenem resists the actions of many enzymes that degrade most other penicillins and penicillin-like anti-infectives.

Therapeutic Effects: Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following aerobic gram-positive organisms: *Staphylococcus aureus* (methicillin-susceptible strains only), *Staphylococcus epidermidis*, *Streptococcus agalactiae*, *S. pneumoniae* (penicillin-susceptible strains only), and *S. pyogenes*. Also active against the following gram-negative aerobic organisms: *Escherichia coli*, *Haemophilus influenzae* (beta-lactamase negative strains), *Klebsiella pneumonia*, *Moraxella catarrhalis*, and *Providencia rettgeri*. Additional anaerobic spectrum includes *Bacteroides fragilis*, *B. distasonis*, *B. ovatus*, *B. thetaiotamicron*, *B. uniformis*, *B. vulgatis*, *Clostridioides clostrioforme*, *Eubacterium lentum*, *Peptostreptococcus*, *Porphyromonas asaccharolytica*, and *Prevotella bivia*.

Pharmacokinetics

Absorption: 90% after IM administration; IV administration results in complete bioavailability.

Distribution: Enters breast milk.

Metabolism and Excretion: Mostly excreted by the kidneys.

Half-life: 1.8 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	rapid	2 hr	24 hr
IV	rapid	end of infusion	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with penicillins, cephalosporins, and other carbapenems; Hypersensitivity to lidocaine (may be used as a diluent for IM administration).

Use Cautiously in: History of multiple hypersensitivity reactions; Seizure disorders; Renal impairment; OB: Safety not established; Lactation: Use during breast feeding only if benefit to patient outweighs potential risk to infant; Pedi: Safety and effectiveness not established; Geri: ↑ sensitivity due to age-related ↓ in renal function.

Adverse Reactions/Side Effects

Derm: ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting. **GU:** vaginitis. **Local:** phlebitis at IV site, pain at IM site. **Neuro:** SEIZURES, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Probenecid ↓ excretion and ↑ levels. May ↓ serum **valproate** levels (↑ risk of seizures).

Route/Dosage

IV, IM (Adults and Children ≥13 yrs): 1 g once daily for up to 14 days (IV) or 7 days (IM).

IV, IM (Children 3 mo–12 yrs): 15 mg/kg twice daily (not to exceed 1 g/day) for up to 14 days (IV) or 7 days (IM).

Renal Impairment

IM, IV (Adults): *CCr ≤30 mL/min/1.73 m²* — 500 mg once daily.

Availability (generic available)

Powder for injection (requires reconstitution): 1 g/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins, cephalosporins, or carbapenems. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician immediately if these occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause ↑ AST, ALT, serum alkaline phosphatase levels.
- May cause ↑ platelet and eosinophil counts.

Implementation

- **IM:** Reconstitute 1-g vial with 3.2 mL of 1% lidocaine without epinephrine. Shake well to form solution. Immediately withdraw contents and inject deep into large muscle mass. Use reconstituted solution within 1 hr.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Reconstitute 1-g vial with 10 mL of sterile water for injection or 0.9% NaCl using a 21-gauge or smaller diameter needle and shake well. *For adults and pediatric patients 13 yrs and older:* further dilute in 50 mL of 0.9% NaCl. *For pediatric patients 3 mo to 12 yr:* immediately withdraw a volume equal to 15 mg/kg (not to exceed 1 g/day) and dilute in 0.9% NaCl to a final concentration of 20 mg/mL or less. Administer within 6 hr of reconstitution. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline,

© F.A. Davis Publishing

amphotericin B lipid complex, amphotericin B liposome, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, chloramphenicol, cisatracurium, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxacurium, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, eptifibatide, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, foscarnet, fosfomycin, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydrocortisone, hydromorphone, ifosfamide, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem/vaborbactam, mesna, methotrexate, methyldopate, methylprednisolone, metoclopramide, metronidazole, milrinone, mitomycin, morphine, moxifloxacin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phentolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, propranolol, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, allopurinol, amiodarone, anidulafungin, caspofungin, chlorpromazine, dantrolene, daunorubicin hydrochloride, diazepam, dobutamine, doxorubicin hydrochloride, droperidol, epirubicin, hydralazine, hydroxyzine, idarubicin, isavuconazonium, midazolam, minocycline, mitoxantrone, nicardipine, ondansetron, pentamidine, phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin, thiopental, topotecan, verapamil.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication. Consult health care professional before treating with antidiarrheals.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

E

escitalopram (ess-sit-**al**-o-pram)

Cipralex, Lexapro

Classification

Therapeutic: antidepressants
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Indications

Major depressive disorder. Generalized anxiety disorder (GAD). **Unlabeled Use:** Panic disorder. Obsessive-compulsive disorder (OCD). Post-traumatic stress disorder (PTSD). Social anxiety disorder (social phobia). Premenstrual dysphoric disorder (PMDD).

Action

Selectively inhibits the reuptake of serotonin in the CNS.
Therapeutic Effects: Antidepressant action.

Pharmacokinetics

Absorption: 80% absorbed following oral administration.
Distribution: Enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver (primarily CYP3A4 and CYP2C19 isoenzymes); 7% excreted unchanged by kidneys.
Half-life: ↑ in elderly and patients with hepatic impairment.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 1–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent pimozide; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of citalopram; Angle-closure glaucoma.
Use Cautiously in: Personal or family history of bipolar disorder, mania, or hypomania (may activate mania/hypomania); History of seizures; Patients at risk for suicide; Hepatic impairment (dose ↓ recommended); Severe renal impairment; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: May ↑ risk of suicide attempt/ideation especially during

© F.A. Davis Publishing

early treatment or dose adjustment; safety not established in children <12 yr; Geri: ↓ doses recommended due to ↓ drug clearance in older patients.

Adverse Reactions/Side Effects

Derm: sweating. **Endo:** syndrome on inappropriate secretion of antidiuretic hormone (SIADH). **F and E:** hyponatremia. **GI:** diarrhea, nausea, abdominal pain, constipation, dry mouth, indigestion. **GU:** ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction. **Metab:** ↑ appetite. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, insomnia, dizziness, drowsiness, fatigue. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: May cause serious, potentially fatal reactions when used with **MAO inhibitors**; allow at least 14 days between escitalopram and **MAO inhibitors**. Concurrent use with **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving escitalopram, immediately discontinue escitalopram and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume escitalopram therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **pimozide** may result in prolongation of the QTc interval and is contraindicated. Use cautiously with other **centrally acting drugs** (including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**; concurrent use with **alcohol** is not recommended). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans**, ↑ risk of serotonin syndrome. **Cimetidine** may ↑ levels. Serotonergic effects may be ↑ by **lithium** (concurrent use should be carefully monitored). **Carbamazepine** may ↓ levels. May ↑ levels of **metoprolol**. Use cautiously with **tricyclic antidepressants** due to unpredictable effects on serotonin and norepinephrine reuptake. ↑ risk of bleeding with **aspirin**, **NSAIDs**, **clopidogrel**, or **warfarin**.

Drug-Natural Products: ↑ risk of serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): *Depression and GAD*— 10 mg once daily, may ↑ to 20 mg once daily after 1 wk.

Hepatic Impairment

PO (Adults): 10 mg once daily.
PO (Geriatric Patients): 10 mg once daily.
PO (Children ≥12 yr): *Depression*— 10 mg once daily, may ↑ to 20 mg once daily after 3 wk.

Availability (generic available)

Tablets: 5 mg, 10 mg, 20 mg. **Cost:** *Generic*— 5 mg $13.16/100, 10 mg $13.87/100, 20 mg $18.01/100.

Orally disintegrating tablets: 10 mg, 20 mg. **Oral solution (peppermint flavor):** 1 mg/mL. **Cost:** *Generic*— $190.20/240 mL.

NURSING IMPLICATIONS

Assessment

- Screen patient for a personal or family history of bipolar disorder, mania, or hypomania before starting therapy; may precipitate a mixed/manic episode.
- Monitor mood changes and level of anxiety during therapy.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional face-to-face at least weekly for 4 wk, then every other wk for next 4 wk, then at 12 wk, and then on advice of health care professional thereafter.
- Assess sexual function before starting escitalopram. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).

Implementation

- Do not administer escitalopram and citalopram concomitantly. Taper to avoid potential withdrawal reactions. Reduce dose by 50% for 3 days, then again by 50% for 3 days, then discontinue.
- **PO:** Administer as a single dose in the morning or evening without regard to meals.

Patient/Family Teaching

- Instruct patient to take escitalopram as directed. Take missed doses on the same day as soon as remembered and consult health care professional. Resume regular dosing schedule next day. Do not double doses. Do not stop abruptly; should be discontinued gradually. Instruct patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood

© F.A. Davis Publishing

or behavior or if rash or symptoms of serotonin syndrome occur.
- Inform patient that escitalopram may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially St. John's wort, alcohol or other CNS depressants.
- Rep: Instruct females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if they plan to breast feed. If used during pregnancy, should be tapered during 3rd trimester to avoid neonatal serotonin syndrome. Monitor infants exposed to escitalopram for excess sedation, restlessness, agitation, poor feeding, and poor weight gain. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patients by calling the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clnical-and-researchprograms/pregnancyregistry/antidepressants/ .
- Emphasize importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes
- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects. Full antidepressant effects occur in 4–6 wk.
- Decrease in anxiety.

REMS

esketamine (es-ket-a-meen)
Spravato

Classification
Therapeutic: antidepressants
Pharmacologic: N-methyl-D-aspartate antagonist

Schedule III

Indications
Treatment-resistant depression (in combination with an oral antidepressant). Depressive symptoms in patients with major depressive disorder with acute suicidal ideation or behavior (in combination with an oral antidepressant).

Action
Acts as a non-competitive N-methyl-D-aspartate (NMDA) receptor antagonist; the exact mechanism by which it exerts its antidepressant effect is unknown. **Therapeutic Effects:** Decreased severity of depressive symptoms and prolonged time to relapse.

Pharmacokinetics
Absorption: 48% absorbed following nasal administration.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Primarily metabolized to noresketamine (active metabolite) in liver by CYP2B6 and CYP3A4 isoenzymes, and to lesser extent by CYP2C9 and CYP2C19 isoenzymes. Primarily excreted in urine (≥78%; <1% as unchanged drug); ≤2% excreted in feces).
Half-life: 7–12 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Intranasal	unknown	20–40 min	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to esketamine or ketamine; Aneurysmal vascular disease (including thoracic and abdominal aorta, intracranial and peripheral arterial vessels) or arteriovenous malformation; History of intracerebral hemorrhage; Severe hepatic impairment; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: History of hypertensive encephalopathy; Psychosis; Moderate hepatic impairment; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children; may ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment.

Adverse Reactions/Side Effects
CV: ↑ BP, tachycardia. **Derm:** ↑ sweating. **EENT:** nasal irritation, throat irritation. **GI:** metallic taste, nausea, vomiting, constipation, diarrhea, dry mouth. **GU:** urinary tract infection. **Neuro:** SUICIDAL THOUGHTS/BEHAVIORS, anxiety, depersonalization, derealization, dissociative changes, dizziness, fatigue, headache, hypoesthesia, sedation, cognitive impairment, insomnia, loss of consciousness, slurred/slow speech, vertigo, tremor.
Misc: physical dependence, psychological dependence, tolerance.

Interactions
Drug-Drug: Concurrent use with **psychostimulants**, including **amphetamines**, **methylphenidate**, or **modafanil**, or **armodafanil**, as well as **monoamine oxidase inhibitors** may ↑ BP. Use with **opioids** or other **CNS depressants**, including **benzo-**

© F.A. Davis Publishing

diazepines, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation.

Route/Dosage

Treatment-Resistant Depression

Intranasal (Adults): *Induction phase (Wk 1–4)* — 56 mg (2 sprays in each nostril) twice weekly; may ↑ dose (after first dose) based on response and tolerability up to 84 mg (3 sprays in each nostril) twice weekly. *Maintenance phase (Wk 5–8)* — 56 mg (2 sprays in each nostril) or 84 mg (3 sprays in each nostril) once weekly. *Maintenance phase (Wk 9 and beyond)* — 56 mg (2 sprays in each nostril) or 84 mg (3 sprays in each nostril) once weekly or every other wk (use least frequent dosing to maintain remission/response).

Depressive Symptoms in Patients With Major Depressive Disorder With Acute Suicidal Ideation or Behavior

Intranasal (Adults): 84 mg (3 sprays in each nostril) twice weekly for 4 wk; may ↓ dosage to 56 mg (2 sprays in each nostril) twice weekly based on tolerability. Re-evaluate patient for continued need for treatment after 4 wk.

Availability

Nasal spray: 28 mg/device (14 mg/spray).

NURSING IMPLICATIONS

Assessment

- Monitor patient for sedation for at least 2 hr after each dose.
- Monitor BP before and 40 min after administration and periodically during 2 hr after administration. If BP elevated before administration, may hold dose. If elevated following dose, continue to monitor patient.
- Assess for history of psychosis. May cause dissociative or perceptual changes (distortion of time, space, and illusions), derealization and depersonalization. Monitor for 2 hr after each dose.
- Monitor for worsening and emergence of suicidal thoughts and behaviors, especially during initial few mo of drug therapy and at times of dose changes.

Implementation

- Must be administered under the supervision of a health care professional.
- ***REMS:*** Due to risks of serious adverse outcomes from sedation, dissociation, and abuse and misuse, available only through a restricted program under Spravato REMS. Health care settings and pharmacies must be certified and patients enrolled in REMS program. Esketamine is only administered in health care settings under direct observation of health care professional and patients must be monitored for at least 2 hr after administration. Patients must be enrolled in the REMS program.
- Advise patient to avoid food for at least 2 hr and liquids for 30 min prior to administration.
- If nasal corticosteroid or nasal decongestant is administered on a dosing day, administer at least 1 hr before esketamine administration.
- Esketamine is given in conjunction with an oral antidepressant.
- **Intranasal:** Use 2 devices (for a 56-mg dose) or 3 devices (for an 84-mg dose), with a 5-min rest between use of each device. Do not prime device. Advise patient to gently blow nose before first dose. Check that indicator shows 2 or 3 green dots. Instruct patient to recline head back 45°. Have patient insert device into nostril until nose rest is between nostrils. Close opposite nostril. Sniff gently after administering dose. Take device from patient; confirm no green dots. Instruct patient to recline and rest for 5 min between doses; do not blow nose. Repeat for each dose. Discard according to institution guidelines for Schedule III drugs.

Patient/Family Teaching

- ***REMS:*** Explain purpose of esketamine, administration procedure, and Spravato REMS program to patient. Advise patient to read *Medication Guide* before starting therapy. If a treatment session is missed and no worsening of depressive symptoms occurs, continue current dosing schedule. If depressive symptoms worsen, may return to previous dosing schedule.
- May cause sedation, dissociative symptoms, perception disturbances, dizziness, vertigo, and anxiety. Caution patient to avoid driving or activities requiring alertness until next day after a restful sleep.
- Advise patient, family, and caregivers to look for changes in behavior and suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability; aggressiveness; acting on dangerous impulses, mania, or other changes in mood or behavior.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products without consulting health care professional.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during therapy and to avoid breast feeding. Notify health care professional promptly if pregnancy is planned or suspected, or if breast feeding. Inform patients who become pregnant during therapy of pregnancy registry that monitors pregnancy outcomes in women exposed to antidepressants. Enroll patients by contacting the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or online at https://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/antidepressants/.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Decreased severity of depressive symptoms and prolonged time to relapse.

HIGH ALERT

esmolol (es-moe-lol)

Brevibloc

Classification

Therapeutic: antiarrhythmics (class II)
Pharmacologic: beta blockers

Indications

Management of sinus tachycardia and supraventricular arrhythmias.

Action

Blocks stimulation of $beta_1$ (myocardial)-adrenergic receptors. Does not usually affect $beta_2$ (pulmonary, vascular, or uterine)-receptor sites. **Therapeutic Effects:** Decreased heart rate. Decreased AV conduction.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Rapidly and widely distributed.
Metabolism and Excretion: Metabolized by enzymes in RBCs and liver.
Half-life: 9 min.

TIME/ACTION PROFILE (antiarrhythmic effect)

ROUTE	ONSET	PEAK	DURATION
IV	within min	unknown	1–20 min

Contraindications/Precautions

Contraindicated in: Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block; Known alcohol intolerance.
Use Cautiously in: Geri: ↑ sensitivity to the effects of beta blockers; Thyrotoxicosis (may mask symptoms); Diabetes mellitus (may mask symptoms of hypoglycemia); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); OB, Lactation, Pedi: Safety not established; neonatal bradycardia, hypotension, hypoglycemia, and respiratory depression may occur rarely.

Adverse Reactions/Side Effects

CV: hypotension, peripheral ischemia. **GI:** nausea, vomiting. **Derm:** sweating. **Local:** injection site reactions. **Neuro:** fatigue, agitation, confusion, dizziness, drowsiness, weakness.

Interactions

Drug-Drug: General anesthesia, IV **phenytoin**, and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamine**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent **thyroid hormone** administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ effectiveness of **theophylline**. May ↓ beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO-inhibitor** therapy (may result in hypertension).

Route/Dosage

IV (Adults): *Antiarrhythmic*—500-mcg/kg loading dose over 1 min initially, followed by 50-mcg/kg/min infusion for 4 min; if no response within 5 min, give 2nd loading dose of 500 mcg/kg over 1 min, then ↑ infusion to 100 mcg/kg/min for 4 min. If no response, repeat loading dose of 500 mcg/kg over 1 min and ↑ infusion rate by 50-mcg/kg/min increments (not to exceed 200 mcg/kg/min for 48 hr). As therapeutic end point is achieved, eliminate loading doses and decrease dose increments to 25 mg/kg/min. *Intraoperative antihypertensive/antiarrhythmic*—250–500-mcg/kg loading dose over 1 min initially, followed by 50-mcg/kg/min infusion for 4 min; if no response within 5 min, give 2nd loading dose of 250–500 mcg/kg over 1 min, then ↑ infusion to 100 mcg/kg/min for 4 min. If no response, repeat loading dose of 250–500 mcg/kg over 1 min and ↑ infusion rate by 50-mcg/kg/min increments (not to exceed 200 mcg/kg/min for 48 hr).
IV (Children): *Antiarrhythmic*—50 mcg/kg/min, may be ↑ every 10 min up to 300 mcg/kg/min.

Availability (generic available)

Solution for injection (for use as loading dose): 10 mg/mL. **Premixed infusion:** 2000 mg/100 mL, 2500 mg/250 mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, ECG, and pulse frequently during dose adjustment period and periodically during therapy. The risk of hypotension is greatest within the first 30 min of initiating esmolol infusion.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- Assess infusion site frequently throughout therapy. Concentrations >10 mg/mL may cause redness, swelling, skin discoloration, and burning at the injection site. Do not use butterfly needles for administration. If venous irritation occurs, stop the infusion and resume at another site.

© F.A. Davis Publishing

- ***Toxicity and Overdose:*** Monitor patients receiving esmolol for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures).
- IV glucagon and symptomatic care are used in the treatment of esmolol overdose. Because of the short action of esmolol, discontinuation of therapy may relieve acute toxicity.

Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous. Esmolol is available in different concentrations; fatalities have occurred when loading dose vial is confused with concentrated solution for injection, which contains 2500 mg in 10 mL (250 mg/mL) and must be diluted. Before administering, have second practitioner independently check original order, dose calculations, and infusion pump settings.
- ***High Alert:*** Do not confuse Brevibloc (esmolol) with Brevital (methohexital). If both are available as floor stock, store in separate areas.
- To convert to other antiarrhythmics following esmolol administration, administer the 1st dose of the antiarrhythmic agent and decrease the esmolol dose by 50% after 30 min. If an adequate response is maintained for 1 hr following the 2nd dose of the antiarrhythmic agent, discontinue esmolol.

IV Administration

- **IV Push:** ***Dilution:*** The 10-mg/mL and 20-mg/mL vials should be used for the loading dose. These vials are already diluted. No further dilution is needed. ***Concentration:*** Avoid concentrations >10 m g/mL. ***Rate:*** Administer over 1 min.
- **Continuous Infusion:** ***Dilution:*** Premixed infusions are already diluted and ready to use. Solution is clear, colorless to light yellow. ***Concentration:*** 10 mg/mL. ***Rate:*** Based on patient's weight (see Route/Dosage section). Titration of dose is based on desired heart rate or undesired decrease in BP. Esmolol infusions should not be abruptly discontinued; the infusion rate should be tapered.
- **Y-Site Compatibility:** alfentanil, amikacin, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, ertapenem, erythromycin, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin (regular), isoproterenol, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methyldopate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amphotericin B deoxycholate, amphotericin B lipid complex, azathioprine, cefotetan, dantrolene, dexamethasone, diazepam, diazoxide, furosemide, ganciclovir, indomethacin, ketorolac, milrinone, mitomycin, oxacillin, pantoprazole, pentobarbital, phenobarbital, warfarin.

Patient/Family Teaching

- May cause drowsiness. Caution patients receiving esmolol to call for assistance during ambulation or transfer.
- Advise patients to change positions slowly to minimize orthostatic hypotension.
- Patients with diabetes should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block dizziness or sweating as signs of hypoglycemia.

Evaluation/Desired Outcomes

- Control of arrhythmias without appearance of detrimental side effects.

BEERS

esomeprazole

(es-oh-**mep**-ra-zole)

NexIUM, NexIUM 24hr

Classification

Therapeutic: antiulcer agents

Pharmacologic: proton-pump inhibitors

Indications

PO, IV: GERD/erosive esophagitis (IV therapy should only be used if PO therapy is not possible/appropriate).

© F.A. Davis Publishing

IV: Reduction in risk of rebleeding following therapeutic endoscopy for acute bleeding gastric or duodenal ulcers. **PO:** Hypersecretory conditions, including Zollinger-Ellison syndrome. **PO:** With amoxicillin and clarithromycin to eradicate *Helicobacter pylori* in duodenal ulcer disease or history of duodenal ulcer disease. **PO:** Decrease risk of gastric ulcer during continuous NSAID therapy. **OTC:** Heartburn occurring ≥twice/wk.

Action

Binds to an enzyme on gastric parietal cells in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen with lessened gastroesophageal reflux. Healing of duodenal ulcers. Decreased incidence of gastric ulcer during continuous NSAID therapy.

Pharmacokinetics

Absorption: 90% absorbed following oral administration; food ↓ absorption.
Distribution: Unknown.
Protein Binding: 97%.
Metabolism and Excretion: Extensively metabolized by the liver (cytochrome P450 [CYP450] system, primarily CYP2C19 isoenzyme, but also the CYP3A4 isoenzyme) 🧬 (the CYP2C19 enzyme system exhibits genetic polymorphism; 15–20% of Asian patients and 3–5% of Caucasian and Black patients may be poor metabolizers and may have significantly ↑ esomeprazole concentrations and an ↑ risk of adverse effects); <1% excreted unchanged in urine.
Half-life: *Children 1–11 yrs:* 0.42–0.88 hr; *Adults:* 1.0–1.5 hr.

TIME/ACTION PROFILE (blood levels*)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.6 hr	24 hr
IV	rapid	end of infusion	24 hr

*Resolution of symptoms takes 5–8 days.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to esomeprazole or related drugs (benzimidazoles); Hypersensitivity; Concurrent use of rilpivirine.
Use Cautiously in: Severe hepatic impairment; Patients using high-doses for >1 yr (↑ risk of hip, wrist, or spine fractures and fundic gland polyps); Patients using therapy for >3 yr (↑ risk of vitamin B_{12} deficiency); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding.

Adverse Reactions/Side Effects

Derm: cutaneous lupus erythematosus. **F and E:** hypomagnesemia (especially if treatment duration ≥3 mo). **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), abdominal pain, constipation, diarrhea, dry mouth, flatulence, fundic gland polyps, nausea. **GU:** acute tubulointerstitial nephritis. **Hemat:** vitamin B_{12} deficiency. **MS:** bone fracture. **Neuro:** headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, or tubulointerstitial nephritis), systemic lupus erythematosus.

Interactions

Drug-Drug: May significantly ↓ levels of **rilpivirine**; concurrent use contraindicated. May ↓ levels of **atazanavir** and **nelfinavir**; avoid concurrent use with either of these antiretrovirals. May ↑ levels and risk of toxicity of **saquinavir** (may need to ↓ dose of saquinavir). May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **ampicillin esters**, **iron salts**, **erlotinib**, and **mycophenolate mofetil**. May ↑ levels of **digoxin** and **methotrexate**. May ↑ risk of bleeding with **warfarin** (monitor INR and PT). **Voriconazole** may ↑ levels. May ↓ the antiplatelet effects of **clopidogrel**; avoid concurrent use. May ↑ levels of **cilostazol**; consider ↓ dose of cilostazol from 100 mg twice daily to 50 mg twice daily. **Rifampin** may ↓ levels and may ↓ response (avoid concurrent use). Hypomagnesemia ↑ risk of **digoxin** toxicity. May ↑ levels of **tacrolimus** and **methotrexate**.
Drug-Natural Products: **St. John's wort** may ↓ levels and may ↓ response (avoid concurrent use).

Route/Dosage

Gastroesophageal Reflux Disease

PO (Adults): *Healing of erosive esophagitis*—20 mg or 40 mg once daily for 4–8 wk; *Maintenance of healing of erosive esophagitis*—20 mg once daily; *Symptomatic GERD*—20 mg once daily for 4 wk (additional 4 wk may be considered for nonresponders); *Heartburn*—20 mg once daily for 2 wk.
PO (Children 12–17 yr): *Short-term treatment of GERD*—20–40 mg once daily for up to 8 wk.
PO (Children 1–11 yr): *Short-term treatment of GERD*—10 mg once daily for up to 8 wk; *Healing of erosive esophagitis*—<20 kg: 10 mg once daily for 8 wk; ≥20 kg: 10–20 mg once daily for 8 wk.
PO (Infants and Children 1 mo–<1 yr): *>7.5–12 kg*—10 mg once daily for up to 6 wk; *>5–7.5 kg*—5 mg once daily for up to 6 wk; *3–5 kg*—2.5 mg once daily for up to 6 wk.
IV (Adults): 20 or 40 mg once daily.
IV (Children 1–17 yr): *<55 kg*—10 mg once daily; *≥55 kg*—20 mg once daily.
IV (Children 1 mo–<1 yr): 0.5 mg/kg once daily.

Hepatic Impairment

PO, IV (Adults): *Severe hepatic impairment*—Dose should not exceed 20 mg/day.

© F.A. Davis Publishing

Reduction of Risk of Rebleeding of Gastric or Duodenal Ulcers After Therapeutic Endoscopy

IV (Adults): 80 mg over 30 min, then 8 mg/hr continuous infusion for 71.5 hr.

Hepatic Impairment

IV (Adults): *Mild-to-moderate hepatic impairment*—Do not exceed continuous infusion rate of 6 mg/hr; *Severe hepatic impairment*—Do not exceed continuous infusion rate of 4 mg/hr.

H. pylori Eradication to Reduce the Risk of Duodenal Ulcer Recurrence (Triple Therapy)

PO (Adults): 40 mg once daily for 10 days with amoxicillin 1000 mg twice daily for 10 days and clarithromycin 500 mg twice daily for 10 days.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*—Dose should not exceed 20 mg/day.

Decrease Gastric Ulcer During Continuous NSAID Therapy

PO (Adults): 20 or 40 mg once daily for up to 6 mo.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*—Dose should not exceed 20 mg/day.

Pathological Hypersecretory Conditions Including Zollinger-Ellison Syndrome

PO (Adults): 40 mg twice daily.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*—Dose should not exceed 20 mg/day.

Availability (generic available)

Delayed-release capsules: 20 mg[Rx, OTC], 40 mg. **Cost:** 20 mg $713.55/90, 40 mg $731.22/90. **Delayed-release oral suspension packets:** 2.5 mg/pkt, 5 mg/pkt, 10 mg/pkt, 20 mg/pkt, 40 mg/pkt. **Cost:** All strengths $268.01/30 pkts. **Delayed-release tablets:** 20 mg[OTC]. **Powder for injection:** 40 mg/vial. ***In combination with:*** naproxen (Vimovo).

NURSING IMPLICATIONS

Assessment

- Assess routinely for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD).
- ***Lab Test Considerations:*** May cause ↑ serum creatinine, uric acid, total bilirubin, alkaline phosphatase, AST, and ALT.
- May alter hemoglobin, WBC, platelets, serum sodium, potassium, and thyroxine levels.
- May cause hypomagnesemia. Monitor serum magnesium prior to and periodically during therapy.
- May cause false positive results in diagnostic investigations for neuroendocrine tumors due to ↑ serum chromogranin A (CgA) levels secondary to drug-induced ↓ gastric acidity. Temporarily stop esomeprazole at least 14 days before assessing CgA levels and consider repeating test if initial CgA levels are high.

Implementation

- ***High Alert:*** Do not confuse Nexium (esomeprazole) with Nexavar (sorafenib).
- Antacids may be used while taking esomeprazole.
- **PO:** Administer at least 1 hr before meals. ***DNC:*** Swallow tablets and capsules whole.
- *Delayed-release capsules:* For patients with difficulty swallowing, place 1 tbsp of applesauce in an empty bowl. Open capsule and carefully empty the pellets inside onto applesauce. Mix pellets with applesauce and swallow immediately. Applesauce should not be hot and should be soft enough to swallow without chewing. Do not store applesauce mixture for future use. Tap water, orange juice, apple juice, and yogurt have also been used. Do not crush or chew pellets.
- *For patients with an NG tube,* delayed-release capsules can be opened and intact granules emptied into a 60-mL syringe and mixed with 50 mL of water. Replace plunger and shake syringe vigorously for 15 sec. Hold syringe with tip up and check for granules in tip. Attach syringe to NG tube and administer solution. After administering, flush syringe with additional water. Do not administer if granules have dissolved or disintegrated. Administer immediately after mixing.
- For *Delayed-release oral suspension:* Mix contents of packet with 1 tbsp (15 mL) of water, leave 2–3 min to thicken, stir and drink within 30 min.
- *For delayed-release oral suspension nasogastric or gastric tube:* Add 15 mL of water to a syringe and then add contents of packet. Shake the syringe, leave 2–3 min to thicken. Shake the syringe and inject through the nasogastric or gastric tube within 30 min.

IV Administration

- **IV Push:** Reconstitute each vial with 5 mL of 0.9% NaCl, LR, or D5W. Do not administer solutions that are discolored or contain a precipitate. Stable at room temperature for up to 12 hr. ***Rate:*** Administer over at least 3 min.
- **Intermittent Infusion:** ***Dilution:*** Dilute reconstituted solution to a volume of 50 mL with *D5W, 0.9% NaCl, or LR for adults* and *with 0.9% NaCl for pediatric patients.* ***Concentration:*** 0.8 mg/mL (40-mg vial) or 0.4 mg/mL (20-mg vial). Solutions diluted with 0.9% NaCl or LR are stable for 12 hr and those diluted with D5W are stable for 6 hr at room temperature. ***Rate:*** Administer over 10–30 min.
- **Continuous Infusion:** *For 80-mg loading dose,* reconstitute two 40-mg vials with 5 mL of 0.9% NaCl.

© F.A. Davis Publishing

Dilution: Further diluted in 100 mL 0.9% NaCl. ***Rate:*** Administer *loading dose* over 30 min. Follow with infusion at a rate of 8 mg/hr for 71.5 hrs.

- **Continuous Infusion:** *For 80 mg dose,* reconstitute two 40 mg vials with 5 mL of 0.9% NaCl. ***Dilution:*** Further diluted in 100 mL 0.9% NaCl. ***Rate:*** Follow loading dose with infusion at a rate of 8 mg/hr for 71.5 hrs.
- **Y-Site Compatibility:** ceftaroline, ceftolozane/tazobactam, D5W, fentanyl, furosemide, insulin regular, lactated Ringer's, meropenem/vaborbactam, metoprolol, nitroglycerin, tedizolid.
- **Y-Site Incompatibility:** dobutamine, dopamine, esmolol, isavuconazonium, labetalol, midazolam, morphine, plazomicin, tacrolimus, telavancin, tigecycline. Do not administer with other medication or solutions. Flush line with 0.9% NaCl, LR, or D5W before and after administration.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses. Advise patient to read the *Patient Information* sheet prior to starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; abdominal pain; or persistent headache to health care professional promptly.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient to notify health care professional if signs of hypomagnesemia (seizures, dizziness, abnormal or fast heartbeat, jitteriness, jerking movements or shaking, muscle weakness, spasms of the hands and feet, cramps or muscle aches, spasm of the voice box) occur.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy.
- Decrease in symptoms of GERD and erosive esophagitis. Sustained resolution of symptoms usually occurs in 5–8 days. Therapy is continued for 4–8 wk after initial episode.
- Decreased incidence of gastric ulcer during continuous NSAID therapy.
- Eradication of *H. pylori* in duodenal ulcer disease.
- Decrease in symptoms of hypersecretory conditions, including Zollinger-Ellison.

Delestrogen

Classification
Therapeutic: hormones
Pharmacologic: estrogens

Indications

PO, IM, Transdermal: Replacement of estrogen (HRT) to diminish moderate to severe vasomotor symptoms of menopause and of various estrogen deficiency states including: Female hypogonadism, Ovariectomy, Primary ovarian failure. Treatment and prevention of postmenopausal osteoporosis (not vaginal dose forms). **PO:** Inoperable metastatic postmenopausal breast or prostate carcinoma. **Vag:** Management of: Atrophic vaginitis due to menopause, Moderate to severe dyspareunia due to menopause.

Action

Estrogens promote growth and development of female sex organs and the maintenance of secondary sex characteristics in women. Metabolic effects include reduced blood cholesterol, protein synthesis, and sodium and water retention. **Therapeutic Effects:** Restoration of hormonal balance in various deficiency states, includ-

© F.A. Davis Publishing

ing menopause. Treatment of hormone-sensitive tumors.

Pharmacokinetics

Absorption: Well absorbed after oral administration. Readily absorbed through skin and mucous membranes.
Distribution: Widely distributed. Crosses the placenta and enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver and other tissues. Enterohepatic recirculation occurs, and more absorption may occur from the GI tract.
Half-life: Gel: 36 hr.

TIME/ACTION PROFILE (estrogenic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown
IM	unknown	unknown	unknown
Transdermal	unknown	unknown	3–4 days (Estraderm), 7 days (Climara)
Topical	unknown	unknown	unknown
Vaginal insert	unknown	unknown	3–4 days
Vaginal ring	unknown	unknown	90 days

Contraindications/Precautions

Contraindicated in: History of anaphylaxis or angioedema to estradiol; Thromboembolic disease (e.g., DVT, PE, MI, stroke); Protein C, protein S, or antithrombin deficiency or other thrombophilic disorder; History of breast cancer; History of estrogen-dependent cancer; Hepatic impairment; Undiagnosed vaginal bleeding; OB: Pregnancy (may cause fetal harm).
Use Cautiously in: Underlying cardiovascular disease; Severe hepatic or renal disease; History of porphyria; History of hereditary angioedema; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects

CV: MI, THROMBOEMBOLISM, edema, hypertension. **Derm:** oily skin, acne, pigmentation, urticaria. **EENT:** intolerance to contact lenses, worsening of myopia or astigmatism. **Endo:** gynecomastia (men), hyperglycemia. **F and E:** hypercalcemia, sodium and water retention. **GI:** nausea, weight changes, anorexia, ↑ appetite, jaundice, vomiting. **GU:** *women*—amenorrhea, dysmenorrhea, breakthrough bleeding, cervical erosions, loss of libido, vaginal candidiasis; *men*, erectile dysfunction, testicular atrophy. **MS:** leg cramps. **Neuro:** headache, dizziness, lethargy. **Misc:** MALIGNANCY (BREAST, ENDOMETRIAL, OVARIAN), breast tenderness.

Interactions

Drug-Drug: May alter requirement for **warfarin**, **oral hypoglycemic agents**, or **insulins**. **Barbiturates** or **rifampin** may ↓ effectiveness. **Smoking** ↑ risk of adverse CV reactions.

Route/Dosage

Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome. Concurrent use of progestin is recommended during cyclical therapy to decrease the risk of endometrial carcinoma in patients with an intact uterus.

Symptoms of Menopause, Atrophic Vaginitis, Moderate-to-Severe Dyspareunia, Female Hypogonadism, Ovarian Failure/Osteoporosis

PO (Adults): 0.45–2 mg once daily or in a cycle.
IM (Adults): 1–5 mg monthly (estradiol cypionate) *or* 10–20 mg (estradiol valerate) monthly.
Topical Gel (Adults): Apply contents of one packet *(Divigel)* or one actuation from pump *(EstroGel, Elestrin)* once daily.
Topical Spray *EvaMist* (Adults): 1 spray once daily, may be ↑ to 2–3 sprays once daily.
Transdermal (Adults): *Climara*—25 mcg/24-hr transdermal patch applied weekly. *Vivelle-Dot*—25–50 mcg/24-hr transdermal patch applied twice weekly. *Menostar*—14 mcg/24-hr transdermal patch applied every 7 days. Progestin may be administered for 10–14 days of each mo. *Minivelle*—37.5 mcg/24–hr transdermal patch applied twice weekly (for treatment of vasomotor symptoms); 25 mcg/24-hr transdermal patch applied twice weekly (for prevention of postmenopausal osteoporosis).
Vag (Adults): *Cream*—2–4 g (0.2–0.4 mg estradiol) once daily for 1–2 wk, then ↓ to 1–2 g/day for 1–2 wk; then maintenance dose of 1 g 1–3 times weekly for 3 wk, then off for 1 wk; then repeat cycle once vaginal mucosa has been restored; *Vaginal ring (Estring)*—2-mg (releases 7.5 mcg estradiol/24 hr) every 3 mo; *Vaginal ring (Femring)*—12.4 mg (releases 50 mcg estradiol/24 hr) every 3 mo or 24.8 mg (releases 100 mcg estradiol/24 hr) every 3 mo (*Femring* requires concurrent progesterone); *Vaginal insert (Vagifem and Imvexxy)*—1 insert once daily for 2 wk, then 1 insert twice weekly.

Postmenopausal Breast Carcinoma

PO (Adults): 10 mg 3 times daily.

Prostate Carcinoma

PO (Adults): 1–2 mg 3 times daily.
IM (Adults): 30 mg every 1–2 wk (estradiol valerate).

Availability (generic available)

Estradiol

Tablets: 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.5 mg $10.83/100, 1 mg $10.83/100, 2 mg $10.83/100. ***In combination with:*** drospirenone (Angeliq); elagolix/norethindrone (Oriahnn); norethindrone (Activella); progesterone (Bijuva); relugolix/norethindrone (Myfembree). See Appendix N.

Estradiol Cypionate

Injection (in oil): 5 mg/mL.

© F.A. Davis Publishing

Estradiol Transdermal Preparations

Gel packet (Divigel): 0.25 mg/pkt, 0.5 mg/pkt, 0.75 mg/pkt, 1 mg/pkt. **Cost:** All strengths $3.45/pkt. **Gel pump (Elestrin):** 0.52 mg/actuation. **Cost:** *Elestrin (0.52 mg/actuation)* — $89.44/26 g. **Gel pump (Estrogel):** 0.75 mg/actuation. **Cost:** *EstroGel (0.75 mg/actuation)* — $103.80/50 g. **Patch:** 14 mcg/24-hr release rate, 25 mcg/24-hr release rate, 37.5 mcg/24-hr release rate, 50 mcg/24-hr release rate, 60 mcg/24-hr release rate, 75 mcg/24-hr release rate, 100 mcg/24-hr release rate. **Cost:** 14 mcg/24 hr $221.46/4, 25 mcg/24 hr $88.40/4, 37.5 mcg/24 hr $88.40/4, 50 mcg/24 hr $88.40/4, 60 mcg/24 hr $88.40/4, 75 mcg/24 hr $88.40/4, 100 mcg/24 hr $88.40/4. **Spray:** 1.53 mg/spray. **Cost:** $108.76/9 mL. ***In combination with:*** levonorgestrel (Climara Pro); norethindrone (Combipatch). See Appendix N.

Estradiol Vaginal Preparations

Vaginal cream: 0.01%. **Cost:** $165.70/43 g. **Vaginal tablet (Vagifem):** 10 mcg. **Cost:** $97.05/8. **Vaginal insert (Imvexxy):** 4 mcg, 10 mcg. **Vaginal ring (Estring):** 2 mg (releases 7.5 mcg/day over 90 days). **Cost:** $252.72/1 ring. **Vaginal ring (Femring):** 12.4 mg (releases 50 mcg/day over 90 days), 24.8 mg (releases 100 mcg/day over 90 days). **Cost:** 50 mcg/day $248.98/1 ring, 100 mcg/day $259.58/1 ring.

Estradiol Valerate

Injection (in oil): 10 mg/mL, 20 mg/mL, 40 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess BP before and periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Menopause:** Assess frequency and severity of vasomotor symptoms.
- ***Lab Test Considerations:*** May cause ↑ HDL, phospholipids, and triglycerides and ↓ serum LDL and total cholesterol concentrations.
- May cause ↑ serum glucose, sodium, cortisol, prolactin, prothrombin, and factor VII, VIII, IX, and X levels. May ↓ serum folate, pyridoxine, antithrombin III, and urine pregnanediol concentrations.
- Monitor hepatic function before and periodically during therapy.
- May cause false interpretations of thyroid function tests, false ↑ in norepinephrine platelet-induced aggregability, and false ↓ in metyrapone tests.
- May cause hypercalcemia in patients with metastatic bone lesions.

Implementation

- **PO:** Administer with or immediately after food to reduce nausea.
- **Vag:** Manufacturer provides applicator with cream. Dose is marked on the applicator. Wash applicator with mild soap and warm water after each use.
- **Transdermal:** When switching from PO form, begin transdermal therapy 1 wk after the last dose or when symptoms reappear.
- **Topical:** Apply *Divigel* individual-use once-daily packets of quick drying gel to an area measuring 5 inches by 7 inches (size of 2 palm prints) on the thigh. Do not wash area for at least 1 hr after gel has dried.
- Spray *EvaMist* on inside of forearm at the same time each day. Do not massage or rub the spray into the skin. Allow to dry for 2 min before dressing and at least 1 hr before washing. Never spray *EvaMist* around breast or vagina. Do not use more than 56 doses, even if fluid remains in pump.
- **IM:** Injection has oil base. Roll syringe to ensure even dispersion. Administer deep IM. Avoid IV administration.

Patient/Family Teaching

- Instruct patient on correct method of administration. Instruct patient to take medication as directed. Take missed doses as soon as remembered as long as it is not just before next dose. If a dose of *EvaMist* is missed, apply if more than 12 hr before next dose; if less than 12 hr, omit dose and return to regular schedule. Do not double doses.
- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding.
- If nausea becomes a problem, advise patient that eating solid food often provides relief.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities, headache, chest pain, blurred vision), mental depression, or hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools) to health care professional.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient that cigarette smoking during estrogen therapy may cause increased risk of serious side effects, especially for women over age 35.
- Caution patient to use sunscreen and protective clothing to prevent increased pigmentation.
- Advise patient treated for osteoporosis that exercise has been found to arrest and reverse bone loss. Patient should discuss any exercise limitations with health care professional before beginning program.
- Inform patient that estrogens should not be used to decrease risk of cardiovascular disease. Estrogens may increase risk of cardiovascular disease (MI, stroke), dementia, and breast cancer.

© F.A. Davis Publishing

- Instruct patient to stop taking medication and notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of routine follow-up physical exams, including BP; breast, abdomen, and pelvic examinations; Papanicolaou smears every 6–12 mo; and mammogram every 12 mo or as directed. Health care professional will evaluate possibility of discontinuing medication every 3–6 mo. If on continuous (not cyclical) therapy or without concurrent progestins, endometrial biopsy may be recommended, if uterus is intact.
- **Vag:** Instruct patient in the correct use of applicator. Patient should remain recumbent for at least 30 min after administration. May use sanitary napkin to protect clothing, but do not use tampon. If a dose is missed, do not use the missed dose, but return to regular dosing schedule.
- Instruct patient to use applicator provided with vaginal tablet. Insert as high up in the vagina as comfortable, without using force.
- **Vaginal Ring:** Instruct patient to press ring into an oval and insert into the upper third of the vaginal vault. Exact position is not critical. Once ring is inserted, patient should not feel anything. If discomfort is felt, ring is probably not in far enough; gently push farther into vagina. Leave in place continuously for 90 days. Ring does not interfere with sexual intercourse. If straining at defecation makes ring move to lower vagina, push up with finger. If expelled totally, rinse ring with lukewarm water and reinsert. To remove, hook a finger through the ring and pull it out.
- **Transdermal:** Instruct patient to wash and dry hands first. Apply disc to intact skin on hairless portion of abdomen (do not apply to breasts or waistline). Apply *Minivelle* patch to lower abdomen or buttocks. Press disc/patch for 10 sec to ensure contact with skin (especially around edges). Avoid areas where clothing may rub disc loose. Change site with each administration to prevent skin irritation. Do not reuse site for 1 wk; disc may be reapplied if it falls off.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- ***Evamist*:** Caution patient to make sure children are not exposed to *Evamist* and do not come into contact with any skin area where the drug was applied. Women who cannot avoid contact with children should wear a garment with long sleeves to cover the application site.

Evaluation/Desired Outcomes

- Resolution of menopausal vasomotor symptoms.
- Decreased vaginal and vulvar itching, inflammation, or dryness associated with menopause.
- Normalization of estrogen levels in patients with ovariectomy or hypogonadism.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Prevention of osteoporosis.

estradiol valerate/dienogest, See CONTRACEPTIVES, HORMONAL.

estrogens, conjugated

(**ess**-troe-jenz **con**-joo-gae-ted)

C.E.S, Congest, Premarin

Classification

Therapeutic: hormones

Pharmacologic: estrogens

Indications

PO: Moderate to severe vasomotor symptoms of menopause. Vulvar and vaginal atrophy associated with menopause. Estrogen deficiency states, including: Female hypogonadism, Ovariectomy, Primary ovarian failure. Prevention of postmenopausal osteoporosis. Advanced inoperable metastatic breast and prostatic carcinoma. **IM, IV:** Uterine bleeding resulting from hormonal imbalance. **Vag:** Atrophic vaginitis. Moderate to severe dyspareunia due to menopause. Concurrent use of progestin is recommended during cyclical therapy to decrease the risk of endometrial carcinoma in patients with an intact uterus.

Action

Estrogens promote the growth and development of female sex organs and the maintenance of secondary sex characteristics in women. **Therapeutic Effects:** Restoration of hormonal balance in various deficiency states and treatment of hormone-sensitive tumors.

Pharmacokinetics

Absorption: Well absorbed after oral administration. Readily absorbed through skin and mucous membranes.

Distribution: Widely distributed. Crosses placenta and enters breast milk.

Metabolism and Excretion: Mostly metabolized by liver and other tissues. Enterohepatic recirculation occurs, with more absorption from GI tract.

Half-life: Unknown.

TIME/ACTION PROFILE (estrogenic effects†)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	unknown	24 hr
IM	delayed	unknown	6–12 hr
IV	rapid	unknown	6–12 hr

†Tumor response may take several wk.

Contraindications/Precautions

Contraindicated in: History of anaphylaxis or angioedema to estrogen; Thromboembolic disease (e.g., DVT, PE, MI, stroke); Undiagnosed vaginal bleeding;

© F.A. Davis Publishing

History of breast cancer; History of estrogen-dependent cancer; Hepatic impairment; Protein C, protein S, or antithrombin deficiency or other thrombophilic disorder; OB: May cause fetal harm; Lactation: Negatively affects quantity and quality of breast milk.

Use Cautiously in: Long-term use (more than 4–5 yr); may ↑ risk of myocardial infarction, stroke, invasive breast cancer, pulmonary emboli, deep vein thrombosis, and dementia in postmenopausal women; Underlying cardiovascular disease; Hypertriglyceridemia; History of hereditary angioedema.

Adverse Reactions/Side Effects

(Systemic use) **CV:** MI, THROMBOEMBOLISM, edema, hypertension. **Derm:** acne, oily skin, pigmentation, urticaria. **Endo:** gynecomastia (men), hyperglycemia. **F and E:** hypercalcemia, sodium and water retention. **GI:** nausea, weight changes, anorexia, ↑ appetite, jaundice, vomiting. **GU:** *women*—amenorrhea, breakthrough bleeding, dysmenorrhea, cervical erosion, loss of libido, vaginal candidiasis; *men*, erectile dysfunction, testicular atrophy. **MS:** leg cramps. **Neuro:** headache, dizziness, insomnia, lethargy, mental depression. **Misc:** ANAPHYLAXIS, ANGIOEDEMA, MALIGNANCY (BREAST, ENDOMETRIAL, OVARIAN), breast tenderness.

Interactions

Drug-Drug: May alter requirement for **warfarin**, **oral hypoglycemic agents**, or **insulins**. **Barbiturates**, **carbamazepine**, or **rifampin** may ↓ effectiveness. **Smoking** ↑ risk of adverse CV reactions. **Erythromycin**, **clarithromycin**, **itraconazole**, **ketoconazole**, and **ritonavir** may ↑ risk of adverse effects.

Drug-Food: Grapefruit juice may ↑ risk of adverse effects.

Route/Dosage

Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.

Ovariectomy, Primary Ovarian Failure

PO (Adults): 1.25 mg once daily administered cyclically (3 wk on, 1 wk off).

Osteoporosis/Menopausal Symptoms

PO (Adults): 0.3–1.25 mg once daily or in a cycle.

Female Hypogonadism

PO (Adults): 0.3–0.625 mg once daily administered cyclically (3 wk on, 1 wk off).

Inoperable Breast Carcinoma—Men and Postmenopausal Women

PO (Adults): 10 mg 3 times daily.

Inoperable Prostate Carcinoma

PO (Adults): 1.25–2.5 mg 3 times daily.

Uterine Bleeding

IM, IV (Adults): 25 mg, may repeat in 6–12 hr if necessary.

Atrophic Vaginitis

PO (Adults): 0.3–1.25 mg once daily.

Vag (Adults): 0.5–2 g cream (0.3125 mg–1.25 g conjugated estrogens) once daily for 3 wk, off for 1 wk, then repeat.

Moderate to Severe Dyspareunia

Vag (Adults): 0.5 g cream (0.3125 mg conjugated estrogens) twice weekly continuously or daily for 3 wk, off for 1 wk, then repeat.

Availability

Powder for injection (requires reconstitution): 25 mg/vial. **Tablets:** 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, 1.25 mg. **Cost:** *Premarin*—0.3 mg $299.14/100, 0.45 mg $299.14/100, 0.625 mg $299.14/100, 0.9 mg $311.87/100, 1.25 mg $298.45/100. **Vaginal cream:** 0.625 mg/g. **Cost:** $208.20/30 g. ***In combination with:*** bazedoxifene (Duavee); medroxyprogesterone (Prempro and Premphase [compliance package]). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess BP before and periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- **Menopause:** Assess frequency and severity of vasomotor symptoms.
- ***Lab Test Considerations:*** May cause ↑ HDL and triglycerides, and ↓ serum LDL and total cholesterol concentrations.
- May cause ↑ serum glucose, sodium, cortisol, prolactin, prothrombin, and factor VII, VIII, IX, and X levels. May ↓ serum folate, pyridoxine, antithrombin III, and urine pregnanediol concentrations.
- Monitor hepatic function before and periodically during therapy.
- May cause false interpretations of thyroid function tests.
- May cause hypercalcemia in patients with metastatic bone lesions.

Implementation

- Estrogens should be used in the lowest doses for the shortest period of time consistent with desired therapeutic outcome.
- **PO:** Administer with or immediately after food to reduce nausea.
- **Vag:** Manufacturer provides applicator with cream. Dose is marked on the applicator. Wash applicator with mild soap and warm water after each use.
- **IM:** To reconstitute, withdraw at least 5 mL of air from dry container and then slowly introduce the

© F.A. Davis Publishing

sterile diluent (bacteriostatic water for injection) against the container side. Gently agitate container to dissolve; do not shake vigorously. Solution is stable for 60 days if refrigerated. Do not use if precipitate is present or if solution is darkened.
- IV is preferred parenteral route because of rapid response.

IV Administration
- **IV Push:** ***Dilution:*** Reconstitute as for IM. Inject into distal port tubing of free-flowing IV of 0.9% NaCl, D5W, or lactated Ringer's solution. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer slowly (no faster than 5 mg/min) to prevent flushing.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.
- **Y-Site Incompatibility:** pantoprazole.

Patient/Family Teaching
- Instruct patient to take oral medication as directed. Advise patient to avoid drinking grapefruit juice during therapy. Take missed doses as soon as remembered, but not just before next dose. Do not double doses.
- Explain dose schedule and maintenance routine. Discontinuing medication suddenly may cause withdrawal bleeding. Bleeding is anticipated during the wk when conjugated estrogens are withheld.
- If nausea becomes a problem, advise patient that eating solid food often provides relief. Inform patient that estrogens should not be used to decrease risk of cardiovascular disease. Estrogens may increase risk of cardiovascular disease and breast cancer.
- Advise patient to report signs and symptoms of fluid retention (swelling of ankles and feet, weight gain), thromboembolic disorders (pain, swelling, tenderness in extremities; headache; chest pain; blurred vision), depression, hepatic dysfunction (yellowed skin or eyes, pruritus, dark urine, light-colored stools), or abnormal vaginal bleeding to health care professional.
- Caution patient that cigarette smoking during estrogen therapy may increase risk of serious side effects, especially for women over age 35.
- Inform patient that *Premarin* tablet may appear in stool; this is not harmful.
- Caution patient to use sunscreen and protective clothing to prevent increased pigmentation.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient treated for osteoporosis that exercise has been found to arrest and reverse bone loss. The patient should discuss any exercise limitations with health care professional before beginning program.
- Contraindicated in pregnancy. Instruct patient to stop taking medication and notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of routine follow-up physical exams, including BP; breast, abdomen, and pelvic examinations; Papanicolaou (Pap) smears every 6–12 mo; and mammogram every 12 mo or as directed. Health care professional will evaluate possibility of discontinuing medication every 3–6 mo. If on continuous (not cyclical) therapy or without concurrent progestins, endometrial biopsy may be recommended if uterus is intact.
- **Vag:** Instruct patient in the correct use of applicator. Patient should remain recumbent for at least 30 min after administration. May use sanitary napkin to protect clothing, but do not use tampon. If a dose is missed, do not use the missed dose, but return to regular dosing schedule.

Evaluation/Desired Outcomes
- Resolution of menopausal vasomotor symptoms.
- Decreased vaginal and vulvar itching, inflammation, or dryness associated with menopause.
- Normalization of estrogen levels in patients with ovariectomy or hypogonadism.
- Control of the spread of advanced metastatic breast or prostate cancer.
- Prevention of osteoporosis.
- Relief of moderate to severe dyspareunia due to menopause.

BEERS

eszopiclone (es-zop-i-klone)
Lunesta

Classification
Therapeutic: sedative/hypnotics
Pharmacologic: cyclopyrrolones

Schedule IV

Indications
Insomnia.

Action
Interacts with GABA-receptor complexes; not a benzodiazepine. **Therapeutic Effects:** Improved sleep with decreased latency and increased maintenance of sleep.

Pharmacokinetics
Absorption: Rapidly absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver (CYP3A4 and CYP2E1 enzyme systems); metabolites are renally excreted, <10% excreted unchanged in urine.
Half-life: 6 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1 hr	6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of experiencing complex sleep behaviors with zolpidem.

Use Cautiously in: Debilitated patients may have ↓ metabolism or increased sensitivity; use lower initial dose; Conditions that may alter metabolic or hemodynamic function; Severe hepatic impairment (↓ dose recommended); OB, Pedi: Safety not established; Lactation: Occasional use while breast feeding an older infant should pose little risk; Geri: ↑ risk of cognitive impairment and falls. Initial dose ↓ recommended.

Adverse Reactions/Side Effects

CV: chest pain, peripheral edema. **Derm:** rash. **GI:** dry mouth, unpleasant taste. **Neuro:** COMPLEX SLEEP BEHAVIORS (including sleep driving, sleep walking, or engaging in other activities while sleeping), abnormal thinking, behavior changes, depression, hallucinations, headache, next day impairment.

Interactions

Drug-Drug: ↑ risk of CNS depression and next day impairment with other **CNS depressants** including **antihistamines**, **antidepressants**, **opioids**, **sedative/hypnotics**, and **antipsychotics**. ↑ levels and risk of CNS depression with **drugs that inhibit the CYP3A4 enzyme system**, including **ketoconazole**, **itraconazole**, **clarithromycin**, **nefazodone**, **ritonavir**, and **nelfinavir**. Levels and effectiveness may be ↓ by **drugs that induce the CYP3A4 enzyme system**, including **rifampin**.

Route/Dosage

PO (Adults): 1 mg immediately before bedtime; may be ↑ to 2–3 mg if needed; *Geriatric patients*— 1 mg immediately before bedtime; may be ↑ to 2 mg if needed; *Concurrent use of CYP3A4 inhibitors*— 1 mg immediately before bedtime; may be ↑ to 2 mg if needed.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*— 1 mg immediately before bedtime; may be ↑ to 2 mg if needed.

Availability (generic available)

Tablets: 1 mg, 2 mg, 3 mg. **Cost:** 1 mg $338.76/30, 2 mg $300.85/30, 3 mg $300.85/30.

NURSING IMPLICATIONS

Assessment

- Assess sleep patterns prior to and during administration. Continued insomnia after 7–10 days of therapy may indicate primary psychiatric or mental illness.
- Assess mental status and potential for abuse prior to administration. Prolonged use of >7–10 days may lead to physical and psychological dependence. Limit amount of drug available to the patient.

Implementation

- Do not confuse Lunesta (eszopiclone) with Neulasta (pegfilgrastim).
- **PO:** Onset is rapid. Administer immediately before going to bed or after patient has gone to bed and has experienced difficulty falling asleep, only on nights when patient is able to get 8 or more hr of sleep before being active again.
- Swallow tablet whole; do not break, crush, or chew.
- Eszopiclone is more effective if not taken with or before a high-fat, heavy meal.

Patient/Family Teaching

- Instruct patient to take eszopiclone immediately before going to bed, as directed. May result in short-term memory impairment, hallucinations, impaired coordination, and dizziness. Do not take eszopiclone if consumed alcohol that evening. Do not increase dose or discontinue without notifying health care professional. Dose may need to be decreased gradually to minimize withdrawal symptoms. Rebound insomnia and/or anxiety may occur upon discontinuation and usually resolves within 1–2 nights. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- May cause daytime and next-day drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient that eszopiclone may cause complex sleep behaviors (sleep walking, sleep driving, making and eating food, talking on the phone, having sex) while unaware. Patient may not remember anything done during the night; increased risk with alcohol or other CNS depressants. Discontinue eszopiclone immediately and notify health care professional if complex sleep behaviors occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants.
- Advise patient to notify health care professional if signs and symptoms of allergic reaction (swelling of tongue or throat, trouble breathing, nausea and vomiting) occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decreased sleep latency and improved sleep maintenance.

© F.A. Davis Publishing

etanercept (e-tan-er-sept)

Brenzys, Enbrel, Erelzi, Eticovo

Classification

Therapeutic: antirheumatics (DMARDs)
Pharmacologic: anti-TNF agents

Indications

Moderately to severely active rheumatoid arthritis (as monotherapy or in combination with methotrexate). Moderate to severely active polyarticular juvenile idiopathic arthritis. Active ankylosing spondylitis. Psoriatic arthritis (as monotherapy or in combination with methotrexate). Moderate to severe chronic plaque psoriasis in patients who are candidates for systemic therapy or phototherapy.

Action

Binds to tumor necrosis factor (TNF), making it inactive. TNF is a mediator of inflammatory response. **Therapeutic Effects:** Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis, psoriatic arthritis, juvenile idiopathic arthritis, and ankylosing spondylitis. Reduced severity of plaques.

Pharmacokinetics

Absorption: 60% absorbed after subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 115 hr (range 98–300 hr).

TIME/ACTION PROFILE (symptom reduction)

ROUTE	ONSET	PEAK	DURATION
Subcut	2–4 wk	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active infection (including localized); Untreated infections; Granulomatosis with polyangiitis (receiving immunosuppressive agents); Concurrent cyclophosphamide or anakinra; Lactation: Lactation.

Use Cautiously in: History of chronic or recurrent infection or underlying illness/treatment predisposing to infection (including advanced or poorly controlled diabetes); History of exposure to tuberculosis; History of opportunistic infection; History of hepatitis B; Patients residing, or who have resided, where tuberculosis, histoplasmosis, coccidioidomycoses, or blastomycosis is endemic; Pre-existing or recent demyelinating disorders (multiple sclerosis, myelitis, optic neuritis); Latex allergy (needle cover of diluent syringe contains latex); OB: Use only if needed; Pedi: Children with significant exposure to varicella virus (temporarily discontinue etanercept; consider varicella zoster immune globulin); ↑ risk of lymphoma (including hepatosplenic T-cell lymphoma [HSTCL]), leukemia, and other malignancies; Pedi: Children <2 yr (juvenile idiopathic arthritis) or <4 yr (plaque psoriasis) (safety and effectiveness not established); Geri: May have ↑ risk of infection.

Adverse Reactions/Side Effects

Derm: psoriasis, rash. **EENT:** rhinitis, pharyngitis. **GI:** abdominal pain, dyspepsia. **Hemat:** pancytopenia. **Local:** injection site reactions. **Neuro:** headache, dizziness, weakness. **Resp:** upper respiratory tract infection, cough, respiratory disorder. **Misc:** INFECTION (including reactivation tuberculosis and other opportunistic infections due to bacterial, invasive fungal, viral, mycobacterial, and parasitic pathogens), MALIGNANCY (including lymphoma, HSTCL, leukemia, and skin cancer), SARCOIDOSIS.

Interactions

Drug-Drug: Concurrent use with **anakinra** ↑ risk of serious infections (not recommended). Concurrent use of **cyclophosphamide** may ↑ risk of malignancies. Concurrent use with **azathioprine** and/or **methotrexate** may ↑ risk of HSTCL. May ↓ antibody response to **live-virus vaccine** and ↑ risk of adverse reactions (do not administer concurrently).

Route/Dosage

Rheumatoid Arthritis, Psoriatic Arthritis, and Ankylosing Spondylitis

Subcut (Adults): 50 mg once weekly.

Plaque Psoriasis

Subcut (Adults): 50 mg twice weekly for 3 mo, then 50 mg once weekly, may also be given as 25–50 mg once weekly as an initial dose.
Subcut (Children ≥4 yr and ≥63 kg): 50 mg once weekly.
Subcut (Children ≥4 yr and <63 kg): *Enbrel or Eticovo*—0.8 mg/kg once weekly.

Juvenile Idiopathic Arthritis

Subcut (Children ≥2 yr and ≥63 kg): 50 mg once weekly.
Subcut (Children ≥2 yr and <63 kg): 0.8 mg/kg once weekly.

Availability

Powder for injection: 25 mg/vial. **Solution for injection:** 25 mg/0.5 mL (prefilled syringe and single-dose vial), 50 mg/mL (prefilled syringe and autoinjector).

NURSING IMPLICATIONS

Assessment

- Assess range of motion, degree of swelling, and pain in affected joints before and periodically during therapy.
- Assess for injection site reaction (erythema, pain, itching, swelling). Reactions are usually mild to moderate and last 3–5 days after injection.
- Monitor patients who develop a new infection while taking etanercept closely. Discontinue therapy in pa-

© F.A. Davis Publishing

tients who develop a serious infection or sepsis. Do not initiate therapy in patients with active infections.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping etanercept until the infection has been diagnosed and adequately treated.
- ***Lab Test Considerations:*** Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue etanercept if symptoms of blood dyscrasias (persistent fever) occur.

Implementation

- Do not confuse Enbrel (etanercept) with Levbid (hyoscyamine).
- Administer a tuberculin skin test prior to administration of etanercept. Patients with active latent TB should be treated for TB prior to therapy.
- Needle cover of the prefilled syringe contains latex and should not be handled by people with latex allergies.
- **Subcut:** Prepare injection with single dose prefilled syringe, single-dose vial or multidose vial for reconstitution.
- Allow solution in prefilled syringe to reach room temperature (15–30 min); do not remove needle cap during this time.
- For single-dose vial, allow solution to reach room temperature for at least 30 min before injecting. Solution may contain small white particles of protein; do not use if discolored, cloudy, or contains other particulate matter. Discard unused solution.
- For multidose vial, reconstitute with 1 mL of the bacteriostatic sterile water supplied by manufacturer for a concentration of 25 mg/mL. If the vial is used for multiple doses, use a 25-gauge needle for reconstituting and withdrawing solution and apply "Mixing Date" sticker with date of reconstitution entered. Inject diluent slowly into vial to avoid foaming. Some foaming will occur. Swirl gently for dissolution; do not shake or vigorously agitate to prevent excess foaming. Solution should be clear and colorless; do not administer solution that is discolored or contains particulate matter. Dissolution usually takes <10 min. Withdraw solution into syringe. Some foam may remain in vial. Amount in syringe should approximate 1 mL. Do not filter reconstituted solution during preparation or administration. Attach a 27-gauge needle to inject. Administer as soon as possible after reconstitution; stable up to 6 hr if refrigerated. Solution and prefilled syringes are stable if refrigerated and used within 14 days.
- May be injected into abdomen, thigh, or upper arm. Rotate sites. Do not administer within 1 in. of an old site or into area that is tender, red, hard, or bruised.
- **Syringe Incompatibility:** Do not mix with other solutions or dilute with other diluents.

E

Patient/Family Teaching

- Instruct patient on self-administration technique, storage, and disposal of equipment. First injection should be administered under the supervision of health care professional. Provide patient with a puncture-proof container for used equipment. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient not to receive live vaccines during therapy. Parents should be advised that children should complete immunizations to date before initiation of etanercept. Patients with significant exposure to varicella virus (chickenpox) should temporarily discontinue therapy and varicella immune globulin should be considered.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient that methotrexate, analgesics, NSAIDs, corticosteroids, and salicylates may be continued during therapy.
- Instruct patient to notify health care professional if upper respiratory or other infections occur. Therapy may need to be discontinued if serious infection occurs.
- Advise patient of risk of malignancies such as hepatosplenic T-cell lymphoma. Instruct patient to report signs and symptoms (splenomegaly, hepatomegaly, abdominal pain, persistent fever, night sweats, weight loss) to health care professional promptly.
- Rep: Instruct females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Advise patients who become pregnant during therapy to notify health care professional. May limit administration of live vaccines to infant.

Evaluation/Desired Outcomes

- Reduction in symptoms of rheumatoid arthritis. Symptoms may return within 1 mo of discontinuation of therapy.
- Reduced severity of plaques in chronic plaque psoriasis.

© F.A. Davis Publishing

ethambutol (e-tham-byoo-tole)

Etibi, Myambutol

Classification

Therapeutic: antituberculars

Indications

Active tuberculosis or other mycobacterial diseases (with at least one other drug).

Action

Inhibits the growth of mycobacteria. **Therapeutic Effects:** Tuberculostatic effect against susceptible organisms.

Pharmacokinetics

Absorption: Rapidly and well absorbed (80%) from the GI tract.

Distribution: Widely distributed; crosses blood-brain barrier in small amounts; crosses placenta and enters breast milk.

Protein Binding: 20–30%.

Metabolism and Excretion: 50% metabolized by the liver, 50% eliminated unchanged by the kidneys.

Half-life: 3.3 hr (increased in renal or hepatic impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Optic neuritis.

Use Cautiously in: Renal and severe hepatic impairment (dosage reduction required); OB: Although safety not established, ethambutol has been used with isoniazid in pregnant women without fetal adverse effects; Lactation: Usually compatible with breast feeding (AAP).

Adverse Reactions/Side Effects

EENT: optic neuritis. **GI:** HEPATITIS, abdominal pain, anorexia, nausea, vomiting. **Metab:** hyperuricemia. **MS:** joint pain. **Neuro:** peripheral neuritis, confusion, dizziness, hallucinations, headache, malaise. **Resp:** pulmonary infiltrates. **Misc:** anaphylactoid reactions, fever.

Interactions

Drug-Drug: Neurotoxicity may be ↑ with other **neurotoxic agents**. **Aluminum hydroxide** may decrease absorption (space doses 4 hr apart).

Route/Dosage

PO (Adults and Children >13 yr): 15–25 mg/kg/day (maximum 2.5 g/day) *or* 50 mg/kg (up to 2.5 g) twice weekly *or* 25–30 mg/kg (up to 2.5 g) 3 times weekly.

PO (Children 1 mo—13 yr): *HIV negative*—15–20 mg/kg/day once daily (maximum: 1 g/day) or 50 mg/kg/dose twice weekly (maximum: 2.5 g/dose); *HIV-exposed/-infected*—15–25 mg/kg/day once daily (maximum: 2.5 g/day); *MAC, secondary prophylaxis, or treatment in HIV-exposed/-infected*—15–25 mg/kg/day once daily (maximum: 2.5 g/day) with clarithromycin (or azithromycin) with or without rifabutin; *Nontuberculous mycobacterial infection*—15–25 mg/kg/day once daily (maximum: 2.5 g/day).

Availability (generic available)

Tablets: 100 mg, 400 mg.

NURSING IMPLICATIONS

Assessment

- Mycobacterial studies and susceptibility tests should be performed before and periodically during therapy to detect possible resistance.
- Assess lung sounds and character and amount of sputum periodically during therapy.
- Assessments of visual function should be made frequently during therapy. Advise patient to report blurring of vision, constriction of visual fields, or changes in color perception immediately. Visual impairment, if not identified early, may lead to permanent sight impairment.
- ***Lab Test Considerations:*** Monitor renal and hepatic functions, CBC, and uric acid levels routinely. Frequently causes elevated uric acid concentrations, which may precipitate an attack of gout.

Implementation

- Ethambutol is given as a single daily dose and should be taken at the same time each day. Some regimens require dosing 2–3 times/wk. Usually administered concurrently with other antitubercular medications to prevent development of bacterial resistance.
- **PO:** Administer with food or milk to minimize GI irritation.
- **PO:** Tablets may be crushed and mixed with apple juice or apple sauce.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; do not double up on missed doses. A full course of therapy may take mo to yr. Do not discontinue without consulting health care professional, even though symptoms may disappear.
- Advise patient to notify health care professional if pregnancy is suspected.
- Instruct patient to notify health care professional if no improvement is seen in 2–3 wk. Health care professional should also be notified if unexpected weight gain or decreased urine output occurs.
- Emphasize the importance of routine exams to evaluate progress and ophthalmic examinations if signs of optic neuritis occur.

Evaluation/Desired Outcomes

- Resolution of clinical symptoms of tuberculosis.
- Decrease in acid-fast bacteria in sputum samples.
- Improvement seen in chest x rays. Therapy for tuberculosis is usually continued for at least 1–2 yr.

everolimus (e-ver-**oh**-li-mus)

Afinitor, Afinitor Disperz, ~~Certican~~, Zortress

Classification

Therapeutic: antineoplastics, immunosuppressants

Pharmacologic: kinase inhibitors

Indications

Afinitor. Advanced renal cell carcinoma that has failed treatment with sunitinib or sorafenib. Subependymal giant cell astrocytoma (SEGA) associated with tuberous sclerosis complex (TSC) in patients who are not candidates for curative surgical resection. TSC-associated partial-onset seizures (adjunctive treatment). Progressive neuroendocrine tumors of pancreatic origin (PNET) in patients with unresectable, locally advanced, or metastatic disease. Progressive, well-differentiated, nonfunctional neuroendocrine tumors (NET) of GI or lung origin in patients with unresectable, locally advanced, or metastatic disease. Renal angiomyolipoma with TSC in patients not requiring immediate surgery. Treatment of postmenopausal women with advanced hormone receptor-positive, HER2-negative breast cancer in combination with exemestane, after failure of treatment with letrozole or anastrozole. **Zortress**. Prevention of organ rejection in patients who have received a kidney transplant and are at low-to-moderate immunologic risk. Prevention of organ rejection in patients who have received a liver transplant.

Action

Acts as a kinase inhibitor, decreasing cell proliferation. Inhibits activation and proliferation of T and B lymphocytes. **Therapeutic Effects:** Decreased spread of renal cell carcinoma and breast cancer. Improvement in progression-free survival in patients with PNET. Decreased volume of SEGA and angiomyolipoma lesions. Prevention of kidney and liver transplant rejection. Reduction in seizure frequency.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: 20% confined to plasma.

Metabolism and Excretion: Mostly metabolized by liver and other systems (CYP3A4 and P-gp; metabolites are mostly excreted in feces [80%] and urine [5%]).

Half-life: 30 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to everolimus or other rapamycins; Severe hepatic impairment (Child-Pugh class C); use only if benefit exceeds risk for renal cell carcinoma, PNET, breast cancer, and renal angiomyolipoma with TSC; Concurrent use with strong CYP3A4 inhibitors (i.e., ketoconazole, itraconazole, clarithromycin, atazanavir, nefazodone, saquinavir, ritonavir, indinavir, nelfinavir, voriconazole); Heart transplantation (Zortress) (↑ risk of mortality); Functional carcinoid tumors; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Mild or moderate hepatic impairment (Child-Pugh class A or B); dose ↓ required;

© F.A. Davis Publishing

Concurrent use of moderate CYP3A4 and/or P-gp inhibitors; dose ↓ required; Exposure to sunlight/UV light (may ↑ risk of malignant skin changes); Patients undergoing radiation treatment before, during, or after therapy (↑ risk of radiation sensitization and radiation recall); Rep: Women of reproductive potential and men with female partners of reproductive potential; Geri: Older adults may be more sensitive to drug effects; consider age-related ↓ in hepatic function, concurrent disease states and drug therapy; Pedi: Safety not established in children for indications other than SEGA and TSC-associated partial-onset seizures.

Adverse Reactions/Side Effects

CV: peripheral edema. **Derm:** delayed wound healing, dry skin, pruritus, rash. **GI:** HEPATIC ARTERY THROMBOSIS, anorexia, constipation, diarrhea, mucositis, mouth ulcers, nausea, stomatitis, vomiting. **GU:** acute renal failure, amenorrhea, ↓ fertility, kidney arterial/venous thrombosis (Zortress), menstrual irregularities, proteinuria. **Hemat:** HEMOLYTIC UREMIC SYNDROME, THROMBOTIC MICROANGIOPATHY, THROMBOTIC THROMBOCYTOPENIC PURPURA, anemia, leukopenia, thrombocytopenia. **Metab:** hyperglycemia, hyperlipidemia, hypertriglyceridemia. **MS:** extremity pain. **Neuro:** fatigue, weakness, dysgeusia, headache. **Resp:** INTERSTITIAL LUNG DISEASE, PULMONARY HYPERTENSION, cough, dyspnea, pulmonary embolism. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), LYMPHOMA/SKIN CANCER (Zortress), fever, infection (including activation of latent viral infections such as BK virus-associated nephropathy).

Interactions

Drug-Drug: Strong **CYP3A4 inhibitors**, including **atazanavir**, **clarithromycin**, **indinavir**, **itraconazole**, **ketoconazole**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, or **voriconazole**, ↑ levels and the risk of toxicity; avoid concurrent use. Moderate inhibitors of CYP3A4, including **aprepitant**, **diltiazem**, **erythromycin**, **fluconazole**, **fosamprenavir**, and **verapamil** ↑ levels and the risk of toxicity; ↓ dose of everolimus (Afinitor). Avoid concurrent use with strong **CYP3A4 inducers** including **carbamazepine**, **dexamethasone**, **phenobarbital**, **phenytoin**, **rifabutin**, and **rifampin**; ↑ dose of everolimus may be required. **Cyclosporine**, **aprepitant**, **diltiazem**, **verapamil**, **fluconazole**, and **fosamprenavir** may ↑ levels. ↑ risk of nephrotoxicity with **aminoglycosides**, **amphotericin B**, **cisplatin**, or **cyclosporine**. **ACE inhibitors** may ↑ risk of angioedema. May ↓ antibody formation and ↑ risk of adverse reactions from **live-virus vaccines**; avoid use of live-virus vaccines during treatment.
Drug-Natural Products: **St. John's wort** may ↓ levels and efficacy; avoid concurrent use.
Drug-Food: ↑ blood levels and risk of toxicity with **grapefruit juice**; avoid concurrent use.

Route/Dosage

Advanced Renal Cell Carcinoma, Advanced PNET, Advanced NET, Advanced Hormone Receptor-Positive, HER2-Negative Breast Cancer, and Renal Angiomyolipoma with TSC (Afinitor)

PO (Adults): 10 mg once daily until disease progression or unacceptable toxicity; *Concurrent use of P-glycoprotein inhibitor and moderate CYP3A4 inhibitor*— 2.5 mg once daily until disease progression or unacceptable toxicity; *Concurrent use of P-glycoprotein inducer and strong CYP3A4 inducer*— ↑ dose in 5 mg increments up to 20 mg once daily; continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Mild hepatic impairment (Child–Pugh Class A)*— 7.5 mg once daily until disease progression or unacceptable toxicity; may ↓ to 5 mg once daily if not well tolerated; *Moderate hepatic impairment (Child–Pugh Class B)*— 5 mg once daily until disease progression or unacceptable toxicity; may ↓ to 2.5 mg once daily if not well tolerated; *Severe hepatic impairment (Child–Pugh Class C)*— 2.5 mg once daily until disease progression or unacceptable toxicity.

SEGA with TSC (Afinitor)

PO (Adults and Children ≥1 yr): 4.5 mg/m² once daily. Titrate, as needed, at 2-wk intervals to achieve recommended whole blood trough concentration. Continue until disease progression or unacceptable toxicity; *Concurrent use of P-glycoprotein inhibitor and moderate CYP3A4 inhibitor*— 2.25 mg/m² once daily. Titrate, as needed, at 2-wk intervals to achieve recommended whole blood trough concentration. Continue until disease progression or unacceptable toxicity; *Concurrent use of P-glycoprotein inducer and strong CYP3A4 inducer*— 9 mg/m² once daily. Titrate, as needed, at 2-wk intervals to achieve recommended whole blood trough concentration. Continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults and Children ≥1 yr): *Severe hepatic impairment (Child–Pugh Class C)*— 2.5 mg/m² once daily. Titrate, as needed, at 2-wk intervals to achieve recommended whole blood trough concentration. Continue until disease progression or unacceptable toxicity.

TSC—Associated Partial-Onset Seizures (Afinitor)

PO (Adults and Children ≥2 yr): 5 mg/m² once daily. Titrate, as needed, at 2-wk intervals to achieve recommended whole blood trough concentration. Continue until disease progression or unacceptable toxicity; *Concurrent use of P-glycoprotein inhibitor and moderate CYP3A4 inhibitor*— 2.5 mg/m² once daily. Titrate, as needed, at 2-wk intervals to achieve recommended whole blood trough concentration. Continue until dis-

© F.A. Davis Publishing

ease progression or unacceptable toxicity; *Concurrent use of P-glycoprotein inducer and strong CYP3A4 inducer*— 10 mg/m² once daily. Titrate, as needed, at 2-wk intervals to achieve recommended whole blood trough concentration. Continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults and Children ≥2 yr): *Severe hepatic impairment (Child–Pugh Class C)* — 2.5 mg/m² once daily. Titrate, as needed, at 2-wk intervals to achieve recommended whole blood trough concentration. Continue until disease progression or unacceptable toxicity.

Kidney Transplantation (Zortress)

PO (Adults): 0.75 mg twice daily (with reduced-dose cyclosporine); titrate to achieve recommended whole blood trough concentration.

Hepatic Impairment

PO (Adults): *Mild hepatic impairment (Child–Pugh Class A)* — ↓ daily dose by 33%; *Moderate or severe hepatic impairment (Child–Pugh Class B or C)* — ↓ daily dose by 50%.

Liver Transplantation (Zortress)

PO (Adults): 1 mg twice daily (with reduced-dose tacrolimus) (start ≥30 days post-transplant); titrate to achieve recommended whole blood trough concentration.

Hepatic Impairment

PO (Adults): *Mild hepatic impairment (Child–Pugh Class A)* — ↓ daily dose by 33%; *Moderate or severe hepatic impairment (Child–Pugh Class B or C)* — ↓ daily dose by 50%.

Availability (generic available)

Tablets (Afinitor): 2.5 mg, 5 mg, 7.5 mg, 10 mg. **Tablets for oral suspension (Afinitor Disperz):** 2 mg, 3 mg, 5 mg. **Tablets (Zortress):** 0.25 mg, 0.5 mg, 0.75 mg, 1 mg.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of noninfectious pneumonitis (hypoxia, pleural effusion, cough, dyspnea) during therapy. If symptoms are mild, therapy may continue. *If Grade 2 pneumonitis occurs:* hold therapy until Grade 0–1; reinitiate everolimus at a 50% dose. Permanently discontinue if does not resolve or improve to Grade 1 within 4 wk. *If Grade 3 pneumonitis occurs:* hold therapy until Grade 0–1; resume at 50% of previous dose. Change to every other day if dose is lower than lowest available strength. Permanently discontinue if Grade 3 pneumonitis recurs. *If Grade 4 pneumonitis occurs:* permanently discontinue.
- Assess for mouth ulcers, stomatitis, or oral mucositis; usually occurs within first 8 wk of therapy. Begin dexamethasone alcohol-free oral solution as a swish and spit mouthwash when starting therapy to reduce incidence and severity of stomatitis. Topical treatments may be used; avoid peroxide-containing mouthwashes and antifungals unless fungal infection has been diagnosed. *If stomatitis Grade 2 occurs:* hold therapy until Grade 0–1; resume at previous dose. If Grade 2 recurs, withhold until Grade 0–1; resume at 50% dose. Change to every other day if dose is lower than lowest available strength. *If Grade 3 stomatitis occurs:* hold therapy until Grade 0–1; hold until Grade 0–1; resume at 50% of previous dose. Change to every other day if dose is lower than lowest available strength. *If Grade 4 stomatitis occurs:* discontinue permanently.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Withhold therapy until infection has been diagnosed and adequately treated.
- Monitor for signs and symptoms of hypersensitivity reactions (anaphylaxis, dyspnea, flushing, chest pain, angioedema) during therapy. Permanently discontinue therapy if severe reactions occur.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor renal function prior to and periodically during therapy. May cause ↑ BUN, serum creatinine, and proteinuria.
- Monitor fasting serum glucose and lipid profile prior to and periodically during therapy. May cause ↑ cholesterol, triglycerides, glucose. Attempt to achieve optimal glucose and lipid control prior to therapy. *If Grade 3 metabolic events (hyperglycemia, dyslipidemia) occur:* hold until improvement to Grade 0, 1, or 2. Resume at 50% of previous dose. Change to every other day if dose is lower than lowest available strength.
- Monitor CBC prior to and every 6 mo for 1st yr of therapy and annually thereafter; may cause ↓ hemoglobin, lymphocytes, neutrophils, and platelets. *If Grade 2 thrombocytopenia occurs:* hold dose until Grade 0–1; resume at same dose. *If Grade 3 or 4 thrombocytopenia occurs:* hold until improvement to Grade 0, 1, or 2. Resume at 50% of previous dose. Change to every other day if dose is lower than lowest available strength. *If Grade 3 neutropenia occurs:* hold dose until Grade 0–1; resume at same dose. *If Grade 4 neutropenia occurs:* hold until improvement to Grade 0, 1, or 2. Resume at 50% of previous dose. Change to every other day if dose is lower than lowest available strength. *If*

© F.A. Davis Publishing

Grade 3 febrile neutropenia occurs: hold until improvement to Grade 0, 1, or 2 and no fever. Resume at 50% of previous dose. Change to every other day if dose is lower than lowest available strength. *If Grade 4 febrile neutropenia occurs:* discontinue permanently.

- May cause ↑ AST, ALT, phosphate, and bilirubin.
- **Afinitor:** Monitor *Afinitor* trough levels 2 wk after initiation of therapy, a change in dose, a change in coadministration of CYP3A4 and/or P-gp inducers or inhibitors, change in hepatic function, or change in dose form between everolimus tablets and *Disperz*. Once at a stable dose, monitor trough concentrations every 3–6 mo in patients with changing body surface area or every 6–12 mo in patients with stable body surface area for duration of treatment. Therapeutic blood concentrations are 5–15 ng/mL (*Afinitor*). If trough concentration is <5 ng/mL increase daily dose by 2.5 mg in patients taking tablets and 2 mg for *Disperz*. If trough concentration is >15 ng/mL decrease daily dose by 2.5 mg in patients taking tablets and 2 mg for *Disperz*. If dose reduction is required with lowest dose, administer every other day. Do not combine dose forms to achieve dose. **Zortress:** Therapeutic blood concentrations are 3–8 ng/mL via the LCMSMS assay (*Zortress*). Base dose adjustments of *Zortress* on trough concentrations obtained 4 or 5 days after a previous dosing change. Adjust dose if trough concentration is <3 ng/mL by doubling dose using available tablet strengths (0.25 mg, 0.5 mg or 0.75 mg). If trough concentration is >8 ng/mL on 2 consecutive measures; decrease dose of *Zortress* by 0.25 mg twice daily.

Implementation

- May impair wound healing. Hold everolimus for at least 1 wk before and at least 2 wk after elective surgery to ensure adequate wound healing.
- **PO:** Administer at the same time each day consistently with or without food, followed by a whole glass of water. ***DNC:*** Swallow tablets whole; do not break, crush, or chew.
- Do not combine the 2 dose forms (*Afinitor Tablets* and *Afinitor Disperz*) to achieve the desired total dose. Use one dose form or the other.
- Administer *Disperz*, dispersible tablet, as a suspension only. Wear gloves to avoid possible contact with everolimus when preparing suspensions for another person. Place dose in 10 mL syringe; do not exceed 10 mg/syringe. If higher dose required, use additional syringe. Do not break or crush tablets. Draw 5 mL water and 4 mL of air into syringe. Place filled syringe into container (tip up) for 3 min until tablets are in suspension. Invert syringe five times immediately prior to administration. Administer immediately after preparation; discard suspension if not administered within 60 min after preparation. After administration, draw 5 mL of water and 4 mL of air into same syringe, and swirl contents to suspend remaining particles. Administer entire contents of syringe. Can also be dispersed using same technique and 25 mL water in small glass.

Patient/Family Teaching

- Instruct patient to take everolimus at the same time each day as directed. Take missed doses as soon as remembered up to 6 hr after time of normal dose. If more than 6 hr after normal dose, omit dose for that day and take next dose next day; do not take two doses to make up missed dose. Do not eat grapefruit or drink grapefruit juice during therapy. Advise patient to read *Patient Information* prior to beginning therapy and with each Rx refill in case of new information.
- Advise patient to report worsening respiratory symptoms or signs of infection (new or worsening cough, shortness of breath, chest pain, difficulty breathing or wheezing, fever, chills, skin rash, joint pain and inflammation, tiredness, loss of appetite, nausea, pale stool or dark urine, yellowing of the skin, pain in upper right side) or severe allergic reaction (rash, itching, hives, flushing, trouble breathing or swallowing, chest pain, dizziness, trouble breathing, swelling of tongue, mouth, or throat) to health care professional promptly.
- Inform patient that mouth sores may occur. Consult health care professional for treatment if pain, discomfort, or open sores in mouth occur. May require special mouthwash or gel.
- Instruct patient to avoid use of live vaccines and close contact with those who have received live vaccines.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Notify health care professional of everolimus therapy before treatment or surgery. May require temporarily stopping everolimus.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for up to 8 wk after last dose, male patients with female partners of reproductive potential to use effective contraception during and for up to 4 wk after last dose, and to notify health care professional if pregnancy is planned or suspected. Advise female patients to avoid breast feeding during and for 2 wk after last dose. May impair fertility in female and male patients.
- Emphasize the importance of routine blood tests to determine effectiveness and side effects.

Evaluation/Desired Outcomes

- Decreased spread of tumor. Continue treatment as long as clinical benefit is observed or until unacceptable toxicity occurs.
- Prevention of kidney or liver transplant rejection.
- Reduced seizure frequency.

© F.A. Davis Publishing

evolocumab (e-vo-lo-kyoo-mab)

Repatha

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: proprotein convertase subtilisin kexin type 9 (PCSK9) inhibitors, monoclonal antibodies

Indications

Primary hyperlipidemia (including heterozygous familial hypercholesterolemia [HeFH]) in adults (as an adjunct to diet as monotherapy or in combination with other low-density lipoprotein cholesterol [LDL-C]-lowering therapies). Homozygous familial hypercholesterolemia (HoFH) (in combination with other LDL-C lowering therapies). HeFH in pediatric patients ≥10 yrs (as an adjunct to diet in combination with other LDL-C-lowering therapies). To reduce the risk of myocardial infarction, stroke, and coronary revascularization in patients with cardiovascular disease.

Action

A human monoclonal immunoglobulin (IgG2) produced in genetically engineered Chinese hamster ovary cells that binds to PCSK9, inhibiting its binding to the low density lipoprotein receptor (LDLR) resulting in ↑ number of LDLRs available to clear LDL from blood.
Therapeutic Effects: Reduction in LDL-C. Reduction in the risk of myocardial infarction, stroke, and coronary revascularization.

Pharmacokinetics

Absorption: Well absorbed (72%) following subcut administration.
Distribution: Crosses the placenta.
Metabolism and Excretion: Eliminated by binding to PCSK9 and by proteolytic degradation.
Half-life: 11–17 days.

TIME/ACTION PROFILE (effect circulating unbound PCSK9)

ROUTE	ONSET	PEAK	DURATION
Subcut	rapid	4 hr	2–4 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Severe renal/hepatic impairment; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <10 yr (safety and effectiveness not established); Geri: Older adults may be more sensitive to drug effects.

Adverse Reactions/Side Effects

Local: injection site reactions. **MS:** back pain. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions

Drug-Drug: None noted.

Route/Dosage

Established Cardiovascular Disease or Primary Hyperlipidemia

Subcut (Adults): 140 mg every 2 wk *or* 420 mg once monthly.

Heterozygous Familial Hypercholesterolemia

Subcut (Children ≥10 yr): 140 mg every 2 wk *or* 420 mg once monthly.

Homozygous Familial Hypercholesterolemia

Subcut (Adults and Children ≥10 yr): 420 mg once monthly; if inadequate response after 12 wk, may ↑ to 420 mg every 2 wk. *Patients on lipid apheresis*—420 mg every 2 wk (administered after apheresis session completed).

Availability

Solution for injection (needle cover contains latex derivative): 420 mg/3.5 mL (Pushtronex system), 140 mg/mL (prefilled syringes and autoinjector).

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially with regard to fat consumption.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, urticaria) during therapy. If symptoms occur, discontinue therapy.
- Assess for latex allergy. Needle cover of the glass prefilled syringe and the autoinjector contain dry natural rubber (a derivative of latex); may cause allergic reactions.
- ***Lab Test Considerations:*** Assess LDL-C levels within 4–8 wk of initiating; response to therapy depends on degree of LDL-receptor function. For patients on a monthly regimen, measure LDL-C just prior to next scheduled dose.

Implementation

- Needle cover of glass single-dose prefilled syringe and single-dose prefilled autoinjector contain latex; avoid with latex allergies.
- **Subcut:** To administer the 140-mg or 420-mg dose using *Single-Use Prefilled SureClick® Autoinjector*, give 1 injection (140-mg dose) or give 3 injections (420-mg dose), using 3 separate pens/syringes in 3 separate sites, consecutively within 30 min. When switching dose regimens, administer first dose of new regimen on next scheduled date of prior regimen. If stored in refrigerator allow solution to warm to room temperature for at least 30 min before injecting. May

© F.A. Davis Publishing

also be stored at room temperature, but only stable for 30 days. Solution is clear to opalescent and colorless to pale yellow; do not administer solutions that are cloudy or contain particulate matter. Do not shake. Stretch or pinch skin. Inject into thigh, abdomen, or upper arm at a 90° angle. Injection may take 15 sec. Window turns from clear to yellow when the injection is done. Rotate sites with each injection. Do not inject into areas that are tender, bruised, red, or indurated. Do not reuse prefilled pen or syringe. Do not administer other injectable drugs at same site.

- To administer the 420-mg dose using *Pushtronex on-body infusor system:* Remove on-body infusor and prefilled cartridge from refrigerator 45 min prior to use to allow to reach room temperature; do not use other sources of warming. Prepare injection site with little hair (may trim) and firm and flat skin surface by cleaning with alcohol and allowing to dry. May use thigh, abdomen (except 2 inches from umbilicus) or outer area of upper arm if not self-administered. Avoid areas that are tender, bruised, red, or hard, or areas with wrinkles, skin folds, scars, stretch marks, moles, and excessive hair. Solution in cartridge should be clear and colorless to slightly yellow; do not administer solutions that are discolored or contain particular matter. Clean bottom of cartridge with alcohol and load into on-body infusor; press firmly on top of unit to secure. Administer injection within 5 min after loading the cartridge; >5 min may dry out medication. Swing door close until it snaps. Peel away both green pull tabs to show adhesive. When blue light flashes, infusor is on. If using abdomen, stretch skin prior to applying; do not stretch skin for thigh placement. Apply infusor to skin making sure blue light is visible and firmly press start button. Flashing green light and click indicates infusion has begun; may beep and patient may feel a pinch. Solution is injected over 5 min. When green light changes to solid, infusion is complete. Remove from skin and check medicine window for green light to be off. Dispose of on-body infusor in a sharps container.

Patient/Family Teaching

- Instruct patient in correct technique for self-injection or on-body infusor, care and disposal of equipment. Administer missed doses within 7 days, then resume original schedule. If not administered within 7 days, wait until next dose on original schedule. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Inform pregnant patients of pregnancy safety study that monitors pregnancy outcomes in women exposed to evolocumab during pregnancy. Enroll patient by contacting Amgen at 1-800-77-AMGEN (1-800-772-6436).

Evaluation/Desired Outcomes

- Decreased LDL-C levels.
- Reduction in the risk of myocardial infarction, stroke, and coronary revascularization.

exemestane (ex-e-mes-tane)

Aromasin

Classification

Therapeutic: antineoplastics

Pharmacologic: aromatase inhibitors

Indications

Adjuvant treatment of breast cancer in postmenopausal women who have estrogen-receptor positive early disease and who have already received 2–3 yr of tamoxifen and are then switched to exemestane to complete a total of 5 yr of adjuvant therapy. Treatment of advanced postmenopausal breast cancer that has progressed despite tamoxifen therapy.

Action

Inhibits aromatase, an enzyme responsible for the conversion of androgen to estrogen. In postmenopausal women, the primary source of estrogen is androgen. Decreases circulating estrogen. **Therapeutic Effects:** Decreased spread of estrogen-sensitive breast cancer.

Pharmacokinetics

Absorption: 42% absorbed following oral administration.

Distribution: Extensively distributed.

Metabolism and Excretion: Mostly metabolized by the liver (CYP3A4 enzyme system); metabolites are excreted in urine (40%) and feces (40%); <1% excreted unchanged in urine.

Half-life: 24 hr.

TIME/ACTION PROFILE (suppression of circulating estrogen)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 days	4–5 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Premenopausal status; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: THROMBOEMBOLISM, hypertension. **GI:** diarrhea, nausea. **GU:** endometrial hyperplasia, uterine polyps. **Endo:** visual disturbances. **Derm:** alopecia, hot flashes, ↑ sweating, dermatitis. **MS:** arthralgia, musculoskeletal pain, carpal tunnel syndrome, muscle cramps, osteoporosis. **Neuro:** fatigue, depression, insomnia, neuropathy, paresthesia.

Interactions

Drug-Drug: Strong **CYP3A4 inducers** including **rifampin** or **phenytoin** may ↓ levels and effectiveness; ↑ daily dose to 50 mg once daily. **Estrogens** can interfere with action.

Route/Dosage

PO (Adults): 25 mg once daily; *Concurrent use with strong CYP3A4 inducers*— 50 mg once daily.

Availability (generic available)

Tablets: 25 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain and other side effects periodically during therapy.
- Monitor patients for bone mineral density loss and treat as appropriate.
- ***Lab Test Considerations:*** Verify negative pregnancy test within 7 days of starting exemestane.
- May cause ↑ GTT, AST, ALT, alkaline phosphatase, bilirubin, and serum creatinine levels.
- Assess 25-hydroxy vitamin D levels prior to starting therapy. Supplement vitamin D deficiency with vitamin D due to high prevalence of vitamin D deficiency in women with early breast cancer.

Implementation

- Take 1 tablet daily after a meal.

Patient/Family Teaching

- Instruct patient to take exemestane as directed at the same time each day. Take missed doses as soon as remembered unless it is almost time for next dose. Do not double doses. Advise patient to read the *Patient Information* leaflet before starting and with each Rx refill in case of changes.
- Advise patient not to take other estrogen-containing agents; may interfere with action of exemestane.
- Inform patient that lower level of estrogen may lead to decreased bone mineral density over time and increased risk of osteoporosis and fracture. Women with osteoporosis or at risk of osteoporosis should have their bone mineral density formally assessed by bone densitometry at end of treatment.
- Advise patient to notify health care professional immediately if chest pain or signs of heart failure or stroke occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and avoid breast feeding during therapy and for at least 1 mo after last dose. May impair female and male fertility.
- Explain need for follow-up blood tests to check liver and kidney function.

Evaluation/Desired Outcomes

- Slowing of disease progression in women with breast cancer.

E

exenatide (ex-en-a-tide)

Bydureon BCise, Byetta

Classification

Therapeutic: antidiabetics

Pharmacologic: incretin mimetic agents

Indications

Type 2 diabetes mellitus (as adjunct to diet and exercise).

Action

Mimics the action of incretin which promotes endogenous insulin secretion and promotes other mechanisms of glucose-lowering. **Therapeutic Effects:** Improved control of blood glucose.

Pharmacokinetics

Absorption: Well absorbed following subcutaneous administration.

Distribution: Unknown.

Metabolism and Excretion: Excreted mostly by glomerular filtration followed by degradation.

Half-life: *Immediate-release*— 2.4 hr.

TIME/ACTION PROFILE (effects on postprandial blood glucose)

ROUTE	ONSET	PEAK	DURATION
Subcut (immediate-release)	within 30 min	2.1 hr	8 hr
Subcut (extended-release)	unknown	9 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; History of drug-induced immune-mediated thrombocytopenia from exenatide; Type 1 diabetes or diabetic ketoacidosis; Severe renal impairment or end-stage renal disease (CCr <30 mL/min) (immediate-release only); CCr <45 mL/min (extended-release); Severe gastrointestinal dis-

© F.A. Davis Publishing

ease; Personal or family history of medullary thyroid carcinoma (extended-release only); Multiple Endocrine Neoplasia syndrome type 2 (extended-release only).
Use Cautiously in: History of pancreatitis; Concurrent use of ACE inhibitors, NSAIDs, or diuretics (↑ risk of renal impairment); OB: Use during pregnancy only if maternal benefit outweighs potential fetal risk; Lactation: Use during breast feeding only if potential maternal benefit outweighs potential risk to infant; Pedi: Safety and effectiveness not established in children <18 yr (Byetta) or <10 yr (Bydureon BCise).

Adverse Reactions/Side Effects

CV: dizziness, headache, jitteriness, weakness. **Derm:** hyperhydrosis. **Endo:** THYROID C-CELL TUMORS (extended-release), hypoglycemia. **GI:** PANCREATITIS, diarrhea, nausea, vomiting, cholecystitis, cholelithiasis, dyspepsia, gastrointestinal reflux. **GU:** acute renal failure, renal impairment. **Hemat:** THROMBOCYTOPENIA. **Metab:** ↓ appetite, weight loss. **Misc:** injection site reactions.

Interactions

Drug-Drug: Concurrent use with **sulfonylureas** or **insulin** may ↑ risk of hypoglycemia (↓ dose of **sulfonylurea** or **insulin** if hypoglycemia occurs). Concurrent use with **nateglinide** or **repaglinide** may ↑ risk of hypoglycemia. Due to slowed gastric emptying, may ↓ absorption of **orally administered medications**, especially those requiring rapid GI absorption or require a specific level for efficacy; take oral **anti-infectives** and **oral contraceptives** at least 1 hr before injecting exenatide). Concurrent use of **ACE inhibitors**, **NSAIDs**, or **diuretics** may ↑ risk of renal impairment.

Route/Dosage

Immediate Release (Byetta)

Subcut (Adults): 5 mcg within 60 min before morning and evening meal; after 1 mo, dose may be ↑ to 10 mcg depending on response.

Renal Impairment

Subcut (Adults): *CCr 30–50 mL/min*—Use caution when ↑ dose from 5 mcg to 10 mcg.

Extended Release (Bydureon BCise)

Subcut (Adults and Children ≥10 yr): 2 mg every 7 days.

Availability

Solution for injection (Byetta) (prefilled pens): 300 mcg/1.2 mL (delivers 5 mcg/dose), 600 mcg/2.4 mL (delivers 10 mcg/dose). **Suspension for injection (Bydureon BCise) (prefilled autoinjectors):** 2 mg/0.85 mL.

NURSING IMPLICATIONS

Assessment

- Observe for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, drowsiness, tremor, tachycardia, anxiety, confusion, irritability, jitteriness), especially when combined with oral sulfonylureas.
- Assess for signs and symptoms of pancreatitis (persistent severe abdominal pain, sometimes radiating to the back, may or may not be accompanied by vomiting) at beginning of therapy and with dose increases. If suspected, promptly discontinue therapy and initiate appropriate management. If pancreatitis is confirmed, do not restart exenatide. Consider other antidiabetic therapies in patients with a history of pancreatitis.
- ***Lab Test Considerations:*** Monitor serum glucose and glycolysated hemoglobin periodically during therapy to evaluate effectiveness of therapy.
- Monitor renal function prior to and periodically during therapy. Renal dysfunction may be reversed with discontinuation of therapy.

Implementation

- Some medications (anti-infectives, oral contraceptives) may need to be taken 1 hr before exenatide.
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **Subcut:** *Immediate release:* Follow directions for *New Pen Setup* in *Information for Patient* prior to use of each new pen. Inject exenatide in thigh, abdomen, or upper arm at any time within the 60-min period **before** the morning and evening meals. Do not administer after a meal. Do not mix with insulin. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. Refrigerate; discard pen 30 days after 1st use, even if some drug remains in pen. Do not freeze. Do not store pen with needle attached; medication may leak from pen or air bubbles may form in the cartridge.
- **Subcut:** *Extended release:* Remove from refrigerator 15 min prior to mixing. Dilute with diluent and needles included in tray. Suspension should be white or off-white and cloudy. Mix by shaking vigorously for 15 sec. Do not inject solutions that are discolored or contain particulate matter. Administer without regard to meals. Inject into upper arm, abdomen, or thigh; change site each wk. Refrigerate; each tray can be kept at room temperature if not >77°F for up to 4 wk. Store *Bydureon BCise* flat. Do not use beyond expiration date.
- Do not mix insulin in the same syringe with exenatide. Injection of *Bydureon Bcise* and insulin may be administered in the same body area, but not right next to each other.
- If switching from immediate-release to extended-release, discontinue other forms of exenatide before starting *Bydureon BCise*. When switching from another extended-release product, may change with next scheduled dose. May cause transient ↑ in blood glucose for 2–4 wk.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take exenatide *immediate release* as directed within 60 min before a meal. Do not take after a meal. If a dose is missed, skip the dose and take the next dose at the prescribed time. Do not take an extra dose or increase the amount of the next dose to make up for missed dose. If a dose of exenatide *extended release* is missed, administer as soon as remembered as long as the next dose is due at least 3 days later; if 1 or 2 days later skip dose and administer next dose as scheduled. The day of weekly administration can be changed as long as the last dose was administered 3 or more days before. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill.
- Instruct patient in proper technique for administration, timing of dose, and concurrent oral medications, storage of medication, and disposal of used needles. Patients should read the *Information for Patient* insert prior to initiation of therapy and with each Rx refill. Advise patient that *New Pen Setup* should be done only with each new pen, not with each dose.
- Inform patient that pen needles are not included with pen and must be purchased separately. Advise patient which needle length and gauge should be used. Caution patient not to share pen and needles.
- Caution patient to never share pen with others, even if needle is changed. May cause transmission of bloodborne pathogens.
- Explain to patient that exenatide helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional. Risk of hypoglycemia is increased if sulfonylureas are taken concurrently with exenatide.
- Advise patient to notify health care professional immediately if symptoms of pancreatitis (unexplained, persistent, severe abdominal pain which may or may not be accompanied by vomiting) occur.
- Inform patient that therapy may result in reduction of appetite, food intake, and/or body weight. Dose modification is not necessary. Nausea is more common at initiation of therapy and usually decreases over time.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products. Exenatide delays stomach emptying. Some medications (such as anti-infectives and oral contraceptives) may need to be taken 1 hr before exenatide injection.
- Instruct patient in proper testing of blood glucose and urine ketones. Monitor closely during periods of stress or illness; notify health care professional if significant changes occur.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Rep: Insulin is the recommended method of controlling blood sugar during pregnancy. Advise patient to notify health care professional if pregnancy is suspected or planned, or if breast feeding.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose and glycosylated hemoglobin.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

ezetimibe (e-zet-i-mibe)

Ezetrol, Zetia

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: cholesterol absorption inhibitors

Indications

Alone or with other agents (HMG-CoA reductase inhibitors) in the management of dyslipidemias including primary hypercholesterolemia, homozygous familial hypercholesterolemia, and homozygous sitosterolemia.

Action

Inhibits absorption of cholesterol in the small intestine.
Therapeutic Effects: Lowering of cholesterol, a known risk factor for atherosclerosis.

Pharmacokinetics

Absorption: Following absorption, rapidly converted to ezetimibe-glucuronide, which is active. Bioavailability is variable.
Distribution: Unknown.
Metabolism and Excretion: Undergoes enterohepatic recycling, mostly eliminated in feces, minimal renal excretion.
Half-life: 22 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute liver disease or unexplained laboratory evidence of liver disease (when used with HMG-CoA reductase inhibitor); Moderate or severe hepatic impairment; Concurrent use of fibrates.

Use Cautiously in: OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <10 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

Derm: rash. **GI:** cholecystitis, cholelithiasis, ↑ liver enzymes (with HMG-CoA reductase inhibitors), nausea, pancreatitis. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Effects may be ↓ by **cholestyramine** or other **bile acid sequestrants**. Concurrent use of **fibrates** may ↑ levels and the risk of cholelithiasis. **Cyclosporine** may ↑ levels. May ↑ risk of rhabdomyolysis when used with **HMG CoA-reductase inhibitors**.

Route/Dosage

PO (Adults): 10 mg once daily.

Renal Impairment

PO (Adults): *CCr <60 mL/min and concurrent use with simvastatin*—Not to exceed simvastatin dose of 20 mg/day.

Availability (generic available)

Tablets: 10 mg. **Cost:** $517.89/90. ***In combination with:*** rosuvastatin (Roszet); simvastatin (Vytorin); see Appendix N.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Evaluate serum cholesterol and triglyceride levels before initiating, after 2–4 wk of therapy, and periodically thereafter.
- May cause ↑ liver transaminases when administered with HMG-CoA reductase inhibitors. Monitor liver enzymes prior to initiation and during therapy according to recommendations of HMG-CoA reductase inhibitor. Elevations are usually asymptomatic and return to baseline with continued therapy.

Implementation

- Do not confuse Zetia with Zestril (lisinopril).
- **PO:** Administer without regard to meals. May be taken at the same time as HMG-CoA reductase inhibitors.

Patient/Family Teaching

- Instruct patient to take ezetimibe as directed, at the same time each day, even if feeling well. Take missed doses as soon as remembered, but do not take more than 1 dose/day. Medication helps control but does not cure elevated serum cholesterol levels. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of change.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking. Ezetimibe does not assist with weight loss.
- Instruct patient to notify health care professional if unexplained muscle pain, tenderness, or weakness occur. Risk may increase when used with HMG-CoA reductase inhibitors.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional promptly if pregnancy is planned or suspected or if breast feeding. If regimen includes HMG-CoA reductase inhibitors, they are contraindicated in pregnancy.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in serum LDL and total cholesterol levels.

© F.A. Davis Publishing

famciclovir (fam-sye-kloe-veer)

~~Famvir~~

Classification
Therapeutic: antivirals

Indications
Acute herpes zoster infections (shingles). Treatment/suppression of recurrent herpes genitalis in immunocompetent patients. Treatment of recurrent herpes labialis (cold sores) in immunocompetent patients. Treatment of recurrent mucocutaneous herpes simplex virus (HSV) infection in HIV-infected patients.

Action
Inhibits viral DNA synthesis in herpes-infected cells only. **Therapeutic Effects:** Decreased duration of herpes zoster infection with decreased duration of viral shedding. Decreased time to healing for cold sores. Decreased lesion formation and improved healing in recurrent HSV infection.

Pharmacokinetics
Absorption: Following absorption, famciclovir is rapidly converted in the intestinal wall to penciclovir, the active compound.
Distribution: Unknown.
Metabolism and Excretion: Penciclovir is mostly excreted by the kidneys.
Half-life: *Penciclovir*—2.1–3 hr (↑ in renal impairment).

TIME/ACTION PROFILE (penciclovir blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.9 hr	8–12 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Patients with impaired renal function (↑ dose interval/↓ dose recommended if CCr <40–60 mL/min); OB: Use during pregnancy only if benefit to patient outweighs potential risk to fetus; Lactation: Use during breast feeding only if benefit to patient outweighs potential risk to infant; Pedi: Safety and effectiveness not established; Geri: Consider age-related ↓ in renal function when prescribing.

Adverse Reactions/Side Effects
CV: palpitations. **Derm:** hypersensitivity vasculitis. **GI:** diarrhea, nausea, vomiting. **GU:** ↓ fertility (males). **Neuro:** SEIZURES, headache, dizziness, fatigue. **Misc:** ANAPHYLAXIS.

Interactions
Drug-Drug: Probenecid ↑ plasma concentrations of penciclovir.

Route/Dosage

Herpes Zoster
PO (Adults): 500 mg every 8 hr for 7 days.

Renal Impairment
PO (Adults): *CCr 40–59 mL/min*—500 mg every 12 hr; *CCr 20–39 mL/min*—500 mg every 24 hr; *CCr <20 mL/min*—250 mg every 24 hr; *Hemodialysis*—250 mg after each dialysis.

Recurrent Genital Herpes Simplex Infections
PO (Adults): 1000 mg twice daily for one day.

Renal Impairment
PO (Adults): *CCr 40–59 mL/min*—500 mg twice daily for 1 day; *CCr 20–39 mL/min*—500 mg as a single dose; *CCr <20 mL/min*—250 mg as a single dose; *Hemodialysis*—250 mg as a single dose after dialysis.

Suppression of Recurrent Herpes Simplex Infections
PO (Adults): 250 mg every 12 hr for up to 1 yr.

Renal Impairment
PO (Adults): *CCr 20–39 mL/min*—125 mg every 12 hr for 5 days; *CCr <20 mL/min*—125 mg every 24 hr for 5 days; *Hemodialysis*—125 mg after each dialysis.

Recurrent Herpes Labialis Infections (cold sores)
PO (Adults): 1500 mg as a single dose.

Renal Impairment
PO (Adults): *CCr 40–59 mL/min*—750 mg as a single dose; *CCr 20–39 mL/min*—500 mg as a single dose; *CCr <20 mL/min*—250 mg as a single dose; *Hemodialysis*—250 mg as a single dose after dialysis.

Herpes Simplex in HIV-Infected Patients
PO (Adults): 500 mg every 12 hr for 7 days.

Renal Impairment
PO (Adults): *CCr 20–39 mL/min*—500 mg every 24 hr for 7 days; *CCr <20 mL/min*—250 mg every 24 hr for 7 days; *Hemodialysis*—250 mg after each dialysis.

Availability (generic available)
Tablets: 125 mg, 250 mg, 500 mg.

NURSING IMPLICATIONS

Assessment
- Assess lesions prior to and daily during therapy.
- Assess patient for postherpetic neuralgia periodically during and following therapy.

© F.A. Davis Publishing

Implementation

- Famciclovir therapy should be started as soon as herpes zoster is diagnosed, at least within 72 hr, preferably within 48 hr.
- **PO:** Famciclovir may be administered without regard to meals.

Patient/Family Teaching

- Instruct patient to take famciclovir as directed for the full course of therapy. Take missed doses as soon as remembered, if not just before next dose.
- Inform patient that famciclovir does not prevent the spread of infection to others. Until all lesions have crusted, precautions should be taken around others who have not had chickenpox or varicella vaccine or people who are immunosuppressed.
- Advise patient to use condoms during sexual contact and to avoid sexual contact while lesions are present.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional immediately if seizures or signs and symptoms of anaphylaxis (rash, facial swelling, difficulty breathing) occur.
- Instruct women with genital herpes to have yearly Papanicolaou (Pap) smears because of increased risk of cervical cancer.
- Rep: Advise women of childbearing potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage women who become pregnant while taking famciclovir to enroll in the pregnancy reporting system to monitor maternal-fetal outcomes. Report pregnancies and pregnancy outcomes to the Novartis Adverse Event reporting line at 1-888-NOW-NOVA (669-6682). May cause decreased fertility in male patients.

Evaluation/Desired Outcomes

- Decrease in time to full crusting, loss of vesicles, loss of ulcers, and loss of crusts in patients with acute herpes zoster (shingles).
- Crusting over and healing of lesions in herpes labialis, genital herpes, and in recurrent mucocutaneous HSV infection in HIV-infected patients.
- Prevention of recurrence of herpes genitalis.
- Decreased time to healing for cold sores.

famotidine, See HISTAMINE H_2 ANTAGONISTS.

fam-trastuzumab deruxtecan

(fam tras-**tu**-zoo-mab de-**rux**-te-can)

Enhertu

Classification

Therapeutic: antineoplastics

Pharmacologic: monoclonal antibodies, enzyme inhibitors

Indications

Unresectable or metastatic human epidermal growth factor receptor 2 (HER2)-positive breast cancer in patients who have previously received ≥2 anti-HER2-based regimens in the metastatic setting. Locally advanced or metastatic HER2-positive gastric or gastroesophageal junction adenocarcinoma in patients who have previously received a trastuzumab-based regimen.

Action

Acts as a HER2-directed antibody-drug conjugate composed of a humanized IgG1 monoclonal antibody (which has the same amino acid sequence as trastuzumab [and targets HER2]), a cleavable linker, and a topoisomerase I inhibitor (DXd) (the cytotoxic component which causes DNA damage and apoptosis). **Therapeutic Effects:** Regression of breast cancer and metastases. Improved survival in gastric or gastroesophageal junction adenocarcinoma.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Minimally distributed to extravascular tissues.

Protein Binding: 97%.

Metabolism and Excretion: Monoclonal antibody component is degraded into smaller peptides via catabolism. DxD primarily metabolized by the liver via CYP3A4 isoenzyme. Excretion pathway unknown.

Half-life: *Fam-trastuzumab deruxtecan*—5.7 days; *DXd*—5.8 days.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Severe renal impairment (CCr <30 mL/min); Severe hepatic impairment (total bilirubin >3–10× ULN or AST > ULN); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: Older adults may have ↑ risk of adverse reactions.

Exercise Extreme Caution in: Pre-existing cardiac dysfunction.

Adverse Reactions/Side Effects

CV: HF. **Derm:** alopecia, rash. **EENT:** dry eye, epistaxis. **F and E:** hypokalemia. **GU:** ↓ fertility (males). **GI:**

© F.A. Davis Publishing

abdominal pain, constipation, diarrhea, dyspepsia, ↑ liver enzymes, nausea, stomatitis, vomiting. **Hemat:** NEUTROPENIA, anemia, leukopenia, thrombocytopenia. **Metab:** ↓ appetite. **Neuro:** dizziness, headache. **Resp:** INTERSTITIAL LUNG DISEASE/PNEUMONITIS, cough, dyspnea, upper respiratory tract infection. **Misc:** fatigue.

Interactions

Drug-Drug: None reported.

Route/Dosage

Do NOT substitute fam-trastuzumab deruxtecan with trastuzumab or ado-trastuzumab emtansine.

Metastatic Breast Cancer

IV (Adults): 5.4 mg/kg every 3 wk. Continue until disease progression or unacceptable toxicity.

Locally Advanced or Metastatic Gastric or Gastroesophageal Junction Adenocarcinoma

IV (Adults): 6.4 mg/kg every 3 wk. Continue until disease progression or unacceptable toxicity.

Availability

Lyophilized powder for injection: 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of interstitial lung disease (ILD)/pneumonitis (cough, dyspnea, fever, and/or any new or worsening respiratory symptoms) periodically during therapy. If asymptomatic (Grade 1), hold medication until resolved to Grade 0, then: if resolved in <28 days from date of onset, maintain dose. If resolved in >28 days from date of onset, reduce dose one level. Consider corticosteroid therapy as soon as ILD/pneumonitis is suspected. If symptomatic ILD/pneumonitis occurs (≥Grade 2), discontinue therapy permanently and start corticosteroid therapy.
- Assess for signs and symptoms of left ventricular dysfunction (LVEF) before starting and at regular intervals during therapy as clinically indicated. If LVEF >45% and absolute decrease from baseline is 10–20%, continue with therapy. If LVEF is 40–45% and absolute decrease from baseline is <10%, continue with therapy. Repeat LVEF assessment within 3 wk. If LVEF is 40–45% and absolute decrease from baseline is 10–20%, hold therapy and repeat LVEF assessment within 3 wk. If LVEF has not recovered to within 10% from baseline, permanently discontinue therapy. If LVEF recovers to within 10% from baseline, resume therapy at the same dose. If LVEF <40% or absolute decrease from baseline >20%, hold therapy and repeat LVEF assessment within 3 wk. If LVEF <40% or absolute decrease from baseline of >20% is confirmed, permanently discontinue therapy. If symptomatic HF occurs, discontinue therapy permanently.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Patient selection for patients with locally advanced or metastatic gastric cancer is based on HER2 protein overexpression or HER2 gene amplification. Reassess HER2 status if it is feasible to obtain a new tumor specimen after prior trastuzumab-based therapy and before treatment with *Enhertu*. Information on FDA-approved tests available at: http://www.fda.gov/CompanionDiagnostics.
- Monitor CBC prior to start of therapy and before each dose, and as clinically indicated. *If neutropenia of Grade 3 (less than $1.0–0.5 \times 10^9$/L) occurs,* hold therapy until resolved to ≤Grade 2, then resume at same dose. *If Grade 4 neutropenia (less than 0.5×10^9/L) occurs,* hold therapy until resolved to ≤Grade 2, then reduce dose by 1 level. If febrile neutropenia (absolute neutrophil count of $<1.0 \times 10^9$/L and temperature >38.3°C or a sustained temperature of ≥38°C for >1 hr), hold therapy until resolved. Reduce dose by 1 level.

Implementation

- Do not substitute fam-traztuzumab deruxtecan for or with trastuzumab or ado-trastuzumab.
- **Dose reduction schedule:** *Breast cancer:* Starting dose 5.4 mg/kg. First dose reduction to 4.4 mg/kg. Second reduction to 3.2 mg/kg. If further dose reduction is needed, discontinue therapy. Do not re-escalate dose after dose reduction is made.
- *Gastric Cancer:* Starting dose 6.4 mg/kg. First dose reduction to 5.4 mg/kg. Second reduction to 4.4 mg/kg. If further dose reduction is needed, discontinue therapy. Do not re-escalate dose after dose reduction is made.

IV Administration

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute immediately before dilution. Reconstitute each 100 mg vial with 5 mL Sterile Water for Injection. ***Concentration:*** 20 mg/mL. Swirl gently to dissolve; do not shake. Solution is clear and colorless to light yellow. Do not use if solution is cloudy, discolored, or contains particulate matter. Reconstituted solution is stable if refrigerated for 24 hr. ***Dilution:*** Dilute in 100 mL D5W; do not dilute with 0.9% NaCl. Gently invert to mix; do not shake. Cover infusion bag to protect from light. Diluted solution is stable for 4 hr at room temperature and up to 24 hr if refrigerated. Allow refrigerated solution to reach room temperature be for infusion. ***Rate:*** Infuse 1st infusion over 90 min via an infusion set of polyolefin or polybutadiene and a 0.20 or 0.22 micron in-line polyethersulfone (PES) or polysulfone (PS) filter. If

© F.A. Davis Publishing

tolerated, subsequent infusions can be infused over 30 min. Slow rate or interrupt infusion if patient develops infusion-related symptoms. If reaction is severe, discontinue medication. Do not administer IV push or bolus.
- **Y-Site Incompatibility:** Do not mix with other drugs or with other drugs in the same line.

Patient/Family Teaching
- Explain purpose of therapy to patient. Advise patient to read *Medication Guide* before starting therapy.
- Advise patient to notify health care professional immediately if signs and symptoms of lung problems (cough, trouble breathing or shortness of breath, fever, other new or worsening breathing symptoms [chest tightness, wheezing), infection (fever, chills), or heart problems (new or worsening shortness of breath, coughing, feeling tired, swelling of ankles or legs, irregular heartbeat, sudden weight gain, dizziness or feeling lightheaded, loss of consciousness) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and avoid breast feeding during and for at least 7 mo after last dose. Advise males with female partners of reproductive potential to use effective contraception during and for at least 4 mo after last dose. May impair male fertility.

Evaluation/Desired Outcomes
- Regression of breast cancer and metastases.
- Improved survival in gastric or gastroesophageal junction adenocarcinoma.

febuxostat (fe-**bux**-o-stat)
Uloric

Classification
Therapeutic: antigout agents
Pharmacologic: xanthine oxidase inhibitors

Indications
Chronic management of hyperuricemia in patients with gout who have an inadequate response to a maximally titrated dose of allopurinol, who are intolerant to allopurinol, or in whom allopurinol is not an appropriate treatment option.

Action
Decreases production of uric acid by inhibiting xanthine oxidase. **Therapeutic Effects:** Lowering of serum uric acid levels with resultant decrease in gouty attacks.

Pharmacokinetics
Absorption: Well absorbed (49%) following oral administration.
Distribution: Unknown.
Protein Binding: 99.2%.
Metabolism and Excretion: Extensively metabolized by the liver; minimal renal excretion of unchanged drug, 45% eliminated in feces as unchanged drug, remainder is eliminated in urine and feces as inactive metabolites.
Half-life: 5–8 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–1.5 hr*	24 hr

*Maximum lowering of uric acid may take 2 wk.

Contraindications/Precautions
Contraindicated in: Concurrent azathioprine or mercaptopurine.
Use Cautiously in: Cardiovascular disease (↑ risk of cardiovascular death compared to allopurinol) (consider using low-dose aspirin when using febuxostat in these patients); Severe renal impairment (CCr <30 mL/min); Severe hepatic impairment; Previous skin reaction with allopurinol; OB: Use only when potential maternal benefit outweighs potential fetal risk; Lactation: Unknown if excreted into breast milk; use caution when breast feeding; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects
Derm: DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash. **GI:** ↑ liver enzymes, nausea. **MS:** gout flare, arthralgia.

Interactions
Drug-Drug: Significantly ↑ levels of and risk of serious toxicity from **azathioprine** and **mercaptopurine**; concurrent use is contraindicated. May ↑ levels of **theophylline**; use cautiously together.

Route/Dosage
PO (Adults): 40 mg once daily initially; if serum uric acid does not ↓ to <6 mg/dL, ↑ to 80 mg once daily.

Renal Impairment
PO (Adults): *CCr <30 mL/min* — Maximum dose = 40 mg/day.

Availability (generic available)
Tablets: 40 mg, 80 mg.

NURSING IMPLICATIONS
Assessment
- Assess for joint pain and swelling, especially during early therapy. Changing serum uric acid levels from mobilization of urate from tissue deposits may cause gout flares. Use prophylactic NSAID or colchicine therapy for up to 6 mo. If a gout flare occurs, continue febuxostat therapy and treat flare concurrently.
- Monitor for signs and symptoms of MI and stroke.
- Assess patient for skin reactions throughout therapy. Reactions may be severe and life threatening. Dis-

© F.A. Davis Publishing

continue therapy if severe reactions or moderate rashes with systemic symptoms occur.

- ***Lab Test Considerations:*** Monitor serum uric acid levels prior to, 2 wk after intitiating, and periodically thereafter. *If serum uric acid levels are ≥6 mg/dL after 2 wk of daily 40 mg therapy,* increase dose to 80 mg daily.
- Monitor liver function at 2 and 4 mo of therapy and periodically thereafter. May cause ↑ AST, ALT, CPK, LDH, alkaline phosphatase, and creatine.
- May cause prolonged aPTT and PT, and ↓ hematocrit, hemoglobin, RBC, platelet count, and lymphocyte, neutrophil counts. May cause ↑ or ↓ WBC.
- May cause ↓ serum bicarbonate and ↑ serum sodium, glucose, potassium, and TSH levels.
- May cause ↑ serum cholesterol, triglycerides, amylase, and LDL levels.
- May cause ↑ BUN and serum creatinine and proteinuria.

Implementation

- **PO:** May be taken with or without food and with antacids.

Patient/Family Teaching

- Instruct patient to take febuxostat as directed. If a gout flare occurs, continue febuxostat and consult health care professional; medications to manage gout flare may be added.
- Advise patient to notify health care professional if rash, chest pain, shortness of breath, dizziness, rapid or irregular heartbeat, or stroke symptoms (weakness, blurred vision, headache, confusion, slurred speech) occur or if side effects are persistent or bothersome.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up lab tests to monitor therapy.

Evaluation/Desired Outcomes

- Reduction in serum uric acid levels and resultant gout attacks.

fenofibrate (fen-o-fi-brate)

Antara, Fenoglide, Fenomax, Lipidil EZ, Lipidil Supra, Lipofen, Tricor, Triglide

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

Indications

With dietary therapy to decrease LDL cholesterol, total cholesterol, triglycerides, and apolipoprotein B in adult patients with hypercholesterolemia or mixed dyslipidemia. With dietary management in the treatment of severe hypertriglyceridemia (types IV and V hyperlipidemia) in patients who are at risk for pancreatitis and do not respond to nondrug therapy.

Action

Fenofibric acid primarily inhibits triglyceride synthesis.
Therapeutic Effects: Lowering of cholesterol and triglycerides with subsequent decreased risk of pancreatitis.

Pharmacokinetics

Absorption: Well absorbed (60%) after oral administration; absorption ↑ by food.
Distribution: Unknown.
Protein Binding: 99%.
Metabolism and Excretion: Rapidly converted to fenofibric acid, which is the active metabolite; fenofibric acid is metabolized by the liver. Fenofibric acid and its metabolites are primarily excreted in urine (60%).
Half-life: 20 hr.

TIME/ACTION PROFILE (lowering of triglycerides)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hepatic impairment (including primary biliary cirrhosis); Pre-existing gallbladder disease; Severe renal impairment; Concurrent use of HMG-CoA reductase inhibitors; Lactation: Lactation.
Use Cautiously in: Concurrent warfarin or HMG-CoA reductase inhibitor therapy; OB: Safety not established in pregnancy; Pedi: Safety and effectiveness not established in children; Geri: Age-related ↓ in renal function may make older patients more susceptible to adverse reactions.

Adverse Reactions/Side Effects

CV: DEEP VEIN THROMBOSIS, arrhythmias. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, urticaria. **GI:** HEPATOTOXICITY, cholelithiasis, ↑ liver enzymes, pancreatitis. **Metab:** ↓ HDL levels. **MS:** rhabdomyolysis. **Neuro:** fatigue/weakness, headache. **Resp:** INTERSTITIAL LUNG DISEASE, PUL-

© F.A. Davis Publishing

MONARY EMBOLISM. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: ↑ anticoagulant effects of **warfarin**. **HMG-CoA reductase inhibitors** ↑ risk of rhabdomyolysis (concurrent use should be avoided). Absorption is ↓ by **bile acid sequestrants** (fenofibrate should be given 1 hr before or 4–6 hr after). ↑ risk of nephrotoxicity with **cyclosporine**. Concurrent use with **colchicine** may ↑ risk of rhabdomyolysis.

Route/Dosage

Primary Hypercholesterolemia/Mixed Dyslipidemia

PO (Adults): *Antara*—90 mg once daily; *Fenoglide*—120 mg once daily; *Tricor*—145 mg once daily; *Triglide*—160 mg once daily; *Lipofen*—150 mg once daily.

Renal Impairment

PO (Adults): *CCr 30–89 mL/min—Antara*—30 mg once daily initially; may titrate, if needed, up to 90 mg once daily. *Fenoglide*—40 mg once daily initially; may titrate, if needed, up to 120 mg once daily. *Lipofen*—50 mg once daily initially; may titrate, if needed, up to 150 mg once daily. *Tricor*—48 mg once daily initially; may titrate, if needed, up to 145 mg once daily.

Hypertriglyceridemia

PO (Adults): *Antara*—30–90 mg once daily; *Fenoglide*—40–120 mg once daily; *Tricor*—48–145 mg once daily; *Triglide*—160 mg once daily; *Lipofen*—50–150 mg once daily.

Renal Impairment

PO (Adults): *CCr 30–89 mL/min—Antara*—30 mg once daily initially; may titrate, if needed, up to 90 mg once daily. *Fenoglide*—40 mg once daily initially; may titrate, if needed, up to 120 mg once daily. *Lipofen*—50 mg once daily initially; may titrate, if needed, up to 150 mg once daily. *Tricor*—48 mg once daily initially; may titrate, if needed, up to 145 mg once daily.

Availability (generic available)

Capsules (Lipofen): 50 mg, 150 mg. **Cost:** 50 mg $213.58/90, 150 mg $468.24/90. **Micronized capsules (Antara):** 30 mg, 90 mg. **Tablets (Fenoglide):** 40 mg, 120 mg. **Cost:** 40 mg $289.44/90, 120 mg $869.40/90. **Tablets (Tricor):** 48 mg, 145 mg. **Cost:** *Generic*—48 mg $171.86/90, 145 mg $515.58/90. **Tablets (Triglide):** 160 mg. **Cost:** *Generic*—160 mg $176.40/100.

NURSING IMPLICATIONS

Assessment

- Obtain a diet history, especially with regard to fat consumption. Attempt to obtain normal serum triglyceride levels with diet, exercise, and weight loss in obese patients before fenofibrate therapy is instituted.
- Assess patient for cholelithiasis. If symptoms occur, gallbladder studies are indicated. Discontinue therapy if gallstones are found.
- Assess patient for skin reactions throughout therapy. Reactions may be severe and life threatening. Discontinue therapy if severe reactions or moderate rashes with systemic symptoms occur.
- ***Lab Test Considerations:*** Monitor serum lipids before therapy to determine consistent elevations, then monitor periodically during therapy.
- Monitor serum AST, ALT, and total bilirubin at baseline and periodically during therapy. May cause ↑ levels. Therapy should be discontinued if levels rise >3 times the normal limit. *If signs or symptoms of liver injury occur or if elevated enzyme levels persist (ALT or AST >3 × ULN, or if accompanied by elevation of bilirubin),* discontinue fenofibrate. Do not restart fenofibrate if there is no alternative explanation for the liver injury.
- If patient develops muscle tenderness during therapy, monitor CK levels. If CK levels are markedly ↑ or myopathy occurs, discontinue therapy.
- May cause mild to moderate ↓ in hemoglobin, hematocrit, and WBCs. Monitor periodically during first 12 mo of therapy. Levels usually stabilize during long-term therapy.
- Monitor prothrombin levels frequently until levels stabilize in patients taking anticoagulants concurrently.

Implementation

- Do not confuse Tricor (fenofibrate) with Tracleer (bosentan).
- Place patients on a triglyceride-lowering diet before therapy and encourage them to remain on this diet throughout therapy.
- Dose may be increased after repeated serum triglyceride levels every 4–8 wk.
- Brands are not interchangeable.
- **PO:** Administer *Antara, Fenoglide, Lipofen, Lipidil Supra,* and *Tricor* products with meals. *Triglide* formulation may be taken without regard to meals.

Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Medication helps control but does not cure elevated serum triglyceride levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional if signs and symptoms of liver injury (jaundice, abdominal pain, nausea, malaise, dark urine, abnormal stool, pruritus), unexplained muscle pain, tenderness, or weakness occurs, especially if accompanied by fever or malaise.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal prod-

© F.A. Davis Publishing

ucts being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional promptly if pregnancy is planned or suspected and to avoid breast feeding during and for at least 5 days after last dose of therapy.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in serum triglycerides and cholesterol to normal levels. Therapy should be discontinued in patients who do not have an adequate response in 2 mo of therapy.

HIGH ALERT

fentaNYL (parenteral)

(**fen**-ta-nil)

Sublimaze

Classification

Therapeutic: opioid analgesics

Pharmacologic: opioid agonists

Schedule II

Indications

Analgesic supplement to general anesthesia; usually with other agents (ultra–short-acting barbiturates, neuromuscular blocking agents, and inhalation anesthetics) to produce balanced anesthesia. Induction/maintenance of anesthesia (with oxygen or oxygen/nitrous oxide and a neuromuscular blocking agent). Neuroleptanalgesia/neuroleptanesthesia (with or without nitrous oxide). Supplement to regional/local anesthesia. Preoperative and postoperative analgesia. **Unlabeled Use:** Continuous IV infusion as part of PCA.

Action

Binds to opiate receptors in the CNS, altering the response to and perception of pain. Produces CNS depression. **Therapeutic Effects:** Supplement in anesthesia. Decreased pain.

Pharmacokinetics

Absorption: Well absorbed after IM administration.

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized by the liver, 10–25% excreted unchanged by the kidneys.

Half-life: *Children*—Bolus dose—2.4 hr, long-term continuous infusion—11–36 hr; *Adults*—2–4 hr (↑ after cardiopulmonary bypass and in geriatric patients).

TIME/ACTION PROFILE (analgesia*)

ROUTE	ONSET	PEAK	DURATION
IM	7–15 min	20–30 min	1–2 hr
IV	1–2 min	3–5 min	0.5–1 hr

*Respiratory depression may last longer than analgesia.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; cross-sensitivity among agents may occur; Known intolerance.

Use Cautiously in: Diabetes; Severe renal, pulmonary, or hepatic disease; CNS tumors; ↑ intracranial pressure; Head trauma; Adrenal insufficiency; Undiagnosed abdominal pain; Hypothyroidism; Alcoholism; Cardiac disease (arrhythmias); OB: Use during pregnancy only if maternal benefit outweighs potential risk to fetus. Chronic maternal treatment with opioids during pregnancy may result in neonatal abstinence syndrome; Lactation: Use while breast feeding only if maternal benefit outweighs potential risk to infant (may cause infant sedation and/or respiratory depression); Geri: Geriatric, debilitated, or critically ill patients.

Adverse Reactions/Side Effects

CV: arrhythmias, bradycardia, circulatory depression, hypotension. **Derm:** facial itching. **EENT:** blurred/double vision. **Endo:** adrenal insufficiency. **GI:** biliary spasm, nausea/vomiting. **MS:** skeletal and thoracic muscle rigidity (with rapid IV infusion). **Neuro:** confusion, paradoxical excitation/delirium, postoperative depression, postoperative drowsiness. **Resp:** APNEA, LARYNGOSPASM, RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia), allergic bronchospasm.

Interactions

Drug-Drug: Avoid use in patients who have received **MAO inhibitors** within the previous 14 days (may produce unpredictable, potentially fatal reactions). Concomitant use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **clarithromycin**, **nelfinavir**, **nefazodone**, **diltiazem**, **aprepitant**, **fluconazole**, **fosamprenavir**, **verapamil**, and **erythromycin** may result in ↑ levels and ↑ risk of CNS and respiratory depression. Concurrent use with **CYP3A4 inducers** including **barbiturates**, **carbamazepine**, **efavirenz**, **corticosteroids**, **modafinil**, **nevirapine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, or **rifampin** may ↓ levels and analgesia; if inducers are discontinued or dosage ↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when al-

© F.A. Davis Publishing

ternative treatment options are inadequate. ↑ risk of hypotension with **benzodiazepines**. **Nalbuphine** or **buprenorphine** may ↓ analgesia. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT_3 receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome. **Drug-Food: Grapefruit juice** is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

Route/Dosage

Preoperative Use

IM, IV (Adults and Children >12 yr): 50–100 mcg 30–60 min before surgery.

Adjunct to General Anesthesia

IM, IV (Adults and Children >12 yr): *Low dose–minor surgery*— 2 mcg/kg. *Moderate dose–major surgery*— 2–20 mcg/kg. *High dose–major surgery*— 20–50 mcg/kg.

Adjunct to Regional Anesthesia

IM, IV (Adults and Children >12 yr): 50–100 mcg.

Postoperative Use (Recovery Room)

IM, IV (Adults and Children >12 yr): 50–100 mcg; may repeat in 1–2 hr.

General Anesthesia

IV (Adults and Children >12 yr): 50–100 mcg/kg (up to 150 mcg/kg).
IV (Children 1–12 yr): 2–3 mcg/kg.

Sedation/Analgesia

IV (Adults and Children >12 yr): 0.5–1 mcg/kg/dose, may repeat after 30–60 min.
IV (Children 1–12 yr): *Bolus*— 1–2 mcg/kg/dose, may repeat at 30–60 min intervals. *Continuous infusion*— 1–5 mcg/kg/hr following bolus dose.
IV (Neonates): *Bolus*— 0.5–3 mcg/kg/dose. *Continuous infusion*— 0.5–2 mcg/kg/hr following bolus dose. *Continuous infusion during ECMO*— 5–10 mcg/kg bolus followed by 1–5 mcg/kg/hr, may require up to 20 mcg/kg/hr after 5 days of therapy.

Availability (generic available)

Solution for injection: 50 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 30 min following IM and 5 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief.
- Monitor respiratory rate and BP frequently during therapy, especially when starting therapy or when given with other drugs that depress respiration. May cause sleep-related breathing disorders (central sleep apnea, sleep-related hypoxemia). Report significant changes immediately. The respiratory depressant effects of fentanyl may last longer than the analgesic effects. Initial doses of other opioids should be reduced by 25–33% of the usually recommended dose. Monitor closely.
- Geri: Opioids have been associated with increased risk of falls in geriatric patients. Assess risk and implement fall prevention strategies.
- Assess type, location, and intensity of pain before and 30 min after IM administration or 3–5 min after IV administration when fentanyl is used to treat pain.
- Assess risk for opioid addiction, abuse, or misuse prior to administration.
- ***Lab Test Considerations:*** May cause ↑ serum amylase and lipase concentrations.
- ***Toxicity and Overdose:*** Symptoms of toxicity include respiratory depression, hypotension, arrhythmias, bradycardia, and asystole. Atropine may be used to treat bradycardia. If respiratory depression persists after surgery, prolonged mechanical ventilation may be required. If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. Pedi: For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Administration of naloxone in these circumstances, especially in cardiac patients, has resulted in hypertension and tachycardia, occasionally causing left ventricular failure and pulmonary edema.

Implementation

- ***High Alert:*** Accidental overdosage of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, route of administration, and infusion pump programming.
- Do not confuse fentanyl with sufentanil.
- Benzodiazepines may be administered before or after administration of fentanyl to reduce the induction dose requirements, decrease the time to loss of consciousness, and produce amnesia. This combination may also increase the risk of hypotension and respiratory depression.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.

© F.A. Davis Publishing

- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms.
- May cause muscle rigidity, particularly involving muscles of respiration; effects are related to the dose and speed of injection. Effects can be reduced by: 1) administration of up to 1/4 of the full paralyzing dose of a non-depolarizing neuromuscular blocking agent just prior to administration of fentanyl; 2) administration of a full paralyzing dose of a neuromuscular blocking agent following loss of eyelash reflex when fentanyl is used in anesthetic doses titrated by slow intravenous infusion; or, 3) simultaneous administration of fentanyl and a full paralyzing dose of a neuromuscular blocking agent when fentanyl is used in rapidly administered anesthetic doses.

IV Administration

- **IV Push:** ***Dilution:*** Administer undiluted. ***Concentration:*** 50 mcg/mL. ***Rate:*** Inject slowly over 1–3 min. Administer doses >5 mcg/kg over 5–10 min. Slow IV administration may reduce the incidence and severity of muscle rigidity, bradycardia, or hypotension. Neuromuscular blocking agents may be administered concurrently to decrease chest wall muscle rigidity.
- **Intermittent Infusion:** ***Dilution:*** May be diluted in D5W or 0.9% NaCl. ***Concentration:*** Up to 50 mcg/mL. ***Rate:*** see IV Push.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alemtuzumab, alfentanil, alprostadil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxapram, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, eravacycline, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, imipenem/cilastatin/relebactam, indomethacin, insulin regular, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem/vaborbactam, mesna, methotrexate, methylpresnisolone, metoclopramide, metoprolol, midazolam, milrinone, mitomycin, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, scopolamine, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiamine, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** dantrolene, diazoxide, gemtuzumab ozogamicin, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Discuss the use of anesthetic agents and the sensations to expect with the patient before surgery.
- Instruct patient on how and when to ask for pain medication. Explain pain assessment scale to patient.
- Advise patient to notify health care professional if pain control is not adequate or if side effects occur.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Geri: Geriatric patients may be at a greater risk for orthostatic hypotension and, consequently, falls. Teach patient to take precautions until drug effects have completely resolved.
- Medication causes dizziness and drowsiness. Advise patient to call for assistance during ambulation and transfer, and to avoid driving or other activities requiring alertness for 24 hr after administration during outpatient surgery.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.

© F.A. Davis Publishing

- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Instruct patient to avoid alcohol or other CNS depressants for 24 hr after administration for outpatient surgery.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to fentanyl through breast milk for excess sedation and respiratory depression.

Evaluation/Desired Outcomes

- General quiescence.
- Reduced motor activity.
- Pronounced analgesia.

REMS HIGH ALERT

fentaNYL (transdermal)

(**fen**-ta-nil)

~~Duragesic~~

Classification

Therapeutic: opioid analgesics, anesthetic adjuncts

Pharmacologic: opioid agonists

Schedule II

Indications

Moderate to severe chronic pain in opioid-tolerant patients requiring use of daily, around-the-clock long-term opioid treatment and for which alternative treatment options are inadequate (extended-release). Transdermal fentanyl is not recommended for the control of postoperative, mild, or intermittent pain, nor should it be used for short-term pain relief.

Action

Binds to opiate receptors in the CNS, altering the response to and perception of pain. **Therapeutic Effects:** Decrease in severity of chronic pain.

Pharmacokinetics

Absorption: Well absorbed (92% of dose) through skin surface under transdermal patch, creating a depot in the upper skin layers. Release from transdermal system into systemic circulation ↑ gradually to a constant rate, providing continuous delivery for 72 hr.

Distribution: Crosses the placenta; enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver via the CYP3A4 isoenzyme; 10–25% excreted unchanged by the kidneys.

Half-life: 17 hr after removal of a single application patch, ↑ to 21 hr after removal of multiple patches (because of continued release from deposition of drug in skin layers).

TIME/ACTION PROFILE (↓ pain)

ROUTE	ONSET	PEAK	DURATION
Transdermal	6 hr†	12–24 hr	72 hr‡

†Achievement of blood levels associated with analgesia. Maximal response and dose titration may take up to 6 days.
‡While patch is worn.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fentanyl or adhesives; Patients who are not opioid tolerant; Acute, mild, intermittent, or postoperative pain; Significant respiratory depression; Acute or severe bronchial asthma; Paralytic ileus; Severe hepatic or renal impairment; Alcohol intolerance (small amounts of alcohol released into skin); OB: Not recommended during labor and delivery; Lactation: Avoid use during breast feeding; may cause infant sedation and/or respiratory depression.

Use Cautiously in: Diabetes; Patients with severe pulmonary disease; Mild or moderate hepatic or renal impairment; CNS tumors; ↑ intracranial pressure; Head trauma; Adrenal insufficiency; Undiagnosed abdominal pain; Hypothyroidism; Alcoholism; Cardiac disease (particularly bradyarrhythmias); Fever or situations that ↑ body temperature (↑ release of fentanyl from delivery system); Titration period (additional analgesics may be required); Cachectic or debilitated patients (dose ↓ suggested because of altered drug disposition); OB: Use only if the potential benefit justifies the potential risk to the fetus. Chronic maternal treatment with opioids during pregnancy may result in neonatal abstinence syndrome; Pedi: Children <2 yr (safety not established); pediatric patients initiating therapy at 25 mcg/hr should be opioid tolerant and receiving at least 60 mg oral morphine equivalents per day; Geri: ↑ risk of respiratory depression; dose ↓ suggested.

Adverse Reactions/Side Effects

CV: bradycardia, hypotension. **Derm:** sweating, erythema. **Endo:** adrenal insufficiency. **GI:** anorexia, constipation, dry mouth, nausea, vomiting. **Local:** application site reactions. **MS:** skeletal and thoracic muscle rigidity. **Neuro:** confusion, sedation, weakness, dizziness, restlessness. **Resp:** APNEA, RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia), bronchoconstriction, laryngospasm. **Misc:** physical dependence, psychological dependence.

Interactions

Drug-Drug: Avoid use in patients who have received **MAO inhibitors** within the previous 14 days (may produce unpredictable, potentially fatal reactions). Concomitant use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **clarithromycin**, **nelfinavir**, **nefazodone**, **amiodarone**, **diltiazem**, **aprepitant**, **fluconazole**, **fosamprenavir**,

© F.A. Davis Publishing

verapamil, and **erythromycin** may result in ↑ plasma levels and ↑ risk of CNS and respiratory depression. Levels and effectiveness may be ↓ by **CYP3A4 inducers** including **rifampin**, **carbamazepine**, and **phenytoin**. Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **nonbenzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. **Mixed agonist/antagonist analgesics**, including **nalbuphine** or **butorphanol** and **partial agonist analgesics**, including **buprenorphine**, may ↓ fentanyl's analgesic effects and/or precipitate opioid withdrawal in physically dependent patients. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5−HT$_3$ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Drug-Food: Grapefruit juice is a moderate inhibitor of the CYP3A4 enzyme system; concurrent use may ↑ blood levels and the risk of respiratory and CNS depression. Careful monitoring and dose adjustment is recommended.

Route/Dosage

Transdermal (Adults): 25 mcg/hr is the initial dose; patients who have not been receiving opioids should receive not more than 25 mcg/hr. To calculate the dose of transdermal fentanyl required in patients who are already receiving opioid analgesics, assess the 24-hr requirement of currently used opioid. Using the equianalgesic table in Appendix I, convert this to an equivalent amount of morphine/24 hr. Conversion to fentanyl transdermal may be accomplished by using the fentanyl conversion table (Appendix I). During dose titration, additional short-acting opioids should be available for breakthrough pain. Morphine 10 mg IM or 60 mg PO every 4 hr (60 mg/24 hr IM or 360 mg/24 hr PO) is considered to be approximately equivalent to transdermal fentanyl 100 mcg/hr. Transdermal patch lasts 72 hr in most patients. Some patients require a new patch every 48 hr.

Transdermal (Adults >60 yr, Debilitated, or Cachectic Patients): Initial dose should be 25 mcg/hr unless previous opioid use was >135 mg morphine PO/day (or other opioid equivalent).

Hepatic Impairment

Transdermal (Adults): *Mild-to-moderate hepatic impairment*— 12 mcg/hr is the initial dose.

Renal Impairment

Transdermal (Adults): *Mild-to-moderate renal impairment*— 12 mcg/hr is the initial dose.

Availability (generic available)

Transdermal systems: 12.5 mcg/hr, 25 mcg/hr, 37.5 mcg/hr, 50 mcg/hr, 62.5 mcg/hr, 75 mcg/hr, 87.5 mcg/hr, 100 mcg/hr. **Cost:** *Generic*— 12 mcg/hr $101.51/5, 25 mcg/hr $72.17/5, 50 mcg/hr $131.92/5, 75 mcg/hr $201.23/5, 100 mcg/hr $267.07/5.

F

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain before and 24 hr after application and periodically during therapy. Monitor pain frequently during initiation of therapy and dose changes to assess need for supplementary analgesics for breakthrough pain.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. May cause sleep-related breathing disorders (central sleep apnea, sleep-related hypoxemia).
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Most patients who receive opioid analgesics for pain rarely develop psychological dependence.
- Progressively higher doses may be required to relieve pain with long-term therapy. It may take up to 6 days after increasing doses to reach equilibrium, so patients should wear higher dose through 2 applications before increasing dose again.
- Assess bowel function routinely. Prevent constipation with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated. Consider drugs for opioid induced constipation.
- Assess risk for opioid addiction, abuse, or misuse prior to administration. Misuse or abuse of *transdermal fentanyl* by chewing, swallowing, snorting or injecting fentanyl extracted from transdermal system will result in the uncontrolled delivery of fentanyl and risk of overdose and death.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule

© F.A. Davis Publishing

of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. Monitor patient closely; dose may need to be repeated or may need to be administered as an infusion because of long duration of action despite removal of patch.

Implementation

- Do not confuse fentanyl with sufentanil.
- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, confirm patient is opioid tolerant and clarify ambiguous orders.
- 12-mcg patch delivers 12.5 mcg/hr of fentanyl. Use supplemental doses of short-acting opioid analgesics to manage pain until relief is obtained with the transdermal system. Patients may continue to require supplemental opioids for breakthrough pain. If >100 mcg/hr is required, use multiple transdermal systems.
- Titrate dose based on patient's report of pain until adequate analgesia (50% reduction in patient's pain rating on numerical or visual analogue scale or patient reports satisfactory relief) is attained. Determine dose by calculating the previous 24-hr analgesic requirement and converting to the equianalgesic morphine dose using Appendix I. The conversion ratio from morphine to transdermal fentanyl is conservative; 50% of patients may require a dose increase after initial application. Increase after 3 days based on required daily doses of supplemental analgesics. Base increases on ratio of 45 mg/24 hr of oral morphine to 12.5 mcg/hr increase in transdermal fentanyl dose.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- To convert to another opioid analgesic, remove transdermal fentanyl system and begin treatment with half the equianalgesic dose of the new analgesic in 12–18 hr.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms. May be necessary to provide patient with a lower dose strength for a successful taper. Monitor frequently to manage pain and withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). If withdrawal symptoms occur, pause the taper for a period of time or raise the dose of opioid analgesic to the previous dose, and then proceed with a slower taper. Also, monitor patients for changes in mood, emergence of suicidal thoughts, or use of other substances. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the opioid analgesic.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.
- **Transdermal:** Apply system to flat, nonirritated, and nonirradiated site such as chest, back, flank, or upper arm. If skin preparation is necessary, use clear water and clip, do not shave, hair. Allow skin to dry completely before application. Apply immediately after removing from package. Do not alter the system (i.e., cut) in any way before application. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure contact is complete. Remove used system and fold so that adhesive edges are together. Flush system down toilet immediately on removal or follow the institutional disposal policy. Apply new system to a different site.

Patient/Family Teaching

- Instruct patient in how and when to ask for and take pain medication. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. The Patient Counseling Guide (PCG) is available at www.fda.gov/OpioidAnalgesicREMSPCG. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Instruct patient in correct method for application and disposal of transdermal system. Fatalities have occurred from children having access to improperly discarded patches. May be worn while bathing, showering, or swimming.
- Advise patient to avoid grapefruit juice during therapy.
- Advise patient that fentanyl is a drug with known abuse potential. Protect it from theft, and never give

© F.A. Davis Publishing

to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- May cause drowsiness or dizziness. Caution patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to change positions slowly to minimize dizziness.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Caution patient that fever, electric blankets, heating pads, saunas, hot tubs, and heated water beds increase the release of fentanyl from the patch.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- Rep: Instruct females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to fentanyl through breast milk for excess sedation and respiratory depression. Chronic use may reduce fertility in females and males.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness, respiratory status, or BP.

Subsys

Classification
Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

F

Indications

Management of breakthrough pain in cancer patients >18 yr old already receiving opioids and tolerant to around-the-clock opioids for persistent cancer pain (60 mg/day of oral morphine or equivalent).

Action

Binds to opioid receptors in the CNS, altering the response to and perception of pain. **Therapeutic Effects:** Decrease in severity of breakthrough pain.

Pharmacokinetics

Absorption: *Buccal tablet*—65% absorbed from buccal mucosa; 50% is absorbed transmucosally, remainder is swallowed and is absorbed slowly from the GI tract. Buccal absorption is enhanced by an effervescent reaction in the dose form; *Sublingual spray*—76% absorbed through sublingual mucosa; *Transmucosal lozenge*—Initial rapid absorption (25%) from buccal mucosa is followed by more prolonged absorption (25%) from GI tract (combined bioavailability 50%).
Distribution: Readily crosses the placenta and enters breast milk.
Metabolism and Excretion: Mostly metabolized in the liver and intestinal mucosa via the CYP3A4 isoenzyme; inactive metabolites are excreted in urine; <7% excreted unchanged in urine.
Half-life: *Buccal tablet*—2.6–11.7 hr (↑ with dose); *Sublingual spray*—5–12 hr; *Transmucosal lozenge*—7 hr.

TIME/ACTION PROFILE (↓ pain)

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Known intolerance or hypersensitivity; Acute/postoperative pain including headache/migraine, dental pain, or emergency room use; Opioid—naive (nontolerant) patients; Concurrent use of MAO inhibitors; OB: Labor and delivery; Lactation: Avoid use during breast feeding; may cause infant sedation and/or respiratory depression.

Use Cautiously in: Chronic obstructive pulmonary disease or pre-existing medical conditions predisposing to hypoventilation; Concurrent use of CNS active drugs; History of substance abuse; Severe renal/hepatic impairment (use lowest effective starting dose); Concurrent use of CYP3A4 inhibitors (use lowest effective dose); Bradyarrhythmias; OB: Use during pregnancy only if the potential benefit justifies the potential risk to the fetus. Chronic maternal treatment with opioids during pregnancy may result in neonatal abstinence syndrome; Pedi: Safety and effectiveness not established in children; Geri: Older adults may be more sensitive to effects and may have an ↑ risk of adverse reactions; titrate dosage carefully.

Exercise Extreme Caution in: Patients susceptible to intracranial effects of CO_2 retention including those with ↑ intracranial pressure, head injuries, or impaired consciousness.

Adverse Reactions/Side Effects

CV: hypotension. **Endo:** adrenal insufficiency. **GI:** constipation, nausea, vomiting, abdominal pain, anorexia, dry mouth. **Neuro:** dizziness, drowsiness, headache, confusion, depression, fatigue, hallucinations, headache, insomnia, weakness. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia), dyspnea. **Misc:** allergic reaction including ANAPHYLAXIS, physical dependence, psychological dependence.

Interactions

Drug-Drug: Should not be used within 14 days of **MAO inhibitors** because of possible severe and unpredictable reactions. Concurrent use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **fluconazole**, **clarithromycin**, **erythromycin**, **nefazodone**, **diltiazem**, **verapamil**, **nelfinavir**, and **fosamprenavir** ↑ levels and risk of opioid toxicity; careful monitoring during initiation, dose changes, or discontinuation of the inhibitor is recommended. Concurrent use with **CYP3A4 inducers** including **barbiturates**, **carbamazepine**, **efavirenz**, **corticosteroids**, **modafinil**, **nevirapine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, or **rifampin** may ↓ fentanyl levels and analgesia; if inducers are discontinued or dosage ↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT_3 receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: St. John's wort is an inducer of CYP3A4; concurrent use may ↓ levels and analgesia; if inducers are discontinued or dosage decreased, patients should be monitored for signs of opioid toxicity and necessary dosage adjustments made.

Drug-Food: Grapefuit juice is a moderate inhibitor of CYP3A4 enzyme system; concurrent use may ↑ levels and the risk of CNS and respiratory depression. Careful monitoring and dose adjustment may be necessary.

Route/Dosage

Transmucosal products are not equivalent on a mcg-to-mcg basis.

Buccal (Adults): *Tablets*—100 mcg, then titrate to dose that provides adequate analgesia without undue side effects.

Oral transmucosal (Adults): One 200-mcg unit dissolved in mouth (see Implementation section) over 15 min; additional unit may be used 15 min after first unit is completed. If more than 1 unit is required per episode (as evaluated over several episodes), dose may be ↑ as required to control pain. Optimal usage/titration should result in using no more than 4 units/day.

SL (Adults): *Spray*—100 mcg initially; if pain not relieved within 30 min, repeat 100-mcg dose (do not take more than 2 doses per breakthrough pain episode); patients must wait ≥4 hr before treating another episode of breakthrough pain. Dose may be titrated during subsequent pain episodes to 200 mcg, then 400 mcg, then 600 mcg, then 800 mcg, then 1200 mcg, and then 1600 mcg to provide adequate analgesia and undue side effects.

Availability (generic available)

Buccal tablets: 100 mcg, 200 mcg, 400 mcg, 600 mcg, 800 mcg. **Cost:** 200 mcg $1,006.04/28. **Oral transmucosal lozenge on a stick (berry flavor-sugar free):** 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1200 mcg, 1600 mcg. **Cost:** *Generic*—400 mcg $599.93/30, 1200 mcg $799.93/30, 1600 mcg $1,155.89/30. **Sublingual spray:** 100 mcg/spray, 200 mcg/spray, 400 mcg/spray, 600 mcg/spray, 800 mcg/spray.

NURSING IMPLICATIONS

Assessment

- Monitor type, location, and intensity of pain before and 1 hr after administration of transmucosal fentanyl.
- Assess BP, pulse, and respirations before and periodically during administration, especially when

© F.A. Davis Publishing

starting therapy or when given with other drugs that depress respiration. May cause sleep-related breathing disorders (central sleep apnea, sleep-related hypoxemia). If respiratory rate is <10 min, assess level of sedation. Physical stimulation may be sufficient to prevent hypoventilation. Subsequent doses may need to be decreased. Patients tolerant to opioid analgesics are usually tolerant to the respiratory depressant effects also. Monitor for respiratory depression; serious, life-threatening, or fatal respiratory depression may occur.

- Monitor for application site reactions (paresthesia, ulceration, bleeding, pain, ulcer, irritation). Reactions are usually self-limited and rarely require discontinuation.
- Assess risk for opioid addiction, abuse, or misuse prior to administration.
- ***Lab Test Considerations:*** May cause anemia, neutropenia, thrombocytopenia, and leukopenia.
- May cause hypokalemia, hypoalbuminemia, hypercalcemia, hypomagnesemia, and hyponatremia.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg every 2 min. Use extreme caution when titrating dose in patients physically dependent on opioid analgesics to avoid withdrawal, seizures, and severe pain. Duration of respiratory depression may be longer than duration of opioid antagonist, requiring repeated doses.

Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders.
- Do not confuse fentanyl with sufentanil.
- Patients considered opioid-tolerant are those who are taking ≥60 mg of oral morphine/day, at least 25 mcg transdermal fentanyl/hr, 30 mg of oxycodone/day, 8 mg of hydromorphone/day or an equianalgesic dose of another opioid for ≥1 wk.
- ***High Alert:*** Dose may be lethal to a child; keep out of reach of children.
- Do not substitute fentanyl products; doses are not equivalent.
- For patients no longer requiring opioid therapy, consider discontinuing, along with a gradual downward titration of other opioids to minimize possible withdrawal effects. In patients who continue to take their chronic opioid therapy for persistent pain, but no longer require treatment for breakthrough pain, therapy can usually be discontinued immediately.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.
- ***REMS:*** Health care professionals who prescribe transmucosal immediate-release fentanyl (TIRF) medicines for outpatient use are required to enroll in the TIRF REMS Access program. Health care professionals already enrolled in an individual Risk Evaluation and Mitigation Strategy (REMS) program for at least one TIRF medicine, will be automatically transitioned to the shared TIRF REMS Access program, and do not need to re-enroll. Enrollment renewal in TIRF REMS program is required every 2 yr from the date of enrollment. Information can be found at www.TIRFREMSaccess.com. A TIRF REMS Access Patient-Prescriber Agreement Form must be signed with each new patient before writing the patient's first TIRF prescription and health care professionals must also provide patients with a copy of the *Medication Guide* during counseling about the proper use of their TIRF medicine. Pharmacists who dispense TIRF medicines are also required to enroll in the TIRF REMS program and re-enroll every 2 yr. Patients are enrolled in the TIRF REMS Access program by the pharmacy at the time their first prescription is filled. Patients can locate a participating pharmacy by consulting their prescriber or calling the TIRF REMS Access program at 1-866-822-1483.
- **Buccal:** *Fentora*: Do not attempt to push tablet through blister, may cause damage to tablet. Open by tearing along perforations to separate from blister card. Then bend blister unit on line where indicated. Blister backing should then be peeled to expose tablets. Use immediately; do not store, may damage integrity of tablet. Tablets are not to be sucked, chewed, or swallowed whole; this will reduce medication effectiveness. Place between cheek and gum above a molar or under tongue and allow medication to dissolve, usually 14–25 min. May cause bubbling sensation between teeth and gum while tablet dissolves. Do not attempt to split tablet. After 30 min, if remnants of tablet remain, swallow with glass of water.
- For patients not previously using transmucosal fentanyl, initial dose should be 100 mcg. Titrate to provide adequate relief while minimizing side effects.

© F.A. Davis Publishing

For patients switching from oral transmucosal fentanyl to fentanyl buccal, if transmucosal dose is 200–400 mcg, switch to 100 mcg buccal; if transmucosal dose is 600–800 mcg, switch to 200 mcg buccal; if transmucosal dose is 1200–1600 mcg, switch to 400 mcg buccal fentanyl.

- Dose may be repeated once during a single episode of breakthrough pain if not adequately relieved. Redose may occur 30 min after start of administration of fentanyl buccal and the same dose should be used.
- If more than 1 dose is required per breakthrough pain episode for several consecutive episodes, dose of maintenance opioid and fentanyl buccal tablets should be adjusted. To increase dose, use multiples of 100 mcg tablet, use two 100-mcg tablets (1 on each side of mouth in buccal cavity). If unsuccessful in controlling breakthrough pain episode, two 100-mcg tablets may be placed on each side of mouth in buccal cavity (four 100-mcg tablets). Titrate above 400 mcg by 200 mcg increments. To reduce risk of overdose, patients should have only one strength available at any one time.
- Once a successful dose has been established, instruct patient to use only one dose for each breakthrough episode; if pain is not relieved in 30 min after completion, only one additional use of the same strength can be used for that episode. Instruct patient to wait 4 hr before treating another episode of breakthrough pain. If more than 4 breakthrough pain episodes/day occur, re-evaluate opioid dose for persistent pain.
- Inform patient if medication is no longer needed they should contact Teva Pharmaceuticals at 1-888-483-8279 or remove from blister pack and flush any remaining product down toilet.
- **Transmucosal:** ***Actiq*****:** Open the foil package immediately before use. Instruct patient to place unit in the mouth between the cheek and lower gum, moving it from one side to the other using the handle. Patient should suck, not chew, the lozenge. If it is chewed and swallowed, lower peak concentrations and lower bioavailability may occur. Instruct patient to consume lozenge over 15-min period; longer or shorter periods may be less efficacious. If signs of excessive opioid effects occur, remove from patient's mouth immediately and decrease future doses.
- Initial dose for breakthrough pain should be 200 mcg. Six 200-mcg units should be prescribed and should be used before increasing to a higher dose. If one unit is ineffective, a 2nd unit may be started 15 min after the completion of the first unit. Do not use more than 2 units during a single episode of breakthrough pain during titration phase. With each new dose during titration, 6 units should be prescribed, allowing treatment of several episodes of breakthrough pain. Adequate dose is determined based on effective analgesia with acceptable side effects. Side effects during titration period are usually greater than after effective dose is determined.
- Once an effective dose is determined, instruct patient to use only one *Actiq* unit for each breakthrough episode; if pain is not relieved in 15 min after completion, only one additional use of the same strength can be used for that episode. Instruct patient to wait 4 hr before treating another episode of breakthrough pain.
- Discontinue with a gradual decrease in dose to prevent signs and symptoms of abrupt withdrawal.
- To dispose of remaining unit, using wire-cutting pliers cut off the drug matrix end so that it falls into the toilet. Flush remaining drug matrix down toilet. Drug remaining on handle may be removed by placing under running warm water until dissolved. Dispose of drug-free handle according to institutional protocol. ***High Alert:*** Partially consumed units are no longer protected by child-resistant pouch; dose may still be fatal. A temporary child-resistant storage bottle is provided for partially consumed units that cannot be disposed of properly.
- **SL: Subsys**: Assess for mucositis before administering *Subsys*. *For patients with Grade 1 mucositis,* increased serum concentration and exposure may increase risk of respiratory depression. Monitor closely for respiratory depression and central nervous system depression. *For patients with ≥Grade 2 mucositis,* avoid use of *Subsys* unless the benefits outweigh the potential risk of respiratory depression from increased exposure.
- Dose must start with 100 mcg initially, titrate to adequate pain relief; if initial dose is adequate, this will be the dose for subsequent breakthrough pain; if dose is inadequate within 30 min give supplemental 100-mcg dose and ↑ next breakthrough dose by 100 mcg; if inadequate continue to ↑ breakthrough dose to 400, then 600 mcg, then 800 mcg, then 1600 mcg.
- If inadequate analgesia after first dose, a 2nd dose may be used after 30 min. No more than 2 doses may be used to treat an episode of breakthrough pain. Episodes should be separated by at least 4 hr. Other rescue medications may be used as directed.
- Spray contents under tongue. Follow instructions in *Medication Guide*.
- Before you throw away the *Subsys* spray units, empty all of medicine (up to 10 spray units) into charcoal-lined disposal pouch provided with each dose. Put nozzle of spray unit upside-down into opening of charcoal-lined disposal pouch. Squeeze fingers and thumb together to spray into the charcoal lined disposal pouch. Place empty spray unit into pouch. To seal used charcoal-lined disposal pouch, remove backing from adhesive strip. Fold the flap down and press to seal charcoal-lined disposal pouch. Place sealed charcoal-lined disposal pouch into a disposal bag and seal. Discard sealed disposal bag in trash out of reach of children. This protects others, espe-

© F.A. Davis Publishing

cially children from harm. Follow instructions for use of disposal pouch in *Medication Guide* and *Instructions for Use*.

Patient/Family Teaching

- Instruct patient to take fentanyl transmucosal as directed. Instruct patient in correct technique for use and disposal. Do not take more often than prescribed, keep out of reach of children, protect it from being stolen, and do not share with others, even if they have the same symptoms. Open only when ready to administer. Advise patient to review *Medication Guide* before and with each Rx refill; new information may be available. Advise patient to notify health care professional if breakthrough pain is not alleviated, worsens, if >4 units/day are required to control pain, or if excessive opioid effects occur.
- ***REMS:*** Explain TIRF REMS program to patient and caregiver. Patients must sign the Patient-Prescriber Agreement Form to confirm they understand the risks, appropriate use, and storage of fentanyl transmucosal.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- Advise patient to avoid grapefruit juice during therapy.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- Medication causes dizziness and drowsiness. Advise patient to call for assistance during ambulation and transfer, and to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants, such as sleep aids.
- Advise patient to notify health care professional if sores on gums or inside cheek become a problem.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Instruct females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to fentanyl through breast milk for excess sedation and respiratory depression. Chronic use may reduce fertility in females and males.
- *Actiq*: Inform patient that this drug may contain sugar and may cause dry mouth. Advise patient to maintain good oral hygiene regular dental exams.

Evaluation/Desired Outcomes

- Decrease in severity of pain during episodes of breakthrough pain in patients receiving and tolerant to long-acting opioids.

ferrous fumarate, See IRON SUPPLEMENTS.

ferrous gluconate, See IRON SUPPLEMENTS.

ferrous sulfate, See IRON SUPPLEMENTS.

fesoterodine

(fee-soe-**ter**-o-deen)

Toviaz

Classification

Therapeutic: urinary tract antispasmodics

Pharmacologic: anticholinergics

Indications

Overactive bladder with symptoms of urinary frequency, urgency, and urge incontinence. Neurogenic detrusor overactivity.

Action

Acts as a competitive muscarinic receptor antagonist resulting in inhibition of cholinergically mediated bladder contraction. **Therapeutic Effects:** Decreased urinary frequency, urgency, and urge incontinence in overactive bladder. Increase in maximum cystometric bladder capacity in neurogenic detrusor overactivity.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration, but is rapidly converted to its active metabolite (bioavailability of metabolite 52%); further metabolism occurs in the liver via CYP2D6 and CYP3A4 enzyme systems; the CYP2D6 enzyme system exhibits genetic

© F.A. Davis Publishing

polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly ↑ fesoterodine concentrations and an ↑ risk of adverse effects. 16% of active metabolite is excreted in urine, most of the remainder of inactive metabolites are renally excreted. 7% excreted in feces.

Distribution: Unknown.

Metabolism and Excretion: Rapidly converted by esterases to active metabolite.

Half-life: 7 hr (following oral administration).

TIME/ACTION PROFILE (active metabolite)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Urinary retention; Significant bladder outlet obstruction (↑ risk of retention); Gastric retention; ↓ GI motility including severe constipation; Severe hepatic impairment; Uncontrolled narrow-angle glaucoma; Pedi: eGFR <15 mL/min/1.73 m² or requiring dialysis (children <6 yr and >35 kg); Pedi: eGFR <30 mL/min/1.73 m² or requiring dialysis (children <6 yr and 25–35 kg); Pedi: Concurrent use of strong CYP3A4 inhibitors (children <6 yr and 25–35 kg).

Use Cautiously in: CCr <30 mL/min (dose adjustment required in adults); Treated narrow-angle glaucoma (use only if benefits outweigh risks); Myasthenia gravis; Severe renal impairment (dose should not exceed 4 mg/day); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children <18 yr (overactive bladder) or <6 yr or <25 kg (neurogenic detrusor overactivity); Geri: ↑ risk of anticholinergic side effects in patients >75 yr.

Adverse Reactions/Side Effects

CV: tachycardia (dose related). **GI:** dry mouth, constipation, nausea, upper abdominal pain. **GU:** dysuria, urinary retention. **MS:** back pain. **Neuro:** dizziness, drowsiness, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions

Drug-Drug: Concurrent use of **strong CYP3A4 inhibitors** including **ketoconazole**, **itraconazole**, and **clarithromycin** ↑ blood levels and risk of toxicity; daily dose should not exceed 4 mg in adults and children ≥6 yr and >35 kg; avoid concurrent use in children ≥6 yr and 25–35 kg. Additive anticholinergic effects with other **anticholinergic drugs**, including **antihistamines**, **phenothiazines**, **quinidine**, **disopyramide**, and **tricyclic antidepressants**. May ↓GI absorption of other drugs.

Route/Dosage

Overactive Bladder

PO (Adults): 4 mg once daily initially; may ↑ to 8 mg/daily, if needed based on response and tolerability; *Concurrent use of strong CYP3A4 inhibitors*—Do not exceed 4 mg/day.

Renal Impairment

PO (Adults): *CCr <30 mL/min*—Do not exceed 4 mg/day.

Neurogenic Detrusor Overactivity

PO (Children ≥6 yr and >35 kg): 4 mg once daily, then ↑ to 8 mg once daily after 1 wk; *Concurrent use of strong CYP3A4 inhibitors*—Do not exceed 4 mg/day.

PO (Children ≥6 yr and 25–35 kg): 4 mg once daily; ↑ to 8 mg once daily, if needed; *Concurrent use of strong CYP3A4 inhibitors*—Use not recommended.

Renal Impairment

PO (Children ≥6 yr and >35 kg): *eGFR 15–29 mL/min/1.73 m²*—Do not exceed 4 mg/day; *eGFR <15 mL/min/1.73 m² or requiring dialysis*—Use not recommended.

Renal Impairment

PO (Children ≥6 yr and 25–35 kg): *eGFR 30–89 mL/min/1.73 m²*—Do not exceed 4 mg/day; *eGFR <30 mL/min/1.73 m² or requiring dialysis*—Use not recommended.

Availability (generic available)

Extended-release tablets: 4 mg, 8 mg.

NURSING IMPLICATIONS

Assessment

- Assess for urinary urgency, frequency, and urge incontinence periodically during therapy.
- Monitor for signs and symptoms of angioedema (swelling of face, lips, tongue, and/or larynx). May occur with first or subsequent doses. Discontinue therapy and prove supportive therapy. Have epinephrine, corticosteroids, and resuscitation equipment available.
- ***Lab Test Considerations:*** May cause ↑ ALT and GGT.

Implementation

- **PO:** Administer with liquid without regard to food.
- ***DNC:*** Swallow extended-release tablets whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take fesoterodine as directed. If a dose is missed, omit and begin taking again the next day; do not take 2 doses the same day. Advise patient to read the *Patient Information* sheet prior to initiation of therapy and with each Rx refill in case of changes.
- May cause drowsiness, dizziness, and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.

© F.A. Davis Publishing

- Advise patient to avoid alcohol; may increase drowsiness.
- Advise patient to use caution in hot environments; may cause decreased sweating and severe heat illness.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to stop medication and notify health care professional if signs and symptoms of angioedema occur.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased urinary frequency, urgency, and urge incontinence.
- Increase in maximum cystometric bladder capacity in neurogenic detrusor overactivity.

fexofenadine

(fex-oh-**fen**-a-deen)

~~Allegra~~, Allegra Allergy, Children's Allegra Allergy, ~~Children's Allegra Hives~~, ~~Mucinex Allergy~~

Classification

Therapeutic: allergy, cold, and cough remedies, antihistamines

Indications

Relief of symptoms of seasonal allergic rhinitis. Management of chronic idiopathic urticaria.

Action

Antagonizes the effects of histamine at peripheral histamine–1 (H_1) receptors, including pruritus and urticaria. Also has a drying effect on the nasal mucosa.

Therapeutic Effects: Decreased sneezing, rhinorrhea, itchy eyes, nose, and throat associated with seasonal allergies. Decreased urticaria.

Pharmacokinetics

Absorption: Rapidly absorbed after oral administration.

Distribution: Unknown.

Metabolism and Excretion: 80% excreted in urine, 11% excreted in feces.

Half-life: 14.4 hr (↑ in renal impairment).

TIME/ACTION PROFILE (antihistaminic effect)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	2–3 hr	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Renal impairment (↑ dosing interval recommended); OB: Use only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established.

Adverse Reactions/Side Effects

GI: dyspepsia. **GU:** dysmenorrhea. **Neuro:** drowsiness, fatigue.

Interactions

Drug-Drug: Magnesium and aluminum-containing antacids ↓ absorption and may decrease effectiveness.

Drug-Food: Apple, **orange**, and **grapefruit juice** ↓ absorption and may decrease effectiveness.

Route/Dosage

PO (Adults and Children ≥12 yr): 60 mg twice daily, or 180 mg once daily.

PO (Children 2–11 yr): 30 mg twice daily.

PO (Children 6 mo–2 yr): 15 mg twice daily.

Renal Impairment

PO (Adults): 60 mg once daily as a starting dose.

PO (Children 6–11 yr): 30 mg once daily as a starting dose.

Availability (generic available)

Gelcaps: 180 mg[OTC]. **Orally disintegrating tablets:** 30 mg[OTC]. **Suspension (berry flavor):** 30 mg/5 mL[OTC]. **Tablets:** 60 mg[OTC], 🍁 120 mg[OTC], 180 mg[OTC]. ***In combination with:*** pseudoephedrine (Allegra-D). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** Will cause false-negative reactions on allergy skin tests; discontinue 3 days before testing.

Implementation

- Do not confuse Allegra (fexofenadine) with Viagra (sildenafil). Do not confuse Allegra (fexofenadine) with Allegra Anti-Itch Cream (diphenhydramine/allantoin).
- **PO:** Administer with food or milk to decrease GI irritation. Administer capsules and tablets with water

© F.A. Davis Publishing

or milk, not juice. Shake solution bottle well before use.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered unless almost time for next dose. Do not take more than recommended.
- Instruct patient or parents to avoid taking fexofenadine with fruit juices (apple, orange, grapefruit) or antacids containing aluminum or magnesium; may decrease effectiveness of fexofenadine.
- Inform patient that drug may cause drowsiness, although it is less likely to occur than with other antihistamines. Avoid driving or other activities requiring alertness until response to drug is known.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Instruct patient to contact health care professional if symptoms persist.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.
- Decrease in urticaria.

fidaxomicin (fi-dax-oh-**mye**-sin)

Dificid

Classification

Therapeutic: anti-infectives
Pharmacologic: macrolides

Indications

Treatment of diarrhea associated with *Clostridioides difficile*.

Action

Bactericial action mostly against clostridia; inhibits RNA synthesis. Acts locally in the GI tract to eliminate *Clostridioides difficile*. **Therapeutic Effects:** Elimination of diarrhea caused by *Clostridioides difficile*.

Pharmacokinetics

Absorption: Minimal systemic absorption.
Distribution: Stays primarily in the GI tract.
Metabolism and Excretion: Mostly transformed via hydrolysis in the GI tract to OP-1118, its active metabolite. Eliminated mostly (>92%) in feces: <1% excreted in urine.
Half-life: *Fidaxomicin*—11.7 hr; *OP-1118*—11.2 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to fidaxomicin or macrolides (cross-sensitivity may occur).

Use Cautiously in: OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <6 mo (safety and effectiveness not established).

Adverse Reactions/Side Effects

GI: GI HEMORRHAGE, nausea, abdominal pain. **Hemat:** anemia, neutropenia. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions

Drug-Drug: None reported.

Route/Dosage

PO (Adults): 200 mg twice daily for 10 days .
PO (Children ≥6 mo and ≥12.5 kg): *Tablets*—200 mg twice daily for 10 days (if unable to swallow tablets, use granules for oral suspension).
PO (Children ≥6 mo and 9–<12.5 kg): *Granules for oral suspension*—160 mg twice daily for 10 days.
PO (Children ≥6 mo and 7–<9 kg): *Granules for oral suspension*—120 mg twice daily for 10 days.
PO (Children ≥6 mo and 4–<7 kg): *Granules for oral suspension*—80 mg twice daily for 10 days.

Availability

Granules for oral suspension (berry-flavor): 200 mg/5 mL. **Tablets:** 200 mg.

NURSING IMPLICATIONS

Assessment

- Monitor bowel function for diarrhea, abdominal cramping, fever, and bloody stools. May begin up to several wk following cessation of antibiotic therapy.
- Monitor for signs and symptoms of hypersensitivity reactions (dyspnea, pruritus, rash, angioedema of mouth, throat, and face) periodically during therapy. Risk increases with a macrolide allergy.
- ***Lab Test Considerations:*** May cause ↑ serum alkaline phosphatase, and hepatic enzymes.
- May cause ↓ serum bicarbonate, ↓ platelet count, anemia, and neutropenia.
- May cause hyperglycemia and metabolic acidosis.

Implementation

- **PO:** Administer twice daily, about 12 hr apart, without regard to food.
- For oral suspension, shake the glass bottle to ensure the granules move around freely and no caking has occurred. Measure 130 mL of purified water, add to glass bottle, and cap tightly. Hold bottle in a horizontal position and shake bottle vigorously in that position for at least 2 minutes. Verify that suspension is homogeneous; shake again. Once suspension is homogeneous, shake an additional 30 seconds. Let bottle stand for 1 min. Verify that suspension is still homogeneous. If not, repeat previous steps. Once reconstituted, oral suspension is white to yellowish white. Write discard date (current date plus 12 days) on the bottle. Stable in refrigerator for up to

© F.A. Davis Publishing

12 days; discard after 12 days. Remove bottle from refrigerator 15 min before administration. Shake vigorously until suspension is homogenous. Administer orally with or without food using an oral dosing syringe to ensure accurate dose.

Patient/Family Teaching

- Instruct patient to take fidamoxicin twice daily, 12 hr apart, as directed for the full course of therapy, even if feeling better. Skipping doses or not completing full course of therapy may decrease effectiveness of therapy and increase risk that bacteria will develop resistance and not be treatable in the future.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in diarrhea caused by *Clostridioides difficile*.

filgrastim (fil-**gra**-stim)

Granix, Grastofil, Neupogen, Nivestym, Zarxio

Classification

Therapeutic: colony-stimulating factors

Indications

Prevention of febrile neutropenia and associated infection in patients who have received bone marrow–depressing antineoplastics for the treatment of nonmyeloid malignancies. Reduction of time for neutrophil recovery and duration of fever in patients undergoing induction and consolidation chemotherapy for acute myelogenous leukemia. Reduction of time to neutrophil recovery and sequelae of neutropenia in patients with nonmyeloid malignancies undergoing myeloablative chemotherapy followed by bone marrow transplantation. Mobilization of hematopoietic progenitor cells into peripheral blood for collection by leukapheresis. Management of severe chronic neutropenia. Survival improvement in patients acutely exposed to myelosuppressive doses of radiation. **Unlabeled Use:** Neutropenia associated with HIV infection. Neonatal neutropenia.

Action

A glycoprotein, filgrastim binds to and stimulates immature neutrophils to divide and differentiate. Also activates mature neutrophils. **Therapeutic Effects:** Decreased incidence of infection in patients who are neutropenic from chemotherapy or other causes. Improved harvest of progenitor cells for bone marrow transplantation. Improved survival in patients exposed to myelosuppressive doses of radiation.

Pharmacokinetics

Absorption: Well absorbed after subcut administration.

Distribution: Unknown.

Metabolism and Excretion: Unknown.

Half-life: *Adults*—3.5 hr; *Neonates*—4.4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV, subcut	unknown	unknown	4 days†

†Return of neutrophil count to baseline.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to filgrastim or *Escherichia coli*-derived proteins.

Use Cautiously in: Congenital neutropenia (↑ risk of myelodysplastic syndrome or acute myeloid leukemia); Patients with breast or lung cancer receiving chemotherapy and/or radiotherapy (↑ risk of myelodysplastic syndrome or acute myeloid leukemia); Patients with sickle cell disease (↑ risk of sickle cell crisis); Malignancy with myeloid characteristics; Pre-existing cardiac disease; OB: Use only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects

CV: aortitis, vasculitis. **EENT:** hemoptysis. **GI:** SPLENIC RUPTURE, splenomegaly. **GU:** glomerulonephritis. **Hemat:** ACUTE MYELOID LEUKEMIA, MYELODYSPLASTIC SYNDROME, excessive leukocytosis, sickle cell crises, thrombocytopenia. **Local:** pain at injection site. **MS:** medullary bone pain. **Resp:** ACUTE RESPIRATORY DISTRESS SYNDROME, pulmonary infiltrates. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Simultaneous use with **antineoplastics** may have adverse effects on rapidly proliferating neutrophils—avoid use for 24 hr before and 24 hr after chemotherapy. **Lithium** may potentiate the release of neutrophils; concurrent use should be undertaken cautiously.

Route/Dosage

After Myelosuppressive Chemotherapy

IV, Subcut (Adults and Children): 5 mcg/kg/day as a single subcut injection, by short IV infusion, or via continuous IV infusion for up to 2 wk or until ANC reaches 10,000/mm^3. Initiate at least 24 hr after chemotherapy. Dose may be ↑ by 5 mcg/kg during each cycle of chemotherapy, depending on blood counts.

© F.A. Davis Publishing

After Bone Marrow Transplantation

IV (Adults): 10 mcg/kg/day as a continuous IV infusion for up to 24 hr; initiate at least 24 hr after chemotherapy and at least 24 hr after bone marrow transplantation. Subsequent dose is adjusted according to blood counts.

Peripheral Blood Progenitor Cell Collection and Therapy

Subcut (Adults): 10 mcg/kg/day for at least 4 days before first leukapheresis and continued until last leukapheresis; Discontinue if WBC >100,000 cells/mm^3.

Severe Chronic Neutropenia

Subcut (Adults): *Congenital neutropenia*—6 mcg/kg twice daily. *Idiopathic/cyclical neutropenia*—5 mcg/kg daily (↓ if ANC remains >10,000/mm^3).

After Myelosuppressive Radiation

Subcut (Adults): 10 mcg/kg once daily; initiate as soon as possible after exposure to radiation doses greater than 2 gray (Gy); continue until ANC remains >1000/mm^3 for 3 consecutive blood counts (performed every 3 days) or is >10,000/mm^3 after a radiation-induced nadir.

Neonatal Neutropenia

IV, Subcut (Neonates): 5–10 mcg/kg/day once daily for 3–5 days.

Availability

Solution for injection (prefilled syringes): 300 mcg/0.5 mL, 480 mcg/0.8 mL. **Solution for injection (vials):** 300 mcg/1 mL, 480 mcg/1.6 mL.

NURSING IMPLICATIONS

Assessment

- Monitor heart rate, BP, and respiratory status before and periodically during therapy.
- Assess bone pain throughout therapy. Pain is usually mild to moderate and controllable with nonopioid analgesics, but may require treatment with opioid analgesics, especially in patients receiving high-dose IV therapy. Loratadine 10 mg PO administered before filgrastim dose has been used to prevent bone pain.
- Monitor for signs and symptoms of allergic reactions (rash, urticaria, facial edema, wheezing, dyspnea, hypotension, tachycardia). Usually occur within 30 min of administration. Treatment includes antihistamines, steroids, bronchodilators, and/or epinephrine; may recur with rechallenge.
- Assess for signs and symptoms of acute respiratory distress syndrome (fever, lung infiltrates, or respiratory distress). If symptoms occur, withhold filgrastim until symptoms resolve or discontinue.
- Monitor for signs and symptoms of splenic enlargement or rupture (left upper abdominal or shoulder pain).
- May cause transient positive bone-imaging changes.
- ***Lab Test Considerations:*** *After chemotherapy,* obtain a CBC with differential, including examination for the presence of blast cells, and platelet count before chemotherapy and twice weekly during therapy to avoid leukocytosis. Monitor ANC. A transient rise is seen 1–2 days after initiation of therapy, but therapy should not be discontinued until ANC >10,000/mm^3.
- *After bone marrow transplant,* the daily dose is titrated by the neutrophil response. When the ANC is >1000/mm^3 for 3 consecutive days, reduce dose to 5 mcg/kg/day. If the ANC remains >1000/mm^3 for 3 or more consecutive days, discontinue filgrastim. If the ANC decreases to <1000/mm^3, resume filgrastim at 5 mcg/kg/day.
- *For chronic severe neutropenia,* monitor CBC with differential and platelet count twice weekly during initial 4 wk of therapy and during 2 wk after any dose adjustment.
- May cause ↓ platelet count and transient ↑ in uric acid, LDH, and alkaline phosphatase concentrations.
- May cause myelodysplastic syndrome (MDS) and acute myeloid leukemia (AML) in patient with severe chronic neutropenia, breast, or lung cancer. Monitor for signs and symptoms (tiredness, fever, easy bruising or bleeding).

Implementation

- Administer no earlier than 24 hr after cytotoxic chemotherapy, at least 24 hr after bone marrow infusion, and not during the 24 hr before administration of chemotherapy.
- Refrigerate; do not freeze. Do not shake. May warm to room temperature for up to 6 hr before injection. Discard if left at room temperature for >6 hr. Vial is for one-time use only.
- **Subcut:** May be administered in outer area of upper arms, abdomen, thighs, or upper outer areas of buttock. If dose requires >1 mL of solution, may be divided into 2 injection sites.
- Cap of needle contains latex; avoid administration by persons with latex allergy.
- May also be administered as a continuous subcut infusion over 24 hr after bone marrow transplantation.

IV Administration

- **Continuous Infusion:** ***Dilution:*** Dilute in D5W; do not dilute with 0.9% NaCl, will precipitate. Refrigerate; do not freeze. Do not shake. May warm to room temperature for up to 6 hr before injection. Vial is for one-time use only. ***Concentration:*** Dilute to a final concentration of at least 15 mcg/mL. If the final concentration is <15 mcg/mL, human albumin in a concentration of 2 mg/mL must be added to D5W before filgrastim to prevent adsorption of the components of the drug delivery system. May be stored at room temperature for up to 24 hr. ***Rate:*** *After chemotherapy* dose is administered via infusion over 15–60 min.
- *After chemotherapy* dose may also be administered as a continuous infusion.

© F.A. Davis Publishing

- *After bone marrow transplant,* administer dose as an infusion over 4 or 24 hr.
- **Y-Site Compatibility:** acyclovir, allopurinol, amikacin, aminophylline, ampicillin, ampicillin/sulbactam, aztreonam, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefotetan, ceftazidime, chlorpromazine, cisplatin, cyclophosphamide, cytarabine, dacarbazine, daunorubicin hydrochloride, dexamethasone, diphenhydramine, doxorubicin, doxycycline, droperidol, enalaprilat, famotidine, floxuridine, fluconazole, fludarabine, ganciclovir, granisetron, haloperidol, hydrocortisone, hydromorphone, idarubicin, ifosfamide, leucovorin calcium, levofloxacin, lorazepam, melphalan, meperidine, mesna, methotrexate, metoclopramide, mitoxantrone, morphine, nalbuphine, ondansetron, posaconazole, potassium chloride, promethazine, rituximab, sodium acetate, sodium bicarbonate, streptozocin, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vinblastine, vincristine, vinorelbine, zidovudine.
- **Y-Site Incompatibility:** aminocaproic acid, cefepime, cefotaxime, cefoxitin, ceftaroline, ceftriaxone, cefuroxime, clindamycin, dactinomycin, etoposide, fluorouracil, furosemide, heparin, isavuconazonium, mannitol, methylprednisolone , metronidazole, mitomycin, prochlorperazine, thiotepa.

Patient/Family Teaching

- Explain purpose of filgrastim to patient. Instruct patient and caregiver on correct technique for injection, care and disposal of equipment. Advise patient to notify health care professional regarding when to give next dose if a dose is missed. Instruct patient and caregiver to read *Instructions for Patients and Caregivers* before starting therapy and with each Rx refill in case of changes.
- Instruct patient to notify health care professional immediately if signs and symptoms of spleen enlargement or rupture, allergic reaction, ARDS, glomerulonephritis (swelling of face or ankles, dark colored urine or blood in urine, decrease in urine production), MDS, AML, or vasculitis (skin redness, purple spots on skin) occur. Discuss risk of sickle cell crisis with patients with sickle cell disease before administering.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Home Care Issues:** Instruct patient on correct technique and proper disposal for home administration. Caution patient not to reuse needle, vial, or syringe. Provide patient with a puncture-proof container for needle and syringe disposal.

Evaluation/Desired Outcomes

- Decreased incidence of infection in patients who receive bone marrow–depressing antineoplastics.
- Reduction of duration and sequelae of neutropenia after bone marrow transplantation.
- Reduction of the incidence and duration of sequelae of neutropenia in patients with severe chronic neutropenia.
- Improved harvest of progenitor cells for bone marrow transplantation.
- Improved survival in patients exposed to myelosuppressive doses of radiation.

F

finasteride (fi-nas-teer-ide)

Propecia, Proscar

Classification

Therapeutic: hair regrowth stimulants
Pharmacologic: androgen inhibitors

Indications

Benign prostatic hyperplasia (BPH); can be used with doxazosin. Androgenetic alopecia (male pattern baldness) in men only.

Action

Inhibits the enzyme 5-alpha-reductase, which is responsible for converting testosterone to its potent metabolite 5-alpha-dihydrotestosterone in prostate, liver, and skin; 5-alpha-dihydrotestosterone is partially responsible for prostatic hyperplasia and hair loss.
Therapeutic Effects: Reduced prostate size with associated decrease in urinary symptoms. Decreases hair loss; promotes hair regrowth.

Pharmacokinetics

Absorption: Well absorbed after oral administration (63%).
Distribution: Enters prostatic tissue and crosses the blood-brain barrier. Remainder of distribution not known.
Protein Binding: 90%.
Metabolism and Excretion: Mostly metabolized; 39% excreted in urine as metabolites; 57% excreted in feces.
Half-life: 6 hr (range 6–15 hr; slightly ↑ in patients >70 yr).

© F.A. Davis Publishing

TIME/ACTION PROFILE (↓ in dihydrotestosterone levels†)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	8 hr	2 wk

†Clinical effects as noted by urinary tract symptoms and hair regrowth may not be evident for several mo and remain for 4 mo after discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Women.
Use Cautiously in: Hepatic impairment; Obstructive uropathy.

Adverse Reactions/Side Effects

Endo: gynecomastia. **GU:** PROSTATE CANCER (HIGH-GRADE), ↓ libido, ↓ volume of ejaculate, erectile dysfunction, infertility. **Misc:** ANGIOEDEMA, BREAST CANCER.

Interactions

Drug-Drug: None reported.

Route/Dosage

PO (Adults): *BPH*—5 mg once daily (Proscar); *Androgenetic alopecia*—1 mg once daily (Propecia).

Availability (generic available)

Tablets: 1 mg (Propecia), 5 mg (Proscar). **Cost:** *Generic*—1 mg $134.61/100, 5 mg $21.85/100.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of prostatic hyperplasia (urinary hesitancy, feeling of incomplete bladder emptying, interruption of urinary stream, impairment of size and force of urinary stream, terminal urinary dribbling, straining to start flow, dysuria, urgency) before and periodically during therapy.
- Digital rectal examinations should be performed before and periodically during therapy for BPH.
- ***Lab Test Considerations:*** Serum prostate-specific antigen (PSA) concentrations, which are used to screen for prostate cancer, may be evaluated before and periodically during therapy. Finasteride may cause a ↓ in serum PSA levels.

Implementation

- Do not confuse Proscar (finasteride) with Prograf (tacrolimus) or Provera (medroxyprogesterone).
- **PO:** Administer once daily with or without meals.

Patient/Family Teaching

- Instruct patient to take finasteride as directed, even if symptoms improve or are unchanged. At least 6–12 mo of therapy may be necessary to determine whether or not an individual will respond to finasteride. Advise patient to read the *Patient Package Insert* prior to starting therapy and with each Rx refill in case of changes.
- Inform patient that the volume of ejaculate may be decreased and erectile dysfunction and decreased libido may occur during therapy and after therapy is completed.
- Advise patient to notify health care professional promptly if changes in breasts (lumps, pain, nipple discharge) occur.
- Inform patient that there is an increased risk of high grade prostate cancer in men taking this drug.
- Rep: Caution patient that finasteride poses a potential risk to a male fetus. Women who are pregnant or may become pregnant should avoid exposure to semen of a partner taking finasteride and should not handle crushed finasteride because of the potential for absorption.
- Emphasize the importance of periodic follow-up exams to determine whether a clinical response has occurred.

Evaluation/Desired Outcomes

- Decrease in urinary symptoms of benign prostatic hyperplasia.
- Hair regrowth in androgenetic alopecia. Evidence of hair growth usually requires 3 mo or longer. Continued use is recommended to sustain benefit. Withdrawal leads to reversal of effect within 12 mo.

finerenone (fin-**er**-e-none)

Kerendia

Classification

Therapeutic: none assigned
Pharmacologic: mineralocorticoid receptor antagonists (non-steroidal)

Indications

To reduce the risk of sustained eGFR decline, end-stage kidney disease, cardiovascular death, nonfatal myocardial infarction, and hospitalization for heart failure in patients with chronic kidney disease associated with type 2 diabetes.

Action

Acts as a nonsteroidal, selective antagonist of the mineralocorticoid receptor which results in reduction in sodium reabsorption and a reduction in fibrosis and inflammation in the heart, blood vessels, and kidneys.
Therapeutic Effects: Reduction in the risk of a sustained eGFR decline, end-stage kidney disease, cardiovascular death, nonfatal myocardial infarction, and hospitalization for heart failure in chronic kidney disease associated with type 2 diabetes.

Pharmacokinetics

Absorption: 44% absorbed following oral administration.
Distribution: Widely distributed to extravascular tissues.
Protein Binding: 92%.
Metabolism and Excretion: Primarily metabolized in the liver via the CYP3A4 isoenzyme, and to a lesser extent by the CYP2C8 isoenzyme to inactive metabolites. Primarily excreted in the urine (80%) as metabolites, with 20% being excreted in feces.

© F.A. Davis Publishing

Half-life: 2–3 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	30 min-1.25 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of strong CYP3A4 inhibitors; Adrenal insufficiency; Hyperkalemia (serum potassium >5 mEq/L); eGFR <25 mL/min/m²; Severe hepatic impairment; Lactation: Lactation.

Use Cautiously in: Renal impairment (↑ risk of hyperkalemia) (adjust dose); Moderate hepatic impairment; OB: Safety not established in pregnancy; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: hypotension. **F and E:** hyperkalemia, hyponatremia.

Interactions

Drug-Drug: **Strong CYP3A4 inhibitors** may significantly ↑ levels and risk of hyperkalemia; concurrent use is contraindicated. **Moderate CYP3A4 inhibitors**, including **erythromycin** or **weak CYP3A4 inhibitors**, including **amiodarone**, may ↑ levels and risk of hyperkalemia; closely monitor serum potassium levels after initiation of or after dosage adjustment of either the CYP3A4 inhibitor or finerenone. **Strong CYP3A4 inducers**, including **rifampin**, or **moderate CYP3A4 inducers**, including **efavirenz**, may ↓ levels and effectiveness; avoid concurrent use. Use with **ACE inhibitors**, **NSAIDs**, **potassium supplements**, **angiotensin II receptor antagonists**, **potassium-sparing diuretics**, **angiotensin converting enzyme inhibitors**, or **cyclosporine** ↑ risk of hyperkalemia.

Drug-Food: **Grapefruit juice** or **grapefruit** may ↑ levels and risk of hyperkalemia; avoid concomitant use.

Route/Dosage

PO (Adults): 20 mg once daily.

Renal Impairment

PO (Adults): *eGFR 25– <60 mL/min/m²* — 10 mg once daily; after 4 wk, may ↑ to 20 mg once daily if serum potassium ≤4.8 mEq/L.

Availability

Tablets: 10 mg, 20 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of hyperkalemia (fatigue, muscle weakness, paresthesia, confusion, dyspnea, cardiac arrhythmias) during therapy. If symptoms occur, confirm with serum potassium.
- ***Lab Test Considerations:*** Measure serum potassium levels and estimated glomerular filtration rate (eGFR) before starting therapy. Do not start therapy if serum potassium is >5.0 mEq/L.
- Measure serum potassium 4 wks after starting therapy and adjust dose. If serum potassium is ≤4.8 mEq/L, increase dose to 20 mg, if at 10 mg/day or maintain 20 mg/day dose. If serum potassium levels are >4.8 to 5.5 mEq/L, maintain current 10 mg/day or 20 mg/day dose. If serum potassium is >5.5 mEq/L, hold finerenone dose. If at 10 mg/day dose, consider restarting at 10 mg/day once serum potassium is ≤5.0 mEq/L. If at 20 mg/day dose, restart at 10 mg/day when serum potassium is ≤5.0 mEq/L. Monitor serum potassium 4 weeks after a dose adjustment and throughout treatment, and adjust the dose as needed.

Implementation

- **PO:** For patients unable to swallow tablets whole, tablets may be crushed and mixed with water or soft foods (applesauce) immediately before use.

Patient/Family Teaching

- Instruct patient to take finerenone as directed. Take missed dose as soon as remembered, but only on same day. Do not double doses.
- Advise patients to consult with health care professional before using potassium supplements or salt substitutes containing potassium.
- Caution patient to avoid grapefruit and grapefruit juice during therapy; may increase the plasma concentration of finerenone.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during and for 1 day after last dose.
- Emphasize the importance of regular lab test to monitor potassium levels.

Evaluation/Desired Outcomes

- Reduction of the risk of sustained eGFR decline, end-stage kidney disease, cardiovascular death, nonfatal myocardial infarction, and hospitalization for heart failure in adult patients with chronic kidney disease (CKD) associated with type 2 diabetes.

fingolimod (fin-**go**-li-mod)
Gilenya

Classification
Therapeutic: anti-multiple sclerosis agents
Pharmacologic: receptor modulators

F

© F.A. Davis Publishing

Indications
Relapsing forms of multiple sclerosis (MS), including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease.

Action
Converted by sphingosine kinase to the active metabolite fingolimod-phosphate, which binds to sphingosine 1–phosphate receptors, resulting in ↓ migration of lymphocytes into peripheral blood. This may ↓ lymphocyte migration into the CNS. **Therapeutic Effects:** ↓ frequency of relapses/delayed accumulation of disability.

Pharmacokinetics
Absorption: Well absorbed (93%) following oral administration.
Distribution: Extensively distributed to body tissues; 86% of parent drug distributes into red blood cells; active metabolite uptake 17%.
Metabolism and Excretion: Converted to its active metabolite, then metabolized mostly by the CYP450 4F2 enzyme system, with further degradation by other enzyme systems. Most inactive metabolites excreted in urine (81%); <2.5% excreted as fingolimod and fingolimod-phosphate in feces.
Protein Binding: >99.7%.
Half-life: 6–9 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–2 mo*	2 mo†

*Time to steady state blood levels, peak blood levels after a single dose at 12–16 hr.
†Time for complete elimination.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; MI, unstable angina, stroke, TIA, or class III or IV HF within previous 6 mo; 2nd- or 3rd-degree heart block or sick sinus syndrome (in the absence of a pacemaker); QT interval ≥500 msec; Cardiac arrhythmias requiring use of class Ia or III antiarrhythmics; Active acute/chronic untreated infections; OB: Pregnancy (may cause fetal harm).
Use Cautiously in: Concurrent use of beta blockers, diltiazem, verapamil, or digoxin (↑ risk of bradycardia/heart block); History of ischemic heart disease, MI, HF, cerebrovascular disease, uncontrolled hypertension, AV or SA heart block, symptomatic bradycardia, recurrent syncope, cardiac arrest, or severe untreated sleep apnea (↑ risk of bradycardia/heart block); QT interval prolongation before doing or during observation period (>450 msec in adult and pediatric males, >470 msec in adult females, >460 msec in pediatric females), hypokalemia, hypomagnesemia, congenital long QT syndrome, or concurrent use of QT interval prolonging medications (↑ risk of QT interval prolongation); Severe hepatic impairment (↑ blood levels and risk of adverse reactions); Diabetes mellitus/history of uveitis (↑ risk of macular edema); Negative history for chickenpox or vaccination against varicella zoster virus vaccination; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Rep: Women of reproductive potential; Pedi: Children <10 yr (safety and effectiveness not established); Geri: Risk of adverse reactions may be ↑ consider age-related ↓ in cardiac/renal/hepatic function, chronic illnesses, and concurrent drug therapy.

Adverse Reactions/Side Effects
CV: ASYSTOLE, BRADYCARDIA, HEART BLOCK, QT INTERVAL PROLONGATION, hypertension, syncope. **Derm:** BASAL/SQUAMOUS CELL CARCINOMA, MELANOMA. **EENT:** blurred vision, eye pain, macular edema. **GI:** HEPATOTOXICITY, diarrhea, ↑ liver enzymes. **Hemat:** leukopenia, lymphopenia. **MS:** back pain. **Neuro:** POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES), PROGRESSIVE MULTIFOCAL LEUKOENCEPHALOPATHY (PML), headache, tumefactive MS. **Resp:** cough, ↓ pulmonary function. **Misc:** HYPERSENSITIVITY REACTIONS (including rash, urticaria, and angioedema), INFECTION (including bacterial, viral and fungal), LYMPHOMA.

Interactions
Drug-Drug: **Class Ia or class III antiarrhythmics** may ↑ risk of serious arrhythmias; concurrent use contraindicated. Concurrent use of **beta blockers**, **diltiazem**, **verapamil**, **ivabradine**, **clonidine**, or **digoxin** may ↑ risk of bradycardia; careful monitoring recommended. Concurrent use of **QT-interval prolonging medications** may ↑ risk of QT interval prolongation and torsade de pointes. Concurrent use of **ketoconazole** may ↑ blood levels and risk of adverse reactions. ↑ risk of immunosuppression with **antineoplastics**, **immunosuppressants**, or **immune modulating therapies**. **Live-attenuated vaccines** ↑ risk of infection.

Route/Dosage
PO (Adults and Children ≥10 yr and >40 kg): 0.5 mg once daily.
PO (Children ≥10 yr and ≤40 kg): 0.25 mg once daily.

Availability (generic available)
Capsules: 0.25 mg, 0.5 mg.

NURSING IMPLICATIONS
Assessment
- Perform *first-dose monitoring* in all patients when starting therapy, when re-starting therapy after drug was discontinued for at least 14 days, when therapy is interrupted ≥1 day within first 2 wk of therapy; when therapy is interrupted for >7 days during wks 3 and 4 of therapy, and in pediatric patients when increasing dose.
- *First dose monitoring:* Monitor pulse and BP hourly for bradycardia for at least 6 hr following first dose and periodically during therapy. Obtain base-

© F.A. Davis Publishing

line ECG before first dose and at end of observation period. *If after 6 hrs of therapy* patient develops heart rate <45 bpm in adults, <55 bpm in pediatric patients ≥12 yrs, or <60 bpm in pediatric patients 10 or 11 yrs of age; heart rate 6 hrs postdose is at lowest value postdose, maximum pharmacodynamic effect on the heart may not have occurred; ECG 6 hrs postdose shows new onset second degree or higher AV block continue monitoring until resolves. If pharmacological treatment is required, continue monitoring overnight and repeat 6-hr monitoring after the second dose. Monitor ECG continuously overnight if pharmacologic intervention for symptomatic bradycardia required, patient has preexisting heart or cerebrovascular condition, patients has a prolonged QTc interval before dosing or during 6-hr observation, or at risk for QT prolongation, or on concurrent therapy with QT prolonging drugs.

- Monitor for signs of infection (fever, tiredness, body aches, chills, nausea, vomiting, headache, sore throat) during and for 2 mo after discontinuation of therapy. Consider suspending therapy if serious infection develops.
- Perform an ophthalmologic exam prior to starting fingolimod, at 3–4 mo after starting therapy, and if visual disturbances occur. Monitor visual acuity at baseline and during routine exams. Patients with diabetes or history of uveitis are at ↑ risk and should have regular ophthalmologic exams.
- Monitor pulmonary function tests for decline periodically during therapy. Obtain spirometry and diffusion lung capacity for carbon monoxide when indicated clinically.
- Assess for any new signs or symptoms that may be suggestive of PML, an opportunistic infection of the brain caused by the Jakob Cruzfeldt (JC) virus, that may be fatal; hold dose and notify health care professional promptly. PML symptoms may begin gradually (hemiparesis, apathy, confusion, cognitive deficiencies, and ataxia) and may include deteriorating renal function. Monitoring MRI every 6 mo may identify PML before clinical signs and symptoms occur.
- May cause severe increase in disability upon discontinuation of therapy. Monitor patients for increase in disability 12–24 wk following discontinuation.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Obtain baseline AST, ALT, and total bilirubin levels before starting, periodically during, and for 2 mo after therapy discontinued. If patient has symptoms of liver injury and ALT >3 × ULN and total bilirubin >2 × ULN, hold therapy until cause is determined. If cause is fingolimod, permanently discontinue therapy. Monitor liver function tests if symptoms develop and discontinue therapy if liver injury is confirmed.
- Before initiating therapy, obtain a recent (within 6 mo) CBC. May cause ↓ lymphocyte counts.
- Test patients for antibodies to varicella zoster virus (VZV) before starting therapy.
- May cause decreased lymphocyte count for up to 2 mo following discontinuation.

Implementation

- Administer varicella vaccine to patients who are antibody negative before starting therapy. Complete all immunizations, including human papilloma virus (HPV), in accordance with current immunization guidelines for pediatric patients before starting therapy. Cancer screening, including Papanicolaou (Pap) test, is recommended before starting therapy.
- **PO:** Administer once daily without regard to food.

Patient/Family Teaching

- Instruct patient to take fingolimod as directed. If a dose is missed, contact health care professional before taking next dose; may need to be observed by a health care professional for at least 6 hrs after taking next dose. Do not discontinue therapy without consulting health care professional, may cause severe increase in disability. Advise patient to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if signs and symptoms of liver dysfunction (unexplained nausea, vomiting, abdominal pain, fatigue, anorexia, jaundice, dark urine), infection, PML, new onset of dyspnea, PRES (sudden headache, confusion, seizures, loss of vision, weakness), hypersensitivity reactions (rash or itchy hives, swelling of lips, tongue, or face), skin nodules (shiny pearly nodules), patches or open sores that do not heal within weeks, or changes in vision develop.
- Instruct patient not to receive live-attenuated vaccines during and for 2 mo after treatment due to risk of infection. Patients who have not had a health care professional confirmed history of chickenpox or documentation of a full course vaccination should be tested for antibodies to varicella zoster virus before starting therapy. Antibody-negative patients should receive vaccination prior to starting therapy, then postpone start of fingolimod for 1 mo to allow for full effect of vaccination.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- May cause basal cell carcinoma, melanoma, and lymphoma. Caution patient to use sunscreen with a high protection factor, wear protective clothing, and limit exposure to sunlight and ultraviolet light.
- Rep: Advise female patients to use contraception during and for at least 2 mo after discontinuation of

© F.A. Davis Publishing

therapy and to notify health care professional immediately if pregnancy is planned or suspected or if breast feeding. Inform pregnant patients of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to fingolimod during pregnancy. To enroll patient in the pregnancy registry, call 1-877-598-7237 or visit www.gilenyapregnancyregistry.com.

Evaluation/Desired Outcomes

- Reduction in frequency of clinical exacerbations and delay of accumulation of physical disability in patients with relapsing forms of multiple sclerosis.

REMS

flibanserin (flib-an-ser-in)

Addyi

Classification

Therapeutic: sexual dysfunction agents

Indications

Treatment of premenopausal women with hypoactive sexual desire disorder (HSDD) unrelated to concurrent medical/psychiatric diagnoses, relationship issues, or substance abuse. Does not enhance sexual performance.

Action

May be explained by agonist activity at $5-HT_{1A}$ receptors and antagonist activity at $5-HT_{2A}$ receptors; also has moderate antagonist activity at $5-HT_{2B}$, $5-HT_{2C}$, and dopamine D_4 receptors. **Therapeutic Effects:** ↑ sexual desire with ↓ distress and interpersonal dysfunction.

Pharmacokinetics

Absorption: Moderately absorbed (33%) following oral administration.

Distribution: Unknown.

Protein Binding: 98%.

Metabolism and Excretion: Primarily metabolized in the liver, mostly by the CYP3A4 isoenzyme, with lesser metabolism by the CYP2C19 isoenzyme; the CYP2C19 isoenzyme exhibits genetic polymorphism; poor metabolizers may have significantly ↑ flibanserin concentrations and an ↑ risk of adverse effects. 44% excreted in urine, 51% in feces almost entirely as metabolites which do not appear to be pharmacologically active.

Half-life: 11 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	within 1 hr	1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of strong/moderate CYP3A4 inhibitors; Concurrent use of CYP3A4 inducers; Hepatic impairment; Lactation: Lactation.

Use Cautiously in: Alcohol ingestion within 2 hours of flibanserin dose (excess risk of hypotension/syncope); CYP2C19 poor metabolizers (↑ risk of adverse reactions including hypotension, syncope, and drowsiness); OB: Safety not established in pregnancy.

Adverse Reactions/Side Effects

CV: HYPOTENSION/SYNCOPE. **Derm:** rash. **GI:** nausea, constipation, dry mouth. **Neuro:** dizziness, drowsiness, anxiety, fatigue, insomnia, vertigo. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Concurrent use of **strong or moderate CYP3A4 inhibitors** including **atazanavir**, **ciprofloxacin**, **clarithromycin**, **conivaptan**, **diltiazem**, **erythromycin**, **fluconazole**, **fosamprenavir**, **indinavir**, **itraconazole**, **ketoconazole**, **indinavir**, **nelfinavir**, **posaconazole**, **ritonavir**, **saquinavir**, and **verapamil** ↑ blood levels, effects and risk of serious adverse reactions; concurrent use is contraindicated. Wait 2 wk after discontinuing inhibitor before initiating flibanserin. If initiating inhibitor, wait two days after last dose of flibanserin. Concurrent use with **alcohol** ↑ risk of hypotension/syncope and excess sedation; wait ≥2 hr after consuming 1–2 standard alcoholic drinks before taking dose at bedtime; skip bedtime dose if consumed ≥3 standard alcoholic drinks. Concurrent use of **oral hormonal contraceptives** and **weak CYP3A4 inhibitors** including **cimetidine**, and **fluoxetine** may also ↑ blood levels, effects and the risk of adverse reactions; avoid use of multiple weak CYP3A4 inhibitors. **Strong CYP2C19 inhibitors** including **proton pump inhibitors**, **SSRIs**, **benzodiazepines**, and **antifungals** ↑ blood levels, effects, and the risk of adverse reactions including hypotension, syncope, and CNS depression; concurrent use should be undertaken with caution. **CYP3A4 inducers** including **carbamazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, **rifampin**, and **rifapentine** ↓ blood levels and effectiveness; concurrent use in not recommended. ↑ **digoxin** and **sirolimus** levels and risk of toxicity; careful monitoring recommended. ↑ risk of CNS depression with other **CNS depressants** including **alcohol**, **antihistamines**, **opioids**, **sedative/hypnotics**, some **antianxiety agents**, **antidepressants**, and **antipsychotics**.

Natural-Natural: Concurrent use with **gingko** may also ↑ blood levels, effects and the risk of adverse reactions; avoid use with other weak CYP3A4 inhibitors. **St. John's wort** ↓ blood levels and effectiveness; concurrent use is not recommended.

Drug-Food: Concurrent ingestion of **grapefruit juice** ↑ blood levels, effects, and risk of hypotension/syncope; concurrent ingestion is contraindicated.

© F.A. Davis Publishing

Route/Dosage
PO (Adults): 100 mg once daily at bedtime.

Availability
Tablets: 100 mg.

NURSING IMPLICATIONS

Assessment
- Assess sexual desire and related distress and interpersonal dysfunction before and periodically during therapy.
- Monitor for hypotension and syncope. Have patient lie supine if dizziness occurs.
- Assess likelihood of patient following alcohol restrictions, taking into account the patient's current and past drinking behavior, and other pertinent social and medical history. Counsel patients who are prescribed flibanserin about the importance of following guidelines for alcohol use; interaction with alcohol increases risk of hypotension and syncope.

Implementation
- Administer once daily at bedtime; administration during waking hrs increases risks of hypotension, syncope, accidental injury, and central nervous system (CNS) depression.

Patient/Family Teaching
- Instruct patient to take flibanserin only at bedtime as directed. If dose is missed, omit and take next dose at bedtime on next day. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient to avoid grapefruit juice during therapy.
- Caution patient to follow alcohol guidelines during therapy. Wait at least 2 hr after drinking 1 or 2 standard alcoholic drinks (one 12-oz regular beer; 5 oz of wine; 1.5 oz or a shot of brandy, gin, rum, tequila, vodka, or whiskey) before taking flibanserin at bedtime. If you drink 3 or more standard alcoholic drinks in the evening, skip your flibanserin dose at bedtime. After you have taken your flibanserin at bedtime do not drink alcohol until the following day. Alcohol increases hypotensive effects. May cause dizziness and fainting.
- Advise patient if dizziness occurs, immediately lie supine and promptly seek medical help if symptoms do not resolve.
- May cause drowsiness. Caution patient to avoid driving and other activities requiring alertness until 6 hr after each dose or until response to medication is known.
- Advise patient to stop taking flibanserin and notify health care professional immediately if signs and symptoms of hypersensitivity reaction (swelling of the face, lips, and mouth; pruritus; urticaria) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes
- Increase in sexual desire in premenopausal women. If no improvement in 8 wk, discontinue flibanserin.

F

fluconazole (floo-kon-a-zole)
Diflucan

Classification
Therapeutic: antifungals (systemic)

Indications
PO, IV: Fungal infections caused by susceptible organisms, including: Oropharyngeal or esophageal candidiasis, Serious systemic candidal infections, Urinary tract infections, Peritonitis, Cryptococcal meningitis. Prevention of candidiasis in patients who have undergone bone marrow transplantation. **PO:** Single-dose oral treatment of vaginal candidiasis. **Unlabeled Use:** Prevention of recurrent vaginal yeast infections.

Action
Inhibits synthesis of fungal sterols, a necessary component of the cell membrane. **Therapeutic Effects:** Fungistatic action against susceptible organisms. May be fungicidal in higher concentrations. **Spectrum:** *Cryptococcus neoformans*. *Candida* spp.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Widely distributed, good penetration into CSF, saliva, sputum, vaginal fluid, skin, eye, and peritoneum. Excreted in breast milk.
Metabolism and Excretion: >80% excreted unchanged by the kidneys; <10% metabolized by the liver.
Half-life: Premature neonates: 46–74 hr; Children: 19–25 hr (PO) and 15–17 hr (IV); Adults: 30 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	24 hr
IV	rapid	end of infusion	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to fluconazole or other azole antifungals; Concurrent use with pimozide, erythromycin, or quinidine; OB: Pregnancy (may

© F.A. Davis Publishing

cause fetal harm); may consider using for severe or life-threatening fungal infection if anticipated maternal benefit justifies potential fetal risk.

Use Cautiously in: Renal impairment (dose ↓ required if CCr <50 mL/min); Underlying liver disease; Structural heart disease, electrolyte abnormalities, or concurrent use of other QT interval-prolonging medications; Geri: ↑ risk of adverse reactions in older adults; consider age-related ↓ in renal function in determining dose.

Adverse Reactions/Side Effects

Incidence of adverse reactions is increased in HIV patients.

CV: TORSADES DE POINTES, QT interval prolongation. **Derm:** STEVENS-JOHNSON SYNDROME. **Endo:** adrenal insufficiency, hypokalemia, hypertriglyceridemia. **GI:** HEPATOTOXICITY, abdominal discomfort, diarrhea, nausea, vomiting. **Neuro:** headache, dizziness, seizures. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: May ↑ levels of **pimozide**, **erythromycin**, **amiodarone** (especially with high-dose fluconazole [800 mg]), and **quinidine** which can prolong the QT interval and ↑ the risk of torsade de pointes. May ↑ levels of and the risk of bleeding with **warfarin**. **Rifampin**, **rifabutin**, and **isoniazid** ↓ levels. ↑ hypoglycemic effects of **tolbutamide**, **glyburide**, or **glipizide**. ↑ levels and risk of toxicity from **cyclosporine**, **carbamazepine**, **celecoxib**, **rifabutin**, **tacrolimus**, **sirolimus**, **theophylline**, **zidovudine**, **alfentanil**, and **phenytoin**. ↑ levels and effects of **benzodiazepines**, **amlodipine**, **felodipine**, **isradipine**, **nifedipine**, **nisoldipine**, **verapamil**, **atorvastatin**, **fluvastatin**, **lovastatin**, **simvastatin**, **methadone**, **flurbiprofen**, **prednisone**, **saquinavir**, **tricyclic antidepressants**, and **losartan**. ↑ levels of **tofacitinib**; ↓ dose of tofacitinib to 5 mg once daily. May ↑ risk of bleeding with **warfarin**. May antagonize effects of **amphotericin B**. May ↑ **voriconazole** levels; avoid concurrent use. May ↑ **olaparib** levels; concurrent use not recommended. May ↑ levels and risk of toxicity of **ibrutinib**; ↓ ibrutinib dose. May ↑ levels and risk of toxicity of **tolvaptan**; ↓ tolvaptan dose.

Route/Dosage

Oropharyngeal Candidiasis

PO, IV (Adults): 200 mg initially, then 100 mg daily for at least 2 wk.

PO, IV (Children >14 days): 6 mg/kg initially, then 3 mg/kg/day for at least 2 wk.

PO, IV (Neonates <14 days, 30–36 wk gestation): same dose as older children except frequency is every 48 hr; Premature neonates <29 wk gestation: 5–6 mg/kg/dose every 48–72 hr.

Esophageal Candidiasis

PO, IV (Adults): 200 mg initially, then 100 mg once daily for at least 3 wk (up to 400 mg/day).

PO, IV (Children >14 days): 6 mg/kg initially, then 3–12 mg/kg/day for at least 3 wk.

PO, IV (Neonates <14 days, 30–36 wk gestation): same dose as older children except frequency is every 48 hr; Premature neonates <29 wk gestation: 5–6 mg/kg/dose every 48–72 hr.

Vaginal Candidiasis

PO (Adults): 150-mg single dose; prevention of recurrence (unlabeled) — 150 mg daily for 3 days then weekly for 6 mo.

Systemic Candidiasis

PO, IV (Adults): 400 mg/day initially, then 200–800 mg/day for 28 days.

PO, IV (Children >14 days): 6–12 mg/kg/day for 28 days.

PO, IV (Neonates <14 days, 30–36 wk gestation): same dose as older children except frequency is every 48 hr; Premature neonates <29 wk gestation: 5–6 mg/kg/dose every 48–72 hr.

Cryptococcal Meningitis

PO, IV (Adults): *Treatment* — 400 mg once daily until favorable clinical response, then 200–800 mg once daily for at least 10–12 wk after clearing of CSF; change to oral therapy as soon as possible. *Suppressive therapy* — 200 mg once daily.

PO, IV (Children >14 days): 12 mg/kg/day initially, then 6–12 mg/kg/day for at least 10–12 wk after clearing of CSF; change to oral therapy as soon as possible. *Suppressive therapy* — 6 mg/kg/day.

PO, IV (Neonates <14 days, 30–36 wk gestation): same dose as older children except frequency is every 48 hr; Premature neonates <29 wk gestation: 5–6 mg/kg/dose every 48–72 hr.

Prevention of Candidiasis after Bone Marrow Transplant

PO, IV (Adults): 400 mg once daily; begin several days before procedure if severe neutropenia is expected, and continue for 7 days after ANC >1000 /mm^3.

PO, IV (Children >14 days): 10–12 mg/kg/day, not to exceed 600 mg/day.

Renal Impairment

PO, IV (Adults): *CCr ≤50 mL/min (no hemodialysis)* — Give 50% of the usual dose (not for single-dose therapy); *Hemodialysis* — Give 100% of the usual dose after each dialysis session; give reduced dose based on CCr on non-dialysis days (not for single-dose therapy).

Availability (generic available)

Tablets: 50 mg, 100 mg, 150 mg, 200 mg. **Cost:** *Generic* — 100 mg $88.17/30, 150 mg $6.99/1. **Powder for oral suspension (orange flavor) (requires reconstitution):** 10 mg/mL, 40 mg/mL. **Cost:** *Generic* — 10 mg/mL $36.00/35 mL, 40 mg/mL $130.76/35 mL. **Premixed infusion:** 200 mg/100 mL 0.9% NaCl, 400 mg/200 mL 0.9% NaCl.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess infected area and monitor CSF cultures before and periodically during therapy.
- Obtain specimens for culture before instituting therapy. Therapy may be started before results are obtained.
- Assess patient for rash (mild to moderate rash usually occurs in the 2nd wk of therapy and resolves within 1–2 wk of continued therapy). If rash is severe (extensive erythematous or maculopapular rash with moist desquamation or angioedema), accompanied by systemic symptoms (serum sickness-like reaction, Stevens-Johnson syndrome, toxic epidermal necrolysis), or occurs during treatment for a superficial fungal infection, therapy must be discontinued immediately.
- ***Lab Test Considerations:*** Monitor BUN and serum creatinine before and periodically during therapy; patients with renal dysfunction will require dose adjustment.
- Monitor liver function tests before and periodically during therapy. May cause ↑ AST, ALT, serum alkaline phosphate, and bilirubin concentrations.

Implementation

- Do not confuse Diflucan (fluconazole) with Diprivan (propofol).
- **PO:** Administer at the same time each day. Shake oral suspension well before administration.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Premixed infusions are prediluted and ready to use. Do not unwrap until ready to use. Some opacity of the plastic is normal and does not affect the solution quality or safety; opacity will diminish gradually. Do not administer solution that is cloudy or has a precipitate. Check for leaks by squeezing inner bag. If leaks are found, discard container as unsterile. ***Concentration:*** 2 mg/mL. ***Rate:*** Infuse over 1–2 hr. Do not exceed a rate of 200 mg/hr. Pedi: For children receiving doses >6 mg/kg/day, give over 2 hr.
- **Y-Site Compatibility:** acyclovir, aldesleukin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotetan, cefoxitin, ceftaroline, chlorpromazine, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, defibrotide, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, eravacycline, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, immune globulin IV, indomethacin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's injection, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oritavancin, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin-dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B lipid complex, ampicillin, dantrolene, diazepam, gemtuzumab ozogamicin, pantoprazole, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Doses should be taken at the same time each day. Take missed doses as soon as remembered, but not if almost time for next dose. Do not double doses.
- May cause dizziness or seizures. Caution patient to avoid driving and other activities requiring alertness until response to fluconazole is known.
- Instruct patient to notify health care professional if skin rash, abdominal pain, fever, or diarrhea becomes pronounced, if signs and symptoms of liver dysfunction (unusual fatigue, anorexia, nausea,

F

© F.A. Davis Publishing

vomiting, jaundice, dark urine, or pale stools) occur, if unusual bruising or bleeding occur, or if no improvement is seen within a few days of therapy.

- Rep: May cause fetal harm. Advise females of reproductive potential use effective contraception during and for 1 wk after last dose and to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of clinical and laboratory indications of fungal infections. Full course of therapy may require wk or mo of treatment after resolution of symptoms.
- Prevention of candidiasis in patients who have undergone bone marrow transplantation.
- Decrease in skin irritation and vaginal discomfort in patients with vaginal candidiasis. Diagnosis should be reconfirmed with smears or cultures before a second course of therapy to rule out other pathogens associated with vulvovaginitis. Recurrent vaginal infections may be a sign of systemic illness.

fludrocortisone

(floo-droe-**kor**-ti-sone)

Florinef

Classification

Therapeutic: hormones

Pharmacologic: corticosteroids (mineralocorticoid)

Indications

Sodium loss and hypotension associated with adrenocortical insufficiency (given with hydrocortisone or cortisone). Management of sodium loss due to congenital adrenogenital syndrome (congenital adrenal hyperplasia). **Unlabeled Use:** Idiopathic orthostatic hypotension (with increased sodium intake). Type IV renal tubular acidosis.

Action

Causes sodium reabsorption, hydrogen and potassium excretion, and water retention by its effects on the distal renal tubule. **Therapeutic Effects:** Maintenance of sodium balance and BP in patients with adrenocortical insufficiency.

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Widely distributed; probably enters breast milk.

Protein Binding: High.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: 3.5 hr.

TIME/ACTION PROFILE (mineralocorticoid activity)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	1–2 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: HF; Addison's disease (patients may have exaggerated response); OB, Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects

CV: HF, arrhythmias, edema, hypertension. **Endo:** adrenal suppression, weight gain. **F and E:** hypokalemia, hypokalemic alkalosis. **GI:** anorexia, nausea. **MS:** arthralgia, muscular weakness, tendon contractures. **Neuro:** ascending paralysis, dizziness, headache. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Use with **thiazide or loop diuretics**, **piperacillin**, or **amphotericin B** may ↑ risk of hypokalemia. Hypokalemia may ↑ risk of **digoxin** toxicity. May produce prolonged neuromuscular blockade following the use of **nondepolarizing neuromuscular blocking agents**. **Phenobarbital** or **rifampin** may ↑ metabolism and ↓ effectiveness.

Drug-Food: Large amounts of **salt** or **sodium-containing foods** may cause excessive sodium retention and potassium loss.

Route/Dosage

PO (Adults): *Adrenocortical insufficiency*—100 mcg/day (range 100 mcg 3 times weekly—200 mcg daily). Doses as small as 50 mcg daily may be required by some patients. Use with 10–37.5 mg cortisone daily or 10–30 mg hydrocortisone daily. *Adrenogenital syndrome*—100–200 mcg/day. *Idiopathic hypotension*—50–200 mcg/day (unlabeled).

PO (Children): 50–100 mcg/day.

Availability (generic available)

Tablets: 100 mcg (0.1 mg).

NURSING IMPLICATIONS

Assessment

- Monitor BP periodically during therapy. Report significant changes. Hypotension may indicate insufficient dose.
- Monitor for fluid retention (weigh daily, assess for edema, and auscultate lungs for rales/crackles).
- Monitor patients with Addison's disease closely and stop treatment if a significant increase in weight or BP, edema, or cardiac enlargement occurs. Patients with Addison's disease are more sensitive to the action of fludrocortisone and may have an exaggerated response.
- ***Lab Test Considerations:*** Monitor serum electrolytes periodically during therapy. Fludrocortisone causes ↓ serum potassium levels.

© F.A. Davis Publishing

Implementation

- ***High Alert:*** Do not confuse Florinef (fludrocortisone) with Floranex (*Lactobacillus*) or Florastor (*Saccharomyces boulardii*).
- **PO:** Tablets are scored and may be broken if dose adjustment is necessary.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not just before next dose is due. Explain that lifelong therapy may be necessary and that abrupt discontinuation may lead to Addisonian Crisis. Patient should keep an adequate supply available at all times.
- Advise patient to follow dietary modification prescribed by health care professional. Instruct patient to follow a diet high in potassium (see Appendix J). Amount of sodium allowed in diet varies with pathophysiology.
- Instruct patient to inform health care professional if weight gain or edema, muscle weakness, cramps, nausea, anorexia, or dizziness occurs.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Advise patient to carry identification at all times describing disease process and medication regimen.

Evaluation/Desired Outcomes

- Normalization of fluid and electrolyte balance without the development of hypokalemia or hypertension.

flumazenil (flu-maz-e-nil)

Anexate, Romazicon

Classification

Therapeutic: antidotes

Indications

Complete/partial reversal of effects of benzodiazepines used as general anesthetics, or during diagnostic or therapeutic procedures. Management of intentional or accidental overdose of benzodiazepines.

Action

Flumazenil is a benzodiazepine derivative that antagonizes the CNS depressant effects of benzodiazepine compounds. It has no effect on CNS depression from other causes, including opioids, alcohol, barbiturates, or general anesthetics. **Therapeutic Effects:** Reversal of benzodiazepine effects.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: 50% primarily to albumin.

Metabolism and Excretion: Metabolism of flumazenil occurs primarily in the liver.

Half-life: Children: 20–75 min; Adults: 41–79 min.

TIME/ACTION PROFILE (reversal of benzodiazepine effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 min	6–10 min	1–2 hr†

†Depends on dose/concentration of benzodiazepine and dose of flumazenil.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to flumazenil or benzodiazepines; Patients receiving benzodiazepines for life-threatening medical problems, including status epilepticus or ↑ intracranial pressure; Serious cyclic antidepressant overdosage.

Use Cautiously in: Mixed CNS depressant overdose (effects of other agents may emerge when benzodiazepine effect is removed); History of seizures (seizures are more likely to occur in patients who are experiencing sedative/hypnotic withdrawal, who have recently received repeated doses of benzodiazepines, or who have a previous history of seizure activity); Head injury (may ↑ intracranial pressure and risk of seizures); Severe hepatic impairment; OB, Lactation: Safety not established; Pedi: Children <1 yr (safety not established).

Adverse Reactions/Side Effects

EENT: abnormal hearing, abnormal vision, blurred vision. **CV:** arrhythmias, chest pain, hypertension. **GI:** nausea, vomiting, hiccups. **Derm:** flushing, sweating. **Local:** pain/injection-site reactions, phlebitis. **Neuro:** paresthesia, SEIZURES, dizziness, agitation, confusion, drowsiness, emotional lability, fatigue, headache, sleep disorders. **Misc:** rigors, shivering.

Interactions

Drug-Drug: None significant.

Route/Dosage

Reversal of Conscious Sedation or General Anesthesia

IV (Adults): 0.2 mg. Additional doses may be given at 1-min intervals until desired results are obtained, up to a total dose of 1 mg. If resedation occurs, regimen may be repeated at 20-min intervals, not to exceed 3 mg/hr.

IV (Children): 0.01 mg/kg (up to 0.2 mg); if the desired level of consciousness is not obtained after waiting an additional 45 sec, further injections of 0.01 mg/kg (up to 0.2 mg) can be administered and repeated at 60-sec intervals when necessary (up to a maximum of 4 additional times) to a maximum total dose of 0.05 mg/kg or 1 mg, whichever is lower. The dose should be individualized based on the patient's response.

© F.A. Davis Publishing

Suspected Benzodiazepine Overdose

IV (Adults): 0.2 mg. Additional 0.3 mg may be given 30 sec later. Further doses of 0.5 mg may be given at 1-min intervals, if necessary, to a total dose of 3 mg. Usual dose required is 1–3 mg. If resedation occurs, additional doses of 0.5 mg/min for 2 min may be given at 20-min intervals (given no more than 1 mg at a time, not to exceed 3 mg per hr).
IV (Children): *Unlabeled*—0.01 mg/kg (maximum dose 0.2 mg) with repeat doses every min up to a cumulative dose of 1 mg. As an alternative to repeat doses, continuous infusions of 0.005–0.01 mg/kg/hr have been used.

Availability (generic available)

Injection: 0.1 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess level of consciousness and respiratory status before and during therapy. Observe patient for at least 2 hr after administration for the appearance of resedation. Hypoventilation may occur.
- **Overdose:** Attempt to determine time of ingestion and amount and type of benzodiazepine taken. Knowledge of agent ingested allows an estimate of duration of CNS depression.

Implementation

- Do not confuse flumazenil with influenza virus vaccine.
- Ensure that patient has a patent airway before administration of flumazenil.
- Observe IV site frequently for redness or irritation. Administer through a free-flowing IV infusion into a large vein to minimize pain at the injection site.
- Optimal emergence should be undertaken slowly to decrease undesirable effects including confusion, agitation, emotional lability, and perceptual distortion.
- Institute seizure precautions. Seizures are more likely to occur in patients who are experiencing sedative/hypnotic withdrawal, patients who have recently received repeated doses of benzodiazepines, or those who have a previous history of seizure activity. Seizures may be treated with benzodiazepines, barbiturates, or phenytoin. Larger than normal doses of benzodiazepines may be required.
- **Suspected Benzodiazepine Overdose:** If no effects are seen after administration of flumazenil, consider other causes of decreased level of consciousness (alcohol, barbiturates, opioid analgesics).

IV Administration

- **IV Push:** ***Dilution:*** May be administered undiluted or diluted in syringe with D5W, 0.9% NaCl, or LR. Diluted solution should be discarded after 24 hr. ***Concentration:*** Up to 0.1 mg/mL. ***Rate:*** Administer each dose over 15–30 sec into free-flowing IV in a large vein. Do not exceed 0.2 mg/min in children or 0.5 mg/min in adults.

Patient/Family Teaching

- Flumazenil does not consistently reverse the amnestic effects of benzodiazepines. Provide patient and family with written instructions for postprocedure care. Inform family that patient may appear alert at the time of discharge but the sedative effects of the benzodiazepine may recur. Instruct patient to avoid driving or other activities requiring alertness for at least 24 hr after discharge.
- Instruct patient not to take any alcohol or nonprescription drugs for at least 18–24 hr after discharge.
- Resumption of usual activities should occur only when no residual effects of the benzodiazepine remain.

Evaluation/Desired Outcomes

- Improved level of consciousness.
- Decrease in respiratory depression caused by benzodiazepines.

flunisolide, See CORTICOSTEROIDS (NASAL).

fluocinolone, See CORTICOSTEROIDS (TOPICAL/LOCAL).

ofloxacin† (oh-**flox**-a-sin)
~~Floxin~~

Classification
Therapeutic: anti-infectives
Pharmacologic: fluoroquinolones

†See Appendix B for ophthalmic use

© F.A. Davis Publishing

Indications

PO, IV: Treatment of the following bacterial infections: Urinary tract infections including cystitis and prostatitis (ciprofloxacin, levofloxacin, ofloxacin) (should be used for acute uncomplicated cystitis only when there are no other alternative treatment options), Gonorrhea (may not be considered first-line agents due to increasing resistance), Gynecologic infections (ciprofloxacin, ofloxacin), Respiratory tract infections including acute sinusitis, acute exacerbations of chronic bronchitis, and pneumonia (should be used for acute sinusitis or acute bacterial exacerbations of chronic bronchitis only when there are no other alternative treatment options), Skin and skin structure infections (delafloxacin, levofloxacin, moxifloxacin, ciprofloxacin, ofloxacin), Bone and joint infections (ciprofloxacin), Infectious diarrhea (ciprofloxacin), Intra-abdominal infections (ciprofloxacin, moxifloxacin). Febrile neutropenia (ciprofloxacin). Postexposure treatment of inhalational anthrax (ciprofloxacin, levofloxacin). Treatment and prophylaxis of plague (ciprofloxacin, levofloxacin, moxifloxacin).

Action

Inhibit bacterial DNA synthesis by inhibiting DNA gyrase. **Therapeutic Effects:** Death of susceptible bacteria. **Spectrum:** Broad activity includes many gram-positive pathogens: Staphylococci including methicillin-resistant *Staphylococcus aureus*, *Staphylococcus epidermidis*, *Staphylococcus saprophyticus*, *Streptococcus pneumoniae*, *Streptococcus pyogenes*, and *Bacillus anthracis*. Gram-negative spectrum notable for activity against: *Escherichia coli*, *Klebsiella*, *Enterobacter*, *Salmonella*, *Shigella*, *Proteus*, *Providencia*, *Morganella morganii*, *Pseudomonas aeruginosa*, *Serratia*, *Haemophilus*, *Acinetobacter*, *Neisseria gonorrhoeae*, *Moraxella catarrhalis*, *Campylobacter*, and *Yersinia pestis*. Additional spectrum includes: *Chlamydia pneumoniae*, *Legionella pneumoniae*, and *Mycoplasma pneumoniae*.

Pharmacokinetics

Absorption: Well absorbed after oral administration (*ciprofloxacin*—70%; *delafloxacin*—59%; *moxifloxacin*—90%; *gemifloxacin*—71%; *levofloxacin*—99%; *ofloxacin*—98%).

Distribution: Widely distributed. High tissue and urinary levels are achieved. All agents appear to cross the placenta. *Ciprofloxacin* and *ofloxacin* enter breast milk.

Metabolism and Excretion: *Ciprofloxacin*—15% metabolized by the liver, 40–50% excreted unchanged by the kidneys; *delafloxacin*—primarily undergoes glucuronidation; 50–65% excreted unchanged by the kidneys; 28–48% excreted unchanged in feces; *gemifloxacin*—minimal metabolism, 61% excreted unchanged in feces, 36% excreted unchanged in urine; *levofloxacin*—87% excreted unchanged in urine, small amounts metabolized; *moxifloxacin*—mostly metabolized by the liver, 20% excreted unchanged in urine, 25% excreted unchanged in feces; *ofloxacin*—70–80% excreted unchanged by the kidneys.

Half-life: *Ciprofloxacin*—4 hr; *delafloxacin*—3.7 hr (IV); 4.2–8.5 hr (PO); *gemifloxacin*—7 hr; *levofloxacin*—8 hr; *moxifloxacin*—12 hr; *ofloxacin*—5–7 hr (all are ↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Ciprofloxacin—PO	rapid	1–2 hr	12 hr
Ciprofloxacin—PO-ER	rapid	1–4 hr	24 hr
Ciprofloxacin—IV	rapid	end of infusion	12 hr
Delafloxacin—PO	rapid	1 hr	12 hr
Delafloxacin—IV	rapid	end of infusion	12 hr
Gemifloxacin—PO	rapid	0.5–2 hr	24 hr
Levofloxacin—PO	rapid	1–2 hr	24 hr
Levofloxacin—IV	rapid	end of infusion	24 hr
Moxifloxacin—PO	within 1 hr	1–3 hr	24 hr
Moxifloxacin—IV	rapid	end of infusion	24 hr
Ofloxacin—PO	rapid	1–2 hr	12 hr
Ofloxacin—IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity. Cross-sensitivity among agents within class may occur; History of myasthenia gravis (may worsen symptoms including muscle weakness and breathing problems); Patients with or at ↑ risk for aortic aneurysm (use only if no alternatives); **Gemifloxacin and moxifloxacin**: Concurrent use of Class IA antiarrhythmics (disopyramide, quinidine, procainamide) or Class III antiarrhythmics (amiodarone, sotalol) (↑ risk of QTc interval prolongation and torsades de pointes); Known QT interval prolongation or concurrent use of agents causing prolongation; **Ciprofloxacin**: Concurrent use with tizanidine; **Delafloxacin**: End-stage renal disease (eGFR <15 mL/min); OB: Do not use unless potential benefit outweighs potential fetal risk (delafloxacin, gemifloxacin, moxifoxacin, ofloxacin); Lactation: Avoid breast feeding during treatment and for 2 days after final dose (for ciprofloxacin and levofloxacin, applies for all indications

© F.A. Davis Publishing

other than post-exposure prophylaxis of inhalational anthrax); Pedi: Use only for treatment of anthrax, plague, and complicated UTIs in children 1–17 yrs due to possible arthropathy.

Use Cautiously in: Seizure disorder; Depression; Renal impairment (dose ↓ if CCr ≤50 mL/min for ciprofloxacin, levofloxacin, ofloxacin; <40 mL/min for gemifloxacin); Cirrhosis (levofloxacin, moxifloxacin); **Gemifloxacin and moxifloxacin**: Concurrent use of erythromycin, antipsychotics, and tricyclic antidepressants (↑ risk of QTc prolongation and torsades de pointes); **Gemifloxacin and moxifloxacin**: Bradycardia; **Gemifloxacin and moxifloxacin**: Acute myocardial ischemia; **Delafloxacin**: Severe renal impairment (dose ↓ if eGFR 15–29 mL/min) (IV diluent may accumulate and ↑ serum creatinine) (↑ risk of tendon rupture in renal failure); Concurrent use of corticosteroids (↑ risk of tendinitis/tendon rupture); Kidney, heart, or lung transplant patients (↑ risk of tendinitis/tendon rupture); Rheumatoid arthritis (↑ risk of tendon rupture); Diabetes; OB: Use during pregnancy only if potential maternal benefit outweighs potential fetal risk (ciprofloxacin and levofloxacin only); Lactation: Can be used while breast feeding for post-exposure prophylaxis of anthrax if potential maternal benefit justifies potential risk to infant (ciprofloxacin and levofloxacin only); Geri: ↑ risk of adverse reactions.

Adverse Reactions/Side Effects

CV: AORTIC ANEURYSM/DISSECTION; *gemifloxacin, levofloxacin, moxifloxacin*, TORSADES DE POINTES, QT interval prolongation, vasodilation. **Derm:** STEVENS-JOHNSON SYNDROME, acute generalized exanthematous pustulosis, photosensitivity, rash. **Endo:** hyperglycemia, hypoglycemia. **GI:** HEPATOTOXICITY (CIPROFLOXACIN), CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, abdominal pain, ↑ liver enzymes (ciprofloxacin, moxifloxacin), vomiting. **GU:** vaginitis. **Local:** phlebitis at IV site. **MS:** arthralgia, myalgia, tendinitis, tendon rupture. **Neuro:** peripheral neuropathy, tremor, ELEVATED INTRACRANIAL PRESSURE (including pseudotumor cerebri), SEIZURES, SUICIDAL THOUGHTS/BEHAVIORS, dizziness, headache, insomnia, acute psychoses, agitation, confusion, depression, drowsiness, hallucinations, lightheadedness, nightmares, paranoia, toxic psychosis. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Ciprofloxacin may ↑ **tizanidine** levels and risk of hypotension and sedation; concurrent use contraindicated. Concurrent use with **QT interval-prolonging medications** may ↑ risk of QT interval prolongation and torsades de pointes; avoid concurrent use. Ciprofloxacin may ↑ **theophylline** levels and risk of CNS toxicity; avoid concurrent use; if concurrent use cannot be avoided, closely monitor serum theophylline levels. Ciprofloxacin may ↑ levels and risk of toxicity of CYP1A2 substrates, including **ropinirole**, **clozapine**, **olanzapine**, and **zolpidem**; avoid concurrent use with **zolpidem**. Administration with **antacids**, **iron salts**, **bismuth subsalicylate**, **sucralfate**, **sevelemer**, **lanthanum**, **didanosine**, and **zinc salts** ↓ absorption of fluoroquinolones; separate administration of medications. May ↑ the effects of and risk of bleeding from **warfarin**. Ciprofloxacin may alter levels and the effects of **phenytoin**. Levels of fluoroquinolones may be ↓ by **antineoplastics**. **Probenecid** may ↑ levels and risk of toxicity. May ↑ risk of nephrotoxicity from **cyclosporine**. Concurrent use of ciprofloxacin with **NSAIDs** may ↑ risk of seizures. Concurrent therapy with **corticosteroids** may ↑ the risk of tendon rupture. May ↑ risk of hypoglycemia when used with **antidiabetic agents**.

Drug-Natural Products: **Fennel** ↓ the absorption of ciprofloxacin.

Drug-Food: Absorption is impaired by **concurrent tube feeding** (because of metal cations). Absorption is ↓ if taken with **dairy products** or calcium-fortified juices.

Route/Dosage

Ciprofloxacin

PO (Adults): *Most infections*—500–750 mg every 12 hr. *Complicated urinary tract infections*—500 mg every 12 hr for 7–14 days (immediate-release); *or* 1000 mg every 24 hr for 7–14 days (extended-release). *Uncomplicated urinary tract infections*—250 mg every 12 hr for 3 days (immediate-release) *or* 500 mg every 24 hr for 3 days (extended-release). *Gonorrhea*—250-mg single dose (immediate-release). *Inhalational anthrax (postexposure) or cutaneous anthrax*—500 mg every 12 hr for 60 days (immediate-release); *Plague*—500–750 mg every 12 hr for 14 days (immediate-release).

PO (Children 1–17 yr): *Complicated urinary tract infections*—10–15 mg/kg every 12 hr (max = 750 mg/dose) for 10–21 days (immediate-release). *Inhalational anthrax (postexposure) or cutaneous anthrax*—10–15 mg/kg every 12 hr (max = 500 mg/dose) for 60 days (immediate-release); *Plague*—15 mg/kg every 8–12 hr (max = 500 mg/dose) for 14 days (immediate-release).

IV (Adults): *Most infections*—400 mg every 12 hr. *Complicated urinary tract infections*—400 mg every 12 hr for 7–14 days. *Uncomplicated urinary tract infections*—200 mg every 12 hr for 7–14 days. *Inhalational anthrax (post exposure)*—400 mg every 12 hr for 60 days; *Plague*—400 mg every 8–12 hr for 14 days.

IV (Children 1–17 yr): *Inhalational anthrax (post exposure)*—10 mg/kg every 12 hr (not to exceed 400 mg/dose) for 60 days; *Complicated urinary tract infections*—6–10 mg/kg every 8 hr (max = 400 mg/dose) for 10–21 days; *Plague*—10 mg/kg every 8–12 hr (max = 400 mg/dose) for 10–21 days.

© F.A. Davis Publishing

Renal Impairment

PO (Adults): *CCr 30–50 mL/min*—250–500 mg every 12 hr; *CCr 5–29 mL/min*—250–500 mg every 18 hr (immediate-release) *or* 500 mg every 24 hr (extended-release).
IV (Adults): *CCr 5–29 mL/min*—200–400 mg every 18–24 hr.

Delafloxacin

IV (Adults): 300 mg every 12 hr for 5–14 days (for acute bacterial skin and skin structure infections) or 5–10 days (for community-acquired pneumonia) *or* 300 mg every 12 hr followed by switching to oral regimen (at dose stated below) for a total of 5–14 days (for acute bacterial skin and skin structure infections) or 5–10 days (for community-acquired pneumonia).
PO (Adults): 450 mg every 12 hr for 5–14 days (for acute bacterial skin and skin structure infections) or 5–10 days (for community-acquired pneumonia).

Renal Impairment

IV (Adults): *eGFR 15–29 mL/min*—200 mg every 12 hr for 5–14 days (for acute bacterial skin and skin structure infections) or 5–10 days (for community-acquired pneumonia) *or* 200 mg every 12 hr followed by switching to oral regimen (450 mg every 12 hr) for a total of 5–14 days (for acute bacterial skin and skin structure infections) or 5–10 days (for community-acquired pneumonia); *eGFR <15 mL/min*—Not recommended.

Gemifloxacin

PO (Adults): *Acute bacterial exacerbation of chronic bronchitis*—320 mg once daily for 5 days; *Community-acquired pneumonia caused by Klebsiella pneumoniae, Moraxella catarrhalis, or multidrug-resistant strains of Streptococcus pneumoniae*—320 mg once daily for 7 days. *Community-acquired-pneumonia caused by Streptococcus pneumoniae, Haemophilus influenzae, Mycoplasma pneumoniae, or Chlamydia pneumoniae*—320 mg once daily for 5 days.

Renal Impairment

PO (Adults): *CCr ≤40 mL/min*—160 mg once daily for 5 days.

Levofloxacin

PO, IV (Adults): *Most infections*—250–750 mg every 24 hr; *inhalational anthrax (postexposure)*—500 mg once daily for 60 days.
PO, IV (Children >50 kg): *Inhalational anthrax (postexposure)*—500 mg once daily for 60 days; *Plague*—500 mg once daily for 10–14 days.
PO, IV (Children <50 kg and ≥6 mo): *Inhalational anthrax (postexposure)*—8 mg/kg (max: 250 mg/dose) every 12 hr for 60 days. *Plague*—8 mg/kg (max: 250 mg/dose) every 12 hr for 10–14 days; *Other infections*—10 mg/kg/dose every 24 hr (max: 500 mg/dose).

Renal Impairment

PO, IV (Adults): *Normal renal function dosing of 750 mg/day: CCr 20–49 mL/min*—750 mg every 48 hr; *CCr 10–19 mL/min*—750 mg initially, then 500 mg every 48 hr; *Normal renal function dosing of 500 mg/day: CCr 20–49 mL/min*—500 mg initially then 250 mg every 24 hr; *CCr 10–19 mL/min*—500 mg initially then 250 mg every 48 hr. *Normal renal function dosing of 250 mg/day: CCr 10–19 mL/min*—250 mg every 48 hr.

Moxifloxacin

PO, IV (Adults): *Bacterial sinusitis*—400 mg once daily for 10 days; *Community-acquired pneumonia*—400 mg once daily for 7–14 days. *Acute bacterial exacerbation of chronic bronchitis*—400 mg once daily for 5 days. *Complicated intra-abdominal infection*—400 mg once daily for 5–14 days. *Skin/skin structure infections*—400 mg/day for 7–21 days. *Treatment/prevention of plague*—400 mg once daily for 10–14 days.

Ofloxacin

PO (Adults): *Most infections*—400 mg every 12 hr. *Prostatitis*—300 mg every 12 hr for 6 wk. *Uncomplicated urinary tract infections*—200 mg every 12 hr for 3–7 days. *Complicated urinary tract infections*—200 mg every 12 hr for 10 days. *Gonorrhea*—400-mg single dose.

Renal Impairment

PO, IV (Adults): *CCr 20–50 mL/min*—100% of the usual dose every 24 hr; *CCr <20 mL/min*—50% of the usual dose every 24 hr.

Availability

Ciprofloxacin (generic available)

Immediate-release tablets: 100 mg, 250 mg, 500 mg, 750 mg. **Cost:** *Generic*—100 mg $20.22/6, 250 mg $7.51/30, 500 mg $15.38/30, 750 mg $278.41/50.
Extended-release tablets: 500 mg, 1000 mg. **Cost:** *Generic*—500 mg $489.94/50, 1000 mg $557.80/50.
Oral suspension (strawberry flavor): 250 mg/5 mL, 500 mg/5 mL. **Cost:** *Generic*—250 mg/5 mL $123.24/100 mL, 500 mg/5 mL $144.28/100 mL. **Premixed infusion:** 200 mg/100 mL D5W, 400 mg/200 mL D5W. **Solution for injection:** 10 mg/mL. ***In combination with:*** hydrocortisone (Cipro HC) (see Appendix N).

Delafloxacin

Lyophilized powder for injection: 300 mg/vial.
Tablets: 450 mg.

© F.A. Davis Publishing

Gemifloxacin (generic available)
Tablets: 320 mg. **Cost:** $239.20/5.

Levofloxacin (generic available)
Tablets: 250 mg, 500 mg, 750 mg. **Cost:** *Generic*—500 mg $13.77/50, 750 mg $24.22/20. **Oral solution:** 25 mg/mL. **Cost:** *Generic*—$579.42/480 mL. **Solution for injection:** 25 mg/mL. **Premixed infusion:** 250 mg/50 mL D5W, 500 mg/100 mL D5W, 750 mg/150 mL D5W.

Moxifloxacin (generic available)
Tablets: 400 mg. **Cost:** $769.58/30. **Premixed infusion:** 400 mg/250 mL 0.8% NaCl.

Ofloxacin (generic available)
Tablets: 200 mg, 300 mg, 400 mg. **Cost:** *Generic*—200 mg $239.20/50, 300 mg $284.66/50, 400 mg $600.36/100.

NURSING IMPLICATIONS
Assessment
- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC; urinalysis; frequency and urgency of urination; cloudy or foul-smelling urine) prior to and during therapy.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction. Patients taking gemifloxacin who are at greater risk for rash are those receiving gemifloxacin for >7 days, <40 yr of age, females, and postmenopausal females receiving hormone replacement therapy.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of *Clostridioides difficile*-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Assess for signs and symptoms of peripheral neuropathy (pain, burning, tingling, numbness, and/or weakness or other alterations of sensation including light touch, pain, temperature, position sense, and vibratory sensation) periodically during therapy. Symptoms may be irreversible; discontinue fluoroquinolone if symptoms occur.
- Assess for suicidal tendencies, depression, or changes in behavior periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ serum AST, ALT, LDH, bilirubin, and alkaline phosphatase. May also cause ↑ or ↓ serum glucose. Monitor blood glucose in patients with diabetes taking insulin or oral hypoglycemic agents. Medication may cause hyperglycemia or hypoglycemia. Moxifloxacin may cause hyperglycemia, hyperlipidemia, and altered prothrombin time. It may also cause ↑ WBC; ↑ serum calcium, chloride, albumin, and globulin; and ↓ hemoglobin, RBCs, neutrophils, eosinophils, and basophils. Monitor prothrombin time closely in patients receiving fluoroquinolones and warfarin; may enhance the anticoagulant effects of warfarin.

Implementation
- Do not confuse levofloxacin with levetiracetam.
- **PO:** Administer *ofloxacin* on an empty stomach 1 hr before or 2 hr after meals, with a full glass of water. *Moxifloxacin, ciprofloxacin, levofloxacin,* and *gemifloxacin* may be administered without regard to meals. Should be taken at least 2 hr (3 hr for gemifloxacin, 4 hr for moxifloxacin) before or 2 hr (6 hr for *ciprofloxacin,* 8 hr for *moxifloxacin*) after antacids or other products containing calcium, iron, zinc, magnesium, or aluminum. Gemifloxacin should be taken at least 2 hr before sucralfate. *Delafloxacin* may be administered without regard to food and with a full glass of water, at the same time each day. Products or foods containing calcium, magnesium, aluminum, iron, or zinc should not be ingested for 2 hr before and 6 hr after administration.
- If gastric irritation occurs, ciprofloxacin may be administered with meals.
- Ciprofloxacin 5% and 10% oral suspension should not be administered through a feeding tube (may ↓ absorption). Shake solution for 15 sec prior to administration.
- *Gemifloxacin* and *ciprofloxacin extended-release tablets;* swallow whole; do not break, crush, or chew.

Ciprofloxacin
IV Administration
- **Intermittent Infusion:** ***Dilution:*** Dilute with 0.9% NaCl or D5W. Stable for 14 days at refrigerated or room temperature. ***Concentration:*** 1–2 mg/mL. ***Rate:*** Administer over 60 min into a large vein to minimize venous irritation.
- **Y-Site Compatibility:** alemtuzumab, amifostine, amiodarone, anidulafungin, argatroban, arsenic trioxide, aztreonam, bivalirudin, bleomycin, calcium gluconate, carboplatin, carmustine, caspofungin, ceftaroline, ceftazidime, ceftolozane/tazobactam, cisatracurium, cisplatin, cyclophosphamide, cytarabine, dactinomycin, daptomycin, daunorubicin, dexmedetomidine, dexrazoxane, digoxin, diltiazem, dimenhydrinate, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposomal, epirubicin, eptifibatide, eravacycline, etoposide, etoposide phosphate, fenoldopam, fludarabine, fosphenytoin, gemcitabine, gentamicin,

© F.A. Davis Publishing

granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, irinotecan, isavuconazonium, labetalol, Lactated Ringer's injection, leucovorin calcium, lidocaine, linezolid, lorazepam, meperidine, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, mycophenolate, naloxone, nicardipine, octreotide, ondansetron, oritavancin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, plazomicin, posaconazole, potassium acetate, potassium chloride, promethazine, quinupristin-dalfopristin, remifentanil, rocuronium, tacrolimus, tedizolid, telavancin, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin/sulbactam, blinatumomab, cangrelor, cefepime, dexamethasone, esmolol, fluorouracil, foscarnet, fosfomycin, furosemide, gemtuzumab ozogamicin, heparin, hydrocortisone, magnesium sulfate, meropenem, meropenem/vaborbactam, methylprednisolone, pantoprazole, pemetrexed, phenytoin, piperacillin/tazobactam, potassium phosphate, propofol, rituxumab, sodium phosphate, warfarin.

Delafloxacin

- **Intermittent Infusion:** Reconstitute with 10.5 mL D5W or 0.9% NaCl for each 300 mg vial. Shake vigorously to completely dissolve. ***Concentration:*** 25 mg/mL. Solution is clear yellow to amber; do not administer solutions that are discolored or contain particulate matter. Reconstituted solution is stable if refrigerated or at room temperature for 24 hrs. ***Dilution:*** Dilute to volume of 250 mL with 0.9% NaCl or D5W. ***Concentration:*** 1.2 mg/mL. Diluted solution is stable if refrigerated or at room temperature for 24 hrs. ***Rate:*** Infuse over 60 min.
- **Y-Site Incompatibility:** Do not administer with other drugs; flush line before and after each dose.

Levofloxacin

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute with 0.9% NaCl, D5W, or dextrose/saline combinations. Also available in premixed bottles and flexible containers with D5W, which need no further dilution. ***Concentration:*** 5 mg/mL. Discard unused solution. Diluted solution is stable for 72 hr at room temperature and 14 days if refrigerated. ***Rate:*** Administer by infusion over at least 60 min for 250 mg or 500 mg doses and over 90 min for 750 mg dose. Avoid rapid bolus injection to prevent hypotension.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, caffeine citrate, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefepime, cefotetan, ceftaroline, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chlorpromazine, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, eravacycline, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, foscarnet, fosphenytoin, gemcitabine, gemtuzumab ozogamicin, gentamicin, granisetron, haloperidol, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isavuconazonium, isoproterenol, labetalol, lactated Ringer's injection, leucovorin calcium, levorphanol, lidocaine, linezolid, mannitol, meperidine, meropenem/vaborbactam, mesna, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, mycophenolate, nalbuphine, naloxone, nicardipine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G sodium, pentamidine, phenylephrine, posaconazole, potassium acetate, potassium chloride, promethazine, propranolol, quinapristin/dalfopristin, remifentanil, rocuronium, sargramostim, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, alprostadil, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, cefazolin, cefoxitin, daunorubicin hydrochloride, diazepam, fluorouracil, furosemide, ganciclovir, heparin, indomethacin, ketorolac, methotrexate, micafungin, nitroglycerin, nitroprusside, pantoprazole, pentobarbital, phenytoin, piperacillin/tazobactam, plazomicin, prochlorperazine, propofol, rituximab, streptozocin, telavancin, thiopental, trastuzumab.

© F.A. Davis Publishing

Moxifloxacin

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Premixed bags are diluted in sodium chloride 0.8% and should not be further diluted. Use transfer set whose piercing pin does not require excessive force; insert with a gentle twisting motion until pin is firmly seated. ***Concentration:*** 1.6 mg/mL. ***Rate:*** Administer over 60 min. Avoid rapid or bolus infusion.
- **Y-Site Compatibility:** alemtuzumab, amifostine, aminocaproic acid, amiodarone, anidulafungin, argatroban, arsenic trioxide, atracurium, bivalirudin, bleomycin, bumetanide, busulfan, calcium acetate, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, ceftaroline, chlorpromazine, cisatracurium, cisplatin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, droperidol, enalaprilat, epinephrine, epirubicin, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fludarabine, gemcitabine, gemtuzumab ozogamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, idarubicin, ifosfamide, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, lidocaine, magnesium sulfate, mannitol, melphalan, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, milrinone, mitomycin, mitoxantrone, mycophenolate, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, phentolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, streptozocin, succinylcholine, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, topotecan, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zoledronic acid.
- **Y-Site Incompatibility:** allopurinol, aminophylline, amphotericin B lipid complex, dantrolene, fluorouracil, fosphenytoin, furosemide, nitroprusside, pantoprazole, phenytoin, vancomycin, voriconazole.

Patient/Family Teaching

- Instruct patient to take medication as directed at evenly spaced times and to finish drug completely, even if feeling better. Take missed doses as soon as possible, unless almost time (within 6 hrs for ciprofloxacin; 8 hrs for moxifloxacin) for next dose. Do not double doses. Advise patient that sharing of this medication may be dangerous.
- Advise patients to notify health care professional immediately if they are taking theophylline.
- Encourage patient to maintain a fluid intake of at least 1500–2000 mL/day to prevent crystalluria.
- Advise patient that antacids or medications containing iron or zinc will decrease absorption. *Ciprofloxacin, levofloxacin,* and *ofloxacin* should be taken at least 2 hr before (3 hr for *gemifloxacin*, 4 hr for *moxifloxacin*) or 2 hr after (6 hrs for *ciprofloxacin,* and *delafloxacin*, 8 hr for *moxifloxacin*) these products.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional of any personal or family history of QTc prolongation or proarrhythmic conditions such as recent hypokalemia, significant bradycardia, or recent myocardial ischemia or if fainting spells or palpitations occur. Patients with this history should not receive gemifloxacin.
- Advise patient to stop taking fluoroquinolone and notify health care professional immediately if signs and symptoms of peripheral neuropathy occur.
- Caution patient to use sunscreen and protective clothing to prevent phototoxicity reactions during and for 5 days after therapy. Notify health care professional if a sunburn-like reaction or skin eruption occurs.
- Instruct patients being treated for gonorrhea that partners also must be treated.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to report signs of superinfection (furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools).
- Instruct patient to notify health care professional if fever and diarrhea develop, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional.
- Instruct patient to notify health care professional immediately if rash, jaundice, signs of hypersensitivity, or tendon (shoulder, hand, Achilles, and other) pain, swelling, or inflammation occur. If tendon symptoms occur, avoid exercise and use of the affected area. Increased risk in >65 yrs old; kidney, heart, and lung transplant recipients; and patients taking corticosteroids concurrently. Therapy should be discontinued.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dan-

© F.A. Davis Publishing

gerous impulses, mania, or other changes in mood or behavior.
- Inform patient that fluoroquinolones may cause worsening of myasthenia gravis symptoms (muscle weakness, breathing problems). Advise patient to notify health care professional immediately if symptoms occur.
- Rep: Advise females of reproductive potential to use effective contraception during delafloxacin, gemifloxacin, moxifoxacin, and ofloxacin therapy and to avoid breast feeding during therapy with delafloxacin, gemifloxacin, moxifoxacin, ofloxacin and during and for 2 days after last dose of ciprofloxacin or levofloxacin. Advise patient notify health care professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes
- Resolution of the signs and symptoms of infection. Time for complete resolution depends on organism and site of infection.
- Post exposure treatment of inhalational anthrax or cutaneous anthrax (ciprofloxacin and levofloxacin).
- Prevention and treatment of plague (ciprofloxacin, levofloxacin, and moxifloxacin).

HIGH ALERT

fluorouracil
(flure-oh-**yoor**-a-sill)
Carac, Efudex, Tolak

Classification
Therapeutic: antineoplastics
Pharmacologic: antimetabolites

Indications
IV: Used alone and in combination with other modalities (surgery, radiation therapy, other antineoplastics) in the treatment of: Colorectal adenocarcinoma, Breast adenocarcinoma, Gastric adenocarcinoma, Pancreatic adenocarcinoma. **Topical:** Management of multiple actinic (solar) keratoses and superficial basal cell carcinomas.

Action
Inhibits DNA and RNA synthesis by preventing thymidine production (cell-cycle S-phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: Minimal absorption (5–10%) after topical application.
Distribution: Widely distributed; concentrates and persists in tumors.
Metabolism and Excretion: Metabolized by dihydropyrimidine dehydrogenase to a less toxic compound; inactive metabolites are excreted primarily in urine.
Half-life: 20 hr.

TIME/ACTION PROFILE (IV = effects on blood counts, Top = dermatologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	1–9 days	9–21 days (nadir)	30 days
Top	2–3 days	2–6 wk	1–2 mo

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Dihydropyrimidine dehydrogenase deficiency (patients at ↑ risk of toxicity); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Infections; Depressed bone marrow reserve; Other chronic debilitating illnesses; Obese patients, patients with edema or ascites (dose should be based on ideal body weight).

Adverse Reactions/Side Effects
More likely to occur with systemic use than with topical use.
CV: CARDIOTOXICITY. **GI:** diarrhea, nausea, stomatitis, vomiting. **Derm:** alopecia, maculopapular rash, local inflammatory reactions (topical only), melanosis of nails, nail loss, palmar-plantar erythrodysesthesia, phototoxicity. **Endo:** sterility. **Hemat:** anemia, leukopenia, thrombocytopenia. **Local:** thrombophlebitis. **Neuro:** acute cerebellar dysfunction. **Misc:** fever.

Interactions
Drug-Drug: Combination chemotherapy with **irinotecan** may produce unacceptable toxicity (dehydration, neutropenia, sepsis). Additive bone marrow depression with other **bone marrow depressants**, including other **antineoplastics** and **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage
Doses may vary greatly, depending on tumor, patient condition, and protocol used.

Advanced Colorectal Cancer
IV (Adults): *In combination with leucovorin alone or leucovorin + oxaliplatin or irinotecan*—400 mg/m² as IV bolus on Day 1, then 2400–3000 mg/m² continuous infusion every 2 wk; *In combination with leucovorin*—500 mg/m² as IV bolus 1 hr after leucovorin on Days 1, 8, 15, 22, 29, and 36 every 8 wk.

Breast Cancer
IV (Adults): *In combination with cyclophosphamide + epirubicin or cyclophosphamide + methotrexate*—500 mg/m² or 600 mg/m² on Days 1 and 28 every 28 days for 6 cycles.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Gastric Adenocarcinoma

IV (Adults): *As part of platinum-containing regimen*—200–1000 mg/m² as IV infusion (frequency of administration and number of cycles depends on specific regimen used).

Pancreatic Adenocarcinoma

IV (Adults): *In combination with leucovorin or as part of multidrug regimen*—400 mg/m² as IV bolus on Day 1, then 2400 mg/m² continuous infusion every 2 wk.

Actinic (Solar) Keratoses

Topical (Adults): *Carac*—Apply 0.5% cream to lesions once daily for up to 4 wk; *Efudex*—Apply 2% or 5% solution or cream to lesions twice daily for 2–4 wk.

Superficial Basal Cell Carcinomas

Topical (Adults): *Efudex*—Apply 5% solution or cream to lesions twice daily for 3–6 wk (up to 12 wk).

Availability (generic available)

Solution for injection: 50 mg/mL. **Topical cream:** 0.5%, 4%, 5%. **Topical solution:** 2%, 5%.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Assess mucous membranes, number and consistency of stools, and frequency of vomiting. Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, pain in lower back or side, difficult or painful urination). Assess for bleeding (bleeding gums; bruising; petechiae; and guaiac test stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min. Notify health care professional if Grade 3 or 4 toxicity (stomatitis or esophagopharyngitis, uncontrollable vomiting, diarrhea, GI bleeding, myocardial ischemia, leukocyte count <3500/mm³, platelet count <100,000/mm³, or hemorrhage from any site) occurs; hold fluorouracil until resolution to ≤Grade 1. May be reinitiated at a lower dose when side effects have subsided.
- Assess IV site frequently for inflammation or infiltration. Patient should notify nurse if pain or irritation at injection site occurs. May cause thrombophlebitis. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Report immediately. Standard treatment includes application of ice compresses.
- Assess skin for palmar-plantar erythrodysesthesia (tingling of hands and feet followed by pain, erythema, swelling, desquamation) throughout therapy. Occurs more frequently with continuous infusion. Usually occurs after 8–9 wk of therapy, but may occur earlier. Hold fluorouracil for Grades 2 or 3 and resume at lower dose when resolved or Grade 1.
- Monitor intake and output, appetite, and nutritional intake. GI effects usually occur on 4th day of therapy. Adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status and administering antidiarrheal agents. May cause severe diarrhea. Withhold therapy if Grade 3 or 4 diarrhea occurs and until resolved or decreased to Grade 1, then resume at reduced dose.
- Monitor for cerebellar dysfunction (ataxia, confusion, disorientation, visual disturbances). This may persist after discontinuation of therapy.
- Monitor for angina, myocardial infarction/ischemia, arrhythmia, and heart failure in patients with no history of coronary artery disease or myocardial dysfunction. Discontinue therapy if symptoms occur.
- Monitor for signs and symptoms of hyperammonemic encephalopathy (altered mental status, confusion, disorientation, coma, ataxia) with ↑ serum ammonia level within 72 hrs of start of infusion. Discontinue fluorouracil and initiate ammonia-lowering therapy.
- Assess for mucositis, stomatitis, and esophagopharyngitis during therapy. May lead to mucosal sloughing or ulceration. Occurs more frequently with IV bolus doses. If Grade 3 or 4 mucositis occurs, withhold dose and resume at reduced dose when resolved or reduced to Grade 1.
- **Topical:** Inspect involved skin before and throughout therapy.
- ***Lab Test Considerations:*** May cause ↓ in plasma albumin.
- Monitor hepatic (AST, ALT, LDH, and serum bilirubin), renal, and hematologic (hematocrit, hemoglobin, leukocyte, platelet count) functions before each treatment and periodically during therapy.
- Monitor CBC daily during IV therapy. Report WBC of <3500/mm³ or platelets <100,000/mm³ immediately; they are criteria for discontinuation. Nadir of leukopenia usually occurs in 9–14 days, with recovery by day 30. May also cause thrombocytopenia. Hold doses if Grade 4 myelosuppression occurs. Resume at reduced dose when resolved or improved to Grade 1.
- May cause ↑ in urine excretion of 5-hydroxyindoleacetic acid (5-HIAA).
- Monitor INR and prothrombin time in patients receiving concomitant warfarin; adjust anticoagulant dose accordingly.

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings. The number 5 in 5-fluorouracil is part of the drug name and does not refer to the dose.
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

© F.A. Davis Publishing

- When administering fluorouracil via IV push, 30 min of cryotherapy is recommended to prevent oral mucositis.

IV Administration

- **IV Push:** ***Dilution:*** May be administered undiluted. ***Concentration:*** 50 mg/mL. ***Rate:*** Rapid IV push administration (over 1–2 min) is most effective, but there is a more rapid onset of toxicity.
- **Intermittent Infusion:** ***Dilution:*** May be diluted with D5W or 0.9% NaCl.
- Use plastic IV tubing and IV bags to maintain greater stability of medication. Solution is stable for 24 hr at room temperature; do not refrigerate. Solution is colorless to faint yellow. Discard highly discolored or cloudy solution. If crystals form, dissolve by warming solution to 140°F, shaking vigorously, and cooling to body temperature. ***Concentration:*** Up to 50 mg/mL. ***Rate:*** Onset of toxicity is greatly delayed by administering an infusion over 2–8 hr.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, butorphanol, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, dacarbazine, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, docetaxel, dopamine, doxorubicin liposome, enalaprilat, ephedrine, ertapenem, erythromycin, esmolol, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, leucovorin calcium, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methohexital, methotrexate, methylprednisolone, metoprolol, metronidazole, milrinone, mitomycin, mitoxantrone, morphine, nalbuphine, naloxone, nitroglycerin, nitroprusside, octreotide, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin, piperacillin/tazobactam, potassium acetate, potassium phosphates, procainamide, propofol, propranolol, remifentanil, rituximab, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tenoposide, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, vasopressin, vecuronium, vinblastine, vincristine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** aldesleukin, amiodarone, amphotericin B deoxycholate, buprenorphine, calcium chloride, caspofungin, chlorpromazine, ciprofloxacin, diazepam, diltiazem, diphenhydramine, dobutamine, doxycycline, droperidol, epinephrine, epirubicin, filgrastim, hydroxyzine, idarubicin, irinotecan, levofloxacin, lorazepam, methadone, midazolam, minocycline, moxifloxacin, nicardipine, pentamidine, phenytoin, prochlorperazine, promethazine, quinapristin/dalfopristin, topotecan, vancomycin, verapamil, vinorelbine.
- **Topical:** Consult health care professional before administering topical preparations to determine which skin preparation regimen should be followed. Tight occlusive dressings are not advised because of irritation to surrounding healthy tissue. A loose gauze dressing for cosmetic purposes is usually preferred. Wear gloves when applying medication. Do not use metallic applicator.

Patient/Family Teaching

- Explain purpose of fluorouracil to patient.
- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; yellowing of skin or eyes; abdominal pain; joint or flank pain; swelling of feet or legs; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patients should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Advise patient to rinse mouth with clear water after eating and drinking and to avoid flossing to minimize stomatitis. Viscous lidocaine may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Caution patient to use sunscreen and protective clothing to prevent phototoxicity reactions.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Increase dietary intake of thiamine may be recommended.
- Rep: May cause fetal harm. Advise female patients of reproductive potential and male patients with partners of reproductive potential to use effective contraception during therapy and for at least 3 mo following completion of therapy and to avoid breast feeding during therapy. Inform patients that fertility may be impaired during therapy.

© F.A. Davis Publishing

- Emphasize the importance of routine follow-up lab tests to monitor progress and to check for side effects.
- **Topical:** Instruct patient in correct application of solution or cream. Emphasize importance of avoiding the eyes; caution should also be used when applying medication near mouth and nose. If patient uses clean finger to self-administer, emphasize importance of washing hands thoroughly after application. Explain that erythema, scaling, and blistering with pruritus and burning sensation are expected. Advise patient to avoid sunlight or ultraviolet light (tanning booths) as much as possible; may increase side effects. Therapy is discontinued when erosion, ulceration, and necrosis occur in 2–6 wk (10–12 wk for basal cell carcinomas). Skin heals 4–8 wk later.

Evaluation/Desired Outcomes

- Tumor regression.
- Removal of solar keratoses or superficial basal cell skin cancers.

FLUoxetine (floo-**ox**-uh-teen)

PROzac, ~~Sarafem~~

Classification

Therapeutic: antidepressants

Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Indications

Major depressive disorder. Obsessive compulsive disorder (OCD). Bulimia nervosa. Panic disorder. Acute treatment of depressive episodes associated with bipolar I disorder (when used with olanzapine). Treatment-resistant depression (when used with olanzapine). Premenstrual dysphoric disorder (PMDD). **Unlabeled Use:** Anorexia nervosa: ADHD, Diabetic neuropathy, Fibromyalgia, Obesity, Raynaud's phenomenon, Social anxiety disorder (social phobia), Posttraumatic stress disorder (PTSD).

Action

Selectively inhibits the reuptake of serotonin in the CNS. **Therapeutic Effects:** Antidepressant action. Decreased behaviors associated with: panic disorder, bulimia. Decreased mood alterations associated with PMDD.

Pharmacokinetics

Absorption: Well absorbed after oral administration. **Distribution:** Crosses the blood-brain barrier. **Protein Binding:** 94.5%. **Metabolism and Excretion:** Converted by the liver to norfluoxetine (primarily by the CYP2D6 isoenzyme), another antidepressant compound; the CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↑ fluoxetine concentrations and an ↑ risk of adverse effects). Fluoxetine and norfluoxetine are mostly metabolized by the liver; 12% excreted by kidneys as unchanged fluoxetine, 7% as unchanged norfluoxetine. **Half-life:** 1–3 days (norfluoxetine 5–7 days).

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	1–4 wk	unknown	2 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Concurrent use of pimozide; Concurrent use of thioridazine (fluoxetine should be discontinued at least 5 wk before thioridazine therapy is initiated). **Use Cautiously in:** History of seizures; Debilitated patients (↑ risk of seizures); Diabetes mellitus; Patients with concurrent chronic illness or multiple drug therapy (dose adjustments may be necessary); Hepatic impairment (↓ doses/↑ dosing interval may be necessary); May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; Congenital long QT syndrome, history of QT interval prolongation, family history of long QT syndrome or sudden cardiac death, concurrent use of QT interval prolonging drugs, hypokalemia, hypomagnesemia, recent MI, uncompensated HF, or bradycardia; Angle-closure glaucoma; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk. Use during first trimester may ↑ risk of cardiovascular malformations in infant. Use during third trimester may result in neonatal serotonin syndrome requiring prolonged hospitalization, respiratory and nutritional support. Use may also be associated with persistent pulmonary hypertension in newborn. May cause sedation in infant; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Risk of suicidal ideation or attempt may be greater in children or adolescents; Pedi: Children <7 yr (safety and effectiveness not established); Geri: Older adults are at ↑ risk for excessive CNS stimulation, sleep disturbances, and agitation.

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, chest pain, palpitations, QT interval prolongation. **Derm:** ↑ sweating, pruritus, erythema nodosum, flushing, rashes. **EENT:** mydriasis, stuffy nose, visual disturbances. **Endo:** dysmenorrhea. **F and E:** hyponatremia. **GI:** diarrhea, abdominal pain, abnormal taste, anorexia, constipation, dry mouth, dyspepsia, nausea, vomiting, weight loss. **GU:** ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction, urinary frequency. **MS:** arthralgia, back pain, myalgia. **Neuro:** tremor, NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, anxiety, drowsiness, headache, insomnia,

© F.A. Davis Publishing

nervousness, abnormal dreams, dizziness, fatigue, hypomania, mania, weakness. **Resp:** cough. **Misc:** SEROTONIN SYNDROME, fever, flu-like syndrome, hot flashes, hypersensitivity reactions.

Interactions

Drug-Drug: Discontinue use of **MAO inhibitors** for 14 days before fluoxetine therapy; combined therapy may result in confusion, agitation, seizures, hypertension, and hyperpyrexia (serotonin syndrome). Fluoxetine should be discontinued for at least 5 wk before MAO inhibitor therapy is initiated. Concurrent use with **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving fluoxetine, immediately discontinue fluoxetine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume fluoxetine therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **pimozide** may ↑ risk of QT interval prolongation. ↑ levels of **thioridazine** may ↑ risk of QT interval prolongation (concurrent use contraindicated; fluoxetine should be discontinued for at least 5 wk before thioridazine is initiated). **QT interval prolonging drugs** may ↑ the risk of QT interval prolongation with arrhythmias; avoid concurrent use. **Ritonavir**, **saquinavir**, and **efavirenz** may ↑ the risk of developing the serotonin syndrome. For concurrent use with **ritonavir** ↓ fluoxetine dose by 70%; if initiating fluoxetine, start with 10 mg/day dose. ↓ metabolism and ↑ effects of **alprazolam** (decrease alprazolam dose by 50%). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome. ↑ CNS depression with **alcohol**, **antihistamines**, other **antidepressants**, **opioid analgesics**, or **sedative/hypnotics**. ↑ risk of side effects and adverse reactions with other **antidepressants**, **risperidone**, or **phenothiazines**. May ↑ effectiveness/risk of toxicity from **carbamazepine**, **clozapine**, **digoxin**, **haloperidol**, **phenytoin**, **lithium**, or **warfarin**. May ↓ the effects of **buspirone**. **Cyproheptadine** may ↓ or reverse effects of fluoxetine. May ↑ sensitivity to **adrenergics** and increase the risk of serotonin syndrome. May alter the activity of other **drugs that are highly bound to plasma proteins**. ↑ risk of serotonin syndrome with **5HT$_1$ agonists**. ↑ risk of bleeding with **NSAIDs**, **aspirin**, **clopidogrel**, or **warfarin**.

Drug-Natural Products: ↑ risk of serotonin syndrome with **St. John's wort** and **SAMe**.

Route/Dosage

PO (Adults): *Depression, OCD*— 20 mg/day in the morning. After several wk, may ↑ by 20 mg/day at weekly intervals. Doses greater than 20 mg/day should be given in 2 divided doses, in the morning and at noon (not to exceed 80 mg/day). Patients who have been stabilized on the 20 mg/day dose may be switched over to delayed-release capsules at dose of 90 mg once weekly, initiated 7 days after the last 20-mg dose. *Panic disorder*— 10 mg/day initially, may ↑ after 1 wk to 20 mg/day (usual dose is 20 mg, but may be ↑ as needed/tolerated up to 60 mg/day). *Bulimia nervosa*— 60 mg/day (may need to titrate up to dosage over several days). *PMDD*— 20 mg/day (not to exceed 80 mg/day) *or* 20 mg/day starting 14 days prior to expected onset on menses, continued through first full day of menstruation, repeated with each cycle. *Depressive episodes associated with bipolar I disorder*— 20 mg/day with olanzapine 5 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 12.5 mg/day; *Treatment-resistant depression*— 20 mg/day with olanzapine 5 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 20 mg/day.

PO (Geriatric Patients): *Depression*— 10 mg/day in the morning initially, may be ↑ (not to exceed 60 mg/day).

PO (Children 7–17 yr): *Depression and OCD (adolescents and higher weight children)*— 10 mg/day may be ↑ after 2 wk to 20 mg/day; additional increases may be made after several more wk (range 20–60 mg/day); *Depression and OCD (lower-weight children)*— 10 mg/day initially, may be ↑ after several more wk (range 20–30 mg/day).

PO (Children 10–17 yr): *Depressive episodes associated with bipolar I disorder*— 20 mg/day with olanzapine 2.5 mg/day (both given in evening); may ↑ fluoxetine dose up to 50 mg/day and olanzapine dose up to 12 mg/day.

Availability (generic available)

Tablets: 10 mg, 20 mg, 60 mg. **Cost:** *Generic*— 20 mg $73.03/100. **Capsules:** 10 mg, 20 mg, 40 mg. **Cost:** *Generic*— 10 mg $10.83/100, 20 mg $8.62/100, 40 mg $41.03/100. **Delayed-release capsules:** 90 mg. **Cost:** *Generic*— $147.96/4. **Oral solution (mint flavor):** 20 mg/5 mL. **Cost:** *Generic*— $118.00/120 mL. ***In combination with:*** olanzapine (Symbyax; see Appendix N).

NURSING IMPLICATIONS

Assessment

- Monitor mood changes. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to

© F.A. Davis Publishing

patient. Risk may be increased in children, adolescents, and adults ≤24 yr. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.

- Monitor appetite and nutritional intake. Weigh weekly. Notify health care professional of continued weight loss. Adjust diet as tolerated to support nutritional status.
- Assess for sensitivity reaction (urticaria, fever, arthralgia, edema, carpal tunnel syndrome, rash, hives, lymphadenopathy, respiratory distress) and notify health care professional if present; symptoms usually resolve by stopping fluoxetine but may require administration of antihistamines or corticosteroids.
- Assess sexual function before starting fluoxetine. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, arrhythmias, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report immediately.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **OCD:** Assess for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning.
- **Bulimia Nervosa:** Assess frequency of binge eating and vomiting during therapy.
- **PMDD:** Monitor mood prior to and periodically during therapy.
- ***Lab Test Considerations:*** Monitor CBC and differential periodically during therapy. Notify health care professional if leukopenia, anemia, thrombocytopenia, or increased bleeding time occurs.
- Proteinuria and mild ↑ in AST may occur during sensitivity reactions.
- May cause ↑ in serum alkaline phosphatase, ALT, BUN, and creatine kinase, as well as hyperuricemia, hypocalcemia, hypoglycemia, hyperglycemia, and hyponatremia.
- May cause hypoglycemia in patient with diabetes.

Implementation

- Do not confuse fluoxetine with duloxetine, paroxetine, or Loxitane (loxapine). Do not confuse Prozac with Prilosec (omeprazole), Prograf (tacrolimus), or Provera (medroxyprogesterone).
- **PO:** Administer as a single dose in the morning. Some patients may require increased amounts, in divided doses, with a 2nd dose at noon.
- May be administered with food to minimize GI irritation. Do not open, dissolve, chew, or crush delayed-release capsules.
- Delayed release capsules may be started after last dose of *PROzac* 20 mg. Dose may be increased after several wk if improvement not clinically significant.

Patient/Family Teaching

- Instruct patient to take fluoxetine as directed. Take missed doses as soon as remembered unless almost time for next dose, then omit and return to regular schedule. Do not double doses or discontinue without consulting health care professional; discontinuation may cause anxiety, insomnia, nervousness.
- May cause drowsiness, dizziness, impaired judgment, and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to the drug is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior, or if symptoms of serotonin syndrome occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications. Advise patient to avoid taking other CNS depressants, including opioids, or alcohol.
- Caution patient to change positions slowly to minimize dizziness.
- Inform patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. If dry mouth persists for more than 2 wk, consult health care professional regarding use of saliva substitute.
- Caution patient to wear protective clothing and use sunscreen to prevent photosensitivity reactions.
- Inform patient that fluoxetine may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Advise patient to notify health care professional if symptoms of sensitivity reaction occur or if headache, nausea, anorexia, anxiety, or insomnia persists.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Monitor infants exposed to fluoxetine during 3rd trimester for respiratory distress, cyanosis, ap-

© F.A. Davis Publishing

nea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hypotonia, hypertonia, hyperreflexia, tremors, jitteriness, irritability, and constant crying. Monitor infants exposed to fluoxetine via breast milk for agitation, irritability, poor feeding, and poor weight gain. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patient by calling the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clinical-and-researchprograms/pregnancyregistry/antidepressants/.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes
- Increased sense of well-being.
- Renewed interest in surroundings. May require 1–4 wk of therapy to obtain antidepressant effects.
- Decrease in obsessive-compulsive behaviors.
- Decrease in binge eating and vomiting in patients with bulimia nervosa.
- Decreased incidence frequency of panic attacks.
- Decreased mood alterations associated with PMDD.

flurandrenolide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

fluticasone, See CORTICOSTEROIDS (INHALATION), CORTICOSTEROIDS (NASAL), and CORTICOSTEROIDS (TOPICAL/LOCAL).

fluvastatin, See HMG-CoA REDUCTASE INHIBITORS (statins).

fluvoxaMINE
(floo-**voks**-a-meen)
Luvox, ~~Luvox CR~~

Classification
Therapeutic: antidepressants, antiobsessive agents
Pharmacologic: selective serotonin reuptake inhibitors (SSRIs)

Indications
Obsessive-compulsive disorder (OCD). **Unlabeled Use:** Depression. Generalized anxiety disorder (GAD). Social anxiety disorder (SAD). Post-traumatic stress disorder (PTSD).

Action
Inhibits the reuptake of serotonin in the CNS. **Therapeutic Effects:** Decrease in obsessive-compulsive behaviors.

Pharmacokinetics
Absorption: 53% absorbed after oral administration.
Distribution: Excreted in breast milk; enters the CNS. Remainder of distribution not known.
Metabolism and Excretion: Mostly metabolized by the liver via the CYP2D6 isoenzyme; the CYP2D6 isoenzyme exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly ↑ fluvoxamine concentrations and an ↑ risk of adverse effects.
Half-life: 13.6–15.6 hr.

TIME/ACTION PROFILE (improvement on obsessive-compulsive behaviors)

ROUTE	ONSET	PEAK	DURATION
PO	within 2–3 wk	several mo	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity to fluvoxamine or other SSRIs; Concurrent use of MAO inhibitors (or within 14 days of discontinuing fluvoxamine), MAO inhibitor-like drugs (linezolid or methylene blue), alosetron, pimozide, thioridazine, or tizanidine.
Use Cautiously in: Hepatic impairment; Risk of suicide (may ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment); Angle-closure glaucoma; OB: Neonates exposed to SSRI in third trimester may develop drug discontinuation syndrome including respiratory distress, feeding difficulty, and irritability; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Risk of suicidal ideation or attempt may be greater in children or adolescents; Pedi: Safety and effectiveness not established in children <18 yr (controlled release) and <8 yr (immediate-release); Geri: Older adults may have ↑ sensitivity; recommend lower initial dose and slower dosage titration.

Adverse Reactions/Side Effects
CV: edema, hypertension, palpitations, postural hypotension, tachycardia, vasodilation. **Derm:** ↑ sweating. **EENT:** sinusitis. **GI:** constipation, diarrhea, dry mouth, dyspepsia, nausea, anorexia, dysphagia, ↑ liver enzymes, flatulence, vomiting. **GU:** ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction. **Metab:** weight gain, weight loss. **MS:** hypertonia, myoclonus/twitching. **Neuro:** hypokinesia/hyperkinesia, tremor, NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, sedation, dizziness, drowsiness,

© F.A. Davis Publishing

headache, insomnia, nervousness, weakness, agitation, anxiety, apathy, emotional lability, manic reactions, mental depression, psychotic reactions, syncope. **Resp:** cough, dyspnea. **Misc:** SEROTONIN SYNDROME, chills, flu-like symptoms, hypersensitivity reactions, tooth disorder/caries, yawning.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious potentially fatal reactions (MAO inhibitors should be stopped at least 14 days before fluvoxamine therapy. Fluvoxamine should be stopped at least 14 days before MAO inhibitor therapy). Concurrent use with **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving fluvoxamine, immediately discontinue fluvoxamine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume fluvoxamine therapy 24 hr after last dose of linezolid or methylene blue). **Smoking** may ↓ effectiveness of fluvoxamine. Concurrent use with **tricyclic antidepressants** may ↑ plasma levels of fluvoxamine. Drugs that affect serotonergic neurotransmitter systems, including **SSRIs**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome. ↓ metabolism and may ↑ effects of some **beta blockers** (**propranolol**), **alosetron** (avoid concurrent use), some **benzodiazepines** (avoid concurrent **diazepam**), **carbamazepine**, **methadone**, **lithium**, **theophylline** (↓ dose to 33% of usual dose), **ramelteon** (avoid concurrent use), **warfarin**, and **L-tryptophan**. ↑ risk of bleeding with **NSAIDs**, **aspirin**, **clopidogrel**, or **warfarin**. ↑ blood levels and risk of toxicity from **clozapine** (dosage adjustments may be necessary).

Drug-Natural Products: Use with **St. John's wort** ↑ of serotonin syndrome.

Route/Dosage

PO (Adults): *Immediate release*—50 mg daily at bedtime; ↑ by 50 mg every 4–7 days until desired effect is achieved. If daily dose >100 mg, give in 2 equally divided doses or give a larger dose at bedtime (not to exceed 300 mg/day); *Controlled release*—100 mg at bedtime; ↑ by 50 mg every 7 days until desired effect is achieved, not to exceed 300 mg/day.

PO (Children 8–17 yr): *Immediate release*—25 mg at bedtime, may ↑ by 25 mg/day every 4–7 days (not to exceed 200 mg/day; daily doses >50 mg should be given in divided doses with a larger dose at bedtime).

Hepatic Impairment

PO (Adults): *Immediate release*—25 mg daily at bedtime initially, slower titration, and longer dosing intervals should be used.

Availability (generic available)

Tablets: 25 mg, 50 mg, 100 mg. **Controlled-release capsules:** 100 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Monitor mood changes. Assess patient for frequency of obsessive-compulsive behaviors. Note degree to which these thoughts and behaviors interfere with daily functioning. Inform health care professional if patient demonstrates significant increase in anxiety, nervousness, or insomnia.
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs. After starting therapy, children, adolescents, and young adults should be seen by health care professional at least weekly for 4 wk, every 3 wk for next 4 wk, and on advice of health care professional thereafter.
- Monitor appetite and nutritional intake. Weigh weekly. Report significant changes in weight. Adjust diet as tolerated to support nutritional status.
- Assess sexual function before starting fluvoxamine. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- ***Toxicity and Overdose:*** Common symptoms of toxicity include drowsiness, vomiting, diarrhea, and dizziness. Coma, tachycardia, bradycardia, hypotension, ECG abnormalities, liver function abnormalities, and convulsions may also occur. Treatment is symptomatic and supportive.

Implementation

- Do not confuse fluvoxamine with fluphenazine or flavoxate. Do not confuse Luvox with Lasix (furosemide).
- Taper to avoid withdrawal effects. Reduce dose by 50% for 3 days, then reduce by 50% for 3 days, then discontinue.
- **PO:** Initial therapy is administered as a single bedtime dose. May be increased every 4–7 days as tolerated.
- Fluvoxamine may be given without regard to meals. ***DNC:*** Do not open, break, crush, or chew controlled-release capsules.

Patient/Family Teaching

- Instruct patient to take fluvoxamine as directed. Do not skip or double up on missed doses. Improvement in symptoms may be noticed in 2–3 wk, but medication should be continued as directed.

© F.A. Davis Publishing

- May cause drowsiness and dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to notify health care professional if rash or hives occur or if headache, nausea, anorexia, anxiety, or insomnia persists.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort. Advise patient to avoid taking other CNS depressants or alcohol.
- Advise patient to avoid use of caffeine (chocolate, tea, cola).
- Inform patient that fluvoxamine may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Monitor exposed to fluvoxamine during 3rd trimester for respiratory distress, cyanosis, apnea, seizures, temperature instability, feeding difficulty, vomiting, hypoglycemia, hypotonia, hypertonia, hyperreflexia, tremors, jitteriness, irritability, and constant crying. Monitor infants exposed to fluvoxamine via breast milk for agitation, irritability, poor feeding, and poor weight gain. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to antidepressants during pregnancy. Register patient by calling the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clinical-and-researchprograms/pregnancyregistry/antidepressants/.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Decrease in symptoms of obsessive-compulsive disorder.

HIGH ALERT

fondaparinux (fon-da-par-i-nux)

Arixtra

Classification

Therapeutic: anticoagulants
Pharmacologic: active factor X inhibitors

F

Indications

Prevention and treatment of deep vein thrombosis and pulmonary embolism. **Unlabeled Use:** Systemic anticoagulation for other diagnoses.

Action

Binds selectively to antithrombin III (AT III). This binding potentiates the neutralization (inactivation) of active factor X (Xa). **Therapeutic Effects:** Interruption of the coagulation cascade resulting in inhibition of thrombus formation. Prevention of thrombus formation decreases the risk of pulmonary emboli.

Pharmacokinetics

Absorption: 100% absorbed following subcutaneous administration.
Distribution: Distributes mainly throughout the intravascular space.
Metabolism and Excretion: Eliminated mainly unchanged in urine.
Half-life: 17–21 hr.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Subcut	rapid	3 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe renal impairment (CCr <30 mL/min; ↑ risk of bleeding); Body weight <50 kg (for prophylaxis) (markedly ↑ risk of bleeding); Active major bleeding; Bacterial endocarditis; Thrombocytopenia due to fondaparinux antibodies.

Use Cautiously in: Mild-to-moderate renal impairment (CCr 30–50 mL/min); Untreated hypertension; Recent history of ulcer disease; Body weight <50 kg (for treatment of DVT or PE) (may ↑ risk of bleeding); Geri: Patients >65 yr (↑ risk of bleeding); Malignancy; History of heparin-induced thrombocytopenia; OB: Use during pregnancy only if clearly needed; Lactation, Pedi: Safety not established.

Exercise Extreme Caution in: History of congenital or acquired bleeding disorder; Severe uncontrolled hypertension; Hemorrhagic stroke; Recent CNS or ophthalmologic surgery; Active GI bleeding/ulceration; Retinopathy (hypertensive or diabetic); Neuroaxial spinal anesthesia or spinal puncture, especially if concurrent with an indwelling epidural catheter, drugs affecting he-

© F.A. Davis Publishing

mostasis, history of traumatic/repeated spinal puncture or spinal deformity (↑ risk of spinal/epidural hematoma that may lead to long-term or permanent paralysis).

Adverse Reactions/Side Effects

CV: edema, hypotension. **GI:** constipation, diarrhea, dyspepsia, ↑ liver enzymes, nausea, vomiting. **GU:** urinary retention. **Derm:** bullous eruption, hematoma, purpura, rash. **Hemat:** bleeding, thrombocytopenia. **F and E:** hypokalemia. **Neuro:** confusion, dizziness, headache, insomnia. **Misc:** hypersensitivity reactions including ANGIOEDEMA, fever, ↑ wound drainage.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **warfarin** or **drugs that affect platelet function**, including **aspirin**, **NSAIDs**, **dipyridamole**, some **cephalosporins**, **valproates**, **clopidogrel**, **eptifibatide**, **tirofiban**, and **dextran**.
Drug-Natural Products: ↑ risk of bleeding with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **gingko**, ***Panax ginseng***, and others.

Route/Dosage

Treatment of DVT/PE

Subcut (Adults): *<50 kg*—5 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); warfarin may be started within 72 hr of fondaparinux (has been used for up to 26 days); *50–100 kg*—7.5 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); *>100 kg*—10 mg once daily for at least 5 days until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); warfarin may be started within 72 hr of fondaparinux.

Prevention of DVT/PE

Subcut (Adults): 2.5 mg once daily, starting 6–8 hr after surgery, continuing for 5–9 days (up to 11 days) following abdominal surgery or knee/hip replacement or continuing for 24 days following hip fracture surgery (up to 32 days).

Availability (generic available)

Solution for subcut injection (prefilled syringes): 2.5 mg/0.5 mL, 5 mg/0.4 mL, 7.5 mg/0.6 mL, 10 mg/0.8 mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit; sudden drop in BP; guaiac positive stools); bleeding from surgical site. Notify health care professional if these occur.
- Assess for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement. Monitor neurological status frequently for signs of impairment, especially in patients with indwelling epidural catheters for administration of analgesia or with concomitant use of drugs affecting hemostasis (NSAIDs, platelet inhibitors, other anticoagulants). Risk is increased by traumatic or repeated epidural or spinal puncture. May require urgent treatment.
- ***Lab Test Considerations:*** Monitor platelet count closely; may cause thrombocytopenia. If platelet count is <100,000/mm^3, discontinue fondaparinux.
- Fondaparinux is not accurately measured by prothrombin time (PT), activated thromboplastin time (aPTT), or international standards of heparin or low-molecular-weight heparins. If unexpected changes in coagulation parameters or major bleeding occurs, discontinue fondaparinux.
- Monitor CBC, serum creatinine levels, and stool occult blood tests routinely during therapy.
- May cause asymptomatic ↑ in AST and ALT. Elevations are fully reversible and not associated with ↑ in bilirubin.
- May cause ↑ aPTT temporally associated with bleeding with or without concomitant administration of other anticoagulants and thrombocytopenia with thrombosis similar to heparin-induced thrombocytopenia, with or without exposure to heparin or low-molecular-weight heparins.

Implementation

- ***High Alert:*** Do not confuse Arixtra with Arista AH (absorbable hemostatic agent).
- Fondaparinux cannot be used interchangeably with heparin, low-molecular-weight heparins, or heparinoids as they differ in manufacturing process, anti-Xa and anti-IIa activity, units, and dose. Each of these medications has its own instructions for use.
- Initial dose should be administered 6–8 hr after surgery. Administration before 6 hr after surgery has been associated with risk of major bleeding.
- **Subcut:** Administer subcut only into fatty tissue, alternating sites between right and left anterolateral or posterolateral abdominal wall. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter. Do not mix with other injections.
- Fondaparinux is provided in a single-dose prefilled syringe with an automatic needle protection system. Do not expel air bubble from prefilled syringe before injection to prevent loss of drug.

Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to health care professional immediately.

© F.A. Davis Publishing

- Instruct patient not to take aspirin or NSAIDs without consulting health care professional during therapy.

Evaluation/Desired Outcomes

- Prevention and treatment of deep vein thrombosis and pulmonary embolism.

foscarnet (foss-kar-net)

Foscavir

Classification

Therapeutic: antivirals

Indications

Treatment of cytomegalovirus (CMV) retinitis in HIV-infected patients (alone or with ganciclovir). Treatment of acyclovir-resistant mucocutaneous herpes simplex virus (HSV) infections in immunocompromised patients.

Action

Prevents viral replication by inhibiting viral DNA-polymerase and reverse transcriptase. **Therapeutic Effects:** Virustatic action against susceptible viruses including CMV.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.

Distribution: Variable penetration into CSF. May concentrate in and be slowly released from bone.

Metabolism and Excretion: 80–90% excreted unchanged in urine.

Half-life: 3 hr (in patients with normal renal function); longer half-life of 90 hr may reflect release of drug from bone.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; HF (due to sodium content); Patients on sodium-restricted diets; Hemodialysis; Lactation: Avoid breast feeding.

Use Cautiously in: Renal impairment (dose ↓ required if CCr ≤1.4–1.6 mL/min/kg; see product information); History of seizures; History of QT interval prolongation or cardiovascular disease; Concurrent use of other QT interval prolonging medications; Hypokalemia or hypomagnesemia (must be corrected prior to therapy); OB, Pedi: Safety not established.

Adverse Reactions/Side Effects

EENT: conjunctivitis, eye pain, vision abnormalities. **Resp:** coughing, dyspnea. **CV:** TORSADE DE POINTES, chest pain, edema, palpitations, QT interval prolongation. **GI:** diarrhea, nausea, vomiting, abdominal pain, abnormal taste sensation, anorexia, constipation, dyspepsia. **GU:** renal failure, albuminuria, dysuria, nocturia, polyuria, urinary retention. **Derm:** ↑ sweating, pruritus, rash, skin ulceration. **F and E:** hypocalcemia, hypokalemia, hypomagnesemia, hyperphosphatemia, hypophosphatemia. **Hemat:** anemia, granulocytopenia, leukopenia, neutropenia. **Local:** pain/inflammation at injection site. **MS:** arthralgia, myalgia, back pain, involuntary muscle contraction. **Neuro:** ataxia, hypoesthesia, neuropathy, paresthesia, tremor, SEIZURES, headache, anxiety, confusion, dizziness, fatigue, malaise, mental depression, weakness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, urticaria, and angioedema), fever, chills, flu-like syndrome, lymphoma, sarcoma.

Interactions

Drug-Drug: Avoid use of drugs known to prolong the QTc interval including **quinidine**, **procainamide**, **amiodarone**, **sotalol**, **chlorpromazine**, **thioridazine**, **moxifloxacin**, **pentamidine**, and **methadone**. Concurrent use with parenteral **pentamidine** may result in severe, life-threatening hypocalcemia. Risk of nephrotoxicity may be ↑ by concurrent use of other **nephrotoxic agents** (**amphotericin B**, **aminoglycosides**, **cyclosporine**, **acyclovir**, **methotrexate**, **tacrolimus**, **pentamidine (IV)**).

Route/Dosage

IV (Adults): *CMV retinitis*—60 mg/kg every 8 hr or 90 mg/kg every 12 hr for 2–3 wk, then 90–120 mg/kg/day as a single dose. Dose ↓ required for any degree of renal impairment; *HSV*—40 mg/kg every 8–12 hr for 2–3 wk or until healing occurs.

Availability (generic available)

Solution for injection: 24 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor ECG periodically during therapy for QT interval prolongation.
- **CMV Retinitis:** Diagnosis of CMV retinitis should be determined by ophthalmoscopy before treatment with foscarnet. Ophthalmologic examinations should also be performed at the conclusion of induction and every 4 wk during maintenance therapy.
- Culture for CMV (urine, blood, throat) may be taken before administration. However, a negative CMV culture does not rule out CMV retinitis.
- **HSV Infections:** Assess lesions before and daily during therapy.
- ***Lab Test Considerations:*** Monitor serum creatinine before and 2–3 times weekly during induction therapy and at least once every 1–2 wk during

© F.A. Davis Publishing

maintenance therapy. Monitor 24-hr CCr before and periodically throughout therapy. If CCr drops below 0.4 mL/min/kg, discontinue foscarnet.

- Monitor serum calcium, magnesium, potassium, and phosphorus before and 2–3 times weekly during induction therapy and at least weekly during maintenance therapy. May cause ↓ concentrations.
- May cause anemia, granulocytopenia, leukopenia, and thrombocytopenia. May cause ↑ AST and ALT levels and abnormal A-G ratios.

Implementation

- Adequately hydrate patient with 750–1000 mL of 0.9% NaCl or D5W before first infusion to establish diuresis, then administer 750–1000 mL with 120 mg/kg of foscarnet or 500 mL with 40–60 mg/kg of foscarnet with each dose to prevent renal toxicity.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** May be administered via central line undiluted. If administered via peripheral line, ***must*** be diluted with D5W or 0.9% NaCl to prevent vein irritation. Do not administer solution that is discolored or contains particulate matter. Do not refrigerate or freeze; stable for 24 hrs at room temperature. Use diluted solution within 24 hr. ***Concentration:*** Undiluted: 24 mg/mL; Diluted: 12 mg/mL.
- Dose is based on patient weight; excess solution may be discarded from bottle before administration to prevent overdosage.
- Patients who experience progression of CMV retinitis during maintenance therapy may be retreated with induction therapy followed by maintenance therapy. ***Rate:*** Administer at a rate not to exceed 1 mg/kg/min.
- Infuse solution via infusion pump to ensure accurate infusion rate.
- **Y-Site Compatibility:** aldesleukin, alemtuzumab, alfentanil, amifostine, amikacin, aminophylline, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone sodium phosphate, dexmedetomidine, dexrazoxane, diltiazem, docetaxel, dopamine, doxacurium, enalaprilat, ephedrine, epinephrine, eptifibatide, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, flucytosine, fludarabine, fluorouracil, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem-cilastatin, insulin, irinotecan, isoproterenol, ketorolac, levofloxacin, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, milrinone, mitomycin, morphine, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G potassium, pentobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, propranolol, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, vancomycin, vecuronium, vinblastine, vincristine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** Manufacturer recommends that foscarnet not be administered concurrently with other drugs or solutions in the same IV catheter except D5W or 0.9% NaCl, acyclovir, allopurinol, amphotericin B deoxycholate, amphotericin B lipid complex, calcium chloride, calcium gluconate, caspofungin, chlorpromazine, ciprofloxacin, dantrolene, daunorubicin, diazepam, digoxin, diphenhydramine, dobutamine, doxorubicin, droperidol, epirubicin, ganciclovir, haloperidol, idarubicin, labetalol, leucovorin, methylprednisolone, midazolam, mitoxantrone, mycophenolate, nicardipine, norepinephrine, ondansetron, pentamidine, prochlorperazine, promethazine, quinupristin/dalfopristin, thiopental, topotecan, verapamil, vinorelbine.

Patient/Family Teaching

- Inform patient that foscarnet is not a cure for CMV retinitis. Progression of retinitis may continue in immunocompromised patients during and after therapy. Advise patients to have regular ophthalmologic exams.
- May cause dizziness and seizures. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional immediately if perioral tingling or numbness in the extremities or paresthesia occurs during or after infusion. If these signs of electrolyte imbalance occur during administration, infusion should be stopped and lab samples for serum electrolyte concentrations obtained immediately.
- Emphasize the importance of frequent follow-up exams to monitor renal function and electrolytes.

Evaluation/Desired Outcomes

- Management of the symptoms of CMV retinitis in patients with AIDS.
- Crusting over and healing of skin lesions in HSV infections.

© F.A. Davis Publishing

fosinopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

fosphenytoin (foss-**fen**-i-toyn)

Cerebyx

Classification

Therapeutic: anticonvulsants

Indications

Short-term (<5 day) parenteral management of generalized, tonic-clonic status epilepticus when use of phenytoin is not feasible. Treatment and prevention of seizures during neurosurgery when use of phenytoin is not feasible. Short-term substitution for oral phenytoin in patients ≥2 yr old.

Action

Limits seizure propagation by altering ion transport. May also decrease synaptic transmission. Fosphenytoin is rapidly converted to phenytoin, which is responsible for its pharmacologic effects. **Therapeutic Effects:** Diminished seizure activity.

Pharmacokinetics

Absorption: Rapidly converted to phenytoin after IV administration and completely absorbed after IM administration.

Distribution: Distributes into CSF and other body tissues and fluids. Enters breast milk; crosses the placenta, achieving similar maternal/fetal levels. Preferentially distributes into fatty tissue.

Protein Binding: *Fosphenytoin*—95–99%; *phenytoin*—90–95%.

Metabolism and Excretion: Mostly metabolized by the liver via the CYP2C9 isoenzyme, and to a lesser extent by the CYP2C19 isoenzyme; ⚠ the CYP2C9 isoenzyme exhibits genetic polymorphism (intermediate or poor metabolizers may have significantly ↑ fosphenytoin concentrations and an ↑ risk of adverse reactions).; minimal amounts excreted in the urine.

Half-life: *Fosphenytoin*—15 min; *phenytoin*—22 hr (range 7–42 hr).

TIME/ACTION PROFILE (anticonvulsant effect)

ROUTE	ONSET	PEAK	DURATION
IM	unknown	30 min	up to 24 hr
IV	15–45 min	15–60 min	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Sinus bradycardia, sinoatrial block, 2nd- or 3rd-degree AV heart block or Adams-Stokes syndrome; Prior acute hepatotoxicity due to fosphenytoin or phenytoin.

Use Cautiously in: Hepatic or renal impairment (↑ risk of adverse reactions; dose ↓ recommended for hepatic impairment); ⚠ CYP2C9 intermediate or poor metabolizers (↑ risk of phenytoin toxicity); OB: ↑ risk of congenital anomalies; ↑ risk of hemorrhage in newborn if used at term); Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Exercise Extreme Caution in: ⚠ Patients positive for HLA-B*1502 allele or carriers of CYP2C9*3 variant (unless benefits clearly outweigh the risks) (↑ risk of serious skin reactions).

Adverse Reactions/Side Effects

CV: hypotension (with rapid IV administration), tachycardia. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus, purple glove syndrome, rash. **EENT:** amblyopia, deafness, diplopia, tinnitus. **GI:** dry mouth, nausea, taste perversion, tongue disorder, vomiting. **MS:** back pain. **Neuro:** ataxia, dysarthria, extrapyramidal syndrome, hypoesthesia, incoordination, paresthesia, tremor, dizziness, drowsiness, nystagmus, agitation, brain edema, headache, stupor, vertigo. **Misc:** ANGIOEDEMA, pelvic pain.

Interactions

Drug-Drug: **Disulfiram**, acute ingestion of **alcohol**, **amiodarone**, **capecitabine**, **chloramphenicol**, **chlordiazepoxide**, **cimetidine**, **diazepam**, **estrogens**, **ethosuximide**, **felbamate**, **fluconazole**, **fluorouracil**, **fluoxetine**, **fluvastatin**, **fluvoxamine**, **halothane**, **isoniazid**, **itraconazole**, **ketoconazole**, **methylphenidate**, **miconazole**, **omeprazole**, **oxcarbazepine**, **phenothiazines**, **salicylates**, **sertraline**, **sulfonamides**, **topiramate**, **trazodone**, **voriconazole**, and **warfarin** may ↑ phenytoin blood levels. **Barbiturates**, **bleomycin**, **carbamazepine**, **carboplatin**, **cisplatin**, **diazoxide**, **doxorubicin**, **folic acid**, **fosamprenavir**, **methotrexate**, **nelfinavir**, **rifampin**, **ritonavir**, **theophylline**, **vigabatrin**, and chronic ingestion of **alcohol** may ↓ phenytoin blood levels. Phenytoin may ↓ the effects of **albendazole**, **amiodarone**, **atorvastatin**, **benzodiazepines**, **carbamazepine**, **chloramphenicol**, **clozapine**, **corticosteroids**, **cyclosporine**, **digoxin**, **disopyramide**, **doxycycline**, **efavirenz**, **estrogens**, **felbamate**, **fluconazole**, **fluvastatin**, **folic acid**, **furosemide**, **indinavir**, **irinotecan**, **itraconazole**, **ketoconazole**, **lamotrigine**, **lopinavir/ritonavir**, **methadone**, **mexiletine**, **nelfinavir**, **nifedipine**, **nimodipine**, **nisoldipine**, **oral contraceptives**, **oxcarbazepine**, **paclitaxel**, **paroxetine**, **posaconazole**, **propafenone**, **quetiapine**, **quinidine**, **rifampin**, **ritonavir**, **saquinavir**, **sertraline**, **simvastatin**, **tacrolimus**, **theophylline**, **topiramate**,

© F.A. Davis Publishing

tricyclic antidepressants, **verapamil vitamin D**, **voriconazole**, **warfarin**, and **zonisamide**.
Drug-Natural Products: St. John's wort may ↓ levels.

Route/Dosage

Note: Doses of fosphenytoin should be expressed as phenytoin sodium equivalents [PE].

Status Epilepticus

IV (Adults and Children): 15–20 mg PE/kg.

Nonemergent and Maintenance Dosing

IV, IM (Adults and Children >16 yr): *Loading dose*— 10–20 mg PE/kg. *Maintenance dose*— 4–6 mg PE/kg/day (start 12 hr after loading dose; administer in 2–3 divided doses).
IV (Children Birth to 16 yr): *Loading dose*— 10–15 mg PE/kg. *Maintenance dose*— 2–4 mg PE/kg given 12 hr after loading dose, then 4–8 mg PE/kg/day (in 2 divided doses).

Availability (generic available)

Solution for injection: 50 mg PE/mL, 75 mg PE/mL.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, frequency, and characteristics of seizure activity. EEG may be monitored periodically during therapy.
- Monitor BP, ECG, and respiratory function continuously during administration of fosphenytoin and during period when peak serum phenytoin levels occur (15–30 min after administration).
- Observe patient for development of rash. Discontinue fosphenytoin at the first sign of skin reactions. Serious adverse reactions such as exfoliative, purpuric, or bullous rashes or the development of lupus erythematosus, Stevens-Johnson syndrome, or toxic epidermal necrolysis preclude further use of fosphenytoin. Stevens-Johnson syndrome and toxic epidermal necrolysis are significantly more common in patients with a particular human leukocyte antigen (HLA) allele, HLA-B*1502 (occurs almost exclusively in patients with Asian ancestry, including Han Chinese, Filipinos, Malaysians, South Asian Indians, and Thais). Avoid using fosphenytoin as an alternative to carbamazepine for patients who test positive. If less serious skin eruptions (measles-like or scarlatiniform) occur, fosphenytoin may be resumed after complete clearing of the rash. If rash reappears, avoid further use of fosphenytoin.
- Assess mental status (orientation, mood, behavior) before and periodically during therapy. Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Monitor injection site for edema, discoloration, and pain distal to the site of injection (described as "purple glove syndrome") frequently during therapy. May or may not be associated with extravasation. The syndrome may not develop for several days after injection of fosphenytoin.
- ***Lab Test Considerations:*** Fosphenytoin contains 0.0037 mmol phosphate per mg PE. Monitor serum phosphate concentrations in patients with renal insufficiency; may cause ↑ phosphate concentrations.
- May cause ↑ serum alkaline phosphatase, GGT, and glucose levels.
- Fosphenytoin therapy may be monitored using phenytoin levels. Optimal total plasma phenytoin concentrations are typically 10–20 mcg/mL (unbound plasma phenytoin concentrations of 1–2 mcg/mL).
- ***Toxicity and Overdose:*** Serum phenytoin levels should not be monitored until complete conversion from fosphenytoin to phenytoin has occurred (2 hr after IV or 4 hr after IM administration).
- Initial signs and symptoms of phenytoin toxicity include nystagmus, ataxia, confusion, nausea, slurred speech, and dizziness.

Implementation

- Do not confuse Cerebyx (fosphenytoin) with Celebrex (celecoxib) or Celexa (citalopram).
- Do not confuse concentration of fosphenytoin with total amount of drug in vial.
- Implement seizure precautions.
- When substituting *fosphenytoin* for oral *phenytoin* therapy, the same total daily dose may be given as a single dose. Unlike parenteral phenytoin, fosphenytoin may be given safely by the IM route.
- The anticonvulsant effect of fosphenytoin is not immediate. Additional measures (including parenteral benzodiazepines) are usually required in the immediate management of status epilepticus. Loading dose of *fosphenytoin* should be followed with the institution of maintenance anticonvulsant therapy.

IV Administration

- **IV Push:** ***Dilution:*** D5W or 0.9% NaCl. ***Concentration:*** 1.5–25 mg PE/mL. May be refrigerated for up to 48 hr. ***Rate:*** Administer at a rate of <150 mg PE/min in adults and <0.4 mg/kg/min in children 2–17 yrs to minimize risk of hypotension and arrhythmias.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine,

© F.A. Davis Publishing

docetaxel, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosfomycin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, insulin, regular, isoproterenol, ketotolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, meropenem/vaborbactam, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, milrinone, mitomycin, morphine, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphates, procainamide, propranolol, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, calcium chloride, calcium gluconate, caspofungin, chlorpromazine, dantrolene, daunorubicin hydrochloride, diazepam, dobutamine, doxorubicin hydrochloride, droperidol, epirubicin, fenoldopam, haloperidol, hydralazine, hydroxyzine, idarubicin, irinotecan, isavuconazonium, midazolam, mitoxantrone, moxifloxacin, mycophenolate, nicardipine, pentamidine, phenytoin, prochlorperazine, quinupristin/dalfopristin, thiopental, topotecan, verapamil.

Patient/Family Teaching

- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Instruct patients that behavioral changes, skin rash, fever, sore throat, mouth ulcers, easy bruising, petechiae, unusual bleeding, abdominal pain, chills, pale stools, dark urine, jaundice, severe nausea or vomiting, drowsiness, slurred speech, unsteady gait, swollen glands, or persistent headache should be reported to health care professional immediately. Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Rep: Advise female patients to use an additional nonhormonal method of contraception during therapy and until next menstrual period. Instruct patient to notify health care professional if pregnancy is planned or suspected. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org. Enrollment must be done by patients themselves.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine exams to monitor progress. Patient should have routine physical exams, especially monitoring skin and lymph nodes, and EEG testing.

Evaluation/Desired Outcomes

- Decrease or cessation of seizures without excessive sedation.

fremanezumab

(free-ma-**nez**-ue-mab)

Ajovy

Classification

Therapeutic: vascular headache suppressants

Pharmacologic: monoclonal antibodies, calcitonin gene-related peptide receptor antagonists

Indications

Migraine prevention.

Action

Monoclonal antibody that binds to the calcitonin gene-related peptide (CGRP) receptor, which reduces the neuroinflammatory and vasodilatory effects of CGRP.

Therapeutic Effects: Reduction in frequency of migraines.

Pharmacokinetics

Absorption: Unknown.

Distribution: Minimal distribution to tissues.

© F.A. Davis Publishing

Metabolism and Excretion: Degraded by enzymatic proteolysis into small peptides and amino acids.
Half-life: 31 days.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	5–7 days	1 mo

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: OB: Safety and effectiveness not established in pregnancy; Lactation: Use only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
Local: injection site reactions. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions
Drug-Drug: None reported.

Route/Dosage
Subcut (Adults): 225 mg once monthly *or* 675 mg every 3 mo.

Availability
Solution for injection (prefilled syringes and autoinjectors): 225 mg/1.5 mL.

NURSING IMPLICATIONS
Assessment
- Assess frequency and intensity of migraines.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, pruritus, drug hypersensitivity, urticaria) during therapy. May occur up to 1 mo after administration. If reaction is severe, discontinue fremanezumab and treat as needed.

Implementation
- **Subcut:** Prior to use allow vial to sit at room temperature for at least 30 min, protect from direct sunlight. Do no use other methods to warm solution (hot water or microwave). Do not shake. Solution is clear to opalescent, colorless to light yellow; do not administer solutions that are discolored, cloudy, or contain particulate matter. Store in refrigerator in original carton to protect from light; do not freeze. May be stored up to 7 days at room temperature; discard if at room temperature >7 days.
- Inject entire contents into abdomen, thigh, or upper arm. Do not inject into areas where the skin is tender, bruised, red, or hard.

Patient/Family Teaching
- Instruct patient to take as directed. Administer missed doses as soon as possible and schedule next dose from date last dose administered. Educate patient and/or caregiver on correct technique for injection and disposal of equipment. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Instruct patient to notify health care professional immediately if signs and symptoms of hypersensitivity reaction (itching, rash, hives, swelling of face, mouth, tongue or throat, trouble breathing) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Women with migraine may be at increased risk of preeclampsia and gestational hypertension during pregnancy. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to fremanezumab during pregnancy. Enrollment can be done by health care professional or patient by calling 1-833-927-2605 or visiting www.tevamigrainepregnancyregistry.com.

Evaluation/Desired Outcomes
- Decrease in frequency of migraines.

frovatriptan (froe-va-**trip**-tan)
Frova

Classification
Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Indications
Acute treatment of migraine headache.

Action
Acts as an agonist at specific 5-HT receptor sites in intracranial blood vessels and sensory trigeminal nerves.
Therapeutic Effects: Cranial vessel vasoconstriction with associated decrease in release of neuropeptides and resultant decrease in migraine headache.

Pharmacokinetics
Absorption: 20–30% following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver (P450 1A2 enzyme system); some metabolites eliminated in urine, <10% excreted unchanged.
Half-life: 26 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; History, symptoms or findings consistent with; Cerebrovascular syndromes including; Uncontrolled hypertension; Hemiplegic or basilar migraine; Peripheral vascular disease,

© F.A. Davis Publishing

including ischemic bowel disease; Should not be used within 24 hr of any other 5-HT agonist or ergot-type compounds (e.g. dihydroergotamine, ergotamine); Pedi: Children <18 yr.

Use Cautiously in: Concurrent use of SSRIs or SNRIs (↑ risk of serotonin syndrome); Geri: May be more susceptible to adverse cardiovascular effects; OB, Lactation: Safety not established.

Exercise Extreme Caution in: Cardiovascular risk factors (hypertension, hypercholesterolemia, cigarette smoking, obesity, diabetes, strong family history, menopausal women or men >40 yr); use only if cardiovascular status has been evaluated and determined to be safe and first dose is administered under supervision.

Adverse Reactions/Side Effects

CV: CORONARY ARTERY VASOSPASM, MI, VENTRICULAR FIBRILLATION, VENTRICULAR TACHYCARDIA, chest pain, myocardial ischemia. **GI:** dry mouth, dyspepsia, nausea. **Derm:** flushing. **MS:** skeletal pain. **Neuro:** paresthesia, dizziness, drowsiness, fatigue. **Misc:** pain.

Interactions

Drug-Drug: Hormonal contraceptives or **propranolol** may ↑ levels. ↑ risk of serious vasospastic reactions with **dihydroergotamine** or **ergotamine** (concurrent use contraindicated). ↑ risk of serotonin syndrome when used with **fluoxetine**, **paroxetine**, **sertraline**, **fluvoxamine**, **citalopram**, **escitalopram**, **venlafaxine**, or **duloxetine**.

Route/Dosage

PO (Adults): 2.5 mg; if there has been initial relief, a 2nd tablet may be taken after at least 2 hr (daily dose should not exceed 3 tablets and should not be used to treat more than 4 attacks/30 day period).

Availability (generic available)

Tablets: 2.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.

Implementation

- **PO:** Tablets may be administered at any time after the headache starts.

Patient/Family Teaching

- Inform patient that frovatriptan should be used only during a migraine attack. It is meant to be used to relieve migraine attack but not to prevent or reduce the number of attacks.
- Instruct patient to administer frovatriptan as soon as symptoms appear, but it may be administered any time during an attack. If migraine symptoms return, a 2nd dose may be used. Allow at least 2 hr between doses, and do not use more than 3 tablets in any 24-hr period.
- If dose does not relieve headache, additional frovatriptan doses are not likely to be effective; notify health care professional.
- Caution patient not to take frovatriptan within 24 hr of another vascular headache suppressant.
- Advise patient that lying down in a darkened room following frovatriptan administration may further help relieve headache.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient that overuse (use more than 10 days/mo) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of frovatriptan and treatment of symptoms (transient worsening of headache).
- Advise patient to notify health care professional prior to next dose of frovatriptan if pain or tightness in the chest occurs during use. If pain is severe or does not subside, notify health care professional immediately. If wheezing; heart throbbing; swelling of eyelids, face, or lips; skin rash; skin lumps; or hives occur, notify health care professional immediately and do not take more frovatriptan without approval of health care professional. If feelings of tingling, heat, flushing, heaviness, pressure, drowsiness, dizziness, tiredness, or sickness develop, discuss with health care professional at next visit.
- Advise patient to avoid alcohol, which aggravates headaches, during frovatriptan use.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional immediately if signs or symptoms of serotonin syndrome occur.
- Caution patient not to use frovatriptan if pregnancy is planned or suspected, or if breast feeding. Adequate contraception should be used during therapy.

Evaluation/Desired Outcomes

- Relief of migraine attack.

© F.A. Davis Publishing

furosemide (fur-oh-se-mide)
Lasix

Classification
Therapeutic: diuretics
Pharmacologic: loop diuretics

Indications
Edema due to heart failure, hepatic impairment, or renal disease. Hypertension.

Action
Inhibits the reabsorption of sodium and chloride from the loop of Henle and distal renal tubule. Increases renal excretion of water, sodium, chloride, magnesium, potassium, and calcium. Effectiveness persists in impaired renal function. **Therapeutic Effects:** Diuresis and subsequent mobilization of excess fluid (edema, pleural effusions). Decreased BP.

Pharmacokinetics
Absorption: 60–67% absorbed after oral administration (↓ in acute HF and in renal failure); also absorbed from IM sites.
Distribution: Crosses placenta, enters breast milk.
Protein Binding: 91–99%.
Metabolism and Excretion: Minimally metabolized by liver, some nonhepatic metabolism, some renal excretion as unchanged drug.
Half-life: 30–60 min (↑ in renal impairment).

TIME/ACTION PROFILE (diuretic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	1–2 hr	6–8 hr
IM	10–30 min	unknown	4–8 hr
IV	5 min	30 min	2 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Cross-sensitivity with thiazides and sulfonamides may occur; Hepatic coma or anuria; Some liquid products may contain alcohol, avoid in patients with alcohol intolerance.
Use Cautiously in: Severe hepatic impairment (may precipitate hepatic coma; concurrent use with potassium-sparing diuretics may be necessary); Electrolyte depletion; Diabetes mellitus; Hypoproteinemia (↑ risk of ototoxicity); Severe renal impairment (↑ risk of ototoxicity); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: ↑ risk for renal calculi and patent ductus arteriosis in premature neonates; Geri: Older adults may have ↑ risk of side effects, especially hypotension and electrolyte imbalance, at usual doses.

Adverse Reactions/Side Effects
CV: hypotension. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, photosensitivity, pruritus, rash, urticaria. **EENT:** hearing loss, tinnitus. **Endo:** hypercholesterolemia, hyperglycemia, hypertriglyceridemia, hyperuricemia. **F and E:** dehydration, hypocalcemia, hypochloremia, hypokalemia, hypomagnesemia, hyponatremia, hypovolemia, metabolic alkalosis. **GI:** anorexia, constipation, diarrhea, dry mouth, dyspepsia, ↑ liver enzymes, nausea, pancreatitis, vomiting. **GU:** ↑ BUN, excessive urination, nephrocalcinosis. **Hemat:** APLASTIC ANEMIA, AGRANULOCYTOSIS, hemolytic anemia, leukopenia, thrombocytopenia. **MS:** muscle cramps. **Neuro:** paresthesia, blurred vision, dizziness, headache, vertigo. **Misc:** fever.

Interactions
Drug-Drug: ↑ risk of hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. ↑ risk of hypokalemia with other **diuretics**, **amphotericin B**, **stimulant laxatives**, and **corticosteroids**. Hypokalemia may ↑ risk of **digoxin** toxicity and ↑ risk of arrhythmia in patients taking drugs that prolong the QT interval. ↓ **lithium** excretion, may cause **lithium** toxicity. ↑ risk of ototoxicity with **aminoglycosides** or **cisplatin**. ↑ risk of nephrotoxicity with **cisplatin**. **NSAIDs** ↓ effects of furosemide. May ↑ risk of **methotrexate** toxicity. ↓ effects when given at same time as **sucralfate**, **cholestyramine**, or **colestipol**. ↑ risk of **salicylate** toxicity (with use of high-dose **salicylate** therapy). Concurrent use with **cyclosporine** may ↑ risk of gouty arthritis.

Route/Dosage
Edema
PO (Adults): 20–80 mg/day as a single dose initially, may repeat in 6–8 hr; may ↑ dose by 20–40 mg every 6–8 hr until desired response. Maintenance doses may be given once or twice daily (doses up to 2.5 g/day have been used in patients with HF or renal disease). *Hypertension*—40 mg twice daily initially (when added to regimen, ↓ dose of other antihypertensives by 50%); adjust further dosing based on response; *Hypercalcemia*—120 mg/day in 1–3 doses.
PO (Children >1 mo): 2 mg/kg as a single dose; may be ↑ by 1–2 mg/kg every 6–8 hr (maximum dose = 6 mg/kg).
PO (Neonates): 1–4 mg/kg/dose 1–2 times/day.
IM, IV (Adults): 20–40 mg, may repeat in 1–2 hr and ↑ by 20 mg every 1–2 hr until response is obtained, maintenance dose may be given every 6–12 hr; *Continuous infusion*—Bolus 0.1 mg/kg followed by 0.1 mg/kg/hr, double every 2 hr to a maximum of 0.4 mg/kg/hr.
IM, IV (Children): 1–2 mg/kg/dose every 6–12 hr; *Continuous infusion*—0.05 mg/kg/hr, titrate to clinical effect.
IM, IV (Neonates): 1–2 mg/kg/dose every 12–24 hr.

© F.A. Davis Publishing

Hypertension

PO (Adults): 40 mg twice daily initially (when added to regimen, ↓ dose of other antihypertensives by 50%); adjust further dosing based on response.

Availability (generic available)

Oral solution (10 mg/mL—orange flavor, 8 mg/mL—pineapple—peach flavor): 8 mg/mL, 10 mg/mL. **Cost:** *Generic*—10 mg/mL $10.40/60 mL. **Tablets:** 20 mg, 40 mg, 80 mg, 🍁 500 mg. **Cost:** *Generic*—20 mg $6.50/100, 40 mg $7.11/100, 80 mg $10.83/100. **Solution for injection:** 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess fluid status. Monitor daily weight, intake and output ratios, amount and location of edema, lung sounds, skin turgor, and mucous membranes. Notify health care professional if thirst, dry mouth, lethargy, weakness, hypotension, or oliguria occurs.
- Monitor BP and pulse before and during administration. Monitor frequency of prescription refills to determine compliance in patients treated for hypertension.
- Geri: Diuretic use is associated with increased risk for falls in older adults. Assess falls risk and implement fall prevention strategies.
- Assess patients receiving digoxin for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Patients taking digoxin are at increased risk of digoxin toxicity because of the potassium-depleting effect of the diuretic. Potassium supplements or potassium-sparing diuretics may be used concurrently to prevent hypokalemia.
- Assess patient for tinnitus and hearing loss. Audiometry is recommended for patients receiving prolonged high-dose IV therapy. Hearing loss is most common after rapid or high-dose IV administration in patients with decreased renal function or those taking other ototoxic drugs.
- Assess for allergy to sulfonamides.
- Assess patient for skin rash frequently during therapy. Discontinue furosemide at first sign of rash; may be life-threatening. Stevens-Johnson syndrome, toxic epidermal necrolysis, or erythema multiforme may develop. Treat symptomatically; may recur once treatment is stopped.
- ***Lab Test Considerations:*** Monitor electrolytes, renal and hepatic function, serum glucose, and uric acid levels before and periodically throughout therapy. Commonly ↓ serum potassium. May cause ↓ serum sodium, calcium, and magnesium concentrations. May also cause ↑ BUN, serum glucose, serum creatinine, and uric acid levels.

Implementation

- Do not confuse Lasix (furosemide) with Luvox (fluvoxamine).
- If administering twice daily, give last dose no later than 5 PM to minimize disruption of sleep cycle.
- IV route is preferred over IM route for parenteral administration.
- **PO:** May be taken with food or milk to minimize gastric irritation. Tablets may be crushed if patient has difficulty swallowing.
- Do not administer discolored solution or tablets.

IV Administration

- **IV Push:** ***Dilution:*** Administer undiluted (larger doses may be diluted and administered as intermittent infusion [see below]). ***Concentration:*** 10 mg/mL. ***Rate:*** Administer at a rate of 20 mg/min. Pedi: Administer at a maximum rate of 0.5–1 mg/kg/min (for doses <120 mg) with infusion not exceeding 10 min.
- **Intermittent Infusion:** ***Dilution:*** Dilute larger doses in 50 mL of D5W, D10W, D20W, D5/0.9% NaCl, D5/LR, 0.9% NaCl, 3% NaCl, or LR. Infusion stable for 24 hr at room temperature. Do not refrigerate. Protect from light. ***Concentration:*** 1 mg/mL. ***Rate:*** Administer at a rate not to exceed 4 mg/min (for doses >120 mg) in adults to prevent ototoxicity. Pedi: not to exceed 1 mg/kg/min with infusion not exceeding 10 min. Use an infusion pump to ensure accurate dose.
- **Y-Site Compatibility:** acyclovir, alfentanil, allopurinol, alprostadil, amifostine, amikacin, aminocaproic acid, aminophylline, amphotericin B cholesteryl, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atropine, azathioprine, aztreonam, bivalirudin, bleomycin, bumetanide, calcium chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, digoxin, docetaxel, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, esomeprazole, etoposide, etoposide phosphate, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, ganciclovir, granisetron, hydrocortisone sodium succinate, hydromorphone, ibuprofen, ifosfamide, imipenem/cilastatin, indomethacin, ketorolac, leucovorin calcium, lidocaine, linezolid, lorazepam, mannitol, melphalan, meropenem, methotrexate, methylprednisolone, metoprolol, metronidazole, micafungin, mitomycin, multivitamins, nafcillin, naloxone, nitroprusside, octreotide, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron,

© F.A. Davis Publishing

pamidronate, pemetrexed, penicillin G, pentobarbital, phenobarbital, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, propofol, propranolol, remifentanil, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, vitamin B complex with C, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, atracurium, benztropine, butorphanol, caspofungin, chlorpromazine, ciprofloxacin, dantrolene, dexrazoxane, diazepam, diazoxide, diltiazem, diphenhydramine, doxycycline, droperidol, epirubicin, eptifibitide, erythromycin, esmolol, fenoldopam, filgrastim, gemcitabine, gentamicin, glycopyrrolate, haloperidol, hydroxyzine, idarubicin, irinotecan, ketamine, levofloxacin, midazolam, milrinone, mitoxantrone, moxifloxacin, mycophenolate, nalbuphine, nicardipine, ondansetron, pancuronium, papaverine, pentamidine, phentolamine, phenylephrine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxine, quinupristin/dalfopristin, rituximab, rocuronium, telavancin, thiamine, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinblastine, vinorelbine.

Patient/Family Teaching

- Instruct patient to take furosemide as directed. Take missed doses as soon as possible; do not double doses.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Caution patient that the use of alcohol, exercise during hot weather, or standing for long periods during therapy may enhance orthostatic hypotension.
- Instruct patient to consult health care professional regarding a diet high in potassium (see Appendix J).
- Advise patient to contact health care professional if weight gain more than 3 lbs in 1 day.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications concurrently with this therapy.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to contact health care professional immediately if rash, muscle weakness, cramps, nausea, dizziness, numbness, or tingling of extremities occurs.
- Advise diabetic patients to monitor blood glucose closely; may cause increased blood glucose levels.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Monitor fetal growth during pregnancy; increased risk for higher birth weights.
- Emphasize the importance of routine follow-up examinations.
- Geri: Caution older patients or their caregivers about increased risk for falls. Suggest strategies for fall prevention.
- **Hypertension:** Advise patients on antihypertensive regimen to continue taking medication even if feeling better. Furosemide controls but does not cure hypertension.
- Reinforce the need to continue additional therapies for hypertension (weight loss, exercise, restricted sodium intake, stress reduction, regular exercise, moderation of alcohol consumption, cessation of smoking).

Evaluation/Desired Outcomes

- Decrease in edema.
- Decrease in abdominal girth and weight.
- Increase in urinary output.
- Decrease in BP.

© F.A. Davis Publishing

gabapentin (ga-ba-pen-tin)

Gralise, Horizant, Neurontin

Classification

Therapeutic: analgesic adjuncts, therapeutic, anticonvulsants, mood stabilizers

Schedule V (only schedule V in some states)

Indications

Partial seizures (adjunct treatment) (immediate-release only). Postherpetic neuralgia. Restless legs syndrome (Horizant only). **Unlabeled Use:** Neuropathic pain. Prevention of migraine headache. Bipolar disorder. Anxiety. Diabetic peripheral neuropathy.

Action

Mechanism of action is not known. May affect transport of amino acids across and stabilize neuronal membranes. **Therapeutic Effects:** Decreased incidence of seizures. Decreased postherpetic pain. Decreased leg restlessness.

Pharmacokinetics

Absorption: Well absorbed after oral administration by active transport. At larger doses, transport becomes saturated and absorption ↓ (bioavailability ranges from 60% for a 300-mg dose to 35% for a 1600-mg dose).
Distribution: Crosses blood-brain barrier; enters breast milk.
Metabolism and Excretion: Eliminated mostly by renal excretion of unchanged drug.
Half-life: *Adults*—5–7 hr (normal renal function); up to 132 hr in anuria; *Children*—4.7 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO-IR	rapid	2–4 hr	8 hr
PO-SR	unknown	5–8 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (↓ dose and/or ↑ dosing interval if CCr ≤60 mL/min); Respiratory impairment (↑ risk of respiratory depression); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <18 yr (sustained-/extended-release) or <3 yr (immediate-release) (safety and effectiveness not established); Geri: May be more susceptible to toxicity due to age-related ↓ in renal function.

Adverse Reactions/Side Effects

CV: hypertension. **Derm:** STEVENS-JOHNSON SYNDROME, bullous pemphigoid. **EENT:** abnormal vision, nystagmus. **GI:** weight gain, anorexia, flatulence, gingivitis. **MS:** RHABDOMYOLYSIS, arthralgia, ↑ creatine kinase. **Neuro:** ataxia, altered reflexes, hyperkinesia, paresthesia, SUICIDAL THOUGHTS, confusion, depression, dizziness, drowsiness, sedation, anxiety, concentration difficulties (children), emotional lability (children), hostility, hyperkinesia (children), malaise, vertigo, weakness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis or angioedema).

Interactions

Drug-Drug: Antacids may ↓ absorption of gabapentin. ↑ risk of CNS and respiratory depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioids**, and **sedative/hypnotics**. May ↓ **hydrocodone** levels.
Drug-Natural Products: Kava-kava, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

The sustained-/extended-release formulations should not be interchanged with the immediate-release products.

Epilepsy

PO (Adults and Children >12 yr): 300 mg 3 times daily initially. Titration may be continued until desired (range is 900–1800 mg/day in 3 divided doses; doses should not be more than 12 hr apart). Doses up to 2400–3600 mg/day have been well tolerated.
PO (Children ≥5–12 yr): 10–15 mg/kg/day in 3 divided doses initially titrated upward over 3 days to 25–35 mg/kg/day in 3 divided doses; dosage interval should not exceed 12 hr (doses up to 50 mg/kg/day have been used).
PO (Children 3–4 yrs): 10–15 mg/kg/day in 3 divided doses initially titrated upward over 3 days to 40 mg/kg/day in 3 divided doses; dosage interval should not exceed 12 hr (doses up to 50 mg/kg/day have been used).

Renal Impairment

PO (Adults and Children >12 yr): *CCr 30–59 mL/min*—200–700 mg twice daily; *CCr 15–29 mL/min*—200–700 mg once daily; *CCr 15 mL/min*—100–300 mg once daily; *CCr <15 mL/min*—Reduce daily dose in proportion to CCr.

Postherpetic Neuralgia

PO (Adults): *Immediate-release*—300 mg once daily on first day, then 300 mg 2 times daily on 2nd day, then 300 mg 3 times/day on day 3, may then be titrated upward as needed up to 600 mg 3 times/day; *Sustained-release (Gralise)*—300 mg once daily on first day, then 600 mg once daily on 2nd day, then 900 mg once daily on days 3–6, then 1200 mg once daily on days 7–10, then 1500 mg once daily on days 11–14, then 1800 mg once daily thereafter; *Extended-release*

© F.A. Davis Publishing

(Horizant) — 600 mg once daily in the morning on days 1–3, then 600 mg twice daily thereafter.

Renal Impairment

PO (Adults): *CCr 30–59 mL/min* — 200–700 mg twice daily (immediate-release); 600–1800 mg once daily (sustained-release [Gralise]); 300 mg once daily in the morning on days 1–3, then 300 mg twice daily thereafter (may ↑ to 600 mg twice daily, as needed) (extended-release [Horizant]); *CCr 15–29 mL/min* — 200–700 mg once daily (immediate-release); sustained release (Gralise) not recommended; 300 mg in the morning on days 1 and 3, then 300 mg once daily in the morning thereafter (may ↑ to 300 mg twice daily, as needed) (extended-release [Horizant]); *CCr 15 mL/min* — 100–300 mg once daily (immediate-release); sustained release (Gralise) not recommended; *CCr <15 mL/min* — ↓ daily dose in proportion to CCr (immediate release); sustained release (Gralise) not recommended; 300 mg every other day in the morning (may ↑ to 300 mg once daily in the morning, as needed) (extended-release [Horizant]); *CCr <15 mL/min (on hemodialysis)* — 300 mg after each dialysis session (may ↑ to 600 mg after each dialysis session, as needed) (extended-release [Horizant]).

Restless Legs Syndrome

PO (Adults): *Extended-release (Horizant)* — 600 mg once daily at 5 PM.

Renal Impairment

(Adults): *CCr 30–59 mL/min* — 300 mg once daily at 5 PM; may ↑ to 600 mg once daily at 5 PM as needed; *CCr 15–29 mL/min* — 300 mg once daily at 5 PM; *CCr <15 mL/min* — 300 mg every other day; *CCr <15 mL/min (on hemodialysis)* — Not recommended.

Neuropathic Pain (unlabeled use)

PO (Adults): 100 mg 3 times daily initially. Titrate weekly by 300 mg/day up to 900–2400 mg/day (maximum: 3600 mg/day).

PO (Children): 5 mg/kg/dose at bedtime initially then ↑ to 5 mg/kg twice daily on day 2 and 5 mg/kg 3 times daily on day 3. Titrate to effect up to 8–35 mg/kg/day in 3 divided doses.

Availability (generic available)

Immediate-release capsules: 100 mg, 300 mg, 400 mg. **Cost:** *Generic* — 100 mg $11.45/100, 300 mg $15.18/100, 400 mg $12.36/100. **Immediate-release tablets:** 600 mg, 800 mg. **Cost:** *Generic* — 600 mg $33.96/100, 800 mg $49.20/100. **Oral solution (cool strawberry anise flavor):** 250 mg/5 mL, 300 mg/6 mL. **Cost:** *Generic* — $148.91/470 mL. **Extended-release tablets (Horizant):** 300 mg, 600 mg. **Sustained-release tablets (Gralise):** 300 mg, 600 mg. **Cost:** 300 mg $99.00/30, 600 mg $329.40/90.

NURSING IMPLICATIONS

Assessment

- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- If administered with CNS depressants, including opioids, monitor for respiratory depression and sedation. Consider starting gabapentin at a low dose.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Postherpetic Neuralgia & Neuropathic Pain:** Assess location, characteristics, and intensity of pain periodically during therapy.
- **Migraine Prophylaxis:** Monitor frequency and intensity of pain on pain scale.
- **Restless Leg Syndrome**: Assess frequency and intensity of restless leg syndrome prior to and periodically during therapy.
- ***Lab Test Considerations:*** May cause false-positive readings when testing for urinary protein with *Ames N-Multistix SG* dipstick test; use sulfosalicylic acid precipitation procedure.
- May cause leukopenia.

Implementation

- Do not confuse gabapentin with gemfibrozil. Do not confuse Neurontin (gabapentin) with Motrin (ibuprofen).
- Doses of *Gralise* and *Horizant* are not interchangeable with other dose forms of gabapentin.
- **PO:** May be administered without regard to meals.
- 600-mg and 800-mg tablets are scored and can be broken to administer a half-tablet. If half-tablet is used, administer other half at the next dose. Discard half-tablets not used within several days.
- Administer *Gralise* with evening meal. Swallow tablet whole; do not crush, break, or chew.
- Administer *Horizant for Restless Leg Syndrome* with evening meal at 5 PM. *Horizant for Postherpetic Neuralgia* is administered twice daily. Swallow tablet whole; do not crush, break, or chew.
- Gabapentin should be discontinued gradually over at least 1 wk. If dose is 600 mg/day, may discontinue without tapering. If >600 mg/day, titrate daily to 600 mg for 1 wk, then discontinue. If patient is taking 600 mg twice daily, taper to once daily before discontinuing. Abrupt discontinuation may cause increase in seizure frequency.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Patients on 3 times daily dosing should not exceed 12 hr between doses. Take missed doses as soon as possible; if less than 2 hr until next dose, take dose immediately and take next dose 1–2 hr later, then resume regular dosing schedule. Do not double dose. Do not discontinue abruptly; may cause increase in frequency of seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, as changes may occur.

© F.A. Davis Publishing

- Advise patient not to take gabapentin within 2 hr of an antacid.
- Gabapentin may cause dizziness and drowsiness. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Seizure patients should not resume driving until physician gives clearance based on control of seizure disorder.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Caution patients about risk of respiratory depression when taken with CNS depressants, including opioids or in patients with underlying respiratory impairment. Teach patients how to recognize respiratory depression and advise them to seek medical attention immediately if it occurs.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; or other unusual changes in behavior or mood occur.
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334 or on the web at www.aedpregnancyregistry.org.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decreased frequency of or cessation of seizures.
- Decreased postherpetic neuralgia pain.
- Decreased intensity of neuropathic pain.
- Decreased frequency of migraine headaches.
- Increased mood stability.
- Decreased effects of restless leg syndrome.

galantamine (ga-lant-a-meen)

~~Razadyne~~, Razadyne ER

Classification

Therapeutic: antiAlzheimer's agents
Pharmacologic: cholinergics (cholinesterase inhibitors)

Indications

Mild to moderate dementia/neurocognitive disorder of the Alzheimer's type.

Action

Enhances cholinergic function by reversible inhibition of cholinesterase. **Therapeutic Effects:** Decreased dementia/cognitive decline (temporary) associated with Alzheimer's disease. Cognitive enhancer.

Pharmacokinetics

Absorption: Well absorbed (90%) following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver (primarily by CYP2D6 and CYP3A4 isoenzymes); the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers and may have significantly ↑ galantamine concentrations and an ↑ risk of adverse effects. 20% excreted unchanged in urine.
Half-life: 7 hr.

TIME/ACTION PROFILE (anticholinesterase activity)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	12 hr
PO-ER	unknown	1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic or renal impairment.
Use Cautiously in: Patients with supraventricular cardiac conduction defects or concurrent use of drugs that may slow heart rate (↑ risk of bradycardia); History of ulcer disease/GI bleeding/concurrent NSAID use; Severe asthma or obstructive pulmonary disease; Mild to moderate renal impairment (avoid use if CCr <9 mL/min); Mild to moderate hepatic impairment (cautious dose titration recommended); May ↑ risk of cardiovascular mortality; OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: bradycardia, chest pain. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS (AGEP), STEVENS-JOHNSON SYNDROME (SJS). **GI:** nausea, vomiting, anorexia, ↓ weight, diarrhea, dyspepsia, flatulence. **GU:** bladder outflow obstruction, incontinence. **Neuro:** extrapyramidal symptoms, tremor, dizziness, fatigue, headache, syncope.

Interactions

Drug-Drug: Will ↑ neuromuscular blockade from **succinylcholine-type neuromuscular blocking**

© F.A. Davis Publishing

agents. May ↑ effects of other **cholinesterase inhibitors** or other **cholinergic agonists**, including **bethanechol**. May ↓ effectiveness of **anticholinergic medications**. Levels and effects may be ↑ by **ketoconazole**, **paroxetine**, **amitriptyline**, **fluvoxamine**, or **quinidine**.

Route/Dosage

PO (Adults): *Immediate-release tablets*—4 mg twice daily initially, dose increments of 4 mg should be made at 4 wk intervals, up to 12 mg twice daily. Doses up to 16 mg twice daily have been used (range 16–32 mg/day; *Extended-release capsules*—8 mg/day as a single dose in the morning, may be ↑ to 16 mg/day after 4 wk, then up to 24 mg/day after 4 wk; increments based on benefit/tolerability.

Renal Impairment

PO (Adults): *Moderate renal impairment*—Daily dose should not exceed 16 mg.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment*—Daily dose should not exceed 16 mg.

Availability (generic available)

Immediate-release tablets: 4 mg, 8 mg, 12 mg. **Extended-release capsules:** 8 mg, 16 mg, 24 mg. **Oral solution:** 4 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- Monitor heart rate periodically during therapy. May cause bradycardia.

Implementation

- Do not confuse Razadyne with Rozerem (ramelteon).
- Patient should be maintained on a stable dose for a minimum of 4 wk prior to increasing dose.
- If dose has been interrupted for several days or longer, restart at the lowest dose and escalate to the current dose.
- **PO:** Administer twice daily, preferably with morning and evening meal. Administration with food, the use of antiemetic medications, and ensuring adequate fluid intake may decrease nausea and vomiting.
- Administer extended-release capsules in the morning, preferably with food. ***DNC:*** Swallow whole; do not open, crush, or chew.
- Use pipette provided with oral solution to administer accurate amount.

Patient/Family Teaching

- Emphasize the importance of taking galantamine daily, as directed. Instruct patient and/or caregiver in correct use of pipette if using oral solution; review *Oral Solution Instruction Sheet* included with product prior to use. Skip missed doses and return to regular schedule the following day; do not double doses. If >3 days doses are missed, restart at lowest dose. Do not discontinue abruptly; although no increase in frequency of adverse events may occur, beneficial affects of galantamine are lost when the drug is discontinued.
- Caution patient and caregiver that galantamine may cause dizziness. Monitor and assist with ambulation and caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to maintain adequate fluid intake during therapy.
- Advise patient and caregiver to stop taking galantamine and notify health care professional immediately if rash occurs.
- Advise patient and caregiver to notify health care professional if nausea or vomiting persists beyond 7 days or if new symptoms occur or previously noted symptoms increase in severity.
- Advise patient and caregiver to notify health care professional of medication regimen prior to treatment or surgery.
- Teach patient and caregivers that improvements in cognitive functioning may take wk to mo to stabilize.
- Caution that disease is not cured and degenerative process is not reversed.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to monitor progress.

Evaluation/Desired Outcomes

- Improvement in cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

galcanezumab

(**gal**-ka-**nez**-ue-mab)

Emgality

Classification

Therapeutic: vascular headache suppressants
Pharmacologic: monoclonal antibodies, calcitonin gene-related peptide receptor antagonists

Indications

Migraine prevention. Treatment of episodic cluster headaches.

Action

Monoclonal antibody that binds to the calcitonin gene-related peptide (CGRP) receptor, which reduces the neuroinflammatory and vasodilatory effects of CGRP.
Therapeutic Effects: Reduction in frequency of migraines and cluster headaches.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Unknown.
Distribution: Some tissue distribution.
Metabolism and Excretion: Degraded into small peptides and amino acids via catabolic pathways.
Half-life: 27 days.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	5 days	1 mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

Local: injection site reactions. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: None reported.

Route/Dosage

Migraine Prevention

Subcut (Adults): 240 mg once initially as loading dose, then 120 mg once monthly.

Episodic Cluster Headache

Subcut (Adults): 300 mg once at the onset of the cluster period, then 300 mg once monthly until the end of the cluster period.

Availability

Solution for injection (prefilled pens and prefilled syringes): 100 mg/mL, 120 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess frequency and intensity of migraines and cluster headaches.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, urticaria, dyspnea) during therapy. If reaction is severe, discontinue galcanezumab and treat as needed.

Implementation

- **Subcut:** Prior to use allow vial to sit at room temperature for at least 30 min, protect from direct sunlight. Do not use other methods to warm solution (hot water or microwave). Do not shake. Solution is clear to opalescent, colorless to light yellow; do not administer solutions that are discolored, cloudy, or contain particulate matter. Store in refrigerator in original carton to protect from light; do not freeze. May be stored in original carton to protect from light up to 7 days at room temperature; discard if at room temperature >7 days. Do not put back in refrigerator.
- Inject entire contents into abdomen, thigh, or upper arm. Do not inject into areas where the skin is tender, bruised, red, or hard.

Migraines

- *Loading dose:* 240 mg (2 consecutive subcut injections of 120 mg each) once. *Monthly:* follow loading dose with monthly doses of 120 mg.

Cluster Headaches

- **Subcut:** 300 mg (3 consecutive subcut injections of 100 mg each) at onset of cluster period; then monthly until end of cluster period.

Patient/Family Teaching

- Instruct patient to take as directed. Administer missed doses as soon as possible and schedule next dose from date last dose administered. Educate patient and/or caregiver on correct technique for injection and disposal of equipment. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Instruct patient to notify health care professional immediately if signs and symptoms of hypersensitivity reaction (itching, rash, hives, swelling of face, mouth, tongue or throat, trouble breathing) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Reduction in frequency of migraines and cluster headaches.

ganciclovir (gan-**sye**-kloe-vir)

Cytovene

Classification
Therapeutic: antivirals

Indications

Treatment of cytomegalovirus (CMV) retinitis in immunocompromised patients, including HIV-infected patients (may be used with foscarnet). Prevention of CMV infection in transplant patients at risk. Congenital CMV infection in neonates.

© F.A. Davis Publishing

Action

CMV converts ganciclovir to its active form (ganciclovir phosphate) inside the host cell, where it inhibits viral DNA polymerase. **Therapeutic Effects:** Antiviral effect directed preferentially against CMV-infected cells.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed; enters CSF.
Protein Binding: 1–2%.
Metabolism and Excretion: 90% excreted unchanged by the kidneys.
Half-life: *Adults:* 2.9 hr; *Children 9 mo–12 yr:* 2.4 ±0.7 hr; *Neonates:* 2.4 hr (↑ in renal impairment).

TIME/ACTION PROFILE (antiviral levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	12–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to ganciclovir or acyclovir; Bone marrow depression or immunosuppression or thrombocytopenia (do not administer if ANC <500/mm³ or platelet count <25,000/mm³); Lactation: Lactation.
Use Cautiously in: Renal impairment (dose ↓ required if CCr <80 mL/min); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Rep: Women of reproductive potential and men with female partners of reproductive potential; Geri: Dose ↓ recommended in older adults.

Adverse Reactions/Side Effects

CV: arrhythmias, edema, hypertension, hypotension. **Derm:** alopecia, photosensitivity, pruritus, rash, urticaria. **Endo:** hypoglycemia. **GI:** GI BLEEDING, abdominal pain, ↑ liver enzymes, nausea, vomiting. **GU:** ↓ fertility, gonadal suppression, hematuria, renal toxicity. **Hemat:** neutropenia, thrombocytopenia, anemia, eosinophilia. **Local:** pain/phlebitis at IV site. **Neuro:** ataxia, tremor, SEIZURES, abnormal dreams, coma, confusion, dizziness, drowsiness, headache, malaise, nervousness. **Resp:** dyspnea. **Misc:** fever.

Interactions

Drug-Drug: Toxicity may be ↑ by **probenecid**. ↑ risk of seizures with **imipenem/cilastatin**; concurrent use not recommended. Concurrent use of other **cyclosporine** or **amphotericin B** ↑ risk of nephrotoxicity. ↑ risk of nephrotoxicity and hematological toxicity with **mycophenolate mofetil**. Concurrent use with **dapsone**, **doxorubicin**, **flucytosine**, **hydroxyurea**, **pentamidine**, **tacrolimus**, **trimethoprim/sulfamethoxazole**, **vinblastine**, **vincristine**, or **zidovudine** ↑ risk of nephrotoxicity and myelosuppression. May ↑ **didanosine** levels.

Route/Dosage

IV (Adults and Children >3 mo): *Induction*—5 mg/kg every 12 hr for 14–21 days. *Maintenance regimen*—5 mg/kg/day or 6 mg/kg for 5 days of each wk. If progression occurs, ↑ to every 12 hr regimen. *Prevention*—5 mg/kg every 12 hr for 7–14 days, then 5 mg/kg/day or 6 mg/kg for 5 days of each wk.
IV (Neonates): *Congenital CMV infection*—12 mg/kg/day divided every 12 hr × 6 wk.

Renal Impairment

IV (Adults and Children): *Induction*—CCr 50–69 mL/min: 2.5 mg/kg/dose every 12 hr; CCr 25–49 mL/min: 2.5 mg/kg/dose every 24 hr; CCr 10–24 mL/min: 1.25 mg/kg/dose every 24 hr; CCr <10 mL/min: 1.25 mg/kg 3 times/wk after hemodialysis; *Maintenance*—CCr 50–69 mL/min: 2.5 mg/kg/dose every 24 hr; CCr 25–49 mL/min: 1.25 mg/kg/dose every 24 hr; CCr 10–24 mL/min: 0.625 mg/kg/dose every 24 hr; CCr <10 mL/min: 0.625 mg/kg 3 times/wk after hemodialysis.

Availability (generic available)

Lyophilized powder for injection: 500 mg/vial.
Premixed infusion: 500 mg/250 mL.

NURSING IMPLICATIONS

Assessment

- Diagnosis of CMV retinitis should be determined by ophthalmoscopy before treatment with ganciclovir.
- Culture for CMV (urine, blood, throat) may be taken before administration. However, a negative CMV culture does not rule out CMV retinitis. If symptoms do not respond after several wk, resistance to ganciclovir may have occurred. Ophthalmologic exams should be performed weekly during induction and every 2 wk during maintenance or more frequently if the macula or optic nerve is threatened. Progression of CMV retinitis may occur during or after ganciclovir treatment.
- Assess for signs of infection (fever, chills, cough, hoarseness, lower back or side pain, sore throat, difficult or painful urination). Notify health care professional if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- ***Lab Test Considerations:*** Verify negative pregnancy test prior to starting therapy.
- Monitor neutrophil and platelet count at least every 2 days during twice daily therapy and weekly thereafter. Granulocytopenia usually occurs during the first 2 wk of treatment but may occur anytime during therapy. Do not administer if neutrophil count <500/mm³ or platelet count <25,000/mm³. Recovery begins within 3–7 days of discontinuation of therapy.
- Monitor BUN and serum creatinine at least once every 2 wk throughout therapy.

© F.A. Davis Publishing

- Monitor liver function tests (AST, ALT, serum bilirubin, alkaline phosphatase) periodically during therapy. May cause ↑ levels.
- May cause ↓ blood glucose.

Implementation

- Do not confuse Cytovene (ganciclovir) with Cytosar (cytarabine).
- Do not administer subcut or IM; severe tissue irritation may result.
- **IV:** Observe infusion site for phlebitis. Rotate infusion site to prevent phlebitis.
- Maintain adequate hydration throughout therapy.

IV Administration

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated containers.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute 500 mg with 10 mL of sterile water for injection for a concentration of 50 mg/mL. Do not reconstitute with bacteriostatic water with parabens; precipitation will occur. Shake well to dissolve completely. Discard vial if particulate matter or discoloration occurs. Reconstituted solution is stable for 12 hr at room temperature; do not refrigerate.
- ***Dilution:*** Dilute in 100 mL of D5W, 0.9% NaCl, Ringer's or LR. Once diluted for infusion, solution should be used within 24 hr. Refrigerate but do not freeze. ***Concentration:*** 10 mg/mL. ***Rate:*** Administer slowly, via infusion pump, over 1 hr using an in-line filter. Rapid administration may increase toxicity.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amphotericin B deoxycholate, amphotericin B lipid complex, anidulafungin, argatroban, arsenic trioxide, atropine, azithromycin, bivalirudin, bleomycin, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, dactinomycin, daptomycin, defibrotide, dexamethasone, dexmedetomidine, digoxin, docetaxel, doxorubicin liposome, enalaprilat, epoetin alfa, eptifibatide, ertapenem, etoposide, etoposide phosphate, fentanyl, filgrastim, fluconazole, fluorouracil, folic acid, fosphenytoin, furosemide, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, ifosfamide, indomethacin, insulin, regular, labetalol, lactated Ringer's, leucovorin calcium, linezolid, lorazepam, mannitol, melphalan, methotrexate, metoprolol, milrinone, mitoxantrone, nafcillin, naloxone, nitroglycerin, nitroprusside, octreotide, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, pemetrexed, pentobarbital, phenobarbital, phytonadione, potassium chloride, propranolol, protamine, remifentanil, rituximab, rocuronium, sodium acetate, sufentanil, thiotepa, tigecycline, tirofiban, trastuzumab, vasopressin, vinblastine, vincristine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** aldesleukin, amifostine, amikacin, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, ascorbic acid, atracurium, azathioprine, aztreonam, benztropine, bumetanide, butorphanol, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, clindamycin, cytarabine, dacarbazine, dantrolene, daunorubicin hydrochloride, dexrazoxane, diazepam, diazoxide, diltiazem, diphenhydramine, dobutamine, dopamine, doxorubicin hydrochloride, doxycycline, ephedrine, epinephrine, epirubicin, erythromycin, esmolol, famotidine, fenoldopam, fludarabine, foscarnet, gemcitabine, gemtuzumab ozogamicin, gentamicin, haloperidol, hydralazine, hydrocortisone, hydroxyzine, idarubicin, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, levofloxacin, lidocaine, magnesium sulfate, meperidine, mesna, methadone, methylprednisolone, metoclopramide, metronidazole, midazolam, minocycline, mitomycin, morphine, multivitamins, mycophenolate, nalbuphine, nicardipine, norepinephrine, ondansetron, oxacillin, palonosetron, papaverine, penicillin G, pentamidine, phentolamine, phenylephrine, phenytoin, piperacillin, piperacillin/tazobactam, potassium acetate, procainamide, prochlorperazine, promethazine, pyridoxine, quinupristin/dalfopristin, sargramostim, sodium bicarbonate, succinylcholine, tacrolimus, theophylline, thiamine, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, verapamil, vinorelbine.

Patient/Family Teaching

- Inform patient that ganciclovir is not a cure for CMV retinitis. Progression of retinitis may continue in immunocompromised patients during and after therapy. Advise patients to have regular ophthalmic exams at least every 6 wk. Duration of therapy for CMV prevention is based on the duration and degree of immunosuppression.
- Advise patient to notify health care professional if fever; chills; sore throat; other signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Rep: May cause fetal harm. Advise female patients of reproductive potential to use a nonhormonal method of contraception during and for at least 30

© F.A. Davis Publishing

days after last dose and to avoid breast feeding during therapy. Advise male patients to use condoms during and for at least 90 days after therapy. Inform patients that ganciclovir may cause temporary or permanent female and male infertility.
- Emphasize the importance of frequent follow-up exams to monitor blood counts.

Evaluation/Desired Outcomes
- Treatment of the symptoms of CMV retinitis in immunocompromised patients.
- Prevention of CMV retinitis in transplant patients at risk.

gefitinib (je-fit-in-ib)
Iressa

Classification
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Indications
First-line treatment of patients with metastatic non–small-cell lung cancer (NSCLC) whose tumors have epidermal growth factor receptor (EGFR) exon 19 deletions or exon 21 (L858R) substitution mutations.

Action
Inhibits activation of kinases found in transmembrane cell surface receptors, including EGFR. **Therapeutic Effects:** Prolonged progression-free survival.

Pharmacokinetics
Absorption: 60% absorbed following oral administration.
Distribution: Extensively distributed.
Metabolism and Excretion: Primarily metabolized by the liver by the CYP3A4 isoenzyme, with some metabolism via the CYP2D6 isoenzyme; the CYP2D6 isoenzyme exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↑ gefitinib concentrations and an ↑ risk of adverse effects). Primarily excreted in feces, with <4% excreted in urine.
Half-life: 48 hr.

TIME/ACTION PROFILE (plasma levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–7 hr	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Idiopathic pulmonary fibrosis (↑ risk of pulmonary toxicity); Concurrent use of strong inhibitors of the CYP3A4 enzyme system (may ↑ risk of toxicity); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects
EENT: aberrant eyelash growth, blepharitis, conjunctivitis, corneal erosion/ulcer, dry eye, nose bleeding. **Resp:** INTERSTITIAL LUNG DISEASE, dyspnea. **GI:** GI PERFORATION, HEPATOTOXICITY, anorexia, diarrhea, nausea, vomiting, dry mouth, mouth ulceration. **GU:** ↓ fertility (females), hematuria, ↑ serum creatinine. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, alopecia, pruritus. **F and E:** dehydration. **Metab:** weight loss. **Misc:** allergic reactions including ANGIOEDEMA, fever.

Interactions
Drug-Drug: Strong inducers of the CYP3A4 enzyme system, including **rifampin** and **phenytoin**, ↓ blood levels and effects (↑ dose of gefitinib to 500 mg/day). Strong inhibitors of the CYP3A4 enzyme system, including **ketoconazole** and **itraconazole**, ↑ blood levels and effects. Absorption and efficacy may be ↓ by **drugs that ↑ gastric pH** including **H_2 receptor antagonists**, **proton pump inhibitors**, and **antacids**; take gefitinib 12 hr after last dose or 12 hr before the next dose of proton pump inhibitor; take gefitinib 6 hr after last dose or 6 hr before next dose H_2 receptor antagonist or antacid. May ↑ the risk of bleeding with **warfarin**.

Route/Dosage
PO (Adults): 250 mg once daily; *Concurrent use of rifampin or phenytoin*—500 mg once daily (resume 250 mg once daily dose 7 days after discontinuing strong CYP3A4 inducer).

Availability
Tablets: 250 mg.

NURSING IMPLICATIONS
Assessment
- Assess for signs of pulmonary toxicity (dyspnea, cough, fever). Withhold gefitinib during diagnosis. If interstitial lung disease is confirmed, discontinue gefitinib and treat appropriately.
- Assess patient for eye symptoms such as pain during therapy. May require interruption of therapy and removal of aberrant eyelash. After symptoms and eye changes have resolved, may reinstate therapy.
- Monitor for rash. Interrupt or discontinue therapy if severe bullous, blistering or exfoliating conditions develop.
- ***Lab Test Considerations:*** Patient selection is based on the presence of EGFR exon 19 deletions or exon 21 L858R mutations in their tumor or plasma specimens. If these mutations are not detected in a plasma specimen, test tumor tissue if feasible. Information on FDA-approved tests for the detection of EGFR mutations in NSCLC is available at: http://www.fda.gov/CompanionDiagnostics.
- Monitor liver function tests periodically. May cause ↑ transaminases, bilirubin, and alkaline phosphatase. Withhold gefitinib in patients with worsening

© F.A. Davis Publishing

liver function tests; discontinue gefitinib if elevations are severe.
- Monitor for changes in prothrombin time and INR in patients taking warfarin. May cause ↑ levels.

Implementation
- Available only through the *Iressa Access Program*. Patients must be currently on the medication or in an approved study and must sign the Patient Consent Form. Physicians and prescribers must enroll in program.
- 🧬 FDA-approved test must be used to detect EGFR mutations in NSCLC. Patients must have EGFR exon 19 deletions or exon 21 substitutions to use gefitinib.
- **PO:** Administer one tablet daily without regard to food. Tablets can also be dispersed in half a glass of drinking water (noncarbonated). No other liquids should be used. Drop the tablet in the water, without crushing it, stir until the tablet is dispersed (approximately 10 min), and drink the liquid immediately. Rinse the glass with half a glass of water and drink. The liquid can also be administered through a nasogastric tube.
- May interrupt therapy briefly (14 days) for patients with poorly tolerated diarrhea with dehydration or skin adverse reactions. Follow by restarting 250 mg dose.

Patient/Family Teaching
- Instruct patient to take gefitinib as directed. Take missed doses up to 12 hrs of next dose. Advise patient to read the *Instruction Sheet* with each Rx refill; new information may be available.
- Advise patient to notify health care professional promptly if severe persistent diarrhea, nausea, vomiting, or anorexia occur; if shortness of breath or cough occur or worsen; or if eye irritation or other new symptoms develop.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 2 wk after last dose, to avoid breast feeding during therapy, and to notify health care professional if pregnancy is suspected. May impair fertility in females.

Evaluation/Desired Outcomes
- Decrease in size and spread of tumors in non–small-cell lung cancer.

HIGH ALERT

gemcitabine (jem-site-a-been)
~~Gemzar~~, Infugem

Classification
Therapeutic: antineoplastics
Pharmacologic: antimetabolites, nucleoside analogues

Indications
Pancreatic cancer (locally advanced or metastatic). Inoperable locally advanced/metastatic non–small-cell lung cancer (with cisplatin). Metastatic breast cancer after failure of prior anthracycline-containing adjuvant chemotherapy (unless anthracycline therapy contraindicated) (with paclitaxel). Advanced ovarian cancer that has relapsed 6 mo after completion of platinum-based therapy (with carboplatin).

Action
Interferes with DNA synthesis (cell-cycle phase–specific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Converted in cells to active diphosphate and triphosphate metabolites; these are excreted primarily by the kidneys.
Half-life: 32–94 min.

TIME/ACTION PROFILE (effect on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: History of cardiovascular disease; Hepatic or renal impairment (↑ risk of toxicity); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects
CV: ARRHYTHMIAS, CAPILLARY LEAK SYNDROME, CEREBROVASCULAR ACCIDENT, MI, edema, hypertension. **Derm:** alopecia, rash. **GI:** HEPATOTOXICITY, diarrhea, ↑ liver enzymes, nausea, stomatitis, vomiting. **GU:** HEMOLYTIC UREMIC SYNDROME, hematuria, proteinuria, ↓ fertility (males), renal failure, thrombotic microangiopathy. **Hemat:** anemia, leukopenia, thrombocytopenia, thrombotic microangiopathy. **Local:** injection site reactions. **Neuro:** paresthesias, POSTERIOR REVERSIBLE ENCEPHALOPATHY SYNDROME (PRES). **Resp:** ADULT RESPIRATORY DISTRESS SYNDROME (ARDS), PULMONARY FIBROSIS, dyspnea, bronchospasm, pulmonary edema. **Misc:** flu-like symptoms, fever, anaphylactoid reactions.

Interactions
Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ anti-

© F.A. Davis Publishing

body response to **live virus vaccines** and ↑ risk of adverse reactions.

Route/Dosage

Pancreatic Cancer

IV (Adults): 1000 mg/m² once weekly for 7 wk, followed by a wk of rest, then on Days 1, 8, and 15 of each 28–day cycle.

Non–Small-Cell Lung Cancer

IV (Adults): 1000 mg/m² on Days 1, 8, and 15 of each 28-day cycle (cisplatin is also given on day 1) *or* 1250 mg/m² on Days 1 and 8 of each 21-day cycle (cisplatin is also given on Day 1).

Breast Cancer

IV (Adults): 1250 mg/m² on Days 1 and 8 of each 21-day cycle (paclitaxel is also given on Day 1).

Ovarian Cancer

IV (Adults): 1000 mg/m² on Days 1 and 8 of each 21-day cycle (carboplatin is also given on Day 1).

Availability (generic available)

Powder for injection: 200 mg/vial, 1 g/vial, 2 g/vial. **Premixed infusion:** 1200 mg/120 mL 0.9% NaCl, 1300 mg/130 mL 0.9% NaCl, 1400 mg/140 mL 0.9% NaCl, 1500 mg/150 mL 0.9% NaCl, 1600 mg/160 mL 0.9% NaCl, 1700 mg/170 mL 0.9% NaCl, 1800 mg/180 mL 0.9% NaCl, 1900 mg/190 mL 0.9% NaCl, 2000 mg/200 mL 0.9% NaCl, 2200 mg/220 mL 0.9% NaCl.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs before and frequently during therapy.
- Assess injection site during administration. Although gemcitabine is not a vesicant, local reactions may occur.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae; guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output, appetite, and nutritional intake. Mild to moderate nausea and vomiting occur frequently. Antiemetics may be used prophylactically.
- Assess for signs and symptoms of capillary leak syndrome (severe hypotension, hypoalbuminemia, hemoconcentration). Discontinue therapy if symptoms occur.
- Monitor respiratory status during therapy. Discontinue gemcitabine if unexplained dyspnea or other evidence of severe pulmonary toxicity occurs. May occur up to 2 wk after last dose.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (PRES) (headache, seizure, lethargy, hypertension, confusion, blindness, and other visual and neurologic disturbances) during therapy. Confirm diagnosis of PRES with magnetic resonance imaging (MRI). Discontinue gemcitabine if PRES develops during therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor CBC, including differential and platelet count, before each dose. Dose guidelines are based on CBC. **For single-agent use:** *If absolute granulocyte count is >1000 and platelet count is >100,000,* full dose may be administered. *If absolute granulocyte count is 500–999 or platelet count is 50,000–99,000,* 75% of dose may be given. *If absolute granulocyte count is <500 or platelet count is <50,000,* withhold further doses. **For gemcitabine with paclitaxel (breast cancer):** *If absolute granulocyte count is >1200 and platelet count is >75,000,* full dose may be administered. *If absolute granulocyte count is 1000–1199 or platelet count is 50,000–75,000,* 75% of dose may be given. *If absolute granulocyte count is 700–999 or platelet count is ≥50,000,* 50% of dose may be given. *If absolute granulocyte count is <700 or platelet count is <50,000,* withhold further doses. **For gemcitabine with carboplatin (ovarian cancer):** *If absolute granulocyte count is >1500 and platelet count is >100,000,* full dose may be administered. *If the absolute granulocyte count is 1000–1499 or platelet count is 75,000–99,000,* 75% of dose may be given. *If the absolute granulocyte count is <1000 or the platelet count is <75,000,* withhold further doses.
- Monitor serum creatinine, potassium, calcium, and magnesium in patients taking cisplatin with gemcitabine.
- Monitor hepatic and renal function before and periodically during therapy. May cause transient ↑ in serum AST, ALT, alkaline phosphatase, and bilirubin concentrations. Discontinue gemcitabine for severe hepatic toxicity or hemolytic-uremic syndrome.
- May also cause ↑ BUN and serum creatinine concentrations, proteinuria, and hematuria.

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations, and infusion pump settings.

IV Administration

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

© F.A. Davis Publishing

- **Intermittent Infusion:** To reconstitute, add 5 mL of 0.9% NaCl without preservatives to 200-mg vial or 25 mL of 0.9% NaCl to the 1-g vial of gemcitabine for a concentration of 40 mg/mL. Incomplete dissolution may result in concentrations greater than 40 mg/mL. ***Dilution:*** May be further diluted with 0.9% NaCl. Solution is colorless to light straw color. Do not administer solutions that are discolored or contain particulate matter. Solution is stable for 24 hr at room temperature. Discard unused portions. Do not refrigerate; crystallization may occur. ***Concentration:*** 0.1–38 mg/mL. ***Rate:*** Administer dose over 30 min. If 2 bags required, infuse total of both bags over 30 min. Infusions longer than 60 min have a greater incidence of toxicity.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, insulin, regular, isoproterenol, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, paclitaxel protein-bound, palonosetron, pamidronate, pancuronium, pentamidine, pentobarbital, phenobarbital, phentolamine, potassium acetate, potassium chloride, potassium phosphates, procainamide, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rituxumab, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, cefepime, cefotaxime, chloramphenicol, dantrolene, daptomycin, diazepam, doxorubicin liposomal, furosemide, ganciclovir, imipenem-cilastatin, irinotecan, ketorolac, methotrexate, methylprednisolone, mitomycin, nafcillin, pantoprazole, pemetrexed, phenytoin, piperacillin/tazobactam, prochlorperazine, thiopental.

Patient/Family Teaching

- Instruct patient to notify health care professional if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Patient should be cautioned not to drink alcoholic beverages or take products containing aspirin or NSAIDs.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and rinse mouth with water after eating and drinking. Stomatitis pain may require management with opioid analgesics.
- Instruct patient to notify health care professional if flu-like symptoms (fever, anorexia, headache, cough, chills, myalgia), swelling of feet or legs, signs and symptoms of pulmonary toxicity (shortness of breath, wheezing, cough), hemolytic-uremic syndrome (changes in color or volume of urine output, increased bruising or bleeding), or hepatic toxicity (jaundice, pain/tenderness in right upper abdominal quadrant) occur.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 6 mo after final dose and to avoid breast feeding during and for at least 1 wk after last dose. Advise males with female partners of reproductive potential to use effective contraception during and for 3 mo after last dose. May cause male infertility.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Palliative, symptomatic improvement in patients with pancreatic cancer.
- Decrease in size and spread of malignancy in lung, ovarian, and breast cancer.

© F.A. Davis Publishing

gemfibrozil (gem-**fye**-broe-zil)

Lipid

Classification

Therapeutic: lipid-lowering agents
Pharmacologic: fibric acid derivatives

Indications

Management of type II-b hyperlipidemia (decreased HDL, increased LDL, increased triglycerides) in patients who do not yet have clinical coronary artery disease and have failed therapy with diet, exercise, weight loss, or other agents (niacin, bile acid sequestrants).

Action

Inhibits peripheral lipolysis. Decreases triglyceride production by the liver. Decreases production of the triglyceride carrier protein. Increases HDL. **Therapeutic Effects:** Decreased plasma triglycerides and increased HDL.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Some metabolism by the liver, 70% excreted by the kidneys (mostly unchanged), 6% excreted in feces.
Half-life: 1.3–1.5 hr.

TIME/ACTION PROFILE (triglyceride-VLDL–lowering effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–5 days	4 wk	several mo

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hepatic impairment; Severe renal impairment; Primary biliary cirrhosis; Gallbladder disease; Concurrent use of simvastatin, repaglinide, dasabuvir, or selexipag.
Use Cautiously in: OB, Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects

Derm: alopecia, rash, urticaria. **EENT:** blurred vision. **GI:** abdominal pain, diarrhea, epigastric pain, flatulence, gallstones, heartburn, nausea, vomiting. **Hemat:** anemia, leukopenia. **MS:** myositis. **Neuro:** dizziness, headache.

Interactions

Drug-Drug: May ↑ levels of **CYP2C8 substrates**, including **dabrafenib**, **dasabuvir**, **enzalutamide**, **loperamide**, **montelukast**, **paclitaxel**, **pioglitazone**, **rosiglitazone**, or **selexipag**; concurrent use with **dasabuvir** or **selexipag** contraindicated. May ↑ levels of **OATP1B1 substrates**, including **atorvastatin**, **bosentan**, **ezetimibe**, **fluvastatin**, **glyburide**, **olmesartan**, **pitavastatin**, **pravastatin**, **repaglinide**, **rifampin**, **rosuvastatin**, **simvastatin**, and **valsartan**; concurrent use with **simvastatin** or **repaglinide** is contraindicated; avoid concurrent use with other **HMG-CoA reductase inhibitors**. May ↑ levels and the risk of bleeding with **warfarin**. Concurrent use with **colchicine** may ↑ risk of rhabdomyolysis, especially in patients with renal dysfunction or elderly. May ↓ the effect of **cyclosporine**. **Cholestyramine** and **colestipol** may ↓ absorption; separate administration by ≥2 hr.

Route/Dosage

PO (Adults): 600 mg twice daily 30 min before breakfast and dinner.

Availability (generic available)

Capsules: 300 mg. **Tablets:** 600 mg. **Cost:** *Generic*— $24.07/100.

NURSING IMPLICATIONS

Assessment

- Obtain patient's diet history, especially regarding fat and alcohol consumption.
- ***Lab Test Considerations:*** Monitor serum triglyceride and cholesterol levels before and periodically during therapy. Assess LDL and VLDL levels before and periodically during therapy. Discontinue gemfibrozil if paradoxical ↑ in lipid levels occurs.
- Assess liver function tests before and periodically during therapy. May cause ↑ serum bilirubin, alkaline phosphatase, CK, LDH, AST, and ALT. If hepatic function tests rise significantly, discontinue therapy and do not resume.
- Evaluate CBC and electrolytes every 3–6 mo and then yearly during therapy. May cause mild ↓ in hemoglobin, hematocrit, and leukocyte counts. May cause ↓ serum potassium concentrations.
- May cause slight ↑ in serum glucose.

Implementation

- Do not confuse gemfibrozil with gabapentin.
- **PO:** Administer 30 min before breakfast or dinner.

Patient/Family Teaching

- Instruct patient to take medication as directed, not to skip doses or double up on missed doses. Take missed doses as soon as remembered unless almost time for next dose.
- Advise patient that gemfibrozil should be used in conjunction with dietary restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional promptly if severe stomach pains with nausea and vomiting, fever, chills, sore throat, rash, diarrhea, muscle cramping, general abdominal discomfort, or persistent flatulence occur.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Decrease in serum triglyceride and cholesterol levels and improved HDL to total cholesterol ratios. If response is not seen within 3 mo, medication is usually discontinued.

gemifloxacin, See FLUOROQUINOLONES.

gentamicin, See AMINOGLYCOSIDES.

glecaprevir/pibrentasvir

(glek-**a**-pre-vir/pi-**brent**-as-vir)

Maviret, Mavyret

Classification

Therapeutic: antivirals

Pharmacologic: NS5A inhibitors, protease inhibitors

Indications

Chronic hepatitis C virus (HCV) genotypes 1, 2, 3, 4, 5, or 6 infection without cirrhosis or with compensated cirrhosis (Child-Pugh A). Chronic HCV genotype 1 infection in patients who have previously received treatment with a regimen containing an HCV NS5A inhibitor or an NS3/4A protease inhibitor, but not both.

Action

Glecaprevir—inhibits the HCV NS3/4A protease, resulting in inhibition of viral replication; *Pibrentasvir*—inhibits the HCV NS5A protein, resulting in inhibition of viral replication. **Therapeutic Effects:** Decreased levels of HCV with sustained virologic response and lessened sequelae of chronic HCV infection.

Pharmacokinetics

Glecaprevir

Absorption: Well absorbed following oral administration; absorption ↑ by high-fat meal.

Distribution: Unknown.

Protein Binding: 97.5%.

Metabolism and Excretion: Partially metabolized by CYP3A4; 92% excreted in feces and <1% eliminated in urine.

Half-life: 6 hr.

Pibrentasvir

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Protein Binding: >99.9%.

Metabolism and Excretion: Not metabolized; 97% excreted in feces.

Half-life: 13 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
glecaprevir (PO)	unknown	5 hr	24 hr
pibrentasvir (PO)	unknown	5 hr	24 hr

Contraindications/Precautions

Contraindicated in: Moderate or severe hepatic impairment (Child-Pugh B or C) or any prior history of hepatic decompensation (↑ risk of hepatic decompensation/failure); Concurrent use of atazanavir, carbamazepine, dabigatran, darunavir, efavirenz, lopinavir, oral contraceptives containing ethinyl estradiol, rifampin, ritonavir, or St. John's wort.

Use Cautiously in: Receiving immunosuppressant or chemotherapy medications (↑ risk of hepatitis B virus reactivation); OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Children <3 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

Derm: pruritus. **GI:** diarrhea, hyperbilirubinemia, nausea. **Neuro:** fatigue, headache. **Misc:** hepatitis B virus reactivation.

Interactions

Drug-Drug: **Atazanavir** may ↑ levels of glecaprevir/pibrentasvir and ↑ risk of liver enzyme elevation; concurrent use contraindicated. **Rifampin** may ↓ levels/effectiveness of glecaprevir/pibrentasvir; concurrent use contraindicated. **Strong CYP3A inducers**, including **carbamazepine** or **efavirenz** may ↓ levels/effectiveness of glecaprevir/pibrentasvir; concurrent use not recommended. **Darunavir**, **lopinavir**, or **ritonavir** may ↑ levels of glecaprevir/pibrentasvir; concurrent use not recommended. May ↑ levels of **atorvastatin**, **fluvastatin**, **lovastatin**, **pitavastatin**, **pravastatin**, **rosuvastatin**, and **simvastatin** and ↑ risk of myopathy; concurrent use with atorvastatin, lovastatin, and simvastatin not recommended; ↓ dose of pravastatin by 50%; do not exceed rosuvastatin dose of 10 mg/day; use lowest possible dose of fluvastatin or pitavastatin. May ↑ **dabigatran** levels; avoid concurrent use. May ↑ **digoxin** levels; ↓ digoxin dose by 50% when initiating glecaprevir/pibrentasvir therapy. Concurrent use with **ethinyl estradiol-containing oral contraceptives** may ↑ risk of liver enzyme elevation; concurrent use not recommended. **Cyclosporine** may ↑ levels/toxicity of glecaprevir/pibrentasvir; concurrent use not recommended if patients require cyclosporine dose >100 mg/day. May cause fluctuations in INR when used with **warfarin**; closely monitor INR. ↑ risk of hypoglycemia with use of certain **antidiabetic agents**.

© F.A. Davis Publishing

Drug-Natural Products: St. John's wort may ↓ levels/effectiveness of glecaprevir/pibrentasvir; concurrent use not recommended.

Route/Dosage

PO (Adults and Children ≥12 yr or ≥45 kg): *Genotype 1, 2, 3, 4, 5, or 6: Treatment-naïve with no cirrhosis or with compensated cirrhosis (Child–Pugh A)* — Three 100–mg/40–mg tablets once daily for 8 wk *or* six 50–mg/20–mg pellet packets once daily for 8 wk; *Genotype 1: Treatment-experienced with NS5A inhibitor (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Three 100–mg/40–mg tablets once daily for 16 wk *or* six 50–mg/20–mg pellet packets once daily for 16 wk; *Genotype 1: Treatment-experienced with NS3/4A protease inhibitor (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Three 100–mg/40–mg tablets once daily for 12 wk *or* six 50–mg/20–mg pellet packets once daily for 12 wk; *Genotype 1, 2, 4, 5, or 6: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (no cirrhosis)* — Three 100–mg/40–mg tablets once daily for 8 wk *or* six 50–mg/20–mg pellet packets once daily for 8 wk; *Genotype 1, 2, 4, 5, or 6: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (with compensated cirrhosis [Child–Pugh A])* — Three 100–mg/40–mg tablets once daily for 12 wk *or* six 50–mg/20–mg pellet packets once daily for 12 wk; *Genotype 3: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Three 100–mg/40–mg tablets once daily for 16 wk *or* six 50–mg/20–mg pellet packets once daily for 16 wk; *Liver or kidney transplant recipients* — Three 100–mg/40–mg tablets once daily for 12 wk (16 wk for those with Genotype 1 who are treatment experienced with NS5A inhibitor without prior treatment with an NS3/4A protease inhibitor; 16 wk for those with Genotype 3 who are treatment experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir) *or* six 50–mg/20–mg pellet packets once daily for 12 wk (16 wk for those with Genotype 1 who are treatment experienced with NS5A inhibitor without prior treatment with an NS3/4A protease inhibitor; 16 wk for those with Genotype 3 who are treatment experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir).

PO (Children 3–<12 yr and 30–<45 kg): *Genotype 1, 2, 3, 4, 5, or 6: Treatment-naïve with no cirrhosis or with compensated cirrhosis (Child–Pugh A)* — Five 50–mg/20–mg pellet packets once daily for 8 wk; *Genotype 1: Treatment-experienced with NS5A inhibitor (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Five 50–mg/20–mg pellet packets once daily for 16 wk; *Genotype 1: Treatment-experienced with NS3/4A protease inhibitor (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Five 50–mg/20–mg pellet packets once daily for 12 wk; *Genotype 1, 2, 4, 5, or 6: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (no cirrhosis)* — Five 50–mg/20–mg pellet packets once daily for 8 wk; *Genotype 1, 2, 4, 5, or 6: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (with compensated cirrhosis [Child–Pugh A])* — Five 50–mg/20–mg pellet packets once daily for 12 wk; *Genotype 3: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Five 50–mg/20–mg pellet packets once daily for 16 wk; *Liver or kidney transplant recipients* — Five 50–mg/20–mg pellet packets once daily for 12 wk (16 wk for those with Genotype 1 who are treatment experienced with NS5A inhibitor without prior treatment with an NS3/4A protease inhibitor; 16 wk for those with Genotype 3 who are treatment experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir).

PO (Children 3–<12 yr and 20–<30 kg): *Genotype 1, 2, 3, 4, 5, or 6: Treatment-naïve with no cirrhosis or with compensated cirrhosis (Child–Pugh A)* — Four 50–mg/20–mg pellet packets once daily for 8 wk; *Genotype 1: Treatment-experienced with NS5A inhibitor (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Four 50–mg/20–mg pellet packets once daily for 16 wk; *Genotype 1: Treatment-experienced with NS3/4A protease inhibitor (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Four 50–mg/20–mg pellet packets once daily for 12 wk; *Genotype 1, 2, 4, 5, or 6: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (no cirrhosis)* — Four 50–mg/20–mg pellet packets once daily for 8 wk; *Genotype 1, 2, 4, 5, or 6: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (with compensated cirrhosis [Child–Pugh A])* — Four 50–mg/20–mg pellet packets once daily for 12 wk; *Genotype 3: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Four 50–mg/20–mg pellet packets once daily for 16 wk; *Liver or kidney transplant recipients* — Four 50–mg/20–mg pellet packets once daily for 12 wk (16 wk for those with Genotype 1 who are treatment experienced with NS5A inhibitor without prior treatment with an NS3/4A protease inhibitor; 16 wk for those with Genotype 3 who are treatment experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir).

© F.A. Davis Publishing

PO (Children 3–<12 yr and <20 kg): *Genotype 1, 2, 3, 4, 5, or 6: Treatment-naïve with no cirrhosis or with compensated cirrhosis (Child–Pugh A)* — Three 50–mg/20–mg pellet packets once daily for 8 wk; *Genotype 1: Treatment-experienced with NS5A inhibitor (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Three 50–mg/20–mg pellet packets once daily for 16 wk; *Genotype 1: Treatment-experienced with NS3/4A protease inhibitor (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Three 50–mg/20–mg pellet packets once daily for 12 wk; *Genotype 1, 2, 4, 5, or 6: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (no cirrhosis)* — Three 50–mg/20–mg pellet packets once daily for 8 wk; *Genotype 1, 2, 4, 5, or 6: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (with compensated cirrhosis [Child–Pugh A])* — Three 50–mg/20–mg pellet packets once daily for 12 wk; *Genotype 3: Treatment-experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir (with no cirrhosis or with compensated cirrhosis [Child–Pugh A])* — Three 50–mg/20–mg pellet packets once daily for 16 wk; *Liver or kidney transplant recipients*— Three 50–mg/20–mg pellet packets once daily for 12 wk (16 wk for those with Genotype 1 who are treatment experienced with NS5A inhibitor without prior treatment with an NS3/4A protease inhibitor; 16 wk for those with Genotype 3 who are treatment experienced with regimens containing interferon, pegylated interferon, ribavirin, and/or sofosbuvir).

Availability

Tablets: glecaprevir 100 mg/pibrentasvir 40 mg. **Oral pellets:** glecaprevir 50 mg/pibrentasvir 20 mg per pkt.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of hepatitis B reactivation or hepatitis (jaundice, dark urine, light colored stools, fatigue, weakness, loss of appetite, nausea, vomiting, stomach pain) during therapy.
- ***Lab Test Considerations:*** Test all patients for current or prior hepatitis B virus (HBV) infection before starting hepatitis C virus therapy; may cause hepatitis B virus reactivation. Measure hepatitis B surface antigen (HBsAg) and hepatitis core antibody (anti-HBc). Monitor for clinical and laboratory signs of hepatitis flare (↑ AST, ALT, bilirubin, liver failure, death) or HBV reactivation (rapid ↑ in serum HBV DNA level) during HCV treatment and post-treatment follow-up.
- Test patient with HCV genotype 1a infection for presence of virus with NS5A resistance-associated polymorphisms prior to starting therapy with Mavyret™ to determine dose regimen and duration.

Implementation

- **PO:** Administer once daily with food.
- **Oral Pellets:** Take oral pellets together, with food, once daily. Oral pellets may also be sprinkled on a small amount of soft food with a low water content that will stick to a spoon and should be swallowed without chewing (peanut butter, chocolate hazelnut spread, cream cheese, thick jam, Greek yogurt). Entire mixture of food and oral pellets should be swallowed within 15 min of preparation; ***DNC:*** Do not crush or chew oral pellets. Liquids or foods that would drip or slide off the spoon are not recommended as the drug may dissolve quickly and become less effective.

Patient/Family Teaching

- Instruct patient to take medication as directed. Do not skip or miss dose. If dose is missed, take if <18 hrs from usual time taken, then take next dose at usual time. If >18 hrs from usual time of dose, omit dose and take next dose at usual time. Do not stop medication without consulting health care professional. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if they have a history of HBV. May cause reactivation.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decreased levels of HCV with sustained virologic response and lessened sequelae of chronic HCV infection.

glimepiride, See SULFONYLUREAS.

glipiZIDE, See SULFONYLUREAS.

glucagon (gloo-ka-gon)

Baqsimi, GlucaGen, Gvoke

Classification

Therapeutic: hormones
Pharmacologic: pancreatics

© F.A. Davis Publishing

Indications
Acute management of severe hypoglycemia. Facilitation of radiographic examination of the GI tract. **Unlabeled Use:** Beta-blocker overdose. Calcium channel blocker overdose.

Action
Stimulates hepatic production of glucose from glycogen stores (glycogenolysis). Relaxes the musculature of the GI tract (stomach, duodenum, small bowel, and colon), temporarily inhibiting movement. Has positive inotropic and chronotropic effects. **Therapeutic Effects:** Increase in blood glucose. Relaxation of GI musculature, facilitating radiographic examination.

Pharmacokinetics
Absorption: Well absorbed following IM, intranasal, and subcut administration; IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized by the liver, plasma, and kidneys.
Half-life: 8–18 min.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IM (hyperglycemic action)	within 10 min	30 min	12–27 min
IV (hyperglycemic action)	1 min	5 min	9–17 min
Subcut (hyperglycemic action)	within 10 min	30–45 min	60–90 min
Intranasal (hyperglycemic action)	within 15 min	unknown	unknown
IV (effect on GI musculature)	45 sec (for 0.25–2-mg dose)	unknown	9–17 min (0.25–0.5-mg dose); 22–25 min (2-mg dose)
IM (effect on GI musculature)	8–10 min (1-mg dose); 4–7 min (2-mg dose)	unknown	9–27 min (1-mg dose); 21–32 min (2-mg dose)

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Pheochromocytoma; Insulinoma.
Use Cautiously in: Prolonged fasting, starvation, adrenal insufficiency, or chronic hypoglycemia (low levels of releasable glucose); When used to inhibit GI motility, use cautiously in geriatric patient with cardiac disease or diabetics; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Safety not established in breast feeding; Pedi: Children <4 yr (safety and effectiveness of nasal powder not established).

Adverse Reactions/Side Effects
CV: hypotension. **Derm:** necrolytic migratory erythema. **EENT:** epistaxis, eye redness, itchy eyes, itchy throat, nasal congestion, nasal discomfort, nasal itching, rhinorrhea, sneezing, watery eyes. **GI:** nausea, vomiting. **Neuro:** headache. **Resp:** cough. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions
Drug-Drug: Large doses may ↑ the effect of **warfarin**. Negates the response to **insulin** or **oral hypoglycemic agents**. **Phenytoin** inhibits the stimulant effect of glucagon on insulin release. Hyperglycemic effect is intensified and prolonged by **epinephrine**. Patients on concurrent **beta blocker** therapy may have a greater ↑ in heart rate and BP.

Route/Dosage

Hypoglycemia
IV, IM, Subcut (Adults and Children >25 kg): 1 mg; may be repeated in 15 min if necessary.
Subcut (Adults and Children ≥12 yr): *Gvoke*—1 mg; may be repeated in 15 min if necessary.
IV, IM, Subcut (Children <25 kg): 0.5 mg or 0.02–0.03 mg/kg; may be repeated in 15 min if necessary.
IV, IM, Subcut (Children >6 yr and unknown weight): 1 mg; may be repeated in 15 min if necessary.
IV, IM, Subcut (Children <6 yr and unknown weight): 0.5 mg or 0.02–0.03 mg/kg; may be repeated in 15 min if necessary.
Subcut (Children 2–12 yr and ≥45 kg): *Gvoke*—1 mg; may be repeated in 15 min if necessary.
Subcut (Children 2–12 yr and <45 kg): *Gvoke*—0.5 mg; may be repeated in 15 min if necessary.
Intranasal (Adults and Children ≥4 yr): 3 mg (one actuation) in one nostril; may be repeated in 15 min if necessary.

Radiographic Examination of the GI Tract
IM, IV (Adults): 0.25–2 mg; depending on location and duration of examination (0.5 mg IV or 2 mg IM for relaxation of stomach; for examination of the colon 2 mg IM 10 min before procedure).

Antidote (unlabeled)
IV (Adults): *Beta blocker overdose*—50–150 mcg (0.05–0.15 mg)/kg, followed by 1–5 mg/hr infusion. *Calcium channel blocker overdose*—2 mg; additional doses determined by response.

Availability (generic available)
Nasal powder: 3 mg/device. **Powder for injection:** 1-mg (equivalent to 1 unit) vials as an emergency kit for low blood glucose and as a diagnostic kit. **Solution for subcutaneous injection (Gvoke) (prefilled syringes and prefilled autoinjectors):** 0.5 mg/0.1 mL, 1 mg/0.2 mL.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess for signs of hypoglycemia (sweating, hunger, weakness, headache, dizziness, tremor, irritability, tachycardia, anxiety) prior to and periodically during therapy.
- Assess neurologic status during therapy. Institute safety precautions to protect patient from injury caused by seizures, falling, or aspiration. For insulin shock therapy, 0.5–1 mg is administered after 1 hr of coma; patient usually awakens in 10–25 min. If no response occurs, repeat the dose. Feed patient supplemental carbohydrates orally to replenish liver glycogen and prevent secondary hypoglycemia as soon as possible after awakening, especially pediatric patients.
- Assess nutritional status. Patients who lack liver glycogen stores (starvation, chronic hypoglycemia, adrenal insufficiency) will require glucose instead of glucagon.
- Assess for nausea and vomiting after administration of dose. Protect patients with depressed level of consciousness from aspiration by positioning on side; ensure that a suction unit is available. Notify health care professional if vomiting occurs; patient will require parenteral glucose to prevent recurrent hypoglycemia.
- ***Lab Test Considerations:*** Monitor serum glucose levels throughout episode, during treatment, and for 3–4 hr after patient regains consciousness. Use of bedside fingerstick blood glucose determination methods is recommended for rapid results. Follow-up lab results may be ordered to validate fingerstick values, but do not delay treatment while awaiting lab results, as this could result in neurologic injury or death.
- Large doses of glucagon may cause a ↓ in serum potassium concentrations.

Implementation

- May be given subcut, IM, or IV. Reconstitute with diluent supplied in kit by manufacturer. Inspect solution prior to use; use only clear, water-like solution. Solution is stable for 48 hr if refrigerated, 24 hr at room temperature. Unmixed medication should be stored at room temperature.
- Administer supplemental carbohydrates IV or orally to facilitate increase of serum glucose levels.
- **Subcut:** *Gvoke* solution is clear and colorless to pale yellow; do not administer if solution is discolored or contains particulate matter. Inject in lower abdomen, outer thigh, or outer upper arm.
- **Intranasal:** Administer by inserting tip into one nostril and pressing device plunger all the way in until green line is no longer showing. Dose does not need to be inhaled. Call for emergency assistance immediately after administering dose. When patient responds to treatment, give oral carbohydrates.

IV Administration

- **IV Push:** ***Reconstitution:*** Reconstitute each vial with 1 mL of an appropriate diluent. For doses ≤2 mg, use diluent provided by manufacturer. For doses >2 mg, use sterile water for injection instead of diluent supplied by manufacturer to minimize risk of thrombophlebitis, CNS toxicity, and myocardial depression from phenol preservative in diluent supplied by manufacturer. Reconstituted vials should be used immediately. ***Concentration:*** Not exceed 1 mg/mL. ***Rate:*** Administer at a rate not exceeding 1 mg/min. May be administered through IV line containing D5W.
- **Continuous Infusion:** ***Reconstitution:*** Reconstitute vials as per directions above (use sterile water for injection). ***Dilution:*** Further dilute 10 mg of glucagon in 100 mL of D5W. ***Concentration:*** 0.1 mg/mL. ***Rate:*** See Route/Dosage section.
- **Y-Site Compatibility:** naloxone.

Patient/Family Teaching

- Teach patient and family signs and symptoms of hypoglycemia. Instruct patient to take oral glucose as soon as symptoms of hypoglycemia occur; glucagon is reserved for episodes when patient is unable to swallow because of decreased level of consciousness.
- **Home Care Issues** Instruct family on correct technique to prepare, draw up, and administer injection. Health care professional must be contacted immediately after each dose for orders regarding further therapy or adjustment of insulin dose or diet.
- Advise family that patient should receive oral glucose when alertness returns.
- Instruct family to position patient on side until fully alert. Explain that glucagon may cause nausea and vomiting. Aspiration may occur if patient vomits while lying on back.
- Instruct patient to check expiration date monthly and to replace outdated medication immediately.
- Review hypoglycemic medication regimen, diet, and exercise programs.
- Patients with diabetes mellitus should carry a source of sugar (such as a packet of sugar or candy) and identification describing disease process and treatment regimen at all times.
- Advise patient to notify health care professional if pregnancy is suspected or if breast feeding.

Evaluation/Desired Outcomes

- Increase of serum glucose to normal levels with improved level of consciousness.
- Smooth muscle relaxation of the stomach, duodenum, and small and large intestine in patients undergoing radiologic examination of the GI tract.

© F.A. Davis Publishing

glyBURIDE, See SULFONYLUREAS.

glycopyrrolate/formoterol

(glye-koe-**pye**-roe-late/for-**moe**-te-rol)

Bevespi Aerosphere

Classification

Therapeutic: bronchodilators

Pharmacologic: anticholinergics, long-acting beta2-adrenergic agonists (LABAs)

Indications

Maintenance treatment of COPD.

Action

Glycopyrrolate—acts as an anticholinergic by inhibiting M3 muscarinic receptors in bronchial smooth muscle resulting in bronchodilation; *Formoterol*—a $beta_2$-adrenergic agonist that stimulates adenyl cyclase, resulting in accumulation of cyclic adenosine monophosphate at $beta_2$—adrenergic receptors resulting in bronchodilation. **Therapeutic Effects:** Bronchodilation with decreased airflow obstruction.

Pharmacokinetics

Absorption: *Glycopyrrolate*—some systemic absorption from lungs and GI tract (40%). *formoterol*—majority of inhaled drug is swallowed and absorbed.

Distribution: *Glycopyrrolate*—unknown. *formoterol*—unknown.

Metabolism and Excretion: *Glycopyrrolate*—primarily metabolized in the liver via CYP2D6; eliminated primarily unchanged in the urine and bile. *formoterol*—mostly metabolized by the liver via CYP2D6 and CYP2C; 10–18% excreted unchanged in urine.

Half-life: *Glycopyrrolate*—33–53 hr. *formoterol*—10 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
formoterol—Inhaln	within 3 min	15 min	unknown
glycopyrrolate—Inhaln	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Asthma; Acutely deteriorating COPD or acute respiratory symptoms.

Use Cautiously in: History of cardiovascular disorders (coronary insufficiency, arrhythmias, hypertension); History of seizures; Thyrotoxicosis; Narrow-angle glaucoma; Urinary retention, prostatic hyperplasia, bladder-neck obstruction; Hepatic impairment; OB: Formoterol may interfere with uterine contractility during labor; use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Exercise Extreme Caution in: Concurrent use of MAO inhibitors, tricyclic antidepressants or drugs that prolong the QTc interval.

Adverse Reactions/Side Effects

Combination.

CV: chest pain, hypertension, tachycardia. **F and E:** hypokalemia. **GI:** dry mouth, vomiting. **GU:** urinary tract infection. **MS:** arthralgia, muscle spasms. **Neuro:** anxiety, dizziness, headache. **Resp:** cough, paradoxical bronchospasm. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema, urticaria, or rash).

Interactions

Drug-Drug: Concurrent use with other **adrenergics** may ↑ adrenergic adverse reactions (↑ heart rate, BP, jitteriness). ↑ risk of hypokalemia or ECG changes with **xanthine derivatives**, **corticosteroids**, **loop diuretics** or **thiazide diuretics**. ↑ risk of serious adverse cardiovascular effects with **MAO inhibitors**, **tricyclic antidepressants**, **QT-interval prolonging drugs**; use with extreme caution. Effectiveness may be ↓ by **beta-blockers**; use cautiously and only when necessary. ↑ risk of anticholinergic adverse reactions when used concurrently with other **anticholinergics**; avoid concurrent use.

Route/Dosage

Inhaln (Adults): 2 inhalations twice daily.

Availability

Inhalation aerosol: glycopyrrolate 9 mcg/formoterol 4.8 mcg per inhalation in 10.7–g canister (120 inhalations).

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced.
- Monitor pulmonary function tests before initiating and periodically during therapy to determine effectiveness.
- Observe for paradoxical bronchospasm (wheezing, dyspnea, tightness in chest) and hypersensitivity reaction (rash; urticaria; swelling of the face, lips, or eyelids). If condition occurs, withhold medication and notify health care professional immediately.
- Monitor ECG periodically during therapy. May cause prolonged QTc interval.
- Monitor patient for signs of hypersensitivity reactions (difficulties in breathing or swallowing, swelling of tongue, lips and face, urticaria, or skin rash) throughout therapy. Discontinue therapy and consider alternative if reaction occurs.
- ***Lab Test Considerations:*** May cause ↑ serum glucose and decreased serum potassium.

© F.A. Davis Publishing

Implementation

- **Inhaln:** Administer as 2 inhalations twice daily, morning and evening. Shake well prior to use. Prime by releasing 4 sprays into air away from face before 1st use and by releasing 2 sprays if unused for more than 7 days. See Appendix for use of metered-dose inhalers.

Patient/Family Teaching

- Instruct patient to use medication as directed. Do not discontinue therapy without discussing with health care professional, even if feeling better. If a dose is missed skip dose and take next dose at regularly scheduled time. Do not double doses. Use a rapid-acting bronchodilator if symptoms occur before next dose is due. Caution patient not to use more than 2 times a day; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication. Instruct patient to review *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Caution patient not to use medication to treat acute symptoms. A rapid-acting inhaled beta-adrenergic bronchodilator should be used for relief of acute asthma attacks. Notify health care professional immediately if symptoms get worse or more inhalations than usual are needed from rescue inhaler.
- Advise patient to clean inhaler each wk so medicine will not build up and block spray through mouthpiece. Take canister out of the actuator, run warm water through actuator, and allowing actuator to air-dry overnight. Shake and re-prime with 2 sprays before use.
- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or nausea, vomiting, shakiness, headache, fast or irregular heartbeat, sleeplessness, or signs and symptoms of narrow angle glaucoma (eye pain or discomfort, blurred vision, visual halos or colored images, red eyes) or urinary retention (difficulty passing urine, painful urination) occur.
- Advise patient to consult health care professional before taking any Rx, OTC, or herbal products or alcohol concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. May interfere with uterine contractility if used during labor or delivery; use during labor only if the potential benefit justifies the potential risk.

Evaluation/Desired Outcomes

- Bronchodilation with decreased airflow obstruction.

glycopyrrolate (systemic)

(glye-koe-**pye**-roe-late)

Cuvposa, Glyrx-PF, ~~Robinul~~

Classification

Therapeutic: antispasmodics

Pharmacologic: anticholinergics

G

Indications

Inhibits salivation and excessive respiratory secretions when given preoperatively. Reverses some of the secretory and vagal actions of cholinesterase inhibitors used to treat nondepolarizing neuromuscular blockade (cholinergic adjunct). Adjunctive management of peptic ulcer disease. **Oral solution:** Reduce chronic severe drooling in children with neurologic conditions associated with drooling.

Action

Inhibits the action of acetylcholine at postganglionic sites located in smooth muscle, secretory glands, and the CNS (antimuscarinic activity). Low doses decrease sweating, salivation, and respiratory secretions. Intermediate doses result in increased heart rate. Larger doses decrease GI and GU tract motility. **Therapeutic Effects:** Decreased GI and respiratory secretions.

Pharmacokinetics

Absorption: Incompletely absorbed (<10%) after oral administration. Well absorbed after IM administration.

Distribution: Distribution not fully known. Does not significantly cross the blood-brain barrier or eye. Crosses the placenta.

Metabolism and Excretion: Eliminated primarily unchanged in the urine and bile.

Half-life: 1.7 hr (0.6–4.6 hr).

TIME/ACTION PROFILE (anticholinergic effects)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	unknown	8–12 hr
IM	15–30 min	30–45 min	2–7 hr*
IV	1–10 min	unknown	2–7 hr*

*Antisecretory effect lasts up to 7 hr; vagal blockade lasts 2–3 hr.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Acute hemorrhage; Tachycardia secondary to cardiac insufficiency or thyrotoxicosis; Severe ulcerative colitis; Toxic megacolon; Myasthenia gravis; Obstructive uropathy; Paralytic ileus; Concurrent use of oral potassium chloride dosage forms (oral solution only).

Use Cautiously in: Patients who may have intra-abdominal infections; Prostatic hyperplasia; Chronic re-

© F.A. Davis Publishing

nal, hepatic, pulmonary, or cardiac disease; Hyperthyroidism; Down syndrome and children with spastic paralysis or brain damage (may be hypersensitive to antimuscarinic effects); OB, Lactation: Safety not established; Pedi: ↑ sensitivity to anticholinergic effects and adverse reactions; Geri: ↑ sensitivity to anticholinergic effects and adverse reactions.

Adverse Reactions/Side Effects

CV: tachycardia, orthostatic hypotension, palpitations. **Derm:** flushing. **EENT:** nasal congestion, blurred vision, cycloplegia, dry eyes, mydriasis. **GI:** dry mouth, vomiting, constipation. **GU:** urinary hesitancy, urinary retention. **Neuro:** headache, confusion, drowsiness.

Interactions

Drug-Drug: May ↑ GI mucosal lesions in patients taking oral **potassium chloride** tablets; concurrent use with oral glycopyrrolate solution contraindicated. Additive anticholinergic effects with other **anticholinergics**, including **antihistamines**, **phenothiazines**, **meperidine**, **amantadine**, **tricyclic antidepressants**, **quinidine**, and **disopyramide**. May alter the absorption of other **orally administered drugs** by slowing motility of the GI tract. May ↑ GI transit time of oral **digoxin** and ↑ digoxin levels. **Antacids** or **adsorbent antidiarrheal agents** ↓ absorption of anticholinergics. May ↑ GI mucosal lesions in patients taking oral **potassium chloride** tablets. May ↑ **atenolol** and **metformin** levels. May ↓ levels of **haloperidol** and **levodopa**. Concurrent use may ↓ absorption of **ketoconazole** (administer 2 hr after ketoconazole).

Route/Dosage

Control of Secretions during Surgery

IM (Adults): 4.4 mcg/kg 30–60 min preop (not to exceed 0.1 mg).
IM (Children >2 yr): 4.4 mcg/kg 30–60 min preop.
IM (Children <2 yr): 4.4–8.8 mcg/kg 30–60 min preop.

Control of Secretions (chronic)

IM, IV (Children): 4–10 mcg/kg/dose every 3–4 hr.
PO (Children): 40–100 mcg/kg/dose 3–4 times/day.

Cholinergic Adjunct

IV (Adults and Children): 200 mcg for each 1 mg of neostigmine or 5 mg of pyridostigmine given at the same time.

Antiarrhythmic

IV (Adults): 100 mcg, may be repeated every 2–3 min.
IV (Children): 4.4 mcg/kg (up to 100 mcg); may be repeated every 2–3 min.

Peptic Ulcer

PO (Adults): 1–2 mg 2–3 times daily. An additional 2 mg may be given at bedtime; may be ↓ to 1 mg twice daily (not to exceed 8 mg/day).
IM, IV (Adults): 100–200 mcg every 4 hr up to 4 times daily.

Chronic Severe Drooling

PO (Children 3–16 yr): *Oral solution*—0.02 mg/kg 3 times daily; may ↑ by 0.02 mg/kg 3 times daily every 5–7 days (not to exceed 0.1 mg/kg 3 times daily or 1.5–3 mg/dose).

Availability (generic available)

Oral solution (cherry-flavor): 1 mg/5 mL. **Solution for injection:** 200 mcg (0.2 mg)/mL. **Tablets:** 1 mg, 1.5 mg, 2 mg.

NURSING IMPLICATIONS

Assessment

- Assess heart rate, BP, and respiratory rate before and periodically during parenteral therapy.
- Monitor intake and output ratios in geriatric or surgical patients; glycopyrrolate may cause urinary retention. Instruct patient to void before parenteral administration.
- Assess patient routinely for abdominal distention and auscultate for bowel sounds. If constipation becomes a problem, increasing fluids and adding bulk to the diet may help alleviate the constipating effects of the drug.
- Periodic intraocular pressure determinations should be made for patients receiving long-term therapy.
- Pedi: Monitor amount and frequency of drooling periodically during therapy.
- Assess for hyperexcitability, a paradoxical response that may occur in children.
- ***Lab Test Considerations:*** Antagonizes effects of pentagastrin and histamine during the gastric acid secretion test. Avoid administration for 24 hr preceding the test.
- May cause ↓ uric acid levels in patients with gout or hyperuricemia.
- ***Toxicity and Overdose:*** If overdose occurs, neostigmine is the antidote.

Implementation

- Do not administer cloudy or discolored solution.
- **PO:** Administer 30–60 min before meals to maximize absorption.
- For drooling: Administer at least 1 hr before or 2 hr after meals.
- Do not administer within 1 hr of antacids or antidiarrheal medications.
- Oral dose is 10 times the parenteral dose.
- **IM:** May be administered undiluted (200 mcg/mL).

IV Administration

- **IV Push:** ***Dilution:*** May be given undiluted through Y-site. ***Concentration:*** 200 mcg/mL. ***Rate:*** Administer at a maximum rate of 20 mcg over 1 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, amikacin, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide,

© F.A. Davis Publishing

buprenorphine, butorphanol, calcium chloride, calcium gluconate, carmustine, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, cisplatin, clindamycin, cyanocobalamin, cyclosporine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, folic acid, foscarnet, fosphenytoin, ganciclovir, gemcitabine, gemtuzumab ozogamicin, gentamicin, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methylprednisolone, metoclopramide, metoprolol, midazolam, milrinone, mitoxantrone, morphine, moxifloxcin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, procainamide, promethazine, propofol, propranolol, protamine, pyridoxine, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B lipid complex, dantrolene, diazepam, diazoxide, furosemide, indomethacin, insulin, regular, irinotecan, mitomycin, pantoprazole, phenytoin, piperacillin/tazobactam, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take glycopyrrolate as directed and not to take more than the prescribed amount. Take missed doses as soon as remembered if not just before next dose.
- Medication may cause drowsiness and blurred vision. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Inform patient that frequent oral rinses, sugarless gum or candy, and good oral hygiene may help relieve dry mouth. Consult health care professional regarding use of saliva substitute if dry mouth persists for more than 2 wk.
- Advise patient to change positions slowly to minimize the effects of drug-induced orthostatic hypotension.
- Caution patient to avoid extremes of temperature. This medication decreases the ability to sweat and may increase the risk of heat stroke.
- Advise patient to notify health care professional immediately if eye pain or increased sensitivity to light occurs. Emphasize the importance of routine eye exams throughout therapy.
- Advise patient to consult health care professional before taking any OTC medications concurrently with this therapy.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Geri: Advise geriatric patients about increased susceptibility to side effects and to call health care professional immediately if they occur.
- Pedi: Instruct parents to use a calibrated measuring device with solution for accurate dosing.
- Advise parents to stop glycopyrrolate and notify health care professional if constipation; signs of urinary retention (inability to urinate, dry diapers or undergarments, irritability, or crying); or rash, hives, or an allergic reaction occurs.
- Glycopyrrolate reduces sweating. Advise parents to avoid exposure of the patient to hot or very warm environmental temperatures to avoid overheating and heat exhaustion or heat stroke.

Evaluation/Desired Outcomes

- Mouth dryness preoperatively.
- Reversal of cholinergic medications.
- Decrease in GI motility and pain in patients with peptic ulcer disease.
- Reduce chronic severe drooling in children with neurologic conditions associated with drooling.

golimumab (go-li-mu-mab)

Simponi, Simponi Aria, Simponi IV

Classification

Therapeutic: antirheumatics

Pharmacologic: DMARDs, monoclonal antibodies, anti-TNF agents

Indications

Simponi and Simponi Aria: Treatment of the following conditions: Moderately to severely active rheumatoid arthritis (in combination with methotrexate), Active psoriatic arthritis, Active ankylosing spondylitis.
Simponi: Moderately to severely active ulcerative colitis in patients who have demonstrated corticosteroid dependence or have responded inadequately to immu-

© F.A. Davis Publishing

nosuppressants such as aminosalicylates, corticosteroids, azathioprine, or 6–mercaptopurine. **Simponi Aria:** Active polyarticular juvenile idiopathic arthritis.

Action

Inhibits binding of TNFα to receptors inhibiting activity and resulting in anti-inflammatory and antiproliferative activity. **Therapeutic Effects:** Decreased pain and swelling with decreased joint destruction in patients with rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis, and polyarticular juvenile idiopathic arthritis. Induction and maintenance of clinical remission of ulcerative colitis.

Pharmacokinetics

Absorption: Well absorbed following subcutaneous administration. IV administration results in complete bioavailability.
Distribution: Distributed primarily in the circulatory system with limited extravascular distribution.
Metabolism and Excretion: Unknown.
Half-life: 2 wk.

TIME/ACTION PROFILE (improvement)

ROUTE	ONSET	PEAK	DURATION
Subcut	within 3 mo	2–7 days†	unknown
IV	within 3 mo	unknown	unknown

† Blood levels.

Contraindications/Precautions

Contraindicated in: Active infection (including localized); Concurrent use of abatacept or anakinra (↑ risk of infections).
Use Cautiously in: History of chronic or recurrent infection or underlying illness/treatment predisposing to infection; History of exposure to tuberculosis; History of opportunistic infection; Patients residing, or who have resided, where tuberculosis, histoplasmosis, coccidioidomycoses, or blastomycosis is endemic; History of HF (may worsen); Pre-existing CNS demyelinating disorders (including multiple sclerosis or Guillain-Barré syndrome); History of cytopenias (may worsen); History of psoriasis (may exacerbate); Hepatitis B virus carriers (risk of reactivation); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children <18 yr (rheumatoid arthritis, ankylosing spondylitis, or ulcerative colitis) or <2 yr (psoriatic arthritis or polyarticular juvenile idiopathic arthritis); ↑ risk of lymphoma (including HSTCL), leukemia, and other malignancies in children; Geri: ↑ risk of infection in older adults.

Adverse Reactions/Side Effects

EENT: nasopharyngitis, optic neuritis. **Resp:** upper respiratory tract infection. **CV:** HF, hypertension. **GI:** ↑ liver enzymes. **Derm:** psoriasis. **Hemat:** agranulocytosis, aplastic anemia, leukopenia, neutropenia, pancytopenia, thrombocytopenia. **Local:** injection site reactions. **Neuro:** paresthesia, CENTRAL NERVOUS SYSTEM DEMYELINATING DISORDERS, Guillain-Barre syndrome, multiple sclerosis. **Misc:** ANAPHYLAXIS, HYPERSENSITIVITY REACTIONS, INFECTIONS (including reactivation tuberculosis and other opportunistic infections due to bacterial, invasive fungal, viral, mycobacterial, and parasitic pathogens), MALIGNANCY (including lymphoma, HSTCL, leukemia, and skin cancer), fever, lupus-like syndrome.

Interactions

Drug-Drug: Abatacept, **anakinra**, **corticosteroids**, or **methotrexate** ↑ risk of serious infections; concurrent use with anakinra or abatacept is not recommended. Use of **live virus vaccines** or therapeutic infectious agents may ↑ risk of infection; avoid concurrent use. Concurrent use with **azathioprine** and/or **6–mercaptopurine** may ↑ risk of HSTCL. May normalize previously suppressed levels of CYP450 enzymes, following initiation or discontinuation of golimumab, effects of substrates of this system may be altered and should be monitored, including **warfarin**, **theophylline**, and **cyclosporine**.

Route/Dosage

Rheumatoid Arthritis and Ankylosing Spondylitis

Subcut (Adults): 50 mg once monthly.
IV (Adults): 2 mg/kg initially and 4 wk later, then 2 mg/kg every 8 wk.

Psoriatic Arthritis

Subcut (Adults): 50 mg once monthly.
IV (Adults): 2 mg/kg initially and 4 wk later, then 2 mg/kg every 8 wk.
IV (Children ≥2 yr): 80 mg/m^2 initially and 4 wk later, then 80 mg/m^{2}every 8 wk.

Ulcerative Colitis

Subcut (Adults): 200 mg initially, then 100 mg 2 wk later, then 100 mg every 4 wk.

Polyarticular Juvenile Idiopathic Arthritis

IV (Children ≥2 yr): 80 mg/m^2 initially and 4 wk later, then 80 mg/m^{2}every 8 wk.

Availability

Solution for subcutaneous injection (prefilled syringes and autoinjectors): 50 mg/0.5 mL, 100 mg/mL. **Solution for intravenous injection (Simponi Aria):** 12.5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs and symptoms of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound) prior to, during, and after therapy. Discontinue therapy if serious or opportunistic infection or sepsis oc-

© F.A. Davis Publishing

curs. If new infection develops during therapy, assess patient and institute antimicrobial therapy. Patients who tested negative for latent tuberculosis (TB) prior to therapy may develop TB during therapy. Initiate treatment for latent TB prior to initiating therapy.

- Test for HBV prior to therapy and monitor carriers of HBV for signs of reactivation during and for several mo after therapy. If reactivation occurs, discontinue golimumab and institute antiviral therapy.
- Monitor patients with HF for new or worsening symptoms. Discontinue therapy if symptoms occur.
- Assess for exacerbations and new onset psoriasis. Discontinue therapy if these occur.
- Assess patient for latex allergy. Needle cover of syringe contains latex and should not be handled by persons sensitive to latex.
- Assess for signs and symptoms of systemic fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping golimumab until the infection has been diagnosed and adequately treated.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue drug and notify health care professional immediately if these problems occur. Keep epinephrine, an antihistamine, and resuscitation equipment close by in case of an anaphylactic reaction.
- **Rheumatoid Arthritis:** Assess pain and range of motion prior to and periodically during therapy.
- **Ulcerative Colitis:** Assess for signs and symptoms before, during, and after therapy.
- ***Lab Test Considerations:*** Monitor liver function tests periodically during therapy. May cause ↑ serum AST and ALT.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue golimumab if symptoms of blood dyscrasias (persistent fever) occur.
- Monitor for HBV blood tests before starting, during, and for several mo after therapy is completed.

Implementation

- Administer a tuberculin skin test prior to administration of golimumab. Assess if treatment for latent tuberculosis is needed; an induration of 5 mm or greater is a positive tuberculin skin test, even for patients previously vaccinated with Bacille Calmette-Guerin (BCG). Consider antituberculosis therapy prior to therapy in patients with a history of latent or active tuberculosis if an adequate course of treatment cannot be confirmed, and for patients with risk factors for tuberculosis infection.
- Update immunizations before starting therapy following current immunization guidelines for patients receiving immunosuppressive agents.
- Initial injection should be supervised by health care professional.
- Refrigerate solution; do not freeze. Allow prefilled syringe or autoinjector to sit at room temperature for 30 min prior to injection; do not warm in any other way. Do not shake. Solution is clear to slightly opalescent and colorless to light yellow. Do not administer solutions that are discolored, cloudy, or contain particulate matter. Discard unused solution.
- **Subcut:** Remove the needle cover or autoinjector cap just prior to injection. Inject into front of middle thigh, lower part of abdomen 2 inches from navel, or caregiver may administer into outer area of upper arm. Do not inject in areas where skin is tender, bruised, red, scaly, or hard; avoid scars or stretch marks. Press a cotton ball or gauze over injection site for 10 sec; do not rub.
- *Autoinjector:* Press open end of autoinjector against skin at 90° angle. Use free hand to pinch and hold skin at injection site. Press button with fingers or thumb; button will stay pressed and does not need to be held. Injection will begin following a loud click. Keep holding the autoinjector against skin until a 2nd loud click is heard (usually 3–6 sec, but may take up to 15 sec). Lift autoinjector from skin following 2nd click. Yellow indicator in viewing window indicates autoinjector worked correctly. If yellow does not appear in viewing window call 1-800-457-6399 for help.
- *Prefilled syringe:* Hold body of syringe between thumb and index finger. Do not pull back on plunger at any time. Pinch skin. Using a dart-like motion, insert needle into pinched skin at 45° angle. Inject all medication by pushing plunger until plunger head is between needle guard wings. Take needle out of skin and let go of skin. Slowly take thumb off plunger to allow empty syringe to move up until entire needle is covered by needle guard.

IV Administration

- **Intermittent Infusion:** Calculate dose and number of vials needed for dose. Solution in vial is colorless to light yellow; may contain a few fine translucent particles of protein. Do not use if opaque particles, discoloration, or other particles present. ***Dilution:*** Withdraw volume of dose from 100 mL bag of 0.9% NaCl or 0.45% NaCl and discard. Add golimumab dose to infusion bag; mix gently. Solution is stable for 4 hrs at room temperature. ***Rate:*** Infuse through an in-line, sterile, non-pyrogenic, low protein-bind-

© F.A. Davis Publishing

ing filter with ≤ 0.22 micrometer pore size over 30 min.

Patient/Family Teaching

- Instruct patient on correct technique for administration. Review patient information sheet, preparation of dose, administration sites and technique, and disposal of equipment into a puncture-resistant container. Advise patient of risks and benefits of golimumab therapy. Inject missed doses as soon as remembered, then return to regular schedule. Instruct patient to read *Medication Guide* before starting therapy and with each Rx refill; new information may be available.
- Caution patient not to share this medication with others, even with the same symptoms; may be harmful.
- Inform patient of increased risk of infections, malignancies, cardiac and nervous system disorders during therapy.
- Caution patient to notify health care professional promptly if any signs of infection, including TB, invasive fungal infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock), reactivation of HBV (muscle aches, clay-colored bowel movements, feeling very tired, fever, dark urine, chills, skin or eyes look yellow, stomach discomfort, little or no appetite, skin rash, vomiting), hypersensitivity reactions, or nervous system problems (vision changes, weakness in arms or legs, numbness or tingling in any part of the body) develop.
- Advise patient to examine skin periodically during therapy and notify health care professional of any changes in appearance of skin or growths on skin.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Inform patient to avoid receiving live vaccinations; other vaccinations may be given.
- Inform patient of increased risk of cancer. Advise patient of need for screening for dysplasia (colonoscopy, skin cancer examinations, biopsy) periodically during therapy.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise females to notify health care professional if they recently had a baby while taking golimumab. Infants may have an increased chance of getting an infection for up to 6 mo after birth; avoid administration of live vaccines to infants for 6 mo after mother's last dose.

Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction in patients with rheumatoid arthritis.
- Decreased signs and symptoms, slowed progression of joint destruction, and improved physical function in patients with psoriatic arthritis.
- Reduced signs and symptoms of ankylosing spondylitis.
- Decreased symptoms, maintaining remission, and mucosal healing with decreased corticosteroid use in ulcerative colitis.

goserelin (goe-se-rel-lin)

Zoladex

Classification

Therapeutic: antineoplastics, hormones
Pharmacologic: gonadotropin-releasing hormones

Indications

Prostate cancer in patients who cannot tolerate orchiectomy or estrogen therapy (palliative). With flutamide and radiation therapy in the treatment of locally confined stage T2b–T4 (stage B2–C) prostate cancer. Advanced breast cancer in peri- and postmenopausal women (palliative). Endometriosis. Produces thinning of the endometrium before endometrial ablation for dysfunctional uterine bleeding.

Action

Acts as a synthetic form of luteinizing hormone–releasing hormone (LHRH, GnRH). Inhibits the production of gonadotropins by the pituitary gland. Initially, levels of luteinizing hormone (LH), follicle-stimulating hormone (FSH), and testosterone increase. Continued administration leads to decreased production of testosterone and estradiol. **Therapeutic Effects:** Decreased spread of cancer of the prostate or breast. Regression of endometriosis with decreased pain. Thinning of the endometrium.

Pharmacokinetics

Absorption: Well absorbed from subcut implant. Absorption is slower in first 8 days, then is faster and continuous for remainder of 28-day dosing cycle.
Distribution: Unknown.
Metabolism and Excretion: Some metabolism by the liver (<10%), some excretion by kidneys (>90%, only 20% as unchanged drug).
Half-life: 4.2 hr.

TIME/ACTION PROFILE (↓ in serum testosterone levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	2–4 wk	length of therapy

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Undiagnosed vaginal bleeding; OB, Lactation: Pregnancy or lactation.
Use Cautiously in: Congenital long QT syndrome, HF, hypokalemia, or hypomagnesemia; Concurrent use

© F.A. Davis Publishing

of other drugs known to prolong the QTc interval; Low BMI (↑ risk of bleeding complications); Concurrent use of anticoagulant therapy (↑ risk of bleeding complications); Pedi: Safety not established.

Adverse Reactions/Side Effects

Neuro: STROKE, headache, anxiety, depression, dizziness, fatigue, insomnia, mood swings, seizures, weakness. **Resp:** dyspnea. **CV:** MYOCARDIAL INFARCTION, QT INTERVAL PROLONGATION, vasodilation, chest pain, hypertension, palpitations. **GI:** anorexia, constipation, diarrhea, nausea, ulcer, vomiting. **GU:** renal insufficiency, urinary obstruction. **Derm:** sweating, acne, rash. **Endo:** ↓ libido, erectile dysfunction, breast swelling, breast tenderness, infertility, ovarian cysts, ovarian hyperstimulation syndrome (with gonadotropins). **F and E:** peripheral edema. **Hemat:** anemia. **Metab:** gout, hyperglycemia, ↑ lipids. **MS:** ↑ bone pain, arthralgia, ↓ bone density. **Misc:** hot flashes, chills, fever, injection site/vascular injury, weight gain.

Interactions

Drug-Drug: None significant.

Route/Dosage

Subcut (Adults): 3.6 mg every 4 wk or 10.8 mg every 12 wk. *Endometrial thinning*—1 or 2 depots given 4 wk apart; if 1 depot used, surgery is performed at 4 wk; if 2 depots used, surgery is performed 2–4 wk after 2nd depot.

Availability

Implant: 3.6 mg, 10.8 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of injection site injury/abdominal hemorrhage (abdominal pain, abdominal distension, dyspnea, dizziness, hypotension, and/or any altered levels of consciousness) following administration. Advise patient to report symptoms immediately to health care professional.
- **Cancer:** Monitor patients with vertebral metastases for increased back pain and decreased sensory/motor function.
- Monitor intake and output ratios and assess for bladder distention in patients with urinary tract obstruction during initiation of therapy.
- **Endometriosis:** Assess patient for signs and symptoms of endometriosis before and periodically during therapy. Amenorrhea usually occurs within 8 wk of initial administration and menses usually resume 8 wk after completion.
- ***Lab Test Considerations:*** Initially ↑, then ↓ LH and FSH. This leads to castration levels of testosterone in men 2–4 wk after initial increase in concentrations.
- Monitor serum acid phosphatase and prostate-specific antigen concentrations periodically during therapy. May cause transient ↑ in serum acid phosphatase concentrations, which usually return to baseline by the 4th wk of therapy and may ↓ to below baseline or return to baseline if elevated before therapy.
- May cause hypercalcemia in patients with breast or prostate cancer with bony metastases.
- May cause an ↑ in serum HDL, LDL, and triglycerides.
- May cause hyperglycemia. Monitor blood glucose and HbA1c periodically during therapy.

Implementation

- **Subcut:** Implant is inserted in upper subcut tissue of upper abdominal wall every 28 days. Local anesthesia may be used before injection.
- If the implant needs to be removed for any reason, it can be located by ultrasound.

Patient/Family Teaching

- Explain purpose of goserelin to patient. Emphasize importance of adhering to the schedule of monthly or every-3-mo administration.
- Advise patient that bone pain may increase at initiation of therapy. This will resolve with time. Patient should discuss use of analgesics to control pain with health care professional.
- Advise female patients to notify health care professional if regular menstruation persists.
- Inform diabetic patients of potential for hyperglycemia. Encourage close monitoring of serum glucose.
- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome. Hormone replacement therapy may be added to decrease vasomotor symptoms and vaginal dryness without compromising beneficial effect.
- Instruct patient to notify health care professional promptly if difficulty urinating or if symptoms of myocardial infarction or stroke (chest pain, difficulty breathing, weakness, loss of consciousness) occur.
- Rep: Advise premenopausal women to notify health care professional if pregnancy is planned or suspected or if breast feeding. Effective contraception should be used during and for 12 wk after treatment ends.

Evaluation/Desired Outcomes

- Decrease in the spread of prostate cancer.
- Reduction of symptoms of advanced breast cancer in peri- and postmenopausal women.
- Decrease in the signs and symptoms of endometriosis. Symptoms are usually reduced within 4 wk of implantation.
- Thinning of the endometrium before endometrial ablation for dysfunctional uterine bleeding.

© F.A. Davis Publishing

granisetron (gra-nees-e-tron)
~~Kytril~~, Sustol

granisetron (transdermal)
Sancuso

Classification
Therapeutic: antiemetics
Pharmacologic: 5-HT_3 antagonists

Indications
PO: Prevention of nausea and vomiting due to emetogenic chemotherapy or radiation therapy. Prevention and treatment of postoperative nausea and vomiting. **Subcut:** Prevention of acute and delayed nausea and vomiting due to moderately emetogenic chemotherapy or anthracycline/cyclophosphamide combination chemotherapy (with dexamethasone). **Transdermal:** Prevention of nausea and vomiting due to moderately/highly emetogenic chemotherapy.

Action
Blocks the effects of serotonin at receptor sites (selective antagonist) located in vagal nerve terminals and in the chemoreceptor trigger zone in the CNS. **Therapeutic Effects:** Decreased incidence and severity of nausea and vomiting following emetogenic chemotherapy, radiation therapy, or surgery.

Pharmacokinetics
Absorption: 50% absorbed following oral administration; transdermal enters systemic circulation via passive diffusion through intact skin.
Distribution: Distributes into erythrocytes; remainder of distribution is unknown.
Protein Binding: 65%.
Metabolism and Excretion: Mostly metabolized by the liver; 12% excreted unchanged in urine.
Half-life: *Patients with cancer*—10–12 hr (range 0.9–31.1 hr); *healthy volunteers*—3–4 hr (range 0.9–15.2 hr); *geriatric patients*—7.7 hr (range 2.6–17.7 hr); *subcutaneous*—24 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	60 min	24 hr
IV	1–3 min	30 min	up to 24 hr
TD*	unknown	48 hr	unknown
Subcut*	unknown	12 hr	7 days

*Blood levels.

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Some products contain benzyl alcohol; avoid use in neonates; Severe renal impairment (subcut).
Use Cautiously in: History of arrhythmias or conduction disorders; Recent abdominal surgery (subcutaneous); Moderate renal impairment (↓ frequency of administration); Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children <18 yr (oral, subcut, or transdermal) or <2 yr (IV).

Adverse Reactions/Side Effects
CV: hypertension, QT interval prolongation. **GI:** constipation, abdominal pain, diarrhea, dyspepsia, ↑ liver enzymes, taste disorder. **Derm:** *Topical*—application site reactions, photosensitivity. **Neuro:** headache, agitation, anxiety, CNS stimulation, dizziness, drowsiness, headache, insomnia, weakness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), SEROTONIN SYNDROME, injection site reactions (subcutaneous) (including infection, bruising, hematoma, bleeding, pain, or nodules), fever.

Interactions
Drug-Drug: ↑ risk of extrapyramidal reactions with other **agents causing extrapyramidal reactions**. ↑ risk of QT interval prolongation with other **agents causing QT interval prolongation**. Drugs that affect serotonergic neurotransmitter systems, including **SSRIs**, **SNRIs**, **tricyclic antidepressants**, **MAO inhibitors**, **fentanyl**, **lithium**, **buspirone**, **tramadol**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Route/Dosage
Prevention of Nausea and Vomiting Due to Emetogenic Chemotherapy
PO (Adults): 1 mg twice daily; 1st dose given at least 60 min prior to chemotherapy and 2nd dose 12 hr later only on days when chemotherapy is administered; may also be given as 2 mg once daily at least 60 min prior to chemotherapy.
IV (Adults and Children 2–16 yr): 10 mcg/kg given within 30 min prior to chemotherapy or 20–40 mcg/kg/day divided once or twice daily (maximum: 3 mg/dose or 9 mg/day).
Transdermal (Adults): One 34.3-mg patch (delivers 3.1 mg/24 hr) applied up to 48 hr prior to chemotherapy, leave in place for at least 24 hr following chemotherapy, may be left in place for a total of 7 days.

Prevention of Nausea and Vomiting Associated with Radiation Therapy
PO (Adults): 2 mg taken once daily within 1 hr of radiation therapy.

Prevention and Treatment of Postoperative Nausea and Vomiting
IV (Adults): *Prevention*—1 mg prior to induction of anesthesia or just prior to reversal of anesthesia; *Treatment*—1 mg.
IV (Children ≥4 yr): 20–40 mcg/kg as a single dose (maximum: 1 mg).

Prevention of Acute and Delayed Nausea and Vomiting Due to Emetogenic Chemotherapy
Subcut (Adults): 10 mg given at least 30 min prior to chemotherapy (with dexamethasone) on Day 1 of

© F.A. Davis Publishing

chemotherapy; do not administer more frequently than every 7 days.

Renal Impairment

Subcut (Adults): *CCr 30–59 mL/min*—Do not administer more frequently than every 14 days.

Availability (generic available)

Tablets: 1 mg. **Solution for intravenous injection:** 1 mg/mL. **Solution for subcutaneous injection (in prefilled syringes):** 10 mg/0.4 mL. **Transdermal patch:** 3.1 mg/24 hr.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea, vomiting, abdominal distention, and bowel sounds prior to and following administration.
- Assess for extrapyramidal symptoms (involuntary movements, facial grimacing, rigidity, shuffling walk, trembling of hands) during therapy. This occurs rarely and is usually associated with concurrent use of other drugs known to cause this effect.
- Monitor ECG in patients with HF, bradycardia, underlying heart disease, renal impairment, and elderly patients.
- Monitor for signs and symptoms of serotonin syndrome (mental status changes [agitation, hallucinations, delirium, and coma], autonomic instability [tachycardia, labile BP, dizziness, diaphoresis, flushing, hyperthermia], neuromuscular symptoms [tremor, rigidity, myoclonus, hyperreflexia, incoordination], seizures, with or without gastrointestinal symptoms [nausea, vomiting, diarrhea]). If symptoms occur discontinue granisetron and treat symptomatically.
- **Transdermal:** Monitor application site. If allergic, erythematous, macular, or papular rash or pruritus occurs, remove patch.
- ***Lab Test Considerations:*** May cause ↑ AST and ALT levels.

Implementation

- Correct hypokalemia and hypomagnesemia before administering.
- For chemotherapy or radiation, granisetron is administered only on the day(s) chemotherapy or radiation is given. Continued treatment when not on chemotherapy or radiation therapy has not been found to be useful.
- **PO:** Administer 1st dose up to 1 hr before chemotherapy or radiation therapy and 2nd dose 12 hr after the first.
- **Subcut:** Use kit and components provided by manufacturer. Injection should be administered by health care professional. Remove kit from refrigerator and allow to warm to room temperature for 60 min. Activate one syringe warming pouch, and wrap syringe in warming pouch for 5 to 6 min to warm to body temperature. Do not inject solutions that contain particulate matter. Inject in back of upper arm or in skin of abdomen at least 1 inch away from umbilicus. Avoid injecting in areas where skin is burned, hardened, inflamed, or swollen. Topical anesthesia may be used at injection site prior to injection. Solution is viscous and requires a slow, sustained injection over 20 to 30 sec. Pressing the plunger harder will NOT expel medication faster.

IV Administration

- **IV Push:** ***Dilution:*** May be administered undiluted or diluted in 20–50 mL of 0.9% NaCl or D5W. Solution should be prepared at time of administration but is stable for 24 hr at room temperature. ***Concentration:*** Up to 1 mg/mL. ***Rate:*** Administer undiluted granisetron over 30 sec or as a diluted solution over 5 min.
- **Y-Site Compatibility:** acetaminophen, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, fosaprepitant, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycopheno-

© F.A. Davis Publishing

late, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B deoxycholate, dantrolene, diazepam, gemtuzumab ozogamicin, phenytoin.
- **Additive Incompatibility:** Granisetron should not be admixed with other medications.
- **Transdermal:** Apply system to clear, dry, intact healthy skin on upper outer arm 24–48 hr before chemotherapy. Do not use creams, lotions, or oils that may keep patch from sticking. Do not apply to skin that is red, irritated, or damaged. Apply immediately after removing from package. Do not cut patch into pieces. Remove liner from adhesive layer and press firmly in place with palm of hand for 30 sec, especially around the edges, to make sure contact is complete. Patch should be worn throughout chemotherapy. If patch does not stick, bandages or medical adhesive tape may be applied on edges of patch; do not cover patch with tape or bandages or wrap completely around arm. Patient may shower and wash normally while wearing patch; avoid swimming, strenuous exercise, sauna, or whirlpool during patch use. Remove patch gently at least 24 hr after completion of chemotherapy; may be worn for up to 7 days. Fold so that adhesive edges are together. Throw away in garbage out of reach of children and pets. Do not reuse patch. Use soap and water to remove remaining adhesive; do not use alcohol or acetone.

Patient/Family Teaching

- Instruct patient to take granisetron as directed.
- Advise patient to notify health care professional immediately if involuntary movement of eyes, face, or limbs occurs.
- May cause dizziness and drowsiness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if symptoms of abnormal heart rate or rhythm (racing heartbeat, shortness of breath, dizziness, fainting) or serotonin syndrome occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Transdermal:** Instruct patient on correct application, removal, and disposal of patch. Advise patient to read *Patient Information* sheet prior to using and with each Rx refill in case of new information. Inform patient that additional granisetron should not be taken during patch application unless directed by health care professional.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- Advise patient to avoid using a heating pad near or over patch and to cover patch application site with clothing to avoid exposure to sunlight, sunlamp, or tanning beds during and for 10 days following removal of patch.
- Instruct patient to notify health care professional if pain or swelling in the abdomen occurs or if redness at patch removal site remains for more than 3 days.

Evaluation/Desired Outcomes

- Prevention of nausea and vomiting associated with emetogenic cancer chemotherapy or radiation therapy.
- Prevention and treatment of postoperative nausea and vomiting.

BEERS

guanFACINE (gwahn-fa-seen)

Intuniv, Intuniv XR, ~~Tenex~~

Classification

Therapeutic: antihypertensives
Pharmacologic: centrally acting antiadrenergics

Indications

Hypertension (with thiazide-type diuretics) (immediate-release). Treatment of attention-deficit hyperactivity disorder (ADHD) as monotherapy or as adjunctive therapy to stimulants (extended-release).

Action

Stimulates CNS alpha$_2$-adrenergic receptors, producing a decrease in sympathetic outflow to heart, kidneys, and blood vessels. Result is decreased BP and peripheral resistance, a slight decrease in heart rate, and no change in cardiac output. Mechanism of action in ADHD is unknown. **Therapeutic Effects:** Lowering of BP in hypertension. Increased attention span in ADHD.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Immediate-release is well absorbed (80%); extended-release has lower rate and extent of absorption (↑ absorption with high-fat meals).
Distribution: Appears to be widely distributed.
Metabolism and Excretion: 50% metabolized by the liver, 50% excreted unchanged by the kidneys.
Half-life: 17 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO (single dose)	unknown	8–12 hr	24 hr
PO (multiple doses)	within 1 wk	1–3 mo	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Severe coronary artery disease or recent myocardial infarction; Cerebrovascular disease; Severe renal or liver disease; History of hypotension, heart block, bradycardia, or cardiovascular disease; OB: Other agents preferred for treatment of hypertension or ADHD in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <6 yr (safety and effectiveness not established); Geri: May have ↑ sensitivity, especially those with hepatic, cardiac, or renal dysfunction.

Adverse Reactions/Side Effects

CV: bradycardia, chest pain, hypotension, palpitations, rebound hypertension, syncope. **EENT:** tinnitus. **GI:** constipation, dry mouth, abdominal pain, nausea. **GU:** erectile dysfunction. **Neuro:** drowsiness, headache, weakness, depression, dizziness, fatigue, insomnia, irritability. **Resp:** dyspnea.

Interactions

Drug-Drug: ↑ hypotension with other **antihypertensives**, **nitrates**, and acute ingestion of **alcohol**. ↑ CNS depression may occur with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, **tricyclic antidepressants**, and **sedative/hypnotics**. **NSAIDs** may ↓ effectiveness. **Adrenergics** may ↓ effectiveness. ↑ risk of hypotension and bradycardia with strong and moderate **CYP3A4 inhibitors**, including **ketoconazole** and **fluconazole** (↓ in dose of guanfacine may be needed). Strong and moderate **CYP3A4 inducers**, including **rifampin**, **efavirenz**, and **carbamazepine** may ↓ effects (an ↑ in dose of guanfacine may be needed). May ↑ levels of **valproic acid**.

Route/Dosage

Immediate-release and extended-release tablets should not be interchanged.

Hypertension

PO (Adults): 1 mg daily given at bedtime, may be ↑ if necessary at 3–4 wk intervals up to 2 mg/day; may also be given in 2 divided doses.

ADHD

PO (Adults and Children ≥6 yr): 1 mg once daily in morning or evening; may be ↑ by 1 mg/day at weekly intervals to achieve dose of 1–4 mg/day (6–12 yr) or 1–7 mg-day (13–17 yr) when used as monotherapy or 1–4 mg/day when used as adjunctive therapy. *Concurrent strong or moderate CYP3A4 inhibitor*—↓ initial and maintenance dose by 50%; *Concurrent strong or moderate CYP3A4 inducer*—Consider ↑ initial and maintenance dose up to double the recommended level (maintenance dose can be ↑ over period of 1–2 wk).

Availability (generic available)

Immediate-release tablets: 1 mg, 2 mg. **Cost:** *Generic*—1 mg $10.34/100, 2 mg $25.67/100. **Extended-release tablets (Intuniv):** 1 mg, 2 mg, 3 mg, 4 mg. **Cost:** All strengths $884.11/100.

NURSING IMPLICATIONS

Assessment

- **Hypertension:** Monitor BP (lying and standing) and pulse frequently during initial dose adjustment and periodically during therapy. Report significant changes.
- Monitor frequency of prescription refills to determine adherence.
- **ADHD:** Assess attention span, impulse control, and interactions with others.
- Monitor BP and heart rate prior to starting therapy, following dose increases, and periodically during therapy. May cause hypotension, orthostatic hypotension, and bradycardia.
- ***Lab Test Considerations:*** May cause temporary, clinically insignificant ↑ in plasma growth hormone levels.
- May cause ↓ in urinary catecholamines and vanillylmandelic acid levels.

Implementation

- Do not confuse guanfacine with guaifenesin. Do not confuse Intuniv (guanfacine) with Invega (paliperidone).
- Do not substitute extended-release tablets for immediate-release tablets on a mg-mg basis. Doses are not the same.
- **PO:** *For hypertension:* Administer daily dose at bedtime to minimize daytime sedation.
- *For ADHD:* Administer once daily. Swallow extended-release tablets whole; do not crush, break, or chew. Do not administer with high fat meals, due to increased exposure.

© F.A. Davis Publishing

Patient/Family Teaching

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cough, cold, or allergy remedies.
- Caution patient to avoid alcohol and other CNS depressants while taking guanfacine.
- Advise patient to notify health care professional if dry mouth or constipation persists. Frequent mouth rinses, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Increase in fluid and fiber intake and exercise may decrease constipation.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if dizziness, prolonged drowsiness, fatigue, weakness, depression, headache, sexual dysfunction, mental depression, or sleep pattern disturbance occurs. Discontinuation may be required if drug-related mental depression occurs.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Monitor breast feeding infants exposed to guanfacine through breast milk for sedation, lethargy, and poor feeding. Inform patient about pregnancy exposure registry that monitors pregnancy outcomes in women exposed to ADHD medications, including INTUNIV, during pregnancy. Healthcare providers are encouraged to register patients by calling the National Pregnancy Registry for ADHD Medications at 1-866-961-2388.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.
- **Hypertension:** Emphasize the importance of continuing to take medication as directed, even if feeling well. Medication controls but does not cure hypertension. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered; do not double doses. If 2 or more doses are missed, consult health care professional. Do not discontinue abruptly; may cause sympathetic overstimulation (nervousness, anxiety, rebound hypertension, chest pain, tachycardia, increased salivation, nausea, trembling, stomach cramps, sweating, difficulty sleeping). These effects may occur 2–7 days after discontinuation, although rebound hypertension is rare and more likely to occur with high doses.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol consumption, regular exercise, and stress management).
- Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and to report significant changes.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- **ADHD:** Instruct patient to take medication as directed at the same time each day. Take missed doses as soon as possible, but should not take more than the total daily amount in any 24-hr period. Do not stop taking abruptly; discontinue gradually at no more than 1 mg every 3–7 days. Monitor heart rate and BP during discontinuation. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill.
- Inform patient that sharing this medication may be dangerous.
- Pedi: Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes

- Decrease in BP without excessive side effects.
- Improved attention span and social interactions in ADHD. Re-evaluate use if used for >9 wk.

guselkumab (gue-sel-koo-mab)

Tremfya

Classification

Therapeutic: antipsoriatics
Pharmacologic: interleukin antagonists, monoclonal antibodies

Indications

Moderate-to-severe plaque psoriasis in patients who are candidates for phototherapy or systemic therapy. Active psoriatic arthritis (as monotherapy or in combination with a conventional disease-modifying antirheumatic drug [DMARD]).

Action

Binds to the p19 protein subunit of the interleukin (IL)-23 cytokine to prevent its interaction with the IL-23 receptor. This cytokine is normally involved in inflammatory and immune responses. Binding to interleukins antagonizes their effects, inhibiting the release of proinflammatory cytokines and chemokines. **Therapeutic Effects:** Decrease in area and severity of psoriatic lesions. Decreased pain and swelling with decreased rate of joint destruction in psoriatic arthritis.

Pharmacokinetics

Absorption: 49% absorbed following subcutaneous administration.
Distribution: Well distributed to tissues.
Metabolism and Excretion: Broken down by catabolic processes into peptides and amino acids.
Half-life: 15–18 days.

© F.A. Davis Publishing

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	5.5 days	8 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active, untreated infection.

Use Cautiously in: History of tuberculosis (possibility of reactivation); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children.

Exercise Extreme Caution in: Chronic infection or history of recurrent infection.

Adverse Reactions/Side Effects

GI: diarrhea, ↑ liver enzymes. **Local:** injection site reactions. **MS:** arthralgia. **Neuro:** headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), infection.

Interactions

Drug-Drug: May ↓ antibody response to and ↑ risk of adverse reactions from **live vaccines**; avoid use during therapy. May affect the activity of CYP450 drug-metabolizing enzymes; appropriate monitoring and dose adjustment should be carried out when treatment is started in patients receiving concurrent treatment with **CYP450 substrate**, especially those with a narrow therapeutic index, including **warfarin** and **cyclosporine**.

Route/Dosage

Subcut (Adults): 100 mg initially and 4 wk later, then 100 mg every 8 wk.

Availability

Solution for injection (prefilled syringes and patient-controlled injectors): 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess affected area(s) prior to and periodically during therapy.
- Assess patient for latent tuberculosis with a tuberculin skin test prior to initiation of therapy. Treatment of latent tuberculosis should be started before therapy with guselkumab.
- Assess for signs of infection (fever, dyspnea, flu-like symptoms, frequent or painful urination, redness or swelling at the site of a wound), including tuberculosis, prior to injection. Monitor new infections closely; most common are upper respiratory tract infections, bronchitis, and urinary tract infections.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, hives, dyspnea, swelling of lips, tongue, or throat) during therapy.
- ***Lab Test Considerations:*** May cause ↑ liver enzymes.

Implementation

- Update immunizations to current prior to initiating therapy. Patients on guselkumab may receive concurrent vaccinations, except for live vaccines.
- **Subcut:** Allow syringe and solution to reach room temperature, for 30 min before injecting. Solution is clear and colorless to light yellow solution and may contain small translucent particles; do not administer solutions that are cloudy, discolored or contain large particles. Store solution in refrigerator in original carton to protect from light; do not shake or freeze. Inject full amount (1 mL) of *One Press injector* in front of thigh, abdomen, or upper arm. Avoid areas that are tender, bruised, red, hard, thick, scaly, or affected by psoriasis.

Patient/Family Teaching

- Instruct patient on correct technique for self-injection, care and disposal of equipment. Review *Medication Guide* with patient before starting therapy and with each injection.
- Advise patient to notify health care professional if signs and symptoms of infection (fever, chills, sore throat, painful urination) occur.
- Instruct patient to avoid receiving live vaccines during therapy.
- Advise patient to notify health care professional immediately if signs and symptoms of hypersensitivity reaction (feel faint; swelling of face, eyelids, lips, mouth, tongue or throat; trouble breathing; throat tightness; chest tightness; skin rash; hives) occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of pregnancy registry that monitors pregnancy outcomes in women exposed to guselkumab during pregnancy. Encourage patients to enroll by calling 1-877-311- 8972.

Evaluation/Desired Outcomes

- Decrease in extent and severity of psoriatic lesions.
- Decreased pain and swelling with decreased rate of joint destruction in psoriatic arthritis.

© F.A. Davis Publishing

© F.A. Davis Publishing

halcinonide, See CORTICOSTEROIDS (TOPICAL/LOCAL).

halobetasol, See CORTICOSTEROIDS (TOPICAL/LOCAL).

BEERS

haloperidol (ha-loe-**per**-i-dole)

Haldol, Haldol Decanoate

Classification

Therapeutic: antipsychotics
Pharmacologic: butyrophenones

Indications

Acute and chronic psychotic disorders including: schizophrenia, manic states, drug-induced psychoses. Patients with schizophrenia who require long-term parenteral (IM) antipsychotic therapy. Also useful in managing aggressive or agitated patients. Tourette's syndrome. Severe behavioral problems in children which may be accompanied by: unprovoked, combative, explosive hyperexcitability, hyperactivity accompanied by conduct disorders (short-term use when other modalities have failed). Considered second-line treatment after failure with atypical antipsychotic. **Unlabeled Use:** Nausea and vomiting from surgery or chemotherapy.

Action

Alters the effects of dopamine in the CNS. Also has anticholinergic and alpha-adrenergic blocking activity.
Therapeutic Effects: Diminished signs and symptoms of psychoses. Improved behavior in children with Tourette's syndrome or other behavioral problems.

Pharmacokinetics

Absorption: Well absorbed following PO/IM administration. Decanoate salt is slowly absorbed and has a long duration of action.
Distribution: Concentrates in liver. Crosses placenta; enters breast milk.
Protein Binding: 92%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 21–24 hr.

TIME/ACTION PROFILE (antipsychotic activity)

ROUTE	ONSET	PEAK	DURATION
PO	2 hr	2–6 hr	8–12 hr
IM	20–30 min	30–45 min	4–8 hr†
IM (decanoate)	3–9 days	unknown	1 mo

†Effect may persist for several days.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Angle-closure glaucoma; Bone marrow depression; CNS depression; Parkinsonism; Severe liver or cardiovascular disease (QT interval prolonging conditions); Some products contain tartrazine, sesame oil, or benzyl alcohol and should be avoided in patients with known intolerance or hypersensitivity; Lactation: Lactation.
Use Cautiously in: Debilitated patients (dose ↓ required); Cardiac disease (risk of QT prolongation with high doses); Diabetes; Respiratory insufficiency; Prostatic hyperplasia; CNS tumors; Intestinal obstruction; Seizures; Patients at risk for falls; OB: Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use during pregnancy only if potential maternal benefit justifies potential fetal risk; Geri: Dose ↓ required in older adults due to ↑ sensitivity; ↑ risk of mortality in older adults treated for dementia-related psychosis.

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, hypotension, QT interval prolongation, tachycardia, ventricular arrhythmias. **Derm:** diaphoresis, photosensitivity, rash. **EENT:** blurred vision, dry eyes. **Endo:** amenorrhea, galactorrhea, gynecomastia. **GI:** constipation, dry mouth, anorexia, drug-induced hepatitis, ileus, weight gain. **GU:** impotence, urinary retention. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia, neutropenia. **Metab:** hyperpyrexia. **Neuro:** SEIZURES, extrapyramidal reactions, confusion, drowsiness, restlessness, tardive dyskinesia. **Resp:** respiratory depression. **Misc:** NEUROLEPTIC MALIGNANT SYNDROME, hypersensitivity reactions.

Interactions

Drug-Drug: Concurrent use with **QT interval prolonging drugs** may ↑ risk of QT interval prolongation. ↑ hypotension with **antihypertensives**, **nitrates**, or acute ingestion of **alcohol**. ↑ anticholinergic effects with **drugs having anticholinergic properties**, including **antihistamines**, **antidepressants**, **atropine**, **phenothiazines**, **quinidine**, and **disopyramide**. ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Concurrent use with **epinephrine** may result in severe hypotension and tachycardia. May ↓ therapeutic effects of **levodopa**. Acute encephalopathic syndrome may occur when used with **lithium**. Dementia may occur with **methyldopa**.
Drug-Natural Products: **Kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

Haloperidol

PO (Adults): 0.5–5 mg 2–3 times daily. Patients with severe symptoms may require up to 100 mg/day.

© F.A. Davis Publishing

PO (Geriatric Patients): 0.5–2 mg twice daily initially; may be gradually ↑ as needed.
PO (Children 3–12 yr or 15–40 kg): 0.25–0.5 mg/day given in 2–3 divided doses; increase by 0.25–0.5 mg every 5–7 days; maximum dose: 0.15 mg/kg/day (up to 0.75 mg/kg/day for Tourette's syndrome or 0.15 mg/kg/day for psychoses).
IM (Adults): *Haloperidol lactate*—2–5 mg every 1–8 hr (not to exceed 100 mg/day).
IM (Children 6–12 yr): *Haloperidol lactate*—1–3 mg/dose every 4–8 hrs to a maximum of 0.15 mg/kg/day.
IV (Adults): *Haloperidol lactate*—0.5–5 mg, may be repeated every 30 min (unlabeled).

Haloperidol Decanoate

IM (Adults): 10–15 times the previous daily PO dose but not to exceed 100 mg initially, given monthly (not to exceed 300 mg/mo).

Availability (generic available)

Tablets: 0.5 mg, 1 mg, 2 mg, 5 mg, 10 mg, 20 mg. **Oral concentrate:** 2 mg/mL. **Solution for intramuscular injection (decanoate):** 50 mg/mL, 100 mg/mL. **Solution for intravenous injection (lactate):** 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) prior to and periodically during therapy.
- Assess positive (hallucination, delusions) and negative (social isolation) symptoms of schizophrenia.
- Assess weight and BMI initially and during therapy. Refer as appropriate for nutritional/weight and medical management.
- Monitor BP (sitting, standing, lying) and pulse prior to and frequently during the period of dose adjustment. May cause QT interval changes on ECG.
- Observe patient carefully when administering medication, to ensure that medication is actually taken and not hoarded.
- Monitor intake and output ratios and daily weight. Assess patient for signs and symptoms of dehydration (decreased thirst, lethargy, hemoconcentration), especially in geriatric patients.
- Assess fluid intake and bowel function. Increased bulk and fluids in the diet help minimize constipating effects.
- Monitor patient for onset of akathisia (restlessness or desire to keep moving), which may appear within 6 hr of 1st dose and may be difficult to distinguish from psychotic agitation. Benztropine may be used to differentiate agitation from akathisia. Observe closely for extrapyramidal side effects (*parkinsonian*—difficulty speaking or swallowing, loss of balance control, pill rolling of hands, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*—muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs). Trihexyphenidyl or benzotropine may be used to control these symptoms. Benzodiazepines may alleviate akathisia.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue, excessive eye blinking). Report immediately; may be irreversible.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness, severe muscle stiffness, loss of bladder control). Report symptoms immediately. May also cause leukocytosis, elevated liver function tests, elevated CK.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- ***Lab Test Considerations:*** Monitor CBC with differential and liver function tests periodically during therapy.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Implementation

- Avoid skin contact with oral solution; may cause contact dermatitis.
- **PO:** Administer with food or full glass of water or milk to minimize GI irritation.
- Use calibrated measuring device for accurate dosage. Do not dilute concentrate with coffee or tea; may cause precipitation. May be given undiluted or mixed with water or juice.
- **IM:** Inject slowly, using 2-in, 21-gauge needle into well-developed muscle via Z-track technique. Do not exceed 3 mL per injection site. Slight yellow color does not indicate altered potency. Keep patient recumbent for at least 30 min following injection to minimize hypotensive effects.

IV Administration

- **IV:** Haloperidol decanoate should not be administered IV.
- **IV Push:** ***Dilution:*** May be administered undiluted for rapid control of acute psychosis or delirium. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer at a rate of 5 mg/min.
- **Intermittent Infusion:** ***Dilution:*** May be diluted in 30–50 mL of D5W. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** acetaminophen, alemtuzumab, amifostine, aminocaproic acid, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, azithromycin, bleomycin, cangrelor, carboplatin, carmustine, caspofungin, ceftaroline, cisatracurium, cisplatin, cladribine, clonidine, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, de-

© F.A. Davis Publishing

xrazoxane, diltiazem, docetaxel, doxorubicin hydrochloride, doxorubicin liposome, epirubicin, eptifibatide, ertapenem, etoposide, etoposide phosphate, fenoldopam, filgrastim, fludarabine, gemcitabine, granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, irinotecan, ketamine, leucovorin calcium, levofloxacin, linezolid, lorazepam, melphalan, methadone, metronidazole, milrinone, mitoxantrone, morphine, moxifloxacin, mycophenolate, nicardipine, octreotide, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, potassium acetate, propofol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, tacrolimus, thiotepa, tigecycline, tirofiban, trastuzumab, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, ampicillin, ampicillin/sulbactam, azathioprine, bumetanide, calcium chloride, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, dantrolene, dexamethasone, diazepam, diazoxide, epoetin alfa, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemtuzumab ozogamicin, heparin, hydralazine, hydrocortisone, imipenem/cilastatin, indomethacin, ketorolac, magnesium sulfate, methylprednisolone, nafcillin, oxacillin, pantoprazole, penicillin G, pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam, potassium chloride, sargramostim, sodium bicarbonate, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as remembered, with remaining doses evenly spaced throughout the day. May require several wk to obtain desired effects. Do not increase dose or discontinue medication without consulting health care professional. Abrupt withdrawal may cause dizziness; nausea; vomiting; GI upset; trembling; or uncontrolled movements of mouth, tongue, or jaw.
- Inform patient of possibility of extrapyramidal symptoms, tardive dyskinesia, and neuroleptic malignant syndrome. Caution patient to report symptoms immediately.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Caution patient to avoid taking alcohol or other CNS depressants, including opioids, concurrently with this medication.
- Advise patient to use sunscreen and protective clothing when exposed to the sun to prevent photosensitivity reactions. Extremes of temperature should also be avoided; drug impairs body temperature regulation.
- Instruct patient to use frequent mouth rinses, good oral hygiene, and sugarless gum or candy to minimize dry mouth.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Instruct patient to notify health care professional promptly if weakness, tremors, visual disturbances, dark-colored urine or clay-colored stools, sore throat, fever, menstrual abnormalities, galactorrhea, or sexual dysfunction occur.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy. Monitor neonates exposed to haloperidol during the third trimester of pregnancy for extrapyramidal and/or withdrawal symptoms following delivery. There have been reports of agitation, hypertonia, hypotonia, tremor, somnolence, respiratory distress and feeding disorder in these neonates. Inform patient of the National Pregnancy Registry for Psychiatric Medications that monitors the safety of psychiatric medications taken by women during pregnancy. Encourage patient to contact the registry at https://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry or by phone 1-866-961-2388. Monitor breast-fed infants for excessive drowsiness, lethargy, and developmental delays.
- Emphasize the importance of routine follow-up exams to monitor response to medication and detect side effects.

Evaluation/Desired Outcomes

- Decrease in hallucinations, insomnia, agitation, hostility, and delusions.
- Decreased tics and vocalization in Tourette's syndrome.
- Improved behavior in children with severe behavioral problems. If no therapeutic effects are seen in 2–4 wk, dosage may be increased.

HIGH ALERT

heparin (hep-a-rin)

Hepalean, Hep-Lock, Hep-Lock U/P

Classification

Therapeutic: anticoagulants
Pharmacologic: antithrombotics

Indications

Prophylaxis and treatment of various thromboembolic disorders including: Venous thromboembolism, Pul-

© F.A. Davis Publishing

monary emboli, Atrial fibrillation with embolization, Acute and chronic consumptive coagulopathies, Peripheral arterial thromboembolism. Used in very low doses (10–100 units) to maintain patency of IV catheters (heparin flush).

Action

Potentiates the inhibitory effect of antithrombin on factor Xa and thrombin. In low doses, prevents the conversion of prothrombin to thrombin by its effects on factor Xa. Higher doses neutralize thrombin, preventing the conversion of fibrinogen to fibrin. **Therapeutic Effects:** Prevention of thrombus formation. Prevention of extension of existing thrombi (full dose).

Pharmacokinetics

Absorption: Erratically absorbed following subcut or IM administration.

Distribution: Does not cross the placenta or enter breast milk.

Protein Binding: Very high (to low-density lipoproteins, globulins, and fibrinogen).

Metabolism and Excretion: Probably removed by the reticuloendothelial system (lymph nodes, spleen).

Half-life: 1–2 hr (↑ with increasing dose); affected by obesity, renal and hepatic function, malignancy, presence of pulmonary embolism, and infections.

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Heparin subcut	20–60 min	2 hr	8–12 hr
Heparin IV	immediate	5–10 min	2–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Uncontrolled bleeding; History of heparin-induced thrombocytopenia; Severe thrombocytopenia; Open wounds (full dose); Pedi: Avoid use of products containing benzyl alcohol in premature infants.

Use Cautiously in: Severe liver or kidney impairment; Retinopathy (hypertensive or diabetic); Ulcer disease; Spinal cord or brain injury; History of congenital or acquired bleeding disorder; Malignancy; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; avoid use of products containing benzyl alcohol; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; avoid use of products containing benzyl alcohol; Geri: Women >60 yr have ↑ risk of bleeding.

Exercise Extreme Caution in: Severe uncontrolled hypertension; Bacterial endocarditis, bleeding disorders; GI bleeding/ulceration/pathology; Hemorrhagic stroke; History of thrombocytopenia related to heparin; Recent CNS or ophthalmologic surgery; Active GI bleeding/ulceration;.

Adverse Reactions/Side Effects

Derm: alopecia (long-term use), rash, urticaria. **GI:** drug-induced hepatitis. **Hemat:** BLEEDING, HEPARIN-INDUCED THROMBOCYTOPENIA (HIT) (WITH OR WITHOUT THROMBOSIS), anemia. **Local:** pain at injection site. **MS:** osteoporosis (long-term use). **Misc:** fever, hypersensitivity reactions.

Interactions

Heparin is frequently used concurrently or sequentially with other agents affecting coagulation. The risk of potentially serious interactions is greatest with full anticoagulation.

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **drugs that affect platelet function**, including **aspirin**, **NSAIDs**, **clopidogrel**, **dipyridamole**, some **penicillins**, **eptifibatide**, **tirofiban**, and **dextran**. Risk of bleeding may be ↑ by concurrent use of **drugs that cause hypoprothrombinemia**, including **quinidine**, **cefotetan**, and **valproic acid**. Concurrent use of **thrombolytics** ↑ risk of bleeding. Heparins affect the prothrombin time used in assessing the response to **warfarin**. **Digoxin**, **tetracyclines**, **nicotine**, and **antihistamines** may ↓ anticoagulant effect of heparin. **Streptokinase** may be followed by relative resistance to heparin.

Drug-Natural Products: ↑ risk of bleeding with **arnica**, **anise**, **chamomile**, **clove**, **dong quai**, **fever few**, **garlic**, **ginger**, and **Panax ginseng**.

Route/Dosage

Therapeutic Anticoagulation

IV (Adults): *Intermittent bolus*—10,000 units, followed by 5000–10,000 units every 4–6 hr. *Continuous infusion*—5000 units (35–70 units/kg), followed by 20,000–40,000 units infused over 24 hr (approx. 1000 units/hr or 15–18 units/kg/hr).

IV (Children >1 yr): *Intermittent bolus*—50–100 units/kg, followed by 50–100 units/kg every 4 hr. *Continuous infusion*—Loading dose 75 units/kg, followed by 20 units/kg/hr, adjust to maintain aPTT of 60–85 sec.

IV (Neonates and Infants <1 yr): *Continuous infusion*—Loading dose 75 units/kg, followed by 28 units/kg/hr, adjust to maintain aPTT of 60–85 sec.

Subcut (Adults): 5000 units IV, followed by initial subcut dose of 10,000–20,000 units, then 8000–10,000 units every 8 hr or 15,000–20,000 units every 12 hr.

Prophylaxis of Thromboembolism

Subcut (Adults): 5000 units every 8–12 hr (may be started 2 hr prior to surgery).

Cardiovascular Surgery

IV (Adults): At least 150 units/kg (300 units/kg if procedure <60 min; 400 units/kg if >60 min).

Intra-arterial (Neonates, Infants, and Children): 100–150 units/kg via an artery prior to cardiac catheterization.

Line Flushing

IV (Adults and Children): 10–100 units/mL (10 units/mL for infants <10 kg, 100 units/mL for all oth-

© F.A. Davis Publishing

ers) solution to fill heparin lock set to needle hub; replace after each use.

Total Parenteral Nutrition

IV (Adults and Children): 0.5–1 units/mL (final solution concentration) to maintain line patency.

Arterial Line Patency

Intra-arterial (Neonates): 0.5–2 units/mL.

Availability (generic available)

Premixed infusion: 1000 units/500 mL, 2000 units/1000 mL, 12,500 units/250 mL, 25,000 units in 250 and 500 mL. **Solution for injection:** 10 units/mL, 100 units/mL, 1000 units/mL, 5000 units/mL, 7500 units/mL, 10,000 units/mL, 20,000 units/mL, 40,000 units/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or BP; guaiac-positive stools). Notify health care professional if these occur.
- Assess patient for evidence of additional or increased thrombosis. Symptoms will depend on area of involvement.
- Monitor patient for hypersensitivity reactions (chills, fever, urticaria).
- **Subcut:** Observe injection sites for hematomas, ecchymosis, or inflammation.
- ***Lab Test Considerations:*** Monitor activated partial thromboplastin time (aPTT) and hematocrit prior to and periodically during therapy. When *intermittent IV* therapy is used, draw aPTT levels 30 min before each dose during initial therapy and then periodically. During *continuous* administration, monitor aPTT levels every 4 hr during early therapy. For *Subcut* therapy, draw blood 4–6 hr after injection.
- Monitor platelet count every 2–3 days during therapy. May cause mild thrombocytopenia, which appears on 4th day and resolves despite continued heparin therapy. Heparin-induced thrombocytopenia (HIT), a more severe form which necessitates discontinuing medication, may develop on 8th day of therapy; may reduce platelet count to as low as 5000/mm^3 and lead to increased resistance to heparin therapy. HIT may progress to development of venous and arterial thrombosis (HITT) and may occur up to several wk after discontinuation. Patients who have received a previous course of heparin may be at higher risk for severe thrombocytopenia for several mo after the initial course.
- May cause hyperkalemia and ↑ AST and ALT levels.
- ***Toxicity and Overdose:*** Protamine sulfate is the antidote. Due to short half-life, overdose can often be treated by withdrawing the drug.

Implementation

- ***High Alert:*** Fatal hemorrhages have occurred in pediatric patients due to errors in which heparin sodium injection vials were confused with heparin flush vials. Carefully examine all heparin sodium injection vials to confirm the correct vial choice prior to administration. Have second practitioner independently check original order, dose calculation, and infusion pump settings. Unintended concomitant use of two heparin products (unfractionated heparin and low-molecular weight heparins) has resulted in serious harm or death. Review patients' recent (emergency department, operating room) and current medication administration records before administering any heparin or LMW heparin product. Do not confuse heparin with Hespan (hetastarch in sodium chloride). Do not confuse vials of heparin with vials of insulin.
- Inform all personnel caring for patient of anticoagulant therapy. Venipunctures and injection sites require application of pressure to prevent bleeding or hematoma formation. Avoid IM injections of other medications; hematomas may develop.
- In patients requiring long-term anticoagulation, oral anticoagulant therapy should be instituted 4–5 days prior to discontinuing heparin therapy.
- Solution is colorless to slightly yellow.

IV Administration

- **Subcut:** Administer deep into subcut tissue. Alternate injection sites between arm and the left and right abdominal wall above the iliac crest. Inject entire length of needle at a 45°- or 90°-angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear; do not inject solution containing particulate matter.
- **IV Push:** ***Dilution:*** Administer loading dose undiluted. ***Concentration:*** Varies depending upon vial used. ***Rate:*** Administer over at least 1 min. Loading dose given before continuous infusion.
- **Continuous Infusion:** ***Dilution:*** Dilute 25,000 units of heparin in 250–500 mL of 0.9% NaCl or D5W. Premixed infusions are already diluted and ready to use. Admixed solutions stable for 24 hr at room temperature or if refrigerated. Premixed infusion stable for 30 days once overwrap removed. ***Concentration:*** 50–100 units/mL. ***Rate:*** See Route/Dosage section. Adjust to maintain therapeutic aPTT. Use an infusion pump to ensure accuracy.

© F.A. Davis Publishing

- **Flush:** To prevent clot formation in intermittent infusion (heparin lock) sets, inject dilute heparin solution of 10–100 units/0.5–1 mL after each medication injection or every 8–12 hr. To prevent incompatibility of heparin with medication, flush lock set with sterile water or 0.9% NaCl for injection before and after medication is administered.
- **Y-Site Compatibility:** acetaminophen, acetylcysteine, acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftazidime/avibactam, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, defibrotide, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, docetaxel, dopamine, doxapram, doxorubicin liposome, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, eravacycline, ertapenem, esmolol, estrogens, conjugated, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gemtuzumab ozogamicin, glycopyrrolate, granisetron, hetastarch, hydrocortisone, hydromorphone, ibuprofen lysine, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isoproterenol, ketorolac, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meropenem, meropenem/vaborbactam, mesna, methohexital, methotrexate, methylergonovine, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, morphine, moxifloxacin, multiple vitamins, nafcillin, nalbuphine, naloxone, neostigmine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, propofol, propranolol, pyridostigmine, pyridoxine, remifentanil, rituximab, rocuronium, sargramostim, scopolamine, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiamine, thiopental, thiotepa, tigecycline, tirofiban, tranexamic acid, trastuzumab, vasopressin, vecuronium, verapamil, vinblastine, vincristine, voriconazole, warfarin, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alteplase, amiodarone, amphotericin B deoxycholate, blinatumomab, caspofungin, ciprofloxacin, dantrolene, daunorubicin hydrochloride, diazepam, diazoxide, doxycycline, epirubicin, filgrastim, haloperidol, hydroxyzine, idarubicin, isavuconazonium, ketamine, levofloxacin, minocycline, mitoxantrone, mycophenolate, oritavancin, palifermin, papaverine, pentamidine, phenytoin, plazomicin, protamine, quinupristin/dalfopristin, reteplase.
- **Additive Compatibility:** It is recommended that heparin not be mixed in solution with other medications when given for anticoagulation, even those that are compatible, because changes in rate of heparin infusion may be required that would also affect admixtures.

Patient/Family Teaching

- Advise patient to report any symptoms of unusual bleeding or bruising to health care professional immediately.
- Instruct patient not to take medications containing aspirin or NSAIDs while on heparin therapy.
- Caution patient to avoid IM injections and activities leading to injury and to use a soft toothbrush and electric razor during heparin therapy.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Patients on anticoagulant therapy should carry an identification card with this information at all times.

Evaluation/Desired Outcomes

- Prolonged partial thromboplastin time (PTT) of 1.5–2.5 times the control, without signs of hemorrhage.
- Prevention of deep vein thrombosis and pulmonary emboli.
- Patency of IV catheters.

HIGH ALERT

HEPARINS (LOW MOLECULAR WEIGHT)

dalteparin (dal-**te**-pa-rin)
Fragmin

enoxaparin (e-nox-a-**pa**-rin)
Lovenox

Classification
Therapeutic: anticoagulants
Pharmacologic: antithrombotics

Indications

Enoxaparin and dalteparin: Prevention of venous thromboembolism (VTE) (deep vein thrombosis [DVT] and/or pulmonary embolism [PE]) in surgical or medi-

© F.A. Davis Publishing

cal patients. **Dalteparin only:** Extended treatment of symptomatic DVT and/or PE in patients with cancer. **Enoxaparin only:** Treatment of DVT with or without PE (with warfarin). **Enoxaparin and dalteparin:** Prevention of ischemic complications (with aspirin) from unstable angina and non-ST-segment-elevation MI. **Enoxaparin only:** Treatment of acute ST-segment-elevation MI (with thrombolytics or percutaneous coronary intervention).

Action

Potentiate the inhibitory effect of antithrombin on factor Xa and thrombin. **Therapeutic Effects:** Prevention of thrombus formation.

Pharmacokinetics

Absorption: Well absorbed after subcut administration (87% for dalteparin, 92% for enoxaparin).
Distribution: Unknown.
Metabolism and Excretion: *Dalteparin*—unknown; *enoxaparin*—primarily eliminated renally.
Half-life: *Dalteparin*—2.1–2.3 hr; *enoxaparin*—3–6 hr (all are ↑ in renal insufficiency).

TIME/ACTION PROFILE (anticoagulant effect)

ROUTE	ONSET	PEAK	DURATION
Dalteparin subcut	rapid	4 hr	up to 24 hr
Enoxaparin subcut	unknown	3–5 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to specific agents, unfractionated heparin, or pork products; cross-sensitivity may occur; Some products contain sulfites or benzyl alcohol and should be avoided in patients with known hypersensitivity or intolerance; Active major bleeding; *Enoxaparin*—History of immune-mediated heparin-induced thrombocytopenia (HIT) within the past 100 days or in the presence of circulating antibodies; *Dalteparin*—History of heparin-induced thrombocytopenia; *Dalteparin*—regional anesthesia during treatment for unstable angina/non–ST—segment elevation MI.
Use Cautiously in: Severe hepatic or renal disease (adjust dose of enoxaparin if CCr <30 mL/min); Women <45 kg or men <57 kg; Retinopathy (hypertensive or diabetic); Untreated hypertension; *Enoxaparin*—History of HIT >100 days ago and no circulating antibodies present; Recent history of ulcer disease; History of congenital or acquired bleeding disorder; OB: Safety not established; should not be used in pregnant patients with prosthetic heart valves or inherited/acquired thrombophilias without careful monitoring; if enoxaparin used during pregnancy, use preservative-free formulation; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; enoxaparin multidose vial contains benzyl alcohol which can cause potentially fatal "gasping syndrome" in neonates; Geri: Older adults may have ↑ risk of bleeding due to age-related ↓ in renal function; *Dalteparin*—Geri: ↑ mortality in patients >70 yrs with renal impairment.
Exercise Extreme Caution in: Spinal/epidural anesthesia (↑ risk of spinal/epidural hematomas, especially with concurrent NSAIDs, repeated or traumatic epidural puncture, or indwelling epidural catheter); Severe uncontrolled hypertension; Bacterial endocarditis; Bleeding disorders.

Adverse Reactions/Side Effects

CV: edema. **Derm:** alopecia, ecchymoses, pruritus, rash, urticaria. **GI:** constipation, ↑ liver enzymes, nausea, vomiting. **GU:** urinary retention. **Hemat:** BLEEDING, anemia, eosinophilia, thrombocytopenia. **Local:** erythema at injection site, hematoma, irritation, pain. **MS:** osteoporosis. **Neuro:** dizziness, headache, insomnia. **Misc:** fever.

Interactions

Drug-Drug: Risk of bleeding may be ↑ by concurrent use of **drugs that affect platelet function and coagulation**, including **warfarin**, **aspirin**, **NSAIDs**, **dipyridamole**, **clopidogrel**, **eptifibatide**, **tirofiban**, and **thrombolytics**.
Drug-Natural Products: ↑ bleeding risk with **arnica**, **chamomile**, **clove**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

Route/Dosage

Dalteparin

Subcut (Adults): *Prophylaxis of DVT following abdominal surgery*—2500 units 1–2 hr before surgery, then once daily for 5–10 days; *Prophylaxis of VTE in high-risk patients undergoing abdominal surgery*—5000 units evening before surgery, then once daily for 5–10 days *or* in patients with malignancy, 2500 units 1–2 hr before surgery, another 2500 units 12 hr later, then 5000 units once daily for 5–10 days; *Prophylaxis of VTE in patients undergoing hip replacement surgery*—2500 units within 2 hr before surgery, then 2500 units 4–8 hr after surgery, then 5000 units once daily (start at least 6 hr after postsurgical dose) for 5–10 days *or* 5000 units evening before surgery (10–14 hr before surgery), then 5000 units 4–8 hr after surgery, then 5000 units once daily for 5–10 days *or* 2500 units 4–8 hr after surgery, then 5000 units once daily (start at least 6 hr after postsurgical dose); *Prophylaxis of VTE in medical patients with severely restricted mobility during acute illness:* 5000 units once daily for 12–14 days. *Unstable angina/non–ST-segment-elevation MI*—120 units/kg (not to exceed 10,000

© F.A. Davis Publishing

units) every 12 hr for 5–8 days with concurrent aspirin; *Extended treatment of symptomatic VTE in cancer patients*—200 units/kg (not to exceed 18,000 units) once daily for first 30 days, followed by 150 units/kg (not to exceed 18,000 units) once daily for mo 2–6.

Renal Impairment

Subcut (Adults): *Cancer patients receiving extended treatment of symptomatic VTE with CCr <30 mL/min*—Monitor anti-Xa levels (target 0.5–1.5 IU/mL).

Enoxaparin

Subcut (Adults): *VTE prophylaxis in patients undergoing knee replacement surgery*—30 mg every 12 hr starting 12–24 hr postop for 7–10 days; *VTE prophylaxis in patients undergoing hip replacement surgery*—30 mg every 12 hr starting 12–24 hr postop *or* 40 mg once daily starting 12 hr before surgery (either dose may be continued for 7–14 days; continued prophylaxis with 40 mg once daily may be continued for up to 3 wk); *VTE prophylaxis following abdominal surgery*—40 mg once daily starting 2 hr before surgery and then continued for 7–12 days or until ambulatory (up to 14 days); *VTE prophylaxis in medical patients with acute illness*—40 mg once daily for 6–14 days; *Treatment of DVT/PE (outpatient)*—1 mg/kg every 12 hr. Warfarin should be started within 72 hr; enoxaparin may be continued for a minimum of 5 days and until therapeutic anticoagulation with warfarin is achieved (INR >2 for 2 consecutive days); *Treatment of DVT/PE (inpatient)*—1 mg/kg every 12 hr *or* 1.5 mg/kg once daily. Warfarin should be started within 72 hr; enoxaparin may be continued for a minimum of 5 days and until therapeutic anticoagulation with warfarin is achieved (INR >2 for two consecutive days); *Unstable angina/non–ST-segment-elevation MI*—1 mg/kg every 12 hr for 2–8 days (with aspirin).

IV, Subcut (Adults <75 yr): *Acute ST-segment-elevation MI*—Administer single IV bolus of 30 mg plus 1 mg/kg subcut dose (maximum of 100 mg for first 2 doses only), followed by 1 mg/kg subcut every 12 hr. The usual duration of treatment is 2–8 days. In patients undergoing percutaneous coronary intervention, if last subcut dose was <8 hr before balloon inflation, no additional dosing needed; if last subcut dose was ≥8 hr before balloon inflation, administer single IV bolus of 0.3 mg/kg.

Subcut (Adults ≥75 yr): *Acute ST-segment-elevation MI*—0.75 mg/kg every 12 hr (no IV bolus needed) (maximum of 75 mg for first 2 doses only; no initial bolus). The usual duration of treatment is 2–8 days.

Renal Impairment

Subcut (Adults CCr <30 mL/min): *VTE prophylaxis for abdominal or knee/hip replacement surgery*—30 mg once daily. *Treatment of DVT/PE*—1 mg/kg once daily. *Unstable angina/non-ST-segment-elevation MI*—1 mg/kg once daily. *Acute ST-segment-elevation MI (patients <75 yr)*—Single IV bolus of 30 mg plus 1 mg/kg subcut dose, followed by 1 mg/kg subcut once daily. *Acute ST-segment-elevation MI (patients ≥75 yr)*—1 mg/kg once daily (no initial bolus).

Availability

Dalteparin

Solution for injection (prefilled syringes): 2500 units/0.2 mL, 5000 units/0.2 mL, 7500 units/0.3 mL, 10,000 units/1 mL, 12,500 units/0.5 mL, 15,000 units/0.6 mL, 18,000 units/0.72 mL. **Solution for injection (multidose vials):** 25,000 units/mL.

Enoxaparin (generic available)

Solution for injection (prefilled syringes): 30 mg/0.3 mL, 40 mg/0.4 mL, 60 mg/0.6 mL, 80 mg/0.8 mL, 100 mg/1 mL, 120 mg/0.8 mL, 150 mg/mL. **Solution for injection (multidose vials):** 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for signs of bleeding and hemorrhage (bleeding gums; nosebleed; unusual bruising; black, tarry stools; hematuria; fall in hematocrit or BP; guaiac-positive stools); bleeding from surgical site. Notify health care professional if these occur.
- Assess patient for evidence of additional or increased thrombosis. Symptoms depend on area of involvement.
- Assess for evidence of additional or increased thrombosis. Symptoms depend on area of involvement. Monitor neurological status frequently for signs of neurological impairment. May require urgent treatment.
- Monitor for hypersensitivity reactions (chills, fever, urticaria). Report signs to health care professional.
- Monitor patients with epidural catheters frequently for signs and symptoms of neurologic impairment. Delay placement or removal of catheter for at least 12 hrs after administration of lower doses (30 mg once or twice daily or 40 mg once daily) and at least 24 hrs after administration of higher doses (0.75 mg/kg twice daily, 1 mg/kg twice daily, or 1.5 mg/kg once daily) of enoxaparin. Do not give 2nd enoxaparin dose in twice daily regimen to patients receiving 0.75 mg/kg twice daily dose or 1 mg/kg twice daily dose to allow a longer delay before catheter placement or removal, then delay next dose for at least 4 hrs. *For patients with CCr <30 mL/min,* double timing of removal of catheter, at least 24 hrs for lower dose (30 mg once daily) and at least 48 hrs for higher dose (1 mg/kg/day). Monitor for signs and symptoms of neurological impairment (midline back pain, sensory and motor deficits [numbness or weakness in lower limbs], bowel and/or bladder dysfunction) frequently if epidural or spinal anesthesia or lumbar puncture is done during therapy.

© F.A. Davis Publishing

- **Subcut:** Observe injection sites for hematomas, ecchymosis, or inflammation.
- ***Lab Test Considerations:*** Monitor CBC, platelet count, and stools for occult blood periodically during therapy. *If thrombocytopenia occurs (platelet count <100,000/mm³)*, discontinue therapy. *If hematocrit ↓ unexpectedly,* assess patient for potential bleeding sites. For *dalteparin* use for extended treatment of symptomatic VTE in cancer patients, if platelets ↓ to 50,000–100,000/mm³, reduce dose to 2500 units once daily until recovery to ≥100,000/mm³; if platelets <50,000/mm³, discontinue until count returns to ≥50,000/mm³.
- Special monitoring of aPTT is not necessary. Monitoring of anti-Xa levels may be considered in patients who are obese or have renal dysfunction (for *enoxaparin*, obtain 4 hr after injection).
- Monitoring of antifactor Xa levels may be necessary to titrate doses in pediatric patients (therapeutic range 0.5–1 unit/mL).
- May cause ↑ in AST and ALT levels.
- ***Toxicity and Overdose:*** For *enoxaparin* overdose, protamine sulfate 1 mg for each mg of *enoxaparin* should be administered by slow IV injection. For *dalteparin* overdose, protamine sulfate 1 mg for each 100 anti-factor Xa IU of *dalteparin* should be administered by slow IV injection. If the aPTT measured 2–4 hr after protamine administration remains prolonged, a 2nd infusion of protamine 0.5 mg/100 anti-factor Xa IU of *dalteparin* may be administered.

Implementation

- ***High Alert:*** Unintended concomitant use of two heparin products (unfractionated heparin and low molecular weight heparins) has resulted in serious harm and death. Review patients' recent and current medication administration records before administering any heparin or low-molecular-weight heparin product.
- Do not confuse Lovenox with Levemir.
- Cannot be used interchangeably (unit for unit) with unfractionated heparin or other low-molecular-weight heparins.
- Assess for latex allergy in all persons handling prefilled syringe; dalteparin prefilled syringe needle shield may contain latex.
- **Subcut:** Administer deep into subcut tissue. Alternate injection sites daily between the left and right anterolateral and left and right posterolateral abdominal wall, the upper thigh, or buttocks. Inject entire length of needle at a 45° or 90° angle into a skin fold held between thumb and forefinger; hold skin fold throughout injection. Do not aspirate or massage. Rotate sites frequently. Do not administer IM because of danger of hematoma formation. Solution should be clear and colorless to slightly yellow; do not inject solution containing particulate matter.
- If excessive bruising occurs, ice cube massage of site before injection may lessen bruising.
- **Enoxaparin:** To avoid the loss of drug, do not expel the air bubble from the syringe before the injection.
- **Subcut:** Per manufacturer's recommendations, to enhance absorption, inject enoxaparin into left or right anterolateral or posterolateral abdominal wall only.
- To minimize risk of bleeding after vascular instrumentation for unstable angina, recommended intervals between doses should be followed closely. Leave vascular access sheath in place for 6–8 hr after enoxaparin dose. Give next enoxaparin dose ≥6–8 hr after sheath removal. Observe site for bleeding or hematoma formation.

IV Administration

- **IV Push:** (for treatment of STEMI only) Inject via IV line. Flush with 0.9% NaCl or D5W prior to and following administration to avoid mixture with other drugs and clear the port of the drug. May be administered with 0.9% NaCl or D5W. ***Rate:*** Inject as a bolus.
- **Y-Site Incompatibility:** Do not mix or co-administer with other medications.

Patient/Family Teaching

- Instruct patient in correct technique for self injection, care and disposal of equipment.
- Advise patient to report any symptoms of unusual bleeding or bruising, dizziness, itching, rash, fever, swelling, or difficulty breathing to health care professional immediately.
- Instruct patient not to take aspirin or NSAIDs without consulting health care professional while on therapy.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Use caution when administering dalteparin preserved with benzyl alcohol to pregnant women, benzyl alcohol may cross the placenta. Large amounts of benzyl alcohol (99-404 mg/kg/day) increase risk of "gasping syndrome" (central nervous system depression, metabolic acidosis, gasping respirations) in premature infants. If anticoagulation with dalteparin is needed during pregnancy, use preservative-free formulations where possible.

Evaluation/Desired Outcomes

- Prevention of DVT and pulmonary emboli (enoxaparin and dalteparin).
- Resolution of DVT and pulmonary embolism (enoxaparin only).

© F.A. Davis Publishing

- Prevention of ischemic complications (with aspirin) in patients with unstable angina or non–ST-segment-elevation MI (enoxaparin and dalteparin).
- Treatment of acute ST-segment-elevation myocardial infarction (enoxaparin only).

HISTAMINE H_2 ANTAGONISTS

cimetidine (sye-**me**-ti-deen)
Tagamet, Tagamet HB

famotidine (fa-**moe**-ti-deen)
Acid Control, Pepcid, Pepcid AC, Peptic Guard, Ulcidine

nizatidine (ni-**za**-ti-deen)
Axid, Axid AR

Classification
Therapeutic: antiulcer agents
Pharmacologic: histamine H_2 antagonists

Indications

Short-term treatment of active duodenal ulcers and benign gastric ulcers. Maintenance therapy for duodenal and gastric ulcers after healing of active ulcers. Management of GERD. Treatment of heartburn, acid indigestion, and sour stomach (OTC use). **Cimetidine, famotidine:** Management of gastric hypersecretory states (Zollinger-Ellison syndrome). **Famotidine IV:** Prevention and treatment of stress-induced upper GI bleeding in critically ill patients. **Unlabeled Use:** Management of GI symptoms associated with the use of NSAIDs. Prevention of acid inactivation of supplemental pancreatic enzymes in patients with pancreatic insufficiency. Management of urticaria.

Action

Inhibits the action of histamine at the H_2-receptor site located primarily in gastric parietal cells, resulting in inhibition of gastric acid secretion. **Therapeutic Effects:** Healing and prevention of ulcers. Decreased symptoms of gastroesophageal reflux. Decreased secretion of gastric acid.

Pharmacokinetics

Absorption: *Cimetidine*—well absorbed after oral administration. *Famotidine*—40–45% absorbed after oral administration. *Nizatidine*—70–95% absorbed after oral administration.
Distribution: All agents enter breast milk and cerebrospinal fluid.
Metabolism and Excretion: *Cimetidine*—30% metabolized by the liver; remainder is eliminated unchanged by the kidneys. *Famotidine*—up to 70% excreted unchanged by the kidneys, 30–35% metabolized by the liver. *Nizatidine*—60% excreted unchanged by the kidneys; some hepatic metabolism; at least 1 metabolite has histamine-blocking activity.
Half-life: *Cimetidine*—2 hr; *famotidine*—2.5–3.5 hr; *nizatidine*—1.6 hr (all are ↑ in renal impairment).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Cimetidine PO	30 min	45–90 min	4–5 hr
Famotidine PO	within 60 min	1–4 hr	6–12 hr
Famotidine IV	within 60 min	0.5–3 hr	8–15 hr
Nizatidine PO	unknown	unknown	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain alcohol and should be avoided in patients with known intolerance; Some products contain aspartame and should be avoided in patients with phenylketonuria.
Use Cautiously in: Renal impairment (more susceptible to adverse CNS reactions; ↑ dose interval recommended for *cimetidine* and *nizatidine* if CCr ≤50 mL/min, and for *famotidine* if CCr <50 mL/min; Geri: More susceptible to adverse CNS reactions; dose ↓ recommended; OB, Lactation: Pregnancy or lactation.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS. **GI:** constipation, diarrhea, drug-induced hepatitis (nizatidine, cimetidine), nausea. **GU:** ↓ sperm count, erectile dysfunction (cimetidine). **Endo:** gynecomastia. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, anemia, neutropenia, thrombocytopenia. **Local:** pain at IM site. **Neuro:** confusion, dizziness, drowsiness, hallucinations, headache. **Misc:** hypersensitivity reactions, vasculitis.

Interactions

Drug-Drug: Cimetidine is a moderate inhibitor of the CYP1A2, CYP2C9, CYP2D6, and CYP3A4 isoenzymes in the liver; may lead to ↑ levels and toxicity with **benzodiazepines** (especially **chlordiazepoxide**, **diazepam**, and **midazolam**), some **beta blockers** (**labetalol**, **metoprolol**, **propranolol**), **caffeine**, **calcium channel blockers**, **carbamazepine**, **cyclosporine**, **dofetilide**, **lidocaine**, **metronidazole**, **mexiletine**, **nefazodone**, **pentoxifylline**, **phenytoin**, **procainamide**, **propafenone**, **quinidine**, **metformin**, **risperidone**, **ritonavir**, **ropinirole**, **selective serotonin reuptake inhibitors**, **sildenafil**, **sulfonylureas**, **tacrolimus**, **theophylline**, **tricyclic antidepressants**, **venlafaxine**, and **warfarin**. Famotidine and nizatidine have a much smaller and less significant effect on the metabolism of other drugs. Cimetidine may ↑ myelosuppressive effects of **carmustine** (avoid concurrent use). All may ↓ absorption of **ketoconazole**, **itraconazole**, **atazanavir**, and **gefitinib**.

Route/Dosage

Cimetidine

PO (Adults): *Short-term treatment of active ulcers*—300 mg 4 times daily *or* 800 mg at bedtime *or*

© F.A. Davis Publishing

400–600 mg twice daily (not to exceed 2.4 g/day) for up to 8 wk. *Duodenal ulcer prophylaxis*—300 mg twice daily *or* 400 mg at bedtime. *GERD*—400 mg every 6 hr *or* 800 mg twice daily for 12 wk. *Gastric hypersecretory conditions*—300–600 mg every 6 hr (up to 2400 mg/day). *OTC use*—up to 200 mg may be taken twice daily (for not more than 2 wk).
PO (Children): *Short-term treatment of active ulcers*—5–10 mg/kg every 6 hr.

Renal Impairment
PO (Adults): *CCr 10–50 mL/min*—Administer 50% of normal dose; *CCr <10 mL/min*—Administer 25% of normal dose.

Renal Impairment
PO (Children): 10–15 mg/kg/day.

Famotidine
PO (Adults): *Short-term treatment of active duodenal ulcers*—40 mg/day at bedtime or 20 mg twice daily for up to 8 wk. *Treatment of benign gastric ulcers*—40 mg/day at bedtime. *Maintenance treatment of duodenal ulcers*—20 mg once daily at bedtime. *GERD*—20 mg twice daily for up to 6 wk; up to 40 mg twice daily for up to 12 wk for esophagitis with erosions, ulcerations, and continuing symptoms. *Gastric hypersecretory conditions*—20 mg every 6 hr initially, up to 160 mg every 6 hr. *OTC use*—10 mg for relief of symptoms; for prevention—10 mg 60 min before eating or take 10 mg as chewable tablet 15 min before heartburn-inducing foods or beverages (not to exceed 20 mg/24 hr for up to 2 wk).
PO, IV (Children 1–16 yr): *Peptic ulcer*—0.5 mg/kg/day as a single bedtime dose or in 2 divided doses (up to 40 mg daily); *GERD*—1 mg/kg/day in 2 divided doses (up to 80 mg twice daily).
PO (Infants >3 mo–1 yr): *GERD*—0.5 mg/kg/dose twice daily.
PO (Infants and neonates <3 mo): *GERD*—0.5 mg/kg/dose once daily.
IV (Adults): 20 mg every 12 hr.

Renal Impairment
PO (Adults): *CCr <50 mL/min*—administer normal dose every 36–48 hr *or* 50% of normal dose at normal dosing interval. *CCr <10 mL/min*—dosing interval may need to be ↑ to every 36–48 hr.

Nizatidine
PO (Adults): *Short-term treatment of active duodenal or benign gastric ulcers*—300 mg once daily at bedtime. *Maintenance treatment of duodenal ulcers*—150 mg once daily at bedtime. *GERD*—150 mg twice daily. *OTC use*—75 mg twice daily given 30–60 min before foods or beverages expected to cause symptoms.

Renal Impairment
PO (Adults): *Short-term treatment of active ulcers—CCr 20–50 mL/min*—150 mg once daily; *CCr <20 mL/min*—150 mg every other day. *Maintenance treatment of duodenal ulcers—CCr 20–50 mL/min*—150 mg every other day; *CCr <20 mL/min*—150 mg every 3 days.

Availability
Cimetidine (generic available)
Tablets: 200 mg[Rx, OTC], 300 mg, 400 mg, 🍁600 mg, 800 mg. **Cost:** *Generic*—200 mg $82.15/100, 300 mg $90.45/100, 400 mg $146.85/100, 800 mg $220.00/100. **Oral liquid (mint-peach flavor):** 200 mg/5 mL[OTC], 300 mg/5 mL. **Cost:** *Generic*—300 mg/5 mL $89.00/237 mL.

Famotidine (generic available)
Tablets: 10 mg[OTC], 20 mg[Rx, OTC], 40 mg. **Cost:** *Generic*—20 mg $173.50/100, 40 mg $335.00/100. **Gelcaps:** 10 mg[OTC]. **Oral suspension (cherry-banana-mint flavor):** 40 mg/5 mL. **Cost:** *Generic*—$176.95/50 mL. **Premixed infusion:** 20 mg/50 mL 0.9% NaCl. **Solution for injection:** 10 mg/mL. ***In combination with:*** ibuprofen (Duexis), calcium carbonate and magnesium hydroxide[OTC] (Pepcid Complete, see Appendix N).

Nizatidine (generic available)
Tablets: 75 mg[OTC]. **Capsules:** 150 mg, 300 mg. **Cost:** *Generic*—150 mg $143.28/60, 300 mg $142.98/30. **Oral solution (bubble gum flavor):** 15 mg/mL. **Cost:** *Generic*—$347.65/473 mL.

NURSING IMPLICATIONS
Assessment
- Assess for epigastric or abdominal pain and frank or occult blood in the stool, emesis, or gastric aspirate.
- Geri: Assess geriatric and debilitated patients routinely for confusion. Report promptly.
- ***Lab Test Considerations:*** Monitor CBC with differential periodically during therapy.
- Antagonize effects of pentagastrin and histamine during gastric acid secretion testing. Avoid administration for 24 hr before the test.
- May cause false-negative results in skin tests using allergenic extracts. Histamine H_2 antagonists should be discontinued 24 hr before the test.
- May cause ↑ in serum transaminases and serum creatinine.
- Serum prolactin concentration may be ↑ after IV bolus of *cimetidine*. May also cause ↓ parathyroid concentrations.
- *Nizatidine* may cause ↑ alkaline phosphatase concentrations.
- *Famotidine* may cause false-positive results for urine protein; test with sulfosalicylic acid.

© F.A. Davis Publishing

Implementation

- **PO:** Administer with meals or immediately afterward and at bedtime to prolong effect.
- If antacids or sucralfate are used concurrently for relief of pain, avoid administration of antacids within 30 min–1 hr of the H_2 antagonist and take sucralfate 2 hr after H_2 antagonist; may ↓ absorption of H_2 antagonist.
- Doses administered once daily should be administered at bedtime to prolong effect.
- Shake oral suspension before administration. Discard unused suspension after 30 days.

Famotidine

IV Administration

- **IV Push:** ***Dilution:*** 0.9% NaCl, D5W, D10W, or LR. ***Concentration:*** 4 mg/mL. ***Rate:*** Administer at a rate of 10 mg/min. Rapid administration may cause hypotension.
- **Intermittent Infusion:** ***Dilution:*** Dilute each 20 mg in 100 mL of 0.9% NaCl, D5W, D10W, or LR. Diluted solution is stable for 48 hr at room temperature. Do not use solution that is discolored or contains a precipitate. ***Concentration:*** 0.2 mg/mL. ***Rate:*** Administer over 15–30 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anakinra, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefotaxime, ceftaroline, ceftazidime, cefuroxime, chlorpromazine, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibitide, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, remifentanil, rituximab, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, azathioprine, cefepime, chloramphenicol, dantrolene, diazepam, diazoxide, ganciclovir, indomethacin, mitomycin, pantoprazole, piperacillin/tazobactam, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses.
- Advise patients taking OTC preparations not to take the maximum dose continuously for more than 2 wk without consulting health care professional. Notify health care professional if difficulty swallowing occurs or abdominal pain persists.
- Inform patient that smoking interferes with the action of histamine antagonists. Encourage patient to quit smoking or at least not to smoke after last dose of the day.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to the drug is known.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Inform patient that increased fluid and fiber intake and exercise may minimize constipation.
- Advise patient to report onset of black, tarry stools; fever; sore throat; diarrhea; dizziness; rash; confusion; or hallucinations to health care professional promptly.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain.
- Treatment and prevention of gastric or duodenal irritation and bleeding. Healing of duodenal ulcers can be seen by x-rays or endoscopy. Therapy is continued for at least 6 wk in treatment of ulcers but not usually longer than 8 wk.
- Decreased symptoms of esophageal reflux.
- Treatment of heartburn, acid indigestion, and sour stomach (OTC use).

© F.A. Davis Publishing

HMG-CoA REDUCTASE INHIBITORS (statins)

atorvastatin (a-**tore**-va-stat-in)
Lipitor

fluvastatin (**floo**-va-sta-tin)
~~Lescol~~, Lescol XL

lovastatin (**loe**-va-sta-tin)
Altoprev, ~~Mevacor~~

pitavastatin (pi-**tav**a-sta-tin)
Livalo, Zypitamag

pravastatin (**pra**-va-sta-tin)
~~Pravachol~~

rosuvastatin (roe-**soo**-va-sta-tin)
Crestor, Ezallor Sprinkle

simvastatin (**sim**-va-sta-tin)
FloLipid, Zocor

Classification
Therapeutic: lipid-lowering agents
Pharmacologic: HMG-CoA reductase inhibitors

Indications

Adjunctive management of primary hypercholesterolemia and mixed dyslipidemias. **Atorvastatin:** Primary prevention of cardiovascular disease (↓ risk of MI or stroke) in patients with multiple risk factors for coronary heart disease CHD or type 2 diabetes mellitus (also ↓ risk of angina or revascularization procedures in patients with multiple risk factors for CHD). **Atorvastatin and pravastatin:** Secondary prevention of cardiovascular disease (↓ risk of MI, stroke, revascularization procedures, angina, and hospitalizations for HF) in patients with clinically evident CHD. **Fluvastatin:** Secondary prevention of coronary revascularization procedures in patients with clinically evident CHD. **Fluvastatin and lovastatin:** Slow progression of coronary atherosclerosis in patients with CHD. **Lovastatin:** Primary prevention of CHD (↓ risk of MI, unstable angina, and coronary revascularization) in patients without symptomatic cardiovascular disease with ↑ total and low-density lipoprotein (LDL) cholesterol and ↓ high-density lipoprotein (HDL) cholesterol. **Pravastatin:** Primary prevention of CHD (↓ risk of MI, coronary revascularization, and cardiovascular mortality) in patients without clinically evident CHD. **Simvastatin:** Secondary prevention of cardiovascular events (↓ risk of MI, coronary revascularization, stroke, and cardiovascular mortality) in patients with clinically evident CHD or those at high-risk for CHD (history of diabetes, peripheral arterial disease, or stroke). **Rosuvastatin:** Slow progression of coronary atherosclerosis. **Rosuvastatin:** Primary prevention of cardiovascular disease (reduces risk of stroke, myocardial infarction, and revascularization) in patients without clinically evident coronary heart disease but with an increased risk of cardiovascular disease because of age (≥50 yr for men; ≥60 yr for women), hsCRP ≥2 mg/L, and the presence of ≥1 risk factor for cardiovascular disease (hypertension, low HDL-C, smoking, or premature family history of coronary heart disease). **Rosuvastatin:** Adjunctive therapy to diet and exercise for the reduction of LDL cholesterol in children 8–17 yrs with heterozygous familial hypercholesterolemia if after diet therapy fails the following still exist: LDL cholesterol remains >190 mg/dL or remains >160 mg/dL (with family history of premature cardiovascular disease or ≥2 risk factors for cardiovascular disease).

H

Action

Inhibit an enzyme, 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) reductase, which is responsible for catalyzing an early step in the synthesis of cholesterol. **Therapeutic Effects:** Lowers total and LDL cholesterol and triglycerides. Slightly increase HDL. Slows the progression of coronary atherosclerosis with resultant decrease in CHD-related events (all agents except rosuvastatin have indication for ↓ events).

Pharmacokinetics

Absorption: *Atorvastatin*—rapidly absorbed but undergoes extensive GI and hepatic metabolism, resulting in 14% bioavailability; *fluvastatin*—98% absorbed after oral administration, but undergoes extensive first-pass metabolism resulting in 24% bioavailability; *lovastatin, pravastatin*—poorly and variably absorbed after oral administration; *pitavastatin*—well absorbed (51%) after oral administration; *rosuvastatin*—20% absorbed following oral administration; *simvastatin*—85% absorbed but rapidly metabolized.
Distribution: *Atorvastatin*—probably enters breast milk. *Fluvastatin*—enters breast milk. *Lovastatin*—crosses the blood-brain barrier and placenta. *Pravastatin*—small amounts enter breast milk. *Pitavastatin, rosuvastatin, and simvastatin*—unknown.
Protein Binding: *Atorvastatin, fluvastatin, pitavastatin, and simvastatin*—>98%.
Metabolism and Excretion: All agents are extensively metabolized by the liver; amount excreted unchanged in urine: *atorvastatin*—<2%, *lovastatin*—10%, *fluvastatin*—5%, *pitavastatin*—15%, *pravastatin*—20%, and *simvastatin*—13%.
Half-life: *Atorvastatin*—14 hr; *fluvastatin*—1.2 hr; *lovastatin*—3 hr; *pitavastatin*—12 hr; *pravastatin*—1.3–2.7 hr; *rosuvastatin*—19 hr; *simvastatin*—unknown.

© F.A. Davis Publishing

TIME/ACTION PROFILE (cholesterol-lowering effect)

ROUTE	ONSET	PEAK	DURATION*
Atorvastatin	unknown	unknown	20–30 hr
Fluvastatin	1–2 wk	4–6 wk	unknown
Lovastatin	2 wk	4–6 wk	6 wk
Pitavastatin	within 4 wk	4 wk	unknown
Pravastatin	several days	2–4 wk	unknown
Rosuvastatin	unknown	2–4 wk	unknown
Simvastatin	several days	2–4 wk	unknown

*After discontinuation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Active liver disease or unexplained persistent ↑ in AST or ALT; *Simvastatin and lovastatin*—Concurrent use of strong CYP3A4 inhibitors (↑ risk of myopathy/rhabdomyolysis); *Pitavastatin*—Concurrent use of cyclosporine; *Pitavastatin*—severe renal impairment (CCr <30 mL/min); *Simvastatin*—Concurrent use of cyclosporine, gemfibrozil, or danazol (↑ risk of myopathy/rhabdomyolysis); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: History of liver disease; Alcoholism; [BB] *Rosuvastatin*—patients with Asian ancestry (may have ↑ blood levels and ↑ risk of rhabdomyolysis); *Atorvastatin*—Concurrent use of azole antifungals, clarithromycin, colchicine, cyclosporine, erythromycin, gemfibrozil, glecaprevir/pibrentasvir, ledipasvir/sofosbuvir, letermovir, niacin (>1 g/day), or tipranavir/ritonavir (↑ risk of myopathy); *Lovastatin*—Concurrent use of gemfibrozil, niacin, cyclosporine, amiodarone, danazol, diltiazem, verapamil, colchicine, or ranolazine (higher risk of myopathy/rhabdomyolysis); *Pitavastatin*—Hypothyroidism, concurrent use of fibrates or lipid-lowering doses of niacin (higher risk of myopathy/rhabdomyolysis); *Rosuvastatin*—Concurrent use of gemfibrozil, azole antifungals, protease inhibitors, niacin, cyclosporine, amiodarone, or verapamil (higher risk of myopathy/rhabdomyolysis); *Simvastatin*—Concurrent use of amiodarone, amlodipine, daptomycin, diltiazem, dronedarone, verapamil, lomitapide, or ranolazine (↑ risk of myopathy/rhabdomyolysis); [BB] *Simvastatin*—Chinese patients receiving ≥1 g/day of niacin (↑ risk of myopathy; do not use simvastatin 80 mg/day in these patients); Renal impairment; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children <18 yr (fluvastatin, pitavastatin), <10 yr (atorvastatin, lovastatin, simvastatin), or <8 yr (pravastatin, rosuvastatin); Geri: *Atorvastatin and pitavastatin*—↑ risk of myopathy in older adults.

Adverse Reactions/Side Effects

CV: chest pain, peripheral edema. **Derm:** rash, pruritus. **EENT:** rhinitis; *lovastatin*, blurred vision. **Endo:** hyperglycemia. **GI:** abdominal cramps, constipation, diarrhea, flatus, heartburn, altered taste, drug-induced hepatitis, dyspepsia, ↑ liver enzymes, nausea, pancreatitis. **GU:** erectile dysfunction. **MS:** RHABDOMYOLYSIS, arthralgia, arthritis, immune-mediated necrotizing myopathy, myalgia, myopathy (↑ with simvastatin 80 mg/day dose). **Neuro:** amnesia, confusion, dizziness, headache, insomnia, memory loss, weakness. **Resp:** bronchitis. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema and urticaria).

Interactions

Atorvastatin, lovastatin, simvastatin, and rosuvastatin are metabolized by the CYP3A4 metabolic pathway. Fluvastatin is metabolized by CYP 2C9. Pravastatin is not metabolized by the CYP P450 system.

Drug-Drug: Atorvastatin, lovastatin, and simvastatin may interact with **CYP3A4 inhibitors**. Risk of myopathy with lovastatin is ↑ by concurrent use of **strong CYP3A4 inhibitors**, including **ketoconazole**, **itraconazole**, **posaconazole**, **voriconazole protease inhibitors**, **clarithromycin**, **erythromycin**, **nefazodone**, and **cobicistat-containing products**; concurrent use contraindicated. Risk of myopathy with simvastatin is ↑ by concurrent use of **cyclosporine**, **gemfibrozil**, **danazol**, **erythromycin**, **clarithromycin**, **protease inhibitors**, **nefazodone**, **ketoconazole**, **itraconazole**, **voriconazole**, **posaconazole**, and **cobicistat-containing products**; concurrent use contraindicated. Risk of myopathy with pitavastatin is ↑ by concurrent use of **cyclosporine**; concurrent use contraindicated. Bioavailability and effectiveness may be ↓ by **cholestyramine** and **colestipol**. Risk of myopathy with atorvastatin is ↑ by concurrent use of **clarithromycin**, **colchicine**, **cyclosporine**, **darunavir/ritonavir**, **elbasvir/grazoprevir**, **erythromycin**, **fosamprenavir**, **fosamprenavir/ritonavir gemfibrozil**, **glecaprevir/pibrentasvir**, **itraconazole**, **ledipasvir/sofosbuvir**, **letermovir**, **lopinavir/ritonavir**, **nelfinavir**, **niacin** (>1 g/day), **saquinavir/ritonavir** or **tipranavir/ritonavir**; concurrent use with **cyclosporine**, **gemfibrozil**, **glecaprevir/pibrentasvir**, or **tipranavir/ritonavir** should be avoided; use lowest dose with **lopinavir/ritonavir**; use ↓ doses with clarithromycin, darunavir/ritonavir, elbasvir/grazoprevir, fosamprenavir, fosamprenavir/ritonavir, itraconazole, letermovir, nelfinavir, or saquinavir/ritonavir. Risk of myopathy with fluvastatin is ↑ by concurrent use of **gemfibrozil**, **erythromycin**, **colchicine**, **cyclosporine**, **azole antifungal agents**, or large doses of **niacin** may ↑ risk of myopathy; concurrent use with gemfibrozil should be avoided; use ↓ doses with cyclosporine and fluconazole. Risk of myopathy with lovastatin is ↑ by concurrent use of **amiodarone cyclosporine**, **gemfibrozil**, **diltiazem**, **verapamil**, **danazol**, and large doses of **niacin**; concurrent use with gemfibrozil or cyclosporine should be avoided; use ↓ doses with danazol, amiodarone, diltiazem, or verapamil. Risk of myopathy with pitavastatin is ↑ by concurrent use of **erythromycin**, **rifampin**, **colchicine**, **fibrates**, or large doses of **niacin**; use ↓ doses with erythromycin, rifampin, and niacin; concur-

© F.A. Davis Publishing

rent use with gemfibrozil should be avoided. Risk of myopathy with pravastatin is ↑ by concurrent use of **cyclosporine**, **fibrates**, **colchicine**, **erythromycin**, **clarithromycin**, **azithromycin**, or large doses of **niacin**; concurrent use with gemfibrozil should be avoided; consider lower dose with niacin. Risk of myopathy with rosuvastatin is ↑ by concurrent use of **atazanavir/ritonavir**, **colchicine**, **cyclosporine**, **darolutamide**, **dasabuvir/ombitasvir/paritaprevir/ritonavir**, **elbasvir/grazoprevir**, **fibrates**, **glecaprevir/pibrentasvir**, **ledipasvir/sofosbuvir**, **lopinavir/ritonavir**, **niacin** (large doses), **regorafenib**, **sofosbuvir/velpatasvir**, and **sofosbuvir/velpatasvir/voxilaprevir**; avoid concurrent use with gemfibrozil, ledipasvir/sofosbuvir, and sofosbuvir/velpatasvir/voxilaprevir; use ↓ doses with atazanavir/ritonavir, cyclosporine, darolutamide, dasabuvir/ombitasvir/paritaprevir/ritonavir, elbasvir/grazoprevir, glecaprevir/pibrentasvir, lopinavir/ritonavir, regorafenib, and sofosbuvir/velpatasvir. Risk of myopathy with simvastatin is ↑ by concurrent use of **amiodarone**, **amlodipine**, **daptomycin**, **diltiazem**, **dronedarone**, **verapamil**, **lomitapide**, **ranolazine**, or **niacin**; temporarily suspend simvastatin therapy during treatment with daptomycin. Atorvastatin, fluvastatin, and simvastatin may slightly ↑ serum **digoxin** levels. Atorvastatin and rosuvastatin may ↑ levels of **hormonal contraceptives**. Atorvastatin, fluvastatin, lovastatin, rosuvastatin, and simvastatin may ↑ risk of bleeding with **warfarin**. **Alcohol**, **cimetidine**, and **omeprazole** may ↑ fluvastatin levels. **Rifampin** may ↓ fluvastatin levels. **Antacids** ↓ absorption of rosuvastatin (administer 2 hr after rosuvastatin. **Lopinavir/ritonavir** may ↑ rosuvastatin levels. Fluvastatin ↑ levels of **glyburide**.

Drug-Natural Products: St. John's wort may ↓ levels and effectiveness (lovastatin and simvastatin).

Drug-Food: Large quantities of **grapefruit juice** may ↑ blood levels and ↑ risk of rhabdomyolysis (atorvastatin, lovastatin, and simvastatin); concurrent use contraindicated. **Food** ↑ blood levels of lovastatin.

Route/Dosage

Atorvastatin

PO (Adults): 10–20 mg once daily initially; (may start with 40 mg/day if LDL-C needs to be ↓ by >45%); may ↑ every 2–4 wk up to 80 mg/day; *Concurrent use of nelfinavir*—Dose should not exceed 40 mg/day; *Concurrent use of clarithromycin, itraconazole, letermovir, saquinavir/ritonavir, darunavir/ritonavir, fosamprenavir, fosamprenavir/ritonavir, or elbasvir/grazoprevir*—Dose should not exceed 20 mg/day.
PO (Children ≥10 yr): 10 mg/day initially, may ↑ every 4 wk up to 20 mg/day; *Concurrent use of nelfinavir*—Dose should not exceed 40 mg/day; *Concurrent use of clarithromycin, itraconazole, saquinavir/ritonavir, darunavir/ritonavir, fosamprenavir, fosamprenavir/ritonavir therapy, or elbasvir/grazoprevir*—Dose should not exceed 20 mg/day.

Fluvastatin

PO (Adults): 20–40 mg (immediate-release) once daily at bedtime. May ↑ to 40 mg twice daily (immediate-release) or 80 mg once daily (extended-release); *Concurrent use of fluconazole or cyclosporine*—Dose should not exceed 20 mg twice daily.

Lovastatin

PO (Adults): 20 mg once daily with evening meal. May ↑ at 4-wk intervals to a maximum of 80 mg/day (immediate-release) or 60 mg/day (extended-release); *Concurrent use of danazol, verapamil, or diltiazem*—Initiate at 10 mg once daily; do not exceed 20 mg/day; *Concurrent use of amiodarone*—Dose should not exceed 40 mg/day.

Renal Impairment

PO (Adults): *CCr <30 mL/min*—Dose should not exceed 20 mg/day unless carefully titrated.
PO (Children ≥10 yr): *Familial heterozygous hypercholesterolemia*—10–40 mg/day adjusted at 4-wk intervals.

Pitavastatin

PO (Adults): 2 mg once daily initially, may ↑ up to 4 mg once daily depending on response. *Concurrent erythromycin therapy*—Dose should not exceed 1 mg/day; *Concurrent use of rifampin*—Dose should not exceed 2 mg/day.

Renal Impairment

PO (Adults): *CCr 30–<60 mL/min*—1 mg once daily initially, may ↑ up to 2 mg daily.

Pravastatin

PO (Adults): 40 mg once daily at bedtime, may be ↑ after 4 wk, if needed to 80 mg once daily at bedtime); *Concurrent use of cyclosporine*—Initiate therapy with 10 mg once daily at bedtime; may be ↑ after 4 wk, if needed, to 20 mg once daily at bedtime (max dose = 20 mg/day); *Concurrent use of clarithromycin*—Dose should not exceed 40 mg/day.
PO (Children 14–18 yrs): 40 mg once daily (max dose = 40 mg/day).
PO (Children 8–13 yrs): 20 mg once daily (max dose = 20 mg/day).

Renal Impairment

PO (Adults): *CCr<30 mL/min*—Initiate therapy with 10 mg once daily at bedtime; may titrate at 4–wk intervals as needed (max dose = 80 mg/day).

Rosuvastatin

PO (Adults): 10 mg once daily initially (range 5–20 mg initially) (20 mg initial dose may be considered for

© F.A. Davis Publishing

patients with LDL-C >190 mg/dL or homozygous familial hypercholesterolemia); dose may be adjusted at 2–4 wk intervals, some patients may require up to 40 mg/day, however this dose is associated with ↑ risk of rhabdomyolysis; *Patients with Asian ancestry*—initial dose should be 5 mg; *Concurrent use of cyclosporine or darolutamide*—Dose should not exceed 5 mg/day; *Concurrent use of atazanavir/ritonavir, dasabuvir/ombitasvir/paritaprevir/ritonavir, elbasvir/grazoprevir, glecaprevir/pibrentasvir, lopinavir/ritonavir, regorafenib, or sofosbuvir/velpatasvir*—Dose should not exceed 10 mg/day; *Concurrent use of gemfibrozil*—Dose should not exceed 10 mg/day (avoid if possible).

PO (Children 10–17 yr): *Heterozygous familial hypercholesterolemia*—5–20 mg once daily; *Patients with Asian ancestry*—initial dose should be 5 mg;*Concurrent use of cyclosporine*—Dose should not exceed 5 mg/day; *Concurrent use of atazanavir/ritonavir, glecaprevir/pibrentasvir, lopinavir/ritonavir, or sofosbuvir/velpatasvir*—Dose should not exceed 10 mg/day.

PO (Children 8–<10 yr): *Heterozygous familial hypercholesterolemia*—5–10 mg once daily; *Patients with Asian ancestry*—initial dose should be 5 mg; *Concurrent use of cyclosporine*—Dose should not exceed 5 mg/day; *Concurrent use of atazanavir/ritonavir, lopinavir/ritonavir, or sofosbuvir/velpatasvir*—Dose should not exceed 10 mg/day.

PO (Children 7–17 yr): *Homozygous familial hypercholesterolemia*—20 mg once daily. *Patients with Asian ancestry*—initial dose should be 5 mg; *Concurrent use of cyclosporine*—Dose should not exceed 5 mg/day; *Concurrent use of atazanavir/ritonavir, lopinavir/ritonavir, or sofosbuvir/velpatasvir*—Dose should not exceed 10 mg/day.

Renal Impairment

PO (Adults): *CCr <30 mL/min*—5 mg once daily initially; dose may be ↑ but should not exceed 10 mg/day.

Simvastatin

The 80 mg dose should be restricted to patients who have been taking this dose for ≥12 mo without evidence of muscle toxicity.

PO (Adults): 5–40 mg once daily in the evening; if LDL goal cannot be achieved with 40 mg/day dose, add another lipid-lowering therapy (do not ↑ simvastatin dose to 80 mg/day). *Concurrent use of verapamil, diltiazem, or dronedarone*—Dose should not exceed 10 mg/day. *Concurrent use of amiodarone, amlodipine, or ranolazine*—Dose should not exceed 20 mg/day; *Concurrent use of lomitapide*—↓ dose by 50% (dose should not exceed 20 mg/day or 40 mg/day for patients who previously received 80 mg/day chronically [for ≥12 mo] without evidence of myopathy).

PO (Children 10–17 yr): 10 mg once daily initially, may ↑ at 4–wk intervals up to 40 mg/day. *Concurrent use of verapamil or diltiazem*—Dose should not exceed 10 mg/day. *Concurrent use of amiodarone, amlodipine, or ranolazine*—Dose should not exceed 20 mg/day.

Renal Impairment

PO (Adults): *CCr <10 mL/min*—5 mg once daily initially, titrate carefully.

Availability

Atorvastatin (generic available)

Tablets: 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** *Generic*—10 mg $33.25/100, 20 mg $48.75/100, 40 mg $40.42/100, 80 mg $49.20/100. ***In combination with:*** amlodipine (Caduet); see Appendix N.

Fluvastatin (generic available)

Immediate-release capsules: 20 mg, 40 mg. **Cost:** *Generic*—All strengths $113.40/30. **Extended-release tablets:** 80 mg. **Cost:** $194.69/30.

Lovastatin (generic available)

Immediate-release tablets : 10 mg, 20 mg, 40 mg. **Cost:** *Generic*—10 mg $10.83/100, 20 mg $10.83/100, 40 mg $16.50/100. **Extended-release tablets (Altoprev):** 20 mg, 40 mg, 60 mg. **Cost:** All strengths $555.98/30.

Pitavastatin (generic available)

Tablets: 1 mg, 2 mg, 4 mg. **Cost:** All strengths $492.48/90.

Pravastatin (generic available)

Tablets: 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** *Generic*—20 mg $10.83/100, 40 mg $29.82/100, 80 mg $142.06/100.

Rosuvastatin

Tablets (Crestor): 5 mg, 10 mg, 20 mg, 40 mg. **Cost:** 5 mg $609.27/100, 10 mg $600.47/100, 20 mg $609.27/100, 40 mg $541.62/100. **Sprinkle capsules (Ezallor):** 5 mg, 10 mg, 20 mg, 40 mg.

Simvastatin (generic available)

Tablets (Zocor): 5 mg, 10 mg, 20 mg, 40 mg, 80 mg. **Cost:** *Generic*—5 mg $7.11/100, 10 mg $10.83/100, 20 mg $10.83/100, 40 mg $10.83/100, 80 mg $9.83/100. **Oral suspension (FloLipid):** 20 mg/5 mL, 40 mg/5 mL. ***In combination with:*** ezetimibe (Vytorin). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Obtain a dietary history, especially with regard to fat consumption.
- ***Lab Test Considerations:*** Evaluate serum cholesterol and triglyceride levels before initiating, after 4–6 wk of therapy, and periodically thereafter.
- Monitor liver function tests, including AST and ALT, before initiating therapy and if signs of liver injury (fatigue, anorexia, right upper abdominal discomfort, dark urine, or jaundice) occur. May also cause ↑ alkaline phosphatase and bilirubin levels.

© F.A. Davis Publishing

- If patient develops muscle tenderness during therapy, monitor CK levels. If CK levels are >10 times the upper limit of normal or myopathy occurs, therapy should be discontinued. Monitor for signs and symptoms of immune-mediated necrotizing myopathy (IMNM) (proximal muscle weakness and ↑ serum CK), persisting despite discontinuation of statin therapy. Perform muscle biopsy to diagnose; shows necrotizing myopathy without significant inflammation. Treat with immunosuppressive agents.

Implementation

- Do not confuse Lipitor with Zyrtec. Do not confuse Mevacor with Benicar. Do not confuse atorvastatin with atomoxetine.
- **PO:** Administer *lovastatin* with food. Administration on an empty stomach decreases absorption by approximately 30%. Initial once-daily dose is administered with the evening meal.
- Administer extended-release tablets at bedtime. Extended-release tablets should be swallowed whole, do not break, crush, chew or open capsules.
- Administer *fluvastatin, pravastatin,* and *simvastatin* once daily in the evening. Do not take two 40 mg fluvastatin tablets at one time. *Atorvastatin, pitavastatin,* and *rosuvastatin* can be taken any time of day. May be administered without regard to food.
- Administer *Ezallor Sprinkle* (rosuvastatin) as a single dose at any time of day, with or without food. Swallow capsules whole; do not crush or chew. For patients who cannot swallow capsules, open capsule for administration. When initiating *Ezallor Sprinkle* therapy or switching from another HMG-CoA reductase inhibitor therapy, begin with *Ezallor Sprinkle* starting dose, and then only titrate according to patient's response. Monitor lipid levels within 2–4 wk of starting *Ezallor Sprinkle* and adjust dose as needed. Consider starting *Ezallor Sprinkle* with 5 mg once daily in Asian patients; may cause increased rosuvastatin plasma concentrations.
- Avoid large amounts of grapefruit juice during therapy; may ↑ risk of toxicity.
- If *fluvastatin* or *pravastatin* is administered in conjunction with bile acid sequestrants (cholestyramine, colestipol), administer at least 4 hr after bile acid sequestrant.
- If *rosuvastatin* is administered in conjunction with magnesium or aluminum-containing antacids, administer antacid at least 2 hr after *rosuvastatin*.

Patient/Family Teaching

- Instruct patient to take medication as directed and not to skip doses or double up on missed doses. Advise patient to avoid drinking more than 200 mL/day of grapefruit juice during therapy. Medication helps control but does not cure elevated serum cholesterol levels.
- Advise patient that this medication should be used in conjunction with diet restrictions (fat, cholesterol, carbohydrates, alcohol), exercise, and cessation of smoking.
- Instruct patient to notify health care professional promptly if signs of liver injury or if unexplained muscle pain, tenderness, or weakness occurs, especially if accompanied by fever or malaise.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during therapy and discuss plans to discontinue statins if trying to conceive. Advise patient to notify health care professional promptly if pregnancy is planned or suspected. Advise patients to avoid breast feeding during therapy.
- Emphasize the importance of follow-up exams to determine effectiveness and to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in LDL and total cholesterol levels.
- Increase in HDL cholesterol levels.
- Decrease in triglyceride levels.
- Slowing of the progression of coronary artery disease.
- Prevention of cardiovascular disease.

hydrALAZINE (hye-dral-a-zeen)

Apresoline

Classification

Therapeutic: antihypertensives
Pharmacologic: vasodilators

Indications

Moderate to severe hypertension (with a diuretic). **Unlabeled Use:** HF unresponsive to conventional therapy with digoxin and diuretics.

Action

Direct-acting peripheral arteriolar vasodilator. **Therapeutic Effects:** Lowering of BP in hypertensive patients and decreased afterload in patients with HF.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration; well absorbed from IM sites.
Distribution: Widely distributed. Crosses the placenta; enters breast milk in minimal concentrations.
Metabolism and Excretion: Mostly metabolized by the GI mucosa and liver by N-acetyltransferase

© F.A. Davis Publishing

(rate of acetylation is genetically determined [slow acetylators have ↑ hydralazine levels and ↑ risk of toxicity; fast acetylators have ↓ hydralazine levels and ↓ response]).
Half-life: 2–8 hr.

TIME/ACTION PROFILE (antihypertensive effect)

ROUTE	ONSET	PEAK	DURATION
PO	45 min	2 hr	2–4 hr
IM	10–30 min	1 hr	3–8 hr
IV	5–20 min	15–30 min	2–6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Some products contain tartrazine and should be avoided in patients with known intolerance.
Use Cautiously in: Cardiovascular or cerebrovascular disease; Severe renal and hepatic impairment (dose modification may be necessary); OB, Lactation: Has been used safely during pregnancy.

Adverse Reactions/Side Effects
CV: tachycardia, angina, arrhythmias, edema, orthostatic hypotension. **GI:** diarrhea, nausea, vomiting. **Derm:** rash. **MS:** arthralgias, arthritis. **Neuro:** dizziness, drowsiness, headache, peripheral neuropathy. **Misc:** drug-induced lupus syndrome.

Interactions
Drug-Drug: ↑ hypotension with acute ingestion of **alcohol**, other **antihypertensives**, or **nitrates**. **MAO inhibitors** may exaggerate hypotension. May ↓ pressor response to **epinephrine**. **NSAIDs** may ↓ antihypertensive response. **Beta blockers** ↓ tachycardia from hydralazine (therapy may be combined for this reason). **Metoprolol** and **propranolol** ↑ levels. ↑ levels of **metoprolol** and **propranolol**.

Route/Dosage
PO (Adults): *Hypertension*— 10 mg 4 times daily initially. After 2–4 days may ↑ to 25 mg 4 times daily for the rest of the 1st wk; may then ↑ to 50 mg 4 times daily (up to 300 mg/day). Once maintenance dose is established, twice-daily dosing may be used. *HF*— 25–37.5 mg 4 times daily; may be ↑ up to 300 mg/day in 3–4 divided doses.
PO (Children >1 mo): 0.75–1 mg/kg/day in 2–4 divided doses (max = 25 mg/dose) initially; may ↑ gradually to 5 mg/kg/day in infants and 7.5 mg/kg/day in children (max = 200 mg/day) in 2–4 divided doses.
IM, IV (Adults): *Hypertension*— 5–40 mg repeated as needed. *Eclampsia*— 5 mg every 15–20 min; if no response after a total of 20 mg, consider an alternative agent.
IM, IV (Children >1 mo): 0.1–0.2 mg/kg/dose every 4–6 hr (max = 20 mg/dose) as needed, up to 1.7–3.5 mg/kg/day in 4–6 divided doses.

Availability (generic available)
Tablets: 10 mg, 25 mg, 50 mg, 100 mg. **Injection:** 20 mg/mL. ***In combination with:*** isosorbide dinitrate (BiDil). See Appendix N.

NURSING IMPLICATIONS
Assessment
- Monitor BP and pulse frequently during initial dose adjustment and periodically during therapy. About 50–65% of Caucasians, Black, South Indians, and Mexicans are slow acetylators at risk for toxicity, while 80–90% of Eskimos, Japanese, and Chinese are rapid acetylators at risk for decreased levels and treatment failure.
- Monitor frequency of prescription refills to determine adherence.
- ***Lab Test Considerations:*** Monitor CBC, electrolytes, LE cell prep, and ANA titer prior to and periodically during prolonged therapy.
- May cause a positive direct Coombs' test result.

Implementation
- Do not confuse hydralazine with hydroxyzine or hydrochlorothiazide.
- IM or IV route should be used only when drug cannot be given orally.
- May be administered concurrently with diuretics or beta blockers to permit lower doses and minimize side effects.
- **PO:** Administer with meals consistently to enhance absorption.
- Pharmacist may prepare oral solution from hydralazine injection for patients with difficulty swallowing.

IV Administration
- **IV Push:** ***Dilution:*** Administer undiluted. Use solution as quickly as possible after drawing through needle into syringe. ***Concentration:*** 20 mg/mL. ***Rate:*** Administer over at least 1 min. Pedi: Administer at a rate of 0.2 mg/kg/min in children. Monitor BP and pulse in all patients frequently after injection.
- **Y-Site Compatibility:** alemtuzumab, amiodarone, anidulafungin, argatroban, arsenic trioxide, bivalirudin, bleomycin, carmustine, cyclophosphamide, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexrazoxane, diltiazem, docetaxel, etoposide, etoposide phosphate, fenoldopam, fludarabine, gemcitabine, granisetron, hetastarch, hydromorphone, idarubicin, irinotecan, lactated Ringer's, leucovorin calcium, linezolid, mesna, metronidazole, milrinone, mitomycin, mitoxantrone, moxifloxacin, mycophenolate, octreotide, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, prochlorperazine, Ringer's solution, 0.9% NaCl, 0.45% NaCl, tacrolimus, thiotepa, tirofiban, topotecan, vecuronium, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amphotericin B deoxycholate, amphotericin B lipid complex, ampicillin/sulbactam, ascorbic acid, azathioprine, cefazo-

© F.A. Davis Publishing

lin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, D5W, dantrolene, diazepam, doxorubicin liposomal, ertapenem, folic acid, foscarnet, fosphenytoin, ganciclovir, gemtuzumab ozogamicin, haloperidol, indomethacin, lorazepam, methylprednisolone, minocycline, multivitamins, nafcillin, nitroprusside, oxacillin, pantoprazole, pemetrexed, pentobarbital, phenytoin, piperacillin/tazobactam, potassium acetate, sodium acetate, tigecycline, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Emphasize the importance of continuing to take this medication, even if feeling well. Instruct patient to take medication at the same time each day; last dose of the day should be taken at bedtime. Take missed doses as soon as remembered; do not double doses. If more than 2 doses in a row are missed, consult health care professional. Must be discontinued gradually to avoid sudden increase in BP. Hydralazine controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, smoking cessation, moderation of alcohol intake, regular exercise, and stress management). Instruct patient and family on proper technique for BP monitoring. Advise them to check BP at least weekly and report significant changes.
- Patients should weigh themselves twice weekly and assess feet and ankles for fluid retention.
- May occasionally cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid sudden changes in position to minimize orthostatic hypotension.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cough, cold, or allergy remedies.
- Instruct patient to notify health care professional of medication prior to treatment or surgery.
- Advise patient to notify health care professional immediately if general tiredness; fever; muscle or joint aching; chest pain; skin rash; sore throat; or numbness, tingling, pain, or weakness of hands and feet occurs. Vitamin B_6 (pyridoxine) may be used to treat peripheral neuritis.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of follow-up exams to evaluate effectiveness of medication.

Evaluation/Desired Outcomes

- Decrease in BP without appearance of side effects.
- Decreased afterload in patients with HF.

hydralazine/isosorbide dinitrate

(hye-**dral**-a-zeen eye-so-**sor**-bide di-**ni**-trate)

BiDil

Classification

Therapeutic: vasodilators

Pharmacologic: vasodilators, nitrates

H

Indications

Management of heart failure in black patients.

Action

BiDil is a fixed-dose combination of **isosorbide dinitrate**, a vasodilator with effects on both arteries and veins, and **hydralazine**, a predominantly arterial vasodilator. **Therapeutic Effects:** Improved survival, increased time to hospitalization and decreased symptoms of heart failure in black patients.

Pharmacokinetics

See pharmacokinetic sections in hydralazine and isosorbide dinitrate monographs of Davis's Drug Guide for Nurses for more information.

Absorption: *Hydralazine*—10–26% absorbed in HF patients, absorption can be saturated leading to large ↑ in absorption with higher doses; *isosorbide dinitrate*—variable absorbed (10–90%) reflecting first-pass hepatic metabolism.

Distribution: *Hydralazine*—widely distributed, crosses the placenta, minimal amounts in breast milk; *isosorbide dinitrate*—accumulates in muscle and venous wall.

Metabolism and Excretion: *Hydralazine*—mostly metabolized by GI mucosa and liver; *isosorbide dinitrate*—undergoes extensive first-pass metabolism in the liver, mostly metabolized by the liver, some metabolites are vasodilators.

Half-life: *Hydralazine*—4 hr; *isosorbide dinitrate*—2 hr.

TIME/ACTION PROFILE (effect on BP)

ROUTE	ONSET	PEAK	DURATION
hydralazine	45 min	2 hr	2–4 hr
isosorbide	15–40 min	unknown	4 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to either component; Concurrent use of PDE-5 inhibitor (avanafil, sildenafil, tadalafil, vardenafil) or riociguat.

Use Cautiously in: Severe renal/hepatic impairment (dose modification may be necessary); Head trauma or cerebral hemorrhage; OB: Safety not established; Lactation: Use while breast feeding only if poten-

© F.A. Davis Publishing

tial maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established; Geri: Start with lower doses.

Adverse Reactions/Side Effects

Hydralazine **CV:** tachycardia, angina, arrhythmias, edema, orthostatic hypotension. **Derm:** rash. **F and E:** sodium retention. **GI:** diarrhea, nausea, vomiting. **MS:** arthralgias, arthritis. **Neuro:** peripheral neuritis, dizziness, drowsiness, headache, dizziness, headache, apprehension, weakness. **Misc:** drug-induced lupus syndrome.

Isosorbide Dinitrate

CV: hypotension, tachycardia, paradoxic bradycardia, syncope. **GI:** abdominal pain, nausea, vomiting. **Misc:** flushing, tolerance.

Interactions

Drug-Drug: Concurrent use of **avanafil**, **sildenafil**, **tadalafil**, or **vardenafil** may result in severe hypotension; concurrent use contraindicated. Concurrent use of **riociguat** may result in severe hypotension; concurrent use contraindicated. ↑ risk of hypotension with other **antihypertensives**, acute ingestion of **alcohol**, and **phenothiazines**. **MAO inhibitors** may exaggerate hypotension. May ↓ the pressor response to **epinephrine**. **Beta blockers** ↓ tachycardia from hydralazine (therapy may be combined for this reason). **Metoprolol** and **propranolol** may ↑ hydralazine levels. Hydralazine ↑ levels of **metoprolol** and **propranolol**.

Route/Dosage

PO (Adults): 1 tablet 3 times daily, may be ↑ to 2 tablets 3 times daily.

Availability

Tablets: hydralazine 37.5 mg/isosorbide dinitrate 20 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse routinely during period of dose adjustment. Symptomatic hypotension may occur even with small doses. Use caution with patients who are volume depleted or hypotensive.
- Assess for signs and symptoms of peripheral neuritis (paresthesia, numbness, tingling) periodically during therapy. Adding pyridoxine may cause symptoms to decrease.
- ***Lab Test Considerations:*** If symptoms of systemic lupus erythematosus (SLE) occur obtain a CBC and ANA titer. If positive for SLE, carefully weigh risks/benefits of continued therapy.

Implementation

- Dose may be titrated rapidly over 3–5 days, but may need to decrease if side effects occur. May decrease to one-half tablet 3 times daily if intolerable side effects occur. Titrate up as soon as side effects subside.

Patient/Family Teaching

- Instruct patient to take medication as directed on a regular schedule.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol or medications for erectile dysfunction with this medication. Patient should also consult health care professional before taking Rx, OTC, or herbal products while taking this medication.
- Caution patient that inadequate fluid intake or excessive fluid loss from perspiration, diarrhea, or vomiting may lead to a fall in BP, dizziness, or syncope. If syncope occurs, discontinue medication and notify health care professional promptly.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe. Do not alter dose to avoid headache.
- Advise patient to notify health care professional if symptoms of systemic lupus erythematosus occur (arthralgia, fever, chest pain, prolonged malaise, or other unexplained symptoms).
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Improved survival, increased time to hospitalization, and decreased symptoms of heart failure in black patients.

hydroCHLOROthiazide, See DIURETICS (THIAZIDE).

HYDROcodone/Acetaminophen
Anexsia, ~~Norco~~, ~~Vicodin~~

HYDROcodone/Ibuprofen
~~Reprexain~~

© F.A. Davis Publishing

Classification
Therapeutic: allergy, cold, and cough remedies (antitussive), opioid analgesics
Pharmacologic: opioid agonists/nonopioid analgesic combinations

Schedule II

For information on the acetaminophen and ibuprofen components of these formulations, see the acetaminophen and ibuprofen monographs

Indications

Extended-release product: Management of pain that is severe enough to warrant daily, around-the-clock, long-term opioid treatment where alternative treatment options are inadequate. **Combination products**: Management of moderate to severe pain. Antitussive (usually in combination products with decongestants).

Action

Bind to opiate receptors in the CNS. Alter the perception of and response to painful stimuli while producing generalized CNS depression. Suppress the cough reflex via a direct central action. **Therapeutic Effects:** Decrease in severity of moderate pain. Suppression of the cough reflex.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver; eliminated in the urine (50–60% as metabolites, 10% as unchanged drug).
Half-life: 2.2 hr; *Extended-release*—8 hr.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	10–30 min	30–60 min	4–6 hr
PO-ER	unknown	unknown	unknown

Contraindications/Precautions

Noted for hydrocodone only; see acetaminophen/ibuprofen monographs for specific information on individual components

Contraindicated in: Hypersensitivity to hydrocodone (cross-sensitivity may exist to other opioids); Significant respiratory depression; Paralytic ileus; Acute or severe bronchial asthma or hypercarbia; Congenital long QT syndrome (Hysingla only); Products containing alcohol, aspartame, saccharin, sugar, or tartrazine (FDC yellow dye #5) should be avoided in patients who have hypersensitivity or intolerance to these compounds.

Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Alcoholism; Difficulty swallowing; Patients with undiagnosed abdominal pain; Prostatic hyperplasia; OB, Lactation: Avoid chronic use; has been used during labor but may cause respiratory depression in the newborn; prolonged use of hydrocodone during pregnancy can result in neonatal opioid withdrawal syndrome; Geri: Older adults are more prone to CNS depression and constipation (initial dose ↓ required).

Adverse Reactions/Side Effects

Noted for hydrocodone only; see acetaminophen/ibuprofen monographs for specific information on individual components.

CV: hypotension, bradycardia, QT interval prolongation (Hysingla only). **Derm:** sweating. **EENT:** blurred vision, diplopia, miosis. **Endo:** adrenal insufficiency. **GI:** constipation, dyspepsia, nausea, choking, dysphagia, esophageal obstruction, vomiting. **GU:** urinary retention. **Neuro:** confusion, dizziness, sedation, euphoria, hallucinations, headache, unusual dreams. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia). **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors**; may produce severe, unpredictable reactions—do not use within 14 days of each other. Concurrent use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **fluconazole**, **clarithromycin**, **erythromycin**, **nefazodone**, **diltiazem**, **verapamil**, **nelfinavir**, and **fosamprenavir** ↑ levels and risk of opioid toxicity; careful monitoring during initiation, dose changes, or discontinuation of the inhibitor is recommended. Concurrent use with **CYP3A4 inducers** including **barbiturates**, **carbamazepine**, **efavirenz**, **corticosteroids**, **modafinil**, **nevirapine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, or **rifampin** may ↓ fentanyl levels and analgesia; if inducers are discontinued or dosage ↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. Use with **benzodiazepines** or other **CNS depressants** including other**opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. **Mixed agonist/antagonist analgesics**, including **nalbuphine** or **butorphanol** and **partial agonist analgesics**, including **buprenorphine**, may ↓ hydrocodone's analgesic effects and/or precipitate opioid withdrawal in physically dependent patients. **Anticholinergic drugs** may ↑ risk of urinary retention and constipation. Drugs

© F.A. Davis Publishing

that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT$_3$ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

PO (Adults): *Analgesic (in combo products)* — 2.5–10 mg every 3–6 hr as needed; if using combination products, acetaminophen dosage should not exceed 4 g/day and should not exceed 5 tablets/day of ibuprofen-containing products; *Antitussive* — 5 mg every 4–6 hr as needed; *Extended-release capsules* — 10 mg every 12 hr; may ↑ as needed in increments of 10 mg every 12 hr every 3–7 days; *Extended-release tablets* — 20 mg once daily; may ↑ as needed in increments of 10–20 mg/day every 3–5 days.

Renal Impairment

PO (Adults): *CCr <45 mL/min* — Extended-release (Hysingla): ↓ initial dose by 50%.

Hepatic Impairment

PO (Adults): *Extended-release tablets* — ↓ initial dose by 50%.

Availability

Hydrocodone (generic available)

Extended-release capsules: 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 50 mg. **Extended-release tablets (Hysingla ER) (abuse deterrent):** 20 mg, 30 mg, 40 mg, 60 mg, 80 mg, 100 mg, 120 mg. **Syrup:** 1 mg/mL. ***In combination with:*** chlorpheniramine (Tussicaps); . See Appendix N.

Hydrocodone/Acetaminophen (generic available)

Tablets: 2.5 mg hydrocodone/325 mg acetaminophen, 5 mg hydrocodone/325 mg acetaminophen, 7.5 mg hydrocodone/325 mg acetaminophen, 10 mg hydrocodone/325 mg acetaminophen. **Cost:** *Generic* — 5 mg/325 mg $15.08/100, 7.5 mg/325 mg $30.93/100, 10 mg/325 mg $41.59/100. **Elixir/oral solution:** 7.5 mg hydrocodone plus 325 mg acetaminophen/15 mL, 10 mg hydrocodone plus 325 mg acetaminophen/15 mL. **Cost:** *Generic* — $58.12/473 mL.

Hydrocodone/Ibuprofen (generic available)

Tablets: 5 mg hydrocodone/200 mg ibuprofen, 7.5 mg hydrocodone/200 mg ibuprofen, 10 mg hydrocodone/200 mg ibuprofen. **Cost:** *Generic* — 7.5 mg/200 mg $48.40/100.

NURSING IMPLICATIONS

Assessment

- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Physical stimulation may be sufficient to prevent significant hypoventilation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. May cause sleep-related breathing disorders (central sleep apnea [CSA], sleep-related hypoxemia).
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated. Consider drugs for opioid-induced constipation.
- **Pain:** Assess type, location, and intensity of pain prior to and 1 hr (peak) following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients taking extended-release hydrocodone may require additional short-acting or rapid-onset opioid doses for breakthrough pain. Doses of short-acting opioids should be equivalent to 10–20% of 24 hr total and given every 2 hr as needed.
- An equianalgesic chart (see Appendix I) should be used when changing routes or when changing from one opioid to another.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Patients who receive opioids for pain rarely develop psychological dependence. If progressively higher doses are required, consider conversion to a stronger opioid.
- Assess risk for opioid addiction, abuse, or misuse prior to administration. Abuse or misuse of extended-release preparations by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of hydrocodone and can result in overdose and death. Hysingla ER is an abuse deterrent formulation that is difficult to crush and, if crushed, results in a gel.
- **Cough:** Assess cough and lung sounds during antitussive use.
- ***Lab Test Considerations:*** May cause ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of

© F.A. Davis Publishing

naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Implementation

- ***High Alert:*** Do not confuse hydrocodone with oxycodone.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Combination with nonopioid analgesics may have additive analgesic effects and permit lower doses. Maximum doses of nonopioid agents limit the titration of hydrocodone doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms. For patients on long-acting agents who are physically opioid-dependent, initiate the taper by a small enough increment (e.g., no greater than 10% to 25% of total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2–4 wk. May be necessary to provide patient with a lower dose strength for a successful taper. Monitor frequently to manage pain and withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). If withdrawal symptoms occur, pause the taper for a period of time or raise the dose of opioid analgesic to the previous dose, and then proceed with a slower taper. Also, monitor patients for changes in mood, emergence of suicidal thoughts, or use of other substances. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the opioid analgesic.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.
- **PO:** May be administered with food or milk to minimize GI irritation.
- ***DNC:*** Swallow extended-release capsules whole; do not open, crush, dissolve, or chew.

Patient/Family Teaching

- ***REMS:*** Advise patient to take medication as directed and not to take more than the recommended amount. Severe and permanent liver damage may result from prolonged use or high doses of acetaminophen. Renal damage may occur with prolonged use of acetaminophen or ibuprofen. Doses of nonopioid agents should not exceed the maximum recommended daily dose. Do not stop taking without discussing with health care professional; may cause withdrawal symptoms if discontinued abruptly after prolonged use. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. The Patient Counseling Guide (PCG) is available at www.fda.gov/OpioidAnalgesicREMSPCG.
- Instruct patient on how and when to ask for and take pain medication.
- Advise patient that hydrocodone is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient to notify health care professional if pain control is not adequate or if severe or persistent side effects occur.
- Advise patient to change positions slowly to minimize orthostatic hypotension.

© F.A. Davis Publishing

- Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Emphasize the importance of aggressive prevention of constipation with the use of hydrocodone.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Advise patient that good oral hygiene, frequent mouth rinses, and sugarless gum or candy may decrease dry mouth.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to hydrocodone through breast milk for excess sedation and respiratory depression. Chronic use may reduce fertility in females and males.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of nonproductive cough.

hydrocortisone, See CORTICOSTEROIDS (SYSTEMIC) and CORTICOSTEROIDS (TOPICAL/LOCAL).

REMS HIGH ALERT

HYDROmorphone

(hye-droe-**mor**-fone)

Dilaudid, ~~Dilaudid-HP~~, ~~Exalgo~~, Hydromorph Contin

Classification

Therapeutic: allergy, cold, and cough remedies (antitussives), opioid analgesics

Pharmacologic: opioid agonists

Schedule II

Indications

Moderate to severe pain (alone and in combination with nonopioid analgesics). Moderate to severe chronic pain in opioid-tolerant patients requiring use of daily, around-the-clock long-term opioid treatment and for which alternative treatment options are inadequate (extended-release). Antitussive (lower doses).

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli while producing generalized CNS depression. Suppresses the cough reflex via a direct central action. **Therapeutic Effects:** Decrease in moderate to severe pain. Suppression of cough.

Pharmacokinetics

Absorption: Well absorbed following oral, rectal, subcut, and IM administration. Extended-release product results in an initial release of drug, followed by a 2nd sustained phase of absorption.

Distribution: Widely distributed. Crosses the placenta; enters breast milk.

Metabolism and Excretion: Mostly metabolized by the liver.

Half-life: *Oral (immediate-release), or injection* — 2–4 hr; *Oral (extended-release)* — 8–15 hr.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO-IR	30 min	30–90 min	4–5 hr
PO-ER	unknown	unknown	unknown
Subcut	15 min	30–90 min	4–5 hr
IM	15 min	30–60 min	4–5 hr
IV	10–15 min	15–30 min	2–3 hr
Rect	15–30 min	30–90 min	4–5 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Some products contain bisulfites and should be avoided in patients with known hypersensitivity; Severe respiratory depression (in absence of resuscitative equipment) (extended-release only); Acute or severe bronchial asthma (extended-release only); Paralytic ileus (extended-release only); Acute, mild, intermittent, or postoperative pain (extended-release only); Prior GI surgery or narrowing of GI tract (extended-release only); Opioid nontolerant patients (extended-release only); Severe hepatic impairment (extended-release only).

Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe pulmonary disease; Moderate or severe renal disease (extended-release only) (dose ↓ recommended); Moderate hepatic impairment (extended-release only) (dose ↓ recommended); Hypothyroidism; Seizure disorder; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hypertrophy; Biliary tract disease (including pancreatitis); OB: Labor and delivery; OB, Lactation: Avoid chronic use; prolonged use of opioids during pregnancy can result in neonatal opioid withdrawal syndrome; Geri: Older adults (↑ risk of respiratory depression; dose ↓ suggested).

Adverse Reactions/Side Effects

CV: hypotension, bradycardia. **Derm:** flushing, sweating. **EENT:** blurred vision, diplopia, miosis. **Endo:** adrenal insufficiency. **GI:** constipation, dry mouth, nausea, vomiting. **GU:** urinary retention. **Neuro:** con-

© F.A. Davis Publishing

fusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia). **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Exercise extreme caution with **MAO inhibitors** (may produce severe, unpredictable reactions—reduce initial dose of hydromorphone to 25% of usual dose, discontinue MAO inhibitors 2 wk prior to hydromorphone). Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. **Mixed agonist/antagonist analgesics**, including **nalbuphine** or **butorphanol** and **partial agonist analgesics**, including **buprenorphine**, may ↓ hydromorphone's analgesic effects and/or precipitate opioid withdrawal in physically dependent patients. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT$_3$ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage

Doses depend on level of pain and tolerance. Larger doses may be required during chronic therapy.

Analgesic

PO (Adults ≥50 kg): *Immediate-release*—4–8 mg every 3–4 hr initially (some patients may respond to doses as small as 2 mg initially); *or* once 24-hr opioid requirement is determined, convert to *extended-release* by administering total daily oral dose once daily.

PO (Adults and Children <50 kg): 0.06 mg/kg every 3–4 hr initially, younger children may require smaller initial doses of 0.03 mg/kg. Maximum dose 5 mg.

IV, IM, Subcut (Adults ≥50 kg): 1.5 mg every 3–4 hr as needed initially; may be ↑.

IV, IM, Subcut (Adults and Children <50 kg): 0.015 mg/kg mg every 3–4 hr as needed initially; may be ↑.

IV (Adults): *Continuous infusion (unlabeled)*—0.2–3 mg/hr depending on previous opioid use. An initial bolus of twice the hourly rate in mg may be given with subsequent breakthrough boluses of 50–100% of the hourly rate in mg.

Rect (Adults): 3 mg every 6–8 hr initially as needed.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (extended–release)*—↓ initial dose by 75%.

Renal Impairment

PO (Adults): *Moderate renal impairment (extended–release)*—↓ initial dose by 50%; *Severe renal impairment (extended–release)*—↓ initial dose by 75%.

Antitussive

PO (Adults and Children >12 yr): 1 mg every 3–4 hr.

PO (Children 6–12 yr): 0.5 mg every 3–4 hr.

Availability (generic available)

Immediate-release tablets: 2 mg, 4 mg, 8 mg. **Controlled-release capsules:** 3 mg, 4.5 mg, 6 mg, 9 mg, 12 mg, 18 mg, 24 mg, 30 mg. **Extended-release tablets (abuse-deterrent):** 8 mg, 12 mg, 16 mg, 32 mg. **Oral solution:** 1 mg/mL. **Solution for injection:** 1 mg/mL, 2 mg/mL, 4 mg/mL, 10 mg/mL. **Rectal suppositories:** 3 mg.

NURSING IMPLICATIONS

Assessment

- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. May cause sleep-related breathing disorders (central sleep apnea [CSA], sleep-related hypoxemia). Geri, Pedi: Assess geriatric and pediatric patients frequently; more sensitive to the effects of opioid analgesics and may experience side effects and respiratory complications more frequently.
- Assess bowel function routinely. Institute prevention of constipation with increased intake of fluids and bulk, and laxatives to minimize constipating effects. Administer stimulant laxatives routinely if opioid use exceeds 2–3 days, unless contraindicated. Consider drugs for opioid induced constipation.
- **Pain:** Assess type, location, and intensity of pain prior to and 1 hr following IM or PO and 5 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. When titrating doses of short-acting hydromorphone, a repeat dose can be safely administered

© F.A. Davis Publishing

at the time of the peak if previous dose is ineffective and side effects are minimal.
- Patients on a continuous infusion should have additional bolus doses provided every 15–30 min, as needed, for breakthrough pain. The bolus dose is usually set to the amount of drug infused each hr by continuous infusion.
- Patients taking extended-release hydromorphone may require additional short-acting or rapid-onset opioid doses for breakthrough pain. Doses of short-acting opioids should be equivalent to 10–20% of 24 hr total and given every 2 hr as needed.
- An equianalgesic chart (see Appendix I) should be used when changing routes or when changing from one opioid to another.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Patients who receive hydromorphone for pain rarely develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess risk for opioid addiction, abuse, or misuse prior to administration. Abuse or misuse of extended-release preparations by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of hydromorphone and can result in overdose and death.
- **Cough:** Assess cough and lung sounds during antitussive use.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, check infusion pump settings. Pedi: Medication errors with opioid analgesics are common in pediatric patients; calculate doses carefully. Use appropriate measuring devices.
- ***High Alert:*** Do not confuse hydromorphone with buprenorphine, morphine, or oxymorphone; fatalities have occurred. Do not confuse high-potency (HP) dose forms with regular dose forms.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower opioid doses.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms. For patients on long-acting agents who are physically opioid-dependent, initiate the taper by a small enough increment (e.g., no greater than 10% to 25% of total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2–4 wks. Patients who have been taking opioids for briefer periods of time may tolerate a more rapid taper.
- When converting from immediate-release to extended-release hydromorphone administer total daily oral hydromorphone dose once daily; dose of extended-release product can be titrated every 3–4 days. To convert from another opioid to extended-release hydromorphone, convert to total daily dose of hydromorphone and then administer 50% of this dose as extended-release hydromorphone once daily; can then titrate dose every 3–4 days. When converting from transdermal fentanyl, initiate extended-release hydromorphone 18 hr after removing transdermal fentanyl patch; for each 25 mcg/hr fentanyl transdermal dose, the equianalgesic dose of extended-release hydromorphone is 12 mg once daily (should initiate at 50% of this calculated total daily dose given once daily).
- **PO:** May be administered with food or milk to minimize GI irritation.
- ***DNC:*** Swallow extended-release tablets whole; do not break, crush, dissolve, or chew.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms. For patients on long-acting agents who are physically opioid-dependent, initiate the taper by a small enough increment (no >10% to 25% of total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2–4 wk. May be necessary to provide patient with a lower dose strength for a successful taper. Monitor frequently to manage pain and withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). If withdrawal symptoms occur, pause taper for a period of time or raise the dose of opioid analgesic to the previous dose, and then proceed with a slower taper. Monitor patients for changes in mood, emergence of suicidal thoughts, or use of other substances. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the opioid analgesic.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education

© F.A. Davis Publishing

program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.

- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.

IV Administration

- **IV Push:** Administer undiluted. Inspect solution for particulate matter. Slight yellow color does not alter potency. Store at room temperature. ***Rate:*** Administer slowly over 2–3 min. ***High Alert:*** Rapid administration may lead to increased respiratory depression, hypotension, and circulatory collapse.
- **Y-Site Compatibility:** acetaminophen, acyclovir, alemtuzumab, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atracurium, atropine, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, busulfan, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, eravacycline, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meropenem, meropenem/vaborbactam, mesna, methohexital, methotrexate, methylprednisolone, metoclopramide, metoprolol, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, mycophenolate, nafcillin, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G potassium, pentamidine, pentobarbital, phenylephrine, piperacillin/tazobactam, plazomicin, posaconazole, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, scopolamine, sodium acetate, sodium phosphate, streptozocin, succinylcholine, tacrolimus, tedizolid, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amphotericin B deoxycholate, dantrolene, dimenhydrinate, minocycline, phenytoin, sargramostim, thiopental.

Patient/Family Teaching

- ***REMS:*** Instruct patient on how and when to ask for pain medication. Do not stop taking without discussing with health care professional; may cause withdrawal symptoms if discontinued abruptly after prolonged use. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. The Patient Counseling Guide (PCG) is available at www.fda.gov/OpioidAnalgesicREMSPCG.
- Advise patient that hydromorphone is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).

© F.A. Davis Publishing

- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if pain control is not adequate or if side effects occur.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to hydromorphone through breast milk for excess sedation and respiratory depression. Chronic use may reduce fertility in females and males.
- **Home Care Issues:** Explain to patient and family how and when to administer hydromorphone, discuss safe storage of medication, and how to care for infusion equipment properly. Pedi: Teach parents or caregivers how to accurately measure liquid medication and to use only measuring device dispensed with medication.
- Emphasize the importance of aggressive prevention of constipation with the use of hydromorphone.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Suppression of cough.

hydroxocobalamin, See VITAMIN B_{12} PREPARATIONS.

hydroxychloroquine

(hye-drox-ee-**klor**-oh-kwin)

Plaquenil

Classification

Therapeutic: antimalarials, antirheumatics (DMARDs)

Indications

Treatment of uncomplicated malaria in geographic areas where chloroquine resistance is not reported. Prophylaxis of malaria in geographic areas where chloroquine resistance is not reported. Acute and chronic rheumatoid arthritis. Chronic discoid lupus erythematosus and systemic lupus erythematosus.

Action

Inhibits protein synthesis in susceptible organisms by inhibiting DNA and RNA polymerase. **Therapeutic Effects:** Death of plasmodia responsible for causing malaria. Also has anti-inflammatory properties. **Spectrum:** Active against chloroquine-sensitive strains of: *Plasmodium falciparum*, *Plasmodium malariae*, *Plasmodium ovale*, and *Plasmodium vivax*.

Pharmacokinetics

Absorption: Highly variable (31–100%) following oral administration.

Distribution: Widely distributed; high concentrations in RBCs; crosses the placenta; excreted into breast milk.

Metabolism and Excretion: Partially metabolized by the liver to active metabolites; partially excreted unchanged by the kidneys.

Half-life: 40 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid†	1–2 hr	days–wk

†Onset of antirheumatic action may take 6 wk.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to hydroxychloroquine or chloroquine; Previous visual damage from hydroxychloroquine or chloroquine.

Use Cautiously in: Concurrent use of hepatotoxic drugs; Hepatic impairment or alcoholism; Use of high doses (>5 mg/kg base), duration of use >5 yr, renal impairment, concurrent use of tamoxifen or macular disease (↑ risk of retinopathy); G6PD deficiency; Psoriasis; Porphyria; Bone marrow depression; Obesity (determine dose by ideal body weight); Pedi: Safety and effectiveness for treatment of rheumatoid arthritis, chronic discoid lupus erythematosus, or systemic lupus erythematosus not established in children; Geri: ↓ renal function may ↑ risk of adverse reactions in older adults.

Adverse Reactions/Side Effects

CV: HF, TORSADES DE POINTES, heart block, QT interval prolongation. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, acute generalized exanthematous pustulosis, alopecia, hair color changes, hyperpigmentation, photosensitivity, pruritus, rash, urticaria. **EENT:** corneal deposits, nystagmus, retinopathy, tinnitus, vertigo, visual disturbances. **Endo:** hypoglycemia. **GI:** HEPATOTOXICITY, abdominal pain, anorexia, diarrhea, ↑ liver

© F.A. Davis Publishing

enzymes, nausea, vomiting. **Hemat:** AGRANULOCYTOSIS, APLASTIC ANEMIA, leukopenia, thrombocytopenia. **Metab:** ↓ weight. **Neuro:** SEIZURES, SUICIDAL THOUGHTS/BEHAVIORS, aggressiveness, anxiety, ataxia, dizziness, dyskinesia, dystonia, fatigue, headache, irritability, neuromyopathy, nightmares, peripheral neuritis, personality changes, psychoses, tremor. **Resp:** PULMONARY HYPERTENSION, bronchospasm. **Misc:** ANGIOEDEMA.

Interactions

Drug-Drug: Concurrent use of other **QT interval-prolonging drugs** may ↑ risk of torsade de pointes. May ↑ the risk of hepatotoxicity when administered with **hepatotoxic drugs**. May ↑ risk of hypoglycemia when used with **antidiabetic agents**. Use with **mefloquine** may ↑ risk of seizures. **Antacids** may bind to and ↓ the absorption of hydroxychloroquine; separate administration by ≥4 hr. **Cimetidine** may ↑ levels; avoid concurrent use. **Urinary acidifiers** may ↑ renal excretion. May ↑ levels of **digoxin** or **cyclosporine**.

Route/Dosage

200 mg hydroxychloroquine sulfate = 155 mg of hydroxychloroquine base.

Malaria

PO (Adults): *Prophylaxis*—400 mg sulfate (310 mg base) once weekly; start 2 wk prior to entering malarious area; continue for 4 wk after leaving area. *Treatment*—800 mg sulfate (620 mg base), then 400 mg sulfate (310 mg base) at 6 hr, 24 hr, and 48 hr after initial dose.

PO (Children ≥31 kg): *Prophylaxis*—6.5 mg/kg sulfate (5 mg/kg base) (not to exceed 400 mg sulfate [310 mg base]) once weekly; start 2 wk prior to entering malarious area; continue for 4 wk after leaving area. *Treatment*—13 mg/kg sulfate (10 mg/kg base) (not to exceed 800 mg sulfate [620 mg base]) initially, then 6.5 mg/kg sulfate (5 mg/kg base) (not to exceed 400 mg sulfate [310 mg base]) at 6 hr, 24 hr, and 48 hr after initial dose.

Rheumatoid Arthritis

PO (Adults): 400–600 mg sulfate (310–465 mg base) per day in 1–2 divided doses; once adequate response obtained, may ↓ dose to maintenance dose of 200–400 mg sulfate (155–310 mg base) per day in 1–2 divided doses.

Lupus Erythematosus

PO (Adults): 200–400 mg sulfate (155–310 mg base) per day in 1–2 divided doses.

Availability (generic available)

Tablets: 200 mg sulfate (155 mg base). **Cost:** *Generic*—$14.88/100.

NURSING IMPLICATIONS

Assessment

- Assess deep tendon reflexes periodically to determine muscle weakness. Therapy may be discontinued should this occur.
- Obtain baseline ocular exam within first yr of therapy. Patients on prolonged high-dose therapy should have eye exams prior to and every 3–6 mo during therapy to detect retinal damage. Monitor patients without risk factors every 5 yrs. Retinal changes may progress even after therapy is completed.
- Monitor ECG for cardiomyopathy and QT prolongation periodically during therapy.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis and/or eosinophilia.
- Assess for suicidal tendencies, depression, or changes in behavior periodically during therapy.
- **Malaria or Lupus Erythematosus:** Assess patient for improvement in signs and symptoms of condition daily throughout course of therapy.
- **Rheumatoid Arthritis:** Assess patient monthly for pain, swelling, and range of motion.
- ***Lab Test Considerations:*** Monitor CBC and platelet count periodically throughout therapy. May cause decreased RBC, WBC, and platelet counts. If severe decreases occur that are not related to the disease process, hydroxychloroquine should be discontinued.
- Monitor liver function tests periodically during therapy.
- May cause hypoglycemia.

Implementation

- Do not confuse hydroxychloroquine with hydroxyurea.
- **PO:** Administer with milk or meals to minimize GI distress.
- Tablets may be crushed and placed inside empty capsules for patients with difficulty swallowing. Contents of capsules may also be mixed with a teaspoonful of jam, jelly, or Jell-O prior to administration.
- **Malaria Prophylaxis:** Hydroxychloroquine therapy should be started 2 wk prior to potential exposure and continued for 4–6 wk after leaving the malarious area.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take medication exactly as directed and continue full course of therapy even if feeling better. Missed doses should be taken as soon as remembered unless it is almost time for next dose. Do not double doses.
- Advise patients to avoid use of alcohol while taking hydroxychloroquine.
- Caution patient to keep hydroxychloroquine out of reach of children; fatalities have occurred with ingestion of 3 or 4 tablets.
- Explain need for periodic ophthalmic exams for patients on prolonged high-dose therapy. Advise patient that the risk of ocular damage may be decreased by the use of dark glasses in bright light. Protective clothing and sunscreen should also be used to reduce risk of dermatoses.
- Advise patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, blurred vision, visual changes, ringing in the ears, difficulty hearing, or muscle weakness occurs.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to hydroxychloroquine during pregnancy. Encourage patients to register by contacting 1-877-311-8972.
- **Malaria Prophylaxis:** Review methods of minimizing exposure to mosquitoes with patients receiving hydroxychloroquine prophylactically (use repellent, wear long-sleeved shirt and long trousers, use screen or netting).
- Advise patient to notify health care professional if fever develops while traveling or within 2 mo of leaving an endemic area.
- **Rheumatoid Arthritis:** Instruct patient to contact health care professional if no improvement is noticed within a few days. Treatment for rheumatoid arthritis may require up to 6 mo for full benefit.

Evaluation/Desired Outcomes

- Prevention or resolution of malaria.
- Improvement in signs and symptoms of rheumatoid arthritis.
- Improvement in symptoms of lupus erythematosus.

HYDROXYprogesterone caproate

(hye-drox-ee-pro-**jess**-te-rone **kap**-roe-ate)

Makena

Classification

Therapeutic: hormones

Pharmacologic: progestins

Indications

To ↓ the risk of preterm birth in women with a singleton pregnancy who have a history of previous singleton preterm birth.

Action

A synthetic analog of progesterone. Produces secretory changes in the endometrium. ↑s basal temperature. Produces changes in the vaginal epithelium. Relaxes uterine smooth muscle. Stimulates mammary alveolar growth. Inhibits pituitary function. Action in reducing risk of recurrent preterm birth is unknown. **Therapeutic Effects:** ↓ risk of preterm birth in women at risk.

Pharmacokinetics

Absorption: Slowly absorbed following IM administration.

Distribution: Unknown.

Protein Binding: Extensively bound to plasma proteins.

Metabolism and Excretion: Extensively metabolized by the liver.

Half-life: 7.8 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IM	unknown	4.6 days	7 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity to hydroxyprogesterone or castor oil; History of or known thrombosis/thromboembolic disorder; History of or known/suspected breast cancer or other hormone-sensitive cancer; Unexplained abnormal vaginal bleeding unrelated to pregnancy; Cholestatic jaundice of pregnancy; Benign/malignant liver tumors or active liver disease; Uncontrolled hypertension.

Use Cautiously in: Risk factors for thromboembolic disorders (may ↑ risk); Diabetes mellitus or risk factors for diabetes mellitus (may impair glucose tolerance); History of preeclampsia, epilepsy, cardiac or renal impairment (may be adversely affected by fluid retention); History of depression (may worsen); Safe and effective use in children <16 yr has not been established.

Adverse Reactions/Side Effects

CV: hypertension. **Derm:** urticaria, pruritus. **F and E:** fluid retention. **GI:** diarrhea, jaundice, nausea. **Hemat:** THROMBOEMBOLISM. **Local:** injections site reactions. **Neuro:** depression. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema).

Interactions

Drug-Drug: May ↑ metabolism and ↓ blood levels and effectiveness of **drugs metabolized by the CYP1A2, CYP2A6, and CYP2B6 enzyme systems**.

© F.A. Davis Publishing

Route/Dosage

IM (Adults): 250 mg once weekly starting between 16 wk, 0 days and 20 wk, 6 days continuing until wk 37 of gestation or delivery, whichever occurs first.
Subcut (Adults): 275 mg once weekly starting between 16 wk, 0 days and 20 wk, 6 days continuing until wk 37 of gestation or delivery, whichever occurs first.

Availability (generic available)

Solution for IM injection (contains castor oil; multidose vial also contains benzyl alcohol): 250 mg/mL. **Solution for subcut injection (auto-injectors; contains castor oil):** 250 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of thromboembolic disorders during therapy.
- Monitor vital signs during therapy. If hypertension occurs, consider discontinuation of therapy.
- Assess for signs and symptoms of allergic reactions (urticaria, pruritus, angioedema) during therapy. Consider discontinuation if allergic reactions occur.
- Monitor for fluid retention during therapy, especially in patients at ↑ risk for complications (preeclampsia, epilepsy, migraine, asthma, cardiac or renal dysfunction).
- Assess mental status and mood changes, especially in women with a history of depression. Discontinue hydroxyprogesterone if depression recurs or worsens.
- ***Lab Test Considerations:*** May ↓ glucose tolerance. Monitor serum glucose in prediabetic and diabetic women during therapy.

Implementation

- Do not confuse hydroxyprogesterone with medroxyprogesterone.
- **Subcut:** Administer via auto-injector in back of upper arm. Rotate sites. Avoid areas where skin is tender, bruised, red, scaly, raised, thick, or hard. Avoid areas with scars, tattoos, or stretch marks. Solution is clear, yellow, viscous and oily. Do not administer solutions that are cloudy or contain particles. Store at room temperature in box to protect from light.
- **IM:** Draw up 1 mL of solution into a 3 mL syringe with an 18 gauge needle. Solution is clear, yellow, viscous and oily. Do not administer solutions that are cloudy or contain particles. Change needle to 21 gauge 1 1/2 inch needle. Inject into upper outer quadrant of gluteus maximus slowly, over 1 min or longer. Apply pressure to injection site to minimize bruising and swelling. Store hydroxyprogesterone in original box, at room temperature, protected from light. Discard unused product after 5 wk from first use.

Patient/Family Teaching

- Instruct patient to continue to receive injection weekly from health care professional. If a dose is missed, consult health care professional for instructions regarding returning to schedule.
- Advise patient to notify health care professional if signs and symptoms of blood clots (leg swelling, redness in leg, a spot on leg that is warm to touch, leg pain that worsens when foot is bended), allergic reactions (hives, itching, swelling of face), depression, or yellowing of skin and whites of the eyes occur.
- Inform patient that injection site reactions (pain, swelling, itching, bruising, nodule formation) may occur. If ↑ pain over time, oozing of blood or fluid, or swelling occur, notify health care professional.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional if breast feeding.

Evaluation/Desired Outcomes

- ↓ risk of preterm birth in women at risk.

© F.A. Davis Publishing

© F.A. Davis Publishing

ibandronate (i-ban-dro-nate)
Boniva

Classification
Therapeutic: bone resorption inhibitors
Pharmacologic: biphosphonates

Indications
Treatment/prevention of postmenopausal osteoporosis.

Action
Inhibits resorption of bone by inhibiting osteoclast activity. **Therapeutic Effects:** Reversal/prevention of progression of osteoporosis with decreased fractures.

Pharmacokinetics
Absorption: 0.6% absorbed following oral administration (significantly ↓ by food).
Distribution: Rapidly binds to bone.
Protein Binding: 90.9–99.5%.
Metabolism and Excretion: 50–60% excreted in urine; unabsorbed drug is eliminated in feces.
Half-life: *PO*— 10–60 hr; *IV*— 4.6–25.5 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.5–2 hr	up to 1 mo
IV	unknown	3 hr	up to 3 mo

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Abnormalities of the esophagus that delay esophageal emptying (i.e. strictures, achalasia); Uncorrected hypocalcemia; Inability to stand/sit upright for at least 60 min; CCr <30 mL/min.
Use Cautiously in: History of upper GI disorders; Concurrent use of NSAIDs or aspirin; Invasive dental procedures, cancer, receiving chemotherapy, corticosteroids, or angiogenesis inhibitors, poor oral hygiene, periodontal disease, dental disease, anemia, coagulopathy, infection, or poorly-fitting dentures (may ↑ risk of jaw osteonecrosis); OB: Use only if potential benefit outweighs risks to mother and fetus; Lactation: Lactation; Pedi: Children <18 yr (safety not established); Geri: Consider age-related ↓ in body mass, renal and hepatic function, concurrent disease states, and drug therapy.

Adverse Reactions/Side Effects
GI: diarrhea, dyspepsia, dysphagia, esophageal cancer, esophagitis, esophageal/gastric ulcer. **MS:** musculoskeletal pain, pain in arms/legs, femur fractures, osteonecrosis (primarily of jaw). **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME. **Resp:** asthma exacerbation. **Misc:** ANAPHYLAXIS, injection site reactions.

Interactions
Drug-Drug: **Calcium-**, **aluminum-**, **magnesium-**, and **iron-**containing products, including **antacids** ↓ absorption (ibandronate should be taken 60 min before). Concurrent use of **NSAIDs**, including **aspirin**, may ↑ risk of gastric irritation.
Drug-Food: Milk and other foods ↓ absorption.

Route/Dosage
PO (Adults): 150 mg once monthly.
IV (Adults): 3 mg every 3 mo.

Availability (generic available)
Tablets: 150 mg. **Injection:** 3 mg/3 mL in prefilled single-use syringe.

NURSING IMPLICATIONS

Assessment
- **Osteoporosis:** Assess patients for low bone mass before and periodically during therapy.
- **IV:** Monitor for signs and symptoms of anaphylactic reactions (swelling of face, lips, mouth or tongue; trouble breathing; wheezing; severe itching; skin rash, redness, or swelling; dizziness or fainting; fast heartbeat or pounding in chest; sweating) during therapy. Discontinue injection immediately and begin supportive treatment if symptoms occur.
- Perform a routine oral exam prior to initiation of therapy. Dental exam with appropriate preventative dentistry should be considered prior to therapy. Patients with history of tooth extraction, poor oral hygiene, gingival infections, diabetes, or use of a dental appliance or those taking immunosuppressive therapy, angiogenesis inhibitors, or systemic corticosteroids are at greater risk for osteonecrosis of the jaw.
- ***Lab Test Considerations:*** Assess serum calcium before and periodically during therapy. Hypocalcemia and vitamin D deficiency should be treated before initiating ibandronate therapy.
- May cause ↓ total alkaline phosphatase levels.
- May cause hypercholesterolemia.

Implementation
- **PO:** Administer first thing in the morning with 6–8 oz plain water 30 min before other medications, beverages, or food. Tablet should be swallowed whole; do not break, crush, or chew.
- *Once-monthly tablet* should be administered on the same date each mo.

IV Administration
- **IV:** Administer using prefilled syringe. Do not administer solution that is discolored or contains particulate matter. Administer IV only; other routes may cause tissue damage.
- ***Rate:*** Administer as a 15–30 sec bolus.
- **Y-Site Incompatibility:** Do not administer with calcium-containing solutions or other IV drugs.

Patient/Family Teaching
- Advise patient to eat a balanced diet and consult health care professional about the need for supple-

© F.A. Davis Publishing

mental calcium and vitamin D. Wait at least 60 min after administration before taking supplemental calcium and vitamin D.
- Encourage patient to participate in regular exercise and to modify behaviors that increase the risk of osteoporosis (stop smoking, reduce alcohol consumption).
- Inform patient that severe musculoskeletal pain may occur within days, mo, or yr after starting ibandronate. Symptoms may resolve completely after discontinuation or slow or incomplete resolution may occur. Notify health care professional if severe pain occurs.
- Advise patient to notify health care professional if rash or signs and symptoms of osteonecrosis of the jaw (pain, numbness, swelling of or drainage from the jaw, mouth, or teeth) occur.
- Instruct patient to notify health care professional if swallowing difficulties, chest pain, new or worsening heartburn, or trouble or pain when swallowing occurs; may be signs of problems of the esophagus.
- Advise patient to inform health care professional of ibandronate therapy prior to dental surgery.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **PO:** Instruct patient on the importance of taking as directed, first thing in the morning, 60 min before other medications, beverages, or food. Ibandronate should be taken with 6–8 oz plain water (mineral water, orange juice, coffee, and other beverages decrease absorption). Do not chew or suck on tablet. If a dose is missed, skip dose and resume the next morning; do not double doses or take later in the day. If a once-monthly dose is missed and the next scheduled dose is >7 days away, take in the morning following the date it is remembered. Resume original schedule the following mo. If the next dose is <7 days away, omit dose and take next scheduled dose. Do not discontinue without consulting health care professional.
- Caution patient to remain upright for 60 min following dose to facilitate passage to stomach and minimize risk of esophageal irritation. Advise patient to stop taking ibandronate and contact health care professional if symptoms of esophageal irritation (new or worsening dysphagia, pain on swallowing, retrosternal pain, or heartburn) occur.
- **IV:** Advise patient that IV doses should not be administered sooner than every 3 mo. If a dose is missed, have health care professional administer as soon as possible; next injection should be scheduled 3 mo from last injection.

Evaluation/Desired Outcomes

- Prevention of or decrease in the progression of osteoporosis in postmenopausal women. Discontinuation after 3–5 yr should be considered for women with low risk for fractures.

BEERS

ibuprofen (eye-byoo-proe-fen)

Advil, Advil Infants, Advil Junior Strength, Advil Migraine, Children's Advil, Children's Europrofen, Children's Motrin, Motrin, Motrin IB, Motrin Infants Drops, Motrin Junior Strength, PediaCare IB Ibuprofen

ibuprofen (injection)

Caldolor, NeoProfen (ibuprofen lysine)

Classification

Therapeutic: antipyretics, antirheumatics, nonopioid analgesics
Pharmacologic: nonsteroidal anti-inflammatory drugs (NSAIDs)

Indications

PO, IV: Treatment of: Mild to moderate pain, Fever. **PO:** Treatment of: Inflammatory disorders including rheumatoid arthritis (including juvenile) and osteoarthritis, Dysmenorrhea. **IV:** Moderate to severe pain with opioid analgesics. Closure of a clinically significant PDA in neonates weighing 500–1500 g and ≤32 wk gestational age (ibuprofen lysine only).

Action

Inhibits prostaglandin synthesis. **Therapeutic Effects:** Decreased pain and inflammation. Reduction of fever.

Pharmacokinetics

Absorption: Oral formulation is well absorbed (80%) from the GI tract; IV administration results in complete bioavailability.
Distribution: Does not enter breast milk in significant amounts.
Protein Binding: 99%.
Metabolism and Excretion: Mostly metabolized by the liver; small amounts (1%) excreted unchanged by the kidneys.
Half-life: Neonates: 26–43 hr; Children: 1–2 hr; Adults: 2–4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (antipyretic)	0.5–2.5 hr	2–4 hr	6–8 hr
PO (analgesic)	30 min	1–2 hr	4–6 hr
PO (anti-inflammatory)	≤7 days	1–2 wk	unknown
IV (analgesic)	unknown	unknown	6 hr
IV (antipyretic)	within 2 hr	10–12 hr†	4–6 hr

†With repeated dosing.

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity (cross-sensitivity may exist with other NSAIDs, including aspirin); Active GI bleeding or ulcer disease; Chewable tablets contain aspartame and should not be used in patients with phenylketonuria; Coronary artery bypass graft (CABG) surgery; History of recent MI; Severe HF; OB: Avoid use after 30 wk gestation; Pedi: Ibuprofen lysine: Preterm neonates with untreated infection, congenital heart disease where patency of PDA is necessary for pulmonary or systemic blood flow, bleeding, thrombocytopenia, coagulation defects, necrotizing enterocolitis, significant renal dysfunction.

Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, MI, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; Renal or hepatic disease, dehydration, or patients on nephrotoxic drugs (may ↑ risk of renal toxicity); Aspirin triad patients (asthma, nasal polyps, and aspirin intolerance); can cause fatal anaphylactoid reactions; Chronic alcohol use/abuse; Coagulation disorders; OB: Use at or after 20 wk gestation may cause fetal or neonatal renal impairment; if treatment is necessary between 20 wk and 30 wk gestation, limit use to the lowest effective dose and shortest duration possible; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established for children <6 mo (oral and IV Caldolor); hyperbilirubinemia in neonates (may displace bilirubin from albumin-binding sites); safety and effectiveness of ibuprofen lysine only established in premature infants; Geri: ↑ risk of adverse in older adults secondary to age-related ↓ in renal and hepatic function, concurrent illnesses, and medications.

Exercise Extreme Caution in: History of GI bleeding or GI ulcer disease.

Adverse Reactions/Side Effects

CV: HF, MYOCARDIAL INFARCTION, STROKE, arrhythmias, edema, hypertension. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash, injection site reaction. **EENT:** amblyopia, blurred vision, tinnitus. **F and E:** hyperkalemia. **GI:** GI BLEEDING, HEPATITIS, constipation, dyspepsia, nausea, necrotizing enterocolitis (ibuprofen lysine), vomiting, abdominal discomfort. **GU:** cystitis, hematuria, renal failure. **Hemat:** anemia, blood dyscrasias, prolonged bleeding time. **Neuro:** headache, dizziness, drowsiness, intraventricular hemorrhage (ibuprofen lysine), psychic disturbances. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: May limit the cardioprotective (antiplatelet) effects of low-dose **aspirin**. Concurrent use with **aspirin** may ↓ effectiveness of ibuprofen. Additive adverse GI side effects with **aspirin**, **oral potassium**, other **NSAIDs**, **corticosteroids**, or **alcohol**. Chronic use with **acetaminophen** may ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics**, **ACE inhibitors**, or other **antihypertensives**. May ↑ hypoglycemic effects of **insulin** or **oral hypoglycemic agents**. May ↑ serum **lithium** levels and risk of toxicity. ↑ risk of toxicity from **methotrexate**. **Probenecid** ↑ risk of toxicity from ibuprofen. ↑ risk of bleeding with **cefotetan**, **corticosteroids**, **valproic acid**, **thrombolytics**, **warfarin**, and **drugs affecting platelet function** including **clopidogrel**, **eptifibatide**, or **tirofiban**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. ↑ risk of nephrotoxicity with **cyclosporine**. May ↓ the clearance and ↑ levels of **amikacin**.

Drug-Natural Products: ↑ bleeding risk with **arnica**, **chamomile**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**, and others.

Route/Dosage

Analgesia/Anti-inflammatory/Antipyretic

PO (Adults): *Anti-inflammatory*—400–800 mg 3–4 times daily (not to exceed 3200 mg/day). *Analgesic/antidysmenorrheal/antipyretic*—200–400 mg every 4–6 hr (not to exceed 1200 mg/day).

PO (Children 6 mo–12 yr): *Anti-inflammatory*—30–50 mg/kg/day in 3–4 divided doses (maximum dose: 2.4 g/day). *Antipyretic*—5 mg/kg for temperature <102.5°F (39.17°C) or 10 mg/kg for higher temperatures (not to exceed 40 mg/kg/day); may be repeated every 4–6 hr.

PO (Infants and Children): *Analgesic*—4–10 mg/kg/dose every 6–8 hr.

IV (Adults): *Analgesic*—400–800 mg every 6 hr as needed (not to exceed 3200 mg/day); *Antipyretic*—400 mg initially, then 400 mg every 4–6 hr or 100–200 mg every 4 hr as needed (not to exceed 3200 mg/day).

IV (Children 12–17 yr): *Analgesic and antipyretic*—400 mg every 4–6 hr as needed (not to exceed 2400 mg/day).

IV (Children 6 mo–12 yr): *Analgesic and antipyretic*—10 mg/kg (not to exceed 400 mg) every 4–6 hr as needed (not to exceed 40 mg/kg/day or 2400 mg/day, whichever is less).

Pediatric OTC Dosing

PO (Children 11 yr/72–95 lb): 300 mg every 6–8 hr.

PO (Children 9–10 yr/60–71 lb): 250 mg every 6–8 hr.

PO (Children 6–8 yr/48–59 lb): 200 mg every 6–8 hr.

PO (Children 4–5 yr/36–47 lb): 150 mg every 6–8 hr.

© F.A. Davis Publishing

PO (Children 2–3 yr/24–35 lb): 100 mg every 6–8 hr.
PO (Children 12–23 mo/18–23 lb): 75 mg every 6–8 hr.
PO (Infants 6–11 mo/12–17 lb): 50 mg every 6–8 hr.

PDA Closure

IV (Neonates Gestational age ≤32 wk, 500–1500 g): 10 mg/kg followed by two doses of 5 mg/kg at 24 and 48 hr after initial dose.

Availability (generic available)

Tablets: 200 mg[OTC], 400 mg, 600 mg, 800 mg. **Capsules (liquigels):** 200 mg[OTC]. **Chewable tablets (fruit, grape, orange, and citrus flavor):** 100 mg[OTC]. **Oral solution (berry flavor):** 50 mg/1.25 mL[OTC]. **Oral suspension (fruit, berry, grape flavor):** 100 mg/5 mL[OTC]. **Solution for injection:** 10 mg/mL (NeoProfen), 100 mg/mL (Caldolor). ***In combination with:*** decongestants[OTC], hydrocodone, famotidine (Duexis). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- Assess for signs and symptoms of GI bleeding (tarry stools, light-headedness, hypotension), renal dysfunction (elevated BUN and serum creatinine levels, decreased urine output), and hepatic impairment (elevated liver enzymes, jaundice). Geri: Higher risk for poor outcomes or death from GI bleeding. Age-related renal impairment increases risk of hepatic and renal toxicity.
- Assess patient for skin rash frequently during therapy. Discontinue ibuprofen at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, facial swelling, eosinophilia) periodically during therapy. If symptoms occur discontinue ibuprofen.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- **Arthritis:** Assess pain and range of motion prior to and 1–2 hr following administration.
- **Fever:** Monitor temperature; note signs associated with fever (diaphoresis, tachycardia, malaise).
- **PDA Closure:** Monitor preterm neonates for signs of bleeding, infection, and decreased urine output. Monitor IV site for signs of extravasation. If ductus arteriosus closes or size significantly decreases, 2nd and 3rd doses are unnecessary.
- ***Lab Test Considerations:*** BUN, serum creatinine, CBC, and liver function tests should be evaluated periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, alkaline phosphatase, LDH, AST, and ALT may show ↑ levels. Blood glucose, hemoglobin, and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- May cause prolonged bleeding time; may persist for <1 day following discontinuation.
- **PDA Closure:** If urinary output <0.6 mL/kg/hr at time of 2nd or 3rd dose, hold dose until renal function has returned to normal.

Implementation

- Do not confuse Motrin (ibuprofen) with Neurontin (gabapentin).
- Administration of higher than recommended doses does not provide increased pain relief but may increase incidence of side effects.
- Patient should be well hydrated before administration to prevent renal adverse reactions. Do not give to neonates with urine output <0.6 mL/kg/hr.
- Use lowest effective dose for shortest period of time, especially in the elderly, to minimize risk of cardiovascular thrombotic events.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- **PO:** For rapid initial effect, administer 30 min before or 2 hr after meals. May be administered with food, milk, or antacids to decrease GI irritation. Tablets may be crushed and mixed with fluids or food; 800-mg tablet can be dissolved in water.
- **Dysmenorrhea:** Administer as soon as possible after the onset of menses. Prophylactic treatment has not been shown to be effective.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** 0.9% NaCl, D5W, or LR. ***Concentration:*** *Ibuprofen injection:* Dilute the 800-mg dose in at least 200 mL and the 100-mg, 200-mg, and 400-mg doses in at least 100 mL for a concentration of 4 mg/mL or less. *Ibuprofen lysine:* Dilute in appropriate volume of D5W or 0.9% NaCl and infuse over 15 min. Do not administer solutions that are discolored or contain particulate matter. Stable for up to 24 hr at room temperature. Discard remaining solution; does not contain preservatives. ***Rate:*** Infuse over at least 30 min for adults and at least 10 min for children for *Caldolor* or over 15 min for *NeoProfen*.

Ibuprofen

- **Y-Site Compatibility:** metoprolol.
- **Y-Site Incompatibility:** esmolol, labetalol.

Ibuprofen Lysine

- **Y-Site Compatibility:** ceftazidime, epinephrine, furosemide, heparin, hydrocortisone, insulin, regular,

© F.A. Davis Publishing

phenobarbital, potassium chloride, sodium bicarbonate.
- **Y-Site Incompatibility:** amikacin, amino acids, caffeine citrate, dobutamine, dopamine, isoproterenol, midazolam, multielectrolyte concentrate, vancomycin, vecuronium.

Patient/Family Teaching
- Advise patients to take ibuprofen with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for next dose. Do not double doses. Pedi: Teach parents and caregivers to calculate and measure doses accurately and to use measuring device supplied with product.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin including low dose aspirin, acetaminophen, and other OTC or herbal products without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Instruct patient not to take OTC ibuprofen preparations for more than 10 days for pain or more than 3 days for fever, and to consult health care professional if symptoms persist or worsen. Many OTC products contain ibuprofen; avoid duplication.
- Caution patient that use of ibuprofen with 3 or more glasses of alcohol per day may increase the risk of GI bleeding.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, epigastric pain, dyspepsia, black stools, hematemesis, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain), or cardiovascular events (chest pain, shortness of breath, weakness, slurring of speech) occurs.
- Pedi: Advise parents or caregivers not to administer ibuprofen to children who may be dehydrated (can occur with vomiting, diarrhea, or poor fluid intake); dehydration increases risk of renal dysfunction.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid ibuprofen starting at 20 wk gestation due to risk of oligohydramnios and 30 wk gestation because of risk of premature closing of the fetal ductus arteriosus. If NSAIDs are necessary between 20 and 30 wk gestation, limit use to the lowest effective dose and shortest duration possible. Consider ultrasound monitoring of amniotic fluid if NSAID therapy extends beyond 48 hr. Discontinue ibuprofen if oligohydramnios occurs and follow up with infant. Advise women to avoid ibuprofen in the 3rd trimester of pregnancy (after 29 wk), may cause premature closure of the fetal ductus arteriosus. Use during labor or delivery may delay birth and increase risk of stillbirth. Advise patient to notify health care professional if breast feeding. May cause temporary infertility in women.

Evaluation/Desired Outcomes
- Decrease in severity of pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 7 days, but maximum effectiveness may require 1–2 wk of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Reduction in fever.
- Closure of PDA.

I

idaruCIZUmab
(eye-da-roo-**siz**-ue-mab)
Praxbind

Classification
Therapeutic: antidotes
Pharmacologic: monoclonal antibodies

Indications
To counteract the anticoagulant effect of dabigatran for emergency surgery/urgent procedures or life-threatening uncontrolled bleeding.

Action
Human monoclonal antibody fragment (Fab) that selectively binds to dabigatran and its metabolites, preventing its binding to thrombin and negating its anticoagulant effects. Does not reverse any other anticoagulants. **Therapeutic Effects:** Reversal of the anticoagulant effect of dabigatran.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Metabolism and Excretion: Biodegraded to smaller molecules. 60% excreted in urine, remainder via protein catabolism primarily in the kidneys.
Half-life: 10.3 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	immediate	unknown	24 hr

Contraindications/Precautions
Contraindicated in: None noted.
Use Cautiously in: Geri: Elderly patients may be more sensitive to drug effects; OB: Safety not estab-

© F.A. Davis Publishing

lished. Consider maternal benefits and fetal risks; Lactation: Safety not established, consider beneficial effects of breast feeding and possible adverse effects in infant; Pedi: Safety and effectiveness not established.
Exercise Extreme Caution in: Hereditary fructose intolerance (risk of serious adverse reactions due to sorbitol excipient); History of serious hypersensivity (including anaphylactoid reactions) to idarucizumab.

Adverse Reactions/Side Effects
CV: THROMBOEMBOLISM. **F and E:** hypokalemia. **GI:** constipation. **Neuro:** delirium. **Misc:** fever, hypersensitivity reactions.

Interactions
Drug-Drug: None noted.

Route/Dosage
IV (Adults): 5 g as single dose.

Availability
Solution for injection (contains sorbitol): 2.5 g/50 mL.

NURSING IMPLICATIONS
Assessment
- Reversal of dabigatran exposes patient to thrombotic risk of their underlying disease; may cause thromboembolism. Resume anticoagulant therapy as soon as medically appropriate. Dabigatran therapy can be reinstituted 24 hr after idarucizumab infusion.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, urticaria, fever, pruritus, dyspnea, orofacial swelling). Contains sorbitol; reactions in patients with hereditary fructose intolerance have included hypoglycemia, hypophosphatemia, metabolic acidosis, increase in uric acid, acute liver failure. If symptoms occur discontinue therapy and treat symptomatically.
- ***Lab Test Considerations:*** Monitor coagulation parameters (activated partial thromboplastin time [aPTT], ecarin clotting time [ECT]) 12–24 hr after infusion.
- May cause hypokalemia.

Implementation
- Do not confuse idarucizumab with idarubicin.

IV Administration
- **Intermittent Infusion:** Flush IV line with 0.9% NaCl prior to and following infusion. Solution is clear to opalescent, colorless to slightly yellow; do not administer solutions that are discolored or contain precipitates. Administer as 2 consecutive infusion or inject both vials consecutively via syringe. Must be administered within 1 hr when removed from vial. Store at room temperature and use within 6 hr if exposed to light.

Patient/Family Teaching
- Explain purpose of idarucizumab to patient.
- Instruct patient to notify health care professional immediately if bleeding or signs and symptoms of hypersensitivity occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes
- Reversal of the anticoagulant effect of dabigatran.

ifosfamide (eye-foss-fam-ide)
Ifex

Classification
Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Indications
Germ cell testicular carcinoma (with other agents). Used with mesna, which prevents ifosfamide-induced hemorrhagic cystitis.

Action
Following conversion to active compounds, interferes with DNA replication and RNA transcription, ultimately disrupting protein synthesis (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics
Absorption: Administered IV only; inactive prior to conversion to metabolites.
Distribution: Excreted in breast milk.
Metabolism and Excretion: Metabolized by the liver to active antineoplastic compounds.
Half-life: 15 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	7–14 days	21 days

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB, Lactation: Pregnancy or lactation.
Use Cautiously in: Patients with childbearing potential; Active infections; ↓ bone marrow reserve; Geri: Geriatric patients; Other chronic debilitating illness; Renal impairment; Pedi: Children.

Adverse Reactions/Side Effects
CV: cardiotoxicity. **GI:** nausea, vomiting, anorexia, constipation, diarrhea, hepatotoxicity. **GU:** hemorrhagic cystitis, dysuria, sterility, renal toxicity. **Derm:** alopecia. **Hemat:** ANEMIA, LEUKOPENIA, THROMBOCYTOPENIA. **Local:** phlebitis. **Neuro:** CNS toxicity (somnolence, confusion, hallucinations, coma), cranial nerve dysfunction, disorientation, dizziness. **Misc:** allergic reactions.

© F.A. Davis Publishing

Interactions

Drug-Drug: CYP3A4 inhibitors, including **ketoconazole**, **fluconazole**, **itraconazole**, **sorafenib**, and **aprepitant** may ↓ its effectiveness. **CYP3A4 inducers**, including **carbamazepine**, **phenytoin**, **phenobarbital**, and **rifampin** may ↑ the formation of a toxic metabolite and may ↑ risk of toxicity. ↑ myelosuppression with other **antineoplastics** or **radiation therapy**. Toxicity may be ↑ by **allopurinol** or **phenobarbital**. May ↓ antibody response to and ↑ risk of adverse reactions from **live-virus vaccines**.

Drug-Food: Grapefruit juice may ↑ levels; avoid concurrent use.

Route/Dosage

Other Regimens are Used

IV (Adults): 1.2 g/m²/day for 5 days; coadminister with mesna. May repeat cycle every 3 wk.

Availability (generic available)

Powder for injection (requires reconstitution): 1 g/vial, 3 g/vial. **Solution for injection:** 50 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, respiratory rate, and temperature frequently during administration. Report significant changes.
- Monitor urinary output frequently during therapy. Notify health care professional if hematuria occurs. To reduce the risk of hemorrhagic cystitis, fluid intake should be at least 3000 mL/day for adults and 1000–2000 mL/day for children. Mesna is given concurrently to prevent hemorrhagic cystitis.
- Monitor neurologic status. Ifosfamide should be discontinued if severe CNS symptoms (agitation, confusion, hallucinations, unusual tiredness) occur. Symptoms usually abate within 3 days of discontinuation of ifosfamide but may persist for longer; fatalities have been reported.
- Assess nausea, vomiting, and appetite. Weigh weekly. Premedication with an antiemetic may be used to minimize GI effects. Adjust diet as tolerated.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- ***Lab Test Considerations:*** Monitor CBC, differential, and platelet count prior to and periodically during therapy. Withhold dose if WBC <2000/mm³ or platelet count is <50,000/mm³. Nadir of leukopenia and thrombocytopenia occurs within 7–14 days and usually recovers within 21 days of therapy.
- Urinalysis should be evaluated before each dose. Withhold dose until recovery if urinalysis shows10 RBCs per high-power field.
- May cause ↑ in liver enzymes and serum bilirubin.
- Monitor AST, ALT, serum alkaline phosphatase, bilirubin, and LDH prior to and periodically during therapy. May cause ↑ in liver enzymes and serum bilirubin.
- Monitor BUN, serum creatinine, phosphate, and potassium periodically during therapy. May cause hypokalemia.

Implementation

- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.

IV Administration

- **IV:** Prepare solution by diluting each 1-g vial with 20 mL of sterile water or bacteriostatic water for injection containing parabens. Use solution prepared without bacteriostatic water within 6 hr. Solution prepared with bacteriostatic water is stable for 1 wk at 30°C or 6 wk at 5°C.
- **Intermittent Infusion:** ***Dilution:*** May be further diluted in D5W, 0.9% NaCl, LR, or sterile water for injection. ***Concentration:*** 0.6 to 20 mg/mL (maximum 40 mg/mL). Dilute solution is stable for 7 days at room temperature or 6 wk if refrigerated. ***Rate:*** Administer over at least 30 min.
- **Continuous Infusion:** Has also been administered as a continuous infusion over 72 hr.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B cholesteryl, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, granisetron, haloperidol, heparin, heta-

© F.A. Davis Publishing

starch, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, insulin, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, minocycline, mitomycin, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** cefepime, diazepam, methotrexate, pantoprazole, phenytoin, potassium phosphates.

Patient/Family Teaching

- Emphasize need for adequate fluid intake throughout therapy. Patient should void frequently to decrease bladder irritation from metabolites excreted by the kidneys. Notify health care professional immediately if hematuria is noted.
- Instruct patient to drink at least 8 glasses of water/day during and for 3 days after completion of therapy.
- Advise patient to avoid grapefruit and grapefruit juice during therapy.
- Instruct patient to notify health care professional promptly if fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis; or confusion occurs.
- Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Patient should also be cautioned not to drink alcoholic beverages or to take products containing aspirin or NSAIDs, as these may precipitate GI hemorrhage.
- Discuss with patient the possibility of hair loss. Explore methods of coping.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient not to receive any vaccinations without advice of health care professional; ifosfamide may decrease antibody response to and increase risk of adverse reactions from live-virus vaccines.
- Review with patient the need for contraception during therapy and for at least 6 mo after therapy. Women should avoid pregnancy and breast feeding and men should avoid fathering a child during and for at least 6 mo after end of therapy.
- Rep: Caution patient about the potential for amenorrhea, premature menopause, and sterility from this medication.

Evaluation/Desired Outcomes

- Decrease in size or spread of malignant germ cell testicular carcinoma.

BEERS

iloperidone

(eye-loe-**per**-i-done)

Fanatp

Classification

Therapeutic: antipsychotics

Pharmacologic: benzisoxazoles

Indications

Schizophrenia.

Action

May act by antagonizing dopamine and serotonin in the CNS. **Therapeutic Effects:** Decreased symptoms of schizophrenia.

Pharmacokinetics

Absorption: Well absorbed (96%) following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver. Metabolism is genetically determined; primarily by CYP3A4 and CYP2D6 enzyme systems, with individual variability in metabolism via CYP2D6 (extensive metabolizers [EM] and poor metabolizers [PM] and some in-between; 7–10% of Caucasians and 3–8% of Black/African Americans are considered PM). Two major metabolites (P88 and P95) may be partially responsible for pharmacologic activity. 58% excreted in urine as metabolites in EM and 45% in PM; 20% eliminated in feces in EM and 22.1% in PM.

Half-life: *EMs*—iloperidone–18 hr, P88–26 hr, P95–23 hr; *PMs*—iloperidone–33 hr, P88–37 hr, P95–31 hr.

TIME/ACTION PROFILE (antipsychotic effect)

ROUTE	ONSET	PEAK	DURATION
PO	2–4 wk	2–4 hr†	unknown

†Blood level.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of drugs known to prolong QTc interval; Bradycardia, recent MI, or uncompensated heart failure (↑ risk

© F.A. Davis Publishing

of serious arrhythmias); Congenital long QT syndrome, QTc interval >500 msec or history of cardiac arrhythmias; Electrolyte abnormalities, especially hypomagnesemia or hypokalemia (correct prior to therapy); Severe hepatic impairment; Lactation: Breast feeding should be avoided.

Use Cautiously in: Known cardiovascular disease including heart failure, history of MI/ischemia, conduction abnormalities, cerebrovascular disease, or other conditions known to predispose to hypotension including dehydration, hypovolemia, concurrent antihypertensive therapy (↑ risk of orthostatic hypotension); Concurrent use of CYP3A4 or CYP2D6 inhibitors; Known ↓ WBC or history of drug-induced leukopenia/neutropenia; Circumstances that may result in ↑ body temperature, including strenuous exercise, exposure to extreme heat, concurrent anticholinergic activity, or dehydration (may impair thermoregulation); Patients at risk for aspiration or falls; Moderate hepatic impairment; OB: Neonates at ↑ risk for extrapyramidal symptoms and withdrawal after delivery when exposed during the 3rd trimester; use only if potential maternal benefit justifies potential fetal risk; Pedi: Safety and effectiveness not established; Geri: Elderly patients with dementia-related psychoses (↑ risk of death, CVA or TIA).

Adverse Reactions/Side Effects

CV: orthostatic hypotension, tachycardia, palpitations, QTc interval prolongation. **EENT:** nasal congestion. **Endo:** dyslipidemia, hyperglycemia, hyperprolactinemia. **GI:** dry mouth, nausea, abdominal discomfort, diarrhea. **GU:** priapism, urinary incontinence. **Metab:** weight gain, weight loss. **MS:** ↓ bone density, musculoskeletal stiffness. **Neuro:** tardive dyskinesia, NEUROLEPTIC MALIGNANT SYNDROME, SUICIDAL THOUGHTS, dizziness, drowsiness, fatigue, agitation, delusion, restlessness, extrapyramidal disorders. **Misc:** ANAPHYLAXIS, ANGIOEDEMA.

Interactions

Drug-Drug: Avoid concurrent use of drugs known to prolong the QTc interval including **quinidine**, **procainamide**, **amiodarone**, **sotalol**, **chlorpromazine**, **thioridazine**, **moxifloxacin**, **pentamidine**, and **methadone**. Concurrent use of strong **CYP2D6 inhibitors** including **fluoxetine** and **paroxetine** ↑ levels and the risk of toxicity; dose ↓ is required. Concurrent use of strong **CYP3A4 inhibitors** including **ketoconazole** and **clarithromycin** ↑ levels and the risk of toxicity; dosage ↓ is required. Concurrent use of **antihypertensives** including **diuretics** may ↑ risk of orthostatic hypotension. Concurrent use of **anticholinergics** may ↑ risk of impaired thermoregulation.

Route/Dosage

PO (Adults): Initiate treatment with 1 mg twice daily on the first day, then 2 mg twice daily the 2nd day, then ↑ by 2 mg/day every day until a target dose of 12–24 mg/day given in two divided doses is reached; *Concurrent use of strong CYP2D6 or CYP3A4 inhibitors*—↓ dose by 50%; if inhibitor is withdrawn ↑ dose to previous amount. Retitration is required if iloperidone is discontinued >300 days; *Poor metabolizers of CYP2D6*—↓ dose by 50%.

Availability (generic available)

Tablets: 1 mg, 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (delusions, hallucinations, and behavior) before and periodically during therapy.
- Monitor mood changes. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor BP (sitting, standing, lying down) and pulse before and periodically during therapy. May cause prolonged QT interval, tachycardia, and orthostatic hypotension. Protect patient from falls.
- Observe patient when administering medication to ensure that medication is actually swallowed and not hoarded.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation of medication may be necessary.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately and discontinue therapy; may be irreversible.
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Discontinue iloperidone and notify health care professional immediately if these symptoms occur.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Assess weight and BMI initially and during therapy. Refer as appropriate for nutritional/weight and medical management.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- ***Lab Test Considerations:*** Monitor fasting blood glucose before and periodically during therapy in diabetic patients.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC.

© F.A. Davis Publishing

May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.
- Monitor serum potassium and magnesium levels in patients at risk for electrolyte disturbances.
- Monitor serum prolactin prior to and periodically during therapy. May cause ↑ serum prolactin levels.

Implementation
- Do not confuse Fanapt (iloperidone) with Xanax (alprazolam).
- **PO:** Administer twice daily without regard to food.

Patient/Family Teaching
- Instruct patient to take medication exactly as directed. If doses are missed for >3 days, restart at initiation dose. Advise patient that appearance of tablets in stool is normal and not of concern.
- Inform patient of the possibility of extrapyramidal symptoms, neuroleptic malignant syndrome, and tardive dyskinesia. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- Inform patient of potential for weight gain and hyperglycemia, and the need for monitoring weight and blood glucose periodically during therapy.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Extremes in temperature should also be avoided; this drug impairs body temperature regulation.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, tremors, palpitations, fainting, menstrual abnormalities, galactorrhea, or sexual dysfunction occur.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding. Encourage women who become pregnant while taking iloperidone to enroll in the National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/. Monitor neonates for extrapyramidal and/or withdrawal symptoms and manage symptoms appropriately.
- Emphasize the need for continued follow-up for psychotherapy and monitoring for side effects.

Evaluation/Desired Outcomes
- Decrease in excited, paranoid, or withdrawn behavior.

HIGH ALERT

imatinib (i-mat-i-nib)
Gleevec

Classification
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Indications
Newly diagnosed Philadelphia positive (Ph+) chronic myeloid leukemia (CML). CML in blast crisis, accelerated phase, or in chronic phase after failure of interferon-alpha treatment. Kit (CD117) positive metastatic/unresectable malignant gastrointestinal stomal tumors (GIST). Adjuvant treatment following resection of Kit (CD117) positive GIST. Pediatric patients with Ph+ CML after failure of bone marrow transplant or resistance to interferon-alpha. Adult patients with relapsed or refractory Ph+ acute lymphoblastic leukemia (ALL). Newly diagnosed Ph+ ALL (in combination with chemotherapy). Myelodysplastic/myeloproliferative disease (MDS/MPD) associated with platelet-derived growth factor receptor (PDGFR) gene rearrangements. Aggressive systemic mastocytosis (ASM) without the D816V c-Kit mutation or with c-Kit mutational status unknown. Hypereosinophilic syndrome and/or chronic eosinophilic leukemia (HES/CEL). Unresectable, recurrent, or metastatic dermatofibrosarcoma protuberans (DFSP).

Action
Inhibits kinases which may be produced by malignant cell lines. **Therapeutic Effects:** Inhibits production of malignant cell lines with decreased proliferation of leukemic cells in CML, HES/CEL, and ALL and malignant cells in GIST, MDS/MPD, ASM, and DFSP.

Pharmacokinetics
Absorption: Well absorbed (98%) following oral administration.
Distribution: Unknown.
Protein Binding: 95%.
Metabolism and Excretion: Mostly metabolized by the CYP3A4 enzyme system to N-demethyl imatinib, which is as active as imatinib. Excreted mostly in feces as metabolites. 5% excreted unchanged in urine.
Half-life: *Imatinib*—18 hr; *N-desmethyl imatinib*—40 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (blood levels of imatinib)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; OB: Potential for fetal harm; Lactation: Potential for serious adverse reactions in nursing infants; breast feeding should be avoided.

Use Cautiously in: Hepatic impairment (dose ↓ recommended if bilirubin >3 times normal or liver transaminases >5 times normal); Cardiac disease (severe HF and left ventricular dysfunction may occur); Renal impairment, diabetes, hypertension, HF (↑ risk of nephrotoxicity); Rep: Women of reproductive potential; Pedi: Children <1 yr (safety not established); Geri: ↑ risk of edema.

Adverse Reactions/Side Effects

CV: HF. **EENT:** epistaxis, nasopharyngitis, blurred vision. **GU:** nephrotoxicity. **Neuro:** fatigue, headache, weakness, dizziness, somnolence. **Resp:** cough, dyspnea, pneumonia. **GI:** HEPATOTOXICITY, abdominal pain, anorexia, constipation, diarrhea, dyspepsia, nausea, vomiting. **Derm:** DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), petechiae, pruritus, skin rash. **F and E:** edema (including pleural effusion, pericardial infusion, pulmonary edema, and superficial edema), hypokalemia. **Endo:** ↓ growth (in children), hypothyroidism. **Hemat:** BLEEDING, NEUTROPENIA, THROMBOCYTOPENIA. **Metab:** weight gain. **MS:** arthralgia, muscle cramps, musculoskeletal pain, myalgia. **Misc:** TUMOR LYSIS SYNDROME, fever, night sweats.

Interactions

Drug-Drug: Blood levels and effects are ↑ by concurrent use of potent CYP3A4 inhibitors (e.g., **ketoconazole**, **itraconazole**, **clarithromycin**, **atazanavir**, **indinavir**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, or **voriconazole**). Blood levels and effects may be ↓ by potent CYP3A4 inducers (e.g., **dexamethasone**, **phenytoin**, **carbamazepine**, **rifampin**, **rifabutin**, and **phenobarbital**; if used concurrently, ↑ dose of imatinib by 50%. ↑ blood levels of **simvastatin**. Imatinib inhibits the following enzyme systems: CYP2C9, CYP2D6, CYP3A4/5 and may be expected to alter the effects of other drugs metabolized by these systems.

Drug-Food: Blood levels and effects are ↑ by **grapefruit juice**; concurrent use should be avoided.

Route/Dosage

Chronic Myeloid Leukemia

PO (Adults): *Chronic phase*—400 mg once daily, may be ↑ to 600 mg once daily; *accelerated phase or blast crisis*—600 mg once daily; may be ↑ to 800 mg/day given as 400 mg twice daily based on response and circumstances.

PO (Children): *Newly diagnosed Ph+ CML*—340 mg/m² once daily (not to exceed 600 mg); *CML recurrent after failure of bone marrow transplant or resistance to interferon-alpha*—260 mg/m² once daily.

Gastrointestinal Stromal Tumors

PO (Adults): *Metastatic or unresectable*—400 mg once daily; may be ↑ to 400 mg twice daily if well tolerated and response insufficient; *Adjuvant treatment after resection*—400 mg once daily.

Ph+ Acute Lymphoblastic Leukemia

PO (Adults): 600 mg once daily.

PO (Children): 340 mg/m² once daily (not to exceed 600 mg).

Myelodysplastic/Myeloproliferative Diseases

PO (Adults): 400 mg once daily.

Aggressive Systemic Mastocytosis

PO (Adults): 400 mg once daily. *For patients with eosinophilia*—100 mg once daily; ↑ to 400 mg once daily if well tolerated and response insufficient.

Hypereosinophilic Syndrome and/or Chronic Eosinophilic Leukemia

PO (Adults): 400 mg once daily. *For patients with FIP1L1–PDGFRa fusion kinase*—100 mg once daily; ↑ to 400 mg once daily if well tolerated and response insufficient.

Dermatofibrosarcoma Protuberans

PO (Adults): 400 mg twice daily.

Hepatic Impairment

PO (Adults): ↓ dose by 25% in severe hepatic impairment.

Renal Impairment

PO (Adults): *CCr 40–59 mL/min*—Do not exceed dose of 600 mg/day; *CCr 20–39 mL/min*—↓ initial dose by 50%; ↑ as tolerated.

Availability (generic available)

Tablets: 100 mg, 400 mg.

NURSING IMPLICATIONS

Assessment

- Monitor for fluid retention. Weigh regularly, and assess for signs of pleural effusion, pericardial effusion, pulmonary edema, ascites (dyspnea, periorbital edema, swelling in feet and ankles, weight gain). Evaluate unexpected weight gain. Edema is usually managed with diuretics. General fluid retention is usually dose related, more common in accel-

© F.A. Davis Publishing

erated phase or blast crisis, and is more common in the elderly. Treatment usually involves diuretics, supportive therapy, and interruption of imatinib.
- Monitor growth rate in children and adolescents; may cause decrease in growth.
- Monitor vital signs; may cause fever.
- Monitor for tumor lysis syndrome (malignant disease progression, high WBC counts, hyperuricemia, hyperkalemia, hyperphosphatemia, hypocalcemia, and/or dehydration). Prevent by maintaining adequate hydration and correcting uric acid levels prior to starting imatinib.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- ***Lab Test Considerations:*** Monitor liver function before and monthly during treatment or when clinically indicated. May cause ↑ transaminases and bilirubin which usually lasts 1 wk and may require dose reduction or interruption. If bilirubin is >3 times the upper limit of normal or transaminases are >5 times the upper limit of normal, withhold dose until bilirubin levels return to <1.5 times the upper limit of normal and transaminase levels to <2.5 times the upper limit of normal. Treatment may then be continued at reduced levels (patients on 400 mg/day should receive 300 mg/day and patients receiving 600 mg/day should receive 400 mg/day).
- Monitor CBC weekly for the 1st mo, biweekly for the 2nd mo, and periodically during therapy. May cause neutropenia and thrombocytopenia, usually lasting 2–3 wk or 3–4 wk, respectively, and anemia. Usually requires dose reduction, but may require discontinuation (see Implementation).
- Patients receiving *chronic phase, myelodysplastic/myeloproliferative disease, aggressive systemic mastocytosis, and hypereosinophilic syndrome and/or chronic eosinophilic leukemia* treatment who develop an ANC $<1.0 \times 10^9$/L and/or platelets $<50 \times 10^9$/L should stop imatinib until ANC $\geq 1.5 \times 10^9$/L and platelets are $\geq 75 \times 10^9$/L. Then resume imatinib treatment at 400 mg or 600 mg/day.
- *Patients receiving accelerated phase and blast crisis treatment or Ph+ acute lymphoblastic leukemia* who develop an ANC $<0.5 \times 10^9$/L and/or platelets $<10 \times 10^9$/L should determine if cytopenia is related to leukemia via marrow aspirate or biopsy. If cytopenia is unrelated to leukemia, reduce dose to 400 mg/day. If cytopenia persists for 2 wk, reduce dose to 300 mg/day. If cytopenia persists for 4 wk and is still unrelated to leukemia, stop imatinib until ANC $\geq 1 \times 10^9$/L and platelets are $\geq 20 \times 10^9$/L. Then resume imatinib treatment at 300 mg/day.
- *Patients receiving aggressive systemic mastocytosis with eosinophilia or hypereosinophilic syndrome and/or chronic eosinophilic leukemia with FIP1L1–PDGFRa fusion kinase* who develop ANC $<1.0 \times 10^9$/L and platelets $<50 \times 10^9$/L should stop imatinib until ANC $\geq 1.5 \times 10^9$/L and platelets $\geq 75 \times 10^9$/L. Resume treatment at previous dose.
- May cause hypokalemia.
- Verify pregnancy status in females with reproductive potential before starting therapy.

Implementation

- ***High Alert:*** Fatalities have occurred with incorrect administration of chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order and dose calculations. Therapy should be initiated by physician experienced in the treatment of patients with chronic myeloid leukemia.
- Patients requiring anticoagulation should receive low-molecular-weight or standard heparin, not warfarin.
- Treatment should be continued as long as patient continues to benefit.
- **PO:** Administer with food and a full glass of water to minimize GI irritation.
- Tablets may be dispersed in water or apple juice (50 mL for the 100-mg and 100 mL for the 400-mg tablet) and stirred with a spoon for patients unable to swallow pills. Administer immediately after suspension.
- Doses for children may be given once daily or divided into two doses, one in morning and one in evening.
- Administer doses >800 m g/day as 400 mg twice daily to decrease exposure to iron.

Patient/Family Teaching

- Explain purpose of imatinib to patient. Instruct patient to take imatinib as directed. If a dose is missed, take next dose at regular scheduled time. Do not double doses.
- Advise patient to avoid grapefruit and grapefruit juice during therapy.
- May cause drowsiness or dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient of possibility of edema and fluid retention. Advise patient to notify health care professional if unexpected rapid weight gain occurs.
- Advise patient to notify health care professional if signs and symptoms of liver failure (jaundice, anorexia, bleeding or bruising) or DRESS occur.
- Rep: Advise female patient with reproductive potential to use effective contraception during and for at least 14 days after last dose of imatinib. Advise patient to notify health care professional if pregnancy is planned or suspected; avoid breast feeding for at least 1 mo after last dose of imatinib.

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Decrease in production of leukemic cells in patients with CML, HES/CEL, and ALL and malignant cells in GIST, MDS/MPD, ASM, and DFSP.

imipenem/cilastatin

(i-me-**pen**-em/sye-la-**stat**-in)
Primaxin

Classification
Therapeutic: anti-infectives
Pharmacologic: carbapenems

Indications

Treatment of: Lower respiratory tract infections, Urinary tract infections, Abdominal infections, Gynecologic infections, Skin and skin structure infections, Bone and joint infections, Bacteremia, Endocarditis, Polymicrobic infections.

Action

Imipenem binds to the bacterial cell wall, resulting in cell death. Combination with cilastatin prevents renal inactivation of imipenem, resulting in high urinary concentrations. Imipenem resists the actions of many enzymes that degrade most other penicillins and penicillin-like anti-infectives. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Spectrum is broad. Active against most gram-positive aerobic cocci: *Streptococcus pneumoniae*, Group A beta-hemolytic streptococci, *Enterococcus*, *Staphylococcus aureus*. Active against many gram-negative bacillary organisms: *Escherichia coli*, *Klebsiella*, *Acinetobacter*, *Proteus*, *Serratia*, *Pseudomonas aeruginosa*. Also displays activity against: *Salmonella*, *Shigella*, *neisseria gonorrhoeae*, Numerous anaerobes.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Metabolism and Excretion: *Imipenem and cilastatin*—70% excreted unchanged by the kidneys.
Half-life: *Imipenem and cilastatin*—1 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	6–8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with penicillins and cephalosporins.

Use Cautiously in: Previous history of multiple hypersensitivity reactions; Seizure disorders; Renal impairment (dose ↓ required if CCr ≤70 mL/min/1.73 m^2); OB: Safety not established; Lactation: Use during breast feeding only if benefit to patient outweighs potential risk to infant; Pedi: Children with CNS infections (↑ risk of seizures) or children <30 kg with renal impairment (safety not established); Geri: May be at ↑ risk for toxic reactions due to age-related ↑ in renal function.

Adverse Reactions/Side Effects

CV: hypotension. **Derm:** rash, pruritus, sweating, urticaria. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, nausea, vomiting. **Hemat:** eosinophilia. **Local:** phlebitis at IV site. **Neuro:** SEIZURES, dizziness, somnolence. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever, superinfection.

Interactions

Drug-Drug: Do not admix with **aminoglycosides** (inactivation may occur). **Probenecid** ↓ renal excretion and ↑ blood levels. ↑ risk of seizures with **ganciclovir** or **cyclosporine** (avoid concurrent use of ganciclovir). May ↓ serum **valproate** levels (↑ risk of seizures).

Route/Dosage

IV (Adults): *Mild infections*—250–500 mg every 6 hr; *Moderate infections*—500 mg every 6–8 hr *or* 1 g every 8 hr; *Serious infections*—500 mg every 6 hr to 1 g every 6–8 hr.
IV (Children ≥3 mo): 15–25 mg/kg every 6 hr; higher doses have been used in older children with cystic fibrosis.
IV (Children 4 wk–3 mo): 25 mg/kg every 6 hr.
IV (Children 1–4 wk): 25 mg/kg every 8 hr.
IV (Children <1 wk): 25 mg/kg every 12 hr.

Renal Impairment

IV (Adults): If dose for normal renal function is 1 g/day *CCr 41–70 mL/min*—125–250 mg every 6–8 hr, *CCr 21–40 mL/min*—125–250 mg every 8–12 hr, *CCr 6–20 mL/min*—125–250 mg every 12 hr; **If dose for normal renal function is 1.5 g/day** *CCr 41–70 mL/min*—125–250 mg every 6–8 hr, *CCr 21–40 mL/min*—125–250 mg every 8–12 hr, *CCr 6–20 mL/min*—125–250 mg every 12 hr; **If dose for normal renal function is 2 g/day** *CCr 41–70 mL/min*—125–500 mg every 6–8 hr, *CCr 21–40 mL/min*—125–250 mg every 8–12 hr, *CCr 6–20 mL/min*—125–250 mg every 12 hr; **If dose for normal renal function is 3 g/day** *CCr 41–70 mL/min*—250–500 mg every 6–8 hr, *CCr 21–40 mL/min*—250–500 mg every 6–8 hr, *CCr 6–20 mL/min*—250–500 mg every 12 hr; **If dose for normal renal function is 4 g/day** *CCr 41–70 mL/min*—

© F.A. Davis Publishing

250–750 mg every 6–8 hr, *CCr 21–40 mL/min*—250–500 mg every 6–8 hr, *CCr 6–20 mL/min*—250–250 mg every 12 hr.

Availability (generic available)

Powder for injection (requires reconstitution and dilution): 250 mg imipenem/250 mg cilastatin, 500 mg imipenem/500 mg cilastatin.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify the physician immediately if these occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** BUN, AST, ALT, LDH, serum alkaline phosphatase, bilirubin, and creatinine may be transiently ↑.
- Hemoglobin and hematocrit concentrations may be ↓.
- May cause positive direct Coombs' test.

Implementation

IV Administration

- **Intermittent Infusion:** Reconstitute each 250- or 500-mg vial with 10 mL of D5W, D5/0.9% NaCl, 0.9% NaCl, or D5/0.45% NaCl and shake well. ***Dilution:*** Further dilute in 100 mL of D5W or 0.9% NaCl. Solution may range from clear to yellow in color. Infusion is stable for 4 hr at room temperature and 24 hr if refrigerated. ***Concentration:*** 2.5 mg/mL (with 250-mg vial); 5 mg/mL (with 500-mg vial). ***Rate:*** Infuse doses ≤500 mg over 20–30 min. Infuse doses ≥750 mg over 40–60 min. Pedi: Infuse doses ≤500 mg over 15–30 min. Infuse doses >500 m g over 40–60 min.
- Rapid infusion may cause nausea and vomiting. If these symptoms develop, slow infusion.
- **Y-Site Compatibility:** acyclovir, alfentanil, amifostine, amikacin, aminocaproic acid, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftazidime/avibactam, cefuroxime, chloramphenicol, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daunorubicin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, dopamine, doxacurium, doxorubicin, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, etoposide, famotidine, fenoldopam, fentanyl, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemtuzumab, gentamicin, glycopyrrolate, granisetron, heparin, hydrocortisone, hydromorphone, idarubicin, ifosfamide, indomethacin, insulin regular, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, magnesium sulfate, melphalan, meropenem/vaborbactam, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, mitomycin, mitoxantrone, morphine, multivitamins, nafcillin, naloxone, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, pamidronate, pancuronium, pantoprazole, pemetrexed, penicillin G, pentobarbital, phentolamine, phenylephrine, phytonadione, plazomicin, potassium acetate, potassium chloride, propofol, propranolol, protamine, remifentanil, rituximab, rocuronium, sodium acetate, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, vasopressin, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** alemtuzumab, allopurinol, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, azathioprine, blinatumomab, ceftriaxone, chlorpromazine, dacarbazine, dantrolene, daptomycin, diazepam, diazoxide, etoposide phosphate, ganciclovir, gemcitabine, haloperidol, lorazepam, mannitol, metaraminol, methyldopate, milrinone, mycophenolate, nalbuphine, nicardipine, palonosetron, phenytoin, prochlorperazine, pyridoxime, quinupristin/dalfopristin, sargramostim, sodium bicarbonate, thiamine, topotecan, trimethoprim/sulfamethoxazole, vecuronium.
- **Additive Incompatibility:** May be inactivated if administered concurrently with aminoglycosides. If administered concurrently, administer in separate sites, if possible, at least 1 hr apart. If second site is unavailable, flush lines between medications.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy. Consult health care professional before treating with antidiarrheals.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat di-

© F.A. Davis Publishing

arrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

imipenem/cilastatin/relebactam

(i-me-**pen**-em/sye-la-**stat**-in/**rel**-e-**bak**-tam)

Recarbrio

Classification

Therapeutic: anti-infectives
Pharmacologic: carbapenems, beta-lactamase inhibitors

Indications

Complicated urinary tract infections (cUTI), including pyelonephritis (for patients with limited or no alternative treatment options). Complicated intra-abdominal infections (for patients with limited or no alternative treatment options). Hospital-acquired or ventilator-associated pneumonia.

Action

Imipenem binds to the bacterial cell wall, resulting in cell death. Cilastatin is a renal dehydropeptidase inhibitor that prevents renal inactivation of imipenem (does not have antibacterial properties). Relebactam inhibits beta-lactamase, which is an enzyme that can destroy beta-lactam antibiotics. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Spectrum is broad. Active against many gram-negative aerobic bacteria: *Acinetobacter calcoaceticus-baumannii complex*, *Citrobacter freundii*, *Enterobacter cloacae*, *Escherichia coli*, *Haemophilus influenzae*, *Klebsiella aerogenes*, *Klebsiella oxytoca*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Serratia marcescens*. Also active against the following gram-negative anaerobic bacteria: *Bacteroides caccae*, *Bacteroides fragilis*, *Bacteroides ovatus*, *Bacteroides stercoris*, *Bacteroides thetaiotaomicron*, *Bacteroides uniformis*, *Bacteroides vulgatus*, *Fusobacterium nucleatum*.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed to tissues.
Metabolism and Excretion: Minimally metabolized. Primarily excreted unchanged by the kidneys (imipenem 63%, cilastatin 77%, relebactam >90%).
Half-life: 1–1.2 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity (cross-sensitivity may occur with penicillins and cephalosporins).
Use Cautiously in: Seizure disorders; Renal impairment (dose ↓ required if CCr <90 mL/min); OB: Use only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; Geri: May be at ↑ risk for adverse reactions due to age-related renal impairment.

Adverse Reactions/Side Effects

CV: hypertension. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, ↑ lipase, ↑ liver enzymes, nausea, vomiting. **Hemat:** anemia. **Local:** phlebitis. **Neuro:** SEIZURES, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever.

Interactions

Drug-Drug: May ↓ serum **valproate** levels (↑ risk of seizures). ↑ risk of seizures with **ganciclovir**; avoid concurrent use.

Route/Dosage

IV (Adults): 1.25 g every 6 hr.

Renal Impairment

IV (Adults): *CCr 60–89 mL/min*—1 g every 6 hr; *CCr 30–59 mL/min*—750 mg every 6 hr; *CCr 15–29 mL/min*—500 mg every 6 hr; *CCr <15 mL/min on hemodialysis*—500 mg every 6 hr (on dialysis days, administer doses after hemodialysis).

Availability

Powder for injection: imipenem 500 mg/cilastatin 500 mg/250 mg relebactam.

NURSING IMPLICATIONS

Assessment

- Assess patient for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Observe patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing).

© F.A. Davis Publishing

Discontinue the drug and notify the physician immediately if these occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.

Implementation

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute with 0.9% NaCl, D5W, D5/0.9% NaCl, D5/0.45% NaCl, or D5/0.225% NaCl. ***Dilution:*** *Step 1:* For diluents available in 100-mL prefilled infusion bags, proceed to step 2. *Step 2:* For diluents not available in 100-mL prefilled infusion bags, withdraw 100 mL of desired diluent and transfer it to an empty infusion bag, then proceed to step 2. Withdraw 20 mL (as two 10-mL aliquots) of diluent from appropriate infusion bag and constitute vial with one 10-mL aliquot of the diluent. Constituted suspension is for intravenous infusion only after dilution in an appropriate infusion solution. *Step 3:* After constitution, shake vial well and transfer suspension into remaining 80 mL of infusion bag. *Step 4:* Add second 10-mL aliquot of infusion diluent to vial and shake well to ensure complete transfer of vial contents; repeat transfer of resulting suspension to infusion solution before administering. Agitate the resulting mixture until clear. Solution is colorless to yellow; do not use solutions that are discolored or contain particulate matter. Stable for 2 hr at room temperature or 24 hr if refrigerated; do not freeze. ***Rate:*** Infuse over 30 min.
- **Y-Site Compatibility:** dexmedetomidine, dopamine, epinephrine, fentanyl, heparin, midazolam, norepinephrine, phenylephrine.
- **Y-Site Incompatibility:** propofol.

Patient/Family Teaching

- Explain purpose of medication to patient, that it is only for bacterial infections, and that skipping or missing doses can increase risk or resistance to medication.
- Instruct patient to notify health care professional immediately if signs and symptoms of allergic reactions occur.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy. Consult health care professional before treating with antidiarrheals.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially valproate.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

BEERS

imipramine (im-**ip**-ra-meen)

Impril, Tofranil, Tofranil PM

Classification

Therapeutic: antidepressants
Pharmacologic: tricyclic antidepressants

Indications

Various forms of depression. Enuresis in children. **Unlabeled Use:** Adjunct in the management of chronic pain, incontinence (in adults), vascular headache prophylaxis, cluster headache, insomnia.

Action

Potentiates the effect of serotonin and norepinephrine. Has significant anticholinergic properties. **Therapeutic Effects:** Antidepressant action that develops slowly over several weeks.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Widely distributed. Probably crosses the placenta and enters breast milk.
Protein Binding: 89–95%.
Metabolism and Excretion: Mostly metabolized by the liver (CYP2D6 isoenzyme) to desipramine; the CYP2D6 enzyme system exhibits genetic polymorphism; ~7% of population may be poor metabolizers (PMs) and may have significantly ↑ imipramine concentrations and an ↑ risk of adverse effects.
Half-life: 8–16 hr.

TIME/ACTION PROFILE (antidepressant effect)

ROUTE	ONSET	PEAK	DURATION
PO	hrs	2–6 wk	wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other antidepressants may occur; Angle-closure glaucoma; Hypersensitivity to tartrazine or sulfites (in some preparations); Recent MI, known history of QTc interval prolongation, heart failure; Concurrent use of MAO inhibitors or MAO-like drugs (linezolid or methylene blue).
Use Cautiously in: Pre-existing cardiovascular disease; Seizures or history of seizure disorder; May ↑ risk of suicide attempt/ideation especially during early treatment or dose adjustment; Lactation: Drug is present in

© F.A. Davis Publishing

breast milk; discontinue imipramine or bottle feed; Pedi: Suicide risk may be greater in children or adolescents. Safety not established in children <6 yr; Geri: More susceptible to adverse reactions. Geriatric males with prostatic hyperplasia are more susceptible to urinary retention.

Adverse Reactions/Side Effects

EENT: blurred vision, dry eyes. **CV:** ARRHYTHMIAS, hypotension, ECG changes. **GI:** constipation, dry mouth, nausea, paralytic ileus, weight gain. **GU:** urinary retention, ↓ libido. **Derm:** photosensitivity. **Endo:** gynecomastia. **Hemat:** blood dyscrasias. **Neuro:** SUICIDAL THOUGHTS, drowsiness, fatigue, agitation, confusion, hallucinations, insomnia.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** may result in serious potentially fatal reactions (MAO inhibitors should be stopped at least 14 days before imipramine therapy. Imipramine should be stopped at least 14 days before MAO inhibitor therapy). Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue**, may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving imipramine, immediately discontinue imipramine and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume imipramine therapy 24 hr after last dose of linezolid or methylene blue). Concurrent use with **SSRI antidepressants** may result in ↑ toxicity and should be avoided (**fluoxetine** should be stopped 5 wk before). Hypertensive crisis may occur with **clonidine**. Imipramine is metabolized in the liver by the **cytochrome P450 2D6 enzyme** and its action may be affected by drugs that compete for metabolism by this enzyme including **other antidepressants**, **phenothiazines**, **carbamazepine**, **class 1C antiarrhythmics** (**propafenone**, **flecainide**); when used concurrently, dose reduction of one or the other or both may be necessary. Concurrent use of other drugs that inhibit the activity of the enzyme, including **cimetidine**, **quinidine**, **amiodarone**, and **ritonavir**, may result in ↑ effects of imipramine. Concurrent use with **levodopa** may result in delayed/↓ absorption of levodopa or hypertension. Blood levels and effects may be ↓ by **rifamycins**. ↑ CNS depression with other CNS **depressants** including **alcohol**, **antihistamines**, **clonidine**, **opioids**, and **sedative/hypnotics**. **Barbiturates** may alter blood levels and effects. **Adrenergic** and **anticholinergic** side effects may be ↑ with other **agents having these properties**. **Phenothiazines** or **hormonal contraceptives** ↑ levels and may cause toxicity. **Cigarette smoking (nicotine)** may ↑ metabolism and alter effects. Drugs that affect serotonergic neurotransmitter systems, including **SSRIs**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Use with **St. John's wort** ↑ risk of serotonin syndrome. Concomitant use of **kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression. ↑ anticholinergic effects with **jimson weed** and **scopolia**.

Route/Dosage

PO (Adults): 25–50 mg 3–4 times daily (not to exceed 300 mg/day); total daily dose may be given at bedtime.
PO (Geriatric Patients): 25 mg at bedtime initially, up to 100 mg/day in divided doses.
PO (Children >12 yr): *Antidepressant*— 25–50 mg/day in divided doses (not to exceed 100 mg/day).
PO (Children 6–12 yr): *Antidepressant*— 10–30 mg/day in 2 divided doses.
PO (Children ≥6 yr): *Enuresis*— 25 mg once daily 1 hr before bedtime; ↑ if necessary by 25 mg at weekly intervals to 50 mg in children <12 yr, up to 75 mg in children >12 yr.

Availability (generic available)

Tablets: 10 mg, 25 mg, 50 mg, 🍁75 mg. **Capsules:** 75 mg, 100 mg, 125 mg, 150 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse rate prior to and during initial therapy.
- Monitor plasma levels in treatment-resistant patients.
- Monitor weight and BMI initially and periodically throughout therapy.
- For overweight/obese individuals, obtain FBS and cholesterol levels. Refer as appropriate for nutrition/weight management and medical management.
- Obtain weight and BMI initially and regularly throughout therapy.
- Assess for sexual dysfunction (decreased libido; erectile dysfunction).
- Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient. Risk may be increased in children, adolescents, and adults ≤24 yrs. After starting therapy, children, adolescents, and young adults should be seen by health care professional face-to-face at least weekly for 4 wk, then every other wk for next 4 wk, then at 12 wk, and on advice of health care professional thereafter.
- Pedi, Geri: Monitor baseline and periodic ECGs in elderly patients or patients with heart disease and before increasing dose with children treated for enuresis. May cause prolonged PR and QT intervals and may flatten T waves.

© F.A. Davis Publishing

- **Depression:** Assess mental status (orientation, mood, behavior) frequently. Confusion, agitation, and hallucinations may occur during initiation of therapy and may require dosage reduction. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- **Enuresis:** Assess frequency of bedwetting during therapy. Ask patient or caretaker to maintain diary.
- **Pain:** Assess location, duration, and severity of pain periodically during therapy. Use pain scale to monitor effectiveness of therapy.
- ***Lab Test Considerations:*** Assess leukocyte and differential blood counts and renal and hepatic functions prior to and periodically during prolonged or high-dose therapy.
- Serum levels may be monitored in patients who fail to respond to usual therapeutic dose. Therapeutic plasma concentration range for depression is 150–300 ng/mL.
- May cause alterations in blood glucose levels.
- ***Toxicity and Overdose:*** Symptoms of acute overdose include disturbed concentration, confusion, restlessness, agitation, seizures, drowsiness, mydriasis, arrhythmias, fever, hallucinations, vomiting, and dyspnea.
- Treatment of overdose includes gastric lavage, activated charcoal, and a stimulant cathartic. Maintain respiratory and cardiac function (monitor ECG for at least 5 days) and temperature. Medications may include digoxin for HF, antiarrhythmics, and anticonvulsants.

Implementation

- Dose increases should be made at bedtime because of sedation. Dose titration is a slow process; may take wk to mo. May be given as a single dose at bedtime to minimize sedation during the day.
- Taper to avoid withdrawal effects. Gradually taper dose over 2–4 wk to prevent withdrawal effects.
- **PO:** Administer medication with or immediately following a meal to minimize gastric irritation.
- **IM:** May be slightly yellow or red in color. Crystals may develop if solution is cool; place ampule under warm running water for 1 min to dissolve.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; if regimen is a single dose at bedtime, do not take in the morning because of side effects. Advise patient that drug effects may not be noticed for at least 2 wk. Abrupt discontinuation may cause nausea, vomiting, diarrhea, headache, trouble sleeping with vivid dreams, and irritability.
- May cause drowsiness and blurred vision. Caution patient to avoid driving and other activities requiring alertness until response to drug is known.
- Instruct patient to notify health care professional if visual changes occur. Inform patient that periodic glaucoma testing may be needed during long-term therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Advise patient, family, and caregivers to look for suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide, new or worse depression or anxiety, agitation or restlessness, panic attacks, insomnia, new or worse irritability, aggressiveness, acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Advise patient to avoid alcohol or other CNS depressant drugs during therapy and for at least 3–7 days after therapy has been discontinued.
- Instruct patient to notify health care professional if urinary retention, dry mouth, or constipation persists. Sugarless candy or gum may diminish dry mouth and an increase in fluid intake or bulk may prevent constipation. If symptoms persist, dose reduction or discontinuation may be necessary. Consult health care professional if dry mouth persists for more than 2 wk.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Alert patient that urine may turn blue-green in color.
- Inform patient of need to monitor dietary intake, as possible increase in appetite may lead to undesired weight gain. Inform patient that increased amounts of riboflavin in the diet may be required; consult health care professional.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Therapy for depression is usually prolonged. Emphasize the importance of follow-up exams to evaluate progress and improve coping skills.
- Instruct female patients to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Pedi: Inform parents that the side effects most likely to occur include nervousness, insomnia, unusual tiredness, and mild nausea and vomiting. Notify health care professional if these symptoms become pronounced.
- Advise parents to keep medication out of reach of children to prevent inadvertent overdose.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings.
- Increased appetite.
- Improved energy level.
- Pain relief.
- Diminished incidence of enuresis.
- Improved sleep in patients treated for depression. Patient may require 2–6 wk of therapy before full therapeutic effects of medication are noticeable.
- Control of bedwetting in children >6 yr.
- Decrease in chronic neurogenic pain.

© F.A. Davis Publishing

BEERS

indomethacin
(in-doe-**meth**-a-sin)
Indocin, ~~Tivorbex~~

Classification
Therapeutic: antirheumatics, ductus arteriosus patency adjuncts (IV only), nonopioid analgesics
Pharmacologic: nonsteroidal anti-inflammatory drugs (NSAIDs)

Indications
PO: Inflammatory disorders including: Rheumatoid arthritis, Gouty arthritis, Osteoarthritis, Ankylosing spondylitis. Mild-to-moderate acute pain. **IV:** Alternative to surgery in the management of patent ductus arteriosus (PDA) in premature neonates.

Action
Inhibits prostaglandin synthesis. In the treatment of PDA, decreased prostaglandin production allows the ductus to close. **Therapeutic Effects: PO:** Suppression of pain and inflammation. **IV:** Closure of PDA.

Pharmacokinetics
Absorption: Well absorbed after oral administration in adults, incomplete oral absorption in neonates.
Distribution: Crosses the blood-brain barrier and the placenta. Enters breast milk.
Protein Binding: 99%.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: Neonates <2 wk: 20 hr; >2 wk: 11 hr; Adults: 2.6–11 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO (analgesic)	30 min	0.5–2 hr	4–6 hr
PO-ER (analgesic)	30 min	unknown	4–6 hr
PO (anti-inflammatory)	up to 7 days	1–2 wk	4–6 hr
PO-ER (anti-inflammatory)	up to 7 days	1–2 wk	4–6 hr
IV (closure of PDA)	up to 48 hr	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Known alcohol intolerance (suspension); Cross-sensitivity may exist with other NSAIDs, including aspirin; Active GI bleeding; Ulcer disease; Proctitis or recent history of rectal bleeding; Intraventricular hemorrhage; Thrombocytopenia; Coronary artery bypass graft (CABG) surgery; OB: Avoid use after 30 wk gestation (may cause premature closure of fetal ductus arteriosus); Pedi: ↑ risk of necrotizing enterocolitis and bowel perforation in premature infants with PDA.
Use Cautiously in: Severe renal or hepatic impairment; Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; History of ulcer disease; Seizure disorders; Hypertension; OB: Use at or after 20 wk gestation may cause fetal renal impairment leading to oligohydramnios and, possibly neonatal renal impairment; if treatment is necessary between 20 wk and 30 wk gestation, limit use to the lowest effective dose and shortest duration possible; Geri: ↑ risk of adverse in older adults secondary to age-related ↓ in renal and hepatic function, concurrent illnesses, and medications.

Adverse Reactions/Side Effects
CNS: dizziness, drowsiness, headache, psychic disturbances. **CV:** HF, MYOCARDIAL INFARCTION, STROKE, edema, hypertension. **Derm:** rash. **EENT:** blurred vision, tinnitus. **F and E:** hyperkalemia; *IV*, dilutional hyponatremia; *IV*, hypoglycemia. **GI:** *PO*— GI BLEEDING, HEPATOTOXICITY, PANCREATITIS, constipation, dyspepsia, nausea, vomiting, discomfort, necrotizing enterocolitis. **GU:** cystitis, hematuria, renal failure. **Hemat:** thrombocytopenia, blood dyscrasias, prolonged bleeding time. **Local:** phlebitis at IV site. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions
Drug-Drug: Concurrent use with **aspirin** may ↓ effectiveness. Additive adverse GI effects with **aspirin**, other **NSAIDs**, **corticosteroids**, or **alcohol**. Chronic use of **acetaminophen** ↑ risk of adverse renal reactions. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ hypoglycemia from **insulins** or **oral hypoglycemic agents**. May ↑ risk of toxicity from **lithium** or **zidovudine** (avoid concurrent use with zidovudine). ↑ risk of toxicity from **methotrexate**. **Probenecid** ↑ risk of toxicity from indomethacin. ↑ risk of bleeding with **anticoagulants**, **aspirin**, **clopidogrel**, **ticagrelor**, **prasugrel**, **corticosteroids**, **fibrinolytics**, **SNRIs**, or **SSRIs**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. ↑ risk of nephrotoxicity with **cyclosporine**. Concurrent use with **potassium-sparing diuretics** may result in hyperkalemia. May ↑ levels of **digoxin**, **methotrexate**, **lithium**, and **aminoglycosides** when used IV in neonates.
Drug-Natural Products: ↑ bleeding risk with **anise**, **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**.

© F.A. Davis Publishing

Route/Dosage

Anti-inflammatory

PO (Adults): *Antiarthritic*—25–50 mg 2–4 times daily *or* 75-mg extended-release capsule once or twice daily (not to exceed 200 mg or 150 mg of SR/day). A single bedtime dose of 100 mg may be used. *Antigout*—100 mg initially, followed by 50 mg 3 times daily for relief of pain, then ↓ further. *Mild-to-moderate acute pain*—20 mg 3 times daily or 40 mg 2–3 times daily.

PO (Children >2 yr): 1–2 mg/kg/day in 2–4 divided doses (not to exceed 4 mg/kg/day or 150–200 mg/day).

PDA Closure

IV (Neonates): *Treatment*—0.2 mg/kg initially, then 2 subsequent doses at 12–24 hr intervals of 0.1 mg/kg if age <48 hr at time of initial dose; 0.2 mg/kg if 2–7 days at initial dose; 0.25 mg/kg if age >7 days at initial dose. *Prophylaxis*—0.1–0.2 mg/kg initially, then 0.1 mg/kg every 12–24 hr for 2 doses.

Availability (generic available)

Capsules: 20 mg, 25 mg, 50 mg. **Sustained-release capsules:** 75 mg. **Oral suspension (fruit mint, pineapple, coconut, mint flavors):** 25 mg/5 mL. **Powder for injection (requires reconstitution):** 1 mg/vial. **Rectal suppository:** 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Monitor for rhinitis, asthma, and urticaria.
- Assess patient for skin rash frequently during therapy. Discontinue ibuprofen at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- Monitor BP during initiation periodically during therapy. May cause fluid retention and edema, leading to new onset or worsening hypertension.
- **Arthritis:** Assess limitation of movement and pain—note type, location, and intensity before and 1–2 hr after administration.
- **PDA:** Monitor respiratory status, heart rate, BP, echocardiogram, and heart sounds routinely throughout therapy.
- Monitor intake and output. Fluid restriction is usually instituted throughout therapy.
- **Acute pain:** Assess type, location, and intensity of pain prior to and 2 hrs (peak) following administration.
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, serum potassium levels, and liver function tests periodically in patients receiving prolonged therapy.
- Serum potassium, BUN, serum creatinine, AST, and ALT tests may show ↑ levels. Blood glucose concentrations may be altered. Hemoglobin and hematocrit concentrations, leukocyte and platelet counts, and CCr may be ↓.
- Urine glucose and urine protein concentrations may be ↑.
- Leukocyte and platelet count may be ↓. Bleeding time may be prolonged for several days after discontinuation.

Implementation

- If prolonged therapy is used, dose should be reduced to the lowest level that controls symptoms to minimize risk of cardiovascular thrombotic events.
- **PO:** Administer after meals, with food, or with antacids to decrease GI irritation. ***DNC:*** Do not break, crush, or chew sustained-release capsules.
- Shake suspension before administration. Do not mix with antacid or any other liquid.

IV Administration

- **IV Push:** ***Dilution:*** Preservative-free 0.9% NaCl or preservative-free sterile water. Reconstitute with 1 or 2 mL of diluent. ***Concentration:*** 0.5–1 mg/mL. Reconstitute immediately before use and discard any unused solution. Do not dilute further or admix. Do not administer via umbilical catheter into vessels near the superior mesenteric artery, as these can cause vasoconstriction and compromise blood flow to the intestines. Do not administer intra-arterially. ***Rate:*** Administer over 20–30 min. Avoid extravasation, as solution is irritating to tissues.
- **Y-Site Compatibility:** aminophylline, ascorbic acid, atropine, bumetanide, cefazolin, cefotaxime, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisplatin, clindamycin, cyanocobalamin, cyclosporine, dexamethasone, digoxin, enalaprilat, ephedrine, epoetin alfa, fentanyl, fluconazole, folic acid, furosemide, ganciclovir, heparin, hydrocortisone, imipenem/cilastatin, insulin regular, ketorolac, lactated Ringer's, lidocaine, mannitol, metoclopramide, metoprolol, multivitamins, nafcillin, nitroglycerin, nitroprusside, penicillin G, pentobarbital, phenobarbital, phytonadione, potassium chloride, procainamide, Ringer's injection, sodium bicarbonate, theophylline.
- **Y-Site Incompatibility:** amikacin, amino acid injection, atracurium, aztreonam, benztropine, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cefotetan, chlorpromazine, dactinomycin, dantrolene, daunorubicin hydrochloride, diazepam, diphenhydramine, dobutamine, dopamine, doxycycline, epinephrine, erythromycin, esmolol, etoposide, famotidine, gentamicin, glycopyrrolate, haloperidol, hydralazine, isoproterenol, labetalol, levofloxacin, magnesium sulfate, meperidine, midazolam, minocycline, morphine, nalbuphine, norepinephrine, ondansetron, oxytocin, paclitaxel, pantoprazole, papaverine, pentamidine,

© F.A. Davis Publishing

phenylephrine, phenytoin, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, succinylcholine, sufentanil, thiamine, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, verapamil.

Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered if not almost time for next dose. Do not double doses.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to avoid the concurrent use of alcohol, aspirin, other NSAIDs, acetaminophen, or other OTC medications without consulting health care professional.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional immediately if signs and symptoms of cardiovascular thrombotic events (shortness of breath or trouble breathing, chest pain, weakness in one part or side of body, slurred speech); hepatotoxicity (nausea, fatigue, lethargy, diarrhea, pruritus, jaundice, right upper quadrant tenderness, "flu-like" symptoms) occur or if rash, itching, chills, fever, muscle aches, visual disturbances, weight gain, edema, abdominal pain, black stools, or persistent headache occurs.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise women to avoid indomethacin in the 3rd trimester of pregnancy (after 29 wk), may cause premature closure of the fetal ductus arteriosus. Use of indomethacin after 20 wk may cause fetal renal dysfunction leading to oligohydramnios. May cause temporary infertility in women.
- **PDA:** Explain to parents the purpose of medication and the need for frequent monitoring.

Evaluation/Desired Outcomes

- Decrease in severity of mild to moderate pain.
- Improved joint mobility. Partial arthritic relief is usually seen within 2 wk, but maximum effectiveness may require up to 1 mo of continuous therapy. Patients who do not respond to one NSAID may respond to another.
- Successful PDA closure.

inFLIXimab (in-flix-i-mab)

Avsola, Inflectra, Ixifi, Remicade, Renflexis, Remsima

Classification

Therapeutic: antirheumatics (DMARDs), gastrointestinal anti-inflammatories
Pharmacologic: monoclonal antibodies

Indications

Moderately to severely active rheumatoid arthritis (in combination with methotrexate). Moderately to severely active Crohn's disease in patients with an inadequate response to conventional therapy. Active psoriatic arthritis. Active ankylosing spondylitis. Moderately to severely active ulcerative colitis in patients with an inadequate response to conventional therapy. Chronic severe plaque psoriasis in patients who are candidates for systemic therapy and when other systemic therapies are less appropriate.

Action

Neutralizes and prevents the activity of tumor necrosis factor-alpha (TNF-alpha), resulting in anti-inflammatory and antiproliferative activity. **Therapeutic Effects:** Decreased signs and symptoms, decreased rate of joint destruction, and improved physical function in rheumatoid arthritis and psoriatic arthritis. Decreased signs and symptoms and induction and maintenance of clinical remission in Crohn's disease. Reduction in number of fistulas and maintenance of closure of fistulae in Crohn's disease. Decreased signs and symptoms in ankylosing spondylitis. Decreased signs and symptoms, maintenance of clinical remission and mucosal healing, and eliminating corticosteroid use in ulcerative colitis. Decreased induration, scaling, and erythema of psoriatic lesions.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Predominantly distributed within the vascular compartment.
Metabolism and Excretion: Unknown.
Half-life: 9.5 days.

TIME/ACTION PROFILE (symptoms of Crohn's disease)

ROUTE	ONSET	PEAK	DURATION
IV	1–2 wk	unknown	12–48 wk†

†After infusion.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to infliximab, murine (mouse) proteins, or other components in the formulation; Moderate to severe HF (doses >5 mg/kg); Concurrent anakinra or abatacept.

© F.A. Davis Publishing

Use Cautiously in: History of chronic or recurrent infection or underlying illness/treatment predisposing to infection; Patients being retreated after 2 yr without treatment (↑ risk of adverse reactions); History of tuberculosis or exposure (latent tuberculosis should be treated prior to infliximab therapy); History of opportunistic infection; Moderate to severe HF (doses ≤5 mg/kg); Patients residing, or who have resided, where tuberculosis, histoplasmosis, coccidioidomycoses, or blastomycosis is endemic; Chronic obstructive pulmonary disease (↑ risk of malignancy); OB: Use only if potential maternal benefit justifies potential fetal risk; infants exposed in utero may be at ↑ risk for infection or agranulocytosis; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <6 yr (safety not established); ↑ risk of lymphoma (including hepatosplenic T-cell lymphoma [HSTCL] in patients with Crohn's disease or ulcerative colitis), leukemia, and other malignancies; Geri: ↑ risk of adverse reactions, including serious infections, in older adults.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, HF, MYOCARDIAL ISCHEMIA/INFARCTION, chest pain, hypertension, hypotension, pericardial effusion, edema, tachycardia, vasculitis. **Derm:** ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS (AGEP), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), acne, alopecia, dry skin, ecchymosis, eczema, erythema, flushing, hematoma, hot flashes, pruritus, psoriasis, rash, sweating, urticaria. **EENT:** conjunctivitis, vision loss. **GI:** abdominal pain, nausea, vomiting, constipation, diarrhea, dyspepsia, flatulence, hepatotoxicity, intestinal obstruction, oral pain, tooth pain, ulcerative stomatitis. **GU:** dysuria, urinary frequency, urinary tract infection. **Hemat:** neutropenia. **MS:** arthralgia, arthritis, back pain, involuntary muscle contractions, myalgia. **Neuro:** paresthesia, STROKE, fatigue, headache, anxiety, depression, dizziness, insomnia. **Resp:** upper respiratory tract infection, bronchitis, cough, dyspnea, laryngitis, pharyngitis, respiratory tract allergic reaction, rhinitis, sinusitis. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), INFECTION (including reactivation tuberculosis and other opportunistic infections due to bacterial, invasive fungal, viral, mycobacterial, and parasitic pathogens), MALIGNANCY (including lymphoma, HSTCL, leukemia, skin cancer, and cervical cancer), SARCOIDOSIS, fever, infusion reactions, chills, flu-like syndrome, lupus-like syndrome, pain.

Interactions

Drug-Drug: Concurrent use with **anakinra** or **abatacept** ↑ risk of serious infections (not recommended). Concurrent use with **azathioprine** and/or **methotrexate** may ↑ risk of HSTCL. Use of **live virus vaccines** or therapeutic infectious agents may ↑ risk of infection; avoid concurrent use; wait for ≥6 mo before administering any live vaccines to infants exposed in utero.

Route/Dosage

Rheumatoid Arthritis

IV (Adults): 3 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then repeat every 8 wk; dose may be adjusted in partial responders up to 10 mg/kg or treatment as often as every 4 wk (to be used with methotrexate).

Crohn's Disease

IV (Adults): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 8 wk; dose may be adjusted up to 10 mg/kg in patients who initially respond and then lose their response.
IV (Children): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 8 wk.

Ankylosing Spondylitis

IV (Adults): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 6 wk.

Psoriatic Arthritis

IV (Adults): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 8 wk (to be used with or without methotrexate).

Ulcerative Colitis

IV (Adults and Children ≥6 yr): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 8 wk.

Plaque Psoriasis

IV (Adults): 5 mg/kg initially, then repeat at 2 and 6 wk after initial infusion, then maintenance dose of 5 mg/kg every 8 wk.

Availability

Lyophilized powder for injection: 100 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for infusion-related reactions (fever, chills, urticaria, pruritus) during and for 2 hr after infusion. Symptoms usually resolve when infusion is discontinued. Reactions are more common after 1st or 2nd infusion. Frequency of reactions may be reduced with immunosuppressant agents.
- Monitor patients who develop a new infection while taking infliximab closely. Discontinue therapy in patients who develop a serious infection or sepsis. Do not initiate therapy in patients with active infections.
- Assess for signs and symptoms of systemic infections (fever, malaise, weight loss, sweats, cough, dyspnea, pulmonary infiltrates, serious systemic illness with or without concomitant shock). Ascertain if patient lives in or has traveled to areas of endemic mycoses. Consider empiric antifungal treatment for patients at

© F.A. Davis Publishing

risk of histoplasmosis and other invasive fungal infections until the pathogens are identified. Consult with an infectious diseases specialist. Consider stopping infliximab until the infection has been diagnosed and adequately treated.
- Assess for latent tuberculosis with a tuberculin skin test prior to initiation of and during therapy. Treatment of latent tuberculosis should be initiated prior to therapy with infliximab.
- Monitor patient for hypersensitivity reactions (urticaria, dyspnea, hypotension) during infusion. Discontinue infliximab if severe reaction occurs. Have medications (antihistamines, acetaminophen, corticosteroids, epinephrine) and equipment readily available in the event of a severe reaction.
- **Rheumatoid Arthritis:** Assess pain and range of motion prior to and periodically during therapy.
- **Crohn's Disease and Ulcerative Colitis:** Assess for signs and symptoms before, during, and after therapy.
- **Psoriasis:** Assess lesions periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ in positive ANA. Frequency may be decreased with baseline immunosuppressant therapy.
- Monitor liver function tests periodically during therapy. May cause mild to moderate AST and ALT ↑ without progressing to liver dysfunction. If patient develops jaundice or liver enzyme elevations ≥5 times the upper limits of normal, discontinue infliximab.
- Monitor CBC with differential periodically during therapy. May cause leukopenia, neutropenia, thrombocytopenia, and pancytopenia. Discontinue infliximab if symptoms of blood dyscrasias (persistent fever) occur.

Implementation

- Do not confuse infliximab with rituximab.
- Ensure vaccinations are brought up to date in adult and pediatric patients before starting therapy.

IV Administration

- **Intermittent Infusion:** Calculate the total number of vials needed. ***Reconstitution:*** Reconstitute each vial with 10 mL of sterile water for injection using a syringe with a 21-gauge needle or smaller. Direct stream to sides of vial. Do not use if vacuum is not present in vial. Gently swirl solution by rotating vial to dilute; do not shake. May foam on reconstitution; allow to stand for 5 min. Solution is colorless to light yellow and opalescent; a few translucent particles may develop because infliximab is a protein. Do not use if opaque particles, discoloration, or other particles occur. ***Dilution:*** Withdraw volume of total infliximab dose from infusion container containing 250 mL with 0.9% NaCl. Slowly add total dose of infliximab. Do not dilute with other solutions. ***Concentration:*** 0.4 to 4 mg/mL. Mix gently. Infusion should begin within 3 hr of preparation. Solution is incompatible with polyvinyl chloride equipment. Prepare in glass infusion bottle or polypropylene or polyolefin bags. Do not reuse or store any portion of infusion solution. ***Rate:*** Administer over at least 2 hr through polyethylene-lined administration set with an in-line, sterile, nonpyrogenic, low protein-building filter with ≤1.2-micron pore size.
- **Y-Site Incompatibility:** Do not administer concurrently in the same line with any other agents.

Patient/Family Teaching

- Explain purpose of infliximab to patient.
- Advise patient that adverse reactions (myalgia, rash, fever, polyarthralgia, pruritus) may occur 3–12 days after delayed (>2 yr) retreatment with infliximab. Symptoms usually decrease or resolve within 1–3 days. Instruct patient to notify health care professional if symptoms occur.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional promptly if symptoms of fungal infection occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise patient of risk of malignancies such as hepatosplenic T-cell lymphoma. Instruct patient to report signs and symptoms (splenomegaly, hepatomegaly, abdominal pain, persistent fever, night sweats, weight loss) to health care professional promptly.
- Advise patient to examine skin periodically during therapy and notify health care professional of any changes in appearance of skin or growths on skin.
- Instruct patient not to receive live vaccines during therapy.
- Advise females to continue regular PAP smears for cervical cancer screening.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and or if breast feeding. Infants exposed to infliximab in utero should wait at least 6 mo before receiving any live vaccine; may be at increased risk of infection.

Evaluation/Desired Outcomes

- Decreased pain and swelling with decreased rate of joint destruction and improved physical function in patients with ankylosing spondylitis, psoriatic, or rheumatoid arthritis.
- Decrease in the signs and symptoms of Crohn's disease and a decrease in the number of draining enterocutaneous fistulas. Decreased symptoms, main-

© F.A. Davis Publishing

taining remission, and mucosal healing with decreased corticosteroid use in ulcerative colitis.
- Decrease in induration, scaling, and erythema of psoriatic lesions.

insulin degludec
(**in**-soo-lin **deg**-lu-dek)
Tresiba, Tresiba FlexTouch

Classification
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

See Appendix K for more information concerning insulins

Indications
Improvement of glycemic control in adults with diabetes mellitus.

Action
Lowers blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics
Absorption: Absorption is slow and delayed.
Distribution: Widely distributed.
Protein Binding: >99%.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: 25 hr (as a result of rate of absorption).

TIME/ACTION PROFILE (effect on blood sugar)

ROUTE	ONSET	PEAK	DURATION
Subcut	within 2 hr	12 hr	up to 42 hr†

†Following discontinuation after chronic use.

Contraindications/Precautions
Contraindicated in: Hypersensitivity to insulin degludec; Hypoglycemia.
Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); Effects may be ↓ in obese patients; Patients with visual impairment who may rely on audible clicks to dial their dose; Geri: Elderly may be ↑ sensitive to drug effects; OB: Pregnancy may temporarily ↑ insulin requirements; Lactation: Consider possible effects on infant (lactating females may require adjustments in insulin dose and/or meal plan); Pedi: Children <1 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects
Endo: HYPOGLYCEMIA. **F and E:** hypokalemia. **Local:** cutaneous amyloidosis, lipodystrophy, pruritus, erythema, swelling. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions
Drug-Drug: Beta blockers and **clonidine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates** may ↓ insulin requirements. Concurrent use with **pioglitazone** or **rosiglitazone** may ↑ risk of fluid retention and worsening HF.
Drug-Natural Products: Glucosamine may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage
Subcut (Adults): *Type 1 diabetes (insulin naïve)* — ⅓–½ of the total daily insulin dose given once daily, then adjust on the basis of patient's needs (remainder of insulin dose should be given as a short-acting insulin and divided between each daily meal) (usual starting total daily insulin dose = 0.2–0.4 units/kg); *Type 2 diabetes (insulin naïve)* — 10 units once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and already on insulin)* — Give the same dose as the total daily dose of the long-acting or intermediate-acting insulin once daily, then adjust on the basis of patient's needs.
Subcut (Children ≥1 yr): *Type 1 or 2 diabetes (and already on insulin)* — Give 80% of the total daily dose of the long-acting or intermediate-acting insulin once daily, then adjust on the basis of patient's needs.

Availability
Solution for injection: 100 units/mL (prefilled pens and vials), 200 units/mL (prefilled pens). ***In combination with:*** liraglutide (Xultophy). See Appendix N.

NURSING IMPLICATIONS
Assessment
- Assess patient for signs and symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- Monitor for signs and symptoms of hypersensitivity reactions (swelling of tongue and lips, diarrhea, nausea, tiredness, itching, urticaria). Discontinue insulin degludec and treat symptomatically.

© F.A. Davis Publishing

- ***Lab Test Considerations:*** Monitor blood glucose during therapy, more frequently in ketoacidosis and times of stress. Hemoglobin A_{1C} may be monitored every 3–6 mo to determine effectiveness.
- Monitor serum potassium periodically during therapy, especially in patients at risk (patients using potassium-lowering medications, patients taking medications sensitive to serum potassium concentrations). May cause hypokalemia.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses). Insulins are available in different types, strengths. Check type, dose, and expiration date. Do not interchange insulins without consulting health care professional. Do not confuse Tresiba (insulin degludec) with Tarceva (erlotinib), Toujeo (insulin glargine), Tradjenta (linagliptin), or Trulicity (dulaglutide).
- Use U-100 vial for pediatric patients requiring <5 units of insulin degludec each day.
- **Subcut:** Inject once daily at the same time each day. Administer into thigh, upper arm, or abdomen. Press and hold down the dose button until dose counter shows 0 and then keep needle in the skin and count slowly to 6. When dose counter returns to 0, prescribed dose is not completely delivered until 6 sec later. If the needle is removed earlier, a stream of insulin may be seen coming from the needle tip. If so, full dose will not be delivered; frequently check blood glucose levels, may need additional insulin. Use a new needle for each dose; do not reuse needles. Rotate injection sites to reduce risk of lipodystrophy and cutaneous amyloidosis. Repeated insulin injections into areas of localized cutaneous amyloidosis may cause hyperglycemia; a sudden change to an unaffected injection site may cause hypoglycemia. Do not administer IV, IM, or in an insulin infusion pump. Solution is clear and colorless; do not administer solutions that are discolored or contain a precipitate. Store unopened prefilled pens in refrigerator; do not freeze. Do not store opened (in-use) prefilled pens in refrigerator; stable at controlled room temperature, protected from light for 56 days (8 wk).
- Do not mix with other insulins or solutions.
- Do not transfer from pen into a syringe for administration.
- Dose increases should be made every 3–4 days as needed.
- Do not perform dose conversion when using the *Tresiba* U-100 or U-200 *FlexTouch* pens. Dose window for both the *Tresiba* U-100 and U-200 *FlexTouch* pens shows number of insulin units to be delivered and no conversion is needed.
- **Starting Dose in Insulin Naïve Patients :** *Type 1 Diabetes Mellitus:* Starting dose is one-third to one-half total daily insulin dose. Administer remainder of total daily insulin dose as short-acting insulin divided between daily meals. Generally, 0.2–0.4 units of insulin/kg can be used to calculate initial total daily insulin dose in insulin naïve patients with type 1 diabetes. *Type 2 Diabetes Mellitus:* 10 units once daily.
- **Starting Dose in Patients Already on Insulin Therapy :** *Type 1 and Type 2 Diabetes Mellitus:* Start insulin degludec at same unit dose as total daily long or intermediate-acting insulin unit dose.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. If a dose is missed, inject daily dose during waking hr upon discovering missed dose. Ensure that at least 8 hr have elapsed between consecutive injections. Discuss importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of bloodborne pathogens.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness, and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, herbal products, or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat

© F.A. Davis Publishing

regular diet, or if blood glucose levels are not controlled.
- Instruct patient and caregiver on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

INSULIN (mixtures) (in-su-lin)

insulin aspart protamine suspension/insulin aspart injection mixtures, rDNA origin
NovoLOG Mix 70/30

insulin lispro protamine suspension/insulin lispro injection mixtures, rDNA origin
HumaLOG Mix 75/25, HumaLOG Mix 50/50

NPH/regular insulin mixtures
HumuLIN 70/30, NovoLIN 70/30

Classification
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

See Appendix K for more information concerning insulins

Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

Action

Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Well absorbed from subcutaneous administration sites. Absorption rate is determined by type of insulin, injection site, volume of injectate, and other factors.
Distribution: Widely distributed.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: 5–6 min (prolonged in patients with diabetes; biologic half-life is 1–1.5 hr).

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
Insulin aspart protamine suspension/ insulin aspart injection mixture subcut	15 min	1–4 hr	18–24 hr
Insulin lispro protamine suspension/ insulin lispro injection mixture subcut	15–30 min	2.8 hr	24 hr
NPH/regular insulin mixture subcutaneous	30 min	2–12 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); OB: Pregnancy may temporarily ↑ insulin requirements; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety of Humalog not established.

Adverse Reactions/Side Effects

Endo: HYPOGLYCEMIA. **F and E:** hypokalemia. **Local:** cutaneous amyloidosis, erythema, lipodystrophy, pruritus, swelling. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Beta blockers and **clonidine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates** may ↓ insulin requirements. Concurrent use with **pioglitazone** or **rosiglitazone** may ↑ risk of fluid retention and worsening HF.
Drug-Natural Products: Glucosamine may worsen blood glucose control. **Fenugreek**, **chro-**

© F.A. Davis Publishing

mium, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors.

Subcut (Adults and Children): 0.5–1 unit/kg/day. *Adolescents during rapid growth*—0.8–1.2 units/kg/day.

Availability

Insulin aspart protamine suspension/insulin aspart injection mixture: 70% insulin aspart protamine suspension and 30% insulin aspart inection—NovoLog Mix 70/30 100 units/mL (vials and prefilled pens). **Insulin lispro protamine suspension/insulin lispro injection mixture:** 75% insulin lispro protamine suspension and 25% insulin lispro injection—Humalog Mix 75/25 100 units/mL (vials and prefilled pens), 50% insulin lispro protamine suspension and 50% insulin lispro injection—Humalog Mix 50/50 100 units/mL (vials and prefilled pens). **NPH insulin/regular insulin suspension mixture:** 70 units NPH/30 units regular insulin/mL—Novolin 70/30, Humulin 70/30 (100 units/mL total) (vials and prefilled pens)[OTC].

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; excessive hunger; headache; irritability; nightmares or trouble sleeping; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. Hemoglobin A_{1C} may also be monitored every 3–6 mo to determine effectiveness.
- Monitor serum potassium in patients at risk for hypokalemia (those using potassium-lowering agents, those receiving IV insulin) periodically during therapy.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting health care professional.
- Do not confuse Humalog with Humulin. Do not confuse Humulin 70/30 with Humalog Mix 75/25. Do not confuse Novolin with Novolog.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL.
- Insulin should be stored in a cool place but does not need to be refrigerated. Follow manufacturer's instructions regarding storage of insulin and insulin pens before and after use. Do not use if cloudy, discolored, or unusually viscous.
- NPH insulins should not be used in the management of ketoacidosis.
- **Subcut:** Rotate injection sites to prevent lipodystrophy and cutaneous amyloidosis. Repeated insulin injections into areas of localized cutaneous amyloidosis may cause hyperglycemia; a sudden change to an unaffected injection site may cause hypoglycemia.
- Administer into abdominal wall, thigh, or upper arm subcutaneously.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Caution patient that insulin pens should not be shared with others, even if clean needles are used.
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of bloodborne pathogens.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal prod-

© F.A. Davis Publishing

ucts being taken and to consult health care professional before taking other Rx, OTC, herbal products, or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

NPH insulin (isophane insulin suspension)

HumuLIN N, HumuLIN N KwikPen, NovoLIN N, NovoLIN N FlexPen

Classification

Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

See Appendix K for more information concerning insulins

Indications

Control of hyperglycemia in patients with diabetes mellitus.

Action

Lowers blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions of insulin: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Rapidly absorbed from subcutaneous administration sites. Presence of protamine delays peak effect and prolongs action.
Distribution: Identical to endogenous insulin.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: Unknown.

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
NPH subcutaneous	2–4 hr	4–10 hr	10–16 hr
70% NPH/30% regular insulin mixture	30 min	2–12 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
Use Cautiously in: Stress or infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); OB: Pregnancy may temporarily ↑ insulin requirements; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects

Endo: HYPOGLYCEMIA. **F and E:** hypokalemia. **Local:** cutaneous amyloidosis, lipodystrophy, pruritus, erythema, swelling. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Beta blockers and **clonidine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates** may ↓ insulin requirements. Concurrent use with **pioglitazone** or **rosiglitazone** may ↑ risk of fluid retention and worsening HF.
Drug-Natural Products: Glucosamine may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors.
Subcut (Adults and Children): 0.5–1 unit total insulin/kg/day. *Adolescents during rapid growth*—0.8–1.2 units total insulin/kg/day.

Availability

Solution for injection (vials and prefilled pens): 100 units/mL.

NURSING IMPLICATIONS

Assessment

- Assess patient periodically for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger;

© F.A. Davis Publishing

headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; unusual thirst) during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** Monitor blood glucose every 6 hr during therapy, more frequently in changes to insulin regimen, ketoacidosis, and times of stress. A1C may be monitored every 3–6 mo to determine effectiveness.
- Monitor serum potassium in patients at risk for hypokalemia (those using potassium-lowering agents, those receiving IV insulin) periodically during therapy.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Implementation

- ***High Alert:*** Medication errors involving insulins have resulted in serious patient harm and death. Clarify all ambiguous orders and do not accept orders using the abbreviation "u" for units, which can be misread as a zero or the numeral 4 and has resulted in tenfold overdoses. Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting other health care professional.
- Do not confuse Humulin N (NPH insulin) with Humalog (insulin lispro) or Novolin N (NPH insulin). Do not confuse Novolin N (NPH insulin) with Novolog (insulin aspart).
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL. Special syringes for doses <50 units are available. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.
- When mixing insulins, draw regular insulin or insulin lispro into syringe first to avoid contamination of regular insulin vial.
- Insulin should be stored in a cool place but does not need to be refrigerated. Once opened, store at room temperature. Follow manufacturer's instructions regarding storage of insulin and insulin pens before and after use.
- When transferring from once-daily NPH human insulin to *insulin glargine*, the dose usually remains unchanged. When transferring from twice-daily NPH human insulin to insulin glargine, the initial dose of insulin glargine is usually reduced by 20%.
- NPH insulin should not be used in the management of ketoacidosis.
- **Subcut:** Administer NPH insulin within 30–60 min before a meal. Inject subcut in abdomen, thigh, upper arm, or buttocks. Rotate injection sites to reduce risk of lipodystrophy or localized cutaneous amyloidosis. Repeated insulin injections into areas of lipodystrophy or localized cutaneous amyloidosis may result in hyperglycemia; and a sudden change in the injection site (to an unaffected area) may result in hypoglycemia.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Caution patient that insulin pens should not be shared with others, even if clean needles are used.
- Demonstrate technique for mixing insulins by drawing up regular insulin or insulin lispro first and rolling intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of bloodborne pathogens.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, herbal products, or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification de-

© F.A. Davis Publishing

scribing their disease and treatment regimen at all times.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes
- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

insulin regular (in-su-lin)
Entuzity, HumuLIN R, Myxredlin, NovoLIN R, NovoLIN R FlexPen, HumuLIN R U-500 (Concentrated), HumuLIN R U-500 KwikPen (Concentrated)

Classification
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

See Appendix K for more information concerning insulins

Indications
Control of hyperglycemia in patients with diabetes mellitus. **Concentrated regular insulin U-500:** Only for use in patients with insulin requirements >200 units/day. **Unlabeled Use:** Treatment of hyperkalemia.

Action
Lowers blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions of insulin: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics
Absorption: Rapidly absorbed from subcutaneous administration sites. U-100 regular insulin is absorbed slightly more quickly than U-500.
Distribution: Identical to endogenous insulin.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: 30–60 min.

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
Regular insulin IV	10–30 min	15–30 min	30–60 min
Regular insulin subcutaneous	30–60 min	2–4 hr	5–7 hr

Contraindications/Precautions
Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
Use Cautiously in: Stress or infection—may temporarily ↑ insulin requirements; Renal/hepatic impairment—may ↓ insulin requirements; Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); OB: Pregnancy may temporarily ↑ insulin requirements.

Adverse Reactions/Side Effects
Endo: HYPOGLYCEMIA. **F and E:** hypokalemia. **Local:** cutaneous amyloidosis, lipodystrophy, pruritus, erythema, swelling. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions
Drug-Drug: Beta blockers and **clonidine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates** may ↓ insulin requirements. Concurrent use with **pioglitazone** or **rosiglitazone** may ↑ risk of fluid retention and worsening HF.
Drug-Natural Products: Glucosamine may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage
Dose depends on blood glucose, response, and many other factors.

Ketoacidosis—Regular (100 units/mL) Insulin Only
IV (Adults): 0.1 unit/kg/hr as a continuous infusion.
IV (Children): Loading dose—0.1 unit/kg, then maintenance continuous infusion 0.05–0.2 unit/kg/hr, titrate to optimal rate of ↓ of serum glucose of 80–100 mg/dL/hr.

Maintenance Therapy
Subcut (Adults and Children): 0.5–1 unit/kg/day in divided doses. *Adolescents during rapid growth*—0.8–1.2 unit/kg/day in divided doses.

Treatment of Hyperkalemia
Subcut, IV (Adults and Children): Dextrose 0.5–1 g/kg combined with insulin 1 unit for every 4–5 g dextrose given.

Availability
Premixed infusion: 100 units/100 mL 0.9% NaCl. **Solution for injection (vials and prefilled pens):** 100 units/mL[OTC]. **Solution for injection (concentrated) (vials and prefilled pens):** 500 units/mL. ***In combination with:*** NPH insulins (Humulin 70/30, Novolin 70/30).

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess patient periodically for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; unusual thirst) during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. A1C may be monitored every 3–6 mo to determine effectiveness.
- Monitor serum potassium in patients at risk for hypokalemia (those using potassium-lowering agents, those receiving IV insulin) periodically during therapy.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine.

Implementation

- ***High Alert:*** Medication errors involving insulins have resulted in serious patient harm and death. Clarify all ambiguous orders and do not accept orders using the abbreviation "u" for units, which can be misread as a zero or the numeral 4 and has resulted in tenfold overdoses. Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting health care professional. Do not confuse regular **concentrated (U-500)** insulin with regular insulin.To prevent errors between regular U-100 insulin and concentrated U-500 insulin, concentrated U-500 insulin is marked with a band of diagonal brown strips and "U-500" is highlighted in red on the label and a conversion chart should always be available.
- Do not confuse Humulin with Humalog (insulin lispro). Do not confuse Novolin with Novolog.
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL. Special syringes for doses <50 units and U-500 insulin are available. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.
- When mixing insulins, draw regular insulin into syringe first to avoid contamination of regular insulin vial.
- Insulin should be stored in a cool place but does not need to be refrigerated. Once opened, store at room temperature. Follow manufacturer's instructions regarding storage of insulin and insulin pens before and after use.
- **Subcut:** Administer regular insulin within 30 min before a meal into the thigh, upper arm, abdomen, or buttocks. Rotate sites with each injection to prevent lipodystrophy and cutaneous amyloidosis. Repeated insulin injections into areas of localized cutaneous amyloidosis may cause hyperglycemia; a sudden change to an unaffected injection site may cause hypoglycemia.

IV Administration

- **IV:** Do not use if cloudy, discolored, or unusually viscous. ***High Alert:*** Do not administer regular (concentrated) insulin U-500 IV.
- **IV Push:** ***Dilution:*** May be administered IV undiluted directly into vein or through Y-site. ***Rate:*** Administer up to 50 units over 1 min.
- **Continuous Infusion:** ***Dilution:*** May be diluted in 0.9% NaCl using polyvinyl chloride infusion bags. ***Concentration:*** 0.1 unit/mL to 1 unit/mL in infusion systems with the infusion fluids. ***Rate:*** Place on an IV pump for accurate administration.
- Rate of administration should be decreased when serum glucose level reaches 250 mg/dL.
- **Y-Site Compatibility:** acyclovir, alfentanil, aminophylline, amphotericin B lipid complex, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, ceftaroline, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, clindamycin, cyanocobalamin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, docetaxel, doxorubicin liposomal, doxycycline, enalapril, ephedrine, epirubicin, epoetin alfa, eravacycline, ertapenem, erythromycin, esmolol, esomeprazole, etoposide, etoposide phosphate, fenoldopam, fentanyl, fluconazole, fludarabine, folic acid, foscarnet, fosphenytoin, ganciclovir, gemcitabine, granisetron, hetastarch, hydrocortisone, hydromorphone, ibuprofen lysine, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, irinotecan, isavuconazonium, ketorolac, lactated Ringer's, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, meropenem/vaborbactam, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, moxifloxacin, mycophenolate, nalbuphine, naloxone, nitroglycerin, nitroprusside,

© F.A. Davis Publishing

octreotide, oritavancin, oxacillin, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentobarbital, phenobarbital, phytonadione, plazomicin, potassium acetate, potassium chloride, procainamide, promethazine, propofol, pyridoxine, remifentanil, sodium bicarbonate, sufentanil, tacrolimus, tedizolid, terbutaline, theophylline, thiamine, thiotepa, tigecycline, tirofiban, topotecan, vancomycin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** alemtuzumab, butorphanol, cefoxitin, chlorpromazine, cisplatin, dantrolene, diazepam, diphenhydramine, gemtuzumab ozogamicin, glycopyrrolate, hydroxyzine, isoproterenol, ketamine, labetalol, micafungin, mitomycin, pentamidine, phentolamine, phenylephrine, phenytoin, piperacillin/tazobactam, prochlorperazine, propranolol, protamine, quinupristin/dalfopristin, rocuronium, trimethoprim/sulfamethoxazole.
- **Additive Compatibility:** May be added to total parenteral nutrition (TPN) solutions.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Opened, unused insulin vials should be discarded 1 mo after opening.
- Demonstrate technique for mixing insulins by drawing up regular insulin first and rolling intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of bloodborne pathogens.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, herbal products, or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

HIGH ALERT

INSULINS (long-acting)

(**in**-su-lin)

insulin degludec
Tresiba

insulin detemir
Levemir

insulin glargine
Basaglar, Lantus, Semglee, Toujeo

Classification
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

See Appendix K for more information concerning insulins

Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

Action

Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Physiochemical characteristics of long-acting insulins result in delayed and prolonged absorption.
Distribution: Widely distributed.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: 5–6 min (prolonged in patients with diabetes); biologic half-life is 1–1.5 hr; *insulin degludec* 25 hr; *insulin detemir* 5–7 hr (dose-dependent).

© F.A. Davis Publishing

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
Insulin degludec	within 2 hr	12 hr	up to 42 hr*
Insulin detemir	3–4 hr	3–14 hr†	6–24 hr‡
Insulin glargine	3–4 hr	none†	24 hr

*Following discontinuation after chronic use.
†Small amounts of insulin glargine and insulin detemir are slowly released resulting in a relatively constant effect over time.
‡Duration is dose dependent; duration ↑ as dose ↑.

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.

Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic impairment (may ↓ insulin requirements); Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); Patients with visual impairment who may rely on audible clicks to dial their dose (Toujeo and Tresiba); OB: Pregnancy may temporarily ↑ insulin requirements; Pedi: Children <18 yr (Toujeo), <6 yr (Basaglar, Lantus, or Semglee), <2 yr (detemir), or <1 yr (degludec) (safety not established).

Adverse Reactions/Side Effects

Endo: HYPOGLYCEMIA. **F and E:** hypokalemia. **Local:** cutaneous amyloidosis, lipodystrophy, pruritus, erythema, swelling. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Beta blockers and **clonidine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates** may ↓ insulin requirements. Concurrent use with **pioglitazone** or **rosiglitazone** may ↑ risk of fluid retention and worsening HF.

Drug-Natural Products: Glucosamine may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Toujeo has a lower glucose-lowering effect than Basaglar or Lantus on a unit-to-unit basis.

Insulin Degludec

Subcut (Adults): *Type 1 diabetes (insulin naïve)* — ⅓–½ of the total daily insulin dose given once daily, then adjust on the basis of patient's needs (remainder of insulin dose should be given as a short-acting insulin and divided between each daily meal) (usual starting total daily insulin dose = 0.2–0.4 units/kg); *Type 2 diabetes (insulin naïve)* — 10 units once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and already on insulin)* — Give the same dose as the total daily dose of the long-acting or intermediate-acting insulin once daily, then adjust on the basis of patient's needs.

Subcut (Children ≥1 yr): *Type 1 or 2 diabetes (and already on insulin)* — Give 80% of the total daily dose of the long-acting or intermediate-acting insulin once daily, then adjust on the basis of patient's needs.

Insulin Detemir

Subcut (Adults and Children ≥6 yr): *Type 2 diabetes patients who are insulin-naive* — 0.1–0.2 units/kg once daily in the evening (or divided into a twice daily regimen) *or* 10 units once daily in the evening (or divided into a twice daily regimen). *Patients with type 1 or 2 diabetes receiving basal insulin or basal bolus therapy* — May substitute on an equivalent unit-per-unit basis.

Insulin Glargine (Basaglar, Lantus, or Semglee)

Subcut (Adults and Children ≥6 yr): *Type 1 diabetes (insulin naïve)* — ⅓ of the total daily insulin dose given once daily, then adjust on the basis of patient's needs (remainder of insulin dose should be given as a short-acting insulin) (usual starting total daily insulin dose = 0.2–0.4 units/kg); *Type 2 diabetes (insulin naïve)* — 0.2 units/kg or up to 10 units once daily; then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and converting from Toujeo)* — Give 80% of Toujeo dose as Basaglar, Lantus, or Semglee once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and converting from once daily NPH)* — Give the same dose once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and converting from twice daily NPH)* — Give 80% of the total daily NPH dose once daily, then adjust on the basis of patient's needs.

Insulin Glargine (Toujeo)

Subcut (Adults): *Type 1 diabetes (insulin naïve)* — ⅓–½ of the total daily insulin dose given once daily, then adjust on the basis of patient's needs (range = 1–80 units/day), (remainder of insulin dose should be given as a short-acting insulin) (usual starting total daily insulin dose = 0.2–0.4 units/kg); *Type 2 diabetes (insulin naïve)* — 0.2 units/kg once daily, then adjust on the basis of patient's needs; *Type 1 or 2 diabetes (and converting from intermediate or long-acting insulin)* — Use same total daily dose and give once daily, then adjust on the basis of patient's

© F.A. Davis Publishing

needs; *Type 1 or 2 diabetes (and converting from NPH insulin)* — Use 80% of the total daily NPH and give once daily, then adjust on the basis of patient's needs.

Availability

Insulin Degludec

Solution for injection: 100 units/mL (prefilled pens and vials), 200 units/mL (prefilled pens). ***In combination with:*** insulin aspart (Rysodeg 70/30); liraglutide (Xultophy). See Appendix N.

Insulin Detemir

Solution for injection: 100 units/mL (prefilled pens and vials). **Cost:** $177.61/10-mL vial; *Levemir Flexpen (3 mL)* — $290.07/5 pens.

Insulin Glargine

Solution for injection (Basaglar): 100 units/mL (prefilled pens). **Solution for injection (Lantus, Semglee):** 100 units/mL (prefilled pens and vials). **Cost:** $180.34/10-mL vial; *Lantus Solostar (3 mL)* — $306.22/5 pens. **Solution for injection (Toujeo):** 300 units/mL (prefilled pens). ***In combination with:*** lixisenatide (Soliqua). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess patient for signs and symptoms of hypoglycemia (anxiety; restlessness; mood changes; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing, polyuria; loss of appetite; nausea; vomiting; tiredness; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- ***Lab Test Considerations:*** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. Hemoglobin A_{1C} may also be monitored every 3–6 mo to determine effectiveness.
- Monitor serum potassium in patients at risk for hypokalemia (those using potassium-lowering agents, those receiving IV insulin) periodically during therapy.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine. Recovery from hypoglycemia may be delayed due to the prolonged effect of long-acting insulins.

Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting health care professional.
- Do not confuse Levemir (insulin detemir) with Lovenox (enoxaparin).
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the insulin's units/mL. Special syringes for doses <50 units are available. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.
- Use U-100 vial for pediatric patients requiring <5 units of insulin degludec each day.
- ***High Alert:*** Do not mix *insulin glargine or insulin detemir* with any other insulin or solution, or use syringes containing any other medicinal product or residue. If giving with a short-acting insulin, use separate syringes and different injection sites. Solution should be clear and colorless with no particulate matter.
- Do not use if cloudy, discolored, or unusually viscous. Store unopened vials and cartridges of *insulin glargine and insulin detemir* in the refrigerator; do not freeze. If unable to refrigerate, the 10-mL vial of *insulin glargine* can be kept in a cool place unrefrigerated for up to 28 days. Once the cartridge is placed in a pen, do not refrigerate. After initial use, *insulin detemir* vials, cartridges, or a prefilled syringe may be stored in a cool place for 42 days. *Insulin degludec* pens may be stored in the refrigerator or kept at room temperature for up to 56 days. Do not store in-use cartridges and prefilled syringes in refrigerator or with needle in place. Keep away from direct heat and sunlight.
- When transferring from once-daily NPH human insulin to *insulin glargine*, the dose usually remains unchanged. When transferring from twice-daily NPH human insulin to insulin glargine, the initial dose of insulin glargine is usually reduced by 20%.
- **Subcut:** Inject in abdominal area, thigh, buttocks or upper arms, and rotate injection sites with each injection to reduce the risk of lipodystrophy and localized cutaneous amyloidosis. Repeated insulin injections into areas of localized cutaneous amyloidosis may cause hyperglycemia; a sudden change to an unaffected injection site may cause hypoglycemia.
- Administer *insulin glargine* and *insulin degludec* once daily at the same time each day.
- Administer *daily insulin detemir* with evening meal or at bedtime. With *twice daily insulin detemir*, administer evening dose with evening meal, at bedtime, or 12 hr after morning dose.

© F.A. Davis Publishing

- Do not administer *insulin detemir, insulin degludec,* or *insulin glargine* IV or in insulin pumps.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Patients taking insulin detemir and *insulin degludec* should be given the *Patient Information* circular for this product.
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of bloodborne pathogens.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, herbal products, or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops; if unable to eat regular diet; or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels in diabetic patients without the appearance of hypoglycemic or hyperglycemic episodes.

INSULINS (rapid-acting)

(**in**-su-lin)

insulin aspart
Fiasp, NovoLOG, NovoRapid

insulin glulisine
Apidra, Apidra Solostar

insulin lispro
Admelog, HumaLOG, Lyumjev

Classification
Therapeutic: antidiabetics, hormones
Pharmacologic: pancreatics

See Appendix K for more information concerning insulins

I

Indications

Control of hyperglycemia in patients with type 1 or type 2 diabetes mellitus.

Action

Lower blood glucose by: stimulating glucose uptake in skeletal muscle and fat, inhibiting hepatic glucose production. Other actions: inhibition of lipolysis and proteolysis, enhanced protein synthesis. These are rapid-acting insulins with a more rapid onset and shorter duration than regular insulin; should be used with an intermediate- or long-acting insulin. **Therapeutic Effects:** Control of hyperglycemia in diabetic patients.

Pharmacokinetics

Absorption: Very rapidly absorbed from subcut administration sites.
Distribution: Widely distributed.
Metabolism and Excretion: Metabolized by liver, spleen, kidney, and muscle.
Half-life: *Insulin aspart*—1–1.5 hr; *Insulin lispro*—1 hr; *insulin glulisine*—42 min.

TIME/ACTION PROFILE (hypoglycemic effect)

ROUTE	ONSET	PEAK	DURATION
Insulin aspart	within 15 min	1–2 hr	3–4 hr
Insulin glulisine	within 15 min	1–2 hr	3–4 hr
Insulin lispro	within 15 min	1–2 hr	3–4 hr

Contraindications/Precautions

Contraindicated in: Hypoglycemia; Allergy or hypersensitivity to a particular type of insulin, preservatives, or other additives.
Use Cautiously in: Stress and infection (may temporarily ↑ insulin requirements); Renal/hepatic dysfunction (may ↓ insulin requirements); Concomitant use with pioglitazone or rosiglitazone (↑ risk of fluid retention and worsening HF); OB: Pregnancy may tem-

© F.A. Davis Publishing

porarily ↑ insulin requirements; Pedi: Safety not established in children <3 yr (Admelog and Humalog), <4 yr (insulin glulisine), <6 yr (for insulin aspart), or <18 yr (Lyumjev).

Adverse Reactions/Side Effects

Endo: HYPOGLYCEMIA. **F and E:** hypokalemia. **Local:** cutaneous amyloidosis, erythema, lipodystrophy, pruritus, swelling. **Misc:** allergic reactions including ANAPHYLAXIS.

Interactions

Drug-Drug: Beta blockers and **clonidine** may mask some of the signs and symptoms of hypoglycemia. **Corticosteroids**, **thyroid supplements**, **estrogens**, **isoniazid**, **niacin**, **phenothiazines**, and **rifampin** may ↑ insulin requirements. **Alcohol**, **ACE inhibitors**, **MAO inhibitors**, **octreotide**, **oral hypoglycemic agents**, and **salicylates** may ↓ insulin requirements. Concurrent use with **pioglitazone** or **rosiglitazone** may ↑ risk of fluid retention and worsening HF.

Drug-Natural Products: Glucosamine may worsen blood glucose control. **Fenugreek**, **chromium**, and **coenzyme Q-10** may produce additive hypoglycemic effects.

Route/Dosage

Dose depends on blood glucose, response, and many other factors. Only insulin aspart and insulin glulisine can be administered IV. Lyumjev has faster onset of action and greater blood glucose-lowering effect than Admelog or Humalog on a unit-to-unit basis.

Subcut (Adults and Children): Total insulin dose determined by needs of patient; generally 0.5–1 unit/kg/day; 50–70% of this dose may be given as meal-related boluses of rapid-acting insulin, and the remainder as an intermediate or long-acting insulin. *Subcutaneous infusion pump*— ~50% of total dose can be given as meal-related boluses and ~50% of total dose can be given as basal infusion.

Availability

Insulin aspart: 100 units/mL in 10-mL vials and 3-mL prefilled cartridges or pens. **Cost:** $163.68/10-mL vial , *NovoLog Flexpen (3 mL)*— $310.56/5 pens; *NovoLog Pen Fill (3 mL)*— $298.95/5 cartridges. **Insulin aspart 70/30 mix (Novolog Mix 70/30):** 70% insulin aspart protamine suspension and 30% insulin aspart solution mix 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Cost:** $169.64/10–mL vial, *NovoLog Mix 70/30 Flexpen (3 mL)*— $310.56/5 pens. **Insulin glulisine:** 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Cost:** $158.53/10–mL vial, *Apidra Solostar (3 mL)*— $294.61/5 pens. **Insulin lispro:** 100 units/mL in 10-mL vials and 3-mL prefilled cartridges and pens 200 units/mL in 3-mL prefilled cartridges and pens. **Cost:** $163.56/10-mL vial, *Humalog Kwikpen (3 mL)*— $309.53/5 pens. **Insulin lispro 75/25 mix (Humalog Mix 75/25):** 75% lispro insulin protamine suspension and 25% insulin lispro mix 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Cost:** $165.07/10-mL vial. **Insulin lispro 50/50 mix (Humalog Mix 50/50):** 50% lispro insulin protamine suspension and 50% insulin lispro mix 100 units/mL in 10-mL vials and 3-mL prefilled pens. **Cost:** *Humalog Mix 50/50 Kwikpen (3 mL)*— $303.58/5 pens.

NURSING IMPLICATIONS

Assessment

- Assess for symptoms of hypoglycemia (anxiety; restlessness; tingling in hands, feet, lips, or tongue; chills; cold sweats; confusion; cool, pale skin; difficulty in concentration; drowsiness; nightmares or trouble sleeping; excessive hunger; headache; irritability; nausea; nervousness; tachycardia; tremor; weakness; unsteady gait) and hyperglycemia (confusion, drowsiness; flushed, dry skin; fruit-like breath odor; rapid, deep breathing; polyuria; loss of appetite; nausea; vomiting; unusual thirst) periodically during therapy.
- Monitor body weight periodically. Changes in weight may necessitate changes in insulin dose.
- Assess patient for signs of allergic reactions (rash, shortness of breath, wheezing, rapid pulse, sweating, low BP) during therapy.
- ***Lab Test Considerations:*** Monitor blood glucose every 6 hr during therapy, more frequently in ketoacidosis and times of stress. HbA_{1C} may also be monitored every 3–6 mo to determine effectiveness.
- Monitor serum potassium in patients at risk for hypokalemia (those using potassium-lowering agents, those receiving IV insulin) periodically during therapy.
- ***Toxicity and Overdose:*** Overdose is manifested by symptoms of hypoglycemia. Mild hypoglycemia may be treated by ingestion of oral glucose. Severe hypoglycemia is a life-threatening emergency; treatment consists of IV glucose, glucagon, or epinephrine. Early signs of hypoglycemia may be less pronounced by long duration of diabetes, diabetic nerve disease, and use of beta blockers; may result in loss of consciousness prior to patient's awareness of hypoglycemia.

Implementation

- ***High Alert:*** Insulin-related medication errors have resulted in patient harm and death. Clarify ambiguous orders; do not accept orders using the abbreviation "u" for units (can be misread as a zero or the numeral 4; has resulted in tenfold overdoses).
- Insulins are available in different types and strengths. Check type, dose, and expiration date with another licensed nurse. Do not interchange insulins without consulting health care professional.
- Do not confuse Humalog with Humulin. Do not confuse Novolog with Novolin. Do not confuse Apidra with Spiriva (tiotropium).
- Use *only* insulin syringes to draw up dose. The unit markings on the insulin syringe must match the in-

© F.A. Davis Publishing

sulin's units/mL. Special syringes for doses <50 units are available. Do not draw up dose into a syringe from the Kwik Pens; syringe markings do not match-up and could lead to a medication error. Use *only* U-100 insulin syringes to draw up *insulin lispro* dose. Prior to withdrawing dose, rotate vial between palms to ensure uniform solution; do not shake.

- *Insulin aspart, insulin glulisine,* and *insulin lispro* may be mixed with NPH insulin. When mixing insulins, draw insulin aspart, insulin glulisine, or insulin lispro into syringe first to avoid contamination of rapid-acting insulin vial. Mixed insulins should never be used in a pump or for IV infusion.
- Store vials in refrigerator. Vials may also be kept at room temperature for up to 28 days. Do not use if cloudy, discolored, or unusually viscous. Store cartridges and pens at room temperature and use within 28 days. Never use the *PenFill* cartridge after the expiration date on the *PenFill* cartridge or on the box.
- Because of their short duration, *insulin lispro*, *insulin glulisine*, and *insulin aspart* must be used with a longer-acting insulin or insulin infusion pump. In patients with type 2 diabetes, *insulin lispro* may be used without a longer-acting insulin when used in combination with an oral sulfonylurea agent.
- Humalog U-200 and Lyumjev U-200 should not be mixed with other insulins, administered IV, or used in insulin pumps.
- **Subcut:** Administer into abdominal wall, thigh, or upper arm subcut. Rotate injection sites to prevent lipodystrophy and cutaneous amyloidosis. Repeated insulin injections into areas of localized cutaneous amyloidosis may cause hyperglycemia; a sudden change to an unaffected injection site may cause hypoglycemia.
- Administer *insulin aspart* within 5–10 min before a meal.
- When used as meal-time insulin, administer *insulin glulisine* 15 min before or within 20 min after starting a meal.
- Administer *insulin lispro: Admelog* and *Humalog* within 15 min before or immediately after a meal. Administer *Lyumjev* at the start of a meal or within 20 minutes after starting a meal.
- May also be administered subcut via external insulin pump. Do not mix with other insulins or solution when used with a pump. Change the solution in the reservoir at least every 6 days (Lyumjev at least every 9 days), change the infusion set, and the infusion set insertion site at least every 3 days. Do not mix with other insulins or with a diluent when used in the pump.
- **IV:** *Insulin aspart* and *insulin glulisine* may be administered IV in selected situations under appropriate medical supervision. ***Dilution:*** Dilute *insulin aspart* with 0.9% NaCl or D5W in infusion systems using polypropylene infusion bags. Dilute *insulin glulisine* with 0.9% NaCl, using polyvinyl chloride (PVC) Viaflex infusion bags and Polyvinyl chloride (PVC) tubing (Clearlink System Continu-Flo solution set) with a dedicated infusion line. ***Concentration:*** 0.05–1 unit/mL. *Insulin lispro (Humalog U-100)* can be administered IV under medical supervision ONLY with close monitoring of blood glucose and potassium levels to avoid hypoglycemia and hypokalemia. ***Concentration:*** 0.1 unit/mL to 1 unit/mL. ***Dilution:*** 0.9% NaCl. Solutions of insulin lispro and 0.9% NaCl can be stored for 48 hrs in refrigerator, then used at room temperature for another 48 hr.

Patient/Family Teaching

- Instruct patient on proper technique for administration. Include type of insulin, equipment (syringe, cartridge pens, external pump, alcohol swabs), storage, and place to discard syringes. Discuss the importance of not changing brands of insulin or syringes, selection and rotation of injection sites, and compliance with therapeutic regimen. Caution patient that insulin pens should not be shared with others, even if clean needles are used.
- Demonstrate technique for mixing insulins by drawing up insulin aspart, insulin glulisine, or insulin lispro first. Roll intermediate-acting insulin vial between palms to mix, rather than shaking (may cause inaccurate dose).
- Caution patient not to share pen device with another person, even if needle is changed; may risk transmission of bloodborne pathogens.
- Instruct patient in prompt identification and correction of the cause of hyperglycemia or ketosis. Pump or infusion set malfunctions can lead to a rapid onset of hyperglycemia and ketoacidosis. Interim therapy with subcutaneous injection may be required. Patients using continuous subcutaneous insulin infusion pump therapy must be trained to administer insulin by injection and have alternate insulin therapy available in case of pump failure.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long term.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness and health care professional notified of significant changes.
- Emphasize the importance of compliance with nutritional guidelines and regular exercise as directed by health care professional.

© F.A. Davis Publishing

- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications or alcohol.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional if nausea, vomiting, or fever develops, if unable to eat regular diet, or if blood glucose levels are not controlled.
- Instruct patient on signs and symptoms of hypoglycemia and hyperglycemia and what to do if they occur.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- Patients with diabetes mellitus should carry a source of sugar (candy, glucose gel) and identification describing their disease and treatment regimen at all times.
- Emphasize the importance of regular follow-up, especially during first few wk of therapy.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes.

INTERFERONS, BETA

(in-ter-**feer**-on)

interferon beta-1a
Avonex, Rebif

interferon beta-1b
Betaseron, Extavia

Classification
Therapeutic: anti-multiple sclerosis agents, immune modifiers
Pharmacologic: interferons

Indications

Relapsing forms of multiple sclerosis, including clinically isolated syndrome, relapsing-remitting disease, and active secondary progressive disease.

Action

Antiviral and immunoregulatory properties produced by interacting with specific receptor sites on cell surfaces may explain beneficial effects. Produced by recombinant DNA technology. **Therapeutic Effects:** Reduce incidence of relapse (neurologic dysfunction) and slow physical disability.

Pharmacokinetics

Absorption: *Interferon beta-1b*—50% absorbed following subcut administration.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: *Interferon beta-1a*—69 hr (subcut), 10 hr (IM); *interferon beta-1b*—8 min–4.3 hr.

TIME/ACTION PROFILE (serum concentrations)

ROUTE	ONSET	PEAK	DURATION
Interferon beta-1a IM, subcut	unknown	3–15 h	unknown
Interferon beta-1b subcut	rapid	16 h	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to natural or recombinant interferon beta or human albumin.
Use Cautiously in: History of suicide attempt or depression; History of seizures (interferon beta-1a); Cardiovascular disease; Congestive HF (may worsen HF); Liver disease (interferon beta-1a); History of alcohol abuse (interferon beta-1a); Latex sensitivity (Extavia only); OB: May ↑ risk of spontaneous abortion; use only if potential maternal benefit outweighs potential fetal risk; Lactation: Safety not established; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: chest pain, edema, hypertension. **Derm:** ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, rash, alopecia, ↑ sweating. **EENT:** sinusitis, vision abnormalities. **GI:** constipation, nausea, vomiting, abdominal pain, autoimmune hepatitis, dry mouth, ↑ liver enzymes. **GU:** cystitis, erectile dysfunction, polyuria, urinary incontinence. **Hemat:** THROMBOTIC THROMBOCYTOPENIC PURPURA, HEMOLYTIC UREMIC SYNDROME, neutropenia, anemia, eosinophilia, thrombocytopenia. **Local:** injection-site reactions, injection site necrosis. **MS:** myalgia, arthralgia, drug-induced lupus erythematosis, muscle spasm. **Neuro:** SEIZURES (↑ WITH INTERFERON BETA-1A), depression, dizziness, fatigue, headache, insomnia, drowsiness, incoordination, rigors, suicidal ideation. **Resp:** dyspnea, upper respiratory tract infection. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), chills, fever, flu-like symptoms, pain.

Interactions

(All interactions below are for Interferon beta-1b).

Drug-Drug: ↑ myelosuppression may occur with other myelosuppressives including **antineoplastics**. Concurrent use of **hepatotoxic agents** may ↑ the risk of hepatotoxicity (↑ liver enzymes).
Drug-Natural Products: Avoid concomitant use with immmunomodulating natural products such as **astragalus**, **echinacea**, and **melatonin**.

Route/Dosage

Interferon Beta-1a

IM (Adults): *Avonex*—30 mcg once weekly.
Subcut (Adults): *Rebif (target dose of 22 mcg 3 times/wk)*—Start with 4.4 mcg 3 times/wk for 2 wk,

© F.A. Davis Publishing

then ↑ to 11 mcg 3 times/wk for 2 wk, then ↑ to maintenance dose of 22 mcg 3 times/wk. *Rebif (target dose of 44 mcg 3 times/wk)* — Start with 8.8 mcg 3 times/wk for 2 wk, then ↑ to 22 mcg 3 times/wk for 2 wk, then ↑ to maintenance dose of 44 mcg 3 times/wk.

Interferon Beta-1b

Subcut (Adults): Initiate with 0.0625 mg (2 million units) every other day and then ↑ dose by 0.0625 mg every 2 wk over a 6-wk period up to target dose of 0.25 mg (8 million units) every other day.

Availability

Interferon Beta-1a

Lyophilized powder for injection (Avonex): 30 mcg/vial. **Solution for injection (prefilled syringes and prefilled pens) (Avonex):** 30 mcg/0.5 mL. **Solution for injection (prefilled syringes) (Rebif):** 22 mcg/0.5 mL, 44 mcg/0.5 mL, titration pack of 6 syringes prefilled with 8.8 mcg/0.2 mL and 6 syringes prefilled with 22 mcg/0.5 mL.

Interferon Beta-1b

Lyophilized powder for injection: 0.3 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess frequency of exacerbations of symptoms of multiple sclerosis periodically during therapy.
- Monitor patient for signs of depression during therapy. If depression occurs, notify health care professional immediately; discontinuation of therapy should be considered.
- ***Lab Test Considerations:*** Monitor hemoglobin, WBC, platelets, and blood chemistries including liver function tests prior to and 1, 3, and 6 mo after initiation of therapy and periodically thereafter. Therapy may be temporarily discontinued if the absolute neutrophil count is <750/mm^3, if AST or ALT exceeds 10 times the upper limit of normal, or if serum bilirubin exceeds 5 times the upper limit of normal. Once the absolute neutrophil count is >750/mm^3 or the hepatic enzymes have returned to normal, therapy can be restarted at 50% of the original dose.
- Thyroid function tests should be monitored every 6 mo, especially in patients with a history of thyroid abnormalities.

Implementation

- Do not confuse products. Interferon beta-1a and interferon beta-1b are not interchangeable.
- **Interferon Beta-1a:** *Avonex:* Reconstitute with 1.1 mL of diluent and swirl gently to dissolve. Do not shake the vial. Inject into the thigh or upper arm. Keep reconstituted solution in refrigerator; inject within 6 hr of reconstitution.
- *Rebif:* Administer subcut via prefilled, single-use syringe at the same time (afternoon or evening) on the same days (Monday, Wednesday, Friday) at least 48 hr apart each wk. Rotate sites with each injection to minimize risk of injection site reactions (pain, erythema, edema, cellulitis, abscess, necrosis). Avoid areas that are inflamed, edematous, erythematous, ecchymotic, or have signs of infection. Discard unused portions. Store in refrigerator.
- **Interferon Beta-1b:** To reconstitute, inject 1.2 mL of diluent supplied into interferon beta-1b vial for a concentration of 0.25 mg/mL. Swirl gently to dissolve completely; do not shake. Do not use solutions that are discolored or contain particulate matter. Keep reconstituted solution refrigerated; inject within 3 hr of reconstitution. Rubber cap of diluent prefilled syringe of Extavia contains latex and should not be handled by individuals allergic to latex.
- Following reconstitution, withdraw 1 mL into a syringe with a 27-gauge needle and inject subcut into arm, abdomen, hip, or thigh. Pinch skin during injection and inject at a 90° angle. Gently massage injection site. Rotate sites with each injection to minimize risk of injection site reactions. Discard unused portion; vials are for single dose only.

Patient/Family Teaching

- **Home Care Issues:** Instruct patient in correct technique for injection and care and disposal of equipment. Caution patient not to reuse needles or syringes and provide patient with a puncture-resistant container for disposal.
- Instruct patient to take medication as directed; do not change dose or schedule without consulting health care professional. Patient should receive a medication guide with each product.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking, other unusual changes in behavior or mood occur.
- Inform patient that flu-like symptoms (fever, chills, myalgia, sweating, malaise) may occur during therapy. Acetaminophen may be used for relief of fever and myalgias.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. May cause spontaneous abortion.

Evaluation/Desired Outcomes

- Decrease in the frequency of relapse (neurologic dysfunction) in patients with relapsing-remitting multiple sclerosis.

© F.A. Davis Publishing

ipilimumab (i-pil-li-moo-mab)

Yervoy

Classification

Therapeutic: antineoplastics
Pharmacologic: monoclonal antibodies cytotoxic T-lymphocyte antigen 4 inhibitors

Indications

Unresectable/metastatic melanoma (as monotherapy or in combination with nivolumab). Adjuvant treatment of cutaneous melanoma with pathologic involvement of regional lymph nodes >1 mm in patients who have undergone complete resection, including total lymphadenectomy. Previously untreated, advanced renal cell carcinoma in patients who are at intermediate or poor risk (in combination with nivolumab). Microsatellite instability-high (MSI-H) or mismatch repair deficient (dMMR) metastatic colorectal cancer that has progressed following treatment with a fluoropyrimidine, oxaliplatin, and irinotecan. Hepatocellular carcinoma in patients who have been previously treated with sorafenib (in combination with nivolumab). First-line treatment of metastatic non–small-cell lung cancer (NSCLC) in patients whose tumors express PD-L1 (≥1%) and have no epidermal growth factor receptor (EGFR) or anaplastic lymphoma kinase (ALK) genomic tumor aberrations (in combination with nivolumab). First-line treatment of metastatic or recurrent NSCLC in patients whose tumors have no EGFR or ALK genomic tumor aberrations (in combination with nivolumab and two cycles of platinum-based chemotherapy). First-line treatment of unresectable malignant pleural mesothelioma (in combination with nivolumab).

Action

Binds to cytotoxic T-lymphocyte-associated antigen 4 (CTLA-4) and prevents it from binding to CD80/CD86 ligands. CTLA-4 is a negative regulator of T-cell activation; binding results in augmented T-cell activation and proliferation as well as enhanced T-cell responsiveness.

Therapeutic Effects: ↓ spread or recurrence of melanoma and improved survival. Improved survival with renal cell carcinoma, NSCLC and malignant pleural mesothelioma. ↓ progression of MSI-H or dMMR metastatic colorectal cancer. ↓ progression of hepatocellular carcinoma.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Crosses the placenta.
Metabolism and Excretion: Unknown.
Half-life: 14.7 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
IV	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Lactation: Avoid breast feeding.

Use Cautiously in: Patients undergoing allogeneic hematopoietic stem cell transplantation (↑ risk of graft-versus-host disease; OB: Use only if potential maternal benefit justifies potential risk to the fetus; may cause fetal harm; Rep: Women of reproductive potential; Pedi: Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: MYOCARDITIS, pericarditis, vasculitis. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), pruritus, rash. **EENT:** iritis, hearing loss, uveitis. **Endo:** ADRENAL INSUFFICIENCY, hypothyroidism, hyperthyroidism, hypoparathyroidism, hypophysitis, type 1 diabetes. **GI:** COLITIS, HEPATITIS, diarrhea, gastritis, pancreatitis. **GU:** nephritis. **Hemat:** hemolytic anemia. **MS:** RHABDOMYOLYSIS, myositis. **Neuro:** autoimmune neuropathy, Guillain-Barré syndrome, myasthenic syndrome, myelitis, ENCEPHALITIS, MENINGITIS, fatigue. **Resp:** PNEUMONITIS. **Misc:** INFUSION REACTIONS.

Interactions

Drug-Drug: Concurrent use with **vemurafenib** may ↑ risk of hepatic dysfunction.

Route/Dosage

Unresectable/Metastatic Melanoma

IV (Adults and Children ≥12 yr): *As monotherapy*—3 mg/kg every 3 wk for up to 4 doses.
IV (Adults): *In combination with nivolumab*—3 mg/kg every 3 wk for up to 4 doses or unacceptable toxicity (administer after nivolumab on same day); after completing 4 doses of the combination, give nivolumab alone until disease progression or unacceptable toxicity.

Adjuvant Treatment of Melanoma

IV (Adults and Children ≥12 yr): 10 mg/kg every 3 wk for up to 4 doses, then 10 mg/kg every 12 wk for up to 3 yr.

Advanced Renal Cell Carcinoma

IV (Adults): 1 mg/kg every 3 wk for up to 4 doses (administer after nivolumab on same day); after completing 4 doses of the combination, give nivolumab alone until disease progression or unacceptable toxicity.

Colorectal Cancer

IV (Adults): 1 mg/kg every 3 wk for 4 doses (administer after nivolumab on same day); after completing 4 doses of the combination, give nivolumab alone until disease progression or unacceptable toxicity.

Hepatocellular Carcinoma

IV (Adults): 3 mg/kg every 3 wk for 4 doses (administer after nivolumab on same day); after completing 4

© F.A. Davis Publishing

doses of the combination, give nivolumab alone until disease progression or unacceptable toxicity.

Metastatic or Recurrent Non–Small-Cell Lung Cancer

IV (Adults): 1 mg/kg every 6 wk until disease progression, unacceptable toxicity or for up to 2 yr (if no disease progression) (administer after nivolumab, but before platinum-based chemotherapy [if being given] on same day) .

Malignant Pleural Mesothelioma

IV (Adults): 1 mg/kg every 6 wk until disease progression, unacceptable toxicity or for up to 2 yr (if no disease progression) (administer after nivolumab on same day).

Availability

Solution for injection: 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor for signs and symptoms of colitis (diarrhea, abdominal pain, mucus or blood in stool, with or without fever) and bowel perforation (peritoneal signs, ileus). Rule out infection and consider endoscopic evaluation. *If Grade 2 colitis occurs,* hold therapy and administer corticosteroids (initial dose of 1–2 mg/kg/day prednisone or equivalent, followed by a corticosteroid taper. Resume therapy at Grade 0 or 1 after corticosteroid taper. Permanently discontinue if no complete or partial resolution within 12 wk of last dose or inability to reduce prednisone to ≤10 mg per day (or equivalent) within 12 wk of initiating steroids. *If Grade 3 or 4 colitis occurs,* permanently discontinue ipilimumab.
- Assess for skin reactions including SJS, TEN, and DRESS (prodrome of fever, flu-like symptoms, mucosal lesions, progressive skin rash) during therapy. Treat mild to moderate nonexfoliative rashes with topical emollients and/or topical corticosteroids. *If SJS, TEN, or DRESS is suspected,* hold ipilimumab; if confirmed, permanently discontinue ipilimumab.
- Monitor for signs and symptoms of pneumonitis (new or worsening cough, chest pain, shortness of breath) during therapy. Evaluate with x ray. Administer corticosteroids (initial dose of 1–2 mg/kg/day prednisone or equivalent, followed by a corticosteroid taper. *For Grade 2 pneumonitis:* hold ipilimumab and resume with complete or partial resolution (Grade 0–1) after corticosteroid taper. *For Grade 3 or 4 or recurrent Grade 2 pneumonitis:* permanently discontinue ipilimumab.
- Monitor for signs and symptoms of neurologic toxicity (headache, neck stiffness, change in consciousness, weakness) periodically during therapy. *If Grade 2 symptoms occur,* hold ipilimumab. *If Grade 3 or 4 symptoms occur,* discontinue ipilimumab permanently.
- Monitor for signs and symptoms of hypophysitis (headache, photophobia, visual field defects) during therapy. May cause hypopituitarism. Begin hormone replacement therapy. Hold or permanently discontinue ipilimumab based on severity.
- Assess eyes for signs and symptoms of uveitis, iritis, or episcleritis. Administer corticosteroid eye drops if these occur. Consider Vogt Koyanagi-Harada-like syndrome if uveitis occurs with other immune-mediated adverse reactions. May require treatment with systemic steroids to reduce the risk of permanent vision loss. *If Grade 2, 3, or 4 ophthalmologic symptoms occur that do not improve to Grade 1 within 2 wk while receiving topical therapy or that requires systemic treatment:* permanently discontinue ipilimumab.
- Monitor for signs and symptoms of infusion-related reactions (pyrexia, chills, flushing, hypotension, dyspnea, wheezing, back pain, abdominal pain, urticaria) during infusion. *For Grade 1 or 2 infusion-related reactions:* interrupt or slow rate of infusion. *For severe (Grade 3) or life-threatening (Grade 4) infusion-related reactions:* stop infusion and permanently discontinue ipilimumab.
- Monitor for signs and symptoms of cardiovascular events during therapy. Assess left ventricular ejection fraction at baseline and periodically during therapy. Manage cardiovascular risk factors (hypertension, diabetes, dyslipidemia). Discontinue ipilimumab for Grade 2, 3, or 4 cardiovascular events.
- ***Lab Test Considerations:*** Patient selection with metastatic NSCLC for treatment with ipilimumab in combination with nivolumab is based on PD-L1 expression. Information on FDA-approved tests for the determination of PD-L1 expression in NSCLC is available at: http://www.fda.gov/Companion-Diagnostics.
- Verify negative pregnancy status before starting therapy.
- May cause hepatitis; monitor liver function tests prior to and periodically during therapy. *If levels increase:* administer corticosteroids (initial dose of 1–2 mg/kg/day prednisone or equivalent, followed by a corticosteroid taper. For hepatitis with no tumor involvement of the liver or hepatitis with tumor involvement of liver/non-HCC: *If AST or ALT ↑ >3 times to <5 times ULN or total bilirubin ↑ >1.5 times to <3 times ULN:* hold ipilimumab and resume with complete or partial resolution (Grade 0–1) after corticosteroid taper. *If AST or ALT >5 times ULN or total bilirubin >3 times ULN:* discontinue ipilimumab permanently. For hepatitis with tumor involvement of the liver/HCC: *If baseline AST or ALT >1–<3 times ULN and increases to >5–<10*

I

© F.A. Davis Publishing

times ULN or if baseline AST or ALT >3– <5 times ULN and increases to >8 to <10 times ULN: hold ipilimumab and resume with complete or partial resolution (Grade 0 to 1) after corticosteroid taper. *If AST or ALT >10 times ULN or if total bilirubin >3 times ULN:* permanently discontinue ipilimumab.

- Monitor for signs and symptoms of adrenal insufficiency, including but not limited to hypothyroidism, hyperthyroidism, adrenal insufficiency, and hyperglycemia during and after treatment. Administer corticosteroids as appropriate, followed by a corticosteroid taper. *If Grade 3 or 4 endocrinopathies occur:* hold ipilimumab until clinically stable or permanently discontinue base on severity, treat low levels, and resume with complete or partial resolution (Grade 0–1) after corticosteroid taper.
- May cause nephritis; monitor for ↑ serum creatinine prior to and periodically during therapy. Administer corticosteroids (initial dose of 1–2 mg/kg/day prednisone or equivalent, followed by a corticosteroid taper. *If Grade 2 or 3 increased blood creatinine occurs:* hold ipilimumab and resume with complete or partial resolution (Grade 0–1) of nephritis and renal dysfunction after corticosteroid taper. *If Grade 4 increased blood creatinine occurs:* permanently discontinue ipilimumab.

Implementation

- For unresectable/metastatic melanoma, doses may be delayed in the event of toxicity, but must be administered within 16 wk from 1st dose. For adjuvant treatment of melanoma, doses can be omitted, but not delayed in the event of toxicity.
- Hold dose for any moderate immune-mediated adverse reactions or for symptomatic endocrinopathy. For patients with complete or partial resolution of adverse reactions (Grade 0–1), who are receiving equivalents of <7.5 mg prednisone/day, resume ipilimumab therapy.
- Permanently discontinue if persistent moderate adverse reactions or inability to reduce corticosteroid dose to equivalent of prednisone 7.5 mg/day, failure to complete full treatment course within 16 wk from infusion of 1st dose, or severe or life-threatening adverse reactions occur including: Colitis with abdominal pain, fever, or peritoneal signs; ↑ in stool frequency of 7 or more over baseline, stool incontinence. Need for IV hydration for >24 hrs, GI hemorrhage and GI perforation; AST or ALT >5 times the upper limits of normal or total bilirubin >3 times the upper limit of normal; Stevens-Johnson syndrome, toxic epidermal necrolysis, or rash complicated by full-thickness dermal ulceration, or necrotic, bullous, or hemorrhagic manifestations; Severe motor or sensory neuropathy, Guillain-Barré syndrome, or myasthenia gravis; Severe immune-mediated reactions involving any organ system (nephritis, pneumonitis, pancreatitis, noninfectious myocarditis); and immune-mediated ocular disease that is unresponsive to topical immunosuppressive therapy.
- Allow vial to stand at room temperature for 5 min prior to preparation of infusion. Withdraw amount of ipilimumab required and transfer to IV bag. ***Dilution:*** Dilute with 0.9% NaCl or D5W. ***Concentration:*** 1 mg/mL–2 mg/mL. Mix slowly by gentle inversion; do not shake. Solution is clear, pale yellow, and may contain translucent-to-white amorphous particles; do not administer if cloudy, discolored, or contains particulate matter. Store for up to 24 hr at room temperature or refrigerated; do not freeze, protect from light. Discard partially used vials.
- **Melanoma**: Infuse over 90 min through a sterile, nonpyrogenic, low-protein-binding in-line filter. Flush the IV line with 0.9% NaCl or D5W after each dose.
- **Renal cell carcinoma or colorectal cancer**: Infuse over 30 min immediately following nivolumab infusion through a sterile, nonpyrogenic, low-protein-binding in-line filter. Flush the IV line with 0.9% NaCl or D5W after each dose.
- **Y-Site Incompatibility:** Do not mix with or infuse with other solutions or products.

Patient/Family Teaching

- Explain purpose and potential adverse effects of ipilimumab to patient.
- Inform patient of the risk of immune-mediated reactions due to T-cell activation and proliferation. Advise patients these may be severe and fatal. Instruct patient to notify health care professional immediately if signs and symptoms occur.
- Instruct patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if signs and symptoms of colitis (diarrhea; black, tarry, sticky, bloody, or mucus in stools; severe abdominal pain or tenderness), hepatitis (yellowing of skin or the whites of eyes, severe nausea or vomiting, pain on right side of abdomen), skin reactions (rash, itching, skin blistering or peeling, painful sores in mouth or nose, throat, or genital area), endocrinopathies (persistent or unusual headache, eye sensitivity to light, eye problems, rapid heartbeat, increased sweating, extreme tiredness, weight gain or weight loss, feeling more hungry or thirsty than usual, urinating more often than usual, hair loss, feeling cold, constipation, deepening of voice, dizziness or fainting, changes in mood or behavior, decreased sex drive, irritability, or forgetfulness), pneumonitis (new or worsening cough, shortness of breath, chest pain), nephritis (decrease in amount of urine, blood in urine, swelling of ankles, loss of appetite), or eye problems (blurry vision, double vision, or other vision problems, eye pain or redness) occur.

© F.A. Davis Publishing

- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, herbal products.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and avoid breast feeding during and for 3 mo following last dose. Women must choose to discontinue breast feeding or ipilimumab. Advise female patients to notify health care professional if pregnancy is planned or suspected. Encourage women who become pregnant during therapy to contact Bristol-Myers Squibb by calling 1-844-593-7869.

Evaluation/Desired Outcomes

- ↓ spread or recurrence of melanoma.
- Improved survival with renal cell carcinoma, NSCLC, and malignant pleural mesothelioma.
- ↓ progression of MSI-H or dMMR metastatic colorectal cancer.
- ↓ progression of hepatocellular carcinoma.

ipratropium (i-pra-**troe**-pee-um)

~~Atrovent~~, Atrovent HFA

Classification

Therapeutic: allergy, cold, and cough remedies, bronchodilators
Pharmacologic: anticholinergics

Indications

Inhaln: Maintenance therapy of reversible airway obstruction due to COPD, including chronic bronchitis and emphysema. **Intranasal:** Rhinorrhea associated with allergic and nonallergic perennial rhinitis (0.03% solution) or the common cold (0.06% solution). **Unlabeled Use: Inhaln:** Adjunctive management of bronchospasm caused by asthma.

Action

Inhaln: Inhibits cholinergic receptors in bronchial smooth muscle, resulting in decreased concentrations of cyclic guanosine monophosphate (cGMP). Decreased levels of cGMP produce local bronchodilation. **Intranasal:** Local application inhibits secretions from glands lining the nasal mucosa. **Therapeutic Effects: Inhaln:** Bronchodilation without systemic anticholinergic effects. **Intranasal:** Decreased rhinorrhea.

Pharmacokinetics

Absorption: Minimal systemic absorption (2% for inhalation solution; 20% for inhalation aerosol; <20% following nasal use).
Distribution: 15% of dose reaches lower airways after inhalation.
Metabolism and Excretion: Small amounts absorbed are metabolized by the liver.
Half-life: 2 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhalation	1–3 min	1–2 hr	4–6 hr
Intranasal	15 min	unknown	6–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to ipratropium, atropine, belladonna alkaloids, or bromide; Avoid use during acute bronchospasm; **Note: Atrovent HFA has replaced the discontinued Atrovent CFC (chlorofluorocarbon). Soy and CFC-allergic patients can now safely use the Atrovent HFA formulation. However, Combivent (ipratropium/albuterol combination) MDI does contain soya lecithin and is contraindicated in patients with a history of hypersensitivity to soy and peanuts.**
Use Cautiously in: Patients with bladder neck obstruction, prostatic hyperplasia, glaucoma, or urinary retention; Lactation: Safety not established in breast feeding; Geri: Older adults may be more sensitive to effects.

Adverse Reactions/Side Effects

CV: hypotension, palpitations. **EENT:** blurred vision, sore throat; *nasal only*, epistaxis, nasal dryness/irritation. **GI:** GI irritation, nausea. **Derm:** rash. **Neuro:** dizziness, headache, nervousness. **Resp:** bronchospasm, cough. **Misc:** allergic reactions.

Interactions

Drug-Drug: ↑ anticholinergic effects with other **drugs having anticholinergic properties (antihistamines, phenothiazines, disopyramide).**

Route/Dosage

Inhaln (Adults and Children >12 yr): *Metered-dose inhaler (nonacute)* — 2 inhalations 4 times daily (not to exceed 12 inhalations/24 hr or more frequently than every 4 hr). *Acute exacerbations* — 4–8 puffs using a spacer device as needed. *Via nebulization (nonacute)* — 500 mcg 3–4 times daily. *Via nebulization (acute exacerbations)* — 500 mcg every 30 min for 3 doses then every 2–4 hr as needed.
Inhaln (Children 5–12 yr): *Metered-dose inhaler (nonacute)* — 1–2 inhalations every 6 hr as needed (not to exceed 12 inhalations/24 hr). *Acute exacerbations* — 4–8 puffs as needed. *Via nebulization (nonacute)* — 250–500 mcg 4 times daily given every 6 hr. *Acute exacerbations* — 250 mcg every 20 min for 3 doses then every 2–4 hr as needed.
Inhaln (Infants): *Nebulization* — 125–250 mcg 3 times a day.
Inhaln (Neonates): *Nebulization* — 25 mcg/kg/dose 3 times a day.

© F.A. Davis Publishing

Intranasal (Adults and Children >6 yr): *0.03% solution*—2 sprays in each nostril 2–3 times daily (21 mcg/spray).
Inhaln (Adults and Children >5 yr): *0.06% solution*—2 sprays in each nostril 3–4 times daily (42 mcg/spray).

Availability (generic available)

Aerosol inhaler (HFA) (chlorofluorocarbon-free): 17 mcg/spray in 12.9-g canister (200 inhalations). **Inhalation solution:** 0.0125%, 0.02%, 0.025%. **Nasal spray:** 0.03% solution—21 mcg/spray in 30-mL bottle (345 sprays/bottle), 0.06% solution—42 mcg/spray in 15-mL bottle (165 sprays). ***In combination with:*** albuterol (Combivent). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess for allergy to atropine and belladonna alkaloids; patients with these allergies may also be sensitive to ipratropium. Atrovent HFA MDI does not contain CFC or soy and may be used safely in soy or CFC-allergic patients. However, Combivent MDI should be avoided in soy or peanut-allergic patients.
- **Inhaln:** Assess respiratory status (rate, breath sounds, degree of dyspnea, pulse) before administration and at peak of medication. Consult health care professional about alternative medication if severe bronchospasm is present; onset of action is too slow for patients in acute distress. If paradoxical bronchospasm (wheezing) occurs, withhold medication and notify health care professional immediately.
- **Nasal Spray:** Assess patient for rhinorrhea.

Implementation

- **Inhaln:** See Appendix C for administration of inhalation medications.
- When ipratropium is administered concurrently with other inhalation medications, administer adrenergic bronchodilators first, followed by ipratropium, then corticosteroids. Wait 5 min between medications.
- Solution for *nebulization* can be diluted with preservative-free 0.9% NaCl. Diluted solution should be used within 24 hr at room temperature or 48 hr if refrigerated. Solution can be mixed with preservative-free albuterol or cromolyn if used within 1 hr of mixing.

Patient/Family Teaching

- Instruct patient in proper use of inhaler, nebulizer, or nasal spray and to take medication as directed. Take missed doses as soon as remembered unless almost time for the next dose; space remaining doses evenly during day. Do not double doses.
- Advise patient that rinsing mouth after using inhaler, good oral hygiene, and sugarless gum or candy may minimize dry mouth. Health care professional should be notified if stomatitis occurs or if dry mouth persists for more than 2 wk.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Inhalation:** Caution patient not to exceed 12 doses within 24 hr. Patient should notify health care professional if symptoms do not improve within 30 min after administration of medication or if condition worsens.
- Explain need for pulmonary function tests prior to and periodically during therapy to determine effectiveness of medication.
- Caution patient to avoid spraying medication in eyes; may cause blurring of vision or irritation.
- Advise patient to inform health care professional if cough, nervousness, headache, dizziness, nausea, or GI distress occurs.
- **Nasal Spray:** Instruct patient in proper use of nasal spray. Clear nasal passages gently before administration. Do not inhale during administration, so medication remains in nasal passages. Prime pump initially with 7 actuations. If used regularly, no further priming is needed. If not used in 24 hr, prime with 2 actuations. If not used for >7 days, prime with 7 actuations.
- Advise patient to contact health care professional if symptoms do not improve within 1–2 wk or if condition worsens.

Evaluation/Desired Outcomes

- Decreased dyspnea.
- Improved breath sounds.
- Decrease in rhinorrhea from perennial rhinitis or the common cold.

irbesartan, See ANGIOTENSIN II RECEPTOR ANTAGONISTS.

irinotecan (eye-ri-noe-**tee**-kan)

Camptosar

Classification
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors

Indications

Metastatic colorectal cancer (with 5-fluorouracil and leucovorin).

Action

Interferes with DNA synthesis by inhibiting the enzyme topoisomerase. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones.

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Unknown.
Protein Binding: *Irinotecan*—30–68%; *SN–38 (active metabolite)*—95%.

© F.A. Davis Publishing

Metabolism and Excretion: Converted by the liver to SN−38, its active metabolite, which is metabolized by the liver by UDP-glucuronosyl 111 transferase 1A1 (UGT1A1) and CYP3A4. Small amounts excreted by kidneys.
Half-life: 6 hr.

TIME/ACTION PROFILE (hematologic effects)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	21−29 days	27−34 days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hereditary fructose intolerance (contains sorbitol); Concurrent use of ketoconazole or St. John's wort; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Previous pelvic or abdominal irradiation or age ≥65 yr (↑ risk of myelosuppression); Presence of infection, underlying bone marrow depression, or concurrent chronic illness; History of prior pelvic/abdominal irradiation and serum bilirubin >1−2 mg/dL (initial dose reduction recommended); Hepatic impairment; Previous severe myelosuppression or diarrhea (reinstitute at lower dose following resolution); Patients with genetically reduced UGT1A1 activity (↑ risk of neutropenia); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Effectiveness in children not established; Geri: ↑ sensitivity to adverse effects (myelosuppression); initiate at lower dose.

Adverse Reactions/Side Effects

CV: edema, vasodilation. **Derm:** alopecia, rash, sweating. **EENT:** rhinitis. **F and E:** dehydration. **GI:** DIARRHEA, ↑ LIVER ENZYMES, abdominal pain/cramping, anorexia, constipation, dyspepsia, flatulence, nausea, stomatitis, vomiting, abdominal enlargement, colonic ulceration. **GU:** ↓ fertility, menstrual abnormalities. **Hemat:** NEUTROPENIA, anemia, leukopenia, thrombocytopenia. **Local:** injection site reactions. **Metab:** weight loss. **MS:** INFECTION, back pain. **Neuro:** dizziness, headache, insomnia, weakness.. **Resp:** INTERSTITIAL LUNG DISEASE, coughing, dyspnea. **Misc:** chills, fever.

Interactions

Drug-Drug: Combination with **fluorouracil** may result in serious toxicity (dehydration, neutropenia, sepsis). ↑ bone marrow depression may occur with other **antineoplastics** or **radiation therapy**. Strong **CYP3A4 inhibitors** (**ketoconazole**, **clarithromycin**, **indinavir**, **itraconazole**, **lopinavir**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, and **voriconazole**) and strong **UGT1A1 inhibitors** (**atazanavir**, **gemfibrozil**, and **indinavir**) may ↑ levels of irinotecan and its active metabolite; should be discontinued ≥1 wk before initiating irinotecan. **Phenobarbital**, **phenytoin**, **carbamazepine**, **rifampin**, or **rifabutin** may ↓ levels of irinotecan and its active metabolite; consider using an alternative anticonvulsant at least 2 wk before initiating irinotecan. **Laxatives** should be avoided (diarrhea may be ↑). **Diuretics** ↑ risk of dehydration (may discontinue during therapy). **Dexamethasone** may ↑ risk of hyperglycemia and lymphocytopenia. **Prochlorperazine** given on the same day as irinotecan ↑ risk of akathisia. May ↓ antibody response to and ↑ risk of adverse reactions from **live virus vaccines**.
Drug-Natural Products: St. John's wort ↓ levels of the active metabolite; concurrent use is contraindicated; should be discontinued at least 2 wk before initiating irinotecan.

Route/Dosage

Other regimens are used; careful modification required for all levels of toxicity/tolerance.

Single Agent

IV (Adults): *Weekly dosage schedule*— 125 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered. *Once-every-3-wk schedule*— 350 mg/m² once every 3 wk. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered.
IV (Geriatric Patients >70 yr): *Weekly dosage schedule*— 125 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered. *Once-every-3-wk schedule*— 300 mg/m² once every 3 wk. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered.
IV (Adults Patients With Reduced UGT1A1 Activity): *Weekly dosage schedule*— 100 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered. *Once-every-3-wk schedule*— 300 mg/m² once every 3 wk. Cycle may be repeated using doses which depend on patient tolerance and degree of toxicity encountered.

Hepatic Impairment

IV (Adults): *Bilirubin 1−2 mg/dL and history of prior pelvic/abdominal irradiation— Weekly dosage schedule*— Initiate therapy at lower dose (100 mg/m²); once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated with dose adjusted as tolerated. *Once-every-3-wk schedule*— 300 mg/m² once every 3 wk. Cycle may be repeated with dose adjusted as tolerated.

© F.A. Davis Publishing

As Part of Combination Therapy With Leucovorin and 5-Fluorouracil

IV (Adults): *Regimen 1 (Bolus regimen)* — 125 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered; *Regimen 2 (Infusional regimen)* — 180 mg/m² every 2 wk for 3 doses, followed by a 3-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered.

IV (Adult Patients With Reduced UGT1A1 Activity): *Regimen 1 (Bolus regimen)* — 100 mg/m² once weekly for 4 wk, followed by a 2-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered; *Regimen 2 (Infusional regimen)* — 150 mg/m² every 2 wk for 3 doses, followed by a 3-wk rest period. Cycle may be repeated using doses that depend on patient tolerance and degree of toxicity encountered.

Availability (generic available)

Solution for injection: 20 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs frequently during administration.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor closely for the development of diarrhea. Two types may occur. The early type occurs within 24 hr of administration and may be preceded by cramps and sweating. Atropine 0.25–1 mg IV may be given to decrease symptoms. Potentially life-threatening diarrhea may occur >24 hr after a dose; may be accompanied by severe dehydration and electrolyte imbalance. Loperamide 4 mg initially, followed by 2 mg every 2 hr until diarrhea ceases for at least 12 hr (or 4 mg every 4 hr if given during sleeping hours) should be administered promptly to treat late-occurring diarrhea. Do not administer loperamide at these doses for >48 hr. Careful fluid and electrolyte replacement should be instituted to prevent complications. *If diarrhea of 2–3 stools/day pretreatment occurs,* maintain dose. *If diarrhea of 4–6 stools/day pretreatment occurs during a cycle,* ↓ by 25 mg/m². *If diarrhea of 4–6 stools/day pretreatment occurs at the beginning of a weekly cycle or at the beginning of a once every 3-wk cycle,* maintain dose. *If diarrhea of 7–9 stools/day pretreatment occurs during a cycle,* hold dose until resolved to ≤Grade 2, then ↓ by 25 mg/m². *If diarrhea of 7–9 stools/day pretreatment occurs at the beginning of a weekly cycle,* ↓ by 25 mg/m². *If diarrhea of 7–9 stools/day pretreatment occurs at the beginning of a once every 3-wk cycle,* ↓ by 50 mg/m². *If diarrhea ≥10 stools/day pretreatment occurs during a cycle,* hold dose until resolved to ≤Grade 2, then ↓ by 50 mg/m². *If diarrhea ≥10 stools/day pretreatment occurs at the beginning of a weekly cycle or at the beginning of a once every 3-wk cycle,* ↓ by 50 mg/m².
- Nausea and vomiting are common. Pretreatment with dexamethasone 10 mg along with agents such as ondansetron or granisetron should be started on the same day as irinotecan at least 30 min before administration. Prochlorperazine may be used on subsequent days but may increase risk of akathisia if given on the same day as irinotecan.
- Assess IV site frequently for inflammation. Avoid extravasation. If extravasation occurs, infusion must be stopped and restarted in another vein to avoid damage to subcut tissue. Flushing site with sterile water and application of ice over the extravasated site are recommended.
- If signs of pulmonary toxicity (dyspnea, cough, fever) occur, interrupt therapy. If interstitial pulmonary disease is determined, discontinue irinotecan.
- Assess for cholinergic symptoms (rhinitis, increased salivation, miosis, lacrimation, diaphoresis, flushing, abdominal cramping, diarrhea) during therapy. Atropine 0.25–1 mg subcut or IV may be used to prevent or treat symptoms.
- ***Lab Test Considerations:*** Consider laboratory test to determine the UGT1A1 status. Testing can detect the UGT1A1 6/6, 6/7 and 7/7 genotypes.
- Verify negative pregnancy test before starting therapy.
- Monitor CBC with differential and platelet count prior to each dose. *If neutropenia, ANC 1500–1999/mm³ occurs,* maintain dose. *If ANC 1000–1499/mm³ occurs during a cycle,* ↓ dose by 25 mg/m². *If ANC 1000–1499/mm³ occurs at beginning of cycle,* maintain dose. *If ANC 500–999/mm³ occurs during a cycle,* hold dose until resolved to ≤Grade 2, then ↓ by 25 mg/m². *If ANC 500–999/mm³ occurs at the beginning of a weekly cycle,* ↓ dose by 25 mg/m². *If ANC 500–999/mm³ occurs at the beginning of a once every 3-wk cycle,* ↓ dose by 50 mg/m². *If ANC <500/mm³ occurs during a cycle,* hold dose until resolved to ≤Grade 2, then ↓ by 50 mg/m². *If ANC 500–999/mm³ occurs at the beginning of a weekly cycle or at the beginning of a once every 3-wk cycle,* ↓ dose by 50 mg/m². *If neutropenic fever occurs during a cycle,* hold dose until resolved, then ↓ by 50 mg/m² when resolved. *If neutropenic fever occurs at the beginning of a weekly cycle or at the beginning of a once every 3-wk cycle,* ↓ by 50 mg/m². Administration of a colony-stimulating factor may be considered if clinically significant decreases in WBC (<2000/mm³), neutrophil count (<1000/mm³),

© F.A. Davis Publishing

hemoglobin (<9 g/dL), or platelet count (<100,000 cells/mm^3) occur.
- May cause ↑ serum alkaline phosphatase and AST concentrations.

Implementation

IV Administration
- Prepare solution in a biologic cabinet. Wear gloves, gown, and mask while handling IV medication. Discard IV equipment in specially designated containers.
- **Intermittent Infusion:** ***Dilution:*** Dilute before infusion with D5W or 0.9% NaCl. Usual diluent is 500 mL of D5W. ***Concentration:*** 0.12–2.8 mg/mL. Solution is pale yellow. Do not administer solutions that are cloudy, discolored, or contain particulate matter. Solution is stable for 24 hr at room temperature or 48 hr if refrigerated. To prevent microbial contamination, solutions should be used within 24 hr of dilution if refrigerated or 6 hr at room temperature. Do not refrigerate solutions diluted with 0.9% NaCl. ***Rate:*** Administer dose over 90 min.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, atracurium, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, caspofungin, cefazolin, cefotetan, cefoxitin, ceftazidime, cefuroxime, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, daptomycin, daunorubicin hydrochloride, dexamethasone, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, foscarnet, gemtuzumab ozogamicin, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, imipenem/cilastatin, insulin regular, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, levoleucovorin, levorphanol, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, moxifloxacin, nalbuphine, naloxone, nicardipine, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pancuronium, pantoprazole, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, allopurinol, amphotericin B lipid complex, amphotericin B liposome, cefepime, cefotaxime, ceftriaxone, chloramphenicol, chlorpromazine, dantrolene, dexmedetomidine, diazepam, droperidol, fluorouracil, fosphenytoin, furosemide, ganciclovir, gemcitabine, glycopyrrolate, methohexital, methylprednisolone, mitomycin, nafcillin, nitroprusside, pemetrexed, phenytoin, piperacillin/tazobactam, thiopental, trastuzumab.

Patient/Family Teaching

- Explain purpose of irinotecan to patient.
- Instruct patient to report occurrence of diarrhea to health care professional immediately if diarrhea occurs for first time during treatment; black or bloody stools; symptoms of dehydration such as lightheadedness, dizziness, or faintness; inability to take fluids by mouth due to nausea or vomiting; or inability to get diarrhea under control within 24 hr. Diarrhea may be accompanied by severe dehydration and electrolyte imbalance. It may be life-threatening; treat promptly. Loperamide may be used for treatment up to 48 hr.
- Instruct patient monitor their temperature and to notify health care professional promptly if fever; chills; sore throat; signs of infection; bleeding gums; bruising; petechiae; blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to monitor temperature frequently, use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or other NSAIDs.
- Instruct patient to notify nurse of pain at injection site immediately.
- Instruct patient to notify health care professional if vomiting, fainting, or dizziness occurs.
- Discuss with patient possibility of hair loss. Explore methods of coping.
- Instruct patient not to receive any vaccinations without consulting health care professional.
- Rep: May cause fetal harm. Advise females of reproductive potential to use highly effective contraception during and for 6 mo after last dose of therapy and to avoid breast feeding during and for 7 days

I

© F.A. Davis Publishing

after final dose. Advise males with female partners of reproductive potential to use condoms during and for 3 mo after last dose. May impair female and male infertility.
- Emphasize the need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes
- Decrease in size and spread of malignancy.

IRON SUPPLEMENTS

carbonyl iron (100%) (**kar**-bo-nil **eye**-ern)
Feosol, Icar

ferrous fumarate (33% elemental iron) (**fer**-us **fyoo**-ma-rate)
Ferretts, Ferrimin 150, Hemocyte

ferrous gluconate (12% elemental iron) (**fer**-us **gloo**-koe-nate)
Ferate

ferrous sulfate (30% elemental iron) (**fer**-us **sul**-fate)
Fer-In-Sol, FeroSul, Slow Fe, Slow Iron

iron dextran (**eye**-ern **dex**-tran)
DexFerrum, Dexiron, InFeD, Infufer

iron polysaccharide (**eye**-ern poll-ee-**sak**-a-ride)
Ferrex 150, IFerex 150, Myferon 150, NovaFerrum, Nu-Iron, Poly-Iron 150

iron sucrose (**eye**-ern **su**-krose)
Venofer

sodium ferric gluconate complex (**so**-dee-yum **ferr**-ic **gloo**-ko-nate)
Ferrlecit

Classification
Therapeutic: antianemics
Pharmacologic: iron supplements

Indications
PO: Prevention/treatment of iron-deficiency anemia.
IM, IV: *Iron dextran*—Treatment of iron-deficiency anemia in patients who cannot tolerate or receive oral iron. *Sodium ferric gluconate complex*—Treatment of iron deficiency in patients undergoing chronic hemodialysis or peritoneal dialysis who are concurrently receiving erythropoietin. Treatment of iron-deficiency anemia in patients with chronic kidney disease including patients who are not on dialysis (with or without erythropoietin) and patients dependent on dialysis (with erythropoietin).

Action
An essential mineral found in hemoglobin, myoglobin, and many enzymes. Enters the bloodstream and is transported to the organs of the reticuloendothelial system (liver, spleen, bone marrow), where it is separated out and becomes part of iron stores. **Therapeutic Effects:** Prevention/treatment of iron deficiency.

Pharmacokinetics
Absorption: 5–10% of dietary iron is absorbed (up to 30% in deficiency states). Therapeutically administered PO iron may be 60% absorbed via an active and passive transport process. Well absorbed following IM administration.
Distribution: Remains in the body for many mo. Crosses the placenta; enters breast milk.
Protein Binding: ≥90%.
Metabolism and Excretion: Mostly recycled; small daily losses occurring via desquamation, sweat, urine, and bile.
Half-life: *Iron dextran, iron sucrose*—6 hr.

TIME/ACTION PROFILE (effects on erythropoiesis)

ROUTE	ONSET	PEAK	DURATION
PO	4 days	7–10 days	2–4 mo
IM, IV	4 days	1–2 wk	wk–mos

Contraindications/Precautions
Contraindicated in: Hemochromatosis, hemosiderosis, or other evidence of iron overload; Anemias not due to iron deficiency; Some products contain alcohol, tartrazine, or sulfites and should be avoided in patients with known intolerance or hypersensitivity.
Use Cautiously in: Peptic ulcer; Ulcerative colitis or regional enteritis (condition may be aggravated); Alcoholism; Severe hepatic impairment; Severe renal impairment (oral products); Pre-existing cardiovascular disease (iron dextran) (may be exacerbated by adverse reactions to this drug); Significant allergies or asthma (iron dextran); History of drug allergy or multiple drug allergies (iron dextran) (may be at ↑ risk for anaphylactic reaction); Rheumatoid arthritis (iron dextran) (may have exacerbation of joint swelling); OB, Lactation: Pregnancy or lactation (safety of some parenteral products not established); Pedi: Safety not established for infants <4 mo (iron dextran), children <2 yr (iron sucrose), or children <6 yr (sodium ferric gluconate complex); safety may not be established for other products in the pediatric population.

Adverse Reactions/Side Effects
CV: *IM, IV*—hypotension, hypertension, tachycardia. **Derm:** *IM, IV*—flushing, urticaria. **GI:** nausea; *PO*, constipation, dark stools, diarrhea, epigastric pain, GI bleeding; *IM, IV*, taste disorder, vomiting. **Local:** pain at IM site (iron dextran), phlebitis at IV site, skin staining at IM site (iron dextran). **MS:** *IM, IV*—arthralgia, myalgia. **Neuro:** *IM, IV*—SEIZURES, dizziness, headache, syncope. **Resp:** *IV*—cough, dyspnea. **Misc:** *PO*—staining of teeth (liquid preparations); *IM, IV*, HYPERSENSITIVITY REACTIONS (including anaphylaxis), fever, lymphadenopathy, sweating.

© F.A. Davis Publishing

Interactions

Drug-Drug: Oral iron supplements ↓ absorption of **tetracyclines**, **bisphosphonates**, **fluoroquinolones**, **levothyroxine**, **mycophenolate mofetil**, and **penicillamine** (simultaneous administration should be avoided). ↓ absorption of and may ↓ effects of **levodopa** and **methyldopa**. Concurrent administration of **H_2 antagonists**, **proton pump inhibitors**, and **cholestyramine** may ↓ absorption of iron. Doses of **ascorbic acid** ≥200 mg may ↑ absorption of iron up to ≥30%. **Chloramphenicol** and **vitamin E** may ↓ hematologic response to iron therapy. **ACE inhibitors** may ↑ risk of anaphylactic reaction with iron dextran.
Drug-Food: Iron absorption is ↓ 33–50% by concurrent administration of food.

Route/Dosage

Oral Iron Dosage for Iron Deficiency (expressed as mg elemental iron, note individual salt forms, multiple ones exist—see approximate equivalent doses below for dose conversions).

Approximate Equivalent Doses (mg of iron salt): *Ferrous fumarate*—197; *Ferrous gluconate*—560; *Ferrous sulfate*—324; *Ferrous sulfate, exsiccated*—217.

PO (Adults): *Deficiency*—120–240 mg/day (2–3 mg/kg/day) in 2–4 divided doses. *Prophylaxis*—60–100 mg/day.
PO (Infants and Children): *Severe deficiency*—4–6 mg/kg/day in 3 divided doses. *Mild to moderate deficiency*—3 mg/kg/day in 1–2 divided doses. *Prophylaxis*—1–2 mg/kg/day in 1–2 divided dose (maximum: 15 mg/day).
PO (Neonates , premature): 2–4 mg/kg/day in 1–2 divided doses, maximum: 15 mg/day.

Iron Dextran

IM, IV (Adults and Children): Test dose of 0.5 mL (25 mg) is given 1 hr prior to therapy.
IM, IV (Infants): Test dose of 0.25 mL (12.5 mg) is given 1 hr prior to therapy.
IM, IV (Adults and Children >15 kg): *Iron deficiency*—Total dose (mL) = 0.0442 × (desired Hgb – actual Hgb) × lean body weight (kg) + [0.26 × lean body weight (kg)]. Divided up and given in small daily doses until total is reached; not to exceed 100 mg/day. *Total dose IV infusion*—Total dose may be diluted and infused over 4–5 hr following a test dose of 10 drops (unlabeled).
IM, IV (Adults): *Blood loss*—Dose (mL) = (Blood loss [mL] × hematocrit) × 0.02.
IM, IV (Children 5–15 kg): *Iron deficiency*—Total dose (mL) = 0.042 (desired Hgb – actual Hgb) × weight (kg) + [0.26 × weight (kg)]. Divided up and given in small daily doses until total is reached; not to exceed 25 mg/day in children <5 kg; 50 mg/day in children 5–10 kg; or 100 mg/day in children >10 kg.

Iron Polysaccharide Complex

PO (Adults): 50–100 mg twice daily of tablets/elixir or 150–300 mg/day of the capsules.
PO (Children >6 yr): 50–100 mg/day (may be given in divided doses).
PO (Infants): 1–2 mg/kg/day.
PO (Adults —Pregnant Women): 30–60 mg/day.

Iron Sucrose

IV (Adults): *Hemodialysis dependent patients*—100 mg during each dialysis session for 10 doses (total of 1000 mg); may repeat if iron deficiency recurs; *Nondialysis dependent patients*—200 mg on 5 different days within a 14-day period to a total of 1000 mg; may also be given as infusion of 500 mg on day 1 and day 14; may repeat if iron deficiency recurs; *Peritoneal dialysis patients*—administered in a total cumulative dose of 1000 mg in 3 divided doses, 14 days apart within a 28 day period with first 2 doses of 300 mg and third dose of 400 mg; may repeat if iron deficiency recurs.
IV (Children ≥2 yr): *Hemodialysis dependent patients (for iron maintenance therapy)*—0.5 mg/kg (max = 100 mg/dose) every 2 wk for 12 wk; may repeat if necessary; *Nondialysis dependent patients or peritoneal dialysis patients who are receiving erythropoietin for iron maintenance therapy*—0.5 mg/kg (max = 100 mg/dose) every 4 wk for 12 wk; may repeat if necessary.

Sodium Ferric Gluconate Complex

IV (Adults): 10 mL (125 mg elemental iron) repeated during 8 sequential dialysis treatments to a total cumulative dose of 1 g.
IV (Children >6 yr): 0.12 mL/kg (not to exceed 125 mg/dose) repeated during 8 sequential dialysis treatments.

Availability

Carbonyl Iron (100% Iron)

Oral suspension: 15 mg/1.25 mL^{OTC}. **Tablets:** 50 mg^{OTC}.

Ferrous Fumarate (33% Elemental Iron) (generic available)

Tablets: 324 mg^{OTC}, 325 mg^{OTC}.

Ferrous Gluconate (11.6% Elemental Iron) (generic available)

Tablets: 240 mg^{OTC}, 324 mg^{OTC}.

Ferrous Sulfate (20–30% Elemental Iron)

Delayed-release tablets: 324 mg^{OTC}, 325 mg^{OTC}. **Extended-release tablets:** 140 mg^{OTC}, 142 mg^{OTC}, 160

© F.A. Davis Publishing

mg[OTC]. **Oral solution:** 75 mg/mL[OTC]. **Syrup:** 300 mg/5 mL[OTC]. **Tablets:** 325 mg[OTC].

Iron Dextran
Solution for injection: 50 mg/mL.

Iron Polysaccharide (mg Iron)
Capsules: 50 mg [OTC], 150 mg [OTC], 200 mg[OTC]. **Oral solution:** 15 mg/mL [OTC], 125 mg/5 mL [OTC].

Iron Sucrose
Aqueous complex for injection: 20 mg/mL.

Sodium Ferric Gluconate Complex (generic available)
Solution for injection (requires dilution): 12.5 mg/mL.

NURSING IMPLICATIONS

Assessment
- Assess nutritional status and dietary history to determine possible cause of anemia and need for patient teaching.
- Assess bowel function for constipation or diarrhea. Notify health care professional and use appropriate nursing measures should these occur.
- **Iron Dextran, Iron Sucrose, and Sodium Ferric Gluconate Complex:** Monitor BP and heart rate frequently following IV administration until stable. Rapid infusion rate may cause hypotension and flushing.
- Assess patient for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing) for at least 30 min following injection. Notify health care professional immediately if these occur. Keep epinephrine and resuscitation equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** Monitor hemoglobin, hematocrit, and reticulocyte values prior to and every 3 wk during the first 2 mo of therapy and periodically thereafter. Serum ferritin and iron levels may also be monitored to assess effectiveness of therapy.
- Occult blood in stools may be obscured by black coloration of iron in stool. Guaiac test results may occasionally be false-positive.
- **Iron Dextran:** Monitor hemoglobin, hematocrit, reticulocyte values, transferrin, ferritin, total iron-binding capacity, and plasma iron concentrations periodically during therapy. Serum ferritin levels peak in 7–9 days and return to normal in 3 wk. Serum iron determinations may be inaccurate for 1–2 wk after therapy with large doses; therefore, hemoglobin and hematocrit are used to gauge initial response.
- May impart a brownish hue to blood drawn within 4 hr of administration. May cause false ↑ in serum bilirubin and false decrease in serum calcium values.
- Prolonged PTT may be calculated when blood sample is anticoagulated with citrate dextrose solution; use sodium citrate instead.
- **Iron Sucrose:** Monitor hemoglobin, hematocrit, serum ferritin, and transferrin saturation prior to and periodically during therapy. Transferrin saturation values increase rapidly after IV administration; therefore, serum iron values may be reliably obtained 48 hr after IV administration. Withhold iron therapy if evidence of iron overload occurs.
- May cause ↑ liver enzymes.
- ***Toxicity and Overdose:*** Early symptoms of overdose include stomach pain, fever, nausea, vomiting (may contain blood), and diarrhea. Late symptoms include bluish lips, fingernails, and palms; drowsiness; weakness; tachycardia; seizures; metabolic acidosis; hepatic injury; and cardiovascular collapse. Patient may appear to recover prior to the onset of late symptoms. Hospitalization continues for 24 hr after patient becomes asymptomatic to monitor for delayed onset of shock or GI bleeding. Late complications of overdose include intestinal obstruction, pyloric stenosis, and gastric scarring.
- If patient is comatose or seizing, gastric lavage with sodium bicarbonate is performed. Deferoxamine is the antidote. Additional supportive treatments to maintain fluid and electrolyte balance and correction of metabolic acidosis are also indicated.
- If signs of overdose occur during IV administration of iron sucrose, treatment includes IV fluids, corticosteroids, and/or antihistamines. Administering at a slower rate usually relieves symptoms.

Implementation
- Discontinue oral iron preparations prior to parenteral administration.
- Sodium ferric gluconate and iron sucrose are for IV use only.
- **PO:** Oral preparations are most effectively absorbed if administered 1 hr before or 2 hr after meals. If gastric irritation occurs, administer with meals. Take tablets and capsules with a full glass of water or juice. Do not crush or chew enteric-coated tablets and do not open capsules.
- Liquid preparations may stain teeth. Dilute in water or fruit juice, full glass (240 mL) for adults and ½ glass (120 mL) for children, and administer with a straw or place drops at back of throat.
- Avoid using antacids, coffee, tea, dairy products, eggs, or whole-grain breads with or within 1 hr after administration of ferrous salts. Iron absorption is decreased by 33% if iron and calcium are given with meals. If calcium supplementation is needed, calcium carbonate does not decrease absorption of iron salts if supplements are administered between meals.
- **Iron Dextran:** The 2-mL ampule may be used for IM or IV administration.
- Prior to initial IM or IV dose, a test dose of 25 mg should be given by the same route as the dose will be given, to determine reaction. The IV test dose should be administered over at least 30 sec. The IM dose

© F.A. Davis Publishing

should be administered in the same injection site and by same technique as the therapeutic dose. The remaining portion may be administered after 1 hr, if no adverse symptoms have occurred.
- **IM:** Inject deeply via Z-track technique into upper outer quadrant of buttock, never into arm or other exposed areas. Use a 2–3 in., 19- or 20-gauge needle. Change needles between withdrawal from container and injection to minimize staining of subcut tissues. Stains are usually permanent.

IV Administration
- **IV: Iron Dextran**: Following IV administration, patient should remain recumbent for at least 30 min to prevent orthostatic hypotension.
- **IV Push:** ***Dilution:*** May administer undiluted or dilute in 0.9% NaCl or D5W. ***Concentration:*** 50 mg/mL. ***Rate:*** Administer slowly at a rate of 50 mg (1 mL) over at least 1 min.
- **Intermittent Infusion:** May be diluted in 200–1000 mL of 0.9% NaCl or D5W; 0.9% NaCl is the preferred diluent; dilution in D5W increases incidence of pain and phlebitis. ***Rate:*** Administer over 1–6 hr following a test dose of 10 drops/min for 10 min. Flush line with 10 mL of 0.9% NaCl at completion of infusion.
- **Y-Site Incompatibility:** Discontinue other IV solutions during infusion.
- **Additive Incompatibility:** Manufacturers recommend that iron dextran not be mixed with other solutions; however, iron dextran has been added to total parenteral nutrition solutions.
- **Sodium Ferric Gluconate Complex:** ***Dilution:*** To administer therapeutic dose of 10 mL (125 mg of elemental iron) dilute in 100 mL of 0.9% NaCl. ***Rate:*** Administer at a maximum rate of 12.5 mg/min.
- **Iron Sucrose:** Each 5-mL vial contains 100 mg of elemental iron.
- Solution is brown. Inspect for particulate matter or discoloration. Do not administer solutions that contain particulate matter or are discolored. Solution is stable for 7 days at room temperature or if refrigerated in syringe, or 7 days at room temperature diluted in IV bag.

Hemodialysis Dependent Patients:
- Most patients require a minimum cumulative dose of 1000 mg of elemental iron, administered over 10 sequential dialysis sessions, to achieve a favorable hemoglobin or hematocrit response.
- **IV Push:** May be administered undiluted by slow injection. ***Rate:*** Inject at a rate of 100 mg over 2–5 min into dialysis line early during the dialysis session (generally within the first hr), not to exceed one vial per injection. Discard any unused portion.
- **Intermittent Infusion:** May be administered as an infusion of 100 mg diluted in a maximum of 100 mL of 0.9% NaCl. ***Rate:*** Infuse over at least 15 min, per consecutive hemodialysis session.

Nondialysis Dependent Patients:
- **IV Push:** May be administered as a slow injection of 200 mg undiluted. ***Rate:*** Administer over 2–5 min.
- **Intermittent Infusion:** Dilute 200 mg in 100 mL 0.9% NaCl. Has also been given as 500 mg diluted in 250 mL 0.9% NaCl. ***Rate:*** Infuse 15 min. Infuse 500-mg dose over 3.5–4 hr on days 1 and 14. May cause hypotension; monitor closely.
- **Additive Incompatibility:** Iron sucrose should not be admixed with any other medications or parenteral nutrition solutions.

Peritoneal Dialysis Patients
- **Intermittent Infusion:** ***Dilution:*** Dilute each dose in a maximum of 250 mL of 0.9% NaCl. ***Rate:*** Administer doses of 300 mg over 1.5 hrs and doses of 400 mg over 2.5 hrs.

Pediatric Patients
- **IV Push:** May be administered undiluted as 0.5 mg/kg, not to exceed 100 mg per dose. ***Rate:*** Inject over 5 min.
- **Intermittent Infusion:** Dilute in 0.9% NaCl at a concentration of 1–2 mg/mL. Do not dilute to concentrations below 1 mg/mL. ***Rate:*** Infuse over 5–60 min.
- **Additive Incompatibility:** Do not mix iron sucrose with other medications or add to parenteral nutrition solutions for IV infusion.

Patient/Family Teaching
- Explain purpose of iron therapy to patient.
- Encourage patient to comply with medication regimen. Take missed doses as soon as remembered within 12 hr; otherwise, return to regular dosing schedule. Do not double doses.
- Advise patient that stools may become dark green or black and that this change is harmless.
- Instruct patient to follow a diet high in iron (see Appendix J).
- Discuss with parents the risk of children's overdosing on iron. Medication should be stored in the original childproof container and kept out of reach of children. Do not refer to vitamins as candy. In the event of a suspected overdose, parents or guardians should contact the poison control center (1-800-222-1222) or emergency medical services (911) immediately.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.
- **Iron Dextran:** Delayed reaction may occur 1–2 days after administration and last 3–4 days if IV

© F.A. Davis Publishing

route used, 3–7 days with IM route. Instruct patient to contact physician if fever, chills, malaise, muscle and joint aches, nausea, vomiting, dizziness, and backache occur.

- **Iron sucrose and sodium ferric gluconate complex:** Instruct patient to immediately report symptoms of hypersensitivity reaction to health care professional.

Evaluation/Desired Outcomes

- Increase in hemoglobin, which may reach normal parameters after 1–2 mo of therapy. May require 3–6 mo for normalization of body iron stores.
- Improvement in iron deficiency anemia or anemia of chronic renal failure.

isavuconazonium

(eye-sa-vue-kon-a-**zoe**-nee-um)
Cresemba

Classification
Therapeutic: antifungals
Pharmacologic: azoles

Indications

Treatment of invasive aspergillosis and mucormycosis.

Action

A prodrug that is converted (rapidly hydrolyzed) to isavuconazole. Inhibits the synthesis of ergosterol, a key component of fungal cell walls. **Therapeutic Effects:** Resolution of invasive fungal infections. **Spectrum:** Active against *Aspergillus flavus*, *Aspergillus fumigatus*, *Aspergillus niger*, and Mucormycetes species including *Rhizopus oryzae*.

Pharmacokinetics

Absorption: Prodrug is rapidly converted to isavuconazole, the active component. 98% absorbed following oral administration. Similar conversion follows intravenous administration, resulting in complete bioavailability.
Distribution: Extensively distributed.
Protein Binding: >99%.
Metabolism and Excretion: Extensively metabolized (mostly by CYP3A4 and CYP3A5); inactive metabolites are mostly renally eliminated, <1% excreted unchanged in urine.
Half-life: 130 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2 hr	unknown
IV	unknown	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Known hypersensitivity; Strong CYP3A4 inhibitors; Familial short QT syndrome; Strong CYP3A4 inducers; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Severe hepatic impairment (use only if benefits outweigh risks, monitor carefully for adverse reactions); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: peripheral edema, chest pain, hypotension. **Derm:** pruritus, rash. **F and E:** hypokalemia, hypomagnesemia. **GI:** constipation, diarrhea, ↑ liver enzymes, nausea, vomiting, ↓ appetite, dyspepsia. **GU:** renal failure. **Local:** injection site reactions. **MS:** back pain. **Neuro:** fatigue, insomnia, headache, anxiety, delirium. **Resp:** cough, dyspnea, respiratory failure. **Misc:** infusion-related reactions.

Interactions

Drug-Drug: ↑ levels and risk of toxicity with **strong inhibitors of CYP3A4**, including **ketoconazole** or high-dose **ritonavir**; concurrent use is contraindicated. **Lopinavir/ritonavir** significantly ↑ levels and risk of toxicity; concurrent use should be undertaken with caution. Isavuconazonium ↓ levels and effectiveness of **lopinavir/ritonavir**. Isavuconazonium ↑ levels and risk of toxicity with **atorvastatin**, **cyclosporine**, **digoxin**, **midazolam**, **mycophenolate**, **sirolimus**, **tacrolimus**; undertake concurrent use with caution, monitoring drug effects and making adjustments if necessary. **Strong inducers of CYP3A4** including long-acting **barbiturates**, **carbamazepine**, or **rifampin** ↓ levels and effectiveness; concurrent use is contraindicated. ↓ levels and effectiveness of **bupropion**; bupropion dose may need to be ↑ but should not exceed maximum recommended dose.
Drug-Natural Products: St. John's wort ↓ blood levels and effectiveness; concurrent use is contraindicated.

Route/Dosage

PO, IV (Adults ≥18 yr): *Loading dose*— 372 mg isavuconazonium (equivalent to 200 mg isavuconazole) every 8 hr for six doses; *Maintenance dose*— 372 mg isavuconazonium (equivalent to 200 mg isavuconazole) once daily starting 12–24 hr after last loading dose.

Availability

Capsules: 186 mg isavuconazonium (equivalent to 100 mg isavuconazole). **Lyophilized powder for injection:** 372 mg isavuconazonium (equivalent to 200 mg isavuconzole)/vial.

NURSING IMPLICATIONS

Assessment

- Obtain specimens for culture and sensitivity prior to therapy. First dose may be given before receiving results.
- Monitor for signs and symptoms of infusion-related reactions (hypotension, dyspnea, chills, dizziness,

© F.A. Davis Publishing

paresthesia, hypoesthesia) periodically during therapy. Discontinue infusion if symptoms occur.
- Monitor skin for hypersensitivity reactions during therapy.
- ***Lab Test Considerations:*** Monitor liver function tests prior to and periodically during therapy. Discontinue therapy if clinical signs of liver disease occur.
- May cause hypokalemia and hypomagnesemia.

Implementation

- Oral and IV formulations are bioequivalent; may be used interchangeably. Loading dose is not needed when switching.
- **PO:** Administer without regard to food. ***DNC:*** Swallow capsule whole; do not open, dissolve, crush or chew.
- To administer via NG tube, reconstitute one vial isavuconazonium for injection (equivalent to 200 mg isavuconazonium) with 5 mL of water for injection. Withdraw the entire contents (5 mL) of vial using a syringe and needle. Discard the needle and cap the syringe. To administer, remove cap from syringe containing the reconstituted solution and connect the syringe to NG tube to deliver dose. After administering, administer three 5 mL rinses to NG tube with water. Administer reconstituted solution via NG tube within 1 hr of reconstitution.

IV Administration

- ***Reconstitution:*** Reconstitute by adding 5 mL sterile water to vial. Shake gently to dissolve powder completely. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter. Solution is stable for 1 hr at room temperature.
- **Intermittent Infusion:** ***Dilution:*** Remove 5 mL of reconstituted solution from vial and add to 250 mL 0.9% NaCl or D5W. ***Concentration:*** 1.5 mg isavuconazonium/mL. Diluted solution may show visible translucent to white particulates; removed with in-line filter. Roll bag to mix gently; avoid shaking. Solution is stable if infused at room temperature within 6 hr; may refrigerate for up to 24 hr; do not freeze. Flush line with 0.9% NaCl or D5W prior to and following infusion. ***Rate:*** Infuse over at least 1 hr to minimize infusion-related reactions. Infuse through a 0.2–1.2 micron in-line filter. Do not administer as a bolus injection.
- **Y-Site Compatibility:** amikacin, amiodarone, anidulafungin, aztreonam, calcium chloride, calcium gluconate, caspofungin, ceftozolane/tazobactam, ciprofloxacin, cisatracurium, daptomycin, dexamethasone, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, dopamine, doxycycline, epinephrine, eptifibatide, esmolol, famotidine, fentanyl, gentamicin, hydrocortisone, hydromorphone, imipenem/cilastatin, insulin regular, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, metoclopramide, midazolam, milrinone, morphine, mycophenolate, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, pantoprazole, phenylephrine, plazomicin, potassium chloride, rocuronium, tacrolimus, tigecycline, tobramycin, vancomycin, vasopressin, vecuronium.
- **Y-Site Incompatibility:** albumin, human, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, ampicillin/sulbactam, cefazolin, cefepime, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, cyclosporine, ertapenem, esomeprazole, filgrastim, fosphenytoin, furosemide, heparin, meropenem, meropenem/vaborbactam, methylprednisolone, micafungin, phenytoin, potassium phosphates, propofol, sodium bicarbonate, sodium phosphates, tedizolidDo not infuse with other medication.

Patient/Family Teaching

- Instruct patient to take isavuconazonium as directed. Do not stop taking isavuconazonium without consulting heath care professional. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- Advise patient to notify health care professional promptly of signs and symptoms of liver disease (itchy skin, nausea, vomiting, yellowing of eyes, feeling very tired, flu-like symptoms), infusion-related reactions, or rash occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 28 days after final dose and to avoid breast feeding during therapy. Advise patient to notify health care professional if pregnancy is planned or suspected.
- Emphasize the importance of lab tests to monitor for side effects during therapy.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of invasive fungal infection.

isoniazid (eye-soe-**nye**-a-zid)
Isotamine

Classification
Therapeutic: antituberculars

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Indications

First-line therapy of active tuberculosis, in combination with other agents. Prevention of tuberculosis in patients exposed to active disease (alone).

Action

Inhibits mycobacterial cell wall synthesis and interferes with metabolism. **Therapeutic Effects:** Bacteriostatic or bactericidal action against susceptible mycobacteria.

Pharmacokinetics

Absorption: Well absorbed following PO/IM administration.

Distribution: Widely distributed; readily crosses the blood-brain barrier. Crosses the placenta; enters breast milk in concentrations equal to plasma.

Protein Binding: 10–15%.

Metabolism and Excretion: 50% metabolized by the liver by N-acetyltransferase (rate of acetylation is genetically determined [slow acetylators have ↑ isoniazid levels and ↑ risk of toxicity; fast acetylators have ↓ isoniazid levels and ↑ risk for treatment failure]); 50% excreted unchanged by the kidneys.

Half-life: 1–4 hr in patients with normal renal and hepatic function; 0.5–1.6 hr in fast acetylators; 2–5 hr in slow acetylators.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	up to 24 hr
IM	rapid	1–2 hr	up to 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute liver disease; History of hepatitis from previous use.

Use Cautiously in: History of liver damage or chronic alcohol ingestion; Black and Hispanic women, women in the postpartum period, or patients >50 yr (↑ risk of drug-induced hepatitis); Severe renal impairment (dose ↓ may be necessary); Malnourished patients, patients with diabetes, or chronic alcoholics (↑ risk of neuropathy); OB, Lactation: Although safety is not established, isoniazid has been used with ethambutol to treat tuberculosis in pregnant women without harm to the fetus.

Adverse Reactions/Side Effects

EENT: visual disturbances. **GI:** DRUG-INDUCED HEPATITIS, nausea, vomiting. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), TOXIC EPIDERMAL NECROLYSIS, rash. **Endo:** gynecomastia. **GI:** PANCREATITIS. **Hemat:** blood dyscrasias. **Neuro:** peripheral neuropathy, psychosis, seizures. **Misc:** fever.

Interactions

Drug-Drug: Additive CNS toxicity with other **antituberculars**. **BCG vaccine** may not be effective during isoniazid therapy. Isoniazid ↓ metabolism of and may ↑ levels of **phenytoin**. **Aluminum-containing antacids** may ↓ absorption. Psychotic reactions and coordination difficulties may result with **disulfiram**. Concurrent administration of **pyridoxine** may prevent neuropathy. ↑ risk of hepatotoxicity with other **hepatotoxic agents** including **alcohol**, **acetaminophen**, and **rifampin**. Isoniazid may ↓ blood levels and effectiveness of **ketoconazole**. May ↑ **carbamazepine** levels and risk of hepatotoxicity. May ↓ effectiveness of **clopidogrel** (avoid concurrent use).

Drug-Food: Severe reactions may occur with ingestion of foods containing high concentrations of **tyramine** (see Appendix J).

Route/Dosage

PO, IM (Adults): 300 mg/day (5 mg/kg) *or* 15 mg/kg (up to 900 mg) 2–3 times weekly.

PO, IM (Children <40 kg): *Latent TB infection*—10–20 mg/kg/day (up to 300 mg/day) *or* 20–40 mg/kg (up to 900 mg) 2 times weekly; *Active TB infection*—10–15 mg/kg/day (up to 300 mg/day) *or* 20–40 mg/kg (up to 900 mg) 2 times weekly.

Availability (generic available)

Tablets: 50 mg, 100 mg, 300 mg. **Oral solution (orange, raspberry flavor):** 50 mg/5 mL. **Solution for injection:** 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Mycobacterial studies and susceptibility tests should be performed prior to and periodically during therapy to detect possible resistance. About 50–65% of Caucasians, Blacks, South Indians, and Mexicans are slow acetylators at risk for toxicity, while 80–90% of Eskimos, Japanese, and Chinese are rapid acetylators at risk for decreased levels and treatment failure.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** Hepatic function should be evaluated prior to and monthly throughout therapy. Increased AST, ALT, and serum bilirubin may indicate drug-induced hepatitis. Black and Hispanic women, postpartal women, and patients >50 yr are at highest risk. Risk is lower in children; therefore, liver function tests are usually ordered less frequently for children. If AST, ALT, or serum bilirubin are >3–5 × ULN, temporarily discontinue isoniazid and consider restarting therapy.

© F.A. Davis Publishing

- ***Toxicity and Overdose:*** If isoniazid overdose occurs, treatment with pyridoxine (vitamin B) is instituted.

Implementation

- **PO:** Administer on an empty stomach.
- **IM:** Medication may cause discomfort at injection site. Massage site after administration and rotate injection sites.
- Solution may form crystals at low temperatures; crystals will redissolve upon warming to room temperature.

Patient/Family Teaching

- Advise patient to take medication as directed. Take missed doses as soon as possible unless almost time for next dose; do not double up on missed doses. Emphasize the importance of continuing therapy even after symptoms have subsided. Therapy may be continued for 6 mo–2 yr.
- Advise patient to notify health care professional promptly if signs and symptoms of hepatitis (yellow eyes and skin, nausea, vomiting, anorexia, dark urine, unusual tiredness, or weakness) or peripheral neuritis (numbness, tingling, paresthesia) occur. Pyridoxine may be used concurrently to prevent neuropathy. Any changes in visual acuity, eye pain, or blurred vision should also be reported immediately.
- Caution patient to avoid the use of alcohol during this therapy, as this may increase the risk of hepatotoxicity. Avoid ingestion of Swiss or Cheshire cheeses, fish (tuna, skipjack, and sardinella), and tyramine-containing foods (see Appendix J); may result in redness or itching of the skin; hot feeling; rapid or pounding heartbeat; sweating; chills; cold, clammy feeling; headache; or light-headedness.
- Rep: May be used as treatment for active tuberculosis during pregnancy. Begin preventative therapy after delivery. May increase the risk of isoniazid-associated peripheral neurotoxicity in the mother; pyridoxine supplementation is recommended in pregnant patients during therapy. May be used during breast feeding as the small concentrations in breast milk do not produce toxicity in the nursing newborn; breast feeding should not be discouraged. Low levels of isoniazid in breast milk can not be relied upon for prophylaxis or therapy in nursing infants. Monitor breast-fed infants for jaundice; discontinue breast feeding or consider changing to a different maternal medication if jaundice develops. Pyridoxine supplementation is recommended for the mother and infant.
- Emphasize the importance of regular follow-up physical and ophthalmologic exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of tuberculosis.
- Negative sputum cultures.
- Prevention of activation of tuberculosis in persons known to have been exposed.

ISOSORBIDE

isosorbide dinitrate
(eye-soe-**sor**-bide dye-**nye**-trate)
~~Dilatrate-SR~~, Isordil

isosorbide mononitrate
(eye-soe-**sor**-bide mo-noe-**nye**-trate)
~~Imdur~~, 🍁 Imdur, ~~Ismo~~, Monoket

Classification
Therapeutic: antianginals
Pharmacologic: nitrates

Indications

Prophylactic management of angina pectoris. **Unlabeled Use:** Treatment of chronic heart failure (unlabeled).

Action

Produce vasodilation (venous greater than arterial). Decrease left ventricular end-diastolic pressure and left ventricular end-diastolic volume (preload). Net effect is reduced myocardial oxygen consumption. Increase coronary blood flow by dilating coronary arteries and improving collateral flow to ischemic regions. **Therapeutic Effects:** Prevention of anginal attacks.

Pharmacokinetics

Absorption: Isosorbide dinitrate undergoes extensive first-pass metabolism by the liver, resulting in 25% bioavailability; isosorbide mononitrate has 100% bioavailability (does not undergo first-pass metabolism).
Distribution: Unknown.
Metabolism and Excretion: Isosorbide dinitrate is metabolized by the liver to 2 active metabolites (5-mononitrate and 2-mononitrate). Isosorbide mononitrate is primarily metabolized by the liver to inactive metabolites; primarily excreted in urine as metabolites.
Half-life: *Isosorbide dinitrate*—1 hr; *isosorbide mononitrate*—5 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
ISDN-PO	45–60 min	unknown	4 hr
ISMN-PO	30–60 min	unknown	7 hr
ISMN-ER	unknown	unknown	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of PDE-5 inhibitor or riociguat.

© F.A. Davis Publishing

Use Cautiously in: Volume depleted patients; Right ventricular infarction; Hypertrophic cardiomyopathy; OB: Safety not established in pregnancy; Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children; Geri: Initial dose ↓ required in older adults due to ↑ potential for hypotension.

Adverse Reactions/Side Effects

CV: hypotension, tachycardia, paradoxic bradycardia, syncope. **Derm:** flushing. **GI:** nausea, vomiting. **Neuro:** dizziness, headache. **Misc:** tolerance.

Interactions

Drug-Drug: Concurrent use of **avanafil**, **sildenafil**, **tadalafil**, or **vardenafil** may result in severe hypotension (do not use within 24 hr of isosorbide dinitrate or mononitrate); concurrent use contraindicated. Concurrent use of **riociguat** may result in severe hypotension; concurrent use contraindicated. Additive hypotension with **antihypertensives**, acute ingestion of **alcohol**, **beta blockers**, **calcium channel blockers**, and **phenothiazines**.

Route/Dosage

Isosorbide Dinitrate

PO (Adults): *Prophylaxis of angina pectoris*—5–20 mg 2–3 times daily; usual maintenance dose is 10–40 mg every 6 hr.

Isosorbide Mononitrate

PO (Adults): *ISMO, Monoket*—5–20 mg twice daily with the 2 doses given 7 hr apart. *Imdur*—30–60 mg once daily; may ↑ to 120 mg once daily (maximum dose = 240 mg/day).

Availability

Isosorbide Dinitrate (generic available)

Tablets: 5 mg, 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Isordil*—40 mg $191.65/100; *Generic*—5 mg $15.54/100, 10 mg $32.96/100, 20 mg $18.85/100, 30 mg $23.32/100. ***In combination with:*** hydralazine (BiDil). See Appendix N.

Isosorbide Mononitrate (generic available)

Tablets (Monoket): 10 mg, 20 mg. **Cost:** *Generic*—10 mg $55.97/180, 20 mg $48.99/180. **Extended-release tablets:** 30 mg, 60 mg, 120 mg. **Cost:** *Generic*—30 mg $10.00/90, 60 mg $10.00/90, 120 mg $61.18/90.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, intensity, and precipitating factors of anginal pain.
- Monitor BP and pulse routinely during period of dose adjustment.
- ***Lab Test Considerations:*** Excessive doses may ↑ methemoglobin concentrations.

Implementation

Isosorbide Dinitrate

- **PO:** Do not administer around the clock to prevent tolerance to nitrate effect; allow nitrate-free interval for ≥14 hr. Twice-daily dosing may be administered at 8 AM and 1 PM and 3 times daily dosing may be given at 8 AM, 1 PM, and 6 PM.

Isosorbide Mononitrate

- **PO:** Do not administer around the clock. Administer immediate release tablets twice daily with doses 7 hr apart (8 AM and 3 PM); administer extended release tablet once daily in the morning upon rising with a half-glassful of fluid. ***DNC:*** Swallow extended-release tablets whole; do not break, crush, or chew. Extended release tablets that are scored may be split.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered; doses of isosorbide dinitrate should be taken at least 2 hr apart; daily doses of isosorbide mononitrate should be taken 7 hr apart. Do not double doses. Do not discontinue abruptly.
- Instruct patient to take last dose of day (when taking 2–4 doses/day) no later than 7 PM to prevent the development of tolerance.
- Caution patient to make position changes slowly to minimize orthostatic hypotension.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol with this medication. Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Inform patient that headache is a common side effect that should decrease with continuing therapy. Aspirin or acetaminophen may be ordered to treat headache. Notify health care professional if headache is persistent or severe. Do not alter dose to avoid headache.
- Advise patient to notify health care professional if dry mouth or blurred vision occurs.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in frequency and severity of anginal attacks.
- Increase in activity tolerance.

© F.A. Davis Publishing

REMS

ISOtretinoin

(eye-soe-**tret**-i-noyn)

Absorica, Absorica LD, ~~Accutane~~, ✱Accutane, Amnesteem, Claravis, ✱Clarus, ✱Epuris, Myorisan, Zenatane

Classification

Therapeutic: antiacne agents

Pharmacologic: retinoids

Indications

Severe recalcitrant nodular acne in patients with multiple inflammatory nodules having a diameter of ≥5 mm and that are unresponsive to more conventional therapy, including systemic antibiotics.

Action

A metabolite of vitamin A (retinol); reduces sebaceous gland size and differentiation. **Therapeutic Effects:** Diminution and resolution of severe acne. May also prevent abnormal keratinization.

Pharmacokinetics

Absorption: Rapidly absorbed following (23–25%) oral administration (bioavailability of Absorica LD higher than that of Absorica); absorption ↑ when taken with a high-fat meal.

Distribution: Appears to be widely distributed; crosses the placenta.

Protein Binding: 99.9%.

Metabolism and Excretion: Metabolized by the liver and excreted in the urine and feces.

Half-life: 10–20 hr.

TIME/ACTION PROFILE (diminution of acne)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	up to 8 wk	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to retinoids, glycerin, soybean oil, or parabens; Patients planning to donate blood; OB: Pregnancy (may cause fetal harm); Lactation: Lactation; Rep: Women of childbearing age who may become or who intend to become pregnant;.

Use Cautiously in: Pre-existing hypertriglyceridemia; Diabetes mellitus; History of alcohol abuse, psychosis, depression, or suicide attempt; Obese patients; Inflammatory bowel disease; Pedi: Children <12 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: edema. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus, palmar desquamation, photosensitivity, skin infections, thinning of hair. **EENT:** conjunctivitis, epistaxis, blurred vision, contact lens intolerance, corneal opacities, ↓ night vision, dry eyes. **GI:** cheilitis, dry mouth, nausea, vomiting, abdominal pain, anorexia, hepatitis, pancreatitis, ↑ appetite. **Hemat:** anemia. **Metab:** ↓ high-density lipoprotein cholesterol, hypercholesterolemia, hypertriglyceridemia, hyperglycemia, hyperuricemia. **MS:** arthralgia, back pain, muscle/bone pain (↑ in adolescents), hyperostosis. **Neuro:** SUICIDE ATTEMPT, behavior changes, depression, PSEUDOTUMOR CEREBRI, psychosis, suicidal ideation. **Misc:** SEVERE BIRTH DEFECTS, ↑ thirst.

Interactions

Drug-Drug: Additive toxicity with **vitamin A** and **drugs having anticholinergic properties**. ↑ risk of pseudotumor cerebri with **tetracycline** or **minocycline**. Concurrent use with **alcohol** ↑ risk of hypertriglyceridemia. Drying effects ↑ by concurrent use of **benzoyl peroxide**, **sulfur**, **tretinoin**, and **other topical agents**.

Drug-Food: Excessive ingestion of **foods high in vitamin A** may result in additive toxicity.

Route/Dosage

Absorica and Absorica LD are not interchangeable.

PO (Adults and Children ≥12 yr): 0.5–1 mg/kg/day (may use up to 2 mg/kg/day for very severe disease) in 2 divided doses for 15–20 wk. Once discontinued, if relapse occurs, therapy may be reinstituted after an 8-wk rest period. *Absorica LD*— 0.4–0.8 mg/kg/day (may use up to 1.6 mg/kg/day for very severe disease) in 2 divided doses for 15–20 wk. Once discontinued, if relapse occurs, therapy may be reinstituted after an 8-wk rest period.

Availability (generic available)

Capsules: 10 mg, 20 mg, 25 mg, 30 mg, 35 mg, 40 mg. **Capsules (Absorica LD):** 8 mg, 16 mg, 24 mg, 32 mg.

NURSING IMPLICATIONS

Assessment

- ***REMS:*** Verify that patient receiving isotretinoin is registered with the *iPLEDGE REMS* and is completing all required interactions with their health care provider.
- Assess skin prior to and periodically during therapy. Transient worsening of acne may occur at initiation of therapy. Note number and severity of cysts, degree of skin dryness, erythema, and itching.
- Assess for allergy to parabens; capsules contain parabens as a preservative.
- Monitor patient for behavioral changes throughout therapy. May cause depression, psychosis, and suicide ideation. If behavioral changes occur, they usually resolve with discontinuation of therapy.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal

© F.A. Davis Publishing

necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.

- ***Lab Test Considerations:*** Verify 2 negative sequential serum or urine pregnancy tests with a sensitivity ≥25 mIU/mL before receiving initial prescription and monthly before each new Rx.
- Monitor liver function (AST, ALT, and LDH) prior to therapy, after 1 mo of therapy, and periodically thereafter. Inform health care professional if these values become ↑ therapy; may need to be discontinued.
- Monitor blood lipids (cholesterol, HDL, triglycerides) under fasting conditions prior to beginning therapy, at 1–2 wk intervals until lipid response to isotretinoin is established (usually within 1 mo), and periodically thereafter. Report ↑ cholesterol and triglyceride levels or ↓ HDL.
- Obtain baseline and periodic CBC, urinalysis, and SMA-12. May cause ↑ blood glucose, CK, platelet counts, and sedimentation rate. May ↓ RBC and WBC parameters. May cause proteinuria, red and white blood cells in urine, and ↑ uric acid.

Implementation

- Do not confuse isotretinoin with tretinoin.
- ***REMS:*** Isotretinoin is approved for marketing only under the *iPLEDGE REMS*, a special restricted distribution program approved by the FDA.
- ***REMS:*** Only patients who meet all requirements of the *iPLEDGE REMS* may receive isotretinoin.
- ***REMS:*** Isotretinoin may only be prescribed by health care providers registered and activated with the *iPLEDGE REMS*.
- ***REMS:*** Isotretinoin may only be dispensed by pharmacies registered with the *iPLEDGE REMS*.
- **PO:** Administer without regard to meals. Administer with a full glass of liquid to decrease the risk of esophageal irritation. ***DNC:*** Do not crush or open capsules.

Patient/Family Teaching

- ***REMS:*** Explain the *iPLEDGE REMS* and its requirements to patient and parent.
- Instruct patient to take isotretinoin as directed. Do not take more than the amount prescribed. If a dose is missed omit dose; do not double doses. Patients must read *Medication Guide* and sign consent form prior to initiation of therapy.
- Explain to patient that a temporary worsening of acne may occur at beginning of therapy.
- Advise patient and family to notify health care professional if rash or thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood occur.
- May cause sudden decrease in night vision. Caution patient to avoid driving at night until response to the medication is known.
- Advise patient to consult with health care professional before using other acne preparations while taking isotretinoin. Soaps, cosmetics, and shaving lotion may also worsen dry skin.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Instruct patient not to take vitamin A supplements and to avoid excessive ingestion of foods high in vitamin A (liver; fish liver oils; egg yolks; yellow-orange fruits and vegetables; dark green, leafy vegetables; whole milk; vitamin A–fortified skim milk; butter; margarine) while taking isotretinoin; this may result in hypervitaminosis.
- Advise patient to avoid alcoholic beverages while taking isotretinoin, as this may further increase triglyceride levels.
- Inform patient that dry skin and chapped lips will occur. Lubricant to lips may help cheilitis.
- Instruct patient that oral rinses, good oral hygiene, and sugarless gum or candy may help minimize dry mouth. Notify health care professional if dry mouth persists for more than 2 wk.
- Discuss possibility of excessively dry eyes with patients who wear contact lenses. Patient should contact health care professional about eye lubricant. Patient may need to switch to glasses during course of therapy and for up to 2 wk following discontinuation.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions. Consult health care professional about sunscreen, as some sunscreens may worsen acne.
- Inform diabetic patients that difficulty controlling blood glucose may occur.
- Instruct patient to report burning of eyes, visual changes, rash, abdominal pain, diarrhea, headache, nausea, and vomiting to health care professional.
- Advise patient not to donate blood while receiving this medication. After discontinuing isotretinoin, wait at least 1 mo before donating blood to prevent the possibility of a pregnant patient receiving the blood.
- Rep: May cause fetal harm. Instruct female patients of reproductive potential to use 2 forms of contraception 1 mo before therapy, during therapy, and for at least 1 mo after discontinuation of isotretinoin. Patient who can become pregnant must have 2 negative serum or urine pregnancy tests with a sensitivity ≥25 mIU/mL before receiving initial prescription. First test is obtained by prescriber when decision is made to prescribe isotretinoin. Second pregnancy

© F.A. Davis Publishing

test should be done after patient has used 2 forms of contraception for 1 mo and during first 5 days of menstrual period immediately preceding beginning of therapy. For patients with amenorrhea, second test should be done 11 days after last act of unprotected sexual intercourse. Each mo of therapy patient must have a negative result from a urine or serum pregnancy test. Pregnancy test must be repeated every mo prior to receiving prescription in patients who can become pregnant. Patient should discontinue medication and inform health care professional immediately if pregnancy is suspected during or 1 month after therapy. If pregnancy occurs, must be reported immediately to the FDA via the MedWatch telephone number 1-800-FDA-1088, and also to the iPLEDGE pregnancy registry at 1-866-495-0654 or via the internet (www.ipledgeprogram.com). Recommended consent form prepared by manufacturer stresses fetal risk. Parents of minors should also read and sign form. Yellow self-adhesive qualification stickers completed by prescriber must accompany prescription. Advise patient to avoid breast feeding during and for at least 8 days after last dose.

- Inform patient of need for medical follow-up. Periodic lab tests may be required.

Evaluation/Desired Outcomes

- Decrease in the number and severity of cysts in severe acne. Therapy may take 4–5 mo before full effects are seen. Therapy is discontinued when the number of cysts is reduced by 70% or after 5 mo. Improvement may occur after discontinuation of therapy; therefore, a delay of at least 8 wk is recommended before a second course of therapy is considered.

istradefylline (is-tra-def-i-lin)

Nourianz

Classification

Therapeutic: antiparkinson agents
Pharmacologic: adenosine receptor antagonist

Indications

Adjunctive treatment to levodopa/carbidopa in patients with Parkinson's disease experiencing "off" episodes.

Action

Acts as an adenosine receptor antagonist; the mechanism by which these effects exert beneficial effects in patients with Parkinson's disease is unknown. **Therapeutic Effects:** Reduction in "off" time.

Pharmacokinetics

Absorption: Unknown.
Distribution: Extensively distributed to tissues.
Protein Binding: 98%.
Metabolism and Excretion: Primarily metabolized in liver via CYP1A1 and CYP3A4 isoenzymes. 48% excreted in feces, 39% in urine.
Half-life: 83 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Severe psychotic disorders (may worsen psychosis); Severe hepatic impairment; OB: Pregnancy (may cause fetal harm).
Use Cautiously in: End-stage renal disease; Moderate hepatic impairment; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

Derm: rash. **Endo:** hyperglycemia, hyperuricemia. **GI:** constipation, diarrhea, nausea. **Metab:** ↓ appetite. **Neuro:** dyskinesia, aggression, agitation, confusion, delusions, delirium, disorientation, dizziness, hallucinations, impulse control disorders (gambling, sexual), insomnia, mania, paranoid ideation.

Interactions

Drug-Drug: Concurrent use with **levodopa** may cause or exacerbate dyskinesia. **Cigarette smoking** may ↓ levels; if patient smokes ≥20 cigarettes/day, ↑ dose to 40 mg once daily. **Strong CYP3A4 inhibitors**, including **clarithromycin**, **itraconazole**, **ketoconazole**, may significantly ↑ levels. **Strong CYP3A4 inducers**, including **carbamazepine**, **phenytoin**, **rifampin**, may significantly ↓ levels; avoid concurrent use. Higher doses (40 mg/day) may ↑ levels of **CYP3A4 substrates**, including **atorvastatin**. May ↑ levels of **P-glycoprotein substrates**, including **digoxin**.
Drug-Natural Products: St. John's wort may significantly ↓ levels; avoid concurrent use.

Route/Dosage

PO (Adults): 20 mg once daily; may ↑ to 40 mg once daily, if needed, based on clinical response. *Concurrent use of strong CYP3A4 inhibitors*—Do not exceed 20 mg/day.

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh B)*—Do not exceed 20 mg/day.

Availability

Tablets: 20 mg, 40 mg.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian symptoms (akinesia, rigidity, tremors, pill rolling, shuffling gait, mask-like face, twisting motions, and drooling) during therapy. "On-off phenomenon" may cause symptoms to appear or improve suddenly.
- Assess for signs and symptoms of dyskinesia (abnormal movements, uncontrolled sudden movements) before and during therapy.
- Monitor for signs and symptoms of behavior changes (hallucinations, psychotic behavior, paranoid ideation, delusions, confusion, mania, disorientation, aggressive behavior, agitation, delirium) during therapy. Consider reducing dose or discontinuing therapy.

Implementation

- **PO:** Administer once daily without regard for food.

Patient/Family Teaching

- Instruct patient to take medication at regular intervals as directed. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient and family to notify health care professional if signs and symptoms of hallucinations or psychosis (being overly suspicious or feeling people want to harm you, disorientation, believing things that are not real, aggressive behavior, seeing or hearing things that are not real, agitation, confusion, delirium, increased activity or talking, or if new or increased gambling, sexual, or other intense urges occur). Dose reduction may be required.
- Advise females of reproductive potential to use effective contraception and avoid breast feeding during therapy. Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decreased "off" time in patients with Parkinson's disease.

ivabradine (eye-**vab**-ra-deen)

Corlanor, Lancora

Classification

Therapeutic: heart failure agents
Pharmacologic: hyperpolarization-activated cyclic nucleotide-gated channel blockers

Indications

To decrease the need for hospitalization due to worsening HF in patients with stable, but symptomatic chronic HF (ejection fraction <35%, sinus rhythm ≥70 bpm, receiving highest tolerated doses of beta-blockers or are unable to tolerate beta-blockers). Treatment of stable, symptomatic HF due to dilated cardiomyopathy in pediatric patients ≥6 mo old who are in sinus rhythm with an elevated heart rate.

Action

Inhibits the cardiac pacemaker I_f-current by acting as a hyperpolarization-activated cyclic nucleoside-gated channel blocker, resulting in ↓ spontaneous pacemaker activity of sinus node. Decreases heart rate without affecting contractility or ventricular repolarization.
Therapeutic Effects: Lowering of heart rate with reduced need for hospitalization in HF patients.

Pharmacokinetics

Absorption: 40% absorbed following oral administration (undergoes first pass metabolism); food delays absorption and ↑ blood levels.
Distribution: Unknown.
Metabolism and Excretion: Extensively metabolized, primarily by the CYP3A4 enzyme system. The major metabolite is pharmacologically active and has the same potency as ivabradine. Metabolites excreted equally in urine and feces; 4% excreted unchanged in urine.
Half-life: 6 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	12 hr

Contraindications/Precautions

Contraindicated in: Acute decompensated heart failure; Clinically significant hypotension; Sick sinus syndrome, sinoatrial block, or 2nd or 3rd degree heart block (unless a functioning demand pacemaker is in place, ↑ risk of bradycardia); Clinically significant bradycardia; Severe hepatic impairment; Pacemaker dependence; Concurrent use of strong CYP3A4 inhibitors; OB: Pregnancy (may cause fetal harm); Lactation: Discontinue ivabradine or discontinue breast feeding.
Use Cautiously in: Rep: Women of reproductive potential; Pedi: Children <6 mo (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: TORSADE DE POINTES, atrial fibrillation, bradycardia, heart block, hypertension, QT interval prolongation, sinus arrest. **EENT:** phosphenes (luminous phenomena).

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **azole antifungals**, **macolide anti-infectives**, **HIV protease inhibitors**, and **nefazodone** may ↑ levels; concurrent use contraindicated. **Moderate CYP3A4 inhibitors**, including **diltiazem** and **verapamil**, may ↑ levels and ↑ risk of bradycardia; avoid concurrent use. **CYP3A4 inducers**, including **barbiturates**,

© F.A. Davis Publishing

phenytoin, and **rifampicin** may ↓ levels; avoid concurrent use. ↑ risk of bradycardia with concurrent use of **negative chronotropes** including **amiodarone**, **beta-blockers**, and **digoxin**; monitor heart rate. Concurrent use of **QT-interval prolonging drugs** may ↑ risk of QT interval prolongation and torsade de pointes.

Drug-Natural Products: Concurrent use of **St. John's wort** may ↓ blood levels and effectiveness and should be avoided.

Drug-Food: Concurrent ingestion of **grapefruit juice** may ↑ blood levels and the risk of adverse effects and should be avoided.

Route/Dosage

PO (Adults): 5 mg twice daily for 2 wk; dose may then be adjusted based on heart rate, not to exceed 7.5 mg twice daily; *Patients with conduction defects or bradycardia*—2.5 mg twice daily initially.

PO (Children ≥6 mo and ≥40 kg): *Tablets*—2.5 mg twice daily; adjust dose at 2-wk intervals by 2.5 mg twice daily to achieve a heart rate reduction of ≥20%; not to exceed 7.5 mg twice daily.

PO (Children ≥6 mo and <40 kg): *Oral solution*—0.05 mg/kg twice daily; adjust dose at 2-wk intervals by 0.05 mg/kg twice daily to achieve a heart rate reduction of ≥20%; not to exceed 0.2 mg/kg twice daily (6 mo–<1 yr) or 0.3 mg/kg twice daily (≥1 yr) up to max of 7.5 mg twice daily.

Availability

Oral solution: 1 mg/mL. **Tablets:** 5 mg, 7.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess heart rate prior to, after 2 wk, and periodically during therapy. Adjust dose for a resting heart rate 50–60 bpm. *If heart rate >60 bpm,* increase dose by 2.5 mg given twice daily up to 7.5 mg twice daily. *If heart rate 50–60 bpm,* maintain dose. *If heart rate <50 bpm or signs and symptoms of bradycardia (dizziness, fatigue, hypotension) occur,* decrease dose by 2.5 mg given twice daily; if current dose is 2.5 mg given twice daily, discontinue ivabradine.
- Monitor ECG periodically during therapy. May cause atrial fibrillation and torsade de pointes. Discontinue ivabradine if atrial fibrillation occurs.

Implementation

- **PO:** Administer twice daily with meals.
- For oral solution, empty entire contents of ampule(s) into a medication cup. With a calibrated oral syringe, measure prescribed dose and administer orally. Discard unused oral solution; do not store or reuse. Solution is colorless.

Patient/Family Teaching

- Instruct patient to take ivabradine as directed. If dose is missed or patient spits out drug omit dose; do not double doses.
- Advise patient to avoid taking grapefruit juice during therapy; may increase risk of side effects.
- Advise patient to notify health care professional if signs and symptoms of irregular or rapid heartbeat (heart pounding or racing, chest pressure, worsened shortness of breath, near fainting or fainting) or slower than normal heart rate (dizziness, fatigue, lack of energy) occur. In young children signs and symptoms of slow heart rate (poor feeding, difficulty breathing, turning blue).
- Inform patient that ivabradine may cause phosphenes or luminous phenomena, a transiently enhanced brightness in a limited area of the visual field, halos, image decomposition, colored bright lights, or multiple images. Phosphenes are usually triggered by sudden variations in light intensity. Usually begin within first 2 mo of therapy, may occur repeatedly of mild to moderate intensity, and resolve after therapy is discontinued.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially St. John's wort.
- May be teratogenic. Advise female patient of reproductive potential to use effective contraception during therapy and to avoid breast feeding during therapy. Advise patient to notify health care professional immediately if pregnancy is suspected.

Evaluation/Desired Outcomes

- Lowering of heart rate to prevent hospitalization in patients with HF.

ixabepilone (icks-a-**bep**-i-lone)

Ixempra

Classification

Therapeutic: antineoplastics

Pharmacologic: epothilone B analogues

Indications

Combination use with capecitabine for the treatment of metastatic or locally advanced breast cancer currently resistant to a taxane and anthracycline or resistant to a taxane and cannot tolerate further anthracycline. May also be used as monotherapy for breast cancers that are not responding to anthracyclines, taxane, or capecitabine.

Action

Binds to β-tubulin subunits on microtubules; this action blocks cells in mitosis, leading to cell death. Also

© F.A. Davis Publishing

has antiangiogenic activity. **Therapeutic Effects:** Decreased spread of breast cancer.

Pharmacokinetics

Absorption: IV administration results in complete bioavailablity.

Distribution: Unknown.

Metabolism and Excretion: Extensively metabolized by the liver, primarily by the CYP3A4 enzyme system. Metabolites are not active and are excreted mainly by the kidneys.

Half-life: 52 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	end of infusion	unknown

Contraindications/Precautions

Contraindicated in: Previous hypersensitivity to any medications containing Cremophor EL or similar derivatives (polyoxyethylated castor oil); Neutrophils <1500 cells/m^3 or platelets <100,000 cells/m^3; Severe hepatic impairment; Use with capecitabine is contraindicated for hepatic impairment (AST or ALT >2.5 × upper limits of normal or bilirubin >1 × upper limit of normal) due to ↑ risk of toxicity and death associated with neutropenia; OB, Lactation: Pregnancy or lactation.

Use Cautiously in: Toxicity; dose adjustments may be required for neuropathy/arthralgia/myalgia/fatigue, neutropenia, thrombocytopenia, moderate hepatic impairment or palmar-plantar erythrodysesthesia; Diluent contains dehydrated alcohol; consider possible CNS effects; Diabetes or history of neuropathy (↑ risk of severe neuropathy); History of cardiac disease (may ↑ risk of myocardial ischemia or ventricular dysfunction; OB: Patients with childbearing potential; Pedi: Effectiveness not established.

Adverse Reactions/Side Effects

EENT: ↑ lacrimation. **CV:** chest pain, edema, left ventricular dysfunction, myocardial ischemia. **Resp:** dyspnea. **GI:** abdominal pain, anorexia, constipation, diarrhea, mucositis, nausea, stomatitis, vomiting, altered taste. **Derm:** alopecia, hyperpigmentation, nail disorder, palmar-plantar erythrodysesthesia (combination therapy with capecitabine), exfoliation, pruritus, rash, hot flushes. **Hemat:** MYELOSUPPRESSION. **MS:** arthralgia, musculoskeletal pain, myalgia. **Neuro:** peripheral neuropathy, fatigue, weakness, dizziness, headache, insomnia. **Misc:** hypersensitivity reactions.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **ketoconazole**, **itraconazole**, **voriconazole**, **clarithromycin**, **atazanavir**, **delavirdine**, **ritonavir**, **saquinavir**, and **nefazodone**, ↑ blood levels and the risk of serious toxicities; concurrent use should be avoided if possible. If concurrent use is required, dose reduction of ixabepilone is recommended. Inducers of the **CYP3A4 enzyme system** including **dexamethasone**, **phenytoin**, **carbamazepine**, **phenobarbital**, **rifampin**, **rifampicin**, or **rifabutin** may ↓ levels and effectiveness, avoid if possible.

Drug-Natural Products: St. John's wort may ↓ blood levels and should be avoided.

Drug-Food: Grapefruit juice may ↑ blood levels and toxicity; avoid concurrent use.

Route/Dosage

IV (Adults): 40 mg/m^2 every 3 wk; not to exceed dose greater than that calculated for 2.2 m^2 (88 mg/dose).

Hepatic Impairment

IV (Adults): *Moderate Impairment*— 20 mg/m^2 every 3 wk; not to exceed 30 mg/m^2.

Availability

Powder for injection (requires specific diluent for initial reconstitution): 15-mg vial (contains 16 mg ixabepilone to allow for withdrawal losses) with 8 mL of diluent in a separate vial as a kit, 45-mg vial (contains 47 mg ixabepilone to allow for withdrawal losses) with 23.5 mL of diluent in a separate vial.

NURSING IMPLICATIONS

Assessment

- Monitor for hypersensitivity reaction (flushing, rash, dyspnea, bronchospasm). If severe reactions occur stop infusion and provide aggressive supportive treatment with epinephrine and corticosteroids. In subsequent cycles, add corticosteroids to the premedication regimen.
- Monitor for myelosuppression frequently during therapy. Assess for signs of infection during neutropenia. Assess for bleeding (bleeding gums, bruising, petechiae, blood in stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min.
- Assess patient for signs of peripheral neuropathy (burning sensation, hyperesthesia, hypoesthesia, paresthesia, discomfort, neuropathic pain); may occur early during treatment within the first 3 cycles. Patients experiencing new or worsening symptoms may require a reduction or delay in dose of ixabepilone. If neuropathy is Grade 2 (moderate) lasting for ≥7 days or Grade 3 (severe) lasting for <7 days, decrease dose by 20%. If neuropathy is Grade 3 lasting ≥7 days or is disabling, discontinue treatment.
- ***Lab Test Considerations:*** Monitor CBC and platelets frequently during therapy. If neutrophil count is <500 cells/mm^3 for ≥7 days or patient has febrile neutropenia or if platelet count is <25,000/mm^3 or platelets are <50,000/mm^3 with bleeding, decrease the dose by 20%. Begin new treatment cycle only if neutrophil count is at least 1500 cells/mm^3 and nonhematologic toxicities have improved to Grade 1 (mild) or resolved. May also cause leukopenia and anemia.

© F.A. Davis Publishing

- Monitor hepatic function prior to therapy. Patients with decreased hepatic function require a decreased dose. If AST and ALT ≤2.5 × the upper limits of normal (ULN) and bilirubin ≤1 × ULN, administer ixabepilone at 40 mg/m². If AST and ALT ≤10 × ULN and bilirubin ≤1 × ULN, administer ixabepilone at 32 mg/m². If AST and ALT ≤10 × ULN and bilirubin >1.5–≤3 × ULN, administer ixabepilone at 20–30 mg/m².

Implementation

- Premedicate patient with an H_1 and an H_2 antagonist approximately 1 hr before ixabepilone infusion. Patients who experienced a hypersensitivity reaction in a previous ixabepilone cycle should also be premedicated with corticosteroids and extension of the infusion time should be considered.
- To minimize risk of dermal exposure, wear impervious gloves when handling ixabepilone vials regardless of setting (unpacking and inspection, transport within a facility, dose preparation and administration).

IV Administration

- **Intermittent Infusion:** Remove *Ixempra kit* (containing ixabepilone vial and diluent vial) from refrigerator and allow to stand at room temperature for 30 min prior to diluting. *Ixempra kit* must be stored in refrigerator. When vials are first removed from refrigerator, a white precipitate may be observed in the diluent vial; precipitate will dissolve to form a clear solution once diluent warms to room temperature. Use only diluent supplied in kit for reconstitution. Reconstitute 15-mg vial with 8 mL and 45-mg vial with 23.5 mL of diluent. Gently swirl and invert vial until powder is completely dissolved. ***Dilution:*** Prior to administration, dilute constituted solution further with only LR supplied in DEHP-free bags. Dilute as soon as possible after constitution, but may be stored at room temperature and room light for up to 1 hr. For most doses use 250-mL bag of LR, 0.9% NaCl (pH adjusted 6.0–9.0 with sodium bicarbonate), or Plasma-lyte A injection (pH 7.4). ***Concentration:*** If final concentration is not between 0.2 mg/mL and 0.6 mg/mL, add to appropriate size bag of LR. Thoroughly mix infusion bag by manual rotation. Diluted solution is stable for up to 6 hr at room temperature and room light; must complete infusion during 6-hr period. Administer through an in-line filter with a microporous membrane of 0.2–1.2 microns. DEHP-free infusion containers and administration sets must be used. Discard remaining solution. ***Rate:*** Infuse over 3 hr.

Patient/Family Teaching

- Advise patient to avoid grapefruit juice during therapy; may lead to increased levels and side effects.
- Solution contains alcohol and may cause drowsiness or dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional promptly if fever >100.5°F; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; burning, painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patients to use a soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or NSAIDs; may precipitate bleeding.
- Instruct patient to notify health care professional promptly if signs and symptoms of hypersensitivity (hives, urticaria, pruritus, rash, flushing, swelling, dyspnea, chest tightness), peripheral neuropathy (numbness and tingling in hands and feet), or cardiac adverse reactions (chest pain, difficulty breathing, palpitations, unusual weight gain) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products, especially St. John's wort.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Discuss the possibility of hair loss with patient. Explore methods of coping. Regrowth usually occurs 2–3 mo after discontinuation of therapy.
- Advise women of childbearing potential to use effective contraception during therapy and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decreased progression of breast cancer.

ixazomib (ix-az-oh-mib)

Ninlaro

Classification

Therapeutic: antineoplastics
Pharmacologic: proteasome inhibitors

Indications

Multiple myeloma in patients whose disease has relapsed despite receiving ≥1 previous drug therapy (in combination with lenalidomide and dexamethasone).

Action

Acts as a proteasome inhibitor by binding to sites on the 20s proteasome. Has antiproliferative and proapoptotic activity. **Therapeutic Effects:** Delayed progression of multiple myeloma.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: 58% absorbed following oral administration; bioavailability ↓ by high-fat foods.
Distribution: Extensively distributed to tissues.
Protein Binding: 99%.
Metabolism and Excretion: Metabolized by multiple CYP450 enzymes (including CYP1A2, CYP2B6, CYP2C8, CYP2C9, CYP2C19, CYP2D6, and CYP3A4). 62% excreted in urine (<3.5% as unchanged drug), 22% excreted in feces.
Half-life: 9.5 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use of strong CYP3A inducers; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Moderate or severe hepatic impairment (↓ dose recommended); Severe renal impairment or end stage renal disease (↓ dose recommended); Rep: Women and men of reproductive potential; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects

CV: edema. **Derm:** rash. **EENT:** blurred vision, conjunctivitis, dry eye. **GI:** HEPATOTOXICITY, constipation, diarrhea, nausea, vomiting. **Hemat:** HEMOLYTIC UREMIC SYNDROME, NEUTROPENIA, THROMBOCYTOPENIA, THROMBOTIC MICROANGIOPATHY, THROMBOTIC THROMBOCYTOPENIC PURPURA. **MS:** back pain. **Neuro:** peripheral neuropathy. **Misc:** herpes zoster infection.

Interactions

Drug-Drug: Strong CYP3A4 inducers, including **carbamazepine**, **phenytoin**, and **rifampin**, may ↓ levels and effectiveness; avoid concurrent use.
Drug-Natural Products: St. John's wort may ↓ levels and effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults): 4 mg once a wk on Days 1, 8, and 15 of a 28-day treatment cycle.

Renal Impairment

(Adults): *CCr <30 mL/min or requiring dialysis*— 3 mg once a wk on Days 1, 8, and 15 of a 28-day treatment cycle.

Hepatic Impairment

(Adults): *Moderate or severe hepatic impairment (total bilirubin >1.5× ULN)*— 3 mg once a wk on Days 1, 8, and 15 of a 28-day treatment cycle.

Availability

Capsules: 2.3 mg, 3 mg, 4 mg.

NURSING IMPLICATIONS

Assessment

- Assess for rash (usually maculopapular or macular) periodically during therapy. *If Grade 2 or 3 rash occurs,* withhold lenalidomide until rash recovers to ≤Grade 1, then resume lenalidomide at next lower dose. *If Grade 2 or 3 rash occurs again,* withhold ixazomib and lenalidomide until rash ≤Grade 1, then resume ixazomib at next lower dose and resume lenalidomide at most recent dose. *If Grade 4 rash occurs,* discontinue therapy.
- Assess for signs and symptoms of peripheral neuropathy (numbness, tingling, burning, pain in feet or hands, or weakness in arms or legs) periodically during therapy. *If Grade 1 peripheral neuropathy with pain or Grade 2 peripheral neuropathy occurs,* withhold ixazomib until peripheral neuropathy recovers to ≤Grade 1 without pain or patient's baseline, then resume ixazomib at most recent dose. *If Grade 2 peripheral neuropathy with pain or Grade 3 peripheral neuropathy occurs,* withhold ixazomib until return to patient's baseline condition or ≤Grade 1 peripheral neuropathy, then resume ixazomib at next lower dose. *If Grade 4 peripheral neuropathy occurs,* discontinue therapy.
- Monitor for signs and symptoms of thrombotic microangiopathy (fever, bruising, nose bleeds, tiredness, decreased urination) during therapy. If symptoms occur, hold ixazomib and evaluate. If diagnosis is excluded, may consider restarting therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Prior to each 28-day cycle, absolute neutrophil count (ANC) should be ≥1,000/mm^3, platelet count should be ≥75,000/mm^3, and nonhematologic toxicities should be recovered to patient's baseline condition or ≤Grade 1.
- For patients taking ixazomib, lenalidomide, and dexamethasone, *if ANC <500/mm^3,* withhold ixazomib and lenalidomide until ANC ≥500/mm^3, then resume lenalidomide at next lower dose and resume ixazomib at most recent dose. Consider adding granulocyte stimulating factor (G-CSF) as per clinical guidelines. *If ANC <500/mm^3 again,* withhold ixazomib and lenalidomide until ANC ≥500/mm^3, then resume ixazomib at next lower dose and resume lenalidomide at most recent dose.
- Monitor platelet counts at least monthly during therapy and more frequently during 1st three cycles. Nadir of thrombocytopenia usually occurs Days 14–21 of each 28-day cycle and recovery to baseline by start of next cycle. *If platelet count ≤30,000/mm^3,* withhold ixazomib and lenalidomide until platelet count is ≥30,000/mm^3, then resume lenalidomide at next lower dose and resume ixazomib at most recent dose. *If platelet count <30,000/mm^3 again,* withhold ixazomib and lenalidomide until platelet count is ≥30,000/mm^3, then resume ixazomib at next

© F.A. Davis Publishing

lower dose and resume lenalidomide at most recent dose.
- Monitor hepatic enzymes periodically during therapy and adjust dosing for Grade 3 or 4 symptoms.

Implementation
- Consider starting antiviral prophylaxis prior therapy to decrease risk of herpes zoster infection.
- **PO:** Administer once weekly on same day and at same time for first 3 wk of four-wk cycle. Take capsules at least 1 hr before or at least 2 hr after food. ***DNC:*** Swallow capsule whole with water; do not open, crush, or chew.
- Avoid direct contact with capsule contents. If powder from the capsule comes in contact with skin, wash area well with soap and water. If powder from capsule gets in the eyes, flush eyes well with water.
- Dexamethasone should be taken with food and not with ixazomib.

Patient/Family Teaching
- Instruct patient to take ixazomib as directed and to avoid contact with capsule contents. Take delayed or missed doses only if next scheduled dose is ≥72 hr away. Do not take within 72 hr of next scheduled dose and do not double doses. If vomiting occurs after taking dose, omit dose and resume dosing at time of next scheduled dose. Advise patient to read *Patient Information* sheet prior to starting therapy and with each Rx refill in case of changes.
- Caution patient to avoid direct contact with capsule contents. If powder accidentally gets on skin, wash area well with soap and water. If in eyes, flush eyes well with water.
- Advise patient to notify health care professional if signs and symptoms of thrombocytopenia (bleeding, easy bruising), thrombotic microangiopathy, GI problems (diarrhea, constipation, nausea, vomiting), peripheral neuropathy (tingling, numbness, pain, burning in feet or hands, weakness in arms or legs), liver problems (yellowing of skin or whites of eyes, pain in right upper abdomen), swelling in arms, hands, legs, ankles, or feet, or weight gain from swelling, new or worsening rash, or back pain occurs.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Rep: May cause fetal harm. Advise females of reproductive potential and males with female partners of reproductive potential to use effective nonhormonal contraception during and for 90 days after last dose and to avoid breast feeding during and for 90 days after last dose. Advise patient to notify health care professional immediately if pregnancy is suspected.

Evaluation/Desired Outcomes
- Delayed progression of multiple myeloma signs and symptoms.

ixekizumab (ix-ee-kiz-ue-mab)
Taltz

Classification
Therapeutic: antipsoriatics
Pharmacologic: interleukin antagonists

I

Indications
Moderate-to-severe plaque psoriasis in patients who are candidates for systemic therapy or phototherapy. Active psoriatic arthritis (as monotherapy or in combination with a nonbiologic DMARD). Active ankylosing spondylitis. Active nonradiographic axial spondyloarthritis in patients with objective signs of inflammation.

Action
A monoclonal antibody that acts as an antagonist of interleukin (IL)−17A by selectively binding to it and preventing its interaction with the IL−17 receptor. Antagonism prevents the production of inflammatory cytokines and chemokines. **Therapeutic Effects:** Decreased plaque formation and spread in plaque psoriasis. Decreased pain and swelling with decreased joint destruction in psoriatic arthritis. Decreased disease activity in ankylosing spondylitis and nonradiographic axial spondyloarthritis.

Pharmacokinetics
Absorption: Well absorbed (60−81%) following subcut administration.
Distribution: Minimally distributed to tissues.
Metabolism and Excretion: Catabolized into small peptides and amino acids.
Half-life: 13 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	4 days	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Active tuberculosis.
Use Cautiously in: Inflammatory bowel disease (may lead to exacerbations); OB: Safety not established; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <6 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects
GI: inflammatory bowel disease, nausea. **Hemat:** neutropenia, thrombocytopenia. **Local:** injection site

© F.A. Davis Publishing

reactions. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, and urticaria), INFECTION (including reactivation tuberculosis).

Interactions

Drug-Drug: May ↓ antibody response to **live-virus vaccine** and ↑ risk of adverse reactions (do not administer concurrently).

Route/Dosage

Plaque Psoriasis

Subcut (Adults): 160 mg (as two 80-mg injections) at wk 0, then 80 mg at wk 2, 4, 6, 8, 10, and 12, then 80 mg every 4 wk.
Subcut (Children ≥6 yr and >50 kg): 160 mg (as two 80-mg injections) at Wk 0, then 80 mg every 4 wk.
Subcut (Children ≥6 yr and 25–50 kg): 80 mg at Wk 0, then 40 mg every 4 wk.
Subcut (Children ≥6 yr and <25 kg): 40 mg at Wk 0, then 20 mg every 4 wk.

Psoriatic Arthritis and Ankylosing Spondylitis

Subcut (Adults): 160 mg (as two 80-mg injections) initially, then 80 mg every 4 wk.

Nonradiographic Axial Spondyloarthritis

Subcut (Adults): 80 mg every 4 wk.

Availability

Solution for injection (prefilled autoinjectors and syringes): 80 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for tuberculosis infection before starting therapy; do not administer to patient with active TB infection. Initiate treatment of latent TB before administering ixekizumab. In patient with previous history of TB in whom adequate course cannot be confirmed, consider anti-TB therapy before starting ixekizumab.
- Monitor for signs and symptoms of infection (fever, sweats, chills, muscle aches, cough, dyspnea, blood in mucus, weight loss, warm, red, or painful skin or sores, diarrhea or stomach pain, burning or frequency of urination) before and periodically during therapy.
- Monitor for signs and symptoms of hypersensitivity (urticaria, feeling faint, swelling of face, eyelids, lips, mouth, tongue, or throat, dyspnea, throat tightness, chest tightness, rash) during therapy. If hypersensitivity reaction occurs, discontinue ixekizumab immediately and begin supportive therapy.
- Monitor for onset or exacerbation of inflammatory bowel disease (abdominal pain, diarrhea with or without blood, weight loss) during therapy.
- ***Lab Test Considerations:*** May cause neutropenia and thrombocytopenia.

Implementation

- Consider completing all age appropriate immunizations prior to starting therapy.
- **Subcut:** Allow to reach room temperature (30 min) before injection; do not microwave, run under hot water, or leave in sunlight to warm. Solution is clear and colorless to slightly yellow; do not administer solutions that are cloudy, discolored, or contain a precipitate. For *prefilled syringe,* pinch skin and inject into upper arm, thigh, or abdomen at a 45° angle; let go of skin pinch before injecting. Place *autoinjector* flat against skin at injection site before injecting. Avoid areas where skin is bruised, tender, erythematous, indurated, or affected by psoriasis. Rotate injection sites. Store in refrigerator in original box to protect from light; may be stored at room temperature for up to 5 days. Do not return to refrigerator once stored at room temperature.

Patient/Family Teaching

- Instruct patient and caregiver in proper technique for self-injection and care and disposal of equipment. Administer missed doses as soon as possible and resume regular dosing schedule. Advise patient to read *Medication Guide and Instructions for Use* prior to starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if signs and symptoms of allergic reaction, infection, or inflammatory bowel disease occur.
- Advise patient to avoid use of live vaccines during therapy.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise female patients of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decreased plaque formation and spread in patients with plaque psoriasis.
- Decreased pain and swelling with decreased joint destruction in psoriatic arthritis.
- Decreased disease activity in ankylosing spondylitis and non-radiographic axial spondyloarthritis.

© F.A. Davis Publishing

ketoconazole, See ANTIFUNGALS (TOPICAL).

BEERS

ketorolac† (kee-toe-role-ak)

Sprix, ~~Toradol~~, Toradol

Classification

Therapeutic: nonopioid analgesics
Pharmacologic: nonsteroidal anti-inflammatory drugs (NSAIDs)

†See Appendix B for ophthalmic use

Indications

Short-term management of pain (not to exceed 5 days total for all routes combined).

Action

Inhibits prostaglandin synthesis, producing peripherally mediated analgesia. Also has antipyretic and anti-inflammatory properties. **Therapeutic Effects:** Decreased pain.

Pharmacokinetics

Absorption: Rapidly and completely absorbed following all routes of administration.
Distribution: Enters breast milk in low concentrations.
Protein Binding: 99%.
Metabolism and Excretion: Primarily metabolized by the liver. Ketorolac and its metabolites are excreted primarily by the kidneys (92%); 6% excreted in feces.
Half-life: 4.5 hr (range 3.8–6.3 hr; ↑ in geriatric patients and patients with impaired renal function).

TIME/ACTION PROFILE (analgesic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 hr	4–6 hr or longer
IM, IV	10 min	1–2 hr	6 hr or longer
IN	unknown	unknown	6–8 hr or longer

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other NSAIDs may exist; Preoperative use; Active or history of peptic ulcer disease or GI bleeding; Known alcohol intolerance (injection only); Coronary artery bypass graft (CABG) surgery; Cerebrovascular bleeding; Advanced renal impairment or at risk for renal failure due to volume depletion; Concurrent use of pentoxifylline or probenecid; OB: Avoid use of after 30 wk gestation; may inhibit labor and ↑ maternal bleeding at delivery.

Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; Heart failure; Coagulation disorders; Mild-to-moderate renal impairment (↓ dose may be required); Hepatic impairment; OB: Use at or after 20 wk gestation may cause fetal or neonatal renal impairment; if treatment is necessary between 20 wk and 30 wk gestation, limit use to the lowest effective dose and shortest duration possible; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety not established in neonates; Geri: Appears on Beers list; ↑ risk of GI bleeding in older adults.

K

Adverse Reactions/Side Effects

CV: HF, MYOCARDIAL INFARCTION, STROKE, edema, pallor, vasodilation. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus, purpura, sweating, urticaria. **EENT:** ↑ lacrimation (spray), nasal discomfort (spray), throat irritation (spray). **F and E:** hyperkalemia. **GI:** GI BLEEDING, abnormal taste, diarrhea, dry mouth, dyspepsia, GI pain, ↑ liver enzymes, nausea. **GU:** oliguria, renal toxicity, urinary frequency. **Hemat:** prolonged bleeding time. **Local:** injection site pain. **Neuro:** paresthesia, drowsiness, abnormal thinking, dizziness, euphoria, headache. **Resp:** asthma, dyspnea. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: **Probenecid** ↑ levels and the risk of adverse reactions; concurrent use is contraindicated. ↑ risk of bleeding when used with **pentoxifylline**; concurrent use is contraindicated. Concurrent use with **aspirin** may ↓ effectiveness. ↑ adverse GI effects with **aspirin**, other **NSAIDs**, **potassium supplements**, **corticosteroids**, or **alcohol**. May ↓ effectiveness of **diuretics** or **antihypertensives**. May ↑ serum **lithium** levels and ↑ risk of toxicity. ↑ risk of toxicity from **methotrexate**. ↑ risk of bleeding with **anticoagulants**, **aspirin**, **clopidogrel**, **ticagrelor**, **prasugrel**, **corticosteroids**, **fibrinolytics**, **SNRIs**, or **SSRIs**. ↑ risk of adverse hematologic reactions with **antineoplastics** or **radiation therapy**. May ↑ risk of nephrotoxicity from **cyclosporine**.
Drug-Natural Products: ↑ bleeding risk with **arnica**, **chamomile**, **clove**, **dong quai**, **feverfew**, **garlic**, **ginger**, **ginkgo**, **Panax ginseng**.

© F.A. Davis Publishing

Route/Dosage

Oral therapy is indicated only as a continuation of parenteral therapy. Total duration of therapy by all routes should not exceed 5 days.

PO (Adults <65 yr): 20 mg initially, followed by 10 mg every 4–6 hr (not to exceed 40 mg/day).

PO (Adults ≥65 yr, <50 kg, or with renal impairment): 10 mg every 4–6 hr (not to exceed 40 mg/day).

PO (Children 2–16 yr, <50 kg): 1 mg/kg as a single dose. No data available for multiple doses.

IM (Adults <65 yr): *Single dose*—60 mg. *Multiple dosing*—30 mg every 6 hr (not to exceed 120 mg/day).

IM (Adults ≥65 yr, <50 kg, or with renal impairment): *Single dose*—30 mg. *Multiple dosing*—15 mg every 6 hr (not to exceed 60 mg/day).

IM (Children 2–16 yr, <50 kg): *Single dose*—0.4–1 mg/kg (maximum: 30 mg/dose). *Multiple dosing*—0.5 mg/kg every 6 hr.

IV (Adults <65 yr): *Single dose*—30 mg. *Multiple dosing*—30 mg every 6 hr (not to exceed 120 mg/day).

IV (Adults ≥65 yr, <50 kg, or with renal impairment): *Single dose*—15 mg. *Multiple dosing*—15 mg every 6 hr (not to exceed 60 mg/day).

IV (Children 2–16 yr, <50 kg): *Single dose*—0.4–1 mg/kg (maximum: 15 mg/dose). *Multiple dosing*—0.5 mg/kg every 6 hr.

Intranasal (Adults <65 yr): 1 spray in each nostril every 6–8 hr (not to exceed 4 sprays in each nostril/day).

Intranasal (Adults ≥65 yr, <50 kg, or with renal impairment): 1 spray in only one nostril every 6–8 hr (not to exceed 4 sprays in one nostril/day).

Availability (generic available)

Tablets: 10 mg. **Nasal spray (Sprix):** 15.75 mg/spray in 1.7-g bottle (delivers 8 sprays). **Solution for injection:** 15 mg/mL, 30 mg/mL.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Monitor BP during initiation and periodically during therapy. May cause fluid retention and edema leading to new onset or worsening hypertension.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, facial swelling) periodically during therapy. Discontinue therapy if symptoms occur.
- **Pain:** Assess pain (note type, location, and intensity) prior to and 1–2 hr following administration.
- ***Lab Test Considerations:*** Evaluate liver function tests, especially AST and ALT, periodically in patients receiving prolonged therapy. May cause ↑ levels.
- May cause prolonged bleeding time that may persist for 24–48 hr following discontinuation of therapy.
- May cause ↑ BUN, serum creatinine, or potassium concentrations.

Implementation

- Do not confuse ketorolac with Ketalar (ketamine) or methadone.
- Administration in higher-than-recommended doses does not provide increased effectiveness but may cause increased side effects. Duration of ketorolac therapy, by all routes combined, should not exceed 5 days. Use lowest effective dose for shortest period of time to minimize risk of cardiovascular thrombotic events.
- Coadministration with opioid analgesics may have additive analgesic effects and may permit lower opioid doses.
- **PO:** Ketorolac therapy should always be given initially by the IM or IV route. Use oral therapy *only* as a continuation of parenteral therapy.

IV Administration

- **IV Push:** Administer undiluted. ***Concentration:*** 15–30 mg/mL. ***Rate:*** Administer over at least 15 sec.
- **Y-Site Compatibility:** alfentanil, amikacin, aminocaproic acid, aminophylline, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, ascorbic acid, atracurium, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, carboplatin, carmustine, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, ertapenem, etoposide, etoposide phosphate, famotidine, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ifosfamide, imipenem/cilastatin, indomethacin, insulin regular, irinotecan, isoproterenol, lactated Ringer's, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitoxantrone, mivacurium, morphine, moxifloxacin, multivitamins, nafcillin, naloxone, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin,

© F.A. Davis Publishing

oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, penicillin G, phenobarbital, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, propranolol, remifentanil, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, vasopressin, verapamil, vinblastine, vincristine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, alemtuzumab, amiodarone, azithromycin, calcium chloride, caspofungin, chlorpromazine, dacarbazine, dantrolene, daunorubicin hydrochloride, diazepam, diltiazem, diphenhydramine, dobutamine, doxycycline, epirubicin, erythromycin, esmolol, fenoldopam, ganciclovir, gemcitabine, gemtuzumab ozogamicin, haloperidol, hydroxyzine, idarubicin, labetalol, levofloxacin, midazolam, minocycline, mycophenolate, nalbuphine, nicardipine, pantoprazole, papaverine, pentamidine, phentolamine, phenytoin, prochlorperazine, promethazine, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vecuronium, vinorelbine.
- **Intranasal:** Activate pump before first use by holding bottle arm's length away with index finger and middle finger resting on top of finger flange and thumb supporting base. Press down evenly and release pump 5 times to activate. Prior to each use, blow nose gently to clear nostrils. Sit up straight or stand. Tilt head slightly forward. Insert tip of container into nostril. Point container away from center of nose. Push down to spray. Bottles are for 24 hr use; discard bottle no more than 24 hr after taking first dose, even if the bottle still contains some liquid.

Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication. Advise patient to read *Medication Guide* and *Instructions for Use* before starting and with each Rx refill in case of changes.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered if not almost time for next dose. Do not double doses. Do not take more than prescribed or for longer than 5 days.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Caution patient to avoid the concurrent use of alcohol, aspirin, NSAIDs, acetaminophen, or other OTC medications without consulting health care professional.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery.
- Advise patient to consult health care professional if rash, itching, visual disturbances, tinnitus, weight gain, edema, black stools, persistent headache, or influenza-like syndrome (chills, fever, muscle aches, pain) occurs.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise women to avoid ketorolac in the 3rd trimester of pregnancy (after 29 wk), may cause premature closure of the fetal ductus arteriosus. Use of ketorolac after 20 wk may cause fetal renal dysfunction leading to oligohydramnios. Avoid use of ketorolac in labor and delivery; may adversely affect fetal circulation and inhibit uterine contractions. The risk of uterine hemorrhage may be increased. May cause reversible infertility in women attempting to conceive; may consider discontinuing ketorolac.
- **Intranasal:** Instruct patient on correct technique for administration, need to open a new bottle every 24 hr, and the 5-day limit for use.

Evaluation/Desired Outcomes

- Decrease in severity of pain. Patients who do not respond to one NSAID may respond to another.

© F.A. Davis Publishing

© F.A. Davis Publishing

HIGH ALERT

labetalol (la-bet-a-lole)

Trandate

Classification

Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

Indications

Hypertension.

Action

Blocks stimulation of $beta_1$ (myocardial)- and $beta_2$ (pulmonary, vascular, and uterine)-adrenergic receptor sites. Also has $alpha_1$-adrenergic blocking activity, which may result in more orthostatic hypotension.
Therapeutic Effects: Decreased BP.

Pharmacokinetics

Absorption: Well absorbed but rapidly undergoes extensive first-pass hepatic metabolism, resulting in 25% bioavailability.
Distribution: Some CNS penetration; crosses the placenta.
Protein Binding: 50%.
Metabolism and Excretion: Undergoes extensive hepatic metabolism.
Half-life: 3–8 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO	20 min–2 hr	1–4 hr	8–12 hr
IV	2–5 min	5 min	16–18 hr

Contraindications/Precautions

Contraindicated in: Decompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia or heart block.
Use Cautiously in: Renal or hepatic impairment; Pulmonary disease (including asthma); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); OB: Recommended for treatment of chronic hypertension (PO) or hypertensive emergency in pregnancy (IV); may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Pedi: Safety and effectiveness not established in children; Geri: Older adults may have ↑ sensitivity (↑ risk of orthostatic hypotension); initial dosage ↓ recommended.

Adverse Reactions/Side Effects

CV: ARRHYTHMIAS, BRADYCARDIA, HF, orthostatic hypotension. **Derm:** itching, rash. **EENT:** blurred vision, dry eyes, intraoperative floppy iris syndrome, nasal stuffiness. **Endo:** hyperglycemia, hypoglycemia. **GI:** constipation, diarrhea, nausea. **GU:** erectile dysfunction, ↓ libido. **MS:** arthralgia, back pain, muscle cramps. **Neuro:** paresthesia, fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nightmares. **Resp:** PULMONARY EDEMA, bronchospasm, wheezing.

Interactions

Drug-Drug: General anesthesia and **verapamil** may cause additive myocardial depression. Additive bradycardia may occur with **digoxin**, **verapamil**, or **diltiazem**. Additive hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulin** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ the effectiveness of **adrenergic bronchodilators** and **theophylline**. May ↓ beneficial beta cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension). Effects may be ↑ by **propranolol** or **cimetidine**. Concurrent **NSAIDs** may ↓ antihypertensive action.

Route/Dosage

PO (Adults): 100 mg twice daily initially, may ↑ by 100 mg twice daily every 2–3 days as needed (usual range 400–800 mg/day in 2–3 divided doses; doses up to 1.2–2.4 g/day have been used).
IV (Adults): 20 mg (0.25 mg/kg) initially, additional doses of 40–80 mg may be given every 10 min as needed (not to exceed 300 mg total dose) *or* 2 mg/min infusion (range 50–300 mg total dose required).

Availability (generic available)

Tablets: 100 mg, 200 mg, 300 mg. **Premixed infusion:** 100 mg/100 mL NaCl, 200 mg/200 mL Dextrose, 200 mg/200 mL NaCl, 300 mg/300 mL NaCl. **Solution for injection:** 5 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor BP and pulse frequently during dose adjustment and periodically during therapy. Assess for orthostatic hypotension when assisting patient up from supine position.
- Check frequency of refills to determine compliance.
- Patients receiving *labetalol IV* must be supine during and for 3 hr after administration. Vital signs should be monitored every 5–15 min during and for several hrs after administration.
- Monitor intake and output ratios and daily weight. Assess patient routinely for evidence of fluid overload (peripheral edema, dyspnea, rales/crackles, fatigue, weight gain, jugular venous distention).
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.

© F.A. Davis Publishing

- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT levels. Discontinue if jaundice or laboratory signs of hepatic function impairment occur.
- ***Toxicity and Overdose:*** Monitor patients receiving beta blockers for signs of overdose (bradycardia, severe dizziness or fainting, severe drowsiness, dyspnea, bluish fingernails or palms, seizures). Notify health care professional immediately if these signs occur.
- Glucagon has been used to treat bradycardia and hypotension.

Implementation

- ***High Alert:*** Before administering intravenously, have second practitioner independently check original order, dosage calculations, and infusion pump settings.
- Do not confuse labetalol with Lamictal or lamotrigine.
- Discontinuation of concurrent clonidine should take place gradually, with beta blocker discontinued first. Then, after several days, discontinue clonidine.
- **PO:** Take apical pulse prior to administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer with meals or directly after eating to enhance absorption.

IV Administration

- **IV Push:** ***Dilution:*** Administer undiluted. ***Concentration:*** 5 mg/mL. ***Rate:*** Administer slowly over 2 min.
- **Continuous Infusion:** ***Dilution:*** Add 200 mg of labetalol to 160 mL of diluent. May also be administered as undiluted drug. Compatible diluents include D5W, 0.9% NaCl, D5/0.9% NaCl, and LR. ***Concentration:*** Diluted: 1 mg/mL; Undiluted: 5 mg/mL. ***Rate:*** Administer at a rate of 2 mg/min. Titrate for desired response. Infuse via infusion pump to ensure accurate dose.
- **Y-Site Compatibility:** acetaminophen, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, carboplatin, carmustine, caspofungin, ceftazidime, ceftolozane/tazobactam, chlorpromazine, ciprofloxacin, cisplatin, clonidine, cyanocobalamin, cyclophosphamide, cyclosporine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin lactobionate, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, fosphenytoin, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, irinotecan, isavuconazonium, isoproterenol, lactated Ringer's, leucovorin calcium, levofloxacin, levothyroxine, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, meropenem/vaborbactam, mesna, methylprednisolone sodium succinate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitoxantrone, morphine, multivitamins, mycophenolate, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, plazomicin, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, albumin, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, azathioprine, cangrelor, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftriaxone, cefuroxime, dantrolene, dexamethasone sodium phosphate, diazepam, diazoxide, foscarnet, gemtuzumab ozogamicin, hydrocortisone, ibuprofen, indomethacin, insulin, regular, ketorolac, micafungin, mitomycin, paclitaxel, pantoprazole, penicillin G, phenytoin, piperacillin/tazobactam, thiopental, warfarin.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Advise patient to make sure enough medication is available for weekends, holidays, and vacations. A written prescription may be kept in wallet in case of emergency.
- Teach patient and family how to check pulse and BP. Instruct them to check pulse daily and BP biweekly. Advise patient to hold dose and contact health care professional if pulse is <50 bpm or BP changes significantly.
- May cause drowsiness or dizziness. Caution patients to avoid driving or other activities that require alertness until response to the drug is known. Caution patients receiving labetalol IV to call for assistance during ambulation or transfer.

© F.A. Davis Publishing

- Advise patients to make position changes slowly to minimize orthostatic hypotension, especially during initiation of therapy or when dose is increased. Patients taking oral labetalol should be especially cautious when drinking alcohol, standing for long periods, or exercising, and during hot weather, because orthostatic hypotension is enhanced.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products, especially NSAIDs and cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of coffee, tea, and cola.
- Advise patients with diabetes to closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication may mask tachycardia and increased BP as signs of hypoglycemia, but dizziness and sweating may still occur.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Appropriate for treatment of chronic hypertension in pregnancy and breast feeding. Monitor fetal growth during pregnancy and the newborn should be monitored for 48 hr after delivery for bradycardia, hypoglycemia, and respiratory depression.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in BP.

lacosamide (la-kose-a-mide)

Vimpat

Classification

Therapeutic: anticonvulsants

Schedule V

Indications

Partial-onset seizures (as either monotherapy or adjunctive therapy). Primary generalized tonic-clonic seizures (as adjunctive therapy).

Action

Mechanism is not known, but may involve enhancement of slow inactivation of sodium channels with resultant membrane stabilization. **Therapeutic Effects:** Decreased incidence and severity of partial-onset seizures generalized tonic-clonic seizures.

Pharmacokinetics

Absorption: 100% absorbed following oral administration; IV administration results in complete bioavailability.

Distribution: Unknown.

Protein Binding: <15%.

Metabolism and Excretion: Partially metabolized by the liver; 40% excreted in urine as unchanged drug, 30% as a metabolite.

Half-life: 13 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–4 hr	12 hr
IV	unknown	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Severe hepatic impairment.

Use Cautiously in: CCr <30 mL/min (use lower daily dose); All patients (may ↑ risk of suicidal thoughts/behaviors); Hepatic or renal impairment and taking strong inhibitor of CYP3A4 or CYP2C9 (dose ↓ may be needed); Mild to moderate hepatic impairment (use lower daily dose); Known cardiac conduction problems (heart block or sick sinus syndrome without a pacemaker), severe cardiac disease (MI or HF), Brugada syndrome, or taking medications that affect cardiac conduction; Diabetic neuropathy or cardiac disease (↑ risk for atrial fibrillation/flutter); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <4 yr (safety and effectiveness not established); Geri: Titrate dose carefully in older adults.

Adverse Reactions/Side Effects

CV: VENTRICULAR ARRHYTHMIAS, atrial fibrillation/flutter, bradycardia, heart block, syncope. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, rash. **EENT:** diplopia. **GI:** nausea, vomiting. **Hemat:** AGRANULOCYTOSIS. **Neuro:** ataxia, SUI-

© F.A. Davis Publishing

CIDAL THOUGHTS, dizziness, headache, hallucinations, syncope, vertigo. **Misc:** physical dependence, psychological dependence.

Interactions

Drug-Drug: Use cautiously with other drugs that affect cardiac conduction, including **sodium channel blockers**, **beta blockers**, **diltiazem**, **verapamil**, **potassium channel blockers**, and **PR-interval prolonging medications**.

Route/Dosage

Partial-Onset Seizures

PO, IV (Adults): *Monotherapy* — 100 mg twice daily; may ↑ weekly by 100 mg/day in 2 divided doses up to a maintenance dose of 150–200 mg twice daily; may also initiate therapy with 200-mg single loading dose followed 12 hr later by 100 mg twice daily; may ↑ weekly by 100 mg/day in 2 divided doses up to a maintenance dose of 150–200 mg twice daily; *Adjunctive therapy* — 50 mg twice daily; may ↑ weekly by 100 mg/day in 2 divided doses up to a maintenance dose of 100–200 mg twice daily; may also initiate therapy with 200-mg single loading dose followed 12 hr later by 100 mg twice daily; may ↑ weekly by 100 mg/day in 2 divided doses up to a maintenance dose of 100–200 mg twice daily.

PO, IV (Children ≥4 yr and ≥50 kg): *Monotherapy* — 50 mg twice daily; may ↑ weekly by 100 mg/day in 2 divided doses up to a maintenance dose of 150–200 mg twice daily; *Adjunctive therapy* — 50 mg twice daily; may ↑ weekly by 100 mg/day in 2 divided doses up to a maintenance dose of 100–200 mg twice daily.

PO, IV (Children ≥4 yr and 30–<50 kg): *Monotherapy or adjunctive therapy* — 1 mg/kg twice daily; may ↑ weekly by 2 mg/kg/day in 2 divided doses up to a maintenance dose of 2–4 mg/kg twice daily.

PO, IV (Children ≥4 yr and 11–<30 kg): *Monotherapy or adjunctive therapy* — 1 mg/kg twice daily; may ↑ weekly by 2 mg/kg/day in 2 divided doses up to a maintenance dose of 3–6 mg/kg twice daily.

Hepatic/Renal Impairment

PO, IV (Adults): *CCr ≤30 mL/min or mild to moderate hepatic impairment* — ↓ dose to 75% of the maximum dose.

Primary Generalized Tonic-Clonic Seizures

PO, IV (Adults): *Adjunctive therapy* — 50 mg twice daily; may ↑ weekly by 100 mg/day in 2 divided doses up to a maintenance dose of 100–200 mg twice daily; may also initiate therapy with 200-mg single loading dose followed 12 hr later by 100 mg twice daily; may ↑ weekly by 100 mg/day in 2 divided doses up to a maintenance dose of 100–200 mg twice daily.

PO, IV (Children ≥4 yr and ≥50 kg): *Adjunctive therapy* — 50 mg twice daily; may ↑ weekly by 100 mg/day in 2 divided doses up to a maintenance dose of 100–200 mg twice daily.

PO, IV (Children ≥4 yr and 30–<50 kg): *Adjunctive therapy* — 1 mg/kg twice daily; may ↑ weekly by 2 mg/kg/day in 2 divided doses up to a maintenance dose of 2–4 mg/kg twice daily.

PO, IV (Children ≥4 yr and 11–<30 kg): *Adjunctive therapy* — 1 mg/kg twice daily; may ↑ weekly by 2 mg/kg/day in 2 divided doses up to a maintenance dose of 3–6 mg/kg twice daily.

Hepatic/Renal Impairment

PO, IV (Adults): *CCr ≤30 mL/min or mild to moderate hepatic impairment* — ↓ dose to 75% of the maximum dose.

Availability (generic available)

Oral solution: 10 mg/mL. **Solution for injection:** 10 mg/mL. **Tablets:** 50 mg, 100 mg, 150 mg, 200 mg.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity. Institute seizure precautions.
- Monitor closely for changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess patient for skin rash frequently during therapy. Discontinue at first sign of rash; may be life-threatening. Stevens-Johnson syndrome may develop. Treat symptomatically; may recur once treatment is stopped.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- **IV:** Assess ECG prior to therapy in patients with pre-existing cardiac disease before starting after titration to steady-state maintenance. Monitor patients with cardiac conduction problems, on medications that prolong PR interval, or with severe cardiac disease (myocardial ischemia, heart failure) closely, as IV lacosamide may cause bradycardia or AV block.
- ***Lab Test Considerations:*** May cause ↑ ALT, which may return to normal without treatment.
- Monitor CBC and platelets periodically during therapy.

Implementation

- Do not confuse Vimpat (lacosamide) with Venofer (iron sucrose) or Vfend (voriconazole).
- IV administration is indicated for short term replacement (up to 5 days) when PO administration is not feasible. When switching from PO to IV, initial total daily dose should be equivalent to total daily dose and frequency of PO therapy. At end of IV period, may switch to PO at equivalent daily dose and frequency of IV therapy.
- When switching from another antiepileptic drug to lacosamide, administer 150 mg–200 mg twice daily

© F.A. Davis Publishing

for at least 3 days before beginning withdrawal of other antiepileptic drug. Gradually decrease other antiepileptic drug over 6 wk.
- When administering loading dose, monitor for CNS adverse reactions (dizziness, headache, nausea, somnolence, fatigue). May occur more frequently.
- When discontinuing lacosamide, gradually decrease dose over 1 wk.
- **PO:** May be administered with or without food. ***DNC:*** Swallow tablets whole with liquid; do not crush, break, or chew.
- Use a calibrated measuring device for accurate dosing of oral solution; household measures are not accurate. Discard any unused solution 7 wk after opening bottle.
- Oral solution may also be given via nasogastric tube or gastrostomy tube.

IV Administration
- **Intermittent Infusion:** ***Dilution:*** May be administered undiluted or diluted with 0.9% NaCl, D5W, or LR. ***Concentration:*** 10 mg/mL. Solution is clear and colorless; do not administer solutions that are cloudy, discolored or contain a precipitate. Solution is stable for 4 hr at room temperature. Discard unused portion. ***Rate:*** Infuse over 15–60 min, preferably 30–60 min. Do not infuse over less than 30 min in children.

Patient/Family Teaching
- Instruct patient to take lacosamide around the clock, as directed. Medication should be gradually discontinued over at least 1 wk to prevent seizures. Advise patient to read the *Medication Guide* before starting therapy and with each Rx refill.
- May cause dizziness, ataxia, and syncope. Caution patient to avoid driving or other activities requiring alertness until response to medication is known. Tell patient not to resume driving until physician gives clearance based on control of seizure disorder. If syncope occurs, advise patient to lay down with legs raised until recovered and notify health care professional.
- Inform patients and families of risk of suicidal thoughts and behavior and advise that behavioral changes, emergency or worsening signs and symptoms of depression, unusual changes in mood, or emergence of suicidal thoughts, behavior, or thoughts of self-harm, rash, or signs and symptoms of DRESS should be reported to health care professional immediately.
- Instruct patient to notify health care professional if signs of multiorgan hypersensitivity reactions (fever, rash, fatigue, jaundice, dark urine) occur.
- Advise patient to consult health care professional before taking other Rx, OTC, or herbal preparation and to avoid taking alcohol or other CNS depressants concurrently with lacosamide.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage pregnant patients to enroll in the North American Antiepileptic Drug (NAAED) pregnancy registry by calling 1-888-233–2334, call must be made by patient. Information on registry can be found at the website http://www.aedpregnancyregistry.org/.

Evaluation/Desired Outcomes
- Decreased seizure activity.

lactic acid/citric acid/potassium bitartrate
(**lak**-tik **as**-id/**sit**-rik **as**-id/poe-**tas**-ee-um bye-**tar**-trate)
Phexxi

Classification
Therapeutic: contraceptive nonhormonals

L

Indications
Rep: Prevention of pregnancy in women of reproductive potential as an on-demand form of contraception.

Action
Lowers the pH in the vagina which subsequently reduces sperm motility. **Therapeutic Effects:** Prevention of pregnancy.

Pharmacokinetics
Absorption: Systemic absorption not expected following vaginal administration.
Distribution: Systemic absorption not expected following vaginal administration.
Metabolism and Excretion: Unknown.
Half-life: Unknown.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Vag	unknown	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Pregnancy; Rep: History of recurrent UTI or urinary tract abnormalities.
Use Cautiously in: Lactation: Safety not established in breast feeding.

Adverse Reactions/Side Effects
GU: vulvovaginal burning, vulvovaginal pruritus, bacterial vaginosis, cystitis, dysuria, genital discomfort, pyelonephritis, urinary tract infection, vagina discharge, vulvovaginal candidiasis, vulvovaginal pain. **Misc:** hypersensitivity reactions.

© F.A. Davis Publishing

Interactions
Drug-Drug: Avoid use with **vaginal rings**.

Route/Dosage
Vag (Adults and Children [females of reproductive potential]): One prefilled applicator (5 g) immediately before or up to 1 hr before each act of vaginal intercourse. If ≥1 act of vaginal intercourse occurs within 1 hr, must insert another prefilled applicator.

Availability
Vaginal gel: lactic acid 90 mg/citric acid 50 mg/potassium bitartrate 20 mg in each 5–g prefilled applicator.

NURSING IMPLICATIONS
Assessment
- Assess patient for history of recurrent urinary tract infections or urinary tract abnormalities. May cause cystitis and pyelonephritis.

Implementation
- **Vag:** Administer one pre-filled applicator vaginally immediately before or up to 1 hr before each act of vaginal intercourse. If >1 act of vaginal intercourse occurs within 1 hr, apply an additional dose.

Patient/Family Teaching
- Instruct patient in correct timing and technique for vaginal administration **before** vaginal sex. May be used during any part of menstrual cycle and as soon as it is safe to resume vaginal intercourse after childbirth, abortion, or miscarriage. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- Advise patient that *Phexxi* is not effective at preventing pregnancy when used **after** vaginal sex.
- Inform patient that *Phexxi* may be used with hormonal contraceptives; latex, polyurethane, and polyisoprene condoms; and vaginal diaphragms. Avoid use with vaginal rings. May also be used concomitantly with other products for vaginal infections (miconazole, metronidazole, tioconazole).
- Advise patient to notify health care professional if severe or prolonged genital irritation or symptoms of urinary tract infection (burning feeling when passing urine, cloudy urine, pain in the pelvis, back pain) occur. May also cause burning, itching, and pain in male partner.
- Inform patient that *Phexxi* does not protect against HIV or other sexually transmitted infections.
- Advise parents to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. There is no use for *Phexxi* in pregnancy; discontinue use.

Evaluation/Desired Outcomes
- Prevention of pregnancy.

lactulose (lak-tyoo-lose)
Cholac, Constilac, Generlac, Kristalose

Classification
Therapeutic: laxatives
Pharmacologic: osmotics

Indications
Treatment of chronic constipation. Adjunct in the management of portal-systemic (hepatic) encephalopathy (PSE).

Action
Increases water content and softens the stool. Lowers the pH of the colon, which inhibits the diffusion of ammonia from the colon into the blood, thereby reducing blood ammonia levels. **Therapeutic Effects:** Relief of constipation. Decreased blood ammonia levels with improved mental status in PSE.

Pharmacokinetics
Absorption: Less than 3% absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Absorbed lactulose is excreted unchanged in the urine. Unabsorbed lactulose is metabolized by colonic bacteria to lactic, acetic, and formic acids.
Half-life: Unknown.

TIME/ACTION PROFILE (relief of constipation)

ROUTE	ONSET	PEAK	DURATION
PO	24–48 hr	unknown	unknown

Contraindications/Precautions
Contraindicated in: Patients on low-galactose diets.
Use Cautiously in: Diabetes mellitus; Excessive or prolonged use (may lead to dependence); Lactation: Safety not established in breast feeding.

Adverse Reactions/Side Effects
GI: belching, cramps, distention, flatulence, diarrhea.
Endo: hyperglycemia (diabetic patients).

Interactions
Drug-Drug: Should not be used with other **laxatives** in the treatment of hepatic encephalopathy (leads to inability to determine optimal dose of lactulose). **Antiinfectives** may ↓ effectiveness in treatment of hepatic encephalopathy.

Route/Dosage
Constipation
PO (Adults): 15–30 mL/day up to 60 mL/day as liquid or 10–20 g as powder for oral solution (up to 40 g/day has been used).
PO (Children): 7.5 mL once daily after breakfast (unlabeled).

© F.A. Davis Publishing

PSE

PO (Adults): 30–45 mL 3–4 times/day; may be given every 1–2 hr initially to induce laxation.
PO (Infants): 2.5–10 mL/day in 3–4 divided doses (unlabeled).
PO (Children and Adolescents): 40–90 mL/day in 3–4 divided doses (unlabeled).
Rect (Adults): 300 mL diluted and administered as a retention enema every 4–6 hr.

Availability (generic available)

Oral solution: 10 g lactulose/15 mL. **Rectal solution:** 10 g lactulose/15 mL. **Single-use packets (Kristalose):** 10 g (equal to 15 mL liquid lactulose), 20 g (equal to 30 mL liquid lactulose).

NURSING IMPLICATIONS

Assessment

- Assess patient for abdominal distention, presence of bowel sounds, and normal pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- **PSE:** Assess mental status (orientation, level of consciousness) before and periodically throughout course of therapy.
- ***Lab Test Considerations:*** ↓ blood ammonia concentrations by 25–50%.
- May cause ↑ blood glucose levels in diabetic patients.
- Monitor serum electrolytes periodically when used chronically. May cause diarrhea with resulting hypokalemia and hypernatremia.

Implementation

- When used in hepatic encephalopathy, adjust dose until patient averages 2–3 soft bowel movements per day. During initial therapy, 30–45 mL may be given hourly to induce rapid laxation.
- Darkening of solution does not alter potency.
- **PO:** Mix with fruit juice, water, milk, or carbonated citrus beverage to improve flavor. Administer with a full glass (240 mL) of water or juice. May be administered on an empty stomach for more rapid results.
- Dissolve single dose packets (Kristalose) in 4 oz of water. Solution should be colorless to slightly pale yellow.
- **Rect:** To administer enema, use rectal balloon catheter. Mix 300 mL of lactulose with 700 mL of water or 0.9% NaCl. Enema should be retained for 30–60 min. If inadvertently evacuated, may repeat administration.

Patient/Family Teaching

- Explain purpose of lactulose to patient. Instruct patient to take lactulose as directed.
- Encourage patients to use other forms of bowel regulation, such as increasing bulk in the diet, increasing fluid intake, and increasing mobility. Normal bowel habits are individualized and may vary from 3 times/day to 3 times/wk.
- Caution patients that this medication may cause belching, flatulence, or abdominal cramping. Health care professional should be notified if this becomes bothersome or if diarrhea occurs.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Passage of a soft, formed bowel movement, usually within 24–48 hr.
- Clearing of confusion, apathy, and irritation, and improved mental status in PSE. Improvement may occur within 2 hr after enema and 24–48 hr after oral administration.

L

lamiVUDine (la-mi-vyoo-deen)

3TC, Epivir, Epivir-HBV, Heptovir

Classification

Therapeutic: antiretrovirals, antivirals
Pharmacologic: nucleoside reverse transcriptase inhibitors

Indications

HIV infection (with other antiretrovirals). Chronic hepatitis B infection. **Unlabeled Use:** Part of HIV-postexposure prophylaxis with zidovudine and indinavir.

Action

After intracellular conversion to its active form (lamivudine-5-triphosphate), inhibits viral DNA synthesis by inhibiting the enzyme reverse transcriptase. **Therapeutic Effects:** Slows the progression of HIV infection and decreases the occurrence of its sequelae. Increases CD4 cell counts and decreases viral load. Protection from liver damage caused by chronic hepatitis B infection; decreases viral load.

Pharmacokinetics

Absorption: Well absorbed after oral administration (86% in adults, 66% in infants and children).
Distribution: Distributes into the extravascular space. Some penetration into CSF; remainder of distribution unknown.
Metabolism and Excretion: Mostly excreted unchanged in urine; <5% metabolized by the liver.
Half-life: *Adults*—3.7 hr; *children*—2 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	0.9 hr†	12 hr

†On an empty stomach; peak levels occur at 3.2 hr if lamivudine is taken with food. Food does not affect total amount of drug absorbed.

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of antiretroviral combination products containing lamivudine or emtricitabine; Lactation: Breast feeding not recommended for HIV positive mothers.

Use Cautiously in: Impaired renal function (↑ dosing interval/↓ dose if CCr <50 mL/min); Women and obesity (↑ risk of lactic acidosis and severe hepatomegaly with steatosis); Coinfection with hepatitis B (hepatitis may recur after discontinuation of lamivudine; Epivir HBV is not indicated for treatment of HIV because lamivudine dosage is subtherapeutic); OB, Pedi: Pregnancy or children <3 mo (safety not established); Geri: ↓ dose may be necessary due to age-related ↓ in renal function.

Exercise Extreme Caution in: Pedi: Pediatric patients with a history of or significant risk factors for pancreatitis (use only if no alternative).

Adverse Reactions/Side Effects

Noted for combination of lamivudine plus zidovudine. **Derm:** alopecia, erythema multiforme, rash, urticaria. **Endo:** hyperglycemia. **F and E:** lactic acidosis. **GI:** HEPATOMEGALY WITH STEATOSIS, PANCREATITIS (↑ in pediatric patients), anorexia, diarrhea, nausea, vomiting, abdominal discomfort, ↑ liver enzymes, dyspepsia. **Hemat:** anemia, neutropenia, pure red cell aplasia. **MS:** musculoskeletal pain, arthralgia, muscle weakness, myalgia, rhabdomyolysis. **Neuro:** neuropathy, SEIZURES, fatigue, headache, insomnia, malaise, depression, dizziness. **Resp:** cough. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), immune reconstitution syndrome.

Interactions

Drug-Drug: Trimethoprim/sulfamethoxazole may ↑ levels (dose alteration may be necessary in renal impairment). ↑ risk of pancreatitis with concurrent use of other **drugs causing pancreatitis**. ↑ risk of neuropathy with concurrent use of other **drugs causing neuropathy**. Combination therapy with **tenofovir** and **abacavir** may lead to virologic nonresponse and should not be used. **Sorbitol** may ↓ levels; avoid concurrent use.

Route/Dosage

HIV infection

PO (Adults): 150 mg twice daily or 300 mg once daily.
PO (Children ≥3 mo): *Oral solution*— 5 mg/kg twice daily or 10 mg/kg once daily (max dose = 300 mg/day); *Tablets*— 14–19 kg: 75 mg twice daily or 150 mg once daily; 20–24 kg: 75 mg in AM, 150 mg in PM or 225 mg once daily; ≥25 kg: 150 mg twice daily or 300 mg once daily.

Renal Impairment

(Adults and Children ≥25 kg): *CCr 30–49 mL/min*— 150 mg once daily; *CCr 15–29 mL/min*— 150 mg initially, then 100 mg once daily; *CCr 5–14 mL/min*— 150 mg initially, then 50 mg once daily; *CCr <5 mL/min*— 50 mg initially, then 25 mg once daily.

Chronic Hepatitis B

PO (Adults): 100 mg once daily.

Renal Impairment

PO (Adults): *CCr 30–49 mL/min*— 100 mg first dose, then 50 mg once daily; *CCr 15–29 mL/min*— 100 mg first dose, then 25 mg once daily; *CCr 5–14 mL/min*— 35 mg first dose, then 15 mg once daily; *CCr <5 mL/min*— 35 mg first dose, then 10 mg once daily.
PO (Children 2–17 yr): 3 mg/kg once daily (up to 100 mg/day).

Availability (generic available)

Epivir

Oral solution (strawberry-banana flavor): 10 mg/mL. **Tablets:** 150 mg, 300 mg. ***In combination with:*** abacavir (Epzicom); abacavir and dolutegravir (Triumeq); efavirenz and tenofovir disoproxil fumarate (Symfi); lamivudine (Dovato); tenofovir disoproxil fumarate (Cimduo, Temixys); zidovudine (Combivir); zidovudine and abacavir (Trizivir). See Appendix N.

Epivir-HBV

Oral solution (strawberry-banana flavor): 5 mg/mL. **Tablets:** 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient, especially pediatric patients, for signs of pancreatitis (nausea, vomiting, abdominal pain) periodically during therapy. May require discontinuation of therapy.
- **HIV:** Assess patient for change in severity of symptoms of HIV infection and for symptoms of opportunistic infection during therapy.
- Monitor patient for signs and symptoms of peripheral neuropathy (tingling, burning, numbness, or pain in hands or feet); may be difficult to differentiate from peripheral neuropathy of severe HIV disease. May require discontinuation of therapy.
- **Chronic Hepatitis B Infection:** Monitor signs of hepatitis (jaundice, fatigue, anorexia, pruritus) during therapy.
- ***Lab Test Considerations:*** Monitor viral load and CD4 levels before and periodically during therapy.
- Monitor serum amylase, lipase, and triglycerides periodically during therapy. Elevated serum levels may indicate pancreatitis and require discontinuation.
- Monitor liver function. May cause ↑ levels of AST, ALT, CPK, bilirubin, and alkaline phosphatase, which usually resolve after interruption of therapy. Lactic acidosis may occur with hepatic toxicity causing hepatic steatosis; may be fatal, especially in women.
- May rarely cause neutropenia and anemia.

Implementation

- Do not confuse lamivudine with lamotrigine. Do not confuse Epivir tablets and oral solution with Epivir-HBV tablets and oral solutions. Epivir Tablets and

© F.A. Davis Publishing

Oral Solution contain a higher dose of the same active ingredient (lamivudine) as Epivir-HBV Tablets and Oral Solution. Epivir-HBV was developed for patients with hepatitis B; do not use for patients dually infected with HIV and hepatitis B; use may lead to lamivudine-resistant HIV due to subtherapeutic dose.

- **PO:** May be administered without regard to food.
- Epivir scored tablet is preferred for HIV-1-infected pediatric patients weighing at least 14 kg and able to swallow pill; solution is associated with higher resistance rates. Before prescribing, assess for ability to swallow tablets. For patients unable to safely and reliably swallow tablets, oral solution may be used.

Patient/Family Teaching

- Instruct patient to take lamivudine as directed, every 12 hr. Explain the difference between Epivir and Epivir-HBV to patients. Emphasize the importance of compliance with full course of therapy, not taking more than the prescribed amount, and not discontinuing without consulting health care professional; discontinuation may lead to deterioration of liver disease. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Caution patient not to share medication with others. Advise patient to read *Patient Information* before starting and with each Rx refill in case of changes.
- Inform patient that lamivudine does not cure HIV disease or prevent associated or opportunistic infections. Lamivudine does not reduce the risk of transmission of HIV to others through sexual contact or blood contamination. Caution patient to use a condom during sexual contact and avoid sharing needles or donating blood to prevent spreading HIV to others. Advise patient that the long-term effects of lamivudine are unknown at this time.
- Instruct patient to notify health care professional promptly if signs of peripheral neuropathy, pancreatitis, lactic acidosis (feel very weak or tired; feel cold, especially in arms and legs; unusual muscle pain; feel dizzy or light-headed; trouble breathing; fast or irregular heartbeat; stomach pain with nausea and vomiting), liver problems (yellowing of skin or white part of eyes; loss of appetite; nausea; dark or "tea-colored" urine; pain, aching, or tenderness on right side of abdomen; light-colored stools) or Immune Reconstitution Syndrome (signs and symptoms of an infection, Mycobacterium avium infection, cytomegalovirus, Pneumocystis jirovecii pneumonia, tuberculosis) occur.
- Inform patient that redistribution and accumulation of body fat may occur, causing central obesity, dorsocervical fat enlargement (buffalo hump), peripheral wasting, breast enlargement, and cushingoid appearance. The cause and long-term effects are not known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking other Rx, OTC, or herbal products.
- Rep: Instruct females using hormonal contraceptives to use an alternative nonhormonal method of contraception. Advise patient to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding. If pregnant patient is exposed to lamivudine, register patient in *Antiretroviral Pregnancy Registry* by calling 1-800-258-4263.
- Emphasize the importance of regular follow-up exams and blood tests to determine progress and monitor for side effects.

Evaluation/Desired Outcomes

- Slowing of the progression of HIV infection and its sequelae.
- Decrease in viral load and improvement in CD4 levels in patients with advanced HIV infection.
- Protection from liver damage caused by chronic hepatitis B infection; decreases viral load.

L

lamoTRIgine (la-**moe**-tri-jeen)

LaMICtal, LaMICtal ODT, LaMICtal XR

Classification

Therapeutic: anticonvulsants

Indications

Adjunct treatment of partial seizures in adults and children with epilepsy (immediate-release, extended-release, chewable, and orally disintegrating tablets). Lennox-Gastaut syndrome (immediate-release, chewable, and orally disintegrating tablets only). Adjunct treatment of primary generalized tonic-clonic seizures in adults and children (immediate-release, extended-release, chewable, and orally disintegrating tablets). Conversion to monotherapy in adults with partial seizures receiving carbamazepine, phenytoin, phenobarbital, primidone, or valproate as the single antiepileptic drug (immediate-release, extended-release, chewable, and orally disintegrating tablets only). Maintenance treatment of bipolar disorder (immediate-release, chewable, and orally disintegrating tablets only).

Action

Stabilizes neuronal membranes by inhibiting sodium transport. **Therapeutic Effects:** Decreased incidence of seizures. Delayed time to recurrence of mood episodes in bipolar disorder.

Pharmacokinetics

Absorption: 98% absorbed following oral administration.

© F.A. Davis Publishing

Distribution: Enters breast milk. Highly bound to melanin-containing tissues (eyes, pigmented skin).
Metabolism and Excretion: Mostly metabolized by the liver via glucuronidation to inactive metabolites; 10% excreted unchanged by the kidneys.
Half-life: Children taking enzyme–inducing anticonvulsants: 7–10 hr; Children taking enzyme inducers and valproic acid: 15–27 hr; Children taking valproic acid: 44–94 hr; Adults: 25.4 hr (during chronic therapy of lamotrigine alone).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.4–4.8 hr; 4–10 hr (XR)	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute manic or mixed episodes; Second- or third-degree heart block, ventricular arrhythmias, ischemic heart disease, HF, valvular heart disease, congenital heart disease, or Brugada syndrome.
Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment or hepatic impairment (lower maintenance doses may be required); Prior history of rash to lamotrigine; OB: Exposure during first trimester may ↑ risk of cleft lip/palate; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Immediate-release, chewable, and orally disintegrating tablets not safe for children <2 yr; extended-release tablets not approved for use in children <13 yr.

Adverse Reactions/Side Effects

CV: CARDIAC ARREST, arrhythmias, bradycardia, heart block, QRS interval prolongation. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, photosensitivity, rash (higher incidence in children, patients taking valproic acid, high initial doses, or rapid dose increases). **EENT:** blurred vision, double vision, rhinitis. **GI:** HEPATIC FAILURE, nausea, vomiting. **GU:** vaginitis. **Hemat:** HEMOPHAGOCYTIC LYMPHOHISTIOCYTOSIS. **MS:** arthralgia. **Neuro:** ASEPTIC MENINGITIS, SUICIDAL THOUGHTS, ataxia, dizziness, headache, behavior changes, depression, drowsiness, insomnia, tremor.

Interactions

Drug-Drug: Concurrent use with **carbamazepine** may ↑ levels of an active metabolite of carbamazepine. Concurrent use with drugs that induce glucuronidation, including **phenobarbital**, **phenytoin**, **primidone**, **carbamazepine**, **estrogen-containing oral contraceptives**, **rifampin**, **lopinavir/ritonavir**, or **atazanavir/ritonavir** may ↓ levels; lamotrigine dose adjustments may be necessary when starting and stopping oral contraceptive or atazanavir/ritonavir therapy. Concurrent use with drugs that inhibit glucuronidation, including **valproic acid**, may ↑ levels and ↑ incidence of rash; may also ↓ valproic acid levels (↓ lamotrigine dose by at least 50%). **Amiodarone**, **disopyramide**, **dronedarone**, **flecainide**, **lidocaine**, **mexiletine**, **procainamide**, **propafenone**, or **quinidine** may ↑ risk of proarrhythmia; avoid concurrent use.

Route/Dosage

Epilepsy

In Combination with Other Antiepileptic Agents

PO (Adults and Children >12 yr; Immediate-release, chewable, or orally disintegrating tablets): *Patients taking anticonvulsant drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate*—25 mg once daily for first 2 wk, then 50 mg once daily for next 2 wk; then ↑ by 50 mg/day every 1–2 wk to maintenance dose of 225–375 mg/day (in 2 divided doses); *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)*—50 mg once daily for first 2 wk, then 50 mg twice daily for next 2 wk; then ↑ by 100 mg/day every 1–2 wk to maintenance dose of 300–500 mg/day (in 2 divided doses); *Patients taking regimen containing valproate*—25 mg every other day for first 2 wk, then 25 mg once daily for next 2 wk; then ↑ by 25–50 mg/day every 1–2 wk to maintenance dose of 100–400 mg/day (in 1–2 divided doses) (maintenance dose of 100–200 mg/day if receiving valproate alone).
PO (Adults and Children ≥13 yr; Extended-release tablets): *Patients taking anticonvulsant drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate*—25 mg once daily for first 2 wk, then 50 mg once daily for next 2 wk; then 100 mg once daily for 1 wk, then 150 mg once daily for 1 wk, then 200 mg once daily for 1 wk, then ↑ by 100 mg/day every wk to maintenance dose of 300–400 mg once daily; *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)*—50 mg once daily for first 2 wk, then 100 mg once daily for next 2 wk, then 200 mg once daily for 1 wk, then 300 mg once daily for 1 wk, then 400 mg once daily for 1 wk, then ↑ by 100 mg/day every wk to maintenance dose of 400–600 mg once daily; *Patients taking regimen containing valproate*—25 mg every other day for first 2 wk, then 25 mg once daily for next 2 wk, then 50 mg once daily for 1 wk, then 100 mg once daily for 1 wk, then 150 mg once daily for 1 wk, then maintenance dose of 200–250 mg once daily.
PO (Children 2–12 yr; Immediate-release, chewable, or orally disintegrating tablets): *Patients taking anticonvulsant drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate*—0.3 mg/kg/day in 1–2 divided doses (rounded down to nearest whole tablet) for first 2 wk, then 0.6 mg/kg/day in 2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then ↑ by 0.6 mg/kg/day (rounded down to nearest whole tablet) every 1–2 wk to maintenance dose of 4.5–7.5 mg/kg/

© F.A. Davis Publishing

day (not to exceed 300 mg/day in 2 divided doses); *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)* — 0.6 mg/kg/day in 2 divided doses (rounded down to nearest whole tablet) for first 2 wk, then 1.2 mg/kg/day in 2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then ↑ by 1.2 mg/kg/day (rounded down to nearest whole tablet) every 1–2 wk to maintenance dose of 5–15 mg/kg/day (not to exceed 400 mg/day in 2 divided doses). *Patients taking regimen containing valproate* — 0.15 mg/kg/day in 1–2 divided doses (rounded down to nearest whole tablet) for first 2 wk, then 0.3 mg/kg in 1–2 divided doses (rounded down to nearest whole tablet) for next 2 wk; then ↑ by 0.3 mg/kg/day (rounded down to nearest whole tablet) every 1–2 wk to maintenance dose of 1–5 mg/kg/day (not to exceed 200 mg/day in 1–2 divided doses) (maintenance dose of 1–3 mg/kg/day if receiving valproate alone).

Conversion to Monotherapy

PO (Adults and Children ≥16 yr; Immediate-release, chewable, or orally disintegrating tablets): *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)* — After achieving a dose of 500 mg/day (as per dosing guidelines above), ↓ dose of other antiepileptic by 20% weekly over 4 wk; *Patients taking regimen containing valproate* — After achieving a dose of 200 mg/day (as per dosing guidelines above), ↓ valproate dose by 500 mg/day on a weekly basis until a dose of 500 mg/day is achieved. Maintain the valproate dose of 500 mg/day and the lamotrigine dose of 500 mg/day for 1 wk. Then ↑ lamotrigine dose to 300 mg/day and ↓ valproate dose to 250 mg/day, and maintain these doses for 1 wk. Then discontinue valproate and ↑ lamotrigine dose by 100 mg/day every wk until maintenance dose of 500 mg/day is achieved.

PO (Adults and Children ≥13 yr; Extended-release tablets): *Patients taking carbamazepine, phenobarbital, phenytoin, or primidone (and not valproate)* — After achieving a dose of 500 mg/day (as per dosing guidelines above), ↓ dose of other antiepileptic by 20% weekly over 4 wk. Two wk later, ↓ dose of lamotrigine by 100 mg/day every wk to achieve maintenance dose of 250–300 mg/day; *Patients taking regimen containing valproate* — After achieving a dose of 150 mg/day (as per dosing guidelines above), ↓ valproate dose by 500 mg/day on a weekly basis until a dose of 500 mg/day is achieved. Maintain the valproate dose of 500 mg/day and the lamotrigine dose of 150 mg/day for 1 wk. Then ↑ lamotrigine dose to 200 mg/day and ↓ valproate dose to 250 mg/day, and maintain these doses for 1 wk. Then discontinue valproate and ↑ lamotrigine dose to 250–300 mg/day; *Patients taking anticonvulsant drugs other than carbamazepine, phenobarbital, phenytoin, primidone, or valproate* — After achieving a dose of 250–300 mg/day (as per dosing guidelines above), ↓ dose of other antiepileptic by 20% weekly over 4 wk.

Bipolar Disorder

Escalation Regimen

PO (Adults): *Patients not taking carbamazepine, phenobarbital, phenytoin, primidone, rifampin, or valproate* — 25 mg once daily for first 2 wk, then 50 mg once daily for next 2 wk, then 100 mg once daily for 1 wk, then 200 mg once daily; *Patients taking valproate* — 25 mg every other day for first 2 wk, then 25 mg once daily for next 2 wk, then 50 mg once daily for 1 wk, then 100 mg once daily; *Patients taking carbamazepine, phenobarbital, phenytoin, primidone, or rifampin (and not valproate)* 50 mg once daily for first 2 wk, then 100 mg/day (in divided doses) for next 2 wk, then 200 mg/day (in divided doses) for one wk, then 300 mg/day (in divided doses) for 1 wk, then up to 400 mg/day (in divided doses).

Dosage Adjustment Following Discontinuation of Other Psychotropics

PO (Adults): *Following discontinuation of valproate (if current dose 100 mg/day)* — ↑ to 150 mg/day for 1 wk, then 200 mg/day; *Following discontinuation of carbamazepine, phenobarbital, phenytoin, primidone, or rifampin (if current dose 400 mg/day)* — 400 mg/day for 1 wk, then 300 mg/day for 1 wk, then 200 mg/day; *Following discontinuation of other psychotropics* — maintain previous dose.

Availability (generic available)

Immediate-release tablets: 25 mg, 100 mg, 150 mg, 200 mg. **Cost:** *Generic* — 25 mg $415.96/100, 100 mg $475.12/100, 150 mg $312.44/100, 200 mg $340.15/100. **Extended-release tablets:** 25 mg, 50 mg, 100 mg, 200 mg, 250 mg, 300 mg. **Cost:** *Generic* — 25 mg $196.43/30, 50 mg $392.81/30, 100 mg $420.77/30, 200 mg $448.70/30, 250 mg $611.88/30, 300 mg $673.07/30. **Orally disintegrating tablets:** 25 mg, 50 mg, 100 mg, 200 mg. **Cost:** 25 mg $218.27/30, 50 mg $233.78/30, 100 mg $249.29/30, 200 mg $297.47/30. **Tablets for oral suspension:** 2 mg, 5 mg, 25 mg. **Cost:** *Generic* — 5 mg $305.33/100, 25 mg $319.80/100.

NURSING IMPLICATIONS

Assessment

- Monitor closely for changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess patient for skin rash frequently during therapy. Discontinue lamotrigine at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Rash

© F.A. Davis Publishing

usually occurs during the initial 2–8 wk of therapy and is more frequent in patients taking multiple antiepileptic agents, especially valproic acid, and much more frequent in patients <16 yr.
- Monitor for signs and symptoms of multiorgan hypersensitivity reactions—DRESS (rash, fever, lymphadenopathy). May be associated with other organ involvement (hepatitis, hepatic failure, blood dyscrasias, acute multiorgan failure). If cause cannot be determined, discontinue lamotrigine immediately.
- **Seizures:** Assess location, duration, and characteristics of seizure activity.
- **Bipolar disorders:** Assess mood, ideation, and behaviors frequently. Initiate suicide precautions if indicated.
- ***Lab Test Considerations:*** Lamotrigine plasma concentrations may be monitored periodically during therapy, especially in patients concurrently taking other anticonvulsants. Therapeutic plasma concentration range has not been established, proposed therapeutic range: 1–5 mcg/mL.
- May cause false-positive results for phencyclidine (PCP) in some rapid urine drug screens. Use a more specific analytical method to confirm results.

Implementation

- Do not confuse lamotrigine with labetalol, lamivudine, levetiracetam, or levothyroxine. Do not confuse Lamical with labetalol or Lamisil (terbinafine).
- When converting from immediate-release to XR form, initial dose of XR should match the total daily dose of immediate-release lamotrigine; monitor closely and adjust as needed.
- **PO:** May be administered without regard to meals. ***DNC:*** Swallow XR tablets whole; do not break, crush, or chew.
- Lamotrigine should be discontinued gradually over at least 2 wk, unless safety concerns require a more rapid withdrawal. Abrupt discontinuation may cause increase in seizure frequency.
- **Orally Disintegrating Tablets:** Place on the tongue and move around the mouth. Tablet will rapidly disintegrate, can be swallowed with or without water, and can be taken with or without food.
- **Tablets for Oral Suspension:** May be swallowed whole, chewed, or dispersed in water or dispersed in fruit juice. If chewed, follow with water or fruit juice to aid in swallowing. Only use whole tablets, do not attempt to administer partial quantities of dispersible tablets.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Do not discontinue abruptly; may cause increase in frequency of seizures. Instruct patient to read the *Medication Guide* before starting and with each Rx refill, changes may occur.
- Advise patient to notify health care professional immediately if skin rash, fever, or swollen lymph glands occur or if frequency of seizures increases.
- May cause dizziness, drowsiness, and blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Caution patient to wear sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood or if symptoms of aseptic meningitis (headache, fever, nausea, vomiting, and nuchal rigidity, rash, photophobia, myalgia, chills, altered consciousness, somnolence) or cardiac symptoms (fast, slow, or pounding heartbeat; heart skipping beats; shortness of breath; chest pain; feeling lightheaded) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Advise patient to notify health care professional immediately if signs and symptoms of hemophagocytic lymphohistiocytosis (fever, hepatosplenomegaly, rash, lymphadenopathy, neurologic symptoms, cytopenias, high serum ferritin, hypertriglyceridemia, liver function, coagulation abnormalities) occur. Symptoms usually occur between 8 and 24 days. May be fatal.
- Rep: Advise females of reproductive potential to use a nonhormonal form of contraception while taking lamotrigine, to avoid breast feeding, and to notify health care professional if pregnancy is planned or suspected. Encourage patients who become pregnant to enroll in the North American Antiepileptic Drug Pregnancy Registry. Must be done by patients themselves by calling 1-888-233-2334 or on the website http://www.aedpregnancyregistry.org.
- Advise patient to carry identification at all times describing disease process and medication regimen.

Evaluation/Desired Outcomes

- Decrease in the frequency of or cessation of seizures.
- Delay in time to occurrence of mood episodes (depression, mania, hypomania, mixed episodes) in patients with Bipolar I disorder.

© F.A. Davis Publishing

BEERS

lansoprazole (lan-soe-pra-zole)

Prevacid, Prevacid 24 Hr, Prevacid SoluTab

Classification

Therapeutic: antiulcer agents
Pharmacologic: proton-pump inhibitors

Indications

Erosive esophagitis. Duodenal ulcers (with or without anti-infectives for *Helicobacter pylori*). Active benign gastric ulcer. Short-term treatment of symptomatic GERD. Healing and risk reduction of NSAID-associated gastric ulcer. Pathologic hypersecretory conditions, including Zollinger-Ellison syndrome. **OTC:** Heartburn occurring ≥twice/wk.

Action

Binds to an enzyme in the presence of acidic gastric pH, preventing the final transport of hydrogen ions into the gastric lumen. **Therapeutic Effects:** Diminished accumulation of acid in the gastric lumen, with lessened acid reflux. Healing of duodenal ulcers and esophagitis.

Pharmacokinetics

Absorption: 80% absorbed after oral administration.
Distribution: Unknown.
Protein Binding: 97%.
Metabolism and Excretion: Extensively metabolized by the liver to inactive compounds. Converted intracellularly to at least two other antisecretory compounds.
Half-life: Children: 1.2–1.5 hr; Adults: 1.3–1.7 hr (↑ in geriatric patients and patients with impaired hepatic function).

TIME/ACTION PROFILE (acid suppression)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1.7 hr	more than 24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to lansoprazole or related drugs (benzimidazoles); Concurrent use of rilpivirine-containing products.

Use Cautiously in: Solutabs contain aspartame; use caution in patients with phenylketonuria; Severe hepatic impairment (not to exceed 30 mg/day in these patients); Patients using high-doses for >1 yr (↑ risk of hip, wrist, or spine fractures and fundic gland polyps); Patients using therapy for >3 yr (↑ risk of vitamin B_{12} deficiency); Lactation: Safety not established in breast feeding; Pedi: Children <1 yr (↑ risk of heart valve thickening); Geri: Maintenance dose not to exceed 30 mg/day unless additional acid suppression is required.

Adverse Reactions/Side Effects

Derm: cutaneous lupus erythematosus, rash. **F and E:** hypomagnesemia (especially if treatment duration ≥3 mo). **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, abdominal pain, fundic gland polyps, nausea. **GU:** acute tubulointerstitial nephritis. **Hemat:** vitamin B_{12} deficiency. **MS:** bone fracture. **Neuro:** dizziness, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, or acute tubulointerstitial nephritis), systemic lupus erythematosus.

Interactions

Drug-Drug: May ↓ **rilpivirine** levels and ↑ risk of resistance; concurrent use contraindicated. **Sucralfate** ↓ absorption of lansoprazole (take 30 min before sucralfate). May ↓ absorption of drugs requiring acid pH, including **ketoconazole**, **itraconazole**, **atazanavir**, **nelfinavir**, **ampicillin esters**, **iron salts**, **erlotinib**, and **mycophenolate mofetil**; avoid concurrent use with **atazanavir** and **nelfinavir**. May ↑ levels of **digoxin tacrolimus**, and **methotrexate**. May ↑ risk of bleeding with **warfarin** (monitor INR/PT). Hypomagnesemia ↑ risk of **digoxin** toxicity.

Route/Dosage

PO (Adults): *Short-term treatment of duodenal ulcer*—15 mg once daily for 4 wk; *H. pylori eradication to reduce the risk of duodenal ulcer recurrence*—30 mg twice daily with clarithromycin 500 mg twice daily and amoxicillin 1000 mg twice daily for 10–14 days (triple therapy) or 30 mg 3 times daily with 1000 mg amoxicillin 3 times daily for 14 days (dual therapy); *Maintenance of healed duodenal ulcers*—15 mg once daily; *Short-term treatment of gastric ulcers/healing of NSAID-associated gastric ulcer*—30 mg once daily for up to 8 wk; *Risk reduction of NSAID-associated gastric ulcer*—15 mg once daily for up to 12 wk; *Short-term treatment of symptomatic GERD*—15 mg once daily for up to 8 wk; *Short-term treatment of erosive esophagitis*—30 mg once daily for up to 8 wk (8 additional wk may be necessary); *Maintenance of healing of erosive esophagitis*—15 mg once daily; *Pathologic hypersecretory conditions*—60 mg once daily initially, up to 90 mg twice daily (daily dose >120 mg should be given in divided doses).

PO (Adults): *OTC*—15 mg once daily for up to 14 days (14 day course may be repeated every 4 mo).

PO (Children 12–17 yr): *Non-erosive GERD*—15 mg once daily for up to 8 wk; *Erosive esophagitis*—30 mg once daily for up to 8 wk.

PO (Children 1–11 yr and >30 kg): *GERD and Erosive Esophagitis*—30 mg once daily for up to 12 wk.

PO (Children 1–11 yr and ≤30 kg): *GERD and Erosive Esophagitis*—15 mg once daily for up to 12 wk.

= Canadian drug name. = Genetic implication. ~~Strikethrough~~ = Discontinued.
*CAPITALS indicates life-threatening; underlines indicate most frequent.

© F.A. Davis Publishing

Availability (generic available)

Delayed-release capsules: 15 mg[Rx, OTC], 30 mg. **Delayed-release orally disintegrated tablets (SoluTabs):** 15 mg[Rx, OTC], 30 mg. ***In combination with:*** amoxicillin and clarithromycin as part of a compliance package (Prevpac). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess patient routinely for epigastric or abdominal pain and for frank or occult blood in stool, emesis, or gastric aspirate.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- ***Lab Test Considerations:*** May cause abnormal liver function tests, including ↑ AST, ALT, alkaline phosphatase, LDH, and bilirubin.
- May cause ↑ serum creatinine and ↑ or ↓ electrolyte levels.
- May alter RBC, WBC, and platelet levels.
- May also cause ↑ gastrin levels, abnormal A/G ratio, hyperlipidemia, and ↑ or ↓ cholesterol.
- Monitor INR and prothrombin time in patients taking warfarin.
- May cause hypomagnesemia. Monitor serum magnesium prior to and periodically during therapy.
- May cause vitamin B_{12} deficiency with long term use (>3 yrs).
- May ↑ serum chromogranin levels which may interfere with diagnosis of neuroendocrine tumors.

Implementation

- **PO:** *Delayed-release capsules:* Administer before meals. ***DNC:*** Swallow whole; do not crush or chew capsule contents. Capsules may be opened and sprinkled on 1 tbsp of applesauce, *Ensure,* pudding, cottage cheese, yogurt, or strained pears and swallowed immediately for patients with difficulty swallowing.
- For patients with an NG tube, capsules may be opened and intact granules may be mixed in 40 mL of apple juice and injected through the NG tube into stomach. Flush NG tube with additional apple juice to clear tube.
- *Orally disintegrating tablets* may be placed on tongue, allowed to disintegrate and swallowed with or without water. Do not cut or break tablet. For administration via oral syringe or nasogastric tube, *Prevacid SoluTab* can be administered by placing a 15-mg tablet in oral syringe and drawing up 4 mL of water, or a 30-mg tablet in oral syringe and drawing up 10 mL of water. Shake gently to allow for a quick dispersal. After tablet has dispersed, administer the contents within 15 min. Refill syringe with 2 mL (5 mL for the 30-mg tablet) of water, shake gently, and administer any remaining contents and flush nasogastric tube.
- Antacids may be used concurrently.

Patient/Family Teaching

- Instruct patient to take medication as directed for the full course of therapy, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose; do not double doses. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- May occasionally cause dizziness. Caution patient to avoid driving and other activities that require alertness until response to medication is known.
- Advise patient to avoid alcohol, products containing aspirin or NSAIDs, and foods that may cause an increase in GI irritation.
- Advise patient to report onset of black, tarry stools; diarrhea; or abdominal pain to health care professional promptly. Instruct patient to notify health care professional immediately if rash, diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in abdominal pain or prevention of gastric irritation and bleeding. Healing of duodenal ulcers can be seen on x-ray examination or endoscopy. Therapy is continued for at least 2–4 wk. Therapy for pathologic hypersecretory conditions may be long term.
- Healing in patients with erosive esophagitis. Therapy is continued for up to 8 wk, and an additional 8-wk course may be used for patients who do not heal in 8 wk or whose ulcer recurs.

lanthanum carbonate

(**lan**-than-um)

Fosrenol

Classification

Therapeutic: hypophosphatemics

Pharmacologic: phosphate binders

Indications

Reduction of serum phosphate levels associated with end-stage renal disease.

Action

Dissociates in the upper GI tract forming lanthanate ions, which form an insoluble complex with phosphate.

© F.A. Davis Publishing

Therapeutic Effects: Decreased serum phosphate levels.

Pharmacokinetics

Absorption: Negligible absorption.
Distribution: Stays within the GI tract.
Metabolism and Excretion: Eliminated almost entirely in feces.
Half-life: 53 hr (in plasma).

TIME/ACTION PROFILE (effect on phosphate levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 wk	unknown

Contraindications/Precautions

Contraindicated in: Bowel obstruction; Ileus; Fecal impaction; OB: Pregnancy (may cause fetal harm); Lactation: Lactation; Pedi: Use in children not recommended (potential negative effect on developing bone).
Use Cautiously in: Patients with risk factors for GI obstruction or perforation, including history of GI surgery, colon cancer, or GI ulceration, diverticular disease, peritonitis, constipation, ileus, diabetic gastroparesis, or taking medications that cause constipation.

Adverse Reactions/Side Effects

GI: nausea, vomiting, diarrhea, fecal impaction, GI obstruction, GI perforation, ileus. **F and E:** hypocalcemia.

Interactions

Drug-Drug: May ↓ absorption of **fluoroquinolones**, **tetracyclines**, and **levothyroxine**; administer at least 1 hr before or 3 hr after lanthanum carbonate.

Route/Dosage

PO (Adults): 1500 mg/day in divided doses; may be titrated upward every 2–3 wk in increments of 750 mg/day up to 4500 mg/day (usual range 1500–3000 mg/day).

Availability (generic available)

Chewable tablets: 250 mg, 500 mg, 750 mg, 1000 mg. **Oral powder:** 750 mg/pkt, 1000 mg/pkt.

NURSING IMPLICATIONS

Assessment

- Assess patient for nausea and vomiting during therapy.
- ***Lab Test Considerations:*** Monitor serum phosphate levels prior to and periodically during therapy.

Implementation

- Do not confuse lanthanum carbonate with lithium carbonate.
- Divide total daily dose and administer with meals.
- **PO:** Administer with or immediately after meals. Tablets should be crushed or chewed completely before swallowing; intact tablets should not be swallowed.
- Sprinkle powder on small quantity of applesauce or other similar food; consume immediately. Consider powder formulation for patients with poor dentition or who have difficulty chewing tablets.

Patient/Family Teaching

- Instruct patient to take lanthanum as directed. Advise patient to read *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient to take antacids or thyroid medicine (levothyroxine), 2 hr before or after lanthanum carbonate and antibiotics 1 hr before or 4 hr after lanthanum carbonate.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to notify health care professional of medication regimen before an abdominal x-ray or if they have a history of gastrointestinal disease.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected and to avoid breast feeding during therapy.

Evaluation/Desired Outcomes

- Decrease in serum phosphate to below than 6.0 mg/dL in patients with end stage renal disease.

lapatinib (la-**pat**-i-nib)

Tykerb

Classification
Therapeutic: antineoplastics
Pharmacologic: enzyme inhibitors, kinase inhibitors

Indications

Advanced or metastatic breast cancer with tumor overexpression of the Human Epidermal Receptor Type 2 (HER2) and past therapy with an anthracycline, a taxane and trastuzumab (in combination with capecitabine). Postmenopausal women with hormone-receptor positive metastatic breast cancer that overexpresses HER2 for whom hormonal therapy is indicated (in combination with letrozole).

Action

Acts as an inhibitor of intracellular tyrosine kinase affecting Epidermal Growth Factor (EGFR, ErbB1) and HER2 (ErbB2). Inhibits the growth of ErbB-driven tumors. Effect is additive with capecitabine. **Therapeutic Effects:** Decreased/slowed spread of metastatic breast cancer.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Incompletely and variably absorbed following oral administration; blood levels ↑ by food.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: Extensively metabolized by, mostly by CYP3A4 and CYP3A5 enzyme systems; <2% excreted by kidneys.
Half-life: 24 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	4 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; ↓ left ventricular ejection fraction (Grade 2 or greater); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Concurrent use of CYP3A4 inhibitors including ketoconazole, itraconazole, clarithromycin, atazanavir, indinavir, nefazodone, nelfinavir, ritonavir, saquinavir, and voriconazole should be avoided (if necessary, ↓ lapatinib dose); Concurrent use of CYP3A4 inducers including dexamathasone, phenytoin, carbamazepine, rifampin, rifabutin, rifapentine, phenobarbital, and St. John's wort should be avoided (if necessary, ↑ lapatinib dose; Severe hepatic impairment (dose ↓ recommended for Child-Pugh Class C); Known QTc interval prolongation or co-existing risk factors for QTc interval prolongation including hypokalemia, hypomagnesemia, concurrent antiarrhythmics or medications that are known to prolong the QTc interval; Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: Older adults may be more sensitive to effects.

Adverse Reactions/Side Effects

CV: ↓ left ventricular ejection fraction, QT interval prolongation. **Derm:** ERYTHEMA MULTIFORM, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, palmar-plantar erythrodysesthesia, rash, dry skin, nail disorders. **GI:** DIARRHEA, HEPATOTOXICITY, nausea, vomiting, dyspepsia, ↑ liver enzymes, stomatitis. **Hemat:** neutropenia. **MS:** back pain, extremity pain. **Neuro:** fatigue, insomnia. **Resp:** dyspnea, interstitial lung disease, pneumonitis.

Interactions

Drug-Drug: Lapatinib inhibits CYP3A4, CYP28, and P-glycoprotein; concurrent use of drugs which are substrates for these enzymes should be undertaken with caution. May ↑ effects of **midazolam**, **paclitaxel**, and **digoxin**. **Strong CYP3A4 inhibitors**, including **ketoconazole**, **itraconazole**, **clarithromycin**, **atazanavir**, **indinavir**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, and **voriconazole** may ↑ levels and risk of toxicity; avoid concurrent use; if concurrent use unavoidable, ↓ lapatinib dose. **Strong CYP3A4 inducers**, including **dexamethasone**, **phenytoin**, **carbamazepine**, **rifampin**, **rifabutin**, **rifapentin**, and **phenobarbital** may ↓ levels and effectiveness; avoid concurrent use; if concurrent use unavoidable, ↑ lapatinib dose.
Drug-Natural Products: Concurrent use of **St. John's wort** may ↓ levels and effectiveness; avoid concurrent use; if concurrent use unavoidable, ↑ lapatinib dose.
Drug-Food: Concurrent **grapefruit juice** may ↑ levels and risk of toxicity; avoid concurrent use.

Route/Dosage

HER2–Positive Metastatic Breast Cancer

PO (Adults): 1250 mg once daily on Days 1–21 of 21-day cycle; continue until disease progression or unacceptable toxicity; *Concurrent use of strong CYP3A4 inhibitors*— 500 mg once daily on Days 1–21 of 21-day cycle; continue until disease progression or unacceptable toxicity; *Concurrent use of strong CYP3A4 inducers*— Gradually titrate dose from 1250 mg once daily up to 4500 mg once daily as tolerated; administer dose on Days 1–21 of 21-day cycle and continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*— 750 mg once daily on Days 1–21 of 21-day cycle; continue until disease progression or unacceptable toxicity.

Hormone Receptor-Positive, HER2–Positive Metastatic Breast Cancer

PO (Adults): 1500 mg once daily on Days 1–21 of 21-day cycle; continue until disease progression or unacceptable toxicity; *Concurrent use of strong CYP3A4 inhibitors*— 500 mg once daily on Days 1–21 of 21-day cycle; continue until disease progression or unacceptable toxicity; *Concurrent use of strong CYP3A4 inducers*— Gradually titrate dose from 1500 mg once daily up to 5500 mg once daily as tolerated; administer dose on Days 1–21 of 21-day cycle and continue until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*— 1000 mg once daily on Days 1–21 of 21-day cycle; continue until disease progression or unacceptable toxicity.

Availability (generic available)

Tablets: 250 mg.

NURSING IMPLICATIONS

Assessment

- Evaluate left ventricular ejection fraction (LVEF) prior to therapy to determine if within institution's normal limits. Continue to monitor periodically during therapy to ensure it does not fall below limits. If LVEF decreases to Grade 2 or greater discontinue therapy. If returns to normal and patient is asymptomatic after 2 wk, may restart therapy at a reduced dose of 1000 mg/day (with capecitabine) or 1250 mg/day (with letrozole).

© F.A. Davis Publishing

- Monitor for diarrhea; usually occurs within first 6 days of therapy and lasts 4–5 days. Treat with antidiarrheals (loperamide) after first loose stool. If diarrhea is severe, treat with oral or intravenous fluids, antibiotics (fluoroquinolones) especially if diarrhea persists >24 hrs or accompanied by fever; may require interruption or discontinuation of therapy. If accompanied by moderate to severe abdominal cramping, nausea or vomiting, decreased performance status, fever, sepsis, neutropenia, frank bleeding, or dehydration, interrupt therapy and reintroduce at lower dose (from 1,250 mg/day to 1,000 mg/day or from 1,500 mg/day to 1,250 mg/day) when diarrhea <Grade 1. If Grade 4 diarrhea occurs, discontinue therapy.
- Monitor ECG prior to and periodically during therapy to monitor QT. Monitor patients who have or may develop prolongation of QTc (hypokalemia, hypomagnesemia, congenital long QT syndrome, patients taking antiarrhythmics or other medication with known risk for QT prolongation/torsades de pointes, and cumulative high-dose anthracycline therapy) during therapy.
- Monitor for respiratory status for symptoms of interstitial lung disease and pneumonitis (dyspnea, cough); may require discontinuation of therapy.
- Monitor for signs and symptoms of skin reactions (progressive skin rash often with blisters or mucosal lesions). Discontinue lapatinib if erythema multiforme, Stevens-Johnson syndrome, or toxic epidermal necrolysis are suspected.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor liver function tests prior to initiation and every 4–6 wk during therapy and as clinically indicated. Discontinue and do not restart lapatinib if patients experience severe changes in liver function tests.
- Monitor serum potassium and magnesium prior to and periodically during therapy. Correct hypokalemia or hypomagnesemia before starting therapy.

Implementation

- Correct hypokalemia and hypomagnesemia prior to therapy.
- **PO:** Administer tablets once daily at least 1 hr before or 1 hr after a meal for 21 days. Do not divide daily dose.

Patient/Family Teaching

- Instruct patient to take lapatinib as directed and to review the *Patient Information Sheet* prior to therapy and with each refill for new information. If a dose is missed take as soon remembered that day. If a day is missed, skip the dose; do not double doses. Caution patient not to share this medication with others, even with same condition; may be harmful.
- Advise patient to avoid drinking grapefruit juice or eating grapefruit during therapy.
- Advise patient to report signs or decreased LVEF (shortness of breath, palpitations, fatigue) and skin rash to health care professional promptly.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's wort.
- Advise patient that lapatinib may cause diarrhea, which may become severe. Instruct patient in how to prevent and manage diarrhea and to notify health care professional if severe.
- Rep: May cause fetal harm. Advise females of reproductive potential and males with female partners of reproductive potential to use effective contraception during and for 1 wk after last dose and to avoid breast feeding for 1 wk after last dose. Advise patient to notify healthcare professional if pregnancy is planned or suspected.

Evaluation/Desired Outcomes

- Decreased/slowed spread of metastatic breast cancer.

lasmiditan (las-mid-i-tan)

Reyvow

Classification

Therapeutic: vascular headache suppressants
Pharmacologic: 5-HT_1 agonists

Schedule V

Indications

Acute treatment of migraine with or without aura.

Action

Acts as a selective agonist of 5-HT_{1F} receptors, which decreases stimulation of the trigeminal system (without causing vasoconstriction). **Therapeutic Effects:** Relief of pain associated with acute migraine attacks.

Pharmacokinetics

Absorption: Rapidly absorbed. Absorption delayed by high-fat food.
Distribution: Unknown.
Metabolism and Excretion: Primarily metabolized by hepatic and non-hepatic pathways (by non-CYP enzymes) to inactive metabolites. Primarily excreted in urine as metabolites.
Half-life: 5.7 hr.

TIME/ACTION PROFILE (pain relief)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	2 hr	up to 24 hr

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Severe hepatic impairment.
Use Cautiously in: History of substance abuse; OB: Use during pregnancy only if potential maternal benefit outweighs potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit outweighs potential risk to infant; Pedi: Safety and effectiveness not established in children; Geri: Use lowest dose possible in older adults (↑ risk for sedation and BP elevation).

Adverse Reactions/Side Effects

CV: ↓ heart rate, ↑ BP. **GI:** nausea, vomiting. **MS:** muscle weakness. **Neuro:** paresthesia, dizziness, drowsiness. **Misc:** HYPERSENSITIVITY REACTIONS (including angioedema), SEROTONIN SYNDROME, fatigue.

Interactions

Drug-Drug: Use with other **CNS depressants**, including **benzodiazepines**, **sedative/hypnotics**, **anxiolytics**, **opioids**, or **alcohol** may cause profound sedation; avoid concurrent use. ↑ risk of serotonin syndrome with **SSRIs**, **SNRIs**, **TCAs**, **MAOIs**, **dextromethorphan**, **triptans**, **trazodone**, **meperidine**, **bupropion**, or **buspirone**. Concurrent use with **beta blockers**, **diltiazem**, **verapamil**, **digoxin**, **clonidine**, or **ivabradine** may result in further ↓ in heart rate; use concomitantly with caution. May ↑ levels and risk of toxicity of **P-glycoprotein substrates** or **breast cancer resistant protein (BCRP) substrates**; avoid concurrent use.
Drug-Natural Products: ↑ risk of serotonin syndrome with **St. John's wort** or **SAMe**.

Route/Dosage

PO (Adults): 50 mg, 100 mg, or 200 mg as a single dose (not to exceed one dose/24 hr).

Availability

Tablets: 50 mg, 100 mg.

NURSING IMPLICATIONS

Assessment

- Assess pain location, intensity, duration, and associated symptoms (photophobia, phonophobia, nausea, vomiting) during migraine attack.
- Assess for occurrence of signs and symptoms of serotonin syndrome periodically during therapy.

Implementation

- **PO:** Administer without regard to food. Do not administer >1 dose/24 hr; a 2nd dose for same migraine is not effective.

Patient/Family Teaching

- Instruct patient to take lasmiditan as directed and not take more than 1 dose in 24 hr. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Inform patient that lasmiditan should be used only *during* a migraine attack. It is meant to be used for relief of migraine attacks but not to prevent or reduce the number of attacks.
- Advise patient that lying down in a darkened room after lasmiditan administration may further help relieve headache.
- May cause dizziness and drowsiness. Caution patient to avoid driving or other activities requiring alertness for at least 8 hr after dose. Do not take lasmiditan if unable to follow this advice.
- Advise patient to notify health care professional if signs and symptoms of serotonin syndrome (mental status changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile blood pressure, hyperthermia], neuromuscular signs [hyperreflexia, incoordination], gastrointestinal [nausea, vomiting, diarrhea] occur. Discontinue lasmiditan if symptoms occur. Concurrent use of SSRIs, SNRIs, TCAs, MAO inhibitors, trazodone, triptans, cough syrups (dextromethorphan) or herbal products (St. John's Wort, SAMe) increase serotonin and may cause serotonin syndrome.
- Advise patient that overuse of acute migraine drugs (use more than 10 days/mo) may lead to exacerbation of headache (migraine-like daily headaches, or as a marked increase in frequency of migraine attacks). May require gradual withdrawal of lasmiditan and treatment of symptoms (transient worsening of headache).
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications, especially St. John's Wort.
- Advise patient to avoid taking other CNS depressants and alcohol, which aggravates headaches and may cause profound sedation, during lasmiditan use.
- Advise patient that lasmiditan is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes

- Relief of migraine attack.

lefamulin (le-**fam**-ue-lin)

Xenleta

Classification
Therapeutic: anti-infectives
Pharmacologic: pleuromutilins

Indications

Community-acquired bacterial pneumonia.

Action

Acts as a pleuromutilin that ultimately interferes with bacterial protein synthesis at the level of the 50S ribosome. **Therapeutic Effects:** Resolution of pneumo-

© F.A. Davis Publishing

nia. **Spectrum:** Active against gram-positive pathogens, including: *Staphylococcus aureus* (methicillin-sensitive strains only), *Streptococcus pneumoniae*. Also active against the following gram-negative pathogen: *Haemophilus influenzae*. Also active against several other pathogens, including: *Legionella pneumophilia*, *Chlamydia pneumoniae*, *Mycoplasma pneumoniae*.

Pharmacokinetics

Absorption: 25% absorbed following oral administration; IV administration results in complete bioavailability.
Distribution: Extensively distributed to tissues.
Protein Binding: 94–97%.
Metabolism and Excretion: Primarily metabolized in the liver via the CYP3A4 isoenzyme. Primarily excreted in feces (77%; 4–9% as unchanged drug), with 15% excreted in urine (9–14% as unchanged drug).
Half-life: 8 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	at end of infusion	12 hr
PO	unknown	0.88–2 hr	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to lefamulin or retapamulin; Concurrent use of CYP3A4 substrates that prolong the QT interval; QT interval prolongation or a history of ventricular arrhythmias (including torsades de pointes); Concurrent use of QT interval prolonging medications; Moderate or severe hepatic impairment (oral tablets only); OB: Pregnancy (may cause fetal harm); Lactation: Lactation (may cause fetal harm).
Use Cautiously in: Severe hepatic impairment (↑ dosing interval for IV injection); Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: QT INTERVAL PROLONGATION. **F and E:** hypokalemia. **GI:** CLOSTRIDIOIDES DIFFICILE ASSOCIATED DIARRHEA (CDAD), diarrhea, ↑ liver enzymes, nausea, vomiting. **Local:** injection site reactions. **Neuro:** headache, insomnia.

Interactions

Drug-Drug: **CYP3A4 substrates** that prolong the QT interval, including **pimozide**, may ↑ the risk of QT interval prolongation and torsades de pointes; concurrent use contraindicated. **Class Ia antiarrhythmics** or **Class III antiarrhythmics** may ↑ the risk of QT interval prolongation and torsades de pointes; avoid concurrent use. **QT interval prolonging medications**, including **antipsychotics**, **erythromycin**, **moxifloxacin**, or **tricyclic antidepressants** may ↑ the risk of QT interval prolongation and torsades de pointes; avoid concurrent use. **Strong CYP3A4 inhibitors** or **P-gp inhibitors** may ↑ levels of oral lefamulin; avoid concurrent use. **Moderate or strong CYP3A4 inducers** or **P-gp inducers** may ↓ levels of either oral or IV lefamulin; avoid concurrent use. Lefamulin tablets may ↑ levels of **CYP3A4 substrates**, including **benzodiazepines**, **diltiazem**, **lovastatin**, **PDE5 inhibitors**, **simvastatin**, and **verapamil**; monitor closely for adverse reactions.

Route/Dosage

IV (Adults): 150 mg every 12 hr for 5–7 days; may switch at any time to oral regimen to complete the treatment course.
PO (Adults): 600 mg every 12 hr for 5 days.

Hepatic Impairment

IV (Adults): *Severe hepatic impairment (Child-Pugh C)* — 150 mg every 24 hr for 5–7 days.

Availability

Film-coated tablets: 600 mg. **Solution for injection (requires dilution):** 10 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy, especially in geriatric patients.
- Obtain specimens for culture and sensitivity before initiating therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Monitor ECG for QT prolongation in patients with ventricular arrhythmias or those on other drugs that prolong QT interval.
- Monitor for signs and symptoms of hypersensitivity reactions (rash, hives, swelling of face or throat) during therapy.
- ***Lab Test Considerations:*** Obtain a negative pregnancy test before starting therapy.

Implementation

- **PO:** Administer at least 1 hr before or 2 hr after a meal. Swallow tablets whole with 6–8 oz of water; ***DNC:*** do not crush, break, or chew.
- **Intermittent Infusion:** Dilute entire 15 mL vial into diluent bag supplied containing 250 mL of 10 mM citrate buffered 0.9% NaCl. Mix thoroughly. So-

© F.A. Davis Publishing

lution is clear and colorless; do not administer solutions that are discolored or contain particulate matter. Solution is stable for 24 hr at room temperature or 48 hr if refrigerated. ***Rate:*** Infuse over 60 min.

Patient/Family Teaching

- Instruct patient to take lefamulin as directed. Take missed doses as soon as remembered up to 8 hr before next dose. If less than 8 hr before next dose, omit dose, and resume dosing at next scheduled dose.
- Instruct patient to notify health care professional immediately if rash, diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue, vaginal itching or discharge, loose or foul-smelling stools) to health care professional.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise females of reproductive potential to use effective contraception and avoid breast feeding during and for 2 days after final dose. If patient becomes pregnant while taking lefamulin, encourage patient to enrol in registry to monitor pregnancy outcomes by calling 1-855-5NABRIVA to enroll.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

leflunomide (le-**flu**-noe-mide)

Arava

Classification

Therapeutic: antirheumatics (DMARDs)
Pharmacologic: immune response modifiers, pyrimidine synthesis inhibitors

Indications

Rheumatoid arthritis (disease-modifying agent).

Action

Inhibits an enzyme required for pyrimidine synthesis; has antiproliferative and anti-inflammatory effects.
Therapeutic Effects: Decreased pain and inflammation, slowed structural progression and improved physical function.

Pharmacokinetics

Absorption: Tablets are 80% absorbed following oral administration; rapidly converted to the M1 metabolite, which is responsible for pharmacologic activity.
Distribution: Crosses the placenta.
Protein Binding: 99%.
Metabolism and Excretion: Extensively metabolized with metabolites excreted in urine (43%) and feces (48%). Also undergoes biliary recycling.
Half-life: 14–18 days.

TIME/ACTION PROFILE (antirheumatic effect)

ROUTE	ONSET	PEAK	DURATION
PO	1 mo	3–6 mo	wk–mos†

†Due to persistence of active metabolite.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to leflunomide or teriflunomide; Compromised immune function, including bone marrow dysplasia or severe uncontrolled infection; Concurrent vaccination with live vaccines; Hepatic impairment; OB: May cause fetal abnormalities or death. Contact Pregnancy Registry if accidental exposure occurs; Lactation: Lactation.
Use Cautiously in: Renal insufficiency; History of interstitial lung disease; Patients >60 yr, with diabetes, or taking neurotoxic medications (↑ risk of peripheral neuropathy); Pedi: Safety and effectiveness not established; OB: Women with childbearing potential must use two forms of birth control. Should not be used in men attempting to father a child.
Exercise Extreme Caution in: Concurrent use of other hepatotoxic agents (↑ risk of hepatotoxicity).

Adverse Reactions/Side Effects

Resp: INTERSTITIAL LUNG DISEASE, bronchitis, cough, pharyngitis, pneumonia, respiratory infection, rhinitis, sinusitis. **CV:** chest pain, hypertension. **GI:** HEPATOTOXICITY, diarrhea, nausea, abdominal pain, anorexia, dyspepsia, gastroenteritis, ↑ liver enzymes, mouth ulcers, vomiting. **GU:** urinary tract infection. **Derm:** STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, alopecia, rash, dry skin, eczema, pruritus. **F and E:** hypokalemia. **Metab:** weight loss. **MS:** arthralgia, back pain, joint disorder, leg cramps, synovitis, tenosynovitis. **Neuro:** paresthesia, peripheral neuropathy, headache, dizziness, weakness. **Misc:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), allergic reactions, flu syndrome, infections including sepsis and tuberculosis reactivation, pain.

Interactions

Drug-Drug: Cholestyramine and **activated charcoal** cause a rapid and significant ↓ in blood levels of active metabolite. Concurrent use of **methotrexate** and other **hepatotoxic drugs** ↑ risk of hepatotoxicity. Concurrent administration of **rifampin** ↑ blood levels of the active metabolite. May ↑ risk of bleeding with **warfarin**.

Route/Dosage

PO (Adults): *Loading dose*— 100 mg daily for 3 days; *maintenance dosing*— 20 mg/day (if intolerance occurs, dose may be ↓ to 10 mg/day).

Availability (generic available)

Tablets: 10 mg, 20 mg, 100 mg.

© F.A. Davis Publishing

NURSING IMPLICATIONS

Assessment

- Assess range of motion and degree of swelling and pain in affected joints before and periodically during therapy.
- Monitor for signs and symptoms of interstitial lung disease (new onset or worsening cough or dyspnea, associated with fever). May require discontinuation of therapy; consider drug elimination procedure if needed.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- ***Lab Test Considerations:*** Monitor liver function throughout therapy. Assess ALT at baseline, then monthly during initial 6 mo of therapy, then every 6–8 wk. If given concurrently with methotrexate, monitor ALT, AST, and serum albumin monthly. May cause ↑ ALT and AST, which are usually reversible with reduction in dose or discontinuation, but may be fatal. If ALT is 2–3 times the upper limit of normal, reduce dose to 10 mg/day and continue therapy. Monitor closely after dose reduction; plasma levels may not ↓ for several wk due to long half-life. If ALT ↑ of 2–3 times the upper limit of normal persists despite dose reduction or if ALT >3 times the upper limit of normal occurs, discontinue leflunomide and administer cholestyramine (see Toxicity and Overdose). Monitor closely and readminister cholestyramine as indicated.
- Monitor CBC with platelets monthly for 6 mo following initiation of therapy and every 6–8 wk thereafter. If used with methotrexate or other immunosuppressive therapy continue monitoring monthly. If bone marrow depression occurs, discontinue leflunomide and begin decreasing levels with cholestyramine (see Implementation).
- May rarely cause ↑ of alkaline phosphatase and bilirubin.
- ***Toxicity and Overdose:*** If overdose or significant toxicity occurs, cholestyramine 8 g 3 times a day for 24 hr, or activated charcoal orally or via nasogastric tube, 50 g every 6 hr for 24 hr, is recommended to accelerate elimination.

Implementation

- Administer a tuberculin skin test prior to administration of leflunomide. Patients with active latent TB should be treated for TB prior to therapy.
- **PO:** Initiate therapy with loading dose of 100 mg/day for 3 days, followed by 20 mg/day dose. May decrease to 10 mg/day if not well tolerated.
- **Drug Elimination Procedure:** Recommended to achieve nondetectable plasma levels <0.02 mg/L after stopping treatment with leflunomide. Administer cholestyramine 8 g 3 times daily for 11 days. (Days do not need to be consecutive unless rapid lowering of levels is desired.) Verify plasma levels <0.02 mg/L by 2 separate tests at least 14 days apart. If plasma levels >00.02 mg/L, consider additional cholestyramine treatment. Plasma levels may take up to 2 yr to reach nondetectable levels without drug elimination procedure.

Patient/Family Teaching

- Instruct patient to take leflunomide as directed.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional prior to taking other Rx, OTC, or herbal products concurrently with leflunomide. Aspirin, NSAIDs, or low-dose corticosteroids may be continued during therapy, but other agents for treatment of rheumatoid arthritis may require discontinuation.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Advise patient to notify health care professional if rash, mucous membrane lesions, unusual tiredness, abdominal pain, jaundice, or symptoms of interstitial lung disease occur.
- Instruct patient to avoid vaccinations with live vaccines during and following therapy without consulting health care professional.
- Rep: Caution patients of childbearing age that leflunomide has teratogenic effects. Women wishing to become pregnant must undergo the drug elimination procedure (see Implementation) and verify that the M1 metabolite plasma levels are <0.02 mg/L. Men wishing to father a child should also take cholestyramine 8 g 3 times daily for 11 days to minimize any possible risk.
- Emphasize the importance of routine lab tests to monitor for side effects.

Evaluation/Desired Outcomes

- Decrease in signs and symptoms of rheumatoid arthritis and slowing of structural damage as evidenced by x-ray erosions and joint narrowings.
- Improved physical function.

REMS

lenalidomide

(le-na-**lid**-o-mide)

Revlimid

Classification

Therapeutic: antineoplastics

Pharmacologic: immunomodulatory agents

© F.A. Davis Publishing

Indications

Transfusion-dependent anemia due to specific myelodysplastic syndromes (MDS) associated with deletion 5q cytogenetic abnormality. Multiple myeloma (MM) (in combination with dexamethasone). Maintenance therapy in patients with MM after autologous hematopoietic stem cell transplantation (auto-HSCT). Mantle cell lymphoma (MCL) patients whose disease has relapsed or progressed after 2 prior therapies including bortezomib. Previously treated follicular lymphoma (FL) (in combination with rituximab). Previously treated marginal zone lymphoma (MZL) (in combination with rituximab).

Action

Lenalidomide is a structural analog of thalidomide. Inhibits secretion of pro-inflammatory cytokines and increases secretion of anti-inflammatory cytokines.

Therapeutic Effects: Decreased anemia in certain MDS with a decreased requirement for transfusions. Slowed progression of MM and MCL. Improved progression-free survival in FL and MZL.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Levels are higher in patients with MM.

Distribution: Crosses the placenta.

Metabolism and Excretion: 66% excreted unchanged in urine, some renal excretion involves active secretion.

Half-life: 3 hr.

TIME/ACTION PROFILE (↓ need for transfusions)

ROUTE	ONSET	PEAK	DURATION
PO	within 3 mo	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Chronic lymphocytic leukemia (↑ risk of mortality); Concurrent use of pembrolizumab in patients with MM (↑ risk of mortality); OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Renal impairment (may ↑ risk of adverse reactions; dose ↓ recommended if CCr <60 mL/min); Patients with MCL with high tumor burden, high MCL International Prognostic Index at diagnosis, and high white blood cell count at baseline (↑ risk of early mortality); Rep: Women of reproductive potential and men with female partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: Consider age-related ↓ in renal function.

Adverse Reactions/Side Effects

CV: DEEP VEIN THROMBOSIS, MI, edema, chest pain, deep vein thrombosis, palpitations. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), TOXIC EPIDERMAL NECROLYSIS (TEN), pruritus, rash, dry skin, sweating. **Endo:** hyperthyroidism, hypothyroidism. **F and E:** hypokalemia, hypomagnesemia. **GI:** HEPATOTOXICITY, abdominal pain, constipation, diarrhea, nausea, vomiting, abnormal taste, anorexia, dry mouth. **Hemat:** NEUTROPENIA, THROMBOCYTOPENIA. **MS:** arthralgia, myalgia. **Neuro:** STROKE, dizziness, fatigue, headache, insomnia, depression. **Resp:** PULMONARY EMBOLISM, cough, pharyngitis. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), MALIGNANCY, fever, chills, tumor flare reaction, tumor lysis syndrome.

Interactions

Drug-Drug: Risk of neutropenia and thrombocytopenia may ↑ with **antineoplastics**, **immunosuppressants**, and **radiation therapy**. May ↑ **digoxin** levels. **Erythropoeitin**, **darbepoeitin**, and **estrogens** may ↑ risk of thromboembolic events.

Route/Dosage

Myelodysplastic Syndromes

PO (Adults): 10 mg once daily.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min* — 5 mg once daily; *CCr <30 mL/min (not on dialysis)* — 2.5 mg once daily; *CCr <30 mL/min (requiring dialysis)* — 2.5 mg once daily (give after dialysis on dialysis days).

Multiple Myeloma

PO (Adults): 25 mg once daily on days 1–21 of repeated 28-day cycles (with dexamethasone); if patients not eligible for auto-HSCT, continue treatment until disease progression or unacceptable toxicity; for patients eligible for auto-HSCT, hematopoietic stem cell mobilization should take place within 4 cycles.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min* — 10 mg once daily; if patient tolerates initial dose, may ↑ to 15 mg once daily after 2 cycles; *CCr <30 mL/min (not on dialysis)* — 15 mg every 48 hr; *CCr <30 mL/min (requiring dialysis)* — 5 mg once daily (give after dialysis on dialysis days).

Maintenance Therapy for Multiple Myeloma Following Autologous Hematopoietic Stem Cell Transplantation

PO (Adults): After adequate hematologic recovery (ANC ≥ 1000/mcL and/or platelet counts ≥75,000/mcL), initiate therapy with 10 mg once daily continuously on Days 1–28 of repeated 28–day cycles); after 3 cycles, dose may be ↑ to 15 mg once daily, if tolerated; continue treatment until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min* — 5 mg once daily; *CCr <30 mL/min (not on dialysis)* — 2.5 mg once daily; *CCr <30 mL/min (requiring dialysis)* — 2.5 mg once daily (give after dialysis on dialysis days).

© F.A. Davis Publishing

Mantle Cell Lymphoma

PO (Adults): 25 mg once daily on days 1–21 of repeated 28–day cycles; continue treatment until disease relapse or unacceptable toxicity develops.

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—10 mg once daily; *CCr <30 mL/min (not on dialysis)*—15 mg every 48 hr; *CCr <30 mL/min (requiring dialysis)*—5 mg once daily (give after dialysis on dialysis days).

Follicular Lymphoma or Marginal Zone Lymphoma

PO (Adults): 20 mg once daily on days 1–21 of repeated 28–day cycles for up to 12 cycles (with rituximab).

Renal Impairment

PO (Adults): *CCr 30–60 mL/min*—10 mg once daily; if patient tolerates initial dose, may ↑ to 15 mg once daily after 2 cycles; *CCr <30 mL/min (not on dialysis)*—5 mg once daily; *CCr <30 mL/min (requiring dialysis)*—5 mg once daily (give after dialysis on dialysis days).

Availability (generic available)

Capsules: 2.5 mg, 5 mg, 10 mg, 15 mg, 20 mg, 25 mg.

NURSING IMPLICATIONS

Assessment

- Assess for signs of deep venous thrombosis and pulmonary edema (dyspnea, chest pain, arm or leg swelling) periodically during therapy; risk is greater when lenalidomide is administered with dexamethasone.
- Assess for skin rash. Discontinue lenalidomide if rash occurs; may cause SJS, DRESS, or TEN. Consider interruption or discontinuation for Grade 2-3 skin rash. Permanently discontinue lenalidomide for Grade 4 rash, exfoliative or bullous rash, or for other severe cutaneous reactions such as SJS, TEN or DRESS.
- Monitor for signs and symptoms of tumor flare reaction (tender lymph node swelling, low-grade fever, pain rash) in patients with MCL; may mimic disease progression. *Grade 1 and 2 tumor flare reaction (TFR):* Lenalidomide may be continued in patients without interruption or modification, at health care professional's discretion. May also be treated with corticosteroids, nonsteroidal anti-inflammatory drugs (NSAIDs) and/or opioid analgesics. *Grade 3 or 4 TFR:* withhold treatment with lenalidomide until TFR resolves to ≤ Grade 1. May be treated for management of symptoms per the guidance for treatment of Grade 1 and 2 TFR.
- ***Lab Test Considerations:*** Verify negative pregnancy status prior to starting therapy. Pregnancy tests with a sensitivity of at least 50 mIU/mL must be done within 10–14 days and within 24 hrs of starting therapy. Once treatment has started, verify negative pregnancy tests weekly during first 4 wk of use, then every 4 wk in females with a regular menstrual cycle and every 2 wk in females with an irregular cycle.
- *Patients taking lenalidomide for MM with dexamethasone or as maintenance therapy:* Monitor CBC every 7 days for first 2 cycles, on days 1 and 15 of Cycle 3, and every 28 days thereafter. *Patients taking lenalidomide for MDS:* Monitor CBC with differential, platelet count, hemoglobin, and hematocrit weekly for first 8 wk of therapy and at least monthly thereafter. *Patients taking lenalidomide for MCL:* Monitor CBC weekly for first 28 days, every 2 wk during Cycles 2–4, and monthly thereafter. May require dose interruption and/or reduction and use of blood support and/or growth factors.
- May cause neutropenia with an onset of 42 days (range 4–411 days) and recovery time of 17 days (range 2–170 days). *For MM:* starting dose is 25 mg/day—If neutropenia develops and neutrophils fall to <1000/mcL interrupt therapy, follow CBC weekly. When neutrophils return to ≥1000/mcL and neutropenia is the only toxicity, resume lenalidomide at 25 mg daily. If neutrophils return to ≥1000/mcL and if other toxicity, resume lenalidomide at next lower dose. For each subsequent drop <1000/mcL interrupt therapy. If neutrophils return to ≥1000/mcL, resume at next lower dose. Do not administer doses below 2.5 mg. *For MDS:* starting dose is 10 mg/day—if neutropenia develops within 4 wk of starting at a 10 mg/day dose in a patient with a baseline neutrophil count (ANC) ≥1000/mcL and ANC falls to <750/mcL interrupt lenalidomide therapy and resume at 5 mg/day dose when ANC returns to ≥1000/mcL. If baseline ANC is <1000/mcL and ANC falls to <500/mcL, interrupt therapy and resume at 5 mg/day dose when ANC returns to ≥500/mcL. If neutropenia develops after 4 wk of therapy at 10 mg/day dose, and ANC <500/mcL for ≥7 days or <500/mcL associated with fever ≥38.5°C, interrupt therapy and resume at 5 mg/day when ANC returns to ≥500/mcL. If neutropenia develops at 5 mg/day dose and ANC <500/mcL for ≥7 days or <500/mcL associated with fever ≥38.5°C, interrupt therapy and resume at 2.5 mg daily when ANC returns to ≥500/mcL. *For MCL:* starting dose is 25 mg/day on days 1–21 of repeated 28-day cycles—If neutrophils fall to <1000/mcL for at least 7 days or fall to <1000/mcL with fever ≥38.5°C or fall to <500/mcL, interrupt therapy and follow CBC weekly. If neutrophils return to ≥1000/mcL resume at 5 mg less than previous dose. Do not administer doses below 5 mg. *For MZL or FL:* If neutrophils <1000/mcL for at least 7 days OR <1000/mcL with associated temperature at least 38.5° C OR <500/mcL hold lenalidomide

© F.A. Davis Publishing

and follow with weekly CBC. If neutrophils return to ≥1000/mcL and patient starting dose was 20 mg daily, resume at 5 mg less than previous dose. Do not administer doses below 5 mg. If neutrophils return to ≥1000/mcL patient starting dose was 10 mg daily, resume at 5 mg less than previous dose. Do not administer doses below 2.5 mg.

- May cause thrombocytopenia with an onset of 28 days (range 8–290 days) and a recovery in 22 days (range 5–224 days). *For MM:* starting dose is 25 mg/day—If platelets fall to <30,000/mcL interrupt therapy and follow CBC weekly. When platelets return to ≥30,000/mcL restart lenalidomide at next lower dose. For each subsequent drop <30,000/mcL interrupt therapy. When platelets return to ≥30,000/mcL resume at next lower dose. Do not administer doses below 2.5 mg. *For MDS:* starting dose is 10 mg/day—If thrombocytopenia develops within 4 wk of starting a 10 mg dose in a patient with a baseline of ≥100,000/mcL, and platelets fall to <50,000/mcL interrupt lenalidomide therapy and resume at 5 mg/day dose when platelets return to >50,000/mcL. If baseline was <100,000/mcL and platelets fall to 50% of baseline value interrupt therapy. If baseline ≥60,000/mcL and returns to ≥50,000/mcL or if baseline is <60,000/mcL and returns to ≥30,000/mcL resume therapy at 5 mg/day. If thrombocytopenia develops after 4 wk of treatment at 10 mg/day and platelets are <30,000/mcL or <50,000/mcL with platelet transfusions, interrupt therapy. When platelets return to ≥30,000/mcL without hemostatic failure resume therapy at 2.5 mg/day. *For MCL:* starting dose is 25 mg/day on days 1–21 of repeated 28–day cycles—If platelets fall to <50,000/mcL interrupt therapy and follow CBC weekly. If platelets return to ≥50,000/mcL resume at 5 mg less than previous dose. Do not administer doses below 5 mg. *For FL or MZL:* if platelets <50,000/mcL, hold lenalidomide and follow with weekly CBC. When platelets return to ≥50,000/mcL, if starting dose was 20 mg daily, resume lenalidomide at 5 mg less than the previous dose. Do not dose below 5 mg daily. If starting dose was 10 mg daily, resume at 5 mg less than previous dose. Do not dose below 2.5 mg daily.
- Monitor liver enzymes periodically during therapy. Stop therapy if enzymes are elevated; may resume when return to normal or decrease dose.
- May cause anemia and leukopenia.
- May cause hypokalemia, hypomagnesemia, and ↑ ALT levels.
- Monitor thyroid function before starting and periodically during therapy.

Implementation

- ***REMS:*** Patients must meet the following conditions before receiving therapy: they must understand the risks and be able to carry out instructions, must be capable of complying with patient registration and patient survey in the *Lenolidomide REMS program*, must comply with contraceptive measures, have received both oral and written warnings of the risks of contraception failure and the need for two reliable forms of contraception (females) or the risks of exposing a fetus to the drug and the need to use a latex condom during sexual conduct with a female with childbearing potential (male), acknowledge understanding of these warnings in writing, and if the patient is between 12 and 18 yr of age, their parent or legal guardian is to read the educational materials and agree to try to ensure compliance with conditions.
- ***REMS:*** Lenalidomide can only be prescribed by health care providers registered in the *Lenolidomide REMS program* and only be dispensed by a pharmacy that is registered in the *Lenolidomide REMS program*. Patients with multiple myeloma who are eligible for autologous stem cell transplantation should have stem cell mobilization performed within 4 cycles of therapy.
- **PO:** Administer once daily without regard to food, at the same time each day, with water. ***DNC:*** Swallow capsules whole; do not open, break, or chew.

Patient/Family Teaching

- ***REMS:*** Instruct patient to take lenalidomide as directed and to comply with all aspects of the *Lenolidomide REMS program*. Take missed doses as soon as remembered within 12 hr of dose missed. If more than 12 hrs, skip dose and return to next scheduled dose; do not administer 2 doses within 12 hrs. Inform patient that they are required to participate in a telephone survey and patient registry while taking lenalidomide. Details are available at www.celgeneriskmanagement.com. Advise patient to read *Medication Guide* before starting and with each Rx refill in case of changes.
- Caution patient not to share lenalidomide with anyone, even someone who has similar symptoms.
- Advise patient to notify health care professional if rash, shortness of breath, chest pain, or arm or leg swelling, signs of infection (fever, dyspnea), rash, signs and symptoms of liver failure (yellowing of skin or white part of eyes; dark or brown (tea-colored) urine; pain on upper right side of your abdomen; feeling tired; unusual bleeding or bruising), hypersensitivity (swelling of lips, mouth, tongue, or throat; trouble breathing or swallowing; hives; very fast heartbeat; feeling dizzy or faint) occur.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Inform patient that lenalidomide may cause an increased risk of death in patients with MCL and may increase risk of new cancers.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.

© F.A. Davis Publishing

- Advise patient that they cannot donate blood during and for 1 mo following therapy and male patients cannot donate sperm while taking lenalidomide.
- Inform patient of risk of new cancers during therapy.
- Rep: May cause fetal harm. Inform females of reproductive potential that they must use one highly effective method (IUD, hormonal contraceptive, tubal ligation, partner's vasectomy) and one additional method (latex condom, diaphragm, cervical cap) AT THE SAME TIME for at least 4 wk before, during therapy and interruptions of therapy, and for 4 wk following discontinuation of therapy, even with a history of infertility unless due to a hysterectomy or patient has been postmenopausal naturally for 24 consecutive mo. Advise female patients to avoid breast feeding during therapy. Males with female partners of reproductive potential receiving lenalidomide must always use a latex condom during and for up to 4 wk following discontinuation, even if they have undergone a successful vasectomy. Male patients taking lenalidomide must not donate sperm. Lenalidomide must be discontinued if pregnancy is suspected or confirmed. Suspected fetal exposure must be reported to FDA via MedWatch at 1-800-FDA-1088 and to Celgene Corporation at 1-888-423-5436. Inform females there is a Pregnancy Exposure Registry that monitors pregnancy outcomes in females exposed to lenalidomide during pregnancy and that they can contact the Pregnancy Exposure Registry by calling 1-888-423-5436.

Evaluation/Desired Outcomes

- Decreased anemia in MDS with a decreased requirement for transfusions.
- Slowing of MM progression.
- Slowing progression of MCL.
- Improved progression-free survival in FL and MZL.

lenvatinib (len-va-ti-nib)

Lenvima

Classification

Therapeutic: antineoplastics
Pharmacologic: kinase inhibitors

Indications

Locally recurrent or metastatic/progressive, radioactive-iodine-refractory differentiated thyroid cancer. Advanced renal cell carcinoma (RCC) following one previous anti-angiogenic therapy (in combination with everolimus). First-line treatment of advanced RCC (in combination with pembrolizumab). Unresectable hepatocellular carcinoma. Advanced endometrial carcinoma that is not microsatellite instability-high or mismatch repair deficient, in patients who have disease progression following prior systemic therapy in any setting and are not candidates for curative surgery or radiation (in combination with pembrolizumab).

Action

Acts as a receptor tyrosine kinase inhibitor; inhibits kinase activities of various vascular endothelial growth factor receptors, resulting in decreased pathogenic angiogenesis, tumor growth and spread. **Therapeutic Effects:** Decreased progression and improved survival of differentiated thyroid cancer, endometrial cancer, RCC, and hepatocellular carcinoma.

Pharmacokinetics

Absorption: Well absorbed following oral administration.
Distribution: Unknown.
Protein Binding: 98–99%.
Metabolism and Excretion: Metabolized primarily by the CYP3A isoenzyme and aldehyde oxidase; 64% eliminated in feces, 25% in urine.
Half-life: 28 hr.

TIME/ACTION PROFILE (improvement in progression-free survival)

ROUTE	ONSET	PEAK	DURATION
PO	within 2 mo	8 mo	throughout treatment

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Hypertension (control BP before initiating treatment, may need to withhold/discontinue for life-threatening elevation); History of heart failure (may need to withhold/discontinue for worsening HF); History of congenital long QTc syndrome, HF, bradyarrhythmias, concurrent use of drugs that prolong QTc, including Class Ia and III antiarrhythmics (↑ risk of further QTc prolongation and serious arrhythmias, may require interruption/discontinuation of lenvatinib); Severe hepatic or renal impairment (lower dose required); Dehydration/volume depletion (↑ risk of renal impairment, may need to withhold/discontinue for worsening renal function); Hypocalcemia (replace calcium, if persistent may require dose adjustment/interruption); History of reversible posterior leukoencephalopathy syndrome (may require dose adjustment/interruption); Invasive dental procedures, concurrent use of bisphosphonates or denosumab, or dental disease (may ↑ risk of jaw osteonecrosis); May damage male reproductive tissue resulting in decreased fertility; Rep: Women and men of reproductive potential; Pedi: Safety and effectiveness not established in children.

Adverse Reactions/Side Effects

CV: HF, MI, hypertension, hypotension, QT interval prolongation. **Derm:** alopecia, palmar-plantar erythrody-

© F.A. Davis Publishing

sesthesia syndrome, rash, hyperkeratosis, impaired wound healing. **EENT:** dysphonia, epistaxis. **Endo:** hypothyroidism. **F and E:** dehydration, hypocalcemia, hypokalemia. **GI:** GASTROINTESTINAL PERFORATION/FISTULA FORMATION, HEPATOTOXICITY, abdominal pain, ↓ appetite, diarrhea, dry mouth, nausea, stomatitis, vomiting, ↑ liver enzymes. **GU:** NEPHROTIC SYNDROME, proteinuria, renal impairment, ↓ fertility. **Hemat:** hemorrhagic events, thrombocytopenia. **Metab:** ↓ weight. **MS:** arthralgia/myalgia, osteonecrosis (primarily of jaw). **Neuro:** dysgeusia, CAROTID ARTERY HEMORRHAGE, REVERSIBLE POSTERIOR LEUKOENCEPHALOPATHY SYNDROME (RPLS), STROKE, fatigue, insomnia, headache. **Resp:** cough.

Interactions

Drug-Drug: Concurrent use of **QT interval prolonging drugs**, including **Class Ia and III antiarrhythmics** may ↑ risk of further QTc prolongation and serious arrhythmias (may require interruption/discontinuation of lenvatinib). Concurrent use of **alendronate**, **denosumab**, **ibandronate**, **pamidronate**, **risedronate**, or **zoledronic acid** may ↑ risk of jaw osteonecrosis.

Route/Dosage

Differentiated Thyroid Cancer

PO (Adults): 24 mg once daily until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *CCr <30 mL/min* — 14 mg once daily until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Child–Pugh C* — 14 mg once daily until disease progression or unacceptable toxicity.

Renal Cell Carcinoma

PO (Adults): *First-line treatment of advanced RCC* — 20 mg once daily (in combination with pembrolizumab) until disease progression or unacceptable toxicity or up to 2 yr. After 2 yr of combination therapy, continue 20 mg once daily (as monotherapy) until disease progression or unacceptable toxicity. *Previously treated RCC* — 18 mg once daily until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *CCr <30 mL/min* — First-line treatment of advanced RCC: 10 mg once daily (in combination with pembrolizumab) until disease progression or unacceptable toxicity or up to 2 yr. After 2 yr of combination therapy, continue 10 mg once daily (as monotherapy) until disease progression or unacceptable toxicity. Previously treated RCC: 10 mg once daily until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Child–Pugh C* — 10 mg once daily until disease progression or unacceptable toxicity.

Hepatocellular Carcinoma

PO (Adults ≥60 kg): 12 mg once daily until disease progression or unacceptable toxicity.
PO (Adults <60 kg): 8 mg once daily until disease progression or unacceptable toxicity.

Endometrial Carcinoma

PO (Adults): 20 mg once daily until disease progression or unacceptable toxicity.

Renal Impairment

PO (Adults): *CCr <30 mL/min* — 10 mg once daily until disease progression or unacceptable toxicity.

Hepatic Impairment

PO (Adults): *Child–Pugh C* — 10 mg once daily until disease progression or unacceptable toxicity.

Availability

Capsules: 4 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Assess BP prior to and after 1 wk, then every 2 wk for first 2 mo, and then at least monthly thereafter during therapy. Initiate or adjust medication management to control BP. Hold lenvatinib for Grade 3 hypertension that persists despite antihypertensive therapy. Resume at a reduced dose (*1st occurrence* — 20 mg/day; *2nd occurrence* — 14 mg/day; *3rd occurrence* — 10 mg/day) when hypertension is controlled or ≤Grade 2). Discontinue lenvatinib for life-threatening hypertension.
- Monitor for clinical signs and symptoms of cardiac dysfunction (shortness of breath, swollen ankles) during therapy. Hold lenvatinib for Grade 3 cardiac dysfunction until improved to Grade 0 or 1 or baseline. Resume at reduced dose (*1st occurrence* — 20 mg/day; *2nd occurrence* — 14 mg/day; *3rd occurrence* — 10 mg/day) or discontinue depending on severity and persistence of cardiac dysfunction.
- Monitor for signs and symptoms of arterial thromboembolic events (chest pain, acute neurologic symptoms of MI or stroke) during therapy. Discontinue lenvatinib if event occurs.
- Assess for signs and symptoms of gastrointestinal perforation or fistula formation (severe abdominal pain) during therapy. Discontinue lenvatinib if gastrointestinal perforation or fistula occurs.
- Monitor ECG for patients with congenital long QT syndrome, congestive heart failure, bradyarrhythmias, or those taking drugs known to prolong QT interval. Hold lenvatinib for development of QT interval prolongation >500 ms or >60 ms increase from baseline. Hold until improves to ≤480 ms or baseline. Resume at reduced dose (*1st occurrence* — 20 mg/day; *2nd occurrence* — 14 mg/day; *3rd occurrence* — 10 mg/day) when QT prolongation resolves to Grade 0 or 1.
- Monitor for signs and symptoms of reversible posterior leukoencephalopathy syndrome (RPLS) (severe

© F.A. Davis Publishing

headache, seizures, weakness, confusion, blindness or change in vision) during therapy. If symptoms occur, confirm diagnosis with MRI. Hold lenvatinib for RPLS until fully resolved. Resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) or discontinue depending on severity and persistence of neurologic symptoms.

- Monitor for bleeding (severe and persistent nose bleeds, vomiting blood, red or black stools, coughing up blood or blood clots, heavy or new onset vaginal bleeding) during therapy. Hold lenvatinib for Grade 3 hemorrhage until resolved to Grade 0 or 1. Resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) or discontinue depending on severity and persistence of hemorrhage. Discontinue lenvatinib if Grade 4 hemorrhage occurs.
- Obtain an oral exam prior to and periodically during therapy. Hold lenvatinib for at least 1 wk before scheduled dental surgery or invasive dental procedures, if possible. Discontinuation of bisphosphonate therapy may reduce the risk of osteonecrosis of the jaw (ONJ). Hold lenvatinib if ONJ develops and restart after adequate resolution.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Monitor serum ALT and AST levels for hepatotoxicity prior to and every 2 wk for first 2 mo, and at least monthly thereafter during therapy. Hold lenvatinib for Grade 3 cardiac dysfunction until improved to Grade 0 or 1 or baseline. Resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) or discontinue depending on severity and persistence of hepatotoxicity. May cause hypoalbuminemia, ↑ alkaline phosphatase, and hyperbilirubinemia.
- Monitor for proteinuria prior to and periodically during therapy. If urine dipstick proteinuria ≥2+ is detected, obtain 24 hr urine protein. Hold lenvatinib for ≥2 g proteinuria/24 hrs and resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) when proteinuria <2 g/24 hrs. Discontinue lenvatinib for nephrotic syndrome.
- Monitor BUN and serum creatinine prior to and periodically during therapy. Hold lenvatinib for Grade 3 or 4 renal failure/impairment until resolved to Grade 0 or 1 or baseline. Resume at reduced dose (*1st occurrence*—20 mg/day; *2nd occurrence*—14 mg/day; *3rd occurrence*—10 mg/day) or discontinue depending on severity and persistence of renal impairment.
- Monitor and correct electrolyte abnormalities. Monitor serum calcium levels at least monthly and replace calcium as needed during therapy. Interrupt and adjust lenvatinib dose based on severity, presence of ECG changes, and persistence of hypocalcemia. May cause hypokalemia, hypomagnesemia, hypoglycemia, hypercalcemia, and hyperkalemia.
- Monitor TSH levels monthly and adjust thyroid replacement medication as needed in patients with ↓ thyroid levels.
- May cause ↑ serum lipase and amylase, hypercholesterolemia, and ↓ platelet count.

Implementation

- Hold therapy for at least 1 wk before elective surgery and for at least 2 wk after major surgery and until adequate wound healing occurs.
- **PO:** Administer two 10-mg capsules and one 4-mg capsule to make 24 mg at the same time each day without regard to food. ***DNC:*** Swallow capsules whole; do not open, crush, or chew. For patients with difficulty swallowing, open capsule and dissolve capsule in small glass of liquid. Measure 1 tablespoon of water or apple juice and put capsule in liquid without breaking or crushing. Leave capsule in liquid for at least 10 min. Stir for at least 3 min, then drink mixture. After drinking, add same amount (1 tablespoon) of water or apple juice to glass. Swirl contents and swallow additional liquid.

Patient/Family Teaching

- Instruct patient to take lenvatinib as directed at the same time each day. Take missed dose within 12 hrs or omit and take next dose at usual time; do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional promptly if signs and symptoms of high BP, heart problems, blood clots (severe chest pain or pressure; pain in arms, back, or jaw; shortness of breath; numbness or weakness on 1 side of body; trouble talking; sudden severe headache; sudden vision changes), liver problems (yellow skin or whites of eyes, dark tea colored urine, light-colored bowel movements), severe stomach pain, RPLS, or bleeding occur.
- Instruct patient to notify health care professional of therapy before any elective surgery or dental procedure. Lenvatinib must be stopped at least 1 wk before and for at least 2 wk after major surgery and until wound healing occurs.
- Advise patient to practice good mouth care during therapy and to notify health care professional if signs and symptoms of ONJ (jaw pain, toothache, sores on gums) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.

© F.A. Davis Publishing

- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for at least 30 days following last dose of therapy and to notify health care professional if pregnancy is suspected. Advise patient to avoid breast feeding during and for at least 1 wk after last dose. May impair fertility in males and females.
- Emphasize importance of lab tests to monitor for adverse reactions.

Evaluation/Desired Outcomes

- Decreased progression and improved survival of differentiated thyroid cancer, endometrial cancer, renal cell carcinoma, and hepatocellular carcinoma.

letrozole (let-roe-zole)

Femara

Classification

Therapeutic: antineoplastics
Pharmacologic: aromatase inhibitors

Indications

First-line or second-line treatment of postmenopausal women with hormone receptor positive or hormone receptor unknown advanced breast cancer. Adjuvant treatment of postmenopausal women with hormone receptor positive early breast cancer. Extended adjuvant treatment of postmenopausal early breast cancer already treated with 5 yr of tamoxifen.

Action

Inhibits the enzyme aromatase, which is partially responsible for conversion of precursors to estrogen.

Therapeutic Effects: Lowers levels of circulating estrogen, which may halt progression of estrogen-sensitive breast cancer. Decreased risk of recurrence/metastatic disease.

Pharmacokinetics

Absorption: Rapidly and completely absorbed.
Distribution: Unknown.
Metabolism and Excretion: Mostly metabolized by the liver.
Half-life: 2 days.

TIME/ACTION PROFILE (effect on lowering of serum estradiol levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	2–3 days	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Premenopausal women; OB: Potential for fetal harm.
Use Cautiously in: Severe hepatic impairment; Rep: Women of reproductive potential; Lactation, Pedi: Safety not established.

Adverse Reactions/Side Effects

CV: DEEP VEIN THROMBOSIS, chest pain, edema, hypertension. **Derm:** alopecia, hot flashes, ↑ sweating, pruritus, rash. **F and E:** hypercalcemia. **GI:** nausea, abdominal pain, anorexia, constipation, diarrhea, dyspepsia, vomiting. **GU:** ↓ fertility. **Metab:** hypercholesterolemia, weight gain. **MS:** musculoskeletal pain, arthralgia, ↓ bone density, fracture. **Neuro:** STROKE/TIA, anxiety, depression, dizziness, drowsiness, fatigue, headache, vertigo, weakness. **Resp:** PULMONARY EMBOLISM, cough, dyspnea, pleural effusion.

Interactions

Drug-Drug: None reported.

Route/Dosage

PO (Adults): 2.5 mg once daily.

Hepatic Impairment

PO (Adults): *Severe hepatic impairment*—2.5 mg every other day.

Availability (generic available)

Tablets: 2.5 mg.

NURSING IMPLICATIONS

Assessment

- Assess patient for pain and other side effects periodically during therapy.
- Monitor bone mineral density periodically during therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- May cause elevated AST, ALT, alkaline phosphatase, bilirubin, GGT and cholesterol levels.

Implementation

- Do not confuse Femara (letrozole) with Femhrt (ethinyl estradiol/norethindrone).
- **PO:** May be taken without regard to food.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- May cause dizziness and fatigue. Caution patient to avoid driving and other activities requiring awareness until response to medication is known.
- Inform patient of potential for adverse reactions and advise her to notify health care professional if side effects are problematic.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and to avoid breast feeding during and for at least 3 wk after last dose of letrozole. May impair fertility in males and females. Caution women who are perimenopausal or who recently became menopausal to use adequate contraception during therapy.

Evaluation/Desired Outcomes

- Slowing of disease progression in women with advanced breast cancer.
- Decreased risk of recurrence/metastatic disease.

© F.A. Davis Publishing

leucovorin calcium
(loo-koe-**vor**-in)

Classification
Therapeutic: antidotes (for methotrexate), vitamins
Pharmacologic: folic acid analogues

Indications
Minimizes hematologic effects of high-dose methotrexate therapy (leucovorin rescue). Advanced colorectal carcinoma (with 5-fluorouracil). Management of overdoses/prevention of toxicity from folic acid antagonists (pyrimethamine, trimethoprim). Folic acid deficiency (megaloblastic anemia) unresponsive to oral replacement.

Action
The reduced form of folic acid that serves as a cofactor in the synthesis of DNA and RNA. **Therapeutic Effects:** Reversal of toxic effects of folic acid antagonists. Reversal of folic acid deficiency.

Pharmacokinetics
Absorption: Well absorbed (38%) following PO administration. ↓ bioavailability with larger doses. Oral absorption is saturated at doses >25 mg.
Distribution: Widely distributed. Concentrates in the CNS and liver.
Metabolism and Excretion: Extensively converted to tetrahydrofolic derivatives, including 5-methyltetrahydrofolate, a major storage form.
Half-life: 3.5 hr.

TIME/ACTION PROFILE (serum folate levels)

ROUTE	ONSET	PEAK	DURATION
PO	20–30 min	unknown	3–6 hr
IM	10–20 min	unknown	3–6 hr
IV	<5 min	unknown	3–6 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Pedi: Preparations containing benzyl alcohol should not be used in neonates.
Use Cautiously in: Undiagnosed anemia (may mask the progression of pernicious anemia); Ascites; Renal failure; Dehydration; Pleural effusions; Urine pH <7; OB, Lactation: Safety not established but has been used safely to treat megaloblastic anemia in pregnancy.

Adverse Reactions/Side Effects
Hemat: thrombocytosis. **Misc:** allergic reactions (rash, urticaria, wheezing).

Interactions
Drug-Drug: May ↓ anticonvulsant effect of **barbiturates**, **phenytoin**, or **primidone**. High doses of the liquid contain significant **alcohol** and may cause ↑ CNS depression when used with **CNS depressants**. Concurrent use with **trimethoprim/sulfamethoxazole** may result in ↓ anti-infective efficacy and poor therapeutic outcome when used to treat *Pneumocystis jirovecii* pneumonia in HIV patients. May ↑ therapeutic effects and toxicity of **fluorouracil**; therapy may be combined for this purpose.

Route/Dosage

High-Dose Methotrexate—Leucovorin Rescue. Must start within 24 hr of methotrexate.
PO, IM, IV (Adults and Children): *Normal methotrexate elimination*—10 mg/m² every 6 hr (1st dose IV/IM, then change to PO) until methotrexate level is $<5 \times 10^{-8}$ M (0.05 micromolar). Larger doses/longer duration may be required in patients with aciduria, ascites, dehydration, renal impairment, GI obstruction, pleural/peritoneal effusions. Dose of leucovorin should be determined on the basis of plasma methotrexate levels.

Advanced Colorectal Cancer
IV (Adults): 200 mg/m² followed by 5-fluorouracil 370 mg/m² or leucovorin 20 mg/m² is followed by 5-fluorouracil 425 mg/m². Regimen is given daily for 5 days every 4–5 wk.

Prevention of Hematologic Toxicity from Pyrimethamine
PO, IV (Adults and Children): 5–15 mg/day.

Inadvertent Overdose of Folic Acid Antagonists
IM, IV (Adults and Children): *Methotrexate–large doses*—75 mg IV followed by 12 mg IM every 6 hr for 4 doses; *methotrexate–average doses*—6–12 mg IM every 6 hr for 4 doses; *other folic acid antagonists*—amount equal in mg to folic acid antagonist.

Megaloblastic Anemia
PO, IM, IV (Adults and Children): Up to 1 mg/day (up to 6 mg/day for dihydrofolate reductase deficiency).

Availability (generic available)
Powder for injection: 50 mg/vial, 100 mg/vial, 200 mg/vial, 350 mg/vial, 500 mg/vial. **Solution for injection (preservative-free):** 10 mg/mL. **Tablets:** 5 mg, 10 mg, 15 mg, 25 mg.

NURSING IMPLICATIONS

Assessment
- Assess patient for nausea and vomiting secondary to methotrexate therapy or folic acid antagonists (pyrimethamine and trimethoprim) overdose. Parenteral route may be necessary to ensure that patient receives dose.

© F.A. Davis Publishing

- Monitor for development of allergic reactions (rash, urticaria, wheezing). Notify health care professional if these occur.
- **Megaloblastic Anemia:** Assess degree of weakness and fatigue.
- ***Lab Test Considerations:*** **Leucovorin rescue:** Monitor serum methotrexate levels to determine dose and effectiveness of therapy. Leucovorin calcium levels should be equal to or greater than methotrexate level. Rescue continues until serum methotrexate level is $<5 \times 10$ M.
- Monitor CCr and serum creatinine prior to and every 24 hr during therapy to detect methotrexate toxicity. An increase >50% over the pretreatment concentration at 24 hr is associated with severe renal toxicity.
- Monitor urine pH every 6 hr during therapy; pH should be maintained >7 to decrease nephrotoxic effects of high-dose methotrexate. Sodium bicarbonate or acetazolamide may be ordered to alkalinize urine.
- *Megaloblastic anemia*—Monitor plasma folic acid levels, hemoglobin, hematocrit, and reticulocyte count prior to and periodically during therapy.

Implementation

- Do not confuse leucovorin calcium with levoleucovorin. Do not confuse leucovorin calcium with Leukeran (chlorambucil).
- Make sure leucovorin calcium is available before administering high-dose methotrexate. Administration must be initiated within 24 hr of methotrexate therapy.
- Administer as soon as possible after toxic dose of folic acid antagonists (pyrimethamine and trimethoprim). Effectiveness of therapy begins to decrease 1 hr after overdose.
- **PO:** Parenteral therapy should be used in patients with GI toxicity, with nausea and vomiting, or with doses >25 mg.
- **IM:** IM route is preferred for treatment of megaloblastic anemia. Ampules of leucovorin calcium injection for IM use do not require reconstitution.

IV Administration

- **IV Push:** Bacteriostatic water or sterile water. Do not use product containing benzyl alcohol. Use immediately if reconstituted with sterile water for injection. Stable for 7 days when reconstituted with bacteriostatic water. ***Concentration:*** reconstitute 50-mg, 100-mg, and 200-mg vials to a concentration of 10 mg/mL; reconstitute 350-mg vial to a concentration of 20 mg/mL. ***Rate:*** Administer by slow injection over a minimum of 3 min; not to exceed 160 mg/min.
- **Intermittent Infusion:** ***Dilution:*** May be diluted in 100–500 mL of D5W, D10W, 0.9% NaCl, Ringer's, or LR. Stable for 24 hr.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetamide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carmustine, caspofungin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexamedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, irinotecan, isoproterenol, ketorolac, labetalol, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methotrexate, methyldopate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, remifentanil, rituximab, rocuronium, sodium acetate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine.
- **Y-Site Incompatibility:** amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, carboplatin, ceftriaxone, chlorpromazine, dantrolene, diazepam, droperidol, epirubicin, foscarnet, methylprednisolone, naloxone, pamidronate, pantoprazole, pentamidine, phenytoin, potassium phosphates, quinupristin/dalfopristin, sodium bicarbonate, thiopental, vancomycin.

Patient/Family Teaching

- Explain purpose of medication to patient. Emphasize need to take exactly as ordered. Advise patient to contact health care professional if a dose is missed.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- **Leucovorin Rescue:** Instruct patient to drink at least 3 liters of fluid each day during leucovorin rescue.
- **Folic Acid Deficiency:** Encourage patient to eat a diet high in folic acid (meat proteins; bran; dried beans; and green, leafy vegetables).

© F.A. Davis Publishing

Evaluation/Desired Outcomes

- Reversal of bone marrow and GI toxicity in patients receiving methotrexate or in overdose of folic acid antagonists.
- Increased sense of well-being and increased production of normoblasts in patients with megaloblastic anemia.

leuprolide (loo-**proe**-lide)

Camcevi, Eligard, Fensolvi, ~~Lupron~~, Lupron, Lupron Depot, Lupron Depot-Ped, Zeulide Depot

Classification

Therapeutic: antineoplastics
Pharmacologic: hormones, gonadotropin-releasing hormones

Indications

Advanced prostate cancer in patients who are unable to tolerate orchiectomy or estrogen therapy (may be used in combination with flutamide or bicalutamide). Central precocious puberty (CPP). Endometriosis (as monotherapy or in combination with norethindrone). Uterine fibroids (in combination with iron).

Action

A synthetic analogue of luteinizing hormone–releasing hormone (LHRH). Initially causes a transient increase in testosterone; however, with continuous administration, testosterone levels are decreased. Reduces gonadotropins, testosterone, and estradiol. **Therapeutic Effects:** Decreased testosterone levels and resultant decrease in spread of prostate cancer. Reduction of pain/lesions in endometriosis. Decreased growth of fibroids. Delayed puberty.

Pharmacokinetics

Absorption: Rapidly and almost completely absorbed following subcut administration. More slowly absorbed following IM administration of depot form.
Distribution: Unknown.
Metabolism and Excretion: Unknown.
Half-life: 3 hr.

TIME/ACTION PROFILE (effect on hormone levels)

ROUTE	ONSET†	PEAK‡	DURATION§
Subcut	within 1st wk	2–4 wk	4–12 wk
IM	within 1st wk	2–4 wk	4–12 wk
IM-depot	within 1st wk	2–4 wk	4–12 wk

†Initial transient ↑ in testosterone and estradiol levels.
‡Maximum decline in testosterone and estradiol levels.
§Restoration of normal pituitary–gonadal function; in amenorrheic patients, normal menses usually returns 60–90 days after treatment is discontinued.

Contraindications/Precautions

Contraindicated in: Hypersensitivity to synthetic analogues of LHRH (GnRH) or GnRH agonists; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.
Use Cautiously in: Hypersensitivity to benzyl alcohol (results in induration and erythema at subcut site); Congenital long QT syndrome, HF, electrolyte abnormalities, or concurrent use of other drugs known to prolong the QT interval; Seizures, cerebrovascular disorders, CNS tumor, or concurrent use of bupropion or selective serotonin reuptake inhibitors; Rep: Women of reproductive potential.

Adverse Reactions/Side Effects

CV: MI, angina, arrhythmias; *Depot*, QT interval prolongation, vasodilation. **Derm:** *Depot*—hair growth, rash; *Subcut*, dry skin, hair loss, pigmentation, skin cancer, skin lesions. **EENT:** blurred vision; *Subcut*, hearing disorder. **Endo:** breast swelling, breast tenderness, hyperglycemia. **F and E:** hypercalcemia, lower extremity edema. **GI:** anorexia, diarrhea, dysphagia, nausea, vomiting; *Depot*, HEPATOTOXICITY, gingivitis; *Subcut*, GI BLEEDING, hepatic impairment, peptic ulcer, rectal polyps, taste disorders. **GU:** ↓ fertility (males), ↓ testicular size, dysuria, incontinence, testicular pain; *Depot*, cervix disorder; *Subcut*, bladder spasm, penile swelling, prostate pain, urinary obstruction. **Local:** burning, itching, swelling at injection site. **Metab:** *Depot*—hyperuricemia, ↓ bone density. **MS:** fibromyalgia, transient ↑ in bone pain (prostate cancer only); *Subcut*, ankylosing spondylitis, joint pain, pelvic fibrosis, temporal bone pain. **Neuro:** *Subcut*—peripheral neuropathy, SEIZURES, STROKE, aggression, anger, dizziness, headache, impatience, irritability, syncope; *Depot*, depression, drowsiness, personality disorder; *Subcut*, anxiety, blurred vision, lethargy, memory disorder, mood swings. **Resp:** PULMONARY EMBOLISM, hemoptysis; *Depot*, epistaxis, throat nodules; *Subcut*, cough, pleural rub, pulmonary fibrosis, pulmonary infiltrate. **Misc:** hot flashes, chills, ↓ libido, fever; *Depot*, body odor, epistaxis.

Interactions

Drug-Drug: ↑ antineoplastic effects with **antiandrogens** (**megestrol**, **flutamide**). Concurrent use with **bupropion** or **SSRIs** may ↑ risk of seizures. **QT interval prolonging drugs** may ↑ risk of QT interval prolongation.

Route/Dosage

Advanced Prostate Cancer

Subcut (Adults): *Leuprolide acetate*—1 mg/day; *Eligard*—7.5 mg once monthly, 22.5 mg every 3 mo, 30 mg every 4 mo, or 45 mg every 6 mo. *Camcevi*—42 mg every 6 mo.
IM (Adults): *Lupron Depot*—7.5 mg once monthly *or* 22.5 mg every 3 mo *or* 30 mg every 4 mo *or* 45 mg every 6 mo.

© F.A. Davis Publishing

Endometriosis

IM (Adults): *Lupron Depot*—3.75 mg once monthly for up to 6 mo *or* 11.25 mg every 3 mo for up to 2 doses; if symptoms recur after initial course of therapy, may administer a 2nd course of therapy.

Uterine Fibroids (with iron therapy)

IM (Adults): *Lupron Depot*—3.75 mg once monthly for up to 3 mo *or* 11.25 mg single injection.

Central Precocious Puberty

Subcut (Children ≥2 yr): *Leuprolide acetate*—50 mcg/kg/day, may ↑ by 10 mcg/kg/day as required. *Fensolvi*—45 mg every 6 mo.

IM (Children ≥2 yr and >37.5 kg): *Lupron Depot-Ped*—15 mg every 4 wk; may ↑ by 3.75 mg every 4 wk as required.

IM (Children ≥2 yr and 26–37.5 kg): *Lupron Depot-Ped*—11.25 mg every 4 wk; may ↑ by 3.75 mg every 4 wk as required.

IM (Children ≥2 yr and ≤25 kg): *Lupron Depot-Ped*—7.5 mg every 4 wk; may ↑ by 3.75 mg every 4 wk as required.

IM (Children ≥2 yr): *Lupron Depot-Ped*—11.25 or 30 mg every 3 mo.

Availability (generic available)

Emulsion for injection (Camcevi) (prefilled syringe): 42 mg/syringe. **Lyophilized microspheres for depot injection (Lupron Depot):** 3.75 mg, 7.5 mg, 11.25 mg, 22.5 mg, 30 mg, 45 mg. **Lyophilized microspheres for depot injection (Lupron Depot-Ped):** 7.5 mg, 11.25 mg, 15 mg, 30 mg. **Lyophilized powder for injection (Fensolvi):** 45 mg/vial. **Polymeric matrix injectable formulation for injection (Eligard):** 7.5 mg, 22.5 mg, 30 mg, 45 mg. **Solution for injection (leuprolide acetate):** 1 mg/0.2 mL.

NURSING IMPLICATIONS

Assessment

- Monitor ECG periodically in patients at risk for QT interval prolongation.
- **Prostate Cancer:** Assess for an increase in bone pain, especially during the first few wk of therapy. Monitor patients with vertebral metastases for increased back pain and decreased sensory/motor function.
- Monitor intake and output ratios; assess for bladder distention in patients with urinary tract obstruction during initiation of therapy.
- **Fibroids:** Assess for severity of symptoms (bloating, pelvic pain, pressure, excessive vaginal bleeding) periodically during therapy.
- **Endometriosis:** Assess for endometrial pain prior to and periodically during therapy.
- **CPP:** Prior to therapy, diagnosis of CPP should be confirmed by onset of secondary sex characteristics in girls <8 yr or boys <9 yr; a complete physical and endocrinologic examination, including height, weight, hand and wrist x-ray; total sex steroid level (estradiol or testosterone); adrenal steroid level; beta human chorionic gonadotropin level; GnRH stimulation test; and computerized tomography of the head must be performed. These parameters are monitored after 1–2 mo and every 3–6 mo during therapy.
- Assess for signs of precocious puberty (menses, breast development, testicular growth) periodically during therapy. Dose is increased until no progression of the disease is noted either clinically or by lab test parameters, then usually maintained throughout therapy. Discontinuation of therapy should be considered before age 11 in girls and age 12 in boys.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Initially ↑, then ↓ luteinizing hormone (LH) and follicle-stimulating hormone (FSH). This leads to castration levels of testosterone in boys 2–4 wk after initial increase in concentrations.
- Monitor testosterone, prostatic acid phosphate, and prostate-specific antigen (PSA) levels to evaluate response to therapy. Transient ↑ in levels may occur during the 1st mo of therapy for prostate cancer.
- Monitor electrolytes before starting and periodically during therapy. May cause ↑ BUN, serum calcium, uric acid, hypoproteinemia, LDH, alkaline phosphatase, AST, hyperglycemia, hyperlipidemia, hyperphosphatemia, WBC, PT, or aPTT. May also cause ↓ platelets and serum potassium.
- Monitor blood sugar and glycosylated hemoglobin periodically during therapy.

Implementation

- Do not confuse Lupron Depot with Lupron Depot-Ped.
- Norethindrone acetate 5 mg daily may be used to prevent bone density loss from leuprolide.
- Correct electrolyte abnormalities before starting therapy.
- **Subcut** *Camcevi:* **Must be administered by a health care professional. Allow prefilled syringe to stand at room temperature for 30 min before injection. Wear gloves during preparation and administration. Inject into upper- or mid-abdominal area with sufficient soft or loose subcutaneous tissue that has not recently been used. Clean the injection site with an alcohol swab. Do NOT inject in areas with brawny or fibrous subcutaneous tissue or locations that can be rubbed or compressed (with a belt or clothing waistband). Avoid applying heat directly to the site of injection. Pinch skin and inject at 90° angle, release skin and inject full contents of syringe.** *Eligard subcut formulation:* **Bring to room temperature before mixing.** ***Reconstitution:*** Assemble the *Eligard* kit and reconstitute solution using syringes provided, as directed by manufacturer. Wearing

© F.A. Davis Publishing

gloves, mix in syringes as directed by manufacturer, do not shake. Solution must reach room temperature before administration and must be administered within 30 min of mixing, or be discarded. Solution is light tan to tan in color. Inject into abdomen, upper buttocks, or anywhere that has adequate amounts of subcut tissue without excessive pigment, nodules, lesions, or hair. Vary site with each injection. Store in refrigerator; may also be stored at room temperature in original packing for up to 8 wk before mixing. *Fensolvi:* Must be administered by a health care professional. Allow to reach room temperature before reconstitution. ***Reconstitution:*** Follow manufacturer's instructions for assembling syringes and mixing. ***Concentration:*** 45 mg/0.375 mL. Administer within 30 min or discard. Inject into abdomen or upper buttocks. Avoid areas that have excessive pigment, nodules, lesions, or hair. Pinch skin and inject at 90° angle. Release skin and inject slowly. Rotate injection sites.

- **IM:** Use syringe supplied by manufacturer. Rotate sites.
- Leuprolide depot is *only* for IM injection.
- *Lupron Depot formulation: Lupron Depot-Ped* must be administered by a health care professional. ***Reconstitution:*** To prepare for injection screw white plunger into end stopper until stopper begins to turn. Hold syringe upright; release diluent by slowly pushing, over 6–8 sec, until the first stopper is at the blue line in the middle of the barrel. Keep syringe upright. Mix microspheres by shaking syringe until power forms a unified suspension. Tap syringe if caking or clumping occurs. Do not combine syringes or partial syringes to arrive at a dose of *Lupron Depot-Ped*. Suspension will appear milky. Do not use if powder does not go into suspension. Keep syringe upright, remove cap and expel air. Inject at 90° angle in gluteal area, anterior thigh, or deltoid, aspirate and discard if blood in syringe. Suspension settles very quickly; mix and administer immediately. Administer within 2 hr or discard. Rotate injection sites.

Patient/Family Teaching

- Advise patient that medication may cause hot flashes. Notify health care professional if these become bothersome.
- Leuprolide depot usually causes a temporary discontinuation of menstruation. Advise patient to notify health care professional if menstruation persists or if intermittent bleeding occurs.
- Inform patient of the possibility of the development or worsening of depression and occurrence of memory disorders.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during therapy. Advise patient to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise patient that leuprolide may impair fertility.
- **Prostate Cancer:** Instruct patient and family on subcut injection technique. Review patient insert provided with leuprolide patient-administration kit.
- Instruct patient to take medication exactly as directed. Take missed doses as soon as remembered unless not remembered until next day.
- Inform patient that bone pain may increase at initiation of therapy, but will resolve with time. Advise patient to discuss use of analgesics to control pain with health care professional.
- Instruct patient to notify health care professional promptly if difficulty urinating, weakness, or numbness occurs.
- **Endometriosis:** Advise patient to use a form of contraception other than oral contraceptives during therapy. Inform patient that amenorrhea is expected but does not guarantee contraception. Advise patient that breast feeding should be avoided during therapy.
- **Central Precocious Puberty:** Instruct patient and family on the proper technique for subcut injection. Emphasize the importance of administering the medication at the same time each day. Rotate injection sites periodically.
- Inform patient and parents that if injections are not given daily, pubertal process may be reactivated.
- Advise patient and parents that during the first 2 mo of therapy patient may experience a light menstrual flow or spotting. Health care professional should be notified if this continues beyond 2nd mo.
- Instruct patient and parents to notify health care professional immediately if irritation at the injection site or unusual signs or symptoms occur.

Evaluation/Desired Outcomes

- Decrease in the spread of prostate cancer.
- Decrease in lesions and pain in endometriosis.
- Resolution of the signs of CPP.
- Improvement in preoperative hematologic parameters in patients with anemia from uterine fibroids.

levalbuterol

(leev-al-**byoo**-ter-ole)

Xopenex, Xopenex HFA

Classification

Therapeutic: bronchodilators

Pharmacologic: adrenergics

Indications

Bronchospasm due to reversible airway disease (short-term control agent).

© F.A. Davis Publishing

Action

R-enantiomer of racemic albuterol. Binds to beta-2 adrenergic receptors in airway smooth muscle leading to activation of adenylcyclase and increased levels of cyclic-3′, 5′-adenosine monophosphate (cAMP). Increases in cAMP activate kinases, which inhibit the phosphorylation of myosin and decrease intracellular calcium. Decreased intracellular calcium relaxes bronchial smooth muscle.
Therapeutic Effects: Relaxation of airway smooth muscle with subsequent bronchodilation. Relatively selective for beta-2 (pulmonary) receptors.

Pharmacokinetics

Absorption: Some absorption occurs following inhalation.
Distribution: Unknown.
Metabolism and Excretion: Metabolized in the liver to an inactive sulfate and 3–6% excreted unchanged in the urine.
Half-life: 3.3–4 hr.

TIME/ACTION PROFILE (bronchodilation)

ROUTE	ONSET	PEAK	DURATION
Inhaln	10–17 min	90 min	5–6 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to levalbuterol or albuterol.
Use Cautiously in: Cardiovascular disorders (including coronary insufficiency, hypertension, and arrhythmias); History of seizures; Hypokalemia; Hyperthyroidism; Diabetes mellitus; Unusual sensitivity to adrenergic amines; OB: Safety not established; Lactation: Use while breast feeding only if maternal benefit outweighs potential risk to infant; Pedi: Children <6 yr (nebulized solution) or <4 yr (metered-dose inhaler) (safety not established).
Exercise Extreme Caution in: Concurrent use or use within 2 wk of **tricyclic antidepressants** or **MAO inhibitors** (may ↑ risk of adverse cardiovascular reactions).

Adverse Reactions/Side Effects

CV: tachycardia. **Endo:** hyperglycemia. **F and E:** hypokalemia. **GI:** dyspepsia, vomiting. **Neuro:** tremor, anxiety, dizziness, headache, nervousness. **Resp:** PARADOXICAL BRONCHOSPASM (excessive use of inhalers), cough, turbinate edema.

Interactions

Drug-Drug: Concurrent use or use within 2 wk of **tricyclic antidepressants** or **MAO inhibitors** may ↑ risk of adverse cardiovascular reactions (use with extreme caution). **Beta blockers** block the beneficial pulmonary effects of adrenergic bronchodilators (choose cardioselective beta blockers if necessary and with caution). May ↑ risk of hypokalemia from **potassium-losing diuretics**. May ↓ serum **digoxin** levels. May ↑ risk of arrhythmias with **hydrocarbon inhalation anesthetics** or **cocaine**.
Drug-Natural Products: Use with caffeine-containing herbs (**guarana**, **tea**, **coffee**) ↑ stimulant effect.

Route/Dosage

Inhaln (Adults and Children ≥4 yr): 2 inhalations every 4–6 hr; some patients may respond to 1 inhalation every 4 hr.
Inhaln (Adults and Children >12 yr): 0.63 mg via nebulization 3 times daily (every 6–8 hr); may be ↑ to 1.25 mg 3 times daily (every 6–8 hr).
Inhaln (Children 6–11 yr): 0.31 mg via nebulization 3 times daily (not to exceed 0.63 mg 3 times daily).

Availability (generic available)

Inhalation aerosol: 45 mcg/actuation in 15-g canisters (200 metered actuations). **Cost:** $54.23/15 g. **Inhalation solution:** 0.31 mg/3 mL, 0.63 mg/3 mL, 1.25 mg/3 mL, 1.25 mg/0.5 mL. **Cost:** *Generic*—All strengths $6.71/3 mL.

NURSING IMPLICATIONS

Assessment

- Assess lung sounds, pulse, and BP before administration and during peak of medication. Note amount, color, and character of sputum produced. Closely monitor patients on higher dose for adverse effects.
- Monitor pulmonary function tests before initiating therapy and periodically during course to determine effectiveness of medication.
- Observe for paradoxical bronchospasm (wheezing, dyspnea, tightness in chest). If condition occurs, withhold medication and notify health care provider immediately.
- ***Lab Test Considerations:*** May cause ↑ serum glucose and ↓ serum potassium.

Implementation

- **Inhaln:** Allow at least 1 min between inhalations of aerosol medication.
- For nebulization, levalbuterol solution does not require dilution prior to administration. Once the foil pouch is opened, vials must be used within 2 wk; open vials may be stored for 1 wk. Discard vial if solution is not clear or colorless.

Patient/Family Teaching

- Instruct patient in the proper use of inhalation aerosol nebulizer (see Appendix C) and to take levalbuterol as directed. Caution patient not to exceed recommended dose; may cause adverse effects, paradoxical bronchospasm, or loss of effectiveness of medication.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any OTC medications or alcoholic beverages concurrently with this therapy. Caution patient also to avoid smoking and other respiratory irritants.

© F.A. Davis Publishing

- Instruct patient to contact health care professional immediately if shortness of breath is not relieved by medication or is accompanied by diaphoresis, dizziness, palpitations, or chest pain.
- Advise patients to use levalbuterol first if using other inhalation medications, and allow 5 min to elapse before administering other inhalant medications unless otherwise directed.
- Advise patient to rinse mouth with water after each inhalation dose to minimize dry mouth.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Encourage women who become pregnant while taking levalbuterol to enroll in the Asthma & Pregnancy Study to monitor pregnancy outcomes in women exposed to asthma medications by calling 1-877-311-8972 or visiting www.mothertobaby.org/ongoing-study/asthma.
- Instruct patient to notify health care professional if no response to the usual dose of levalbuterol.

Evaluation/Desired Outcomes

- Prevention or relief of bronchospasm.

levETIRAcetam

(le-ve-teer-**a**-se-tam)

Elepsia XR, Keppra, Keppra XR, ~~Roweepra~~, Spritam

Classification

Therapeutic: anticonvulsants

Pharmacologic: pyrrolidines

Indications

Partial onset seizures (as monotherapy or adjunctive therapy). Primary generalized tonic-clonic seizures (adjunct) (immediate-release and injection only). Myoclonic seizures in patients with juvenile myoclonic epilepsy (adjunct) (immediate-release and injection only). **Unlabeled Use:** Status epilepticus.

Action

Appears to inhibit burst firing without affecting normal neuronal excitability and may selectively prevent hypersynchronization of epileptiform burst firing and propagation of seizure activity. **Therapeutic Effects:** Decreased incidence and severity of seizures.

Pharmacokinetics

Absorption: Rapidly and completely absorbed following oral administration.

Distribution: Unknown.

Protein Binding: <10%.

Metabolism and Excretion: 66% excreted unchanged by the kidneys; some metabolism by the liver (metabolites inactive).

Half-life: 7.1 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–1.5 hr†‡	12 hr

†1 hr in the fasting state, 1.5 hr when taken with food.
‡4 hr with extended-release.

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: All patients (may ↑ risk of suicidal thoughts/behaviors); Renal impairment (dose ↓ recommended if CCr ≤80 mL/min); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; blood levels may be ↓ during pregnancy (especially during 3rd trimester); Lactation: Safety not established in breast feeding; Pedi: Safety and effectiveness not established in children <1 mo (immediate-release tablets, tablets for oral suspension, oral solution, and injection), <12 yr (extended-release tablets); Geri: Older adults may have ↓ renal elimination (dose ↓ may be necessary).

Adverse Reactions/Side Effects

CV: hypertension. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS. **Hemat:** AGRANULOCYTOSIS, anemia, eosinophilia, neutropenia, thrombocytopenia. **Neuro:** coordination difficulties (adults only), SUICIDAL THOUGHTS, aggression, agitation, anger, anxiety, apathy, depersonalization, depression, dizziness, drowsiness, fatigue, hostility, irritability, personality disorder, psychosis, weakness, hyperkinesia. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: None noted.

Route/Dosage

Only the oral solution should be used in patients ≤20 kg.

Partial Onset Seizures

PO, IV (Adults and Children ≥16 yr): 500 mg twice daily initially; may ↑ by 1000 mg/day at 2-wk intervals up to 3000 mg/day in 2 divided doses.

PO (Adults and Children 4–15 yr): *Oral solution* — 10 mg/kg twice daily; ↑ by 20 mg/kg/day at 2-wk intervals to recommended dose of 30 mg/kg twice daily (not to exceed 1500 mg twice daily). *Immediate-release tablets or tablets for oral suspension (for patients >40 kg)* — 500 mg twice daily; may ↑ by 1000 mg/day at 2-wk intervals up to 3000 mg/day in 2 divided doses. *Immediate-release tablets or tablets for oral suspension (for patients 20–40 kg)* — 250 mg twice daily; may ↑ by 500 mg/day at 2-wk intervals up to 1500 mg/day in 2 divided doses.

© F.A. Davis Publishing

PO (Adults and Children ≥12 yr and ≥50 kg): *Extended-release*—1000 mg once daily; may ↑ by 1000 mg/day at 2-wk intervals up to 3000 mg once daily.
IV (Children 4–15 yr): 10 mg/kg twice daily; ↑ by 20 mg/kg/day at 2-wk intervals to recommended dose of 30 mg/kg twice daily (not to exceed 1500 mg twice daily).
PO, IV (Children 6 mo–3 yr): 10 mg/kg twice daily; ↑ by 20 mg/kg/day at 2-wk intervals to recommended dose of 25 mg/kg twice daily.
PO, IV (Children 1–5 mo): 7 mg/kg twice daily; ↑ by 14 mg/kg/day at 2-wk intervals to recommended dose of 21 mg/kg twice daily.

Primary Generalized Tonic-Clonic Seizures

PO, IV (Adults and Children ≥16 yr): 500 mg twice daily initially; ↑ by 1000 mg/day at 2-wk intervals to recommended dose of 3000 mg/day.
PO (Adults and Children ≥6 yr and >40 kg): *Tablets for oral suspension*—500 mg twice daily; may ↑ by 1000 mg/day at 2-wk intervals up to 3000 mg/day in 2 divided doses.
PO, IV (Children 6–15 yr): 10 mg/kg twice daily; ↑ by 20 mg/kg/day at 2-wk intervals to recommended dose of 30 mg/kg twice daily.
PO (Children ≥6 yr and 20–40 kg): *Tablets for oral suspension*—250 mg twice daily; may ↑ by 500 mg/day at 2-wk intervals up to 1500 mg/day in 2 divided doses.

Myoclonic Seizures

PO, IV (Adults and Children ≥12 yr): 500 mg twice daily initially; ↑ by 1000 mg/day at 2-wk intervals to recommended dose of 3000 mg/day (in 2 divided doses).

Status Epilepticus

IV (Infants and Children <16 yr): 50 mg/kg as a loading dose followed by maintenance dose of 30–55 mg/kg/day IV/PO in 2 divided doses.
IV (Neonates): 20–30 mg/kg as a loading dose followed by neonatal seizure dosing.

Renal Impairment

PO, IV (Adults): *CCr 50–80 mL/min*—500–1000 mg twice daily (1000–2000 mg once daily for extended-release); *CCr 30–50 mL/min*—250–750 mg twice daily (500–1500 mg once daily for extended-release); *CCr <30 mL/min*—250–500 mg twice daily (500–1000 mg once daily for extended-release); *Dialysis (immediate-release and injection)*—500–1000 mg once daily with a 250–500-mg supplemental dose after dialysis.

Availability (generic available)

Immediate-release tablets: 250 mg, 500 mg, 750 mg, 1000 mg. **Cost:** *Generic*—250 mg $29.94/100, 500 mg $43.36/100, 750 mg $55.11/100, 1000 mg $148.42/180. **Extended-release tablets:** 500 mg, 750 mg, 1000 mg, 1500 mg. **Cost:** *Generic*—500 mg $266.82/60, 750 mg $400.64/60. **Oral solution (grape-flavored):** 100 mg/mL. **Cost:** *Generic*—$307.74/473 mL. **Tablets for oral suspension (Spritam) (spearmint-flavored):** 250 mg, 500 mg, 750 mg, 1000 mg. **Premixed infusion:** 250 mg/50 mL 0.82% NaCl, 500 mg/100 mL 0.82% NaCl, 1000 mg/100 mL 0.75% NaCl, 1500 mg/100 mL 0.54% NaCl. **Solution for injection (requires dilution):** 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess location, duration, and characteristics of seizure activity.
- Assess patient for CNS adverse effects during therapy. Adverse effects are categorized as somnolence and fatigue (asthenia), coordination difficulties (ataxia, abnormal gait, or incoordination), and behavioral abnormalities (agitation, hostility, anxiety, apathy, emotional lability, depersonalization, depression) and usually occur during the first 4 wk of therapy.
- Monitor mood changes. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- Monitor for signs and symptoms of anaphylaxis (dyspnea, wheezing, facial swelling). Discontinue levetiracetam if symptoms occur.
- Pedi: Monitor patients 1 mo to <4 yr of age for increases in diastolic BP.
- ***Lab Test Considerations:*** May cause ↓ RBC and WBC and abnormal liver function tests.

Implementation

- Do not confuse Keppra (levetiracetam) with Kaletra (lopinavir/ritonavir) or Keflex (cephalexin). Do not confuse levetiracetam with lamotrigine, levocarnitine, or levofloxacin.
- IV doses should be used temporarily when oral route is not feasible. To convert IV to PO, equivalent dose and frequency may be used.
- **PO:** May be administered without regard to meals.
- ***DNC:*** Administer tablets whole; do not administer partial tablets. Do not break, crush, or chew XR tablets.
- *Tablets for oral suspension (Spritam)* can be administered by placing tablet on tongue with a dry hand, follow with a sip of liquid and swallow only after tablet disintegrates; do not swallow tablet intact. Do not administer partial tablets. *Spritam* disinte-

© F.A. Davis Publishing

grates in about 11 seconds in the mouth when taken with a sip of liquid. May also add whole tablet to a small volume of liquid in a cup (one tablespoon or enough to cover tablets). Allow the tablet to disperse before consuming the entire contents immediately. After administration of suspension, resuspend any residue by adding an additional small volume of liquid and swallow the full amount. Do not administer partial quantities of dispersed tablets. Peel foil to access tablet, do not push through foil.

- Pedi: Patients <20 kg should receive oral solution. Administer with calibrated measuring device for accurate dose.
- Discontinue gradually to minimize the risk of increase in seizure frequency.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Dilute dose in 100 mL of 0.9% NaCl, D5W, or LR. If a smaller volume is required (e.g. pediatric patients), concentration should not exceed 15 mg/mL. Do not administer solutions that are cloudy or contain particulate matter. ***Rate:*** Infuse over 15 min.
- **Y-Site Compatibility:** diazepam, lorazepam, valproate.

Patient/Family Teaching

- Instruct patient to take medication as directed. Pedi: Explain to parents the importance of using calibrated measuring device for accurate dosing. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Do not discontinue abruptly; may cause increase in frequency of seizures. Advise patient and parents to read the *Medication Guide* prior to starting therapy and with each Rx refill in case of changes.
- May cause dizziness and somnolence. Caution patient to avoid driving or activities requiring alertness until response to medication is known. Do not resume driving until physician gives clearance based on control of seizure disorder.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme increase in activity and talking; other unusual changes in behavior or mood, or if skin rash occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Instruct patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage pregnant patients to enroll in the North American Antiepileptic Drug (NAAED) Pregnancy Registry by calling 1-888-233-2334; information is available at www.aedpregnancyregistry.org.
- Advise patient to carry identification describing disease process and medication regimen at all times.

Evaluation/Desired Outcomes

- Decrease in the frequency of or cessation of seizures.

levocetirizine

(lee-vo-se-**teer**-i-zeen)

~~Xyzal~~, Xyzal Allergy 24HR

Classification

Therapeutic: antihistamines

Pharmacologic: piperazines

L

Indications

Seasonal/perennial allergic rhinitis. Chronic idiopathic urticaria.

Action

Antagonizes the effects of histamine at H_1 receptor sites; does not bind to or inactivate histamine. **Therapeutic Effects:** Decreased symptoms of histamine excess (rhinitis, itching).

Pharmacokinetics

Absorption: Well absorbed following oral administration.

Distribution: Unknown.

Metabolism and Excretion: Excreted mostly unchanged by the kidneys (85%).

Half-life: 8 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	0.9 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to levocetirizine or cetirizine; Severe renal impairment (CCr <10 mL/min).

Use Cautiously in: Geri: Consider age related ↓ in renal function and concurrent disease states; OB: Use during pregnancy only if potential maternal benefit outweighs potential fetal risk; Lactation: Safety not established in breast feeding; Pedi: Children <6 mo (safety and effectiveness not established).

Adverse Reactions/Side Effects

Derm: acute generalized exanthematous pustulosis. **GI:** dry mouth. **GU:** urinary retention. **Neuro:** drowsiness, fatigue, weakness.

© F.A. Davis Publishing

Interactions
Drug-Drug: ↑ levels of **ritonavir**. ↑ CNS depression may occur with **alcohol**, **opioid analgesics**, or **sedative hypnotics**.

Route/Dosage
PO (Adults and Children ≥12 yr): 5 mg once daily in the evening; some patients may respond to 2.5 mg once daily.
PO (Children 6–11 yr): 2.5 mg once daily in the evening.
PO (Children 6 mo–5 yr): 1.25 mg (oral solution) once daily in the evening.

Renal Impairment
(Adults and Children ≥12 yr): *CCr 50–80 mL/min*—2.5 mg once daily; *CCr 30–50 mL/min*—2.5 mg every other day; *CCr 10–30 mL/min*—2.5 mg twice weekly (every 3–4 days).

Availability (generic available)
Tablets : 5 mg OTC. **Oral solution:** 2.5 mg/5 mL OTC.

NURSING IMPLICATIONS
Assessment
- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.
- ***Lab Test Considerations:*** May cause false-negative result in allergy skin testing.
- May cause transient ↑ in serum bilirubin and transaminases.

Implementation
- **PO:** Administer once daily in the evening without regard to food. Oral solution is clear and colorless; administer undiluted.

Patient/Family Teaching
- Instruct patient to take medication as directed. Do not increase doses; may cause increased drowsiness.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Decrease in allergic symptoms.
- Resolution of uncomplicated skin manifestations of chronic idiopathic urticaria.

levodopa (lee-voe-doe-pa)
Inbrija

Classification
Therapeutic: antiparkinson agents
Pharmacologic: dopamine agonists

Indications
Intermittent treatment of "off" episodes in patients with Parkinson's disease treated with carbidopa/levodopa.

Action
Converted to dopamine in the CNS, where it serves as a neurotransmitter. **Therapeutic Effects:** Reduction in "off" episodes.

Pharmacokinetics
Absorption: 70% absorbed following oral inhalation.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Primarily metabolized in liver by decarboxylation (via dopa decarboxylase) and O-methylation (by catechol-O-methyltransferase [COMT]).
Half-life: 2.3 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Inhaln	unknown	30 min	unknown

Contraindications/Precautions
Contraindicated in: Concurrent or recent (within past 2 wk) use of nonselective MAO inhibitor therapy; Major psychotic disorders; Asthma, COPD, or underlying lung disease (may ↑ risk of bronchospasm).
Use Cautiously in: Glaucoma (may ↑ intraocular pressure); OB: Safety not established; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established; Geri: ↑ risk of adverse reactions.

Adverse Reactions/Side Effects
CV: orthostatic hypotension. **EENT:** ↑ intraocular pressure, nasal discharge discoloration, nasopharyngitis. **GI:** hyperbilirubinemia, ↑ liver enzymes, nausea, vomiting. **MS:** dyskinesias. **Neuro:** aggression, agitation, confusion, delirium, delusions, disorientation, hallucinations, headache, insomnia, paranoid ideation, psychosis, sedation, urges (gambling, sexual), vivid dreams. **Resp:** cough, upper respiratory tract infection, sputum discoloration. **Misc:** falls.

Interactions
Drug-Drug: **Nonselective MAO inhibitors**, including **phenelzine** or **tranylcypromine**, can ↑ risk of severe hypertension; concurrent use contraindicated (MAO inhibitor must be discontinued ≥2 wk before initiating levodopa). **Selective MAO inhibitors**, includ-

© F.A. Davis Publishing

ing **rasagiline** or **selegiline** may ↑ risk of orthostatic hypotension. **Haloperidol**, **isoniazid metoclopramide**, **phenothiazines**, or **risperidone** may ↓ effectiveness. **Iron** or **multivitamins** containing iron may ↓ absorption of levodopa.

Route/Dosage

Should be used in patients already taking carbidopa/levodopa.

Inhaln (Adults): 84 mg as needed for "off" episodes up to 5 times per day (max = 420 mg/day).

Availability

Capsules for oral inhalation: 42 mg.

NURSING IMPLICATIONS

Assessment

- Assess parkinsonian symptoms (akinesia, rigidity, tremors, pill rolling, shuffling gait, mask-like face, twisting motions, and drooling) during therapy. "On-off phenomenon" may cause symptoms to appear or improve suddenly.
- Assess for signs and symptoms of dyskinesia (abnormal movements, uncontrolled sudden movements of face, tongue, or other body parts) before and during therapy. May increase during therapy requiring dose adjustment or discontinuation.
- Monitor for signs and symptoms of behavior changes (hallucinations, psychotic behavior, paranoid ideation, delusions, confusion, mania, disorientation, aggressive behavior, agitation, delirium) during therapy. Consider reducing dose or discontinuing therapy.
- ***Lab Test Considerations:*** May cause ↑ alkaline phosphatase, AST, ALT, lactic dehydrogenase (LDH), and bilirubin.
- May cause ↑ blood urea nitrogen (BUN), hemolytic anemia and positive direct antibody test.

Implementation

- **Inhaln:** Administer up to 5 times daily when symptoms of an OFF period start to return. Capsules are for oral inhalation only; use only with the Inbrija inhaler.

Patient/Family Teaching

- Instruct patient to take medication when their Parkinson's symptoms (OFF periods) first occurs as directed. Instruct patient in correct use of Imbrija inhaler and that each dose is 2 capsules. Capsules are for use in inhaler; do not take orally. Discontinue slowly; abrupt discontinuation may cause fever, confusion, stiff muscles, changes in breathing and heartbeat. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- May cause sudden onset of sleep, drowsiness, or dizziness. Advise patient to avoid driving and other activities that require alertness until response to drug is known.
- Inform patient that medication may cause dark color bodily fluids (saliva, sputum, urine, sweat).
- Advise patient to notify health care professional if abnormal involuntary movements appear or get worse during therapy.
- Caution patient to change positions slowly to minimize orthostatic hypotension. Health care professional should be notified if orthostatic hypotension occurs.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient and family to notify health care professional if signs and symptoms of hallucinations or psychosis (being overly suspicious or feeling people want to harm you, disorientation, believing things that are not real, aggressive behavior, seeing or hearing things that are not real, agitation, confusion, delirium, increase activity or talking), or if new or increased gambling, sexual, or other intense urges occur. Dose reduction may be required.
- Advise females of reproductive potential to use effective contraception and avoid breast feeding during therapy. Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decreased "off" time in patients with Parkinson's disease.

levofloxacin, See FLUOROQUINOLONES.

levomilnacipran

(lee-voe-mil-**na**-si-pran)

Fetzima

Classification

Therapeutic: antidepressants

Pharmacologic: selective serotonin/norepinephrine reuptake inhibitors

Indications

Major depressive disorder.

Action

Inhibits neuronal reuptake of norepinephrine and serotonin in the CNS (SNRI). **Therapeutic Effects:** Decrease in depressive symptomatology, with fewer relapses/recurrences.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Well absorbed (92%) following oral administration.
Distribution: Widely distributed.
Metabolism and Excretion: 58% eliminated unchanged in urine; 42% metabolized, primarily by the CYP3A4 enzyme system; metabolites are renally eliminated.
Half-life: 12 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	Unknown	6–8 hr (blood level)	Unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity to levomilnacipran or milnacipran; Uncontrolled narrow-angle glaucoma; Concurrent use of or in close temporal proximity to MAO inhibitors, linezolid or methylene blue (risk of serotonin syndrome); Concurrent use of alcohol; Lactation: Lactation.
Use Cautiously in: History of hypertension, cardiovascular or cerebrovascular disease (BP should be controlled prior to treatment); History of bipolar disorder (may activate mania/hypomania); Renal impairment (dose ↓ required for CCr <60 mL/min); OB: Use only if potential maternal benefit justifies potential fetal risk; Pedi: ↑ risk of suicidal thinking and behavior (suicidality) in adolescents and young adults up to 24 yrs with major depressive disorder; Geri: Consider age-related ↓ in renal function, chronic disease state and concurrent drug therapy; may have ↑ risk of hyponatremia.
Exercise Extreme Caution in: Concurrent use with other serotonergic drugs (↑ risk of serotonin syndrome especially during initiation and dose adjustment).

Adverse Reactions/Side Effects

CV: hypertension, hypotension, palpitations, tachycardia. **Derm:** hot flush, hyperhidrosis, rash. **EENT:** mydriasis. **F and E:** hyponatremia (in association with syndrome of inappropriate antidiuretic hormone [SIADH]). **GI:** nausea, ↓ appetite, constipation, vomiting. **GU:** ↓ libido, delayed/absent orgasm, ejaculatory delay/failure, erectile dysfunction, testicular pain, urinary hesitation/retention. **Hemat:** BLEEDING. **Neuro:** SUICIDAL THOUGHTS/BEHAVIORS, activation of mania/hypomania. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors used for psychiatric disorders** may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of levomilnacipran. Wait at least 7 days after discontinuing levomilnacipran before initiation of MAO inhibitor. Concurrent use with **MAO-inhibitor like drugs**, such as **linezolid** or **methylene blue**, may ↑ risk of serotonin syndrome; concurrent use contraindicated; do not start therapy in patients receiving **linezolid** or **methylene blue**; if **linezolid** or **methylene blue** need to be started in a patient receiving levomilnacipran, immediately discontinue levomilnacipran and monitor for signs/symptoms of serotonin syndrome for 2 wk or until 24 hr after last dose of linezolid or methylene blue, whichever comes first (may resume levomilnacipran therapy 24 hr after last dose of linezolid or methylene blue). Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans**, ↑ risk of serotonin syndrome. Concurrent use of **NSAIDs**, **aspirin**, **warfarin** or other **drugs that affect coagulation** may ↑ the risk of bleeding. Blood levels and risk of toxicity ↑ by concurrent use of **CYP3A4 inhibitors** including **ketoconazole**, **clarithromycin**, **ritonavir**; daily dose should not exceed 80 mg. Concurrent use of other **medications that may ↑ BP** may ↑ risk of hypertension. Concurrent use with **alcohol** may cause a rapid release of drug and should be avoided.
Drug-Natural Products: Concurrent use with **St. John's wort** or **tryptophan** may ↑ the risk of serotonin syndrome; also ↑ risk of coronary vasoconstriction and hypertension.

Route/Dosage

PO (Adults): 20 mg once daily for 2 days, then ↑ to 40 mg once daily, may then ↑ by 40 mg every two or more days; may ↑ up to 120 mg/day; *Concurrent use of CYP3A4 inhibitors (including ketoconazole, clarithromycin, ritonavir)* — not to exceed 80 mg/day.

Renal Impairment

PO (Adults): *CCr 30–59 mL/min* — not to exceed 80 mg/day; *CCr 15–29 mL/min* — not to exceed 40 mg/day.

Availability (generic available)

Extended-release capsules: 20 mg, 40 mg, 80 mg, 120 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP and heart rate before and periodically during therapy. Treat pre-existing hypertension and cardiac disease prior to therapy. Sustained hypertension may require discontinuation of therapy.
- Monitor closely for notable changes in behavior that could indicate the emergence or worsening of suicidal thoughts or behavior or depression.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).

© F.A. Davis Publishing

- Assess sexual function before starting levomilnacipran. Assess for changes in sexual function during treatment, including timing of onset; patient may not report.
- ***Lab Test Considerations:*** May cause hyponatremia.

Implementation

- ***High Alert:*** Do not confuse Fetzima (levomilnacipran) with Farxiga (dapagliflozin).
- **PO:** Administer daily without regard to food. ***DNC:*** Swallow capsule whole; do not open, crush, or chew.

Patient/Family Teaching

- Instruct patient to take levomilnacipran as directed at the same time each day. Take missed doses as soon as possible unless time for next dose; do not double dose. Do not stop abruptly; must be decreased gradually. Abrupt discontinuation may cause dysphoric mood, irritability, agitation, dizziness, paresthesia, electric shock sensation, anxiety, confusion, headache, lethargy, emotional lability, insomnia, hypomania, tinnitus, and seizures. Advise patient to read *Medication Guide* prior to therapy and with each Rx refill in case of changes.
- May cause drowsiness and may affect ability to make decisions or react quickly. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient, family, and caregivers to look for activation of mania/hypomania and suicidality, especially during early therapy or dose changes. Notify health care professional immediately if thoughts about suicide or dying, attempts to commit suicide; new or worse depression or anxiety; agitation or restlessness; panic attacks; insomnia; new or worse irritability; aggressiveness; acting on dangerous impulses, mania, or other changes in mood or behavior or if symptoms of serotonin syndrome occur.
- Caution patient of the risk or serotonin syndrome (agitation, hallucinations, changes in mental status, muscle twitching, fast heartbeat, high or low BP, sweating or fever, nausea or vomiting, diarrhea, muscle stiffness or tightness), especially when taking triptans, tramadol, tryptophan supplements and other serotonergic or antipsychotic agents.
- Inform patient that levomilnacipran may cause symptoms of sexual dysfunction. In males, ejaculatory delay or failure, decreased libido, and erectile dysfunction may occur. In female patients, may result in decreased libido and delayed or absent orgasm. Advise patient to notify health care professional if symptoms occur.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to avoid concurrent use of Rx, OTC, and herbal products, especially St. John's wort, NSAIDs, aspirin, and warfarin, without consulting health care professional; may increase bleeding.
- Instruct patient to notify health care professional if signs of hyponatremia (headache, difficulty concentrating, memory impairment, confusion, weakness, unsteadiness) occur.
- Advise patient to avoid taking alcohol during levomilnacipran therapy.
- Rep: Advise females of reproductive potential to notify healthcare professional if pregnancy is planned or suspected, and to avoid breast feeding during therapy. Use of levomilnacipran in last month of pregnancy may increase risk or postpartum hemorrhage. Monitor infants exposed to levomilnacipran via breast feeding for sedation, poor feeding and poor weight gain. Register patients exposed to levomilnacipran during pregnancy in the National Pregnancy Registry for Antidepressants at 1-844-405-6185 or visiting online at https://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/antidepressants/.
- Encourage patient to maintain routine follow-up visits with health care provider to determine effectiveness.

Evaluation/Desired Outcomes

- Increased sense of well-being.
- Renewed interest in surroundings. Need for therapy should be periodically reassessed.

levonorgestrel, See CONTRACEPTIVES, HORMONAL.

levothyroxine

(lee-voe-thye-**rox**-een)

Eltroxin, Euthyrox, Levo-T, Levoxyl, Synthroid, Thyquidity, Thyro-Tabs, Tirosint, Tirosint-SOL, Unithroid

Classification

Therapeutic: hormones
Pharmacologic: thyroid preparations

Indications

Thyroid supplementation in hypothyroidism. Treatment or suppression of euthyroid goiters. Adjunctive treatment for thyrotropin-dependent thyroid cancer.

Action

Synthetic form of thyroxine (T_4). Replacement of or supplementation to endogenous thyroid hormones. Principal effect is increasing metabolic rate of body tissues: Promote gluconeogenesis, Increase utilization and mobilization of glycogen stores, Stimulate protein synthesis, Promote cell growth and differentiation, Aid in the development of the brain and CNS. **Therapeutic Effects:** Replacement in hypothyroidism to restore

© F.A. Davis Publishing

normal hormonal balance. Suppression of thyroid cancer.

Pharmacokinetics

Absorption: Levothyroxine is variably (40–80%) absorbed from the GI tract.
Distribution: Distributed into most body tissues. Thyroid hormones do not readily cross the placenta; minimal amounts enter breast milk.
Protein Binding: >99%.
Metabolism and Excretion: Metabolized by the liver and other tissues to active T3. Thyroid hormone undergoes enterohepatic recirculation and is excreted in the feces via the bile.
Half-life: 6–7 days.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Levothyroxine PO	unknown	1–3 wk	1–3 wk
Levothyroxine IV	6–8 hr	24 hr	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Recent MI; Hyperthyroidism.
Use Cautiously in: Cardiovascular disease (initiate therapy with lower doses); Severe renal insufficiency; Uncorrected adrenocortical disorders; Pedi: Monitor neonates and infants for cardiac overload, arrhythmias, and aspiration during first 2 wk of therapy; Geri: Extremely sensitive to thyroid hormones; initial dose should be ↓.

Adverse Reactions/Side Effects

Usually only seen when excessive doses cause iatrogenic hyperthyroidism.
CV: angina pectoris, arrhythmias, tachycardia. **Derm:** sweating. **Endo:** hyperthyroidism, menstrual irregularities. **GI:** abdominal cramps, diarrhea, vomiting. **Metab:** heat intolerance, weight loss. **MS:** accelerated bone maturation in children. **Neuro:** headache, insomnia, irritability.

Interactions

Drug-Drug: Cholestyramine, **colesevelam**, **colestipol**, and **sodium polystyrene sulfonate** may bind to and ↓ absorption of orally administered levothyroxine; administer levothyroxine ≥4 hr prior to these medications or monitor TSH levels. **Phosphate binders**, including **calcium carbonate**, **ferrous sulfate**, **lanthanum carbonate**, and **sevelemer** may bind to and ↓ absorption of orally administered levothyroxine; administer levothyroxine ≥4 hr apart from these medications. Absorption may be ↓ by **orlistat**, **proton pump inhibitors**, **sucralfate**, **antacids**, and **simethicone**. **Phenobarbital** and **rifampin** may ↑ metabolism of and ↓ efficacy of levothyroxine; may need to ↑ levothyroxine dosage. May ↑ the effects of **warfarin**. May ↑ requirement for **insulin** or **oral hypoglycemic agents** in diabetics. May ↓ the therapeutic effects of **digoxin**; may need to ↑ digoxin dosage. Concurrent use with **ketamine** may lead to significant hypertension and tachycardia. ↑ cardiovascular effects with **adrenergics** (sympathomimetics).
Drug-Food: Foods or supplements containing calcium, iron, magnesium, or zinc may bind levothyroxine and prevent complete absorption. Absorption may be delayed when used with **grapefruit juice**.

Route/Dosage

PO (Adults): *Hypothyroidism*—1.6 mcg/kg once daily; may ↑ by 12.5–25 mcg/day every 4–6 wk until patient clinically euthyroid based on signs/symptoms and TSH levels.
PO (Geriatric Patients and Patients with Cardiac Disease): 12.5–25 mcg once daily; may ↑ by 12.5–25 mcg/day every 6–8 wk until patient clinically euthyroid based on signs/symptoms and TSH levels.
PO (Children >12 yr): 2–3 mcg/kg/day (≥150 mcg/day).
PO (Children 6–12 yr): 4–5 mcg/kg/day (100–125 mcg/day).
PO (Children 1–5 yr): 5–6 mcg/kg/day (75–100 mcg/day).
PO (Children 6–12 mo): 6–8 mcg/kg/day (50–75 mcg/day).
PO (Infants 3–6 mo): 8–10 mcg/kg/day (25–50 mcg/day).
PO (Infants 0–3 mo or Infants at Risk for Cardiac Failure): 10–15 mcg/kg/day or 25 mcg/day; may be ↑ after 4–6 wk to 50 mcg.
IM, IV (Adults): *Hypothyroidism*—50–100 mcg/day as a single dose. *Myxedema coma/stupor*—300–500 mcg IV; additional 100–300 mcg may be given on 2nd day, followed by daily administration of smaller doses.
IM, IV (Children): *Hypothyroidism*—50–80% of the oral dose.

Availability (generic available)

Tablets: 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg, 300 mcg. **Capsules (Tirosint):** 13 mcg, 25 mcg, 50 mcg, 75 mcg, 88 mcg, 100 mcg, 112 mcg, 125 mcg, 137 mcg, 150 mcg, 175 mcg, 200 mcg. **Oral solution:** 13 mcg/mL, 20 mcg/mL, 25 mcg/mL, 50 mcg/mL, 75 mcg/mL, 88 mcg/mL, 100 mcg/mL, 112 mcg/mL, 125 mcg/mL, 137 mcg/mL, 150 mcg/mL, 175 mcg/mL, 200 mcg/mL. **Powder for injection:** 100 mcg/vial, 200 mcg/vial, 500 mcg/vial. **Solution for injection:** 20 mcg/mL, 40 mcg/mL, 100 mcg/mL.

NURSING IMPLICATIONS

Assessment

- Assess apical pulse and BP prior to and periodically during therapy. Assess for tachyarrhythmias and chest pain.
- **Children:** Monitor height, weight, and psychomotor development.

© F.A. Davis Publishing

- ***Lab Test Considerations:*** Monitor thyroid function studies prior to and during therapy. Monitor thyroid-stimulating hormone (TSH) serum levels in adults 6–8 wk after change in dose or changing from one brand to another in adults. For pediatric patients, monitor TSH and total or free-T4 in children 2 and 4 wk after start of therapy, 2 wk after any change in dose, and then every 3–12 mo thereafter after dose stabilization until growth is completed.
- Monitor blood and urine glucose in diabetic patients. Insulin or oral hypoglycemic dose may need to be increased.
- ***Toxicity and Overdose:*** Overdose is manifested as hyperthyroidism (tachycardia, chest pain, nervousness, insomnia, diaphoresis, tremors, weight loss). Usual treatment is to withhold dose for 2–6 days then resume at a lower dose. Acute overdose is treated by induction of emesis or gastric lavage, followed by activated charcoal. Sympathetic overstimulation may be controlled by antiadrenergic drugs (beta blockers), such as propranolol. Oxygen and supportive measures to control symptoms are also used.

Implementation

- ***High Alert:*** Do not confuse levothyroxine with lamotrigine, Lanoxin (digoxin), or liothyronine.
- **PO:** Administer with a full glass of water, on an empty stomach, 30–60 min before breakfast, to prevent insomnia.
- Initial dose is low, especially in geriatric and cardiac patients. Dose is increased gradually, based on thyroid function tests.
- For patients with difficulty swallowing, tablets can be crushed and placed in 5–10 mL of water and administered immediately via dropper or spoon; do not store suspension.

IV Administration

- **IV Push:** ***Reconstitution:*** Reconstitute the 200-mcg and 500-mcg vials with 2 or 5 mL, respectively, of 0.9% NaCl without preservatives (diluent usually provided). ***Concentration:*** 100 mcg/mL. Shake well to dissolve completely. Administer solution immediately after preparation; discard unused portion. ***Rate:*** Administer at a rate of 100 mcg over 1 min. Do not add to IV infusions; may be administered through Y-tubing.
- **Y-Site Incompatibility:** Do not admix with other IV solutions.

Patient/Family Teaching

- Instruct patient to take medication as directed at the same time each day. Take missed doses as soon as remembered unless almost time for next dose. If more than 2–3 doses are missed, notify health care professional. Do not discontinue without consulting health care professional.
- Explain to patient that medication does not cure hypothyroidism; it provides a thyroid hormone supplement. Therapy is lifelong.
- Advise patient to notify health care professional if headache, nervousness, diarrhea, excessive sweating, heat intolerance, chest pain, increased pulse rate, palpitations, weight loss >2 lb/wk, or any unusual symptoms occur.
- Caution patient to avoid taking other medications concurrently with thyroid preparations unless instructed by health care professional. Advise patient to take 4 hrs apart from antacids, iron, and calcium supplements.
- Instruct patient to inform health care professionals of thyroid therapy.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Pregnancy may increase thyroid requirements.
- Emphasize importance of follow-up exams to monitor effectiveness of therapy. Thyroid function tests are performed at least yearly.
- Pedi: Discuss with parents the need for routine follow-up studies to ensure correct development. Inform patient that partial hair loss may be experienced by children on thyroid therapy. This is usually temporary.

Evaluation/Desired Outcomes

- Resolution of symptoms of hypothyroidism and normalization of hormone levels.

L

HIGH ALERT

LIDOCAINE

lidocaine (parenteral)
(**lye**-doe-kane)
Xylocaine, Xylocard

lidocaine (local anesthetic)
Xylocaine

lidocaine (mucosal)
Jampocaine Viscous, Xylocaine Viscous

lidocaine (transdermal)
Lidoderm, ZTLido

lidocaine (topical)
Betacaine, Cathejell, Glydo, Lidodan, L-M-X 4, L-M-X 5, Lyracaine, Maxilene, Stallion, Topicaine, Xylocaine

Classification
Therapeutic: anesthetics (topical/local), antiarrhythmics (class IB)

© F.A. Davis Publishing

Indications

IV: Ventricular arrhythmias. **IM:** Self-injected or when IV unavailable (during transport to hospital facilities). **Local:** Infiltration/mucosal/topical anesthetic. **Transdermal:** Pain due to post-herpetic neuralgia.

Action

IV, IM: Suppresses automaticity and spontaneous depolarization of the ventricles during diastole by altering the flux of sodium ions across cell membranes with little or no effect on heart rate. **Local:** Produces local anesthesia by inhibiting transport of ions across neuronal membranes, thereby preventing initiation and conduction of normal nerve impulses. **Therapeutic Effects:** Control of ventricular arrhythmias. Local anesthesia.

Pharmacokinetics

Absorption: Well absorbed after administration into the deltoid muscle; some absorption follows local use.
Distribution: Widely distributed. Concentrates in adipose tissue. Crosses the blood-brain barrier and placenta; enters breast milk.
Metabolism and Excretion: Mostly metabolized by the liver; <10% excreted in urine as unchanged drug.
Half-life: Biphasic—initial phase, 7–30 min; terminal phase, 90–120 min; ↑ in HF and liver impairment.

TIME/ACTION PROFILE (IV, IM = antiarrhythmic effects; local = anesthetic effects)

ROUTE	ONSET	PEAK	DURATION
IV	immediate	immediate	10–20 min (up to several hrs after continuous infusion)
IM	5–15 min	20–30 min	60–90 min
Local	rapid	unknown	1–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; cross-sensitivity may occur; Third-degree heart block; Wolff-Parkinson-White syndrome; Pedi: Children <3 yr (↑ risk of seizures, cardiac arrest and death with viscous lidocaine); viscous lidocaine should not be used for teething pain; should only be used for other indications when safer alternatives are not available or have failed.
Use Cautiously in: Glucose–6–phosphate dehydrogenase deficiency, history of methemoglobinemia, cardiac or pulmonary disease, or concurrent exposure to oxidizing agents (or metabolites of these agents) (↑ risk of methemoglobinemia); Liver disease, HF, patients weighing <50 kg, and geriatric patients (↓ bolus and/or maintenance dose); Respiratory depression; Shock; Heart block; OB, Lactation: Use only if the potential benefit justifies the potential risk to the fetus; Pedi: Infants <6 mo (↑ risk of methemoglobinemia); safety of transdermal patch not established in children.

Adverse Reactions/Side Effects

CV: CARDIAC ARREST, arrhythmias, bradycardia, heart block, hypotension. **EENT:** *mucosal use*—↓ or absent gag reflex. **GI:** nausea, vomiting. **Hemat:** methemoglobinemia. **Local:** stinging, burning, contact dermatitis, erythema. **MS:** chondrolysis. **Neuro:** paresthesia, tremor, SEIZURES, confusion, drowsiness, agitation, blurred vision, dizziness, slurred speech. **Resp:** bronchospasm. **Misc:** allergic reactions, including ANAPHYLAXIS.

Interactions

Drug-Drug: Concurrent use of **acetaminophen**, **benzocaine**, **bupivacaine**, **chloroquine**, **cyclophosphamide**, **dapsone**, **flutamide**, **hydroxyurea**, **ifosfamide**, **metoclopramide**, **nitrofurantoin**, **nitroglycerin**, **nitroprusside**, **nitrous oxide**, **phenobarbital**, **phenytoin**, **prilocaine**, **primaquine**, **procaine**, **quinine**, **rasburicase**, **ropivacaine**, **sulfonamides**, **tetracaine**, and **valproate** may ↑ risk of methemoglobinemia; monitor closely. ↑ cardiac depression and toxicity with **phenytoin**, **amiodarone**, **quinidine**, **procainamide**, or **propranolol**. **Cimetidine**, **azole antifungals**, **clarithromycin**, **erythromycin**, **fluoxetine**, **fluvoxamine**, **nefazodone**, **paroxetine**, **protease inhibitors**, **propofol**, **ritonavir**, **verapamil**, and **propranolol** may ↓ metabolism and ↑ risk of toxicity. Lidocaine may ↑ levels of **calcium channel blockers**, certain **benzodiazepines**, **cyclosporine**, **fluoxetine**, **lovastatin**, **simvastatin**, **mirtazapine**, **paroxetine**, **ritonavir**, **tacrolimus**, **theophylline**, **tricyclic antidepressants**, and **venlafaxine**. Effects of lidocaine may be ↓ by **carbamazepine**, **phenobarbital**, **phenytoin**, and **rifampin**.

Route/Dosage

Ventricular Tachycardia (with a Pulse) or Pulseless Ventricular Tachycardia/Ventricular Fibrillation

IV (Adults): 1–1.5 mg/kg bolus; may repeat doses of 0.5–0.75 mg/kg every 5–10 min up to a total dose of 3 mg/kg; may then start continuous infusion of 1–4 mg/min.
Endotracheal (Adults): Give 2–2.5 times the IV loading dose down the endotracheal tube, followed by a 10 mL saline flush.
IV (Children): 1 mg/kg bolus (not to exceed 100 mg), followed by 20–50 mcg/kg/min continuous infusion (range 20–50 mcg/kg/min); may administer 2nd bolus of 0.5–1 mg/kg if delay between bolus and continuous infusion.
Endotracheal (Children): Give 2–3 mg/kg down the endotracheal tube followed by a 5 mL saline flush.
IM (Adults and Children ≥50 kg): 300 mg (4.5 mg/kg); may be repeated in 60–90 min.

© F.A. Davis Publishing

Local

Infiltration (Adults and Children): Infiltrate affected area as needed (increased amount and frequency of use increases likelihood of systemic absorption and adverse reactions).
Topical (Adults): Apply to affected area 2–3 times daily.
Mucosal (Adults): *For anesthetizing oral surfaces*—20 mg as 2 sprays/quadrant (not to exceed 30 mg/quadrant) may be used. 15 mL of the viscous solution may be used every 3 hr for oral or pharyngeal pain. *For anesthetizing the female urethra*—3–5 mL of the jelly or 20 mg as 2% solution may be used. *For anesthetizing the male urethra*—5–10 mL of the jelly or 5–15 mL of 2% solution may be used before catheterization or 30 mL of jelly before cystoscopy or similar procedures. Topical solutions may be used to anesthetize mucous membranes of the larynx, trachea, or esophagus.
Mucosal (Children ≥3 yr): Do not exceed 4.5 mg/kg/dose (or 300 mg/dose) of viscous solution; swish in the mouth and spit out no more frequently than every 3 hr (maximum: 4 doses per 12-hr period).
Mucosal (Children <3 yr): ≤1.2 mL applied to area with a cotton-tipped applicator no more frequently than every 3 hr (maximum: 4 doses per 12-hr period); use only if the underlying condition requires treatment with product volume of ≤1.2 mL.
Transdermal (Adults): Up to 3 patches may be applied once for up to 12 hr in any 24-hr period; consider smaller areas of application in geriatric or debilitated patients.

Availability (generic available)

Autoinjector for IM injection: 300 mg/3 mL. **IV push injection:** 5 mg/mL (0.5%), 10 mg/mL (1%), 15 mg/mL (1.5%), 20 mg/mL (2%). **For IV admixture:** 100 mg/mL (10%). **Premixed solution for IV infusion:** 200 mg/100 mL D5W (0.2%), 400 mg/100 mL D5W (0.4%), 1000 mg/250 mL D5W (0.4%), 2000 mg/500 mL D5W (0.4%), 800 mg/100 mL D5W (0.8%), 2000 mg/250 mL D5W (0.8%). **Injection for local infiltration/nerve block:** 0.5%, 1%, 2%, 4%. ***In combination with:*** epinephrine for local infiltration. **Cream:** 4%OTC. **Gel:** 0.5%OTC, 2.5%OTC, 🍁 5%OTC. **Jelly:** 2%. **Liquid:** 5%. **Ointment:** 5%. **Transdermal system:** 1.8%, 5%. **Cost:** $309.45/30. **Topical solution:** 4%. **Spray:** 10%. **Viscous solution:** 2%. ***In combination with:*** prilocaine (as EMLA cream, Oraquix); with tetracaine (Synera); with bupivacaine (Duocaine); with epinephrine (LidoSite).

NURSING IMPLICATIONS

Assessment

- **Antiarrhythmic:** Monitor ECG continuously and BP and respiratory status frequently during administration.
- **Anesthetic:** Assess degree of numbness of affected part.
- **Transdermal:** Monitor for pain intensity in affected area periodically during therapy.
- ***Lab Test Considerations:*** Serum electrolyte levels should be monitored periodically during prolonged therapy.
- IM administration may cause ↑ CK levels.
- ***Toxicity and Overdose:*** Monitor serum lidocaine levels periodically during prolonged or high-dose IV therapy. Therapeutic serum lidocaine levels range from 1.5–5 mcg/mL.
- Signs and symptoms of toxicity include confusion, excitation, blurred or double vision, nausea, vomiting, ringing in ears, tremors, twitching, seizures, difficulty breathing, severe dizziness or fainting, and unusually slow heart rate.
- If symptoms of overdose occur, stop infusion and monitor patient closely.

Implementation

- ***High Alert:*** Lidocaine is readily absorbed through mucous membranes. Inadvertent overdose of lidocaine jelly and spray has resulted in patient harm or death from neurologic and/or cardiac toxicity. Do not exceed recommended doses.
- **Throat Spray:** Ensure that gag reflex is intact before allowing patient to drink or eat.
- **IM:** IM injections are recommended only when ECG monitoring is not available and benefits outweigh risks. Administer IM injections only into deltoid muscle while frequently aspirating to prevent IV injection.

IV Administration

- **IV Push:** Only 1% and 2% solutions are used for IV push injection. ***Dilution:*** Administer undiluted. ***Rate:*** Administer loading dose over 2–3 min. Follow by IV continuous infusion.
- **Continuous Infusion:** ***Dilution:*** Lidocaine vials need to be further diluted. Dilute 2 g of lidocaine in 250 mL or 500 mL of D5W or 0.9% NaCl. Admixed infusion stable for 24 hr at room temperature. Premixed infusions are already diluted and ready to use. ***Concentration:*** 4–8 mg/mL. ***Rate:*** See Route/Dosage section. Administer via infusion pump for accurate dose.
- **Y-Site Compatibility:** acetaminophen, alemtuzumab, alfentanil, alteplase, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefox-

itin, ceftaroline, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etomidate, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, LR, leucovorin calcium, levofloxacin, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem/vaborbactam, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, micafungin, midazolam, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, warfarin, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, amphotericin B deoxycholate, azathioprine, caspofungin, dantrolene, diazepam, ganciclovir, gemtuzumab ozogamicin, milrinone, pantoprazole, pentobarbital, phenobarbital, phenytoin, thiopental, trimethoprim/sulfamethoxazole.
- **Infiltration:** Lidocaine with epinephrine may be used to minimize systemic absorption and prolong local anesthesia.
- **Transdermal:** When used concomitantly with other products containing local anesthetic agents, consider amount absorbed from all formulations.
- *Lidoderm* and *ZTLido* are not interchangeable.

Patient/Family Teaching

- Explain purpose of lidocaine to patient.
- May cause drowsiness and dizziness. Advise patient to call for assistance during ambulation and transfer.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- **IM:** Available in LidoPen Auto-Injector for use outside the hospital setting. Advise patient to telephone health care professional immediately if symptoms of a heart attack occur. Do not administer unless instructed by health care professional. To administer, remove safety cap and place back end on thickest part of thigh or deltoid muscle. Press hard until needle prick is felt. Hold in place for 10 sec, then massage area for 10 sec. Do not drive after administration unless absolutely necessary.
- **Topical:** Apply *Lidoderm Patch* to intact skin to cover the most painful area. Patch may be cut to smaller sizes with scissors before removing release liner. Clothing may be worn over patch. Avoid contact with water (bathing, swimming, showering), may not stick if it gets wet. If irritation or burning sensation occurs during application, remove patch until irritation subsides. Wash hands after application; avoid contact with eyes. Dispose of used patch to avoid access by children or pets.
- Apply *ZTLido* to intact skin to cover the most painful area. Apply immediately after removing from envelope. System may be cut to smaller sizes with scissors before removing release liner. Clothing may be worn over patch. May be used during moderate exercise (biking for 30 min). May be exposed to water (showering for 10 min or immersion for 15 min). Dry by gently patting the skin, not by rubbing skin or topical system. If edges have lifted, press firmly on edges. If system detaches, may be reapplied as originally directed. If system will not stick, dispose by folding adhesive sides together and discard where children or pets cannot get to them. Apply a new system for total duration of 12 hrs of used and new system together. If irritation or a burning sensation occurs during application, remove and reapply when irritation subsides.
- Caution women to consult health care professional before using a topical anesthetic for a mammogram or other procedures. If recommended, use lowest drug concentration, and apply sparingly. Do not apply to broken or irritated skin, do not wrap skin, and do not apply heat to area (heating pad/electric blanket), to decrease chance that drug may be absorbed into the body. May result in seizures, cardiac arrhythmias, respiratory failure, coma, and death.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **Mucosal:** Caution parent to administer as directed, not to use more or more often than directed, and to

© F.A. Davis Publishing

use measuring device for accurate dose in children younger than 3 yrs. Advise parent that if signs and symptoms of toxicity (lethargy, shallow breathing, seizure activity) occur to seek emergency attention and not to administer more lidocaine.
- Caution parents that oral lidocaine causes numbness and may impair swallowing; do not administer food and/or chewing gum for at least 60 min after administration.

Evaluation/Desired Outcomes
- Decrease in ventricular arrhythmias.
- Local anesthesia.

linaGLIPtin (lin-a-glip-tin)
Tradjenta, Trajenta

Classification
Therapeutic: antidiabetics
Pharmacologic: dipeptidyl peptidase-4 (DDP-4) inhibitors, enzyme inhibitors

Indications
Adjunct to diet and exercise in the management of type 2 diabetes mellitus.

Action
Inhibits the enzyme dipeptidyl peptidase-4 (DPP-4), which slows the inactivation of incretin hormones, resulting in increased levels of active incretin hormones. These hormones are released by the intestine throughout the day, and are involved in regulation of glucose. Increased/prolonged incretin levels increase insulin release and decrease glucagon levels. **Therapeutic Effects:** Improved control of blood glucose.

Pharmacokinetics
Absorption: 30% absorbed following oral administration.
Distribution: Extensively distributed to tissues.
Metabolism and Excretion: Minimally metabolized; primarily excreted in feces (80%) and urine (5%) as unchanged drug.
Half-life: >100 hr (due to saturable binding to DPP-4).

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1.5 hr†	24 hr

†Blood level.

Contraindications/Precautions
Contraindicated in: Hypersensitivity. Cross-sensitivity may exist with sitagliptin, alogliptin, or saxagliptin; Type 1 diabetes mellitus; Diabetic ketoacidosis.
Use Cautiously in: History of pancreatitis; History of HF or renal impairment (↑ risk of HF); OB: Use only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established in children; Geri: Older adults may have greater sensitivity to drug effects.

Adverse Reactions/Side Effects
CV: HF. **Derm:** bullous pemphigoid, localized exfoliation, urticaria. **GI:** PANCREATITIS, ↑ lipase. **Metab:** hypoglycemia, hypertriglyceridemia. **MS:** RHABDOMYOLYSIS, arthralgia. **Resp:** bronchial hyperreactivity. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis, angioedema, and exfoliative skin conditions).

Interactions
Drug-Drug: ↑ risk of hypoglycemia with **sulfonylureas** or **insulin**; dose ↓ of sulfonylurea or insulin may be necessary. Concurrent use of P-glycoprotein or CYP3A4 inducers, including **rifampin**, may ↓ blood levels and effectiveness and should be avoided.

Route/Dosage
PO (Adults): 5 mg once daily.

Availability (generic available)
Tablets: 5 mg. ***In combination with:*** empagliflozin (Glyxambi); empagliflozin and metformin XR (Trijardy XR); metformin (Jentadueto); metformin XR (Jentadueto XR). See Appendix N.

NURSING IMPLICATIONS
Assessment
- Assess for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Monitor for signs of pancreatitis (nausea, vomiting, anorexia, persistent severe abdominal pain, sometimes radiating to the back) during therapy. If pancreatitis occurs, discontinue linagliptin and monitor serum and urine amylase, amylase/creatinine clearance ratio, electrolytes, serum calcium, glucose, and lipase.
- Monitor for arthralgia. Severe joint pain usually disappears with discontinuation of linagliptin.
- ***Lab Test Considerations:*** Monitor hemoglobin A1C prior to and periodically during therapy.
- May cause ↑ uric acid levels.

Implementation
- Do not confuse linagliptin with linaclotide. Do not confuse Tradjenta (linagliptin) with Toujeo (insulin glargine), Tresiba (insulin degludec), or Trulicity (dulaglutide).
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **PO:** May be administered without regard to food.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take linagliptin as directed. Take missed doses as soon as remembered, unless it is almost time for next dose; do not double doses. Advise patient to read the *Medication Guide* before starting and with each Rx refill in case of changes.
- Explain to patient that linagliptin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Instruct patient not to share this medication with others, even if they have the same symptoms; it may harm them.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Advise patient to notify health care professional promptly if signs and symptoms of pancreatitis or if rash; hives; blisters; or swelling of face, lips, or throat occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially other oral hypoglycemic medications.
- Rep: Insulin is the recommended method of controlling blood sugar during pregnancy. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Improved hemoglobin A1C, fasting plasma glucose and 2-hr postprandial glucose levels.

linezolid (li-nez-o-lid)

Zyvox, ✱Zyvoxam

Classification

Therapeutic: anti-infectives
Pharmacologic: oxazolidinones

Indications

Nosocomial pneumonia. Community-acquired pneumonia. Complicated skin and skin structure infections. Uncomplicated skin and skin structure infections. Infections caused by vancomycin-resistant *Enterococcus faecium*.

Action

Inhibits bacterial protein synthesis at the level of the 23S ribosome of the 50S subunit. **Therapeutic Effects:** Bactericidal action against streptococci; bacteriostatic action against enterococci and staphylococci. **Spectrum:** Active against gram-positive pathogens, including: *Staphylococcus aureus* (methicillin-susceptible and methicillin-resistant), *Streptococcus agalactiae*, *Streptococcus pneumoniae*, *Streptococcus pyogenes*, *Enterococcus faecium*,

Pharmacokinetics

Absorption: Rapidly and extensively (100%) absorbed following oral administration.
Distribution: Readily distributes to well-perfused tissues.
Metabolism and Excretion: 65% metabolized, mostly by the liver; 30% excreted unchanged by the kidneys.
Half-life: 6.4 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1–2 hr	12 hr
IV	rapid	end of infusion	12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Phenylketonuria (suspension contains phenylalanine); Uncontrolled HTN, pheochromocytoma, thyrotoxicosis, or concurrent use of sympathomimetic agents, vasopressors, or dopaminergic agents (↑ risk of hypertensive response); Concurrent or recent (<2 wk) use of monoamine oxidase (MAO) inhibitors (↑ risk of hypertensive response); Carcinoid syndrome or concurrent use of SSRIs, SNRIs, TCAs, triptans, opioids, bupropion, or buspirone (↑ risk of serotonin syndrome).
Use Cautiously in: Thrombocytopenia, concurrent use of antiplatelet agents or bleeding diathesis (platelet counts should be monitored more frequently); Diabetes (↑ risk of hypoglycemia); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant.

Adverse Reactions/Side Effects

CV: headache insomnia. **Derm:** TOXIC EPIDERMAL NECROLYSIS. **EENT:** teeth discoloration, tongue discoloration. **F and E:** hyponatremia, syndrome of inappropriate diuretic hormone (SIADH) secretion. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea, ↑ liver enzymes, nausea, taste alteration, vomiting. **Endo:** hypoglycemia. **F and E:** lactic acidosis. **Hemat:** thrombocytopenia. **Neuro:** optic neuropathy, peripheral neuropathy. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: ↑ risk of hypertensive response with **MAO inhibitors**, **sympathomimetics** (e.g., **pseudo-**

© F.A. Davis Publishing

ephedrine), **vasopressors** (e.g., **epinephrine**, **norepinephrine**), and **dopaminergic agents** (e.g., **dopamine**, **dobutamine**); concurrent or recent use should be avoided. ↑ risk of serotonin syndrome with **SSRIs**, **SNRIs**, **TCAs**, **triptans**, **opioids**, **bupropion**, or **buspirone**; avoid concurrent use. **Rifampin**, **carbamazepine**, **phenytoin**, and **phenobarbital** may ↓ levels. Concurrent use with **oral hypoglycemics** or **insulin** may ↑ risk of hypoglycemia.

Drug-Food: Because of monoamine oxidase inhibitory properties, consumption of large amounts of foods or beverages containing tyramine should be avoided (↑ risk of pressor response. See Appendix J).

Route/Dosage

Vancomycin-Resistant *Enterococcus faecium* Infections

PO, IV (Adults): 600 mg every 12 hr for 14–28 days.
PO, IV (Children birth–11 yr): In the first wk of life, pre-term neonates may initially receive 10 mg/kg every 12 hr.

Pneumonia, Complicated Skin/Skin Structure Infections

PO, IV (Adults): 600 mg every 12 hr for 10–14 days.
PO, IV (Children birth–11 yr): 10 mg/kg every 8 hr for 10–14 days (in the first wk of life, preterm neonates may initially receive 10 mg/kg every 12 hr).

Uncomplicated Skin/Skin Structure Infections

PO (Adults): 400 mg every 12 hr for 10–14 days.
PO, IV (Children 5–11 yr): 10 mg/kg every 12 hr for 10–14 days.
PO, IV (Children <5 yr): 10 mg/kg every 8 hr for 10–14 days (in the first wk of life, pre-term neonates may initially receive 10 mg/kg every 12 hr).

Availability (generic available)

Tablets: 600 mg. **Oral suspension: (orange-flavored):** 100 mg/5 mL (each 5 mL contains phenylalanine 20 mg). **Premixed infusion:** 200 mg/100 mL, 600 mg/300 mL.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and during therapy.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving.
- May cause lactic acidosis. Notify health care professional if recurrent nausea and vomiting, unexplained acidosis, or low bicarbonate levels occur.
- Monitor visual function in patients receiving linezolid for ≥3 mo or who report visual symptoms (changes in acuity or color vision, blurred vision, visual field defect) regardless of length of therapy. If optic neuropathy occurs, therapy should be reconsidered.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Monitor patient taking serotonergic drugs for signs of serotonin syndrome (hyperthermia, rigidity, myoclonus, autonomic instability, mental status changes, extreme agitation progressing to delirium and coma) for 2 wk (5 wk if fluoxetine was taken) or until 24 hrs after the last dose of linezolid, whichever comes first.
- ***Lab Test Considerations:*** May cause bone marrow suppression, anemia, leukopenia, pancytopenia. Monitor CBC and platelet count weekly, especially in patients at risk for increased bleeding, having pre-existing bone marrow suppression, receiving concurrent medications that may cause myelosuppression, or requiring >2 wk of therapy. Discontinue therapy if bone marrow suppression occurs or worsens.
- May cause ↑ AST, ALT, LDH, alkaline phosphatase, and BUN.
- May cause hypoglycemia requiring decrease in dose of antidiabetic agent or discontinuation of linezolid.
- Monitor serum sodium levels regularly in the elderly, in patients taking diuretics, and in other patients at risk of hyponatremia and/or SIADH. If signs and symptoms of hyponatremia and/or SIADH occur, discontinue linezolid, and institute supportive measures.

Implementation

- ***High Alert:*** Do not confuse Zyvox with Zovirax (acyclovir).
- Dose adjustment is not necessary when switching from IV to oral dose.
- **PO:** May be administered with or without food.
- Before using oral solution gently invert 3–5 times to mix; do not shake. Store at room temperature.

IV Administration

- **Intermittent Infusion:** ***Dilution:*** Premixed infusions are already diluted and ready to use. Solution is yellowish in color which may intensify over time without affecting its potency. ***Concentration:*** 2 mg/mL. ***Rate:*** Infuse over 30–120 min. Flush line before and after infusion.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome,

© F.A. Davis Publishing

ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium acetate, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftazidime/avibactam, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, D5W, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, eravacycline, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, LR, leucovorin calcium, levofloxacin, lidocaine, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, meropenem/vaborbactam, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, 0.9% NaCl, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, remifentanil, rocuronium, sodium acetate, sodium bicarbonate, sodium phosphate, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** chlorpromazine, dantrolene, diazepam, pantoprazole, pentamidine, phenytoin, thiopental.

Patient/Family Teaching

- Instruct patients taking oral linezolid to take as directed, for full course of therapy, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose; do not double dose.
- Instruct patient to avoid large quantities of foods or beverages containing tyramine (See Appendix J). May cause hypertensive response.
- Instruct patient to notify health care professional if patient has a history of hypertension or seizures.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially cold remedies, decongestants, or antidepressants.
- Instruct patient to notify healthcare professional if changes in vision occur or immediately if diarrhea, abdominal cramping, fever, or bloody stools occur and not to treat with antidiarrheals without consulting health care professionals.
- Advise patient to notify health care professional promptly if signs and symptoms of SIADH (confusion, somnolence, generalized weakness, respiratory failure). May be fatal.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise lactating women to monitor breast-fed infant for diarrhea and vomiting. May reversibly impair fertility in male patients.
- Advise patient to notify health care professional if no improvement is seen in a few days.

Evaluation/Desired Outcomes

- Resolution of signs and symptoms of infection. Length of time for complete resolution depends on organism and site of infection.

liraglutide (lir-a-**gloo**-tide)

Saxenda, Victoza

Classification

Therapeutic: antidiabetics
Pharmacologic: glucagon-like peptide-1 (GLP-1) receptor agonists

Indications

Victoza: Type 2 diabetes mellitus (as adjunct to diet and exercise). To reduce the risk of major adverse cardiovascular events (cardiovascular death, nonfatal MI, or nonfatal stroke) in patients with type 2 diabetes mellitus and established cardiovascular disease. **Saxenda**: Chronic weight management in adults who are obese (body mass index [BMI] ≥30 kg/m²) or are overweight (BMI ≥27 kg/m²) with ≥1 weight-related comorbid condition (e.g. hypertension, dyslipidemia, type 2 diabetes) (as adjunct to reduced-calorie diet and increased physical activity). **Saxenda**: Chronic weight management in children ≥12 yrs old with a body weight >60 kg and an initial BMI corresponding to ≥30 kg/m² for adults (obese) by international cutoffs (Cole Criteria) (as adjunct to reduced-calorie diet and increased physical activity).

© F.A. Davis Publishing

Action

Acts as an acylated human glucagon-like peptide-1 (GLP-1, an incretin) receptor agonist; increases intracellular cyclic AMP (cAMP) leading to insulin release when glucose is elevated, which then subsides as blood glucose decreases toward euglycemia. Also decreases glucagon secretion and delays gastric emptying. Also helps to suppress appetite, leading to decreased caloric intake. **Therapeutic Effects:** Improved glycemic control. Reduction in body weight. Reduction in cardiovascular death, non-fatal myocardial infarction, or non-fatal stroke.

Pharmacokinetics

Absorption: 55% absorbed following subcutaneous injection.
Distribution: Unknown.
Protein Binding: >98%.
Metabolism and Excretion: Endogenously metabolized.
Half-life: 13 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
Subcut	within 4 wk†within 2 wk‡	8 wk†40 wk‡	unknown†‡

†↓ in A1c.
‡↓ in body weight.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Personal or family history of medullary thyroid carcinoma; Multiple Endocrine Neoplasia syndrome type 2; Type 1 diabetes (Victoza only); Diabetic ketoacidosis (Victoza only); Concurrent use with other weight-loss products (Saxenda only); History of suicidal attempts or suicidal thoughts (Saxenda only); OB: Weight loss not recommended during pregnancy (Saxenda only); Lactation: Lactation; Pedi: Children ≥12 yr with type 2 diabetes (safety and effectiveness not established) (Saxenda only).
Use Cautiously in: History of pancreatitis; History of angioedema or anaphylaxis to another GLP-1 receptor agonist; Hepatic/renal impairment; OB: Use only if potential maternal benefit justifies potential fetal risk to (Victoza only); Pedi: Safety and effectiveness not established in children <12 yr (Saxenda) and children <10 yr (Victoza); ↑ risk of hypoglycemia with use of either Saxenda or Victoza in children.

Adverse Reactions/Side Effects

CV: tachycardia. **Derm:** pruritus, rash. **Endo:** THYROID C-CELL TUMORS, hypoglycemia. **GI:** PANCREATITIS, diarrhea, nausea, vomiting, cholecystitis, cholelithiasis (Saxenda only), constipation. **GU:** acute renal failure. **Local:** injection site reactions. **Neuro:** SUICIDAL BEHAVIOR/IDEATION (Saxenda only), headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema).

Interactions

Drug-Drug: Concurrent use with **agents that increase insulin secretion**, including **sulfonylureas** and **insulin** may ↑ the risk of serious hypoglycemia; use cautiously and consider ↓ dose of agent increasing insulin secretion. May alter absorption of concomitantly administered **oral medications** due to delayed gastric emptying.

Route/Dosage

Victoza

Type 2 DM

Subcut (Adults): 0.6 mg once daily for 1 wk, then 1.2 mg once daily for 1 wk; may then ↑ dose, if needed, up to 1.8 mg once daily.
Subcut (Children ≥10 yr): 0.6 mg once daily for 1 wk; may then ↑ dose, if needed, to 1.2 mg once daily; after 1 wk, if additional glycemic control needed, may then ↑ dose to 1.8 mg once daily.

Reduction in Risk of Major Adverse Cardiovascular Events

Subcut (Adults): 0.6 mg once daily for 1 wk, then 1.2 mg once daily for 1 wk; may then ↑ dose, if needed, up to 1.8 mg once daily.

Saxenda

Subcut (Adults): 0.6 mg once daily for 1 wk (Wk 1), then 1.2 mg once daily for 1 wk (Wk 2), then 1.8 mg once daily for 1 wk (Wk 3), then 2.4 mg once daily for 1 wk (Wk 4), then 3 mg once daily. Discontinue if patient cannot tolerate dose of 3 mg once daily.
Subcut (Children ≥12 yr): 0.6 mg once daily for 1 wk (Wk 1), then 1.2 mg once daily for 1 wk (Wk 2), then 1.8 mg once daily for 1 wk (Wk 3), then 2.4 mg once daily for 1 wk (Wk 4), then 3 mg once daily. If patient cannot tolerate dose of 3 mg once daily, ↓ to 2.4 mg once daily; discontinue if patient cannot subsequently tolerate dose of 2.4 mg once daily.

Availability

Solution for injection (Saxenda) (prefilled pens): 18 mg/3 mL (delivers doses of 0.6 mg, 1.2 mg, 1.8 mg, 2.4 mg, or 3 mg). **Solution for injection (Victoza) (prefilled pens):** 18 mg/3 mL (delivers doses of 0.6 mg, 1.2 mg, or 1.8 mg). ***In combination with:*** insulin degludec (Xultophy). See Appendix N.

NURSING IMPLICATIONS

Assessment

- If thyroid nodules or elevated serum calcitonin are noted, patient should be referred to an endocrinologist.

© F.A. Davis Publishing

- Monitor for pancreatitis (persistent severe abdominal pain, sometimes radiating to the back, with or without vomiting). If pancreatitis is suspected, discontinue liraglutide; if confirmed, do not restart liraglutide.
- **Victoza:** Observe patient taking concurrent insulin for signs and symptoms of hypoglycemic reactions (sweating, hunger, weakness, dizziness, tremor, tachycardia, anxiety).
- **Saxenda:** Monitor patients for weight loss and adjust concurrent medications (antihypertensives, antidiabetics, lipid-lowering agents) as needed.
- ***Lab Test Considerations:*** Monitor serum A1c periodically during therapy to evaluate effectiveness.

Implementation

- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin.
- **Subcut:** Administer once daily at any time of the day, without regard to food. Inject into abdomen, thigh, or upper arm. Solution should be clear and colorless; do not administer solutions that are discolored or contain particulate matter.
- Initial dose of 0.6 mg/day is increased after 1 wk to 1.2 mg/day. If glycemic control is not acceptable, increase to 1.8 mg/day. Available in a prefilled pen without needle; patient may require Rx for needles.
- *First Time Use for Each New Pen*—Follow manufacturer's instructions only once with each new pen or if pen is dropped.

Patient/Family Teaching

- Instruct patient on use of pen injector and to take liraglutide as directed. If a dose is missed, omit and take next dose as scheduled; do not double doses. If >3 days dosing missed, reinitiate with 0.6 mg dose; titrate at direction of health care professional. Pen should never be shared between patients, even if needle is changed. Store pen in refrigerator; do not freeze. After initial use, pen may be stored at room temperature or refrigerated up to 30 days. Keep pen cap on when not in use. Protect from excessive heat and sunlight. Remove and safely discard needle after each injection and store pen without needle attached. Advise patient to read the *Patient Medication Guide* before starting liraglutide and with each Rx refill.
- If a dose is missed do not make up, skip and take next scheduled dose the next day. If more than 3 days are missed, reinitiate at 0.6 mg to minimize GI effects. Notify health care professional and increase dose as directed.
- Inform patient that nausea is the most common side effect, but usually decreases over time.
- Advise patient taking insulin and liraglutide to never mix insulin and liraglutide together. Give as 2 separate injections. Both injections may be given in the same body area, but should not be given right next to each other.
- Explain to patient that this medication controls hyperglycemia but does not cure diabetes. Therapy is long-term.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water and notify health care professional.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hypoglycemic or hyperglycemic episodes.
- Instruct patient in proper testing of serum glucose and ketones. These tests should be closely monitored during periods of stress or illness, and health care professional should be notified if significant changes occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to discontinue liraglutide and notify health care professional immediately if signs of pancreatitis (nausea, vomiting, abdominal pain) occur.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Inform patient of risk of benign and malignant thyroid C-cell tumors. Advise patient to notify health care professional if symptoms of thyroid tumors (lump in neck, hoarseness, trouble swallowing, shortness of breath) or if signs of allergic reaction (swelling of face, lips, tongue, or throat; fainting or feeling dizzy; very rapid heartbeat; problems breathing or swallowing; severe rash or itching) occur.
- Rep: Insulin is the preferred method of controlling blood glucose during pregnancy. Counsel females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. *Saxenda* is contraindicated in pregnancy as weight loss during pregnancy may cause fetal harm.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Emphasize the importance of routine follow-up exams.

Evaluation/Desired Outcomes

- Improved glycemic control.
- Reduction in body weight. If patient has not lost at least 4% of body weight after 16 wk of therapy, it is unlikely that patient will achieve and sustain clinically meaningful weight loss with continued treatment.
- Reduction in cardiovascular death, non-fatal myocardial infarction, or non-fatal stroke.

© F.A. Davis Publishing

lisdexamfetamine

(lis-dex-am-**fet**-a-meen)

Vyvanse

Classification

Therapeutic: central nervous system stimulants

Pharmacologic: sympathomimetics

Schedule II

Indications

Attention deficit hyperactivity disorder (ADHD). Moderate to severe binge eating disorder.

Action

Blocks reuptake and increases release of norepinephrine and dopamine resulting in increased levels in extraneuronal space. **Therapeutic Effects:** Improved attention span in ADHD. Reduction in number of binge eating days per wk.

Pharmacokinetics

Absorption: Rapidly absorbed and converted to dextroamphetamine, the active drug.

Distribution: Unknown.

Metabolism and Excretion: 42% excreted in urine as amphetamine.

Half-life: less than 1 hr for lisdexamfetamine.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	rapid	1 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to lisdexamfetamine or other sympathomimetic amines; Advanced arteriosclerosis; Symptomatic cardiovascular disease including known structural cardiac abnormalities (may ↑ the risk of sudden death); Moderate to severe hypertension; Glaucoma; Agitation; History of substance abuse; Concurrent use or use within 14 days of MAO inhibitors or MAO-like drugs (linezolid or methylene blue); Lactation: Lactation.

Use Cautiously in: History of pre-existing psychosis, bipolar disorder, aggression, tics, Tourette's syndrome or seizures (may exacerbate condition); Severe renal impairment (↓ maximum daily dose); OB: Use only if potential maternal benefit outweighs potential fetal risk; Pedi: Children <6 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: SUDDEN DEATH, Raynaud's phenomenon. **Derm:** alopecia, rash. **EENT:** blurred vision, poor accommodation. **GI:** abdominal pain, ↓ appetite, dry mouth, nausea, vomiting. **GU:** ↓ libido, priapism. **Metab:** ↓ weight. **MS:** RHABDOMYOLYSIS. **Neuro:** paresthesia, behavioral disturbances, dizziness, hallucinations, insomnia, irritability, mania, psychomotor hyperactivity, thought disorder, tics. **Misc:** SEROTONIN SYNDROME, long-term growth suppression.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** or **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of amphetamine mixtures. Drugs that affect serotonergic neurotransmitter systems, including **MAO inhibitors**, **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **lithium**, and **triptans** ↑ risk of serotonin syndrome. Concurrent use of other **sympathomimetic amines** may result in additive effects and ↑ risk of adverse reactions. **Urinary acidifying agents** including **sodium acid phosphate** ↑ excretion and ↓ blood levels and may result in ↓ effectiveness. May ↓ effectiveness of **adrenergic blockers**. ↑ risk of adverse cardiovascular reactions with **tricyclic antidepressants**. May ↓ sedating effects of **antihistamines**. May ↓ effectiveness of **antihypertensives**. Effects may be ↓ by **haloperidol**, **lithium**, or **chlorpromazine**. May ↓ absorption of **phenobarbital** or **phenytoin**.

Route/Dosage

ADHD

PO (Adults and Children 6–17 yr): 30 mg once daily; may ↑ by 10–20 mg/day at weekly intervals, up to 70 mg/day.

Binge Eating Disorder

PO (Adults): 30 mg once daily; may ↑ by 20 mg/day at weekly intervals, up to target dose of 50–70 mg/day.

Renal Impairment

PO (Adults and Children 6–17 yr): *CCr 15–29 mL/min*—Do not exceed 50 mg/day; *CCr <15 mL/min*—Do not exceed 30 mg/day.

Availability

Capsules: 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg, 70 mg. **Cost:** 20 mg $531.93/90, 30 mg $566.90/90, 40 mg $509.91/90, 50 mg $514.34/90, 60 mg $529.67/90, 70 mg $500.01/90. **Chewable tablets:** 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiration before administering and periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation

© F.A. Davis Publishing

(ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- Assess risk of abuse prior to prescribing. After prescribing, keep accurate prescription records, educate patient and family about risk of abuse, monitor for signs of abuse and overdose, and evaluate need for use periodically during therapy.
- Screen patients with bipolar disorder for risk of manic episode (comorbid or history of depressive symptoms or a family history of suicide, bipolar disorder, depression) prior to starting therapy.
- Monitor growth, both height and weight, in children on long-term therapy. May need to interrupt therapy in patients who are not growing or gaining height or weight as expected.
- Monitor closely for behavior change.
- Assess for serotonin syndrome (mental changes [agitation, hallucinations, coma], autonomic instability [tachycardia, labile BP, hyperthermia], neuromuscular aberrations [hyperreflexia, incoordination], and/or GI symptoms [nausea, vomiting, diarrhea]), especially in patients taking other serotonergic drugs (SSRIs, SNRIs, triptans).
- **ADHD:** Assess child's attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- **Binge Eating Disorder:** Monitor frequency and amount of binge eating.
- ***Lab Test Considerations:*** May cause ↑ plasma corticosteroid levels interfering with urinary steroid determinations.

Implementation

- **PO:** Administer in the morning without regard to meals. Afternoon doses should be avoided due to potential for insomnia. Capsules may be swallowed whole or opened and the entire contents dissolved in yogurt, water, or orange juice. If solution method is used, consume immediately; do not store for future use. Do not divide capsules or take less than one capsule per day. Chewable tablets must be chewed thoroughly. Tablets and chewable tablets can be substituted on a unit per unit/mg per mg basis.

Patient/Family Teaching

- Instruct patient to take medication as directed. Advise patient and parents to read *Medication Guide* prior to initiation of therapy and with each renewal of Rx refill. If more than prescribed amount is taken notify health care professional immediately. Instruct patient not to alter dose without consulting health care professional.
- Inform patient that sharing this medication may be dangerous.
- Advise patient to check weight 2–3 times weekly and report weight loss to health care professional. Pedi: If reduced appetite and weight loss are a problem, advise parents to provide high calorie meals when drug levels are low (at breakfast and or bedtime).
- Inform patients starting therapy of risk of peripheral vasculopathy. Instruct patients to notify health care professional of any new numbness; pain; skin color change from pale, to blue, to red; or coolness or sensitivity to temperature in fingers or toes, and call if unexplained wounds appear on fingers or toes. May require rheumatology consultation.
- Advise parents to notify health care professional immediately if child has signs of heart problems (chest pain, shortness of breath, fainting) or if new or worsening mental symptoms or problems, especially seeing or hearing things that are not real, believing things that are not real, or are suspicious occur.
- May cause dizziness or blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if nervousness, restlessness, insomnia, dizziness, anorexia, or dry mouth becomes severe.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Inform patient that health care professional may order periodic holidays from the drug to assess progress and to decrease dependence.
- Rep: May cause fetal harm. Advise patient to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding. May cause premature delivery. Monitor infants born to mothers taking lisdexamphetamine for symptoms of withdrawal (feeding difficulties, irritability, agitation, excessive drowsiness). Inform patient of pregnancy exposure registry that monitors pregnancy outcomes in women exposed to ADHD medications during pregnancy. Register patient by calling the National Pregnancy Registry for Psychostimulants at 1-866-961-2388 or visiting online at https://womensmentalhealth.org/clinical-and-researchprograms/pregnancyregistry/adhdmedications/.
- Emphasize the importance of routine follow-up exams to monitor progress.
- **Home Care Issues:** Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes

- Improved attention span, decreased impulsiveness and hyperactivity in ADHD.
- Reduction in number of binge eating days per wk.

lisinopril, See ANGIOTENSIN-CONVERTING ENZYME (ACE) INHIBITORS.

© F.A. Davis Publishing

lithium (lith-ee-um)

Carbolith, Lithane, Lithmax, Lithobid

Classification

Therapeutic: mood stabilizers

Indications

Treatment of acute manic and mixed episodes associated with bipolar I disorder. Maintenance treatment of bipolar I disorder.

Action

Alters cation transport in nerve and muscle. May also influence reuptake of neurotransmitters. **Therapeutic Effects:** Prevents/decreases incidence of acute manic episodes.

Pharmacokinetics

Absorption: Completely absorbed after oral administration.

Distribution: Widely distributed into many tissues and fluids; CSF levels are 50% of plasma levels. Crosses the placenta; enters breast milk.

Metabolism and Excretion: Excreted almost entirely unchanged by the kidneys.

Half-life: 20–27 hr.

TIME/ACTION PROFILE (antimanic effects)

ROUTE	ONSET	PEAK	DURATION
PO, PO–ER	5–7 days	10–21 days	days

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Brugada syndrome; Some products contain alcohol or tartrazine and should be avoided in patients with known hypersensitivity or intolerance; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Significant cardiovascular disease, renal impairment, dehydration, fever, or hyponatremia (↑ risk of lithium toxicity); Diabetes mellitus; Pedi: Children <7 yr (safety and effectiveness not established); Geri: Initial dosage ↓ recommended.

Adverse Reactions/Side Effects

CV: ECG changes, arrhythmias, edema, hypotension, unmasking of Brugada syndrome. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), acneiform eruption, folliculitis, alopecia, diminished sensation, pruritus. **EENT:** aphasia, blurred vision, dysarthria, tinnitus. **Endo:** hypothyroidism, goiter, hyperglycemia, hyperparathyroidism, hyperthyroidism. **F and E:** hypercalcemia, hyponatremia. **GI:** abdominal pain, anorexia, bloating, diarrhea, nausea, dry mouth, metallic taste. **GU:** polyuria, glycosuria, nephrogenic diabetes insipidus, renal impairment. **Hemat:** leukocytosis. **Metab:** weight gain. **MS:** muscle weakness, hyperirritability, rigidity. **Neuro:** tremors, PSEUDOTUMOR CEREBRI, SEIZURES, fatigue, headache, impaired memory, ataxia, sedation, confusion, dizziness, drowsiness, psychomotor retardation, restlessness, stupor. **Misc:** SEROTONIN SYNDROME.

Interactions

Drug-Drug: May prolong the action of **neuromuscular blocking agents**. ↑ risk of neurologic toxicity with **calcium channel blockers**, **methyldopa**, **phenytoin**, or **carbamazepine**. **Diuretics**, **NSAIDs**, **ACE inhibitors**, **angiotensin II receptor blockers**, and **metronidazole** may ↑ levels and risk of toxicity. Hypothyroid effects may be additive with **potassium iodide** or **antithyroid agents**. **Aminophylline**, **acetazolamide**, **theophylline**, and **sodium bicarbonate** ↑ renal elimination and ↓ effectiveness. **Psyllium** can ↓ **lithium** levels. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **amphetamines**, and **triptans** ↑ risk of serotonin syndrome. Concurrent use with **antipsychotics** may ↑ risk of developing an encephalopathic syndrome (i.e., weakness, lethargy, fever, tremulousness and confusion, extrapyramidal symptoms, leukocytosis, ↑ BUN, and ↑ fasting blood glucose); monitor closely.

Drug-Natural Products: Caffeine-containing herbs (**cola nut**, **guarana**, **mate**, **tea**, **coffee**) may ↓ **lithium** serum levels and efficacy. ↑ risk of serotonergic side effects including serotonin syndrome with **St. John's wort**.

Drug-Food: Large changes in **sodium** intake may alter the renal elimination of lithium. ↑ sodium intake will ↑ renal excretion.

Route/Dosage

Precise dosing is based on serum lithium levels. 300 mg lithium carbonate contains 8–12 mEq lithium.

PO (Adults and Children ≥7 yr and >30 kg): *Tablets/capsules/liquid*—300 mg 3 times daily initially; ↑ by 300 mg/day every 3 days; usual dose for treatment of acute manic and mixed episodes = 600 mg 2–3 times daily; usual maintenance dose = 300–600 mg 2–3 times daily.

PO (Adults and Children >12 yr): *Extended-release tablets*—450–900 mg twice daily *or* 300–600 mg 3 times daily initially; usual maintenance dose is 450 mg twice daily *or* 300 mg 3 times daily.

PO (Children ≥7 yr and 20–30 kg): *Tablets/capsules/liquid*—300 mg twice daily initially; ↑ by 300 mg/wk; usual dose for treatment of acute manic and mixed episodes = 600–1500 mg/day in divided doses; usual maintenance dose = 600–1200 mg/day in divided doses.

© F.A. Davis Publishing

Availability (generic available)

Immediate-release tablets: 300 mg. **Cost:** *Generic*— $21.52/100. **Immediate-release capsules:** 150 mg, 300 mg, 600 mg. **Cost:** *Generic*— 150 mg $13.97/100, 300 mg $17.91/100, 600 mg $39.11/100. **Extended-release tablets:** 300 mg, 450 mg. **Cost:** *Generic*— 300 mg $46.52/100, 450 mg $50.05/100. **Oral solution:** 300 mg (8 mEq lithium)/5 mL.

NURSING IMPLICATIONS

Assessment

- Assess mental status (orientation, mood, behavior) initially and periodically. Initiate suicide precautions if indicated.
- Monitor intake and output ratios. Report significant changes in totals. Unless contraindicated, fluid intake of at least 2000–3000 mL/day should be maintained. Weight should also be monitored at least every 3 mo.
- ***Lab Test Considerations:*** Evaluate renal and thyroid function, WBC with differential, serum electrolytes, and glucose periodically during therapy.
- ***Toxicity and Overdose:*** Monitor serum lithium levels twice weekly during initiation of therapy and every 2 mo during chronic therapy. Draw blood samples in the morning immediately before next dose. Therapeutic levels range from 0.5–1.5 mEq/L for acute mania and 0.6–1.2 mEq/L for long term control. Serum concentrations should not exceed 2.0 mEq/L.
- Assess patient for signs and symptoms of lithium toxicity (vomiting, diarrhea, slurred speech, lightheadedness, decreased coordination, drowsiness, muscle weakness, tremor, or twitching). If these occur, report before administering next dose.

Implementation

- Do not confuse lithium carbonate with lanthanum carbonate. Do not confuse lithium with Ultram (tramadol).
- **PO:** Administer with food or milk to minimize GI irritation. ***DNC:*** Extended-release preparations should be swallowed whole; do not break, crush, or chew.

Patient/Family Teaching

- Instruct patient to take medication as directed, even if feeling well. Take missed doses as soon as remembered unless within 2 hr of next dose (6 hr if extended release).
- Lithium may cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Low sodium levels may predispose patient to toxicity. Advise patient to drink 2000–3000 mL fluid each day and eat a diet with consistent and moderate sodium intake. Excessive amounts of coffee, tea, and cola should be avoided because of diuretic effect. Avoid activities that cause excess sodium loss (heavy exertion, exercise in hot weather, saunas). Notify health care professional of fever, vomiting, and diarrhea, which also cause sodium loss.
- Advise patient that weight gain may occur. Review principles of a low-calorie diet.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially NSAIDs and St. John's wort.
- Review side effects and symptoms of toxicity with patient. Instruct patient to stop medication and report signs of toxicity to health care professional promptly.
- Advise patient to notify health care professional if fainting, irregular pulse, or difficulty breathing occurs.
- Rep: May cause fetal harm. Advise females of reproductive potential to use contraception during therapy and to consult health care professional if pregnancy is planned or suspected, and to avoid breast feeding. Monitor breast-fed infants for signs and symptoms of lithium toxicity (hypertonia, hypothermia, cyanosis, ECG changes).
- Emphasize the importance of periodic lab tests to monitor for lithium toxicity.

Evaluation/Desired Outcomes

- Resolution of the symptoms of mania (hyperactivity, pressured speech, poor judgment, need for little sleep).
- Decreased incidence of mood swings in bipolar disorders.
- Improved affect in unipolar disorders. Improvement in condition may require 1–3 wk.
- Decreased incidence of acute manic episodes.

lofexidine (loe-**fex**-i-deen)

Lucemyra

Classification

Therapeutic: none assigned
Pharmacologic: adrenergics (centrally acting)

Indications

Mitigation of opioid withdrawal symptoms to facilitate abrupt opioid discontinuation in adults.

Action

Stimulates alpha$_2$-adrenergic receptors in the CNS, which results in decreased sympathetic outflow. **Therapeutic Effects:** Reduction in severity of opioid withdrawal symptoms.

Pharmacokinetics

Absorption: Well absorbed (72%) following oral administration.
Distribution: Extensively distributed to tissues, including CNS.
Metabolism and Excretion: Metabolized by the liver (primarily by CYP2D6, but also CYP1A2 and

© F.A. Davis Publishing

CYP2C19 to some extent) to inactive metabolites; primarily excreted in urine (15–20% as unchanged drug); ⛓ ~7% of population may be poor metabolizers and may have significantly ↑ lofexidine concentrations and an ↑ risk of adverse effects.
Half-life: 17–22 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–5 hr	unknown

Contraindications/Precautions

Contraindicated in: Concurrent use with medications that lower blood pressure or heart rate; Congenital long QT syndrome.
Use Cautiously in: Severe cardiac or cerebrovascular disease, recent MI, chronic renal failure, severe bradycardia; HF, bradyarrhythmias, hepatic impairment, renal impairment, hypokalemia, or hypomagnesemia; Concurrent use of QT-interval prolonging medications; ⛓ CYP2D6 poor metabolizers; Geri: ↑ risk of orthostatic hypotension and adverse CNS effects in older adults (↓ dose recommended); OB: Safety not established; Lactation: Use only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, bradycardia, hypotension, palpitations, QT interval prolongation, syncope. **EENT:** tinnitus. **GI:** dry mouth. **Neuro:** drowsiness, dizziness, insomnia.

Interactions

Drug-Drug: Additive hypotension with other **antihypertensives** and **nitrates**; avoid concurrent use. Additive bradycardia with **beta blockers**, **diltiazem**, **verapamil**, **digoxin**, or **ivabradine**; avoid concurrent use. Additive sedation with **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Concurrent use with **QT interval-prolonging medications**, including **methadone**, may ↑ risk of QT interval prolongation and torsades de pointes. May ↓ **naltrexone (PO)** levels; separate administration by >2 hr. **CYP2D6 inhibitors**, including **paroxetine** may ↑ levels.

Route/Dosage

PO (Adults): 0.54 mg 4 times daily (with 5–6 hr between each dose) during the period of peak withdrawal symptoms (usually the first 5–7 days after the last opioid dose); may adjust dose based on symptoms (max dose = 2.88 mg/day or 0.72 mg/dose); may be continued for up to 14 days. Must taper therapy upon discontinuation (gradually ↓ dose over 2–4-day period).

Hepatic Impairment

PO (Adults): *Moderate hepatic impairment (Child-Pugh B)* — 0.36 mg 4 times daily (with 5–6 hr between each dose) during the period of peak withdrawal symptoms (usually the first 5–7 days after the last opioid dose); *Severe hepatic impairment (Child-Pugh C)* — 0.18 mg 4 times daily (with 5–6 hr between each dose) during the period of peak withdrawal symptoms (usually the first 5–7 days after the last opioid dose).

Renal Impairment

PO (Adults): *CCr 30– <90 mL/min* — 0.36 mg 4 times daily (with 5–6 hr between each dose) during the period of peak withdrawal symptoms (usually the first 5–7 days after the last opioid dose); *CCr <30 mL/min* — 0.18 mg 4 times daily (with 5–6 hr between each dose) during the period of peak withdrawal symptoms (usually the first 5–7 days after the last opioid dose).

Availability

Tablets: 0.18 mg.

NURSING IMPLICATIONS

Assessment

- Assess vital signs and symptoms of bradycardia and orthostatic hypotension (low blood pressure, slow heartbeat, dizziness, lightheadedness, feeling faint at rest or when standing up) before dose and as needed during therapy.
- Monitor ECG when starting therapy and in patients with HF, bradyarrhythmias, hepatic impairment, renal impairment, or those taking medications (methadone) that lead to QT prolongation.
- ***Lab Test Considerations:*** Monitor electrolytes before starting and during therapy. Correct electrolyte abnormalities (hypokalemia, hypomagnesemia) before starting therapy.

Implementation

- **PO:** Administer 3 tablets four times daily without regard to food, with 5–6 hrs between doses.

Patient/Family Teaching

- Instruct patient to take lofexidine as directed and not to stop without consulting health care professional. Abrupt discontinuation can cause diarrhea, insomnia, anxiety, chills, hyperhidrosis, and extremity pain. Reduce dose gradually.
- Caution patients that after a period of not using opioids, they may be more sensitive to the effects of opioids and at greater risk of overdosing.
- May cause dizziness and sedation. Caution patient to avoid driving and activities requiring alertness until response to medication is known.
- Caution patient to avoid sudden changes in position to decrease orthostatic hypotension. Use of alcohol,

© F.A. Davis Publishing

standing for long periods, exercising, dehydration, and hot weather may increase orthostatic hypotension.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any other Rx, OTC, or herbal products, especially benzodiazepines, barbiturates, tranquilizers, or sleeping pills.
- Caution patient to avoid concurrent use of alcohol or other CNS depressants with lofexidine.
- Advise female patients to notify health care professional if pregnancy is planned or suspected or if breast feeding.

Evaluation/Desired Outcomes
- Reduction in severity of opioid withdrawal symptoms.

loperamide (loe-**per**-a-mide)
Imodium, Imodium A-D

Classification
Therapeutic: antidiarrheals

Indications
Adjunctive therapy of acute diarrhea. Chronic diarrhea associated with inflammatory bowel disease. Decreases the volume of ileostomy drainage.

Action
Inhibits peristalsis and prolongs transit time by a direct effect on nerves in the intestinal muscle wall. Reduces fecal volume, increases fecal viscosity and bulk while diminishing loss of fluid and electrolytes. **Therapeutic Effects:** Relief of diarrhea.

Pharmacokinetics
Absorption: Not well absorbed following oral administration.
Distribution: Unknown. Does not cross the blood-brain barrier.
Protein Binding: 97%.
Metabolism and Excretion: Metabolized partially by the liver, undergoes enterohepatic recirculation; 30% eliminated in the feces. Minimal excretion in the urine.
Half-life: 10.8 hr.

TIME/ACTION PROFILE (relief of diarrhea)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2.5–5 hr	10 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Patients in whom constipation must be avoided; Abdominal pain of unknown cause, especially if associated with fever; Alcohol intolerance (liquid only).
Use Cautiously in: Hepatic dysfunction; Lactation: Usually compatible with breast feeding; OB: Safety not established; Pedi: Children <2 yr (safety not established); Geri: ↑ sensitivity to effects.

Adverse Reactions/Side Effects
CV: CARDIAC ARREST, QT INTERVAL PROLONGATION, TORSADES DE POINTES, VENTRICULAR ARRHYTHMIAS, syncope. **GI:** constipation, abdominal pain/distention/discomfort, dry mouth, nausea, vomiting. **Neuro:** drowsiness, dizziness. **Misc:** allergic reactions.

Interactions
Drug-Drug: ↑ CNS depression with other **CNS depressants**, including **alcohol**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. ↑ anticholinergic properties with other **drugs having anticholinergic properties**, including **antidepressants** and **antihistamines**. Concurrent use of **cimetidine**, **clarithromycin**, **erythromycin**, **gemfibrozil**, **itraconazole**, **ketoconazole**, **quinidine**, **quinine**, or **ritonavir** may ↑ levels and risk of cardiac arrhythmias. **Drug-Natural Products:** **Kava-kava**, **valerian**, **skullcap**, **chamomile**, or **hops** can ↑ CNS depression.

Route/Dosage
Acute and Chronic Diarrhea
PO (Adults and Children >12 yr): 4 mg initially, then 2 mg after each loose stool. Maintenance dose usually 4–8 mg/day in divided doses (not to exceed 8 mg/day for OTC use or 16 mg/day for Rx use).

Acute Diarrhea
PO (Children 9–11 yr or 30–47 kg): 2 mg initially; then 1 mg after each loose stool (not to exceed 6 mg/24 hr; OTC use should not exceed 2 days).
PO (Children 6–8 yr or 24–30 kg): 1 mg initially, then 1 mg after each loose stool (not to exceed 4 mg/24 hr; OTC use should not exceed 2 days).
PO (Children 2–5 yr or 13–20 kg): 1 mg initially, then 0.1 mg/kg after each loose stool (not to exceed 3 mg/24 hr; OTC use should not exceed 2 days).

Chronic Diarrhea
PO (Children): 0.08–0.24 mg/kg/day divided 2–3 times/day (not to exceed 2 mg/dose).

Availability (generic available)
Tablets: 2 mg[OTC]. **Capsules:** 2 mg. **Oral liquid (mint):** 1 mg/5 mL[OTC], 1 mg/7.5 mL[OTC]. ***In combination with:*** simethicone (Imodium Multi-Symptom Relief[OTC], see Appendix N).

NURSING IMPLICATIONS
Assessment
- Assess frequency and consistency of stools and bowel sounds prior to and during therapy.
- Assess fluid and electrolyte balance and skin turgor for dehydration.

Implementation
- **PO:** Administer with clear fluids to help prevent dehydration, which may accompany diarrhea.

© F.A. Davis Publishing

Patient/Family Teaching

- Instruct patient to take medication as directed. Do not take missed doses, and do not double doses. In acute diarrhea, medication may be ordered after each unformed stool. Advise patient not to exceed the maximum number of doses.
- May cause drowsiness. Advise patient to avoid driving or other activities requiring alertness until response to drug is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may relieve dry mouth.
- Caution patient to avoid using alcohol and other CNS depressants concurrently with this medication.
- Instruct patient to notify health care professional if diarrhea persists or if fever, abdominal pain, or distention occurs.

Evaluation/Desired Outcomes

- Decrease in diarrhea.
- In acute diarrhea, treatment should be discontinued if no improvement is seen in 48 hr.
- In chronic diarrhea, if no improvement has occurred after at least 10 days of treatment with maximum dose, loperamide is unlikely to be effective.

loratadine (lor-a-ta-deen)

Alavert, Claritin, Claritin Allergy Childrens, Claritin Childrens, Claritin Reditabs, Loradamed

Classification

Therapeutic: antihistamines

Indications

Relief of symptoms of seasonal allergies. Management of chronic idiopathic urticaria. Management of hives.

Action

Blocks peripheral effects of histamine released during allergic reactions. **Therapeutic Effects:** Decreased symptoms of allergic reactions (nasal stuffiness; red, swollen eyes, itching).

Pharmacokinetics

Absorption: Rapidly absorbed after oral administration (80%).

Distribution: Unknown.

Protein Binding: *Loratadine*—97%; *descarboethoxyloratadine*—73–77%.

Metabolism and Excretion: Rapidly and extensively metabolized during first pass through the liver. Much is converted to descarboethoxyloratadine, an active metabolite.

Half-life: *Loratadine*—8.4 hr; *descarboethoxyloratadine*—28 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	1–3 hr	8–12 hr	>24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Hepatic impairment or CCr <30 mL/min (↓ dose to 10 mg every other day); Pedi: children <2 yr (safety and effectiveness not established). Syrup contains sodium benzoate; avoid use in neonates; Geri: ↑ risk of adverse reactions in older adults.

Adverse Reactions/Side Effects

Derm: photosensitivity, rash. **EENT:** blurred vision. **GI:** dry mouth, GI upset. **Metab:** weight gain. **Neuro:** confusion, drowsiness (rare), paradoxical excitation.

Interactions

Drug-Drug: The following interactions may occur, but are less likely to occur with loratadine than with more sedating antihistamines. **MAO inhibitors** may intensify and prolong effects of antihistamines. ↑ CNS depression may occur with other **CNS depressants**, including **alcohol**, **antidepressants**, **opioid analgesics**, and **sedative/hypnotics**. **Amiodarone** may ↑ loratadine levels and ↑ risk of QTc interval prolongation.

Drug-Natural Products: **Kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

PO (Adults and Children ≥6 yr): 10 mg once daily.

PO (Children ≥2–5 yr): 5 mg once daily.

Renal Impairment

PO (Adults): *CCr <30 mL/min*—10 mg every other day.

Hepatic Impairment

PO (Adults): 10 mg every other day.

Availability (generic available)

Tablets: 10 mg[OTC]. **Capsules:** 10 mg[OTC]. **Chewable tablets (cool-mint-flavor, grape-flavor, bubble-gum-flavor):** 5 mg[OTC], 10 mg[OTC]. **Orally disintegrating tablets (mint):** 5 mg[OTC], 10 mg[OTC]. **Oral solution (grape-flavor, fruit-flavor):** 5 mg/5 mL[OTC]. ***In combination with:*** pseudoephedrine (Claritin-D)[OTC]. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Assess allergy symptoms (rhinitis, conjunctivitis, hives) before and periodically during therapy.
- Assess lung sounds and character of bronchial secretions. Maintain fluid intake of 1500–2000 mL/day to decrease viscosity of secretions.

© F.A. Davis Publishing

- ***Lab Test Considerations:*** May cause false-negative result on allergy skin testing.

Implementation

- Do not confuse Claritin (loratadine) with Claritin Eye (ketotifen fumarate).
- **PO:** Administer once daily.
- *For rapidly disintegrating tablets (Alavert, Claritin Reditabs)* — place on tongue. Tablet disintegrates rapidly. May be taken with or without water.

Patient/Family Teaching

- Instruct patient to take medication as directed.
- May cause dizziness or drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Advise patient to avoid taking alcohol or other CNS depressants concurrently with this drug.
- Advise patient that good oral hygiene, frequent rinsing of mouth with water, and sugarless gum or candy may minimize dry mouth. Patient should notify dentist if dry mouth persists >2 wk.
- Instruct patient to contact health care professional immediately if dizziness, fainting, or fast or irregular heartbeat occurs or if symptoms persist.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Decrease in allergic symptoms.
- Management of chronic idiopathic urticaria.
- Management of hives.

BEERS

LORazepam (lor-az-e-pam)

Ativan, Loreev XR

Classification

Therapeutic: anesthetic adjuncts, antianxiety agents, sedative/hypnotics
Pharmacologic: benzodiazepines

Schedule IV

Indications

PO: Anxiety disorder. **IM, IVStatus epilepticus, Preanesthetic to produce sedation, decrease preoperative anxiety and induce amnesia.**

Action

Depresses the CNS, probably by potentiating GABA, an inhibitory neurotransmitter. **Therapeutic Effects:** Sedation. Decreased anxiety. Decreased seizures.

Pharmacokinetics

Absorption: Well absorbed following oral administration. Rapidly and completely absorbed following IM administration. Sublingual absorption is more rapid than oral and is similar to IM.

Distribution: Widely distributed. Crosses the blood-brain barrier. Crosses the placenta; enters breast milk.
Metabolism and Excretion: Highly metabolized by the liver.
Half-life: Full-term neonates: 18–73 hr; Older children: 6–17 hr; Adults: 10–16 hr.

TIME/ACTION PROFILE (sedation)

ROUTE	ONSET	PEAK	DURATION
PO	15–60 min	1–6 hr	8–12 hr
PO-XR	unknown	unknown	unknown
IM	30–60 min	1–2 hr†	8–12 hr
IV	15–30 min	15–20 min	8–12 hr

†Amnestic response.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other benzodiazepines may exist; Comatose patients or those with pre-existing CNS depression; Uncontrolled severe pain; Angle-closure glaucoma; Severe hypotension; Sleep apnea; OB: Use in pregnancy may cause CNS depression, flaccidity, feeding difficulties, hypothermia, seizures, and respiratory problems in the neonate; IV use may affect child's brain development when used during 3rd trimester; Lactation: Lactation.
Use Cautiously in: Severe hepatic/renal/pulmonary impairment; Myasthenia gravis; Depression; Psychosis; History of suicide attempt or drug abuse/substance use disorder; COPD; Sleep apnea; Pedi: Safety and effectiveness not established in children <18 yr (IV) or <12 yr (PO); in ↑ doses, benzyl alcohol in injection may cause potentially fatal "gasping syndrome" in neonates; IV use may affect brain development in children <3 yr; Geri: Lower doses recommended for older adults.

Adverse Reactions/Side Effects

CV: *rapid IV use only* — APNEA CARDIAC ARREST, bradycardia, hypotension. **Derm:** rash. **EENT:** blurred vision. **GI:** constipation, diarrhea, nausea, vomiting, weight gain (unusual). **Neuro:** dizziness, drowsiness, lethargy, hangover, headache, ataxia, slurred speech, forgetfulness, confusion, mental depression, rhythmic myoclonic jerking in pre-term infants, paradoxical excitation. **Resp:** respiratory depression. **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with **opioids** or other **CNS depressants**, including other **benzodiazepines**, **nonbenzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. May ↓ the efficacy of **levodopa**. **Smoking** may ↑ metabolism and ↓ effectiveness. **Valproate** and **probenecid** can ↑ levels; ↓ dose by 50%. **Oral contraceptives** may ↓ levels.
Drug-Natural Products: Concomitant use of **kava-kava**, **valerian,** or **chamomile** can ↑ CNS depression.

© F.A. Davis Publishing

Route/Dosage

Status Epilepticus

IV, IM (Adults): 4 mg; may be repeated after 10–15 min.

Preanesthetic

IM (Adults): 0.05 mg/kg (not to exceed 4 mg) ≥2 hr before surgery.
IV (Adults): 0.044 mg/kg (not to exceed 2 mg) 15–20 min before surgery.

Anxiety

PO (Adults): *Immediate-release tablets*—1–3 mg 2–3 times daily (up to 10 mg/day). *Extended-release capsules*—Give total daily dose of lorazepam immediate-release tablets (at the previous three times daily dose) and administer once daily in the morning. If dose ↑ needed, switch to lorazepam immediate-release tablets to ↑ the dose; once stable response achieved, may switch back to equivalent daily dose of lorazepam extended-release capsules.
PO (Geriatric Patients or Debilitated Patients): 0.5–2 mg/day in divided doses initially.

Availability (generic available)

Immediate-release tablets: 0.5 mg, 1 mg, 2 mg. **Cost:** *Generic*—0.5 mg $6.99/100, 1 mg $9.73/100, 2 mg $10.34/100. **Extended-release capsules (Loreev XR):** 1 mg, 2 mg, 3 mg. **Sublingual tablets :** 0.5 mg, 1 mg, 2 mg. **Concentrated oral solution:** 2 mg/mL. **Cost:** *Generic*—$39.80/30 mL. **Solution for injection:** 2 mg/mL, 4 mg/mL.

NURSING IMPLICATIONS

Assessment

- Conduct regular assessment of continued need for treatment.
- Assess risk for addiction, abuse, or misuse prior to administration and periodically during therapy.
- Pedi: Assess neonates for prolonged CNS depression related to inability to metabolize lorazepam.
- Geri: Assess geriatric patients carefully for CNS reactions as they are more sensitive to these effects. Assess falls risk.
- **Anxiety:** Assess degree and manifestations of anxiety and mental status (orientation, mood, behavior) prior to and periodically throughout therapy.
- Prolonged high-dose therapy may lead to psychological or physical dependence. Restrict amount of drug available to patient.
- **Status Epilepticus:** Assess location, duration, characteristics, and frequency of seizures. Institute seizure precautions.
- ***Lab Test Considerations:*** Patients on high-dose therapy should receive routine evaluation of renal, hepatic, and hematologic function.
- ***Toxicity and Overdose:*** If overdose occurs, flumazenil (Romazicon) is the antidote. Do not use with patients with seizure disorder. May induce seizures.

Implementation

- Do not confuse lorazepam with alprazolam, clonazepam, or Lovaza (omega-3–acid ethyl esters).
- Gradually taper to discontinue or reduce the dose to reduce risk of withdrawal reactions, increased seizure frequency, and status epilepticus. If a patient develops withdrawal reactions, consider pausing taper or increasing the dose to the previous tapered dose level. Subsequently decrease the dose more slowly. Some patients may require longer tapering period (weeks to >12 mo).
- Following parenteral administration, keep patient supine for at least 8 hr and observe closely.
- **PO:** Tablet may also be given sublingually (unlabeled) for more rapid onset.
- Administer XR capsules with or without food. ***DNC:*** Do not crush or chew. Swallow whole or open and sprinkle the entire contents of capsule over a tablespoon of applesauce, then drink water after consuming the applesauce (without chewing). Consume entire contents of capsule within 2 hrs of opening capsule.
- Take concentrated liquid solution with water, soda, pudding, or applesauce. Use calibrated dropper provided to ensure accurate dose.
- **IM:** Administer IM doses deep into muscle mass at least 2 hr before surgery for optimum effect.

IV Administration

- **IV Push:** ***Dilution:*** Dilute immediately before use with an equal amount of sterile water for injection, D5W, or 0.9% NaCl for injection. Pedi: To decrease the amount of benzyl alcohol delivered to neonates, dilute the 4 mg/mL injection with preservative-free sterile water for injection to make a 0.4 mg/mL dilution for IV use. Do not use if solution is colored or contains a precipitate. ***Rate:*** Administer at a rate not to exceed 2 mg/min or 0.05 mg/kg over 2–5 min. Rapid IV administration may result in apnea, hypotension, bradycardia, or cardiac arrest.
- **Y-Site Compatibility:** acetaminophen, acyclovir, albumin, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B deoxycholate, amphotericin B lipid complex, anakinra, anidulafungin, argatroban, arsenic trioxide, atracurium, azithromycin, bleomycin, bumetanide, buprenorphine, busulfan, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, ciprofloxacin,

© F.A. Davis Publishing

cisatracurium, cisplatin, cladribine, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin lactobionate, esmolol, etomidate, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydrocortisone sodium succinate, hydromorphone, ifosfamide, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketorolac, labetalol, leucovorin calcium, lidocaine, linezolid, magnesium sulfate, mannitol, melphalan, meropenem, meropenem/vaborbactam, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitoxantrone, morphine, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, oritavancin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, pentamidine, pentobarbital, phentolamine, phenobarbital, phenylephrine, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, quinupristin/dalfopristin, remifentanil, rituximab, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, tacrolimus, tedizolid, teniposide, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** aldesleukin, amphotericin B liposome, ampicillin, ampicillin/sulbactam, aztreonam, dantrolene, fluorouracil, gemtuzumab ozogamicin, hydralazine, idarubicin, imipenem/cilastatin, meperidine, mitomycin, ondansetron, pantoprazole, phenytoin, potassium phosphates, rocuronium, sargramostim, sufentanil.

Patient/Family Teaching

- Instruct patient to take medication exactly as directed and not to skip or double up on missed doses. If medication is less effective after a few wk, check with health care professional; do not increase dose. Must be discontinued gradually. Do not suddenly stop taking lorazepam without consulting health care professional; may cause unusual movements, responses or expressions, seizures, sudden and severe mental or nervous system changes, depression, seeing or hearing things that others do not see or hear, an extreme increase in activity or talking, losing touch with reality, and suicidal thoughts or actions. Instruct patient to ready *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Advise patient that lorazepam is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Advise patient that lorazepam is usually prescribed for short-term use and does not cure underlying problem.
- May cause drowsiness or dizziness. Advise patient to avoid driving or other activities requiring alertness until response to medication is known.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Caution patient to avoid taking alcohol or other CNS depressants, including opioids and cannabidiol, concurrently with this medication without consulting health care professional.
- Rep: May cause fetal harm. Advise females of reproductive potential to contact health care professional immediately if pregnancy is planned or suspected. Monitor infants of women who have taken lorazepam for several wks or more prior to delivery for signs and symptoms of withdrawal (hypoactivity, hypotonia, hypothermia, respiratory depression, apnea, feeding problems, impaired metabolic response to cold stress). Avoid breast feeding during therapy; may cause infant sedation and inability to suckle.
- Emphasize the importance of follow-up exams to determine effectiveness of the medication.

Evaluation/Desired Outcomes

- Increase in sense of well-being.
- Decrease in subjective feelings of anxiety without excessive sedation.
- Reduction of preoperative anxiety.
- Postoperative amnesia.
- Improvement in sleep patterns.

lumacaftor/ivacaftor

(loo-ma-**kaf**-tor/**eye**-va-**kaf**-tor)
Orkambi

Classification
Therapeutic: cystic fibrosis therapy adjuncts
Pharmacologic: transmembrane conductance regulator potentiators

Indications

Treatment of cystic fibrosis (CF) in patients who are homozygous for the *F508del* mutation in the *CFTR* gene.

Action

Ivacaftor—acts as a potentiator of the CFTR protein (a chloride channel on the surface of endothelial cells) facilitating chloride transport by increasing the channel-open probability (gating). *Lumacaftor*—improves the conformational stability of *F508del-CFTR* which results in increased processing and trafficking of mature protein to the cell surface. **Therapeutic Effects:** Improved lung function with increased weight, decreased exacerbations and CF symptoms.

Pharmacokinetics

Lumacaftor
Absorption: Some absorption follows oral administration; absorption is enhanced 2-fold by fat-containing foods.
Distribution: Widely distributed.
Protein Binding: >99%.
Metabolism and Excretion: Minimally metabolized via oxidation and glucuronidation; 51% excreted unchanged in feces; <1% excreted unchanged in urine.
Half-life: 26 hr.

Ivacaftor
Absorption: Some absorption follows oral administration; absorption is enhanced 3-fold by fat-containing foods.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: Extensively metabolized, mostly by the CYP3A enzyme system; one metabolite (M1) is pharmacologically active; 87.8% eliminated in feces; negligible urinary elimination.
Half-life: 9 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Lumacaftor (PO)	within 1 wk	4 hr	12 hr
Ivacaftor (PO)	within 1 wk	4 hr	12 hr

Contraindications/Precautions

Contraindicated in: Concurrent use of strong CYP3A inducers; Concurrent use of sensitive CYP3A substrates or those with a narrow therapeutic index.
Use Cautiously in: Concurrent use of CYP3A inhibitors; Moderate or severe hepatic impairment (dose ↓ recommended); Severe renal impairment (CCr <30 mL/min) or end stage renal disease; Advanced lung disease (↑ risk of respiratory events); OB: Use in pregnancy only if clearly needed; Lactation: Use cautiously during breast feeding; Pedi: Children <2 yr (safety and effectiveness not established).

Adverse Reactions/Side Effects

CV: ↑ blood pressure. **Derm:** rash. **EENT:** cataracts, rhinorrhea. **GI:** diarrhea, nausea, flatulence, ↑ bilirubin, ↑ liver enzymes. **GU:** amenorrhea, dysmenorrhea, menorrhagia. **MS:** ↑ creatine kinase. **Neuro:** fatigue. **Resp:** dyspnea, chest discomfort.

Interactions

Drug-Drug: Lumacaftor is a strong inducer of CYP3A4. Ivacaftor is a CYP3A substrate. **Strong CYP3A inducers** including **rifampin**, **rifabutin**, **phenobarbital**, **carbamazepine** and **phenytoin** may ↓ ivacaftor levels and effectiveness; avoid concurrent use. Lumacaftor may ↓ levels of **CYP3A substrates**, including **hormonal contraceptive agents**; avoid concurrent use with sensitive CYP3A substrates or those with a narrow therapeutic index, including **cyclosporine**, **everolimus**, **midazolam**, **sirolimus**, **tacrolimus**, or **triazolam**. **Strong CYP3A inhibitors** including **ketoconazole**, **itraconazole**, **posaconazole**, **voriconazole**, and **clarithromycin** may ↑ ivacaftor levels; no dose adjustment required when initiating CYP3A inhibitor in patients currently receiving ivacaftor/lumacaftor; ↓ initial ivacaftor/lumacaftor dose for 1 wk when starting therapy in patient currently receiving strong CYP3A4 inhibitor and then proceed with recommended dose. Lumacaftor may ↓ levels of **CYP2B6 substrates**, **CYP2C8 substrates**, **CYP2C9 substrates**, and **CYP2C19 substrates**. Ivacaftor may ↑ levels of **CYP2C9 substrates**. May ↑ or ↓ **digoxin** or **warfarin** levels. May ↓ levels of **citalopram**, **clarithromycin**, **corticosteroids**, **erythromycin**, **escitalopram**, **ibuprofen**, **itraconazole**, **ketoconazole**, **montelukast**, **posaconazole**, **proton pump inhibitors**, **repaglinide**, **sertraline**, **sulfonylureas**, **voriconazole**.
Drug-Natural Products: St. John's wort may ↓ ivacaftor levels and effectiveness; avoid concurrent use.

Route/Dosage

PO (Adults and Children ≥12 yr): Two lumacaftor 200 mg/ivacaftor 125 mg tablets every 12 hr with fat-containing food; *Initiation of therapy in patients receiving strong CYP3A inhibitor*—One lumacaftor 200 mg/ivacaftor 125 mg tablet once daily for 1 wk,

© F.A. Davis Publishing

then ↑ to two lumacaftor 200 mg/ivacaftor 125 mg tablets every 12 hr.

PO (Children 6–11 yr): Two lumacaftor 100 mg/ivacaftor 125 mg tablets every 12 hr with fat-containing food; *Initiation of therapy in patients receiving strong CYP3A inhibitor*—One lumacaftor 100 mg/ivacaftor 125 mg tablet once daily for 1 wk, then ↑ to two lumacaftor 200 mg/ivacaftor 125 mg tablets every 12 hr.

PO (Children 2–5 yr and ≥14 kg): One lumacaftor 150 mg/ivacaftor 188 mg granule packet every 12 hr with fat-containing food; *Initiation of therapy in patients receiving strong CYP3A inhibitor*—One lumacaftor 150 mg/ivacaftor 188 mg granule packet every other day for 1 wk, then ↑ to one lumacaftor 150 mg/ivacaftor 188 mg granule packet every 12 hr.

PO (Children 2–5 yr and <14 kg): One lumacaftor 100 mg/ivacaftor 125 mg granule packet every 12 hr with fat-containing food; *Initiation of therapy in patients receiving strong CYP3A inhibitor*—One lumacaftor 100 mg/ivacaftor 125 mg granule packet every other day for 1 wk, then ↑ to one lumacaftor 100 mg/ivacaftor 125 mg granule packet every 12 hr.

Hepatic Impairment

(Adults and Children ≥12 yr): *Moderate hepatic impairment (Child-Pugh Class B)*—Two lumacaftor 200 mg/ivacaftor 125 mg tablets in AM and one lumacaftor 200 mg/ivacaftor 125 mg tablet in PM; *Severe hepatic impairment (Child-Pugh Class C)*—One lumacaftor 200 mg/ivacaftor 125 mg tablet in AM and one lumacaftor 200 mg/ivacaftor 125 mg tablet in PM.

Hepatic Impairment

(Children 6–11 yr): *Moderate hepatic impairment (Child-Pugh Class B)*—Two lumacaftor 100 mg/ivacaftor 125 mg tablets in AM and one lumacaftor 100 mg/ivacaftor 125 mg tablet in PM; *Severe hepatic impairment (Child-Pugh Class C)*—One lumacaftor 100 mg/ivacaftor 125 mg tablet in AM and one lumacaftor 100 mg/ivacaftor 125 mg tablet in PM.

Hepatic Impairment

(Children 2–5 yr and ≥14 kg): *Moderate hepatic impairment (Child-Pugh Class B)*—One lumacaftor 150 mg/ivacaftor 188 mg granule packet in AM and one lumacaftor 150 mg/ivacaftor 188 mg granule packet every other PM; *Severe hepatic impairment (Child-Pugh Class C)*—One lumacaftor 150 mg/ivacaftor 188 mg granule packet in AM.

Hepatic Impairment

(Children 2–5 yr and <14 kg): *Moderate hepatic impairment (Child-Pugh Class B)*—One lumacaftor 100 mg/ivacaftor 125 mg granule packet in AM and one lumacaftor 100 mg/ivacaftor 125 mg granule packet every other PM; *Severe hepatic impairment (Child-Pugh Class C)*—One lumacaftor 100 mg/ivacaftor 125 mg granule packet in AM.

Availability

Oral granules: lumacaftor 100 mg/ivacaftor 125 mg/pkt, lumacaftor 150 mg/ivacaftor 188 mg/pkt. **Tablets:** lumacaftor 100 mg/ivacaftor 125 mg, lumacaftor 200 mg/ivacaftor 125 mg.

NURSING IMPLICATIONS

Assessment

- Assess respiratory status (chest discomfort, dyspnea, respiration abnormal) prior to and periodically during therapy.
- Monitor BP periodically during therapy; may cause hypertension.
- Obtain baseline and periodic ophthalmological exams on pediatric patients starting therapy; may cause cataracts.
- ***Lab Test Considerations:*** Determine patient's genotype prior to starting therapy. If genotype is unknown, use an FDA-cleared CF mutation test to detect presence of the F508del mutation on both alleles of the CFTR gene.
- Monitor ALT, AST, and bilirubin prior to starting therapy, every 3 mo during 1st yr of therapy, and annually thereafter. Monitor patients with a history of ALT, AST, or bilirubin ↑ more frequently. If ↑ ALT, AST, or bilirubin occur, monitored closely until resolved. *If ALT or AST >5 × upper limit of normal (ULN) when not associated ↑ bilirubin,* withhold therapy. *If ALT or AST >3 × ULN when associated with bilirubin >2 × ULN,* withhold therapy. Consider benefits and risks of resuming dosing, once ↑ levels resolve.

Implementation

- **PO:** Administer 2 tablets every 12 hrs with fat-containing food (eggs, avocados, nuts, butter, peanut butter, cheese pizza, whole-milk dairy products [whole milk, cheese, yogurt], etc).
- To administer granules, mix entire content of single-use packet with 1 tsp (5 mL) of age-appropriate soft food or liquid (puréed fruits, flavored yogurt or pudding, milk or juice). Food should be at room temperature or below. Mixture is stable for 1 hr.

Patient/Family Teaching

- Instruct patient to take medication as directed. Take missed doses within 6 hrs with fat-containing food. If >6 hrs after usual dosing time, omit dose and resume normal schedule for following dose; do not double doses. Advise patient to read *Patient Information* prior to starting and with each Rx refill in case of changes.
- May cause dizziness. Avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional if signs and symptoms of liver problems (pain or discomfort in upper right abdomen, yellowing of skin or white of eyes, loss of appetite, nausea or vomiting, dark, amber-colored urine, confusion) or respira-

© F.A. Davis Publishing

tory problems (shortness of breath, chest tightness) occur.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Advise female patients of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Use a nonhormonal contraceptive during therapy.
- Pedi: Advise patient of childbearing age to use nonhormonal contraception. Ivacaftor/lumacaftor may ↓ hormonal contraceptive exposure (oral, injectable, transdermal, implantable) ↓ effectiveness; do not rely upon as effective method of contraception.

Evaluation/Desired Outcomes

- Improved lung function with ↑ weight, decreased exacerbations and fewer CF symptoms.

BEERS

lurasidone (loo-ras-i-done)

Latuda

Classification

Therapeutic: antipsychotics
Pharmacologic: benzoisothiazole

Indications

Treatment of schizophrenia. Depressive episodes associated with bipolar I disorder (as monotherapy or with lithium or valproate).

Action

Effect may be mediated via effects on central dopamine Type 2 (D_2) and serotonin Type 2 ($5HT_{2A}$) receptor antagonism. **Therapeutic Effects:** ↓ schizophrenic behavior. ↓ depressive episodes in bipolar I disorder.

Pharmacokinetics

Absorption: 9–19% absorbed following oral administration.
Distribution: Unknown.
Protein Binding: >99%.
Metabolism and Excretion: Mostly metabolized by the CYP3A4 enzyme system. Two metabolites are pharmacologically active; 80% eliminated in feces, 8% in urine primarily as metabolites.
Half-life: 18 hr.

TIME/ACTION PROFILE

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 hr*	24 hr

*Blood level.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Concurrent use of strong CYP3A4 inhibitors or inducers.
Use Cautiously in: Moderate or severe renal impairment (dose adjustment recommended); Moderate or severe hepatic impairment (dose adjustment recommended); History of suicide attempt; Diabetes mellitus; Overheating/dehydration (may ↑ risk of serious adverse reactions); Patients at risk for falls; History of leukopenia or previous drug-induced leukopenia/neutropenia; Geri: ↑ risk of seizures; ↑ risk of mortality and stroke in elderly patients treated for dementia-related psychosis; use cautiously in elderly females (↑ risk of tardive dyskinesia); OB: Use in pregnancy only if potential benefit justifies potential risk to fetus; Lactation: Breast feeding should only be considered if potential benefit justifies risk to child; Pedi: May ↑ risk of suicide attempt/ideation especially during dose early treatment or dose adjustment; risk may be greater in children, adolescents, and young adults taking antidepressants; safety and effectiveness not established in children <10 yr.

Adverse Reactions/Side Effects

CV: bradycardia, orthostatic hypotension, syncope, tachycardia. **Derm:** pruritus, rash. **EENT:** blurred vision. **Endo:** hyperglycemia, hyperprolactinemia. **GI:** nausea, esophageal dysmotility. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia. **Metab:** dyslipidemia, weight gain. **Neuro:** NEUROLEPTIC MALIGNANT SYNDROME, SEIZURES, SUICIDAL THOUGHTS, akathisia, drowsiness, parkinsonism, agitation, anxiety, cognitive/motor impairment, dizziness, dystonia, tardive dyskinesia.

Interactions

Drug-Drug: Strong CYP3A4 inhibitors, including **ketoconazole**, **clarithromycin**, **ritonavir**, and **voriconazole** ↑ blood levels and risk of adverse reactions; concurrent use contraindicated. **Strong CYP3A4 inducers**, including **rifampin**, **phenytoin**, and **carbamazepine** ↓ blood levels and effectiveness; concurrent use contraindicated. **Moderate inhibitors of the CYP3A4 enzyme system**, including **diltiazem**, **atazanavir**, **erythromycin**, **fluconazole**, and **verapamil** ↑ blood levels; if used concurrently, dose of lurasidone should not exceed 40 mg/day. ↑ sedation may occur with other **CNS depressants**, including **alcohol**, **sedative/hypnotics**, **opioids**, some **antidepressants** and **antihistamines**.
Drug-Natural Products: St. John's wort ↓ blood levels and effectiveness; concurrent use contraindicated.
Drug-Food: Grapefruit juice ↑ blood levels and risk of adverse reactions; concurrent use contraindicated.

© F.A. Davis Publishing

Route/Dosage

Schizophrenia

PO (Adults): 40 mg once daily (not to exceed 160 mg once daily); *Addition of moderate CYP3A4 inhibitor to existing lurasidone therapy*—↓ lurasidone dose by 50%; *Addition of lurasidone to existing moderate CYP3A4 inhibitor therapy*—20 mg once daily (not to exceed 80 mg once daily).
PO (Children 13–17 yr): 40 mg once daily (not to exceed 80 mg once daily); *Addition of moderate CYP3A4 inhibitor to existing lurasidone therapy*—↓ lurasidone dose by 50%; *Addition of lurasidone to existing moderate CYP3A4 inhibitor therapy*—20 mg once daily (not to exceed 80 mg once daily).

Renal Impairment

PO (Adults and Children 13–17 yr): *CCr <50 mL/min*—20 mg once daily (not to exceed 80 mg once daily).

Hepatic Impairment

(Adults and Children 13–17 yr): *Child-Pugh Class B*—20 mg once daily (not to exceed 80 mg once daily); *Child-Pugh Class C*—20 mg once daily (not to exceed 40 mg once daily).

Depressive Episodes Associated with Bipolar I Disorder

PO (Adults): 20 mg once daily (not to exceed 120 mg once daily); *Addition of moderate CYP3A4 inhibitor to existing lurasidone therapy*—↓ lurasidone dose by 50%; *Addition of lurasidone to existing moderate CYP3A4 inhibitor therapy*—20 mg once daily (not to exceed 80 mg once daily).
PO (Children 10–17 yr): 20 mg once daily (not to exceed 80 mg once daily); *Addition of moderate CYP3A4 inhibitor to existing lurasidone therapy*—↓ lurasidone dose by 50%; *Addition of lurasidone to existing moderate CYP3A4 inhibitor therapy*—20 mg once daily (not to exceed 80 mg once daily).

Renal Impairment

PO (Adults and Children 10–17 yr): *CCr <50 mL/min*—20 mg once daily (not to exceed 80 mg once daily).

Hepatic Impairment

PO (Adults and Children 10–17 yr): *Child-Pugh Class B*—20 mg once daily (not to exceed 80 mg once daily); *Child-Pugh Class C*—20 mg once daily (not to exceed 40 mg once daily).

Availability (generic available)

Tablets: 20 mg, 40 mg, 60 mg, 80 mg, 120 mg.

NURSING IMPLICATIONS

Assessment

- Monitor patient's mental status (orientation, mood, behavior) before and periodically during therapy.
- Assess weight and BMI initially and during therapy. Refer as appropriate for nutritional/weight and medical management.
- Monitor mood changes. Assess for suicidal tendencies, especially during early therapy. Restrict amount of drug available to patient.
- Monitor BP (sitting, standing, lying down) and pulse before and frequently during initial dose titration. May cause tachycardia and orthostatic hypotension. If hypotension occurs, dose may need to be ↓.
- Observe patient when administering medication to ensure medication is swallowed and not hoarded or cheeked.
- Monitor patient for onset of extrapyramidal side effects (*akathisia*—restlessness; *dystonia*—muscle spasms and twisting motions; or *pseudoparkinsonism*—mask-like face, rigidity, tremors, drooling, shuffling gait, dysphagia). Report these symptoms; reduction of dose or discontinuation may be necessary. Trihexyphenidyl or benztropine may be used to control symptoms.
- Monitor for tardive dyskinesia (involuntary rhythmic movement of mouth, face, and extremities). Report immediately; may be irreversible.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- Monitor for development of neuroleptic malignant syndrome (fever, respiratory distress, tachycardia, seizures, diaphoresis, hypertension or hypotension, pallor, tiredness). Notify health care professional immediately if these symptoms occur.
- Monitor for symptoms of hyperglycemia (polydipsia, polyuria, polyphagia, weakness) periodically during therapy.
- Assess for falls risk. Drowsiness, orthostatic hypotension, and motor and sensory instability increase risk. Institute prevention if indicated.
- ***Lab Test Considerations:*** May cause ↑ serum prolactin levels.
- May cause ↑ CPK.
- Obtain fasting blood glucose and cholesterol levels initially and periodically during therapy.
- Monitor CBC frequently during initial mo of therapy in patients with pre-existing or history of low WBC. May cause leukopenia, neutropenia, or agranulocytosis. Discontinue therapy if this occurs.

Implementation

- ***High Alert:*** Do not confuse Latuda (lurasidone) with Lantus (insulin glargine).
- **PO:** Administer once daily with food of at least 350 calories. Use beyond 6 wk has not been studied.

Patient/Family Teaching

- Instruct patient to take medication as directed. Emphasize the caloric food needs for taking medication.

© F.A. Davis Publishing

- Inform patient of the possibility of extrapyramidal symptoms. Instruct patient to report these symptoms immediately to health care professional.
- Advise patient to change positions slowly to minimize orthostatic hypotension. Protect from falls.
- May cause drowsiness and cognitive and motor impairment. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient and family to notify health care professional if thoughts about suicide or dying, attempts to commit suicide; new or worse depression; new or worse anxiety; feeling very agitated or restless; panic attacks; trouble sleeping; new or worse irritability; acting aggressive; being angry or violent; acting on dangerous impulses; an extreme ↑ in activity and talking, other unusual changes in behavior or mood occur.
- Advise patient to avoid extremes in temperature; this drug impairs body temperature regulation.
- Advise patient to tell health care professional what medications they are taking and to avoid taking new Rx, OTC, vitamins, or herbal products without consulting health care professional, especially alcohol and other CNS depressants.
- Advise patient to notify health care professional of medication regimen before treatment or surgery.
- Instruct patient to notify health care professional promptly if sore throat, fever, unusual bleeding or bruising, rash, or tremors occur.
- Rep: Advise female patients to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding. Encourage women who become pregnant while taking lurasidone to enroll in the National Pregnancy Registry for Atypical Antipsychotics at 1-866-961-2388 or visit http://womensmentalhealth.org/clinical-and-research-programs/pregnancyregistry/. Monitor neonates for extrapyramidal and/or withdrawal symptoms and manage symptoms appropriately.
- Emphasize the importance of routine follow up exams to monitor side effects.

Evaluation/Desired Outcomes

- ↓ in symptoms of schizophrenia (delusions, hallucinations, social withdrawal, flat, blunted affects).
- ↓ depressive episodes in bipolar I disorder.

luspatercept (lus-pat-er-sept)

Reblozyl

Classification

Therapeutic: antianemics
Pharmacologic: fusion proteins

Indications

Anemia in patients with beta thalassemia who require regular red blood cell (RBC) transfusions. Anemia in patients with very low- to intermediate-risk myelodysplastic syndromes with ring sideroblasts (MDS-RS) or with myelodysplastic/myeloproliferative neoplasm with ring sideroblasts and thrombocytosis (MDS/MPN-RS-T) who have failed an erythropoiesis stimulating agent and require ≥2 RBC units over 8 wk.

Action

A fusion protein that binds several endogenous transforming growth factor-beta (TGF-β) superfamily ligands. Inhibition of TGF-β superfamily results in increased differentiation and proliferation of erythroid precursors. **Therapeutic Effects:** Reduction in RBC transfusions.

Pharmacokinetics

Absorption: Unknown.
Distribution: Not significantly distributed to tissues.
Metabolism and Excretion: Broken down into amino acids.
Half-life: 11–13 days.

TIME/ACTION PROFILE (increase in hemoglobin levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	Within 7 days	Unknown	8 wk

Contraindications/Precautions

Contraindicated in: OB: Pregnancy (may cause fetal harm); Lactation: Lactation; Pedi: Not recommended for use in children (may ↑ risk of hematologic malignancies).
Use Cautiously in: Risk factors for thromboembolism; Hypertension; Rep: Women of reproductive potential.

Adverse Reactions/Side Effects

CV: DEEP VEIN THROMBOSIS, THROMBOEMBOLIC EVENTS, hypertension, syncope. **EENT:** vertigo. **GI:** abdominal pain, diarrhea, ↑ liver enzymes, nausea. **GU:** ↓ fertility (females). **Metab:** hyperuricemia. **Local:** injection site reactions. **MS:** arthralgia, bone pain. **Neuro:** STROKE, dizziness, headache. **Resp:** PULMONARY EMBOLISM, cough, upper respiratory tract infection. **Misc:** fatigue, hypersensitivity reactions.

Interactions

Drug-Drug: None reported.

Route/Dosage

Beta Thalassemia

Subcut (Adults): 1 mg/kg every 3 wk. If no reduction in RBC transfusion burden occurs after 2 consecutive doses (6 wk), ↑ dose to 1.25 mg/kg every 3 wk. Dis-

© F.A. Davis Publishing

continue therapy if no reduction in RBC transfusion burden occurs after 3 consecutive doses (9 wk) at maximum dose (1.25 mg/kg) or if unacceptable toxicity occurs.

Myelodysplastic Syndromes with Ring Sideroblasts or Myelodysplastic/Myeloproliferative Neoplasm with Ring Sideroblasts and Thrombocytosis

Subcut (Adults): 1 mg/kg every 3 wk. If patient is not RBC transfusion-free after 2 consecutive doses (6 wk), ↑ dose to 1.33 mg/kg every 3 wk. If patient is not RBC transfusion-free after 2 consecutive doses (6 wk), ↑ dose to 1.75 mg/kg every 3 wk. Discontinue therapy if no reduction in RBC transfusion burden occurs after 3 consecutive doses (9 wk) at maximum dose (1.75 mg/kg) or if unacceptable toxicity occurs.

Availability

Lyophilized powder for injection: 25 mg/vial, 75 mg/vial.

NURSING IMPLICATIONS

Assessment

- Monitor patient for signs and symptoms of thromboembolic events during therapy.
- Monitor BP before each administration. Manage hypertension or exacerbations.
- Monitor BP before each injection.
- ***Lab Test Considerations:*** Verify negative pregnancy test before starting therapy.
- Review hemoglobin level and transfusion record before each dose. If an RBC transfusion occurred before dosing, use pretransfusion hemoglobin for dose evaluation. **Dose modification for predose hemoglobin levels or rapid hemoglobin rise in Beta Thalassemia:** *If predose hemoglobin ≥11.5 g/dL in the absence of transfusions,* interrupt therapy and restart when hemoglobin is ≤11 g/dL. *If increase in hemoglobin >2 g/dL within 3 wk in the absence of transfusion and current dose is 1.25 mg/kg,* reduce dose to 1 mg/kg. *If current dose is 1 mg/kg,* reduce dose to 0.8 mg/kg. *If current dose is 0.8 mg/kg,* reduce dose to 0.6 mg/kg. *If current dose is 0.6 mg/kg,* discontinue therapy. **Dose modification for predose hemoglobin levels or rapid hemoglobin rise in MDS-RS or MDS/MPN-RS-T:** *If predose hemoglobin ≥11.5 g/dL in the absence of transfusions,* interrupt therapy and restart when hemoglobin is ≤11 g/dL. *If increase in hemoglobin >2 g/dL within 3 wk in the absence of transfusion and current dose is 1.75 mg/kg,* reduce dose to 1.33 mg/kg. *If current dose is 1.33 mg/kg,* reduce dose to 1 mg/kg. *If current dose is 1 mg/kg,* reduce dose to 0.8 mg/kg. *If current dose is 0.8 mg/kg,* reduce dose to 0.6 mg/kg. *If current dose is 0.6 mg/kg,* discontinue therapy. May cause ↑ AST, ALT, alkaline phosphatase, total and direct bilirubin.

Implementation

- Luspatercept should be reconstituted and administered by a health care professional.
- If a dose is missed administer as soon as possible and continue dosing with at least 3 wk between doses.
- ***Reconstitution:*** Reconstitute 25 mg vial with 0.68 mL and 75 mg vial with 1.6 mL Sterile Water for Injection, directing stream onto powder. ***Concentration:*** 25 mg/0.5 mL and 75 mg/1.5 mL, respectively. Allow to stand for 1 min. Discard needle and syringe; do not use for injection. Swirl gently for 30 sec, then allow vial to sit upright for 30 sec. If undissolved powder is observed, repeat step 3 until the powder is completely dissolved. *Invert vial and swirl gently in inverted position for 30 sec. Return vial to upright position and let sit for 30 sec.* Repeat procedure in italics 7 more times to ensure complete reconstitution of material on sides of vial. Solution is colorless to slightly yellow, clear to slightly opalescent; do not inject solutions that are cloudy, discolored, or contain particulate matter. Store reconstituted solution in original vial at room temperature for up to 8 hrs; discard if not used in 8 hr. May be stored in refrigerator for up to 24 hr in original vial; do not freeze. Remove from refrigerator 15–30 min before injection to allow to reach room temperature. Discard if not used in 24 hr. Vials are for single dose only.
- **Subcut:** Withdraw dose into syringe; divide doses >1.2 mL into 2 syringes and inject into 2 different sites. Administer into upper arm, thigh, or abdomen.

Patient/Family Teaching

- Explain purpose of luspatercept to patient. Advise patient to read *Patient Information* before starting and periodically during therapy in case of changes.
- Advise patient to notify health care professional immediately if signs and symptoms of blood clots (chest pain; trouble breathing or shortness of breath; pain in leg, with or without swelling; a cold or pale arm or leg; sudden numbness or weakness that are both short-term or continue to happen over a long period of time, especially on one side of the body; severe headache or confusion; sudden problems with vision, speech, or balance) occur.
- Inform patient that BP will be monitored before each dose. May require antihypertensive medication to treat high BP.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception and avoid breast feeding during and for at least 3 mo after last dose. May impair female fertility.

Evaluation/Desired Outcomes

- Reduction in RBC transfusions.

© F.A. Davis Publishing

magaldrate, See MAGNESIUM AND ALUMINUM SALTS.

MAGNESIUM AND ALUMINUM SALTS

magaldrate (with simethicone)
(**mag**-al-drate)
Riopan Plus

magnesium hydroxide/aluminum hydroxide
(mag-**nee**-zhum hye-**drox**-ide/ a-**loo**-mi-num hye-**drox**-ide)
Alamag, Diovol Plus, Maalox, Rulox

Classification
Therapeutic: antiulcer agents
Pharmacologic: antacids

Indications
Useful in a variety of GI complaints, including: Hyperacidity, Indigestion, GERD, Heartburn.

Action
Neutralize gastric acid following dissolution in gastric contents. Inactivate pepsin if pH is raised to ≥4. **Therapeutic Effects:** Neutralization of gastric acid with healing of ulcers and decrease in associated pain.

Pharmacokinetics
Absorption: During routine use, antacids are nonabsorbable. With chronic use, 15–30% of magnesium and smaller amounts of aluminum may be absorbed.
Distribution: Small amounts absorbed are widely distributed, cross the placenta, and appear in breast milk. Aluminum concentrates in the CNS.
Metabolism and Excretion: Excreted by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (effect on gastric pH)

ROUTE	ONSET	PEAK	DURATION
Aluminum PO	slightly delayed	30 min	30 min–1 hr (empty stomach); 3 hr (after meals)
Magnesium PO	slightly delayed	30 min	30 min–1 hr (empty stomach); 3 hr (after meals)

Contraindications/Precautions
Contraindicated in: Severe abdominal pain of unknown cause, especially if accompanied by fever; Renal failure (CrCl <30 mL/min); Products containing tartrazine or sugar in patients with known intolerance.

Use Cautiously in: Antacids containing magnesium in patients with any degree of renal insufficiency; ↓ bowel motility; Dehydration; Upper GI hemorrhage; Pedi: Children <12 yr (safety not established).

Adverse Reactions/Side Effects
GI: *aluminum salts*—constipation; *magnesium salts*, diarrhea. **F and E:** *magnesium salts*—hypermagnesemia; *aluminum salts*, hypophosphatemia.

Interactions
Drug-Drug: Absorption of **tetracyclines**, **phenothiazines**, **ketoconazole**, **itraconazole**, **iron salts**, **fluoroquinolones**, and **isoniazid** may be ↓ (separate by at least 2 hr).

Route/Dosage

Magaldrate/Simethicone
PO (Adults): 5–10 mL (540–1080 mg) between meals and at bedtime.

Magnesium Hydroxide/Aluminum Hydroxide
PO (Adults and Children ≥12 yr): 5–30 mL or 1–2 tablets 1–3 hr after meals and at bedtime.

Availability

Magaldrate/Simethicone (generic available)
Suspension: 540 mg magaldrate/20 mg simethicone/5 mL[OTC], 1080 mg magaldrate/40 mg simethicone/5 mL[OTC].

Magnesium Hydroxide/Aluminum Hydroxide (generic available)
Chewable Tablets: 300 mg aluminum hydroxide/150 mg magnesium hydroxide[OTC]. **Suspension:** 225 mg aluminum hydroxide/200 mg magnesium hydroxide/5 mL[OTC], 500 mg aluminum hydroxide/500 mg magnesium hydroxide/5 mL[OTC]. ***In combination with:*** simethicone[OTC]. See Appendix N.

NURSING IMPLICATIONS

Assessment
- **Antacid:** Assess for heartburn and indigestion as well as location, duration, character, and precipitating factors of gastric pain.
- ***Lab Test Considerations:*** Monitor serum phosphate, potassium, and calcium levels periodically during chronic use. May cause ↑ serum calcium and ↓ serum phosphate concentrations.

Implementation
- Magnesium and aluminum are combined as antacids to balance the constipating effects of aluminum with the laxative effects of magnesium.
- **PO:** To prevent tablets from entering small intestine in undissolved form, they must be chewed thor-

© F.A. Davis Publishing

oughly before swallowing. Follow with at least ½ glass of water.
- Shake suspensions well before administration.
- For an antacid effect, administer 1–3 hr after meals and at bedtime.

Patient/Family Teaching
- Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if relief is not obtained, or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- Advise patient not to take this medication within 2 hr of taking other medications.
- Pedi: Aluminum- or magnesium-containing medicines can cause serious side effects in children, especially when given to children with renal disease or dehydration. Advise parents or caregivers not to administer OTC antacids to children without consulting health care professional.

Evaluation/Desired Outcomes
- Relief of gastric pain and irritation.

MAGNESIUM SALTS (ORAL)

magnesium chloride (12% Mg; 9.8 mEq Mg/g)
(mag-**nee**-zhum **klor**-ide)
Chloromag, Slo-Mag

magnesium citrate (16.2% Mg; 4.4 mEq Mg/g)
(mag-**nee**-zhum **si**-trate)
Citrate of Magnesia, Citroma, Citromag

magnesium gluconate (5.4% Mg; 4.4 mEq/g)
(mag-**nee**-zhum **gloo**-con-ate)
Magtrate, Magonate

magnesium hydroxide (41.7% Mg; 34.3 mEq Mg/g)
(mag-**nee**-zhum hye-**drox**-ide)
Dulcolax Magnesia Tablets, Phillips Magnesia Tablets, Phillips Milk of Magnesia, MOM

magnesium oxide (60.3% Mg; 49.6 mEq Mg/g)
(mag-**nee**-zhum **ox**-ide)
Mag-Ox 400, Uro-Mag

Classification
Therapeutic: mineral and electrolyte replacements/supplements, laxatives
Pharmacologic: salines

Indications
Treatment/prevention of hypomagnesemia. As a: Laxative, Bowel evacuant in preparation for surgical/radiographic procedures. Milk of Magnesia has also been used as an antacid.

Action
Essential for the activity of many enzymes. Play an important role in neurotransmission and muscular excitability. Are osmotically active in GI tract, drawing water into the lumen and causing peristalsis. **Therapeutic Effects:** Replacement in deficiency states. Evacuation of the colon.

Pharmacokinetics
Absorption: Up to 30% may be absorbed orally.
Distribution: Widely distributed. Cross the placenta and are present in breast milk.
Metabolism and Excretion: Excreted primarily by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (laxative effect)

ROUTE	ONSET	PEAK	DURATION
PO	3–6 hr	unknown	unknown

Contraindications/Precautions
Contraindicated in: Hypermagnesemia; Hypocalcemia; Anuria; Heart block; OB: Unless used for preterm labor, use during active labor or within 2 hr of delivery may ↑ potential for magnesium toxicity in newborn.
Use Cautiously in: Any degree of renal insufficiency.

Adverse Reactions/Side Effects
GI: diarrhea. **Derm:** flushing, sweating.

Interactions
Drug-Drug: Potentiates **neuromuscular blocking agents**. May ↓ absorption of **fluoroquinolones**, **nitrofurantoin**, and **tetracyclines** and **penicillamine**.

Route/Dosage

Prevention of Deficiency (in mg of Magnesium)
PO (Adults and Children >10 yr): *Adolescent and adult men*—270–400 mg/day; *adolescent and adult women*—280–300 mg/day; *pregnant women*—320 mg/day; *breast-feeding women*—340–355 mg/day.
PO (Children 7–10 yr): 170 mg/day.
PO (Children 4–6 yr): 120 mg/day.
PO (Children birth–3 yr): 40–80 mg/day.

Treatment of Deficiency (Expressed as mg of Magnesium)
PO (Adults): 200–400 mg/day in 3–4 divided doses.
PO (Children 6–11 yr): 3–6 mg/kg/day in 3–4 divided doses.

© F.A. Davis Publishing

Laxative

PO (Adults): *Magnesium citrate*—240 mL; *magnesium hydroxide (Milk of Magnesia)*—30–60 mL single or divided dose or 10–20 mL as concentrate.
PO (Children 6–12 yr): *Magnesium citrate*—100 mL; *magnesium hydroxide (Milk of Magnesia)*—15–30 mL single or divided dose.
PO (Children 2–5 yr): *magnesium hydroxide (Milk of Magnesia)*—5–15 mL single or divided dose.

Availability

Magnesium Chloride (generic available)

Sustained-release tablets: 535 mg (64 mg magnesium)OTC. **Enteric-coated tablets:** 833 mg (100 mg magnesium)OTC.

Magnesium Citrate (generic available)

Oral solution: 240-, 296-, and 300-mL bottles (77 mEq magnesium/100 mL)OTC.

Magnesium Gluconate (generic available)

Tablets: 500 mgOTC. **Liquid:** 54 mg/5 mLOTC.

Magnesium Hydroxide (generic available)

Liquid: 400 mg/5 mL (164 mg magnesium/5 mL)OTC. **Concentrated liquid:** 800 mg/5 mL (328 mg magnesium/5 mL)OTC. **Chewable tablets:** 300 mg (130 mg magnesium)OTC, 600 mg (260 mg magnesium)OTC.

Magnesium Oxide (generic available)

Tablets: 400 mg (241.3 mg magnesium)OTC. **Capsules:** 140 mg (84.5 mg magnesium)OTC.

NURSING IMPLICATIONS

Assessment

- **Laxative:** Assess patient for abdominal distention, presence of bowel sounds, and usual pattern of bowel function.
- Assess color, consistency, and amount of stool produced.
- **Antacid:** Assess for heartburn and indigestion as well as location, duration, character, and precipitating factors of gastric pain.

Implementation

- **PO:** To prevent tablets entering small intestine in undissolved form, they must be chewed thoroughly before swallowing. Follow with ½ glass of water.
- *Magnesium citrate:* Refrigerate solutions to ensure they retain potency and palatability. May be served over ice. Magnesium citrate in an open container will lose carbonation upon standing; this will not affect potency but may reduce palatability.
- *Magnesium hydroxide:* Shake solution well before administration.
- **Antacid:** Administer 1–3 hr after meals and at bedtime.
- Powder and liquid forms are considered more effective than tablets.
- **Laxative:** Administer on empty stomach for more rapid results. Follow all oral laxative doses with a full glass of liquid to prevent dehydration and for faster effect. Do not administer at bedtime or late in the day.

Patient/Family Teaching

- Advise patient not to take this medication within 2 hr of taking other medications, especially fluoroquinolones, nitrofurantoin, and tetracyclines.
- **Antacids:** Caution patient to consult health care professional before taking antacids for more than 2 wk if problem is recurring, if relief is not obtained, or if symptoms of gastric bleeding (black, tarry stools; coffee-ground emesis) occur.
- **Laxatives:** Advise patient that laxatives should be used only for short-term therapy. Long-term therapy may cause electrolyte imbalance and dependence.
- Encourage patient to use other forms of bowel regulation, such as increasing bulk in the diet, fluid intake, and mobility. Normal bowel habits are individualized; frequency of bowel movement may vary from 3 times/day to 3 times/wk.
- Advise patient to notify health care professional if unrelieved constipation, rectal bleeding, or symptoms of electrolyte imbalance (muscle cramps or pain, weakness, dizziness) occur.

Evaluation/Desired Outcomes

- Relief of gastric pain and irritation.
- Passage of a soft, formed bowel movement, usually within 3–6 hr.
- Prevention and treatment of magnesium deficiency.

HIGH ALERT

magnesium sulfate (parenteral)

(mag-**nee**-zhum **sul**-fate)

Classification

Therapeutic: mineral and electrolyte replacements/supplements
Pharmacologic: minerals/electrolytes

Indications

Treatment/prevention of hypomagnesemia. Prevention and treatment of seizures associated with severe eclampsia or pre-eclampsia. **Unlabeled Use:** Treatment of torsades de pointes. Adjunctive treatment for bronchodilation in moderate to severe acute asthma.

Action

Essential for the activity of many enzymes. Plays an important role in neurotransmission and muscular excitability. **Therapeutic Effects:** Replacement in deficiency states. Resolution of eclampsia.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: IV administration results in complete bioavailability; well absorbed from IM sites.
Distribution: Widely distributed. Crosses the placenta and is present in breast milk.
Metabolism and Excretion: Excreted primarily by the kidneys.
Half-life: Unknown.

TIME/ACTION PROFILE (anticonvulsant effect)

ROUTE	ONSET	PEAK	DURATION
IM	60 min	unknown	3–4 hr
IV	immediate	unknown	30 min

Contraindications/Precautions

Contraindicated in: Hypermagnesemia; Hypocalcemia; Anuria; Heart block.
Use Cautiously in: Renal impairment; OB: Avoid using for more than 5–7 days for preterm labor (may ↑ risk of hypocalcemia and bone changes in newborn); avoid continuous use during active labor or within 2 hr of delivery due to potential for magnesium toxicity in newborn; Geri: Older adults may require ↓ dosage due to age-related ↓ in renal function.

Adverse Reactions/Side Effects

CV: arrhythmias, bradycardia, hypotension. **Derm:** flushing, sweating. **GI:** diarrhea. **Metab:** hypothermia. **MS:** muscle weakness. **Neuro:** drowsiness. **Resp:** ↓ respiratory rate.

Interactions

Drug-Drug: May potentiate **calcium channel blockers** and **neuromuscular blocking agents**.

Route/Dosage

Treatment of Deficiency

IM, IV (Adults): *Severe deficiency*—8–12 g/day in divided doses; *mild deficiency*—1 g every 6 hr for 4 doses or 250 mg/kg over 4 hr.
IM, IV (Children >1 mo): 25–50 mg/kg/dose every 4–6 hr for 3–4 doses, maximum single dose: 2 g.
IV (Neonates): 25–50 mg/kg/dose every 8–12 hr for 2–3 doses.

Seizures Associated with Eclampsia/Pre-Eclampsia

IV (Adults): 4–6 g loading dose over 15–30 min at onset of labor or induction/cesarean delivery, followed by 1–2 g/hr continuous infusion for ≥24 hours after delivery (max infusion rate = 3 g/hr). If seizure occurs while receiving magnesium, an additional bolus of 2–4 g may be administered over ≥5 minutes. Max dose = 40 g/24 hr.
IM (Adults): 10 g loading dose administered as 5 g in each buttock at onset of labor or induction/cesarean delivery, followed by 5 g every 4 hours for ≥24 hours after delivery.

Torsades de Pointes

IV (Infants and Children): 25–50 mg/kg/dose, maximum dose: 2 g.

Bronchodilation

IV (Adults): 2 g single dose.
IV (Children): 25 mg/kg/dose, maximum dose: 2 g.

Parenteral Nutrition

IV (Adults): 4–24 mEq/day.
IV (Children): 0.25–0.5 mEq/kg/day.

Availability (generic available)

Solution for injection (8.1 mEq Mg/g): 500 mg/mL (50%). **Premixed infusion:** 1 g/100 mL, 2 g/50 mL, 4 g/50 mL, 4 g/100 mL, 20 g/500 mL, 40 g/1000 mL.

NURSING IMPLICATIONS

Assessment

- **Hypomagnesemia/Anticonvulsant:** Monitor pulse, BP, respirations, and ECG frequently during administration of parenteral magnesium sulfate. Respirations should be at least 16/min before each dose.
- Monitor neurologic status before and throughout therapy. Institute seizure precautions. Patellar reflex (knee jerk) should be tested before each parenteral dose of magnesium sulfate. If response is absent, no additional doses should be administered until positive response is obtained.
- Monitor newborn for hypotension, hyporeflexia, and respiratory depression if mother has received magnesium sulfate.
- Monitor intake and output ratios. Urine output should be maintained at a level of at least 100 mL/4 hr.
- ***Lab Test Considerations:*** Monitor serum magnesium levels and renal function periodically during administration of parenteral magnesium sulfate.

Implementation

- ***High Alert:*** Accidental overdose of IV magnesium has resulted in serious patient harm and death. Have second practitioner independently double-check original order, dose calculations, and infusion pump settings. Do not confuse milligram (mg), gram (g), or milliequivalent (mEq) doses.
- **IM:** IM route should only be used when unable to establish venous access. Administer deep IM into gluteal sites. Administer subsequent injections in alternate sides. Dilute to a concentration of 200 mg/mL prior to injection.

IV Administration

- **IV Push:** ***Dilution:*** 50% solution must be diluted in 0.9% NaCl or D5W to a concentration of ≤20% prior to administration. ***Concentration:*** ≤20%. ***Rate:*** Administer over several min at a rate not to exceed 150 mg/min. In patients not in cardiac arrest, rapid administration may cause hypotension and asystole.

© F.A. Davis Publishing

- **Intermittent Infusion:** ***Dilution:*** 50% solution must be diluted in 0.9% NaCl or D5W to a concentration of ≤20% prior to administration. ***Concentration:*** ≤20%. ***Rate:*** *For ventricular tachycardia/torsades:* Infuse over 10–20 min; rapid infusion may cause hypotension. *For severe asthma exacerbation:* Infuse over 15–60 min.
- **Continuous Infusion:** ***Dilution:*** Dilute in D5W, 0.9% NaCl, or LR. ***Concentration:*** 0.5 mEq/mL (60 mg/mL) (may use maximum concentration of 1.6 mEq/mL) (200 mg/mL) in fluid-restricted patients. ***Rate:*** Infuse over 2–4 hr. Do not exceed a rate of 1 mEq/kg/hr (125 mg/kg/hr). When rapid infusions are needed (severe asthma or torsade de pointes) may infuse over 10–20 min.
- **Y-Site Compatibility:** acetaminophen, acyclovir, aldesleukin, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, argatroban, arsenic trioxide, ascorbic acid, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftazidime/avibactam, ceftolozane/tazobactam, chloramphenicol, chlorpromazine, cisatracurium, cisplatin, clindamycin, clonidine, cyanocobalamin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin liposome, doxycycline, enalaprilat, ephedrine, epinephrine, epoetin alfa, eptifibatide, eravacycline, ertapenem, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, gemcitabine, gemtuzumab ozogamicin, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketamine, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, lidocaine, linezolid, lorazepam, mannitol, meropenem/vaborbactam, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentobarbital, phenobarbital, phentolamine, phenylephrine, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, vitamin B complex with C, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** aminophylline, amphotericin B deoxycholate, amphotericin B lipid complex, amphotericin B liposome, anidulafungin, azathioprine, calcium chloride, cefepime, cefuroxime, ciprofloxacin, dantrolene, dexamethasone sodium phosphate, diazepam, diazoxide, doxorubicin hydrochloride, epirubicin, ganciclovir, haloperidol, indomethacin, methylprednisolone sodium succinate, pentamidine, phenytoin, phytonadione, tedizolid.

Patient/Family Teaching

- Explain purpose of medication to patient and family.
- Rep: Monitor vital signs, oxygen saturation, respiration, deep tendon reflexes, level of consciousness, fetal heart rate, maternal uterine activity, and renal function when used during pregnancy. Monitor magnesium concentrations every 4 hr in patients with renal dysfunction (every 2 hr if serum magnesium is elevated). Breast milk concentrations are increased for only 24 hr after end of therapy. When used for prevention of seizures, magnesium sulfate is considered compatible with breast feeding.

Evaluation/Desired Outcomes

- Normal serum magnesium concentrations.
- Control of seizures associated with toxemias of pregnancy.

BEERS

meclizine (mek-li-zeen)

Antivert, Bonine

Classification

Therapeutic: antiemetics, antihistamines

Indications

Management/prevention of: Motion sickness, Vertigo associated with diseases of vestibular system.

Action

Has central anticholinergic, CNS depressant, and antihistaminic properties. Decreases excitability of the middle ear labyrinth and depresses conduction in middle ear vestibular-cerebellar pathways. **Therapeutic Effects:** Decreased motion sickness. Decreased vertigo from vestibular pathology.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: Absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: Primarily metabolized by the CYP2D6 isoenzyme; the CYP2D6 enzyme system exhibits genetic polymorphism (~7% of population may be poor metabolizers and may have significantly ↑ meclizine concentrations and an ↑ risk of adverse effects).
Half-life: 6 hr.

TIME/ACTION PROFILE (antihistaminic effects)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	unknown	8–24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity.
Use Cautiously in: Prostatic hyperplasia; Angle-closure glaucoma; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Children <12 yr (safety and effectiveness not established); Geri: ↑ sensitivity and risk of adverse reactions in older adults.

Adverse Reactions/Side Effects

EENT: blurred vision. **GI:** dry mouth. **Neuro:** drowsiness, fatigue.

Interactions

Drug-Drug: Additive CNS depression with other **CNS depressants**, including **alcohol**, other **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. Additive anticholinergic effects with other **drugs possessing anticholinergic properties**, including some **antihistamines**, **antidepressants**, **atropine**, **haloperidol**, **phenothiazines**, **quinidine**, and **disopyramide**. **CYP2D6 inhibitors** may ↑ levels.

Route/Dosage

PO (Adults and Children ≥12 yr): *Motion sickness*—25–50 mg 1 hr before exposure; may repeat in 24 hr; *vertigo*—25–100 mg/day in divided doses.

Availability (generic available)

Tablets: 12.5 mg, 25 mg[Rx, OTC], 50 mg. **Chewable tablets (raspberry flavor):** 25 mg[OTC].

NURSING IMPLICATIONS

Assessment

- Assess patient for level of sedation after administration.
- **Motion Sickness:** Assess patient for nausea and vomiting before and 60 min after administration.
- **Vertigo:** Assess degree of vertigo periodically in patients receiving meclizine for labyrinthitis.
- ***Lab Test Considerations:*** May cause false-negative results in skin tests using allergen extracts. Discontinue meclizine 72 hr before testing.

Implementation

- **PO:** Administer oral doses with food, water, or milk to minimize GI irritation. ***DNC:*** Swallow tablets whole; do not crush, break, or chew.
- Chewable tablets must be chewed or crushed completely before swallowing. Do not swallow chewable tablets whole.

Patient/Family Teaching

- Instruct patient to take meclizine exactly as directed. If a dose is missed, take as soon as possible unless almost time for next dose. Do not double doses.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to the medication is known.
- Advise patient that frequent mouth rinses, good oral hygiene, and sugarless gum or candy may decrease dryness of mouth.
- Caution patient to avoid concurrent use of alcohol and other CNS depressants, including opioids, with this medication.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.
- **Motion Sickness:** When used as prophylaxis for motion sickness, advise patient to take medication at least 1 hr before exposure to conditions that may cause motion sickness.

Evaluation/Desired Outcomes

- Prevention and relief of symptoms in motion sickness.
- Prevention and treatment of vertigo due to vestibular pathology.

medroxyPROGESTERone†

(me-**drox**-ee-proe-**jess**-te-rone)
Depo-Provera, Depo-SubQ Provera 104, Provera

Classification
Therapeutic: antineoplastics, contraceptive hormones
Pharmacologic: hormones, progestins

Indications

Prevention of pregnancy. To decrease endometrial hyperplasia in postmenopausal women receiving concurrent estrogen (0.625 mg/day conjugated estrogens). Treatment of secondary amenorrhea and abnormal uterine bleeding caused by hormonal imbalance. **IM:** Treatment of advanced unresponsive endometrial or renal carcinoma. †Prevention of pregnancy. Management of endometriosis-associated pain (Depo-Sub Q Provera 104 only). **Unlabeled Use:** Obesity-hypoventilation (pickwickian) syndrome. Sleep apnea. Hypersomnolence.

© F.A. Davis Publishing

Action

A synthetic form of progesterone—actions include secretory changes in the endometrium, increases in basal body temperature, histologic changes in vaginal epithelium, relaxation of uterine smooth muscle, mammary alveolar tissue growth, pituitary inhibition, and withdrawal bleeding in the presence of estrogen. **Therapeutic Effects:** Decreased endometrial hyperplasia in postmenopausal women receiving concurrent estrogen (combination with estrogen decreases vasomotor symptoms and prevents osteoporosis). Restoration of hormonal balance with control of uterine bleeding. Management of endometrial or renal cancer. Prevention of pregnancy.

Pharmacokinetics

Absorption: 0.6–10% absorbed after oral administration.
Distribution: Enters breast milk.
Metabolism and Excretion: Metabolized by the liver.
Half-life: *1st phase*—52 min; *2nd phase*—230 min; *biological*—14.5 hr.

TIME/ACTION PROFILE (IM = antineoplastic effects)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	unknown
IM	wk–mos	mo	unknown†
SC	unknown	1 wk	3 mo

†Contraceptive effect lasts 3 mo.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to parabens (IM suspension only); Missed abortion; Thromboembolic disease; Cerebrovascular disease; Severe liver disease; Breast or genital cancer; Porphyria; OB: May ↑ risk of fetal genitourinary malformation.
Use Cautiously in: History of liver disease; Renal disease; Cardiovascular disease; Seizure disorders; Mental depression.

Adverse Reactions/Side Effects

CV: DEEP VEIN THROMBOSIS, thrombophlebitis. **Derm:** chloasma, melasma, rash. **EENT:** retinal thrombosis. **Endo:** amenorrhea, breakthrough bleeding, breast tenderness, changes in menstrual flow, galactorrhea, hyperglycemia, spotting. **F and E:** edema. **GI:** drug-induced hepatitis, gingival bleeding. **GU:** cervical erosions, dysmenorrhea. **Local:** injection site reactions. **Metab:** bone loss, ↓ weight, ↑ weight. **Neuro:** depression. **Resp:** PULMONARY EMBOLISM. **Misc:** BREAST CANCER, HYPERSENSITIVITY REACTIONS (including anaphylaxis or angioedema).

Interactions

Drug-Drug: Strong **CYP3A4 inhibitors**, including **ketoconazole**, **itraconazole**, **clarithromycin**, **atazanavir**, **indinavir**, **nefazodone**, **nelfinavir**, **ritonavir**, **saquinavir**, and **voriconazole** may ↑ levels; avoid concurrent use. Strong **CYP3A4 inducers**, including **phenytoin**, **carbamazepine**, **rifampin**, **rifabutin**, **rifapentin**, and **phenobarbital** may ↓ levels; avoid concurrent use. May ↓ effectiveness of **bromocriptine** when used concurrently for galactorrhea/amenorrhea. Contraceptive effectiveness may be ↓ by **carbamazepine**, **phenobarbital**, **phenytoin**, **rifampin**, or **rifabutin**.
Drug-Natural Products: **St. John's wort** may ↓ levels; avoid concurrent use.

Route/Dosage

Postmenopausal Women Receiving Concurrent Estrogen

PO (Adults): 2.5–5 mg daily concurrently with 0.625 mg conjugated estrogens (monophasic regimen) *or* 5 mg daily on days 15–28 of the cycle with 0.625 mg conjugated estrogens taken daily throughout cycle (biphasic regimen).

Secondary Amenorrhea

PO (Adults): 5–10 mg/day for 5–10 days; start at any time in cycle.

Dysfunctional Uterine Bleeding/Induction of Menses

PO (Adults): 5–10 mg/day for 5–10 days, starting on day 16 or day 21 of menstrual cycle.

Renal or Endometrial Carcinoma

IM (Adults): 400–1000 mg, may be repeated weekly; if improvement occurs, attempt to ↓ dose to 400 mg monthly.

Endometriosis-Associated Pain

Subcut (Adults): 104 mg every 12–14 wk (3 mo), beginning on day 5 of normal menses (not recommended for more than 2 yr).

Prevention of Pregnancy

IM (Adults): 150 mg within first 5 days of menses or within 5 days postpartum, if not breast feeding. If breast feeding, give 6 wk postpartum; repeat every 3 mo.
Subcut (Adults): 104 mg within first 5 days of menses or within 5 days postpartum, if not breast feeding. If breast feeding, give 6 wk postpartum; repeat every 12–14 wk.

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg, ✱ 100 mg. **Suspension for intramuscular injection:** ✱ 50 mg/mL, 150 mg/mL. **Suspension for subcutaneous injection**

© F.A. Davis Publishing

(Depo-SubQ Provera 104): 104 mg/0.65 mL. ***In combination with:*** conjugated estrogens as Prempro (single combination tablet of 0.626 mg conjugated estrogens plus 2.5 or 5 mg medroxyprogesterone) or Premphase (0.625 mg conjugated estrogens tablet for 14 days followed by combination tablet of 0.625 mg conjugated estrogens plus 5 mg medroxyprogesterone for days 15–28) in convenience packages. See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor BP periodically during therapy.
- Monitor intake and output ratios and weekly weight. Report significant discrepancies or steady weight gain.
- ***Lab Test Considerations:*** Monitor hepatic function before and periodically during therapy.
- May cause ↑ alkaline phosphatase levels. May ↓ pregnanediol excretion concentrations.
- May cause ↑ serum LDL concentrations or ↓ HDL concentrations.
- May alter thyroid hormone assays.
- May ↓ glucose tolerance; monitor diabetic patients closely.

Implementation

- Do not confuse Depo-Provera with Depo-Provera CI or Depo-SubQ Provera 104. Do not confuse Provera (medroxyprogesterone) with Proscar (finasteride) or Prozac (fluoxetine). Do not confuse medroxyprogesterone with methylprednisolone, or methyltestosterone.
- *Contraception:* To ensure patient is not pregnant at time of 1st injection, administer ONLY during first 5 days of a normal menstrual period; ONLY within first 5-days postpartum if not breast feeding; and if exclusively breast feeding, ONLY at the sixth postpartum week. If interval between injections >13 weeks, use pregnancy test to ensure patient is not pregnant before administration. Only the 150 mg/mL vial or prefilled syringe should be used for contraception.
- When switching from other hormonal contraceptives, administer within dosing period (7 days after taking last active pill, removing patch or ring, or within dosing period for IM injection).
- Injectable medroxyprogesterone may lead to bone loss, especially in women younger than 21 yr. Injectable medroxyprogesterone should be used for >2 yr only if other methods of contraception are inadequate. If used long term, women should use supplemental calcium and vitamin D, and monitor bone mineral density.
- IM and subcut injections are to be administered by a health care professional.
- **Subcut:** Shake vigorously before use to form a uniform suspension. Inject slowly (over 5–7 sec) at a 45 angle into fatty area of anterior thigh or abdomen every 12 to 14 wk. If more than 14 wk elapse between injections, rule out pregnancy prior to administration. **Do not rub area after injection**.
- **IM:** Shake vial or prefilled syringe vigorously before preparing IM dose. Administer deep IM into gluteal or deltoid muscle. Rotate sites with each injection. If period between injections is >14 wk, determine that patient is not pregnant before administering the drug.
- In patients with cancer, IM dose may initially be required weekly. Once stabilized, IM dose may be required only monthly.
- Dose for contraception lasts 3 mo and should not be used longer than 2 yr.

Patient/Family Teaching

- Explain the dose schedule. Instruct patient to take medication at the same time each day. Take missed doses as soon as remembered, but do not double doses. Advise patient to read *Patient Information* before starting therapy and with each Rx refill or injection in case of changes.
- Explain the importance of adhering to every 3-mo schedule to patients using medroxyprogesterone for contraception.
- Advise patients receiving medroxyprogesterone for menstrual dysfunction to anticipate withdrawal bleeding 3–7 days after discontinuing medication.
- Emphasize the importance of notifying health care professional if visual changes, sudden weakness, incoordination, difficulty with speech, headache, leg or calf pain, shortness of breath, chest pain, changes in vaginal bleeding pattern, yellow skin, swelling of extremities, depression, or rash occur.
- Advise patient to keep a 1-mo supply of medroxyprogesterone available at all times.
- Instruct patient in correct method of monthly breast self-examination. Increased breast tenderness may occur.
- Advise patient that gingival bleeding may occur. Instruct patient to use good oral hygiene and to receive regular dental care and examinations.
- Inform patient that medroxyprogesterone does not protect against HIV infection and other STIs.
- Medroxyprogesterone may cause melasma (brown patches of discoloration) on face when patient is exposed to sunlight. Advise patient to avoid sun exposure and to wear sunscreen or protective clothing when outdoors.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Rep: Advise females of reproductive potential to notify health care professional if menstrual period is missed or if pregnancy is suspected or if breast feeding. Patient should not attempt conception for 3 mo after discontinuing medication in order to decrease risk to fetus. Once discontinued may delay conception for 10 mo or more.

© F.A. Davis Publishing

- Emphasize the importance of routine follow-up physical exams, including BP; breast, abdomen, and pelvic exams; and Papanicolaou smears every 6–12 mo.
- **IM Subcut:** Advise patient to maintain adequate amounts of dietary calcium and vitamin D to help prevent bone loss.

Evaluation/Desired Outcomes

- Regular menstrual periods.
- Decrease in endometrial hyperplasia in postmenopausal women receiving concurrent estrogen.
- Control of the spread of endometrial or renal cancer.
- Prevention of pregnancy.

medroxyprogesterone, See CONTRACEPTIVES, HORMONAL.

BEERS

megestrol (me-jess-trole)

~~Megace~~, Megace ES

Classification

Therapeutic: antineoplastics, hormones
Pharmacologic: progestins

Indications

Palliative treatment of endometrial and breast carcinoma, either alone or with surgery or radiation (tablets only). Treatment of anorexia, weight loss, and cachexia associated with AIDS (oral suspension only).

Action

Antineoplastic effect may result from inhibition of pituitary function. **Therapeutic Effects:** Regression of tumor. Increased appetite and weight gain in patients with AIDS.

Pharmacokinetics

Absorption: Well absorbed from the GI tract.
Distribution: Unknown.
Protein Binding: ≥90%.
Metabolism and Excretion: Completely metabolized by the liver.
Half-life: 38 hr (range 13–104 hr).

TIME/ACTION PROFILE (antineoplastic activity)

ROUTE	ONSET	PEAK	DURATION
PO	wk–mos	2 mo	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Undiagnosed vaginal bleeding; Severe liver disease; Suspension contains alcohol and should be avoided in patients with known intolerance; OB: Pregnancy (may cause fetal harm); Lactation: Lacation (may cause harm to infant).
Use Cautiously in: Diabetes; Mental depression; Renal disease; History of thrombophlebitis; Cardiovascular disease; Seizures; Rep: Women of reproductive potential; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

CV: THROMBOEMBOLISM, edema. **Derm:** alopecia. **Endo:** asymptomatic adrenal suppression (chronic therapy). **GI:** GI irritation. **GU:** vaginal bleeding. **Hemat:** thrombophlebitis. **MS:** carpal tunnel syndrome.

Interactions

Drug-Drug: May ↑ INR and risk of bleeding when used with **warfarin**.

Route/Dosage

PO (Adults): *Breast carcinoma*—160 mg/day as a single dose or divided doses; *Endometrial/ovarian carcinoma*—40–320 mg/day in divided doses; *Anorexia associated with AIDS*—Megace: 800 mg once daily; may ↓ to 400 mg/day after 1 mo (range 400–800 mg/day); Megace ES: 625 mg once daily.

Availability (generic available)

Oral suspension (lemon-lime flavor): 40 mg/mL, 125 mg/mL (Megace ES). **Tablets:** 20 mg, 40 mg, 160 mg.

NURSING IMPLICATIONS

Assessment

- Assess for swelling, pain, or tenderness in legs. Report these signs of deep vein thrombophlebitis.
- **Anorexia:** Monitor weight, appetite, and nutritional intake in patients with AIDS.
- ***Lab Test Considerations:*** Obtain a negative pregnancy test prior to starting therapy.

Implementation

- Because of high dose, suspension is most convenient form for patients with AIDS.
- Do not confuse *Megace* 40 mg/mL with *Megace ES* 125 mg/mL.
- **PO:** May be administered with meals if GI irritation becomes a problem.
- Shake suspension well before administering.

Patient/Family Teaching

- Instruct patient to take megestrol as directed; do not skip or double up on missed doses. Missed doses may be taken as long as not right before next dose. Gradually decrease dose prior to discontinuation.
- Advise patient to report to health care professional any unusual vaginal bleeding or signs of deep vein thrombophlebitis.
- Discuss with patient the possibility of hair loss. Explore methods of coping.

© F.A. Davis Publishing

- Rep: Advise patient that this medication may have teratogenic effects. Advise females of reproductive potential to use effective contraception during and for at least 4 mo after therapy is completed. Advise patient to notify health care professional immediately if pregnancy is planned or suspected, and to avoid breast feeding.

Evaluation/Desired Outcomes

- Slowing or arresting the spread of endometrial or breast malignancy. Therapeutic effects usually occur within 2 mo of initiating therapy.
- Increased appetite and weight gain in patients with AIDS.

BEERS

meloxicam (me-lox-i-kam)

Anjeso, ~~Mobic~~

Classification

Therapeutic: nonopioid analgesics
Pharmacologic: nonsteroidal anti-inflammatory drugs (NSAIDs)

Indications

PO: Relief of signs and symptoms of osteoarthritis and rheumatoid arthritis (including juvenile rheumatoid arthritis). **IV:** Moderate-to-severe pain (as monotherapy or in combination with non-NSAID analgesics) (not to be used when rapid analgesia needed).

Action

Inhibits prostaglandin synthesis, probably by inhibiting the enzyme cyclooxygenase. **Therapeutic Effects:** Decreased pain and inflammation.

Pharmacokinetics

Absorption: Well absorbed following oral administration. IV administration results in complete bioavailability.
Distribution: Not widely distributed to tissues.
Protein Binding: 99.4%.
Metabolism and Excretion: Mostly metabolized to inactive metabolites by the liver via the CYP2C9 isoenzyme (and to a lesser extent by the CYP3A4 isoenzyme); the CYP2C9 isoenzyme exhibits genetic polymorphism (intermediate or poor metabolizers may have significantly ↑ meloxicam concentrations and an ↑ risk of adverse reactions). Metabolites are excreted in urine and feces.
Half-life: 20.1 hr.

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	5–6 hr	24 hr
IV	2–3 hr†	unknown	unknown

† Pain relief

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity may occur with other NSAIDs, including aspirin; Severe renal impairment (CCr ≤15 mL/min); Concurrent use of aspirin (↑ risk of adverse reactions); Coronary artery bypass graft (CABG) surgery; OB: Avoid use after 30 wk gestation.
Use Cautiously in: Cardiovascular disease or risk factors for cardiovascular disease (may ↑ risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, especially with prolonged use or use of higher doses); avoid use in patients with recent MI or HF; Dehydration (correct deficits before initiating therapy); Impaired renal function, heart failure, liver dysfunction, concurrent ACE inhibitor or diuretic therapy (↑ risk of renal impairment); Hypertension; Coagulation disorders or concurrent anticoagulant therapy (may ↑ risk of bleeding); OB: Use at or after 20 wk gestation may cause fetal or neonatal renal impairment; if treatment is necessary between 20 wk and 30 wk gestation, limit use to the lowest effective dose and shortest duration possible; Lactation: Safety not established in breast feeding; Pedi: Children <2 yr or <60 kg (safety and effectiveness of tablets not established); safety and effectiveness of capsules and injection not established in children; Geri: ↑ risk of GI bleeding and renal impairment in older adults.

Adverse Reactions/Side Effects

CV: HF, MYOCARDIAL INFARCTION, STROKE, edema, hypertension. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), EXFOLIATIVE DERMATITIS, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, pruritus. **F and E:** hyperkalemia. **GI:** BLEEDING, HEPATOTOXICITY, ↑ liver enzymes, diarrhea, dyspepsia, nausea. **GU:** delayed ovulation. **Hemat:** anemia, leukopenia, thrombocytopenia.

Interactions

Drug-Drug: May ↓ antihypertensive effects of **ACE inhibitors**. May ↓ diuretic effects of **furosemide** or **thiazide diuretics**. Concurrent use with **aspirin** ↑ meloxicam blood levels and may ↑ risk of adverse reactions. Concurrent use with **cholestyramine** ↓ blood levels. ↑ plasma **lithium** levels (close monitoring recommended when meloxicam is introduced or withdrawn). ↑ risk of bleeding with **anticoagulants**, **aspirin**, **clopidogrel**, **ticagrelor**, **prasugrel**, **corticosteroids**, **fibrinolytics**, **SNRIs**, or **SSRIs**. Concurrent use with **sodium polystyrene sulfonate** may ↑ risk of colonic necrosis; concurrent use should be avoided.

Route/Dosage

ODTs are NOT interchangeable with the tablets or capsules.
PO (Adults): *Capsules*—5 mg once daily; may ↑ to 10 mg once daily, if needed; *Tablets*—7.5 mg once daily; may ↑ to 15 mg once daily, if needed.

© F.A. Davis Publishing

PO (Children 2–17 yr and ≥60 kg): *Tablets*—7.5 mg once daily.
IV (Adults): 30 mg once daily.

Availability (generic available)

Tablets: 7.5 mg, 15 mg. **Cost:** *Generic*—7.5 mg $9.02/100, 15 mg $7.41/100. **Capsules:** 5 mg, 10 mg. **Solution for injection:** 30 mg/mL. ***In combination with:*** bupivacaine (Zynrelef Kit). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Patients who have asthma, aspirin-induced allergy, and nasal polyps are at increased risk for developing hypersensitivity reactions. Assess for rhinitis, asthma, and urticaria.
- Analgesic effect is delayed. Assess pain and range of motion prior to and 2–3 hr following administration. Patient may not experience adequate analgesia for entire 24-hr dosing interval and may require administration of a short-acting, non-NSAID, immediate-release analgesic.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome or toxic epidermal necrolysis. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- Monitor BP during initiation and periodically during therapy. May cause fluid retention and edema leading to new onset or worsening hypertension.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, facial swelling) periodically during therapy. Discontinue therapy if symptoms occur.
- ***Lab Test Considerations:*** Evaluate BUN, serum creatinine, CBC, and liver function periodically in patients receiving prolonged therapy. May cause anemia, thrombocytopenia, leukopenia, and abnormal liver or renal function tests.
- Bleeding time may be prolonged.

Implementation

- Administration in higher than recommended doses does not provide increased effectiveness but may cause increased side effects. Use lowest effective dose for shortest period of time to minimize risk of cardiovascular thrombotic events.
- To reduce risk of renal toxicity, ensure patient is well hydrated prior to administration.
- **PO:** May be administered without regard to food.
- **IV Push:** Administer undiluted. ***Rate:*** Inject over 15 seconds. Solution is opaque and pale yellow; do not administer solutions that are discolored or contain particulate matter.

Patient/Family Teaching

- Advise patient to take this medication with a full glass of water and to remain in an upright position for 15–30 min after administration.
- Instruct patient to take medication as directed. Take missed doses as soon as remembered but not if almost time for the next dose. Do not double doses. Instruct parent/caregiver to read the *Medication Guide* prior to use and with each Rx refill in case of changes.
- Caution patient to avoid the concurrent use of alcohol, aspirin, acetaminophen, or other OTC medications without consulting health care professional.
- Inform patient that meloxicam may increase the risk for heart attack and stroke; risk increases with longer use or in patients with heart disease.
- Advise patient to inform health care professional of medication regimen prior to treatment or surgery, especially right before or after coronary artery bypass graft (CABG).
- Advise patient to consult health care professional if rash, itching, visual disturbances, weight gain, edema, black stools, or signs of hepatotoxicity (nausea, fatigue, lethargy, jaundice, upper right quadrant tenderness, flu-like symptoms) occur.
- Rep: May cause fetal harm. Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Advise women to avoid meloxicam in the 3rd trimester of pregnancy (after 29 wks), may cause premature closure of the fetal ductus arteriosus. Use of meloxicam after 20 wks may cause fetal renal dysfunction leading to oligohydramnios. May cause reversible infertility in females and males attempting to conceive; may consider discontinuing meloxicam.

Evaluation/Desired Outcomes

- Relief of pain.
- Improved joint mobility. Patients who do not respond to one NSAID may respond to another.

melphalan (mel-fa-lan)

Alkeran, Evomela

Classification
Therapeutic: antineoplastics
Pharmacologic: alkylating agents

Indications

IV: High-dose conditioning treatment prior to hematopoietic stem cell transplantation (Evomela only). **IV and PO:** Palliative treatment of multiple myeloma. **PO:** Palliative treatment of nonresectable epithelial ovarian carcinoma.

© F.A. Davis Publishing

Action

Inhibits DNA and RNA synthesis by alkylation (cell-cycle phase–nonspecific). **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones. Also has immunosuppressive properties.

Pharmacokinetics

Absorption: Incompletely and variably absorbed following oral administration. IV administration results in complete bioavailability.

Distribution: Rapidly distributed throughout total body water.

Protein Binding: ≤30%.

Metabolism and Excretion: Rapidly metabolized in the bloodstream. Small amounts (10%) excreted unchanged by the kidneys.

Half-life: 1.5 hr.

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
IV	unknown	2–3 wk	4–5 wk
PO	5 days	2–3 wk	5–6 wk

Contraindications/Precautions

Contraindicated in: Hypersensitivity to melphalan; OB: Pregnancy (may cause fetal harm); Lactation: Lactation.

Use Cautiously in: Active infections; ↓ bone marrow reserve; Renal impairment (dose ↓ recommended for IV for palliative treatment only if BUN ≥30 mg/dL; dose ↓ may be needed when using PO therapy); Rep: Women of reproductive potential and men with female sexual partners of reproductive potential; Pedi: Safety and effectiveness not established in children; Geri: Begin at lower end of dosing range in older adults due to potential for age-related ↓ in renal, hepatic, or cardiac function.

Adverse Reactions/Side Effects

CV: peripheral edema. **Derm:** alopecia, pruritus, rash. **Endo:** menstrual irregularities. **F and E:** hypokalemia, hypophosphatemia. **GI:** constipation, diarrhea, mucositis, nausea, vomiting, hepatotoxicity. **GU:** infertility. **Hemat:** leukopenia, thrombocytopenia, anemia. **Metab:** hyperuricemia. **Neuro:** dizziness. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis) (more common with IV), MALIGNANCY, fever.

Interactions

Drug-Drug: ↑ bone marrow depression with other **antineoplastics** or **radiation therapy**. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. Concurrent IV use with **cyclosporine** may ↑ risk of renal failure.

Route/Dosage

Multiple Myeloma (Palliative Treatment)

PO (Adults): 6 mg once daily for 2–3 wk followed by up to 4 wk rest, then 2 mg once daily *or* 10 mg once daily for 7–10 days, then 2 mg once daily once WBC >4000/mm^3 and platelets >100,000/mm^3 *or* 0.15 mg/kg/day for 7 days, followed by 2–6 wk rest, then 0.05 mg/kg/day maintenance dose *or* 0.25 mg/kg/day for 4 days every 4–6 wk *or* 0.2 mg/kg/day for 5 days every 4–6 wk.

IV (Adults): 16 mg/m^2 every 2 wk for 4 doses, then every 4 wk.

Renal Impairment

IV (Adults): *BUN ≥30 mg/dL* — ↓ dose by up to 50%.

Multiple Myeloma (Conditioning Treatment)

IV (Adults): 100 mg/m^2/day on Day 3 and Day 2 prior to autologous stem cell transplantation on Day 0.

Ovarian Carcinoma

PO (Adults): 0.2 mg/kg/day for 5 days every 4–5 wk.

Availability (generic available)

Tablets: 2 mg. **Powder for injection:** 50 mg/vial.

NURSING IMPLICATIONS

Assessment

- Assess for signs of infection (fever, chills, sore throat, cough, hoarseness, lower back or side pain, difficult or painful urination). Notify health care professional if these symptoms occur.
- Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis). Avoid IM injections and taking rectal temperatures. Apply pressure to venipuncture sites for 10 min.
- May cause nausea and vomiting. Monitor intake and output, appetite, and nutritional intake. Prophylactic antiemetics may be used. Adjust diet as tolerated.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid per day. Allopurinol may be given to decrease uric acid levels.
- Anemia may occur. Monitor for increased fatigue and dyspnea.
- Assess patient for allergy to chlorambucil. Patients may have cross-sensitivity.
- **Evomela:** For patients receiving *Evomela* as part of a conditioning regimen, nausea, vomiting, mucositis, and diarrhea may occur in over 50% of patients. Use prophylactic antiemetic medication and provide supportive care. Provide nutritional support and analgesics for patients with severe mucositis.
- ***Lab Test Considerations:*** Monitor CBC and differential weekly during therapy. The nadir of leukopenia occurs in 2–3 wk. Notify physician if leukocyte count is <3000/mm^3. The nadir of thrombocytopenia occurs in 2–3 wk. Notify physician if platelet count is <100,000/mm^3. Recovery of leukopenia and thrombocytopenia occurs in 5–6 wk.
- Monitor liver function studies (AST, ALT, LDH, bilirubin) and renal function studies (BUN, serum cre-

© F.A. Davis Publishing

atinine) prior to and periodically during therapy to detect hepatotoxicity and nephrotoxicity.
- May cause ↑ uric acid. Monitor periodically during therapy.
- May cause ↑ 5-hydroxyindoleacetic acid (5-HIAA) concentrations as a result of tumor breakdown.

Implementation

- Do not confuse Alkeran (melphalan) with Leukeran (chlorambucil) or Myleran (busulfan).
- **PO:** May be ordered in divided doses or as a single daily dose.

IV Administration

- Solution should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard IV equipment in specially designated container.
- If solution contacts skin or mucosa, immediately wash skin or mucosa with soap and water.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute with 10 mL of diluent supplied. ***Concentration:*** 5 mg/mL. Shake vigorously until solution is clear. ***Dilution:*** Dilute dose immediately with 0.9% NaCl. ***Concentration:*** Not to exceed 0.45 mg/mL. Administer within 60 min of reconstitution. Store at room temperature and protect from light; do not refrigerate reconstituted solution. ***Rate:*** Administer over 15–30 min. Keep time between reconstitution/dilution and administration to a minimum; reconstituted and diluted solutions are unstable.
- **Evomela Intermittent Infusion:** For patients receiving *Evomela* as part of a conditioning regimen, myeloablation occurs in all patients. Do not begin the conditioning regimen if a stem cell product is not available for rescue.
- ***Reconstitution:*** Reconstitute with 8.6 mL 0.9% NaCl. ***Concentration:*** 5 mg/mL. solution. Reconstituted solution is stable for 1 hr at room temperature and 24 hr if refrigerated. Solution is clear and colorless to light yellow; do not administer solutions that are discolored or contain particulate matter. ***Dilution:*** Dilute further in 0.9% NaCl. ***Concentration:*** 0.45 mg/mL. Diluted solution is stable for an additional 4 hrs at room temperature. ***Rate:*** Infuse over 30 min via injection port or central venous catheter; may cause local tissue damage if extravasation occurs. Do not administer IV push into a peripheral vein. Administer *Evomela* by injecting slowly into a fast-running IV infusion via a central venous access line.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, amikacin, aminophylline, amphotericin B lipid complex, ampicillin, anidulafungin, argatroban, arsenic trioxide, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium gluconate, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, ceftazidime, ceftriaxone, cefuroxime, cisplatin, clindamycin, cyclophosphamide, cytarabine, dacarbazine, dactinomycin, daunorubicin hydrochloride, dexamethasone, dexrazoxane, diltiazem, diphenhydramine, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ertapenem, etoposide, famotidine, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemtuzumab ozogamicin, gentamicin, granisetron, haloperidol, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, leucovorin calcium, linezolid, lorazepam, mannitol, meperidine, mesna, methotrexate, methylprednisolone, metoclopramide, metronidazole, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, nalbuphine, octreotide, ondansetron, palonosetron, pamidronate, pancuronium, pentostatin, piperacillin/tazobactam, potassium acetate, potassium chloride, prochlorperazine, promethazine, sodium bicarbonate, streptozocin, thiotepa, tigecycline, tirofiban, tobramycin, trimethoprim/sulfamethoxazole, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** amiodarone, chlorpromazine, pantoprazole.

Patient/Family Teaching

- Instruct patient to take melphalan as directed, even if nausea and vomiting occur. If vomiting occurs shortly after dose is taken, consult health care professional. If a dose is missed, do not take at all. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient to notify health care professional if fever; chills; dyspnea; persistent cough; sore throat; signs of infection; bleeding gums; bruising; petechiae; or blood in urine, stool, or emesis occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor. Caution patient not to drink alcoholic beverages or take products containing aspirin or other NSAIDs.
- Instruct patient to notify health care professional if skin rash, vasculitis, bleeding, fever, persistent cough, nausea, vomiting, amenorrhea, weight loss, or unusual lumps/masses occur.
- Instruct patient to inspect oral mucosa for redness and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Consult health care professional if pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Advise patient to notify health care professional immediately if signs and symptoms of allergic reactions

© F.A. Davis Publishing

(skin reactions, including welts, rash, itching, and redness; fast heartbeat; shortness of breath or trouble breathing; feel lightheaded or dizzy; blurry vision; swelling of face, tongue, or throat) occurs.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Inform patient that melphalan may cause new cancers.
- Rep: May cause fetal harm. Advise females of reproductive potential to use effective contraception during and for 6 mo after last dose of melphalan and avoid breast feeding during and for 1 wk after last dose. Advise males with a female partner of reproductive potential to use effective contraception during and for 3 mo after last dose. May cause female and male infertility.
- Emphasize need for periodic lab tests to monitor for side effects.

Evaluation/Desired Outcomes
- Decrease in size and spread of malignant tissue.

memantine (me-man-teen)
Ebixa, Namenda, Namenda XR

Classification
Therapeutic: antiAlzheimer's agents
Pharmacologic: N-methyl-D-aspartate antagonist

Indications
Moderate to severe dementia/neurocognitive disorder associated with Alzheimer's disease.

Action
Binds to CNS N-methyl-D-aspartate (NMDA) receptor sites, preventing binding of glutamate, an excitatory neurotransmitter. **Therapeutic Effects:** Decreased symptoms of dementia/cognitive decline. Does not slow progression. Cognitive enhancement. Does not cure disease.

Pharmacokinetics
Absorption: Well absorbed after oral administration.
Distribution: Unknown.
Metabolism and Excretion: 57–82% excreted unchanged in urine by active tubular secretion moderated by pH dependent tubular reabsorption. Remainder metabolized; metabolites are not pharmacologically active.
Half-life: 60–80 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	3–7 hr	12 hr
PO-ER	unknown	9–12 hr	24 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity.
Use Cautiously in: Severe renal impairment (↓ dose); Severe hepatic impairment; Concurrent use of other NMDA antagonists (amantadine, rimantadine, ketamine, dextromethorphan); Concurrent use of drugs or diets that cause alkaline urine; Conditions that ↑ urine pH including severe urinary tract infections or renal tubular acidosis (lead to ↓ excretion and ↑ levels); OB: Safety not established in pregnancy; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Pedi: Safety and effectiveness in children not established.

Adverse Reactions/Side Effects
CV: hypertension. **Derm:** rash. **GI:** diarrhea, weight gain. **GU:** urinary frequency. **Hemat:** anemia. **Neuro:** dizziness, fatigue, headache, sedation.

Interactions
Drug-Drug: Medications that ↑ urine pH (e.g. **carbonic anhydrase inhibitors**, **sodium bicarbonate**) may↓ excretion and ↑ blood levels.

Route/Dosage
PO (Adults): *Immediate-release*—5 mg once daily initially, ↑ at weekly intervals to 10 mg/day (5 mg twice daily), then 15 mg/day (5 mg once daily, 10 mg once daily as separate doses), then to target dose of 20 mg/day (10 mg twice daily); *Extended-release*—7 mg once daily, ↑ at weekly intervals by 7 mg/day to target dose of 28 mg once daily.

Renal Impairment
(Adults): *CCr 5–29 mL/min*—Immediate-release (solution): Target dose is 10 mg/day (5 mg twice daily); Extended-release: Target dose is 14 mg once daily.

Availability (generic available)
Extended-release capsules: 7 mg, 14 mg, 21 mg, 28 mg. **Cost:** 7 mg $302.62/30, 14 mg $907.85/90, 21 mg $302.62/30, 28 mg $907.85/90. **Immediate-release tablets:** 5 mg, 10 mg. **Cost:** 5 mg $887.69/180. **Oral solution, sugar-free, alcohol-free (peppermint):** 2 mg/mL. **Cost:** $668.50/360 mL. ***In combination with:*** donepezil (Namzaric). See Appendix N.

NURSING IMPLICATIONS
Assessment
- Assess cognitive function (memory, attention, reasoning, language, ability to perform simple tasks) periodically during therapy.
- ***Lab Test Considerations:*** May cause anemia.

Implementation
- Do not confuse memantine with methadone.
- Dose increases should occur no more frequently than weekly.
- To switch from *Namenda* to *Namenda XR*, patients taking 10 mg twice daily of *Namenda* tablets may be switched to *Namenda XR* 28 mg once daily capsules the day following the last dose of a 10 mg *Namenda* tablet. Patients with renal impairment may use the same procedure to switch from *Namenda* 5 mg twice daily to *Namenda XR* 14 mg once daily.

© F.A. Davis Publishing

- **PO:** May be administered without regard to food.
- Administer oral solution using syringe provided. Do not dilute or mix with other fluids.
- ***DNC:*** Swallow extended release capsules whole; do not crush, chew, or divide. Capsules may be opened, sprinkled on applesauce, and swallowed. Entire contents of each capsule should be consumed; do not divide dose.

Patient/Family Teaching

- Instruct patient and caregiver on how and when to administer memantine and how to titrate dose. Take missed doses as soon as remembered but not just before next dose; do not double doses. If several days doses are missed, may need to resume at a lower dose and re-titrate up to previous dose; consult health care professional. Advise patient and caregiver to read *Patient Instructions* before starting and with each Rx refill in case of changes.
- Caution patient and caregiver that memantine may cause dizziness. Monitor and assist with ambulation and caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient and caregiver to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Teach patient and caregivers that improvement in cognitive functioning may take months; degenerative process is not reversed.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Improvement in neurocognitive decline (memory, attention, reasoning, language, ability to perform simple tasks) in patients with Alzheimer's disease.

BEERS REMS HIGH ALERT

meperidine (me-**per**-i-deen)

Demerol

Classification

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Indications

Moderate or severe pain (alone or with nonopioid agents). Anesthesia adjunct. Analgesic during labor. Preoperative sedation. **Unlabeled Use:** Rigors.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression. **Therapeutic Effects:** Decrease in severity of pain.

Pharmacokinetics

Absorption: 50% from the GI tract; well absorbed from IM sites. Oral doses are about half as effective as parenteral doses.

Distribution: Widely distributed. Crosses the placenta; enters breast milk.

Protein Binding: Neonates: 52%; Infants 3–18 mo: 85%; Adults: 60–80%.

Metabolism and Excretion: Mostly metabolized by the liver; some converted to normeperidine, which may accumulate and cause seizures. 5% excreted unchanged by the kidneys.

Half-life: Neonates: 12–39 hr; Infants 3–18 mo: 2.3 hr; Children 5–8 yr: 3 hr; Adults: 2.5–4 hr (↑ in impaired renal or hepatic function [7–11 hr]).

TIME/ACTION PROFILE (analgesia)

ROUTE	ONSET	PEAK	DURATION
PO	15 min	60 min	2–4 hr
IM	10–15 min	30–50 min	2–4 hr
Subcut	10–15 min	40–60 min	2–4 hr
IV	immediate	5–7 min	2–3 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hypersensitivity to bisulfites (some injectable products); Recent (within 14 days) MAO inhibitor therapy; Severe respiratory insufficiency; OB: Labor and delivery; Lactation: Lactation.

Use Cautiously in: Head trauma; ↑ intracranial pressure; Severe renal or hepatic impairment; Acute asthma attack, COPD, hypoxia, or hypercapnea; Hypothyroidism; Adrenal insufficiency; Alcoholism; Debilitated patients (dose ↓ suggested); Undiagnosed abdominal pain or prostatic hyperplasia; Patients with renal impairment, or extensive burns; High-dose or prolonged therapy (>600 mg/day or >2 days; ↑ risk of CNS stimulation and seizures due to accumulation of normeperidine); Sickle cell anemia (may require ↓ initial doses); OB: Avoid chronic use during pregnancy as can result in neonatal opioid withdrawal syndrome; Pedi: Syrup contains benzyl alcohol, which can cause "gasping syndrome" in neonates. Children have ↑ risk of seizures due to accumulation of normeperidine; Geri: Appears on Beers list; morphine recommended.

Adverse Reactions/Side Effects

CV: hypotension, bradycardia. **Derm:** flushing, sweating. **EENT:** blurred vision, diplopia, miosis. **Endo:** adrenal insufficiency. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Neuro:** SEIZURES, confu-

© F.A. Davis Publishing

sion, sedation, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea or sleep-related hypoxemia). **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Do not use in patients receiving **MAO inhibitors** or **procarbazine** (may cause fatal reaction—contraindicated within 14 days of MAO inhibitor therapy). Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Administration of **mixed agonist/antagonist analgesics**, including **nalbuphine** or **butorphanol** or **partial agonist analgesics**, including **buprenorphine**, may ↓ meperidine's analgesic effects and/or precipitate opioid withdrawal in physically dependent patients. Concurrent use of **CYP3A4 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **fluconazole**, **clarithromycin**, **erythromycin**, **nefazodone**, **diltiazem**, **verapamil**, **nelfinavir**, and **fosamprenavir** ↑ levels and risk of opioid toxicity; careful monitoring during initiation, dose changes, or discontinuation of the inhibitor is recommended. Concurrent use with **CYP3A4 inducers** including **barbiturates**, **carbamazepine**, **efavirenz**, **corticosteroids**, **modafinil**, **nevirapine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, or **rifampin** may ↓ levels and analgesia; if inducers are discontinued or dosage ↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. **Nalbuphine** may ↓ analgesia. **Protease inhibitors** may ↑ effects and adverse reactions (concurrent use should be avoided). **Phenytoin** ↑ metabolism and may ↓ effects. **Chlorpromazine** and **thioridazine** may ↑ the risk of adverse reactions (concurrent use should be avoided). May aggravate side effects of **isoniazid**. **Acyclovir** may ↑ plasma concentrations of meperidine and normeperidine. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT$_3$ receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome.

Drug-Natural Products: Concomitant use of **kava-kava**, **valerian,** or **chamomile** can ↓ CNS depression. **St. John's wort** may ↑ serious side effects, concurrent use is not recommended.

Route/Dosage

PO (Adults): *Analgesia*—50–150 mg every 3–4 hr; may ↑ as needed (not to exceed 600 mg/24 hr).

IM, Subcut (Adults): *Analgesia*—50–150 mg every 3–4 hr; may ↑ as needed (not to exceed 600 mg/24 hr). *Analgesia during labor*—50–100 mg when contractions become regular; may repeat every 1–3 hr. *Preoperative sedation*—50–100 mg 30–90 min before anesthesia.

PO (Children): *Analgesia*—1.1–1.8 mg/kg every 3–4 hr (max = 100 mg/dose).

IM, Subcut (Children): *Analgesia*—1.1–1.8 mg/kg every 3–4 hr (max = 100 mg/dose). *Preoperative sedation*—1.1–2.2 mg/kg 30–90 min before anesthesia (not to exceed adult dose).

IV (Adults): 15–35 mg/hr as a continuous infusion; *PCA*—10 mg initially; with a range of 1–5 mg/incremental dose, recommended lockout interval is 6–10 min (minimum 5 min).

IV (Children): *Continuous infusion*—0.5–1 mg/kg loading dose followed by 0.3 mg/kg/hr, titrate to effect up to 0.5–0.7 mg/kg/hr.

Availability (generic available)

Tablets: 50 mg, 100 mg. **Oral solution (banana flavor):** 50 mg/5 mL. **Solution for injection :** 25 mg/mL, 50 mg/mL, 75 mg/mL, 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess type, location, and intensity of pain prior to and 1 hr following PO, subcut, and IM doses and 5 min (peak) following IV administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numerical or visual analogue scale or the patient reports satisfactory pain relief. A repeat dose can be safely administered at the time of the peak if previous dose is ineffective and side effects are minimal.
- An equianalgesic chart (see Appendix I) should be used when changing routes or when changing from one opioid to another.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. May cause sleep-related breathing disorders (central sleep apnea [CSA], sleep-related hypoxemia).
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated. Consider drugs for opioid induced constipation.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Patients who receive meperidine for pain rarely

© F.A. Davis Publishing

develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Monitor patients on chronic or high-dose therapy for CNS stimulation (restlessness, irritability, seizures) due to accumulation of normeperidine metabolite. Risk of toxicity increases with doses >600 mg/24 hr, chronic administration (>2 days), and renal impairment.
- Assess risk for opioid addiction, abuse, or misuse prior to administration.
- Geri: Meperidine has been reported to cause delirium in the elderly; older adults are at increased risk for normeperidine toxicity. Monitor frequently.
- Pedi: Assess pediatric patient frequently; neonates, infants, and children are more sensitive to the effects of opioid analgesics and may experience respiratory complications, excitability, and restlessness more frequently.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase concentrations.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone (Narcan) is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain. In patients receiving meperidine chronically, naloxone may precipitate seizures by eliminating the CNS depressant effects of meperidine, allowing the convulsant activity of normeperidine to predominate. Monitor patient closely.

Implementation

- ***High Alert:*** Accidental overdose of opioid analgesics has resulted in fatalities. Before administering, clarify all ambiguous orders; have second practitioner independently check original order, dose calculations, and infusion pump settings. Pedi: Medication errors with opioid analgesics are common in the pediatric population and include misinterpretation or miscalculation of doses and use of inappropriate measuring devices.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if given before pain becomes severe.
- Coadministration with nonopioid analgesics may have additive analgesic effects and permit lower doses.
- Oral dose is <50% as effective as parenteral. When changing to oral administration, dose may need to be increased (see Appendix I).
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms. For patients who are physically opioid dependent, initiate the taper by a small enough increment (no greater than 10% to 25% of total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2 to 4 wk. Patients who have been taking opioids for briefer periods of time may tolerate a more rapid taper. Monitor frequently to manage pain and withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). If withdrawal symptoms occur, pause the taper for a period of time or raise dose of opioid analgesic to previous dose, and then proceed with a slower taper. Also, monitor patients for changes in mood, emergence of suicidal thoughts, or use of other substances. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the opioid analgesic.
- May be administered via PCA pump.
- **PO:** Doses may be administered with food or milk to minimize GI irritation. Syrup should be diluted in half-full glass of water.
- **IM:** Administration of repeated subcut doses may cause local irritation.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.

IV Administration

- **IV Push:** Administer undiluted. ***Rate: High Alert:*** Administer slowly over at least 5 min. Rapid admin-

© F.A. Davis Publishing

istration may lead to increased respiratory depression, hypotension, and circulatory collapse.

- **Intermittent Infusion:** ***Dilution:*** Dilute with D5W, D10W, dextrose/saline combinations, dextrose/Ringer's or lactated Ringer's injection combinations, 0.45% NaCl, 0.9% NaCl, or Ringer's or LR. Administer via infusion pump. ***Concentration:*** 1 mg/mL. ***Rate:*** Administer over 15–30 min.
- **Y-Site Compatibility:** acetaminophen, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atracurium, atropine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, busulfan, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefotaxime, cefoxitin, ceftaroline, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, daunorubicin liposome, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, floxuridine, fluconazole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, hetastarch, hydrocortisone, ifosfamide, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketamine, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, mannitol, melphalan, meropenem/vaborbactam, mesna, methotrexate, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, multivitamins, mycophenolate, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propofol, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, streptozocin, succinylcholine, sufentanil, tacrolimus, tedizolid, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** allopurinol, amphotericin B deoxycholate, amphotericin B liposome, azathioprine, cefepime, dantrolene, diazepam, diazoxide, ganciclovir, gemtuzumab ozogamicin, idarubicin, indomethacin, lorazepam, micafungin, nafcillin, pantoprazole, pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, thiopental.

Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication.
- ***REMS:*** Instruct patient to take meperidine as directed. If dose is less effective after a few wk, do not increase dose without consulting health care professional. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. The Patient Counseling Guide (PCG) is available at www.fda.gov/OpioidAnalgesicREMSPCG. Pedi: Teach parents or caregivers how to accurately measure liquid medication and to use only the measuring device dispensed with the medication.
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient that meperidine is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Instruct patient to avoid concurrent use of alcohol or other CNS depressants.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Advise ambulatory patients that nausea and vomiting may be decreased by lying down.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and

© F.A. Davis Publishing

symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to meperidine through breast milk for excess sedation and respiratory depression. Chronic use may reduce fertility in females and males.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Resolution of rigors.

mepolizumab

(me-poe-**liz**-ue-mab)

Nucala

Classification

Therapeutic: anti-asthmatics

Pharmacologic: monoclonal antibodies, interleukin antagonists

Indications

Severe asthma that is of an eosinophilic phenotype (as add-on maintenance treatment). Eosinophilic granulomatosis with polyangiitis. Hypereosinophilic syndrome (HES) with a duration of ≥6 mo that has no identifiable, non-hematologic, secondary cause. Chronic rhinosinusitis with nasal polyps in patients with an inadequate response to nasal corticosteroids (as add-on maintenance treatment).

Action

Interleukin-5 (IL-5) antagonist that inhibits binding of IL-5 to the surface of the eosinophil, which reduces the production and survival of eosinophils. **Therapeutic Effects:** Decreased incidence of asthma exacerbations and reduction in use of maintenance oral corticosteroid therapy. Prolonged duration of remission and reduction in use of maintenance oral corticosteroid therapy in eosinophilic granulomatosis with polyangiitis. Reduction in HES flares. Reduction in nasal polyps and nasal obstruction.

Pharmacokinetics

Absorption: 80% absorbed following subcut administration.
Distribution: Minimally distributed to tissues.
Metabolism and Excretion: Degraded by proteolytic enzymes located throughout the body.
Half-life: 16–22 days.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Acute bronchospasm or status asthmaticus.
Use Cautiously in: OB: Pregnancy; expected to cross the placenta (potential effects likely to be greater during 2nd and 3rd trimesters); Lactation: Safety not established in pregnancy; Pedi: Safety and effectiveness not established in children <18 yr (eosinophilic granulomatosis with polyangiitis), <12 yr (HES), or <6 yr (severe asthma of an eosinophilic phenotype).

Adverse Reactions/Side Effects

Derm: flushing, rash. **MS:** back pain, myalgia.
Neuro: headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), fatigue, herpes zoster infection, injection site reactions.

Interactions

Drug-Drug: None known.

Route/Dosage

Severe Asthma

Subcut (Adults and Children ≥12 yr): 100 mg every 4 wk.
Subcut (Children 6–11 yr): 40 mg every 4 wk.

Eosinophilic Granulomatosis with Polyangiitis

Subcut (Adults): 300 mg every 4 wk.

Hypereosinophilic Syndrome

Subcut (Adults and Children ≥12 yr): 300 mg every 4 wk.

Chronic Rhinosinusitis with Nasal Polyps

Subcut (Adults): 100 mg every 4 wk.

Availability

Lyophilized powder for injection: 100 mg/vial. **Solution for injection (prefilled autoinjectors and prefilled syringes):** 100 mg/mL.

NURSING IMPLICATIONS

Assessment

- Assess respiratory status (rate, breath sounds, degree of dyspnea, pulse) periodically during therapy.
- Monitor for signs and symptoms of hypersensitivity reactions (anaphylaxis, angioedema, bronchospasm, urticaria, rash) following injection. Reactions usually occur within hrs, but may have a delayed onset (days). Discontinue mepolizumab if hypersensitivity reaction occurs.
- Assess for and treat parasitic infections prior to therapy. If infected during therapy and unresponsive to antihelminth treatment, discontinue mepolizumab until infection resolves.

© F.A. Davis Publishing

Implementation

- Only administer in a health care setting by a health care professional able to manage anaphylaxis. Mepolizumab is for prevention; do not use to treat acute bronchospasm or status asthmaticus.
- Consider administration of varicella vaccination prior to starting therapy.
- Do not abruptly stop systemic or inhaled corticosteroids when starting therapy. May ↓ corticosteroid doses gradually under direct supervision of health care professional. Corticosteroid ↓ may lead to systemic withdrawal symptoms and/or unmask conditions previously suppressed.
- ***Reconstitution:*** Reconstitute with 1.2 mL of sterile water for injection using a 2- or 3-mL syringe and a 21-gauge needle. ***Concentration:*** 100 mg/mL. Direct stream into center of cake. Swirl gently for 10 sec until powder is dissolved; do not shake. Reconstitution takes 5 min or more. Solution is clear to opalescent and colorless to pale yellow or pale brown; do not administer if solution is discolored, cloudy, or contains particles. Stable for 8 hr if refrigerated.
- **Subcut:** Using a 21- to 27-gauge needle, administer 1 mL for the 100 mg dose or 0.4 mL for the 40 mg dose once every 4 wk into upper arm, thigh, or abdomen.
- Remove prefilled autoinjector from refrigerator 30 min before injection and allow to sit to warm to room temperature; do not warm in any other way.
- 300 mg dose must be given as three separate 100-mg injections at least 2 inches apart.

Patient/Family Teaching

- Explain purpose of mepolizumab to patient. Administer missed doses as soon as possible, if next dose is already due administer as planned. Instruct patient to read *Patient Information* before starting therapy.
- May be self-administered by adults and adolescents 12 yrs or older using the prefilled auto-injector and prefilled syringe. Remove autoinjector from refrigerator 30 min before injection; do not warm in any other way. Inspect window of autoinjector; solution is clear to opalescent, colorless to pale yellow to pale brown in color. Do not administer solutions that are discolored or contain particulate matter. Inject into thigh or abdomen, 2 inches from navel, or upper arm if administered by caregiver. If multiple injections are needed, separate each injection by at least 2 inches. Avoid areas that are tender, bruised, red, or hard.
- Inform patient of risk and signs and symptoms of anaphylaxis. Instruct patient to notify health care professional immediately if signs and symptoms of hypersensitivity reactions (swelling of face, mouth, tongue, fainting, dizziness, feeling lightheaded, hives, breathing problems, rash) occur.
- Advise patient to notify health care professional if asthma remains uncontrolled or worsens after starting therapy.
- Caution patient not to reduce corticosteroid dose unless instructed by health care professional.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and consult health care professional before taking any new medications.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. Encourage women who become pregnant while taking mepolizumab to enroll in the Pregnancy Exposure Registry that monitors pregnancy outcomes in women with asthma exposed to mepolizumab during pregnancy by calling 1-877-311-8972 or visiting www.mothertobaby.org/asthma.

Evaluation/Desired Outcomes

- Decreased incidence of asthma exacerbations and reduction in use of maintenance oral corticosteroid therapy.
- Reduction in HES flares.
- Reduction in nasal polyps and nasal obstruction.

meropenem (mer-oh-**pen**-nem)

Merrem

Classification

Therapeutic: anti-infectives
Pharmacologic: carbapenems

Indications

Complicated skin and skin structure infections. Complicated intra-abdominal infections. Bacterial meningitis. **Unlabeled Use:** Febrile neutropenia. Hospital-acquired pneumonia and sepsis.

Action

Binds to bacterial cell wall, resulting in cell death. Meropenem resists the actions of many enzymes that degrade most other penicillins and penicillin-like anti-infectives. **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following gram-positive organisms: *Staphylococcus aureus*, *Streptococcus agalactiae*, *Streptococcus pneumoniae*, *Streptococcus pyogenes*, viridans group streptococci, *Enterococcus faecalis*. Also active against the following gram-negative pathogens: *Escherichia coli*, *Haemophilus influenzae*, *Klebsiella pneumoniae*, *Neisseria meningitidis*, *Proteus mirabilis*, *Pseudomonas aeruginosa*. Active against the following anaerobes: *Bacteroides fragilis*, *Bacteroides thetaiotaomicron*, *Peptostreptococcus spp.*

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Widely distributed into body tissues and fluids; enters CSF when meninges are inflamed.
Metabolism and Excretion: 50–75% excreted unchanged by the kidneys.

© F.A. Davis Publishing

Half-life: Premature neonates: 3 hr; Term neonates: 2 hr; Infants 3 mo–2 yr: 1.4 hr; Children >2 yr and Adults: 1 hr (↑ in renal impairment).

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to meropenem or imipenem; Serious hypersensitivity to other beta-lactams (penicillins or cephalosporins; cross-sensitivity may occur).

Use Cautiously in: Renal impairment (↑ risk of thrombocytopenia and seizures; dose ↓ recommended if CCr <50 mL/min); History of seizures, brain lesions, or meningitis; OB: Safety not established in pregnancy; Lactation: Use during breast feeding only if potential maternal benefit outweighs risk to infant; Pedi: Children <3 mo (safety and effectiveness not established for complicated skin/skin structure infections and meningitis).

Adverse Reactions/Side Effects

Derm: acute generalized exanthematous pustulosis, DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS), ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, moniliasis (children only), pruritus, rash. **GI:** CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), constipation, diarrhea, glossitis (↑ in children), nausea, thrush (↑ in children), vomiting. **Hemat:** thrombocytopenia (↑ in renal impairment). **Local:** inflammation at injection site, phlebitis. **Neuro:** paresthesias, SEIZURES, dizziness, headache. **Resp:** APNEA. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis).

Interactions

Drug-Drug: Probenecid ↓ renal excretion and ↑ levels; concurrent use not recommended. May ↓ serum **valproate** levels and ↑ the risk of seizures.

Route/Dosage

Complicated Skin/Skin Structure Infections

IV (Adults): 500 mg every 8 hr or 1 g every 8 hr (if caused by *Pseudomonas aeruginosa*).

IV (Children ≥3 mo–12 yr): 10 mg/kg (max dose = 500 mg) every 8 hr or 20 mg/kg (max dose = 1 g) every 8 hr (if caused by *Pseudomonas aeruginosa*).

Renal Impairment

IV (Adults): *CCr 26–50 mL/min*—500 mg every 12 hr; *CCr 10–25 mL/min*—250 mg every 12 hr; *CCr <10 mL/min*—250 mg every 24 hr.

Intra-abdominal Infections

IV (Adults): 1 g every 8 hr.

IV (Children ≥3 mo–12 yr): 20 mg/kg (max dose = 1 g) every 8 hr.

IV (Children <3 mo): *<32 wk gestational age (GA) and postnatal age (PNA) <2 wk*—20 mg/kg every 12 hr; *<32 wk GA and PNA ≥2 wk*—20 mg/kg every 8 hr; *≥32 wk GA and PNA <2 wk*—20 mg/kg every 8 hr; *≥32 wk GA and PNA ≥2 wk*—30 mg/kg every 8 hr.

Renal Impairment

IV (Adults): *CCr 26–50 mL/min*—1 g every 12 hr; *CCr 10–25 mL/min*—500 mg every 12 hr; *CCr <10 mL/min*—500 mg every 24 hr.

Bacterial Meningitis

IV (Children ≥3 mo): 40 mg/kg (max dose = 2 g) every 8 hr.

Availability (generic available)

Powder for injection (requires reconstitution): 500 mg, 1 g. **Premixed infusion:** 500 mg/50 mL 0.9% NaCl, 1 g/50 mL 0.9% NaCl.

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify physician immediately if these symptoms occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- Assess injection site for phlebitis, pain, and swelling periodically during administration.
- Monitor for signs and symptoms of DRESS (fever, rash, lymphadenopathy, and/or facial swelling, associated with involvement of other organ systems (hepatitis, nephritis, hematologic abnormalities, myocarditis, myositis) during therapy. May resemble an

© F.A. Davis Publishing

acute viral infection. Eosinophilia is often present. Discontinue therapy if signs occur.
- Assess patient for skin rash frequently during therapy. Discontinue meropenem at first sign of rash; may be life-threatening. Stevens-Johnson syndrome or toxic epidermal necrolysis may develop. Treat symptomatically; may recur once treatment is stopped.
- ***Lab Test Considerations:*** Monitor hematologic, hepatic, and renal functions periodically during therapy.
- BUN, AST, ALT, LDH, serum alkaline phosphatase, bilirubin, and creatinine may be transiently ↑.
- Hemoglobin and hematocrit concentrations may be ↓.
- May cause positive direct or indirect Coombs' test.

Implementation

IV Administration
- **IV Push:** ***Reconstitution:*** Reconstitute 500-mg and 1-g vials with 10 mL and 20 mL, respectively, of sterile water for injection. ***Concentration:*** 50 mg/mL. ***Rate:*** Administer over 3–5 min.
- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute 500-mg and 1-g vials with 10 mL and 20 mL, respectively, of sterile water for injection, 0.9% NaCl, or D5W. Vials reconstituted with sterile water for injection are stable for 3 hr at room temperature and 13 hr if refrigerated; if reconstituted with 0.9% NaCl, stable for 1 hr at room temperature and 15 hr if refrigerated; if reconstituted with D5W, should be used immediately. ***Dilution:*** Further dilute in 0.9% NaCl or D5W to achieve concentration below. Infusions further diluted in 0.9% NaCl are stable for 4 hr at room temperature and 24 hr if refrigerated. Infusions further diluted in D5W are stable for 1 hr at room temperature and 4 hr if refrigerated. ***Concentration:*** 1–20 mg/mL. ***Rate:*** Infuse over 15–30 min.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, aminocaproic acid, aminophylline, anidulafungin, argatroban, atropine, azithromycin, bivalirudin, bleomycin, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cisplatin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, docetaxel, doxorubicin liposomal, enalaprilat, eptifibatide, etoposide, etoposide phosphate, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, granisetron, heparin, hetastarch, hydromorphone, ifosfamide, insulin, regular, irinotecan, labetalol, leucovorin calcium, linezolid, lorazepam, mesna, methotrexate, metoclopramide, metronidazole, milrinone, mitomycin, mitoxantrone, morphine, naloxone, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pemetrexed, phenobarbital, potassium acetate, potassium chloride, rocuronium, tacrolimus, telavancin, thiotepa, tigecycline, tirofiban, vancomycin, vasopressin, vecuronium, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.
- **Y-Site Incompatibility:** amiodarone, amphotericin B lipid complex, amphotericin B liposome, ciprofloxacin, dacarbazine, diazepam, doxorubicin hydrochloride, epirubicin, fenoldopam, idarubicin, ketamine, mycophenolate, nicardipine, pantoprazole, quinupristin/dalfopristin, topotecan.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- May cause dizziness. Caution patient to avoid driving or other activities requiring alertness until response to drug is known.
- Caution patient to notify health care professional if rash or fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

meropenem/vaborbactam

(mer-oh-**pen**-nem/va-bor-**bak**-tam)
Vabomere

Classification
Therapeutic: anti-infectives
Pharmacologic: carbapenems beta-lactamase inhibitors

Indications

Treatment of complicated urinary tract infections, including pyelonephritis.

Action

Binds to bacterial cell wall, resulting in cell death. Addition of vaborbactam protects meropenem from being degraded by certain serine beta-lactamases such as *Klebsiella pneumoniae* carbapenemase (KPC). **Therapeutic Effects:** Bactericidal action against susceptible bacteria. **Spectrum:** Active against the following gram-negative pathogens: *Escherichia coli*, *Enterobacter cloacae*, *Klebsiella pneumoniae*.

© F.A. Davis Publishing

Pharmacokinetics

Absorption: IV administration results in complete bioavailability.
Distribution: Well distributed into body tissues and fluids.
Metabolism and Excretion: Meropenem undergoes hydrolysis; vaborbactam is not metabolized. Both meropenem and vaborbactam are primarily excreted by the kidneys (40–60% of meropenem and 75–95% of vaborbactam excreted unchanged in the urine).
Half-life: Meropenem: 1.22 hr; vaborbactam: 1.68 hr.

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
IV	rapid	end of infusion	8 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity to any of the carbapenems (ertapenem, imipenem, meropenem); Anaphylactic reactions to other beta-lactams (cross-sensitivity may occur); OB: May cause fetal harm.
Use Cautiously in: Renal impairment (↑ risk of thrombocytopenia and seizures; ↓ dose if eGFR <50 mL/min); History of seizures, brain lesions, or meningitis; Lactation: Consider benefits of breast feeding against possible risk to infant; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

GI: CLOSTRIDIOIDES DIFFICILE-ASSOCIATED DIARRHEA (CDAD), diarrhea. **Neuro:** paresthesias, SEIZURES, delirium, headache. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), infusion site reactions, phlebitis.

Interactions

Drug-Drug: Probenecid ↓ renal excretion of meropenem and ↑ its blood levels; concurrent use not recommended. May ↓ **valproate** levels and ↑ risk of seizures; concurrent use not recommended.

Route/Dosage

IV (Adults): 4 g (meropenem 2 g/vaborbactam 2 g) every 8 hr for up to 14 days.

Renal Impairment

IV (Adults): *eGFR 30–49 mL/min*—2 g (meropenem 1 g/vaborbactam 1 g) every 8 hr for up to 14 days; *eGFR 15–29 mL/min*—2 g (meropenem 1 g/vaborbactam 1 g) every 12 hr for up to 14 days; *eGFR <15 mL/min*—1 g (meropenem 0.5 g/vaborbactam 0.5 g) every 12 hr for up to 14 days.

Availability

Powder for injection (requires reconstitution and dilution): 2 g/vial (1 g meropenem/1 g vaborbactam).

NURSING IMPLICATIONS

Assessment

- Assess for infection (vital signs; appearance of wound, sputum, urine, and stool; WBC) at beginning of and throughout therapy.
- Obtain a history before initiating therapy to determine previous use of and reactions to penicillins. Persons with a negative history of penicillin sensitivity may still have an allergic response.
- Obtain specimens for culture and sensitivity prior to initiating therapy. First dose may be given before receiving results.
- Monitor bowel function. Diarrhea, abdominal cramping, fever, and bloody stools should be reported to health care professional promptly as a sign of Clostridioides difficile-associated diarrhea (CDAD). May begin up to several wk following cessation of therapy.
- Observe for signs and symptoms of anaphylaxis (rash, pruritus, laryngeal edema, wheezing). Discontinue the drug and notify health care professional immediately if these symptoms occur. Have epinephrine, an antihistamine, and resuscitative equipment close by in the event of an anaphylactic reaction.
- ***Lab Test Considerations:*** May cause hyperkalemia, hyperglycemia, and hypoglycemia.

Implementation

- **Intermittent Infusion:** ***Reconstitution:*** Reconstitute each vial with 20 mL 0.9% NaCl withdrawn from infusion bag. Mix gently to dissolve. ***Dilution:*** Dilute further in 250 mL to 1000 mL infusion bag of 0.9% NaCl. ***Concentration:*** 2 mg/mL to 16 mg/mL. Solution is clear to light yellow; do not infuse solutions that are discolored or contain particulate matter. Infusion must be completed within 4 hrs if stored at room temperature or 22 hrs if refrigerated. ***Rate:*** Infuse over 3 hrs.

Patient/Family Teaching

- Advise patient to report the signs of superinfection (black, furry overgrowth on the tongue; vaginal itching or discharge; loose or foul-smelling stools) and allergy.
- May cause seizures, delirium, headaches, and/or paresthesias. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Caution patient to notify health care professional if fever and diarrhea occur, especially if stool contains blood, pus, or mucus. Advise patient not to treat diarrhea without consulting health care professional. May occur up to several wk after discontinuation of medication.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products

© F.A. Davis Publishing

being taken and to consult with health care professional before taking other medications.
- Advise female patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding.

Evaluation/Desired Outcomes

- Resolution of the signs and symptoms of infection. Length of time for complete resolution depends on the organism and site of infection.

mesalamine (me-**sal**-a-meen)
Apriso, ~~Asacol~~, Asacol, Asacol 800, Asacol HD, Canasa, Delzicol, Lialda, Mezavant, Mezera, Pentasa, Rowasa, Salofalk, Teva 5–ASA

Classification
Therapeutic: gastrointestinal anti-inflammatories

Indications

Delzicol, Lialda, and Pentasa: Treatment and maintenance of remission of mildly-to-moderately-active ulcerative colitis. **Apriso:** Maintenance of remission of ulcerative colitis. **Asacol HD:** Treatment of moderately-active ulcerative colitis. **Canasa**: Treatment of active ulcerative proctitis. **Rowasa**: Treatment of active mild-to-moderate distal ulcerative colitis, proctosigmoiditis, or proctitis.

Action

Locally acting anti-inflammatory action in the colon, where activity is probably due to inhibition of prostaglandin synthesis. **Therapeutic Effects:** Reduction in the symptoms of ulcerative colitis, proctosigmoiditis, and proctitis.

Pharmacokinetics

Absorption: 28% absorbed following oral administration; 10–30% absorbed from the colon, depending on retention time, following rectal administration.
Distribution: Unknown.
Metabolism and Excretion: Some metabolism occurs, site unknown; mostly eliminated unchanged in the feces.
Half-life: *Oral*—12 hr (range 2–15 hr); *Rectal*—0.5–1.5 hr.

TIME/ACTION PROFILE (clinical improvement)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	unknown	6–8 hr
ER	2 hr	9–12 hr	24 hr
Rectal	3–21 days	unknown	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity reactions to sulfonamides, salicylates, mesalamine, or sulfasalazine; Cross-sensitivity with furosemide, sulfonylureas, or carbonic anhydrase inhibitors may exist; Hypersensitivity to bisulfites (mesalamine enema only); Urinary tract or intestinal obstruction; Porphyria.
Use Cautiously in: Hepatic or renal impairment; Atopic dermatitis or atopic eczema (↑ risk of photosensitivity); Phenylketonuria (Apriso contains phenylalanine); OB: Use tablets only if potential benefits justify potential fetal risks (enteric coating contains dibutyl phthalate, which has been shown to cause congenital malformations in animals); Lactation: Use while breast feeding only if potential maternal benefits justify potential risk to infant; Geri: Older adults may have ↑ risk of agranulocytosis, neutropenia, and pancytopenia.

Adverse Reactions/Side Effects

CV: pericarditis. **Derm:** DRUG REACTION WITH EOSINOPHILIA AND SYSTEMATIC SYMPTOMS (DRESS), STEVENS-JOHNSON SYNDROME (SJS), hair loss, photosensitivity, rash. **EENT:** pharyngitis, rhinitis. **GI:** HEPATOTOXICITY, diarrhea, eructation (PO), flatulence, nausea, pancreatitis, vomiting. **GU:** interstitial nephritis, nephrolithiasis, renal failure. **Local:** anal irritation (enema, suppository). **MS:** back pain, myalgia. **Neuro:** headache, dizziness, malaise, weakness.. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), acute intolerance syndrome, fever.

Interactions

Drug-Drug: May ↑ myelosuppressive effects of **mercaptopurine** or **azathioprine**; avoid concurrent use, if possible. Concurrent use with **NSAIDs** may ↑ risk of nephrotoxicity.

Route/Dosage

One Asacol HD 800-mg tablet is NOT bioequivalent to two Delzicol 400-mg capsules.

Treatment of Ulcerative Colitis

PO (Adults): *Delzicol*—800 mg (two 400-mg capsules) 3 times daily for 6 wk; *Asacol HD*—1.6 g (two 800-mg tablets) 3 times daily for 6 wk; *Lialda*—2.4–4.8 g (two to four 1.2-g tablets) once daily for up to 8 wk; *Pentasa*—1 g (four 250-mg capsules or two 500-mg capsules) 4 times daily for up to 8 wk.
Rect (Adults): *Rowasa*—4-g enema (60 mL) at bedtime, retained for 8 hr for 3–6 wk.
PO (Children ≥12 yr and 54–90 kg): *Delzicol*—27–44 mg/kg/day in 2 divided doses (max dose = 2.4 g/day) for 6 wk.
PO (Children ≥12 yr and 33–53 kg): *Delzicol*—37–61 mg/kg/day in 2 divided doses (max dose = 2 g/day) for 6 wk.
PO (Children ≥12 yr and 17–32 kg): *Delzicol*—36–71 mg/kg/day in 2 divided doses (max dose = 1.2 g/day) for 6 wk.
PO (Children >50 kg): *Lialda*—4.8 g (four 1.2-g tablets) once daily for 8 wk, then 2.4 g (two 1.2–g tablets) once daily.

© F.A. Davis Publishing

PO (Children 36–50 kg): *Lialda*—3.6 g (three 1.2-g tablets) once daily for 8 wk, then 2.4 g (two 1.2–g tablets) once daily.
PO (Children 24–35 kg): *Lialda*—2.4 g (two 1.2-g tablets) once daily for 8 wk, then 1.2 g once daily.

Maintenance of Remission of Ulcerative Colitis

PO (Adults): *Apriso*—1.5 g (four 375-mg capsules) once daily in the morning; *Delzicol*—800 mg (two 400-mg capsules) 2 times daily; *Lialda*—2.4 g (two 1.2-g tablets) once daily; *Pentasa*—1 g (four 250-mg capsules or two 500-mg capsules) 4 times daily.

Treatment of Ulcerative Proctosigmoiditis

Rect (Adults): *Rowasa*—4-g enema (60 mL) at bedtime, retained for 8 hr (treatment duration = 3–6 wk).

Treatment of Ulcerative Proctitis

Rect (Adults): *Rowasa*—4-g enema (60 mL) at bedtime, retained for 8 hr (treatment duration = 3–6 wk); *Canasa*—Insert a 1-g suppository at bedtime, retain for at least 1–3 hr (treatment duration = 3–6 wk).

Availability (generic available)

Delayed-release tablets: 400 mg, 500 mg, 800 mg (Asacol HD), 1 g, 1.2 g (Lialda). **Delayed-release capsules (Delzicol):** 400 mg. **Extended-release capsules (Apriso) (contain phenylalanine):** 375 mg. **Extended-release capsules (Pentasa):** 250 mg, 500 mg. **Rectal enema (Rowasa):** 1 g/100 mL, 2 g/60 mL, 4 g/60 mL, 4 g/100 mL. **Rectal foam:** 1 g/actuation. **Rectal suppository (Canasa):** 500 mg, 1 g.

NURSING IMPLICATIONS

Assessment

- Assess abdominal pain and frequency, quantity, and consistency of stools at the beginning of and during therapy.
- Assess for allergy to sulfonamides and salicylates. Patients allergic to sulfasalazine may take mesalamine or olsalazine without difficulty, but therapy should be discontinued if rash or fever occurs.
- Monitor intake and output ratios. Fluid intake should be sufficient to maintain a urine output of at least 1200–1500 mL daily to prevent crystalluria and stone formation.
- Monitor for signs and symptoms of acute intolerance syndrome (cramping, acute abdominal pain and bloody diarrhea, sometimes fever, headache, rash) during therapy; may be difficult to distinguish from an exacerbation of ulcerative colitis. If syndrome occurs, promptly discontinue therapy.
- ***Lab Test Considerations:*** Monitor urinalysis, BUN, and serum creatinine prior to and periodically during therapy. Mesalamine may cause renal toxicity.
- Mesalamine may cause ↑ AST and ALT levels, serum alkaline phosphatase, GGT, LDH, amylase, and lipase.

Implementation

- Do not confuse Asacol (mesalamine) with Os-Cal (calcium carbonate).
- **PO:** Administer with a full glass of water. ***DNC:*** Swallowed tablets whole; do not break the outer coating, which is designed to remain intact. Take *Lialda* tablets with a meal. Take *Apriso* capsules in the morning without regard to meals. Do not coadminister with antacids; may affect dissolution of the coating of the granules in *Apriso* capsules. Intact or partially intact tablets may occasionally be found in the stool. If this occurs repeatedly, advise patient to notify health care professional. ***DNC:*** Swallow *Delzicol* capsules whole; do not break, crush, or chew. Administer without regard to meals. If unable to swallow capsules, may open capsule and swallow inner tablets. Intact or partially intact tablets may occasionally be found in the stool. If this occurs repeatedly, advise patient to notify health care professional. Two *Delzicol* 400-mg capsules are not equal to one *Asacol HD* (mesalamine) delayed-release 800-mg tablet. *Pentasa* capsules may be swallowed whole or opened and sprinkled onto applesauce or yogurt. Consume entire contents immediately. ***DNC:*** Avoid crushing or chewing capsules and capsule contents.
- **Rect:** Patient should empty bowel prior to administration of rectal dose forms.
- Avoid excessive handling of *suppository*. Remove foil wrapper and insert pointed end first into rectum with gentle pressure. Do not cut or break suppository. Retain suppository for 1–3 hr or more for maximum benefit.
- Administer 60-mL retention enema once daily at bedtime. Solution should be retained for approximately 8 hr. Prior to administration of *rectal suspension*, shake bottle well and remove the protective cap. Have patient lie on left side with the lower leg extended and the upper leg flexed for support or place the patient in knee-chest position. Gently insert the applicator tip into the rectum, pointing toward the umbilicus. Squeeze the bottle steadily to discharge most of the preparation.

Patient/Family Teaching

- Instruct patient on the correct method of administration. Advise patient to take medication as directed, even if feeling better. Take missed doses as soon as remembered unless almost time for next dose. Advise patient to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Advise patient not to change brands of mesalamine without consulting health care professional.
- Encourage patient to drink an adequate amount of fluids to minimize risk of kidney stones and to notify

© F.A. Davis Publishing

health care professional if signs and symptoms of kidney stones (severe side or back pain, blood in urine) occur.
- May cause dizziness. Caution patient to avoid driving or other activities that require alertness until response to medication is known.
- Advise patient to notify health care professional if skin rash, sore throat, fever, mouth sores, unusual bleeding or bruising, wheezing, fever, or hives occur.
- Advise patient to avoid sun exposure, wear protective clothing, and use a broad-spectrum sunscreen when outdoors to decrease risk of photosensitivity.
- Instruct patient to notify health care professional if symptoms do not improve after 1–2 mo of therapy.
- Instruct patient to notify health care professional if symptoms worsen or do not improve. If symptoms of acute intolerance (cramping, acute abdominal pain, bloody diarrhea, fever, headache, rash) occur, discontinue therapy and notify health care professional immediately.
- Inform patient that proctoscopy and sigmoidoscopy may be required periodically during treatment to determine response.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Monitor breast-fed infants for diarrhea.
- **Rect:** Instruct patient to use *rectal suspension* at bedtime and retain suspension all night for best results.

Evaluation/Desired Outcomes
- Decrease in diarrhea and abdominal pain.
- Return to normal bowel pattern in patients with inflammatory bowel disease. Effects may be seen within 3–21 days. The usual course of therapy is 3–6 wk.
- Maintenance of remission in patients with inflammatory bowel disease.

mesna (**mes**-na)
Mesnex, Uromitexan

Classification
Therapeutic: antidotes
Pharmacologic: ifosfamide detoxifying agents

Indications
Prevention of ifosfamide-induced hemorrhagic cystitis (see Ifosfamide monograph). **Unlabeled Use:** May also prevent hemorrhagic cystitis from cyclophosphamide.

Action
Binds to the toxic metabolites of ifosfamide in the kidneys. **Therapeutic Effects:** Prevents hemorrhagic cystitis from ifosfamide.

Pharmacokinetics
Absorption: IV administration results in complete bioavailability; 45–79% absorbed after oral administration. Following IV with PO dosing ↑ systemic exposure.
Distribution: Unknown.
Metabolism and Excretion: Rapidly converted to mesna disulfide, then back to mesna in the kidneys, where it binds to toxic metabolites of ifosfamide (18–26% excreted as free mesna in urine after IV and PO dosing).
Half-life: *Mesna*—0.36 hr (IV); 1.2—8.3 hr (IV followed by PO); *mesna disulfide*—1.17 hr.

TIME/ACTION PROFILE (detoxifying action)

ROUTE	ONSET	PEAK	DURATION
PO, IV	rapid	unknown	4 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity to mesna or other thiol (rubber) compounds; Lactation: Lactation (may cause harm to infant).
Use Cautiously in: OB: Safety not established; Pedi: Injection contains benzyl alcohol which can cause potentially fatal "gasping syndrome" in neonates.

Adverse Reactions/Side Effects
Derm: flushing. **GI:** anorexia, diarrhea, nausea, unpleasant taste, vomiting. **Local:** injection site reactions. **Neuro:** dizziness, drowsiness, headache. **Misc:** flu-like symptoms.

Interactions
Drug-Drug: None significant.

Route/Dosage
IV (Adults): Give a dose of mesna equal to 20% of the ifosfamide dose at the same time as ifosfamide and 4 and 8 hr after.
PO, IV (Adults): Give a dose of IV mesna equal to 20% of the ifosfamide dose at the same time as ifosfamide; then give PO mesna equal to 40% of the ifosfamide dose 2 and 6 hr after ifosfamide (total mesna dose is 100% of ifosfamide dose).

Availability (generic available)
Solution for injection (requires dilution): 100 mg/mL. **Tablets:** 400 mg.

NURSING IMPLICATIONS
Assessment
- Monitor for development of hemorrhagic cystitis in patients receiving ifosfamide.
- ***Lab Test Considerations:*** Obtain a negative pregnancy test before starting when mesna is given with ifosfamide.
- Causes a false-positive result when testing urinary ketones.

Implementation
- Initial IV bolus is to be given at time of ifosfamide administration.
- **PO:** If second and third doses are given orally, administer 2 and 6 hr after IV dose.
- If PO mesna is vomited within 2 hr of administration, repeat dose or use IV mesna.

© F.A. Davis Publishing

IV Administration

- **Intermittent Infusion:** 2nd IV dose is given 4 hr later, 3rd dose is given 8 hr after initial dose. This schedule must be repeated with each subsequent dose of ifosfamide. ***Dilution:*** Dilute 2-, 4-, and 10-mL ampules, containing a concentration of 100 mg/mL in 8 mL, 16 mL, or 50 mL, respectively, of D5W, 0.9% NaCl, D5/0.9% NaCl, D5/0.2% NaCl, D5/0.33% NaCl, or LR. ***Concentration:*** 20 mg/mL. Refrigerate to store. Use within 6 hr. Discard unused solution. ***Rate:*** Administer over 15–30 min or as a continuous infusion.
- **Syringe Compatibility:** ifosfamide.
- **Y-Site Compatibility:** alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium acetate, calcium chloride, calcium gluconate, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cladribine, clindamycin, cyclophosphamide, cytarabine, dactinomycin, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hetastarch, hydralazine, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, methotrexate, methyldopate, methylprednisolone, metoclopramide, metoprolol, metronidazole, micafungin, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, nalbuphine, naloxone, nitroglycerin, norepinephrine, octreotide, ondansetron, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, pentamidine, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, sufentanil, tacrolimus, theophylline, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.
- **Y-Site Incompatibility:** acyclovir, amphotericin B deoxycholate, amphotericin B lipid complex, dacarbazine, dantrolene, diazepam, fenoldopam, ganciclovir, nicardipine, nitroprusside, phenytoin, quinupristin/dalfopristin, thiopental.

Patient/Family Teaching

- Inform patient that unpleasant taste may occur during administration.
- Advise patient to notify health care professional if nausea, vomiting, or diarrhea persists or is severe.
- Rep: Advise female patients of reproductive potential to use effective contraception during and for 6 mo after last dose and to avoid breast feeding during and for 1 wk after last dose of mesna. Advise males with female partners of reproductive potential to use effective contraception during and for 3 mo after last dose. Advise patient to notify health care professional immediately if pregnancy is suspected.

Evaluation/Desired Outcomes

- Prevention of hemorrhagic cystitis associated with ifosfamide therapy.

mestranol/norethindrone, See CONTRACEPTIVES, HORMONAL.

metFORMIN (met-for-min)

~~Glucophage~~, ~~Glucophage XR~~, Glumetza, Glycon, Riomet, ~~Riomet ER~~

Classification

Therapeutic: antidiabetics
Pharmacologic: biguanides

Indications

Management of type 2 diabetes mellitus; may be used with diet, insulin, or sulfonylurea oral hypoglycemics.

Action

Decreases hepatic glucose production. Decreases intestinal glucose absorption. Increases sensitivity to insulin.

Therapeutic Effects: Maintenance of blood glucose.

Pharmacokinetics

Absorption: 50–60% absorbed after oral administration.

Distribution: Enters breast milk in concentrations similar to plasma.

Metabolism and Excretion: Eliminated almost entirely unchanged by the kidneys.

Half-life: 17.6 hr.

© F.A. Davis Publishing

TIME/ACTION PROFILE (blood levels)

ROUTE	ONSET	PEAK	DURATION
PO-IR	unknown	unknown	12 hr
PO-ER	unknown	4–8 hr	24 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Metabolic acidosis (including diabetic ketoacidosis); Severe renal impairment (CCr <30 mL/min); Iodinated contrast imaging procedure in patients with CCr 30–60 mL/min, a history of liver disease, alcoholism or heart failure, or in those who will be administered intra-arterial iodinated contrast (discontinue metformin and reevaluate renal function 48 hr after imaging procedure; may restart therapy if renal function stable); Hepatic impairment.

Use Cautiously in: Mild to moderate renal impairment (initiation of therapy not recommended if CCr 30–45 mL/min; if CCr becomes <45 mL/min during therapy, assess risk-to-benefit of continuing therapy); Chronic alcohol use/abuse; Hypoxic states (acute HF, shock, MI, sepsis; discontinue metformin); Surgery (temporarily discontinue metformin when food and/or fluid intake is restricted); Pituitary deficiency or hyperthyroidism; OB, Lactation, Pedi: Pregnancy, lactation, or children <10 yr (safety not established; extended release for use in patients >17 yr only); Geri: May be at ↑ risk of lactic acidosis .

Adverse Reactions/Side Effects

F and E: LACTIC ACIDOSIS. **GI:** abdominal bloating, diarrhea, nausea, vomiting, unpleasant metallic taste. **Hemat:** ↓ vitamin B_{12} levels.

Interactions

Drug-Drug: Acute or chronic **alcohol** ingestion or **iodinated contrast media** ↑ risk of lactic acidosis. **Amiloride**, **digoxin**, **morphine**, **procainamide**, **quinidine**, **triamterene**, **trimethoprim**, **calcium channel blockers**, and **vancomycin** may compete for elimination pathways with metformin. Altered responses may occur. **Cimetidine** and **furosemide** may ↑ effects of metformin. **Nifedipine** ↑ absorption and effects.

Drug-Natural Products: Glucosamine may worsen blood glucose control. **Chromium** and **coenzyme Q-10** may produce ↑ hypoglycemic effects.

Route/Dosage

PO (Adults): 500 mg twice daily; may ↑ by 500 mg at weekly intervals up to 2000 mg/day. If doses >2000 mg/day are required, give in 3 divided doses (not to exceed 2500 mg/day) or 850 mg once daily; may ↑ by 850 mg at 2-wk intervals (in divided doses) up to 2550 mg/day in divided doses (up to 850 mg 3 times daily); *Extended-release tablets*— 500 mg once daily with evening meal, may ↑ by 500 mg at weekly intervals up to 2000 mg once daily.

PO (Children 10–17 yr): 500 mg twice daily, may be ↑ by 500 mg/day at 1-wk intervals, up to 2000 mg/day in 2 divided doses.

Availability (generic available)

Immediate-release tablets: 500 mg, 850 mg, 1000 mg. **Cost:** *Generic*— 500 mg $6.99/100, 850 mg $7.18/100, 1000 mg $7.01/100. **Extended-release tablets (Glucophage XR, Glumetza):** 500 mg, 750 mg, 1000 mg. **Cost:** *Generic*— 500 mg $74.50/100, 750 mg $119.70/100. **Oral solution (Riomet) (cherry flavor):** 500 mg/5 mL. **Cost:** $59.30/118 mL. ***In combination with:*** alogliptin (Kazano); canagliflozin (Invokamet, Invokamet XR); dapagliflozin (Xigduo XR); empagliflozin (Synjardy); empagliflozin and linagliptin (Trijardy XR); glipizide (Metaglip); glyburide (Glucovance); linagliptin (Jentadueto, Jentadueto XR); pioglitazone (Actoplus Met); repaglinide (PrandiMet); rosiglitazone (generic only); saxagliptin (Kombiglyze XR); and sitagliptin (Janumet, Janumet XR). See Appendix N.

NURSING IMPLICATIONS

Assessment

- When combined with oral sulfonylureas, observe for signs and symptoms of hypoglycemic reactions (abdominal pain, sweating, hunger, weakness, dizziness, headache, tremor, tachycardia, anxiety).
- Patients who have been well controlled on metformin who develop illness or laboratory abnormalities should be assessed for ketoacidosis or lactic acidosis. Assess serum electrolytes, ketones, glucose, and, if indicated, blood pH, lactate, pyruvate, and metformin levels. If either form of acidosis is present, discontinue metformin immediately and treat acidosis. Patients with severe renal impairment are at greatest risk for lactic acidosis.
- ***Lab Test Considerations:*** Monitor serum glucose and glycosylated hemoglobin periodically during therapy to evaluate effectiveness of therapy. May cause false-positive results for urine ketones.
- Assess renal function before initiating and at least annually during therapy. Monitor patients at risk for renal impairment (e.g., elderly) more frequently. Discontinue metformin if renal impairment occurs.
- Monitor serum folic acid and vitamin B_{12} every 1–2 yr in long-term therapy. Metformin may interfere with absorption.

Implementation

- Do not confuse metformin with metronidazole.
- Patients stabilized on a diabetic regimen who are exposed to stress, fever, trauma, infection, or surgery may require administration of insulin. Withhold metformin and reinstitute after resolution of acute episode.
- Temporarily discontinue metformin in patients requiring surgery involving restricted intake of food and fluids. Resume metformin when oral intake has resumed and renal function is normal.
- Hold metformin before or at the time of studies requiring IV administration of iodinated contrast media and for 48 hr after study.

© F.A. Davis Publishing

- **PO:** Administer metformin with meals to minimize GI effects.
- ***DNC:*** XR tablets must be swallowed whole; do not crush, dissolve, or chew. Administer *Glumetza* with the evening meal.

Patient/Family Teaching

- Instruct patient to take metformin at the same time each day, as directed. Take missed doses as soon as possible unless almost time for next dose. Do not double doses. Instruct parent/caregiver to read the *Medication Guide* prior to use and with each Rx refill; new information may be available.
- Explain to patient that metformin helps control hyperglycemia but does not cure diabetes. Therapy is usually long term.
- Encourage patient to follow prescribed diet, medication, and exercise regimen to prevent hyperglycemic or hypoglycemic episodes.
- Review signs of hypoglycemia and hyperglycemia with patient. If hypoglycemia occurs, advise patient to take a glass of orange juice or 2–3 tsp of sugar, honey, or corn syrup dissolved in water, and notify health care professional.
- Instruct patient in proper testing of blood glucose and urine ketones. These tests should be monitored closely during periods of stress or illness and health care professional notified if significant changes occur.
- Explain to patient the risk of lactic acidosis and the potential need for discontinuation of metformin therapy if a severe infection, dehydration, or severe or continuing diarrhea occurs or if medical tests or surgery is required. Symptoms of lactic acidosis (chills, diarrhea, dizziness, low BP, muscle pain, abdominal pain, sleepiness, slow heartbeat or pulse, dyspnea, or weakness) should be reported to health care professional immediately.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications or alcohol.
- Inform patient that metformin may cause an unpleasant or metallic taste that usually resolves spontaneously.
- Inform patients taking XR tablets that inactive ingredients resembling XR tablet may appear in stools.
- Advise patient to inform health care professional of medication regimen before treatment or surgery.
- Advise patient to report the occurrence of diarrhea, nausea, vomiting, and stomach pain or fullness to health care professional.
- Advise patient to carry a form of sugar (sugar packets, candy) and identification describing disease process and medication regimen at all times.
- Rep: Insulin is the recommended method of controlling blood glucose during pregnancy. Advise females of reproductive potential to notify health care professional promptly if pregnancy is planned or suspected, or if breast feeding. Caution patient that metformin may result in ovulation in some anovulatory women leading to unintended pregnancy.
- Emphasize the importance of routine follow-up exams and regular testing of blood glucose, glycosylated hemoglobin, renal function, and hematologic parameters.

Evaluation/Desired Outcomes

- Control of blood glucose levels without the appearance of hypoglycemic or hyperglycemic episodes. Control may be achieved within a few days, but full effect of therapy may be delayed for up to 2 wk. If patient has not responded to metformin after 4 wk of maximum dose therapy, an oral sulfonylurea may be added. If satisfactory results are not obtained with 1–3 mo of concurrent therapy, oral agents may be discontinued and insulin therapy instituted.

M

REMS HIGH ALERT

methadone (meth-a-done)

~~Dolophine~~, Metadol, Metadol-D, Methadose

Classification

Therapeutic: opioid analgesics
Pharmacologic: opioid agonists

Schedule II

Indications

Moderate to severe chronic pain in opioid-tolerant patients requiring use of daily, around-the-clock long-term opioid treatment and for which alternative treatment options are inadequate (extended-release). Detoxification and maintenance therapy for opioid use disorder. **Unlabeled Use:** Neonatal abstinence syndrome.

Action

Binds to opiate receptors in the CNS. Alters the perception of and response to painful stimuli, while producing generalized CNS depression. **Therapeutic Effects:** Decrease in severity of pain. Suppression of withdrawal symptoms during detoxification and maintenance from heroin and other opioids.

Pharmacokinetics

Absorption: Well absorbed from all sites (50% absorbed following oral administration). IV administration results in complete bioavailability.
Distribution: Widely distributed. Crosses the placenta; enters breast milk.
Protein Binding: 85–90%.

© F.A. Davis Publishing

Metabolism and Excretion: Mostly metabolized by the liver; some metabolites are active and may accumulate with chronic administration.
Half-life: 15–25 hr; ↑ with chronic use.

TIME/ACTION PROFILE (analgesic effect)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	90–120 min	4–12 hr
IM, IV, subcut	10–20 min	60–120 min	8–12 hr

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Significant respiratory depression; Acute or severe bronchial asthma; Paralytic ileus; Known alcohol intolerance (some oral solutions); Concurrent MAO inhibitor therapy.
Use Cautiously in: Structural heart disease, concomitant diuretic use, hypokalemia, hypomagnesemia, history of arrhythmia/syncope, or other risk factors for arrhythmias; Concurrent use of drugs that prolong the QTc interval or are CYP3A4 inhibitors; Head trauma; Seizure disorders; ↑ intracranial pressure; Severe renal, hepatic, or pulmonary disease; Hypothyroidism; Adrenal insufficiency; Alcoholism; Undiagnosed abdominal pain; Prostatic hyperplasia or ureteral stricture; OB: Use with addiction control: weigh risk against potential for illicit drug use. Counsel mother about potential harm to fetus. Prolonged use of methadone during pregnancy can result in neonatal opioid withdrawal syndrome; Lactation: May lead to excessive sedation or respiratory depression in infant. Use while breast feeding only if potential maternal benefit justifies potential risk to infant; Geri: ↑ risk of respiratory depression (dose ↓ suggested).

Adverse Reactions/Side Effects

CV: TORSADES DE POINTES, hypotension, bradycardia, QT interval prolongation. **Derm:** flushing, sweating. **EENT:** blurred vision, diplopia, miosis. **Endo:** adrenal insufficiency. **GI:** constipation, nausea, vomiting. **GU:** urinary retention. **Neuro:** confusion, sedation, dizziness, dysphoria, euphoria, floating feeling, hallucinations, headache, unusual dreams. **Resp:** RESPIRATORY DEPRESSION (including central sleep apnea and sleep-related hypoxemia). **Misc:** physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Use with extreme caution in patients receiving **MAO inhibitors** (may result in severe, unpredictable reactions—↓ initial dose of methadone to 25% of usual dose). Use with extreme caution with any drug known to potentially prolong QT interval, including **class I and III antiarrhythmics**, some **neuroleptics** and **tricyclic antidepressants**, and **calcium channel blockers**. Use with extreme caution with CYP3A4 inhibitors, including **ketoconazole**, **itraconazole**, **erythromycin**, **clarithromycin**, **calcium channel blockers**, or **voriconazole**. Concurrent use with **laxatives**, **diuretics**, or **mineralocorticoids** may ↑ risk of hypomagnesemia or hypokalemia and ↑ risk of arrhythmias. Drugs that affect serotonergic neurotransmitter systems, including **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **MAO inhibitors**, **TCAs**, **tramadol**, **trazodone**, **mirtazapine**, **5–HT_3 receptor antagonists**, **linezolid**, **methylene blue**, and **triptans** ↑ risk of serotonin syndrome. Concurrent use of **CYP3A4 inhibitors**, **CYP2C9 inhibitors**, **CYP2C19 inhibitors**, or **CYP2D6 inhibitors** including **ritonavir**, **ketoconazole**, **itraconazole**, **fluconazole**, **clarithromycin**, **erythromycin**, **nefazodone**, **diltiazem**, **verapamil**, **nelfinavir**, **fosamprenavir**, and **fluvoxamine** ↑ levels and risk of opioid toxicity; careful monitoring during initiation, dose changes, or discontinuation of the inhibitor is recommended. Concurrent use with **CYP3A4 inducers**, **CYP2C9 inducers**, or **CYP2C19 inducers** including **barbiturates**, **carbamazepine**, **efavirenz**, **corticosteroids**, **modafinil**, **nevirapine**, **oxcarbazepine**, **phenobarbital**, **phenytoin**, **rifabutin**, or **rifampin** may ↓ levels and analgesia; if inducers are discontinued or dosage ↓, patients should be monitored for signs of opioid toxicity and necessary dose adjustments should be made. Use with **benzodiazepines** or other **CNS depressants** including other **opioids**, **non-benzodiazepine sedative/hypnotics**, **anxiolytics**, **general anesthetics**, **muscle relaxants**, **antipsychotics**, and **alcohol** may cause profound sedation, respiratory depression, coma, and death; reserve concurrent use for when alternative treatment options are inadequate. Administration of **agonist/antagonist opioids** may precipitate opioid withdrawal in physically dependent patients. **Nalbuphine** may ↓ analgesia. **Interferons (alpha)** may ↓ metabolism and ↑ effects. May ↑ blood levels and effects of **zidovudine** and **desipramine**. May ↓ level and effects of **didanosine** and **stavudine**. Concurrent abuse of methadone with **benzodiazepines** has resulted in death. **Mixed agonist/antagonist analgesics**, including **nalbuphine** or **butorphanol** and **partial agonist analgesics**, including **buprenorphine**, may ↓ methadone's analgesic effects and/or precipitate opioid withdrawal in physically dependent patients.
Drug-Natural Products: **St. John's wort** ↑ metabolism and ↓ blood levels, concurrent use may result in withdrawal. **Kava-kava**, **valerian**, or **chamomile** can ↑ CNS depression.

Route/Dosage

Moderate-to-Severe Pain

PO (Adults and Children ≥50 kg): *Usual starting dose for moderate to severe pain in opioid-naive patients*—2.5 mg every 8–12 hr;.
PO (Adults and Children <50 kg): 0.1 mg/kg/dose every 4 hr for 2–3 doses then every 6–8 hr prn; maximum: 10 mg/dose.
PO, IV (Neonates): Initial 0.05–0.2 mg/kg/dose every 12–24 hr or 0.5 mg/kg/day divided every 8 hr; taper dose by 10–20% per wk over 1–1.5 mo.

© F.A. Davis Publishing

IV, IM, Subcut (Adults and Children ≥50 kg): 10 mg every 6–8 hr.
IV, IM, Subcut (Adults and Children <50 kg): 0.1 mg/kg every 6–8 hr; maximum: 10 mg/dose.

Opioid Detoxification

PO (Adults and Children ≥50 kg): 15–40 mg once daily or amount needed to prevent withdrawal. Dose may be ↓ every 1–2 days; maintenance dose is determined on an individual basis.
PO (Adults and Children <50 kg): 0.05–0.1 mg/kg/dose every 6 hr; ↑ by 0.05 mg/kg/dose until withdrawal symptoms controlled; after 1–2 days lengthen dosing interval to every 12–24 hr; taper by ↓ dose by 0.05 mg/kg/day.
IV, IM, Subcut (Adults and Children ≥50 kg): 15–40 mg once daily or amount needed to prevent withdrawal. Dose may be ↓ every 1–2 days; maintenance dose is determined on an individual basis.

Availability (generic available)

Tablets: 1 mg, 5 mg, 10 mg, 25 mg. **Oral concentrate (cherry and unflavored):** 10 mg/mL. **Oral solution (contains alcohol) (citrus):** 5 mg/5 mL, 10 mg/5 mL. **Solution for injection:** 10 mg/mL. **Tablets for oral suspension:** 40 mg (available only to licensed detoxification/maintenance programs).

NURSING IMPLICATIONS

Assessment

- **Pain:** Assess type, location, and intensity of pain prior to and 1–2 hr (peak) following administration. When titrating opioid doses, increases of 25–50% should be administered until there is either a 50% reduction in the patient's pain rating on a numeric or visual analogue scale or the patient reports satisfactory pain relief. Dose increases should be made no more frequently than every 3–5 days because of variability in half-life between patients. Cumulative effects of this medication may require periodic dose adjustments.
- Doses of methadone for patients on methadone maintenance only prevent withdrawal symptoms; *no analgesia is provided*. Additional opioid doses are required for treatment of pain.
- An equianalgesic chart (see Appendix I) should be used when changing routes or when changing from one opioid to another.
- Assess BP, pulse, and respirations before and periodically during administration. If respiratory rate is <10/min, assess level of sedation. Dose may need to be decreased by 25–50%. Initial drowsiness will diminish with continued use. Monitor for respiratory depression, especially during initiation or following dose increase; serious, life-threatening, or fatal respiratory depression may occur. May cause sleep-related breathing disorders (central sleep apnea [CSA], sleep-related hypoxemia).
- Assess bowel function routinely. Prevention of constipation should be instituted with increased intake of fluids and bulk and with laxatives to minimize constipating effects. Stimulant laxatives should be administered routinely if opioid use exceeds 2–3 days, unless contraindicated. Consider drugs for opioid induced constipation.
- Prolonged use may lead to physical and psychological dependence and tolerance. This should not prevent patient from receiving adequate analgesia. Patients who receive methadone for pain rarely develop psychological dependence. Progressively higher doses may be required to relieve pain with long-term therapy.
- Assess for history of structural heart disease, arrhythmia, and syncope. Obtain a pretreatment ECG to measure QTc interval and follow-up ECG within 30 days and annually. Additional ECGs recommended if dose >100 m g/day or if patients have unexplained syncope or seizures. If QTc interval is >450 ms but <500 ms, discuss potential risks and benefits with patients and monitor more frequently. If the QTc interval >500 ms, consider discontinuing or reducing dose; eliminating contributing factors (drugs that promote hypokalemia) or using an alternative therapy.
- Assess risk for opioid addiction, abuse, or misuse prior to administration. Abuse or misuse by crushing, chewing, snorting, or injecting dissolved product will result in uncontrolled delivery of methadone and can result in overdose and death.
- **Opioid Detoxification:** Assess patient for signs of opioid withdrawal (irritability, runny nose and eyes, abdominal cramps, body aches, sweating, loss of appetite, shivering, unusually large pupils, trouble sleeping, weakness, yawning). Methadone maintenance is undertaken only by federally approved treatment centers. This does not preclude maintenance for addicts hospitalized for other conditions and who require temporary maintenance during their care.
- ***Lab Test Considerations:*** May ↑ plasma amylase and lipase levels.
- ***Toxicity and Overdose:*** If an opioid antagonist is required to reverse respiratory depression or coma, naloxone is the antidote. Dilute the 0.4-mg ampule of naloxone in 10 mL of 0.9% NaCl and administer 0.5 mL (0.02 mg) by IV push every 2 min. For children and patients weighing <40 kg, dilute 0.1 mg of naloxone in 10 mL of 0.9% NaCl for a concentration of 10 mcg/mL and administer 0.5 mcg/kg every 2 min. Titrate dose to avoid withdrawal, seizures, and severe pain.

Implementation

- ***High Alert:*** Do not confuse methadone with dexmethylphenidate, ketorolac, memantine, Mephyton (phytonadione), methylphenidate, or metolazone.

© F.A. Davis Publishing

- When used for the treatment of opioid addiction in detoxification or maintenance programs, methadone is dispensed only by opioid treatment programs certified by the Substance Abuse and Mental Health Services Administration approved by the designated state authority.
- Explain therapeutic value of medication prior to administration to enhance the analgesic effect.
- Regularly administered doses may be more effective than prn administration. Analgesic is more effective if administered before pain becomes severe. For patients in chronic severe pain, the oral solution containing 5 or 10 mg/5 mL is recommended on a fixed dose schedule.
- Coadministration with nonopioid analgesics may have additive analgesic effects and may permit lower doses.
- Avoid the use of mixed agonist/antagonist (nalbuphine, butorphanol) or partial agonist (buprenorphine) analgesics in patients taking methadone.
- Medication should be discontinued gradually after long-term use to prevent withdrawal symptoms. For patients on long-acting agents who are physically opioid-dependent, initiate the taper by a small enough increment (less than 10% of total daily dose) to avoid withdrawal symptoms, and proceed with dose-lowering at an interval of every 2 to 4 wk. Patients who have been taking opioids for briefer periods of time may tolerate a more rapid taper. Monitor frequently to manage pain and withdrawal symptoms (restlessness, lacrimation, rhinorrhea, yawning, perspiration, chills, myalgia, mydriasis, irritability, anxiety, backache, joint pain, weakness, abdominal cramps, insomnia, nausea, anorexia, vomiting, diarrhea, or increased blood pressure, respiratory rate, or heart rate). If withdrawal symptoms occur, pause the taper for a period of time or raise the dose of opioid analgesic to the previous dose, and then proceed with a slower taper. Also, monitor patients for changes in mood, emergence of suicidal thoughts, or use of other substances. A multimodal approach to pain management may optimize the treatment of chronic pain, as well as assist with the successful tapering of the opioid analgesic.
- ***REMS:*** FDA strongly encourages health care professionals to complete a REMS-compliant education program that includes all the elements of the FDA Education *Blueprint for Health Care Providers Involved in the Management or Support of Patients with Pain,* available at www.fda.gov/OpioidAnalgesicREMSBlueprint. Information on programs can be found at 1-800-503-0784 or www.opioidanalgesicrems.com.
- Discuss availability of naloxone for emergency treatment of opioid overdose with the patient and caregiver and assess the potential need for access to naloxone, both when initiating and renewing therapy, especially if patient has household members (including children) or other close contacts at risk for accidental exposure or overdose. Consider prescribing naloxone, based on the patient's risk factors for overdose, such as concomitant use of CNS depressants, a history of opioid use disorder, or prior opioid overdose. However, the presence of risk factors for overdose should not prevent the proper management of pain in any patient.
- **PO:** Doses may be administered with food or milk to minimize GI irritation.
- Dilute each dose of 10 mg/mL oral concentrate with at least 30 mL of water or other liquid prior to administration.
- Diskettes (dispersible tablets) are to be dissolved and used for detoxification and maintenance treatment only. Available only to licensed detoxification/maintenance programs.
- **Subcut, IM:** IM is the preferred parenteral route for repeated doses. Subcut administration may cause tissue irritation.
- **IV Push:** Administer undiluted. ***Rate:*** Inject slowly.
- **Y-Site Compatibility:** amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, arsenic trioxide, atropine, azithromycin, aztreonam, bleomycin, bumetanide, busulfan, calcium chloride, calcium gluconate, carboplatin, carmustin, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, diazepam, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposome, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, eptifibatide, ertapenem, erythromycin, esmolol, esomeprazole, etoposide, etoposide phosphate, famotidine, fenoldopam, fluconazole, fludarabine, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, haloperidol, heparin, hydralazine, hydrocortisone, idarubicin, ifosfamide, imipenem/cilastatin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meropenem, mesna, methotrexate, methylprednisolone, metoclopramide, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, mycophenolate, nafcillin, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, pantoprazole, pemetrexed, phenobarbital, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin, rocu-

© F.A. Davis Publishing

ronium, sodium acetate, sodium bicarbonate, sodium phosphates, streptozocin, succinylcholine, tacrolimus, theophylline, thiotepa, tirofiban, tobramycin, topotecan, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** acyclovir, allopurinol, dantrolene, fluorouracil, ganciclovir, methohexital, pentobarbital, phenytoin, piperacillin/tazobactam, thiopental, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient on how and when to ask for and take pain medication.
- ***REMS:*** Instruct patient to take methadone exactly as directed. If dose is less effective after a few wk, do not increase dose without consulting health care professional. Discuss safe use, risks, and proper storage and disposal of opioid analgesics with patients and caregivers with each Rx. The Patient Counseling Guide (PCG) is available at www.fda.gov/OpioidAnalgesicREMSPCG.
- Advise patient that methadone is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- Educate patients and caregivers on how to recognize respiratory depression and emphasize the importance of calling 911 or getting emergency medical help right away in the event of a known or suspected overdose. Inform patients and caregivers about various ways to obtain naloxone as permitted by individual state naloxone dispensing and prescribing requirements or guidelines (by prescription, directly from a pharmacist, or as part of a community-based program).
- May cause drowsiness or dizziness. Advise patient to call for assistance when ambulating or smoking and to avoid driving or other activities requiring alertness until response to medication is known.
- Inform patient of the potential for arrhythmias and emphasize the importance of regular ECGs.
- Caution patient to notify health care professional if signs of overdose (difficult or shallow breathing, extreme tiredness or sleepiness, blurred vision, inability to think, talk, or walk normally, and feelings of faintness, dizziness, or confusion) occur. Methadone has a prolonged action causing increased risk of overdose.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Advise patient to tell health care professional what medications they are taking and to avoid taking new Rx, OTC, vitamins, or herbal products without consulting health care professional. Caution patient to avoid concurrent use of alcohol or other CNS depressants with this medication.
- Encourage patient to turn, cough, and breathe deeply every 2 hr to prevent atelectasis.
- Rep: Advise patient to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Inform patient of potential for neonatal opioid withdrawal syndrome with prolonged use during pregnancy. Monitor neonate for signs and symptoms of withdrawal symptoms (irritability, hyperactivity and abnormal sleep pattern, high pitched cry, tremor, vomiting, diarrhea, and/or failure to gain weight); usually occur the first days after birth. Monitor infants exposed to methadone through breast milk for excess sedation and respiratory depression. Chronic use may reduce fertility in females and males. During pregnancy, a woman's methadone dose may need to be increased or the dosing interval decreased due to increased clearance.

Evaluation/Desired Outcomes

- Decrease in severity of pain without a significant alteration in level of consciousness or respiratory status.
- Prevention of withdrawal symptoms in detoxification from heroin and other opioid analgesics.

M

methIMAzole (meth-im-a-zole)

~~Tapazole~~

Classification

Therapeutic: antithyroid agents

Indications

Palliative treatment of hyperthyroidism. Used as an adjunct to control hyperthyroidism in preparation for thyroidectomy or radioactive iodine therapy.

Action

Inhibits the synthesis of thyroid hormones. **Therapeutic Effects:** Decreased signs and symptoms of hyperthyroidism.

Pharmacokinetics

Absorption: Rapidly absorbed following oral administration.

Distribution: Crosses the placenta and enters breast milk in high concentrations.

Metabolism and Excretion: Mostly metabolized by the liver; <10% eliminated unchanged by the kidneys.

Half-life: 3–5 hr.

TIME/ACTION PROFILE (effect on thyroid function)

ROUTE	ONSET	PEAK	DURATION
PO	1 wk	4–10 wk	wk

© F.A. Davis Publishing

Contraindications/Precautions

Contraindicated in: Hypersensitivity.

Use Cautiously in: Patients with ↓ bone marrow reserve; Patients >40 yr (↑ risk of agranulocytosis); OB: Use during pregnancy only if maternal benefit outweighs potential risk to fetus. May cause congenital malformations (especially if used during 1st trimester).

Adverse Reactions/Side Effects

Derm: rash, skin discoloration, urticaria. **GI:** HEPATOTOXICITY, diarrhea, loss of taste, nausea, parotitis, vomiting. **Hemat:** AGRANULOCYTOSIS, anemia, leukopenia, thrombocytopenia. **MS:** arthralgia. **Neuro:** drowsiness, headache, vertigo. **Misc:** fever, lymphadenopathy.

Interactions

Drug-Drug: Additive bone marrow depression with **antineoplastics** or **radiation therapy**. Antithyroid effect may be ↓ by **potassium iodide** or **amiodarone**. ↑ risk of agranulocytosis with **phenothiazines**. May alter response to **warfarin** and **digoxin**.

Route/Dosage

PO (Adults): *Initial*—15–60 mg/day in 3 divided doses. *Maintenance*—5–15 mg once daily.

PO (Children): *Initial*—0.4 mg/kg/day in 3 divided doses. *Maintenance*—0.2 mg/kg/day in single dose or 2 divided doses.

Availability (generic available)

Tablets: 5 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Monitor response for symptoms of hyperthyroidism or thyrotoxicosis (tachycardia, palpitations, nervousness, insomnia, fever, diaphoresis, heat intolerance, tremors, weight loss, diarrhea).
- Assess for development of hypothyroidism (intolerance to cold, constipation, dry skin, headache, listlessness, tiredness, or weakness). Dose adjustment may be required.
- Assess for skin rash or swelling of cervical lymph nodes. Treatment may be discontinued if this occurs.
- ***Lab Test Considerations:*** Monitor thyroid function studies prior to therapy, monthly during initial therapy, and every 2–3 mo during therapy.
- Monitor WBC and differential counts periodically during therapy. Agranulocytosis may develop rapidly; usually occurs during the first 2 mo and is more common in patients over 40 yr and those receiving >40 mg/day. This necessitates discontinuation of therapy.
- May cause ↑ AST, ALT, LDH, alkaline phosphatase, serum bilirubin, and prothrombin time.

Implementation

- Do not confuse methimazole with metolazone or methazolamide.
- **PO:** Administer at same time in relation to meals every day. Food may either increase or decrease absorption.

Patient/Family Teaching

- Instruct patient to take medication as directed, around the clock. Take missed doses as soon as remembered; take both doses together if almost time for next dose; check with health care professional if more than 1 dose is missed. Consult health care professional prior to discontinuing medication.
- Instruct patient to monitor weight 2–3 times weekly. Notify health care professional of significant changes.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to consult health care professional regarding dietary sources of iodine (iodized salt, shellfish).
- Advise patient to report sore throat, fever, chills, headache, malaise, weakness, yellowing of eyes or skin, unusual bleeding or bruising, rash, or symptoms of hyperthyroidism or hypothyroidism promptly.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Advise patient to carry identification describing medication regimen at all times.
- Advise patient to notify health care professional of medication regimen prior to treatment or surgery.
- Rep: Advise female patients of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. May cause fetal harm, especially during 1st trimester. If breast feeding, monitor infant thyroid levels weekly or biweekly.
- Emphasize the importance of routine exams to monitor progress and to check for side effects.

Evaluation/Desired Outcomes

- Decrease in severity of symptoms of hyperthyroidism (lowered pulse rate and weight gain).
- Return of thyroid function studies to normal.
- May be used as short-term adjunctive therapy to prepare patient for thyroidectomy or radiation therapy or may be used in treatment of hyperthyroidism. Treatment from 6 mo to several yr may be necessary, usually averaging 1 yr.

HIGH ALERT

methotrexate (meth-o-**trex**-ate)
Metoject, Otrexup, Rasuvo, ~~Rheumatrex~~, Trexall, Xatmep

Classification
Therapeutic: antineoplastics, antirheumatics (DMARDs), immunosuppressants
Pharmacologic: antimetabolites

© F.A. Davis Publishing

Indications

Acute lymphoblastic leukemia (in combination with other chemotherapy drugs). Treatment and prophylaxis of meningeal leukemia. Non-Hodgkin's lymphoma. Osteosarcoma (in combination with other chemotherapy drugs). Breast cancer (in combination with other chemotherapy drugs). Squamous cell carcinoma of the head and neck. Gestational trophoblastic neoplasia (in combination with other chemotherapy drugs). Severe, active rheumatoid arthritis and polyarticular juvenile idiopathic arthritis in patients with intolerance or an inadequate response to first-line therapy. Severe, recalcitrant, disabling psoriasis in patients with an inadequate response to other therapies. Treatment of mycosis fungoides (cutaneous T-cell lymphoma).

Action

Interferes with folic acid metabolism. Result is inhibition of DNA synthesis and cell reproduction (cell-cycle S-phase–specific). Also has immunosuppressive activity. **Therapeutic Effects:** Death of rapidly replicating cells, particularly malignant ones, and immunosuppression.

Pharmacokinetics

Absorption: Small doses are well absorbed from the GI tract. Larger doses incompletely absorbed.
Distribution: Actively transported across cell membranes, widely distributed. Does not reach therapeutic concentrations in the CSF. Crosses placenta; enters breast milk in low concentrations. Absorption in children is variable (23–95%) and dose-dependent.
Metabolism and Excretion: Excreted mostly unchanged by the kidneys.
Half-life: *Low dose*—3–10 hr; *high dose*—8–15 hr (↑ in renal impairment).

TIME/ACTION PROFILE (effects on blood counts)

ROUTE	ONSET	PEAK	DURATION
PO, IM, IV	4–7 days	7–14 days	21 days
Subcut	unknown	unknown	unknown

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Alcoholism or hepatic impairment; Immunosuppression; ↓ bone marrow reserve; OB: Pregnancy (may cause fetal harm); Lactation: Lactation; Pedi: Products containing benzyl alcohol should not be used in neonates.
Use Cautiously in: Cranial radiation (↑ risk of leukoencephalopathy); Peptic ulcer disease or ulcerative colitis; Renal impairment (CCr must be ≥60 mL/min prior to therapy); Active infections; Rep: Women of reproductive potential and men with female partners of reproductive potential; Geri: Older adults may be more sensitive to toxicity and adverse events.

Adverse Reactions/Side Effects

Derm: ERYTHEMA MULTIFORME, STEVENS-JOHNSON SYNDROME, TOXIC EPIDERMAL NECROLYSIS, alopecia, painful plaque erosions (during psoriasis treatment), photosensitivity, pruritus, rash, skin ulceration, soft tissue necrosis, urticaria. **EENT:** blurred vision, dysarthria, transient blindness. **GI:** GI PERFORATION, HEPATOTOXICITY, anorexia, diarrhea, nausea, stomatitis, vomiting. **GU:** nephropathy, acute renal failure, ↓ fertility, menstrual abnormalities, oligospermia. **Hemat:** APLASTIC ANEMIA, anemia, leukopenia, thrombocytopenia. **Metab:** hyperuricemia. **MS:** hemiparesis, osteonecrosis, stress fracture. **Neuro:** SEIZURES, arachnoiditis (IT use only), confusion, dizziness, drowsiness, headache, leukoencephalopathy, malaise. **Resp:** INTERSTITIAL PNEUMONITIS, interstitial pneumonitis. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis), INFECTIONS, SECONDARY MALIGNANCY, chills, fever, tumor lysis syndrome.

Interactions

Drug-Drug: The following drugs may ↑ hematologic toxicity of methotrexate: high-dose **salicylates**, **dapsone**, **pemetrexed**, **mercaptopurine**, **NSAIDs**, **phenytoin**, **tetracyclines**, **probenecid**, **trimethoprim/sulfamethoxazole**, **penicillins**, **pyrimethamine**, **sulfonylureas**, and**warfarin**. ↑ risk of hepatotoxicity with other **hepatotoxic drugs** including **azathioprine**, **sulfasalazine**, and **retinoids**. ↑ risk of nephrotoxicity with other **nephrotoxic drugs**. ↑ risk of bone marrow depression with other **antineoplastics** or **radiation therapy**. **Radiation therapy** ↑ risk of soft tissue necrosis and osteonecrosis. May ↓ antibody response to **live-virus vaccines** and ↑ risk of adverse reactions. ↑ risk of neurologic reactions with **acyclovir** (IT methotrexate only). **Nitrous oxide** may ↑ risk of toxicity; avoid concurrent use. **Folic acid** may ↓ antineoplastic effects; avoid concurrent use. May ↑ levels and risk of toxicity of **theophylline**.
Drug-Natural Products: Concomitant use with **echinacea** and **melatonin** may interfere with immunosuppression. **Caffeine** may ↓ efficacy of methotrexate, similar effect may occur with **guarana**.

Route/Dosage

Acute Lymphoblastic Leukemia

IV (Adults and Children): 10–5,000 mg/m² followed by leucovorin rescue (for doses >500 mg/m²). Lower doses (20–30 mg/m²/wk may be used IM.

Meningeal Leukemia

IT (Adults and Children ≥9 yr): 12–15 mg given at intervals of 2 or more days up to twice weekly (for treatment) and no more than once weekly (for prophylaxis).

© F.A. Davis Publishing

IT (Children 3–<9 yr): 12 mg given at intervals of 2 or more days up to twice weekly (for treatment) and no more than once weekly (for prophylaxis).
IT (Children 2–<3 yr): 10 mg given at intervals of 2 or more days up to twice weekly (for treatment) and no more than once weekly (for prophylaxis).
IT (Children 1–<2 yr): 8 mg given at intervals of 2 or more days up to twice weekly (for treatment) and no more than once weekly (for prophylaxis).
IT (Children <1 yr): 6 mg given at intervals of 2 or more days up to twice weekly (for treatment) and no more than once weekly (for prophylaxis).

Non-Hodgkin's Lymphoma

IV (Adults and Children): *In combination with other chemotherapy agents*—1,000 mg/m² *or* 3,000 mg/m² over 24 hours followed by leucovorin rescue. *CNS-directed therapy*—8,000 mg/m² over 4 hr followed by leucovorin rescue (as monotherapy) *or* 3,000–8,000 mg/m² followed by leucovorin rescue (in combination with immunochemotherapy).

Osteosarcoma

IV (Adults and Children): 12 g/m² (max = 20 g/dose) over 4 hr followed by leucovorin rescue, usually as part of a combination chemotherapeutic regimen (or ↑ dose until peak serum methotrexate level is 1×10^{-3} M/L but not to exceed 15 g/m²); 12 courses are given starting 4 wk after surgery and repeated at scheduled intervals.

Breast Cancer

IV (Adults): 40 mg/m² on days 1 and 8 (with other agents; many regimens are used).

Squamous Cell Carcinoma of Head and Neck

IV (Adults): 40–60 mg/m² once weekly.

Gestational Trophoblastic Neoplasia

IV, IM (Adults): *Low-risk gestational trophoblastic neoplasia*—30–200 mg/m².
IV (Adults): *High-risk gestational trophoblastic neoplasia*—300 mg/m² over 12 hr (with other agents).

Rheumatoid Arthritis

PO, IM, Subcut (Adults): 7.5 mg once weekly (not to exceed 20 mg/wk); when response is obtained, dose should be ↓. Otrexup may be used when dose is 10–20 mg/wk.

Polyarticular Juvenile Idiopathic Arthritis

PO, IM, Subcut (Children): 10 mg/m² once weekly initially, may be ↑ up to 20–30 mg/m²; however, response may be better if doses >20 mg/m² are given IM or subcut; Otrexup may be used when dose is 10–25 mg/wk.

Psoriasis

Therapy may be preceded by a 5–10-mg test dose.
PO, IM, Subcut, IV (Adults): 10–25 mg once weekly (not to exceed 25 mg/wk); Otrexup may be used when dose is 10–25 mg/wk.

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg. **Cost:** 2.5 mg $96.36/30, 5 mg $352.75/30, 7.5 mg $529.13/30, 10 mg $705.50/30, 15 mg $1,058.27/30. **Oral solution:** 2.5 mg/mL. **Solution for subcutaneous injection (Otrexup):** 10 mg/0.4 mL, 12.5 mg/0.4 mL, 15 mg/0.4 mL, 17.5 mg/0.4 mL, 20 mg/0.4 mL, 22.5 mg/0.4 mL, 25 mg/0.4 mL. **Solution for subcutaneous injection (Rasuvo):** 7.5 mg/0.15 mL, 10 mg/0.2 mL, 12.5 mg/0.25 mL, 15 mg/0.3 mL, 17.5 mg/0.35 mL, 20 mg/0.4 mL, 22.5 mg/0.45 mL, 25 mg/0.5 mL, 30 mg/0.6 mL. **Powder for injection:** 1 g/vial. **Solution for injection:** 25 mg/mL. **Cost:** *Generic*—$115.02/30 mL. **Solution for injection (preservative free):** 25 mg/mL.

NURSING IMPLICATIONS

Assessment

- Monitor vital signs periodically during administration. Report significant changes.
- Monitor for abdominal pain, diarrhea, or stomatitis; therapy may need to be discontinued.
- Monitor for bone marrow depression. Assess for bleeding (bleeding gums, bruising, petechiae, guaiac stools, urine, and emesis) and avoid IM injections and taking rectal temperatures if platelet count is low. Apply pressure to venipuncture sites for 10 min. Assess for signs of infection during neutropenia. Anemia may occur. Monitor for increased fatigue, dyspnea, and orthostatic hypotension.
- Monitor intake and output ratios and daily weights. Report significant changes in totals.
- Monitor for symptoms of interstitial pneumonitis, which may manifest early as a dry, nonproductive cough.
- Monitor for symptoms of gout (increased uric acid, joint pain, edema). Encourage patient to drink at least 2 L of fluid each day. Allopurinol and alkalinization of urine may be used to decrease uric acid levels.
- Assess nutritional status. Administering an antiemetic prior to and periodically during therapy and adjusting diet as tolerated may help maintain fluid and electrolyte balance and nutritional status.
- Assess for rash periodically during therapy. May cause Stevens-Johnson syndrome. Discontinue therapy if severe or if accompanied with fever, general malaise, fatigue, muscle or joint aches, blisters, oral lesions, conjunctivitis, hepatitis, and/or eosinophilia.
- **IT:** Assess for development of nuchal rigidity, headache, fever, confusion, drowsiness, dizziness, weakness, or seizures.
- **Rheumatoid Arthritis:** Assess patient for pain and range of motion prior to and periodically during therapy.
- **Psoriasis:** Assess skin lesions prior to and periodically during therapy.
- ***Lab Test Considerations:*** Verify negative pregnancy test prior to starting therapy.
- Monitor CBC and differential prior to and at least monthly during therapy and at least daily for high-

© F.A. Davis Publishing

dose regimens. The nadir of leukopenia and thrombocytopenia occurs in 7–14 days. Leukocyte and thrombocyte counts usually recover 7 days after the nadirs. Discontinue methotrexate immediately for any sudden drop in values.

- Monitor renal (BUN and serum creatinine) and hepatic function (AST, ALT, bilirubin, and LDH) prior to and every 1–2 mo during therapy. Urine pH should be monitored prior to high-dose methotrexate therapy and every 6 hr during leucovorin rescue. Urine pH should be kept above 7.0 from before 1st dose through therapy to prevent renal damage.
- May cause ↑ serum uric acid concentrations, especially during initial treatment of leukemia and lymphoma.
- ***Toxicity and Overdose:*** Monitor serum methotrexate levels every at least daily during high-dose therapy and adjust hydration and leucovorin dosing as needed. This monitoring is essential to plan correct leucovorin dose and determine duration of rescue therapy.
- With high-dose therapy (doses of ≥500 mg/m^2), patient must receive leucovorin rescue within 24–48 hr to prevent fatal toxicity. May be considered for intermediate doses of 100 mg/m^2 to <500 mg/m^2. Administer IV fluids starting before 1st dose and continuing through therapy to maintain adequate hydration and urine output. Administer glucarpidase in patients who have toxic plasma methotrexate concentrations (>1 micromole per liter) and delayed methotrexate clearance due to impaired renal function. Glucarpidase may be used for patients with impaired renal function. If glucarpidase is used, do not administer leucovorin within 2 hrs before or after glucarpidase because leucovorin is a substrate for glucarpidase. In cases of massive overdose, hydration and urinary alkalinization with sodium bicarbonate are required to prevent renal tubule damage. Leucovorin and levoleucovorin are indicated to diminish the toxicity and counteract the effect of inadvertently administered overdoses of methotrexate. Monitor fluid and electrolyte status; patients must be well hydrated. Intermittent hemodialysis using a high-flux dialyzer may be used for clearance until levels are <0.05 micromolar. Methotrexate should be delayed until recovery if WBC <1500/mcL, neutrophil count <200/mcL, platelet count <75,000/mcL, serum bilirubin level >1.2 mg/dL, AST level >450 IU/L, mucositis is present, until evidence of healing, persistent pleural effusion is present, should be drained dry prior to infusion. Adequate renal function is required. Serum creatinine must be normal, CCr must be >60 mL/min, before initiation of therapy. Serum creatinine must be measured before each course of therapy. If ↑ by ≥50% of a prior value, CCr must be >60 mL/min, even if serum creatinine is within normal range.

Implementation

- ***High Alert:*** Fatalities have occurred with chemotherapeutic agents. Before administering, clarify all ambiguous orders; double-check single, daily, and course-of-therapy dose limits; have second practitioner independently double-check original order, calculations and infusion pump settings. Methotrexate for nononcologic use is given at a much lower dose and frequency—often just once a wk. Do not confuse nononcologic dosing regimens with dosing regimens for cancer patients. Do not confuse methotrexate with metolazone.
- Administer IV fluids starting before 1st dose and continuing through therapy to maintain adequate hydration and urine output.
- Solutions for injection should be prepared in a biologic cabinet. Wear gloves, gown, and mask while handling medication. Discard equipment in specially designated containers.
- *Otrexup* and *Rasuvo* are not indicated for treatment of neoplastic diseases. Not for patients requiring oral, IM, IV, intra-arterial, or IT dosing, doses <10 mg/wk, doses >25 mg/wk, high-dose regimens, or dose adjustments of less than 5 mg increments.
- **Subcut:** *Otrexup* and *Rasuvo* are single-dose autoinjectors. Inject once weekly in abdomen or upper thigh. Avoid areas where skin is tender, bruised, red, scaly, hard, or has scars or stretch marks. Solution is clear and yellow; do not inject solutions that are discolored or contain particulate matter.

IV Administration

- **IV Push:** ***Reconstitution:*** Reconstitute each vial with 25 mL of 0.9% NaCl. Use sterile preservative-free diluents for high-dose regimens, neonates, low-birth weight infants, and intrathecal use to prevent complications from large amounts of benzyl alcohol. Solution is clear yellow; do not use preparations that are cloudy, discolored or that contain a precipitate. Reconstitute immediately before use. Discard unused portion. ***Concentration:*** <25 mg/mL for IV push and intermittent/continuous infusions. ***Rate:*** Administer at a rate of 10 mg/min into Y-site of a free-flowing IV.
- **Intermittent/Continuous Infusion:** ***Dilution:*** Doses >100–300 mg/m^2 may also be diluted in D5W, D5/0.9% NaCl, or 0.9% NaCl and infused as intermittent or continuous infusion. ***Rate:*** Administration rates of 4–20 mg/hr have been used.
- **Y-Site Compatibility:** acyclovir, alemtuzumab, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, amphotericin B lipid complex, amphotericin B liposome, ampicillin, ampicillin/sulbactam, anidulafungin, argatroban, azithromycin, aztreonam, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium

© F.A. Davis Publishing

chloride, calcium gluconate, carboplatin, carmustine, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftazidime, ceftriaxone, cefuroxime, ciprofloxacin, cisatracurium, cisplatin, clindamycin, cyclophosphamide, cyclosporine, cytarabine, dactinomycin, daunorubicin hydrochloride, dexmedetomidine, digoxin, diphenhydramine, docetaxel, doxorubicin hydrochloride, doxorubicin liposomal, enalaprilat, ephedrine, epinephrine, epirubicin, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole, fludarabine, fluorouracil, foscarnet, fosphenytoin, furosemide, ganciclovir, gemtuzumab ozogamicin, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, imipenem/cilastatin, insulin, regular, isoproterenol, ketorolac, leucovorin calcium, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, mesna, methadone, methohexital, methylprednisolone, metoclopramide, metoprolol, metronidazole, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, naloxone, nitroglycerin, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, paclitaxel, palonosetron, pamidronate, pancuronium, pentobarbital, phenobarbital, phenylephrine, piperacillin/tazobactam, potassium acetate, potassium chloride, potassium phosphate, procainamide, prochlorperazine, propranolol, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, sodium phosphate, succinylcholine, sufentanil, tacrolimus, theophylline, thiopental, thiotepa, tigecycline, tirofiban, tobramycin, trastuzumab, trimethoprim/sulfamethoxazole, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amiodarone, caspofungin, chlorpromazine, dacarbazine, daptomycin, dexrazoxane, diazepam, diltiazem, dobutamine, dopamine, doxycycline, gemcitabine, gentamicin, idarubicin, ifosfamide, levofloxacin, midazolam, mycophenolate, nalbuphine, nicardipine, pantoprazole, pentamidine, phenytoin, propofol, quinupristin/dalfopristin.
- **IT:** Reconstitute preservative-free methotrexate with preservative-free 0.9% NaCl, Elliot's B solution, or patient's CSF to a concentration not greater than 2 mg/mL. May be administered via lumbar puncture or Ommaya reservoir. To prevent bacterial contamination, use immediately.

Patient/Family Teaching

- Instruct patient to take medication as directed. If a dose is missed, it should be omitted. Consult health care professional if vomiting occurs shortly after a dose is taken. Advise patients taking PO or subcut therapy to read *Patient Information* before starting therapy and with each Rx refill in case of changes.
- Instruct patient to notify health care professional promptly if rash, fever; chills; cough; hoarseness; sore throat; signs of infection; lower back or side pain; painful or difficult urination; bleeding gums; bruising; petechiae; blood in stools, urine, or emesis; increased fatigue; dyspnea; or orthostatic hypotension occurs. Caution patient to avoid crowds and persons with known infections. Instruct patient to use soft toothbrush and electric razor and to avoid falls. Caution patient not to drink alcoholic beverages or take medication containing aspirin or other NSAIDs; may precipitate gastric bleeding.
- Instruct patient to inspect oral mucosa for erythema and ulceration. If ulceration occurs, advise patient to use sponge brush and to rinse mouth with water after eating and drinking. Topical therapy may be used if mouth pain interferes with eating. Stomatitis pain may require treatment with opioid analgesics.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.
- Discuss the possibility of hair loss with patient. Explore methods of coping.
- Instruct patient not to receive any vaccinations without advice of health care professional.
- Caution patient to use sunscreen and protective clothing to prevent photosensitivity reactions.
- Rep: May cause fetal harm. Advise female patients of reproductive potential to use effective contraception during and for 6 mo after last dose and avoid breast feeding during and for 1 wk after last dose of therapy. Advise males with female partners of reproductive potential to use effective contraception during and for 3 mo after therapy. Advise patient to notify health care professional if pregnancy is suspected. May impair fertility in both men and women.
- Emphasize the need for periodic lab tests to monitor for side effects.
- **Subcut:** Instruct patient on correct technique for injection and care and disposal of equipment.

Evaluation/Desired Outcomes

- Improvement of hematopoietic values in leukemia.
- Decrease in symptoms of meningeal involvement in leukemia.
- Decrease in size and spread of non-Hodgkin's lymphomas and other solid cancers.
- Resolution of skin lesions in severe psoriasis.
- Decreased joint pain and swelling.
- Improved mobility in patients with rheumatoid arthritis.
- Regression of lesions in mycosis fungoides.

methylergonovine

(meth-ill-er-goe-**noe**-veen)
Methergine

Classification
Therapeutic: oxytocic
Pharmacologic: ergot alkaloids

© F.A. Davis Publishing

Indications
Prevention and treatment of postpartum or postabortion hemorrhage caused by uterine atony or subinvolution.

Action
Directly stimulates uterine and vascular smooth muscle.
Therapeutic Effects: Uterine contraction.

Pharmacokinetics
Absorption: Well absorbed following oral or IM administration.
Distribution: Unknown. Enters breast milk in small quantities.
Metabolism and Excretion: Probably metabolized by the liver.
Half-life: 30–120 min.

TIME/ACTION PROFILE (effects on uterine contractions)

ROUTE	ONSET	PEAK	DURATION
PO	5–15 min	unknown	3 hr
IM	2–5 min	unknown	3 hr
IV	immediate	unknown	45 min–3 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; OB: Should not be used to induce labor; Lactation: Do not breast feed during treatment and for 12 hrs after the last dose; Concurrent use of potent CYP3A4 inhibitors.
Use Cautiously in: Hypertensive or eclamptic patients (more susceptible to hypertensive and arrhythmogenic side effects); History of or risk factors for coronary artery disease; Severe hepatic or renal disease; Sepsis; Concurrent use of moderat CYP3A4 inhibitors.
Exercise Extreme Caution in: OB: Third stage of labor.

Adverse Reactions/Side Effects
EENT: tinnitus. **Resp:** dyspnea. **CV:** HYPERTENSION, arrhythmias, AV block, chest pain, palpitations. **GI:** nausea, vomiting. **GU:** cramps. **Derm:** diaphoresis. **Neuro:** paresthesia, STROKE, dizziness, headache. **Misc:** allergic reactions.

Interactions
Drug-Drug: Excessive vasoconstriction may result when used with heavy cigarette smoking (**nicotine**), other **vasopressors**, such as **dopamine**, or **beta-blockers**. Potent **CYP3A4 inhibitors**, including **erythromycin**, **clarithromycin**, **troleandomycin**, **ritonavir**, **indinavir**, **nelfinavir**, **delavirdine**, **ketoconazole**, **itraconazole**, or **voriconazole** may ↑ levels and ↑ risk of ischemia; concurrent use contraindicated. Moderate **CYP3A4 inhibitors** including **saquinavir**, **nefazodone**, **fluconazole**, **fluoxetine**, **fluvoxamine**, **zileuton**, or **clotrimazole** may ↑ levels; use with caution. **CYP3A4 inducers** including **nevirapine** and **rifampin** may ↓ levels. **Anesthetics** may ↓ its oxytocic properties. May ↓ the antianginal effects of **nitrates**.
Drug-Food: Grapefruit juice may ↑ levels; use with caution.

Route/Dosage
PO (Adults): 200–400 mcg (0.2–0.4 mg) every 6–12 hr for 2–7 days.
IM, IV (Adults): 200 mcg (0.2 mg) every 2–4 hr for up to 5 doses.

Availability (generic available)
Tablets: 200 mcg (0.2 mg). **Injection:** 200 mcg (0.2 mg)/mL.

NURSING IMPLICATIONS

Assessment
- Monitor BP, heart rate, and uterine response frequently during medication administration. Notify health care professional promptly if uterine relaxation becomes prolonged or if character of vaginal bleeding changes.
- Assess for signs of ergotism (cold, numb fingers and toes, chest pain, nausea, vomiting, headache, muscle pain, weakness).
- ***Lab Test Considerations:*** If no response to methylergonovine, calcium levels may need to be assessed. Effectiveness of medication is ↓ with hypocalcemia.
- May cause ↓ serum prolactin levels.

Implementation
IV Administration
- **IV:** IV administration is used for emergencies only. Oral and IM routes are preferred.
- **IV Push:** ***Dilution:*** May be given undiluted or diluted in 5 mL of 0.9% NaCl and administered through Y site. Do not add to IV solutions. Do not mix in syringe with any other drug. Refrigerate; stable for storage at room temperature for 60 days; deteriorates with age. Use only solution that is clear and colorless and that contains no precipitate. ***Concentration:*** 0.2 mg/mL. ***Rate:*** Administer at a rate of 0.2 mg over at least 1 min.
- **Y-Site Compatibility:** heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

Patient/Family Teaching
- Instruct patient to take medication as directed; do not skip or double up on missed doses. If a dose is missed, omit it and return to regular dose schedule.
- Advise patient that medication may cause menstrual-like cramps.
- Caution patient to avoid smoking, because nicotine constricts blood vessels.

© F.A. Davis Publishing

- Instruct patient to notify health care professional if infection develops, as this may cause increased sensitivity to the medication.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications.

Evaluation/Desired Outcomes

- Contractions that maintain uterine tone and prevent postpartum hemorrhage.

methylnaltrexone

(me-thil-nal-**trex**-one)

Relistor

Classification

Therapeutic: laxatives

Pharmacologic: opioid antagonists

Indications

Subcut: Treatment of opioid-induced constipation (OIC) in patients with advanced illness or pain caused by active cancer who require opioid dose escalation for palliative care. **Subcut, PO:** Treatment of OIC in patients with chronic, non-cancer pain, including those with chronic pain related to prior cancer or its treatment who do not require frequent (e.g. weekly) opioid dose escalation.

Action

Acts peripherally as mu-opioid receptor antagonist, blocking opioid effects on the GI tract. **Therapeutic Effects:** Blocks constipating effects of opioids on the GI tract without loss of analgesia.

Pharmacokinetics

Absorption: Rapidly absorbed after subcutaneous and oral administration; oral absorption delayed by high-fat meal by 2 hr.

Distribution: Moderate tissue distribution, does not cross the blood-brain barrier.

Metabolism and Excretion: Some metabolism; 85% excreted unchanged in urine.

Half-life: 15 hr (oral).

TIME/ACTION PROFILE (plasma concentrations)

ROUTE	ONSET	PEAK	DURATION
Subcut	rapid	0.5 hr	24–48 hr
PO	rapid	1.5 hr	unknown

Contraindications/Precautions

Contraindicated in: Known/suspected mechanical GI obstruction.

Use Cautiously in: Known/suspected lesions of GI tract (↑ risk for GI perforation); Moderate-severe renal impairment (dose ↓ required); Moderate-severe hepatic impairment (dose ↓ may be required); OB, Lactation: Use in pregnancy only if clearly needed; use cautiously during lactation; Pedi: Safety and effectiveness not established.

Adverse Reactions/Side Effects

Derm: hyperhidrosis. **GI:** GI PERFORATION, abdominal pain, flatulence, nausea, diarrhea. **Neuro:** dizziness. **Misc:** opioid withdrawal.

Interactions

Drug-Drug: None noted.

Route/Dosage

OIC in Patients with Advanced Illness

Subcut (Adults): *38–<62 kg*—8 mg every other day, not to exceed every 24 hr; *62–114 kg*—12 mg every other day, not to exceed every 24 hr; *>114 kg*—0.15 mg/kg every other day, not to exceed every 24 hr.

Renal Impairment

(Adults): *CCr <60 mL/min*—use 50% of recommended dose based on weight.

OIC in Patients with Non-Cancer Pain

Subcut (Adults): 12 mg once daily.

Renal Impairment

Subcut (Adults): *CCr <60 mL/min*—6 mg once daily.

Hepatic Impairment

Subcut (Adults): *Severe hepatic impairment (Child–Pugh Class C)*—<38 kg: 0.075 mg/kg once daily; 38–<62 kg: 4 mg once daily; 62–114 kg: 6 mg once daily: >114 kg: 0.075 mg/kg once daily.

PO (Adults): 450 mg once daily.

Renal Impairment

PO (Adults): *CCr <60 mL/min*—150 mg once daily.

Hepatic Impairment

PO (Adults): *Moderate or severe hepatic impairment (Child–Pugh Class B or C)*—150 mg once daily.

Availability

Solution for injection (prefilled syringes): 8 mg/0.4 mL, 12 mg/0.6 mL. **Cost:** All strengths $71.46/syringe. **Tablets:** 150 mg.

NURSING IMPLICATIONS

Assessment

- Assess bowel sounds and frequency, quantity, and consistency of stools periodically during therapy.
- Monitor pain intensity during therapy. Methylnaltrexone does not affect pain or effects of opioid analgesics on pain control.

Implementation

- Maintenance laxative must be stopped prior to administration of methylnaltrexone. If response is not sufficient after 3 days, laxatives may be restarted.
- **PO:** Administer with water on an empty stomach at least 30 min before first meal of the day.

© F.A. Davis Publishing

- **Subcut:** Pinch skin and administer in upper arm, abdomen, or thigh at a 45° angle using a 1-mL syringe with a 27-gauge needle inserted the full length of the needle. Do not rub the injection site. Solution is clear and colorless to pale yellow. Do not administer solutions that are discolored or contain a precipitate. Solution is stable for 24 hr at room temperature. Protect vials from light. Do not freeze. Do not use single-use vials for more than 1 dose.

Patient/Family Teaching

- Instruct patient to take methylnaltrexone as directed and on correct technique for administration of methylnaltrexone and disposal of supplies. Usual schedule is one dose every other day, as needed, but no more than one dose in a 24-hr period. Advise patient to read the *Patient Information* prior to starting therapy and with each Rx refill in case of changes.
- Advise patient that laxation may occur within 30 min of subcut injection, so toilet facilities should be available following administration.
- Advise patient to discontinue all maintenance laxatives; can be added if inadequate response to methylnaltrexone.
- May cause dizziness. Caution patient to avoid driving and other activities requiring alertness until response to medication is known.
- Advise patient to notify health care professional and discontinue therapy if severe or persistent diarrhea occurs or if abdominal pain, nausea, or vomiting persists or worsens.
- Instruct patient to stop taking methylnaltrexone if they stop taking opioid medications.
- Advise patient to consult health care professional prior to taking other Rx, OTC, or herbal products.
- Advise female patients to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding; may cause opioid withdrawal in infant.

Evaluation/Desired Outcomes

- Laxation and relief of OIC.

methylphenidate (oral)

(meth-ill-**fen**-i-date)

Adhansia XR, Aptensio XR, Biphentin, Concerta, Cotempla XR-ODT, Foquest, Jornay PM, Metadate CD, Methylin, Methylin ER, Quillichew ER, Quillivant XR, Ritalin, Ritalin LA, Ritalin SR

methylphenidate (transdermal)

Daytrana

Classification

Therapeutic: central nervous system stimulants

Schedule II

Indications

Oral, orally distintegrating tablets, and transdermal: Attention-deficit/hyperactivity disorder (ADHD) (adjunct). **Oral only**: Narcolepsy.

Action

Produces CNS and respiratory stimulation with weak sympathomimetic activity. **Therapeutic Effects:** Increased attention span in ADHD. Increased motor activity, mental alertness, and diminished fatigue in narcolepsy.

Pharmacokinetics

Absorption: Slow and incomplete after oral administration; absorption of sustained or extended-release tablet (SR) is delayed and provides continuous release; well absorbed from skin. *Aptensio XR, Metadate CD, Concerta, Ritalin LA*—provides initial rapid release followed by a second continuous release (biphasic release).

Distribution: Unknown.

Metabolism and Excretion: Mostly metabolized (80%) by the liver.

Half-life: 2–4 hr.

TIME/ACTION PROFILE (CNS stimulation)

ROUTE	ONSET	PEAK	DURATION
PO	unknown	1–3 hr	4–6 hr
PO-ER	unknown	4–7 hr	3–12 hr†
Transdermal	unknown	unknown	12 hr

†Depends on formulation.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Hyperexcitable states; Hyperthyroidism; Patients with psychotic personalities or suicidal or homicidal tendencies; Personal or family history of Tourette's syndrome; Glaucoma; Motor tics; Concurrent use or use within 14 days of MAO inhibitors or MAO inhibitor-like drugs (linezolid or methylene blue); Fructose intolerance, glucose-galactose malabsorption, or sucrose-isomaltase insufficiency; Surgery.

Use Cautiously in: History of cardiovascular disease (sudden death has occurred in children with structural cardiac abnormalities or other serious heart problems); Hypertension; Diabetes mellitus; History of contact sensitization with transdermal product (may be at ↑ risk for systemic sensitization reactions with oral products); History or family history of vitiligo (may be at ↑ risk for loss of skin pigmentation with transdermal product); Continual use (may result in psychological or physical dependence); Seizure disorders (may lower

© F.A. Davis Publishing

seizure threshold); Concerta product should be used cautiously in patients with esophageal motility disorders or severe GI narrowing (may ↑ the risk of obstruction); OB: Use during pregnancy only if potential maternal benefit outweighs potential fetal risk; may lead to premature delivery and low birth weight infants; Lactation: Use while breast feeding only if potential maternal benefit outweighs potential risk to infant; Pedi: Growth suppression may occur in children with long-term use; children <6 yr (↑ risk of adverse reactions, particularly weight loss in children 4–<6 yr); Geri: Safety and effectiveness of many of the products have not been evaluated in older adults.

Adverse Reactions/Side Effects

CV: SUDDEN DEATH, hypertension, palpitations, tachycardia, hypotension, peripheral vasculopathy. **Derm:** contact sensitization (erythema, edema, papules, vesicles) (transdermal), erythema, loss of skin pigmentation (transdermal), rash. **EENT:** blurred vision, teeth grinding. **GI:** anorexia, constipation, cramps, diarrhea, dry mouth, metallic taste, nausea, vomiting. **GU:** priapism. **Metab:** growth suppression (especially with prolonged use), weight loss (especially with prolonged use). **MS:** RHABDOMYOLYSIS. **Neuro:** akathisia, dyskinesia, tics, hyperactivity, insomnia, restlessness, tremor, behavioral disturbances, dizziness, hallucinations, headache, irritability, mania, thought disorder. **Misc:** HYPERSENSITIVITY REACTIONS (including anaphylaxis and angioedema), fever, physical dependence, psychological dependence, tolerance.

Interactions

Drug-Drug: Concurrent use with **MAO inhibitors** or **MAO-inhibitor-like drugs**, such as **linezolid** or **methylene blue** may result in serious, potentially fatal reactions; wait at least 14 days following discontinuation of MAO inhibitor before initiation of amphetamine mixtures. Drugs that affect serotonergic neurotransmitter systems, including **MAO inhibitors**, **tricyclic antidepressants**, **SSRIs**, **SNRIs**, **fentanyl**, **buspirone**, **tramadol**, **lithium**, and **triptans** ↑ risk of serotonin syndrome. ↑ sympathomimetic effects with other **adrenergics**, including **vasoconstrictors**, **decongestants**, and **halogenated anesthetics**. Metabolism of **warfarin**, **phenytoin**, **phenobarbital**, **primidone**, **SSRIs**, and **tricyclic antidepressants** may be ↓ and effects ↑. Avoid concurrent use with **pimozide** (may mask cause of tics). May ↓ the effectiveness of **antihypertensives**. **Alcohol** may ↑ rate of release of drug from some methylphenidate formulations (Metadate CD, Ritalin LA). Concurrent use with **risperidone** may ↑ risk of extrapyramidal symptoms.

Drug-Natural Products: Use with caffeine-containing herbs (**guarana**, **tea**, **coffee**) ↑ stimulant effect. **St. John's wort** may ↑ risk of serotonin syndrome.

Drug-Food: Excessive use of **caffeine**-containing foods or beverages (**coffee**, **cola**, **tea**) may cause ↑ CNS stimulation.

Route/Dosage

Attention-Deficit/Hyperactivity Disorder

PO (Adults <65 yr): *Immediate-release tablets*— 5–20 mg 2–3 times daily. When maintenance dose is determined, may change to extended-release formulation. *Methylphenidate SR*— may be used in place of the immediate-release tablets when the 8-hr dose corresponds to the titrated 8-hr dosage of the immediate-release tablets; *Concerta (patients who have not taken methylphenidate previously)*— 18–36 mg once daily in the morning initially, may be titrated as needed up to 72 mg/day. *Concerta (patients are currently taking other forms of methylphenidate)*— 18 mg once daily in the morning if previous dose was 5 mg 2–3 times daily; 36 mg once daily in the morning if previous dose was 10 mg 2–3 times daily; 54 mg once daily in the morning if previous dose was 15 mg 2–3 times daily; 72 mg once daily in the morning if previous dose was 20 mg 2–3 times daily. *Aptensio XR*— 10 mg once daily; may ↑ dose in 10-mg increments at weekly intervals (maximum dose = 60 mg/day). *Quillivant XR and Quillichew ER*— 20 mg once daily; may ↑ dose in 10–20-mg increments at weekly intervals (maximum dose = 60 mg/day). *Adhansia XR*— 25 mg once daily; may ↑ dose in 10–15-mg increments at weekly intervals (maximum dose = 100 mg/day). *Jornay PM*— 20 mg once daily in the evening; may ↑ dose in 20-mg increments at weekly intervals (maximum dose = 100 mg/day).

PO (Children ≥6 yr [Ritalin LA for children 6–12 yr]): *Immediate-release tablets*— 0.3 mg/kg/dose or 2.5–5 mg before breakfast and lunch; may ↑ dose by 0.1 mg/kg/dose or by 5–10 mg/day at weekly intervals (not to exceed 60 mg/day or 2 mg/kg/day). When maintenance dose is determined, may change to extended-release formulation. *Methylphenidate SR*— may be used in place of the immediate-release tablets when the 8-hr dose corresponds to the titrated 8-hr dosage of the immediate-release tablets; *Ritalin LA (patients who have not taken methylphenidate previously)*— 20 mg once daily; may ↑ by 10 mg/day at weekly intervals (max = 60 mg/day); *Ritalin LA (patients currently taking other forms of methylphenidate)*— can be used in place of immediate-release twice daily regimen given once daily at same total dose, or in place of SR product at same dose; *Concerta (patients who have not taken methylphenidate previously)*— 18 mg once daily in the morning initially, may be titrated as needed up to 54 mg/day (children 6–12 yr old) or up to 72 mg/day (children 13–17 yr old). *Concerta (patients are currently taking other forms of methylphenidate)*— 18 mg once daily in the morning if previous dose was 5 mg 2–3 times daily; 36 mg once daily in the morning if previous dose was 10 mg 2–3 times daily; 54 mg once daily in the morning if previous dose was 15 mg 2–3 times daily; 72 mg once daily in the morning if previous dose was 20 mg 2–3 times daily. *Aptensio XR*— 10 mg once daily; may ↑

© F.A. Davis Publishing

dose in 10-mg increments at weekly intervals (maximum dose = 60 mg/day). *Metadate CD*—20 mg once daily; may ↑ dose in 20-mg increments at weekly intervals (maximum dose = 60 mg/day). *Quillivant XR and Quillichew ER*—20 mg once daily; may ↑ dose in 10–20-mg increments at weekly intervals (maximum dose = 60 mg/day). *Adhansia XR*—25 mg once daily; may ↑ dose in 10–15-mg increments at weekly intervals (maximum dose = 85 mg/day). *Jornay PM*—20 mg once daily in the evening; may ↑ dose in 20-mg increments at weekly intervals (maximum dose = 100 mg/day). *Cotempla XR-ODT*—17.3 mg once daily in the morning; may ↑ dose in 8.6–17.3-mg increments at weekly intervals (maximum dose = 51.8 mg/day). **Transdermal (Children ≥6 yr):** Apply one 10-mg patch initially (should be applied 2 hr before desired effect and removed 9 hr after application); may be titrated based on response and tolerability; may ↑ to 15-mg patch after 1 wk, and then to 20-mg patch after another wk, and then to 30-mg patch after another wk.

Narcolepsy

PO (Adults): *Immediate-release tablets*—10 mg 2–3 times/day; maximum dose 60 mg/day.

Availability (generic available)

Immediate-release tablets (Ritalin): 5 mg, 10 mg, 20 mg. **Cost:** *Generic*—5 mg $73.08/100, 10 mg $104.19/100, 20 mg $149.81/100. **Extended-release capsules (Adhansia XR):** 25 mg, 35 mg, 45 mg, 55 mg, 70 mg, 85 mg, 🍁 100 mg. **Extended-release capsules (Aptensio XR):** 10 mg, 15 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg. **Extended-release capsules (Jornay PM):** 20 mg, 40 mg, 60 mg, 80 mg, 100 mg. **Extended-release capsules (Metadate CD):** 10 mg, 20 mg, 30 mg, 40 mg, 50 mg, 60 mg. **Cost:** *Generic*—10 mg $560.21/100, 20 mg $560.21/100, 30 mg $560.21/100, 40 mg $711.52/100, 50 mg $944.19/100, 60 mg $944.19/100. **Extended-release capsules (Ritalin LA):** 10 mg, 20 mg, 30 mg, 40 mg. **Cost:** *Generic*—10 mg $630.47/100, 20 mg $630.47/100, 30 mg $644.82/100, 40 mg $66.274/100. **Extended-release tablets (Concerta):** 18 mg, 27 mg, 36 mg, 54 mg. **Cost:** *Generic*—18 mg $622.18/100, 27 mg $637.78/100, 36 mg $657.86/100, 54 mg $715.83/100. **Extended-release tablets (Metadate ER):** 20 mg. **Extended-release tablets (Methylin ER):** 10 mg, 20 mg. **Cost:** *Generic*—10 mg $171.91/100, 20 mg $247.21/100. **Sustained-release tablets (Ritalin SR):** 🍁 20 mg. **Cost:** $266.65/100. **Extended-release orally-disintegrating tablets (Cotempla XR-ODT):** 8.6 mg, 17.3 mg, 25.9 mg. **Chewable tablets (Methylin) (grape flavor):** 2.5 mg, 5 mg, 10 mg. **Cost:** 2.5 mg $351.16/100, 5 mg $501.16/100, 10 mg $715.09/100. **Extended-release chewable tablets (Quillichew ER):** 20 mg, 30 mg, 40 mg. **Oral solution (Methylin) (grape flavor):** 5 mg/5 mL, 10 mg/5 mL. **Cost:** *Generic*—5 mg/5 mL $451.61/500 mL, 10 mg/5 mL $643.82/500 mL. **Extended-release oral suspension (Quillivant XR) (banana flavor):** 25 mg/5 mL. **Transdermal patch:** 10 mg/9 hr, 15 mg/9 hr, 20 mg/9 hr, 30 mg/9 hr. **Cost:** All strengths $249.35/30.

NURSING IMPLICATIONS

Assessment

- Monitor BP, pulse, and respiration before administering and periodically during therapy. Obtain a history (including assessment of family history of sudden death or ventricular arrhythmia), physical exam to assess for cardiac disease, and further evaluation (ECG and echocardiogram), if indicated. If exertional chest pain, unexplained syncope, or other cardiac symptoms occur, evaluate promptly.
- Monitor closely for behavior change.
- Assess risk of abuse prior to prescribing. After prescribing, keep accurate prescription records, educate patient and family about risk of abuse, monitor for signs of abuse and overdose, and evaluate need for use periodically during therapy.
- Screen patients with bipolar disorder for risk of manic episode (comorbid or history of depressive symptoms or a family history of suicide, bipolar disorder, depression) prior to starting therapy.
- Monitor for signs and symptoms of peripheral vasculopathy (numbness and burning in fingers, digital changes). May require reduction in dose or discontinuation.
- Pedi: Monitor growth, both height and weight, in children on long-term therapy. May need to interrupt therapy in patients who are not growing or gaining height or weight as expected.
- May produce a false sense of euphoria and well-being. Provide frequent rest periods and observe patient for rebound depression after the effects of the medication have worn off.
- **ADHD:** Assess children for attention span, impulse control, and interactions with others. Therapy may be interrupted at intervals to determine whether symptoms are sufficient to continue therapy.
- **Narcolepsy:** Observe and document frequency of episodes.
- **Transdermal:** Assess skin for signs of contact sensitization (erythema with edema, papules, or vesicles that does not improve within 48 hr or spreads beyond patch site) during therapy. May lead to systemic sensitization to other forms of methylphenidate (flare-up of previous dermatitis or prior positive patch-test sites, generalized skin eruptions, headache, fever, malaise, arthralgia, diarrhea, vomiting). If contact sensitization develops and oral methylphenidate is instituted, monitor closely.

© F.A. Davis Publishing

- Monitor for signs of skin depigmentation. May cause persistent loss of skin pigmentation at and around the application site and at other sites distant from application site. Discontinue transdermal if depigmentation occurs.
- ***Lab Test Considerations:*** Monitor CBC, differential, and platelet count periodically in patients receiving prolonged therapy.

Implementation

- Do not confuse Metadate ER/CD (methylphenidate), or methylphenidate with methadone. Do not confuse Metadate CD with Metadate ER.
- **PO:** Administer immediate and sustained-release tablets on an empty stomach (30–45 min before a meal). Sustained-release tablets should be swallowed whole; do not break, crush, or chew. *Quillichew ER* chewable tablets may be broken in half. *Aptensio XL, Metadate CD* and *Ritalin LA* capsules may be opened and sprinkled on cool applesauce; entire mixture should be ingested immediately and followed by a drink of water. Do not store for future use. *Concerta* may be administered without regard to food, but must be taken with water, milk, or juice.
- Shake extended-release oral suspension for 10 sec before administering. May be given with or without food.
- **Transdermal:** Apply patch to a clean, dry site on the hip which is not oily, damaged, or irritated; do not apply to waistline where tight clothing may rub it. Press firmly in place with palm of hand for 30 sec to make sure of good contact with skin, especially around edges. Alternate site daily. Apply patch 2 hr before desired effect and remove 9 hr after applied; effects last several more hrs. Do not apply or reapply with dressings, tape, or other adhesives. Do not cut patches.
- If difficulty in separating patch from release liner, tearing, or other damage occurs during removal from liner, discard patch and apply a new patch. Inspect release liner to ensure no adhesive containing medication has transferred to liner; if transfer has occurred, discard patch. Avoid touching adhesive during application; wash hands immediately after application.
- If patch does not fully adhere or partially detaches, remove and replace with another patch. Wear patch for a total of 9 hr, regardless of number used. Exposure to water during bathing, swimming, or showering may affect patch adherence.
- Patches may be removed earlier before decreasing dose if an unacceptable loss of appetite or insomnia occurs.
- Store patches at room temperature in a safe place to prevent abuse and misuse; do not refrigerate or freeze.
- To remove patch, peel off slowly. An oil-based product (petroleum jelly, olive oil, mineral oil) may be applied gently to facilitate removal. Upon removal, fold so that adhesive side of patch adheres to itself and flush down toilet or dispose of in an appropriate lidded container.

Patient/Family Teaching

- Instruct patient to take medication as directed. If an oral dose is missed, take the remaining doses for that day at regularly spaced intervals; do not double doses. Take the last dose before 6 PM to minimize the risk of insomnia. Instruct patient not to alter dose without consulting health care professional. Abrupt cessation of high doses may cause extreme fatigue and mental depression. Instruct parent/caregiver to read the *Medication Guide* prior to use and with each Rx refill; new information may be available.
- Advise patient to check weight 2–3 times weekly and report weight loss to health care professional.
- Advise patient that methylphenidate is a drug with known abuse potential. Protect it from theft, and never give to anyone other than the individual for whom it was prescribed. Store out of sight and reach of children, and in a location not accessible by others.
- May cause dizziness or blurred vision. Caution patient to avoid driving or activities requiring alertness until response to medication is known.
- Inform patient and/or parents that shell of *Concerta* tablet may appear in the stool. This is no cause for concern.
- Advise patient to avoid using caffeine-containing beverages concurrently with this therapy.
- Advise patient to notify health care professional if nervousness, insomnia, palpitations, vomiting, skin rash, fever, painful and prolonged erections, or circulation problems (fingers or toes feel numb, cool, painful; fingers or toes change color from pale, to blue, to red) occur.
- Advise patient and/or parents to notify health care professional of behavioral changes.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially St. John's wort.
- Inform patient that health care professional may order periodic holidays from the drug to assess progress and to decrease dependence.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected or if breast feeding. May lead to premature delivery and low birth weight infants. Inform patients who become pregnant while taking methylphenidate of National Pregnancy Registry of ADHD Medications that monitors pregnancy outcomes in women exposed to ADHD medications during pregnancy. Enroll patient by calling 1-866-961-2388 or visit online at https://womensmentalhealth.org/adhd-medications/. Monitor breast feeding infants for agitation, insomnia, anorexia, and reduced weight gain.
- Emphasize the importance of routine follow-up exams to monitor progress.
- **Transdermal:** Encourage parent or caregiver to use the administration chart included in package to

© F.A. Davis Publishing

monitor application and removal time and disposal method.
- Caution patient to avoid exposing patch to direct external heat sources (hair dryers, heating pads, electric blankets, heated water beds, etc.). May increase rate and extent of absorption.
- Inform parent/caregiver that skin redness, itching and small bumps on the skin are common. If swelling or blistering occurs, the patch should not be worn and health care professional notified. Caution parent/caregiver not to apply hydrocortisone or other solutions, creams, ointments, or emollients prior to application.
- Advise patient referred for MRI test to discuss patch with referring health care professional and MRI facility to determine if removal of patch is necessary prior to test and for directions for replacing patch.
- **Home Care Issues:** Pedi: Advise parents to notify school nurse of medication regimen.

Evaluation/Desired Outcomes
- Improved attention span and social interactions in ADHD.
- Decreased frequency of narcoleptic symptoms.

methylPREDNISolone, See CORTICOSTEROIDS (SYSTEMIC).

BEERS

metoclopramide
(met-oh-**kloe**-pra-mide)
Gimoti, Metonia, Reglan

Classification
Therapeutic: antiemetics

Indications
PO: Gastroesophageal reflux. **PO, IV, Intranasal:** Acute and recurrent diabetic gastroparesis. **IV:** Used for the following conditions: Prevention of nausea and vomiting associated with emetogenic chemotherapy, Prevention of postoperative nausea and vomiting when nasogastric suctioning is undesirable, Facilitation of small bowel intubation in radiographic procedures.
Unlabeled Use: Treatment of hiccups.

Action
Blocks dopamine receptors in chemoreceptor trigger zone of the CNS. Stimulates motility of the upper GI tract and accelerates gastric emptying. **Therapeutic Effects:** Decreased nausea and vomiting. Decreased symptoms of gastric stasis. Easier passage of nasogastric tube into small bowel.

Pharmacokinetics
Absorption: Well absorbed from the GI tract, from rectal mucosa, and from IM sites. 47% absorbed following intranasal administration.
Distribution: Widely distributed into body tissues and fluids. Crosses blood-brain barrier and placenta. Enters breast milk in concentrations greater than plasma.
Metabolism and Excretion: Partially metabolized by the liver (primarily by CYP2D6; the CYP2D6 enzyme system exhibits genetic polymorphism); ~7% of population may be poor metabolizers and may have significantly ↑ metoclopramide concentrations and an ↑ risk of adverse effects. 25% eliminated unchanged in the urine.
Half-life: 2.5–6 hr.

TIME/ACTION PROFILE (effects on peristalsis)

ROUTE	ONSET	PEAK	DURATION
PO	30–60 min	unknown	1–2 hr
IM	10–15 min	unknown	1–2 hr
Intranasal	unknown	unknown	unknown
IV	1–3 min	immediate	1–2 hr

Contraindications/Precautions
Contraindicated in: Hypersensitivity; Possible GI obstruction, perforation, or hemorrhage; Seizure disorders; Hypertension; Pheochromocytoma; History of tardive dyskinesia; Parkinson's disease; Concurrent use of MAO inhibitors; Moderate or severe renal or hepatic impairment (intranasal only); CYP2D6 poor metabolizers (↑ risk for tardive dyskinesia) (intranasal only); Concurrent use of strong CYP2D6 inhibitors (intranasal only).
Use Cautiously in: History of depression; Diabetes (may alter response to insulin); Cirrhosis or HF (↑ risk of fluid retention); Renal impairment (↓ dose in CCr <50 mL/min) (oral and IV/IM only); Chronic use >12 wk (↑ risk for tardive dyskinesia); Moderate or severe hepatic impairment; CYP2D6 poor metabolizers (↑ risk for tardive dyskinesia) (oral and IV/IM only); OB: May cause extrapyramidal symptoms or methemoglobinemia in neonate when used during pregnancy; Lactation: May lead to diarrhea, extrapyramidal symptoms, or methemoglobinemia in infant when used during breast feeding; Pedi: Prolonged clearance in neonates can result in high serum concentrations and ↑ the risk for methemoglobinemia. Side effects are more common in children, especially extrapyramidal reactions. Avoid use of tablets and intranasal because of ↑ risk of tardive dyskinesia and methemoglobinemia (in neonates); Geri: Older adults are more susceptible to oversedation, extrapyramidal reactions, and tardive dyskinesia (↓ dose); intranasal therapy not recommended as initial therapy in older adults (can be transitioned to intranasal therapy once stabilized on oral therapy).

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: arrhythmias (supraventricular tachycardia, bradycardia), hypertension, hypotension. **Endo:** gynecomastia, hyperprolactinemia. **GI:** constipation, diarrhea, dry mouth, nausea. **Hemat:** methemoglobinemia, neutropenia, leukopenia, agranulocytosis. **Neuro:** drowsiness, dysgeusia (intranasal), extrapyramidal reactions, restlessness, NEUROLEPTIC MALIGNANT SYNDROME, anxiety, bradykinesia, cog-wheel rigidity, depression, irritability, tardive dyskinesia, tremor.

Interactions

Drug-Drug: MAO inhibitors may cause release of catecholamines which may ↑ BP; avoid concurrent use. Additive CNS depression with other **CNS depressants**, including **alcohol**, **antidepressants**, **antihistamines**, **opioid analgesics**, and **sedative/hypnotics**. May ↑ absorption and risk of toxicity from **cyclosporine**. May affect the GI absorption of other **orally administered drugs** as a result of effect on GI motility. May exaggerate hypotension during **general anesthesia**. ↑ risk of tardive dyskinesia, extrapyramidal reactions, or neuroleptic malignant syndrome with **antipsychotic agents**; avoid concurrent use. **Strong CYP2D6 inhibitors**, including **bupropion**, **fluoxetine**, **paroxetine**, or **quinidine** may ↑ levels and risk of extrapyramidal reactions; avoid concurrent use with intranasal metoclopramide; ↓ PO or IV/IM metoclopramide dose. **Opioids** and **anticholinergics** may antagonize the GI effects of metoclopramide. May ↑ neuromuscular blockade from **succinylcholine**. May ↓ effectiveness of **levodopa**. May ↑ **tacrolimus** serum levels.

Route/Dosage

Prevention of Chemotherapy-Induced Nausea and Vomiting

IV (Adults and Children): 1–2 mg/kg 30 min before chemotherapy. Additional doses of 1–2 mg/kg may be given every 2–4 hr, pretreatment with diphenhydramine will ↓ the risk of extrapyramidal reactions to this dose.

Facilitation of Small Bowel Intubation

IV (Adults and Children >14 yr): 10 mg over 1–2 min.
IV (Children 6–14 yr): 2.5–5 mg (dose should not exceed 0.5 mg/kg) over 1–2 min.
IV (Children <6 yr): 0.1 mg/kg over 1–2 min.

Diabetic Gastroparesis

PO, IV, IM (Adults): 10 mg 30 min before meals and at bedtime for 2–8 wk (not to exceed 40 mg/day). *CYP2D6 poor metabolizers*—5 mg 30 min before meals and at bedtime for 2–8 wk (not to exceed 20 mg/day). *Concurrent use of strong CYP2D6 inhibitor*—5 mg 30 min before meals and at bedtime for 2–8 wk (not to exceed 20 mg/day).
Intranasal (Adults): One spray (15 mg) in one nostril 30 min before each meal and at bedtime (not to exceed 60 mg/day) for 2–8 wk (not to exceed 12 wk).
PO, IV, IM (Geriatric Patients): 5 mg 30 min before meals and at bedtime for 2–8 wk; may titrate up to 10 mg 30 min before each meal and at bedtime based on response and tolerability (not to exceed 40 mg/day).
Intranasal (Geriatric Patients): *Patients receiving alternative metoclopramide product at stable dose of 10 mg four times daily*—One spray (15 mg) in one nostril 30 min before each meal and at bedtime (not to exceed 60 mg/day) for 2–8 wk (not to exceed 12 wk).

Renal Impairment

PO (Adults): *CCr ≤60 mL/min*—5 mg 30 min before meals and at bedtime for 2–8 wk (not to exceed 20 mg/day). *End-stage renal disease (including hemodialysis and peritoneal dialysis)*—5 mg twice daily for 2–8 wk (not to exceed 10 mg/day).

Hepatic Impairment

PO, IV, IM (Adults): *Mild hepatic impairment (Child-Pugh A)*—10 mg 30 min before meals and at bedtime for 2–8 wk (not to exceed 40 mg/day). *Moderate or severe hepatic impairment (Child-Pugh B or C)*—5 mg 30 min before meals and at bedtime for 2–8 wk (not to exceed 20 mg/day).

Gastroesophageal Reflux

PO (Adults): 10–15 mg 30 min before each meal and at bedtime (not to exceed 60 mg/day). *CYP2D6 poor metabolizers*—5 mg 30 min before each meal and at bedtime or 10 mg 3 times daily (not to exceed 30 mg/day). *Concurrent use of strong CYP2D6 inhibitor*—5 mg 30 min before each meal and at bedtime or 10 mg 3 times daily (not to exceed 30 mg/day).
PO (Geriatric Patients): 5 mg 30 min before each meal and at bedtime; may titrate up to 10–15 mg 30 min before each meal and at bedtime based on response and tolerability (not to exceed 60 mg/day).

Renal Impairment

PO (Adults): *CCr ≤60 mL/min*—5 mg 30 min before each meal and at bedtime or 10 mg 3 times daily (not to exceed 30 mg/day). *ESRD (including hemodialysis and peritoneal dialysis)*—5 mg 30 min before each meal and at bedtime or 10 mg twice daily (not to exceed 20 mg/day).

Hepatic Impairment

PO (Adults): *Mild hepatic impairment (Child-Pugh A)*—10–15 mg 30 min before each meal and at bedtime (not to exceed 60 mg/day). *Moderate or severe hepatic impairment (Child-Pugh B or C)*—5 mg 30 min before each meal and at bedtime or 10 mg 3 times daily (not to exceed 30 mg/day).

Prevention of Postoperative Nausea and Vomiting

IM, IV (Adults): 10 mg at the end of surgical procedure, repeat in 6–8 hr if needed.

Treatment of Hiccups

PO, IM (Adults): 10–20 mg 4 times daily PO; may be preceded by a single 10-mg dose IM (unlabeled).

© F.A. Davis Publishing

Availability (generic available)

Nasal spray: 15 mg/metered spray in 9.8–mL bottle (delivers 112 metered sprays). **Oral solution (apricot-peach flavor):** 5 mg/5 mL. **Orally disintegrating tablets:** 5 mg, 10 mg. **Cost:** $26.40/10. **Solution for injection:** 5 mg/mL. **Tablets:** 5 mg, 10 mg. **Cost:** *Generic*— 5 mg $11.04/100, 10 mg $7.18/100.

NURSING IMPLICATIONS

Assessment

- Assess for nausea, vomiting, abdominal distention, and bowel sounds before and after administration.
- Assess for extrapyramidal side effects (*parkinsonian*— difficulty speaking or swallowing, loss of balance control, pill rolling, mask-like face, shuffling gait, rigidity, tremors; and *dystonic*— muscle spasms, twisting motions, twitching, inability to move eyes, weakness of arms or legs) periodically throughout course of therapy. May occur wk to mo after initiation of therapy and are reversible on discontinuation. Dystonic reactions may occur within min of IV infusion and stop within 24 hr of discontinuation of metoclopramide. May be treated with 50 mg of IM diphenhydramine or diphenhydramine 1 mg/kg IV may be administered prophylactically 15 min before metoclopramide IV infusion.
- Monitor for tardive dyskinesia (uncontrolled rhythmic movement of mouth, face, and extremities; lip smacking or puckering; puffing of cheeks; uncontrolled chewing; rapid or worm-like movements of tongue). Avoid treatment with metoclopramide (all dose forms and routes of administration) for longer than 12 wk due to increased risk of developing tardive dyskinesia with longer-term use. Report immediately and discontinue metoclopramide; may be irreversible.
- Monitor for neuroleptic malignant syndrome (hyperthermia, muscle rigidity, altered consciousness, irregular pulse or BP, tachycardia, and diaphoresis).
- Assess for signs of depression periodically throughout therapy.
- Monitor for symptoms related to hyperprolactinemia (menstrual abnormalities, galactorrhea, sexual dysfunction).
- ***Lab Test Considerations:*** May alter hepatic function test results.
- May cause ↑ serum prolactin and aldosterone concentrations.

Implementation

- **PO:** Administer doses 30 min before meals and at bedtime.
- Do not remove *orally disintegrating tablets* from the bottle until just prior to dosing. Remove tablet from bottle with dry hands and immediately place on tongue to disintegrate and swallow with saliva. Tablet typically disintegrates in 1–1.5 min. Administration with liquid is not necessary.
- **IM:** For prevention of postoperative nausea and vomiting, inject IM near the end of surgery.
- **Intranasal:** Administer 1 spray in one nostril. Before administering 1st dose from a bottle, prime the pump by pressing down on the finger flange and releasing 10 sprays in the air. Place the spray nozzle tip under one nostril and lean the head slightly forward so the tip of spray nozzle is aimed away from the septum and toward the back of the nose. Close the other nostril with the other index finger. Move spray pump upwards so the tip of the nozzle is in the nostril. To ensure a full dose, hold the bottle upright while pressing down firmly and completely on finger flange and release while inhaling slowly through the open nostril. Remove spray pump nozzle tip from nostril and exhale slowly through the mouth. Wipe the spray nozzle with a clean tissue. If uncertain that spray entered the nose, do not repeat dose. Take next dose at scheduled time.

IV Administration

- **IV Push:** Administer IV dose 30 min before administration of chemotherapeutic agent. ***Rate:*** Doses may be given slowly over 1–2 min. Rapid administration causes a transient but intense feeling of anxiety and restlessness followed by drowsiness.
- **Intermittent Infusion:** ***Dilution:*** May be diluted for IV infusion in 50 mL of D5W, 0.9% NaCl, D5/0.45% NaCl, Ringer's solution, or LR. Diluted solution is stable for 48 hr if protected from light or 24 hr under normal light. ***Concentration:*** May dilute to 0.2 mg/mL or give undiluted at 5 mg/mL. ***Rate:*** Infuse slowly (maximum rate 5 mg/min) over at least 15–30 min.
- **Y-Site Compatibility:** acetaminophen, aldesleukin, alemtuzumab, alfentanil, amifostine, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B lipid complex, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, azathioprine, azithromycin, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, caspofungin, cefazolin, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftolozane/tazobactam, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisatracurium, cisplatin, cladribine, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, ertapenem, erythromycin, esmolol, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, filgrastim, fluconazole,

© F.A. Davis Publishing

fludarabine, folic acid, foscarnet, fosphenytoin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, regular, irinotecan, isavuconazonium, isoproterenol, ketamine, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, lidocaine, linezolid, lorazepam, magnesium sulfate, mannitol, melphalan, meperidine, meropenem, meropenem/vaborbactam, mesna, methadone, methotrexate, methylprednisolone, metoprolol, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multiple vitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroglycerin, nitroprusside, norepinephrine, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, plazomicin, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, remifentanil, rituximab, rocuronium, sargramostim, sodium acetate, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, tedizolid, telavancin, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, topotecan, trastuzumab, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zidovudine, zoledronic acid.

- **Y-Site Incompatibility:** amphotericin B deoxycholate, amphotericin B liposome, carmustine, cefepime, dantrolene, diazepam, doxorubicin liposome, ganciclovir, gemtuzumab ozogamicin, phenytoin, propofol, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take metoclopramide as directed. Explain how to administer intranasal doses. Take oral missed doses as soon as remembered if not almost time for next dose. If an intranasal dose is missed, omit and take the next dose at regularly scheduled time; do not double doses. Advise patient to read the *Medication Guide* before starting therapy and with each Rx refill in case of changes.
- Pedi: Unintentional overdose has been reported in infants and children with the use of metoclopramide oral solution. Teach parents how to accurately read labels and administer medication.
- May cause drowsiness. Caution patient to avoid driving or other activities requiring alertness until response to medication is known.
- Advise patient to avoid concurrent use of alcohol and other CNS depressants while taking this medication.
- Inform patient of risk of extrapyramidal symptoms, tardive dyskinesia, and neuroleptic malignant syndrome. Advise patient to notify health care professional immediately if involuntary or repetitive movements of eyes, face, or limbs occur.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Monitor neonates for extrapyramidal signs and methemoglobinemia.

Evaluation/Desired Outcomes

- Prevention or relief of nausea and vomiting.
- Decreased symptoms of gastric stasis.
- Facilitation of small bowel intubation.
- Decreased symptoms of esophageal reflux.
- Metoclopramide should not be used for more than 12 wk due to risk of tardive dyskinesia.

metOLazone (me-tole-a-zone)

Zaroxolyn

Classification

Therapeutic: antihypertensives, diuretics
Pharmacologic: thiazide-like diuretics

Indications

Mild to moderate hypertension. Edema associated with HF or the nephrotic syndrome.

Action

Increases excretion of sodium and water by inhibiting sodium reabsorption in the distal tubule. Promotes excretion of chloride, potassium, magnesium, and bicarbonate. May produce arteriolar dilation. **Therapeutic Effects:** Lowering of BP in hypertensive patients. Diuresis with subsequent mobilization of edema. Effect may continue in renal impairment.

Pharmacokinetics

Absorption: Absorption is variable.
Distribution: Unknown.
Protein Binding: 95%.
Metabolism and Excretion: Excreted mainly unchanged by the kidneys.
Half-life: 6–20 hr.

TIME/ACTION PROFILE (diuretic effect†)

ROUTE	ONSET	PEAK	DURATION
PO	1 hr	2 hr	12–24 hr

†Full antihypertensive effect may take days–wk.

Contraindications/Precautions

Contraindicated in: Hypersensitivity; Cross-sensitivity with other sulfonamides may exist; Anuria; Lactation: Lactation.

Use Cautiously in: Severe hepatic impairment; OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; may ↑ risk of hypoglycemia, hypokalemia, hyponatremia, jaundice, and thrombocytopenia in fetus; Geri: Older adults may have ↑ sensitivity to drug effects.

© F.A. Davis Publishing

Adverse Reactions/Side Effects

CV: chest pain, hypotension, palpitations. **Derm:** photosensitivity, rash. **Endo:** hyperglycemia. **F and E:** hypokalemia, dehydration, hypercalcemia, hypochloremic alkalosis, hypomagnesemia, hyponatremia, hypophosphatemia, hypovolemia. **GI:** anorexia, bloating, cramping, drug-induced hepatitis, nausea, pancreatitis, vomiting. **Hemat:** blood dyscrasias. **Metab:** hyperuricemia. **MS:** muscle cramps. **Neuro:** drowsiness, lethargy.

Interactions

Drug-Drug: ↑ risk of hypotension with **nitrates**, acute ingestion of **alcohol**, or other **antihypertensives**. ↑ risk of hypokalemia with **corticosteroids**, **amphotericin B**, or **piperacillin/tazobactam**. May ↑ the risk of **digoxin** toxicity. ↓ the excretion of **lithium**; may cause toxicity. May ↓ the effectiveness of **methenamine**. **Stimulant laxatives** (including **aloe**, **senna**) may ↑ risk of potassium depletion.

Drug-Food: **Food** may ↑ extent of absorption.

Route/Dosage

PO (Adults): *Hypertension*—2.5–5 mg/day; *edema*—5–20 mg/day.

PO (Children): 0.2–0.4 mg/kg/day divided every 12–24 hr.

Availability (generic available)

Tablets: 2.5 mg, 5 mg, 10 mg.

NURSING IMPLICATIONS

Assessment

- Monitor BP, intake and output, and daily weight, and assess feet, legs, and sacral area for edema daily.
- Assess patient, especially if taking digoxin, for anorexia, nausea, vomiting, muscle cramps, paresthesia, and confusion. Notify health care professional if these signs of electrolyte imbalance occur. Patients taking digoxin are at risk of digoxin toxicity because of the potassium-depleting effect of the diuretic.
- Assess patient for allergy to sulfonamides.
- **Hypertension:** Monitor BP before and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- ***Lab Test Considerations:*** Monitor electrolytes (especially potassium), blood glucose, BUN, and serum creatinine and uric acid levels before and periodically during therapy.
- May cause ↑ in serum and urine glucose in diabetic patients.
- May cause an ↑ in serum bilirubin, calcium, creatinine, and uric acid, and a ↓ in serum magnesium, potassium, and sodium and urinary calcium concentrations.
- May cause ↓ serum protein-bound iodine concentrations.
- May cause ↑ serum cholesterol, low-density lipoprotein, and triglyceride concentrations.

Implementation

- Do not confuse metolazone with methimazole, methazolamide, methadone, or methotrexate.
- Administer in the morning to prevent disruption of sleep cycle.
- Intermittent dose schedule may be used for continued control of edema.
- **PO:** May give with food or milk to minimize GI irritation.

Patient/Family Teaching

- Instruct patient to take metolazone at the same time each day. Take missed doses as soon as remembered but not just before next dose is due. Do not double doses.
- Instruct patient to monitor weight biweekly and notify health care professional of significant changes.
- Caution patient to change positions slowly to minimize orthostatic hypotension; may be potentiated by alcohol.
- Advise patient to use sunscreen and protective clothing in the sun to prevent photosensitivity reactions.
- Instruct patient to discuss dietary potassium requirements with health care professional (see Appendix J).
- Instruct patient to notify health care professional of medication regimen before treatment or surgery.
- Advise patient to report muscle weakness, cramps, nausea, vomiting, diarrhea, or dizziness to health care professional.
- Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, and to avoid breast feeding during therapy. Monitor for hypoglycemia, hypokalemia, hyponatremia, jaundice, and thrombocytopenia in the fetus or newborn following maternal use.
- Emphasize the importance of routine follow-up exams.
- **Hypertension:** Advise patient to continue taking the medication even if feeling better. Medication controls but does not cure hypertension.
- Encourage patient to comply with additional interventions for hypertension (weight reduction, low-sodium diet, regular exercise, smoking cessation, moderation of alcohol consumption, and stress management).
- Instruct patient and family in correct technique for monitoring weekly BP.
- Advise patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult with health care professional before taking other medications, especially

© F.A. Davis Publishing

cough or cold preparations, concurrently with this therapy.

Evaluation/Desired Outcomes

- Decrease in BP.
- Increase in urine output.
- Decrease in edema.

HIGH ALERT

metoprolol (me-**toe**-proe-lole)
Kapspargo Sprinkle, Lopresor SR, Lopressor, Toprol XL

Classification
Therapeutic: antianginals, antihypertensives
Pharmacologic: beta blockers

Indications

Hypertension. Angina pectoris. Prevention of MI and decreased mortality in patients with recent MI. Management of stable, symptomatic (class II or III) heart failure due to ischemic, hypertensive or cardiomyopathic origin (may be used with ACE inhibitors, diuretics and/or digoxin; Toprol XL only). **Unlabeled Use:** Ventricular arrhythmias/tachycardia. Migraine prophylaxis. Tremors. Aggressive behavior. Drug-induced akathisia. Anxiety.

Action

Blocks stimulation of $beta_1$ (myocardial)-adrenergic receptors. Does not usually affect $beta_2$ (pulmonary, vascular, uterine)-adrenergic receptor sites. **Therapeutic Effects:** Decreased BP and heart rate. Decreased frequency of attacks of angina pectoris. Decreased rate of cardiovascular mortality and hospitalization in patients with heart failure.

Pharmacokinetics

Absorption: Well absorbed after oral administration.
Distribution: Crosses the blood-brain barrier, crosses the placenta; small amounts enter breast milk.
Metabolism and Excretion: Mostly metabolized by the liver (primarily by CYP2D6; the CYP2D6 enzyme system exhibits genetic polymorphism); ~7% of population may be poor metabolizers and may have significantly ↑ metoprolol concentrations and an ↑ risk of adverse effects.
Half-life: 3–7 hr.

TIME/ACTION PROFILE (cardiovascular effects)

ROUTE	ONSET	PEAK	DURATION
PO†	15 min	unknown	6–12 hr
PO–ER	unknown	6–12 hr	24 hr
IV	immediate	20 min	5–8 hr

†Maximal effects on BP (chronic therapy) may not occur for 1 wk. Hypotensive effects may persist for up to 4 wk after discontinuation.

Contraindications/Precautions

Contraindicated in: Uncompensated HF; Pulmonary edema; Cardiogenic shock; Bradycardia, heart block, or sick sinus syndrome (in absence of a pacemaker).
Use Cautiously in: Renal impairment; Hepatic impairment; Pulmonary disease (including asthma; $beta_1$ selectivity may be lost at higher doses); Diabetes mellitus (may mask signs of hypoglycemia); Thyrotoxicosis (may mask symptoms); Patients with a history of severe allergic reactions (intensity of reactions may be ↑); Untreated pheochromocytoma (initiate only after alpha blocker therapy started); OB: Use during pregnancy only if potential maternal benefit justifies potential fetal risk; crosses the placenta and may cause fetal/neonatal bradycardia, hypotension, hypoglycemia, or respiratory depression; Lactation: Use while breast feeding only if potential maternal benefit justifies potential risk to infant; may result in bradycardia, constipation, diarrhea, and dry mouth/skin/eyes in infant, especially in mothers who are CYP2D6 poor metabolizers.; Pedi: Safety and effectiveness not established in children <18 yr (tablets, extended-release tablets, and injection) or <6 yr (extended-release capsules); Geri: Older adults may have ↑ sensitivity to beta blockers; initial dose ↓ recommended.

Adverse Reactions/Side Effects

CV: BRADYCARDIA, HF, PULMONARY EDEMA, hypotension, peripheral vasoconstriction. **Derm:** rash. **EENT:** blurred vision, stuffy nose. **Endo:** hyperglycemia, hypoglycemia. **GI:** constipation, diarrhea, drug-induced hepatitis, dry mouth, flatulence, gastric pain, heartburn, ↑ liver enzymes, nausea, vomiting. **GU:** erectile dysfunction, ↓ libido, urinary frequency. **MS:** arthralgia, back pain, joint pain. **Neuro:** fatigue, weakness, anxiety, depression, dizziness, drowsiness, insomnia, memory loss, mental status changes, nervousness, nightmares. **Resp:** bronchospasm, wheezing. **Misc:** drug-induced lupus syndrome.

Interactions

Drug-Drug: General anesthesia, **IV phenytoin**, and **verapamil** may cause ↑ myocardial depression. ↑ risk of bradycardia when used with **digoxin**, **verapamil**, **diltiazem**, or **clonidine**. ↑ hypotension may occur with other **antihypertensives**, acute ingestion of **alcohol**, or **nitrates**. Concurrent use with **amphetamines**, **cocaine**, **ephedrine**, **epinephrine**, **norepinephrine**, **phenylephrine**, or **pseudoephedrine** may result in unopposed alpha-adrenergic stimulation (excessive hypertension, bradycardia). Concurrent administration of **thyroid** administration may ↓ effectiveness. May alter the effectiveness of **insulins** or **oral hypoglycemic agents** (dose adjustments may be necessary). May ↓ the effectiveness of **theophylline**. May ↓ the beneficial $beta_1$-cardiovascular effects of **dopamine** or **dobutamine**. Use cautiously within 14 days of **MAO inhibitor** therapy (may result in hypertension).

© F.A. Davis Publishing

Route/Dosage

When switching from immediate-release to extended-release product, the same total daily dose can be used

PO (Adults): *Hypertension/angina*—25–100 mg/day as a single dose initially or 2 divided doses; may be ↑ every 7 days as needed up to 450 mg/day (immediate-release) or 400 mg/day (extended-release) (for angina, give in divided doses). Extended-release products are given once daily. *MI*—25–50 mg (starting 15 min after last IV dose) every 6 hr for 48 hr, then 100 mg twice daily. *Heart failure*—12.5–25 mg once daily (of extended-release), can be doubled every 2 wk up to 200 mg/day. *Migraine prevention*—50–100 mg 2–4 times daily (unlabeled).
IV (Adults): *MI*—5 mg every 2 min for 3 doses, followed by oral dosing.
PO (Children ≥6 yr): *Hypertension*—1 mg/kg once daily (extended-release capsules); may be titrated, as needed (not to exceed 50 mg/day).

Availability (generic available)

Tablets (tartrate): 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg. **Cost:** *Generic*—All strengths $7.18/100. **Extended-release capsules (succinate; Kapspargo Sprinkle):** 25 mg, 50 mg, 100 mg, 200 mg. **Extended-release tablets (succinate; Toprol XL):** 25 mg, 50 mg, 100 mg, 200 mg. **Cost:** *Generic*—25 mg $35.68/100, 50 mg $41.93/100, 100 mg $53.95/100, 200 mg $84.54/100. **Solution for injection:** 1 mg/mL. ***In combination with:*** hydrochlorothiazide (Dutoprol, Lopressor HCT). See Appendix N.

NURSING IMPLICATIONS

Assessment

- Monitor BP, ECG, and pulse frequently during dose adjustment and periodically during therapy.
- Monitor frequency of prescription refills to determine compliance.
- Monitor vital signs and ECG every 5–15 min during and for several hrs after parenteral administration. If heart rate <40 bpm, especially if cardiac output is also decreased, administer atropine 0.25–0.5 mg IV.
- Monitor intake and output ratios and daily weights. Assess routinely for signs and symptoms of HF (dyspnea, rales/crackles, weight gain, peripheral edema, jugular venous distention).
- **Angina:** Assess frequency and characteristics of anginal attacks periodically during therapy.
- ***Lab Test Considerations:*** May cause ↑ BUN, serum lipoprotein, potassium, triglyceride, and uric acid levels.
- May cause ↑ ANA titers.
- May cause ↑ in blood glucose levels.
- May cause ↑ serum alkaline phosphatase, LDH, AST, and ALT levels.

Implementation

- ***High Alert:*** IV vasoactive medications are inherently dangerous. Before administering intravenously, have second practitioner independently check original order and dose calculations.
- ***High Alert:*** Do not confuse Toprol-XL (metoprolol succinate) with Topamax (topiramate). Do not confuse Lopressor (metoprolol tartrate) with Lyrica (pregabalin). Do not confuse metoprolol tartrate with metoprolol succinate.
- **PO:** Take apical pulse before administering. If <50 bpm or if arrhythmia occurs, withhold medication and notify health care professional.
- Administer metoprolol with meals or directly after eating.
- ***DNC:*** Extended-release tablets may be broken in half; do not crush or chew.
- Swallow *Kapspargo Sprinkle* whole. If unable to swallow a capsule, may be opened and contents sprinkled over soft food (applesauce, pudding, yogurt). Swallow contents of capsule along with a small amount (tsp) of soft food. Swallow drug/food mixture within 60 min; do not store for future use. May also be administered via NG tube by opening and adding capsule contents to an all plastic oral tip syringe and adding 15 mL of water. Gently shake syringe for about 10 sec. Promptly administer through a 12 French or larger NG tube. Rinse with additional water to ensure no granules are left in syringe.

IV Administration

- **IV Push:** ***Dilution:*** Administer undiluted. ***Concentration:*** 1 mg/mL. ***Rate:*** Administer over 1 min.
- **Y-Site Compatibility:** acetaminophen, acyclovir, albumin, human, alemtuzumab, alfentanil, amikacin, aminocaproic acid, aminophylline, amiodarone, amphotericin B liposome, anidulafungin, argatroban, arsenic trioxide, ascorbic acid, atropine, aztreonam, benztropine, bivalirudin, bleomycin, bumetanide, buprenorphine, butorphanol, calcium chloride, calcium gluconate, cangrelor, carboplatin, carmustine, caspofungin, cefazolin, cefepime, cefotaxime, cefotetan, cefoxitin, ceftaroline, ceftazidime, ceftriaxone, cefuroxime, chloramphenicol, chlorpromazine, ciprofloxacin, cisplatin, clindamycin, cyanocobalamin, cyclophosphamide, cyclosporine, cytarabine, dacarbazine, dactinomycin, daptomycin, daunorubicin hydrochloride, dexamethasone, dexmedetomidine, dexrazoxane, digoxin, diltiazem, diphenhydramine, dobutamine, docetaxel, dopamine, doxorubicin hydrochloride, doxorubicin liposomal, doxycycline, enalaprilat, ephedrine, epinephrine, epirubicin, epoetin alfa, eptifibatide, erythromycin, esmolol, esomeprazole, etoposide, etoposide phosphate, famotidine, fenoldopam, fentanyl, flucona-

zole, fludarabine, fluorouracil, folic acid, foscarnet, fosphenytoin, furosemide, ganciclovir, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch, hydrocortisone, hydromorphone, ibuprofen, idarubicin, ifosfamide, imipenem/cilastatin, indomethacin, insulin, regular, irinotecan, isoproterenol, ketorolac, labetalol, lactated Ringer's, leucovorin calcium, levofloxacin, levothyroxine, linezolid, lorazepam, magnesium sulfate, mannitol, meperidine, meropenem, mesna, methadone, methotrexate, methylprednisolone, metoclopramide, metronidazole, midazolam, milrinone, mitomycin, mitoxantrone, morphine, moxifloxacin, multivitamins, mycophenolate, nafcillin, nalbuphine, naloxone, nicardipine, nitroprusside, norepinephrine, 0.9% NaCl, octreotide, ondansetron, oxacillin, oxaliplatin, oxytocin, paclitaxel, palonosetron, pamidronate, pancuronium, papaverine, pemetrexed, penicillin G, pentamidine, pentobarbital, phenobarbital, phentolamine, phenylephrine, phytonadione, piperacillin/tazobactam, potassium acetate, potassium chloride, procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, quinupristin/dalfopristin, rocuronium, sodium bicarbonate, succinylcholine, sufentanil, tacrolimus, theophylline, thiamine, thiotepa, tigecycline, tirofiban, tobramycin, vancomycin, vasopressin, vecuronium, verapamil, vinblastine, vincristine, vinorelbine, voriconazole, zoledronic acid.

- **Y-Site Incompatibility:** allopurinol, amphotericin B deoxycholate, amphotericin B lipid complex, dantrolene, diazepam, gemtuzumab ozogamicin, pantoprazole, phenytoin, trimethoprim/sulfamethoxazole.

Patient/Family Teaching

- Instruct patient to take medication as directed, at the same time each day, even if feeling well; do not skip or double up on missed doses. Take missed doses as soon as possible up to 8 hr before next dose. Abrupt withdrawal may precipitate life-threatening arrhythmias, hypertension, or myocardial ischemia.
- Teach patient and family how to check pulse daily and BP biweekly and to report significant changes to health care professional.
- May cause drowsiness. Caution patient to avoid driving or other activities that require alertness until response to the drug is known.
- Advise patient to change positions slowly to minimize orthostatic hypotension.
- Caution patient that this medication may increase sensitivity to cold.
- Instruct patient to notify health care professional of all Rx or OTC medications, vitamins, or herbal products being taken and to consult health care professional before taking any Rx, OTC, or herbal products, especially cold preparations, concurrently with this medication. Patients on antihypertensive therapy should also avoid excessive amounts of coffee, tea, and cola.
- Diabetics should closely monitor blood glucose, especially if weakness, malaise, irritability, or fatigue occurs. Medication does not block sweating as a sign of hypoglycemia.
- Advise patient to notify health care professional if slow pulse, difficulty breathing, wheezing, cold hands and feet, dizziness, light-headedness, confusion, depression, rash, fever, sore throat, unusual bleeding, or bruising occurs.
- Instruct patient to inform health care professional of medication regimen before treatment or surgery.
- Rep: Advise females of reproductive potential to notify health care professional if pregnancy is planned or suspected, or if breast feeding. Monitor neonates of women taking metoprolol for symptoms of hypotension, bradycardia, hypoglycemia, and respiratory depression and manage accordingly. Monitor breast-fed infants for bradycardia, dry mouth, skin or eyes, and diarrhea or constipation.
- Advise patient to carry identification describing disease process and medication regimen at all times.
- **Hypertension:** Reinforce the need to continue additional therapies for hypertension (weight loss, sodium restriction, stress reduction, regular exercise, moderation of alcohol consumption, and smoking cessation). Medication controls but does not cure hypertension.

Evaluation/Desired Outcomes

- Decrease in BP.
- Reduction in frequency of anginal attacks.
- Increase in activity tolerance.
- Prevention of MI.

metroNIDAZOLE

(me-troe-**ni**-da-zole)

Flagyl, MetroCream, MetroGel, MetroGel-Vaginal, MetroLotion, Metro IV, ✱Nidagel, Noritate, Nuvessa, Vandazole

Classification

Therapeutic: anti-infectives, antiprotozoals, antiulcer agents

Indications

PO, IV: Treatment of the following anaerobic infections: Intra-abdominal infections (may be used with a cephalosporin), Gynecologic infections, Skin and skin structure infections, Lower respiratory tract infections, Bone and joint infections, CNS infections, Septicemia, Endocarditis. **IV:** Perioperative prophylactic agent in colorectal surgery. **PO:** Treatment of the following infections: Amebic dysentery, amebic liver abscess, and trichomoniasis, Peptic ulcer disease caused by *Helicobacter pylori*. **Topical:** Acne rosacea. **Vag:** Bacterial vaginosis. **Unlabeled Use:** Giardiasis. Anti-infective associated *Clostridioides difficile*-associated diarrhea (CDAD).
